WOOD SHINGLES
(RED CEDAR, TIDewater RED CYPRESS
CALIFORNIA REDWOOD)
(FOURTH EDITION)

COMMERCIAL STANDARD CS31-38
[Supersedes CS31-35]

Effective Date, October 1, 1938

A RECORDED STANDARD OF THE INDUSTRY
PROMULGATION
of
COMMERCIAL STANDARD CS31–38
for
WOOD SHINGLES
(Red Cedar, Tidewater Red Cypress, California Redwood)
(Fourth Edition)

On March 27, 1931, a general conference of representative manufacturers, distributors, and users of red-cedar shingles adopted a commercial standard for this commodity. At the request of the groups at interest, the standard was later revised to include California redwood and tidewater red-cypress shingles, and issued as the Commercial Standard for Wood Shingles, CS31–33. This standard was reaffirmed in 1935.

A revision conference was held in Seattle, Wash., on March 31, 1938, and the recommendations of the conference were circulated to the industry for written acceptance. The industry has since accepted and approved for promulgation by the U. S. Department of Commerce, through the National Bureau of Standards, the revised standard as shown herein, which is effective from October 1, 1938.

Promulgation recommended.

Secretary of Commerce.
WOOD SHINGLES

(Red Cedar, Tidewater Red Cypress, California Redwood)

(Fourth Edition)

COMMERCIAL STANDARD CS31-38

PURPOSE

1. This quality standard for wood shingles is a basis for common understanding between manufacturers, distributors, and users of this product. By its general acceptance, use, and certification by labels, it is hoped that interest may be increased in the manufacture, sale, and use of high-grade wood shingles, which should redound to the mutual advantage of all concerned.

2. The protection and service afforded by wood shingles is in direct proportion to the quality of shingles used and, therefore, the following commercial standard of quality is provided for guidance in the manufacture, sale, and use of this product.

SCOPE

3. This quality standard provides a minimum specification for the highest commercial grade of sawn wood shingles of the above species known as "No. 1 grade" in American Lumber Standards and as published in the 1933 supplement to Simplified Practice Recommendation R16-29. It covers length, width, thickness, grain, characteristics, color, packing, and the grading tolerances for these requirements.

GENERAL REQUIREMENTS

4. All commercial-standard wood shingles shall be of 100-percent heartwood, well manufactured, and neatly packed; they must comply with or exceed the specifications herein established for quality.

GRAIN

5. All commercial-standard shingles shall be strictly vertical, or edge-grained; that is, the thin lines constituting the annual, or growth rings, shall be vertical when the shingle is laid flat, as in use. Edge grain is synonymous with quartered or quarter-sawed lumber or flooring, and the condition is considered fulfilled when no portion of the grain slope exceeds 45° from the perpendicular.

---

1 Shingles covered by this standard are from the following species, which are among the highest class of decay-resistant woods, the high durability, close grain, and even texture of which make them especially suitable for roofing shingles: Western red cedar (Thuja plicata), whose chief commercial range is in Oregon, Washington, and British Columbia; Tidewater red cypress (Taxodium distichum), found chiefly in the tidewater regions of Florida and Louisiana; California redwood (Sequoia sempervirens), found in the coastal region of northern California and the southwestern extremity of Oregon.
CHARACTERISTICS

6. Knots, wormholes, decay, shakes, checks, crimps, flat grain, cross grain, and sapwood constitute natural characteristics that are not admissible. Defects in manufacturing, including shims, feather tips, diagonal grain, waves, and torn fiber are likewise not admissible.

COLOR

7. Variations in the color of heartwood of these species are caused by differences in the density of natural color filtrations. No evidence has yet been found that color of the heartwood of any species has any influence upon the strength or decay resistance. Consequently, color differences are not considered defects.

DETAIL REQUIREMENTS

LENGTH

8. Minimum length shall be 16 inches. The usual lengths, in addition to 16-inch shingles, are 18 and 24 inches.
9. A minus tolerance of 1 inch will be allowed in not more than 10 percent of any shipment. Shingles cut from equalized blocks or rebutted may be ¾ inch less than the standard length.

WIDTH

10. Maximum width shall be 14 inches. Minimum width for shingles, 16 inches up to but not including 24 inches long, shall be 3 inches. Minimum width for shingles 24 inches and longer shall be 4 inches. In 16- and 18-inch shingles those less than 4 inches in width shall not constitute more than 10 percent of any shipment.
11. Shingles shall be uniform in width; that is, with parallel sides. A tolerance of ¼-inch variation in the width shall be allowed.

THICKNESS

12. Shingles are measured for thickness at the butt ends and designated according to the number of pieces necessary to constitute a specific unit of thickness. For example, 4/2 indicates that four shingles measure 2 inches, while 5/2½ means that each five shingles measure 2½ inches in thickness.
13. Shingles shall be uniform in thickness, but a minus tolerance of 3 percent is allowable to compensate for the difference in shrinkage encountered in kiln drying. This tolerance is based on the total thickness of the bundle.

PACKING

14. All random-width shingles shall be packed flat in straight courses. The unit shall be the “square” pack ² and shall contain not less than the minimum quantity specified in table 1.

² See description under glossary of terms.

15. In the packing of shingles the number of courses in each end are indicated, so that the designation 13/14 means a bundle with 13 courses at one end and 14 courses at the other end, or a total of 27 courses.

DIMENSION SHINGLES

16. Those shingles cut to specified widths and known as “dimension shingles” shall be designated only according to the number of pieces per bundle.

RUNNING INCHES

17. The chief concern of the shingle buyer is the amount of coverage provided in a bundle of shingles with a prescribed exposure to the weather. This depends on the total width of the shingles, when laid side by side, and shall be referred to as “running inches,” as shown respectively for “Green” and “Dry” in table 1. Modern methods of manufacture and packing random-width shingles have established 18½ inches, when green, as the average measure of running inches in each course of shingles in the bundle, and the total running inches may be ascertained this figure by the number of courses.

GRADING TOLERANCE

18. The economical production of wood shingles requires the use of high-speed machinery and other facilities to reduce the expense incident to sorting and packing. As a consequence, it is possible that some few shingles with unnoticed defects will occasionally be put into the bundles.

19. If reinspection is necessary because of the too frequent appearance of defects, the shipment may be refused if the total running inches of defective shingles constitutes 4 percent or more of the shipment.

INSPECTION

20. The inspection of wood shingles, both in car lots at destination or at customary inspection points, shall ordinarily be made on the basis of the usual unit of inspection, which is eight bundles per carload or fraction thereof. Because of the wide variation in shingle widths, all percentages shall be calculated on the basis of running inches.
GLOSSARY OF TERMS

Checks.—A check is a lengthwise separation of the wood, which occurs usually across the rings of annual growth.

Crimps.—A crimp is a breaking-down or collapse of wood fibers, usually due to an inherent condition in some timber or a result of too rapid drying.

Cross grain.—A condition that should not be confused with the terms “flat” or “edge” grain, and that might better be termed “cross fiber”, since it is a deviation of the wood fibers from the true parallel of the shingle. It is a serious defect when it runs from one face of the shingle to the other within a longitudinal distance of 4 inches or less in any portion measured 12 inches from the butt.

Decay.—A disintegration of the wood substance caused by the action of wood-destroying fungi. Dote and rot are synonymous with decay.

Diagonal grain.—A condition where the grain of the wood does not run parallel to the edges of the shingle. It is considered a defect when the grain diverges or slants 2 inches or more in width in 12 inches of length.

Dote.—See Decay.

Edge grain.—See Vertical grain.

Feather tips.—A feather tip or shim is a condition of manufacture found on the thin ends of some shingles where the saw came out of the piece prematurely, producing a thin, flimsy, featherlike edge. The tip ends of the shingle may be uniformly thin and produce a thoroughly satisfactory roof, but when they are uneven or with corners sawn off, the shingles will not lay-up evenly.

Flat grain.—A condition in shingles or lumber where the growth rings are flat, or horizontal, as opposed to edge-grained, or quartered, material where the growth rings are on edge, or vertical to the surface.

Knots.—A knot is the remains of a branch or limb embedded in the wood substance of a tree, which has been exposed in the process of manufacture.

Rot.—See Decay.

Sapwood.—The portion of the wood of a tree immediately next to the bark, usually characterized by a lighter color than the heartwood, or interior wood of the tree. While there is usually no difference in the physical strength of the two kinds of wood, sapwood is quite susceptible to decay.

Shakes.—A shake is a lengthwise separation of the wood, which occurs usually between and parallel to the growth rings.

Shims.—See Feather tips.

Square pack.—A unit providing sufficient shingles for the coverage of an area of 100 square feet when the shingles are laid at any specified exposure to the weather. See page 5.

Torn fiber.—This condition may also be referred to as “torn grain”—a fuzzy or whiskered appearance usually caused by a dull saw.

Vertical, or edge grain.—A quality condition of manufacture in which the rings of annual growth are vertical to the exposed surface or nearly so, or to such an extent that no portion of the slope of ring growth exceeds 45° from the vertical.

Waves.—Irregularities on the face of a shingle also referred to as “washboards”, usually caused by a wobbling of the saw on its arbor.
**Wood Shingles**

**Wormholes.**—Wormholes are voids in the wood caused by the burrowing action of certain wood-infesting worms.

**MANUFACTURERS’ RECOMMENDATIONS**

The following information is not part of the commercial standard for wood shingles, but represents the manufacturers’ recommendations, based on long experience for maximum service in the use of wood shingles:

**Table 2.**—Approximate covering capacities, in square feet, of the various sized shingles

(Random width, square pack)

</tr>
</tbody>
</table>

* Greater exposure not recommended.

**Proper weather exposure.**—In roofing, long experience has indicated the wisdom of exposing not more than one-third of the shingle to the weather in order to assure adequate protection from the elements. Dry shingles should be spaced 1/4 to 3/8 inch between the edges of adjacent shingles.

Recommended shingle exposures are shown in tables 3 and 4.

**Table 3.**—Roof shingle exposures for various pitches

</tbody>
</table>

1 Assuming exposed course is face-nailed.
Formula for covering capacities per "square":

\[
\text{Total number of courses in both ends of bundle} \times 18\frac{1}{2} \times \left\{ \frac{\text{number of bundles in square}}{\text{number of inches exposed to weather}} \right\} = \text{Number square feet 1 square will cover.}
\]

* Running inches in each course.

The proper nail.—The heartwood of western red cedar, tidewater red cypress, and California redwood is naturally highly resistant to decay, and when employed as shingles for roofs or side walls, it is desirable to use nails which will last as long as the shingles. Just as the chain is no stronger than its weakest link, so is a shingled roof no more enduring than its nails. When ordinary wire nails are used, moisture soon reaches the nail and the process of rusting begins. A small pocket is formed which harbors moisture and facilitates the rusting process. In time the nails become rusted through and the shingles are torn loose under the attack of wind and weather. If the proper nails are used, however, the shingles will be held securely and give service and protection throughout their natural life.

Numerous experiments have conclusively proved the wisdom and economy of high-grade nails, and maximum service may be assured by using either cut or wire type, hot-dipped zinc-coated nails.

**EFFECTIVE DATE**

The revised standard became effective October 1, 1938.

**STANDING COMMITTEE**

The following comprises the membership of the standing committee which is to review, prior to circulation for acceptance, revisions proposed to keep the standard abreast of progress. Each association nominated its own representatives. Comment concerning the standard and suggestions for revision, may be addressed to any member of the committee or to the Division of Trade Standards, National Bureau of Standards, which acts as secretary for the committee.

**Manufacturers:**
- George A. Bergstrom (chairman), C. B. Lumber & Shingle Co., Tenth and Norton Sts., Everett, Wash.
- Chas. H. Ingram, Weyerhaeuser Timber Co., Tacoma, Wash.
- C. W. Bahr, California Redwood Assn., 405 Montgomery St., San Francisco, Calif.

**Distributors:**
- H. P. Kendall, Creo-Dipt Co., Inc., North Tonawanda, N. Y.
- A. E. Lane, Arthur E. Lane Mill Service, 1722 Grand Central Terminal, New York, N. Y.
- Findlay M. Torrence, Ohio Association of Retail Lumber Dealers, Green and Market Sts., Xenia, Ohio.
- Frank Carnahan, National Retail Lumber Dealers Assn., Union Trust Bldg., Washington, D. C.
- R. M. Cross, Twin City Lumber & Shingle Co., 2563 Franklin Ave., St. Paul, Minn.
Users:
Theodore I. Coe, The American Institute of Architects, 4000 Cathedral Ave., Washington, D. C.

LABELING

Figure 1 illustrates how an important group of producers have arranged to certify complete compliance with the commercial standard. Shingles produced by members of this group to conform to the standard may be readily identified by copies of the label appearing on each bundle. It is understood that two other groups will use substantially the same label.

Label Series D 574

**NAILS**

Use only two hot-dipped zinc-coated nails in the laying of each shingle. Only such nails will endure as long as Certigrade Red Cedar Shingles. Owners should DEMAND and INSIST on the use of these rust-proof nails.

[...]

Ask the retail lumberman for literature on over-roofing or remodeling with Red Cedar Shingles, or write direct to RED CEDAR SHINGLE BUREAU, White Building, Seattle, Washington.

Figure 1.—Facsimile of label for each bundle of grade 1 shingles.
HISTORY OF PROJECT

General conference.—Pursuant to a request of the Red Cedar Shingle Bureau a general conference of manufacturers, distributors, and consumers of red-cedar shingles met in Seattle, Wash., on March 27, 1931, and approved a commercial standard for their product that was later accepted by the trade.

A survey of adherence to the standard, covering the first 9 months of 1932, indicated its use by an unweighted average of 97.5 percent of those reporting and numerous comments were received as to its stabilizing effect.

First revision (second edition).—Early in 1933, applications were received from the California Redwood Association and the Southern Cypress Manufacturers’ Association for admittance of California redwood and tidewater red cypress under the scope of this standard, thus providing for the inclusion of the three principal shingle species under a common standard to the mutual advantage of all concerned, which the standing committee accordingly approved.

When reprinting became necessary in 1935, the standing committee voted to reaffirm the standard without change (third edition).

Second revision (fourth edition).—In early 1938 a request was received from the Red Cedar Shingle Bureau for a revision of the standard to include No. 2 and No. 3 grade shingles. A revision conference was held in Seattle, Wash., on March 31, 1938, but the conference voted against such a revision of the standard, due chiefly to the lack of uniformity in the grade specifications of the three species. A number of minor changes were approved, which do not change the grade requirements in any way, but clarify their interpretation and add several suggestions under the manufacturers’ recommendations. The recommended revision was circulated to the industry for acceptance on May 9, 1938, and the establishment of the revision was announced on September 2, 1938, becoming effective from October 1, 1938.
ACCEPTANCE OF COMMERCIAL STANDARD

This sheet properly filled in, signed, and returned will provide for the recording of your organization as an acceptor of this commercial standard.

Date ____________________________

Division of Trade Standards,
National Bureau of Standards,
Washington, D. C.

Gentlemen:

Having considered the statements on the reverse side of this sheet, we accept the Commercial Standard CS31-38 as our standard of practice in the

Production
Distribution
Use

of wood shingles.

We will assist in securing its general recognition and use, and will cooperate with the standing committee to effect revisions of the standard when necessary.

Signature of individual officer ____________________________

(in ink)

(Kindly typewrite or print the following lines)

Name and title of above officer ____________________________

Company ____________________________

(Fill in exactly as it should be listed in pamphlet)

Street address ____________________________

City and State ____________________________

1 Please designate which group you represent by drawing lines through the other two. Please file separate acceptances for all subsidiary companies and affiliates which should be listed separately as acceptors. In the case of related interests, trade papers, colleges, etc., desiring to record their general approval, the words "in principle" should be added after the signature.
TO THE ACCEPTOR

The following statements answer the usual questions arising in connection with the acceptance and its significance:

1. Enforcement.—Commercial standards are commodity specifications voluntarily established by mutual consent of the industry. They present a common basis of understanding between the producer, distributor, and consumer and should not be confused with any plan of governmental regulation or control. The United States Department of Commerce has no regulatory power in the enforcement of their provisions, but since they represent the will of the industry as a whole, their provisions through usage soon become established as trade customs, and are made effective through incorporation into sales contracts by means of labels, invoices, and the like.

2. The acceptor's responsibility.—The purpose of commercial standards is to establish for specific commodities, nationally recognized grades or consumer criteria and the benefits therefrom will be measurable in direct proportion to their general recognition and actual use. Instances will occur when it may be necessary to deviate from the standard and the signing of an acceptance does not preclude such departures; however, such signature indicates an intention to follow the commercial standard where practicable, in the production, distribution, or consumption of the article in question.

3. The Department's responsibility.—The major function performed by the Department of Commerce in the voluntary establishment of commercial standards on a Nation-wide basis is fourfold: first, to act as an unbiased coordinator to bring all branches of the industry together for the mutually satisfactory adjustment of trade standards; second, to supply such assistance and advice as past experience with similar programs may suggest; third, to canvass and record the extent of acceptance and adherence to the standard on the part of producers, distributors, and users; and fourth, after acceptance, to publish and promulgate the standard for the information and guidance of buyers and sellers of the commodity.

4. Announcement and promulgation.—When the standard has been endorsed by companies representing a satisfactory majority of production, the success of the project is announced. If, however, in the opinion of the standing committee of the industry or the Department of Commerce, the support of any standard is inadequate, the right is reserved to withhold promulgation and publication.
ACCEP'TORS

The organizations and individuals listed below have accepted these grading rules as their standard of practice in the production, distribution, and use of wood shingles. Such endorsement does not signify that they may not find it necessary to deviate from the standard, nor that producers so listed guarantee all of their products to conform with the requirements of this standard. Therefore, specific evidence of quality certification should be obtained where required.
