## 1. INTRODUCTION

### 1.1 Purpose

This report documents a test suite for validation and conformance testing in support of the interoperability among building design and energy analysis applications.

The objectives of this test suite are to:

- Provide to software vendors test cases to evaluate their software implementations of Building Performance and Energy Analysis (BPEA) data exchange specifications and to ensure that their implementations are correct;
- Provide to industry test cases and guidance for conformance testing and interoperability testing;
- Contribute to the validation of the draft BPEA data exchange specification (and its components) for satisfaction of specified requirements and fulfillment of its intended purposes, and
- Identify needed improvements in the draft BPEA data exchange specifications.

The intended audience for this document includes developers of building information modeling (BIM) software and energy analysis applications as well as researchers and industry organizations working on achieving interoperability among these software and applications.

### 1.2 Scope

This test suite defines a test plan and test cases with verdict criteria for the concepts and data structures regarding spatial layout for energy analysis documented in the BPEA specification. The concepts in BPEA data exchange specification include:

- Conceptual spatial layout (covered in this test suite)
> Project, site, building, and building element information
- Energy and Performance (not covered in this test suite)
> Energy targets, ventilation, and thermal-related information
- Analysis Results (not covered in this test suite)
$>$ Energy analysis and cost information
Details about the three categories of data exchange specifications are provided in section 3.1.1.
Recognizing that exhaustive conformance and interoperability testing is not practical, this test suite is designed to cover selected combinations of concepts in the BPEA conceptual spatial layout specification to provide a maximum initial coverage and to be sufficient to support the objectives listed above. At the next stage the test suite should be expanded for a complete coverage of the concepts in the BPEA data exchange specifications.

DISCLAIMER: Any mention of commercial products or trade names does not imply recommendation or endorsement by NIST.

## 2. Acronyms and Definitions

| AECOO: | Architecture, Engineering, Construction, Owner and Operator |
| :---: | :---: |
| ASHRAE: | American Society of Heating, Refrigerating and Air-Conditioning Engineers |
| BIM: | Building Information Model / Modeling |
| BPEA: | Building Performance and Energy Analysis |
| CAD: | Computer Aided Design |
| CAE: | Computer Aided Engineering |
| CEC: | California Energy Commission |
| GSA: | U.S. General Service Administration |
| IAI: | International Alliance for Interoperability |
| IDM: | Information Delivery Manual |
| IFC: | Industry Foundation Classes |
| LBNL: | Lawrence Berkeley National Laboratory |
| MVD: | Model View Definition |
| NIST: | National Institute of Standards and Technology |
| OGC: | Open Geospatial Consortium |
| Postprocessor: | A software unit that translates product information from a product data exchange format to the internal format of a software application. |
| Preprocessor: | A software unit that translates product information from the internal format of a software application to a product data exchange format. |
| Space boundari | es: Virtual objects that are used to calculate quantities for various forms of analysis (including quantity take-off for cost estimating and energy analysis) related to spaces or rooms in buildings [10]. |
| 1LSB: | First Level Space Boundaries, boundaries of a space defined by the surfaces of building elements bounding this space (physical space boundaries) or by virtual surfaces provided by an adjacent space with no dividing wall [10]. |
| 2LSB: | Second Level Space Boundaries, boundaries of a space defined by the surfaces of building elements bounding this space, but are subdivided in any of the following cases: 1. differences in materials and/or material assemblies; 2. differences in spaces or zones on the other side of the building element (e.g. two different spaces on the other side of a wall) [10]. Differentiation between physical or virtual is the same as for 1LSB. There is also a differentiation within 2LSB based on what kind of element is on the other side of the space boundary: it is type " 2 a " when the other side is a space; it is type " 2 b " when the other side is a physical element [5]. |

## 3. BPEA TESTING METHODOLOGY

### 3.1 BPEA Overview

Building performance and energy analysis (BPEA) involves using building information models (BIM) and energy demand data to produce an accurate prediction of the building's usage profile and cost of energy consumption. The ability to quickly complete informative energy analyses during the conceptual design phase, in particular, is crucial for maximizing building performance and reducing energy demand at later design phases.

Conceptual design phase energy modeling requires a wide range of input data, which includes building orientation, building geometry including the layout and configuration of spaces, construction materials including the thermal properties of all construction elements, HVAC system type and operating characteristics, space condition requirements, weather data, and other energy analysis related information (BPEA IDM [1]).

The output results of energy analysis may include the assessment of the building's energy performance for compliance with regulations and targets, overall estimate of the energy used by the building, overall estimate of the energy cost, and lifecycle estimate of the energy use and cost for the building (BPEA IDM [1]).

Figure 1 illustrates a process map showing the conceptual design phase of a BPEA project. The process map is a swim lane diagram containing swim lanes which are arranged horizontally. Each swim lane depicts an individual participant involved in the project processes and information exchanges. There is an information exchange lane in between every participant lane, as shown in the figure, to display the information exchanged between participants.

There are two main items in the swim lanes: project processes and information exchanges between project participants. In this BPEA project the participants are the design team, the client staff, and the technical staff or consultant. The information being exchanged is BIM data and energy analysis data. The project processes include sub-processes or tasks that are performed in the BPEA conceptual design phase denoted by a number (e.g., task 1.2 export BIM for analysis) as well as decisions that are involved (e.g., is BIM valid for energy analysis?). At the starting point, in the lower left, of the process map an initial conceptual BIM should be completed, in other words, at this point the architect has defined a building concept design with all the required building elements and space objects. This design provides a proposed building layout including space configurations and placement of geometric elements.

Figure 1. BPEA conceptual design process map
(Source: BPEA IDM [1])
Figure 2 illustrates the details of sub-process 1.1: Prepare/Adjust BIM for Energy Analysis. In this subprocess the concept design BIM is passed to the appropriate designer to prepare the BIM for energy analysis. The designer may be an architect, a mechanical engineer or energy consultant, or any combination of those three. Sub-process 1.1 contains several tasks, including modifying building design or geometry for energy analysis, creating and assigning construction types and space types, and assigning energy targets. After geometry, construction type, space type, and any other modifications to the building are made, the BIM is ready to be evaluated for conformance to energy analysis specifications, which is shown in task 1.1.11.

The evaluation of the BIM for conformance to energy analysis specifications is performed by checking the IFC file exported from BIM software to ensure that the IFC file includes all data structures specified in the BPEA Model View Definition (MVD). The MVD is generated based on the exchange requirements specified in the BPEA Information Delivery Manual (IDM). Section 3.1.1 and Section 3.1.2 provide a detailed description of the IDM and MVD, respectively. The IFC file needs to contain second level space boundaries (2LSB) information, which relate spaces and building elements and define the heat transfer surfaces required for energy simulation.

Figure 2. The details of sub-process 1.1: Preparing/Adjusting BIM for Energy Analysis
(Source: BPEA IDM [1])

This BPEA Test Suite is developed to ensure that reliable software implementations of product data exchange specifications for import and export interfaces are developed in BIM software to completely and correctly support the evaluation of BIM for energy analysis. This test suite provides test cases that are developed based on the exchange requirements and implementation agreements specified in the BPEA IDM and MVD. It provides a baseline for software vendors to assess the correctness and coverage of their software implementations. Essentially, if the software implementations in BIM software fulfill the specifications documented in the IDM and MVD, then it should generate a BIM that fulfills the conformance to energy analysis specifications and passes the BPEA Test Suite.

### 3.1.1 BPEA Information Delivery Manual (IDM)

The IDM has two main components: one is the process map detailing the end user processes and information exchange between end users, as shown earlier in Figures 1 and 2. The other component is the list of exchange requirements. Before starting the processes described in the IDM, a building model needs to be available from which relevant geometric information required for energy analysis can be derived. The building model should also provide context information about the project including units used, coordinate systems information and the direction of the true north.

There are three categories of exchange requirements in the BPEA IDM:
I. Conceptual spatial layout

Information about the building and its spatial configuration
II. Energy and performance

Information about energy data associated with spaces in the building
III. Analysis results

Information about energy demand, comfort, and energy consumption
Figure 3 below provides a summary of the BPEA exchange requirements.

| Summary of Exchange Requirements in the BPEA IDM |  |  |
| :---: | :---: | :---: |
| I. Conceptual Spatial Layout <br> - Project information <br> - Site information <br> - Building information <br> - Building stories <br> - Spaces <br> - Space boundaries <br> - Building elements <br> - Materials and material layers <br> Focus of this BPEA Test Suite | II. Energy and Performance <br> - Energy target <br> - Space thermal comfort <br> - Space ventilation <br> - Building elements thermal information <br> - Materials and material layers thermal information <br> - Energy analysis zones | III. Analysis Inputs and Results <br> - Site outside design criteria <br> - Results for ventilation design <br> - Results of peak load calculations <br> - Rate of energy consumptions <br> - Thermal comfort analysis <br> - Energy tariff <br> - Energy costs |

Figure 3. Summary of exchange requirements in the BPEA IDM
This BPEA Test Suite considers only the conceptual spatial layout exchange requirements. The objective is to first construct a well-structured test suite for just one set of exchange requirements, once this test suite exists, then it should be an easier task to expand the test suite to cover other sets of exchange requirements in future works.

In this test suite, the following exchange requirements from the BPEA IDM are taken into account:

- Project shall have project identifier, i.e., project name
- Site shall have global coordinates (latitude and longitude) and elevation
- Building shall have identification, orientation, and elevation
- Building stories shall have identification and elevation
- Building elements shall have building element type, construction type, 3D geometry, exterior or interior classification, and links to space boundaries
- Material layer set shall have identification, description, and list of material layers
- Material layers shall have identification, description, and material identification
- Spaces shall have identification, space type, classification of inside or outside space, 3D geometry, and links to space boundaries
- Second level space boundaries shall have boundary type, boundary tag, 3D planar geometry, link to space, and link to building element

Figure 4 below illustrates how a portion of the information exchange requirements appear in the BPEA IDM documentation. Shown in the figure are conceptual spatial layout exchange requirements regarding project, site, and building information. The exchange requirements in the BPEA IDM provide the following information: the type of information contained in the building model (i.e., project, site, building, spaces, etc.) and the information (either required or optional) needed for the building model, as well as applicable data type and units.

| Type of Information | Information Needed | Required | Optional | Data Type | Units |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Project | The following properties should be induded: |  |  |  |  |
|  | - Identification | X |  | String | n/a |
|  | - Owner/Clientinformation |  | X | String | n/a |
|  | - Model Author |  | X | String | n/a |
| Site | The following properties should be induded: |  |  |  |  |
|  | - Address |  | X | String | n/a |
|  | - Global Coordinates | X |  | (2) triples | deg/min/sec |
|  | - Site Elevation (datum)(relative to sea level) | X |  | Real | m |
|  | - 2D Geometry |  | X | IFC Geometry | varies |
|  | - 3D Geometry |  | X | IFC Geometry | varies |
| Site Context | The following properties should be induded for existing buildings adjacent to the subject building: |  |  |  |  |
|  | - Identification | X |  | String | n/a |
|  | - 3D Geometry | X |  | IFC Geometry | m |
| Building | The following properties should be induded (if not known then probable values should be used): |  |  |  |  |
|  | - Identification | X |  | String | n/a |
|  | - Global Coordinates | X |  | (2) triples | deg/min/sec |
|  | - Functional Classification (OmniClass) |  | X | String | n/a |
|  | - Orientation (deviation of building grid from true north, clockwise) | X |  | Real | Angular <br> Degrees |
|  | - Elevation (relative to the site datum) | X |  | Real | m |

Figure 4. Portion of the information exchange requirements as appeared in BPEA IDM documentation
(Source: BPEA IDM [1])

### 3.1.2 Model View Definition (MVD)

The IFC schema contains a wide range of data as it covers the whole lifecycle of a building and its environment. Software products should only deal with a subset of the full IFC schema to avoid processing overwhelming amount of data. Therefore a Model View Definition is created as the tool for defining model subsets that are relevant for the data exchange between specific application types. The goal is that software implementers only need to focus on the parts of the IFC schema relevant to them.

The MVD structure consists of three levels. At the first level is a list of entities that are relevant for the data exchange. For the case of BPEA, the list of entities includes wall, slab, door, window, and other building elements as well as mechanical and electrical systems. Each entity is listed under a group such as "architectural systems". Figure 5 below displays such a list of entities for BPEA for four of the major groups: model structure, architectural systems, mechanical systems and electrical systems.

Figure 5. BPEA MVD: list of relevant entities (Source: BPEA MVD [3])
At the second level is a list of concepts associated with a particular entity. These concepts include basic information such as the name and description of the entity as well as specific characterization related to the entity. Figure 6 expands the wall entity to illustrate some of its associated concepts, which include property set, material layer set, object placement and geometric representation.

Finally at the third level is a list of implementer's agreements associated with a particular concept. Since IFC does not provide detailed information about how it should be used in specific cases because of its wide scope and inclusive nature, making such decisions about the use of IFC has been left to IFC implementers. These decisions are called implementer's agreements and they are documented as part of MVDs. Figure 7 displays an example of the implementer's agreements for the concept "material layers", which is related to the wall entity in this case.

According to the definition provided by the buildingSMART Implementation Support Group, implementer's agreements define additional restrictions on using particular attributes (or values), geometric representation types or relationships [6]. For example, specifying that "RelatingMaterial" must be "IfcMaterialLayerSetUsage" for "IfcRelAssociatesMaterial" is an agreement because "RelatingMaterial" is being limited to a specific value when other options are available. However, some of the implementer's agreements listed in Figure 7 are not actually agreements. They are requirements in
the IFC schema. For example, making sure that a GUID and an owner history are provided are requirements of the IFC schema. They are not agreements defined by a certain group of implementers.

Here are some other examples of implementer's agreement [6]:

- Exporting the construction type: it should be exported as property "Reference", which is a part of the common property set, e.g. Pset_WallCommon.Reference
- Use of geometric representation context: the context type attribute should be "Model" for all but annotations and "Plan" for annotations
- Extrusion thickness of opening elements should be within reasonable boundaries: the size of the opening element should not exceed the bounding box of the voided element

IFC Model View Definition Diagram : Wall IFC2x3

| VIEWID | VIEW NAME | APPLICATION NAME | APP. VERSION | EXCHANGE TYPE | DIAGRAM STATUS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| BSA.001 | Concept Design to Bidg Performance Energy Analysis (BPEA) | Generic | Generic | Generic | Candidate |

Figure 6. BPEA MVD: list of concepts associated with wall entity (Source: BPEA MVD [3])
IfcRelAssociatesMaterial

| Attribute | Implementation agreements |
| :--- | :--- |
| Globalld | Providing a GUID is mandatory, but the GUID is allowed to change. |
| OwnerHistory | Providing an OwnerHistory is mandatory, but it is allowed to use dummy data. |
| Name | Reserved. |
| Description | Reserved. |
| RelatedObjects | Must be IfcObjectDefinition or IfcPropertyDefinition. |
| RelatingMaterial | Must be IfcMaterialLayerSetUsage. |

Figure 7. BPEA MVD: implementer's agreements associated with material layer sets [3]
It is important to define agreements among the implementers on a consistent interpretation of the IFC specifications to avoid ambiguity and eliminate the existence of multiple options to exchange the same set of information. After an agreement has been made all implementers are required to respect the agreement. The development of this BPEA test suite is an effort to allow implementers to check that their implementation does indeed respect the requirements and agreements in the IDM and MVD.

### 3.1.3 From IDM and MVD to IFC

This section provides a brief overview and some examples illustrating how exchange requirements in the IDM and implementer's agreements in the MVD are mapped into the IFC schema. Essentially, the IDM provides a list of information that must appear in the IFC schema and the MVD provides the guideline specifying how the information must appear in the IFC schema. Two examples are provided in this section: one is second level space boundary and the other is wall. Each specific information is highlighted by a number to better illustrate how the information is mapped from the BPEA IDM to the MVD and then to the IFC schema.

### 3.1.3.1 Second level space boundary

2LSB IDM exchange requirements [1]:

| Type of Information | Information Needed | Required | Optional | Data Type |
| :---: | :---: | :---: | :---: | :---: |
| Second Level Space Boundaries | The following properties should be induded for $2^{\text {nd }}$ level space boundaries: |  |  |  |
| (1) | - Space Boundary Type (1=internal, 2=external, 3=virtual) | X |  | Enum |
| (2) | - Space Boundary Tag (2nd level, "face) | X |  | String |
| (3) | - 3D planar geometry | X |  | IFC Geometry |
| (4) | - Link to Space | X |  | Relationship |
| (5) | - Link to Building Element | X |  | Relationship |

2LSB MVD implementation agreements [3]:

| Implementation agreements |  |  |
| :--- | :--- | :--- |
| IfcRelSpaceBoundary |  |  |
| Attribute | Implementation agreements |  |
| Globalld |  | Must be given, but may change |
| OwnerHistory | Must be given, but may contain dummy data | Must be '2nd Level' |
| Name |  | Not case sensitive |

2LSB IFC entities related to IDM and MVD:

```
#3510= IFCRELSPACEBOUNDARY (GUID,#13,(2)'2ndLevel',$,(4)#3234,(5)#2094, (3) #3509,
(1a).PHYSICAL.,(1b).EXTERNAL.);
#3234= IFCSPACE (GUID,#13,'Room',$,$,...);
#2094= IFCWALLSTANDARDCASE(GUID,#13,'WA34','B2010 Exterior Walls',...);
#3509= IFCCONNECTIONSURFACEGEOMETRY(#3505,$);
```

Note that sometimes the information in the IDM does not map directly to the MVD. An example is space boundary type, in the IDM it has three enumerators (internal, external, and virtual), but in the MVD "physical or virtual" and "internal or external" are two separate agreements.

### 3.1.3.2 Building elements

Building element IDM exchange requirements [1]:

| Type of Information | Information Needed | Required | Optional | Data Type |
| :---: | :---: | :---: | :---: | :---: |
| Building Elements (General) | The following properties should be induded (if not known then probable values should be used): |  |  |  |
|  | - Building Element Type (wall (exteriorfinterior), curtain wall, roof, floor, ceiling, window, door, shading device) | X |  | Enum |
| (1) | - Construction type (e.g. wall type, door type, window type, shading deviœ type, etc.) Window constructions from Window 6, opaque constructions from ASHRAE Fundamentals. | X |  | String |
| (2) | - Classification - UniFormat (reference to a classification - see below) |  | X | String |
| (3) | - 3D Geometry | X |  | IFC Geometry |
| (4) | - Exterior or Interior Element (i.e. Is Exterior) | X |  | Boolean |

Building element (wall) MVD implementation agreements [3]:

## IfcPropertySingleValue

| Attribute | Implementation agreements |
| :---: | :---: |
| Name | Reference. ---This is used to exchange the wall construction type. |
| Description | Not used. |
| NominalValue (1) | This is a STRING that indicates IAI Standard 'construction type' property. |
| Unit | Not used for this property |

IfcClassificationReference

| Attribute | Implementation agreements |
| :--- | :--- |
| ItemReference | STRING $=$ The Classification Assignment Number. Example: classification for <br> "Exterior Walls" is: B2010 (2) |
| Name | STRING $=$ The Classification Assignment Name. Example: the classification <br> name for B2010 is: Exterior Walls. |

IfcPropertySingleValue

| Attribute | Implementation agreements |
| :--- | :--- |
| Name | (4) |
| IsExternal. ---This is a Boolean flag which indicates whether the wall faces the outside air. |  |
| Description | Not used. |
| NominalValue | This is a BOOLEAN indicating if the building element is part of the building envelope or 'skin' <br> That is: does this building element touch 'outside' space [TRUE] or not [FALSE]? |
| Unit | Not used for this property |

Building element (wall) IFC entities related to IDM and MVD:

```
#2085= IFCWALLSTANDARDCASE (GUID,#13,'WA34',(2)'B2010 Exterior Walls',
    $,#2082,#2155,$);
#2149= (3) IFCSHAPEREPRESENTATION (#398,'Body','SweptSolid',(#2146));
#2146= (3) IFCEXTRUDEDAREASOLID (#2142,#2143,#36,3.048);
#2197= IFCPROPERTYSET(GUID,#13,'Pset_WallCommon',$,(#2202,#2206));
#2202= IFCPROPERTYSINGLEVALUE ((1)'Reference',$,IFCIDENTIFIER('WA34'),$);
#2206= IFCPROPERTYSINGLEVALUE ( (4)'䙵External',$, IFCBOOLEAN(.T.'),$);
```

Note: UniFormat is an optional requirement in the IDM. For simplicity, in this test suite UniFormat classification will appear in the "description" field of the building element, rather than creating the additional IFC entities (IfcRelAssociatesClassification, IfcClassificationReference, and IfcClassification) specified in the MVD.

### 3.2 Structure of a Test Case

The BPEA Test Suite consists of several test cases. This section provides a description regarding the structure of a test case. Since the test suite is developed based on the exchange requirements and implementer's agreements in the BPEA IDM and MVD, one main part that is considered in a test case is the fulfillment of the data exchange requirements in the IDM and MVD. Section 3.1.1 refers to the list of exchange requirements that are considered in this test suite.

The other main part that is considered in a test case is a check on the numeric values that are passed to the IFC file. These numeric values can be coordinate points, dimension measurements, or others. The check is to ensure that the numeric values in the IFC file are within a certain tolerance from the values described in the building model. Also, there is a check on the existence of all building element entities in the IFC file. For each building element in a test case building model, there should be a corresponding entity for that particular building element in the IFC file.

Shown in Figure 8 is a section of Test Case 1, which includes verdict criteria for checking the existence of all building elements and checking the requirements for project and site. The verdict criteria are "pass or fail" conditions to check fulfillment of the IDM and MVD requirements and that the numeric values are within the tolerance. Also in the test case there are some corresponding content from the IFC file that are extracted from a reference IFC file to provide a better illustration.

```
Verdict Criteria: All the requirements below are fulfilled and all the specified numeric
values are within a tolerance of 0.0625 (1/16) inch [Pass / Fail ]
- Check that all building elements exist
    4 ~ I f c W a l l S t a n d a r d C a s e ~
    2 IfcSlab
    2 lfcOpeningElement - }1\mathrm{ lfcDoor
    1 lfcWindow __ 1 IfcSpace
Project
- Project identifier is required
    IfcProject.LongName = "BPEA Test Case 1"
Sample IFC Code }\mp@subsup{}{}{1
#63= IFCPROJECT(GUID,#13,'Default Project','BPEA Test Case 1',$,'BPEA Test
Case 1',$,(#60,#119,#407),#35);
Site
- Site location is specified
    IfcSite.LongName = "Washington D.C."
- Global coordinates (latitude and longitude) are required
    IfcSite.RefLatitude = (38,55,0)
    IfcSite.RefLongitude = (-77,0,0)
- Site elevation (relative to sea level) is required
    IfcSite.RefElevation= 120 (in.)
- Coordinate of site origin is correctly specified
    Coordinate of site origin is the origin of world coordinate system, (0.,0.,0.)
```

Figure 8. A section of Test Case 1 for illustrating the test case structure

Shown in Figure 9 is another section of Test Case 1 illustrating the verdict criteria for checking the requirements for the wall entity. According to the IDM, it is necessary for the wall entity to have 3D geometry, wall construction type, exterior or interior classification, and links to space boundaries (not included Figure 9).

```
Verdict Criteria: All the requirements below are fulfilled and all the specified numeric
values are within a tolerance of 0.0625 (1/16) inch [ Pass / Fail ]
Walls (West Wall)
- Check wall dimension and geometry }\mp@subsup{}{}{1
    Origin 2 = (0.,0.,0.)
    XYZ directions2:}\textrm{X}=(0.,1.,0.),Y=(-1.,0.,0.),Z = (0.,0.,1.
    IfcShapeRepresentation.RepresentationIdentifier = "Body"
    IfcShapeRepresentation.RepresentationType = "SweptSolid"
    IfcShapeRepresentation.Items must be one IfcExtrudedAreaSolid
    IfcExtrudedAreaSolid.Depth = }120\mathrm{ (in.)
    IfcExtrudedAreaSolid.ExtrudedDirection = (0.,0.,1.)
    IfcExtrudedAreaSolid.Position = (0.,0.,0.)
    IfcExtrudedAreaSolid.SweptArea.ProfileType = "AREA"
    4 Cartesian points for the swept area }\mp@subsup{}{}{3}=(0.,0.),(288.,0.), (269.125,-18.875),
    (18.875,-18.875)
- Check wall properties
Check wall construction type
        Pset_WallCommon.Reference = "WA34" OR IfcWall.Name = "WA34"
Check Uniformat classification
        IfcWall.Description = "B2010 Exterior Wall"
Check exterior or interior is declared
__ Pset_WallCommon.IsExternal = IfcBoolean(T)
```

Figure 9. Verdict criteria for a wall entity
It would be redundant to provide a verdict criteria table such as the one shown in Figure 9 for each building elements and space boundaries of a test case model. Hence this is done only for Test Case 1 for a complete illustration, where a detailed verdict criteria table along with corresponding IFC content extraction is provided for each and every building element and space boundary. For subsequent test cases, a more concise verdict criteria table is used. Figure 10 below displays an example of the concise version of the verdict criteria table.

| Numeric Values and Specifications Summary for 1st <br> Wall Verdict Criteria Table for specific details) |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | North Wall | East Wall | South Wall | West Wall |
|  |  |  |  |  |
| Wall dimension |  |  |  |  |
| and geometry |  |  |  |  |

Figure 10. Concise version of verdict criteria table

### 3.3 Structure of the Test Suite

This section provides a description about the structure of the BPEA Test Suite and how each test case in the test suite is chosen. The first step in creating the BPEA Test Suite is to identify and list possible test case scenarios from common building structures and designs. A BPEA Test Matrix is created to organize the listings of test case scenarios.

In the BPEA Test Matrix, the horizontal rows list the test case scenarios and vertical columns identify the characteristics of the test case scenario. These characteristics include building plans, shape of the roof, single or multiple stories, as well as shape, alignment, and other properties of building elements, as shown in Figure 11. For example, the first test case scenario: BPEA-1, has the characteristics of rectangular floor plan, flat roof, and has only one floor.

Figure 11. The columns of the BPEA Test Matrix identifying the characteristics of test scenarios

The matrix currently contains 28 test case scenarios that are created based on variations of building plan, roof and floor geometry, exterior and interior wall geometry, and inclusion of windows, doors, columns, curtain walls, and shading devices. Figure 12 provides a list of the 28 test case scenarios and their descriptions. Figure 13 provides an overview look of the BPEA Test Matrix. Some test case scenarios are developed based on other sources: the space boundary documentation [8], the GSA building model from the AECOO Testbed (Figure 14), and LBNL test cases [11]. Test case scenarios that have a "LBNL ID" refer to the test cases developed by LBNL for the second level space boundary testing.

BPEA 1-4 are one-story rectangular buildings with no windows, doors, or interior walls, but they are different from each other in floor plans and roof designs. For each subsequent scenario there is either additional building element or a variation in the characteristic of existing building elements.

BPEA 5-8 are one-story rectangular buildings with various variations of interior walls. For example, the interior walls can be perpendicular to the exterior wall or intersect the exterior wall at an angle, or the interior walls can have varying thickness, or the interior wall can be a curve wall. BPEA 9-12 add variations of doors and windows to the rectangular building.

BPEA 13-17 are two-story buildings with variations in floor plans and interior walls. For example, the building can have interior walls on the first floor only, same interior walls on both floors, or different interior walls on both floors. BPEA 18-20 add variations of doors, windows, columns, and openings to the building.

BPEA 20-25 are buildings with more complicated floor plans and variations of building elements. BPEA 26-28 are buildings with shading devices. The test matrix includes three types of shading devices [2]: detached from other building elements, extruded from the interior slab, and free form.

| Test ID | LBNL ID | Description | Other |
| :---: | :---: | :---: | :---: |
| BPEA-18 |  | Same as [17], with windows, doors |  |
| BPEA-19 | $\begin{aligned} & \mathrm{CSC}-1- \\ & \csc -3 \end{aligned}$ | Same as [18], with columns |  |
| BPEA-20 | $\begin{array}{\|l\|l} \text { CsO-1 } \\ \text { cso-3 } \end{array}$ | Same as [18], with openings | CsO-2 |
| BPEA-21 |  | Room bounded by curve wall, with doors and windows |  |
| BPEA-22 |  | Room bounded by a curve wall and by clipped walls, with doors and windows |  |
| BPEA-23 |  | Room with a virtual element, with doors and windows |  |
| BPEA-24 |  | Two-story building, contains adjacent spaces separated by walls, slabs, and doors |  |
| BPEA-25 |  | Two-story building, contains an atrium and hence has space boundaries spanning over more than one storey |  |
| BPEA-26 |  | With a shading device that is detached from other building elements |  |
| BPEA-27 |  | With a shading device that is extruded from the interior slab |  |
| BPEA-28 |  | With a shading device that is free form |  |

Figure 12. The listing of the 28 test case scenarios in the BPEA Test Matrix

Figure 13. The BPEA Test Matrix
(Not meant to be legible, the purpose is to show a general overview of test case scenarios)

Figure 14. Simplified CAD model of the GSA Headquarters building
(This building model was used in the AECOO-1 Testbed led by OGC and buildingSMART alliance. The Testbed was focused on streamlining communications between parties in the conceptual design phase to get an early understanding of the tradeoffs between construction costs and energy efficiency)

The 28 test case scenarios are a good illustration of variations in building structures and designs. However, making each scenario to be a single test case would imply unnecessary redundant testing because many of the 28 test case scenarios have identical characteristics. For example, many of the 28 test case scenarios have straight exterior walls and flat roof, and it is unnecessary to test a straight wall multiple times. Hence the second step in creating the BPEA Test Suite is to take the test case scenarios from the BPEA Test Matrix and make combinations of unique characteristics to be tested, thereby resulting in a smaller number of test cases and reducing redundant testing.

The BPEA Test Suite in this documentation contains 5 test cases:

1. Test Case 1 : Simple One-Story Building

Description: simple rectangular building with one door and one window BPEA Test Matrix: BPEA-9, which also contains the characteristics of BPEA-1
2. Test Case 2: Two-Stories Building with Different Floor Plans

Description: two-story rectangular building with internal walls and air walls on both floors BPEA Test Matrix: BPEA-17, which also contains the characteristics of BPEA 13-16
3. Test Case 3: Two-Stories Building with Doors, Windows, Columns Description: two-story rectangular building with internal walls, doors, windows, and columns BPEA Test Matrix: BPEA-18 and BPEA-19, which also contains the characteristics of BPEA-17
4. Test Case 4: One-Story Non-rectangular building with Curtain Wall and Shading Devices Description: one wall is not orthogonal to its two adjacent walls creating the non-rectangular floor plan, has curtain wall and shading devices BPEA Test Matrix: BPEA-2 with characteristics of BPEA-9, BPEA-11, and BPEA-27
5. Test Case 5: One-Story Non-rectangular building with curve wall and sloped roof Description: one-story building with a semi-circular curve wall and a sloped roof BPEA Test Matrix: BPEA-2, BPEA-3, BPEA-21, and BPEA-22

A detailed description will be provided at the beginning of each test case. Table 1 summarizes the characteristics of each test case. All the information about each test case, including detailed test model description and verdict criteria tables, are in the Appendix section.

It is important to keep in mind that the BPEA Test Matrix is not meant to be exhaustive and covers all possible test case scenarios. The scenarios in the matrix are a selection of commonly seen building designs and structures. There are some scenarios in the matrix that are not covered in the test suite, including curved roof, curved interior wall, interior wall with varying thickness, interior wall nonperpendicular to the exterior wall, non-rectangular doors and windows, floor slab containing openings, two-story building with an atrium, free form and extrusion from interior slab shading devices.

All the test cases are designed using metric units for dimensioning, with the exception of Test Case 1, which contains both a metric and an imperial unit version for the purpose of illustration.

Table 1. Characteristics of the 5 test cases

|  | Test Case 1 | Test Case 2 | Test Case 3 | Test Case 4 | Test Case 5 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Walls <br> - Have openings, windows, doors | X |  | X | X | X |
| - Have interior walls |  | X | X |  |  |
| - Have connection of two different types of walls |  | X | X | X |  |
| - Non-orthogonal connection between walls |  |  |  | X |  |
| - Have curvature |  |  |  |  | X |
| Slabs <br> - Have only baseslab and roof (one-story) | X |  |  | X | X |
| - Have base-slab, floor(s), and roof (two or multistories) |  | X | X |  |  |
| - Non-rectangular slabs |  |  |  |  | X |
| - Sloped slabs |  |  |  |  | X |
| - Shading device slabs |  |  |  | X |  |
| Other Building Elements <br> - Curtain walls |  |  |  | X |  |
| - Columns |  |  | X |  |  |
| - Virtual elements (i.e., air walls) |  | X |  |  |  |
| - Have $2^{\text {nd }}$ level space boundaries: Type 2a | X | X | X | X | X |
| - Have $2^{\text {nd }}$ level space boundaries: Type 2b |  | X | X |  |  |

## 4. REFERENCE IFC FILES

### 4.1 Generating Reference IFC Files

The reference IFC files are created to provide an example IFC file for each test case. They can serve two purposes. The first is to allow test suite users to see the mappings between IDM and MVD requirements and the IFC schema. In each test case, parts of the reference IFC file relevant to the verdict criteria are extracted and included in the verdict criteria table to illustrating the mappings. The second purpose is to allow test suite users to compare the IFC files that are generated by their software, when a compatible tool for comparing IFC files is available.

The BIM software that is used to generate the reference IFC files is Graphisoft ArchiCAD 12 (the preprocessor). This software is selected as the preprocessor due to its capability of generating second level space boundaries (2LSB). Currently, many other BIM software do not have the capability of generating 2LSB, they require some middleware tools to do so. A postprocessor (software application for importing the IFC file) is not involved in this test suite.

The reference IFC file for each test case can be accessed at this link:
http://cic.nist.gov/BPEA/BPEA Test Suite IFC Files.zip

### 4.2 Tools for Testing IFC Files

There are a number of tools that support IFC file checking, many of which are available to the public at no cost. These tools include viewers for visualization of the building model and also for illustration of the project structure and the properties of objects depicted in the IFC file; text browsers for debugging the original IFC file; and syntax checkers for checking for the conformance of the syntax in the IFC file to the IFC schema. The list below provides short descriptions to some of the IFC checking tools.

## Viewers

> IfcStoreyView (developed by Karlsruhe Institute of Technology): this tool provides 2D and 3D visualization of the building model, information regarding building structure as well as building elements and layers, properties and relations of IFC entities, and display of space boundaries.
$>$ Solibri Model Viewer (developed by Solibri Inc.): this tool provides a 3D visualization of the building model as well as the capability of navigation inside the model, a tree view showing information of model components, properties and relations of IFC entities. This tool can work in conjunction with Solibri Model Checker, which is a tool used to check the integrity of BIM.
$>$ DDS CAD Viewer (developed by Data Design System): this tool provides various options of 3D visualization of the building model such as "hidden-line" and "wireframe" views of the model. This tool also allows navigation inside the model.

Note that screenshots of building models using the above three viewers are provided in each test case.
The tools listed in this section as well as several other IFC checking tools can be downloaded at this link: http://www.ifcwiki.org/index.php/Free_Software

## Text browsers

$>$ IfcQuickBrowser (developed by G.E.M. Team Solutions): this is a text browser for large IFC files. The IFC file is displayed in a tree structure.

## Syntax checkers

$>$ EXPRESS Data Manager (EDM) Supervisor (developed by EPM Technology)
$>$ IfcObjectCounter (developed by Karlsruhe Institute of Technology)
$>$ Express Engine
The syntax checkers go through the IFC files and check for violations of various rules pertaining to the IFC schema and generally create a log file displaying the results. Two of commonly used rules are "where" rules and "unique" rules, which are described below. Other rules include checking mandatory attributes and array entries, checking inverse attributes, and checking subtype/supertype constraints.

- "Where" rule: an expression that must evaluate to "True" otherwise the corresponding content does not conform to the IFC schema.

Example: the entity IfcAxis2Placement3D has five "where" rules:
WR1: SELF\IfcPlacement.Location.Dim $=3$;
The dimensionality of the placement location shall be 3 .
WR2: (NOT (EXISTS (Axis))) OR (Axis.Dim = 3);
The Axis when given should only reference a three-dimensional IfcDirection.
WR3: (NOT (EXISTS (RefDirection))) OR (RefDirection.Dim = 3);
The RefDirection when given should only reference a three-dimensional IfcDirection.

WR4: (NOT (EXISTS (Axis))) OR (NOT (EXISTS (RefDirection))) OR (IfcCrossProduct (Axis, RefDirection).Magnitude > 0.0); The Axis and RefDirection shall not be parallel or anti-parallel.

WR5: NOT ((EXISTS (Axis)) XOR (EXISTS (RefDirection)));
Either both (Axis and RefDirection) are not given and therefore defaulted, or both shall be given.

- "Unique" rule: an entity instance with certain attribute or a combination of attributes, which makes a unique key for the particular entity instance, can not have duplications, i.e. another entity instance with the same attribute or combination of attributes.

Example: the entity IfcApplication has two "unique" rules:
UR1: ApplicationIdentifier;
The short identifying name for the application can not appear more than once in the IfcApplication entity instances

UR2: ApplicationFullName, Version;
The combination of the full name of the application and its version number as specified by the application developer can not appear more than once in the IfcApplication entity instances.

Figure 15 below shows how the error messages appear in EDM Supervisor, Express Engine, and IfcObjectCounter when the first unique rule of entity IfcApplication is violated. Figure 16 shows a summary report of errors encountered when checking an IFC file using EDM Supervisor.

```

### 4.3 Testing Reference IFC Files

Table 2 shows the results of checking the reference IFC files of each test case using three of the IFC syntax checkers: EDM Supervisor, IfcObjectCounter, and Express Engine. The errors received are: violation of unique rules of entity IfcApplication, violation of where rule of entity IfcNormalisedRatioMeasure, and an error regarding data type. The violation of the two unique rules is caused by the preprocessor Graphisoft ArchiCAD. It creates multiple instances of the same IfcApplication entity in the IFC file.

The other two errors, however, appear only in one of the IFC syntax checkers and appear to be programming mistake within the syntax checker. The where rule of entity IfcNormalisedRatioMeasure states that its attribute value has to be in between 0.0 and 1.0 , and EDM Supervisor indicates that the values in the reference IFC file are out of range. A manual crosscheck and the fact that the other two syntax checkers not reporting this error leads to the conclusion that this is a programming mistake within EDM Supervisor. Similarly, IfcBoolean(T) is a valid IFC syntax and is accepted by both EDM Supervisor and IfcObjectCounter, but Express Engine does not recognize IfcBoolean(T) as a valid expression and appears to be a programming mistake within Express Engine.

Table 2: Results of checking reference IFC files using IFC syntax checkers

| Reference IFC files testing results |  |  |  |

## 5. Closure

The BPEA Test Suite is created to provide test cases to software vendors to evaluate their software implementations of BPEA data exchange specifications and to ensure that their implementations are correct. There are five test cases in the test suite. Each test case is created based on a combination of various commonly seen building structures and designs. It is impractical to provide an exhaustive testing hence this test suite does not cover all the concepts in BPEA data exchange specifications. This test suite aims at providing a sufficient coverage of the BPEA concepts to provide the guidance for conformance testing and interoperability testing to the industry.

The evaluation for conformance to BPEA data exchange specifications is performed by first using preprocessor BIM software to generate an IFC file of the building model specified in the test case, and then check the IFC file to ensure that it includes all data structures specified in the BPEA IDM and MVD. Each test case has its own set of verdict criteria, which are "pass or fail" conditions to check fulfillment of the IDM and MVD requirements and that the numeric values are within the tolerance. Essentially, if the software implementations in BIM software fulfill the specifications documented in the IDM and MVD, then it should generate a BIM that conforms to energy analysis specifications and passes the BPEA Test Suite.

While theoretically a direct mapping should exist between the IDM, the MVD, and the IFC schema where the IDM provides a list of information that must appear in the IFC schema and the MVD provides the guideline specifying how the information must appear in the IFC schema, but in reality there is inconsistency in the mapping as noted in the section 3.1.3. The IDM and the MVD are supposed to be complementary of each other, but in the case of BPEA, this is not completely true. Hence this is certainly one area that needs further improvements. One possible solution is to first thoroughly go through each and every exchange requirement in the IDM and check the corresponding implementer's agreements in the MVD for consistent mapping of information, then go through the ones that have inconsistency in the mapping and come to agreements on how the direct mapping would be achieved.

This test suite document provides the textual content for BPEA testing. To further allow the test suite users to evaluate their software implementations, the next step is to implement the content of this test suite into an online testing tool that can compare the IFC file that is generated by user's software with the test case reference IFC file. One major challenge in creating this tool is to implement the capability to identify the content in the IFC file that are relevant to the testing and filter out all the information specific to the preprocessor that generated the IFC file. The ability to identify the content in the IFC file is also a challenge since the IFC files generated by different software usually have completely different layouts and structures. Nonetheless, the successful implementation of this tool would certainly enhance the utility of this test suite as guidance for conformance and interoperability testing.

## 7. Appendix: BPEA Test Cases

### 7.1 BPEA Test Case 1 (imperial)

## BPEA Test Case 1 (imperial units)

Test Case Title: Simple One-Story Building
Date of Last Edit: 10/05/2009
Summary Description: Test Case 1 consists of the simple one-story building shown on Figure A1. The building elements included in this test case are: 4 exterior walls, 1 base slab, 1 roof slab, 2 openings, 1 door, 1 window and 1 space.

## Test Objectives:

- Check existence of all building elements
- Check existence of information required by BPEA IDM
- Check accuracy of dimensions of all building elements
- Check construction type and space type
- Check relevant property sets

Figure A1: Simple one-story building

## Testing Details for BPEA Test Case 1

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.0625 (1/16) inch [ Pass / Fail ]

- Check that all building elements exist
- Project identifier is required
$\qquad$ IfcProject.LongName = "BPEA Test Case 1"
Sample IFC Code ${ }^{1}$ :
\#63= IFCPROJECT (GUID, \#13, 'Default Project',' BPEA Test Case 1',\$,'BPEA Test Case 1', $\$(\# 60, \# 119, \# 407), \# 35) ;$
- Correct unit assignment
___ Length measurement is in "Inch"
Sample IFC Code:
\#17= IFCCONVERSIONBASEDUNIT(\#16,.LENGTHUNIT.,'INCH',\#15);
Site
- Site location is specified

IfcSite.LongName = "Washington D.C."

- Global coordinates (latitude and longitude) are required

IfcSite. RefLatitude $=(38,55,0)$
IfcSite.RefLongitude $=(-77,0,0)$

- Site elevation (relative to sea level) is required IfcSite.RefElevation = 120 (in.)
- Coordinate of site origin is correctly specified
__ Coordinate of site origin is the origin of world coordinate system, ( $0 ., 0 ., 0$.
Sample IFC Code ${ }^{2}$ :
\#73 = IFCSITE (GUID, \#13,' Default Site','Washington D.C.' $, \$, \# 70, \$$, Washington
D.C.' . ELEMENT., ( $38,55,0),(-77,0,0), \underline{120 ., \$, \$) ; ~}$
\#70 = IFCLOCALPLACEMENT (\$, \#53);
\#53 = IFCAXIS2PLACEMENT3D (\#49, \#45, \#37);
\#49 = IFCCARTESIANPOINT ( (0., 0., 0.) ) ;
${ }^{1}$ One of the attributes on many IFC entities is a globally unique identifier known as a GUID. The GUID is a 22 character string such as 'ObY52t0r7xHf8OxWOsY\$t_'. In the examples, the GUID is shortened to the string 'GUID' to save space and improve readability.
${ }^{2}$ In some of the sample code the order of the entity instances has been changed from the original file and indentation added to show the hierarchy and relationship between the various entities.

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.0625 (1/16) inch [ Pass / Fail ]

## Building ${ }^{1}$

- Building identifier is required

IfcBuilding.LongName $=$ "TC1"

- Elevation (base elevation of ground level floor above sea level) is required

IfcBuilding.ElevationOfRefHeight = 120 (in.)

- Coordinate of building origin is correctly specified
___ Coordinate of building origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code:
\#86= IFCBUILDING (GUID,\#13,'Default Building','TC1',\$,\#83,\$,'TC1',.ELEMENT., 120., \$, \$);

```
#83= IFCLOCALPLACEMENT(#70,#53);
        #70= IFCLOCALPLACEMENT($,#53);
        #53= IFCAXIS2PLACEMENT3D(#49,#45,#37);
```

- Number of stories is specified
__ Pset_BuildingCommon.NumberOfStoreys = 1
Sample IFC Code:
\#3620= IFCPROPERTYSINGLEVALUE ('NumberOfStoreys', $\$$, IFCINTEGER(1), \$);
- Building orientation (the degrees of clockwise from true north) is required ${ }^{2}$

IfcGeometricRepresentationContext.TrueNorth $=(-0.5,0.866)$
Sample IFC Code:
\#60= IFCGEOMETRICREPRESENTATIONCONTEXT('Plan','Design',3,1.0000000E-5,\#53, \#56);
\#56= $\operatorname{IFCDIRECTION((-0.5,0.866));~}$
Building Stories

- Identification is required

IfcBuildingStorey.Name = " $1^{\text {st }}$ Floor"

- Elevation (relative to building datum) is required

IfcBuildingStorey.Elevation = 0

- Coordinate of building story origin is correctly specified
__ Coordinate of building story origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code:
\#102 = IFCBUILDINGSTOREY (GUID, \#13, '1st Floor', \$, \$, \#99, \$, \$, .ELEMENT., 0.) ;
\#99 = IFCLOCALPLACEMENT (\#83, \#96); \#83 = IFCLOCALPLACEMENT (\#70, \#53) ; \#70 = IFCLOCALPLACEMENT (\$, \#53); \#53 = IFCAXIS2PLACEMENT3D (\#49, \#45, \#37); \#96= IFCAXIS2PLACEMENT3D (\#49, \#45, \#37); \#49 = IFCCARTESIANPOINT ( (0., 0., 0.) );
${ }^{1}$ IDM indicates that buildings should contain latitude and longitude information, as different buildings in the same site may have different latitude and longitude values. However, RefLatitude and RefLongitude are attributes of IfcSite, not IfcBuilding.
${ }^{2}$ The building orientation is considered to be the grid rotation from true north, therefore if the building and/or the site is modeled in a different orientation on the original grid, then a combination of rotations from the building and site would need to be considered to determine the actual orientation.

${ }^{1}$ The intersection between walls can affect the geometry, i.e., the placement of the Cartesian points of the swept area.
${ }^{2}$ The origin and the direction of the wall (and other building elements) are indicated by IfcWall (or IfcWallStandardCase).IfcLocalPlacement.Position. The XYZ directions are the axes of the local coordinate system in reference to the world coordinate system.
${ }^{3}$ These are points in the local coordinate system.
${ }^{4}$ The position and orientation in \#2222 are related to the wall. The position and orientation in \#2286 are related to the extrusion.

### 7.2 BPEA Test Case 1 (metric)

## BPEA Test Case 1

Test Case Title: Simple One-Story Building
Date of Last Edit: 10/01/2009
Summary Description: Test Case 1 consists of the simple one-story building shown on Figure A2. The building elements included in this test case are: 4 exterior walls, 1 base slab, 1 roof slab, 2 openings, 1 door, 1 window and 1 space.

## Test Objectives:

- Check existence of all building elements
- Check existence of information required by BPEA IDM
- Check accuracy of dimensions of all building elements
- Check construction type and space type
- Check relevant property sets

Figure A2: Simple one-story building

Detailed Description:

| Project Name: BPEA Test Case 1 (met |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Site Location: Washington D.C. ( $38^{\circ} 55^{\prime}$ Latitude, $-77^{\circ} 0^{\prime}$ Longitude) Site Elevation $=3 \mathrm{~m}$ |  |  |  |  |
|  |  |  |  |  |
| Building Name: TC1 |  |  |  |  |
| Building Global Coordinates: $38^{\circ} 55^{\prime}$ Latitude, $-77^{\circ} 0^{\prime}$ Longitude |  |  |  |  |
| Building Orientation: $30^{\circ}$ from true north |  |  |  |  |
| Building Elevation from Sea Level $=3 \mathrm{~m}$ |  |  |  |  |
| Total Number of Building Stories $=1$ |  |  |  |  |
| Name of $1^{\text {st }}$ Building Story: "1 ${ }^{\text {st }}$ Floor" |  |  |  |  |
| Elevation (relative to building datum) $=0 \mathrm{~m}$ |  |  |  |  |
| Building Elements | Dimension and Origin in World Coordinate Sys. | Construction Type (ASHRAE)** | Description (ASHRAE)** | UniFormat Classification |

## Testing Details for BPEA Test Case 1 (metric)

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.002 meter [ Pass / Fail ]

- Check that all building elements exist

Project

- Project identifier is required
$\qquad$ IfcProject.LongName = "BPEA Test Case 1"
Sample IFC Code ${ }^{1}$ :
\#54 = IFCPROJECT (GUID, \#13,' Default Project',' BPEA Test Case 1','\$,'BPEA Test Case 1',\$,(\#51,\#110,\#398),\#26);
- Correct unit assignment
___ Length measurement is in "Meter"
Sample IFC Code:
\#14= IFCSIUNIT(*,.LENGTHUNIT., $\$,$. METRE.);
Site
- Site location is specified

IfcSite.LongName = "Washington D.C."

- Global coordinates (latitude and longitude) are required

IfcSite.RefLatitude $=(38,55,0)$
IfcSite.RefLongitude $=(-77,0,0)$

- Site elevation (relative to sea level) is required IfcSite.RefElevation $=3$ ( m .)
- Coordinate of site origin is correctly specified
__ Coordinate of site origin is the origin of world coordinate system, ( $0 ., 0 ., 0$.)
Sample IFC Code ${ }^{2}$ :
\#64 = IFCSITE (GUID, \#13,' Default Site','Washington D.C.' $, \$, \# 61, \$$, 'Washington
D.C.' , ELEMENT., (38,55,0), (-77,0,0), 3., \$, \$);
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 = IFCCARTESIANPOINT ( (0., 0., 0.) ) ;
${ }^{1}$ One of the attributes on many IFC entities is a globally unique identifier known as a GUID. The GUID is a 22 character string such as '0bY52t0r7xHf8OxWOsY\$t_'. In the examples, the GUID is shortened to the string 'GUID' to save space and improve readability.
${ }^{2}$ In some of the sample code the order of the entity instances has been changed from the original file and indentation added to show the hierarchy and relationship between the various entities.

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.002 meter [ Pass / Fail ]

## Building ${ }^{1}$

- Building identifier is required

IfcBuilding.LongName $=$ "TC1"

- Elevation (base elevation of ground level floor above sea level) is required IfcBuilding.ElevationOfRefHeight $=3(\mathrm{~m}$.
- Coordinate of building origin is correctly specified
___ Coordinate of building origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code:
\#77= IFCBUILDING (GUID,\#13,'Default Building','TC1',\$,\#74,\$,'TC1',.ELEMENT.,
3., \$, \$);
\#74 = IFCLOCALPLACEMENT (\#61,\#44); \#61= IFCLOCALPLACEMENT (\$,\#44); \#44 = IFCAXIS2PLACEMENT3D (\#40,\#36,\#28);
\#40= IFCCARTESIANPOINT ( (0., 0., 0.) );
- Number of stories is specified
__ Pset_BuildingCommon.NumberOfStoreys = 1
Sample IFC Code:
\#3611= IFCPROPERTYSINGLEVALUE ('NumberOfStoreys', \$, IFCINTEGER(1), \$);
- Building orientation (the degrees of clockwise from true north) is required ${ }^{2}$
$\qquad$ IfcGeometricRepresentationContext.TrueNorth $=(-0.5,0.866)$
Sample IFC Code:
\#51= IFCGEOMETRICREPRESENTATIONCONTEXT('Plan','Design',3,1.0000000E-5, \#44, \#47);
\#47 $=\operatorname{IFCDIRECTION((-0.5,0.866));~}$

## Building Stories

- Identification is required

IfcBuildingStorey.Name = " $1^{\text {st }}$ Floor"

- Elevation (relative to building datum) is required

IfcBuildingStorey.Elevation = 0

- Coordinate of building story origin is correctly specified
__ Coordinate of building story origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code:
\#93= IFCBUILDINGSTOREY(GUID, \#13,'1st Floor', \$,\$, \#90,\$,\$, .ELEMENT., 0. ) ;
\#90 = IFCLOCALPLACEMENT (\#74, \#87) ; \#74 = IFCLOCALPLACEMENT (\#61, \#44); \#61= IFCLOCALPLACEMENT (\$,\#44); \#44 = IFCAXIS2PLACEMENT3D(\#40,\#36,\#28); \#87= IFCAXIS2PLACEMENT3D (\#40,\#36,\#28); \#40= IFCCARTESIANPOINT ( (0., 0., 0.) );
${ }^{1}$ IDM indicates that buildings should contain latitude and longitude information, as different buildings in the same site may have different latitude and longitude values. However, RefLatitude and RefLongitude are attributes of IfcSite, not IfcBuilding.
${ }^{2}$ The building orientation is considered to be the grid rotation from true north, therefore if the building and/or the site is modeled in a different orientation on the original grid, then a combination of rotations from the building and site would need to be considered to determine the actual orientation.

```

${ }^{1}$ In other words, it is the $(1 ., 0 ., 0)$ direction in the world coordinate system.
${ }^{2}$ Since extrusion is in the (1.,0.,0) direction, these points would be on the $Y-Z$ plane.
${ }^{3}$ The Cartesian point $(3.6576,-0.4794,0.9144)$ is placed relative to the point $(10.9728,7.3152,0)$ in the world coordinate system, which is the origin of the east wall. Also note that in this local coordinate system, the X direction is $(0,-1,0)$.

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.002 meter [ Pass / Fail]

## Door

- Check door dimension and geometry

### 7.3 BPEA Test Case 2

## BPEA Test Case 2

Test Case Title: Two Stories Building with Different Floor Plan

## Date of Last Edit: 10/07/2009

Summary Description: Test Case 2 consists of a two-stories building in which there are internal walls and air walls on both floors, as shown on Figure A3. The building elements included in this test case are: 8 exterior walls ( 4 for each floor), 3 interior walls ( 2 on $1^{\text {st }}$ floor and 1 on $2^{\text {nd }}$ floor), 2 air walls ( 1 on each floor), 1 base slab, 1 floor slab, and 1 roof slab.

## Test Objectives:

- Check existence of all building elements
- Check existence of information required by BPEA IDM
- Check accuracy of dimensions of all building elements
- Check construction type and space type
- Check relevant property sets
- Check for accurate counts of spaces and space boundaries
- Check space boundary attributes, reference to space and building elements, and connection geometry.

Figure A3: Two Stories Building with Different Floor Plan

Detailed Description:

| Project Name: BPEA Test Case 2 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Site Location: Washington D.C. ( $38^{\circ} 55^{\prime}$ Latitude, $-77^{\circ} 0^{\prime}$ Longitude) Site Elevation $=0 \mathrm{~m}$ |  |  |  |  |
|  |  |  |  |  |
| Building Name: TC2Building Global Coordinates: $38^{\circ} 55^{\prime}$ Latitude, $-77^{\circ} 0^{\prime}$ Longitude |  |  |  |  |
|  |  |  |  |  |
| Building Orientation: $30^{\circ}$ from true north |  |  |  |  |
| Building Elevation from Sea Level $=0 \mathrm{~m}$ |  |  |  |  |
| Total Number of Building Stories $=2$ |  |  |  |  |
| Name of $1^{\text {st }}$ Building Story: "1 ${ }^{\text {st }}$ Floor" |  |  |  |  |
| Elevation (relative to building datum) $=0 \mathrm{~m}$ Name of $2^{\text {nd }}$ Building Story: " 2 nd Floor" |  |  |  |  |
|  |  |  |  |  |
| Elevation (relative to building datum) $=3.61 \mathrm{~m}$ |  |  |  |  |
| Building Elements | Dimension and Origin in World Coordinate Sys. | Construction Type (ASHRAE)** | Description (ASHRAE)** | UniFormat Classification |
| 1. Exterior Wall* ( $1^{\text {st }}$ floor east) | Length: 10 m Height: 3 m Thickness: 0.48 m Origin: $(15,0,0)$ | WA34 | 12-in HW concrete R-19 insulation Gypsum board | B2010 <br> Exterior Walls |
| 2. Exterior Wall ( $1^{\text {st }}$ floor west) | Length: 10 m Height: 3 m Thickness: 0.48 m Origin: ( $0,10,0$ ) | WA34 | 12-in HW concrete R-19 insulation Gypsum board | B2010 Exterior Walls |
| 3. Exterior Wall ( $1^{\text {st }}$ floor south) | Length: 15 m Height: 3 m Thickness: 0.41 m Origin: $(0,0,0)$ | WA26 | 12-in LW CMU Fill insulation Gypsum board | $\begin{aligned} & \hline \text { B2010 } \\ & \text { Exterior Walls } \end{aligned}$ |
| 4. Exterior Wall ( $1^{\text {st }}$ floor north) | Length: 15 m Height: 3 m Thickness: 0.41 m Origin: $(15,10,0)$ | WA26 | 12-in LW CMU Fill insulation Gypsum board | B2010 <br> Exterior Walls |
| 5. Exterior Wall ( $2^{\text {nd }}$ floor east) | Length: 10 m Height: 3 m Thickness: 0.48 m Origin: (15, 0, 3.61) | WA34 | 12-in HW concrete R-19 insulation Gypsum board | B2010 Exterior Walls |
| 6. Exterior Wall ( $2^{\text {nd }}$ floor west) | Length: 10 m Height: 3 m Thickness: 0.48 m Origin: $(0,10,3.61)$ | WA34 | 12-in HW concrete R-19 insulation Gypsum board | B2010 Exterior Walls |

* The length of exterior walls refers to the length of the exterior side of the walls

DDS-CAD Viewer

## Testing Details for BPEA Test Case 2

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

- Check that all building elements exist

Project

- Project identifier is required

IfcProject.LongName = "BPEA Test Case 2"
Sample IFC Code ${ }^{1}$ :
\#54= IFCPROJECT (GUID, \#13,' Default Project',' BPEA Test Case 2', $\$$,'BPEA Test
Case 2', \$, (\#51,\#110,\#271), \#26);

- Correct unit assignment
___ Length measurement is in "Meter"
Sample IFC Code:
\#14= IFCSIUNIT(*,.LENGTHUNIT., \$,.METRE.);

## Site

- Site location is specified IfcSite.LongName = "Washington D.C."
- Global coordinates (latitude and longitude) are required IfcSite.RefLatitude $=(38,55,0)$ IfcSite.RefLongitude $=(-77,0,0)$
- Site elevation (relative to sea level) is required IfcSite.RefElevation = 0 ( m .)
- Coordinate of site origin is correctly specified
__ Coordinate of site origin is the origin of world coordinate system, ( $0 ., 0 ., 0$.
Sample IFC Code ${ }^{2}$ :
\#64= IFCSITE (GUID, \#13, 'Default Site','Washington D.C.',\$,\#61,\$,'Washington
D.C.' , ELEMENT., (38,55,0), (-77,0,0), ㅇ., \$,\$);
\#61= IFCLOCALPLACEMENT (\$, \#44); \#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 = IFCCARTESIANPOINT ( (0.,0.,0.) );
${ }^{1}$ One of the attributes on many IFC entities is a globally unique identifier known as a GUID. The GUID is a 22 character string such as '0bY52t0r7xHf8OxWOsY\$t_'. In the examples, the GUID is shortened to the string 'GUID' to save space and improve readability.
${ }^{2}$ In some of the sample code the order of the entity instances has been changed from the original file and indentation added to show the hierarchy and relationship between the various entities.

> Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

## Building

- Building identifier is required

IfcBuilding.LongName $=$ "TC2"

- Elevation (base elevation of ground level floor above sea level) is required IfcBuilding.ElevationOfRefHeight $=0$ (m.)
- Coordinate of building origin is correctly specified
___ Coordinate of building origin is the origin of world coordinate system, ( $0 ., 0 ., 0$. )
Sample IFC Code:
\#77 = IFCBUILDING (GUID, \#13,'Default Building', 'TC2', \$, \#74, \$,'TC2',.ELEMENT.,
ㅇ., \$, \$) ;
\#74 = IFCLOCALPLACEMENT (\#61, \#44) ; \#61 = IFCLOCALPLACEMENT (\$, \#44); \#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 = IFCCARTESIANPOINT ( (0., 0., 0.) ) ;
- Number of stories is specified
___ Pset_BuildingCommon.NumberOfStoreys = 2
Sample IFC Code:
\#6400= IFCPROPERTYSINGLEVALUE ('NumberOfStoreys', \$, IFCINTEGER(2), \$);
- Building orientation (the degrees of clockwise from true north) is required IfcGeometricRepresentationContext.TrueNorth $=(-0.5,0.866)$

Sample IFC Code:
\#51= IFCGEOMETRICREPRESENTATIONCONTEXT('Plan','Design',3,1.0000000E-5, \#44, \#47);
\#47= IFCDIRECTION((-0.5,0.866));
Building Stories

- Identification is required

IfcBuildingStorey.Name $=$ " $1^{\text {st }}$ Floor", IfcBuildingStorey.Name $=$ " 2 nd Floor"

- Elevation (relative to building datum) is required

IfcBuildingStorey.Elevation = 0, IfcBuildingStorey.Elevation $=3.61$ (m.)

- Coordinate of building story origin is correctly specified
__ Coordinate of building story origin is the origin of world coordinate system, ( $0 ., 0 ., 0$. )
Coordinate of building story origin ( $2^{\text {nd }}$ floor) is ( $0 ., 0 ., 3.61$ )
Sample IFC Code:
\#93= IFCBUILDINGSTOREY (GUID,\#13,'1st Floor', $\$, \$, \# 90, \$, \$, . E L E M E N T ., 0.0) ;$
\#90= IFCLOCALPLACEMENT (\#74, \#87);
\#74 = IFCLOCALPLACEMENT (\#61,\#44);
\#61= IFCLOCALPLACEMENT (\$,\#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40,\#36,\#28);
\#87= IFCAXIS2PLACEMENT3D (\#40,\#36,\#28);
\#40 $=$ IFCCARTESIANPOINT ( (0.,0., 0. $)$ );
\#2129= IFCBUILDINGSTOREY (GUID,\#13,'2nd Floor', \$,\$,\#2126,\$,\$,.ELEMENT., 3.61);
\#2126= IFCLOCALPLACEMENT (\#74,\#2123);
\#74 = IFCLOCALPLACEMENT (\#61, \#44);
\#2123= IFCAXIS2PLACEMENT3D(\#2119,\#36,\#28);
\#2119= IFCCARTESIANPOINT ( (0.,0.,3.61) );

| Count of Space Boundaries relating to Room 101 = 8 |  |  |  |  |

${ }^{1}$ For all physical internal $2^{\text {nd }}$ level space boundaries, there is a differentiation of two types of boundary that is influenced by "what kind of element is on the other side" of the space boundary. Type 2 a is for space boundary that has a space behind and Type $2 b$ is for space boundary that has no space behind, but a physical element. Type 2 b is also called $3^{\text {rd }}$ level space boundary.

### 7.4 BPEA Test Case 3

## BPEA Test Case 3

Test Case Title: Two Stories Building with Doors, Windows, and Columns

## Date of Last Edit: 10/08/2009

Summary Description: Test Case 3 consists of a two-stories building with internal walls as well as columns, doors and windows, as shown on Figure A4. The floor plan of Test Case 3 is similar to that of Test Case 2, except that the $2^{\text {nd }}$ floor internal walls have been removed, and the air wall in $1^{\text {st }}$ floor has been replaced by a regular wall. The building elements included in this test case are: 8 exterior walls ( 4 for each floor), 3 interior walls (all on $1^{\text {st }}$ floor), 3 doors ( 2 exterior and 1 interior, all on $1^{\text {st }}$ floor), 2 windows (all on $1^{\text {st }}$ floor), 2 columns (one freestanding and one embedded to the wall, both go through $1^{\text {st }}$ and $2^{\text {nd }}$ floor), 1 base slab, 1 floor slab, and 1 roof slab.

## Test Objectives:

- Check existence of all building elements
- Check existence of information required by BPEA IDM
- Check accuracy of dimensions of all building elements
- Check construction type and space type
- Check relevant property sets
- Check for accurate counts of spaces and space boundaries
- Check space boundary attributes, reference to space and building elements, and connection geometry.

Figure A4: Two Stories Building with Doors, Windows, and Columns

Detailed Description:

| Project Name: BPEA Test Case 3 |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Site Location: Washington D.C. ( $38^{\circ} 55^{\prime}$ Latitude, $-77^{\circ} 0^{\prime}$ Longitude) Site Elevation $=0 \mathrm{~m}$ |  |  |  |  |
| Building Name: TC3 |  |  |  |  |
| Building Global Coordinates: $38^{\circ} 55^{\prime}$ Latitude, $-77^{\circ} 0^{\prime}$ Longitude |  |  |  |  |
| Building Orientation: $30^{\circ}$ from true north Building Elevation from Sea Level $=0 \mathrm{~m}$ |  |  |  |  |
|  |  |  |  |  |
| Total Number of Building Stories $=2$ |  |  |  |  |
| Name of $1^{\text {st }}$ Building Story: "1 ${ }^{\text {st }}$ Floor" |  |  |  |  |
| Elevation (relative to building datum) $=0 \mathrm{~m}$ Name of $2^{\text {nd }}$ Building Story: " 2 nd Floor" |  |  |  |  |
|  |  |  |  |  |
| Elevation (relative to building datum) $=3.61 \mathrm{~m}$ |  |  |  |  |
| Building Elements | Dimension and Origin in World Coordinate Sys. | Construction Type (ASHRAE)** | Description (ASHRAE)** | UniFormat Classification |
| 1. Exterior Wall* ( $1^{\text {st }}$ floor east) | Length: 10 m Height: 3 m Thickness: 0.48 m Origin: $(15,0,0)$ | WA34 | 12-in HW concrete R-19 insulation Gypsum board | B2010 <br> Exterior Walls |

## Testing Details for BPEA Test Case 3

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

- Check that all building elements exist

11 lfcW allStandardCase
5 IfcOpeningElement 2 IfcWindow 2 IfcColumn

## Project

- Project identifier is required

IfcProject.LongName = "BPEA Test Case 3"
Sample IFC Code ${ }^{1}$ :
\#54 = IFCPROJECT (GUID, \#13,' Default Project','BPEA Test Case 3', \$,'BPEA Test Case 2',\$, (\#51, \#110, \#271), \#26);

- Correct unit assignment
___ Length measurement is in "Meter"
Sample IFC Code:
\#14 = IFCSIUNIT (*, .LENGTHUNIT., \$, .METRE.) ;
Site
- Site location is specified

IfcSite.LongName = "Washington D.C."

- Global coordinates (latitude and longitude) are required

IfcSite.RefLatitude $=(38,55,0)$
IfCSite. RefLongitude $=(-77,0,0)$

- Site elevation (relative to sea level) is required

IfcSite.RefElevation $=0$ ( m .)

- Coordinate of site origin is correctly specified
$\qquad$ Coordinate of site origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code ${ }^{2}$ :
\#64 = IFCSITE (GUID, \#13, 'Default Site', 'Washington D.C.' ${ }^{\prime}$, \# $\# 1, \$$, 'Washington
D.C.' . ELEMENT., $(38,55,0),(-77,0,0), 0 ., \$, \$) ;$
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28) ;
\#40 = IFCCARTESIANPOINT ( $0 ., 0 ., 0)$.$) ;$
${ }^{1}$ One of the attributes on many IFC entities is a globally unique identifier known as a GUID. The GUID is a 22 character string such as '0bY52t0r7xHf8OxWOsY\$t_'. In the examples, the GUID is shortened to the string 'GUID' to save space and improve readability.
${ }^{2}$ In some of the sample code the order of the entity instances has been changed from the original file and indentation added to show the hierarchy and relationship between the various entities.

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

## Building

- Building identifier is required

IfcBuilding.LongName = "TC3"

- Elevation (base elevation of ground level floor above sea level) is required IfcBuilding.ElevationOfRefHeight $=0$ (m.)
- Coordinate of building origin is correctly specified

Coordinate of building origin is the origin of world coordinate system, ( $0 ., 0 ., 0$. )
Sample IFC Code:
\#77= IFCBUILDING (GUID,\#13,'Default Building','TC3',\$,\#74,\$,'TC3',.ELEMENT.,
0., \$, \$);
\#74 = IFCLOCALPLACEMENT (\#61, \#44);
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 = IFCCARTESIANPOINT ( (0.,0.,0.) );

- Number of stories is specified
__ Pset_BuildingCommon.NumberOfStoreys = 2
Sample IFC Code:
\# 9207 = IFCPROPERTYS INGLEVALUE ('NumberOfStoreys' , \$, IFCINTEGER (2), \$);
- Building orientation (the degrees of clockwise from true north) is required IfcGeometricRepresentationContext.TrueNorth $=(-0.5,0.866)$

Sample IFC Code:
\# 51 = IFCGEOMETRICREPRESENTATIONCONTEXT ('Plan', 'Design', 3, 1. $0000000 \mathrm{E}-5$, \#44, \#47);
\#47 = IFCDIRECTION ( (-0.5,0.866) );

## Building Stories

- Identification is required IfcBuildingStorey.Name $=$ " 1 st Floor", IfcBuildingStorey. Name $=$ " 2 nd Floor"
- Elevation (relative to building datum) is required

IfcBuildingStorey.Elevation $=0$, IfcBuildingStorey.Elevation $=3.61$ ( m. )

- Coordinate of building story origin is correctly specified

Coordinate of building story origin is the origin of world coordinate system, ( $0 ., 0 ., 0$. ) Coordinate of building story origin ( $2^{\text {nd }} f l o o r$ ) is ( $(0,0 ., 3.61$ )

Sample IFC Code:
\#93 = IFCBUILDINGSTOREY(GUID, \#13, '1st Floor', $\$, \$, \# 90, \$, \$, . E L E M E N T ., 0$.
\# $90=$ IFCLOCALPLACEMENT (\#74, \#87);
\#74 = IFCLOCALPLACEMENT (\#61, \#44);
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#87= IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 = IFCCARTESIANPOINT ( (0., 0., 0.) ) ;
\#5666= IFCBUILDINGSTOREY (GUID, \#13, '2nd Floor', \$, \$, \#5663, \$, \$, .ELEMENT., 3.61);
\#5663 = IFCLOCALPLACEMENT (\#74, \#5660); \#74 = IFCLOCALPLACEMENT (\#61, \#44); \#5660 = IFCAXIS2PLACEMENT3D (\#5656, \#36, \#28);
\#5656= IFCCARTESIANPOINT ( (0.,0.,3.61));

```

${ }^{1}$ The intersection between walls can affect the geometry, i.e., the placement of the Cartesian points of the swept area.
${ }^{2}$ The origin and the direction of the wall (and other building elements) are indicated by IfcWall (or IfcWallStandardCase).IfcLocalPlacement.Position. The XYZ directions are the axes of the local coordinate system (LCS) in reference to the world coordinate system.
${ }^{3}$ These are points in the local coordinate system.
${ }^{4}$ The position and orientation in \#3570 are related to the wall. The position and orientation in \#3634 are related to the extrusion.

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

Walls (All Walls)

### 7.5 BPEA Test Case 4

## BPEA Test Case 4

Test Case Title: One Story Non-Rectangular Building with Curtain Wall and Shading Devices
Date of Last Edit: 10/10/2009
Summary Description: Test Case 4 consists of a one-story building with non-rectangular floor plan and has curtain wall and shading devices, as shown on Figure A5. The south wall of the building is not orthogonal to the east and west walls, producing the non-rectangular floor plan. The building elements included in this test case are: 4 exterior walls ( 3 regular walls and 1 curtain wall base wall), 1 door, 1 regular windows, 7 curtain wall windows, 3 shading device slabs ( 1 for the entire curtain wall windows, 1 for the regular window, and 1 for the door), 1 base slab, and 1 roof slab.

## Test Objectives:

- Check existence of all building elements
- Check existence of information required by BPEA IDM
- Check accuracy of dimensions of all building elements
- Check construction type and space type
- Check relevant property sets
- Check for accurate counts of spaces and space boundaries
- Check space boundary attributes, reference to space and building elements, and connection geometry.

Figure A5: One Story Non-rectangular Building with Curtain Wall and Shading Devices

## Detailed Description:

IfcStoreyView

Solibri Model Checker

## Testing Details for BPEA Test Case 4

Verdict Criteria: All the requirements below are fulfilled and all the specified numeric
values are within a tolerance of 0.005 meter [ Pass / Fail ]

- Check that all building elements exist 4 lfcW allStandardCase 9 lfcOpeningElement 8 lfcWindow

Project

- Project identifier is required

IfcProject.LongName = "BPEA Test Case 4"
Sample IFC Code ${ }^{1}$ :
\#54 = IFCPROJECT (GUID, \#13, 'Default Project',' BPEA Test Case 4', $\$$ Case 4',\$,(\#51,\#110,\#394),\#26);

- Correct unit assignment
__ Length measurement is in "Meter"
Sample IFC Code:
\#14= IFCSIUNIT(*,.LENGTHUNIT., $\$,$. METRE.);
Site
- Site location is specified

IfcSite.LongName = "Washington D.C."

- Global coordinates (latitude and longitude) are required

IfcSite.RefLatitude $=(38,55,0)$
IfcSite. RefLongitude $=(-77,0,0)$

- Site elevation (relative to sea level) is required IfcSite.RefElevation $=0$ (m.)
- Coordinate of site origin is correctly specified
__ Coordinate of site origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code ${ }^{2}$ :
\#64 = IFCSITE (GUID, \#13,' Default Site','Washington D.C.', \$, \#61, \$, 'Washington
D.C.' , ELEMENT., (38,55,0), (-77,0,0), ㅇ., \$, \$);
\#61 = IFCLOCALPLACEMENT (\$, \#44); \#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28) ;
\#40 = IFCCARTESIANPOINT ( (0.,0.,0.));
${ }^{1}$ One of the attributes on many IFC entities is a globally unique identifier known as a GUID. The GUID is a 22 character string such as 'ObY52t0r7xHf8OxWOsY\$t_'. In the examples, the GUID is shortened to the string 'GUID' to save space and improve readability.
${ }^{2}$ In some of the sample code the order of the entity instances has been changed from the original file and indentation added to show the hierarchy and relationship between the various entities.

Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

## Building

- Building identifier is required

IfcBuilding.LongName = "TC4"

- Elevation (base elevation of ground level floor above sea level) is required IfcBuilding.ElevationOfRefHeight = 0 (m.)
- Coordinate of building origin is correctly specified
___ Coordinate of building origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code:
\#77= IFCBUILDING (GUID,\#13,'Default Building','TC4,\$,\#74,\$,'TC4',.ELEMENT.,
ㅇ.. $\$$, \$) ;
\#74 = IFCLOCALPLACEMENT (\#61, \#44) ;
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40= IFCCARTESIANPOINT ((0.,0.,0.));
- Number of stories is specified
__ Pset_BuildingCommon.NumberOfStoreys = 1
Sample IFC Code:
\#7739= IFCPROPERTYSINGLEVALUE ('NumberOfStoreys', \$, IFCINTEGER(1), \$);
- Building orientation (the degrees of clockwise from true north) is required
__ IfcGeometricRepresentationContext.TrueNorth $=(-0.5,0.866)$
Sample IFC Code:
\#51= IFCGEOMETRICREPRESENTATIONCONTEXT('Plan','Design',3,1.0000000E-5, \#44, \#47);
\#47= IFCDIRECTION((-0.5,0.866));

## Building Stories

- Identification is required

IfcBuildingStorey.Name = "1 $1^{\text {st }}$ Floor"

- Elevation (relative to building datum) is required IfcBuildingStorey.Elevation = 0
- Coordinate of building story origin is correctly specified
__ Coordinate of building story origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code:
\#93= IFCBUILDINGSTOREY(GUID,\#13,'1st Floor', \$,\$,\#90,\$,\$,.ELEMENT., ㅇ..);
\# $90=$ IFCLOCALPLACEMENT (\#74, \#87);
\#74 = IFCLOCALPLACEMENT (\#61, \#44);
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#87= IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 = IFCCARTESIANPOINT ( (0., 0., 0.) ) ;

```

```

${ }^{1}$ The intersection between walls can affect the geometry, i.e., the placement of the Cartesian points of the swept area.
${ }^{2}$ The origin and the direction of the wall (and other building elements) are indicated by IfcWall (or IfcWallStandardCase).IfcLocalPlacement.Position. The XYZ directions are the axes of the local coordinate system (LCS) in reference to the world coordinate system.
${ }^{3}$ These are points in the local coordinate system.
${ }^{4}$ The position and orientation in \#4031 are related to the wall. The position and orientation in \#4095 are related to the extrusion.

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

Walls (All Walls)

### 7.6 BPEA Test Case 5

## BPEA Test Case 5

Test Case Title: One Story Non-Rectangular Building with Curve Wall and Sloped Roof
Date of Last Edit: 10/25/2009
Summary Description: Test Case 5 consists of a one-story building with non-rectangular floor plan and has a semicircular curve wall and a sloped roof, as shown on Figure A6. The roof slab over the semicircle portion is flat. The building elements included in this test case are: 4 exterior walls ( 3 regular walls and 1 semicircular curve wall), 1 door, 2 windows, 1 base slab, and 2 roof slabs (one flat semicircular slab and one sloped rectangular slab).

## Test Objectives:

- Check existence of all building elements
- Check existence of information required by BPEA IDM
- Check accuracy of dimensions of all building elements
- Check construction type and space type
- Check relevant property sets
- Check for accurate counts of spaces and space boundaries
- Check space boundary attributes, reference to space and building elements, and connection geometry.

Figure A6: One Story Non-rectangular Building with Curve Wall and Sloped Roof

## Detailed Description:

[^4]| Building Elements | Dimension and Origin in World Coordinate Sys. | Construction Type (ASHRAE) | Description (ASHRAE) | UniFormat Classification |
| :---: | :---: | :---: | :---: | :---: |
| 5. Base Slab | Thickness: 0.256 m Origin: ( $0,0,-0.256$ ) <br> $X$-axis ( $1,0,0$ ) <br> 4 edges of the slab on the XY plane: <br> 1. line segment from $(0,0)$ to $(10,0)$ <br> 2. semicircle from $(10,0)$ to $(10,20)$ counterclockwise <br> 3. line segment from $(10,20)$ to $(0,20)$ <br> 4. line segment from $(0,20)$ to $(0,0)$ | FA5 | 6-in HW concrete 4-in Gravel | A1030 <br> Slab-on-grade |
| 6. ## Testing Details for BPEA Test Case 5

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

- Check that all building elements exist 4 lfcWallStandardCase

3 IfcSlab
3 IfcOpeningElement
1 IfcDoor
2 IfcWindow
1 IfcSpace
Project

- Project identifier is required

IfcProject.LongName = "BPEA Test Case 5"
Sample IFC Code ${ }^{1}$ :
\#54 = IFCPROJECT (GUID, \#13,' Default Project',' BPEA Test Case 5', $\$$,'BPEA Test Case 5',\$,(\#51,\#110,\#390),\#26);

- Correct unit assignment
__ Length measurement is in "Meter"
Sample IFC Code:
\#14= IFCSIUNIT(*,.LENGTHUNIT.,\$,. METRE.);
Site
- Site location is specified

IfcSite.LongName = "Washington D.C."

- Global coordinates (latitude and longitude) are required

IfcSite.RefLatitude $=(38,55,0)$ IfcSite.RefLongitude $=(-77,0,0)$

- Site elevation (relative to sea level) is required IfcSite.RefElevation $=0$ (m.)
- Coordinate of site origin is correctly specified
__ Coordinate of site origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code ${ }^{2}$ :
\#64 = IFCSITE (GUID, \#13,' Default Site','Washington D.C.', \$, \#61, \$,'Washington
D.C.' , ELEMENT., (38,55,0), (-77,0,0), ㅇ., \$, \$);
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28) ;
\#40 = IFCCARTESIANPOINT ( (0.,0.,0.));
${ }^{1}$ One of the attributes on many IFC entities is a globally unique identifier known as a GUID. The GUID is a 22 character string such as '0bY52t0r7xHf8OxWOsY\$t_'. In the examples, the GUID is shortened to the string 'GUID' to save space and improve readability.
${ }^{2}$ In some of the sample code the order of the entity instances has been changed from the original file and indentation added to show the hierarchy and relationship between the various entities.

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

## Building

- Building identifier is required

IfcBuilding.LongName = "TC5"

- Elevation (base elevation of ground level floor above sea level) is required IfcBuilding.ElevationOfRefHeight $=0$ ( m .)
- Coordinate of building origin is correctly specified

Coordinate of building origin is the origin of world coordinate system, ( $0 ., 0 ., 0$. )
Sample IFC Code:
\#77 = IFCBUILDING (GUID, \#13,'Default Building','TC5',\$,\#74,\$,'TC5',.ELEMENT.,
0., \$, \$);
\#74 = IFCLOCALPLACEMENT (\#61, \#44);
\#61 = IFCLOCALPLACEMENT (\$, \#44);
\#44 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 = IFCCARTESIANPOINT ( (0.,0.,0.) );

- Number of stories is specified
__ Pset_BuildingCommon.NumberOfStoreys = 1
Sample IFC Code:
\#9970 = IFCPROPERTYS INGLEVALUE ('NumberOfStoreys' , \$, IFCINTEGER (1), \$);
- Building orientation (the degrees of clockwise from true north) is required IfcGeometricRepresentationContext.TrueNorth $=(-0.5,0.866)$

Sample IFC Code:
\# 51 = IFCGEOMETRICREPRESENTATIONCONTEXT ('Plan', 'Design', 3, 1. $0000000 \mathrm{E}-5$, \#44, \#47);
\#47 $=$ IFCDIRECTION $((\underline{-0.5,0.866}))$;
Building Stories

- Identification is required

IfcBuildingStorey.Name = " $1^{\text {st }}$ Floor"

- Elevation (relative to building datum) is required

IfcBuildingStorey.Elevation $=0$

- Coordinate of building story origin is correctly specified
___ Coordinate of building story origin is the origin of world coordinate system, (0.,0.,0.)
Sample IFC Code:
\#93= IFCBUILDINGSTOREY (GUID,\#13,'1st Floor', $\$, \$, \# 90, \$, \$, . E L E M E N T ., 0.0) ;$
\# $90=$ IFCLOCALPLACEMENT (\#74, \#87);
\#74 = IFCLOCALPLACEMENT (\#61, \#44);
\#61 = IFCLOCALPLACEMENT (\$, \#44) ; \#44 $=$ IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#87 = IFCAXIS2PLACEMENT3D (\#40, \#36, \#28);
\#40 $=\operatorname{IFCCARTESIANPOINT((0.,0.,0.));~}$

## Verdict Criteria: All the requirements below are fulfilled and all the specified numeric values are within a tolerance of 0.005 meter [ Pass / Fail ]

## Walls (South Wall)

- Check wall dimension and geometry ${ }^{1}$

P2: (-6.,0.,0.) <br> P2: (-6.,0.31,0.) P4: (0.,0.31,0.) <br> TO <br> Origin: (9.52,0.,6.) <br> X: (0.,0.,-1) Z: (0.,0.,-1) <br> P1: (0., 0., 0.) P2: (6., 0., 0.) <br> P3: (6.,0.15,0.) P4: (0.,0.15,0.) <br> Each space boundary has a dimension of 0.31 m by 6 m to cover the semicircular curve wall of radius 9.52 m (the inner edge of the wall), which leads to a total of 97 space boundaries for the curve wall. <br> (There are 960.31 m by 6 m space boundaries and one 0.15 m by 6 m boundary) |
| Count of Space Boundaries relating to Room = 106 |  |  |  |  |

Total Space Boundary Count $=106$

[^0]:    * The length of exterior walls refers to the length of the exterior side of the walls
    ** ASHRAE Fundamentals Chapter 30 Tables 17, 18, 19

[^1]:    * The length of exterior walls refers to the length of the exterior side of the walls
    ** ASHRAE Fundamentals Chapter 30 Tables 17, 18, 19

[^2]:    ${ }^{1}$ The intersection between walls can affect the geometry, i.e., the placement of the Cartesian points of the swept area.
    ${ }^{2}$ The origin and the direction of the wall (and other building elements) are indicated by IfcWall (or IfcWallStandardCase).IfcLocalPlacement.Position. The XYZ directions are the axes of the local coordinate system (LCS) in reference to the world coordinate system.
    ${ }^{3}$ These are points in the local coordinate system.
    ${ }^{4}$ The position and orientation in \#954 are related to the wall. The position and orientation in \#1018 are related to the extrusion.

[^3]:    * The length of exterior walls refers to the length of the exterior side of the walls

[^4]:    * The length of exterior walls refers to the length of the exterior side of the walls
    ** ASHRAE Fundamentals Chapter 30 Tables 17, 18, 19
