January, 1992

## 1. Introduction

The Apparel STEP<sup>1</sup> Translator is a computer program for translating apparel pattern data between different file formats using a set of neutral data structures based on the NIST apparel information model [Lee90]. This program was initially developed on an Apple© Macintosh™ computer. In the summer of 1991, it was ported to an IBM PC computer. This document describes how to install and run the program on a PC compatible computer. The report, *Apparel STEP Translator* [Moncarz91], provides a general description of the program's implementation.

The software is available from NIST on an IBM-formatted, low density disk (5 1/4", unless 3 1/2" is requested). This distribution disk contains the latest version of the Translator for the IBM PC and compatible computers. The disk includes the complete source code for the program, the run-time version of the program itself (the executable), help files used by the program during its operation to guide the user, project files for managing program development, and a number of sample pattern data files. The data files were provided by the U.S. Air Force and contain pattern data for military uniforms. A file named `readme.doc` on the disk gives a brief overview of the program and lists the contents of the disk, including a description of each directory and file. Also included in that file is a report of known problems and current update information.

This software was developed as part of an ongoing project at NIST to extend STEP to include apparel applications. The project is sponsored by the Defense Logistics Agency, and the work is being carried out in cooperation with the Computer Integrated Manufacturing Committee of the American Apparel Manufacturers Association (AAMA). In the short term, the project goal is to develop a neutral data format for exchanging two-dimensional pattern data between apparel CAD systems. In the long term, the goal is to develop an information model that can be used to encompass the entire apparel life cycle. This achievement would allow all of the processes involved in the apparel life cycle to share the same data.

The U.S. effort to develop STEP is called PDES<sup>2</sup>. APDES is the acronym given to the NIST work in extending PDES to include apparel. In this document the expression APDES Translator refers to the Apparel STEP Translator.

---

<sup>1</sup>STEP, an abbreviation for the Standard for the Exchange of Product Model Data, is an emerging international standard to represent a product's data throughout the product's manufacturing life cycle.

<sup>2</sup>PDES is the abbreviation for Product Data Exchange using STEP.

## 1.1 System Requirements

In order to run the IBM version of the Translator, you must have an IBM or compatible computer with VGA graphics capabilities. The minimum configuration it was tested on was an XT with 640K RAM and running DOS 3.3. It should run on any configuration that is upwardly compatible to this one. To install the software as it is distributed, you must have a hard disk drive or at least two floppy drives, one of which is high density. (If you have a hard drive, you only need one floppy drive, which can be low or high density.)

## 1.2 Features

The PC version of the APDES Translator features the following:

- Ability to translate between any two of these three formats: PN<sup>3</sup>, DXF<sup>4</sup>, and STEP
- Easy to use, menu-driven system
- Full screen text editing and viewing functions
- Pop-up help screens from within the program
- VGA routines to display pattern pieces

## 1.3 Overview

Section 2 describes the procedure for installing the APDES software from the distribution disk onto your hard drive. Section 3 contains a brief overview for starting and operating the program. It can be used if you want to start operating the program immediately. Section 4 contains a detailed description of program operation; it is organized as a reference guide for operating the program.

## 1.4 Conventions

The following typographic conventions are used in this manual:

Courier	File names, computer output, and menu commands (e.g. Help)
COURIER	Directory names (e.g. APDES)
<b>Courier bold</b>	User input (e.g. <code>mkdir APDES&lt;enter&gt;</code> )
<b>COURIER BOLD</b>	Directory names that are user input (e.g. <b>APDES</b> )
<i>&lt;Courier bold italic&gt;</i>	Individual key stroke (e.g. <code>&lt;enter&gt;</code> )

---

<sup>3</sup>PN is a proprietary file format for apparel pattern data from Gerber Garment Technology, Inc.

<sup>4</sup>DXF™ is a proprietary file format from AutoDesk, Inc. used in their AutoCAD® product.

## 2. Installation

The APDES software (including the executable, project, source, help, and data files) is distributed on an IBM-formatted disk in a compressed format. This disk contains a self-extracting file named `apdes_se.exe`. To install the software onto your system, first create a directory named APDES. This directory should be created on your hard drive, if you have one. Otherwise, it should be created on your high density floppy drive. For example:

```
C>mkdir APDES<enter>
```

(Note: some keyboards may contain the key `<return>` or `<->` instead of `<enter>`.)

will create the directory, APDES, on your hard drive C:. Next, go to your floppy drive where the distribution disk is mounted (e.g. A:), and type the following:

```
A>apdes_se -d C:\APDES<enter>
```

This command will execute `apdes_se.exe`, decompress the APDES software, and transfer the resulting directories and files to C:\APDES.

The only file necessary to run the APDES Translator is `apdes.exe`. The help files (all of the files with `.hlp` extensions) are not required, but without them you cannot use the Translator's built-in help functions.

## 3. Operation

This section contains a brief overview for starting and operating the APDES Translator. Refer to Section 4 for detailed instructions on operating the APDES Translator.

The APDES Translator must be installed on your computer before it can be operated. Refer to Section 2 for instructions on installation. After the APDES Translator has been installed, change the current directory to APDES, and enter the command `apdes` to operate the program:

```
C>cd APDES<enter>
```

```
C:\APDES>apdes<enter>
```

It is important that you run the APDES Translator from the directory which contains the file `apdes.exe` and the help files (`.hlp` files). If you do not, the program will not be able to access the help files.

When the program starts, the first thing you will see is the APDES Translator introductory screen, which displays general information about the program. There is also a menu bar at the top of the screen which lists the names of the menus available to operate the program. When you press any key, the title screen will disappear, and the File menu item in the upper left corner of the screen will be highlighted. The File menu will be displayed as a list of commands under the File menu item. This list of commands is called a pull-down menu. The first item in this list, `New`, is highlighted. If you press the `enter` key, the `New` command in the File menu will be invoked.

The commands available to you to operate the APDES Translator are organized into seven pull-down menus. Use the `<left/right>` cursor keys to move to the desired menu, and use the `<up/down>` cursor keys to move to the desired menu item within each pull-down menu. The menu that is highlighted in the menu bar is the active menu, and the item highlighted in the pull-down menu is the active command. The active command will be invoked when the `<enter>` key is pressed.

The primary capabilities of the Translator are parsing and generating DXF, PN, and STEP formatted files. These functions are executed from the `Parse` and `Generate` menus. To parse a file means to read a data file in one of the three formats (DXF, PN, or STEP) and translate it to a neutral data format. To generate a file means to translate the neutral data format to one of the three file formats and write that to disk. A file cannot be generated unless some file was previously parsed. The program will indicate an error if you try to generate a file without first parsing one. Once a file has been parsed, it can be graphically displayed using the `Display Pattern` command from the `Special` menu. As with generating, an error is indicated if you try to display a pattern without first parsing a data file.

The Translator operates in one of two possible modes: Edit mode or Menu mode. The mode of operation described above is the Menu mode. When you open a file or create a new file (using the corresponding `File` menu commands, `Open` or `New`), the program will automatically switch to Edit mode. This mode is used to view or edit existing text files or to create new ones. Once a text file has been opened or created, it is referred to as the current text file. In Edit mode, the current text file is displayed in a window on the screen, the `Edit` label is highlighted in the menu bar, and a blinking cursor appears in the text window. To return to Menu mode, press the `<esc>` key. To later continue editing the current text file, position the menu bar over the `Edit` label and strike `<enter>`.

The Translator contains a help function. Pressing `<F1>` will display a help screen explaining the basic operations of the program. For more detailed help, the `Help` menu provides several help screens describing each menu of the program.

When you are finished using the Translator, select the `Quit` command from the `File` menu to quit to DOS. If you have opened a text file that you have changed and not saved, the program will give you a chance to save it before exiting from the Translator.

## 4. Detailed Instructions

This section contains detailed instructions for operating the program. Section 4.1 presents an overall description of the menu system. Section 4.2 describes each command, with the exception of the `Edit` command. Because the operation of the `Edit` command is different than the rest of the menu commands, it is described separately in Section 4.3.

### 4.1 The Menu System

The APDES Translator is organized into a series of pull-down menus, each containing a number of commands. The bar along the top of the screen (called the menu bar) contains the titles of the various menus. The menu titles are `≡`, `File`, `Edit`, `Parse`, `Generate`, `Special`, and `Help`. One of these menu titles is always highlighted to indicate which menu is currently active, or "open". Immediately after starting the program, the `File` menu is opened and the word *File* is

highlighted in the menu bar. Figure 1 is a diagram of how the menu system would appear if all of the menus were pulled down at the same time. (The program allows only one menu at a time to be pulled down.)

≡	<u>F</u> ile	<u>E</u> dit	<u>P</u> arse	<u>G</u> enerate	<u>S</u> pecial	<u>H</u> elp
About	New alt-N Open alt-O C <b>l</b> ose F9 Save F10 Save As alt-A		PN File ... DXF File ... STEP File ...	PN File ... DXF File ... STEP File ...	Display Pattern Print Pattern	General Operations F1 File Menu Help Editor Help Parse Menu Help Generate Menu Help Help with Help Menu
	Directory alt-D Change Dir alt-C					
	Print					
	Quit alt-Q					

Figure 1: Menu bar from APDES Translator with all menus pulled down

Pressing the *<left>* or *<right>* cursor keys will close the current menu and move the selection to the adjacent menu. Another way to move quickly from one menu to another is to press and hold down the *<alt>* key while typing the first letter of the menu. For example, pressing *<alt-H>* will close the current menu and open the Help menu.

With the exception of the Edit menu, each pull-down menu consists of a list of commands. The selection bar is a highlighted area that you can move up and down in a menu by using the cursor keys. To select a command from a menu, simply move the selection bar to the desired command and press *<enter>*. A second way to perform a menu command from a pulled-down menu is provided. One letter (usually the first letter) of each command is highlighted indicating the letter to type to activate that command. Typing the command letter is sometimes quicker than positioning the selection bar and pressing *<enter>*. For example, to view a DOS directory listing when the File menu is displayed, you can either move the selection bar to Directory and hit *<enter>*, or simply type the letter *<D>*.

Some commands, although they appear in only one menu, can be activated from any menu. For example, you do not have to be in the File menu to view a directory listing. You can view a directory listing from any menu by pressing *<alt-D>*. Commands like *<alt-D>* are called hot-key commands, because they can be issued no matter what menu is currently active. If a menu command has an associated hot-key command, the corresponding hot key is displayed on the right side of the menu selection. Thus, in the File menu, the menu selection for viewing a directory reads "Directory alt-D", indicating that *<alt-D>* is the hot key for viewing a directory.

The complete list of hot-key commands is shown below. Note that three of the commands, Help, File|Close, and File|Save, are invoked by function keys. These keys do not require the *<alt>* key to be simultaneously depressed.

<u>Key Stroke</u>	<u>Menu Equivalent</u>	<u>Action</u>
<alt-A>	File Save As	Save the current text file with new name.
<alt-C>	File Change Dir	Change the current working directory.
<alt-D>	File Directory	View a disk directory.
<alt-N>	File New	Create a new text file.
<alt-O>	File Open	Open a text file for editing.
<alt-Q>	File Quit	Quit the program (exit to DOS).
<F1>	Help  General Operations	View help screen.
<F9>	File Close	Close the current text file.
<F10>	File Save	Save the current text file.

<F1> is a hot-key command that will display a pop-up help screen giving some basic guidelines for using the APDES Translator. The remaining hot-key commands are included in the File menu and will be described in detail in Section 4.2.2.

## 4.2 Menu Commands

The menus shown in Figure 1 are described in detail in the sections below.

### 4.2.1 The ≡ Menu

The ≡ in the upper left corner of the screen is the symbol for the About menu. There is only one command currently available from this menu: About. About displays some general information about the program. It is not a help screen, but rather an information screen that tells where, when, and by whom the program was developed.

### 4.2.2 The File Menu

The File menu contains commands for opening and closing text files as well as changing and viewing DOS directories. The nine available commands in the File menu are described below. If a command has a hot-key equivalent, it is given after the command.

New <alt-N>      The New command creates a new text file and then switches to Edit mode. If a file is open that has been changed, the program will verify that you wish to close the current editor file and enable you to save the modifications. When you execute New, the program will ask for a file name, but the newly created file is not saved to disk until you use either the Save or Save As command. The hot key for creating a new file is <alt-N>.

Open <alt-O>      The Open command loads an existing text file, so that you can edit or view the text. If there is already a file open that has

been changed, the program will verify that you wish to close the current editor file and enable you to save the modifications. When the Open command is given, the file selection window will appear, and you will be prompted for a file mask. The file mask is a search string telling the program which file names to list. The mask can contain the standard DOS wild-card characters like \* and ?. Pressing <enter> will give the default file mask, \*.\* (which displays all file names). Next the program will display a list of all the files that match the given mask. Select one of these files by positioning the menu bar on the desired file name and pressing <enter>. After opening the file, the Translator will switch to Edit mode. The hot key for opening a file is <alt-O>.

Close <F9>

The Close command will erase the current text file from memory and erase the text window from the screen. If you have changed the current text file, the program will verify that you wish to close the file and enable you to save the modifications. If you close a file without saving it, all changes to the file are lost. The hot key for closing a file is <F9>.

Save <F10>

Save will save the current text file to disk. If there is an existing file on disk with the same file name, Save will erase it and write over it without confirmation. If you are afraid of erasing previous unmodified versions of a text file, use Save As instead of Save, or change the directory using the Change Dir command before you save. The hot key for saving a file is <F10>.

Save As <alt-A>

Save As performs the same operation as Save, except it allows you to specify a new file name under which to save the file. You will not be prompted if a file with this name already exists. Check with the Directory command to avoid overwriting an existing file. The hot key for this command is <alt-A>.

Directory <alt-D>

Directory will display a listing of the current disk directory. When you call the Directory command, the program will open a window on the left portion of the screen and prompt you for a file mask. If you hit <enter> without typing a mask, the program will use the default mask, \*.\* , which will list the names of all of the files in that directory. The hot key for viewing a directory is <alt-D>.

Change Dir <alt-C>

The Change Dir command allows you to change the current working directory. Initially, the current working directory is the one from which you started the program. When you select Change Dir, the program will first display the current directory at the bottom of the screen. After pressing any key, it will prompt you for a new directory. Pressing <esc> will cancel the operation. The hot key for changing directories is <alt-C>.

Print	The Print command will print a text file. Currently, the Print command is not implemented. The DOS print command can be used instead.
Quit <alt-Q>	The Quit command will terminate the APDES Translator and return to DOS. If there is a text file open that has been changed and not saved, the program will verify that you wish to discard changes. Before quitting, the program will also verify that you indeed wish to exit to DOS. The hot key for quitting is <alt-Q>.

### 4.2.3 The Edit Menu

The Edit menu is handled differently than the other menus. When Edit is selected, the built-in editor is invoked directly, rather than through a pull-down menu. The editor is described in detail in Section 4.3.

### 4.2.4 The Parse Menu

From the Parse menu, you can parse either a Gerber PN file [GGT88], an AutoCAD® DXF™ file [AutoCAD88], or a STEP file [ISO91].

PN File	This command will parse a Gerber PN file. PN, which stands for piece number, is a proprietary format developed by Gerber Garment Technology for representing apparel patterns.
DXF File	This command will parse a DXF formatted file. DXF is a proprietary format developed by AutoDesk for exchanging general computer-aided design data. Currently, the AAMA is working on a standard set of conventions for representing apparel pattern data within the DXF format. The Translator program supports an initial version of the DXF pattern conventions.
STEP File	This command will parse a STEP formatted file. The STEP physical file contains instances of the various entities defined by an information model developed at the National Institute of Standards and Technology [Lee90].

When a Parse command is executed, the program will display the file selection window described previously in the Open command. You must enter a file mask (or accept the default) and then select a file using the cursor movement keys. (Pressing <esc> instead of selecting a file name will cancel the operation.) When a file is parsed, the program will display a status box on the screen. If the file is successfully parsed, a success message will be displayed in the status box; otherwise an error message will be displayed. Press any key to close the status box and continue. Once a file is parsed, it remains active until another file is parsed or the program is terminated. To graphically display a pattern piece after it has been parsed, select Display Pattern from the Special menu.

#### 4.2.5 The Generate Menu

The `Generate` menu looks the same as the `Parse` menu, but instead of reading pattern files, the `Generate` menu contains commands that create pattern files. The same three file formats supported by `Parse` are available from the `Generate` menu: `PN`, `DXF` and `STEP`. If you try to execute a `Generate` command before you have parsed a file into memory, the `Translator` will display an error message. The `Generate` commands are listed below:

- |                        |  |
|------------------------|--|
| <code>PN File</code>   | This command will generate a <code>PN</code> data file from the pattern piece currently active.  |
| <code>DXF File</code>  | This command will generate a <code>DXF</code> data file from the pattern piece currently active using the <code>AAMA</code> conventions.                               |
| <code>STEP File</code> | This command will generate a <code>STEP</code> data file from the pattern piece currently active using the <code>STEP</code> conventions for physical file formatting. |

When you select a command from the `Generate` menu, the program will ask for a file name to generate. If a file already exists with the file name given, the new file will overwrite it. A status box on the screen will report the status of the generate operation and any errors.

#### 4.2.6 The Special Menu

The `Special` menu contains commands for viewing and printing the graphic representation of an apparel pattern piece. There are two available commands:

- |                              |  |
|------------------------------|--|
| <code>Display Pattern</code> | Issuing this command will clear the screen and draw a picture of what the pattern piece should look like (with base size and graded sizes). An error message will be displayed if there is no pattern piece currently in memory. This command requires that your computer system has <code>VGA</code> graphics capabilities. |
| <code>Print Pattern</code>   | This command is currently not implemented.   |

#### 4.2.7 The Help Menu

The help features of the `APDES Translator` are easily accessed by pressing `<F1>`. If you are in `Menu` mode, pressing `<F1>` will display a screen of information about how to use the menu system. If you are currently editing a text file, pressing `<F1>` will display a list of editor commands. If you need more detailed information about one menu in particular, more specific help screens are available through the `Help` menu. To view one of these screens, select the appropriate command from the `Help` menu.

- |  |   |
|--|---|
| <code>General Operations &lt;F1&gt;</code> | This command is the same as typing <code>&lt;F1&gt;</code> when you are in <code>Menu</code> mode. The general help screen contains a summary of how to use the menu system, a brief description of each menu, and a list of available global commands. |
|--|---|

File Menu Help	This command displays a help screen describing specifically what commands are available in the File menu and what each one does.
Editor Help	This command displays a help screen for the editor. The editor help screen gives a list of all of the editor commands including cursor movement, editing commands, and file commands.
Parse Menu Help	This command displays a help screen for the Parse menu, describing all of the available commands in the Parse menu.
Generate Menu Help	This command displays a help screen for the Generate menu, describing all of the available commands in the Generate menu.
Special Menu Help	This command will display a screen of information about the commands available in the Special menu.
Help with Help Menu	This command gives detailed information about how to use the help features of the APDES Translator, including a list of the available help screens and instructions for calling them.

### 4.3. The Built-in Editor

The APDES Translator has a built-in, full-screen file editor which can be used to view or edit text files without exiting to DOS. The editor is intended to be used with the text representation of pattern data files. However, it will operate with any file that is a text file. To view or edit an existing file, select Open from the File menu or type `<alt-O>`, the corresponding hot key. This command will prompt for a file name, read the specified text file into memory, and open an edit window on the screen. The file name is displayed along the top border of the edit window; the bottom border of the window is a status line. Within the window you will see the text of the current file, with the cursor positioned at the top of the file.

#### 4.3.1 Entering and Exiting the Editor

The APDES Translator operates in one of two possible modes: Edit mode or Menu mode. The Menu mode of operation has been described in detail previously in this document. When you create a new file or open an existing file (using `<alt-N>`, `<alt-O>` or the corresponding File menu commands) the program will automatically switch to Edit mode.

When you are in Edit mode you can no longer move between menus by using the cursor keys, because these keys are used to move the cursor within the edit window. The hot keys, of course, are still active. You can determine when the program is in Edit mode because (1) an edit window will be displayed on the screen with a double line border, and (2) a blinking cursor will be displayed inside the edit window.

When you are in Edit mode and you wish to switch to Menu mode (for example, you wish to temporarily stop editing and want to parse a PN file), press the `<esc>` key. The cursor will disappear and the edit window border will change from a double line to a single line, indicating that the program is in Menu mode. Switching from Edit mode to Menu mode does not close the current text file. It merely pauses the editing features and allows you to perform menu commands. In other words, the text file previously opened will still be displayed. If you perform a `Display Pattern` command, the edit window will be erased, and a picture of the pattern will be displayed. Pressing any key when the pattern is displayed will cause the pattern to be erased and the program to be returned to Menu mode. Also, the previously displayed text file will be displayed again.

### 4.3.2 The Cursor

When you are in Edit mode, there is always a blinking cursor in the edit window, indicating your current position within the current file. The cursor is either a blinking line underscoring the current character, or a blinking block over each character. When the cursor is a blinking line, the editor is in the overwrite state. This means that any characters typed will write over the existing text. When the cursor is a blinking block, the editor is in the insert state. This means that any characters typed will be inserted into the text file just before the cursor, pushing the subsequent text to the right. These two states are toggled with the `<Ins>` key. The default is the overwrite state.

### 4.3.3 The Status Line

The bottom line of the edit window is the status line. The current line number and character position are displayed on the left side of the status line. These numbers are the coordinates of the cursor position in the text file. When the editor is in insert mode, the letters `INS` are displayed on the right side of the status line.

### 4.3.4 Cursor Movement

The arrow keys on the numeric keypad allow you to move the cursor within a text file. Below is a list of the arrow key commands:

<code>&lt;Left&gt;/&lt;Right&gt;</code>	Move the cursor one character to the left or right.
<code>&lt;Up&gt;/&lt;Down&gt;</code>	Move the cursor to the previous line or next line, respectively.
<code>&lt;PgUp&gt;/&lt;PgDn&gt;</code>	Display the previous or next screen of text in the text file.
<code>&lt;ctl-Left&gt;</code>	Move the cursor one word to the left.
<code>&lt;ctl-Right&gt;</code>	Move the cursor one word to the right.

### 4.3.5 Editing Commands

The following commands provide some simple editing features like inserting and deleting text:

<code>&lt;F2&gt;</code>	Pressing <code>&lt;F2&gt;</code> will insert a blank line into the text file before the current line. (The current line is the line containing the cursor.)
<code>&lt;F3&gt;</code>	Pressing <code>&lt;F3&gt;</code> will delete the line containing the cursor, shifting all subsequent lines up.

- < b s p >** The **<backspace>** key will delete the character immediately before the current cursor position, shifting all subsequent characters in the line to the left.
- < d e l >** The **<del>** key will delete one character at the current cursor position, shifting all subsequent characters in the line to the left.
- < i n s >** The **<ins>** key will switch from the insert to the overwrite state, or vice-versa.

#### 4.3.6 File Commands from within the Editor

The following commands have been described previously because they are hot-key commands in the File menu. They are presented again here briefly, because they are useful for doing file operations from the Edit mode (without having to switch to Menu mode and accessing the File menu).

- < a l t - A >** Save the current text file with new name.
- < a l t - N >** Create a new text file.
- < a l t - O >** Open a text file for editing.
- < F 9 >** Close the current text file.
- < F 1 0 >** Save the current text file.

5. AUTHOR(S)  Thomas Murphy and Howard T. Moncarz		
6. PERFORMING ORGANIZATION (IF JOINT OR OTHER THAN NIST, SEE INSTRUCTIONS)  U.S. DEPARTMENT OF COMMERCE NATIONAL INSTITUTE OF STANDARDS AND TECHNOLOGY GAITHERSBURG, MD 20899	7. CONTRACT/GRANT NUMBER	8. TYPE OF REPORT AND PERIOD COVERED
9. SPONSORING ORGANIZATION NAME AND COMPLETE ADDRESS (STREET, CITY, STATE, ZIP)  Defense Logistics Agency Manufacturing Engineering/Research Office Cameron Station DLA-PR Alexandria, VA 22304-6100		
10. SUPPLEMENTARY NOTES		
11. ABSTRACT (A 200-WORD OR LESS FACTUAL SUMMARY OF MOST SIGNIFICANT INFORMATION. IF DOCUMENT INCLUDES A SIGNIFICANT BIBLIOGRAPHY OR LITERATURE SURVEY, MENTION IT HERE.)  <p>The Apparel STEP Translator is a computer program for translating apparel pattern data from one file format into another. The Translator uses a set of neutral data structures based on an apparel information model previously developed at the National Institute of Standards and Technology (NIST). This program was initially developed on an Apple Macintosh computer. In the summer of 1991, it was ported to an IBM PC computer. This document describes how to install and run the program on a PC compatible computer.</p> <p>This program was developed as part of an ongoing project at NIST to extend the emerging international standard, Standard for the Exchange of Product Model Data (STEP), to apparel applications. The project is sponsored by the U.S. Defense Logistics Agency, and the work is being carried out in cooperation with the Computer Integrated Manufacturing committee of the American Apparel Manufacturers Association (AAMA).</p>
