ABSTRACT

This report is a programmer's manual for a microcomputer package which was designed by the National Bureau of Standards to assist the Internal Revenue Service in choosing locations for its posts-of-duty which will minimize costs to the IRS and to the taxpayer. The package was written in two sections of code, one in FORTRAN and the other in PASCAL. This manual describes the FORTRAN driver which handles graphics displays and controls input and output for the solution procedure.

Keywords: facility location, interactive graphics, personal computer, microcomputer, Graphical Kernel System (GKS)

Section I: Introduction

The Internal Revenue Service Post-of-Duty Location System is a microcomputer package designed to assist IRS district planners in choosing locations for posts-of-duty (POD's) which will minimize costs to the IRS and to the taxpayer. The package uses color graphics in performing tasks such as displaying maps of workload, setting user options to initialize location problems, and displaying solutions to location problems.

This manual is one of a series of reports documenting the POD location system. The reports in the series are as follows.

1) The Internal Revenue Service Post-of-Duty Location Modeling System: Final Report

This report describes the post-of-duty location problem and its mathematical model. It discusses the types of data which are considered in calculating costs, describes the methods used to solve the location problem, and gives a brief introduction to the computer implementation of the model. (NBS Contact: Richard H. F. Jackson)

This report is a user's guide for the post-of-duty location computer system. It gives hardware and software requirements, instructions for installing the system, descriptions of data files, and detailed instructions for operating the system. (NBS Contact: Marjorie A. McClain)

The post-of-duty location program is written in two sections of code, one in FORTRAN and the other in PASCAL. This report describes the FORTRAN driver which handles graphics displays and controls input and output for the solution procedure. The report includes an alphabetical list of the FORTRAN routines, describing the purpose, the calling sequence and the variables of each routine. (NBS Contact: Marjorie A. McClain)

This report describes the second part of the post-of-duty location program, the PASCAL solver. It discusses the algorithms and data structures used to solve a location problem. (NBS Contact: Paul D. Dornich)
It is assumed that the reader of this programmer’s manual is thoroughly familiar with IBM-PC DOS, with the FORTRAN language, and with the POD location system User’s Manual.

Note: Reference to a tradename or product in this report does not imply endorsement by the National Bureau of Standards.
Section II: **Software Requirements**

The following software is required to be able to use and make changes to the POD location system programs.

1) IBM-PC DOS (Version 2.1 or later)
2) IBM Professional FORTRAN (Version 1.00)
3) Turbo PASCAL (Turbo-87 Version 3.0)
4) IBM Graphical Kernel System (Version 1.00) (GKS includes the Virtual Device Interface and device drivers. See the User's Manual for information on how to set up the device drivers in the AUTOEXEC.BAT and CONFIG.SYS files.)
5) Source code for the POD location system, contained in the following files.
   Data File Initialization Programs --
   TEMPZIP.BAS
   UNFORM.FOR
   SAVCEN.FOR
   TEMPSTE.BAS
   BINSTE.FOR
   System Driver Programs --
   LOCATE.BAT
   DRIVER.FOR
   IRS.FOR
   GKSUTIL.FOR
   System Solver Programs --
   SOLVER.PAS
   INIT.PAS
   DSTRUCT.PAS
   GREEDY.PAS
   INTCHG.PAS
   PODCLR.PAS
   FIVCLR.PAS
6) Executable code for the POD location system, contained in the following files.
   Data File Initialization Programs --
   TEMPZIP.BAS
   UNFORM.EXE
   SAVCEN.EXE
   TEMPSTE.BAS
   BINSTE.EXE
   System Driver Programs --
   LOCATE.BAT
   DRIVER.EXE
   System Solver Program --
   SOLVER.COM

Only a subset of this software is required for a user who just wants to run the system and not make any changes to it. See the User's Manual for user software requirements and also for general hardware requirements.
Section III: Description of Data File Initialization Programs

The POD location system requires the use of zip code boundary coordinates obtained from a commercial vendor. This data must be processed when the system is first installed to convert it to a useable format. The following program files are used in the initialization process.

1) TEMPZIP.BAS

This BASIC program reads a zip code boundary file from floppy disks and writes it onto a fixed disk. In the process, labels are removed and end-of-record marks are added to make the file readable by a FORTRAN program.

2) UNFORM.FOR

This FORTRAN program reads the file created by TEMPZIP.BAS and converts it to an unformatted direct access file. This is done to allow faster data accessing.

3) SAVCEN.FOR

This FORTRAN program calculates the centroid of each zip code by taking a weighted average of its boundary points. The centroids are stored in an unformatted direct access file which also contains five-digit zip code names and pointers to each zip code in the boundary file.

4) TEMPSTE.BAS

This BASIC program reads a state boundary coordinate file from a floppy disk and writes it onto a fixed disk. End-of-record marks are added.

5) BINSTE.FOR

This FORTRAN program reads the file created by TEMPSTE.BAS and converts it to an unformatted direct access file. Also, the state boundary coordinates are transformed to be in the same units as the zip code boundary coordinates.

Note: These coordinate files will eventually be replaced by files from another vendor, so the initialization programs will be completely rewritten.
Section IV: Overview of System Programs

The POD location system is written in two separate sections of code. One section is written in FORTRAN and contains the code for drawing maps and initializing location problems. It allows the user to display workload, set up a location problem, and display the solution. The second section is written in PASCAL and contains the code for solving a location problem. Data is passed between the two sections of code by the use of files.

A batch file called LOCATE.BAT controls the flow of execution between the two sections of code. LOCATE.BAT first checks to see if files called ERRORS.GKS and EXITFILE.BAT exist from a previous run. If so, it erases them. Then LOCATE.BAT enters a loop which passes control between the FORTRAN section (stored in DRIVER.EXE) and the PASCAL section (stored in SOLVER.COM). DRIVER is always entered first. Then, depending on actions taken by the user, either SOLVER is entered or an exit is taken from the loop. In the first case, after SOLVER has completed, control returns to DRIVER and the loop repeats. In the second case, a file called EXITFILE.BAT is created by DRIVER. It contains instructions for deleting work files created during the run. This new batch file is executed, and then LOCATE.BAT terminates.

The FORTRAN source code is contained in three files: DRIVER.FOR, IRS.FOR and GKSUTIL.FOR. DRIVER.FOR contains the main program DRIVER along with most of the high-level subroutines. IRS.FOR contains mostly intermediate-level subroutines for drawing menus and maps. GKSUTIL.FOR contains low-level subroutines for working with GKS. A complete description of each subroutine is given in Section V.

If a change is made in a subroutine, it must be recompiled by typing "PROFORT filename", where "filename" is the name of the source code file containing the subroutine. Then the program must be relinked by typing "LINK DRIVER IRS GKSUTIL /GKS\PFGKS, /PROFORT\PROFORT \GKS\GKS\GKS\PFGKS /S:5000 /X:350". (This assumes that DRIVER.OBJ, IRS.OBJ and GKSUTIL.OBJ are stored in the current directory, Professional FORTRAN files are in a directory called \PROFORT and GKS files are in a directory called \GKS. These path names may be changed.) The result is a new executable file called DRIVER.EXE.

The PASCAL solver routines are described in "The Internal Revenue Service Post-of-Duty Location Modeling System: Programmer's Manual for PASCAL Solver".
Section V: Description of FORTRAN Routines

This section contains brief descriptions of each of the FORTRAN routines. Information is provided on the purpose of the routine, the name of the file containing its source code, names of input and output variables, and names of programs called by the routine and programs which call it. The routines are listed in alphabetical order.

SUBROUTINE BEEP:

This subroutine beeps the speaker.

Source Code Location --
GKSUTIL.FOR

Programs Called --
None

Calling Programs --
STEMAP
ZIPMAP

SUBROUTINE BORDER(XMIN,XMAX,YMIN,YMAX):

This subroutine draws a border around the current screen window. The provided window limits are slightly reduced before the border is drawn; otherwise some sides of the border may not appear because of roundoff error in the conversion from world coordinates to screen coordinates. (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variables --
XMIN: REAL*4
Smallest x value of world coordinates
XMAX: REAL*4
Largest x value of world coordinates
YMIN: REAL*4
Smallest y value of world coordinates
YMAX: REAL*4
Largest y value of world coordinates

Programs Called --
BOX
GSPLCI

Calling Programs --
ERSMNU
SUBROUTINE BOX(XMIN,XMAX,YMIN,YMAX):

This subroutine draws a box. (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variables --
XMIN: REAL*4
  X coordinate of lower left corner (in world coordinates)
XMAX: REAL*4
  X coordinate of upper right corner (in world coordinates)
YMIN: REAL*4
  Y coordinate of lower left corner (in world coordinates)
YMAX: REAL*4
  Y coordinate of upper right corner (in world coordinates)

Program Called --
GPL

Calling Programs --
BORDER
MENU20
MENU21
MENU23

SUBROUTINE CENSRT(IERR,STATE,MAXM,M,XCENT,YCENT,INDEX,PNT,ZIP5):

This subroutine reads the centroid file STATEXX.CEN and calls a heapsort program to sort the centroids according to increasing x and y coordinates. (This is done to speed up the process of searching for zip codes on a map. It also speeds up the drawing of maps.) Arrays are set up to store the following information from the file: centroids, pointers to the zip code boundary file, zip code index numbers, and five-digit zip code names. This subroutine is executed whenever the program DRIVER is entered.

Source Code Location --
IRS.FOR

Input Variables --
STATE: CHARACTER*2  
State code number
MAXM: INTEGER*4  
Maximum number of zip codes allowed

Output Variables --
IERR: INTEGER*4  
Error flag --
IERR=0 for normal return
IERR=1 if an error was encountered
M: INTEGER*4  
Number of zip codes
XCENT(M): REAL*4  
Array containing x coordinates of centroids, sorted according to increasing x and y
YCENT(M): REAL*4  
Array containing y coordinates of centroids, sorted according to increasing x and y
INDEX(M): INTEGER*2  
Zip code index array --
INDEX(I) is the original index of the zip code with centroid (XCENT(I),YCENT(I)) before sorting
PNT(M): INTEGER*2  
Pointer array --
PNT(I) points to the beginning of information on the zip code with centroid (XCENT(I),YCENT(I)) in the zip code boundary file
ZIP5(M): INTEGER*4  
Array of five-digit zip codes, in original sequential order

Program Called --
SORT

Calling Program --
DRIVER

SUBROUTINE CHOICE(WKID, CHDNR):
This subroutine initializes choice mode (function keys). To use the function keys, call GRQCH ("REQUEST CHOICE"). (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variable --
WKID: INTEGER*2  
Workstation identifier

Output Variable --
CHDNR: INTEGER*2  
Choice device number
Program Called --
GSCHM

Calling Programs --

FUNCTION COSTFN(IMFFNC,WRK,IRSWT,IRSFCT,TXPWT,TXPFCT,MILCST,
  TRVDIF,DIST,SQFCST,SQFT):

This function calculates the cost of assigning a zip code to a POD site.
The cost is made up of travel costs and office space costs. Travel costs
are based on the Individual Master File (IMF) workload generated by the zip
code, its distance from the POD site, and the cost per mile. (Business
Master File (BMF) data is not yet available.) However, the cost may be
weighted by several user-supplied factors. Office space costs are based on
the number of IMF returns generated by the zip code and the rental cost per
square foot for office space at the POD site. (Warning: Office space costs
are currently being computed incorrectly, since the required data is not yet
available. The number of IMF returns examined is being used in place of the
total number of IMF returns.) For further information on how costs are
computed, see "The Internal Revenue Service Post-of-Duty Location Modeling
System: Final Report".
Source Code Location -- DRIVER.FOR

Input Variables --
IMFFNC(4): INTEGER*4
   Array indicating which IRS functions are to be included in
   the cost calculation for IMF data --
   IMFFNC(1): Examination
   IMFFNC(2): Collection
   IMFFNC(3): Taxpayer Service
   IMFFNC(4): Criminal Investigation

WRK(16): INTEGER*4
   Workload array for current zip code

IRSWT: REAL*4
   Weight (between 0 and 1) to be assigned to IRS travel costs

IRSFCT(16): REAL*4
   Array of IRS trip factors

TXPWT: REAL*4
   Weight (between 0 and 1) to be assigned to taxpayer travel costs

TXPFCT(16): REAL*4
   Array of taxpayer trip factors

MILCST: REAL*4
   Mileage cost ($/mile)

TRVDIF: REAL*4
   Travel difficulty factor for trips between current zip code
   and current POD site

DIST: REAL*4
   Distance between current zip code and current POD site
   (miles)

SQFCST: REAL*4
   Office space cost for current POD site
   ($/square foot/month)

SQFT: REAL*4
   Office space required per IMF return (square feet)

Output Variable --
COSTFN: REAL*8
   Cost of assigning current zip code to current POD site ($)

Programs Called --
None

Calling Program --
SOLVE

SUBROUTINE CRSBOX(WKID, TRN, STAT, XMIN, XMAX, YMIN, YMAX):

This subroutine creates a cursor box. To use the cursor, first move the
crosshair cursor to one corner of the desired box and enter this point.
Then a rectangular cursor will appear which can be used to enter the
opposite corner of the box. (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variables --
WKID: INTEGER*2
  Workstation identifier
TRN: INTEGER*2
  Transformation number

Output Variables --
STAT: INTEGER*2
  Cursor status indicator
  STAT=0: error reading cursor location
  STAT=1: no errors encountered
XMIN: REAL*4
  X coordinate of lower left corner of box
XMAX: REAL*4
  X coordinate of upper right corner of box
YMIN: REAL*4
  Y coordinate of lower left corner of box
YMAX: REAL*4
  Y coordinate of upper right corner of box

Programs Called --
GINLC
GPREC
GQNT
GRQLC

Calling Program --
ZOOMIN

SUBROUTINE CURSOR(WKID, TRN, IPX, IPY):

This subroutine initializes a graphics cursor. To use the cursor, call GRQLC ("REQUEST LOCATOR"). (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variables --
WKID: INTEGER*2
  Workstation identifier
TRN: INTEGER*2
  Transformation number
IPX: REAL*4
  Initial x position of cursor in world coordinates
IPY: REAL*4
Initial y position of cursor in world coordinates

Programs Called --
GINLC
GPREC

Calling Program --
MAPKEY

SUBROUTINE DISPLY(IERR, STATE, PALETT, NCLRS, MENU, COLOR, MODIFY,
                   M, XCENT, YCENT, INDEX, PNT, ZIPCLR): 

This subroutine is the driver for displaying maps. It uses GKS to draw a
state map and then allows the user to zoom in or modify the colors on the
map. The following common block is required by GKS:

COMMON /GRACOM/SIZE, INTARY.

SIZE is an INTEGER*4 variable set equal to 2500, and INTARY is an INTEGER*4
array of length 2500.

Source Code Location --
IRS.FOR

Input Variables --
STATE: CHARACTER*2
State code number
PALETT: INTEGER*2
Palette identifier (1 or 2)
PALETT=1 for a variety of colors
PALETT=2 for shades of green
(PALETT is used only on an enhanced display)
NCLRS: INTEGER*2
Number of colors in menu
(only used if MODIFY=.TRUE.)
MENU: INTEGER*2
Menu type switch (for map keys) --
MENU=0 for general coloring menu
MENU=1 for menu of POD types
MENU=2 for title of solution map
MENU=3 for key to workload map
COLOR: LOGICAL
Color indicator --
COLOR=.TRUE. if an array of zip code colors is provided
COLOR=.FALSE. otherwise
MODIFY: LOGICAL
Color modification indicator --
MODIFY=.TRUE. if the array of zip code colors is
allowed to be modified
MODIFY=.FALSE. otherwise
M: INTEGER*4
Number of zip codes
XCENT(M): REAL*4
Array containing x coordinates of centroids, sorted
according to increasing x and y

**YCEN(M):** REAL*4
Array containing y coordinates of centroids, sorted according to increasing x and y

**INDEX(M):** INTEGER*2
Zip code index array --
INDEX(I) is the original index of the zip code with centroid (XCENT(I), YCENT(I)) before sorting

**PNT(M):** INTEGER*2
Pointer array --
PNT(I) points to the beginning of information on the zip code with centroid (XCENT(I), YCENT(I)) in the zip code boundary file

**ZIPCLR(M):** INTEGER*4
Zip code color array --
ABS(ZIPCLR(INDEX(I))) is the color (a number from 1 to 9) of the zip code with centroid (XCENT(I), YCENT(I)) (only input if COLOR=.TRUE.)
Positive value: centroid drawn as asterisk
Negative value: centroid drawn as small box

Output Variables --

**IERR:** INTEGER*4
Error flag --
IERR=0 for normal return
IERR=1 if an error was encountered

**COLOR:** LOGICAL
Set to .TRUE. if color array was created

**ZIPCLR(M):** INTEGER*4
Modified zip code color array
(same as input if MODIFY=.FALSE.)

PROGRAM DRIVER:

This program is the driver for the POD location system. It first initializes the report file STATEXX.REP and sets up data structures for storing zip code information. Then it uses GKS to write the top-level menu on the screen and allows the user to choose which phase of a problem to work on. The possible choices are:

1. Exit.
2. Display workload.
3. Display or modify initial POD sites.
4. Solve for optimal POD locations.
5. Display optimal POD locations.

The driver terminates in one of two possible ways:

1. The user chooses "F1 - EXIT" from the top menu. In this case, a file called EXITFILE.BAT is created which signals the batch program LOCATE.BAT to leave the POD location system.
2. The user chooses "F4 - SOLVE FOR OPTIMAL POD LOCATIONS" from the top menu. In this case, LOCATE.BAT passes control to the solution algorithm SOLVER.COM. When the solution procedure is finished, control returns to DRIVER.EXE.

The following files must exist to run the POD location system. (In the following, "XX" should be replaced by the state code number.)

1. STATEXX.STE: STATE BOUNDARY FILE
2. STATEXX.ZIP: ZIP CODE BOUNDARY FILE
3. STATEXX.CEN: ZIP CODE CENTROID FILE
4. STATEXX.POD: POD SITE FILE
5. STATEXX.WRK: WORKLOAD FILE

(See the User's Manual for information on the format of these files.)

The following common block is required by the graphics package GKS:

```
COMMON /GRACOM/SIZE,INTARY.
```

SIZE is an INTEGER*4 variable set equal to 2500, and INTARY is an INTEGER*4 array of length 2500.

Source Code Location --

DRIVER.FOR

Definition of Variables --

CHDNR: INTEGER*2
   Choice device number (used to initialize function keys)

CHNR: INTEGER*2
   Choice number (number of function key selected)

COST(MAXPOD): REAL*8
   Work array containing POD costs for a zip code

CSQRFT(MAXPOD): REAL*4
   Array containing monthly rental costs per square foot for POD site office space

EX: LOGICAL
   Flag indicating whether a file exists

FXCOST(MAXPOD): REAL*4
   Array containing opening/closing costs for POD sites
I: INTEGER*4
Loop counter
IERR: INTEGER*4
Error flag --
IERR=0 for normal return
IERR=1 if an error was encountered
INDEX(MAXM): INTEGER*2
Zip code index array --
INDEX(I) is the original index of the zip code with centroid (XCENT(I),YCENT(I)) in the zip code boundary file
JCOEF(MAXPOD): INTEGER*2
Work array
M: INTEGER*4
Number of zip codes
MAXDIF: INTEGER*4
Maximum possible number of non-unit travel difficulty factors
MAXM: INTEGER*4
Maximum possible number of zip codes
(initialized to be 1000)
MAXPOD: INTEGER*4
Maximum possible number of POD sites
(initialized to be 85)
PAUSE: INTEGER*4
Loop counter limit for error message pause
PNT(MAXM): INTEGER*2
Pointer array --
PNT(I) points to the beginning of information on the zip code with centroid (XCENT(I),YCENT(I)) in the zip code boundary file
PODCLR(MAXM): INTEGER*4
Zip code color array for POD site types
PODSET: LOGICAL
Flag indicating whether POD types have been initialized
PODZIP(MAXPOD): INTEGER*2
Array containing zip code indices of POD sites
STAT: INTEGER*2
Status flag returned with function key --
STAT=0: function key not recognized
STAT=1: function key recognized successfully
STATE: CHARACTER*2
Two-digit FIPS code number for state (must be entered by user)
TRVDIF(MAXPOD): REAL*4
Work array
WKID: INTEGER*2
GKS workstation identifier
WORK(MAXPOD): REAL*4
Work array
XCENT(MAXM): REAL*4
Array containing x coordinates of centroids, sorted according to increasing x and y
XPOD(MAXPOD): REAL*4
Array containing x coordinates of centroids of POD sites

YCENT(MAXM): REAL*4
Array containing y coordinates of centroids, sorted according to increasing x and y

YPOD(MAXPOD): REAL*4
Array containing y coordinates of centroids of POD sites

ZIP5(MAXM): INTEGER*4
Array of five-digit zip codes, in original sequential order

ZIPCLR(MAXM): INTEGER*4
Zip code color array

ZIPIND(MAXM): INTEGER*2
Array of zip code indices, sorted by POD assignments

SUBROUTINE MAPKEY(IERR, MODIFY, TRN, PALETT, NCLRS, STATE, MENU,
M, XCENT, YCENT, INDEX, PNT, ZIPCLR):

This subroutine displays a color key for the current zip code map. It allows the user to locate a zip code on the map with the cursor and have its five-digit name printed on the screen. (To do this, a search of the centroid array is done to find the closest centroid to the cursor position.) It may also allow the color of a zip code to be changed.

Source Code Location --
IRS.FOR

Input Variables --
MODIFY: LOGICAL
   Color modification indicator --
   MODIFY=.TRUE. if the array of zip code colors is
   allowed to be modified
   MODIFY=.FALSE. otherwise
TRN: INTEGER*2
   Transformation number
PALETT: INTEGER*2
   Palette identifier (1 or 2)
NCLRS: INTEGER*2
   Number of colors in menu
   (only used if MODIFY=.TRUE.)
STATE: CHARACTER*2
   State code number
MENU: INTEGER*2
   Menu type switch --
   MENU=0 for general coloring menu
   MENU=1 for menu of POD types
   MENU=2 for title of solution map
   MENU=3 for key to workload map
M: INTEGER*4
   Number of zip codes
XCENT(M): REAL*4
Array containing x coordinates of centroids, sorted according to increasing x and y

YCENT(M): REAL*4
Array containing y coordinates of centroids, sorted according to increasing x and y

INDEX(M): INTEGER*2
Zip code index array, sorted corresponding to XCENT and YCENT arrays

PNT(M): INTEGER*2
Pointer array, sorted corresponding to XCENT and YCENT arrays

ZIPCLR(M): INTEGER*4
Zip code color array --
Positive value: centroid drawn as asterisk
Negative value: centroid drawn as small box

Output Variables --
IERR: INTEGER*4
Error flag --
IERR=0 for normal return
IERR=1 if an error was encountered

ZIPCLR(M): INTEGER*4
Zip code color array

SUBROUTINE OPTION(IO, DSTLIM, TXPWGT, IRSWGT, IMF, BMF):

This subroutine displays the default options for the cost calculation and allows the user to make changes.

Source Code Location --
DRIVER.FOR

Input Variables --
IO: INTEGER*4
   Unit number defining where display will appear
DSTLIM: REAL*4
   Default maximum travel distance allowed from zip code to POD
TXPWGT: REAL*4
   Default weight (between 0 and 1) to be assigned to taxpayer travel costs
IRSWGT: REAL*4
   Default weight (between 0 and 1) to be assigned to IRS travel costs
IMF(4): INTEGER*4
   Default array indicating which IRS functions are to be included in the cost calculation for Individual Master File data --
   IMF(1): Examination
   IMF(2): Collection
   IMF(3): Taxpayer Service
IMF(4): Criminal Investigation
BMF(4): INTEGER*4
Default array indicating which IRS functions are to be included in the cost calculation for Business Master File data --
BMF(1): Examination
BMF(2): Collection
BMF(3): Taxpayer Service
BMF(4): Criminal Investigation

Output Variables --
DSTLIM: REAL*4
Maximum travel distance allowed from zip code to POD
TXPWGT: REAL*4
Weight (between 0 and 1) to be assigned to taxpayer travel costs
IRSWGT: REAL*4
Weight (between 0 and 1) to be assigned to IRS travel costs
IMF(4): INTEGER*4
Array indicating which IRS functions are to be included in the cost calculation for IMF data
BMF(4): INTEGER*4
Array indicating which IRS functions are to be included in the cost calculation for BMF data

SUBROUTINE PODMAP(IERR, STATE, PAUSE, M, XCENT, YCENT, INDEX, PNT, ZIP5, ZIPCLR):

This subroutine initializes the display of a map of current and potential POD sites. It is executed when the user chooses "F3 - DISPLAY OR MODIFY INITIAL POD SITES" from the top menu. First it reads the file STATEXX.POD to find which zip codes are allowed to be POD sites and which zip codes currently are POD sites. Color #1 (background) is assigned to zip codes which cannot be POD sites, color #2 is assigned to potential POD sites, and color #3 is assigned to current POD sites. (Note: A negative color number indicates that the centroid will be drawn as a small box; otherwise the centroid is an asterisk.) Then these colors are passed in an array to the subroutine DISPLY, which draws the map and lets the user change the colors. The new colors are returned in the original array. Color #4 in the new array indicates a zip code which the user has made a fixed POD site.

Source Code Location --
DRIVER.FOR

Input Variables --
STATE: CHARACTER*2
State code number

32
PAUSE: INTEGER*4
Loop counter limit for error message pause

M: INTEGER*4
Number of zip codes

XCENT(M): REAL*4
Array containing x coordinates of centroids, sorted according to increasing x and y

YCENT(M): REAL*4
Array containing y coordinates of centroids, sorted according to increasing x and y

INDEX(M): INTEGER*2
Zip code index array -- INDEX(I) is the original index of the zip code with centroid (XCENT(I),YCENT(I)) before sorting

PNT(M): INTEGER*2
Pointer array -- PNT(I) points to the beginning of information on the zip code with centroid (XCENT(I),YCENT(I)) in the zip code boundary file

ZIP5(M): INTEGER*4
Array of five-digit zip codes, in original sequential order

Output Variables --
IERR: INTEGER*4
Error flag -- IERR=0 for normal return IERR=1 if an error was encountered

ZIPCLR(M): INTEGER*4
Zip code color array for POD site types

Program Called --
DISPLY

Calling Program --

      TXPFCT):

This subroutine writes information on the problem initialization into the report file.

Source Code Location --
DRIVER.FOR

Input Variables --
M: INTEGER*4
   Number of zip codes
ZIPCLR(M): INTEGER*4
   Zip code color array for POD site types
ZIP5(M): INTEGER*4
   Array of five-digit zip codes
DSTLIM: REAL*4
   Maximum travel distance allowed from zip code to POD
IRSWT: REAL*4
   Weight assigned to IRS travel costs
TXPWT: REAL*4
   Weight assigned to taxpayer travel costs
IMFFNC(4): INTEGER*4
   Array indicating which IRS functions are included in the cost calculation for Individual Master File data
BMFFNC(4): INTEGER*4
   Array indicating which IRS functions are included in the cost calculation for Business Master File data
NREC: INTEGER*4
   Number of non-unit travel difficulty factors
DIFZIP(NREC): INTEGER*4
   Five-digit zip code array for use with travel difficulty factors
DIFPOD(NREC): INTEGER*4
   POD zip code array for use with travel difficulty factors
DIFFAC(NREC): REAL*4
   Array of travel difficulty factors
FXCOST(NPOD): REAL*4
   Array containing fixed costs of POD sites
CSQRFT(NPOD): REAL*4
   Array containing monthly rental costs per square foot for POD site office space
SQFT: REAL*4
   Office space required per IMF return (square feet)
MILCST: REAL*4
Mileage cost ($/mile)

IRSFCT(16): REAL*4
Array of IRS trip factors

TXPFCT(16): REAL*4
Array of taxpayer trip factors

Programs Called --
OPTION

Calling Program --
SOLVE

SUBROUTINE REPSOL(COST,NZIP,ZIPIND,NPOD,ENDPNT,ZIP5):

This subroutine writes information on the problem solution into the report file.

Source Code Location --
DRIVER.FOR

Input Variables --
COST: REAL*8
Total cost of assigning zip codes to POD sites

NZIP: INTEGER*4
Number of zip codes in solution file

ZIPIND(NZIP): INTEGER*2
Array containing zip code indices from the solution file, sorted according to POD assignments

NPOD: INTEGER*4
Number of POD sites in solution

ENDPNT(NPOD): INTEGER*2
Array of POD pointers --
ZIPIND(ENDPNT(I)) is the last zip code index in ZIPIND assigned to the Ith POD site

ZIP5(M): INTEGER*4
Array of five-digit zip codes

Programs Called --
None

Calling Program --
SOLMAP

FUNCTION REVERS(X,MIN,MAX):

This function reverses the direction of a coordinate axis. (This is necessary because the x coordinates in the Ganesa files increase from right to left, but GKS assumes that they increase from left to right.)

Source Code Location --
IRS.FOR

Input Variables --
X: REAL*4
   Value of coordinate to be reversed
MIN: REAL*4
   Minimum value of coordinate axis
MAX: REAL*4
   Maximum value of coordinate axis

Output Variable --
REVERS: REAL*4
   Reversed value of X

Programs Called --
None

Calling Programs --
MAPKEY
STEMAP
ZIPMAP
ZOOMIN

SUBROUTINE SEARCH(XPT,YPT,M,X,Y,POS):

This subroutine searches the list of sorted centroids to find the centroid closest to a given point. A binary search is done to find the nearest x coordinate, and then a sequential search is done to find the nearest y coordinate.

Source Code Location --
IRS.FOR

Input Variables --
XPT: REAL*4
   X coordinate of point to be located
YPT: REAL*4
   Y coordinate of point to be located
M: INTEGER*4
   Number of zip codes
X(M): REAL*4
   Array containing x coordinates of centroids, sorted according to increasing x and y
Y(M): REAL*4
   Array containing y coordinates of centroids, sorted according to increasing x and y

Output Variable --
POS: INTEGER*4
   Position of (XPT,YPT) in centroid list
   (i.e., (XPT,YPT)=(X(POS),Y(POS)))
   POS=0 if point was not found
Programs Called --
None

Calling Program --
MAPKEY

SUBROUTINE SETCOL(WKID, PALETT):

This subroutine defines the colors to be used by the display device. The type of display device in use is determined by calling the GKS routine GQCF which returns the number of colors available on the current device driver. For a medium-resolution four-color display, this subroutine sets palette two with a blue background. For an enhanced color display, it sets sixteen colors in one of two possible palettes. (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variables --
WKID: INTEGER*2
Workstation identifier
PALETT: INTEGER*2
Palette identifier (1 or 2) --
PALETT=1: 16 distinct colors
PALETT=2: colors 4 through 9 are shades of green
(PALETT is not used in medium resolution mode)

Programs Called --
GQCF
GSCR

Calling Programs --
SPLTWN
WINDOW

SUBROUTINE SOLMAP(IERR, STATE, PAUSE, M, XCENT, YCENT, INDEX, PNT, ZIPCLR, ZIP5, ZIPIND, ENDPNT):

This subroutine initializes the display of a solution map. It is executed when the user chooses "F5 - DISPLAY OPTIMAL POD LOCATIONS" from the top menu. It checks the solution file STATEXX.SOL to see whether the graph-coloring algorithm was used by the solver. (This algorithm is used only if an input file is present giving zip code adjacency information.) If graph-coloring was not used, then only zip codes which are POD sites (as determined by the solution) will be colored on the map (using color #3); all other zip codes will be in the background color (color #1). (Note: A negative color number indicates that the centroid will be drawn as a small box; otherwise the centroid is an asterisk.) If graph-coloring was used, then a color for each zip code is read from the solution file (the color
number is increased by one to avoid using the background color). The resulting map will show a POD and its assigned zip codes all in the same color. The subroutine REPSOL is called to write solution information in the report file and the subroutine DISPLY is called to draw the map.

Source Code Location --
DRIVER.FOR

Input Variables --
STATE: CHARACTER*2
State code number
PAUSE: INTEGER*4
Loop counter limit for error message pause
M: INTEGER*4
Number of zip codes
XCENT(M): REAL*4
Array containing x coordinates of centroids, sorted according to increasing x and y
YCENT(M): REAL*4
Array containing y coordinates of centroids, sorted according to increasing x and y
INDEX(M): INTEGER*2
Zip code index array --
INDEX(I) is the original index of the zip code with centroid (XCENT(I),YCENT(I)) before sorting
PNT(M): INTEGER*2
Pointer array --
PNT(I) points to the beginning of information on the zip code with centroid (XCENT(I),YCENT(I)) in the zip code boundary file
ZIP5(M): INTEGER*4
Array of five-digit zip codes

Output Variables --
IERR: INTEGER*4
Error flag --
IERR=0 for normal return
IERR=1 if an error was encountered
ZIPCLR(M): INTEGER*4
Zip code color array
ZIPIND(NZIP): INTEGER*2
Array of zip code indices, sorted by POD assignments
ENDPNT(NPOD): INTEGER*2
Array of POD pointers --
ZIPIND(ENDPNT(I)) is the last zip code index in ZIPIND assigned to the Ith POD site

Program Called --

SUBROUTINE SOLVE(IERR, STATE, PAUSE, MAXPOD, PODZIP, XPOD, YPOD, M, HOLD, FXCOST, CSQRFT, TRVDIF, ZIPCLR, ZIP5, JCOEF, COST, MAXDIF, DIFZIP, DIFPOD, DIFFAC):

This subroutine allows the user to set parameters to initialize a location problem and then calculates costs which are passed to the solution procedure SOLVER.COM. It is executed when the user chooses "F4 - SOLVE FOR OPTIMAL POD LOCATIONS" from the top menu. First, opening/closing costs and office rental costs are read from the file STATEXX.POD. If any POD sites exist which are not in the file, the user is asked to enter the costs. Then several parameters such as cost per mile, maximum travel distance, and trip factors are read from the file STATEXX.WRK. The user is allowed to set weights for IRS and taxpayer costs, to turn categories of workload on or off, to change the distance limit, and to set travel difficulty factors. The parameter settings are summarized in the report file STATEXX.REP.

After all parameters have been set, the program proceeds to calculate costs of assigning zip codes to POD sites. These costs are passed to the PASCAL solution procedure in the unformatted sequential file STATEXX.DBL. For each zip code, the program finds all possible POD sites (current, potential and fixed) within the specified distance limit and calculates the cost of each assignment using the function COSTFN. The assignments are then sorted in order of decreasing cost; if a zip code is a possible POD site, its cost is last in the list. The list of costs and POD sites for a particular zip code is written as one record of the file STATEXX.DBL. The type of the zip code (i.e., whether it is a potential POD site, a fixed POD site, etc.) is also included in the record. The record is padded with zeroes to make the file readable by a PASCAL program. If, for some zip code, there are no possible POD sites within the distance limit, an error message will appear on the screen. Otherwise, the subroutine is exited and control passes to the solution procedure. (The solution algorithm is described in "The Internal Revenue Service Post-of-Duty Location Modeling System: Programmer's Manual for PASCAL Solver").

Source Code Location --
DRIVER.FOR

Input Variables --
STATE: CHARACTER*2
State code number
PAUSE: INTEGER*4
Loop counter limit for error message pause
MAXPOD: INTEGER*4
Maximum possible number of POD sites
M: INTEGER*4
Number of zip codes
ZIPCLR(M): INTEGER*4
Zip code color array for POD site types
ZIP5(M): INTEGER*4
Array of five-digit zip codes, in original sequential order
MAXDIF: INTEGER*4
Maximum number of non-unit travel difficulty factors
Output Variables --

IERR: INTEGER*4
Error flag --
IERR=0 for normal return
IERR=1 if an error was encountered

PODZIP(NPOD): INTEGER*4
Array containing zip code indices of POD sites

XPOD(NPOD): REAL*4
Array containing x coordinates of centroids of
POD sites

YPOD(NPOD): REAL*4
Array containing y coordinates of centroids of
POD sites

HOLD(NPOD): REAL*4
Work array

FXCOST(NPOD): REAL*4
Array containing fixed costs (opening/closing costs) of
POD sites

CSQRFT(NPOD): REAL*4
Array containing monthly rental costs per square foot for
POD site office space

TRVDIF(NPOD): REAL*4
Work array containing travel difficulty factors from a
zip code to all possible POD sites

JCOEF(NPOD): INTEGER*2
Work array containing POD indices for a zip code

COST(NPOD): REAL*8
Work array containing POD costs for a zip code

DIFZIP(NREC): INTEGER*4
Five-digit zip code array for use with travel difficulty
factors

DIFPOD(NREC): INTEGER*4
POD zip code array for use with travel difficulty factors

DIFFAC(NREC): REAL*4
Array of travel difficulty factors --
DIFAC(I) is the factor associated with zip code
DIFZIP(I) and POD site DIFPOD(I)

DISPILY

SUBROUTINE STYLE(IERR,WKID,PALETT,INDEX):

This subroutine sets one of sixteen area-filling interior styles. For a medium-resolution four-color display, the style is either a solid color or a
cross-hatch pattern. For an enhanced color display, the style is always a solid color. (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variables --
WKID: INTEGER*2
   Workstation identifier
PALETT: INTEGER*2
   Palette identifier (1 or 2) --
      PALETT=1: 16 distinct colors
      PALETT=2: 6 shades of green plus 10 other colors
      (PALETT is not used in medium resolution mode)
INDEX: INTEGER*4
   Index (between 1 and 16) of desired interior style

Output Variable --
IERR: INTEGER*4
   Error flag --
      IERR=0 for normal return
      IERR=1 if an error was encountered

SUBROUTINE TOPMNU:

This subroutine writes the text for the top-level menu on the screen. The format of the menu is slightly different depending on whether a regular color display or an enhanced color display is being used. This is determined by calling the GKS routine GQCF which finds the number of colors available on the current device driver.

SUBROUTINE WINDOW(WKID, TRN, PALETT, XMIN, XMAX, YMIN, YMAX):

This subroutine sets a window and a viewport in a way that preserves the aspect ratio of the world coordinates. (See the GKS manual for definitions of graphics terms.)

Source Code Location --
GKSUTIL.FOR

Input Variables --
WKID: INTEGER*2
  Workstation identifier
TRN: INTEGER*2
  Transformation number (between 1 and 7)
PALETT: INTEGER*2
  Palette identifier (1 or 2)
XMIN: REAL*4
  Smallest x value of world coordinates
XMAX: REAL*4
  Largest x value of world coordinates
YMIN: REAL*4
  Smallest y value of world coordinates
YMAX: REAL*4
  Largest y value of world coordinates

SUBROUTINE WRKMAP(IERR, STATE, PAUSE, M, XCENT, YCENT, INDEX, PNT, ZIPCLR):
This subroutine initializes the display of a workload map. It is executed when the user chooses "F2 - DISPLAY WORKLOAD" from the top menu. It first asks the user to choose the category of workload to be displayed and then sets a series of sixteen switches corresponding to the desired columns of the workload file STATEXX.WRK. These columns are read and summed for each zip code. Then the workloads are divided into six equally spaced ranges. Each zip code is assigned a color according to the range its workload falls in. The colors are passed in an array to the subroutine DISPLY which draws the map.

Source Code Location --
DRIVER.FOR

Input Variables --
STATE: CHARACTER*2
State code number
PAUSE: INTEGER*4
Loop counter limit for error message pause
M: INTEGER*4
Number of zip codes
XCENT(M): REAL*4
Array containing x coordinates of centroids, sorted according to increasing x and y
YCENT(M): REAL*4
Array containing y coordinates of centroids, sorted according to increasing x and y
INDEX(M): INTEGER*2
Zip code index array --
INDEX(I) is the original index of the zip code with centroid (XCENT(I),YCENT(I)) before sorting
PNT(M): INTEGER*2
Pointer array --
PNT(I) points to the beginning of information on the zip code with centroid (XCENT(I),YCENT(I)) in the zip code boundary file

Output Variables --
IERR: INTEGER*4
Error flag --
IERR=0 for normal return
IERR=1 if an error was encountered
ZIPCLR(M): INTEGER*4
Zip code color array for workload

Program Called --
DISPLY

Calling Program --
DRIVER

SUBROUTINE ZIPMAP(IERR, TRN, PALETT, STATE, ZOOM, COLOR, XMIN, XMAX, YMIN, YMAX, M, XCENT, YCENT, INDEX, PNT, ZIPCLR):
This subroutine draws a zip code map either for a full state or for a smaller area. Centroids are included, and the zip codes are colored if specified. The zip code boundaries are read from the file STATEXX.ZIP. If the whole state is not to be drawn, but only a smaller region specified by a zoom rectangle, a search is done first to find the first and last zip codes (as given in the sorted centroid list) included in the rectangle.

Source Code Location --
IRS.FOR

Input Variables --
TRN: INTEGER*2
Transformation number
PALETT: INTEGER*2
Palette identifier (1 or 2)
STATE: CHARACTER*2
State code number
ZOOM: LOGICAL
Zoom indicator --
ZOOM=.FALSE. if entire state is to be drawn
ZOOM=.TRUE. if only part of state is to be drawn
COLOR: LOGICAL
Color indicator --
COLOR=.TRUE. if zip codes are to be colored as they are drawn
COLOR=.FALSE. if just zip code boundaries are to be drawn
XMIN: REAL*4
X coordinate of lower left corner of zoom rectangle
(used only if ZOOM=.TRUE.)
XMAX: REAL*4
X coordinate of upper right corner of zoom rectangle
(used only if ZOOM=.TRUE.)
YMIN: REAL*4
Y coordinate of lower left corner of zoom rectangle
(used only if ZOOM=.TRUE.)
YMAX: REAL*4
Y coordinate of upper right corner of zoom rectangle
(used only if ZOOM=.TRUE.)
M: INTEGER*4
Number of zip codes
XCENT(M): REAL*4
Array containing x coordinates of centroids
YCENT(M): REAL*4
Array containing y coordinates of centroids
INDEX(M): INTEGER*2
Zip code index array
PNT(M): INTEGER*2
Pointer array --
PNT(I) points to the beginning of information on the zip code with centroid (XCENT(I),YCENT(I)) in the zip code boundary file
ZIPCLR(M): INTEGER*4
Zip code color array --
(colors used only if COLOR=.TRUE.)
Positive value: centroid drawn as asterisk
Negative value: centroid drawn as small box

Output Variables --
IERR: INTEGER*4
   Error flag --
   IERR=0 for normal return
   IERR=1 if an error was encountered
XMIN: REAL*4
   X coordinate of lower left corner of map
   (same as input XMIN if ZOOM=.TRUE.)
XMAX: REAL*4
   X coordinate of upper right corner of map
   (same as input XMAX if ZOOM=.TRUE.)
YMIN: REAL*4
   Y coordinate of lower left corner of map
   (same as input YMIN if ZOOM=.TRUE.)
YMAX: REAL*4
   Y coordinate of upper right corner of map
   (same as input YMAX if ZOOM=.TRUE.)

ZOOMIN

SUBROUTINE ZOOMIN(IERR, TRN, PALETT, STATE, XMIN, XMAX, YMIN, YMAX,
   M, XCENT, YCENT, INDEX, PNT, ZIPCLR):

This subroutine allows the user to draw a box with the cursor on a
previously drawn map and then zooms in on the boxed area.

Source Code Location --
IRS.FOR

Input Variables --
TRN: INTEGER*2
   Transformation number
PALETTE: INTEGER*2
Palette identifier (1 or 2)

STATE: CHARACTER*2
State code number

XMIN: REAL*4
X coordinate of lower left corner of current map

XMAX: REAL*4
X coordinate of upper right corner of current map

YMIN: REAL*4
Y coordinate of lower left corner of current map

YMAX: REAL*4
Y coordinate of upper right corner of current map

M: INTEGER*4
Number of zip codes

XCENT(M): REAL*4
Array containing x coordinates of centroids

YCENT(M): REAL*4
Array containing y coordinates of centroids

INDEX(M): INTEGER*2
Zip code index array

PNT(M): INTEGER*2
Pointer array --
PNT(I) points to the beginning of information on the
zip code with centroid (XCENT(I),YCENT(I)) in the zip
code boundary file

ZIPCLR(M): INTEGER*4
Zip code color array

Output Variables

IERR: INTEGER*4
Error flag --
IERR=0 for no return
IERR=1 if an error was encountered

TRN: INTEGER*2
Transformation number

XMIN: REAL*4
X coordinate of lower left corner of zoom region

XMAX: REAL*4
X coordinate of upper right corner of zoom region

YMIN: REAL*4
Y coordinate of lower left corner of zoom region

YMAX: REAL*4
Y coordinate of upper right corner of zoom region

**Abstract**
This report is a programmer's manual for a microcomputer package which was designed by the National Bureau of Standards to assist the Internal Revenue Service in choosing locations for its posts-of-duty which will minimize costs to the IRS and to the taxpayer. The package was written in two sections of code, one in FORTRAN and the other in PASCAL. This manual describes the FORTRAN driver which handles graphics displays and controls input and output for the solution procedures.

**Key Words**
facility location, interactive graphics, personal computer, microcomputer, Graphical Kernel System (GKS)

**Availability**
- Unlimited
- For Official Distribution. Do Not Release to NTIS
- Order From National Technical Information Service (NTIS), Springfield, VA. 22161

**Price**
$13.95
