Abstract

The Electronics and Electrical Engineering Laboratory (EEEL) promotes U.S. economic growth by providing measurement capability of high impact focused primarily on the critical needs of the U.S. electronics and electrical industries, and their customers and suppliers. This measurement capability promotes economic growth by improving the *competitiveness* of U.S. industries. This capability is part of the national infrastructure that helps attract and retain businesses and jobs in the United States. EEEL focuses on measurement capability that U.S. industries need but cannot provide for themselves, for technical, economic, or other reasons. The beneficiaries include U.S. industry, government, academic, other organizations, and the general public.

The supported electronics and electrical industries are highly important to the U.S. economy. In round numbers, the electronics industry ships \$500 billion of products each year. The electrical-equipment industry ships the better part of \$100 billion of products each year. The electric-power industry, a service industry, relies on the electrical-equipment industry for power equipment and uses that equipment to provide \$200 billion of electricity each year. These three industries are enabling industries for the entire U.S. economy. Virtually all other manufacturing and service industries rely on these three industries for equipment, power, information and control technology, and related services.

EEEL's measurement capability is an important part of the *tools* that manufacturers need to conduct research and development toward new products, to manufacture those products, to market them successfully, and to support them after sale. Successful marketplace exchange requires proving product performance to customers, and proving compliance with domestic and international requirements that would otherwise bar market entry. EEEL's measurement capability is also important to the success of materials, information-services, and energy providers. Examples include the telecommunications and electric-power providers, as they seek to remain competitive while addressing new technical challenges inherent in deregulation.

EEEL's strategic plan describes important measurement contributions to the supported industries and the nation. The projects selected result from close interaction with industry and government to identify the needs most important to economic growth and competitiveness.

Keywords

communications, competitiveness, computers, digital electronics, displays, economic growth, electrical equipment, electrical power, electrical quantities, electronic data exchange, electronics, integrated circuits, magnetics, measurement instrumentation, measurement reference standards, measurements, microwaves, optical-fiber communications, optoelectronics, radio frequency, semiconductors, sensors, superconductors, telecommunications, video

PREFACE

This Strategic Plan supports effective management of the Electronics and Electrical Engineering Laboratory (EEEL). This laboratory is one of eight that provide measurement research and related services at the National Institute of Standards and Technology (NIST). NIST itself is an agency within the U.S. Department of Commerce.

The format chosen for the Strategic Plan is responsive to the Government Performance and Results Act of 1993 (GPRA). (Terms with specially defined meanings in the GPRA, like Strategic Plan, have been capitalized here.) This Strategic Plan also specifies Performance Goals for multiple years. As a result, this document supports the development of both the Strategic Plan and the Annual Performance Plans required of the Department of Commerce by the GPRA. The scope of EEEL's Performance Goals is considerable, so only a selection from the most important can appear here.

The format of this plan was derived from *OMB Circular No. A-11, Part 2: Preparation and Submission of Strategic Plans and Annual Performance Plans*. The table below shows how the sections in the OMB circular relate to the sections of this plan. Elements (2) and (4) are addressed in a single section of this plan called "Goals and Objectives". This approach relates Objectives to Performance Goals by stating each Performance Goal immediately after the Objective supported. The other four elements track one-to-one with the sections of this plan.

Circular Section Content	Circular Section Number	EEEL Strategic Plan
(1) Mission Statement	210.6	Mission Statement
(2) Goals and Objectives	210.7	Goals and Objectives
(3) how they will be achieved	210.8	Strategies
(4) relationship to Performance Goals in Annual Performance Plan	210.9	(Goals and Objectives)
(5) key factors affecting achievement	210.10	Factors Affecting Achievement
(6) program evaluations used, and scheduled	210.11	Program Evaluations

The Goals expressed in this plan are generally within EEEL's span of influence. The Objectives are generally within EEEL's span of control, as defined in the OMB Circular. Exceptions are noted where they occur.

This plan has been written to address Evaluation Factors 1 through 6 of the document "Interim Evaluation of Draft Strategic Plans". The Evaluation Factors track with elements (1) through (6) above, respectively. Evaluation Factors 7 through 10 are addressed in plans at higher organizational levels. This approach simplifies the use of this document by the Department of Commerce in responding to the GPRA.

In EEEL's other planning documents, EEEL's work is divided into *programs* that provide a structure for description. To track to these programs, each Objective in this plan ends with a three-letter code in brackets, such as [SEM] for "Semiconductors". This code identifies the EEEL program conducting the work. The program names are listed alphabetically below, along with the associated codes:

Electromagnetic Compatibility	EMC
Electronic Data Exchange	EDE
Low Frequency	LFQ

Magnetics	MAG
National Electrical Standards	NES
Optoelectronics	OPT
Power	PWR
Radio Frequency	RFQ
Semiconductors	SEM
Superconductors	SUP
Video	VID

The scope of this plan includes all work managed by EEEL, whether conducted within EEEL or in other parts of NIST, and whether funded by (1) direct appropriations to NIST, (2) other agencies, or (3) other sources outside NIST. The above programs are conducted primarily within EEEL, drawing on skills from the other NIST laboratories, as needed. In addition, EEEL manages two programs that are conducted NIST wide. These programs are shown below, along with their associated codes:

Law Enforcement Standards	LES
National Semiconductor Metrology Program	NSM

Performing organizations that conduct the work of these two programs, and that are outside EEEL, are referenced after each applicable Objective in this Strategic Plan.

MISSION STATEMENT

The Electronics and Electrical Engineering Laboratory (EEEL) promotes U.S. economic growth by providing measurement capability of high impact focused primarily on the critical needs of the U.S. electronics and electrical industries, and their customers and suppliers.

U.S. economic growth requires international competitiveness, which requires new technology, which in turn requires new measurement capability, which itself must be based on world-class scientific research. Therefore, EEEL pursues world-class capability in measurements to facilitate U.S. economic growth. This capability is part of the national infrastructure that helps attract and retain businesses and jobs in the United States. This capability is an *essential tool* that industry uses to develop and market new products. EEEL focuses on measurement capability that U.S. industries need but cannot provide for themselves for technical, economic, or other reasons. The needed capability reflects the rapidly changing nature of electronic and electrical technologies that are both global and critical.

Provide Measurement Capability that U.S. Industries Cannot Provide

NIST provides only that measurement capability that U.S. industries cannot provide for themselves. There are several circumstances under which NIST's assistance to industry is appropriate: (1) Special measurement expertise is required (often multidisciplinary) that is not available in industry; (2) industry cannot recover the costs of measurement development that is so fundamental and so broadly beneficial; (3) NIST's acknowledged impartiality and measurement competence are required to gain acceptance among manufacturers, suppliers, and customers in order to realize the maximum benefits to the nation; or (4) NIST's imprimatur as the lead U.S. agency for measurements is required to gain international acceptance so that U.S. products can be sold abroad.

Focus on Improving Competitiveness

EEEL strengthens the U.S. economy by strengthening the international competitiveness of U.S. manufacturers. To be competitive, a manufacturer must meet the challenges in Table 1. Success in addressing the first two challenges is largely dependent on a manufacturer's ability to realize desirable product characteristics, especially those in Table 2. Success in addressing all four challenges in Table 1 requires meeting a number of marketing requirements, especially those in Table 3. This plan shows how EEEL helps manufacturers address the challenges in Tables 1, 2, and 3 thus improve their competitiveness.

Address Economically Significant Industries

EEEL assures high impact by addressing three economically significant industries. The estimated annual shipments of these industries for 1999 are shown in Table 4 to the nearest \$100 billion. All told, industries with shipments with approximately \$800 billion per year are the direct beneficiaries of EEEL's work.

Table 4: Shipments of Customer Industries (1999 estimates)

Industry	Shipments (\$billions)
Electronics	500
Electric Power	200
Electrical Equipment	100
	800

Among U.S. manufacturing industries, the electronics industry is the largest in shipments, followed by the automotive and chemical industries. The electronics industry is also the largest in employment, by a factor of two, with 1.9 million employees.

The electric-power industry is composed of the providers of electricity, whether independent or owned by investors, government, or cooperatives. The \$200 billion shown in Table 4 is the electricity they sell in a year.

The electrical-equipment industry makes equipment that provides electricity, through products such as generators, transformers, and batteries. This industry also makes equipment that converts electricity into other useful forms, through products such as motors, lighting, and heating elements.

The industries in Table 4 are enabling industries. All other industries, government agencies, and the public rely on these industries for power, equipment, information and control technology, and related services.

Further International Agreement on Measurements

EEEL supports U.S. international trade by furthering international agreement on measurements. A key means of doing this is comparing EEEL's measurements with those of counterpart measurement laboratories in other nations. International agreement is necessary to meet the requirements for U.S. competitiveness embodied in Table 3, especially the first two: (1) International agreement enables U.S. manufacturers to *gain access to foreign markets* by proving compliance with the growing number of international written standards that might otherwise bar product entry. (2) International agreement enables U.S. manufacturers to *reach agreement with their own suppliers and customers*, both domestic and international, on product characteristics, so that sales can be completed.

Focus on Highest Impact Needs for Measurement Capability

EEEL determines the highest impact measurement needs requiring EEEL's assistance through workshops, surveys, studies, and visits to companies. For example, as shown in Table 5, EEEL has developed and published measurement-needs assessments for two of the three industries through which EEEL stimulates economic growth: the electronics industry and the electric-power industry.

EEEL's ability to anticipate industry's measurement needs benefits greatly from roadmaps developed by industry, including those in Table 6. The roadmaps lay out industry's plans for remaining competitive in future years. This information helps EEEL to understand how industry expects to evolve and, therefore, what measurement capability industry will need, and when. EEEL assists industry in roadmap development by determining the measurement implications for industry's planned route to remain competitive.

Assure Measurement Accuracy, Accessibility, and Applicability

EEEL pursues three important aims when developing measurement capability needed by the U.S. economy. These aims are shown in Table 7 and are highlighted throughout this plan. First, EEEL pursues *measurement accuracy*; above all, the United States relies on EEEL to provide the foundation for accurate measurement of all electrical quantities. Second, EEEL pursues *measurement accessibility*; that is, EEEL translates its measurement capability into forms that are technically and economically accessible to producers and consumers. Without such translation, that capability could not be readily afforded or adopted. Finally, EEEL pursues *measurement applicability*, which is the translation of EEEL's measurement capability into forms applicable to specific needs.

Table 7: Aims for EEEL's Measurement Capability

Accuracy
Accessibility
Applicability

For example, a measurement method for voltage applicable at 0.000001 volts to support the semiconductor industry would not be applicable at 100,000 volts to support the electric-power industry, even though both measurements rely on the same measurement foundation maintained by EEEL.

GOALS AND OBJECTIVES (and responsive Performance Goals)

Goal 1: Strengthen Foundation for All Electrical Measurements

The foundation for all measurements is based on Measurement Reference Standards. They are electronic systems, special devices, or special materials that NIST develops or measures. Each Measurement Reference Standard provides a high level of accuracy for a measured quantity fundamental to the measurement foundation. The expertise of many NIST laboratories is necessary to provide all of the Measurement Reference Standards needed for the measurement foundation.

NIST must transfer accuracy from these Measurement Reference Standards to millions of customers in industry, government, universities, and other organizations. To do this efficiently, NIST employs several approaches; but one is especially important for electrical quantities: calibration. NIST *calibrates* a small number of high-performance measurement instruments provided by customer organizations. Calibration is done by comparing the measurement performance of the instrument against the Measurement Reference Standards. The instruments so calibrated are then used by customer organizations to calibrate other instruments, for themselves and others, and so on in an ever expanding chain of calibrations. In this way, NIST delivers accuracy to millions of users through commercial channels and instrumentation.

NIST's Measurement Reference Standards must have high enough accuracy to support the most demanding users, including those pursuing major innovations. High *accuracy* is best achieved by basing the Measurement Reference Standards on the fundamental physics of nature. Such a basis is believed to be unchanging. Such a basis also furthers *accessibility* by enabling others to build similar Measurement Reference Standards of comparable accuracy because the fundamental physics of nature is accessible to all.

The quantities most important to the foundation for electrical measurements are shown in Table 8. The first four quantities—time, length, mass, and current—are called *base* quantities. They are especially important because measurements of all electrical quantities, as well as many other quantities, are based on them. Measurements with improved accuracy or accessibility are particularly needed for the

quantities checked (✓) in the table. Each of these quantities is discussed below. Then the route from the measurement foundation to competitiveness is discussed.

Mass

Measurement of time and length have an advantage compared to mass. The Measurement Reference Standards for time and length are based on the fundamental physics of nature, so they are very accurate and accessible. For example, time is based on counting a specified number of cycles of radiation emitted by a cesium atom under special conditions. The cesium atom is accessible to everyone. The Measurement Reference Standard for time is maintained by NIST's Physics Laboratory. Time can be measured more accurately than any other quantity.

Unfortunately, the Measurement Reference Standard for mass is not yet based on the fundamental physics of nature. Instead, mass is referenced to a single World Measurement Reference Standard, in the form of a cylinder of platinum-iridium alloy kept at the International Bureau of Weights and Measures (BIPM) in France. A copy is kept at NIST to serve as the U.S. Measurement Reference Standard, and its accuracy is established by comparison with the BIPM one. These cylinders are subject to change caused by factors such as the release of dissolved gases, or the loss of material during handling. This weak member in the measurement foundation limits the accuracy of measurements of mass, weight, electrical quantities, and other quantities, too. The first step to improving the accuracy of mass measurements is to determine how much the Measurement Reference Standard for mass is changing in time. Objective 1.1 below addresses this need. It may later lead to an electronic method for creating a new Measurement Reference Standard for mass that depends only on the fundamental physics of nature and that is, therefore, much more accessible.

Objective 1.1: Establish the long-term accuracy of an electronic system for monitoring the drift in the kilogram. This system was successfully developed in FY 1998 and is based on the fundamental physics of nature. *Performance Goal:* Achieve long-term uncertainty of ten parts per billion in monitoring the kilogram standard by FY2001. [NES]

AC Voltage and Current

The next quantities checked in Table 8 are ac (time-varying) voltage and current. These ac quantities are important because, without them, most services provided by electronic and electrical systems would not be possible, for example, digital computing, wireless communications, and electric-power distribution. For many applications, improved accessibility or improved accuracy are needed for ac quantities. In general, ac quantities are measured by comparison to dc (steady) quantities because dc quantities can be measured very accurately. However, a loss of accuracy occurs in the comparison. Further, the process used for the comparison is expensive. EEEL will pursue two routes to improvement. The first will provide a less expensive method for making the comparison, to improve *accessibility*. It is described in Objective 1.2.

Objective 1.2: Improve accessibility to accurate measurements of ac voltage and ac current by developing a lower-cost integrated-circuit device to relate ac quantities to dc quantities. *Performance Goal:* Complete and test a device, suitable for industry adoption, by FY 2000. [LFQ]

Table 8: Measurement Foundation for Electrical Quantities	
Base Quantities	
	time
	length
✓	mass
	dc current
Electrical Quantities	
	dc voltage
✓	ac voltage
✓	ac current
	power
	impedance
✓	capacitance
	inductance
	resistance

Industry will use these devices to calibrate high-performance instruments. If the costs of these devices can be reduced sufficiently, industry may be able to build them into the high-performance measurement instruments to assure continued accuracy with reduced need for costly calibrations.

The second route to improved measurement of ac quantities is a new method for generating ac voltages, to improve *accuracy*. It is described in Objective 1.3. This approach may lead to a new Measurement Reference Standard for ac voltage, based on the same superconducting effect used for the present Measurement Reference Standard for dc voltage.

Objective 1.3: Improve the accuracy of ac voltage measurements by developing an ac-voltage source based on the same fundamental physics of nature used to provide the Measurement Reference Standard for dc voltage. *Performance Goal:* Demonstrate first operational source by FY 2001. [SUP]

Capacitance

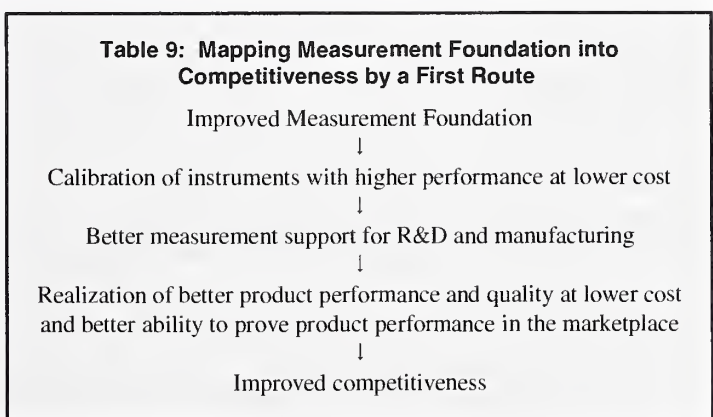

The last quantity checked in Table 8 is capacitance. It is important because it is one of three quantities that can be used to *impede*, and thus control, the flow of electrical current. For example, capacitance, when used with inductance, enables *tuning* television transmitters and television sets to specific channels by impeding the signals from all unwanted channels. The present Measurement Reference Standard for capacitance is already based on the fundamental physics of nature, but its use is too laborious and thus too costly. The new approach in Objective 1.4 promises to reduce the labor required from months to weeks, for each use. It, too, is based on the fundamental physics of nature.

Objective 1.4: Improve accessibility of capacitance measurements by developing a new method for measuring capacitance, using the approach of the present Measurement Reference Standard for dc voltage, plus an electron-tunneling technique for determining electronic charge, both based on the fundamental physics of nature. *Performance Goal:* Compare new capacitance measurement device with present Measurement Reference Standard, the calculable capacitor, by FY 2001. [NES]

Routes to Impacting Competitiveness

The improvements made to the measurement foundation for electrical quantities, in fulfillment of Goal 1, impact competitiveness through two principal routes.

The first route is through support of *high-performance measurement instruments*, as shown in Table 9. Such instruments directly benefit research, development, and manufacturing, especially process control. These, in turn, impact the competitiveness factors identified in Tables 1, 2, and 3.

The second route from the measurement foundation to competitiveness is through development of *application-specific measurement capability*. Such capability derives its *accuracy* from the measurement foundation, but extends *applicability* to specific industry problems that cannot be addressed with the measurement foundation alone. This extension is the subject of Goal 2, which is focused on the electronics industry, and of Goal 3, which is focused on the two electrical industries. A

similar extension must also be made for non-electrical quantities, such as length, to support these industries. Extending the measurement foundation greatly increases the impact of measurement capability on competitiveness, and thus multiplies the benefits of the investment made in strengthening the measurement foundation through pursuit of Goal 1.

Goal 2: Provide Measurement Capability Required for a World-Class Electronics Industry

The products of the electronics and electrical industries provide a variety of basic services shown in Table 10. The table includes examples of the products associated with each basic service. The electronics industry is focused primarily on services related to information signals. These services are the subject of Goal 2. In contrast, the two electrical industries are focused on services related to electric power and energy. These rather different products and services are the subject of Goal 3.

EEEL develops measurement capability that supports products performing all of the information-signal services in Table 10, including the products shown as examples. EEEL's development of application-specific measurement capability for these products impacts competitiveness through all of the mechanisms in Tables 1, 2, and 3. Needed measurement capability arises in all three families of electronic materials that are the most important enablers of the functionality of electronic products. These materials are shown in Table 11: semiconductor (*semi*), optoelectronic (*opto*), and magnetic (*mag*). These materials are particularly critical to the services checked (✓) in the table.

The product characteristics in Table 2 are elaborated in Table 12 for reference in discussing the specific EEEL Objectives below. The electronics industry pursues the desirable product characteristics in Table 12 through many means, especially: (1) miniaturization, accomplished principally with integrated circuits (*int*); (2) higher frequencies (*hfq*); and (3) digital techniques (*dig*). The checks (✓) in Table 12 show how these means tie to the factors impacting competitiveness. The three means are interdependent; progress in one may enable progress in others. The discussion below shows how EEEL's Objectives facilitate industry's efforts to realize the desirable product characteristics in Table 12, and thus competitiveness. First, measurement needs for integration are addressed, since integration advances all information-signal services in Table 10. Then, measurement needs beyond integration are addressed for three information services: display, store, and transfer.

Integration

Integration is fundamental to competitiveness in electronic products. NIST has launched an agency-wide effort to provide measurement capability to facilitate industry's

success with integration. The resulting National Semiconductor Metrology Program focuses on semiconductor products. Products based on semiconductor materials lead the way to the highest levels of integration. Later, products based on other enabling materials will benefit. Some of the most important challenges to improving integration are shown in Table 13.

Higher Fabrication Productivity

Integrated circuits are fabricated, many at a time, in arrays of rows and columns across the surfaces of thin, very flat, round "wafers" of silicon. Fabrication productivity can be increased by making individual integrated circuits smaller, so that more of them can fit on each wafer. This requires making *all* of the circuit elements smaller, including the transistors, their internal insulating materials, and the "wiring" interconnections. The resulting greater "device density", which is already doubling every two to three years, lowers costs and facilitates improving most of the *performance* characteristics in Table 12. However, achieving greater device density requires better application-specific measurements. EEEL responds in Objectives 2.1 to 2.4.

Table 13: Integration Challenges	
Higher Fabrication Productivity	smaller circuit elements bigger wafer sizes
Higher Fabrication Yield	purer input materials better processes
Higher Frequencies	microwave circuits optoelectronic circuits

Objective 2.1: Develop improved measurements for making thinner insulating layers in transistors in integrated circuits, and for identifying better insulating materials, with thicknesses down to at least 2 nanometers. *Performance Goal: Measurement methods published by FY 2001. [SEM]*

Objective 2.2: Support industry's pursuit of new, thinner insulating materials for gate stacks by developing a suite of dielectric evaluation techniques for characterizing electrical breakdown and wear-out of those stacks. *Performance goal: Evaluation techniques completed by FY 2003. [NSM]*

Objective 2.3: Support accuracy of industrial linewidth standards used for accurate calibration of lithography tools for making element sizes down to 100 nanometers. *Performance Goal: Technical support provided for industrial development, and method of "tracing accuracy" to NIST placed in service, by FY 2001. [SEM]*

Objective 2.4: Develop laser power and energy measurements to support ultraviolet lasers operating at additional wavelengths in the 150-200 nanometer range, including 157 nanometers, to support imaging even smaller elements in optical lithography processes. *Performance Goal: Calibration services for wavelengths between 150 and 200 nanometers implemented by FY 2001. [OPT]*

Fabrication productivity can also be improved by increasing the size of the wafers, so that more integrated circuits can be made on each wafer simultaneously. Larger wafer sizes require improved measurements for flatness, since flatness must be maintained over a larger area.

Objective 2.5: Develop measurements for the flatness and thickness of wafers as large as 300 millimeters in diameter, with measurement uncertainties of only 2 nanometers. *Performance Goal: Measurement service available by FY 2000. [NSM: Conducted in NIST's Manufacturing Engineering Laboratory.]*

Higher Fabrication Yield

Reducing fabrication costs requires high "yield", which means the percentage of *working* integrated circuits resulting from fabrication. Fabrication processes are disturbed by even small levels of contamination and even small departures from desired chemical composition. In particular, surfaces of

integrated circuits must be inspected for contaminants and for desired constituents to support process development and trouble shooting.

Objective 2.6: Develop a measurement method for detecting the presence and concentrations of desired and undesired atomic elements in integrated circuits with increased speed and accuracy, using a superconducting x-ray detector. *Performance Goal:* Commercial licensing of technology by FY 2000. Within EEEL's span of influence, but outside EEEL's span of control. [SUP]

Higher Frequencies

Semiconductor integrated circuits must operate at ever higher frequencies to achieve higher information capacity in computer circuits, to support expanding applications of wireless communications and local radar, and to avoid congestion at lower frequencies. At these higher frequencies, extending into the microwave region above 1 gigahertz, the elements of integrated circuits behave differently; new measurement capability is needed to determine performance and to support product development.

Objective 2.7: Develop measurement methods for determining the microwave properties of thin insulating films used within individual conducting lines on integrated-circuit substrates. *Performance Goal:* Measurement method and accompanying software published by FY 2000. [RFQ]

Increasingly, optoelectronic components are being fabricated as integrated circuits, too. Optoelectronic components offer special capabilities, such as the ability to emit light. Epitaxial deposition is an important fabrication technique for making many of these components, such as the vertical-cavity surface-emitting lasers (VCSELs) used as light sources for local-area fiber-optic networks. However, control of fabrication processes, especially while they are occurring (real-time), is presenting major measurement challenges.

Objective 2.8: Provide data and real-time measurement methods for controlling the thickness and composition of layered structures during their growth by epitaxial deposition. *Performance Goal:* Measurement methods for thickness and composition documented by FY 2000. [OPT]

Display

The use of flat-panel liquid-crystal displays is essential for competitiveness in portable computers and portable video products and is becoming increasingly important for competitiveness in desktop computer monitors. The United States is not a significant manufacturer of these displays; but U.S. manufacturers need special measurements to specify, evaluate, and purchase the displays.

Objective 2.9: Provide measurement methods for display performance for use by U.S. industry when specifying, evaluating, and purchasing flat-panel displays for computer and video products. *Performance Goal:* Comprehensive flat-panel display measurement standard completed by industry by FY 2001. Within EEEL's span of influence, but not within EEEL's span of control. [VID]

Store

Storage of information signals is accomplished by three principal methods: (1) semiconductor memory in the form of semiconductor integrated circuits, supported by the measurement efforts described above in the section on "Integration"; (2) optical disk drives; and (3) magnetic disk drives, discussed below. All three methods employ *digital* techniques.

Pursuit of greater information capacity is critical to competitiveness of magnetic disk drives. At present, information density in magnetic disk drives is increasing at a rate of 60 percent per year. To support further advances, Measurement Reference Standards are needed for calibrating the special microscopes that industry uses to develop products employing ever smaller magnetic patterns.

Objective 2.10: Support increased information density (bits per unit area) in magnetic disk drives by developing a Magnetic Imaging Reference Sample (MIRS) containing magnetic patterns of accurately known dimensions in the vicinity of 1 micrometer. *Performance Goal:* MIRS completed by FY 2000. [MAG]

Also, for magnetic disk drives, higher information transfer rates, based on *higher frequencies* for reading and writing, are also a major factor in competitiveness. Especially needed are measurement methods for determining the time required to magnetize (switch) the individual bits (1 or 0) of information.

Objective 2.11: Develop a measurement method for switching times in magnetic materials with resolution of 0.1 nanosecond to support data rates of 1 gigabit per second or higher, versus the present 100-200 megabits per second. *Performance Goal:* Measurement method published by FY 2000. [MAG]

Transfer

Optical-fiber communications systems are critical to the national infrastructure and are dependent upon continued advances in measurement capability to support improvements in performance, quality control, and compatibility for components. Especially needed are Measurement Reference Standards for the calibration of instruments that measure critical quantities.

Objective 2.12: Develop Measurement Reference Standards to support accurate measurement of (1) wavelengths of light, with focus on the 1280-1560 nanometer range, to support wavelength-division multiplexing for increased information capacity; and (2) propagation characteristics critical to specifying the information capacity of an optical fiber. *Performance Goal:* New Measurement Reference Standards issued by FY 2000. [OPT]

The emergence of new microwave products, such as roadside communications, vehicle anti-collision radar, and automatic traffic-light controls, motivate the use of *higher frequencies* from 75 gigahertz to 100 gigahertz. These higher frequencies are less used than lower frequencies and offer special properties such as controllable range to minimize interference with nearby systems. New measurement capability is needed to support the development of the antennas required for the new applications.

Objective 2.13: Develop the facilities and methodology needed for near-field scanning antenna measurements in the region 75-100 gigahertz. *Performance Goal:* Facility improvements and methodology implemented by FY 2000. [RFQ]

The emergence of more electronic products emitting electromagnetic signals has increased the need to assure that products with critical electronic components, such as motor vehicles, are not susceptible to harmful interference. International standards for susceptibility testing are particularly needed.

Objective 2.14: Provide technical support in pursuit of U.S. and international acceptance of reverberation-chamber measurements as a standard method for compliance testing for electromagnetic susceptibility. *Performance Goal:* Domestic and international acceptance realized by FY 2000. Within EEEL's span of influence, but outside EEEL's span of control. [EMC]

Goal 3: Provide Measurement Capability Required for World-Class Electrical Industries

The measurement needs of the electrical-equipment industry are driven by many of the same competitiveness factors that apply to the electronics industry. The electrical-equipment industry supplies equipment to the automotive industry, the appliance industry, and virtually every other manufacturing industry. The electrical-equipment industry also provides equipment to the electric-power industry, which is a service industry that plays an especially critical role in the national infrastructure. The

Table 14: Basic Power and Energy Services

		eff	rel	equ	env	pq
generate	generator	<input type="checkbox"/>			<input type="checkbox"/>	
control	relay, switchgear	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>		<input type="checkbox"/>	<input type="checkbox"/>
transfer	transformer, wire	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	
convert	motor, lighting	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
store	battery	<input type="checkbox"/>			<input type="checkbox"/>	

driving forces influencing these two electrical industries are usefully considered together and as a combination of competitiveness challenges and broader national challenges. Table 14 expands on the lower half of Table 10 by showing the principal points of intersection between basic power and energy services and national challenges. The challenges are energy efficiency (eff), the reliability and stability of the national power system (rel), equity in revenue metering (equ), environmental quality (env), and power quality (pq). The intersections of the challenges with the basic power and energy services are indicated by the presence of a box (□), with or without a dot (•) in it. EEEL has provided measurement capability helpful in addressing many of these challenges. Each intersection in Table 14 that is the subject of EEEL work described below is marked with a dot in the box (◻). Deregulation is being introduced to realize the benefits of domestic competition. It will give customers a choice of providers, based on market factors, such as price and quality of service. Deregulation, and its implications for needed measurement support, are examined in detail in EEEL's study of the electric-power industry, listed in Table 5. In Objectives 3.1 through 3.3 below, EEEL is responding by providing measurement capability helpful in addressing (1) equity in revenue metering; (2) control of the power network to assure reliability and stability; and (3) energy efficiency in use.

Equity

Under deregulation, electricity will be generated by more providers and will be delivered to users through a shared transmission and distribution system, just as shared highways and railways enable moving merchandise. Accurate revenue metering, at a greater number of sites, will be needed to track ownership and to support equitable volume billing for electricity moving through the shared system. In response, industry has developed electronic watt-hour meters with higher accuracy over wider ranges. Calibrations from NIST are needed to validate accuracy and assure acceptance.

Objective 3.1: Develop new capability to support the calibration of electronic watt-hour revenue meter standards that provide high accuracy at five times the voltage and twenty times the current of earlier designs. *Performance Goal:* Build and validate needed capability by FY 2000. [PWR]

Reliability and Stability

The national electric-power system will become more complex, and thus more challenging to control, under deregulation. Particularly important are improved measurement sensors for providing the data needed by control systems to assure the reliability and stability of the system. Optical sensors for electrical quantities are especially promising. These sensors resist interference, interface readily with optical-fiber communications systems for transfer of data to control systems, and enable more measurements at more locations throughout the electric-power system.

Objective 3.2: Establish the feasibility of using optical sensors to achieve improved accuracy and accessibility in a new Measurement Reference Standard for ac current, and in electrical measurements made throughout the national electric-power system. *Performance Goal:* Develop and test calibration procedure for optical current sensors by FY 2000. [PWR]

Efficiency

Power distribution transformers perform the last voltage reduction just before the delivery of electricity to end users. High efficiency in these transformers is essential to the overall efficiency of the electric-power system.

Objective 3.3: Validate, or improve as necessary, measurement methods and statistical sampling protocols for determining the energy efficiency of power-system distribution transformers (35,000 volts and below). *Performance Goal:* Publication of method and protocol by FY 2002. [PWR]

Goal 4: Provide Technical Support to Law Enforcement

EEEL manages a special NIST-wide program, authorized by the Congress, that supports the criminal-justice community. That community includes law enforcement, corrections, crime laboratories, fire services, and the court system. This program exploits the measurement and standards capabilities of NIST in diverse fields of science and technology to benefit this community in several ways: (1) to reduce injury and loss of life in law enforcement encounters; (2) to improve the quality of justice and security by increasing the reliability of techniques used for investigations and identification; and (3) to hold down the costs of public safety. This program is funded entirely by other Federal agencies, including the Departments of Justice and Transportation, and the Executive Office of the President. Upcoming Objectives, focused on reduction of loss of life, are described below.

Objective 4.1: Support reduction of loss of life by developing mathematical models, based on laboratory and field investigations, that aid in estimating injury caused by less-than-lethal technologies employing physical-impact weapons. *Performance Goal:* Completion of NIJ technical report on use of the model to determine injury from blunt trauma by FY 2001. [LES: Conducted by U.S. Army and contractor.]

Objective 4.2: Support reduction of loss of life and injuries in law-enforcement encounters by developing a standard for stab- and puncture-resistant armor, and issue it as an NIJ standard. (*Performance goal:* Implementation as an NIJ standard by FY 2001. Within sphere of influence but not control.) [LES]

STRATEGIES (how the Goals and Objectives will be achieved)

Resources (human, capital, and information)

EEEL's Goals are repeated in Table 15, along with the resources applied to each in FY 1999. If these levels of resources can be continued to FY 2005 in constant dollars, they will support pursuit of EEEL's goals to the extent described below. Seventy-four percent of EEEL's funding comes to NIST by direct appropriation. This funding supports work broadly beneficial to the national economy. The rest of EEEL's funding comes from "other agencies" and "other outside" organizations, as reimbursements for measurement services they require.

Goal 1: This is EEEL's first priority, since strengthening the measurement foundation underpins all progress in measurements. Resources are adequate for pursuit of core activity but are less than needed for advances to support innovative new technologies developed by industry.

Goal 2: This is EEEL's second priority. EEEL can address selected measurement needs of the electronics industry, including those in the Objectives. However, the broader needs are many times greater, based on EEEL's study of the electronics industry in Table 5, which integrated information from many key information resources, and on the roadmaps in Table 6, which are themselves key information resources. Resources are less than needed. To make up the shortfall, EEEL will pursue budget initiatives and support from other Federal agencies when possible. To maximize leverage, EEEL focuses on electronic materials and components that are the basis for diverse electronic products.

Goal 3: This is EEEL's third priority. EEEL can address selected measurement needs of the two electrical industries, including those in the Objectives. The broader needs are many times greater, based on EEEL's study of the electric-power industry in Table 5, which integrated many key information resources. Resources are less than needed. To make up the shortfall, EEEL will pursue budget initiatives and support from other Federal agencies when possible.

Goal 4: All funding is provided by other Federal agencies and is adequate to the tasks requested of NIST.

Table 15: FY 1999 Resources Managed by EEEL

	Funding (\$millions)				Staff	
	Total	NIST	Other Agencies	Other Outside	Full Time Permanent	Other Paid
Funds Spent Inside EEEL						
Goal 1: Strengthen Foundation for All Electrical Measurements	11	7	3	1	58	8
Goal 2: Provide Measurement Capability Required for a World-Class Electronics Industry	35	29	3	3	181	24
Goal 3: Provide Measurement Capability Required for World-Class Electrical Industries	1	1	-	-	11	1
Goal 4: Provide Technical Support to Law Enforcement	3	-	3	-	9	-
	50	37	9	4	260	33
Funds Spent Outside EEEL						
Goal 2: Provide Measurement Capability Required for a World-Class Electronics Industry	7	7	-			
Goal 4: Provide Technical Support to Law Enforcement	2	-	2			

All dollars rounded to nearest million.

Communication, Accountability, and Other Factors

Goals and Objectives are developed with the EEEL staff and managers, and are communicated during that process. This plan is published and posted on the Internet for other agencies, customer organizations, and the general public. EEEL managers and staff are held accountable through individual performance plans. EEEL programs, as presently designed, are suitable for achieving the Objectives stated here. No legislative changes are required to enable the achievement of those Objectives.

FACTORS AFFECTING ACHIEVEMENT (external)

The most important challenge to EEEL is *keeping pace* with the growing number and complexity of measurement needs, as electronic and electrical technologies advance rapidly on a global basis. One form of EEEL's response is to assist industry in developing roadmaps because they provide early warning of impending measurement needs. The roadmaps are shown in Table 6.

NIST faces considerable *technical complexity* in its work because NIST does *only* what industry cannot do for itself. EEEL responds by hiring able staff and by assisting NIST in planning the facilities required to support world-class research. Implementation of the NIST's Advanced Measurements Laboratory is the most important facilities improvement affecting the long-term health of EEEL's measurement program.

The world of written, or documentary, standards is changing. Written standards are generally developed by the private sector. They address product performance, quality, compatibility, and safety, among other topics. When embodied as international standards, they affect market entry and U.S. competitiveness for many products. EEEL joins the rest of NIST in examining industry arguments for a different, and possibly increased role, for NIST in written standards, particularly when effective representation of U.S. interests in international standards bodies is at stake. If this direction is determined to be in the national interest, an increased, and competing, demand for NIST's resources will result.

PROGRAM EVALUATION

EEEL plans its program primarily through *prospective evaluation* of needs. EEEL continues to review program relevance throughout its own research-and-development stages in order to guide the work to a successful conclusion and to facilitate timely transfer to the user.

EEEL *monitors its outputs*: (1) reimbursed services such as calibrations services and sale of Measurement Reference Standards for calibrating instruments; (2) joint activities, such as participation in written-standards organizations, professional societies, trade associations, and cooperative research, used for discovery of needs and delivery of findings; and (3) communications, such as publications, conference presentations, and consultations, used for delivery of findings and discovery of needs.

EEEL's *output quality* is assessed in published documents each year by an outside panel of impartial experts from industry, government, and universities, convened by the National Research Council.

EEEL *measures outcomes* through economic impact studies which sample EEEL's work. The studies are conducted by outside contractors funded by NIST. The studies completed (c) since 1991 are shown in Table 16, along with those currently underway (u). The dates are the actual or anticipated completion dates. The findings of these studies help guide planning by indicating what types of contributions have proved especially helpful to industry. The studies also provide a measure of assurance that EEEL's overall process for the selection and conduct of its work is effective.

Table 16: Economic Impact Studies Completed and Underway

FY	Topic	Status
1991	electromagnetic compatibility	c
1992	semiconductors (electromigration)	c
1992	optical fibers	c
1995	power and energy	c
1999	semiconductors (power devices)	c
2000	optoelectronics (laser calibrations)	u
2000	measurement foundation (voltage)	u

Status: c = completed, u = underway
