## APPLIED MATHEMATICS DIVISION FUNCTIONS

**APPLIED MATHEMATICS DIVISION (205.00):** Conducts research and provides consulting services to the Bureau and other Federal agencies in various fields of mathematics important in science and engineering, including automatic data processing and operations research, with emphasis on statistical, numerical and combinatorial analysis, and on mathematical physics. Develops tools for mathematical work such as mathematical tables, handbooks, manuals, mathematical models and computational methods, and advises on their use. Provides training in disciplines related to these functions.

**MATHEMATICAL ANALYSIS SECTION (205.01):** Conducts research and provides consulting services in core and applied mathematics as they impact on science and engineering, involving research supporting the advancement of computation, particularly in the development of computing algorithms and criteria for their evaluation. Performs mathematical analysis of complex physical systems for the purpose of developing rigorous analytic procedures. Simulates the behavior of physical systems by means of electronic computers, using approximation techniques and semi-analytic methods. Studies the properties and representations of special functions encountered in research and consultation. Develops methods for computing these special functions, and critically evaluates methods commonly used. Collaborates with representatives of government agencies, industry, and universities in an effort of extensive testing, evaluation and documentation of algorithms and computer programs for scientific calculation.

**OPERATIONS RESEARCH SECTION (205.02):** Develops and applies mathematical-computational techniques for and provides consulting services in the analysis, improvement or optimization of complex systems or activity patterns. Conducts investigations in the art of constructing useful mathematical models of complex systems. Studies such systems by applying analytic or simulation methods. Applies these techniques to problems arising in the work of the Bureau or of other Government agencies lacking specialized personnel in this field. Performs research in underlying areas of mathematics, such as linear programming, the theory of linear graphs, and the theory of strategic contests.

**STATISTICAL ENGINEERING SECTION (205.03):** Provides consulting services in the application of mathematical statistics to physical science experiments and engineering tests, particularly in the design of experiments and in the analysis and interpretation of data. Contributes to the development of appropriate statistical techniques on a foundation of research on pertinent topics in probability and mathematical statistics. Conducts studies of computational methods, and prepares reports, manuals, tables, and handbooks to facilitate the application of modern statistical methods.

## 1. MATHEMATICAL ANALYSIS

### RESEARCH IN MATHEMATICAL ANALYSIS

Task 20540-12-205141/55-57

1550-11

Origin: NBS  
Manager: H.J. Oser  
Full task description: July - September 1954 issue, p. 27

Authorized 9/1/54

Status: Continued

An extensive revision of a paper by Kraft entitled "An Existence Theorem for a Linear Transport Equation" was completed. This paper has been split into two papers. The first is entitled "A Rate of Convergence Inequality for Semidiscretizations of a Linear Transport Equation", the second paper carries the same title as the original. Both papers have been typed and minor corrections are being made.

A paper by Kraft on fundamental solutions for systems of O.D.E.'s was completed. Minor corrections are being made before submitting the manuscript for publication.

A key step (computing "angle factors") in Kraft's program for numerical solution of the integral equation of interreflections was completed. He intends to compare his procedure (for computing "angle factors") with analytical bench marks and submit the results for publication.

In collaboration with the Electronic Technology Division, S.R. Kraft studied mathematical models of semiconductor doping. It is important in the manufacturing process of "chips" to control the density distribution of defects in the silicon lattice which are introduced through foreign atoms such as phosphorus and boron. The "doping" is affected through thermal oxidation and diffusion. The present formulation led mathematically to a system of Volterra Integral Equations. The numerical solution of these singular equations is in progress at this time.

Kraft has found a way to apply some results of his on "Riemann functions" to obtain generalizations of Gronwall's inequality. These results have applications to uniqueness and stability of certain types of partial differential equations. These ideas are being prepared for publication.

Seymour Haber devised a method for numerical evaluation of certain 5-fold integrals arising in the study of the response of tall buildings to turbulent winds. The work was done in consultation with Dr. E. Simiu of the Center for Building Technology; programs for evaluating the integrals and related parameters describing properties of buildings were written by D. Sookne and D. Lozier. It is hoped that in the future these programs may be put into a form which will make them widely available to engineers and architects.

S. Haber and O. Shisha of the Naval Research Laboratory continued their study of the representation of improper Riemann integrals as limits of Riemann sums, and of related questions about the numerical evaluation of such integrals. They completed a paper on this subject.

S. Haber calculated explicit error bounds for a simplified form of an extremely accurate quadrature formula due to Frank Stenger.

MATHEMATICAL ALGORITHMS

Task 205-12-2050143

Origin: NBS (RTS)  
Manager: H.J. Oser

Authorized 7/1/72

Status: Continued

Results of the testing of the UNIVAC FORTRAN Library of mathematical functions have been submitted to NBS Journal of Research, Section B. Lozier and Sadowski continued the development of the Bit Comparison Package to handle comparison between reference values and computer results to any number of bits. Thus the Bit Comparison Package can be used in testing minicomputer libraries.

Preliminary work on testing of the FORTRAN library on the Interdata 70 computer was undertaken in support of the dimensional metrology program at IBS. This work will be continued. Albert Liao participated in several phases of this work.

David J. Sookne had four papers accepted by the NBS J. of Research, B. Two contain algorithms and FORTRAN programs for Bessel functions  $I_n(x)$  and  $J_n(x)$  for real and complex arguments, the other two are devoted to the certification of these computer programs.

Frank W.J. Olver has constructed a complete set of algorithms for the computation of associated Legendre functions for arbitrary real values of the argument and degree and integer values of the order. The algorithms await testing before publication.

Publications:

- (1) A Bit Comparison Program for Algorithm Testing. D.W. Lozier, L.C. Maximon and W.L. Sadowski. The Computer Journal, Vol. 16, No. 2, 1973, pp. 111-117.
- (2) Performance Testing of a FORTRAN Library of Mathematical Function Routines - A Case Study in the Application of Testing Techniques. D.W. Lozier, L.C. Maximon and W.L. Sadowski. Accepted for publication by NBS Journal of Research, Sec. B.
- (3) Bessel Functions of Real Argument and Integer Order. D.J. Sookne. To appear in NBS Journal of Research, Sec. B.
- (4) Certification of BESLRI. D.J. Sookne. To appear in NBS Journal of Research, Sec. B.
- (5) Bessel Functions I and J of Complex Argument and Integer Order. D.J. Sookne. To appear in NBS Journal of Research, Sec. B.
- (6) Certification of BESLCI. D.J. Sookne. To appear in NBS Journal of Research, Sec. B.

HIGH PRECISION MATH CALCULATION SYSTEM

Task 205-12-2050460

Origin: U.S. Army Materiel Command  
Manager: Walter L. Sadowski

Authorized 2/8/73

Objective: To test, document and validate a mathematical software system consisting of an arithmetic unit for extended precision calculations and a library of elementary functions. To develop, test and validate a preprocessor that will enable a computer user to declare certain variables in a FORTRAN program to be extended precision and run the program in extended precision without further modifications.

Status: New

Daniel Lozier and Walter Sadowski began work to test and validate a Super Precision Package developed by William T. Wyatt at the Harry Diamond Laboratories. In addition to the design of tests intended to validate the individual components of the package, heavy emphasis was placed on the documentation and verification of the mathematical algorithms used. Furthermore, uniform coding conventions were introduced and program flow simplified wherever it was felt that this would contribute to the understanding and ease of maintenance of the package. The result of this was the development of a "testable" version of the main arithmetic routines that will materially contribute to the information collected in the field tests.

Don Orser, in consultation with Lozier and Sadowski has written the first pass of the preprocessor. This part does the scanning and parsing of the FORTRAN text. The work on this project continues.

## 2. OPERATIONS RESEARCH

### CONSULTATION IN MATHEMATICAL OPERATIONS RESEARCH

Origin and Sponsor: NBS  
Manager: A.J. Goldman  
Full task description: October-December 1960 issue, p.3

Authorized 12/30/60

Status: CONTINUED

(1) Section staff provided miscellaneous consulting and advisory services in 146 recorded instances, 83 involving assistance to NBS staff. These instances totalled to 735 man-hours. One new source was a number of inquiries stimulated by L.S. Joel's arranging a pair of lectures (and delivering one of them), on "cluster analysis" and related techniques, in the Division's Expository Seminar series. Other agencies assisted included DOC (BDC), OST, HEW, NSF, and various DOD units.

(2) A.J. Goldman continued service as representative of the Operations Research Society of America (ORSA) to the Conference Board of the Mathematical Sciences (CBMS), beginning service on the Board's Nominations Committee and organizing/chairing a session on "Mathematical Modelling in the Decision Sciences" for the 1/73 joint national mathematical-society meeting. He also continued as Associate Editor of ORSA's "Transportation Science" journal, and as NBS representative to the Mathematical Sciences Division of the National Research Council.

(3) Goldman continued service as a consultant to NBS' Experimental Technological Incentives Program (ETIP), in particular helping to monitor contracted studies on the roles of government procurement and of market aggregation as mechanisms to promote innovation. (Reported here for convenience; supported under Project 1150068.)

#### Publications

- (1) A.J. Goldman. The adequacy of management science technology for non-military applications in the Federal government. To appear in Proc., Amer. Soc. Public Admin. Workshop on Management Science in the Federal Government (11/69).
- (2) A.J. Goldman. Product solutions and separation of variables. Journal of Research NBS, 76B (1972), 201-204.

### COMBINATORIAL METHODS

Task 205-12-2050152

Origin and Sponsor: NBS  
Manager: A.J. Goldman  
Full task description: October-December 1964 issue, p.3; April-June 1962, p.15

Authorized 12/30/60

Status: TERMINATED

(1) Documentation of work by J. Gilsinn and C. Witzgall, on comparative evaluation of shortest-path algorithms, was published. The study showed that order-of-magnitude gains in efficiency of solution can be obtained by proper matching of calculation method with network characteristics. The latter include more than the mere numbers of nodes and links; the distinction between "long thin" and "squareish" configurations is also important, as is the variation in link-lengths. Algorithm performance can be extremely sensitive to what might be regarded as minor details of a method. The study identified 3 out of some 30 algorithms for recommendation, together with criteria for choosing among the 3 in particular cases. Its results should assist the over 300 million shortest-path calculations made annually, and have already permitted cutting an early estimate of computation effort by 2/3 in an NBS project involving determination of 21 million shortest paths.

(2) L.S. Joel investigated some questions of convex-hull determination which arise in seeking to solve certain combinatorial optimization problems by means of linear programming. In particular, he proved that the convex hull of the  $n$ -by- $n$  permutation matrices which represent transpositions consists of the doubly stochastic matrices with trace  $n-2$ .

(3) Subsequent work on some themes of this project (specifically, optimal facility location and optimization of network operations) will be reported under a new project "Mathematical Algorithms and Models of Operations Research" to be initiated in July 1973.

## Publications

## LINEAR AND NON LINEAR PROGRAMMING

Task 205-12-2050153

Origin and Sponsor: NBS

Authorized 12/30/60

Manager: W.G. Hall

Full task description: October-December 1960 issue, p.3

Status: TERMINATED

- (1) R.H.F. Jackson continued the acquisition of mathematical programming algorithms from other institutions. Codes for linear, nonlinear and integer programming were obtained from Cornell and the University of Wisconsin; a code for generating large-scale (uncapacitated) network problems as an aid to algorithm evaluation was secured from the University of Texas. Further assimilation (i.e., familiarization and systematic testing) of these codes during FY 1974 is indicated.
- (2) Jackson and P.B. Saunders converted the NBS linear and quadratic programming routines to EXEC 8. T.B. Ayers revised forthcoming documentation on supplementary routines for ranging and parametric analyses.
- (3) Need for consultation services in mathematical programming, and for reliable codes like the NBS linear programming routines and the NBS-sponsored dynamic programming algorithms, remains quite heavy among many government groups. Such assistance was provided to the AEC, Federal Rail Administration, Social Security Administration, Agriculture Department, Tariff Commission, and 4 Forestry Service sites, as well as NBS staff. P.B. Saunders performed most of these consultations.
- (4) Work continued by A.J. Goldman, W.A. Horn and M.H. Pearl on applying a previously-developed minimax estimation technique to two bivariate problems, one involving the estimation of transit-line flows.
- (5) The theme which has recently dominated this project, that of meeting the keen need in the governmental and general technical communities for high-quality solution algorithms for recurrent classes of problems in mathematical operations research, will be continued under a new project "Mathematical Algorithms and Models of Operations Research" to be initiated in July 1973.

## Publication

- (1) A.J. Goldman. Scheduling a time shared server to minimize aggregate delay. Journal of Research NBS, 76B (1972), 109-117.

OPERATIONS RESEARCH SERVICES FOR TECHNICAL ANALYSIS DIVISION

Task 205-12-2050586

Origin: NBS (Div. 431)  
Sponsor: NBS, various other agencies  
Manager: A.J. Goldman  
Full task description: July-December 1970 issue, p.8

Authorized 7/15/71

Status: CONTINUED

- (1) Project 4310900: A.J. Goldman participated in a number of project and document reviews for the sponsoring division.
- (2) Project 4314431: A.J. Goldman, W.G. Hall and W.A. Horn (with Dr. H.J. Oser 205.01) completed participation in this project, to assist DOT's Urban Mass Transportation Administration in several systems-analysis tasks. Some 20 contractor reports and proposals were evaluated during FY 1973.
- (3) Project 4314487: P.B. Saunders and R.H.F. Jackson continued collaboration in this study, to aid the Army Nurse Corps in personnel-level planning. A simulation model, incorporating historical data and current policies (on attrition, promotions, etc.) was designed to project Corps strength in various rank-speciality categories; the model was programmed, tested and is being documented.
- (4) Project 4314552: A.J. Goldman continued consultation on this project, to evaluate the Shirley Highway Express Busway Demonstration Project. Emphasis this period was on monitoring a contracted study on modal-split modelling.
- (5) Project 4314518: W.G. Hall, with T.B. Ayers, J. Gilsinn and L.S. Joel, continued participation in this study of the lead-paint poisoning problem. Gilsinn was involved in the planning phase. Hall directed and Ayers participated in a methodology-testing survey of District of Columbia housing units, involving X-ray fluorescence lead detectors, with a reading being taken in each room from each wall, the baseboard, a window sill or frame, etc. High lead levels were found in a number of older dwellings. These results are being documented, along with preparation of a manual to advise authorities in other cities on the conduct of such surveys. Joel analyzed data on lead content in 250 small cans (under 5 gallons) from 5 retail outlets, and is documenting the findings and implications.
- (6) Project 4314568: This involves systems studies in support of NBS' Office of Weights and Measures. Assistance was provided in refining a methodology for estimating the "misflow" of dollars due to faulty weighing and measuring devices. P.B. Saunders, with T.B. Ayers and M.H. Pearl, began efforts to develop a model describing the dependence of the device performance upon inspection policy, in particular interviewing persons associated with the manufacture, sales and services of such devices, and opening a dialog with the scale manufacture industry in search of basic data. A.J. Goldman and M.H. Pearl are analyzing some simplified game-theoretic models concerning the dependence of the performance of a W&M inspection system upon penalty levels and inspection resources. W.G. Hall with Goldman examined some legal literature and other sources as a start toward elucidating the concept of "equity in the marketplace" which is the basis for the Bureau's weights & measures activities. Documentation of this work, performed during the last quarter of FY 1973, is in progress.
- (7) Project 4314427: J. Gilsinn, R.H.F. Jackson and L.S. Joel are participating in this study, to assist the FAA by examining that agency's needs for air traffic level projections for various analyses, identifying common elements among these needs, and recommending approaches to meet these common needs in a consistent and efficient way. During FY 1973 effort was focussed on: a survey to identify the requirements for traffic projects, a preliminary structuring of data needs, and initialization of a search for data sources.

### 3. PROBABILITY AND MATHEMATICAL STATISTICS

#### RESEARCH IN PROBABILITY AND MATHEMATICAL STATISTICS

Task 20503-12-2050131/63-1259  
6030-11

Origin: NBS  
Manager: Joan Raup Rosenblatt  
Full task description: July - December 1962

Authorized 10/1/62

Status: CONTINUED. Wesley L. Nicholson (Institute for Basic Standards Visiting Scientist) worked, in collaboration with David Hogben and Sally T. Peavy, on algorithm development and implementation for several new "resistive" procedures for data analysis. Effective exploratory data analysis requires statistical techniques that both (1) display and evaluate the agreement between observations and hypothesized theoretical representations and (2) call attention to the existence and nature of discordant observations. The name "resistive" is given to techniques that achieve a useful adjustment of observations in spite of the presence of outliers.

Substantial progress was made in the development of a high quality, portable computer program for the "stem and leaf" technique of exploratory data analysis. The stem and leaf diagram is similar to a histogram in that it displays the frequency distribution of a set of data, but it does more: the variation within intervals can be inspected, and selected order statistics are indicated. Thus the stem and leaf diagram is a technique for studying the frequency distribution of measurement data in order to formulate mathematical models and to evaluate "outlying" values, so that summary measures (average, standard deviation) can be correctly interpreted.

The "median polish" procedure is an alternative to the common technique for analysis of a two-way table by estimating row and column averages. An iterative adjustment is performed using row and column medians. David Hogben and Sally T. Peavy collaborated with Nicholson to develop a median polish subroutine and to examine the results obtained in analyses of several experiments.

The "BIWEIGHT" procedure was, like the two above, originally proposed by John W. Tukey (Princeton and Bell Labs). It represents a general approach to iterative adjustment of least squares fits using weights determined by the residuals (deviations of observations from trial fits). Nicholson investigated a version of BIWEIGHT advocated by David F. Andrews (Univ. of Toronto), along with other modifications of simple least squares, in application to X-ray crystal structure analyses. This work will be continued by Nicholson, in collaboration with Edward Prince (NBS Reactor Radiation Division) with applications to neutron diffraction crystal structure analysis.

#### Publications:

- (1) Tables of two-associate-class partially balanced designs. Willard H. Clatworthy (State Univ. of New York, Buffalo), with contributions by J. M. Cameron (Office of Measurement Services) and J. A. Speckman. NBS Applied Math. Series 63, May 1973.
- (2) Design and analysis of experiments. Mary G. Natrella. To appear as a chapter in the third edition of Quality Control Handbook (J. M. Juran, ed.).
- (3) The t-statistic for a double exponential distribution. Raymond C. Sansing. Submitted to a technical journal.
- (4) Some recent developments in linear least squares computations. Roy H. Wampler. To appear in Proc., Computer Science and Statistics: Sixth Annual Symposium on the Interface, Berkeley, California, October 16-17, 1972.

DEVELOPMENT OF "OMNITAB"

Task 20503-12-2050131  
6030-11

Origin and Sponsor: NBS  
Managers: David Hogben, Sally T. Peavy  
Full task description: July - December 1968

Authorized 11/1/68

Status: CONTINUED. OMNITAB II, which had been implemented under the Exec II operating system, was modified to be a processor under the Exec 8 operating system. The transition from Exec II to Exec 8 was remarkably smooth with virtually no disruption to the users. Continued development included the correction of minor errors and the modification of some subprograms so that they could be used independently of OMNITAB.

#### 4. STATISTICAL ENGINEERING SERVICES

##### COLLABORATION ON STATISTICAL ASPECTS OF

##### NBS RESEARCH AND TESTING

Task 13911-612050950/51-1  
9500-11

Origin: NBS

Authorized 7/1/50

Managers: H. H. Ku, J. R. Rosenblatt

Full task description: July - September 1950 issue, p. 60

Status: CONTINUED. This is a continuing project involving cooperation with other Bureau scientists on the statistical aspects of their investigations. These services vary from short (one-hour) sessions to extended collaborations involving several man-months; and are concerned primarily with statistical design of experiments, analysis and interpretation of data, and the use of computers in statistical analysis of data. Typical examples of services performed are the following.

W. L. Nicholson and H. H. Ku collaborated with B. N. Taylor (Absolute Electrical Measurements Section) in the analysis of U.S.S.R. measurements of the proton gyromagnetic ratio. There were 38 values of  $\gamma_p$  obtained between 1960-1968 using 12 different solenoid coils. The result of the analysis showed (1) there was one outlier that should be excluded from the data, (2) the between coil component was small compared to measurement errors, and (3) the apparent increasing trend with time was confounded with coils. Semi-weighted mean techniques were also used as an alternative method of analysis, and the random component of uncertainty was computed using several different models for comparison.

Harry Ku assisted Lucy Cavallo (Radioactivity Section) in the analysis of 100 ampules of Cs-137 to be used as nuclear fuel burn-up standards. The activities of these ampules, measured once in April and once in September of this year, can be certified either for individual ampule, or for the entire lot of 100 allowing for differences among ampules. Individual certification was recommended to assure the unbiasedness of the estimate of activity for each ampule; since there was evidence that the activity depends on weight and that the ampules differed in weight of contents.

David Hogben has assisted E. S. Newman (Materials Reference Laboratories Section) to improve his FORTRAN programs for analysis of laboratory test results for two kinds of asphalt (soils, aggregates and cements). The programs (over 5000 statements) are used five or six times every other month. A run may take over 15 minutes and produce over 2000 pages of output. Results are sent to state highway materials engineers. Programs print: ordered lists of tests results, Youden plots, statistical analyses and reports concerning agreement with precision statements in American Association of State Highway Officials (AASHO) and ASTM specifications.

James J. Filliben has been assisting Gilbert Ugiansky (Metallurgy Division, Corrosion Section) in the analysis of an ASTM interlaboratory stress corrosion testing program. The purpose of the program is to characterize and assess three proposed test procedures (instrumental configurations) to be used in stress corrosion testing of aluminum alloys containing copper. The test procedures in question are employed, for example, by the Air Force in the testing of aluminum to be used in aircraft construction.

The techniques utilized in the analysis were presented as a case study in data analysis in an Applied Mathematics Division Expository Seminar Series lecture on June 11. The conclusions of the analysis were presented to an ASTM test group in Philadelphia on June 25.

James J. Filliben has been collaborating with Emil Simiu (Center for Building Technology) in the analysis of daily maximum wind velocities for six cities: Washington (5 years worth), Miami (3 years), Great Falls, Montana (3 years), Denver (3 years), Chicago (10 years), and Trenton, New Jersey (5 years). Of ultimate interest is to be able to predict, from probabilistic considerations, the maximum wind velocity for a longer (20, 50, or 100 years) time period. On the basis of these predicted extremes, existing building and structure codes may be confirmed or modified accordingly.

Use of computerized probability plot procedures demonstrated that for all six cities, the daily maximum wind velocities closely followed a Weibull distribution with tail length parameter 2 (i.e., a Rayleigh distribution). Location and scale estimates for each individual city were also obtained. Estimates of the distribution of the maximum value for 20, 50, and 100 year periods were derived using both exact order statistic theory and asymptotic extreme value theory.

## NBS Boulder Laboratories

John F. LaBrecque and Peter V. Tryon have been participating actively in the planning, preliminary data analysis, and evaluation of several automated measurement systems in the Electromagnetics Division, in collaboration with E. L. Komarek and F. X. Ries (Circuit Standards Section) and W. Yates (Power-Current-Voltage Standards Section) and others. The activities can be divided into three areas: (1) initial experimentation, "feeling out" the Automatic Network Analyzer (ANA); (2) measurement evaluation, for calibration services and measurement assurance programs; (3) future improvements of the ANA, involving the interaction among hardware changes, mathematical models, and experiment design and analysis.

In the first two areas, substantial progress has been made in the study of measurements of the quantities: power, magnitude and phase of reflection coefficient, and attenuation. In each case the objective has been to study the nature of the random variation of the system through planned experimentation and components of variance analysis. The total variation among measurements has been separated into components due to connectors, tuning of the ANA, unexplainable (physically) day to day variation and short term error. Problem areas can then be isolated such as the following situation. For the impedance parameters the random component due to tuning proved to be serious. The tuning procedure is now roughly equivalent to fitting a circle to only 3 points in the x, y plane. Tryon and LaBrecque suggested that an improvement could be made by taking additional measurements following a designed experiment and using non-linear least squares analysis to fit the circle. They are assisting with the development and evaluation of software for the ANA to implement this.

Peter V. Tryon and John F. LaBrecque have been developing innovative approaches to the teaching of statistics for scientific and engineering laboratory staff members.

Tryon has been teaching a two-semester University of Colorado course, Statistical Methods in Research, making extensive use of OMNITAB as a teaching tool, for example in the presentation of analysis of variance with emphasis on concepts and interpretation instead of algebraic and arithmetic drudgery. The second semester, dealing with regression methods, has led to a cooperative investigation of a variety of least squares computer programs now in use at the Boulder laboratories.

A seminar series on "the evaluation of measurement processes" has attracted approximately 20 participants organized into four discussion groups, two groups meeting with Tryon and two meeting with LaBrecque. Using John Mandel's "The Statistical Analysis of Experimental Data" as a text, the groups are also working with examples drawn from NBS work and using the OMNITAB computing system.

STATISTICAL SERVICES

Task 20503-40-2050132/58-346  
5040-11

Origin: Various Agencies

Authorized 3/31/58

Sponsor: NBS

Manager: J. R. Rosenblatt

Full task description: January - March 1958 issue, p. 45

Status: CONTINUED. This is a continuing project which involves providing, upon request, statistical services to other governmental agencies, universities, industrial organizations, and other non-governmental agencies. Approximately 40 such requests are handled per month ranging from short conferences to collaboration involving several days work.

The Department of Commerce, Office of Telecommunications sought help in preparing to monitor the effect of a telephone rate structure change made in Colorado in October 1972. (The method for charging for installation service has been changed from flat rate to actual cost.) Using data on the number of telephones installed each month from January 1967 to September 1972, Peter V. Tryon developed a prediction model from which one can calculate the number of telephone installations that would be expected to occur under the old rate structure. In supplementary studies, similar prediction models were developed for other variables, and the use of economic variables to improve projections of annual growth was investigated.

## 5. OTHER ACTIVITIES

### RESEARCH IN NUMERICAL ANALYSIS AND RELATED FIELDS

Task 20501-12-2050110/55-55

1540-11

Origin: NBS  
Manager: Morris Newman  
Full task description: July - September 1954 issue, p. 1

Authorized 8/29/54

Status: CONTINUED. A survey of programs for computing the inverse of a matrix was undertaken by K.E. Fitzgerald, at the suggestion of M. Newman. The programs were compared primarily on the basis of execution time and accuracy. Accuracy estimates were included, and several of the programs using "iterative refinement" were tested both with and without this option. It appears that for matrices of small order (say at most 50) improvement procedures are worthwhile, but for matrices of large order (say more than 100) their use is not always justified. Two other points emerged: the need for some kind of error estimate in the output of any good inversion program, and the superiority of  $N(AB)$  over  $N(A)N(B)$  [here  $N(A)$  is some norm of the matrix(A)] in computing error estimates involving matrices.

Improved versions of the multi-length euclidean algorithm and the multi-length quotient and remainder algorithm were written by M. Newman and incorporated into his program for the exact solution of linear systems of equations. One of the versions of this program now produces the solution as quotients of relatively prime integers, and does so in a moderate amount of time. Thus for a typical system of 50 equations in 50 unknowns the running time is approximately 30 seconds on the UNIVAC 1108 computer.

M. Newman has prepared programs for arbitrary precision computation with decimals and with integers. A program to compute the exponential function to any number of decimals was written and has been thoroughly checked out. A program to compute the invariant factors and elementary divisors of an integral matrix using arbitrary precision integer arithmetic is in process of being written.

M. Newman has proved that if  $a_1, a_2, \dots, a_n$  are elements of a principal ideal ring  $R$  such that  $(a_1, a_2, \dots, a_n) = 1$ , and if  $n \geq 3$ , then the row  $(a_1, a_2, \dots, a_n)$  may be completed to a symmetric matrix of  $SL(n, R)$ . As a consequence of this result it is shown that if  $R$  is a field, then every element of  $SL(n, R)$  is the product of a fixed number of symmetric matrices of  $SL(n, R)$  except when  $n = 2$ ,  $R = GF(3)$ , which is a genuine exception.

M. Newman also showed that if  $A$  is an integral matrix such that  $A \equiv A^T \pmod{m}$  and  $\det A \equiv 1 \pmod{m}$ , where  $m$  is odd, then there is an integral matrix  $B$  such that  $B$  is symmetric,  $\det B = 1$ , and  $B \equiv A \pmod{m}$ . The result is false if  $m$  is even.

M. Newman and M. Sheingorn have studied a class of functional equations and have proved that they possess non-trivial continuous solutions. A key result is the following: Let  $a_1, a_2, \dots, a_n$  be distinct real numbers. Then the entire function  $\sum_{k=1}^n e^{a_k z}$  always has a zero, provided  $n \geq 2$ .

M. Newman has shown that if  $M = \begin{bmatrix} A & B \\ 0 & C \end{bmatrix}$  is a partitioned matrix over a principal ideal ring  $R$ ,

and if  $(\det A, \det C) = 1$ , then the invariant factors of  $M$  are the same as the invariant factors

of  $\begin{bmatrix} A & 0 \\ 0 & C \end{bmatrix}$ ; i.e. the matrix  $B$  contributes nothing to the Smith normal form of  $M$ . This is a useful computational result.

M. Newman has initiated work on the group generated by  $\begin{pmatrix} 1 & \zeta \\ 0 & 1 \end{pmatrix}, \begin{pmatrix} 1 & 0 \\ \zeta & 1 \end{pmatrix}$ , where  $\zeta$  is a root of unity. He conjectures that this group is never free, and has proved this conjecture in two cases; namely, when  $\zeta$  is a  $2^n$  th root of unity, and when  $\zeta$  is a  $p$ th root of unity, where  $p$  is a prime having  $2$  as a primitive root.

The posthumous book "Topics in Analytic Number Theory" by H. Rademacher, which was edited by M. Newman, J. Lehner, and E. Grosswald, has now appeared as a Springer publication in their "Ergebnisse" series.

C.R. Johnson continued his work on a number of matrix theory and related problems. These primarily involved eigenvalues and the inertia of matrix products. He showed that all powers of a square matrix  $A$  have positive definite hermitian part if and only if  $A$  is positive definite hermitian. Also related to investigating powers of matrices, Johnson and Newman showed that there is essentially only one exception to the following statement: let  $\alpha, \beta, \gamma$  be distinct complex numbers of unit modulus; then there is a positive integer  $m$  such that  $0$  is in the convex hull of  $\alpha^m, \beta^m, \gamma^m$ . With C.S. Ballantine (Oregon State University), Johnson completed classifying the set products of certain positivity classes. Continuing his investigation of D-Stability, Johnson provided parallel necessary and sufficient conditions involving real and complex quadratic forms respectively. For the field of values of a matrix he gave an inclusion set computable directly from the entries. For tree graphs Johnson also showed how to label the nodes to attain minimum edge difference. This is an initial case of a problem arising in simplifying the computation of the finite-element method of structure analysis.

TOTAL ENERGY SYSTEMS DATA ANALYSIS

Task 2020595

Origin: NBS (Division 462)  
Sponsor: HUD  
Manager: Russell A. Kirsch

Status: NEW. A residential community under construction in New Jersey generates its own energy. Instrumentation supplied by NBS monitors energy generation, distribution and consumption as well as energy-related parameters like temperatures, pressures and flow rates. We are assisting the Center for Building Technology in the task of planning the data acquisition system, designing editing procedures and programs for producing archival records, and analyzing the data to determine trends in the performance of the total energy system. When the system goes into operation (estimated in early '74) the fine structure of the behavior of all energy parameters sampled every 5 minutes for a year on 300 variables will be analyzed. During the current period early planning efforts were the main involvement.

ARTIFICIAL INTELLIGENCE

Task 2050104

Origin: NBS  
Manager: Russell A. Kirsch

Status: NEW. The PDP-10 LISP Processing Language built at NBS (see project description for Task 2050404 Jan-June 1972, p. 14) is being used for the analysis of images obtained from Earth Resources Satellites. Image decomposition and reconstruction algorithms previously developed for biological purposes were used to analyze, reconstruct and spectrally classify a view of the NBS site from 925 km in space.

MATHEMATICAL AIDS

Task 20500-40-2050121/57-216

Origin and Sponsor: NBS  
Manager: I. A. Stegun  
Full task description: July-December 1964 issue, p. 4.

Status: CONTINUED. Consultations continued at the rate of about 10 per month with staff of NBS, other government agencies, industry and universities. Topics covered for the most part were approximations, computing techniques and pitfalls.

The 10th printing(corrected) of the Handbook of Mathematical Functions was released by the Government Printing Office , December 1972. The 7th printing(paperback) by Dover Publications, Inc. was also recently released. Questioned items are checked and an errata list is maintained covering all printings of the volume.

As a consequence of the consulting work and checking of the citation index, exploratory work was started on the evaluation of the sine, cosine and exponential integrals,  $Si(x)$ ,  $Ci(x)$  and  $Ei(x)$ . The numerical evaluation of more complicated integrals is frequently aided by expansions in terms of these functions. Recent applications have been found in the estimation of the characteristics of photochromic materials as a recording medium for phase holograms, investigations of radiation impedance of a long narrow rectangular baffled piston and spectrophotometric linearity testing using the double-aperture method. Limiting values, zeros, maxima and minima, practical bounds of various computing methods, pitfalls, critical values, etc., will all be discussed in a forthcoming paper. A many place radix table will also be supplied.

An automatic integration routine will be made generally available after undergoing further testing. It has been used thus far in connection with the evaluation of various special functions under study.

Publications: Handbook of Mathematical Functions, AMS 55, Tenth Printing (with corrections), December 1972.

Automatic Computing Methods for Special Functions. Part II. The Exponential Integral  $E_n(x)$ . Irene A. Stegun and Ruth Zucker. In process.

## Publication Activities

### 1.0 PUBLICATIONS THAT APPEARED DURING THIS PERIOD

#### 1.1 Tables

Tables of Two-Associate-Class Partially Balanced Designs. W. H. Clatworthy (SUNY, Buffalo), with J. M. Cameron (Office of Measurement Services) and J. A. Speckman. NBS Applied Mathematics Series 63, May 1973.

#### 1.2 Manuals

A User's Guide to the OMNITAB Command "STATISTICAL ANALYSIS". H. H. Ku. NBS Technical Note 756, March 1973.

#### 1.3 Technical Papers

Matroid Designs. J. Edmonds and Peyton Young (CUNY). J. of Research NBS 77B(1973), 15-45.

Comments on the Paper "Treatment of Null Responses" by Genevieve L. Meyer and Ronald L. Johnson. James J. Filliben. Proc. 17th Conf. on the Design of Experiments in Army Research, Development and Testing, Walter Reed Army Medical Center, 27-29 October 1971, Report No. 72-2, U. S. Army Research Office - Durham, September 1972, pages 397-402.

Confidence Limits for the Abscissa of Intersection of Two Linear Regressions. James J. Filliben and John E. McKinney (Rheology Section). J. of Research NBS 76B (1972), 179-192.

Product Solutions and Separation of Variables. A. J. Goldman. J. of Research NBS 76B (1972), 201-204.

Scheduling a Time-Shared Server to Minimize Aggregate Delay. A. J. Goldman. J. of Research NBS 76B (1972), 109-117.

Material Variability as Measured by Low Temperature Electrical Restivity. Alan F. Clark (Cryogenics Division) and Peter V. Tryon. Cryogenics, Vol. 12 (1972), 451-461.

On the Eigenvalues of  $A + B$  and  $AB$ . H. Wielandt. Edited by C. C. Johnson. J. of Research NBS 77B (1973), 61-63.

#### 1.4 Reviews and Notes

Minimizing Average Flow Time with Parallel Machines. W. A. Horn. Operations Research, 21 (1973), 846-847.

#### 1.5 Books

Handbook of Mathematical Functions, AMS 55, Tenth Printing (with corrections), December 1972.

#### 1.8 Technical Notes

A Performance Comparison of Labelling Algorithms for Calculating Shortest Path Trees. J. Gilsinn and C. Witzgall. NBS Technical Note 772(3/73).

### 2.0 MANUSCRIPTS IN THE PROCESS OF PUBLICATION

#### 2.2 Manuals

Design and Analysis of Experiments. Mary G. Natrella. To appear as a chapter in the third edition of Quality Control Handbook (J. M. Juran, ed.).

#### 2.3 Technical Papers

Comparison of Some FORTRAN Programs for Matrix Inversion. K. E. Fitzgerald. To appear in J. of Research NBS, Section B.

Gersgorin Sets and the Field of Values. C. R. Johnson. To appear in J. Math. Anal. and Appl.

A Note on Matrix Solutions to  $A = XY - YX$ . C. R. Johnson. To appear in Proc. Amer. Math. Soc.

A Lyapunov Theorem for Angular Cones. C. R. Johnson. To appear in the J. of Research NBS, Section B.
