# PLAIN AND THREAD PLUG AND RING GAGE BLANKS

COMMERCIAL STANDARD CS8–30

ELIMINATION OF WASTE
Through
SIMPLIFIED COMMERCIAL PRACTICE

Below are described some of the series of publications of the Department of Commerce which deal with various phases of waste elimination.

**Simplified Practice Recommendations.**

These present in detail the development of programs to eliminate unnecessary variety in sizes, dimensions, styles, and types of over 100 commodities. They also contain lists of associations and individuals who have indicated their intention to adhere to the recommendations. These simplified schedules, as formulated and approved by the industries, are indorsed by the Department of Commerce.

**Commercial Standards.**

These are developed by various industries under a procedure similar to that of simplified practice recommendations. They are, however, primarily concerned with considerations of grade, quality, and such other characteristics as are outside the scope of dimensional simplification.

**American Marine Standards.**

These are promulgated by the American Marine Standards Committee, which is controlled by the marine industry and administered as a unit of the division of simplified practice. Their object is to promote economy in construction, equipment, maintenance, and operation of ships. In general, they provide for simplification and improvement of design, interchangeability of parts, and minimum requisites of quality for efficient and safe operation.

Lists of the publications in each of the above series can be obtained by applying to the Bureau of Standards, Washington, D. C.

# PLAIN AND THREAD PLUG AND RING GAGE BLANKS

## COMMERCIAL STANDARD CS8–30

At the request of the American Gage Design Committee, a pamphlet entitled "Plain and Thread Plug and Ring Gage Blanks, Recommended Commercial Standard" was circulated on March 4, 1930, to producers and users for written acceptance. The industry has since accepted and approved for promulgation by the Department of Commerce the standards [1] shown herein.

This standard is effective for new production July 1, 1930, and for clearance of existing stocks not later than January 1, 1931.

Promulgation recommended.

I. J. Fairchild,
*Chief, Division of Trade Standards.*

Promulgated.

George K. Burgess,
*Director, Bureau of Standards.*

Approved.

R. P. Lamont,
*Secretary of Commerce.*

[1] The technical details of this commercial standard are identical with Plain and Thread Plug and Ring Gage Blanks, Bureau of Standards Miscellaneous Publication No. 100.

## TERMINOLOGY

The following glossary is intended to clarify the meaning of certain technical terms employed in this report. The definitions are not intended to be general; rather they are specific as to their application to the American Gage Design Standards.

*American Gage Design Standard.*—The caption "American Gage Design Standard" has been adopted to designate gages made to the design specifications promulgated by the American Gage Design Committee.

A *plain cylindrical plug gage* is a complete unthreaded internal gage of single or double ended type for the size control of holes. It consists of handle and gaging member or members, with suitable locking means.

A *progressive cylindrical plug gage* is a complete unthreaded internal gage consisting of handle and gaging member in which the "go" and "not go" gaging sections are combined in a single unit secured to one end of the handle.

A *thread plug gage* is a complete internal thread gage of either single or double ended type, comprising handle and threaded gaging member or members, with suitable locking means.

The *gaging member* is that integral unit of a plug gage which is accurately finished to size and is employed for size control of the work. In taper lock gages, the gaging member consists of a shank and a gaging section.

The *gaging section* is that portion of the gage which comes into physical contact with the work. In the plug range above 1.510 to and including 4.510 inches, the gaging section is identical with the gaging member.

The *shank* (applied to taper lock gages only) is that portion of the gaging member which is employed for fixing the gaging member to the handle.

The term "*taper lock*" designates that construction in which the gaging member has a taper shank, which is forced into a taper hole in the handle. This design is standard for plug gages in the range above 0.059 inch to and including 1.510 inches, is optional for plain cylindrical and thread plug gages in the range above 1.510 inches to and including 2.510 inches, and is standard for pipe-thread plug gages up to and including 2-inch nominal pipe size.

A *reversible plug gage* is a plain cylindrical or thread plug gage, in which three wedge-shaped *locking prongs* on the handle are forced into corresponding *locking grooves* in the gaging member by means of a single through screw thus providing a self-centering support with a positive lock. This design is standard for all plug gages in the ranges above 1.510 to and including 4.510 inches, with the exception of pipe thread plug gages, for which it is standard in the ranges above 2.510 to and including 4.510 inches.

*Lightening holes* are unfinished drilled holes provided in the heavier sizes of gaging members for the sole purpose of reducing the weight of the gage.

The *handle* is that portion of a plug gage which is employed as supporting means for the gaging member or members.

The *drift hole* or *drift slot* is a small hole or slot provided in the side of a taper lock gage handle near the "go" end through which a pin or drift may be inserted for the purpose of ejecting the gaging member from the handle.

A *plain ring gage* is an unthreaded external gage employed for the size control of external diameters. In the smaller sizes it consists of a gage body into which is pressed a *bushing*, the latter being accurately finished to size for gaging purposes.

A *thread ring gage* is an external thread gage employed for the size control of threaded work, means of adjustment being provided integral with the gage body.

The *flange* is that external portion of a large ring gage which is reduced in section for the purpose of lightening the gage.

The *hub* is the mid-section of a flanged ring gage. It determines the length of the gaging section.

The *thread ring gage locking device* is a means of expanding and contracting the thread ring gage during the manufacturing or resizing processes. It also provides an effectual lock. It comprises an *adjusting screw*, a *locking screw*, and a *sleeve*. For detailed description and illustration see page 26.

*Adjusting slots* are radial slots provided in thread ring gages in order to facilitate expansion and contraction of gage size by means of the adjusting device. An adjusting slot always terminates in an *adjusting slot terminal hole*.

The *locking slot* is that slot which passes entirely through the wall of a thread ring gage. In conjunction with the thread ring gage locking device, it permits expansion and contraction of gage size.

## DETAILS OF CONSTRUCTION, AMERICAN GAGE DESIGN STANDARDS

### PLAIN CYLINDRICAL PLUG GAGE BLANKS AND HANDLES

Two separate designs have been adopted for plain cylindrical plug gages—the *taper lock* design for the range from 0.059 to and including 1.510 inches, and the *reversible* design with reversible gaging members for the range from above 1.510 to and including 4.510 inches. For sizes above 0.240 inch to and including 2.510 inches, both straight and progressive gaging members are provided. Use of the taper lock design is optional for the size range from above 1.510 to and including 2.510 inches.

#### (a) TAPER LOCK DESIGN ABOVE 0.059 TO AND INCLUDING 1.510 INCHES

It was felt that the taper lock design was particularly well suited for the smaller sizes of plain plug gages. This type of gage is simple and is economical of production and maintenance. The gaging member has a taper shank which is forced into a taper hole in the handle. When properly assembled, the taper lock gage possesses the rigidity of a solid gage and is entirely free of shake or "wink." Drift slots or drift holes are provided near one end of the handle, permitting gaging members to be removed when replacement is necessary. In the case of double-end gages, one end is removed by running a rod

through the hollow handle. In the smaller size ranges above 0.059 inch to and including 0.240 inch, a groove is provided near one end of the handle to designate the "not go" end, as the length of the "go" member in this range is often insufficient clearly to distinguish it from the "not go" member. The groove is omitted as unnecessary above 0.240 inch.

Complete dimensional tolerances have been established for the mating parts of gaging members and handles, insuring absolute interchangeability of gaging members and handles wherever manufactured. General details of construction will be apparent from Figure 1, page 5. See also Tables 1 to 4, pages 6 to 9.

#### (b) REVERSIBLE DESIGN, ABOVE 1.510 TO AND INCLUDING 4.510 INCHES

Considerations of rigidity of construction and long life have dictated the choice of the reversible design with reversible gaging members for the size range above 1.510 inches. With this construction there is no chance for shake or "wink" to interfere with the sensitive feel so necessary in gages of this type. Three wedge-shaped locking prongs on the handle are forced into corresponding grooves in the gaging member by a single through screw thus providing a self-centering support with a positive lock, and resulting in a degree of rigidity equivalent to that of a solid gage. The useful life of the plug is furthermore materially increased, as when one end is worn the plug can be reversed and is then, for most purposes, as good as new.

The construction is protected by carefully worked out dimensional limits, and interchangeability is insured between gaging members and handles wherever manufactured. Details of construction will be apparent from Figure 1, page 5, and Figure 2, page 11. See also Tables 5 and 6, pages 12 and 13.

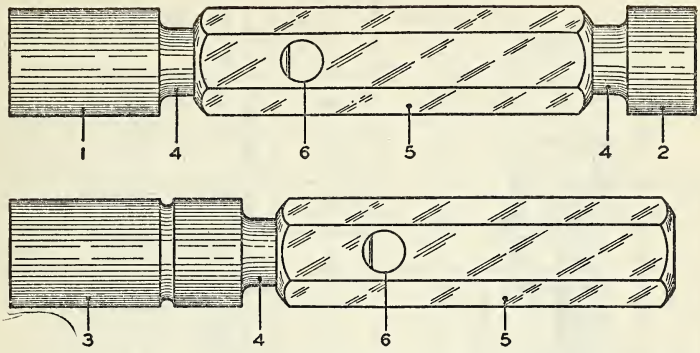
#### (c) HANDLES

Handles for both taper lock and reversible gages are of the hexagonal type. However, the use of round medium-knurled handles, while not recommended, is made optional in all sizes.

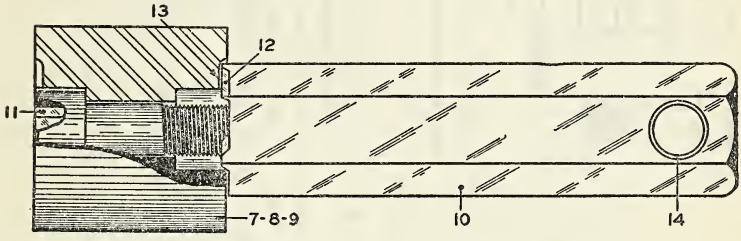
Handles as designed for taper lock and reversible gages offer a feature of economy in that they may be disassembled from gaging members when the latter are worn out or discarded for any other reason, and may then be reassembled with new gaging members, thus giving them, with reasonable care, practically indefinite life.

### THREAD PLUG GAGE BLANKS AND HANDLES

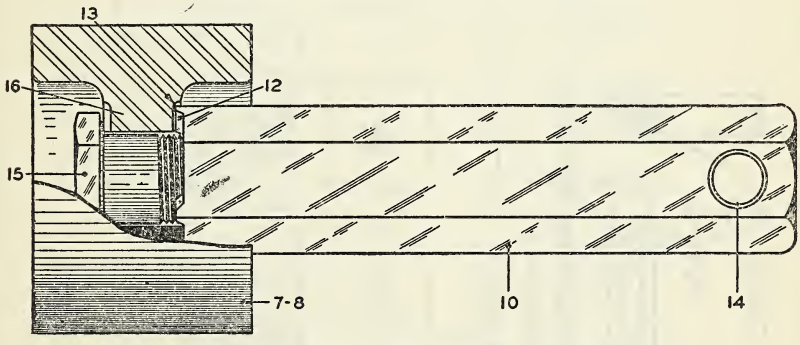
The taper lock and reversible designs have been adopted for thread plug gage blanks and handles and follow the plain cylindrical plug gage designs described on pages 3 and 4 with the exception that the length of thread-gaging members is slightly different in some instances and the use of taper lock blanks and handles for pipe-thread plug gages is standard to and including 2 inches nominal pipe size. General details of construction will be apparent from Figure 3. Data sheets for thread plug gages are set forth on pages 15 to 24. A separate table specifying the taper lock handles and gaging members for pipe-thread plug gages is set forth on page 20.



Range: Above 0.059 to and including 1.510 inches; Optional above 1.510 to and including 2.510 inches



Range: Above 1.510 to and including 2.510 inches



Range: Above 2.510 to and including 4.510 inches

FIGURE 5.—*American Gage Design Standard plain ring gages, details of construction*

## PLAIN RING GAGE BLANKS

The use of the solid ring-gage design for external size control, being fairly well established, the committee's work on plain ring gages was concerned chiefly with matters of proportion. In the smaller sizes of plain ring gages it was felt desirable to employ a hardened bushing pressed into a soft gage body, in place of the one-piece ring gage, and this design has been adopted in the range above 0.059 to and including 0.510 inch. The single piece gage is employed in all cases above 0.510 inch, but gages in sizes above 1.510 inches are flanged, in order to eliminate unnecessary weight and facilitate handling.

No dimensional difference exists between "go" and "not go" blanks of identical size range, but an annular groove is provided in the periphery of "not go" blanks as a means of identification.

General details of construction are shown in Figure 5, and dimensions are given in Tables 14 and 15.

## THREAD RING GAGE BLANKS

The committee found universal accord as to the superiority of the adjustable thread ring gage over the solid type, with the result that all American Gage Design Standard thread ring gage blanks are equipped with an effective device for adjusting and locking the gage in the manufacturing or resizing processes. Of the many locking devices considered the single-unit locking device was finally adopted as standard, as it permits a minimum diameter of blank for a given size range, and provides a simple adjustment and positive lock without introducing any mechanical stresses into the gage body which might tend to create distortion after setting. Referring to Figure 6, the construction and operation of this device is as follows:

The adjusting screw, *3*, is threaded externally and internally and split longitudinally. Turning this screw to the right exerts pressure on the sleeve, *2*, against the shoulder in the left-hand side of the gage here shown, thus spreading the ring. Once the ring has been properly adjusted by means of adjusting screw, *3*, the adjustment is locked by tightening locking screw, *1*. The tightening of locking screw, *1*, exerts a pull between the shoulder immediately under its head and the internal threads of the adjusting screw, *3*, which causes the adjusting screw to expand into the threads in the wall of the gage, the thrust of this action being taken up longitudinally by the sleeve, *2*. Therefore, the clamping is accomplished by expansion of the adjusting screw equally in all directions and not by the application of any eccentric forces that tend to distort the gage or upset the adjustment. The locking pressure, it is seen, is taken up centrally in the locking screw itself as the reacting support is directly under the head of the locking screw in the form of a shoulder in the gage. The sleeve, *2*, being accurately fitted, serves as a large dowel to maintain the alignment of the gage.

Three types of thread ring gage blanks have been provided as illustrated in Figure 7, namely:

1. A thin flat disk type with one adjusting slot for all sizes and pitches, both "go" and "not go," No. 0 to $\frac{5}{16}$ inch, inclusive.

2. A thin flat disk type with two adjusting slots for the following: (*a*) All sizes and pitches, "go" and "not go," above $\frac{5}{16}$ to and in-

cluding ½ inch; (*b*) fine pitches,[1] "go" and "not go," above ½ to and including 4½ inches; (*c*) coarse pitches, "not go" only, above ½ to and including 4½ inches.

3. A thick flanged type with two adjusting slots for all "go" coarse pitch gages, above ½ to and including 4½ inches.

Dimensions for thread ring gage blanks in the range from No. 0 to 4½ inches, inclusive, and of parts for the thread ring gage locking device, are given in Tables 16, 17, 18, and 19.

## TAPER PLUG AND RING GAGES FOR CHECKING TAPER LOCK HANDLES AND GAGING MEMBERS

It has been deemed advisable to formulate specifications for a complete set of finished gages for inspecting the taper shanks and handles of gages of taper lock design.

A complete set consists of a taper plug and a taper ring for each size range. General details of construction will be apparent from drawings, and Tables 20 and 21, pages 35 and 36.

In the range above 0.059 to and including 0.240 inch, the taper limits established by the American Gage Design Committee for taper lock handles and shanks may be readily maintained by the use of gages shown in Table 20, in which the taper plug gage is a double-end limit gage. Similarly, in the range above 0.240 to and including 1.510 inches, the taper limits established by the American Gage Design Committee for taper lock handles and shanks may be readily maintained by the use of the gages shown in Table 21, in which the taper plug gage is of the single-end limit type, with a ground step representing the minimum size of hole. For either range equally satisfactory results may be secured by using a single-end taper plug gage, on which a scribed line represents the minimum size of hole and the shoulder of the gage represents the maximum size of hole. Both designs are sanctioned by the American Gage Design Committee.

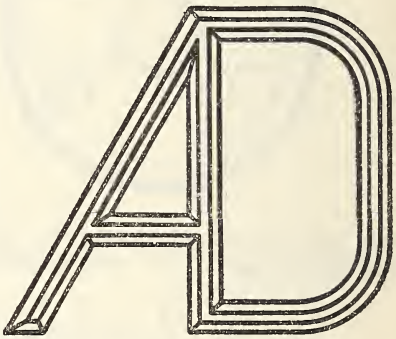

FIGURE 8.—*Official monogram for designating products made to American Gage Design Standards*

## OFFICIAL MONOGRAM FOR DESIGNATING PRODUCTS MADE TO AMERICAN GAGE DESIGN STANDARDS

The optional use of the monogram shown in Figure 8, to identify gages made to American Gage Design Standards, is sanctioned by the committee. The monogram, it will be noted, consists of the initials "AD," the right hand side of the "A" and the straight side of the "D" being common. The monogram, if used, should be placed adjacent to the maker's trade-mark.

[1] Specific information as to the meaning of the terms "fine pitches" and "coarse pitches," as used above, is given in the footnote to Table 16, p 32.

TABLE 14.—*Plain ring gages, range above 0.059 to and including 1.510 inches*

[1] Bushings are 1/16 inch longer than ring thickness, but are ground flush after hole is finished.
[2] Sizes 3, 4, and 5 are solid.

[1] Approximate.

NOTE.—Thin gage blanks are to be used for all "not go" thread ring gages, all American National fine-thread "go" ring gages, and American National coarse-thread "go" ring gages up to and including the one-half inch size. Thick blanks are to be used for all American National coarse-thread "go" ring gages above the one-half-inch size.

It is recommended that standard thread ring gage blanks be used for special pitches as follows:

No. 0 to ½ inch, inclusive, thin blanks for all pitches.

Above ½ inch to and including 1⅛ inches, thin blanks for 12 threads per inch and finer, and thick blanks for all "go" gages in pitches coarser than 12 threads per inch.

Above 1⅛ inches, thin blanks for 10 threads per inch and finer, and thick blanks for all "go" gages in pitches coarser than 10 threads per inch.

## APPLICATION OF AMERICAN GAGE DESIGN STANDARDS TO SPECIAL TYPES OF GAGES, RECOMMENDED PRACTICE

While the American Gage Design Standards have been adopted with specific types and sizes of gages in mind, it is recommended that standard blanks and handles be used wherever practicable in the design and manufacture of special gages, the design of which did not come within the scope of the committee's work.

Where lengths and diameters are entirely special and blanks of standard dimensions can not be utilized, it is further recommended that standard handles and fittings be used.

Observance of this practice will tend to reduce costs and facilitate procurement.

## HISTORY OF PROJECT

The American Gage Design Committee was formed in December, 1926, to consolidate for the benefit of industry at large the independent efforts which were already in progress on the part of a number of large industrial concerns, representatives of United States Government departments, and several of the leading gage manufacturers to simplify gaging practice through the adoption of standard designs for gage blanks and component parts. The designs developed by the American Gage Design Committee are now available to everyone and will minimize the necessity for the manufacture of special gages of the simpler types. The committee was given full support and recognition by engineering societies, the American Standards Association, the Bureau of Standards, the War and Navy Departments, and the National Screw Thread Commission. It should be pointed out, however, that the major work of the committee was contributed by industry itself, many of the country's largest industrial units in widely diversified fields being represented by active membership on the committee. Joint meetings were held with the National Screw Thread Commission throughout 1927 and 1928. Rapid progress was made in these meetings, and formal design standards were completed and adopted for plain plug and ring, and thread plug and ring gages of all sizes above 0.059 to and including 4½ inches diameter.

The meetings of the committee were open, and ideas and suggestions from all branches of industry were welcomed and given careful consideration, it being the earnest endeavor of the committee to crystallize the best design and construction of gage blanks, handles, and component parts for plain and thread gages. No attempt has been made to set gage tolerances or fits, the work being confined solely to selection of the best possible designs for gage blanks; but the work on fits and tolerances of the National Screw Thread Commission and of the Sectional Committee on the Standardization of Plain Limit Gages for General Engineering Work is available for use in connection with gages made to American Gage Design Standards.

The fullest cooperation was extended by all, proprietary patent rights being waived by individual gage manufacturers for the general benefit of industry.

In promulgating the new standards, the committee has not intended to obsolete existing stocks of gages in the hands of manufacturers or users; rather, it has been its intention to provide a standard which could be gradually adopted through replacement of existing stocks. Representing the best ideas of industry at large, including gage makers

and gage users, the American Gage Design Standards should have whole-hearted support and be accepted and used by gage purchasers, and should render obsolete the wasteful and costly practice of requisitioning gages to individual design standards, which has existed in many cases heretofore. Tool supervisors and standards departments of large industrial concerns are particularly urged to adopt, as soon as practicable, the American Gage Design Standards as a substitute for any individual standards which may now be employed. The result will inevitably be the elimination of confusion in gage departments, and advancement in the direction of economy and quality of product.

The committee's efforts to make available in every instance the best possible design of gage blank was materially furthered by the generous action of the gage manufacturers represented on the committee, all of whom offered without reservation to dedicate to public use their proprietary patent rights on any gage construction the utilization of which might be desired by the committee. The committee desires to make formal recognition of the specific action of the Pratt & Whitney Co., of Hartford, Conn., and the Taft-Peirce Manufacturing Co., of Woonsocket, R. I., in contributing, respectively, their patented trilock plug gage design and patented single-unit thread ring gage ocking device to public use, as a part of this standardization program.

## GENERAL CONFERENCE

The sessions of the American Gage Design Committee held October 12 and 13, 1928, in New Haven, Conn., assumed the functions of the general conference. Practically all of the leading producers and users had been invited, and the work of the committee was essentially complete.

The general conference formally adopted the report of the American Gage Design Committee as a commercial standard and voted to request the application of the certification plan by the Bureau of Standards.

It was the consensus of opinion that the standard should be regularly considered for revision every six months in order that it might be kept abreast with current practices and progress in the art.

## STANDING COMMITTEE

The following standing committee was appointed to consider semiannually any comments or suggestions as to changes in the standard in order that it may be kept in accord with the desires of the industry and the advance in the art:

Col. J. O. Johnson, chairman, Ordnance Department, United States Army.
F. S. Blackall, jr., Taft-Peirce Manufacturing Co.
E. J. Bryant, Greenfield Tap & Die Corporation.
C. R. Burt, Pratt & Whitney Co.
A. C. Danekind, General Electric Co.
C. B. LePage, The American Society of Mechanical Engineers.
D. W. Ovaitt, General Motors Corporation.

The following, among others, have participated in the work of the American Gage Design Committee:

Erik Aldeborgh, the Standard Gage Co., Poughkeepsie, N. Y.
J. Chester Bath, John Bath & Co., Worcester, Mass.
H. W. Bearce, secretary, Bureau of Standards, Washington, D. C.
F. J. Benesch, machine manufacturing planning division, Western Electric Co., Hawthorne Station, Chicago, Ill.
*†F. S. Blackall, jr., chairman of editorial subcommittee, vice president and general manager, The Taft-Peirce Manufacturing Co., Woonsocket, R. I.
*‡E. J. Bryant, Greenfield Tap & Die Corporation, Greenfield, Mass.
*C. R. Burt, vice president and general manager, Pratt & Whitney Co., Hartford, Conn.
Fred Colvin, editor American Machinist, Tenth Avenue and Thirty-sixth Street, New York, N. Y.
*‡A. C. Danekind, manager's office, Building 44, General Electric Co., Schenectady, N. Y.
A. H. d'Arcambal, Pratt & Whitney Co., Hartford, Conn.
C. F. Dreyer, development engineer, mechanical inspection development, Western Electric Co., Hawthorne Station, Chicago, Ill.
George M. Foster, Northern Electric Co., Montreal, Canada.
John Gaillard, mechanical engineer, A. S. A., 29 West Thirty-ninth Street, New York, N. Y.
††‡W. H. Gourlie, gage division, Pratt & Whitney Co., Hartford, Conn.
A. Grieve, Chevrolet Motor Co., Detroit, Mich.
E. D. Hall, Western Electric Co., Hawthorne Station, Chicago, Ill.
E. A. Hanson, president, The Hanson-Whitney Machine Co., Hartford, Conn.
P. M. Herrick, Cadillac division, General Motors Corporation, Detroit, Mich.
H. D. Hiatt, Nash Motors Co., Racine, Wis.
W. L. Hindman, Dodge Bros., (Inc.), Detroit, Mich.
Commander H. B. Hird, Bureau of Engineering, Navy Department, Washington, D. C.
*Col. J. O. Johnson, chairman, chief, gage section, Ordnance Department, 3737 Munitions Building, Washington, D. C.
C. V. Johnson, sales engineer, The John-Sons Gage Works, Hartford, Conn.
‡H. S. Kartsher, 3211 Sycamore Road, Cleveland Heights, Ohio.
*C. B. LePage, assistant secretary, A. S. M. E., 29 West Thirty-ninth Street, New York, N. Y.
‡H. B. Lewis, Brown & Sharpe Manufacturing Co., Providence, R. I.
A. M. Lord, Taylor Instrument Cos., Rochester, N. Y.
‡L. M. McPharlin, Pierce-Arrow Motor Car Co., Buffalo, N. Y.
‡P. V. Miller, manager, small tool department, The Taft-Peirce Manufacturing Co., Woonsocket, R. I.
C. H. Moen, Muncie Products Co., Muncie, Ind.
W. C. Mueller, assistant superintendent of manufacturing planning, Western Electric Co., Hawthorne Station, Chicago, Ill.
R. S. Newton, the New York Air Brake Co., Watertown, N. Y.
W. J. Outcalt, standards section, General Motors Corporation, Detroit, Mich.
*‡D. W. Ovaitt, chairman of technical subcommittee, General Motors Corporation, c/o Buick Motor Co., Flint, Mich.
C. J. Oxford, chief engineer, National Twist Drill & Tool Co., Detroit, Mich.
Lieut. Col. E. C. Peck, Room 305, Lake Erie Bank Building, 1612 Euclid Avenue, Cleveland, Ohio.
Louis E. Peck, general manager, the Threadwell Tool Co., Greenfield, Mass.
Charles M. Pond, manager, small tool and gage division, Pratt & Whitney Co., Hartford, Conn.
C. H. Reynolds, The Sheffield Machine & Tool Co., Dayton, Ohio.
P. D. Ritchey, the Standard Gage Co., Poughkeepsie, N. Y.
C. E. Rundorff, research department, Buick Motor Co., Flint, Mich.
‡A. W. Schoof, gage development and standards department, Western Electric Co., Hawthorne Station, Chicago, Ill.
A. J. Schwartz, United States Naval Gun Factory, Navy Yard, Washington, D. C.
J. A. Siegel, Packard Motor Car Co., Detroit, Mich.
O. J. Snider, Cadillac Motor Car Co., Detroit, Mich.

* Member of standing committee.
† Member of editorial committee.
‡ Member of technical subcommittee.

H. B. Stringer, Winter Bros. Co., Wrentham, Mass.
H. L. Van Keuren, The Van Keuren Co., 12 Copeland Street, Watertown, Boston, Mass.
‡C. E. Watterson, president, The Sheffield Machine & Tool Co., Dayton, Ohio.
‡W. H. Weingar, 88 Maplewood Avenue, West Hartford, Conn.
K. D. Williams, Bureau of Engineering, Room 2326, Navy Department, Washington, D. C.
Charles E. Winter, Winter Bros. Co., Wrentham, Mass.
George R. Worner, Taylor Instrument Cos., Rochester, N. Y.

## EFFECTIVE DATE

The general conference set the effective date for new production as July 1, 1930, and for clearance of existing stocks not later than January 1, 1931.

## PROMOTION OF EXPORT TRADE

The question of promoting export trade on the basis of these standards was left to the discretion of the standing committee.

## CERTIFICATION PLAN

The general conference voted to request the application of the certification plan to this standard by the National Bureau of Standards.

The certification plan as applied by the National Bureau of Standards to commercial standards consists in the compilation and distribution of lists of manufacturers who are willing, when requested to do so, to certify to purchasers that products supplied by them comply with all the requirements and tests set forth in nationally recognized commercial standards. The plan is also applied to selected Federal specifications.

These lists are available on request to individual consumers, consumer groups, companies, and, in fact, to any prospective purchasers, for their guidance.

The benefits now derived from the use of specifications by large consumers are thus made immediately available to the small consumer, with incidental advantage to the larger consumers of convenience in ordering and accepting material with fewer laboratory tests, and of lowering the price by reason of broadening the field of supply. The manufacturer also benefits from the well-known economies accompanying "mass production."

The lists of manufacturers "willing-to-certify" to the quality of certain commodities are made by corresponding with, as nearly as possible, all the manufacturers of that product and listing only those who signify their willingness to certify to the purchaser, when requested to do so, that the commodities delivered actually comply with the commercial standard.

Obviously, the purchaser making use of the lists of "willing-to-certify" manufacturers will select therefrom such manufacturers as are known (or assumed) by him to be reliable.

The trend toward the purchase of materials of certified quality from sources shown on such willing-to-certify lists supplies added

‡Member of technical subcommittee.

incentive to standardization on the part of other producers, and thus the benefits of the certification plan will be felt by purchasers either directly or indirectly, whether or not they make use of the plan themselves.

## COMMERCIAL STANDARDS SERVICE

Industry has long sensed the need for a wider application and use of specifications developed and approved by nationally recognized organizations. To assist these bodies and the producers and consumers in securing this result and as a natural outgrowth of the movement toward elimination of waste through simplified practice, the Bureau of Standards has set up a procedure under which specifications, properly indorsed, may be printed as official publications of the Department of Commerce and promulgated as "commercial standards." This service parallels that of simplified practice in many respects and is available only upon request.

Broadly speaking, the aim is to continue the same character of cooperative service in this field that is being rendered in simplification. The division of trade standards is not designed to act as a standardizing body, nor will it engage in the preparation of specifications. Its service is mainly promotional in character, since its chief mission is to get behind a standard or a specification which any branch of industry may want to promulgate on a nation-wide basis; to determine its eligibility for promulgation; to publish and broadcast it in the event the prerequisites of procedure have been met, including a satisfactory majority acceptance; to facilitate the application of the certification plan for the assurance and convenience of the purchaser; to provide means for periodic audits of adherence; and to cooperate with the Bureau of Foreign and Domestic Commerce in determining the desire of industry relative to translation and promulgation of such specifications as a basis for foreign commerce.

In general, it may be said that a simplification covers types, sizes, and varieties of a commodity which are retained by industry on the basis of demand, whereas a commercial standard establishes definite requirements as to grade, quality, or dimensional tolerances in addition to any limitation of variety desired and accepted by the industry.

## ORGANIZATION AND DUTIES OF STANDING COMMITTEE

In order to carry on the aims and desires of the industry in the standardization of their product, a standing committee is appointed at the general conference. This committee consists of members from each division of the industry, namely, producers, distributors, and consumers, and thus reflects the well-balanced viewpoint of all concerned.

The members of the committee receive all suggestions regarding the commercial standard and consider its revision in the event that such action is desirable and mutually beneficial.

If the commercial standard does not warrant revision, it is reaffirmed in its existing form but if any important changes are found desirable, their adoption is recommended by the committee, where-

upon the industry is again solicited for written acceptance of the standard in its revised form.

The committee is in effect a centralizing agency for criticisms and comments regarding the commercial standard and is charged with the responsibility of recommending revisions to keep the standard abreast with current industrial practice.

The proper functioning of the committee requires that, when necessary, its members be willing to attend meetings held at some central place, although in many cases it will be possible to conduct the work by correspondence.

When any deceptions in reference to the commercial standard are reported to the standing committee, it applies moral suasion or such other corrective measures as seem desirable. The Department of Commerce has no "police power" to compel adherence, therefore, it is incumbent upon the standing committee to do all in its power to encourage all divisions of the industry to follow the provisions of the commercial standard and contribute in every way possible to its general adoption and usefulness.

## YOUR COOPERATION

As a producer, distributor, or consumer of some of the commodities for which commercial standards have already been established, you are in a position to avail yourself of the benefits arising from the use of quality standards and incidentally to add impetus to this method of eliminating waste.

The first step is a declaration in favor of the standard by recording your intention to adhere, as closely as circumstances will allow, to the standards for those products which you may buy or sell.

The receipt of your signed acceptance will permit the listing of your company in new editions of the commercial standards that you accept.

You will, of course, want to examine any commercial standards before signing a formal acceptance. The Bureau of Standards will, therefore, furnish a copy of any standard under consideration for acceptance. To facilitate this procedure, a list appears on page 46 that may be checked and mailed to the Division of Trade Standards, Bureau of Standards, Washington, D. C. The publications may also be secured singly or in quantities at a nominal price from the Government Printing Office. Prices will be furnished upon request.

The acceptance of a commercial standard is an entirely voluntary action and applies to the production, sale, and use of stock items. It is not meant to interfere with the manufacture or sale of special sizes and types sometimes required.

Trade associations and individual companies often distribute large numbers of the printed standard for the information and guidance of their members or customers. In such cases it is possible to extend the scope and degree of adherence by urging each recipient to send in an acceptance, bearing in mind that the practical value of any standardization is measured by the observance it receives.

An acceptance form for the commercial standard herein covered is included on page 43,

## ACCEPTANCE OF COMMERCIAL STANDARD

Please sign and return this sheet to Division of Trade Standards, Bureau of Standards, Washington, D. C.

Date _____

DIVISION OF TRADE STANDARDS,
BUREAU OF STANDARDS,
*Washington, D. C.*

GENTLEMEN: We, the undersigned, do hereby accept the original draft of the commercial standard, as our standard practice in the {Production [1] / Distribution [1] / Use [1]} of plain and thread plug and ring gage blanks, beginning _____ (Date), and will use our best effort in securing its general adoption.

To permit intelligent review of the effectiveness of the commercial standard every year by an accredited committee of all interests, working in cooperation with the Department of Commerce, we plan to supply all data, upon request, which may be necessary for the development of constructive revisions. It is understood that any suggested modifications will be submitted as soon as formulated, and shall not be promulgated until accepted in form similar to this recommendation.

Title _____

Company _____

Street address _____

City and State _____

We are members of the following associations or other organizations interested in the production, sale, or use of plain and thread plug and ring gage blanks:

_____

_____

_____

[1] Please designate which group you represent by drawing lines through the other two. In the case of related interests, trade papers, colleges, etc., desiring to record their general approval, the words "in principle" should be added after the signature.

## TO THE ACCEPTOR

In signing the acceptance blank, please bear the following points clearly in mind:

1. *Adherence.*—The Department of Commerce has no regulatory powers to enforce adherence to the commercial standards. Instead, this waste-elimination program is based on voluntary cooperation and self-government in industry. To make this specific standardization operate as a satisfactory example of self-government, it is highly desirable that it be kept distinct from any plan or method of governmental regulation or control. It will be successful according to the degree to which manufacturers, distributors, and purchasers adhere to its terms and conditions.

2. *The industry's responsibility.*—The department cooperates only on the request of the industry and assumes no responsibility for industrial acceptance or adherence. This program was developed by the industry on its own initiative. Its success depends wholly on the active cooperation of those concerned.

3. *The acceptor's responsibility.*—You are entering into an entirely voluntary arrangement, whereby the members of the industry—the distributors and consumers of the product, and others concerned—hope to secure the benefits inherent in commercial standardization. Those responsible for this standard realize that instances may occur in which it will be necessary to supply or purchase items not included therein. The purpose is, however, to secure wider support for nationally recognized standards covering grade, quality, and other characteristics of products. Consumers can make the program a success if, in their purchasing, they will make a definite and conscientious effort to specify in terms of this commercial standard.

4. *The department's responsibility.*—The function performed by the Department of Commerce is fourfold: First, to act as a referee to insure adequate consideration of the needs of all interests; second, to supply such assistance and advice in the development of this program as past experience with similar programs may suggest; third, to solicit and record the extent of adoption and adherence to the standard; and fourth, to add all possible prestige to this standardization movement by publication and promulgation if and when it is adopted and accepted by all elements directly concerned.

REQUEST FOR COMMERICAL STANDARDS

Date _____

DIVISION OF TRADE STANDARDS,
BUREAU OF STANDARDS,
*Washington, D. C.*

GENTLEMEN: The undersigned wishes to examine the commercial standards checked on the reverse side of this page, with a view toward accepting them as our standard of practice in the production, distribution, or consumption of the standardized lines.
