## Foreword

During the past 10 years a laboratory study of the resistance of building brick to freezing and thawing has been in progress at the National Bureau of Standards. Tests were made on a total of 4,558 bricks, comprising 722 samples of the various gradings produced by 229 manufacturers. These samples were collected from 36 of the 48 States, as well as from the principal cities of the United States.

This paper reports the compressive and transverse strengths, water absorptions, by two methods, saturation coefficients, and either the number of cycles of freezing and thawing required to produce failure, or the percentage loss in weight after 51 cycles of freezing and thawing for 3,368 of these bricks, representing 525 gradings as produced by 209 manufacturers. Average results, by grades, for all tests except freezing and thawing, are given for the remaining 197 gradings, representing 1,190 specimens, which include samples from 20 additional manufacturers.

These results should prove useful in (1) providing information for specification writers, (2) illustrating the types and qualities of bricks available in different sections of the United States, and (3) indicating needed improvements in certain districts.

LYMAN J. BRIGGS, *Director.*

## ABSTRACT

This paper reports the compressive and transverse strengths, water absorptions, saturation coefficients, and either the number of cycles of freezing and thawing required to produce failure or the loss in weight after 51 cycles for each of 3,368 bricks representing 525 gradings produced by 209 manufacturers. Average results for all tests except freezing and thawing are given for an additional 197 gradings or samples, comprising a total of 1,190 specimens. These 197 gradings include samples from 20 additional manufacturers.

## I. INTRODUCTION

For the past 10 years the National Bureau of Standards has conducted, as part of the work on masonry and masonry materials, a study of the durability of building brick. A survey conducted jointly by the Common Brick Manufacturers Association of America and the Bureau, which was started in 1930, included laboratory freezing-and-thawing tests. In the ensuing decade additional samples were received and tested from time to time. Partial reports

of the results have been communicated to the manufacturers supplying the samples and partial reports in summary have been published [1, 2].<sup>1</sup> The detailed results have hitherto not been published.

Publication is now undertaken for several reasons: (1) The Tentative Specifications for Building Brick (made from clay or shale) C 62-37T of the American Society for Testing Materials were recently revised (1939) [3] to provide for the waiver of certain physical requirements if a sample had been subjected to 50 cycles of freezing and thawing without the resulting loss in weight exceeding certain limits. This revision, furthermore, provided that "A particular lot or shipment shall be given the same grading as a previously tested lot, without repeating the freezing-and-thawing test, provided the brick are made by the same manufacturer from similar raw materials and by the same method of forming; and provided also

<sup>1</sup> Figures in brackets indicate the literature references at the end of this paper

that a sample of five bricks selected from the particular lot has an average and individual minimum strength not less than a previously graded sample, and has average and individual maximum water absorption and saturation coefficient not greater than those of the previously tested sample graded according to the freezing-and-thawing test." Data presented in this paper, therefore, can be used as "reference sample" reports, as provided in this specification. (2) A number of individuals and organizations interested in the preparation of specifications for building brick have indicated the desirability of making these data generally available for examination and analysis by others in this field. (3) Though these data do not represent a complete cross section of the building bricks produced throughout the entire United States, it is believed that architects, engineers, and contractors will find them useful from the standpoint of indicating the expected durability and other properties of bricks in particular districts.

## II. SAMPLING, AND DISTRIBUTION OF SOURCES

Unless otherwise indicated, all samples were collected as part of the 1930 survey [1]. In this survey, 221 manufacturers submitted samples of their bricks. Quoting from the 1933 paper [1], "Each manufacturer was requested to submit a sample consisting of not fewer than five briks for each commercial grade as classified and marketed by him. Where soft or salmon (underburned) brick were produced, a special sample representing that grade was requested, even though such brick were not marketed. Information as to the percentage of the kiln product represented by each sample was in all cases secured from the manufacturer. If it were the manufacturer's practice to sell the entire output of the kiln without sorting or classifying, then a sample of 15 briks was requested. It was suggested that this 'kiln run' sample should be selected so as to represent a vertical section of the kiln setting."

The plant numbers and grade numbers in the present paper are those originally assigned to the manufacturers in 1930. The plant numbers range from 1 to 221 and were assigned in the order of receipt of samples.

In 1936 [4] 23 shipments of brick were purchased by the Bureau and sampled. Some of these shipments were from plants represented in the 1930 survey and were ordered to represent certain of the gradings previously sampled. Other shipments were from plants not previously sampled. Insofar as the samples represent plants and gradings previously sampled, the same numbers were assigned. These resamples are distinguished by the notation "1936," as are the new plants which have designating numbers beginning at 222. A third series of samples was received in 1937 [5], and they are so designated.

It was stated with reference to the 1930 survey [1]: "That portion of the United States situated between the Mississippi River and the Rocky Mountains, as well as several sections of the south are poorly represented." The same statement applies to the Pacific coast and to the Rocky Mountain States, with the exception of Colorado. The reader is referred to table 1 of the 1933 paper [1] for figures on the distribution of sources and completeness of sampling represented by the 1930 survey.

It should be pointed out that the results reported on freezing-and-thawing tests represent only the poorer grades of the samplings on hand, for the following reason. Samples were selected for test in the inverse order of their expected durability. The first freezing-and-thawing tests were made on samples classified by the manufacturer as "salmons." When these specimens had failed, the next grade in order of increasing durability was tested. In general, durability correlates positively with strength and negatively with a water absorption and saturation coefficient. Therefore, when a sample, or grading, of a particular manufacturer had successfully passed 50 cycles of freezing and thawing, no tests were made on samples which exceeded the satisfactory sample in strength and were characterized by lower absorption and saturation coefficient. Relatively few tests were made on bricks which had properties complying with grade SW of Specification C 62-39T of the American Society for Testing Materials. Certain districts (Connecticut, Hudson Valley, and Chicago) are represented by freezing and thawing tests on nearly all samples submitted as a part of the 1930 Survey, since these samples

exhibited some departures from the usual relation between freezing-and-thawing results and physical properties.

### III. METHODS OF TESTING

Compressive strengths, moduli of rupture, and absorptions by cold immersion and by boiling were determined by methods complying in essence with those described in the American Society for Testing Materials' Standard Methods for Testing Brick C 67-39 [6]. Weighings for the absorption determinations in the 1930 survey were made to the nearest 5.0 grams. Succeeding samples were weighed to the nearest 1.0 gram, as were all of the freezing-and-thawing test specimens. Originally, the saturation coefficients were calculated by dividing the absorption after 48-hr cold immersion by the absorption measured by 5-hr boiling. Since 1936 the practice of using, as the numerator, the absorption resulting from 24-hr cold immersion has been followed.

Method A of "Freezing-and-Thawing Tests of Brick" (ASTM Designation C 67-39T [7]) was used except during the last year of this work, when method B of the same standard was substituted. Data have been published [5] which indicate that these two methods are of comparable severity.

### IV. PRESENTATION OF DATA, BY PRODUCING DISTRICTS

The data on physical properties (strength, absorption, and saturation coefficients) and the results of freezing-and-thawing tests are presented in tables 1 to 25. Additional information, such as method of forming, raw material, percentage of kiln represented by the sample, the manufacturer's description of the grade, and, in some cases, the location of the plant, are given.

The following abbreviations are used in the tables:

SM=sand-struck, soft-mud process.

WM=water-struck, soft-mud process.

DP=dry-press process.

SDP=semidry-press process.

SC=stiff-mud, side-cut process.

EC=stiff-mud, end-cut process.

C=clay.

FC=fire clay.

S=shale.

F=failure.

c=cycles.

Unless otherwise indicated, the loss in weight is that resulting from 51 cycles of freezing and thawing by method A. Where the designation (B) is used, the results are for 50 cycles and the test was made by method B. When failure occurred earlier, the number of cycles required for failure is substituted for loss in weight. In the last columns of the respective tables are entered the results obtained from additional cycles, insofar as such tests were made.

TABLE 1.—*Properties of bricks produced in Maine, New Hampshire, and Vermont*

[All samples received were made from surface clay and were formed by the soft-mud process]

| Specimen number                                      | Modulus of rupture<br>lb/in. <sup>2</sup> | Compressive strength<br>lb/in. <sup>2</sup> | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |

TABLE 2.—Properties of bricks produced in Massachusetts

[All samples received with the exception of those from plant 7 (side-cut) were formed by the soft-mud process. All bricks were made from surface clay. Much of the Massachusetts brick production resembles that from Maine, New Hampshire, and Vermont in appearance and properties]

| Specimen number | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |
|-----------------|--------------------|----------------------|----------------------|--------------|------------------------|---------------------------------------------------------|--------------------------|
|                 |                    |                      | 48-hr cold immersion | 5-hr boiling |                        |                                                         |                          |

Plant 5, grade 1 ("Common face," 60 percent of kiln, SM, C)

| Specimen number | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |
|-----------------|--------------------|----------------------|----------------------|--------------|------------------------|---------------------------------------------------------|--------------------------|
|                 |                    |                      | 48-hr cold immersion | 5-hr boiling |                        |                                                         |                          |
| 1-----          | 1170               | 5230                 | 7.7                  | 10.4         | 0.74                   | No test                                                 |                          |
| 2-----          | 1220               | 4820                 | 7.6                  | 11.4         | .67                    | 0.00                                                    |                          |
| 3-----          | 1120               | 4960                 | 7.8                  | 10.4         | .75                    | .13                                                     |                          |
| 4-----          | 1145               | 5350                 | 7.5                  | 10.7         | .70                    | .00                                                     |                          |
| 5-----          | 875                | 6720                 | 8.5                  | 10.8         | .79                    | .11                                                     |                          |
| Avg-----        | 1105               | 5420                 | 7.8                  | 10.7         | 0.73                   | 0.06                                                    |                          |

Plant 5, grade 2 ("Merchantable," 90 percent of kiln, SM, C)

| Specimen number | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |

<sup>b</sup> Grades 1, 2, and 3 together represent 100 percent of kiln.

TABLE 5.—Properties of bricks produced in New York State, excluding the Hudson Valley District

[On the basis of the few samples submitted, it appears that brick made from surface clay and formed by the soft-mud process are produced in the eastern part of the State, and that side-cut shale bricks are produced in the western part]

| Specimen number                                          | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |
|----------------------------------------------------------|--------------------|----------------------|----------------------|--------------|------------------------|---------------------------------------------------------|--------------------------|
|                                                          |                    |                      | 48-hr cold immersion | 5-hr boiling |                        |                                                         |                          |
| Plant 15, grade 1 ("Clinker," 10 percent of kiln, SC, S) |                    |                      |                      |              |                        |                                                         |                          |
| 1                                                        | 1790               | 7140                 | 6.4                  | 9.8          | 0.65                   | 0.23                                                    |                          |

<sup>a</sup>The gain in weight produced by 59 cycles of freezing and thawing in specimens 1 and 2 of grade 2 of plant 190 may have been caused by hydration of lime.

TABLE 6.—Properties of bricks produced in New Jersey

[All samples received were made from surface clay. The shale bricks made in the northern part of the state were not represented. The methods of forming include soft-mud and stiff-mud (side-cut and end-cut) processes. Dry-press bricks are also made in New Jersey but no samples were received]

| Specimen number                                                          | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |

<sup>a</sup> Grade 2 of plant 60 was partially disintegrated by boiling, with consequent loss in weight. The absorption measure by 5-hr. boiling and the saturation coefficients are therefore unknown.

TABLE 7.—Properties of bricks produced in Delaware and Maryland

[The samples reported were all made from surface clay and were formed by the soft-mud or the stiff-mud (side-cut and end-cut) process. No brieks from Western Maryland, which are made from shale and formed by the side-cut process, are included. These shale bricks closely resemble, in properties, the bricks reported in table 10.]

| Specimen number | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |

<sup>a</sup> Water absorption by 5-hr boiling is probably not a true measure of total fillable pore space for deaired briks, hence the saturation coefficients are higher than would be those calculated from the true porosity.

TABLE 10.—Properties of briks produced in West Virginia and Western Pennsylvania

[All samples received were formed by the stiff-mud, side-cut process. With few exceptions, shale was the raw material. Fire clay and mixtures of clay and shale were also reported as raw materials]

TABLE 13.—Properties of bricks produced in Wisconsin

[All samples received were formed from surface clay by either the soft-mud or the stiff-mud, side-cut process. Many of the bricks contain finely divided free lime which hydrates and carbonates with time, causing significant gains in weight. This high lime content is the cause of the characteristic light color of many of these samples]

| Specimen number                                       | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |
|-------------------------------------------------------|--------------------|----------------------|----------------------|--------------|------------------------|---------------------------------------------------------|--------------------------|

TABLE 16.—Properties of bricks produced in Nebraska, Iowa, Kansas, and Minnesota

[All samples received with the exception of those from plant 183 (soft-mud) were formed by the stiff-mud, side-cut process. Both clay and shale are represented. Two types of shale occur in this district. What might be called typical shale is represented by the specimens from plant 17. These bricks correspond in properties to those reported for shale bricks in tables 5, 9, 10, 11, and 15. A hard-burned shale brick, characterized by water absorption by 5-hr boiling exceeding 12 percent, is also produced in this district. The data on the specimens from plant 227 illustrate the properties of bricks made from this type of shale]

| Specimen number | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |
|-----------------|--------------------|----------------------|----------------------|--------------|------------------------|---------------------------------------------------------|--------------------------|
|                 |                    |                      | 48-hr cold immersion | 5-hr boiling |                        |                                                         |                          |

<sup>a</sup> No disintegration.

These desired bricks have anomalous absorption and are difficult to dry to constant weight, therefore the absorption and saturation coefficient are uncertain and the effect of freezing and thawing was estimated visually instead of by loss in weight. A comparable sample exposed to natural weather showed disintegration in 10 percent of the specimens after 2 years.

TABLE 16.—Properties of bricks produced in Nebraska, Iowa, Kansas, and Minnesota—Continued

| Specimen number                                                               | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |

\* These bricks contain considerable lime. The gain in weight in some specimens is due to hydration or carbonation of this lime.

TABLE 17.—Properties of bricks produced in Utah and Wyoming

(The samples received included bricks made from shale, surface clay, and fire clay and all methods of forming were represented except the soft-mud process. A more complete picture of brick production in Utah is given in the report by Beckstrand and French [8].)

| Specimen number | Modulus of rupture | Compressive strength | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |
|-----------------|--------------------|----------------------|----------------------|--------------|------------------------|---------------------------------------------------------|--------------------------|
|                 |                    |                      | 48-hr cold immersion | 5-hr boiling |                        |                                                         |                          |

Plant 78, grade 1 ("Arch," 10 percent of kiln, DP, C and S)

TABLE 19.—Properties of bricks produced in Washington, Oregon, and California

|                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The samples received included bricks made from shale and surface clay and formed by the soft-mud and the stiff-mud, side-cut processes.                                                                                                                                                                           |
| Data on 13 additional plants in the Los Angeles District were provided by the California Clay Products Institute. All of these plants manufactured brick made from surface clay.                                                                                                                                  |
| The averages were as follows:                                                                                                                                                                                                                                                                                     |
| Modulus of rupture 600 lb/in. <sup>2</sup> ; compressive strength 3,690 lb/in. <sup>2</sup> ; water absorption by 48-hr cold immersion 11.8 percent; water absorption by 5-hr boiling 14.2 percent; saturation coefficient 0.83. Reference is made to Williams' article [9] for additional data on Oregon bricks] |
| Plant 39, grade 1 ("Hard commons," 30 percent of kiln, SC, C)                                                                                                                                                                                                                                                     |

<sup>a</sup> The gain in weight resulting from freezing and thawing of grade 1A is accounted for by the hydration and carbonation of the very considerable lime content of these specimens. Grades 1A and 2 were tested within 60 days of their manufacture. Grade 1 had "aged" for 7 years before starting freezing and thawing tests and gave an average gain in initial dry weight of 8.0 percent. Grade 2 sufficiently disintegrated in 51 cycles so that the resulting loss in weight exceeded the gain results from hydration and carbonation, except for No. 5.

TABLE 20.—Properties of bricks produced in Texas—Continued

| Specimen number                                                       | Modulus of rupture          | Compressive strength        | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |

TABLE 21.—Properties of bricks produced in Arkansas, Louisiana, Mississippi, and Alabama

[The samples submitted included brick formed from surface clay, fire clay, or shale by the dry-press and the stiff-mud (side-cut and end-cut) processes. Some of the raw materials are unusual in that variations in time and temperature of firing, instead of producing variation in shades of red (dark to light) bring out entirely different colors (reds, browns, greys, etc.)]

| Specimen number                                          | Modulus of rupture          | Compressive strength         | Water absorption     |              | Saturation coefficient | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |

TABLE 25.—Properties of bricks produced in Virginia and the District of Columbia

[The samples from Virginia and the District of Columbia represent bricks made from surface clay or shale and formed by the soft-mud, dry-press or the stiff-mud, side-cut process. The report by Whittemore and Dear [11] gives a quite complete survey of the properties of Virginia brick, including freezing and thawing results at 10 cycles]

| Specimen number                                                       | Modulus of rupture | Compressive strength | Water absorption     |              | Weight loss at 51 cycles or number of cycles at failure | Results beyond 51 cycles |
|-----------------------------------------------------------------------|--------------------|----------------------|----------------------|--------------|---------------------------------------------------------|--------------------------|
|                                                                       |                    |                      | 48-hr cold immersion | 5-hr boiling |                                                         |                          |

C. E. Lovewell, W. W. Harrison, Gifford Earnest, D. A. Parsons, E. E. W. Bowen, G. P. Ransom, C. B. Affleck, A. R. Eberle, R. H. Brink, I. Bachman, H. Dollar, and E. C. Patrick assisted in the laboratory work and in making calculations at various times. Special acknowledgment is made to the staff of the Common Brick Manufacturers Association of America and to the staff of its successor, The Structural Clay Products Institute, for their aid in collecting samples and securing information from the industry.

## BUILDING MATERIALS AND STRUCTURES REPORTS

On request, the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C., will place your name on a special mailing list to receive notices of new reports in this series as soon as they are issued. There will be no charge for receiving such notices.

An alternative method is to deposit with the Superintendent of Documents the sum of \$5.00, with the request that the reports be sent to you as soon as issued, and that the cost thereof be charged against your deposit. This will provide for the mailing of the publications without delay. You will be notified when the amount of your deposit has become exhausted.

If 100 copies or more of any paper are ordered at one time, a discount of 25 percent is allowed. Send all orders and remittances to the *Superintendent of Documents, U. S. Government Printing Office, Washington, D. C.*

The following publications in this series are available by purchase from the Superintendent of Documents at the prices indicated:

| BMS4  | Accelerated Aging of Fiber Building Boards-----                                                                                                                         | 10¢ |
| BMS5  | Structural Properties of Six Masonry Wall Constructions-----                                                                                                            | 15¢ |
| BMS6  | Survey of Roofing Materials in the Southeastern States-----                                                                                                             | 15¢ |
| BMS7  | Water Permeability of Masonry Walls-----                                                                                                                                | 10¢ |
| BMS8  | Methods of Investigation of Surface Treatment for Corrosion Protection of Steel-----                                                                                    | 10¢ |
| BMS9  | Structural Properties of the Insulated Steel Construction Company's "Frameless-Steel" Constructions for Walls, Partitions, Floors, and Roofs-----                       | 10¢ |
| BMS10 | Structural Properties of One of the "Keystone Beam Steel Floor" Constructions Sponsored by the H. H. Robertson Co-----                                                  | 10¢ |
| BMS11 | Structural Properties of the Curren Fabrihome Corporation's "Fabrihome" Constructions for Walls and Partitions-----                                                     | 10¢ |
| BMS12 | Structural Properties of "Steelox" Constructions for Walls, Partitions, Floors, and Roofs Sponsored by Steel Buildings, Inc-----                                        | 15¢ |
| BMS13 | Properties of Some Fiber Building Boards of Current Manufacture-----                                                                                                    | 10¢ |
| BMS14 | Indentation and Recovery of Low-Cost Floor Coverings-----                                                                                                               | 10¢ |
| BMS15 | Structural Properties of "Wheeling Long-Span Steel Floor" Construction Sponsored by Wheeling Corrugating Co-----                                                        | 10¢ |
| BMS16 | Structural Properties of a "Tilecrete" Floor Construction Sponsored by Tilecrete Floors, Inc-----                                                                       | 10¢ |
| BMS17 | Sound Insulation of Wall and Floor Constructions-----                                                                                                                   | 10¢ |
| BMS18 | Structural Properties of "Pre-Fab" Constructions for Walls, Partitions, and Floors Sponsored by the Harnischfeger Corporation-----                                      | 10¢ |
| BMS19 | Preparation and Revision of Building Codes-----                                                                                                                         | 15¢ |
| BMS20 | Structural Properties of "Twachtman" Constructions for Walls and Floors Sponsored by Connecticut Pre-Cast Buildings Corporation-----                                    | 10¢ |
| BMS21 | Structural Properties of a Concrete-Block Cavity-Wall Construction Sponsored by the National Concrete Masonry Association-----                                          | 10¢ |
| BMS22 | Structural Properties of "Dun-Ti-Stone" Wall Construction Sponsored by the W. E. Dunn Manufacturing Co-----                                                             | 10¢ |
| BMS23 | Structural Properties of a Brick Cavity-Wall Construction Sponsored by the Brick Manufacturers Association of New York, Inc-----                                        | 10¢ |
| BMS24 | Structural Properties of a Reinforced-Brick Wall Construction and a Brick-Tile Cavity-Wall Construction Sponsored by the Structural Clay Products Institute-----        | 10¢ |
| BMS25 | Structural Properties of Conventional Wood-Frame Constructions for Walls, Partitions, Floors, and Roofs-----                                                            | 15¢ |
| BMS26 | Structural Properties of "Nelson Pre-Cast Concrete Foundation" Wall Construction Sponsored by the Nelson Cement Stone Co., Inc-----                                     | 10¢ |
| BMS27 | Structural Properties of "Bender Steel Home" Wall Construction Sponsored by The Bender Body Co-----                                                                     | 10¢ |
| BMS28 | Backflow Prevention in Over-Rim Water Supplies-----                                                                                                                     | 10¢ |
| BMS29 | Survey of Roofing Materials in the Northeastern States-----                                                                                                             | 10¢ |
| BMS30 | Structural Properties of a Wood-Frame Wall Construction Sponsored by the Douglas Fir Plywood Association-----                                                           | 10¢ |
| BMS31 | Structural Properties of "Insulite" Wall and "Insulite" Partition Constructions Sponsored by The Insulite Co-----                                                       | 15¢ |
| BMS32 | Structural Properties of Two Brick-Concrete-Block Wall Constructions and a Concrete-Block Wall Construction Sponsored by the National Concrete Masonry Association----- | 10¢ |

|       |                                                                                                                                                                    |     |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| BMS33 | Plastic Calking Materials-----                                                                                                                                     | 10¢ |
| BMS34 | Performance Test of Floor Coverings for Use in Low-Cost Housing: Part 1-----                                                                                       | 10¢ |
| BMS35 | Stability of Sheathing Papers as Determined by Accelerated Aging-----                                                                                              | 10¢ |
| BMS36 | Structural Properties of Wood-Frame Wall, Partition, Floor, and Roof Constructions with "Red Stripe" Lath Sponsored by The Weston Paper and Manufacturing Co.----- | 10¢ |
| BMS37 | Structural Properties of "Palisade Homes" Constructions for Walls, Partitions, and Floors, Sponsored by Palisade Homes-----                                        | 10¢ |
| BMS38 | Structural Properties of Two "Dunstone" Wall Constructions Sponsored by the W. E. Dunn Manufacturing Co-----                                                       | 10¢ |
| BMS39 | Structural Properties of a Wall Construction of "Pfeifer Units" Sponsored by the Wisconsin Units Co-----                                                           | 10¢ |
| BMS40 | Structural Properties of a Wall Construction of "Knap Concrete Wall Units" Sponsored by Knap America, Inc-----                                                     | 10¢ |
| BMS41 | Effect of Heating and Cooling on the Permeability of Masonry Walls-----                                                                                            | 10¢ |
| BMS42 | Structural Properties of Wood-Frame Wall and Partition Constructions With "Celotex" Insulating Boards Sponsored by The Celotex Corporation-----                    | 10¢ |
| BMS43 | Performance Test of Floor Coverings for Use in Low-Cost Housing: Part 2-----                                                                                       | 10¢ |
| BMS44 | Surface Treatment of Steel Prior to Painting-----                                                                                                                  | 10¢ |
| BMS45 | Air Infiltration Through Windows-----                                                                                                                              | 10¢ |
| BMS46 | Structural Properties of "Scot-Bilt" Prefabricated Sheet-Steel Constructions for Walls, Floors, and Roofs Sponsored by The Globe-Wernicke Co-----                  | 10¢ |
| BMS47 | Structural Properties of Prefabricated Wood-Frame Constructions for Walls, Partitions, and Floors Sponsored by American Houses, Inc-----                           | 10¢ |
| BMS48 | Structural Properties of "Precision-Built" Frame Wall and Partition Constructions Sponsored by the Homasote Co-----                                                | 10¢ |
| BMS49 | Metallic Roofing for Low-Cost House Construction-----                                                                                                              | 10¢ |
| BMS50 | Stability of Fiber Building Boards as Determined by Accelerated Aging-----                                                                                         | 10¢ |
| BMS51 | Structural Properties of "Tilecrete Type A" Floor Construction Sponsored by the Tilecrete Corporation-----                                                         | 10¢ |
| BMS52 | Effect of Ceiling Insulation on Summer Comfort-----                                                                                                                | 10¢ |
| BMS53 | Structural Properties of a Masonry Wall Construction of "Munlock Dry Wall Brick," Sponsored by the Munlock Engineering Co-----                                     | 10¢ |
| BMS54 | Effect of Soot on the Rating of an Oil-Fired Heating Boiler-----                                                                                                   | 10¢ |
| BMS55 | Effects of Wetting and Drying on the Permeability of Masonry Walls-----                                                                                            | 10¢ |
| BMS56 | A Survey of Humidities in Residences-----                                                                                                                          | 10¢ |
| BMS57 | Roofing in the United States: Results of a Questionnaire-----                                                                                                      | 10¢ |
| BMS58 | Strength of Soft-Soldered Joints in Copper Tubing-----                                                                                                             | 10¢ |
| BMS59 | Properties of Adhesives for Floor Coverings-----                                                                                                                   | 10¢ |
| BMS60 | Strength, Absorption, and Resistance to Laboratory Freezing and Thawing of Building Bricks Produced in the United States-----                                      | 15¢ |
