MOTORISTS' MANUAL OF WEIGHTS AND MEASURES

The tables given herein have been prepared primarily for the convenience of American motoriats traveling in Canada, Mexico, or elsewhere where the units of welghts and measures in customary use in trade or commerce are those of the British (Imperial) or of the metric system of measurement. The tables may, of course, be found useful by others who have occasion to make conversions between U. S. customary, British (Imperial), and metric units.

Letter Circular LC 517 - 3

## I. INTRODUCTION

In these days of extensive motor travel it is not unusual for American motorists to visit Canada, Mexico, the British Isles, or the Continent of Europe. In such cases a working knowledge of the weights and measures units oustomarily used in the countries visited is essential or at least very convenient.

In the United States the motorist is in the habit of thinking, with reference to his car, in terms of U. S. gallons, U. S. quarts, miles, miles per gallon, miles per hour, cents per gallon, cents per quart, etc., having in mind our customary system of weights, measures, and money. Similariy with reference to commodities purchased he is in the habit of thinking in terms of our customary units.

While it is impracticable, because of the variable rates of exchange, to make up useful comparison tables of equivalent prices in terms of the various monetary units, it is entirely practicable to prepare such comparison tables for the various units of volume, distance, speed, etco, and for certain combinations of these units.

The following tables are belleved to include those most likely to be found useful to the American motorist and others traveling in foreign countries.

For the sake of simplicity and convenience the tables of equivalents given herein are carried only to a sufficient number of decimal places to meet practical require. ments. The equivalents are in all cases correct to the number of decimal places given. If more exact values are required reference should be made to more complete tables published elsewhere, for example, to Miscellaneous Publication Ml2l of the National Bureau of Standards.

Tables 10,21 , and 22 are included in the present manual to emphasize certain facts that should be kept in mina by every motorist, but which are all too often ignored.

From Table 10 it is seen that an automobile, in common with all other moving objects when traveling at high speed, moves an incredibly long distance in one second of time. Fternal vigilance on the part of the driver is, therefore, not only the price of liberty but of ifie.

Letter Circular LC 5l7-4

From Table 21 it is seen that even under the best of conditions a very considerable distance is required for bringing a fast moving motor vehicle to a sare stop. The optimistic individual who boasts that he can stop his car in its own length, from a speed of 30 or 40 miles per hour, would do well to go out and try it, on a clear road, before he is faced with the necessity of doing it in an emergency.

Table 22 shows the distance required to pass another car going in the same direction. This table should cause the driver to think twice before attempting to pass unless there is ample time and clear space ahead. The driver who "takes a chance" will sooner or later guess wrong. In this event he is not likely to have a second guess.

## II. CONVERSION FACTORS

The tables published herein are based on the following conversion pactors:

1 U. S. gallon

1 Tmperial gallon

1 1iter

1 U.S. Ilquid quart $=0.83267$ Imperial quart

- 0.94633 iiter
$=32$ U. S. fluid ounces
1 Imperial quart $=1.20095 \mathrm{U} . \mathrm{S}$. $11 q$ qid quarts
$=1.13649$ ifters
$=40$ Imperial fluid ounces
1 liter
$=1.05671$ U.S. Iiquid quarts
$=0.87989$ Imperial quart
$=33.8147$ U. S. Pluid ounces
$=35.1956$ Imperial fluid ounces

Letter Circular IC 517 - 6
III. TABLES

Table 1. U. S. Gallons to Imperial Gallons and to Liters

| $\begin{aligned} & \text { U. S. } \\ & \text { Gallons } \end{aligned}$ | Imperial Gallons | Iiters |
| :---: | :---: | :---: |
| 1 | 0.83 | 3.79 |
| 2 | 1.67 | 7.57 |
| 3 | 2.50 | 11.36 |
| 4 | 3.33 | 15.14 |
| 5 | 4.16 | 18.93 |
| 6 | 5.00 | 22.71 |
| 7 | 5.83 | 26.50 |
| 8 | 6.66 | 30.28 |
| 9 | 7.49 | 34.07 |
| 10 | 8.33 | 37.85 |
| 11 | 9.16 | 41.64 |
| 12 | 9.99 | 45.42 |
| 13 | 10.82 | 49.21 |
| 14 | 11.66 | 53.00 |
| 15 | 12.49 | 56.78 |
| 16 | 13.32 | 60.57 |
| 17 | 14.16 | 64.35 |
| 18 | 14.99 | 68.14 |
| 19 | 15.82 | 71.92 |
| 20 | 16.65 | 75.71 |
| 21 | 17.49 | 79.49 |
| 22 | 18.32 | 83.28 |
| 23 | 19.15 | 87.06 |
| 24 | 19.98 | 90.85 |
| 25 | 20.82 | 94.63 |

Example: If you are in the habit of buying gasoline in 10 g gallon lots, it is seen that the equivalent amount is 8.33 Imperial gallons, or 37.85 liters. Possibly you will find it convenient to empty your tank to a somewhat lower point before reifling, in order that you may add 10 Imperial gallons, or 45 or 50 liters; assuming that your gasoline tank is of sufficient capacity to permit this.

Note: Inclusion in this table of speeds in excess of legal driving speeds is not to be interpreted as approval of those speeds. It is, rether, a means of emphasizing the danger of excessive speeds, by indicating the distance traveled in one second, at various speeds.

If a driver who sets for himself a top driving speed of 60 miles per hour is driving a car of which the speedometer indicates speed in kilometers per hour he should see to it that his indicated speed is kept below 100.

## Use of Tables

In using the tables, in those cases in which the desired equivalent is not given direotly in the table, it will be found convenient to break the given value down into hundreds, tens, and units, find their equivalents separately from the table and add the results. For example, to find the equivalent, in miles, of 857 kilometarg,proceed as follows:

Letter Circular LC 517 - 25

## Letter Circular LC 517 - 29

## Performance of Automobile Brakes

The National Bureau of Standards has done no recent work on the performance of automobile brakes and its only official publication on this subject is Miscellaneous Publication M107 (Safety Code for Brakes and Brake Testing), copies of which can be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., for 5 cents each. The maximum stopping distances proposed in this code are now excessive as they were based on conditions in 1923-25 before 4-wheel brakes came into general use.

Available data indicate that today the average automobile with 4 -wheel brakes in good adjustment will stop in about 20 feet, after the brake is applied, from a speed of 20 mph on a straight, level, hard-surfaced highway.

A ligure now coming to be generally adopted as a legal requirement is that an automobile with four-wheel brakes must be able to stop Irom a speed of 20 miles per hour in a distance of 30 feet on a straight level hardsurfaced road free from loose material.

Given $S$, the braking distance in feet from a speed of 20 mph , the braking distance $\left(\mathrm{S}_{1}\right)$ from any other speed $\left(V_{1}\right)$ can be computed by the relation $S_{1}=V_{1}{ }^{2} \mathrm{~S} / 400$. Thus, if $S=20$ feet, $S_{1}$ will be 5 feet from $10 \mathrm{mph}, 45$ feet from $30 \mathrm{mph}, 80$ feet from 40 mph , 125 feet from 50 mph , and 180 feet from 60 mph .

The term "braking distance" as used above refers to the distance that the car will travel after the brake pedal is depressed. It should be noted that the average driver requires about one-hali second, from the time he receives a signal or warning to stop, before he can put the brakes in action. During this interval the car will travel approximately the distances indicated in column 3, Table 21, e.g., 7 feet at $10 \mathrm{mph}, 15$ feet at 20 mph , 22 feet at 30 $\mathrm{mph}, 29$ leet at $40 \mathrm{mph}, 37$ feet at 50 mph , and 44 feet at 60 mph . The reaction times of different drivers differ considerably so that the one-hall second here assumed can be taken only as a general average.

In the accompanying table (Table 21) the minimum braking distance and minimum stopping distance, from various speeds, under the most favorable conditions are shown in colums 4 and 6 ; the braking distance and stopping distance, from various speeds, that may be regarded as reasonable maximum distances allowed under motor vehicie regulations are shown in colums 5 and 7.

Inclusion in the accompanying table of car speeds in excess of legal driving speeds should not be interpreted as approval of those speeds, but rather as a feans of emphasizing the danger of such speeds, by calling attention to the distances travelled in l second, and to the excessive stopping distances required by a car traveling at high speed.

Table 2l.- Speeds and Stopping Distances

| Car Speed |  | Reaction <br> Distance* | Braking Distance |  | Stopping Distance |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 55 | 80.7 | 40.3 | 151.2 | 226.9 | 192 | 267 |
| 60 | 88.0 | 44.0 | 180.0 | 270.0 | 224 | 314 |
| 65 | 95.3 | 47.7 | 211.2 | 316.9 | 259 | 365 |
| 70 | 102.7 | 51.3 | 245.0 | 367.5 | 296 | 419 |
| 75 | 110.0 | 55.0 | 281.2 | 421.9 | 336 | 477 |
| 80 | 117.3 | 58.7 | 320.0 | 480.0 | 379 | 539 |
| 85 | 124.7 | 62.3 | 361.2 | 541.9 | 424 | 604 |
| 90 | 132.0 | 66.0 | 405.0 | 607.5 | 471 | 674 |
| 95 | 139.3 | 69.7 | 451.2 | 676.9 | 521 | 747 |
| 100 | 146.7 | 73.3 | 500.0 | 750.0 | 573 | 823 |

* Based on a reaction time of one-half second.

Threemquarters second is sometimes used, but experiments heve shown thet one-half second more nearly represents the average reaction time of experienced drivers.
** For a car that will pass reasonable motor vehicle inspection regulations.

Caution: When stopping from high speeds, brakes should be applied with extreme care, even under most favorable conditions.

## Minimum Passing Distance

When one driver overtakes another on the road and wishes to pass he must ind a clear space in opposing traffic so that he can pass in safety. The clear space needed will depend on the relative speed of the two cars. If the passing driver is treveling at much higher speed than the one ahead and if the road is ciear he can pass in a correspondingly shortar aistance. But is roads are congested and one must follow the car ahead, waiting for a chance to pass, the speeds of the two cars will be nearly the same. Under these conditions, which are the most comon ones, the time required to speed up and pass the car ahead and get back on the right side of the road is found to be very nearly 6 seconds whether the cars are traveling at 5 miles per hour or at 60, or anywhere between these speeds.

However, it is found that even the most expert drivers must allow more time than this. They find that it is not safe to pass unless there is 8 seconds of time available before meeting another car. This provides a "safety factor" of only 2 seconds, which certainly is as little as any driver should allow.

The following table gives the minimum distance which must be clear of approaching traffic in order that passing may be done with safety at different speeds.

## Some Rules for Safe Driving

1. Keep on your own side of the road and in your own trafic lane,
2. Never exceed a speed from which you can stop safely within the clear distance you can see ahead. At night this distance is limited to the field clearly illuminated by your headlights. Don't out-drive your lights.
3. Don't pass another vehicle anywhere uniess you are sure the road is clear far enough ahead to make passing safe.
4. At night when you meet a car that is standing still with its headlights on, slow down and keep well away irom the standing car. You can see practically nothing beyond these headlights, and almost anything may be there. If your own car is standing still, dim your lights.
5. Be on your guard for unexpected actions of pedestrians, children, bicycle riders, inexperienced drivers, and strey animais. Don't expect them to get out of your way. The full responsibility is yours not to hit them.
6. Avoid doing the wnexpected. Do not puil out from the curb, cross from ona trafisic lane to another, turn, or stop without making sure that the way is clear.
7. At railroad crossings look both ways heiore crossing. and is there are two or more tracks look out for moving trains temporarily hidden by standing cars or other trains. The fact that one train has just passed is no guarantee that there will not be another.
8. Don't hold up normal traffic by slov! driving on a busy highway. If many cars are passing you, without exceeding the legal speed, you are driving too slowly; speed up.
9. Train yourself not to try to get back on the pavement at once if for any reason your right front wheel runs off the shoulder of the roadway. Slow down until you can get back safely. The natural impulse to get beck on the parement suddenly hes been responsible for many serious accidents. Even a sjight shoulder may cause your car to dart to the left, into the stream of oncoming traffic.
10. Look ahead and avoid trouble by anticipating it. The safe driver keeps out of trouble instead of showing how skillful he is in eetting out of it.
