NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards¹ was established by an act of Congress on March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau's technical work is performed by the National Measurement Laboratory, the National Engineering Laboratory, and the Institute for Computer Sciences and Technology.

THE NATIONAL MEASUREMENT LABORATORY provides the national system of physical and chemical and materials measurement; coordinates the system with measurement systems of other nations and furnishes essential services leading to accurate and uniform physical and chemical measurement throughout the Nation's scientific community, industry, and commerce; conducts materials research leading to improved methods of measurement, standards, and data on the properties of materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government agencies; develops, produces, and distributes Standard Reference Materials; and provides calibration services. The Laboratory consists of the following centers:

Absolute Physical Quantities² — Radiation Research — Thermodynamics and Molecular Science — Analytical Chemistry — Materials Science.

THE NATIONAL ENGINEERING LABORATORY provides technology and technical services to the public and private sectors to address national needs and to solve national problems; conducts research in engineering and applied science in support of these efforts; builds and maintains competence in the necessary disciplines required to carry out this research and technical service; develops engineering data and measurement capabilities; provides engineering measurement traceability services; develops test methods and proposes engineering standards and code changes; develops and proposes new engineering practices; and develops and improves mechanisms to transfer results of its research to the ultimate user. The Laboratory consists of the following centers:

Applied Mathematics — Electronics and Electrical Engineering² — Mechanical Engineering and Process Technology² — Building Technology — Fire Research — Consumer Product Technology — Field Methods.

THE INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides scientific and technical services to aid Federal agencies in the selection, acquisition, application, and use of computer technology to improve effectiveness and economy in Government operations in accordance with Public Law 89-306 (40 U.S.C. 759), relevant Executive Orders, and other directives; carries out this mission by managing the Federal Information Processing Standards Program, developing Federal ADP standards guidelines, and managing Federal participation in ADP voluntary standardization activities; provides scientific and technological advisory services and assistance to Federal agencies; and provides the technical foundation for computer-related policies of the Federal Government. The Institute consists of the following centers:

Programming Science and Technology — Computer Systems Engineering.

¹Headquarters and Laboratories at Gaithersburg, MD, unless otherwise noted;
mailing address Washington, DC 20234.

²Some divisions within the center are located at Boulder, CO 80303.

STANDARD X-RAY DIFFRACTION POWDER PATTERNS

Previous work has been published as a book entitled *Powder Diffraction Data from the Joint Committee on Powder Diffraction Standards Associateship at the National Bureau of Standards* (1976) (JCPDS--International Centre for Diffraction Data, 1601 Park Lane, Swarthmore, PA 19081). The volume is sold with an accompanying search manual, and contains 949 card images of patterns of experimental data, published originally as Circular 539 (vols. 1-10) and Monograph 25, Sections 1-12, and most of Section 13.

Individual copies of the Circular and Monograph are still available and may be obtained from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. If a publication listed below is identified with a number, it must be used in ordering. All are available in hardcopy or microfiche; the price is not fixed and will be furnished on request.

STANDARD X-RAY DIFFRACTION POWDER PATTERNS

Section 16. --- Data for 86 Substances

by

Marlene C. Morris, Howard F. McMurdie, Eloise H. Evans,
Boris Paretzkin, and Johan H. de Groot
JCPDS - International Centre for Diffraction Data

and

Camden R. Hubbard and Simon J. Carmel
National Bureau of Standards

Standard x-ray diffraction patterns are presented for 86 substances. Fifty-eight of these patterns represent experimental data and 28 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All d-values were assigned Miller indices determined by comparison with computed interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Key words: Crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

INTRODUCTION

The Powder Diffraction File is a continuing compilation of diffraction patterns gathered from many sources. Produced and published by the ¹ JCPDS--International Centre for Diffraction Data, the File is used for identification of crystalline materials by matching d-spacings and diffraction intensity measurements. Under the partial sponsorship of the JCPDS, the program at the National Bureau of Standards contributes new data to this File. Our work also aids in the evaluation and revision of published x-ray data and in the development of diffraction techniques. This report presents information for 86 compounds (58 experimental and 28 calculated patterns), and is the twenty-sixth of the series of "Standard X-ray Diffraction Powder Patterns" ².

EXPERIMENTAL POWDER PATTERNS

CAS registry number. The Chemical Abstracts Service Registry Number is included, when available, to help identify the sample. This number forms the basis for computer aided searching of Chemical Abstracts.

¹ JCPDS--International Centre for Diffraction Data, 1601 Park Lane, Swarthmore, PA. 19081. This Pennsylvania non-profit corporation functions in cooperation with the American Ceramic Society, the American Crystallographic Association, the American Society for Testing and Materials, The Clay Minerals Society, The Institute of Physics, the Mineralogical Association of Canada, the Mineralogical Society of America, The Mineralogical Society of Great Britain and Ireland, the National Association of Corrosion Engineers, and the Société Française de Minéralogie et de Cristallographie.

² See previous page for other published volumes.

Sample. The samples used to make NBS patterns were obtained from a variety of sources or were prepared in small quantities in our laboratory. Appropriate annealing or recrystallization of the samples improved the quality of most of the patterns. A check of phase purity was provided by indexing the x-ray pattern.

Optical data. When reported, optical measurements were made by grain immersion methods, in white light, using oils standardized in sodium light, in the refractive index range 1.49 to 2.1 [Hartshorne and Stuart, 1970].

The names of the sample colors were selected from the ISCC-NBS Centroid Color Charts [1965].

Interplanar spacings. For spacing determinations, a shallow holder was packed with a sample mixed with an internal standard. Choice of the standard was determined by the need for low angle and unobstructed reflections. The amount of standard was estimated so that the intensity of its strongest peak would be about equal to the intensity of the strongest peak of the sample.

To avoid errors associated with aberrations at the very top of the peaks, the readings of 20 were taken at positions about 20% of the way down from the top, and in the center of the peak width. The $K\alpha_2$ peaks were occasionally read to assist in establishing a $K\alpha_1$ peak position, but $K\alpha_2$ peaks were not reported.

At low angles, $K\alpha_1$ and $K\alpha_2$ peaks were unresolved for both the sample and the internal standard. The internal standard corrections were established from the theoretical values for $K\alpha_1$ and were applied to the unresolved low angle peaks, as well as to the resolved $K\alpha$ peaks in the higher angle regions. If the internal standard correction varied along the length of the pattern, linear interpolations were used.

The internal standards used were of high purity (99.99%). The lattice constants used for them at 25 °C are given in Table 1; the 2θ angles were computed using cell dimensions uncorrected for index of refraction.

Table 1

Calculated 2θ Angles, CuKα ₁ λ = 1.540598 Å			
hkl	W a=3.16524 Å ±.00004	Ag a=4.08651 Å ±.00002	Si a=5.43088 Å ±.00004

The new internal standard Si powder is available as Standard Reference Material 640 [1974]. The lattice constant for the Si was refined from multiple powder data measurements made with tungsten as an internal standard [Swanson et al., 1966]. Cell parameter data were also collected for single crystal from the boules ground to prepare the powder. The lattice parameters from the two methods agreed within 3 parts in 10⁵ [Hubbard et al. 1975]. D-spacing results using SRM 640 will be in agreement with patterns recorded in this series of monographs since 1966.

All of our spacing measurements were recorded at 25 ± 1 °C on a diffractometer equipped with a focusing graphite or lithium fluoride crystal monochromator located between the sample and the scintillation counter. Pulse height discrimination was used as well. All measurements were performed using copper radiation: λ(CuKα₁, peak)=1.540598 Å [Deslattes and Henins, 1973].

Structure, lattice constants. The space groups were listed with short Hermann-Mauguin symbols as well as the space group numbers given in the *International Tables for X-ray Crystallography*, Vol. I [1952].

Orthorhombic cell dimensions were arranged according to the Dana convention b>a>c [Palache et al., 1944]. Monoclinic and triclinic lattice constants were transformed if necessary in order

to follow the convention of *Crystal Data* [1973].

A computer program [Evans et al., 1963] assigned hkl's and refined the lattice constants. Cell refinement was based only upon 2θ_{obs} values which could be indexed without ambiguity. The program minimized the value Σ(θ_{obs}-θ_{calc})². The estimated standard deviations (e.s.d.'s) of the reciprocal cell parameters were determined from the inverse matrix of the normal equations. The program calculated the e.s.d.'s of the direct cell constants by the method of propagation of errors. Since 1973, the e.s.d.'s derived by the computer program have been increased by 50% in order to reflect more truly the uncertainty in the lattice constants. A similar increase should also be applied to all lattice constants in earlier publications of this series. The e.s.d.'s in the least significant figures are given in parentheses following the lattice constants.

In indexing cubic patterns, multiple hkl's were not utilized in the refinement or reported. Instead, the single appropriate index having the largest *h* was listed. The number of significant figures reported for d-values varied with the symmetry and crystallinity of each sample.

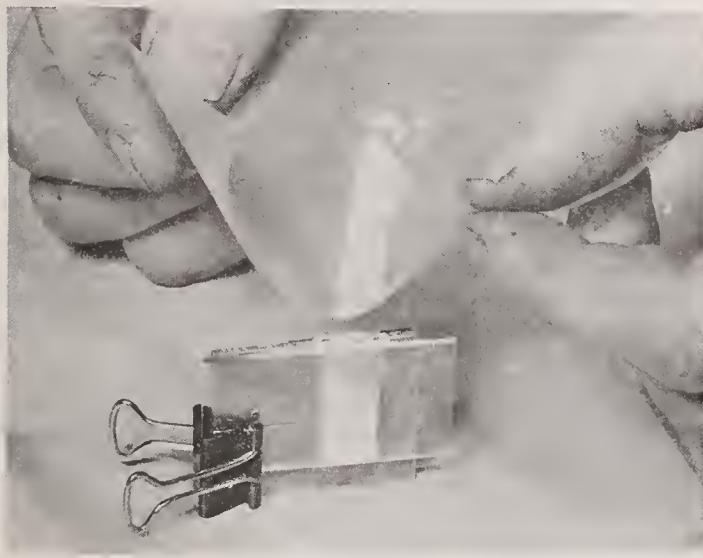

Densities. These were calculated from the specified lattice constants, the Avogadro number 6.0220943 × 10²³ [Deslattes et al., 1974] and atomic weights published by the International Union of Pure and Applied Chemistry [1972].

Figure of merit. Several figures of merit ratings are available for assessing indexed powder data. M₂₀ [de Wolff, 1968] is a criterion for the reliability of the unit cell and indexing. A value of M₂₀ > 10 will guarantee the essential correctness of the indexing provided there are not more than 2 spurious lines (X₂₀ ≤ 2) [de Wolff, 1968]. All patterns reported in this publication have M₂₀ between 20 and 233, and X₂₀ = 0 unless noted otherwise. M₂₀ was specified for any pattern indexed with a cell derived only through computer indexing from powder data, without further confirmation.

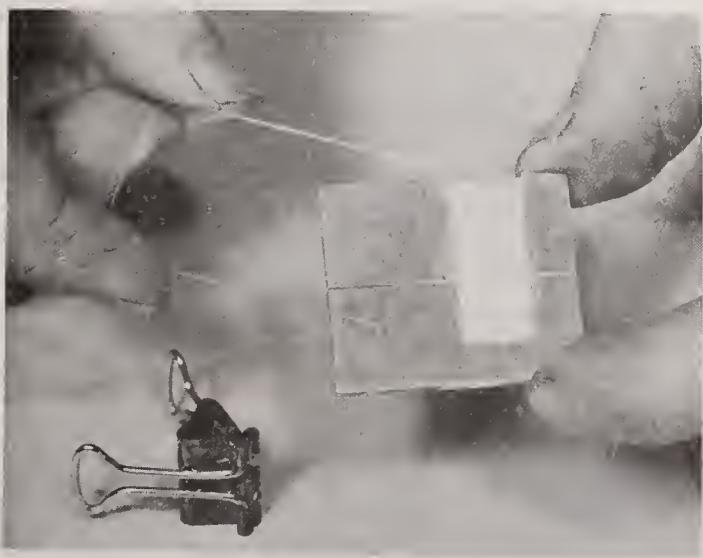

The accuracy and completeness of measured interplanar spacings is conveniently reported as F_N [Smith and Snyder, 1979]. The format used in this publication was F_N = overall value (|Δ2θ|, N_{poss}), where N, the number of observed reflections was chosen as 30 or the maximum number of lines of the pattern, if the entire pattern had fewer than 30 lines. The "overall value" was the figure of merit, F_N, as defined by Smith and Snyder [1979], and |Δ2θ| was the average absolute magnitude of discrepancy between observed and calculated 2θ values for the N lines. N_{poss} was the number of unique and resolvable diffraction lines allowed in the space group, up to the Nth observed and indexed line. In this publication, the value of F_N ranged from 31 to 118, with an average value of 61 for the 58 patterns from experimental data.

Intensity measurements. It was found that samples which gave satisfactory intensity patterns usually had an average particle size smaller than 10 μm, as recommended by Alexander et al. [1948]. In order to avoid the orientation effects which occur when powdered samples are packed or pressed,

a sample holder was made that had in its top face a rectangular cavity which extended to one end of the holder. To prepare the sample, a glass slide was clamped over the top face to form a temporary cavity wall (see Figure 1), and the powdered sample was allowed to drift into the end opening while the holder was held in a vertical position.

With the sample holder returned to a horizontal position, the glass slide was carefully removed so that the sample could be exposed to the x-ray beam (see Figure 2). If the sample powder did not flow readily, or was prone to orient excessively, approximately 50 volume percent of finely ground silica-gel was added as a diluent. The intensities of the diffraction lines were measured as peak heights above background and were expressed in percentages of the strongest line. Any intensity larger than 20 was rounded to the nearer multiple of 5. At least 3 patterns for intensity measurements were prepared for each sample to check reproducibility.

Reference Intensity Ratio, I/I_{corundum} . The reference intensity ratio, I/I_c , has been defined as the direct ratio of the intensity of the strongest reflection of a sample, to the intensity of the reflection 113 (hexagonal) of corundum ($\alpha\text{-Al}_2\text{O}_3$) [Visser and de Wolff, 1964]. In this publication, the ratios I/I_c were tabulated for copper $K\alpha$ radiation, for a 1:1 mixture by weight of the sample and corundum. Occasionally I/I_c was not determined because it was not feasible.

A procedure has been adopted, to achieve greater statistical accuracy [Hubbard and Smith, 1977]. For any weight fractions of sample and corundum, x_s and x_c ($x_s = 1 - x_c$), the intensities for reflection h of the sample and k of corundum were measured for several combinations of h and k usually within the same region of 2θ , to provide indications of possible preferred orientation, extinction, or other systematic errors. The reference intensity ratio is then given by

$$\frac{I(h_0)}{I_c(113)} = \frac{x_c}{x_s} \cdot \frac{I_c^{\text{rel}}(k)}{I_s^{\text{rel}}(h)} \cdot \frac{I(h)}{I(k)}$$

and (h_0) indicates specifically which reflection was chosen for tabulation purposes. For each of our patterns, the reflection (h_0) will be the one with $I=100$ since only copper radiation was used. Typically, at least 3 sets of reflections and 2 mountings of the mixture were used to obtain 6 or more values for the reference intensity ratio, I/I_c . These values yield the tabulated average $\langle I/I_c \rangle$. From these data, the estimated deviation, Δ , was obtained from

$$\Delta = \frac{\sum_{i=1}^n |(I/I_c)_i - \langle I/I_c \rangle|}{n}$$

where n is the number of measurements of the reference intensity ratio. The estimated deviation in the least significant figures is given in parentheses.

Format of tables. The printing of the data has been computerized. Superimposed reflections were treated in one of two ways. If a d-spacing had only two possible indices, an M was added to the d-spacing which was repeated on the next line, but with the second index. However, if there were more than two possible indices, a + sign was used in like manner. In both cases, the composite intensity was printed only once and aligned with the first reflection. The symbol "1L" in the intensity column was used to indicate "less than 1."

CALCULATED POWDER PATTERNS

Since some substances of interest are not readily available for experimental work, powder patterns were calculated from published crystal structure data. The FORTRAN program used for the computations was developed by Clark et al. [1973] and modified at NBS.

Lattice parameters. Before the computations of the patterns, any necessary changes were made

in the lattice constants in order to make them consistent with the revised value of $\lambda(\text{CuK}\alpha_1) = 1.540598\text{\AA}$ [Deslattes and Henins, 1973]. Both the altered and the original published values are given. A lattice constant arrangement which follows the convention of *Crystal Data* has been referred to as the "CD cell." In several of the calculated patterns, the literature lattice constants, the atom positions, and hence the final patterns were not given in the CD arrangement. For cross-reference purposes, the CD cell was calculated separately and included in the text.

Scattering factors. Whenever possible, the same scattering factors were used which the author of the reference article specified. Otherwise, the factors were taken directly from the *International Tables for X-ray Crystallography, Vol. III*, [1962]. The factors were corrected for dispersion if the author had done so.

Thermal parameters. The computer program used thermal parameter data of only two forms, the isotropic B 's (\AA^2) or the anisotropic β_{ij} 's in the following expressions:

$$e^{(-B \sin^2\theta)/\lambda^2}$$

or

$$e^{-(h^2\beta_{11}+k^2\beta_{22}+\ell^2\beta_{33}+2hk\beta_{12}+2h\ell\beta_{13}+2k\ell\beta_{23})}.$$

Other thermal parameters (e.g. U_{ij}) were converted to one of these two forms. The isotropic parameters were used directly, if given by the structure reference. In a few of our patterns, anisotropic parameters were also used directly as given by the structure reference; in other work, instead of using given anisotropic parameters, approximately equivalent isotropic values were substituted as defined by:

$$B = 4 \left[\frac{\beta_{11} \beta_{22} \beta_{33}}{a^2 b^2 c^2} \right]^{\frac{1}{3}}$$

Structural information. The atom positions used in these calculated patterns varied somewhat in the degree of reliability. In our text, when the expression "the structure was determined by..." was used, the atomic parameters in the reference cited had been calculated from refinement of single crystal data. Otherwise, the atomic positions had been derived by analogy with similar compounds whose structure was known. In cases where isostructural relationships were used, the atoms were in fixed special positions or the ionic radii were closely related to the corresponding radii of the atoms in the known structure.

Integrated intensities. The theoretical integrated intensity of reflection i on the "absolute-relative" scale is I_i^{abs}/K , as defined by Hubbard et al. [1976] in the equation

$$\frac{I_i^{\text{abs}}}{K} = \frac{M_i L p_i |F_i T_i|^2}{2\mu V^2}$$

where:

F is the structure factor
 T is the thermal correction

$L_p = \frac{1+\cos^2 2\theta}{\sin^2 \theta \cos \theta}$ is the Lorentz-polarization term

M is the multiplicity for the reflection i
 μ is the linear absorption coefficient
 V is the volume of the unit cell.

When the largest integrated intensity was assigned a relative value of 100 and all other reflections were scaled relative to it, the intensities were placed on the relative intensity scale (I^{rel}). Reflections with I^{rel} less than 0.7 were omitted. Relative intensities were rounded to the nearest integer value before being listed, except that for phases whose structures were postulated or were based on analogy, any intensity above 20 was rounded further, to the nearer multiple of 5.

Scale factor (integrated intensities). The scale factor, γ , was defined to convert the tabulated I^{rel} to the "absolute-relative" scale [Hubbard et al., 1976]. That is:

$$\gamma = \frac{M' L p' |F' T'|^2}{200\mu V^2}$$

and

$$\frac{I^{\text{abs}}}{K} = \gamma I^{\text{rel}}$$

The primes denoted the values for the largest integrated intensity. In earlier Monographs (1969-1975), a different scale factor, k_{NBS} , was reported which is related to γ :

$$\frac{\gamma}{k_{\text{NBS}}} = \frac{1}{2\mu V^2}$$

From γ , the theoretical value of the Reference Intensity Ratio, I/I_c , was calculated:

$$I/I_c = \frac{\mu \gamma \rho_c}{\mu_c \gamma_c \rho}$$

where ρ is the density and the subscript c represents corundum ($\alpha\text{-Al}_2\text{O}_3$).

For refined structures, the value of I/I_c was given. For those phases whose structures were postulated or were based only on analogy to other powder patterns, I/I_c was not included.

I/I_c and γ are each based on the single strongest reflection, not on the overlapping sum of superimposed reflections.

Peak heights. The purpose of calculating peak height intensity was to provide a tabulated pattern similar to what might be obtained from experimental diffractometer measurements. For each predicted reflection, Cauchy profiles centered at both the α_1 and the α_2 peak positions were calculated and summed, forming a simulated powder pattern. The full width at half-maximum (FWHM)

was allowed to vary to represent the changing FWHM as a function of 2θ . [The values of the FWHM vs 2θ are given in Table 2]. The resultant simulated powder pattern was then analyzed for peaks. In the regions of the predicted reflections several reflections could have identical or similar 2θ angles and produce only one composite peak in the simulated pattern. The 2θ angle of the composite peak was assigned the hkl of the reflection having the greatest contribution to the peak height intensity. If any other peak contributed more than 10% of the intensity toward the composite peak height intensity, a plus sign (+) was appended to the hkl .

Peaks due solely to α_2 lines were omitted. If a composite peak was formed by the overlap of an α_1 peak of reflection j with the α_2 peak of reflection i , the reflection j was listed separately only if it contributed a significant intensity (>10%) at the composite peak location.

The peak search routine located peaks only at 2θ angles which were a multiple of 0.02° .

Table 2

2θ CuK α_1	FWHM	2θ CuK α_1	FWHM
0°	0.12°	140	0.230
20	.12	145	.255
40	.12	150	.285
60	.125	155	.315
80	.130	160	.360
100	.135	162.5	.410
120	.155	165	.500
130	.185		

UNITS

In this publication the Ångström unit ($1\text{\AA}=100\text{pm}$) was selected for presentation of the d-spacings and lattice parameters to maintain consistency with (a) the earlier publications of Standard X-ray Diffraction Powder Patterns (Circular 539 volumes 1-10 and Monograph 25 sections 1-15), (b) the publications of the International Union of Crystallography: Acta Crystallographica and the Journal of Applied Crystallography, and (c) the continuing publication of cards and search manuals of the Powder Diffraction File (now consisting of nearly 30,000 entries). The PDF search manuals are based on the d-spacings in Å of the three strongest lines. Consistent with the choice of the Å unit for length, the volume of the unit cell is expressed in Å^3 ($=1 \times 10^{-30} \text{ m}^3$). Other reported parameters and their units are density in g/cm^3 ($1 \text{ gm/cm}^3 = 10^{-3} \text{ kg/m}^3$) and the linear absorption coefficient in cm^{-1} .

ACKNOWLEDGMENTS

We would like to thank Mary Owen of the JCPDS Associateship for her assistance, particularly for key-punching the data and helping with the proofreading of this manuscript. Appreciation is also expressed to the Text Editing Facilities of the National Measurement Laboratory of NBS for typing the manuscript.

Sample

The sample is Standard Reference Material 141c of the National Bureau of Standards, obtained from J. T. Baker Co., Phillipsburg, NJ. It is used for checking microchemical procedures for the determination of carbon, hydrogen and nitrogen in organic matter.

Color
Colorless

Structure

Orthorhombic, Pcab (61), Z = 8. The structure was determined by Brown and Corbridge [1954] and refined by Brown [1966].

Lattice constants of this sample

$$a = 9.494(3) \text{ \AA}$$

$$b = 19.645(4)$$

$$c = 7.995(2)$$

$$a/b = 0.4833$$

$$c/b = 0.4070$$

Volume
 $1491. \text{ \AA}^3$

Density
(calculated) 1.204 g/cm³

Figure of merit
 $F_{30} = 56.3 (0.013, 40)$

Reference intensity
 $I/I_{\text{corundum}} = 0.63(4)$

Antimonic Acid, $H_{14}Sb_{14}O_{21}(OH)_{42}$

Sample

The sample was prepared by dissolving Sb metal in warm HCl and HNO_3 (both concentrated). With constant stirring, the solution was poured into water at 80 °C. Stirring was continued overnight at 70 °C. The crystals formed were filtered off and dried in air at room temperature. The water content varies somewhat but causes little change in the x-ray pattern [Abe and Ito, 1968; Stewart et al., 1972]. The material is often referred to as " $Sb_2O_5 \cdot 4H_2O$ ".

Color

Colorless

Structure

Cubic, $Fd\bar{3}m$ (227), $Z = 1$. The structure was determined by Baetsle and Huys [1968]. Dehydrated phases have powder patterns similar to that of $H_{14}Sb_{14}O_{21}(OH)_{42}$ in d-spacings and cell size, but are quite distinct in relative intensities [Stewart et al., 1972].

Lattice constant of this sample

$a = 10.3553(7)$ Å

Volume
 1110.4 Å³

Density
(calculated) 4.140 g/cm³

Figure of merit

$F_{20} = 54.9(0.012, 31)$

Reference intensity

$I/I_{corundum} = 3.49(10)$

Additional patterns

Antimony Tin, SbSn

CAS registry no.
28980-49-6

Sample

The sample was made by melting Sn and Sb together above 1100 °C in air. It was then quenched by pouring out onto a slab, and ground. This phase has a homogeneity range of 45-55 percent Sb [Hägg and Hybinette, 1935].

Color

Black

Structure

Hexagonal, R³, Z = 3. This phase was studied by Hägg and Hybinette [1935]. These authors reported a rhombohedral cell with both a and c doubled. No lines were found in the authors' pattern or the NBS pattern that required the larger cell. This phase has been considered cubic [Osawa, 1929] and [Bowen and Jones, 1931].

Lattice constants of this sample

$$a = 4.3255(3) \text{ \AA}$$

$$c = 5.3465(8)$$

$$c/a = 1.2360$$

Volume °
86.6 Å³

Density

(calculated) 13.827 g/cm³

Figure of merit

$$F_{14} = 67.4(0.013, 16)$$

Reference intensity

$$I/I_{\text{corundum}} = 2.34(12)$$

Polymorphism

SbSn transforms to a different phase at 320 °C [Iwasé et al., 1931].

Barium Bromide Hydrate, $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$

CAS registry no.
7791-28-8

Sample

The sample was made by slow evaporation of an aqueous solution at room temperature.

Color

Colorless

Optical data

Biaxial (-), $N_\alpha = 1.720$, $N_\beta = 1.732$,
 $N_\gamma = 1.748$. $2V$ is large.

Structure

Monoclinic, $C2/c$ (15), $Z = 4$. The structure was determined by Bang [1961].

Lattice constants of this sample

$a = 10.442(2)$ Å

$b = 7.207(1)$

$c = 8.384(2)$

$\beta = 113.61(2)^\circ$

$a/b = 1.4489$

$c/b = 1.1633$

Volume 578.1 Å^3

Density

(calculated) 3.828 g/cm^3

Figures of merit

$F_{30} = 82.2(0.011,32)$

$M_{20} = 43.8$

Reference intensity

$I/I_{\text{corundum}} = 4.3(2)$

Barium Chlorate, Ba(ClO₃)₂

CAS registry no.
13477-00-4

Sample

The sample was prepared by heating Ba(ClO₃)₂·H₂O at about 250 °C for 15 hours.

Color

Colorless

Structure

Orthorhombic. The crystal system aspect is apparently F*** and Z is assumed to be 8. The cell was determined from the Visser program [1969].

Lattice constants of this sample

$$a = 11.782(3) \text{ Å}$$

$$b = 13.264(3)$$

$$c = 7.727(2)$$

$$a/b = 0.8883$$

$$c/b = 0.5826$$

Volume
1207.5 Å³

Density
(calculated) 3.347 g/cm³ (assuming Z = 8)

Figure of merit

$$F_{30} = 52.2(0.014, 41)$$

Additional pattern

1. PDF card 1-530 [Hanawalt et al., 1938],
data appears to be for Ba(ClO₄)₂

Barium Iodide Hydrate, $\text{BaI}_2 \cdot 2\text{H}_2\text{O}$

CAS registry no.
7787-33-9

Sample

The sample was made by slow evaporation of an aqueous solution of BaI_2 at about 60 °C.

Color

Strong yellowish brown

Structure

Monoclinic, $I2/a$ (15), $Z = 4$, by analogy with the powder pattern for $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$. The axial ratios confirmed those given by Groth [1906]. The equivalent C-centered cell is $a = 11.090(2)$ Å, $b = 7.634(1)$, $c = 8.656(2)$, $\beta = 112.98(2)$ °.

Lattice constants of this sample

$$a = 11.089(2) \text{ \AA}$$

$$b = 7.634(1)$$

$$c = 8.656(2)$$

$$\beta = 112.96(2)$$
 °

$$a/b = 1.4526$$

$$c/b = 1.1339$$

Volume °
674.7 Å³

Density
(calculated) 4.206 g/cm³

Figure of merit
 $F_{30} = 68.5(0.012, 38)$

Reference intensity
 $I/I_{\text{corundum}} = 3.4(2)$

Barium Phosphate, $\text{Ba}_2\text{P}_2\text{O}_7$, (high form)

CAS registry no.
13466-21-2

Sample

The sample was prepared by heating BaCO_3 with $\text{H}_4\text{P}_2\text{O}_7$ at 950 °C for 1 hour, grinding and heating a few minutes at 1100 °C. Chemical analysis of material dried at 100 °C gave BaO as 68.25 percent and P_2O_5 as 31.12 percent. The theoretical composition for $\text{Ba}_2\text{P}_2\text{O}_7$ gives $\text{BaO} = 68.4$ percent and $\text{P}_2\text{O}_5 = 31.6$ percent.

Color

Colorless

Optical data

Uniaxial (+), $N_o = 1.595$, $N_e = 1.600$

Structure

Hexagonal. The crystal system aspect is apparently $P6_3^{**}$ and Z is assumed to be 3. The cell was determined from the Visser [1969] program. Ranby et al. [1955] proposed an orthorhombic cell for this phase. It did not fit our data. Mehdi et al. [1977] proposed a different orthorhombic cell which did not properly fit his data or ours.

Lattice constants of this sample

$a = 9.4175(8)$ Å

$c = 7.081(1)$

$c/a = 0.7519$

Volume
 543.85 Å³

Density

(calculated) 4.109 g/cm³, assuming $Z = 3$.

Figures of merit

$F_{30} = 54.8(0.012, 46)$

$M_{20} = 58.7$

Reference intensity

$I/I_{\text{corundum}} = 4.3(2)$

Polymorphism

Below about 725 °C, $\text{Ba}_2\text{P}_2\text{O}_7$ forms an α phase, isostructural with $\alpha\text{-Ca}_2\text{P}_2\text{O}_7$ [McCauley and Hummel, 1968; Ranby et al., 1955].

Barium Thiosulfate Hydrate, $\text{BaS}_2\text{O}_3 \cdot \text{H}_2\text{O}$

CAS registry no.
13466-25-6

Sample

The sample was made by adding a concentrated solution of $\text{Na}_2\text{S}_2\text{O}_3$ to a similar hot solution of BaCl_2 . The solution was then cooled. This produced small plates. When the pure material was dissolved in water and the liquid allowed to evaporate at room temperature, small needles were formed. The intensities were determined on a mixture of the crystal types.

Color

Colorless

Structure

Orthorhombic, Pnca (60), $Z = 8$. The structure of $\text{BaS}_2\text{O}_3 \cdot \text{H}_2\text{O}$ was studied by Nardelli and Fava [1962].

Lattice constants of this sample

$a = 7.386(1) \text{ \AA}$
 $b = 20.050(3)$
 $c = 7.191(2)$

$a/b = 0.3684$
 $c/b = 0.3587$

Cadmium Borate, CdB_4O_7

Sample

The sample was prepared by heating CdO and B_2O_3 in a 1:2 molar mixture at 900 °C for 5 hours.

Color

Colorless

Structure

Orthorhombic, Pbca (61), $Z = 8$, [Hand and Krogh-Moe, 1962]. The structure of CdB_4O_7 has been determined by Ihara and Krogh-Moe [1966].

Lattice constants of this sample

$$\begin{aligned} a &= 8.704(1) \text{ \AA} \\ b &= 14.176(2) \\ c &= 8.229(1) \end{aligned}$$

$$\begin{aligned} a/b &= 0.6140 \\ c/b &= 0.5805 \end{aligned}$$

Volume
 1015.4 \AA^3

Density

(calculated) 3.501 g/cm^3

Figure of merit

$$F_{30} = 50.8(0.013, 46)$$

Reference intensity

$$I/I_{\text{corundum}} = 0.82(6)$$

Additional pattern

Cadmium Phosphate, $\text{Cd}_2\text{P}_2\text{O}_7$

Sample

The sample was prepared by heating a 1:1 molar mixture of CdCO_3 and $(\text{NH}_4)_2\text{HPO}_4$ at 700 °C for several days, followed by heating at 800 °C for 2 hours.

Color

Colorless

Structure

Triclinic, $P\bar{1}$ (2), $Z = 2$. The structure of $\text{Cd}_2\text{P}_2\text{O}_7$ was determined by Calvo and Au [1969].

Lattice constants of this sample

$$a = 6.602(2) \text{ } \text{\AA}$$

$$b = 6.778(2)$$

$$c = 6.631(2)$$

$$\alpha = 95.79(2)^\circ$$

$$\beta = 97.68(2)$$

$$\gamma = 65.00(2)$$

$$a/b = 0.9740$$

$$c/b = 0.9783$$

Volume

$$266.2 \text{ } \text{\AA}^3$$

Density

$$(\text{calculated}) 4.975 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 51.3(0.012, 47)$$

Reference intensity

$$I/I_{\text{corundum}} = 1.58(3)$$

Cadmium Phosphate, $\text{Cd}_3(\text{PO}_4)_2$

Sample

The sample was prepared by heating a 3:2 molar mixture of CdO and $(\text{NH}_4)_2\text{HPO}_4$ at 800 °C overnight.

Color

Colorless

Structure

Monoclinic, $P2_1/c$ (14), $Z = 4$. The cell was found by use of the Visser program [1969] and by comparison with $\beta\text{-Zn}_3(\text{PO}_4)_2$ and $\text{Mn}_3(\text{PO}_4)_2$. The space group was assigned by consideration of the absences in the powder pattern.

Lattice constants of this sample

$a = 8.662(2)$ Å
 $b = 10.333(3)$
 $c = 8.307(2)$
 $\beta = 114.48(2)^\circ$

$a/b = 0.8383$
 $c/b = 0.8039$

Volume
 676.7 Å^3

Density
 (calculated) 5.174 g/cm³ (assuming $Z = 4$)

Figures of merit

$F_{30} = 72.4(0.011,39)$
 $M_{20} = 35.5$

Reference intensity

$I/I_{\text{corundum}} = 1.16(6)$

Calcium Aluminum Iron Oxide (Brownmillerite), $\text{Ca}_4\text{Al}_2\text{Fe}_2\text{O}_{10}$

CAS registry no.
12068-35-8

Sample

The sample was prepared by the Portland Cement Association. This phase is a component of portland cement and is known as C_4AF .

Color

Deep brown

Structure

Orthorhombic, Pcmn (62), $Z = 2$. The structure was determined by Bertaut et al. [1959]. $\text{Ca}_4\text{Al}_2\text{Fe}_2\text{O}_{10}$ is isostructural and forms a series of solid solutions with $\text{Ca}_2\text{Fe}_2\text{O}_5$ [Bertaut et al., 1959].

Lattice constants of this sample

$$a = 5.5672(9) \text{ \AA}$$

$$b = 14.521(2)$$

$$c = 5.349(1)$$

$$a/b = 0.3834$$

$$c/b = 0.3684$$

Volume
 432.4 \AA^3

Density
(calculated) 3.732 g/cm^3

Figure of merit
 $F_{30} = 30.9(0.011, 85)$

Reference intensity
 $I/I_{\text{corundum}} = 1.32(10)$

Additional patterns

Chromium Chloride Hydrate, CrCl₃·6H₂O

Synonym

1. Dichlorotetraaquochromium(III) chloride dihydrate, [Cr(H₂O)₄Cl₂]Cl·2H₂O

CAS registry no.

10060-12-5

Sample

The sample was obtained from City Chemical Corp., New York, NY.

Color

Very dark yellowish green

Structure

Monoclinic, C2/c (15), Z = 4. The structure was determined by Dance and Freeman [1965]. Morosin [1966] had also independently determined the same structure. The synonym name and formula are those obtained as the results of crystal structure analysis.

Lattice constants of this sample

a = 12.048(2) Å

b = 6.8352(8)

c = 11.643(1)

β = 94.14(1)°

a/b = 1.7626

c/b = 1.7032

Volume
956.27 Å³

Density

(calculated) 1.851 g/cm³

Figure of merit

F₃₀ = 65.2(0.012,39)

Polymorphism

A hexagonal modification has been reported by Andress and Carpenter [1934].

Additional pattern

Copper Lead Hydroxide Sulfate, Linarite, CuPb(OH)₂(SO₄)

Sample

The hand separated sample is from U.S. National Museum (NMNH R8105) from Mammoth Mine, Pinel Co., AZ.

Major impurities

Approximately 10% PbSO₄ was present in this mineral as a second phase and was ignored.

Color

Deep blue

Structure

Monoclinic, P2₁/m (11), Z = 2. The structure was determined by Bachmann and Zeeman [1961]. Araki [1962] re-examined his earlier work and confirmed the above structure.

Lattice constants of this sample

a = 9.6913(9) Å

b = 5.6503(6)

c = 4.6873(5)

β = 102.66(1)°

a/b = 1.7152

c/b = 0.8296

Volume

250.43 Å³

Density

(calculated) 5.315 g/cm³

Figure of merit

F₃₀ = 76.6(0.011, 35)

Gold Chloride, AuCl

CAS registry no.
10294-29-8

Sample

The sample was prepared by dissolving Au metal in aqua regia. The dark red intermediate crystals obtained were dried at 200 °C for one hour. The AuCl crystals were found to be metastable, disproportionately decomposing into Au metal and Au₂Cl₆ [Janssen et al., 1974]. Au₂Cl₆ was not detected in this sample; however, the Au metal present was used as the internal standard.

Color

Yellow

Structure

Tetragonal, I4₁/amd (141), Z = 8. The structure was studied by Janssen et al. [1974]. The structure had been reported to be orthorhombic by Capella and Schwab [1965].

Lattice constants of this sample

a = 6.7425(9) Å
c = 8.694(1)

c/a = 1.2894

Volume
395.2 Å³

Density
(calculated) 7.812 g/cm³

Figure of merit
F₁₆ = 81.8(0.010,20)

Iron Phosphate Hydrate (Vivianite), $\text{Fe}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$

Sample

The sample was made by slow reaction of H_3PO_4 on FeSO_4 solution with some H_2SO_4 added. The flask was freed of air by flushing with natural gas and left with occasional shaking for two weeks.

Color

Grayish purplish blue

Structure

Monoclinic, $I2/m$ (12), $Z = 2$ [Barth, 1937]. The structure was determined by Mori and Ito [1950]. It is isostructural with $\text{Fe}_3(\text{AsO}_4)_2 \cdot 8\text{H}_2\text{O}$ (parasymplesite) [Ritz et al., 1974].

Lattice constants of this sample

$$a = 10.034(3) \text{ \AA}^\circ$$

$$b = 13.449(3)$$

$$c = 4.707(2)$$

$$\beta = 102.65(3)^\circ$$

$$a/b = 0.7461$$

$$c/b = 0.3500$$

Volume

$$619.7 \text{ \AA}^3$$

Density

$$(\text{calculated}) 2.688 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 52.6 (0.015, 38)$$

Polymorphism

A polymorph of $\text{Fe}_3(\text{PO}_4)_2 \cdot 8\text{H}_2\text{O}$ occurs naturally, is triclinic and is called meta-vivianite [Ritz et al., 1974].

Lead Bromide Hydroxide, PbBr(OH)

CAS registry no.
16651-91-5

Sample

The sample was prepared by making a saturated aqueous solution of fresh recrystallized PbBr_2 . To this was added a 10% solution of NaOH. The precipitate was left for 80 hours in the liquid to promote growth of the crystals.

Color

Colorless

Structure

Orthorhombic, Pnam (62), $Z = 4$. The structure of $\text{PbBr}(\text{OH})$ was determined by Møller [1966]. $\text{PbBr}(\text{OH})$ is isostructural with SbBrS and $\text{PbCl}(\text{OH})$.

Lattice constants of this sample

$$a = 7.3850(8) \text{\AA}$$

$$b = 10.013(1)$$

$$c = 4.0835(5)$$

$$a/b = 0.7375$$

$$c/b = 0.4078$$

Volume
 301.96 \AA^3

Density
(calculated) 6.689 g/cm^3

Figure of merit
 $F_{30} = 78.7(0.012, 31)$

Reference Intensity
 $I/I_{\text{corundum}} = 5.9(3)$

Lithium Calcium Aluminum Boron Hydroxy Silicate,
Liddicoatite, $\text{Ca}(\text{Li},\text{Al})_3\text{Al}_6\text{B}_3\text{Si}_6\text{O}_{27}(\text{OH},\text{F})_3(\text{OH},\text{F})$

Sample

The sample is holotype material from U.S. National Museum (NMNH #135815). The locality of this sample can be stated only in general terms. The crystals occur as detritus in the soils near Antsirabe in Madagascar, and a specific site for the occurrence of the type mineral is not known [Dunn et al., 1977].

Color

Dark olive brown

Optical data

Uniaxial(-), $N_o = 1.637$, $N_e = 1.621$ [Dunn et al., 1977].

Structure

Hexagonal, R3m (160), $Z = 3$, isostructural with tourmalines [Dunn et al., 1977].

Lattice constants of this sample

$a = 15.847(1) \text{ \AA}$
 $c = 7.1080(7)$

$c/a = 0.4485$

Volume
 1546.0 \AA^3

Density

(calculated) 3.06 g/cm^3 [based on $\text{Ca}(\text{Li}_{1.74}\text{Al}_{1.26})\text{Al}_6\text{B}_3\text{Si}_6\text{O}_{27.52}(\text{OH})_{2.48}(\text{F},\text{OH})$ according to empirical formula by Dunn et al. (1977)].

Figure of merit
 $F_{30} = 62.0(0.015, 32)$

Lithium Chromium Oxide Hydrate, $\text{Li}_2\text{CrO}_4 \cdot 2\text{H}_2\text{O}$

Sample

The sample was made by slow evaporation at room temperature of an aqueous solution of Li_2CrO_4 .

Color

Strong orange yellow

Structure

Orthorhombic, $P2_12_12_1$ (19), $Z = 4$. The cell was obtained from the axial ratios of Groth [1908] assuming a density near 2.1 and a $Z = 4$.

Lattice constants of this sample

$$a = 7.746(1) \text{ \AA}$$

$$b = 12.011(2)$$

$$c = 5.5094(7)$$

$$a/b = 0.6449$$

$$c/b = 0.4587$$

Volume

$$512.56 \text{ \AA}^3$$

Density

$$(\text{calculated}) 2.150 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 74.6(0.012, 35)$$

Lithium Tin Oxide, Li_2SnO_3

CAS registry no.
12188-25-9

Sample

The sample was prepared by heating $\text{Li}_2\text{C}_2\text{O}_4$ and SnO_2 at 800 °C for 10 minutes followed by 950 °C for 20 minutes.

Color

Colorless

Structure

Monoclinic, $A2/a$ (15), $Z = 8$, [Scheer et al., 1955; Lang, 1954]. The structure of Li_2SnO_3 has been studied by Kreuzburg et al. [1970].

Lattice constants of this sample

$a = 10.027(2)$ Å
 $b = 9.181(2)$
 $c = 5.301(2)$
 $\beta = 100.26(2)^\circ$

$a/b = 1.0921$
 $c/b = 0.5774$

Volume
 $480.1 \text{ } \text{\AA}^3$

Density
 (calculated) 4.996 g/cm^3

Figure of merit
 $F_{30} = 27.9(0.014, 80)$

Reference intensity
 $I/I_{\text{corundum}} = 4.1(3)$

Polymorphism

There is a second form of Li_2SnO_3 which differs in its stacking [Lang, 1966].

Magnesium Sulfate Hydrate (Kieserite), $\text{MgSO}_4 \cdot \text{H}_2\text{O}$

CAS registry no.
14567-64-7

Sample

A sample of $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$ was obtained from Fisher Scientific Co. of Fairlawn, NJ. The material was heated first at 150 °C, then sealed in a tube and heated for 1 3/4 hours at 400 °C.

Color

Colorless

Structure

Monoclinic, A2/a (15), Z = 4. The structure was determined by Leonhardt and Weiss [1957] and confirmed by Bregeault et al. [1972].

Lattice constants of this sample

$a = 7.5110(9)$ Å
 $b = 7.611(1)$
 $c = 6.921(1)$
 $\beta = 116.17(1)$ °

$a/b = 0.9868$
 $c/b = 0.9093$

Volume °
355.1 Å³

Density
(calculated) 2.589 g/cm³

Figure of merit
 $F_{30} = 60.5(0.011, 47)$

Reference intensity
 $I/I_{\text{corundum}} = 1.02(4)$

Additional pattern

1. PDF card 13-102 [Kubisz, 1960] (natural mineral)

Manganese Phosphate, $\text{Mn}_3(\text{PO}_4)_2$

Sample

The sample was prepared by heating a 3:2 molar mixture of MnCO_3 and $(\text{NH}_4)_2\text{HPO}_4$ overnight at 850 °C.

Color

Pinkish white

Structure

Monoclinic, $P2_1/c$ (14), $Z = 4$. The cell was found by use of the Visser program [1969] and by comparison with $\beta\text{-Zn}_3(\text{PO}_4)_2$ and $\text{Cd}_3(\text{PO}_4)_2$. The space group was assigned by consideration of the absences in the powder pattern.

Lattice constants of this sample

$$a = 8.446(2) \text{ \AA}$$

$$b = 10.059(3)$$

$$c = 8.047(2)$$

$$\beta = 114.27(2)^\circ$$

$$a/b = 0.8396$$

$$c/b = 0.8000$$

Volume
623.2 \AA^3

Density

(calculated) 3.781 g/cm³ (assuming $Z = 4$)

Figures of merit

$$F_{30} = 54.0(0.013,44)$$

$$M_{20} = 31.1$$

Polymorphism

$\text{Mn}_3(\text{PO}_4)_2$ is also reported to crystallize in a graftonite structure [Calvo, 1968]. Stephens and Calvo [1969] also describe a second monoclinic form of $\text{Mn}_3(\text{PO}_4)_2$ which they call " β ".

Manganese Sulfate Hydrate (Szmikite), $\text{MnSO}_4 \cdot \text{H}_2\text{O}$

Sample

A sample of MnSO_4 was obtained from J. T. Baker Co., Phillipsburg, NJ. Crystals were formed from a saturated solution of the material at room temperature. The crystals slowly changed to the monohydrate when left in open air and were finally heated at 250 °C for 2½ hours.

Color

Colorless

Structure

Monoclinic, $A2/a$ (15), $Z = 4$, isostructural with $\text{CoSO}_4 \cdot \text{H}_2\text{O}$. The structure was determined by Le Fur et al. [1966].

Lattice constants of this sample

$$a = 7.766(1) \text{ \AA}^{\circ}$$

$$b = 7.666(1)$$

$$c = 7.120(1)$$

$$\beta = 115.85(1) {}^{\circ}$$

$$a/b = 1.0130$$

$$c/b = 0.9288$$

Mercury Sulfate, HgSO_4

Sample

The sample was obtained from Alfa Division,
Ventron Corp., Danvers, MA.

Color

Yellowish white

Structure

Orthorhombic, $P2_1mn$ (31), $Z = 2$. The structure was determined by Bonefačić [1963] and Kokkoros and Rentzeperis [1963]. Aurivillius [1964] reports that the symmetry is monoclinic rather than orthorhombic.

Lattice constants of this sample

$$a = 4.8150(2) \text{ \AA}$$

$$b = 6.5752(3)$$

$$c = 4.7810(2)$$

$$a/b = 0.7323$$

$$c/b = 0.7271$$

Volume

$$151.36 \text{ \AA}^3$$

Density

$$(\text{calculated}) 6.509 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 118(0.008, 31)$$

Mercury Sulfate, Hg_2SO_4

Sample

The sample was reagent material obtained from Kahlbaum, Berlin, Germany.

Color

Yellowish white

Structure

Monoclinic, $P2/a$ (13), $Z = 2$, isostructural with mercury selenate. The structure was determined by Dorm [1969].

Lattice constants of this sample

$$a = 8.365(1) \text{ \AA}$$

$$b = 4.4262(5)$$

$$c = 6.2785(9)$$

$$\beta = 91.77(1)^\circ$$

$$a/b = 1.8899$$

$$c/b = 1.4185$$

Volume

$$232.34 \text{ \AA}^3$$

Density

$$(\text{calculated}) 7.108 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 76.4(0.013, 30)$$

Reference intensity

$$I/I_{\text{corundum}} = 3.4(3)$$

Additional pattern

Nicotinic Acid, C₆H₅NO₂

Synonym

1. 3-Pyridinecarboxylic Acid

CAS registry no.

59-67-6

Sample

The sample was NBS Standard Reference Material 148. It is used for checking microdeterminations of carbon, hydrogen and nitrogen.

Color

Colorless

Optical data

Biaxial(-), N _{α} = 1.424(2), N _{β} = 1.717,

N _{γ} ~ 1.79.

2V = 46° [Wright and King, 1950].

Structure

Monoclinic, P2₁/a (14), Z = 4, [Wright and King, 1950].

Lattice constants of this sample

a = 7.222(2) Å

b = 11.672(3)

c = 7.178(2)

β = 113.42(2)°

a/b = 0.6187

c/b = 0.6150

Volume

555.3 Å³

Density

(calculated) 1.473 g/cm³

Figure of merit

F₃₀ = 47.8(0.011,57)

Reference intensity

I/I_{corundum} = 0.95(3)

Oxalic Acid Hydrate, $C_2H_2O_4 \cdot 2H_2O$

Synonym

1. Ethanedioic acid dihydrate
2. Hydrogen oxalate hydrate

CAS registry no.

6153-56-6

Sample

Oxalic acid hydrate, analytical reagent was obtained from Mallinkrodt, St. Louis, MO 63147. It was dissolved in distilled water at room temperature. The solution was allowed to evaporate partly at room temperature and the precipitate was filtered.

Color

Colorless

Structure

Monoclinic, $P2_1/a$ (14), $Z = 2$. The structure was last refined by Ahmed and Cruickshank [1953] who correlated various earlier data.

Lattice constants of this sample

$$a = 11.890(3) \text{ \AA}$$

$$b = 3.6070(7)$$

$$c = 6.121(1)$$

$$\beta = 103.31(3)^\circ$$

$$a/b = 3.2966$$

$$c/b = 1.6971$$

Volume A^3

$$255.4 \text{ A}^3$$

Density

$$(\text{calculated}) 1.639 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 52.8(0.012, 47)$$

Potassium Chromium Sulfate, $KCr(SO_4)_2$

CAS registry no.
10141-00-1

Sample

The sample was prepared by heating $KCr(SO_4)_2 \cdot 12H_2O$ at 300 °C for several days. The crystallinity was improved by heating at 700 °C. However some impurity lines developed at this temperature, and therefore there may be minor errors in the intensities.

Color

Medium yellow green

Structure

Hexagonal, P321 (150), $Z = 1$, isostructural with other dehydrated alums such as $KAl(SO_4)_2$ and $NH_4Al(SO_4)_2$. The structure of these compounds was studied by Vegard and Maurstad [1928].

Lattice constants of this sample

$$a = 4.7547(6)\text{\AA}$$

$$c = 8.054(2)$$

$$c/a = 1.6939$$

Volume
 157.68 \AA^3

Density
(calculated) 2.983 g/cm³

Figure of merit
 $F_{19} = 74.6(0.010, 25)$

Additional pattern

Potassium Nitrosyl Ruthenium Chloride, $K_2NORuCl_5$

Sample

These data are essentially the same pattern reported by Swanson et al. [1963], with minor revisions. The pattern has been indexed using crystallographic data published since 1963. The very small sample used then was a special preparation and is no longer available. The original sample had been prepared from a mixture of a soluble ruthenium salt with KCl and concentrated HNO_3 .

Color

Very dark red

Optical data

Biaxial(+), $N_\alpha = 1.750$, $N_\beta = 1.762$, $N_\gamma = 1.777$,
 $2V \sim 90^\circ$

Structure

Orthorhombic, Pmn_b (62), Z = 4 [Khodeshova and Bokii, 1964; de Wolff, 1968].

Lattice constants of this sample

$a = 10.369(4)\text{\AA}$
 $b = 13.296(4)$
 $c = 6.894(3)$

$a/b = 0.7798$
 $c/b = 0.5185$

Volume
 950.4 \AA^3

Density
 (calculated) 2.701 g/cm^3

Figure of merit
 $F_{30} = 54.6(0.018, 31)$

Additional patterns

1. PDF card 24-886, revised by PDF editors [Swanson et al., 1963]
2. Powder Diffraction Data, [1976]. The data is very nearly the same as that given here.

Sodium Borate, $\text{Na}_2\text{B}_4\text{O}_7$

CAS registry no.
1330-43-4

Sample

The sample was made by heating $\text{Na}_2\text{B}_4\text{O}_7 \cdot 10\text{H}_2\text{O}$ at 500 °C for 72 hours.

Color

Colorless

Structure

Triclinic, $P\bar{1}$ (2), $Z = 4$. The structure was refined by Krogh-Moe [1974].

Lattice constants of this sample

$$a = 8.646(4) \text{ \AA}$$

$$b = 10.506(4)$$

$$c = 6.572(2)$$

$$\alpha = 94.95(2)^\circ$$

$$\beta = 90.93(4)$$

$$\gamma = 93.18(3)$$

$$a/b = 0.8229$$

$$c/b = 0.6255$$

Volume
 593.7 \AA^3

Density

(calculated) 2.252 g/cm^3

Figure of merit

$$F_{30} = 44.4 (0.014, 49)$$

Sodium Borate Hydroxide Hydrate (Borax), $\text{Na}_2\text{B}_4\text{O}_5(\text{OH})_2 \cdot 8\text{H}_2\text{O}$

Synonym
1. Tincal

CAS registry no.
1303-96-4

Sample

The sample from Fisher Scientific Co., Fairlawn, NJ was recrystallized from aqueous solution. It was somewhat unstable in dry air, losing H_2O to become the 5-hydrate. Because of this instability it was impossible to obtain consistent results with the intensity measurements.

Color

Colorless

Structure

Monoclinic, $A2/a$ (15), $Z = 4$. The structure of borax was studied by Morimoto [1956], and refined by Levy and Lisenky [1978] using neutron diffraction.

Lattice constants of this sample

$a = 12.219(3)$ Å
 $b = 10.665(3)$
 $c = 11.884(2)$
 $\beta = 106.64(2)^\circ$

$a/b = 1.1457$
 $c/b = 1.1143$

Volume 1483.8 Å^3

Density
(calculated) 1.709 g/cm^3

Figure of merit
 $F_{30} = 44.2(0.014, 48)$

Sodium Silicon Fluoride (Malladrite), Na_2SiF_6

Sample

The sample was from Fisher Scientific Co.,
Fairlawn, NJ.

Color

Colorless

Structure

Hexagonal, P321 (150), $Z = 3$, isostructural with Na_2GeF_6 and other hexafluorides. The structure is similar to that of $\text{K}_2\text{S}_2\text{O}_6$. The structure of Na_2SiF_6 was determined by Zalkin et al. [1964].

Lattice constants of this sample

$a = 8.8659(7) \text{ \AA}$
 $c = 5.0433(5)$

$c/a = 0.5688$

Volume
 343.3 \AA^3

Density
 (calculated) 2.729 g/cm^3

Figure of merit
 $F_{30} = 76.6(0.012, 34)$

Reference intensity
 $I/I_{\text{corundum}} = 0.87(2)$

Sodium Titanium Oxide, $\text{Na}_2\text{Ti}_3\text{O}_7$

CAS registry no.
12034-36-5

Sample

The sample was prepared by dry heating $\text{Na}_2\text{CO}_3 + \text{TiO}_2$ (anatase) at 1250 °C. Since Na evaporated, NaOH plus moisture was added to make a paste. The sample was then heated for 45 minutes at 1000 °C and then reheated for 17 hours at 950 °C after correcting with TiO_2 .

Color

Colorless

Structure

Monoclinic, $P2_1/m$ (11), $Z = 2$. The structure was determined by Andersson and Wadsley [1961].

Lattice constants of this sample

$a = 9.1279(7)$ Å

$b = 3.8032(5)$

$c = 8.5621(7)$

$\beta = 101.60(1)$ °

$a/b = 2.4001$

Strontium Chromium Oxide, Sr_2CrO_4

CAS registry no.
12206-20-1

Sample

The sample was made by heating Cr_2O_3 with SrCrO_4 and $\text{Sr}(\text{OH})_2$ under N_2 at about 1000°C for about 1/2 hour.

Color
Black

Structure

Orthorhombic, $P2_1nb$ (33), $Z = 8$. The structure of Sr_2CrO_4 has been studied by Wilhelmi [1967].

Lattice constants of this sample

$a = 10.007(2) \text{ \AA}$
 $b = 14.194(3)$
 $c = 5.809(1)$

$a/b = 0.7050$
 $c/b = 0.4093$

Volume
 825.1 \AA^3

Density
(calculated) 4.689 g/cm^3

Figure of merit

$F_{30} = 66.2(0.012,38)$

Polymorphism

Kafalas and Longo [1972] report that Sr_2CrO_4 transforms to a K_2NiF_4 structure at 65 kbars and 1000°C .

Additional pattern

Thallium, α -Tl

CAS registry no.
7440-28-0

Sample

The sample was obtained from the Fisher Scientific Co., Silver Spring, MD.

Color

Gray metallic

Structure

Hexagonal, $P6_3/mmc$ (194), $Z = 2$, isostructural with magnesium. The structure of thallium was studied by Sekito [1930].

Lattice constants of this sample

$$a = 3.4568(3) \text{ \AA}$$

$$c = 5.5259(5)$$

$$c/a = 1.5986$$

Volume 57.185 \AA^3

Density

(calculated) 11.869 g/cm^3

Figure of merit

$$F_{22} = 76.9(0.012, 24)$$

Polymorphism

Hexagonal thallium transposes to a body-centered cubic phase above 230°C [Lipson and Stokes, 1941]. Becker and Ebert [1923] had reported a tetragonal phase which later was shown to be hexagonal.

Thallium Fluoride, TlF

CAS registry no.
7789-27-7

Sample

The sample was obtained from the City Chemical Co., New York, NY.

Color

Colorless

Structure

Orthorhombic, Z = 4. Pca* is consistent with the absences and has been used without any verifying data. Ketelaar [1935] determined that TlF belonged to the space group Fmmm (69). However, data reported here, as well as data from another researcher, Harshaw (priv. comm.), have a number of weak extra lines which do not fit that space group. These extra lines were found to persist after the sample had been refluxed.

Lattice constants of this sample

a = 5.4910(4) Å

b = 6.0974(3)

c = 5.1855 (4)

a/b = 0.9006

c/b = 0.8504

Volume

173.61 Å³

Density

(calculated) 8.546 g/cm³

Figures of merit

Thallium Hydrogen Phthalate, $C_8H_5O_4Tl$

Synonyms

1. Thallous acid phthalate
2. Thallium hydrogen-o-phthalate

CAS registry no.
29050-41-7

Sample

The sample was obtained as fragments of a single crystal, originally from Quartz Products, Plainfield, NJ.

Color
Colorless

Structure
Orthorhombic, $Pca2_1$ (29), $Z = 4$, by analogy with $C_8H_5O_4Rb$. The structure of $C_8H_5O_4Rb$ was refined by Smith [1975].

Lattice constants of this sample

$a = 10.050(2) \text{ \AA}$
 $b = 12.882(2)$
 $c = 6.622(1)$

$a/b = 0.7802$
 $c/b = 0.5140$

Volume
 857.2 \AA^3

Density
(calculated) 2.863 g/cm^3

Figure of merit
 $F_{30} = 54.7(0.014, 40)$

Reference

Thallium Oxide (Avicennite), Tl_2O_3

The experimental data reported here are the same as those reported earlier by Swanson and Fuyat [1953]. This pattern has not been re-measured. The space group has been changed and the corresponding indices were changed when necessary. Also other additional information has been added.

CAS registry no.
1314-12-1

Sample

The sample of thallium oxide from Johnson Matthey Co., Ltd., London, England, was annealed at 370 °C in a sealed tube for 2 hours to prevent volatilization of noxious fumes.

Major impurities

0.001 to 0.01% each: Ca, Mg, Li, and Na
less than 0.001% each: Al, Cu, Pb, and Si.

Color
Black

Structure

Cubic, $Ia\bar{3}$ (206), $Z = 16$, isostructural with Mn_2O_3 [Pauling and Shappell, 1930].
The space group used earlier was $I\bar{2}1\bar{3}$.

Lattice constant of this sample

$a = 10.5434(7)$ Å

Volume
 1172.0 Å³

Density
(calculated) 10.354 g/cm³

Figure of merit
 $F_{30} = 52.7(0.018, 31)$

Polymorphism

Prewitt et al. [1969] report the existence of a hexagonal modification.

Uric Acid (Phase 1), C₅H₄N₄O₃

Synonyms

1. 2,6,8-Trioxypurine
2. 8-Hydroxyxanthine

CAS registry no.
69-93-2

Sample

The sample was NBS Standard Reference Material 913.

Color

Colorless

Structure

Monoclinic, P₂₁/n (14), Z = 4. The structure was determined by Ringertz [1966].

Lattice constants of this sample

$$a = 13.102(3) \text{ \AA}$$

$$b = 7.416(2)$$

$$c = 6.225(1)$$

$$\beta = 90.37(3)^\circ$$

$$a/b = 1.7667$$

$$c/b = 0.8394$$

Volume
604.9 Å³

Density

(calculated) 1.846 g/cm³

Figure of merit

$$F_{30} = 36.3(0.012,68)$$

Reference intensity

$$I/I_{\text{corundum}} = 0.94(1)$$

Polymorphism

Shirley and Sutor [1968] report a second phase with a monoclinic cell of similar size.

Zinc Chlorate Hydrate, $\text{Zn}(\text{ClO}_4)_2 \cdot 6\text{H}_2\text{O}$

CAS registry no.
13637-61-1

Sample

The sample was prepared by evaporation at room temperature of an aqueous solution.

Color
Colorless

Structure

Hexagonal, $P6/mmm$ (191), $Z = 4$, isostructural with Ni and other divalent metal perchlorate hexahydrates. The structure of this group of compounds was studied by West [1935].

Lattice constants of this sample

$a = 15.629(4) \text{ \AA}$
 $c = 5.215(1)$

$c/a = 0.3337$

Volume A^3
 1103.1 \AA^3

Density
(calculated) 2.242 g/cm^3

Figure of merit

$F_{30} = 32.3(0.012,77)$

Additional pattern

Zinc Phosphate, α - $Zn_3(PO_4)_2$

CAS registry no.
7779-90-0

Sample

The sample was prepared by heating $ZnCO_3$ and P_2O_5 at 900 °C for several days with intermittent grindings.

Color

Colorless

Structure

Monoclinic, A2/a (15), $Z = 4$. The structure was determined by Calvo [1965].

Lattice constants of this sample

$a = 15.006(3)$ Å
 $b = 5.635(1)$
 $c = 8.183(1)$
 $\beta = 104.99(2)$ °

$a/b = 2.6629$
 $c/b = 1.4521$

Volume
668.5 Å³

Density
3.836 g/cm³

Figure of merit
 $F_{30} = 37.4(0.016, 51)$

Reference intensity
 $I/I_{corundum} = 1.40(9)$

Polymorphism

Above 942 °C, α - $Zn_3(PO_4)_2$ transforms to β - $Zn_3(PO_4)_2$. A small percentage of Mn++ substituting for the Zn++ stabilizes a γ form [Calvo, 1965].

Zinc Phosphate, γ -Zn₃(PO₄)₂

Sample

This sample was prepared by heating stoichiometric amounts of ZnCO₃ and H₃PO₄ with 3% of the ZnCO₃ replaced by MnCO₃, at 900 °C for several days. This phase has useful luminescence properties, and is only stabilized by the addition of low percents of certain other bivalent cations [Calvo, 1965].

Color

Colorless

Structure

Monoclinic, P2₁/n (14), Z = 2. The structure of γ -Zn₃(PO₄)₂ was determined by Calvo [1963].

Lattice constants of this sample

$$a = 7.549(1) \text{ \AA}$$

$$b = 8.499(1)$$

$$c = 5.0491(8)$$

$$\beta = 95.03(1)^\circ$$

$$a/b = 0.8882$$

$$c/b = 0.5941$$

Volume
322.7 \AA^3

Density
(calculated) 3.973 g/cm³

Figure of merit
 $F_{30} = 85.9$ (0.009, 37)

Reference intensity

$$I/I_{\text{corundum}} = 1.6(2)$$

Polymorphism

Without the addition of other bivalent ions Zn₃(PO₄)₂ exists in an α form below 942 °C and in a β form above. Both are monoclinic [Calvo, 1965].

Additional pattern

1. Hummel and Katnack [1958]

Zinc Phosphate Hydrate (Hopeite), $\text{Zn}_3(\text{PO}_4)_2 \cdot 4\text{H}_2\text{O}$

CAS registry no.
7543-51-3

Sample

The sample was a reagent from the Chicago Apparatus Co., recrystallized from aqueous solution.

Color

Colorless

Structure

Orthorhombic, Pnma (62), $Z = 4$. The structure of hopeite has been determined by Mamedov et al. [1961] and Liebau [1965].

Lattice constants of this sample

$$a = 10.611(1) \text{ \AA}$$

$$b = 18.312(2)$$

$$c = 5.0309(6)$$

$$a/b = 0.5795$$

$$c/b = 0.2747$$

Volume 977.55 \AA^3

Density
(calculated) 3.113 g/cm^3

Figure of merit

$$F_{30} = 73.8(0.010, 40)$$

Polymorphism

A polymorph of $\text{Zn}_3(\text{PO}_4)_2 \cdot 4\text{H}_2\text{O}$ is called parahopeite [Chao, 1969]. The pattern for parahopeite is on card 24-1461.

Aluminum Iron Antimony Oxide, Bahianite, $\text{Al}_{5.66}\text{Fe}_{0.09}\text{Sb}_{2.95}\text{O}_{16}$

Structure

Monoclinic, C2/m (12), $Z = 2$. The structure was determined by Moore and Araki [1976], for a sample from Serra de Mangabeira, Bahia, Brazil.

Atom positions

2(a) 1.8 antimony and 0.2 iron
 4(g) 4 antimony
 2(d) 2 aluminum
 8(j) 7.52 aluminum and 0.48 iron
 8(j) 8 oxygen in each of 3 different sites
 4(i) 4 oxygen in each of 2 different sites
 The single crystal analysis did not refine positions for the Al atoms in the tetrahedral sites and they were omitted also from calculation of this powder pattern. Minor amounts of W^{+6} in the octahedral sites were not determined either but their contribution was absorbed into the site distribution refinement [Moore and Araki, 1976].

Lattice constants

$a = 9.407(6)$ Å
 $b = 11.542(8)$
 $c = 4.410(3)$
 $\beta = 90.94(3)^\circ$

$a/b = 0.8150$
 $c/b = 0.3821$

(published values: $a = 9.406(6)$ Å,
 $b = 11.541(8)$, $c = 4.410(3)$, $\beta = 90.94(3)^\circ$
 [Moore and Araki, 1976]).

Volume 478.75 Å^3

Density

(calculated) 5.362 g/cm^3

This is the value calculated from the formula above, based on a chemical analysis by Moore and Araki in their table 1 part A [1976]. Due to the problems in the site distribution, mentioned above, a density is different if calculated from the multiplicities given in the atom positions.

Thermal parameters

Isotropic [Moore and Araki, 1976]

Scattering factors

Al^{3+} , Fe^{3+} , O^{1-} , Sb^{5+} [Cromer and Mann, 1968]. Dispersion corrections were applied to Al, Fe, and O [Cromer and Liberman, 1970].

Scale factors (integrated intensities)

$\gamma = 0.1911 \times 10^{-3}$

I/I_{corundum} (calculated) = 1.74 for reflection with $hkl = \bar{2}01$

Antimony Iron Titanium Oxide Hydroxide, Derbylite, $\text{SbFe}_4\text{Ti}_3\text{O}_{13}(\text{OH})$

Structure

Monoclinic, $P2_1/m$ (11), $Z = 2$. The structure was determined by Moore and Araki [1976] using data from sample #C4430, U.S. National Museum. The original location was Diamantina, Minas Gerais, Brazil.

Atom positions

Moore and Araki [1976]

2(e) 2 antimony
 2(e) 2 titanium
 4(f) 1.72 iron and 2.28 titanium
 4(f) 1.72 titanium and 2.28 iron
 2(e) 2 oxygen
 2(e) 2 hydroxyl
 4(f) 4 oxygen in each of 6 different sites
 4(f) 4 iron

Lattice constants

$a = 7.160(1)$ Å
 $b = 14.348(3)$
 $c = 4.970(1)$
 $\beta = 104.61(2)$ °

$a/b = 0.4990$
 $c/b = 0.3464$

(published values: $a = 7.160(1)$ Å,
 $b = 14.347(3)$, $c = 4.970(1)$, $\beta = 104.61(2)$ °
 [Moore and Araki, 1976]).

Volume °
 494.1 Å^3

Density
 (calculated) 4.798 g/cm^3

Thermal parameters
 Isotropic [Moore and Araki, 1976]

Scattering factors
 Sb^{3+} , Fe^{3+} , Ti^{4+} , O^- [Cromer and Mann, 1968].
 Antimony, iron and titanium factors were corrected for dispersion [Cromer and Liberman, 1970].

Scale factors (integrated intensities)
 $\gamma = 0.1340 \times 10^{-3}$
 I/I_{corundum} (calculated) = 1.58 for reflection with $hkl = 131$.

Benactyzine Hydrochloride, $C_{20}H_{26}ClNO_3$

Synonym

1. 2-Diethylaminoethyl benzilate hydrochloride

Structure

Triclinic, $P\bar{1}$ (2), $Z = 2$. The structure was refined by Petcher et al. [1974].

Atom positions

All atoms were in general positions 2(i).

Lattice constants

$$a = 8.792(4) \text{ \AA}$$

$$b = 15.949(8)$$

$$c = 7.091(6)$$

$$\alpha = 95.73(1)^\circ$$

$$\beta = 94.10(1)$$

$$\gamma = 87.57(1)$$

$$a/b = 0.5513$$

$$c/b = 0.4446$$

(published values: $a = 879.1(4)$ pm,
 $b = 1594.8(8)$, $c = 709.1(6)$, $\alpha = 95.73(1)^\circ$,
 $\beta = 94.10(1)$, $\gamma = 87.57(1)$ [Petcher et al.,
1974])

Volume
 986.2 \AA^3

Density

(calculated) 1.225 g/cm^3

Thermal parameters

Isotropic. For hydrogen atoms, overall
 $B = 5.5$. For all other atoms, isotropic B_i
were estimated from β_{ij} for individual atoms.

Scattering factors

Zero ionization [International Tables, 1962]

Scale factors (integrated intensities)

$$\gamma = 0.3987 \times 10^{-3}$$

I/I_{corundum} (calculated) = 0.380 for reflection
with $hkl = 100$.

Additional pattern

1. Folen [1975]

Beryllium Calcium Iron Magnesium Aluminum Phosphate Hydroxide Hydrate,
Roscherite, $\text{Be}_2\text{Ca}(\text{Fe}_{0.3}\text{Mg}_{0.7})_2\text{Al}_{10.67}(\text{PO}_4)_3(\text{OH})_3 \cdot 2\text{H}_2\text{O}$

Structure

Monoclinic, C2/c (15), Z = 4. The structure was refined by Fanfani et al. [1975] using material from the U.S. National Museum of Natural History (NMNH #R17847) from Lavra da Ilha, Taquaral (Minas Gerais), Brazil.

Atom positions

Fanfani et al. [1975]

4(a)	2.68 aluminum with 1.32 positions void
4(e)	4 calcium
8(f)	5.6 magnesium plus 2.4 iron
8(f)	8 beryllium
8(f)	8 phosphorus
4(e)	4 phosphorus
8(f)	8 oxygen in each of 6 different sites
8(f)	8 hydroxyl
4(e)	4 hydroxyl
8(f)	8 water

Polymorphism

A triclinic roscherite exists and has a very similar atomic arrangement. Its chemical composition is somewhat different including the replacement of most of the magnesium by manganese [Fanfani et al., 1977].

Lattice constants

$a = 15.875(4) \text{ \AA}$
 $b = 11.855(3)$
 $c = 6.605(1)$
 $\beta = 95.35(3)^\circ$

$a/b = 1.3391$
 $c/b = 0.5571$
 (published values: $a = 15.874(4) \text{ \AA}$,
 $b = 11.854(3)$, $c = 6.605(1)$, $\beta = 95^\circ 21' (2')$
 [Fanfani et al., 1975]).

Volume 1237.6 \AA^3

Density
 (calculated) 2.768 g/cm^3
 (measured) $2.766(7)$ [Fanfani et al., 1975]

Thermal parameters

Isotropic [Fanfani et al., 1975]

Scattering factors

Zero ionization [International Tables, 1962].

Scale factors (integrated intensities)
 $\gamma = 0.1851 \times 10^{-3}$
 I/I_{corundum} (calculated) = 0.654 for reflection
 with $hkl = 110$.

Additional patterns

1. PDF card 11-355 [Lindberg, 1958]. The data may represent a mixture of the monoclinic and triclinic forms.

**Beryllium Calcium Manganese Aluminum Iron Phosphate Hydroxide Hydrate,
Roscherite, $\text{Be}_4\text{Ca}_2(\text{Mn}_{3.91}\text{Mg}_{0.04}\text{Ca}_{0.05})(\text{Al}_{1.13}\text{Fe}_{0.42}\text{Mn}_{0.12})(\text{PO}_4)_6(\text{OH})_4 \cdot 6\text{H}_2\text{O}$**

Structure

Triclinic, $\bar{C}1$ (2), $Z = 2$. The structure was refined by Fanfani et al. [1977]. The material used in the structure determination was from Foote Mine, NC.

Atom positions

The trivalent cations Fe, Mn and Al filled only $2/3$ of the special positions at $0, 0, \frac{1}{2}$, the rest being void. All other atoms were in the 4 general positions of the C-centered arrangement [ibid.]. The z coordinate for O(4B) was taken as + 0.1754 and the z coordinate for O(5A) was taken as + 0.9195.

Polymorphism

A monoclinic roscherite exists and has a very similar atomic arrangement with partial disorder of the trivalent cations over the sites $(0, 0, 0)$ and $(0, 0, \frac{1}{2})$. Its chemical composition is somewhat different, including the replacement of most of the manganese by magnesium [Fanfani et al., 1977].

Lattice constants

$a = 15.922(5)$ Å
 $b = 11.966(4)$
 $c = 6.741(1)$
 $\alpha = 91.07(8)^\circ$
 $\beta = 94.35(8)$
 $\gamma = 89.99(8)$

(published values: $a = 15.921(5)$ Å,
 $b = 11.965(4)$, $c = 6.741(1)$, $\alpha = 91^\circ 4(5)'$,
 $\beta = 94^\circ 21(5)'$, $\gamma = 89^\circ 59.5(5.0)'$ [Fanfani et al., 1977]).

CD cell: $a = 9.959$ Å, $b = 9.957$, $c = 6.741$,
 $\alpha = 92.83^\circ$, $\beta = 94.12$, $\gamma = 73.85$, sp. gp. P1;
 $a/b = 1.0002$, $c/b = 0.6770$

Volume
 1280.4 Å³

Density
(calculated) 2.888 g/cm³

Thermal parameters
Isotropic [Fanfani et al., 1977]

Scattering factors
Zero ionization [International Tables, 1962]
Scale factors (integrated intensities)
 $\gamma = 0.1244 \times 10^{-3}$
 I/I_{corundum} (calculated) = 0.728 for reflection with $hkl = 020$.

Calcium Borate Hydrate, Hexahydroborite, $\text{Ca}[\text{B}(\text{OH})_4]_2 \cdot 2\text{H}_2\text{O}$

Structure

Monoclinic, $P2/a$ (13), $Z = 2$. The structure was determined by Simonov et al. [1976], for material from the Solongo deposits in the Urals.

Atom positions

Calcium atoms were in special positions ($3/4$, $0, z$). All other atoms were in general positions [ibid.].

Lattice constants

Simonov et al. [1976]

$$\begin{aligned} a &= 8.006(2) \text{ \AA} \\ b &= 8.012(2) \\ c &= 6.649(2) \\ \gamma &= 104.21(2)^\circ \end{aligned}$$

CD cell: $a = 8.012 \text{ \AA}$, $b = 6.649$, $c = 8.006$, $\beta = 104.21^\circ$ sp. gp. $P2/c$; $a/b = 1.2050$, $c/b = 1.2041$

Volume
 413.4 \AA^3

Density
(calculated) 1.878 g/cm^3

Thermal parameters

Isotropic [Simonov et al., 1976]

Scattering factors

B^0 , Ca^0 , O^- [Cromer and Mann, 1968].
 H^0 [International Tables, 1962]

Scale factors (integrated intensities)

$\gamma = 0.4656 \times 10^{-3}$

I/I_{corundum} (calculated) = 1.05 for reflection with $hkl = 010$.

Additional pattern

1. PDF card 23-866 [Gode and Kuka, 1970]

Calcium Chromium Iron Titanium Oxide, Loveringite,
 $\text{Ca}_{.72}\text{RE}_{.33}(\text{Y, Th, U, Pb})_{.05}\text{Ti}_{12.48}\text{Fe}_{3.38}\text{Cr}_{2.24}\text{Mg}_{.92}\text{Zr}_{.58}\text{Al}_{.39}\text{V}_{.21}\text{Mn}_{.04}\text{O}_{38}$

Structure

Hexagonal, $\bar{R}\bar{3}$ (148), $Z = 3$, isostructural with senaite. The structure was refined by Gatehouse et al. [1978] using rhombohedral positions. Those were used to calculate the powder pattern which was transformed to the hexagonal setting given here. The sample used for the structure work came from the Jimberlana Intrusion near Norseman, Western Australia.

Atom positions

M(0) in 1(a) .72 calcium +.23 RE (as .1284 lanthanum and .1016 cerium) +.017 lead +.014 yttrium +.011 uranium +.006 thorium
 M(1) in 1(b) .58 zirconium +.32 magnesium +.1 RE (as .0285 hafnium, .0259 cerium, .0245 neodymium and .0236 holmium)
 M(2) in 2(c) partially vacant, with 1.23 iron and 0.6 magnesium
 M(3) in 6(f) partially vacant, with 2.24 chromium +2.19 iron +.86 titanium +.21 vanadium
 M(4) in 6(f) 5.81 titanium and .19 aluminum
 M(5) in 6(f) 5.81 titanium and .19 aluminum
 6(f) 6 oxygen in each of 6 different sites
 2(c) 2 oxygen

Electron microprobe analysis results gave weight percents of the elements as oxides, and the unit cell composition was normalized to 38 oxygen. Distribution of the cations in sites M(0) to M(5) inclusive was guided by the results for senaite and crichtonite which showed ordering sequences based on the size of the cations [Gatehouse et al., 1978]. The Mn was combined with the Fe in sites M(2) and M(3).

Lattice constants

$$a = 10.337 \text{ \AA}$$

$$c = 20.676$$

$$c/a = 2.0002$$

(published values: $a = 9.117(4)$ \AA , $\alpha = 69.07(1)^\circ$ [Gatehouse et al., 1978])

Volume 1913.4 \AA^3

Density

(calculated) 4.415 g/cm^3

Thermal parameters

Isotropic [Gatehouse et al., 1978]

Scattering factors

Al^{3+} , Ce^{4+} , Cr^{3+} , Fe^{3+} , Hf^{4+} , Ho^{3+} , La^{3+} , Mg^{2+} , Nd^{3+} , O^{1-} , Pb^{2+} , Th^{4+} , Ti^{4+} , U^{4+} , V^{5+} , Y^{3+} , Zr^{4+} [International Tables, 1974]
 Ca^{2+} [Cromer and Mann, 1968]

The factors for cerium, lanthanum and zirconium were corrected for dispersion [Cromer and Liberman, 1970]

Scale factors (integrated intensities)

$$\gamma = 0.06676 \times 10^{-3}$$

$I/I_{\text{corundum}} = 0.624$, for reflection with hexagonal $hkl = 024$.

Calcium Hydrogen Phosphate Sulfate Hydrate, $\text{Ca}_2\text{HPO}_4\text{SO}_4 \cdot 4\text{H}_2\text{O}$

Structure

Monoclinic, Cc (9), $Z = 4$. The structure was determined by Sakae et al. [1978].

Atom positions

4(a) 2 phosphorus(1) and 2 sulfur(1)
4(a) 2 phosphorus(2) and 2 sulfur(2)

Four hydrogen atoms were not located in the structure determination. All other atoms are in general positions 4(a) and the "x" and "z" parameters were given to only 3 significant figures [ibid.].

Lattice constants

$a = 5.721(5) \text{ \AA}$
 $b = 30.994(5)$
 $c = 6.250(4)$
 $\beta = 117.26(6)^\circ$

(published values: $a = 5.721(5) \text{ \AA}$,
 $b = 30.992(5)$, $c = 6.250(4)$, $\beta = 117.26(6)^\circ$
[Sakae et al., 1978]).

CD cell: $a = 6.248(4) \text{ \AA}$, $b = 30.994(5)$,
 $c = 5.721(5)$, $\beta = 117.22(6)^\circ$, sp. gp. Aa(9);
 $a/b = 0.2016$, $c/b = 0.1846$.

Volume
 985.15 \AA^3

Density
(calculated) 2.321 g/cm^3

Thermal parameters

Isotropic [Sakae et al., 1978]

Scattering factors
Zero ionization [International Tables, 1962]

Scale factor (integrated intensities)

$\gamma = 0.3683 \times 10^{-3}$

Cannabidiol, C₂₁H₃₀O₂

Synonym

1. (1R-trans)-2-[3-Methyl-6-(1-methylethenyl)-2-cyclohexen-1-yl]-5-pentyl-1,3-benzenediol

CAS registry no.

13956-29-1

Structure

Monoclinic, P2₁ (4), Z = 4. The structure was refined by Jones et al. [1977].

Atom positions

All atoms were in general positions 2(a). Sixty-eight hydrogen positions were not located.

Lattice constants

a = 10.618(4) Å
b = 10.650(5)
c = 17.267(6)
β = 95.30(4)°

(published values: a = 10.617(4) Å,
b = 10.649(5), c = 17.266(6), β = 95.30(4)°
[Jones et al., 1977])

CD cell: a = 17.267(6) Å, b = 10.650(5),
c = 10.618(4), β = 95.30(4)°; sp. gp. P2₁;
a/b = 1.6213; c/b = 0.9970

Volume °
1944.2 Å³

Density

(calculated) 1.074 g/cm³ [Jones et al., 1977]

Thermal parameters

Isotropic. For hydrogen atoms, overall
B = 0.125. For other atoms, B_{ij} were
estimated from U_{ij} for individual atoms.

Scattering factors

Zero ionization [International Tables, 1962]

Scale factors (integrated intensities)

γ = 2.067 × 10⁻³
I/I_{corundum} (calculated) = 0.668 for reflections
with hkl = 011.

L-Cocaine Hydrochloride, C₁₇H₂₂ClNO₄

Synonyms

1. L-3-Tropanylbenzoate-2-carboxylic acid methyl ester hydrochloride
2. Cocaine muriate

CAS registry no.

53-21-4

Structure

Orthorhombic, P₂₁2₁2₁ (19), Z = 4. The structure was refined by Gabe and Barnes [1963].

Atom positions

All atoms were in general positions 4(a). A position was not located for the hydrogen associated with the chlorine in the hydrochloride.

Lattice constants

a = 7.633(1) Å
b = 10.301(1)
c = 21.460(3)

(published values: a = 7.633(1) Å,
b = 10.300(1), c = 21.459(3) [Gabe and Barnes, 1963])

CD cell: a = 10.301(1) Å, b = 21.460(3),
c = 7.633(1); sp. gp. P₂₁2₁2₁; a/b = 0.4800,
c/b = 0.3557.

Volume °
1687.3 Å³

Density

(calculated) 1.338 g/cm³
(measured) 1.342 g/cm³ [Gabe and Barnes, 1963]

Thermal parameters

Isotropic [Gabe and Barnes, 1963]

Scattering factors

Cl⁻, C⁰, H⁰, N⁰, O⁰ [International Tables, 1962]

Scale factors (integrated intensities)

γ = 0.4587 × 10⁻³

I/I_{corundum} (calculated) = 0.470 for reflection with hkl = 002.

Additional patterns

1. PDF card 28-1609 [Owen et al., 1972]

Codeine Hydrobromide Hydrate, $C_{18}H_{22}BrNO_3 \cdot 2H_2O$

Synonyms

1. 7,8-Didehydro-4,5- α -epoxy-3-methoxy-17-methyl-morphinan-6- α -ol hydrobromide hydrate
2. Methyl morphine hydrobromide hydrate

Structure

Orthorhombic, $P2_12_12_1$ (19), $Z = 4$ [Lindsey and Barnes, 1955]. The structure was refined by Kartha et al. [1962]. The final R was 0.126. Intensities have been rounded to the nearer multiple of 10.

Atom positions

C , O , and N atoms were all in general positions 4(a). The Br atom was represented by 2 isotropic half-atoms separated slightly along "x". The H atom positions were not determined [Kartha et al. 1962].

Lattice constants

$a = 13.090(10) \text{ \AA}$
 $b = 20.826(15)$
 $c = 6.808(5)$

$a/b = 0.6285$
 $c/b = 0.3269$

(published values: $a = 13.089(10) \text{ \AA}$,
 $b = 20.825(15)$, $c = 6.808(5)$ [Kartha et al.])

Volume
 $1856. \text{ \AA}^3$

Density

(calculated) 1.490 g/cm^3
(measured) 1.489 [Lindsey and Barnes, 1955]

Thermal parameters

Isotropic [Kartha et al., 1962]

Scattering factors

Zero ionization [International Tables, 1962]

Scale factor (integrated intensities)

$\gamma = 0.4209 \times 10^{-3}$

Additional pattern

1. PDF card 10-801 [Barnes and Lindsey, 1955]

Copper Arsenate (Trippkeite), CuAs₂O₄

Structure

Tetragonal, P4mbc (135), Z = 4. The structure was determined by Pertlik [1975].

Atom positions

[Pertlik, 1975]

4(d) 4 copper
8(g) 8 oxygen(1)
8(h) 8 oxygen(2)
8(h) 8 arsenic

Lattice constants

$a = 8.592(4)$ Å
 $c = 5.573(4)$ [ibid.]

$a/c = 0.6486$

Volume Å³
411.4 Å³

Density

(calculated) 4.478 g/cm³

Thermal parameters

Isotropic, in table 3 [Pertlik, 1975]

Scattering factors

Zero ionization [International Tables, 1962]

Scale factor (integrated intensities)

$\gamma = 1.112 \times 10^{-3}$
 I/I_{corundum} (calculated) = 4.16 for reflection
with $hkl = 211$.

α -Dihydrophyllocladene, Hartite (or Bombiccite), $C_{20}H_{34}$

Synonyms

The name hartite was designated in 1841 and material called bombiccite was described later. Because of uncertainty in the chemistry, the two were not identified as the same phase until 1955 [Pellizer, 1955].

Structure

Triclinic, $P\bar{1}$ (1), $Z = 4$. The structure was determined by Serantoni et al. [1978]. The natural mineral used for the determination was repeatedly dissolved and recrystallized from benzene.

Atom positions

1(a) 80 carbon

Hydrogen positions were not specified.

Lattice constants

$a = 11.39(7)$ \AA

$b = 21.29(5)$

$c = 7.45(1)$

$\alpha = 94.6(1)$ $^\circ$

$\beta = 101.8(2)$

$\gamma = 81.5(1)$

$a/b = 0.5350$

$c/b = 0.3499$

Volume

$1747.$ \AA^3

Density

(calculated) 1.044 g/cm^3

(measured) 1.08 [Serantoni et al., 1978]

Thermal parameters

Isotropic B_i calculated from U_i given in

Serantoni et al. [1978]

Scattering factors

C^0 [Cromer and Mann, 1968]

Scale factor (integrated intensities)

$\gamma = 3.162 \times 10^{-3}$

(-)-Ephedrine Hydrochloride, C₁₀H₁₆ClNO

Synonyms

1. Biophedrin
2. Ephedral
3. Sanedrine

CAS registry no.
877-36-1

Structure
Monoclinic, P2₁ (4), Z = 2. The structure was determined by Phillips [1954]. Bergin [1971] refined the structure using 3-dimensional data.

Atom positions
All atoms were in general positions 2(a) [Bergin, 1971].

Lattice constants

Bergin [1971]

$$\begin{aligned}a &= 12.671(3) \text{ \AA} \\b &= 6.090(4) \\c &= 7.301(2) \\&\beta = 102.11(8)^\circ\end{aligned}$$

$$\begin{aligned}a/b &= 2.0806 \\c/b &= 1.1989\end{aligned}$$

Volume \AA^3
550.9 \AA^3

Density
(calculated) 1.216 g/cm³

Thermal parameters

Anisotropic [Bergin, 1971]

Scattering factors

Zero ionization [International Tables, 1962]

Scale factors (integrated intensities)

$$\gamma = 0.6728 \times 10^{-3}$$

I/I_{corundum} (calculated) = 0.962 for reflection with $hkl = 011$.

Additional patterns

1. PDF card 5-0263 [E. Lilly and Co., Indianapolis, IN]
2. PDF card 24-1735 [Institute of Physics, University College, Cardiff, Wales]

Haloperidol, $C_{21}H_{23}ClFNO_2$

Synonyms

1. Haldol
2. Serenase
3. 4-(4-hydroxy-4-p-chlorophenylpiperidino)4'-fluorobutyrophenone

CAS registry no.

52-86-8

Structure

Monoclinic, $P2_1/c$ (14), $Z = 4$. The structure was refined by Reed and Schaefer [1973].

Atom positions

All atoms were in general positions 4(e). The "x" parameter for carbon(7) was used as 0.0838. No hydrogen positions were listed in the reference.

Lattice constants

$a = 7.816(5)$ Å
 $b = 8.996(6)$
 $c = 28.346(20)$
 $\beta = 106.34^\circ$

(published values: $a = 7.816(5)$ Å,
 $b = 8.995(6)$, $c = 28.344(20)$,
 $\beta = 106.34(4)^\circ$ [Reed and Schaefer, 1973])

CD cell: $a = 27.202$, $b = 8.996$, $c = 7.816$,
 $\beta = 90.33^\circ$, space group $P2_1/n$; $a/b = 3.0237$,
 $c/b = 0.8688$

Volume
 1912.6 Å³

Density

(calculated) 1.305 g/cm³
(measured) 1.23 g/cm³ [Reed and Schaefer, 1973]

Thermal parameters

Anisotropic [Reed and Schaefer, 1973]

Scattering factors

Zero ionization [International Tables, 1962]

Scale factor (integrated intensities)

$\gamma = 1.271 \times 10^{-3}$
 I/I_{corundum} (calculated) = 1.29 for reflection with $hkl = \bar{1}15$.

Imipramine Hydrochloride, C₁₉H₂₅ClN₂

Synonyms

1. 5-(3-Dimethylaminopropyl)-10,11-dihydro-5H-dibenz[b,f]azepine hydrochloride
2. Berkomine
3. Tofranil
4. Deprinol

Structure

Monoclinic, P2₁ (14), Z = 8. The structure was refined by Post et al. [1975].

Atom positions

All atoms were in general positions 4(e).

Lattice constants

$$\begin{aligned}a &= 11.304(3) \text{ \AA} \\b &= 29.229(8) \\c &= 14.283(3) \\&\beta = 130.91(1)^\circ\end{aligned}$$

(published values: a = 11.303(3) Å,
b = 29.227(8), c = 14.282(3), β = 130.91(1)°
[Post et al., 1975])

CD cell: a = 11.304(1), b = 29.229(8),
c = 10.969(3), β = 100.24(1)°; sp. gp. P2₁/n;
a/b = 0.3867, c/b = 0.3753

Volume
3566.5 Å³

Density

(calculated) 1.180 g/cm³

(measured) 1.18 g/cm³ [Post et al., 1975]

Thermal parameters

For hydrogen atoms, overall isotropic B = 7.26,
converted from U_{iso} = 0.092 Å². For all other
atoms, isotropic B_i were estimated from U_{ij}
for individual atoms.

Scattering factors

Zero ionization [International Tables, 1962]

Scale factors (integrated intensities)

$$\gamma = 0.2872 \times 10^{-3}$$

I/I_{corundum} (calculated) = 0.285 for
reflection with hkl = 060.

Additional pattern

1. PDF card 27-1765 [de Leenheer and Heyndrickx, 1971]. The primary reference indicates that the powder data are for the HCl derivative; apparently the name and formula on the card are in error.

Morphine Hydrochloride Hydrate, $C_{17}H_{20}ClNO_3 \cdot 3H_2O$

Synonyms

1. (-)-7,8-Didehydro-4,5- α -epoxy-17-methylmorphinan-3,6- α -diol hydrochloride hydrate
2. Morphine Chlorhydrate
3. Morphine Chloride Hydrate

Structure

Orthorhombic, $P2_12_12_1$ (19), $Z = 4$. The structure was determined by Gylbert [1973].

Atom positions

All atoms were in general positions 4(a). Bond lengths were calculated and indicated that the "z" coordinate of atom C3 should be 0.0935. That value was used in these calculations.

Lattice constants

$a = 13.020(7) \text{ \AA}$
 $b = 20.751(10)$
 $c = 6.941(4)$

$a/b = 0.6274$
 $c/b = 0.3345$

(published values: $a = 13.019(7) \text{ \AA}$,
 $b = 20.750(10)$, $c = 6.941(4)$ [Gylbert, 1973])

Volume 1875.3 \AA^3

Density

(calculated) 1.331 g/cm^3
(measured) 1.310 g/cm^3 [Gylbert, 1973]

Thermal parameters

Isotropic. For the hydrogen atoms, overall $B = 3.0$ [Gylbert, 1973]. For other atoms, isotropic B_i were estimated from β_{ij} for individual atoms.

Scattering factors

C^0 , H^0 , Cl^0 , N^0 , O^0 [International Tables, 1962]

Scale factors (integrated intensities)

$\gamma = 0.4275 \times 10^{-3}$
 I/I_{corundum} (calculated) = 0.421, for reflection with $hkl = 020$.

Additional patterns

1. PDF card 10-798 [Barnes and Lindsey, 1955]

Naloxone Hydrochloride Hydrate, $C_{19}H_{22}ClNO_4 \cdot 2H_2O$

Synonyms

1. 17-Allyl-4,5-epoxy-3,14-dihydroxy-morphinan-6-one hydrochloride hydrate
2. (-)-N-Allyl-7,8-dihydro-14-hydroxy-morphinone hydrochloride hydrate

Structure

Orthorhombic, $P2_12_12_1$ (19), $Z = 4$. The structure was refined in 1975 by Sime et al., and in 1974 by Karle.

Atom positions

All atoms were in the general positions 4(a) given by Sime et al. [1975]. The "x" parameter for C(15) appeared to be in error, and the value 0.1908 was used instead, in these calculations.

Lattice constants

$$\begin{aligned} a &= 7.833(3) \text{ \AA} \\ b &= 13.186(5) \\ c &= 18.570(5) \end{aligned}$$

(published values: $a = 7.833(3)$ \AA, $b = 13.185(5)$, $c = 18.569(5)$ [Sime et al., 1975])

CD cell: $a = 13.185(5)$, $b = 18.570(5)$, $c = 7.833(3)$; sp. gp. = $P2_12_12_1$; $a/b = 0.7101$, $c/b = 0.4218$

Volume
 1918.0 \AA^3

Density

(calculated) 1.385 g/cm^3
(measured) 1.35 g/cm^3 [Sime et al.]

Thermal parameters

Isotropic. For hydrogen: overall $B = 4.0$ and for other atoms, B_i was estimated from B_{ij} for individual atoms.

Scattering factors

H^0 [International Tables, 1962]

All other atoms, zero ionization, from Cromer and Mann [1968]. The chlorine atoms were corrected for dispersion [Cromer and Liberman, 1970].

Scale factors (integrated intensities)

$$\gamma = 1.196 \times 10^{-3}$$

I/I_{corundum} (calculated) = 1.13 for the reflection with $hkl = 101$.

Palladium Selenium (Palladseite), $Pd_{17}Se_{15}$

Structure

Cubic, $Z = 2$. The space group $Pm\bar{3}m$ was used for the structure determination by Geller [1962] and for the powder pattern here. The x-ray data did not eliminate uncertainty about the space group which could also be $P\bar{4}3m$ or $P432$ [Geller, 1962].

Atom positions

24(m)	24	palladium
12(j)	12	selenium
12(i)	12	selenium
6(f)	6	selenium
6(e)	6	palladium
3(d)	3	palladium
1(b)	1	palladium

Lattice constants

$a = 10.607(3) \text{ \AA}^\circ$

(published value: $a = 10.606(3) \text{ \AA}^\circ$ [Geller, 1962]).

Volume 1193.4 \AA^3

Density
(calculated) 8.330 g/cm^3

Thermal parameters

Isotropic, Table 2 [Geller, 1962]

Scattering factors

Pd^0 , Se^0 [Thomas and Umeda, 1957], corrected for dispersion [Cromer and Liberman, 1970]

Scale factor (integrated intensities)

$\gamma = 0.4090 \times 10^{-3}$

I/I_{corundum} (calculated) = 4.11 for reflection with $hkl = 440$.

Phencyclidine Hydrochloride, C₁₇H₂₆ClN

Synonyms

1. 1-(1-Phenylcyclohexyl) piperidine hydrochloride
2. Sernyl hydrochloride
3. Sernylan
4. PCP hydrochloride

CAS registry no.

956-90-1

Structure

Monoclinic, P₂1/c (14), Z = 4. The structure was determined by Argos et al. [1970].

Atom positions

All atoms were in general positions [ibid.]

Lattice constants

a = 8.881(10) Å
 b = 13.867(20)
 c = 13.099(10)
 β = 104.55(16)°

(published values: a = 8.881(10),
 b = 13.866(20), c = 13.098(10),
 β = 104°33'(10') [Argos et al., 1970])

CD cell: a = 13.099(10) Å, b = 13.867(20),
 c = 8.881(10), β = 104.55(16)°; sp. gp. P₂1/a;
 a/b = 0.9446; c/b = 0.6404

Volume °
 1561.4 Å³

Density

(calculated) 1.190 g/cm³
 (measured) 1.190(4) [Argos et al., 1970]

Thermal parameters

Isotropic B_i, estimated from β_{ij} for individual atoms.

Scattering factors

Zero ionization [International Tables, 1962]

Scale factors (integrated intensities)

γ = 0.6975 × 10⁻³
 I/I_{corundum} (calculated) = 0.751 for reflection with hkl = 021.

Additional pattern

1. Folen [1975]

Phenobarbital, form III, $C_{12}H_{12}N_2O_3$

Synonyms

1. 5-Ethyl-5-phenylbarbituric acid
2. Phenobarbitone
3. Luminal
4. Phenemal
5. Phenylethylmalonylurea

CAS registry no.

50-06-6

Structure

Monoclinic, $P2_1/c$ (14), $Z = 4$. The structure was determined by Williams [1974].

Atom positions

All atoms are in general positions 4(e) [ibid.].

Polymorphism

There may be as many as 12 anhydrous forms of phenobarbital, as well as the monohydrate and perhaps other hydrates [ibid.].

Lattice constants

$$\begin{aligned}a &= 9.535(2) \text{ \AA} \\b &= 11.856(3) \\c &= 10.795(3) \\&\beta = 111.56(1)^\circ\end{aligned}$$

(published values: $a = 9.534(2)$ Å, $b = 11.855(3)$, $c = 10.794(3)$, $\beta = 111.56(1)^\circ$ [Williams, 1974])

CD cell: $a = 10.795(3)$ Å, $b = 11.856(3)$, $c = 9.535(2)$, $\beta = 111.56(1)^\circ$; sp. gp. $P2_1/a$; $a/b = 0.9105$; $c/b = 0.8042$

Volume Å^3
1135.0 Å

Density

(calculated) 1.359 g/cm³

Thermal parameters

Isotropic for hydrogen atoms [Williams, 1974].

Isotropic B_i for other atoms, estimated from U_{ij} for each atom.

Scattering factors

C^0 , H^0 , N^0 , O^0 [International Tables, 1962]

Scale factors (integrated intensities)

$\gamma = 1.581 \times 10^{-3}$

I/I_{corundum} (calculated) 0.610 for reflection with $hkl = \bar{2}02$

Additional pattern

1. PDF card 5-0324 [Huang, 1951]

Potassium Barium Iron Titanium Oxide, $K_{1.16}Ba_{0.72}Fe_{0.36}Ti_{5.58}O_{13}$

Structure

Monoclinic, C2/m (12), Z = 2. The structure was refined using data from a natural mineral found in the Kimberley Division of Western Australia [Bagshaw et al., 1977]. Electron microprobe analysis gave the composition listed [ibid.].

Atom positions

Bagshaw et al. [1977]

- 2(a) 2 oxygen
- 4(i) 4 oxygen in each of 6 different sites
- 4(i) 3.72 titanium and 0.24 iron in each of 3 different sites
- 4(i) 2.32 potassium and 1.44 barium

Lattice constants

$a = 15.454(2)$ Å
 $b = 3.8370(7)$
 $c = 9.124(2)$
 $\beta = 99.25(1)$ °

$a/b = 4.0276$

$c/b = 2.3779$

(published values: $a = 15.453(2)$ Å,
 $b = 3.8368(7)$, $c = 9.123(2)$, $\beta = 99.25(1)$ °
[Bagshaw et al., 1977].

Volume
 533.99 Å³

Density
 3.978 g/cm³

Thermal parameters

Isotropic B_i estimated from U_{ij} for individual atoms

Scattering factors

K^+ , Ba^{2+} , Fe^0 , Ti^0 , O^0 [Cromer and Mann, 1968].
K, Ba, Fe and Ti factors were corrected for dispersion [Cromer, 1965].

Scale factors (integrated intensities)

$\gamma = 0.1046 \times 10^{-3}$

$I/I_{corundum}$ (calculated) = 1.06 for reflection with $hk\ell = 310$.

Procaine Hydrochloride, $C_{13}H_{21}ClN_2O_2$

Synonyms

1. Novocaine hydrochloride
2. p-Aminobenzoyldiethylaminoethanol hydrochloride
3. 2-Diethylaminoethyl p-aminobenzoate hydrochloride

CAS registry no.

51-05-8

Structure

Orthorhombic, $Pcab$ (61), $Z = 8$. The structure was studied by Beall, Herdklotz and Sass [1970]. The parameters used here are from the refinement by Dexter [1972].

Atom positions

All atoms were in the general positions 8(c) [Dexter, 1972].

Lattice constants

$a = 25.019(1)$ Å
 $b = 8.3060(5)$
 $c = 14.193(1)$

(published values: $a = 25.017(1)$ Å,
 $b = 8.3050(5)$, $c = 14.192(1)$ [Dexter, 1972])

CD cell: $a = 14.193(1)$ Å, $b = 25.019(1)$,
 $c = 8.3060(5)$; sp. gp. $Pcab$; $a/b = 0.5673$;
 $c/b = 0.3320$

Volume
 2949.4 Å³

Density
(calculated) 1.229 g/cm³

Thermal parameters

Isotropic: hydrogen atoms, overall $B = 4.0$ [Dexter, 1972].

Isotropic B_i for other atoms, estimated from U_{ij} for each atom.

Scattering factors
 C^0, H^0, N^0, O^0, Cl^- [International Tables, 1962]

Scale factors (integrated intensities)
 $\gamma = 0.5173 \times 10^{-3}$
 $I/I_{corundum}$ (calculated) = 0.601, for reflection with $hkl = 113$.

Additional patterns

1. PDF card 27-1975 [Wang, P. Polytechnic Inst. of New York, 1975]
2. Folen [1975]

Psilocin, C₁₂H₁₆N₂O

Synonyms

1. 3-(2-(Dimethylamino)ethyl)-indol-4-ol
2. 4-Hydroxy-N,N-dimethyltryptamine

CAS registry no.
520-53-6

Structure

Monoclinic, P2₁/c (14), Z = 4. The structure was determined by Petcher and Weber [1974].

Atom positions

All the atoms were in general positions 4(e). For H(7), the value 0.273 was used for "z" as given in the Supplementary Publ. #SUP20980, referred to by Petcher and Weber [1974]. Bond length calculations indicated that the value of 0.014 for "z" for H(12) should be used.

Lattice constants

$$a = 10.60(3) \text{ \AA}$$

$$b = 8.53(2)$$

$$c = 12.51(3)$$

$$\beta = 91.25(30)^\circ$$

[Petcher and Weber, 1974]

CD cell: a = 12.51(3) Å, b = 8.53(2), c = 10.60(3), β = 91.25(30)°; sp. gp. P2₁/2; a/b = 1.4665, c/b = 1.2426

Volume
1131. Å³

Density

(calculated) 1.200 g/cm³

(measured) 1.19 [Petcher and Weber, 1974]

Thermal parameters

Isotropic B_i estimated from β_{ij} for individual atoms.

Scattering factors

Zero ionization [International Tables, 1962]

Scale factors (integrated intensities)

$$\gamma = 3.259 \times 10^{-3}$$

I/I_{corundum} (calculated) = 1.06 for reflection with hkl = 112.

Additional pattern

1. PDF card 13-981 [Physical Data of Indole and Dihydroindole Alkaloids, edited by Neuss, Eli Lilly and Co., 1962]

Psilocybin Methanolate, C₁₃H₂₁N₂O₄P

Synonyms

1. Indocybin
2. 3-[2-(Dimethylamino)ethyl]indol-4-ol
dihydrogen phosphate methanolate

CAS registry no.

520-52-5

Structure

Monoclinic, P₂₁/c (14), Z = 8. The structure was determined by Weber and Petcher [1974].

Atom positions

All atoms were in general positions 4(e).

Lattice constants

$a = 12.64(1)$ Å
 $b = 29.11(2)$
 $c = 8.848(6)$
 $\beta = 107.37(2)^\circ$

$a/b = 0.4342$

$c/b = 0.3040$

(published values: $a = 12.64(1)$ Å,
 $b = 29.11(2)$, $c = 8.847(6)$, $\beta = 107.37(2)^\circ$
[Weber and Petcher, 1974])

Volume

3107. Å³

Density

(calculated) 1.352 g/cm³

(measured) 1.34 [Weber and Petcher, 1974]

Thermal parameters

Isotropic, for hydrogens [Weber and Petcher, 1974]. For all other atoms, B_i were estimated for β_{ij} for individual atoms.

Scattering factors

Zero ionization [International Tables, 1962]

Scale factors (integrated intensities)

γ = 0.5540 × 10⁻³

I/I_{corundum} (calculated) = 0.455 for reflection with hkl = 120.

Sodium Barbital, C₈H₁₁N₂NaO₃

Synonyms

1. Sodium 5,5-diethylbarbiturate
2. Soluble barbital
3. Barbitone sodium
4. Sodium malonylurea

CAS registry no.

144-02-5

Structure

Orthorhombic, P₂12₁2₁ (19), Z = 4. The structure was determined by Berking and Craven [1971]. It is isostructural with potassium barbital [Berthou et al., 1962].

Atom positions

All atoms were in general positions 4(a) [ibid.].

Lattice constants

a = 6.724(1) Å
b = 11.951(2)
c = 12.130(2)

(published values: a = 6.724(1) Å,
b = 11.950(2), c = 12.129(2) [Berking and Craven, 1971])

CD cell: a = 11.951(2) Å, b = 12.130(2),
c = 6.724(1); sp. gp. P₂12₁2₁; a/b = 0.9852,
c/b = 0.5543

Volume 974.75 Å³

Density

(calculated) 1.405 g/cm³
(measured) 1.408 g/cm³ [Berking and Craven, 1971]

Thermal parameters

Isotropic for hydrogen atoms, anisotropic for non-hydrogen atoms [Berking and Craven, 1971]

Scattering factors

C⁰, H⁰, Na⁰, N⁰, O⁰ [International Tables, 1962]

Scale factors (integrated intensities)

$\gamma = 1.519 \times 10^{-3}$
I/I_{corundum} (calculated) = 0.877 for reflection with $hkl = 011$

Additional pattern

Δ^9 -Tetrahydrocannabinolic Acid B, $C_{22}H_{30}O_4$

Synonyms

1. delta (sup 9) - THC acid B
2. 6,6,9-trimethyl-3-pentyl-7,8,9,10-tetrahydro-6H-dibenzo(b,d)pyran-1-ol

Structure

Orthorhombic, $P2_12_12_1$ (19), $Z = 4$. The structure was refined by Rosenqvist and Ottersen [1975].

Atom positions

All atoms were in general positions 4(a).

Lattice constants

$a = 16.515(2)$ \AA
 $b = 14.325(2)$
 $c = 8.744(1)$

(published values: $a = 16.514(2)$ \AA ,
 $b = 14.324(2)$, $c = 8.744(1)$ [Rosenqvist and
Ottersen, 1975])

CD cell: $a = 14.325(2)$ \AA , $b = 16.514(2)$,
 $c = 8.744(1)$. sp. gp. $P2_12_12_1$; $a/b = 0.8674$;
 $c/b = 0.5295$.

Volume 2068.6 \AA^3

Density

(calculated) 1.151 g/cm^3
(measured) 1.12 g/cm^3 [Rosenqvist and
Ottersen, 1975]

Thermal parameters

For hydrogen: isotropic B_i [Rosenqvist and
Ottersen, 1975]
For other atoms, isotropic B_i estimated from
 β_{ij} for individual atoms.

Scattering factors

H^0 [Stewart et al., 1965]
 C^0 , O^0 [Doyle and Turner, 1968]

Scale factors (integrated intensities)

$\gamma = 3.492 \times 10^{-3}$
 I/I_{corundum} (calculated) = 1.20 for reflection
with $hk\ell = 110$.

Vinbarbital, Form I, $C_{11}H_{16}N_2O_3$

Synonyms

1. 5-Ethyl-5(1-methyl-1-butenyl) barbituric acid

Structure

Monoclinic, $P2_1/c$ (14), $Z = 4$. The structure was determined by Craven and Cusatis [1969].

Atom positions

All atoms are in general positions 4(e). The reference was lacking data for H(221); it was omitted from these calculations.

Polymorphism

Two polymorphs (melting points 129° and 106°) have been reported but they are very difficult to prepare from melt or solution [Craven and Cusatis, 1969].

Lattice constants

$$a = 14.396(5) \text{ \AA}$$

$$b = 6.822(3)$$

$$c = 12.541(7)$$

$$\beta = 107.43(3)^\circ$$

$$a/b = 2.1102$$

$$c/b = 1.8383$$

(published values: $a = 14.395(5) \text{ \AA}$,
 $b = 6.822(3)$, $c = 12.540(7)$, $\beta = 107^\circ 26(2)'$
[Craven and Cusatis, 1969]

Volume Å^3
 1175.1 Å^3

Density

(calculated) 1.268 g/cm^3

Thermal parameters

Anisotropic for non-hydrogen atoms [Craven and Cusatis, 1969]. Overall $B = 5.0$ for hydrogen atoms.

Scattering factors

C^0 , H^0 , N^0 , O^0 [International Tables, 1962]

Scale factors (integrated intensities)

$$\gamma = 2.068 \times 10^{-3}$$

I/I_{corundum} (calculated) = 0.799 for reflection with $hkl = 110$.

Additional pattern

1. PDF card 9-555 [Parkes, E. B., South Western Forensic Science Lab., Westbury-on-Trym, Bristol, Eng.]

CUMULATIVE INDEX TO CIRCULAR 539, VOLUMES 1-10 and MONOGRAPH 25, SECTIONS 1-16, inclusive.

INORGANIC NAMES

	Vol. or Sec.	Page		Vol. or Sec.	Page
Aluminum, Al	1	11	Ammonium aluminum selenate hydrate, $\text{NH}_4\text{Al}(\text{SeO}_4)_2 \cdot 12\text{H}_2\text{O}$	9m	6
Aluminum antimony, AlSb	4	72	Ammonium aluminum sulfate, $\text{NH}_4\text{Al}(\text{SO}_4)_2$	10m	5
Aluminum bismuth oxide, $\text{Al}_4\text{Bi}_2\text{O}_9$..	11m	5	Ammonium aluminum sulfate hydrate (tschermigite), $\text{NH}_4\text{Al}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	3
Aluminum chloride, AlCl_3	9m	61	Ammonium azide, NH_4N_3	9	4
Aluminum chloride hydrate (chloraluminite), $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$	7	3	Ammonium beryllium fluoride, $(\text{NH}_4)_2\text{BeF}_4$	3m	5
Aluminum copper, Al_4Cu_9	11m	79	Ammonium boron fluoride, NH_4BF_4	3m	6
Aluminum fluoride hydroxide silicate, topaz, $\text{Al}_2(\text{F},\text{OH})_2\text{SiO}_4$	1m	4	Ammonium bromide, NH_4Br	2	49
Aluminum iron antimony oxide, bahianite, $\text{Al}_{5.66}\text{Fe}_{0.09}\text{Sb}_{2.95}\text{O}_{16}$	16m	87	Ammonium cadmium bromide, $(\text{NH}_4)_4\text{CdBr}_6$	15m	9
Aluminum iron oxide, AlFeO_3	15m	7	Ammonium cadmium chloride, NH_4CdCl_3	5m	6
Aluminum lithium, Al_4Li_9	10m	98	Ammonium cadmium sulfate, $(\text{NH}_4)_2\text{Cd}_2(\text{SO}_4)_3$	7m	5
Aluminum nickel, AlNi	6m	82	Ammonium cadmium sulfate hydrate, $(\text{NH}_4)_2\text{Cd}(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$	8m	5
Aluminum nitride, AlN	12m	5	Ammonium calcium sulfate, $(\text{NH}_4)_2\text{Ca}_2(\text{SO}_4)_3$	8m	7
Aluminum nitrate hydrate, $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$	11m	6	Ammonium chlorate, NH_4ClO_4 (orthorhombic)	7	6
Aluminum oxide (corundum), $\alpha\text{-Al}_2\text{O}_3$	9	3	Ammonium chloride (salammoniac), NH_4Cl	1	59
Aluminum oxide hydrate (boehmite), $\alpha\text{-Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$	3	38	Ammonium chromium sulfate hydrate, $\text{NH}_4\text{Cr}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	7
Aluminum oxide hydrate, diaspore, $\beta\text{-Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$	3	41	Ammonium cobalt (II) chloride, NH_4CoCl_3	6m	5
Aluminum phosphate, $\text{Al}(\text{PO}_4)_3$	2m	3	Ammonium cobalt fluoride, NH_4CoF_3	8m	9
Aluminum phosphate (berlinite), AlPO_4 (trigonal)	10	3	Ammonium copper bromide hydrate, $(\text{NH}_4)_2\text{CuBr}_4 \cdot 2\text{H}_2\text{O}$	10m	6
Aluminum phosphate, AlPO_4 (orthorhombic)	10	4	Ammonium copper chloride, NH_4CuCl_3	7m	7
Aluminum plutonium, Al_3Pu	15m	77	Ammonium copper chloride hydrate, $(\text{NH}_4)_2\text{CuCl}_4 \cdot 2\text{H}_2\text{O}$	12m	6
Aluminum rhenium, AlRe	15m	79	Ammonium copper fluoride, NH_4CuF_3	11m	8
Aluminum rhenium, Al_{12}Re	15m	80	Ammonium gallium sulfate hydrate, $\text{NH}_4\text{Ga}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	9
Aluminum rhodium, AlRh	15m	82	Ammonium germanium fluoride, $(\text{NH}_4)_2\text{GeF}_6$	6	8
Aluminum ruthenium, AlRu	15m	83	Ammonium hydrogen arsenate, $\text{NH}_4\text{H}_2\text{AsO}_4$	16m	9
Aluminum ruthenium, Al_6Ru	15m	84	Ammonium hydrogen carbonate (teschemacherite), $(\text{NH}_4)\text{HCO}_3$	9	5
Aluminum samarium, AlSm_2	15m	86	Ammonium hydrogen phosphate, $\text{NH}_4\text{H}_2\text{PO}_4$	4	64
Aluminum samarium, AlSm_3	15m	88	Ammonium iodate, NH_4IO_3	10m	7
Aluminum samarium, Al_2Sm	15m	90	Ammonium iodide, NH_4I	4	56
Aluminum samarium, Al_3Sm	15m	91	Ammonium iridium chloride, $(\text{NH}_4)_2\text{IrCl}_6$	8	6
Aluminum silicate (mullite), $\text{Al}_6\text{Si}_2\text{O}_{13}$	3m	3	Ammonium iron chloride hydrate, $(\text{NH}_4)_2\text{FeCl}_5 \cdot \text{H}_2\text{O}$	14m	7
Aluminum sulfate, $\text{Al}_2(\text{SO}_4)_3$	15m	8	Ammonium iron fluoride, $(\text{NH}_4)_3\text{FeF}_6$	9m	9
Aluminum technetium, Al_6Tc	15m	93	Ammonium iron sulfate, $\text{NH}_4\text{Fe}(\text{SO}_4)_2$	10m	8
Aluminum terbium, Al_2Tb	15m	95	Ammonium iron sulfate hydrate, $\text{NH}_4\text{Fe}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	10
Aluminum terbium, Al_2Tb_3	15m	96	Ammonium lead chloride, $(\text{NH}_4)_2\text{PbCl}_6$	11m	10
Aluminum thorium uranium, Al_6ThU ..	15m	98	Ammonium magnesium aluminum fluoride, $\text{NH}_4\text{MgAlF}_6$	10m	9
Aluminum tungsten, Al_5W , δ -phase ..	15m	100	Ammonium magnesium chromium oxide hydrate, $(\text{NH}_4)_2\text{Mg}(\text{CrO}_4)_2 \cdot 6\text{H}_2\text{O}$	8m	10
Aluminum tungsten oxide, $\text{Al}_2(\text{WO}_4)_3$..	11m	7	Ammonium magnesium phosphate hydrate (struvite), $\text{NH}_4\text{MgPO}_4 \cdot 6\text{H}_2\text{O}$	3m	41
Aluminum vanadium, Al_{10}V	15m	102	Ammonium manganese chloride hydrate, $(\text{NH}_4)_2\text{MnCl}_4 \cdot 2\text{H}_2\text{O}$	11m	11
Aluminum vanadium, $\text{Al}_{10.25}\text{V}$	15m	104			
Aluminum vanadium, Al_{23}V_4	15m	106			
Aluminum vanadium, Al_{45}V_7 , α' -phase	15m	108			
Aluminum ytterbium, Al_2Yb	15m	111			
Aluminum yttrium, Al_3Y	15m	112			
Ammonium aluminum fluoride, $(\text{NH}_4)_3\text{AlF}_6$	9m	5			

Further work on this program is in progress, and it is anticipated that additional sections will be issued. Therefore, the cumulative index here is not necessarily the concluding index for the project.

m - Monograph 25.

A mineral name in () indicates a synthetic sample.

	Vol. or Sec.	Page		Vol. or Sec.	Page
Ammonium manganese(II) fluoride, NH_4MnF_3	5m	8	Antimony iron titanium oxide hydroxide, derbylite, $\text{SbFe}_4\text{Ti}_3\text{O}_{13}(\text{OH})$	16m	89
Ammonium manganese sulfate, $(\text{NH}_4)_2\text{Mn}_2(\text{SO}_4)_3$	7m	8	Antimony lanthanum, LaSb	4m	42
Ammonium manganese sulfate hydrate, $(\text{NH}_4)_2\text{Mn}(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$	8m	12	Antimony neodymium, NdSb	4m	43
Ammonium mercury chloride, NH_4HgCl_3	8m	14	Antimony(III) oxide (senarmontite), Sb_2O_3 (cubic)	3	31
Ammonium molybdenum oxide phosphate hydrate, $(\text{NH}_4)_3(\text{MoO}_3)_{12}\text{PO}_4 \cdot 4\text{H}_2\text{O}$..	8	10	Antimony(III) oxide, valentinite, Sb_2O_3 (orthorhombic)	10	6
Ammonium nickel(II) chloride, NH_4NiCl_3	6m	6	Antimony(IV) oxide (cervantite), Sb_2O_4	10	8
Ammonium nickel chromium oxide hydrate, $(\text{NH}_4)_2\text{Ni}(\text{CrO}_4)_2 \cdot 6\text{H}_2\text{O}$	8m	16	Antimony(V) oxide, Sb_2O_5	10	10
Ammonium nitrate (nitrammite), NH_4NO_3	7	4	Antimony oxide, Sb_6O_{13}	16m	14
Ammonium osmium bromide, $(\text{NH}_4)_2\text{OsBr}_6$	3	71	Antimony praseodymium, PrSb	4m	43
Ammonium osmium chloride, $(\text{NH}_4)_2\text{OsCl}_6$	1m	6	Antimony scandium, SbSc	4m	44
Ammonium palladium chloride, $(\text{NH}_4)_2\text{PdCl}_4$	6	6	Antimony selenide, Sb_2Se_3	3m	7
Ammonium palladium chloride, $(\text{NH}_4)_2\text{PdCl}_6$	8	7	Antimony silver sulfide, AgSb_2S (cubic).....	5m	48
Ammonium platinum bromide, $(\text{NH}_4)_2\text{PtBr}_6$	9	6	Antimony silver sulfide (miargyrite), AgSb_2S (monoclinic).....	5m	49
Ammonium platinum chloride, $(\text{NH}_4)_2\text{PtCl}_6$	5	3	Antimony silver sulfide (pyrargyrite), Ag_3SbS_3 (trigonal).....	5m	51
Ammonium potassium iron chloride hydrate (kremersite), $(\text{NH}_4,\text{K})_2\text{FeCl}_5 \cdot \text{H}_2\text{O}$	14m	8	Antimony silver telluride, AgSbTe_2 ..	3m	47
Ammonium rhenium oxide, NH_4ReO_4 ...	9	7	Antimony(III) sulfide (stibnite), Sb_2S_3	5	6
Ammonium selenium bromide, $(\text{NH}_4)_2\text{SeBr}_6$	8	4	Antimony telluride, Sb_2Te_3	3m	8
Ammonium silicon fluoride (cryptothalite), $(\text{NH}_4)_2\text{SiF}_6$	5	5	Antimony terbium, SbTb	5m	61
Ammonium strontium chromium oxide, $(\text{NH}_4)_2\text{Sr}(\text{CrO}_4)_2$	14m	9	Antimony thorium, SbTh	4m	44
Ammonium strontium sulfate, $(\text{NH}_4)_2\text{Sr}(\text{SO}_4)_2$	15m	11	Antimony thulium, SbTm	4m	45
Ammonium sulfate (mascagnite), $(\text{NH}_4)_2\text{SO}_4$	9	8	Antimony tin, SbSn	16m	15
Ammonium tellurium bromide, $(\text{NH}_4)_2\text{TeBr}_6$	8	5	Antimony ytterbium, SbYb	4m	45
Ammonium tellurium chloride, $(\text{NH}_4)_2\text{TeCl}_6$	8	8	Antimony yttrium, SbY	4m	46
Ammonium tin chloride, $(\text{NH}_4)_2\text{SnCl}_6$	5	4	Arsenic, As	3	6
Ammonium titanium fluoride, $(\text{NH}_4)_2\text{TiF}_6$	16m	10	Arsenic cerium, AsCe	4m	51
Ammonium vanadium oxide, NH_4VO_3 ..	8	9	Arsenic(III) iodide, AsI_3	13m	7
Ammonium zinc chloride, $(\text{NH}_4)_3\text{ZnCl}_5$	15m	12	Arsenic oxide (arsenolite), As_2O_3 (cubic)	1	51
Ammonium zinc fluoride, NH_4ZnF_3 ...	8m	18	Arsenic oxide, claudetite, As_2O_3 (monoclinic)	3m	9
Ammonium zirconium fluoride, $(\text{NH}_4)_3\text{ZrF}_7$	6	14	Barium, Ba	4	7
Antimonic acid, $\text{H}_{14}\text{Sb}_{14}\text{O}_{21}(\text{OH})_{42}$..	16m	13	Barium aluminum oxide, BaAl_2O_4 ..	5m	11
Antimony, Sb	3	14	Barium aluminum oxide, $\text{Ba}_3\text{Al}_2\text{O}_6$..	12m	7
Antimony bromide, $\alpha\text{-SbBr}_3$	15m	13	Barium arsenate, $\text{Ba}_3(\text{AsO}_4)_2$..	2m	6
Antimony cerium, CeSb	4m	40	Barium borate, BaB_4O_7	4m	6
Antimony cobalt, CoSb	15m	121	Barium borate, high form, $\text{Ba}_2\text{B}_2\text{O}_4$..	4m	4
Antimony cobalt, CoSb_2	15m	122	Barium borate, $\text{BaB}_8\text{O}_{13}$	7m	10
Antimony cobalt titanium, CoSbTi ...	15m	124	Barium bromate hydrate, $\text{Ba}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$	8m	19
Antimony cobalt vanadium, CoSbV	15m	125	Barium bromide, BaBr_2	10m	63
Antimony dysprosium, DySb	4m	41	Barium bromide fluoride, BaBrF	10m	10
Antimony erbium, ErSb	4m	41	Barium bromide hydrate, $\text{BaBr}_2 \cdot \text{H}_2\text{O}$	3m	10
Antimony(III) fluoride, SbF_3	2m	4	Barium cadmium chloride hydrate, $\text{BaCdCl}_4 \cdot 4\text{H}_2\text{O}$	16m	16
Antimony gadolinium, GdSb	4m	42	Barium calcium nitrate, $\text{Ba}_{.25}\text{Ca}_{.75}(\text{NO}_3)_2$	15m	14
Antimony gallium, GaSb	6	30	Barium calcium nitrate, $\text{Ba}_{.50}\text{Ca}_{.50}(\text{NO}_3)_2$	12m	38
Antimony gold (aurostibite), AuSb_2	7	18	Barium calcium nitrate, $\text{Ba}_{.75}\text{Ca}_{.25}(\text{NO}_3)_2$	12m	38
Antimony indium, InSb	4	73	Barium calcium tungsten oxide, Ba_2CaW_6	9m	10
Antimony(III) iodide, SbI_3	6	16	Barium carbonate (witherite), BaCO_3 (orthorhombic)	2	54
			Barium carbonate, BaCO_3 (cubic) at 1075 °C	10	11
			Barium chlorate, $\text{Ba}(\text{ClO}_3)_2$	16m	17

	Vol. or Sec.	Page		Vol. or Sec.	Page
Barium chloride hydrate, $\text{Ba}(\text{ClO}_4)_2 \cdot 3\text{H}_2\text{O}$	2m	7	Beryllium calcium iron magnesium aluminum phosphate hydroxide hydrate, roscherite (monoclinic), $\text{Be}_2\text{Ca}(\text{Fe}_{.3}\text{Mg}_{.7})_2\text{Al}_{.67}(\text{PO}_4)_3(\text{OH})_3 \cdot 2\text{H}_2\text{O}$ 16m	16m	96
Barium chloride hydrate, $\text{Ba}(\text{ClO}_3)_2 \cdot \text{H}_2\text{O}$	8m	21	Beryllium calcium manganese aluminum iron phosphate hydroxide hydrate, roscherite (triclinic), $\text{Be}_4\text{Ca}_2(\text{Mn}_{3.91}\text{Mg}_{.04}\text{Ca}_{.05})(\text{Al}_{.13}\text{Fe}_{.42}\text{Mn}_{.12})(\text{PO}_4)_6(\text{OH})_4 \cdot 6\text{H}_2\text{O}$	16m	100
Barium chloride, BaCl_2 , (cubic) ...	9m	13	Beryllium calcium oxide, $\text{Be}_{17}\text{Ca}_{12}\text{O}_{29}$	7m	89
Barium chloride, BaCl_2 , (orthorhombic)	9m	11	Beryllium chromium oxide, BeCr_2O_4	10	12
Barium chloride fluoride, BaClF ...	10m	11	Beryllium cobalt, BeCo	5m	62
Barium chloride hydrate, $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$	12m	9	Beryllium germanium oxide, Be_2GeO_4	10	13
Barium chromium oxide, $\text{Ba}_3(\text{CrO}_4)_2$	15m	16	Beryllium lanthanum oxide, $\text{Be}_2\text{La}_2\text{O}_5$	9m	65
Barium fluoride, BaF_2	1	70	Beryllium niobium, Be_2Nb	7m	92
Barium hydroxide phosphate, $\text{Ba}_5(\text{OH})(\text{PO}_4)_3$	11m	12	Beryllium oxide (bromellite), BeO	1	36
Barium iodide, BaI_2	10m	66	Beryllium palladium, BePd	5m	62
Barium iodide hydrate, $\text{BaI}_2 \cdot 2\text{H}_2\text{O}$...	16m	18	Beryllium silicate, phenakite, Be_2SiO_4	8	11
Barium lead chloride, BaPbCl_4	11m	13	Beryllium sulfate, BeSO_4	15m	20
Barium lead nitrate, $\text{Ba}_{.33}\text{Pb}_{.67}(\text{NO}_3)_2$	12m	40	Bismuth, Bi	3	20
Barium lead nitrate, $\text{Ba}_{.67}\text{Pb}_{.33}(\text{NO}_3)_2$	12m	40	Bismuth bromide oxide, BiOBr	8	14
Barium manganese oxide, $\text{Ba}(\text{MnO}_4)_2$	15m	17	Bismuth cerium, BiCe	4m	46
Barium molybdenum oxide, BaMoO_4 ...	7	7	Bismuth chloride oxide (bismoclite), BiOCl	4	54
Barium molybdenum oxide, Ba_2MoO_5 ..	12m	10	Bismuth dysprosium, BiDy	4m	47
Barium nitrate (nitrobarite), $\text{Ba}(\text{NO}_3)_2$	11m	14	Bismuth erbium, BiEr	4m	47
Barium nitrite hydrate, $\text{Ba}(\text{NO}_2)_2 \cdot \text{H}_2\text{O}$	15m	18	Bismuth fluoride, BiF_3	1m	7
Barium oxide, BaO	9m	63	Bismuth holmium, BiHo	4m	48
Barium oxide, BaO_2	6	18	Bismuth(III) iodide, BiI_3	6	20
Barium phosphate, $\text{Ba}_2\text{P}_2\text{O}_7$, (high form).....	16m	19	Bismuth iodide oxide, BiOI	9	16
Barium phosphate, $\text{Ba}_3(\text{PO}_4)_2$	12m	12	Bismuth lanthanum, BiLa	4m	48
Barium selenide, BaSe	5m	61	Bismuth neodymium, BiNd	4m	49
Barium silicate, $\beta\text{-BaSiO}_3$	13m	8	Bismuth oxide (bismite), $\alpha\text{-Bi}_2\text{O}_3$..	3m	16
Barium silicate (sanbornite), $\beta\text{-BaSi}_2\text{O}_5$	13m	10	Bismuth phosphate, BiPO_4 (monoclinic)	3m	11
Barium silicate, Ba_2SiO_4	13m	12	Bismuth phosphate, BiPO_4 (trigonal)	3m	13
Barium silicate, $\text{Ba}_2\text{Si}_3\text{O}_8$	13m	13	Bismuth praseodymium, BiPr	4m	49
Barium silicate, Ba_3SiO_5	13m	15	Bismuth sulfide (bismuthinite), Bi_2S_3	5m	13
Barium silicate, $\text{Ba}_3\text{Si}_5\text{O}_{13}$	13m	17	Bismuth telluride, BiTe	4m	50
Barium silicon fluoride, BaSiF_6 ...	4m	7	Bismuth telluride (tellurobis-muthite), Bi_2Te_3	3m	16

16. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.) Standard x-ray diffraction patterns are presented for 87 substances. Fifty-nine of these patterns represent experimental data and 28 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All d-values were assigned Miller indices determined by comparison with computed interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.				
17. KEY WORDS (six to twelve entries; alphabetical order; capitalize only the first letter of the first key word unless a proper name; separated by semicolons) Crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

CRYSTAL DATA

Volumes 3 & 4 Now Available

Jointly by the National Bureau
of Standards and the U.S. Department
of Commerce and the JCPDS-International
Centre for Diffraction Data.

ential
chemists,
allurgists,
minists, solid
e physicists,
eralogists,
talographers,
biochemists

Most reliable source
for identification
of crystalline
materials

Important
for materials
characterization,
phase analysis,
alloy and solid
solution studies,
and materials
design

Compiled at the National Bureau of Standards, the Cambridge Crystallographic Data Centre (England), and the U.S. Geological Survey.

Two new volumes have been added to the popular Third Edition Series of **Crystal Data—Determinative Tables** to update and expand the coverage of this essential reference work for the characterization of crystalline materials.

Volume 3 continues the coverage of Volume 1 on organic and organometallic crystals with data on over 12,000 substances published from 1967 to 1974. Volume 4 continues the coverage of Volume 2 on inorganic and mineral crystals with listings for more than 11,000 substances from 1967 to 1969.

Cell dimensions, space group or diffraction aspect, the number of formula units per unit cell, crystal structure (whether determined), measured density, and x-ray calculated density are given for each entry.

The name of the compound, chemical formula, literature references, and the transformation matrix are also given.

When available, data on crystal structure type, crystal habit, cleavages, twinning, color, optical properties, indices of refraction, melting point, and transition point are included.

Contains
information
on inorganics,
organics,
organometallics,
minerals, drugs,
pesticides,
metals, and
intermetallics

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH—The Journal of Research of the National Bureau of Standards reports NBS research and development in those disciplines of the physical and engineering sciences in which the Bureau is active. These include physics, chemistry, engineering, mathematics, and computer sciences. Papers cover a broad range of subjects, with major emphasis on measurement methodology and the basic technology underlying standardization. Also included from time to time are survey articles on topics closely related to the Bureau's technical and scientific programs. As a special service to subscribers each issue contains complete citations to all recent Bureau publications in both NBS and non-NBS media. Issued six times a year. Annual subscription: domestic \$17; foreign \$21.25. Single copy, \$3 domestic; \$3.75 foreign.

NOTE: The Journal was formerly published in two sections: Section A "Physics and Chemistry" and Section B "Mathematical Sciences."

DIMENSIONS/NBS—This monthly magazine is published to inform scientists, engineers, business and industry leaders, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on work at NBS. The magazine highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, it reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing. Annual subscription: domestic \$11; foreign \$13.75.

NONPERIODICALS

Monographs—Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

Handbooks—Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications—Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series—Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series—Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NBS under the authority of the National Standard Data Act (Public Law 90-396).

NOTE: The principal publication outlet for the foregoing data is the Journal of Physical and Chemical Reference Data (JPCRD) published quarterly for NBS by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements available from ACS, 1155 Sixteenth St., NW, Washington, DC 20056.

Building Science Series—Disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes—Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

Voluntary Product Standards—Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The standards establish nationally recognized requirements for products, and provide all concerned interests with a basis for common understanding of the characteristics of the products. NBS administers this program as a supplement to the activities of the private sector standardizing organizations.

Consumer Information Series—Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

Order the above NBS publications from: Superintendent of Documents, Government Printing Office, Washington, DC 20402.

Order the following NBS publications—FIPS and NBSIR's—from the National Technical Information Services, Springfield, VA 22161.

Federal Information Processing Standards Publications (FIPS PUB)—Publications in this series collectively constitute the Federal Information Processing Standards Register. The Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NBS Interagency Reports (NBSIR)—A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Services, Springfield, VA 22161, in paper copy or microfiche form.

BIBLIOGRAPHIC SUBSCRIPTION SERVICES

The following current-awareness and literature-survey bibliographies are issued periodically by the Bureau:

Cryogenic Data Center Current Awareness Service. A literature survey issued biweekly. Annual subscription: domestic \$25; foreign \$30.

Liquefied Natural Gas. A literature survey issued quarterly. Annual subscription: \$20.

Superconducting Devices and Materials. A literature survey issued quarterly. Annual subscription: \$30. Please send subscription orders and remittances for the preceding bibliographic services to the National Bureau of Standards, Cryogenic Data Center (736) Boulder, CO 80303.
