# MICROCOMPUTER-BASED SOFTWARE FOR MANAGEMENT OF CALIBRATION SERVICE

William E. Anderson

## Abstract

The majority of the calibration customers' concerns are directed not to the technical details of the calibration service but to the timely delivery of that service. It is therefore proper that the calibration services be closely managed. For a Group or Division with a large calibration load, this can be a difficult task. The Applied Electrical Measurements Group of the Electrosystems Division has developed microcomputer-based software to provide considerable assistance to the calibration manager. With this database software, complete information on the status of all the calibration jobs is instantly available.

Key words: calibration management; calibrations; database management; microcomputer; software

## 1. INTRODUCTION

In order to provide adequate service to calibration clients, good management must be exercised at the Group and/or Division level. Most complaints concerning a calibration service are not directed to the technical aspects of the service but more often to the timely delivery of the service. Therefore, it would be of considerable value if complete information as to the status of each calibration job were instantly accessible.

In the past, the Applied Electrical Measurements Group of the Electrosystems Division kept a calibration log book. The arrival of purchase orders, test folders, and equipment prompted an entry into the log book. Also entered were the device type, closing date and fees. While most of the information necessary to maintain a calibration service was contained in the log, retrieval of the information in real time was not always possible. The requests for additional fiscal and statistical information (e.g., the income per quarter from a specific calibration service), sometimes required excessive amount of time for response.

With the advent of microprocessor-based workstations and commercially available database software, vast improvements could be made in providing the information without a significant expenditure in resources. Such a system was developed in the Electrosystems Division and has been in use for the past six months. The system has been able to meet all demands on it and also has served as a means for checking the accuracy of the centralized accounting system. Further, the availability of accurate information on the current financial status of the calibration service permits better planning decisions to be made.

## 2. DESCRIPTION OF SOFTWARE

Relational database software is readily available for both 8 and 16-bit microcomputers. The database management system, dBase II [1], from Ashton-Tate was selected because it was the only such software available at that time which

could be used on all the computers anticipated to be used by the Group. A similar calibration management program could be designed using database management software from other vendors.

While dBase II provides the command structure to create and manipulate databases, the user must provide the programs (in dBase II's language) to tailor the software to the user's needs. (A listing of the various programs along with sample output is provided in the appendix). In order to make it possible for this calibration management software to be used without any knowledge of dBase II, the software was written to be menu-driven. Assuming the operator has turned on the computer, loaded in the operating system, and that the programs and database reside on the default disk drive, entering 'dbase menu' should provide the following onscreen menu:

NUMBER OF RECORDS IS ---

CALIBRATION FILE MENU

- 0 - EXIT
- 1 - ENTER NEW RECORD
- 2 - AMEND OR CHECK CONTENTS OF DATABASE RECORD
- 3 - PRINT LIMITED
- 4 - PRINT ALL
- 5 - PRINT ACTIVE
- 6 - PRINT LATE JOBS
- 7 - PRINT BY DEVICE
- 8 - PRINT BY CUSTOMER
- 9 - DISPLAY ACTIVE
- A - COPY DATABASE

ENTER DESIRED ACTION

WAITING

Menu choices '1' and '2' provide the user a method for changing the contents of a database record. The program is designed in such a way that each record corresponds to one instrument received for calibration. (For multiple instruments attached to the same test folder, suffixes A,B,C, etc. are concatenated to the test number). Each record consists of the following fourteen fields: test number, purchase order number, type of instrument, model name and number, serial number, staff member assigned to calibration, customer's name, customer's city and state (and zip code), starting date for job, promised date, finishing date, form letter information, number of manhours, and cost (excluding OPMS surcharges). While the contents of most of these fields may be apparent, the intended contents of the form letter information field may need explaining. It is the policy of the Electrosystems Division to keep its customers informed as to the status of their calibration job with the use of form letters. For example, if a purchase order is received with no instrument, the customer is so notified. The customer always receives at least one form letter with the estimated cost of the calibration and the date the job should be finished. The form letter information field is 50 characters wide, permitting the entry of the dates the form letters have been sent out and, if necessary, a one or two letter code describing the form letter contents. The menu choices allow either modification of the database or output of information contained in the database to the user. Each of the choices is explained below.

0 - EXIT Menu choice '0' causes the program to terminate and exit to the operating system (DOS or CPM). It is important that the user select this choice before removing the diskettes or turning off the computer as this selection also guarantees that the actual database file is properly updated from memory.

1 - ENTER NEW RECORD Menu choice '1' allows the user to enter initial information concerning a calibration job. The user is prompted on each data entry. The day's date is automatically entered as the job start data. In the cases where the test number is not known, a temporary number should be assigned in order to facilitate fast retrieval of the record.

2 - AMEND OR CHECK CONTENTS OF DATABASE RECORD Menu choice '2' allows the user to observe or update the information in the database as the work progresses. If the user selects menu choice '2', the user will be prompted to give either the test number or purchase order number of the record to be updated or checked. Since the database is indexed on test numbers, a typical search for a test number takes less than 2 seconds.

3 - PRINT LIMITED Menu choice '3' provides the user a means of getting a partial listing on the system printer of the database contents. The fields printed are the test number, type of instrument, customer name, job closing date, and cost. The total cost or income is also listed. The listing is in order of test numbers.

4 - PRINT ALL Menu choice '4' results in a more complete listing of the database contents than choice '3.' Specifically all the fields are printed out except the purchase order, staff member, and form letter information fields. The information is printed in compressed print (132 characters per line on the IBM printer). The total cost or income along with the manhours are also listed. Users can get hardcopy access to the three missing fields by exercising choice '2' and a print screen command if their computer supports it.

5 - PRINT ACTIVE Menu choice '5' permits the user to receive a hardcopy listing of all the active jobs. Basically the database is searched for all records without a closing date entry. This enables the user to check the active jobs against the OPMS monthly statement of active jobs.

6 - PRINT LATE JOBS Menu choice '6' causes the database to be searched for all records in which the promised date comes before the present date and there is no closing date entry. These jobs demand immediate attention, normally in the form of a letter to the customers informing them of a revised promised date.

7 - PRINT BY DEVICE Menu choice '7' provides the user with a hardcopy summary of all the jobs to date of a particular type of instrument (e.g., voltage transformers). The summary also includes the total income earned for that type of instrument and the calibration manhours expended.

8 - PRINT BY CUSTOMER Menu choice '8' yields a hardcopy listing of the jobs done or in progress for a particular customer. The total cost to that customer is also presented. If a customer calls concerning a calibration, this command may be the quickest way to find the corresponding record if the test or purchase order number are not available.

9 - DISPLAY ACTIVE Menu choice '9' is identical to choice '5' except the output is to the display screen and not the printer.

A - COPY DATABASE Menu choice 'A' permits the user to copy the database onto another floppy diskette to serve as backup. It is assumed that the default drive is the "A" drive and contains the database programs and the database. A formatted diskette must be placed in drive "B" before selecting this menu choice. Experience has shown two problems with this menu choice. The first is that the duplication process is relatively slow in dBase II. The second is that if an error occurs during the duplication process, one often ends up in the operating system. This could result in the database not being updated since a proper exit from dBase II has not taken place. This command has been left on the display screen as a reminder to the user to backup the database. The best way to do this, however, is exiting via menu choice '0' and copying the database file in the operating system, using operating system commands.

The above choices represent only a small fraction of the useful information contained in the database. Unfortunately, the more choices presented on the menu, the more cluttered the screen becomes. A programmer with some familiarity with dBase II can extract a myriad of useful information from the database. For example, if there is a need to know the number and income derived from watt-hour standards calibrated in the third quarter from state governments, that information can be extracted readily from the database. Also, it is possible to modify the menu choices to better meet the needs of a particular group of users.

The software system described has a great amount of flexibility. If it becomes apparent that additional fields of information need to be saved in the database, they can be added. For example, in the future it may be important to keep track of when and if an instrument has been calibrated by the National Bureau of Standards previously. Also, field sizes can be modified. If it is found that 50 characters do not provide enough space to accommodate the form letter information, the field can be expanded. The information contained in the database can be communicated to files used by word processors or to other computers. The software is portable in the sense that although it was developed on the IBM PC [1], it runs perfectly on the 8-bit storeroom microcomputer after modification of three program lines.

---

[1] Certain commercial hardware and software are identified in this report in order to specify the procedure used to manage the calibration data. Such identification does not imply recommendation or endorsement by the National Bureau of Standards nor does it imply that the items identified are necessarily the best available for the purpose.

### 3. SUMMARY

We have developed a microcomputer-based software system for the management of a calibration service at the Group or Division level. The system has been designed for user "friendliness." A Group secretary has demonstrated total success in using the software. The software has provided Group and Division management with information on the status of calibrations far superior to that currently available from other sources. It has allowed the Group to make better estimates of the financial status concerning our calibration services. In fact, it is a likely case that this software itself has justified the investments the Group has made in the procurement of the microprocessor workstations.

## APPENDIX A

The microcomputer-based software for the management of a calibration service is presented. The software was written to be used on an IBM PC or XT using dBase II version 2.4. A slight modification will be presented that enables the software to be run on the 8-bit storeroom microcomputer. Comments are not encouraged in dBase II in the sense that they must be on a separate program line. Variable names have been chosen, however, that should help in understanding the programs.

Listing A is the program entitled 'menu.' It can be run from the operating system by typing 'dbase menu' or from dBase II by typing 'do menu.' This program causes the menu shown in display A to appear on the screen. Users not having a color monitor and users of the 8-bit storeroom microcomputer should delete the second line (SET COLOR TO 4.2). The database in this listing has the file name CALFY83. The software is designed so that a new database should be used each fiscal year.

Selection of menu choice '1' causes the program 'NEWRC'D' (listing B) to be called. Display B shows the resulting screen display. The user is prompted for each of the possible fields of data entry.

Selection of menu choice '2' calls the program 'AMERCD' (listing C). The user is requested to enter either the test number or purchase order number so the software can find the record to be modified or checked. The resulting display is shown in display C.

Selection of menu choice '3' calls the program 'PRINTLIM' (listing D). This listing also includes the report format to be used for the printout. (M=1 sets the lefthand margin, N results in no page heading, N results in a single-spaced report, Y allows numerical totalling, and N disallows subtotalling). A page of the resulting printout is shown in printout D.

Selection of menu choice '4' calls the program 'PRINTALL' (listing E). The second line of the program tells the IBM printer to use compressed type. For the Prism printer used with the storeroom microcomputer, this line should be changed from 'chr(15)' to 'chr(31).' A page of the resulting printout is shown in printout E.

Selection of menu choice '5' calls the program 'PRINTACT' (listing F). A sample of the printout is shown in printout F.

Selection of menu choice '6' calls the program 'PRINTDEL' (listing G). A sample of the printout is shown in printout G.

Selection of menu choice '7' calls the program 'PRINTDEV' (listing H). The user is prompted to enter the type of calibration instrument. A sample of the printout is shown in printout H.

Selection of menu choice '7' calls for the program 'PRINTCUS' (listing I). The user is prompted to enter the customer's name. The second line of the program tells the IBM printer to use compressed type. For the Prism printer used with the storeroom microcomputer, this line should be changed from 'chr(15)' to 'chr(31).' A sample of the printout is shown in printout I.

Selection of menu choice '9' calls the program 'DISPACT' (listing J). This menu choice is identical to choice '5' except the output is to the screen and not the printer. The report format for this program 'PRINTACT' is shown in listing F.

Selection of menu choice 'A' calls the program 'DUP' (listing K). As mentioned in the main text, this command should only be used on a machine known to have two well-running disk drives.

U.S. DEPT. OF COMM. <b>BIBLIOGRAPHIC DATA SHEET</b> (See instructions)	1. PUBLICATION OR REPORT NO. NBSIR 84-2863	2. Performing Organ. Report No.	3. Publication Date April 1984
4. TITLE AND SUBTITLE  MICROCOMPUTER-BASED SOFTWARE FOR MANAGEMENT OF CALIBRATION SERVICE			
5. AUTHOR(S) William E. Anderson			
6. PERFORMING ORGANIZATION (If joint or other than NBS, see instructions)  NATIONAL BUREAU OF STANDARDS DEPARTMENT OF COMMERCE WASHINGTON, D.C. 20234		7. Contract/Grant No.  8. Type of Report & Period Covered	
9. SPONSORING ORGANIZATION NAME AND COMPLETE ADDRESS (Street, City, State, ZIP)			
10. SUPPLEMENTARY NOTES  <input type="checkbox"/> Document describes a computer program: SF-185, FIPS Software Summary, is attached.			
11. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here)  <p style="text-align: center;">The majority of the calibration customers' concerns are directed not to the technical details of the calibration service but to the timely delivery of that service. It is therefore proper that the calibration services be closely managed. For a Group or Division with a large calibration load, this can be a difficult task. The Applied Electrical Measurements Group of the Electrosystems Division has developed microcomputer-based software to provide considerable assistance to the calibration manager. With this database software, complete information on the status of all the calibration jobs is instantly available.</p>			
12. KEY WORDS (Six to twelve entries; alphabetical order; capitalize only proper names; and separate key words by semicolons) calibration management; calibrations; database management; microcomputer; software			
13. AVAILABILITY  <input type="checkbox"/> Unlimited <input checked="" type="checkbox"/> For Official Distribution.
