SINE BARS, BLOCKS, PLATES, AND FIXTURES

COMMERCIAL STANDARD CS141-47
Effective Date for New Production From August 15, 1947

A RECORDED VOLUNTARY STANDARD
OF THE TRADE

UNITED STATES DEPARTMENT OF COMMERCE
W. AVERELL HARRIMAN, Secretary

For sale by the Superintendent of Documents, U. S. Government Printing Office
Washington 25, D. C. - Price 5 cents
COMMERCIAL STANDARDS

Commercial Standards are voluntary standards of the trade developed through concerted action of those directly concerned, and issued by the United States Department of Commerce upon written evidence of their acceptability to the trade. They are initiated by written request from a responsible element of business to the Division of Trade Standards of the National Bureau of Standards. The Division of Trade Standards acts as a coordinating and fact-finding agency in ascertaining the desires of all concerned.

The Federal Government exercises no regulatory authority in the enforcement of Commercial Standards. In accepting a Commercial Standard, the producer, distributor, or user says in effect that he considers it a useful standard of practice, and plans to utilize it as far as practicable in his business, reserving the right to depart from the standard so long as no deception results from such departure. When reference to a Commercial Standard is made in contracts, labels, invoices, or advertising literature, however, the provisions of the standard are enforceable through usual legal channels as a part of the sales contract.

Organized in 1927, the Division of Trade Standards has assisted many industries in the development of Commercial Standards for a wide variety of commodities. A list of previously established Commercial Standards appears herein.

COMMERCIAL STANDARD FOR SINE BARS, BLOCKS, PLATES, AND FIXTURES

On August 10, 1945, at the instance of the War Production Board, a proposed Commercial Standard for Sine Bars, Blocks, Plates, and Fixtures was circulated to leading representatives of the trade for comment. A draft adjusted in line with that comment was made available to the War Production Board.

Following surrender of the Axis powers, and upon recommendation of leading manufacturers and users, the adjusted draft was circulated to interested producers, distributors, testing laboratories, and users for written acceptance on January 28, 1946. The trade has since accepted and approved the standard as shown herein.

Project Manager: F. E. Powell, assisted by P. S. Murphy, Division of Trade Standards, National Bureau of Standards.

Technical Advisers: D. R. Miller and C. E. Haven, Division of Metrology, National Bureau of Standards.
SINE BARS, BLOCKS, PLATES, AND FIXTURES

COMMERCIAL STANDARD CS141-47

PURPOSE

1. The purpose of this commercial standard is to provide minimum essential requirements for sine bars, blocks, plates, and fixtures described herein, as a basis for better understanding between sellers and buyers, for fair competition, and for identification of sine bars, blocks, plates, and fixtures conforming thereto.

SCOPE

2. This standard covers the major essential requirements for sine bars, sine blocks and sine plates, sine bar fixtures and sine plate fixtures, in the following classifications and with particular reference to the following sizes:
   (a) Sine bars, commercial and laboratory classifications, in sizes 5 in., 10 in., and 20 in.
   (b) Sine blocks and sine plates, commercial and laboratory classifications in sizes 5 in., 10 in., and 20 in.
   (c) Sine bar fixtures and sine plate fixtures, commercial and laboratory classifications, in sizes 5 in., 10 in., and 20 in.

DEFINITIONS

3. Sine bar.—For purposes of this standard, a sine bar consists essentially of a bar serving as a straightedge and two cylindrical buttons mounted thereon with their axes parallel and at a specified distance apart, and with the line of the button centers accurately parallel to the upper face (and lower face, if a reference surface) of the bar. Sine bars permit accurate measurement and layout of angular relationships through use of the sine function. In determining a specific angle, the known distance between button axes becomes the hypotenuse of a right triangle, and the height of leg opposite the angle being determined, is measured by gage blocks or similar accurate means.

4. Sine block, sine plate.—For purposes of this standard, a sine block or sine plate consists essentially of a block or plate providing reference surfaces, with two cylinders attached to the block or plate and so disposed as to provide for measurement of angles in the same manner as with a sine bar. Facilities for attachment of accessories or work pieces to the several surfaces of the block or plate, or short extensions (heels) constituting the legs of a right angle iron or both, are customarily provided.
5. **Sine bar fixture.**—For purposes of this standard, a sine bar fixture consists essentially of a sine bar, a flat surfaced base, and means for adjusting and holding the sine bar in accurate relation to the surface of the base.

6. **Sine plate fixture.**—For purposes of this standard, a sine plate fixture consists essentially of a sine block or plate and a base with the reference areas of its upper and lower surfaces plane and parallel. The plate is usually hinged to the base at one end. Sine plate fixtures may be of the compound type with provision for angular adjustment in two planes.

**GENERAL REQUIREMENTS**

7. **Material.**

7a. **Tool steel.**—For purposes of this standard, tool steel means a high quality electric furnace alloy steel, alloy case hardening steel, alloy tool steel, carbon tool steel, or steel of composition corresponding to SAE No. 1020 suitably case hardened, free from all imperfections which might mar the finished surface of the product.

7b. **Cast iron.**—For purposes of this standard, cast iron shall be a suitable grade of fine-grained grey iron, free from inclusions, sand holes, and porosity that might in any way affect the finish, accuracy, or usefulness of the tool.

8. **Seasoning (dimensional stabilizing).**—For purposes of this standard, to minimize dimensional changes after finishing, dimensional stabilizing shall include an appropriate treatment for the aging of cast iron and tool steel.

9. **Finish.**—All sharp edges and corners shall be removed. For purposes of this standard, requirements of the following designations for surface finish apply:

9a. **Scraped.**—A scraped surface shall be hand-scraped so that the surface defined by the bearing areas will not vary from a true plane by an amount greater than the applicable flatness tolerance herein specified. The number of bearing areas or of scraped relief spots (in lapped or ground surfaces) shall be not less than 15 per square inch. Bearing area shall be uniformly distributed and shall be not less than 20 percent nor more than 40 percent of the area of the surface, except that on high-precision surfaces for special requirements and having more than 15 bearing areas per square inch, a greater percentage of bearing area may be allowed.

9b. **Ground.**—All surfaces having a ground finish, shall be smooth, and free from objectionable defects such as chatter, tool marks, irregular wheel marks, burning, cracks, or scratches.

9c. **Lapped.**—A lapped surface shall be finished to give a uniformly flat or cylindrical surface, smooth and free from all traces of machining or grinding, and shall show no evidence of objectionable scratching.

**DETAIL REQUIREMENTS**

**SINE BARS**

10. **Types.**—Sine bars are manufactured in two types, side button and base button, corresponding to the positioning of the buttons on the side of the bar or on the under surface of the bar.
11. Sizes.—Specific sizes of sine bars covered by this standard are 5 in., 10 in., and 20 in., center to center of buttons, as shown in tables 1 and 2. (See par. 16.)

12. Classifications.—Sine bars are provided in (1) commercial and (2) laboratory classifications.

12a. Commercial.—For the purpose of this standard, commercial class sine bars are those conforming to the tolerances shown in table 1.

12b. Laboratory.—For the purpose of this standard, laboratory class sine bars are those conforming to the tolerances shown in table 2.

13. Construction.—The buttons attached to the side or to the under surface of the bar shall be ground and lapped to the same size. The side faces of the bar shall be ground square with the working face or faces which may be ground or ground and lapped as specified.

14. Material.—Sine bars shall be tool steel, hardened, drawn and seasoned. (See par. 7a.)

15. Hardness.—Sine bar buttons shall have a Rockwell hardness of C62–66 or equivalent surface hardness, and the bar shall have a Rockwell hardness of C60–65 or equivalent surface hardness.

16. Accuracy.—A sine bar shall conform in all respects to the accuracy requirements of its classification and size, tables 1 and 2. (For sizes smaller than 5 in., tolerances for the 5-in. size of the designated class shall apply. For sizes above 5 in.—other than 10 in. and 20 in.—applicable tolerances shall be obtained by straight-line interpolation between the values in tables 1 and 2 or by extrapolation on the straight lines determined by the 10-in. and 20-in. values in tables 1 and 2.

16a. Bar tolerances.—Errors in flatness of the working face or faces of the bar, in squareness of working face to sides of bar, and in parallelism of working faces (if double, that is, if upper and lower working faces are provided) shall not exceed the tolerances specified in column 2 of tables 1 and 2 for commercial and laboratory classifications, respectively. Specified tolerances apply to all areas to within 3/32 in. from the edge of the finished surfaces.

16b. Diameter of buttons.—On any bar, the difference between the average diameter of one button and the average diameter of the other button shall be within the applicable tolerance specified in column 3 of table 1 or 2.

</table>

16c. *Roundness and taper of buttons.*—Total variation in diameter (out-or-roundness and/or taper) for each button shall be within the applicable tolerance specified in column 3 of table 1 or 2.

16d. *Alignment of button axes.*—Errors in parallelism of button axes, in the length of the buttons, shall not exceed the applicable tolerance specified in column 4, table 1 or 2. Button axes shall be parallel to the working surface of the bar within the applicable tolerance specified in column 4, table 1 or 2. On any bar, the two button axes shall be the same distance from the working surface of the bar within the applicable tolerance specified in column 4, table 1 or 2.

16e. *Spacing of button axes.*—On any bar, errors in spacing of button axes shall not exceed the applicable tolerance specified in column 5 of table 1 or 2.

### Sine Blocks and Sine Plates

17. *Sizes.*—Specific sizes of sine blocks and sine plates covered by this standard are 5 in., 10 in., and 20 in., center to center of cylinders as shown in table 1 and 2. (See par. 22.)

18. *Classifications.*—Sine blocks and sine plates are provided in (1) commercial and (2) laboratory classifications.

18a. *Commercial.*—For the purpose of this standard, commercial class sine blocks and sine plates are those conforming to the tolerances shown in table 1.

18b. *Laboratory.*—For the purpose of this standard, laboratory class sine blocks and sine plates are those conforming to the tolerances shown in table 2.

19. *Construction.*—Cylinders shall be ground and lapped to the same size. The side faces of the block or plate shall be ground square with the working face or faces which may be ground or ground and lapped as specified.

20. *Material.*—Sine blocks and sine plates shall be tool steel, hardened, drawn and seasoned. (See par. 7a.)

21. *Hardness.*—Sine block and sine plate cylinders shall have a Rockwell hardness of C62–66 or equivalent surface hardness, and the block or plate shall have a Rockwell hardness of C60–65 or equivalent surface hardness.
22. **Accuracy.**—Accuracy requirements for sine blocks and sine plates shall be interpreted as in the case of sine bars (par. 16). Tolerances shall not exceed the applicable values shown in tables 1 and 2, except that where actual width of working surface is greater than the nominal size of the block or plate, maximum flatness tolerance along the width dimension is obtained by interpolation as set forth in paragraph 16, actual width of working surface being substituted for nominal size.

**SINE BAR FIXTURES AND SINE PLATE FIXTURES**

23. **Sizes.**—Specific sizes of sine bar and sine plate fixtures covered by this standard are 5 in., 10 in., and 20 in., center to center of cylinders, as shown in tables 1 and 2. (See par. 28a.)

24. **Classifications.**—Sine bar and sine plate fixtures are provided in (1) commercial and (2) laboratory classifications.

24a. **Commercial.**—For the purpose of this standard, commercial class sine bar and sine plate fixtures are those conforming to applicable tolerances shown in table 1.

24b. **Laboratory.**—For the purpose of this standard, laboratory class sine bar and sine plate fixtures are those conforming to applicable tolerances shown in table 2.

25. **Construction.**—Construction shall be such as to provide for smooth adjustment of the sine bar or sine plate and if provided with clamping means, for its rigidity when clamped in position above the working surface of the base. In the case of hinged fixtures the diameter of the pivot cylinder may differ from that of the cylinder at the free end.

26. **Material.**—The bases of sine bar and sine plate fixtures shall be seasoned cast iron or tool steel hardened, drawn and seasoned. (See par. 7a and 7b.) The material of the bar or plate shall be tool steel, hardened, drawn, and seasoned.

27. **Hardness.**—Cast iron bases of sine bar and sine plate fixtures shall have a hardness of 180–220 Brinell or equivalent surface hardness; steel bases shall have a hardness of Rockwell C60–65 or equivalent surface hardness. Hardness of bars and buttons and of plates and cylinders shall be as specified respectively for sine bars (par. 15) and sine blocks and plates (par. 21).

28. **Accuracy.**

28a. **Sine bars and sine plates.**—Accuracy requirements for sine bars of sine bar fixtures and for sine plates of sine plate fixtures shall be as specified in paragraphs 16 and 22 and tables 1 and 2. Additionally, for any operating setting of the complete fixture, including clamped settings, parallelism of button or cylinder axes to the working surface of the base shall be maintained within the limits specified in column 4 of tables 1 and 2.

28b. **Bases.**—Reference surfaces of bases of sine bar and sine plate fixtures shall be scraped, ground, or lapped flat and parallel within the applicable tolerances specified in column 2 of tables 1 and 2, for commercial and laboratory classifications, respectively. Specified tolerances apply to all areas to within \( \frac{3}{16} \) in. from edges of finished surfaces.
METHODS OF TEST

29. Bar, block, and plate tolerances.
29a. Flatness of working surfaces of sine bars, blocks and plates is determined by means of an optical flat (where applicable), or by other suitable means, such as a precision reference surface and precision indicator.

29b. Squareness of working surface to side faces of the bar, block, or plate shall be tested by means of a cylindrical square, gage blocks, and surface plate, or by means of an angle iron of suitable accuracy, indicator, and surface plate, or by equivalent means.

29c. Parallelism of working surfaces shall be tested by means of a precision flat and precision indicator, or by equivalent means.

30. Diameter, roundness, and taper of buttons and cylinders shall be determined at 68°F by means of a measuring machine or a vertical or horizontal comparator of suitable amplification using gage blocks of suitable accuracy and with a 1-pound measuring load. An additional test for out-of-roundness due to lobular shape of button or cylinder section shall be made with a multiple contact anvil such as a V-block. In making the above measurements, the error should be not greater than 20% of the tolerance specified for the part being measured. Equivalent methods may be used.

31. Alignment of buttons and cylinders.—Parallelism of button and cylinder axes with each other and with upper face of the bar, block, or plate (and with lower face if a reference surface) shall be tested by means of a precision flat and precision indicator, or by equivalent means.

32. Axial spacing of buttons and cylinders shall be determined at 68°F by means specified in paragraph 30, or by equivalent means.

33. Flatness and bearing area of fixture bases.—(a) Bases shall be tested for flatness of surface with an indicator-mounted three-point comparator checked against a reference surface, or equivalent means, or by means of an optical flat if surface finish permits (b) on cast iron plates, bearing area shall be determined by means of coating the surface with prussian blue or other suitable material, rubbing with another flat plate to reveal bearing areas, placing on the surface a glass plate ruled into small squares of equal area and recording the proportion of each small square occupied by high spots as well as the number of spots per square inch, or by a method of comparable accuracy.

34. Alignment of sine bars and sine plates on fixtures shall be tested in each extreme position and in at least one intermediate position, for parallelism of button axes to working surface of base by means of a precision indicator, or by equivalent means.

PACKING

35. Each sine bar, block, plate or fixture shall be supplied in a suitable, protective case or box, and as a protection against climatic conditions, shall be coated with a suitable noncorrosive oil or grease, and be securely wrapped in waxed paper or its equivalent.
MARKING

36. *Size and classification.*—Each sine bar, sine block or plate, sine bar fixture, and sine plate fixture, shall have its nominal size and classification designation (commercial or laboratory) legibly and permanently marked upon it in characters not less than 1/8-in. high.

37. *Manufacturer's name or trade mark.*—Each sine bar, sine block or plate, sine bar fixture, and sine plate fixture, shall have legibly and permanently marked upon it in characters not less than 1/6-in. high, the manufacturer's name or trade mark.

38. *Identification.*—In order to provide purchasers with a ready means of identifying sine bars, blocks, plates, and fixtures complying with this standard, it is recommended that each such device so complying, be marked “CS 141-47” in characters not less than 1/6-in. high.

39. It is further recommended that catalog descriptions, sales literature and slips accompanying sine bars, blocks, plates, and fixtures complying with this standard should incorporate the following statement:

This sine bar (sine block, sine plate, sine bar fixture, sine plate fixture) complies with all the applicable requirements of Commercial Standard CS 141-47, as issued by the National Bureau of Standards of the United States Department of Commerce.

EFFECTIVE DATE

40. This standard becomes effective as a voluntary standard of the trade from August 15, 1947.

STANDING COMMITTEE

The following individuals comprise the membership of the standing committee, which is to review, prior to circulation for acceptance, revisions proposed to keep the standard abreast of progress. Comment concerning the standard and suggestions for revision may be addressed to any member of the committee or to the Division of Trade Standards, National Bureau of Standards, which acts as secretary for the committee.

D. R. MILLER, Chairman

Manufacturers:
J. A. HARRINGTON, The DoAll Co., Savage, Minn.
P A U L V. MILLER, Small Tool & Gage Division, The Taft-Peirce Mfg. Co., Woonsocket, R. I.

Users:
L. W. DWYER, Gage Section, Watervliet Arsenal, Watervliet, N. Y.
MERRILL S. HUGO, P. O. Box 273, Mountain View, Calif.

Testing Laboratories:
DR. T. SMITH TAYLOR, United States Testing Co., Inc., 1415 Park Ave., Hoboken, N. J.
HISTORY OF PROJECT

The War Production Board, on September 30, 1943, requested the cooperation of the National Bureau of Standards in the establishment of commercial standards for precision hand tools falling in several categories, one of these being tool room specialties. A preliminary manufacturers' conference in New York City, on December 15, 1943, reviewed a preliminary draft and directed that related groups of the items covered by this draft be submitted for comment by the manufacturers directly concerned.

Further development in accordance with the directions of the conference was continued by correspondence. Agreeable to the suggestion of the industry committee chairman, a separate draft of a proposed commercial standard for sine bars, blocks, plates, and fixtures was prepared on the basis of recommendations from leading manufacturers.

This draft was circulated on August 10, 1945, to manufacturers and representative user, distributor, and testing organizations for comment. Following adjustment of the draft in the light of that comment, the recommended commercial standard was circulated on January 28, 1946, to the trade for written acceptance.

Upon receipt of requisite acceptances in writing from the trade, including manufacturers representing a satisfactory majority by volume of production, announcement was issued on February 14, 1947, that the standard would become effective for new production from August 15, 1947.
ACCEPTANCE OF COMMERCIAL STANDARD

If acceptance has not previously been filed, this sheet properly filled in, signed, and returned will provide for the recording of your organization as an acceptor of this commercial standard.

Date __________________________

Division of Trade Standards,
National Bureau of Standards,
Washington 25, D. C.

Gentlemen:

We believe that the Commercial Standard CS141–47 constitutes a useful standard of practice, and we individually plan to utilize it as far as practicable in the

production ¹  distribution ¹  purchase ¹  testing ¹

of sine bars, blocks, plates, and fixtures.

We reserve the right to depart from it as we deem advisable.

We understand, of course, that only those articles which actually comply with the standard in all respects can be identified or labeled as conforming thereto.

Signature of authorized officer ________________________________

(In ink)

(Kindly typewrite or print the following lines)

Name and title of above officer ________________________________

Organization ________________________________

(Fill in exactly as it should be listed)

Street address ________________________________

City, zone, and State ________________________________

¹ Underscore which one. Please see that separate acceptances are filed for all subsidiary companies and affiliates which should be listed separately as acceptors. In the case of related interests, trade associations, trade papers, etc., desiring to record their general support, the words “General Support” should be added after the signature.
TO THE ACCEPTOR

The following statements answer the usual questions arising in connection with the acceptance and its significance:

1. Enforcement.—Commercial standards are commodity specifications voluntarily established by mutual consent of those concerned. They present a common basis of understanding between the producer, distributor, and consumer and should not be confused with any plan of governmental regulation or control. The United States Department of Commerce has no regulatory power in the enforcement of their provisions, but since they represent the will of the interested groups as a whole, their provisions through usage soon become established as trade customs, and are made effective through incorporation into sales contracts by means of labels, invoices, and the like.

2. The acceptor's responsibility.—The purpose of commercial standards is to establish for specific commodities, nationally recognized grades or consumer criteria and the benefits therefrom will be measurable in direct proportion to their general recognition and actual use. Instances will occur when it may be necessary to deviate from the standard and the signing of an acceptance does not preclude such departures; however, such signature indicates an intention to follow the commercial standard where practicable, in the production, distribution, or consumption of the article in question.

3. The Department's responsibility.—The major function performed by the Department of Commerce in the voluntary establishment of commercial standards on a Nation-wide basis is fourfold: first, to act as an unbiased coordinator to bring all interested parties together for the mutually satisfactory adjustment of trade standards; second, to supply such assistance and advice as past experience with similar programs may suggest; third, to canvass and record the extent of acceptance and adherence to the standard on the part of producers, distributors, and users; and fourth, after acceptance, to publish and promulgate the standard for the information and guidance of buyers and sellers of the commodity.

4. Announcement and promulgation.—When the standard has been endorsed by a satisfactory majority of production or consumption in the absence of active, valid opposition, the success of the project is announced. If, however, in the opinion of the standing committee or the Department of Commerce, the support of any standard is inadequate, the right is reserved to withhold promulgation and publication.
ACCEPTEES

46. The organizations listed below have individually accepted this standard for use as far as practicable in the production, distribution, testing, or purchase of sine bars, blocks, plates, and fixtures. In accepting the standard they reserved the right to depart therefrom as they individually deem advisable. It is expected that articles which actually comply with the requirements of this standard in all respects will be regularly identified or labeled as conforming thereto, and that purchasers will require such specific evidence of conformity.

Commercial Standard CS111-47

CS No.  Item
51-36. Marking articles made of silver in combination with gold.
52-35. Mohair pile fabrics (100-percent mohair plain velvet, 100-percent mohair plain frieze, and 50-percent mohair plain frieze).
53-35. Colors and finishes for cast stone.
54-35. Mattresses for hospitals.
55-35. Mattresses for institutions.
57-40. Book cloths, buckram, and impregnated fabrics for bookbinding purposes except library bindings (second edition).
59-44. Textiles—testing and reporting (fourth edition).
60-36. Hardwood dimension lumber.
61-37. Wood-slat venetian blinds.
63-38. Colors for bathroom accessories.
64-37. Walnut veneers.
66-38. Marking of articles made wholly or in part of fibers.
67-38. Marking articles made of karat gold.
68-38. Liquid hypochlorite disinfectant, deodorant, and germicide.
72-38. Household insecticide (liquid spray type).
75-42. Automatic mechanical draft oil burners designed for domestic installations (second edition).
77-40. Sanitary cast-iron enameled ware.
80-41. Electric direction signal systems other than semaphore type for commercial and other vehicles subject to special motor vehicle legislation (after market) (after market).
81-41. Adverse-weather lamps for vehicles (after market).
82-41. Electric-searched spotlamps for vehicles (after market).
83-41. Clearance, marker, and identification lamps for vehicles (after market).
84-41. Electric-signal lamps for vehicles (after market).
85-41. Electric license-plate lamps for vehicles (after market).
86-41. Electric spotlamps for vehicles (after market).
87-41. Red electric warning lanterns.
88-41. Liquid-burning flares.
89-40. Hardwood stair treads and risers.
90- . (Reserved for power shovel and cranes).
91-41. Factory-fitted Douglas fir entrance doors.
92-41. Cedar, cypress and redwood tank stock lumber.
93-41. Portable electric drills (exclusive of high frequency).

CS No.  Item
94-41. Calking lead.
95-41. Lead pipe.
96-41. Lead traps and bends.
97-42. Electric supplementary driving and passing lamps for vehicles (after market).
98-42. Artists’ oil paints.
99-42. Gas floor furnaces—gravity circulating type.
100-44. Porcelain-enamelled steel utensils (second edition).
101-43. Flue-connected oil-burning space heaters equipped with vaporizing pot-type burners.
102- . (Reserved for Diesel and fuel-oil engines).
103-42. Cotton and rayon velour—jacquard and plain.
104-46. Warm-air furnaces equipped with vaporizing pot-type oil burners (second edition).
105-43. Mineral wool; loose granulated, or felted form, in low-temperature installations.
108-43. Treading automobiles and truck tires.
109-44. Solid-fuel-burning forced-air furnaces.
110-43. Tire repairs—vulcanized (passenger, truck, and bus tires).
111-43. Earthenware (vitreous-glazed) plumbing fixtures.
112-43. Homogeneous fiber wallboard.
113-44. Oil-burning floor furnaces equipped with vaporizing pot-type burners.
114-43. Hospital sheeting for mattress protection.
115-44. Porcelain-enamelled tanks for domestic use.
116-44. Bituminized-fibre drain and sewer pipe.
117-44. Mineral wool; blankets, blocks, insulating cement and pipe insulation for heated industrial equipment.
118-44. Marking of jewelry and novelties of silver.
(E)119-45. Dial indicators (for linear measurements).
121-45. Women’s slip sizes (woven fabrics).
122-45. Western hard-lock plywood.
123-45. Grading of diamond powder.
(E)124-45. Master disks.
125-45. Prefabricated homes.
126-45. Tank mounted air compressors.
127-45. Self-contained mechanically refrigerated drinking water coolers.
128-45. Men's sport shirt sizes—woven fabrics (other than those marked with regular neckband sizes).
129-46. Materials for safety wearing apparel.
130-46. Oil mining tools for art education in schools.
131-46. Industrial mineral wool products, all types—testing and reporting.
132-46. Hardware cloth.
133-46. Vorton wire netting.
135-46. Men's shirt sizes (exclusive of work shirts).
136-40. Blankets for hospitals (wool and wool and cotton).
137-46. Size measurements for men's and boys' shorts (woven fabrics).
138-47. Insect wire screening.
139-47. Work gloves.
140-47. Convectors; testing and rating.
141-47. Sine bars, blocks, plates and fixtures.

Notice.—Those interested in commercial standards with a view toward accepting them as a basis of everyday practice may secure copies of the above standards, while the supply lasts, by addressing the Division of Trade Standards, National Bureau of Standards, Washington 25, D. C.

1 Where “(E)” precedes the CS number, it indicates an emergency commercial standard, drafted under war conditions with a view toward early revision.
