NOTICE

EIA Engineering Standards and Publications are designed to serve the public interest through eliminating misunderstandings between manufacturers and purchasers, facilitating interchangeability and improvement of products, and assisting the purchaser in selecting and obtaining with minimum delay the proper product for his particular need. Existence of such Standards and Publications shall not in any respect preclude any member or non-member of EIA from manufacturing or selling products not conforming to such Standards and Publications, nor shall the existence of such Standards and Publications preclude their voluntary use by those other than EIA members, whether the standard is to be used either domestically or internationally.

Recommended Standards and Publications are adopted by EIA without regard to whether or not their adoption may involve patents on articles, materials, or processes. By such action, EIA does not assume any liability to any patent owner, nor does it assume any obligation whatever to parties adopting the Recommended Standard or Publication.

This EIA Standard is considered to have International Standardization implication, but the International Electrotechnical Commission activity has not progressed to the point where a valid comparison between the EIA Standard and the IEC document can be made.

This Standard does not purport to address all safety problems associated with its use or all applicable regulatory requirements. It is the responsibility of the user of this Standard to establish appropriate safety and health practices and to determine the applicability of regulatory limitations before its use.

(From Standards Proposal No. 1814 formulated under the cognizance of EIA Engineering Committee TR-29 on Facsimile Systems and Equipment.)

FACSIMILE CODING SCHEMES AND CODING CONTROL FUNCTIONS
FOR GROUP 4 FACSIMILE EQUIPMENT

1. General

1.1 Scope

1.1.1

This Standard (P/N 1814) defines the facsimile coding schemes, and their control functions to be used in the group 4 facsimile

1.1.2

This Standard (P/N 1814) should be read in conjunction with the following Recommendations:

- T.5 - General aspects of Group 4 facsimile equipment (Equivalent to EIA P/N 1466);
- T.73 - Document interchange protocol for the Telematic service;
- T.62 - Control procedures for Teletex and Group 4 facsimile services (Equivalent to EIA P/N 1467);
- T.70 - Network-independent basic transport service for Telematic services;
- F.161 - International Group 4 facsimile service

In addition, in the case of Group 4 class 2/3 (Teletex or mixed-mode of operation), the following Recommendations should also be read:

- T.60 - Terminal equipment for use in the Teletex service
- T.61 - Character repertoire and coded character sets for the international Teletex service
- T.72 - Terminal capabilities for mixed mode of operation

1.2 Fundamental principles

1.2.1 Facsimile coding schemes and coding control functions

- (1) Facsimile coding schemes consist of the basic facsimile coding scheme and optional facsimile coding schemes. They are defined in Section 2 and Sections 3 and 4 respectively.
- (2) Facsimile coding schemes are specified assuming that transmission errors are corrected by control procedure on lower level.
- (3) Basic facsimile coding scheme is the two-dimensional coding scheme which is in principle the same as the two-dimensional coding scheme of Group 3 facsimile specified in Recommendation T.4.
- (4) Optional facsimile coding schemes are specified not only for black and white images, but also for grey scale images and color images.
- (5) Facsimile coding control functions are used in facsimile user information in order to change facsimile parameters or to invoke the end of facsimile block. They are defined in Section 2.4.

2. Facsimile coding schemes and coding control functions for black and white images

2.1 General

2.1.1

This Section specifies the facsimile coding schemes, and associated control functions for black and white images.

2.1.2

Facsimile coding schemes consist of the basic facsimile coding scheme and optional coding schemes.

2.1.3

The use of the optional facsimile coding schemes is subject to mutual agreement between terminals and shall be initiated by the appropriate procedural steps.

2.2 Basic facsimile coding scheme

2.2.1 Principle of coding scheme

This is a two-dimensional line-by-line coding method in which the position of each changing picture element on the current or coding line is coded with respect to the position of a corresponding reference element situated on either the coding line or the reference line which is immediately above the coding line. After the coding line has been coded, it becomes the reference line for the next coding line. The reference line for the first coding line in a page is an imaginary white line.

2.2.2 Definition of changing picture elements (see Figure 1)

A changing element is defined as an element whose "color" (i.e. black or white) is different from that of the previous element along the same scan line.

- a_0 : The reference or starting changing element on the coding line. At the start of the line a_0 is set on an imaginary white changing element situated just before the first element on the line. During the coding of the coding line, the position of a_0 is defined by previous coding mode. (See 2.2.3)
- a_1 : The next changing element to the right of a_0 on the coding line.
- a_2 : The next changing element to the right of a_1 on the coding line.
- b_1 : The first changing element on the reference line to the right of a_0 and of opposite color to a_0 .
- b_2 : The next changing element to the right of b_1 on the reference line.

FIGURE 1

Changing picture elements

2.2.3 Coding modes

One of the three coding modes are chosen according to the coding procedure described in Section 2.2.4 to code the position of each changing element along the coding line. Examples of the three coding modes are given in Figure 2, 3 and 4.

a) Pass mode (see Figure 2)

This mode is identified when the position of b_2 lies to the left of a_1 .

FIGURE 2
Pass mode

However, the site where b_2 occurs just above a_1 , as shown in Figure 3 is not considered as a pass mode.

FIGURE 3
An example not corresponding to a Pass mode

b) Vertical Mode

When this mode is identified, the position of a_1 is coded relative to the position of b_1 . The relative distance $a_1 b_1$ can take on one of seven values $V(0)$, $V_R(1)$, $V_R(2)$, $V_R(3)$, $V_L(1)$, $V_L(2)$ and $V_L(3)$, each of which is represented by a separate code word. The subscripts R and L indicate that a_1 is to the right or left respectively of b_1 , and the number in brackets indicates the value of the distance $a_1 b_1$. (See Figure 4)

c) Horizontal mode

When this mode is identified, both the run-lengths $a_0 a_1$ and $a_1 a_2$ are coded using the code words $H + M(a_0 a_1) + M(a_1 a_2)$. H is the flag code word 001 taken from the two-dimensional code table (Table 1). $M(a_0 a_1)$ and $M(a_1 a_2)$ are code words which represent the length and "color" of the runs $a_0 a_1$ and $a_1 a_2$ respectively and are taken from the appropriate white or black run-length code tables (Tables 2 and 3).

FIGURE 4

Vertical mode and horizontal mode

2.2.4 Coding procedures

The coding procedure identifies the coding mode that is to be used to code each changing element along the coding line. When one of the three coding modes has been identified according to Step 1 or Step 2 mentioned below, an appropriate code word is selected from the code table given in Table 1. The coding procedure is as shown in the flow diagram of Figure 5.

Step 1

- i) If a pass mode is identified, this is coded using the word 0001 (Table 1). After this processing, picture element a_0 just under b_2 is regarded as the new starting picture element a_0 for the next coding. (See Figure 2).
- ii) If a pass mode is not detected, then proceed to Step 2.

Note - It does not affect compatibility to restrict the use of pass mode in the encoder to a single pass mode. Variations of the algorithm which do not affect compatibility should be the subject of further study.

Step 2

- i) Determine the absolute value of the relative distance a_1b_1 .
- ii) If $|a_1b_1| < 3$, as shown in Table 1, a_1b_1 is coded by the vertical mode, after which position a_1 is regarded as the new starting picture element a_0 for the next coding.
- iii) If $|a_1b_1| > 3$, as shown in Table 1, following horizontal mode code 001, a_0a_1 and a_1a_2 are respectively coded by one-dimensional run length coding.

Run lengths in the range of 0 to 63 pels are encoded with their appropriate Terminating code word of Table 2. Note that there is a different list of code words for black and white run lengths. Run lengths in the range of 64 to 2623 pels are encoded first by the Make-up code word representing the run length which is nearest, not longer, to that required. This is then followed by the Terminating code word representing the difference between the required run length and the run length represented by the Make-up code. Run lengths in the range of longer than or equal to 2624 pels are coded first by the Make-up code of 2560. If the remaining part of the run (after the first Make-up code of 2560), is 2560 pels or greater, additional Make-up code(s) of 2560 are issued until the remaining part of the run becomes less than 2560 pels. Then the remaining part of the run is encoded by Terminating code or by Make-up code plus Terminating code according to the range as mentioned above.

After this processing, position a_2 is regarded as the new starting picture element a_0 for the next coding.

Note - Coding examples are referred to in Section 4.2.5 in Recommendation T.4.

Note - Code M() of the horizontal mode represents the code words in Tables 2 and 3.

2.2.5 Processing the first and last picture element in a line

a) Processing the first picture element

The first starting picture element a_0 on each coding line is imaginarily set at a position just before the first picture element, and is regarded as a white picture element (see Section 2.2.2).

The first run length on a line a_0a_1 is replaced by $a_0a_1 - 1$. Therefore, if the first actual run is black and is deemed to be coded by horizontal mode coding, then the first code word $M(a_0a_1)$ corresponds to an imaginarily white run of zero length (see Figure 10 in Recommendation T.4, Example 5).

b) Processing the last picture element

The coding of the coding line continues until the position of the imaginarily changing element situated just after the last actual element has been coded. This may be coded as a_1 or a_2 . Also, if b_1 and/or b_2 are not detected at any time during the coding of the line, they are positioned on the imaginarily changing element situated just after the last actual picture element on the reference line.

2.3 Optional facsimile coding schemes for black and white images

2.3.1 Uncompressed mode

Uncompressed mode is an optional coding scheme associated to basic facsimile coding scheme and is used to transmit the image information without data compression technique as shown in Table 4.

Extension code in Section 2.2.4 with the xxx bit set to 111 is used as an entrance code from basic coding scheme in Section 2.2 to uncompressed mode.

2.4 Facsimile coding control functions

2.4.1 Control functions for basic facsimile coding scheme

2.4.1.1 End of facsimile block

The End of facsimile block (EOFB) code is added to the end of every coded facsimile block. The format of EOFB is as follows:

Format: 000000000001000000000001
24 bits

2.4.1.2 Pad bits

Pad bits may be used after the End of facsimile block code if it is necessary to align on octet boundaries or to a fixed block size. The format used is as follows:

Format: Variable Length string of 0s.

2.4.1.3 Extension

Extension code is used to indicate the change from the current mode to another mode, e.g., another coding scheme.

Format: 0000001xxx

Where xxx = 111 indicates uncompressed mode which is specified in Section 3.2.1.

Further study is needed to define other unspecified xxx bit assignments and their use for any further extensions.

TABLE 1
Code table

Mode	Elements to be coded		Notation	Code word	
Pass	b_1, b_2		P	0001	
Horizontal	$a_0 a_1, a_1 a_2$		H	$001 + M(a_0 a_1) + M(a_1 a_2)$ (see Note)	
Vertical	a_1 just under b_1	$a_1 b_1 = 0$	$V(0)$	1	
	a_1 to the right of b_1	$a_1 b_1 = 1$	$V_R(1)$	011	
		$a_1 b_1 = 2$	$V_R(2)$	000011	
		$a_1 b_1 = 3$	$V_R(3)$	0000011	
	a_1 to the left of b_1	$a_1 b_1 = 1$	$V_L(1)$	010	
		$a_1 b_1 = 2$	$V_L(2)$	000010	
		$a_1 b_1 = 3$	$V_L(3)$	0000010	
	Extension				0000001xxx

Note - Code M() of the horizontal mode represents the code words in Tables 2 and 3

TABLE 4
Uncompressed mode code words

Entrance code to uncompressed mode	Basic coding scheme : 0000001111	
Uncompressed mode code	<i>Image pattern</i>	<i>Code word</i>
Exist from uncompressed mode code	0 00 000 0000	0000001T 00000001T 000000001T 0000000001T 00000000001T

T denotes a tag bit which tells the colour of the next run (black = 1, white = 0).

This standard has been adopted for Federal Government use.

Details concerning its use within the Federal Government are contained in Federal Information Processing Standards Publication 150, Facsimile Coding Schemes and Coding Control Functions for Group 4 Facsimile Apparatus. For a complete list of the publications available in the Federal Information Processing Standards Series, write to the Standards Processing Coordinator (ADP), National Institute of Standards and Technology, Gaithersburg, MD 20899.
