DISCLAIMER

Certain commercial equipment or instruments are identified in this report to specify adequately the experimental procedures. Such identification does not imply recommendations or endorsement by the National Institute of Standards and Technology nor does it imply that the equipment or instruments are the best available for the purpose.

ABSTRACT

The National Institute of Standards and Technology (NIST), in support of the National Oceanic and Atmospheric Administration's Marine Mammal Health and Stranding Response Program (NOAA/MMHSRP), conducts annual interlaboratory comparison exercises for the determination of chlorinated pesticides, polychlorinated biphenyl congeners (PCBs), and trace elements in marine mammal tissues. These exercises provide one mechanism for laboratories to evaluate their measurement quality and comparability for these constituents in marine mammal tissues. In the 2003 exercise, 24 laboratories participated in determining the concentrations of selected PCBs and organochlorine pesticides in a homogenized blubber control material "Marine Mammal Quality Assurance Exercise Homogenate VI" (Homogenate VI) and Standard Reference Material (SRM) 1945 Organics in Whale Blubber. This report includes the results reported by the participating laboratories, combined consensus data results, and summary statistics for each analyte in the samples. The numerical indices used to assess laboratory performance are also discussed.

INTRODUCTION

Laboratories measuring organic contaminants in the marine environment must assess the accuracy and precision of their measurements. Quality control of measurements made on marine environmental samples is vital to the accurate assessment of marine pollution and its effects on wildlife and human health. NIST aims to improve the quality of analytical measurements of organic contaminants in marine and environmental matrices by developing improved analytical methods, producing NIST Standard Reference Materials (SRMs) and other control materials, and conducting annual interlaboratory comparison exercises.

Through the NIST National Marine Analytical Quality Assurance Program and with support from the NOAA Marine Mammal Health and Stranding Response Program (MMHSRP), NIST conducts interlaboratory comparison activities to include analyses of marine mammal tissues. The 2003 NIST/NOAA Interlaboratory Comparison Exercise Program for Organic Contaminants in Marine Mammal Tissues was modeled after previous exercises (Schantz et al., 1996; Schantz et al., 2002; Kucklick et al., 2002). The current exercise was designed to help laboratories assess data comparability and quality relative to other groups providing measurements of organochlorine contaminants in marine mammal tissues and to link these important measurements to a national metrology laboratory. The results of the exercises presented in this report should be useful for both assessing current methodology and reducing the variability of contaminant data reported on marine mammals. Future exercises will allow for the assessment of analytical data quality over time. This report summarizes the 2003 organic contaminant exercise including methods used for analysis, data reported by the laboratories on the intercomparison materials, and numerical indices used to assess laboratory performance. A report describing the 2003 trace element results of this exercise is in preparation.

MATERIALS USED IN THE 2003 EXERCISE

The 2003 NIST/NOAA Interlaboratory Comparison Exercise for Organochlorines in Marine Mammal Tissues (2003 MMQA) used two materials sent out to 30 laboratories. Twenty-four laboratories submitted data for this exercise (Table 1). Participants were asked to make three measurements each on two materials: SRM 1945 “Organics in Whale Blubber” and MMQA-VI (Homogenate VI), the “unknown.” The unknown material for the 2003 Organic Intercomparison Exercise was fat from two polar bears (*Ursus maritimus*). Four approximately 150 g samples, 2 samples from each animal, were shipped to the NMMTB as extra material. Both animals were adult males and were collected from Barrow, Alaska. The tissues were homogenized and blended (Zeisler *et al.*, 1983) on February 7, 2002 and partitioned into sixty-three 8 g to 10 g samples to be used as the Unknown QA Material VI. At NIST-Charleston, the blubber tissue was stored in a liquid nitrogen (LN₂) vapor phase freezer at -150 °C until prepared for this exercise. One bottle of this material along with one bottle of SRM 1945 were sent either on dry ice or using a liquid nitrogen cooled biological dry shipper via overnight express to each participating laboratory.

Exercise Requirements and Target Analytes

A suite of analytes was chosen for the exercise based on those used in prior exercises (Schantz et al., 1996; Schantz et al., 2002; Kucklick et al., 2002) and several additional analytes were

included to broaden this list (Table 2). In addition the compounds listed in Table 2, participants were requested to provide, if possible, values for brominated diphenyl ether congeners, coplanar PCB congeners, total toxaphene and toxaphene congeners, chlorinated dioxins and furans and fatty acids. Laboratories were requested to make triplicate measurements of these compounds in each of the materials and report their data using a data template provided by NIST. Results from the exercise were discussed during a workshop held in conjunction with the 2003 Society of Marine Mammology Biennial meeting held in Greensboro, North Carolina on December 16, 2003.

EVALUATION OF THE EXERCISE RESULTS

Determination of Laboratory Means for Compounds in Table 3

Each laboratory reported the results of their analyses (Sample 1, Sample 2, and Sample 3) and the mean for each laboratory was calculated. Non-numerical results were reported as “NA” (not available). None of the target analytes were below the limit of detection for the participating laboratories (Tables 4 - 7 and Appendix A).

Establishment of Consensus Values

The following guidelines were used by NIST for establishing the “consensus values” for the exercise. The consensus values for Homogenate VI were the mean of all the reported laboratory means for a compound after the data were first screened for the presence of outliers by examining box plots. Individual means for the majority of data were log normally distributed, hence the geometric mean was used. Outliers were not included in the mean. Generally, most or all the values were included in the determination of the consensus values (outliers are shown in bold in Tables 4 and 5). The target values for the SRM were the certified values, reference values, or the consensus value determined from data pooled from prior exercises where SRM 1945 was also analyzed (Tables 6 and 7).

Reported Results

Laboratories were assigned a numerical identification code or (alphabetical code for fatty acids) based on the order in which data were received with the exception of NIST Charleston, which was Laboratory 1 and NIST Gaithersburg, which was Laboratory 2. The same code was used for both materials. The results from the analysis of Homogenate VI and SRM 1945 are summarized in Tables 4 through 7. Appendix A shows the tabulated results from the individual laboratories for both materials and the results are shown graphically in Appendix B. Appendix C gives the methods used for analysis by each laboratory and Appendix D shows data for additional analytes.

Assignment of z-and p-scores

Performance Scores: Different programs have different data quality needs. The acceptability of the results submitted by a laboratory will be decided by the individual program(s) for which the laboratory provides data. Typically, the program will use these exercise results in conjunction with the laboratory's performance in the analysis of certified reference materials and/or control materials, and of other quality assurance samples. These exercise results are shown in a number of ways in this report to aid in the evaluation of data quality.

IUPAC guidelines (IUPAC 1993) describe the use of "z-scores" and "p-scores" for assessment of accuracy and precision in interlaboratory comparison exercises, such as described in this report. These indices assess the difference between the result of the laboratory and the exercise assigned value, and can be used, with caution, to compare performance on different analytes and on different materials.

Accuracy Assessment (z-score):

$$z = \text{bias estimate} / \text{performance criterion}$$

or

$$z = (x - X)/\sigma$$

where x is the individual laboratory result, X is the "Exercise Assigned Value," and σ is the target value for the standard deviation. As described in the IUPAC guidelines, the choice of σ is dependent upon the data quality objective of a particular program. It can be fixed or determined by reference to validated methodology (*e.g.*, the calculated σ from the exercise data, see Tables 4 through 7). The fixed performance criterion is more useful in the comparison of a laboratory's performance on different materials, while the use of the actual variation may be more useful within a given exercise, for example, if the determination of a particular analyte is more problematic than usual.

The z-scores calculated using both approaches and applied to each laboratory's data are given in Appendix A. The same criterion was adopted for use in this exercise as was used in the former NIST/NOAA/NS&T program, where the target standard deviation was set to 25 % of the exercise assigned value. The z-scores for the Homogenatel VI represent 25 % of the assigned value so that $z = +1$ is the assigned value plus 25 %, $z = -1$ is the assigned value minus 25 % and so forth. z-scores are also calculated based on the standard deviation of an analyte in the control material such that $z = +1$ is one "exercise standard deviation" higher than the assigned value and $z = -1$ is one "exercise standard deviation" lower than the assigned value and so forth. From a scientific point of view, IUPAC does not recommend the classification of z-scores, but does allow for such classification, *e.g.*,

$$|z| \leq 2 \quad \text{Satisfactory}$$

$$2 \leq |z| \leq 3 \quad \text{Questionable}$$

$$|z| \geq 3 \quad \text{Unsatisfactory}$$

The tables in Appendix A summarize the results and performance indices including the number of analytes that fall within each category for each laboratory.

Precision Assessment (p-score):

$$p = \sigma_{\text{lab}} / \sigma_{\text{target}} \approx CV_{\text{lab}} / CV_{\text{target}}$$

where σ_{lab} and σ_{target} are variance estimates for the individual laboratory and the target variance, respectively. The CV_{lab} is the coefficient of variance (or ratio of standard deviation to the mean), while the CV_{target} is a target value chosen by the participants. During the workshop that accompanied this exercise, a target CV of 15% was agreed upon, which is the same value used by other NIST run exercise programs (Schantz et al., 1996; Schantz et al., 2002; Kucklick et al., 2002). Note that the precision that p describes is that which occurs within a batch of analyses. Between-batch variance is likely larger and was not assessed in this exercise.

RESULTS AND DISCUSSION

Summarized results are shown in Tables 4 through 7 for the compounds listed in Table 3 and data for brominated diphenyl ether (BDE) congeners and fatty acids are shown in Tables 8 and 9, respectively. The concentration of certain organochlorine compounds in Homogenate VI was considerably higher than in SRM 1945, especially for PCB 153 and *beta*-HCH. The relative concentrations of organochlorine compounds in the polar bear were very different than SRM 1945, which is pilot whale blubber, and consistent with observations from other studies of polar bears (e.g. Letcher et al., 1998). The consensus value for the sum of PCB congeners in Homogenate VI was 3,580 ng/g wet mass versus 1,350 ng/g wet mass in SRM 1945 (sum of the certified and reference values, Table 6). Likewise the sum of the organochlorine pesticides in Homogenate VI was 2,610 ng/g wet mass versus 1,500 ng/g wet mass in SRM 1945 (sum of the reference values, Table 7). PCB 153 was present in the highest concentration in Homogenate VI samples with a consensus value of 1610 ng/g (522 ng/g (1 SD)) compared to a certified value of 213 ng/g \pm 19 ng/g in SRM 1945. *Beta*-HCH was the compound present in the highest concentration in Homogenate VI with a concentration of 1100 ng/g (375 ng/g) versus a reference value of 8.0 ng/g \pm 1.4 ng/g in SRM 1945. The mean “total extractable organics” determined in Homogenate VI was 73.1 % (4.3 %) and the average value determined by the participants in SRM 1945 was 73.4 % (7.3 %) relative to the certified value of 74.3 % \pm 0.45 % (Table 7).

The relative scatter among the laboratories appeared similar for many of the compounds with some exceptions (Appendix B). As in previous years, this was especially noticeable for PCB congener 201 for both the control material and the SRM. This may be a result of the two nomenclature systems used for this PCB congener (Guitart et al., 1993). High biases (most values exceeding the certified value) were observed among the values determined in the SRM relative to the certified value for the following compounds: PCB 87, PCB 99, PCB 180, PCB 194, PCB 206, PCB 209, and *cis*-nonachlor. Low biases (most values below the certified or

reference value) were observed for PCB 18, PCB 28, PCB 49, PCB 52, PCB 105, PCB 149, PCB 195, 4,4'-DDT, 4,4'-DDD, HCB, and *trans*-nonachlor.

The data reported on the BDE congeners are given in Table 8. Five laboratories submitted data for the BDE congeners for SRM 1945 and four submitted data for Homogenate VI. Data for 19 BDE congeners were reported along with data for brominated biphenyl 153. A consensus mean was derived using the geometric mean of the reported values after screening for outliers using box plots.

The relative proportions and the concentrations of BDE congeners differed between the two materials. The concentrations of BDE congeners were at least ten-fold less in Homogenate VI than in SRM 1945. The lower concentrations in Homogenate VI are not unexpected based on other published BDE measurements in Arctic marine mammals (*e.g.*, Ikonomou et al., 2002). Based on the consensus means, BDE 47 comprised 44 % and 73 % of the total BDEs (sum of congeners 47, 99, 100, 153, and 154) in SRM 1945 and Homogenate VI, respectively.

Table 8 also contains literature values for the concentrations of BDE congeners 47, 99, 100, 153, and 154 in SRM 1945. In general, consensus values agreed with literature values for SRM 1945 within a factor of two; however the literature values were all greater than the consensus values for unknown reasons.

Data for a large number (≈ 100) of individual fatty acids were reported by four laboratories (Tables 9 and 10). However, only the fatty acids listed in Table 9 and 10 were requested; additional fatty acids are listed in Appendix D. A mean value was calculated for laboratories A through C as these results are in mg/g wet mass. Laboratory D's data were not included in this as it appeared their data were in units of fraction (%) of fatty acid to the total fatty acids. Laboratories E and F's data are in fraction (%) of fatty acid to the total fatty acids.

A number of laboratories reported results for analytes in addition to the target compounds (Appendix D). Additional analytes that were reported included other PCB congeners (Labs 1, 2, 4, 6, 7, 8, 19, 22), coplanar PCBs (Labs 5, 6, 8, 13), and other organochlorine pesticides (Labs 1, 2, 4, 6, 14).

The participants used a variety of different methods to analyze the materials in this exercise (Appendix E). Nine laboratories used Soxhlet extraction to extract the materials, eight used pressurized fluid extraction, and the remaining laboratories used other techniques including maceration with solvent and column elution. Of the laboratories that responded, eight laboratories performed a pre-separation on the sample extracts prior to gas chromatographic (GC) analysis (*i.e.*, fractionation), while nine laboratories did not. About half of the laboratories used GC/electron capture detection (ECD) to quantify the compounds and the other half used GC/mass spectrometry detection (MS) or a combination of GC/ECD and GC/MS. Eight laboratories performed a pre-separation prior to analysis by GC/MS. Other details are summarized in Appendix E.

CONCLUSIONS

Twenty-four laboratories submitted data for the two exercise materials on a wide variety of organic constituents including PCBs, pesticides, fatty acids, and BDE congeners. The increasing participation in the exercise indicates the value of the exercise to those labs submitting data. A new exercise will be conducted in late 2004 or early 2005 using SRM 1945 and a new unknown material. The exercise coordinators plan to vary the type of control material used to include other species of interest such as a delphinid. NIST is somewhat constrained on the choice of the material as a fairly large quantity (≈ 1 kg) is needed, and this amount of material is not available on a routine basis. SRM 1945 will continue to be the SRM used in this exercise, because it is the only marine mammal tissue available with certified and reference values for organochlorine compounds. The core suite of analytes (Table 3) will remain the same, however data from BDEs, toxaphene and fatty acids will be requested.

DL=Below Detection Limit

Table 4: Mean organochlorine pesticide and lipid concentrations in Homogenate VI determined by each laboratory (ng/g wet mass and percent (mass fraction), respectively). Notes are given in Appendix E.

The values in bold are outliers and were not used to determine the geometric consensus mean.

Appendix D

Tabular summary of methods used for analysis by each laboratory

Summary of Methods Used

Laboratory	Approximate mass of sample extracted (g):		Procedure used to measure Lipid	Were "wet" or "dry" samples extracted?	
	SRM 1945	Homog. VI		SRM 1945	Homog. VI
1	1	1	Subsampled the dichloromethane extract, evaporated the solvent and weighed the remaining residue.	wet	wet
2	1	1	PFE hexane:acetone 4:1; repeated extraction, combined extracts; repeat drying 30 min @ 100-101° C until plateau.	wet	wet
3	1	1	Gravimetric. After extraction, a 5 mL aliquote of a 100 mL volume is dried to determine lipid percent.	wet	wet
4	1	1	Gravimetric; ASE extraction using dichloromethane, followed by evaporation of solvent. Lipid determined as total extractable organics.	wet	wet
5	0.29	0.31	Pentane/hexane extraction and quantitation by thin-layer chromatography with flame ionization detection (TLC/FID).	wet	wet
6	1.6 to 2.9	4.0 to 5.8	After extraction with dichloromethane, each extract was concentrated to 10 mL. 2 mL of this extract was added to a previously weighed and dried aluminum pan. The contents were allowed to evaporate, and the pan was reweighed.	dry	dry
7	1.37 to 1.40	1.31-1.50	Gravimetric, 10% of extract.	wet	wet
8	0.3	0.2	Determined % lipid in the process of sample extraction, i.e., did not use separate sample for lipid. Mortar pestle / sodium sulfate / gravity column extraction with 1:1 DCM:HEX collected extract / evaporated by roto vap and nitrogen .	dry	dry
9	1	1	Gravimetric	wet	wet
10	0.9 to 1 g	0.8 to 1 g	Removed 1mL aliquot from 10 mL sample extract and placed in small preweighed glass vial. Evaporated DCM in the hood for a total of 24 hours. Weighed individual vials after 12 and 24 hours. Averaged the masses and calculated a percent lipid (n=3 for each sample).	wet	wet
11	0.9	0.9	An aliquot of total extract was dried and weighed	wet	wet
12	2	2	Sample extracted with ethyl ether/petroleum ether (1:1). Evaporate the solvent and record the weight that stays in container.	wet	wet

Summary of Methods Used

Laboratory	Approximate mass of sample extracted (g):		Procedure used to measure Lipid	Were "wet" or "dry" samples extracted?	
	SRM 1945	Homog. VI		SRM 1945	Homog. VI
13	2	2	Gravimetric on whole sample	wet	wet
14	1	1	*NA	wet	wet
15	0.55	0.51	Dionex PFE (ASE) method # 342. Preheat 1 min, heat 6 min, static 3 min, methylene chloride, oven temp 125 °C 2000 psi, 3 cycles, 60 % vol. flush, 120 sec. purge. Samples extracted for lipids, evaporated and extracts dried at 70 °C.	wet	wet
16	1.5 to 2.5	1.5 to 2.5	Gravimetric determination after extraction with cyclohexane and acetone. The lipid extract was dried at least 24 hours at 40 °C in a sand bath then weighted until constant weight.	wet	wet
17	2.2	3.1	It was determined gravimetrically from an aliquot of the Soxhlet extraction.	wet	wet
18	0.27	0.3	Samples were mixed with sodium sulphate and Soxhlet extracted. Lipids were determined on an aliquot of the extract (~1/6) after solvent evaporation at 105 °C for 1h.	wet	wet
19	3	2.1	Gravimetric analysis	wet	wet
20	5.1	5.5	see Smedes, Foppe. Determination of total lipid using non-chlorinated solvents. Analyst (Cambridge, United Kingdom) (1999), 124(11), 1711-1718	wet	wet

Summary of Methods Used

Laboratory	Extraction Method	Extraction Solvent	Extraction Time	Extraction Other	Sample Extract Cleanup Method
1	Pressurized Fluid Extraction (Dionex, ASE)	Dichloromethane	15 min	Sample dried with 45 g sodium sulfate, then packed into a 33 mL PFE cell. PFE Conditions: cell temp 100 °C. equilibration 5 min, static time 5 min, cell pressure 2000 psi and there were three cycles. Samples were first run through a Gel Permeation chrom	Samples were first run through a Gel Permeation chromatography column (PL Gel 600 mm) using DCM as the mobile phase. Eluent containing organochlorines was cleaned up by automated SPE using a 1 g Florisil column then fractionated on a silicic acid column
2	Pressurized Fluid Extraction (Dionex, ASE)	Dichloromethane	15 min	100 °C; 2000 psi, 3 cycles; 90	SEC - collect 70 mL fraction; conc with solvent change to hexane NH2 Sep Pak - condition and elute with 15 mL of 10% dichloromethane in hexane : concentrate for GC/MS.
3	Pressurized Fluid Extraction (Dionex, ASE)	Dichloromethane	40 min		A 1 gram sample is extracted using a Dionex Accelerated Solvent Extractor at 110 degrees Celsius and 1300 psi. The solvent is reduced and the oil is removed by size exclusion chromatography using SX-3 Bio-beads. The sample is then passed through a florisil 1 gram disposable cartridge on a Zymark Rapid Trace SPE workstation.
4	Pressurized Fluid Extraction (Dionex, ASE)	Dichloromethane	16 min	ASE Conditions: Pressure = 2000 psi, temp = 100 °C	Gravity flow column with silica and neutral alumina, followed by HPLC-SEC to elute AH/CH fraction.
5	See Krahn et al. 1994 Chemosphere	Pentane/hexane (50:50; v/v)	4 min		Acidic/basic/neutral silica gel column (see Krahn et al. 1994 Chemosphere).
6	Soxhlet extraction	dichloromethane	18 h		After lipid determination was completed, each extract was eluted through a glass chromatography column packed with florisil, alumina, and silica and was concentrated to 10mL. Two 1 mL portions of this eluate were each diluted to 5 mL with methylene chlo
7	Ball Mill	Hexane	2 x 10 min		Florisil (1.2% deactivated) fractionation and clean up for OC Pesticides, PCBs F1-hexane, F2-15/85 DCM/Hexane, F3-50/50 DCM/Hexane.

8		1 : 1 DCM : HEXANE		Sample was weighed, spiked with internal stds., pulverized with 50 g of anhydrous sodium sulfate using a mortar/pestle, transferred quantitatively to glass column, 1:1 DCM:HEX was added 325 mL of solvent percolated through column (ie gravity column extract	PCBs: Single column of layers; from top (neutral silica / acidic silica / neutral silica / basic silica) (sample added in 1:1 DCM : HEXANE and eluted with same) Further cleanup on neutral alumina (sample added in hexane, hexane added to column, discar
9	Soxhlet	Dichloromethane	12 h		GPC, activated silica
10	Pressurized Fluid Extraction (Dionex, ASE)	Dichloromethane	1 h 45 min		Gel Permeation Chromatography (GPC) with Biobeads (SX-3) followed by florisil column chromatography GPC-- F1 100 ml 50 % DCM in Hexane (discard); F2 200 ml 50 % DCM in Hexane. Evaporate to 1 ml for florisil. Florisil-- 18 g deactivated florisil (1%) wash
11	Pressurized Fluid Extraction (Dionex, ASE)	Dichloromethane	5 min x 3	NaSO ₄	Silica gel column followed by GPC

Summary of Methods Used

Laboratory	Extraction Method	Extraction Solvent	Extraction Time	Extraction Other	Sample Extract Cleanup Method
12	Sample mixed with anhydrous sodium sulfate and extracted three times with organic solvent	ethyl ether/petroleum ether (1:1)	1 h		Silica gel 60 column clean up. Elute with hexane first followed by benzene.
13	ASE	Dichloromethane	11 minutes	1/10 of the extracted fat was used to go through cleanup and analysis.	Preheat 0; Heat 5 min; Static 2 min; Flush 100%; Purge 30 sec; Cycles 2; Pressure 1500 psi; Temp 100C; Cell size 22 ml
14	Liquid/Liquid	Pentane	15 min		Florisil SPE, sodium sulfate, extract with dichloromethane/hexane.
15	Tissue lightly ground with sodium sulfate, wet packed in hexane in a 35cm long x 3.1cm ID column with 300ml reservoir.	Dichloromethane: hexane 1:1	30 min	100 °C, 2000 psi, 3 cycles	Extract evaporated to 8 mL and injected on gel permeation chromatograph to remove lipids, using 1:1 dichloromethane:hexane. Extract evaporated to 1 mL and separated on a 8 g activated silica gel column. 30 cm long column x 1 cm ID, with 250 mL reservoir
16	Ultrasonication	Cyclohexane and acetone	3 min		Sulfuric acid
17	Soxhlet	Hexane	5 h	Mixed with sulfuric acid	Sulfuric acid
18	Hot Soxhlet	Hexane:Acetone=3:1 (v/v)	2 h		Column chromatography on silica/acid silica elution with 15 ml hexane and 10 ml dichloromethane.
19	Soxhlet	dichloromethane & hexane (3:1)	16 h		Sulfuric acid treatment followed by Florisil cleanup.
20	Dialysis	300 mL hexane	60 h		(1) Multilayer: Silica gel // Silica gel-H ₂ SO ₄ (44 %, w:w) // Silica gel-H ₂ SO ₄ (22 %, w:w); (2) Multilayer: Silica gel // Silica gel-KOH // Silica gel-H ₂ SO ₄ (44 %, w:w); and (3) Fractionation: ENVI-Carb SPE.
21		5% ethanol in ethyl acetate, 50 mL	homogenize for 2 min		25 g anhydrous sodium sulfate + 50 mL 5 % ethanol in ethyl acetate were added to each sample. Following homogenization, samples were centrifuged and the supernatant was pulled off. A silica SPE cartridge was used for sample cleanup. Following SPE extraction, the samples were evaporated under a stream of nitrogen, and then reconstituted with 1mL of toluene.

22	Soxhlet	Mixture of hexane: diethylether (1:3)	8 h	Sample was ground with anhydrous sodium sulfate.	Silica-gel column chromatography (activated by 3- 6hours at 130 °C., 1.5 g, cloumn i.d.: 10mm.) after gel permeation chromatography (GPC) (Gel: Bio bead S-X3, Column: 2 cm i.d. 50 cm length).
23	grinding with sodium sul	dichloromethane	3 x 3 min		Slica gel/alumina and phenogel; aliquot of the extract was cleaned up further in order to sparate the planar PCBs from the other anlytes on a charcoal column.
A	Accelerated solvent extraction (ASE)	Dichloromethane	~16 min.	ASE Conditions: Pressure = 2000 psi, temp = 100 °C	
B	NA	NA	NA	NA	NA
C	Accelerated solvent extraction (ASE)	Hexane: acetone 4:1	3 static cycles, 6 minutes each	1500 psig, 125 C, 100% flush.	Transesterification via NaOH and BF3/MeOH
D	NA	NA	NA	NA	NA
E	Sonication with sodium sulfate at room temperature.	Hexane			Derivatization: fatty acid methyl esters (FAMES) were prepared using methanolic KOH at room temperature. (Christopherson, S. W. and Glass, R. L., 1969. Preparation of milk fat methyl esters by alcoholysis in an essentially nonalcoholic solution. J. Dairy
F	Modified NOAA Status and Trends for Extraction of Biological Tissues for Trace Organics.	dichloromethane:M EOH (3:1 v/v)- 0.01 %BHT added as preservative	10 minutes sonication		Florisil column used post derivatization.

Summary of Methods Used

6	REPORT ADDITIONAL ANALYTICAL RESULTS INCLUDING OPTIONAL ANALYSES IN THE SPACE BELOW						
	<p>Notes:</p> <p>1. Two other candidate standards were added to each sample: octachloronaphthalene (OCN) and 3,3',4,4'-tetrabromobiphenyl (TBB) to assess their utility as GC internal standards in the final chromatographic analysis. Using our gas chromatographic conditions, PCB 206 elutes very near the OCN peak. Unfortunately, too much OCN was added to each sample that made the identification and quantification of PCB 206 very difficult. The responses for TBB in each sample were reduced from those observed in our calibration solutions, which made it an unreliable standard for chromatographic analysis. We speculate that the reduced response of TBB may be related to matrix effects. In summary, we did not find either standard suitable for these particular analyses.</p> <p>2. To prepare the calibration solutions for this intercomparison exercise, we used these solutions: SRM 2261 and SRM 2274 from NIST as the sources for the chlorinated pesticides. From Accustandard, Inc, New Haven, CT., we purchased the 20 PCB mixture C-CCSEC and the individual PCBs: 87, 132, and 201. We also purchased the supplementary PCB solution SRM 2275 from NIST.</p>						

Additional Data and Notes

3. We used hydrogen gas as the carrier gas at a linear velocity of 40 cm/min. For the analyses of PCBs and pesticides, 1 microliter of sample was injected into the GC-ECD.

4. Using our gas chromatographic conditions, PCB 153 and PCB 132 elute very closely to each other when a calibration solution is run. In the samples, the peak in this region of the chromatogram is very broad making identification and quantification of PCB 132 very difficult. PCB 105 is separated from both PCB 153 and PCB 132.

Other: We found the following pairs of analytes coelute from our DB-5 column:

Other^A: 4,4'-DDD and cis-Nonachlor

Other^B: PCB 8 and alpha-HCH

Other^C: PCB 87 and dieldrin

Other^D: PCBs 132 and 153 elute closely to each other. Conservatively, the concentration of PCB 153 given in the table should be treated as the sum of PCB 153 and PCB 132.

Other^E: PCB 206 and the internal standard octachloronaphthalene

General Comment:

We use a nitrogen generator as the source of the make-up gas for the ECD. This nitrogen supply was interrupted during the analyses of the SRM samples. These analyses were resumed after the plumbing for the air supply for the generator was repaired. The ECD baseline for the SRM samples was elevated and very noisy compared to the baseline for the Homogenate VI samples.

Report Additional Analyte Results Below

Additional Pesticides and PCBs	Homog VI	Homog VI	Homog VI	SRM 1945	SRM 1945	SRM 1945
	Sample 1 (ng/g wet wt)	Sample 2 (ng/g wet wt)	Sample 3 (ng/g wet wt)	Sample 1 (ng/g wet wt)	Sample 2 (ng/g wet wt)	Sample 3 (ng/g wet wt)

PCB 126	DL	DL	DL	DL	DL	26.5
PCB 169	DL	DL	DL	14.4	58.7	19.4

Other: We found the following pairs of analytes coelute from our DB-5 column:

Other^B: PCB 8 and alpha-HCH

Other^F: Since PCB 77 and PCB 110 coelute from our column and the response of each congener vary from each other, the relative ratios of two congeners can not be determined. We do not report the concentrations of either PCB 77 or PCB 110.

Other comments:

PCB 126 was detected in only one SRM 1945 sample.

7

PBDE CONGENER ANALYSES

Approximately 1.5 grams extracted with hexane using a ball mill. % lipid determined gravimetrically using 10% of extract. Lipid removed from 80% of extract by GPC, further cleaned on 1.2% deactivated Florisil. Analysed by GC-HRMS using 30 m DB-5MS (0.25 mm ID, 0.1 um film) HRMS at RP = 10,000, EI mode.

Comments:						
We are surprised by the patterns of PCB/pesticide in the two samples. We would like to know the lokations from where the samples are taken and/or if they are spiked.						
The pesticides and the PCBs are analyzed on the two different columns listed earlier. The results given are selected from the column with the best recovery and best seperation.
