NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards¹ was established by an act of Congress on March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau's technical work is performed by the National Measurement Laboratory, the National Engineering Laboratory, and the Institute for Computer Sciences and Technology.

THE NATIONAL MEASUREMENT LABORATORY provides the national system of physical and chemical and materials measurement; coordinates the system with measurement systems of other nations and furnishes essential services leading to accurate and uniform physical and chemical measurement throughout the Nation's scientific community, industry, and commerce; conducts materials research leading to improved methods of measurement, standards, and data on the properties of materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government agencies; develops, produces, and distributes Standard Reference Materials; and provides calibration services. The Laboratory consists of the following centers:

Absolute Physical Quantities² — Radiation Research — Thermodynamics and Molecular Science — Analytical Chemistry — Materials Science.

THE NATIONAL ENGINEERING LABORATORY provides technology and technical services to the public and private sectors to address national needs and to solve national problems; conducts research in engineering and applied science in support of these efforts; builds and maintains competence in the necessary disciplines required to carry out this research and technical service; develops engineering data and measurement capabilities; provides engineering measurement traceability services; develops test methods and proposes engineering standards and code changes; develops and proposes new engineering practices; and develops and improves mechanisms to transfer results of its research to the ultimate user. The Laboratory consists of the following centers:

Applied Mathematics — Electronics and Electrical Engineering² — Mechanical Engineering and Process Technology² — Building Technology — Fire Research — Consumer Product Technology — Field Methods.

THE INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides scientific and technical services to aid Federal agencies in the selection, acquisition, application, and use of computer technology to improve effectiveness and economy in Government operations in accordance with Public Law 89-306 (40 U.S.C. 759), relevant Executive Orders, and other directives; carries out this mission by managing the Federal Information Processing Standards Program, developing Federal ADP standards guidelines, and managing Federal participation in ADP voluntary standardization activities; provides scientific and technological advisory services and assistance to Federal agencies; and provides the technical foundation for computer-related policies of the Federal Government. The Institute consists of the following centers:

Programming Science and Technology — Computer Systems Engineering.

¹Headquarters and Laboratories at Gaithersburg, MD, unless otherwise noted; mailing address Washington, DC 20234.

²Some divisions within the center are located at Boulder, CO 80303.

STANDARD X-RAY DIFFRACTION POWDER PATTERNS

Previous work has been published as a book entitled Powder Diffraction Data from the Joint Committee on Powder Diffraction Standards Associateship at the National Bureau of Standards (1976) (JCPDS--International Centre for Diffraction Data, 1601 Park Lane, Swarthmore, PA 19081). The volume is sold with an accompanying search manual, and contains 949 card images of patterns of experimental data, published originally as Circular 539 (vols. 1-10) and Monograph 25, Sections 1-12, and most of Section 13.

Individual copies of the Circular and Monograph are still available and may be obtained from the National Technical Information Service, 5285 Port Royal Road, Springfield, VA 22161. If a publication listed below is identified with a number, it must be used in ordering. All are available in hardcopy or microfiche; the price is not fixed and will be furnished on request.

ERRATA

Monograph 25

- Section 9, pp. 73,74: Much of the data is incorrect. See a corrected pattern in this issue.
- Section 15, p. 136: The correct year should be 1970 for the reference to Fletcher et al.
- Section 17, p. 41: The color should be light grayish yellowish brown.
- p. 62: Under "Structure," the date should be 1967 for reference to Katz and Megaw.
- p. 64: Under "References," after J. Appl. Crystallogr., add 2, 89.
- p. 70: Under "Synonym," at line 1, delete hydrate.
- p. 70: Under "Lattice constants," the value for c should be 5.567.
- pp. 103,104: The text is out of order. Page 104 should precede page 103.

STANDARD X-RAY DIFFRACTION POWDER PATTERNS

Section 18 --- Data for 58 Substances

by

Marlene C. Morris, Howard F. McMurdie, Eloise H. Evans,
Boris Paretzkin, Harry S. Parker, and Nicolas C. Panagiotopoulos
JCPDS--International Centre for Diffraction Data

and

Camden R. Hubbard
National Bureau of Standards

Standard x-ray powder diffraction patterns are presented for 58 substances. These experimental patterns, useful for identification, were obtained by diffractometer methods. The lattice constants were refined by least-squares methods, and reflections were assigned Miller indices consistent with space group extinctions. Relative intensities, calculated densities, literature references, and other relevant data are included.

Key words: Crystal structure; densities; lattice constants; powder patterns; reference intensities; standard; x-ray diffraction.

INTRODUCTION

The Powder Diffraction File (PDF) is a continuing compilation of diffraction patterns gathered from many sources. Produced and published by the JCPDS--International Centre for Diffraction Data,¹ the PDF is used for identification of crystalline materials by matching d-spacings and diffraction intensity measurements. Under the partial sponsorship of the JCPDS, the program at the National Bureau of Standards contributes new or improved data to the PDF. Our work also aids in the development of diffraction techniques. This report presents information for 58 experimental patterns, and is the twenty-eighth of the series of Standard X-ray Diffraction Powder Patterns.²

EXPERIMENTAL POWDER PATTERNS

Names. The nomenclature follows the current practice of the PDF.

CAS registry number. The Chemical Abstracts Service Registry Number is included, when available, to help identify the sample. This number forms the basis for computer-aided searching of Chemical Abstracts.

Sample. The samples used to make NBS patterns were obtained from a variety of sources or were prepared in small quantities in our laboratory.

¹JCPDS--International Centre for Diffraction Data, 1601 Park Lane, Swarthmore, PA 19081. This Pennsylvania non-profit corporation functions in cooperation with the American Ceramic Society, the American Crystallographic Association, the American Society for Testing and Materials, The Clay Minerals Society, The Institute of Physics, the Mineralogical Association of Canada, the Mineralogical Society of America, The Mineralogical Society of Great Britain and Ireland, the National Association of Corrosion Engineers, and the Société Francaise de Minéralogie et de Cristallographie.

²See previous page for other published volumes.

Appropriate annealing or recrystallization of the samples improved the quality of many of the patterns. A check of phase purity was provided by indexing the x-ray pattern and by optical examination.

Optical data. When reported, optical measurements were made by grain immersion methods, in white light, using oils standardized in sodium light, in the refractive index range 1.49 to 2.1 [Hartshorne and Stuart, 1970].

The names of the sample colors are selected from the ISCC-NBS Centroid Color Charts [1965].

Interplanar spacings. All spacing determinations were made using an internal standard mixed with the sample, packed in a shallow holder. Choice of the standard was determined by the need for low angle and unobstructed reflections. The amount of standard was estimated so that the intensity of its strongest peak would be about equal to the intensity of the strongest peak of the sample. The internal standards used were of high purity (99.99%). The lattice constants used for them at 25 °C are given in Table 1; the 2θ angles were computed using cell dimensions uncorrected for index of refraction.

The internal standard Si powder is available as Standard Reference Material 640 [1974]. The lattice constant for the Si was refined from multiple powder data measurements made with tungsten as an internal standard [Swanson et al., 1966]. Single crystal cell parameter data were also collected. The lattice parameters from the two methods agreed within three parts in 10⁵ [Hubbard et al., 1975]. D-spacing results using SRM 640 will be in agreement with patterns recorded in this series of Monographs since 1966.

All patterns were recorded at 25 ± 1 °C on a diffractometer equipped with a focusing graphite or

lithium fluoride crystal monochromator located between the sample and the scintillation counter. Pulse height discrimination was used as well. All data were collected using copper radiation: $\lambda(\text{CuK}\alpha_1, \text{peak}) = 1.540598\text{\AA}$ [Deslattes and Henins, 1973].

Table 1

Calculated 2θ Angles, $\text{CuK}\alpha_1, \lambda = 1.540598\text{\AA}$			
hkl	W a=3.16524 \AA $\pm .00004$	Ag a=4.08651 \AA $\pm .00002$	Si a=5.43088 \AA $\pm .00004$

321	131.171		
400	153.535	97.875	69.131
331		110.499	76.377
420		114.914	
422		134.871	88.032
511/333		156.737	94.954
440			106.710
531			114.094
620			127.547
533			136.897
444			158.638

The readings of 2θ were taken at positions about 20% of the way down from the top, and in the center of the peak width. This avoided errors associated with aberrations at the very top of the peaks. The $\text{K}\alpha_2$ peaks were occasionally read to assist in establishing a $\text{K}\alpha_1$ peak position, but $\text{K}\alpha_2$ peaks are not reported.

At low angles, $\text{K}\alpha_1$ and $\text{K}\alpha_2$ peaks were unresolved for both the sample and the internal standard. The internal standard corrections were established from the theoretical values for $\text{K}\alpha_1$ and were applied to the unresolved low angle peaks, as well as to the resolved $\text{K}\alpha_1$ peaks in the higher angle regions. In general, if the internal standard correction varied along the length of the pattern, linear interpolations were used.

Structure, lattice constants. The space group symbols are given the short Hermann-Mauguin notation. Also given are the space group numbers listed in the International Tables for X-ray Crystallography, Vol. I [1965].

Orthorhombic cell dimensions are arranged according to the Dana convention $b > a > c$ [Palache et al., 1944]. Monoclinic and triclinic lattice constants are transformed if necessary in order to follow the convention of Crystal Data [1973]. The lattice constant ratios, a/b , c/b , and c/a , also follow the conventions used for the determinative ratios in Crystal Data [1973].

In most cases, preliminary lattice constants were available in the literature, and were used for the initial indexing and refinement. In cases where such data were not available, other methods were tried. If suitable single crystals were available, the lattice constants were obtained by use of a four-circle diffractometer. Axial ratios and densities from Groth [1908] were sometimes useful. Cell constants were also found in some instances by use of the Visser computer program [1969].

A least squares program [Evans et al., 1963] assigned hkl 's and refined the lattice constants. In indexing cubic patterns, for a given reflection multiple hkl 's were not utilized in the refinement or reported. Instead, the single appropriate index having the largest h was used. Cell refinement was based only upon 2θ values which could be indexed without ambiguity. The program minimized the value $\sum (\theta_{\text{obs}} - \theta_{\text{calc}})^2$. The estimated standard deviations (e.s.d.'s) of the reciprocal cell parameters were determined from the inverse matrix of the normal equations. The program calculated the e.s.d.'s of the direct cell constants by the method of propagation of errors. Since 1973, the e.s.d.'s derived by the computer program have been increased by 50% in order to reflect more truly the uncertainty in the lattice constants. A similar increase should also be applied to all lattice constants published in this series prior to 1973. The e.s.d.'s in the least significant figures are given in parentheses following the lattice constants.

For each d-value, the number of significant figures was derived from the average error in $|2\theta_{\text{obs}} - 2\theta_{\text{calc}}|$ and the equation $\Delta d/d = -(cot\theta)\Delta\theta$. With these conditions, the rounded value of d agrees with its appropriate 2θ within the average error in 2θ . The value of $\Delta\theta$ varies with the symmetry and crystallinity of each sample.

Densities. These were calculated from the specified lattice constants, the Avogadro number 6.0220943×10^{23} [Deslattes et al., 1974] and 1977 atomic weights published by the International Union of Pure and Applied Chemistry [1979].

Figure of merit. Several figures of merit ratings are available for assessing indexed powder data. M_{20} [de Wolff, 1968] is a criterion for the reliability of the unit cell and indexing. A value of $M_{20} > 10$ will guarantee the essential correctness of the indexing provided there are not more than 2 spurious lines ($X_{20} \leq 2$) [de Wolff, 1968]. In general, patterns reported in this publication had $M_{20} > 20$ and $X = 0$. M_{20} is reported if a cell was derived only through computer indexing from powder data, without further confirmation.

The accuracy and completeness of measured interplanar spacings is conveniently reported as F_N [Smith and Snyder, 1979]. The format used in this publication is $F_N = \text{overall value } (|\Delta 2\theta|, N_{\text{poss}})$, where N , the number of observed reflections was chosen as 30, or the maximum number of lines of

the pattern if the entire pattern had fewer than 30 lines. The "overall value" is the figure of merit, F_N , as defined by Smith and Snyder [1979], and $|\Delta\theta|$ is the average absolute magnitude of discrepancy between observed and calculated 2θ values for each reported hkl . N_{poss} is the number of diffraction lines allowed in the space group, up to the N^{th} observed and indexed line. Co-positional lines such as the cubic 221 and 300 are counted as one possible line.

Intensity measurements. The intensities of the diffraction lines were measured as peak heights above background and were expressed in percentage of the strongest line. It has been found that samples which give satisfactory intensity patterns usually have an average particle size smaller than $10 \mu\text{m}$, as recommended by Alexander et al. [1948]. In order to avoid the orientation effects which occur when powdered samples are packed or pressed, a sample holder was made that had in its top face a rectangular cavity which extended to one end of the holder. To prepare the sample, a glass slide was clamped over the top face to form a temporary cavity wall (see Figure 1), and the powdered sample was allowed to drift into the end opening while the holder was held in a vertical position. With the sample holder returned to a horizontal position, the glass slide was carefully removed so that the sample could be exposed to the x-ray beam (see Figure 2). As a general practice, approximately 50 volume percent of finely ground silica-gel was added as a diluent. Occasionally, a rotating sample holder was used.

As a check on reproducibility, each sample was mounted at least 3 times. The intensity values were determined for each of the mountings. The reported I_{rel} value for each observed spacing is the average of 3 or more observations and is rounded to the nearest integer. Theta-compensating (variable divergence) slits were sometimes used to gather the intensity data. In that case, the average $I(\text{comp})$ for each spacing was converted to an equivalent fixed slit value, using the approximate equation:

$$I(\text{fixed}) = \frac{I(\text{comp})}{\sin \theta}$$

The estimated standard deviation, σ , in the relative intensity values was calculated from the values of the five strongest lines, excluding the line with $I_{\text{rel}}=100$.

$$\sigma_i^2 = \frac{1}{n-1} \sum_{k=1}^n (I_i^{\text{rel}}(k) - \langle I \rangle_i)^2$$

and

$$\sigma = \left\{ \frac{1}{m} \sum_{i=1}^m \sigma_i^2 \right\}^{1/2}$$

where

m is the number of strong lines (usually 5), and
 n is the number of independent observations i , per line.

Figure 1.

Figure 2.

Where conversion of intensities for effects of theta-compensating slits was required, each σ_i was multiplied by the conversion factor

$$f = \frac{I(\text{comp})}{I(\text{fixed})}$$

Reference intensity ratio, I/I_{corundum}

The reference intensity ratio, I/I_c , has been defined as the direct ratio of the intensity of the strongest reflection of a sample, to the intensity of the 113 (hexagonal) reflection of corundum ($\alpha\text{-Al}_2\text{O}_3$) [Visser and de Wolff, 1964]. In this publication the ratios I/I_c are tabulated for copper $K\alpha_1$ radiation, for a 1:1 mixture by weight of the sample and corundum. I/I_c was determined only for very common phases.

A procedure has been adopted, to achieve greater statistical accuracy [Hubbard and Smith, 1977]. For any weight fractions of sample and corundum, X_s and X_c ($X_s = 1-X_c$), the intensities

for reflection \underline{h} of the sample and \underline{k} of corundum were measured for several combinations of \underline{h} and \underline{k} usually within the same region of 2θ , to provide indications of possible preferred orientation, extinction, or other systematic errors. The reference intensity ratio is then given by

$$\frac{I(h_o)}{I_c(113)} = \frac{x_c}{x_s} \cdot \frac{I_c^{\text{rel}}(\underline{k})}{I_s^{\text{rel}}(\underline{h})} \cdot \frac{I(\underline{h})}{I_c(\underline{k})}$$

where (h_o) indicates specifically which reflection was chosen for tabulation purposes. For each of our patterns, the reflection (h_o) will be the one with $I = 100$ since only copper radiation was used. Typically, at least 3 sets of reflections and 2 mountings of the mixture were used to obtain 6 or more values for the reference intensity ratio, I/I_c . These values yielded, the tabulated average $\langle I/I_c \rangle$. From these data, the standard deviation, σ , was obtained from

$$\sigma^2 = \frac{\sum_{i=1}^n \left((I/I_c)_i - \langle I/I_c \rangle \right)^2}{n(n-1)}$$

where n was the number of measurements of the reference intensity ratio. The standard deviation in the least significant figures is given in parentheses.

Format of tables. The printing of the data has been computerized. Superimposed reflections are treated in one of two ways. If a d-spacing has only two possible indices, an \underline{M} is added to the d-spacing which is repeated on the next line, but with the second index. However, if there are more than two possible indices, a plus sign is used in like manner. In both cases, the composite intensity is printed only once and aligned with the first reflection. The symbol "1L" in the intensity column is used to indicate "less than 1".

UNITS

In this publication the Ångström unit ($1\text{Å} = 100 \text{ pm}$) was selected for presentation of the d-spacings and lattice parameters. This maintained consistency with (a) the earlier publications of Standard X-ray Diffraction Powder Patterns (Circular 539 and Monograph 25), (b) the publications of the International Union of Crystallography, and (c) the continuing publication of cards and search manuals of the PDF (now consisting of over 35,000 entries). The PDF search manuals are based on the d-spacings in Å of the 3 strongest lines. Consistent with the choice of the Å unit for length, the volume of the unit cell is expressed in Å^3 ($1\text{Å}^3 = 1 \times 10^{-30} \text{ m}^3$). Densities are reported in g/cm^3 ($1 \text{ gm/cm}^3 = 10^3 \text{ kg/m}^3$).

ACKNOWLEDGMENTS

We would like to thank Carolyn Wingo of the JCPDS Associateship for her assistance, particularly for keyboarding the data and helping with the proofreading of this manuscript. Appreciation is also expressed to the Text Editing Facility of the National Measurement Laboratory of NBS for typing the manuscript.

Aluminum Iron, AlFe

Synonym

Iron aluminum

CAS registry no.
12042-17-0

Sample

The sample was obtained from the Metallurgy Section of the National Bureau of Standards. It had been heated to 800 °C for 5 days and cooled to room temperature in 4 days.

Color

Dark gray

Structure

Cubic, Pm3m (221), Z = 1. The structure was determined by Bradley and Jay [1932].

Lattice constant of this sample

a = 2.8954(2) Å

Volume °
24.274 Å³

Density

(calculated) 5.666 g/cm³

Figure of merit

F₁₀ = 52.9(0.017,11)

Additional pattern

PDF card 1-1257 [Hanawalt et al. 1938]

Ammonium Cerium Nitrate, $(\text{NH}_4)_2\text{Ce}(\text{NO}_3)_6$

Synonym

Diammonium hexanitratocerate

CAS registry no.

16774-21-3

Sample

The sample was obtained from the Fisher Scientific Co., Fair Lawn, NJ. The material is a strong oxidant, deliquescent, and unstable, causing some inconsistency in intensity measurements.

Color

Unground, vivid orange
Ground, vivid yellow

Structure

Monoclinic, $P2_1/n$ (14), $Z = 2$. The structure was determined by Beineke and Delgaudio [1968].

Lattice constants of this sample

$a = 13.069(3) \text{ \AA}$
 $b = 6.8461(12)$
 $c = 8.1732(16)$
 $\beta = 91.36(2)^\circ$

$a/b = 1.9090$
 $c/b = 1.1938$

Volume
 731.06 \AA^3

Density
(calculated) 2.490 g/cm^3

Figure of merit
 $F_{30} = 42.9(0.016, 43)$

Ammonium Tin Fluoride, NH_4SnF_3

Synonyms

Ammonium fluorostannite
Ammonium tin trifluoride
Ammonium trifluorostannate

Sample

The sample was obtained from ICN Pharmaceuticals, Inc., Plainview, NY.

Color

Pale yellow green

Optical data

Uniaxial (+) $N_{\varepsilon} = 1.564$, $N_o = 1.536$

Structure

Hexagonal, R^* , $Z = 6$. The cell was measured on a single crystal diffractometer by V. Himes at NBS. The value of Z was assumed from the reported density. Donaldson and O'Donoghue [1964] reported this phase as being orthorhombic.

Lattice constants of this sample

$a = 6.8426(9)\text{\AA}$
 $c = 15.925(3)$

$c/a = 2.3273$

Volume

645.73 \AA^3

Density

(calculated) 2.989 g/cm^3

Figure of merit

$F_{30} = 61.2(0.013, 38)$

Additional pattern

Arsenic Bromide, AsBr₃

Synonym

Arsenic tribromide

CAS registry no.

7784-33-0

Sample

The sample was obtained from the Alfa Products, Thiokol/Ventron Division, Danvers, MA. The compound decomposed rapidly in the atmosphere. Therefore, both experimental and calculated intensities are reported. Both gave the same 6 strongest lines, but their order was different. The calculated intensities are based on Trotter's structure.

Color

Colorless

Structure

Orthorhombic, P2₁2₁2₁ (19), Z = 4. The structure was determined by Trotter [1965] and Singh and Swaminathan [1967].

Lattice constants of this sample

a = 10.240(3) Å
 b = 12.182(2)
 c = 4.3226(9)

a/b = 0.8406
 c/b = 0.3551

Volume
 539.22 Å³
Density
 (calculated) 3.896 g/cm³
Figure of merit
 F₃₀ = 42.8(0.016,44)

Barium Aluminum Titanium Oxide, Ba_{1.23}Al_{2.46}Ti_{5.54}O₁₆

Sample

The requisite materials were ground up in the ratio of 1m BaO, 1m Al₂O₃ and 4.5m TiO₂, heated at 800 °C for 26 hrs at 1000 °C for 5 days and at 1200 °C for 7 days with periodic grindings.

Color

Grayish white

Structure

Tetragonal, I4/m (87), Z = 1. The compound is of the hollandite structure type. Its unit cell was determined by Roth [1981] on the basis of a related hollandite type phase, whose structure was determined by Sinclair et al. [1980].

Lattice constants of this sample

$$a = 9.9619(5) \text{ \AA}$$

$$c = 2.9242(3)$$

$$c/a = 0.2935$$

Volume

$$290.20 \text{ \AA}^3$$

Density

$$(\text{calculated}) 4.330 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 76.8(0.011, 35)$$

Barium Manganese Oxide, BaMnO₄

Synonym

Barium manganate

CAS registry no.

7787-35-1

Sample

The sample was prepared at NBS using the procedure given by Schlesinger and Siems [1924] and Jellinek [1960].

Color

Blackish purple

Structure

Orthorhombic, PbNm (62), Z = 4, iso-structural with BaSO₄. The structure was studied by Jellinek [1960].

Lattice constants of this sample

$$a = 7.3360(9) \text{ \AA}$$

$$b = 9.1101(12)$$

$$c = 5.4982(9)$$

$$a/b = 0.8053$$

$$c/b = 0.6035$$

Volume

$$367.45 \text{ \AA}^3$$

Density

$$(\text{calculated}) 4.633 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 78.6(0.011,36)$$

Additional pattern

Barium Neodymium Titanium Oxide, BaNd₂Ti₃O₁₀

Synonym

Barium neodymium titanate

Sample

Stoichiometric amounts of BaO, Nd₂O₃, and TiO₂ were ground together and heated at 1200 °C for one day, then at 1425 °C for 6 days and finally at 1500 °C for 7 days with intermittent grindings.

Color

Very pale violet

Structure

Orthorhombic Amam (63) Z = 4 [Kolar et al., 1981]. The structure is pseudo-orthorhombic, but the true symmetry is monoclinic with a double "c" [Olsen et al., 1981].

Lattice constants of this sample

$$a = 7.624(1) \text{ \AA}$$

$$b = 28.164(3)$$

$$c = 3.8654(6)$$

$$a/b = 0.2707$$

$$c/a = 0.1372$$

Volume

$$829.99 \text{ \AA}^3$$

Density

$$(\text{calculated}) 5.838 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 58.7(0.012, 43)$$

Benzidine Hydrochloride, C₁₂H₁₂N₂·2HCl

Synonym

(1-1-Biphenyl)-4,4-diamine dihydrochloride

CAS registry no.

531-85-1

Sample

The sample was obtained from Mallinckrodt Chemical Co., St. Louis, MO. Only one intensity pattern was made because the compound is carcinogenic.

Color

Colorless

Structure

Triclinic, P₁ (2), Z = 1. The structure was determined by Koo et al. [1942].

Lattice constants of this sample

$$a = 5.760(2) \text{ \AA}$$

$$b = 12.585(3)$$

$$c = 4.3533(11)$$

$$\alpha = 95.55(3)^\circ$$

$$\beta = 98.67(3)$$

$$\gamma = 101.55(3)$$

$$a/b = 0.4577$$

$$c/b = 0.3459$$

Volume

$$302.86 \text{ \AA}^3$$

Density

$$(\text{calculated}) 1.409 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 50.8(0.013, 33)$$

Beryllium Nitride, Be₃N₂

CAS registry no.
1304-54-7

Sample

The sample was obtained from Brush Beryllium Co., Cleveland, OH. The lattice constant reported here was obtained from a thin sample on a slide smeared with high vacuum grease. The peak positions from a thick sample are shifted to lower angles resulting from the penetration of the beam owing to the unusually low absorption of the sample. For a thick sample an apparent lattice parameter of 8.150 Å would be expected for lines below 100° 2θ.

Color
Light gray

Structure

Cubic, Ia3 (206), Z = 16. The structure was determined by von Stackelberg and Paulus (1933).

Lattice constant of this sample
a = 8.1482(2) Å

Volume
540.98 Å³

Density
(calculated) 2.704 g/cm³

Polymorphism

There is a hexagonal β-form, prepared by heating the cubic form above 1400 °C.

Figure of merit
F₃₀ = 56.3(0.013,41)

Bismuth Selenide (Paraguanajuatite), Bi_2Se_3

CAS registry no.
12068-69-8

Sample

The sample was obtained from Alfa Products,
Thiokol/Ventron Division, Danvers, MA.

Color

Unground, gray metallic
Ground, dark gray

Structure

Hexagonal, $R\bar{3}m$ (166), $Z = 3$, isostructural
with tetradymite, $\text{Bi}_2\text{Te}_2\text{S}$. The structure
of Bi_2Se_3 was refined by Nakajima [1963],
following earlier work by Semiletov and
Pinsker [1955].

Lattice constants of this sample

$a = 4.1396(4)\text{\AA}$
 $c = 28.636(4)$

$c/a = 6.9176$

Volume
 424.97 \AA^3

Density

(calculated) 7.676 g/cm^3

Figure of merit

$F_{30} = 54.4(0.012, 44)$

Calcium Borate, CaB₂O₄

Synonym

Calcium metaborate

CAS registry no.

13701-64-9

Sample

The sample was prepared by fusion of B₂O₃ and CaCO₃ using a small excess of fused B₂O₃. The sample was quenched. Later, it was annealed in a sealed platinum tube and held at 945 °C for 31 days, then quenched again.

Color

Colorless

Structure

Orthorhombic, Pnca (60), Z = 4. The structure was determined by Marezio et al. [1963].

Lattice constants of this sample

$$a = 6.2156(5) \text{ \AA}$$

$$b = 11.607(13)$$

$$c = 4.2828(6)$$

$$a/b = 0.5355$$

$$c/b = 0.3690$$

Volume
308.98 Å³

Density
(calculated) 2.702 g/cm³

Polymorphism

Calcium borate crystallizes in 4 forms, depending on the pressures used in its synthesis. Form I, described here, exists up to pressures of 12 kbars. Form II occurs at pressures of 12-15 kbars, form III at 15-25 kbars, and form IV at 25-40 kbars [Marezio et al., 1969].

Figure of merit

$$F_{30} = 55.5(0.013, 42)$$

Reference intensity

$$I/I_{\text{corundum}} = 1.11(2)$$

Calcium Cyanamide, CaCN₂

CAS registry no.
27668-50-4

Sample

The sample was from Alfa Products, Thiokol/Ventron Division, Danvers, MA. The sample contained some graphite and the intensities may be somewhat in error.

Color
Black

Structure

Hexagonal, R̄3m (166), Z = 3. The structure of CaCN₂ was discussed by Bredig [1942] and Dehlinger [1942]. It was determined by Vannerberg [1962].

Lattice constants of this sample

a = 3.6961(6) Å
c = 14.743(3)

c/a = 3.9888

Volume °
174.42 Å³

Density

Calcium Iron Oxide, CaFe_2O_4

Synonym

Calcium ferrate

CAS registry no.

12013-33-1

Sample

The sample was prepared from stoichiometric amounts of CaCO_3 and $\alpha\text{-Fe}_2\text{O}_3$, blended by grinding in an agate mortar. Initial heat treatments at 600° , 800° , and 900°C for periods of 20 hrs. were used to drive off CO_2 from the mixture. Successively higher heat treatments at 1050°C for $6\frac{1}{2}$ days and 1200°C for 13 days, with periodic grinding were performed to ensure complete reaction.

Color

Unground, dark grayish red
Ground, medium brown

Structure

Orthorhombic, Pnam (62), $Z = 4$, isomorphous with β -calcium chromite. Structure determinations were made by Hill et al. [1956] and by Decker and Kasper [1957].

Lattice constants of this sample

$a = 9.2281(13)$ Å
 $b = 10.7052(12)$
 $c = 3.0185(5)$

$a/b = 0.8620$
 $c/b = 0.2820$

Volume
 298.19 Å^3
Density

(calculated) 4.806 g/cm^3

Calcium Sulfate Hydrate (Bassanite), $\text{CaSO}_4 \cdot 0.5\text{H}_2\text{O}$

Synonym

Plaster of Paris

CAS registry no.

10034-76-1

Sample

The sample was prepared at NBS by adding H_2SO_4 to an aqueous solution of $\text{Ca}(\text{NO}_3)_2$ to form $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$. The wet fresh material was mixed with concentrated HNO_3 , heated at 80 °C, and held there for several days. Extremely fine crystals developed and were bottled while still moist. Just before measurements were taken, the crystals were dried in air at room temperature. The material was somewhat unstable, slowly changing to $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ under conditions of high atmospheric humidity.

Consistent intensity data were difficult to obtain. The data here were measured on samples which had been side-drifted into holders, with no further packing or smoothing. Other measurements on packed samples showed different intensities; in particular, the reflection at $d=2.807$ showed values as low as 19, and at $d=1.847$, the packed samples had values as low as 29.

Color

Colorless

Structure

Pseudo-orthorhombic, I***, $Z = 12$. The literature on $\text{CaSO}_4 \cdot 0.5\text{H}_2\text{O}$ is extensive and confusing as noted by Gay [1965] and Clifton [1972]. The cell below was modified from one given by Gay [1965] who stated that the true symmetry was monoclinic, with $\beta \cong 90^\circ$. This NBS cell was also consistent with one found by use of the Visser program and associated refinement procedures. Bushuev [1980] reported a similar monoclinic cell for $\text{CaSO}_4 \cdot 0.67\text{H}_2\text{O}$ with $a=12.028$, $b=38.022$, $c=6.927$, $\gamma=90.21^\circ$, space group I2. There was no evidence to require the monoclinic cell for NBS data.

Lattice constants of this sample

$a = 12.031(4)$ Å
 $b = 12.695(6)$
 $c = 6.934(2)$

$a/b = 0.9477$
 $c/b = 0.5462$

Volume
 1059.1 Å³

Density
(calculated) 2.731 g/cm³

Polymorphism

Two forms, α and β have been described by several authors, as noted by Clifton [1972]. He concluded that although slight differences have been observed between the properties of the two forms, it could not be conclusively determined whether the differences were sufficiently significant to consider the supposed α and β forms as separate entities.

Figures of merit

$$F_{30} = 17.6(0.017, 99)$$

$$M_{20} = 17.6$$

Cerium Niobium Oxide, CeNbO₄

Synonym

Cerium niobate

CAS registry no.

12014-72-1

Sample

The sample was prepared at NBS by heating CeO₂ and Nb₂O₅ at 1000 °C for 21 hours, at 1500 °C for 21 hours, and at 800 °C for 4 days under a high vacuum.

Color

Medium bright green

Structure

Monoclinic, I2/a (15), Z = 4. The structure of CeNbO₄ has been determined using neutron powder diffraction by Santoro et al. [1980]. This phase had earlier been reported to be in space group Ia(5) by Komkov [1959]. CeNbO₄ is isostructural with other rare earth niobates and tantalates [Roth et al., 1977]. The structure is a distorted scheelite type called beta-fergusonite-(Ce) or brocenite [Kuo et al., 1975].

Lattice constants of this sample

$$a = 5.5403(7) \text{ \AA}$$

$$b = 11.4087(14)$$

$$c = 5.1631(7)$$

$$\beta = 94.602(13)^\circ$$

$$a/b = 0.4856$$

$$c/b = 0.4526$$

Volume

$$325.30 \text{ \AA}^3$$

Density

$$(\text{calculated}) 6.065 \text{ g/cm}^3$$

Polymorphism

When heated to about 580 °C, CeNbO₄ undergoes a readily reversible phase change to a tetragonal structure of the fergusonite type, very similar to scheelite, CaWO₄ [Gingerich and Bair, 1963].

Figure of merit

$$F_{30} = 75.8(0.010, 40)$$

Cerium Tantalum Oxide, CeTaO₄

Synonym

Cerium tantalate

CAS registry no.

12343-76-9

Sample

A 2:1 mixture of CeO₂ and Ta₂O₅ was heated at 1000 °C for 2½ hours, next at 1400 °C for 2 hours, then at 1500 °C for 17 hours. It was cooled and sealed in an evacuated glass tube. It was heated again at 800 °C for 6 days at a total pressure equal to or less than 2x10⁻⁶ Torr.

Color

Light olive

Structure

Monoclinic, P₂1/a (14), Z = 4, with LaTaO₄-type structure. The structure was refined by Santoro et al. [1980]. Neutron powder diffraction techniques were used.

Lattice constants of this sample

$$a = 7.7654(5)\text{\AA}$$

$$b = 5.5294(4)$$

$$c = 7.6230(6)$$

$$\beta = 100.865(7)^\circ$$

$$a/b = 1.4044$$

$$c/b = 1.3786$$

Volume

$$321.45\text{\AA}^3$$

Density

$$(\text{calculated}) 7.957 \text{ g/cm}^3$$

Polymorphism

A monoclinic to orthorhombic phase transition was observed at 820 °C in vacuum [Cava et al., 1978].

Figure of merit

$$F_{30} = 82.4(0.007,53)$$

Cesium Magnesium Titanium Oxide, $\text{Cs}_{1.45}\text{Mg}_{0.724}\text{Ti}_{7.27}\text{O}_{16}$

Synonym

Cesium magnesium titanate.

Sample

The sample was prepared at NBS by mixing stoichiometric proportions of cesium, magnesium, and titanium oxides. The mixture was heated at 750 °C for 18 hours, then re-heated with periodic grindings at 1200 °C for 5 hours. Finally, it was heated at 1200 °C in a sealed platinum tube for 5 days.

Color

Pale yellow

Structure

Tetragonal, I4/m (87), Z = 1. Roth [1981] determined by analogy that this compound is of the hollandite type structure. The structure of the related hollandite type phases was determined by Sinclair et al. [1980].

Lattice constants of this sample

$a = 10.2818(4)$ Å
 $c = 2.9717(3)$

$c/a = 0.2890$

Volume
 314.15 Å^3

Density

(calculated) 4.305 g/cm³

Figure of merit

$F_{30} = 84.4(0.010, 35)$
 $M_{20} = 128.4$

Cobalt Phosphide, Co_2P

CAS registry no.
12134-02-0

Sample

The sample was obtained from ICN-K&K Laboratories, Plainview, NY. It contained a few percent of $\text{Co}_3(\text{PO}_4)_2$ which did not interfere with measurements.

Color

Black

Structure

Orthorhombic, Pnam (62), $Z = 4$, isostructural with Co_2Si . The structure was determined by Nowotny [1947]. It was refined by Rundqvist [1960] who stated that there is an extended homogeneity range at elevated temperatures; the widening of the range is apparently connected with random vacancies in the metal atom sites.

Lattice constants of this sample

$$a = 5.6465(8) \text{ \AA}$$

$$b = 6.6099(10)$$

$$c = 3.5130(7)$$

$$a/b = 0.8542$$

$$c/b = 0.5315$$

Volume \AA^3

$$131.11 \text{ \AA}^3$$

Density

Iron Boride, FeB

CAS registry no.
12006-84-7

Sample

The sample was obtained from Cooper Metallurgical Associates, Cleveland, OH.

Color

Unground, shiny metallic gray in chunks
Ground, olive gray

Structure

Orthorhombic, Pbmm (62), Z = 4. The structure was determined by Bjurström and Arnfelt [1929].

Lattice constants of this sample

$a = 4.0587(3)\text{\AA}$
 $b = 5.5032(5)$
 $c = 2.9474(3)$

$a/b = 0.7375$
 $c/b = 0.5336$

Volume
 65.833 \AA^3

Density
(calculated) 6.725 g/cm^3

Figure of merit
 $F_{29} = 79.0(0.009, 39)$

Intensities

Owing to the difficulty of getting reproducible intensities, a comparison between experimental intensities and those calculated on the basis of the structure given in Pearson [1967] was made. In the calculated pattern, the four strongest lines were: $2.188(100)$, $1.904(67)$, $2.384(65)$, $2.011(65)$.

Iron Fluoride, FeF_3

Synonym

Ferric fluoride

CAS registry no.

7783-50-8

Sample

The sample was obtained from Alfa Products, Thiokol/Ventron Division, Danvers, MA. It was dried at 140° for 2-3 hours.

Color

Pale yellow green

Structure

Hexagonal, $\bar{R}\bar{3}c$ (167), $Z = 6$. The structure was determined by Hepworth et al. [1957].

Lattice constants of this sample

$$a = 5.200(1) \text{ \AA}$$

$$c = 13.323(2)$$

$$c/a = 2.5621$$

Volume
 311.94 \AA^3

Density

(calculated) 3.604 g/cm^3

Figure of merit

$$F_{21} = 65.3(0.013, 25)$$

Additional pattern

Iron Oxide (Hematite), $\alpha\text{-Fe}_2\text{O}_3$

Synonyms

Iron sesquioxide
Diiiron trioxide
Ferric oxide

CAS registry no.
1309-37-1

Sample

The sample was obtained from Pfizer, Inc., New York, NY. It was heated at 800 °C for 3 days.

Color

Dark reddish brown

Structure

Hexagonal, R $\bar{3}c$ (167), Z = 6. The structure was determined by Pauling and Hendricks (1925) and refined by Blake et al. (1966). It is isostructural with $\alpha\text{-Al}_2\text{O}_3$, corundum.

Lattice constants of this sample

$a = 5.0356(1)$ Å
 $c = 13.7489(7)$

$c/a = 2.7303$

Volume
 $301.93 \text{ } \overset{\circ}{\text{A}}^3$

Density

(calculated) 5.270 g/cm³

Figure of merit

$F_{30} = 67.6(0.011, 40)$

Polymorphism

Three other forms of this compound have been reported. Delta- Fe_2O_3 crystallizes in a hexagonal form. Maghemite, $\gamma\text{-Fe}_2\text{O}_3$ has been reported in both a cubic and a tetragonal form.

Reference intensity

$I/I_{\text{corundum}} = 2.60(1)$

Iron Yttrium Oxide, $\text{Fe}_5\text{Y}_3\text{O}_{12}$

Synonyms

YIG, Yttrium iron garnet, $\text{Y}_3\text{Fe}_2(\text{FeO}_4)_3$
Diiron triyttrium trisferrate, $\text{Fe}_2\text{Y}_3(\text{FeO}_4)_3$

CAS registry no.

12063-56-8

Sample

The sample was obtained from Trans-Tech, Inc.,
Gaithersburg, MD.

Color

Medium olive

Structure

Cubic, Ia3d (230), $Z = 8$, garnet structure. The
structure was refined by Euler and Bruce [1965]
following earlier determinations [Geller and
Gilleo, 1957; Batt and Post, 1962].

Lattice constant of this sample

$a = 12.3774(2) \text{ \AA}^\circ$

Volume

1896.22 \AA^3

Density

(calculated) 5.170 g/cm^3

Polymorphism

Shimada et al. [1968] reported the existence
of a dense allotropic form.

Figure of merit

$F_{30} = 88.4(0.010, 35)$

Reference intensity

$I/I_{\text{corundum}} = 4.12(13)$

Lithium Iodide Hydrate, LiI·3H₂O

Synonym

Lithium iodide trihydrate

CAS registry no.

7790-22-9

Sample

The sample was from ICN Pharmaceuticals Inc., Plainview, NY. It was marked "Lithium Iodide Anhydrous." The material was hygroscopic and the intensities may be somewhat in error.

Color

Light brown

Structure

Hexagonal, P6₃mc (186), Z = 2. The structure of LiI·3H₂O was studied by Hendricks [1928] and discussed by West [1934].

Lattice constants of this sample

$$a = 7.4907(11) \text{ \AA}$$

$$c = 5.4859(11)$$

$$c/a = 0.7323$$

Volume

Magnesium Phosphate, α -Mg₂P₂O₇

Synonym

Magnesium pyrophosphate

Sample

The sample was prepared at NBS. The composition of a commercially available sample of magnesium phosphate (mixed phases) was adjusted with additions of (NH₄)H₂PO₄. The mixture was fused and resolidified to yield single phase α -Mg₂P₂O₇. After being ground, the sample was annealed at 140 °C for 5 hours and slowly cooled to room temperature.

Color

Colorless

Structure

Monoclinic, P₂₁/n (14), Z = 4. The structure was determined by Calvo [1967].

Lattice constants of this sample

a = 8.9124(16) Å
 b = 8.290(2)
 c = 6.9492(15)
 β = 111.70(1)°

a/b = 1.0751
 c/b = 0.8383

Volume °
 477.05 Å³

Density
 (calculated) 3.099 g/cm³

Polymorphism

A high-temperature β -form exists and is also monoclinic, with a and c roughly half as large as in the α -phase. The phase transformation was found to be reversible, and both phases coexist from 59 to 63 °C [Calvo et al., 1967].

Figure of merit

F₃₀ = 27.6(0.016,70)

Reference intensity

I/I_{corundum} = 1.72(3)

Additional pattern

PDF card 22-1152 [Swanson et al., 1971]. This pattern on the card and in the reference both have substantial errors.

Manganese, β -Mn

CAS registry no.
7439-96-5

Sample

A sample of α -Mn from Fisher Scientific Co., Fair Lawn, NJ, was heated to 1065 °C in vacuum and annealed for 3 hours. It contained a small amount of MnO.

Color

Olive gray

Structure

Cubic, $P4_{1,3}32$ (212 or 213), $Z = 20$. The structure was determined by Westgren and Phragmén [1925].

Lattice constant of this sample

$a = 6.3116(3)$ Å

Volume

251.43 Å³

Density

(calculated) 7.270 g/cm³

Polymorphism

There are also α -, γ -, and δ -Mn, the most probable transition temperatures being $\alpha \xrightarrow{\text{?}} \beta$, 700 °C, $\beta \xrightarrow{\text{?}} \gamma$, 1079 °C, and $\gamma \xrightarrow{\text{?}} \delta$ 1143 °C [Sully, 1955].

Figure of merit

$F_{26} = 71.2(0.011, 33)$

Molybdenum Oxide, MoO₂

Synonym

Molybdenum dioxide

CAS registry no.

18868-43-4

Sample

The sample was made at NBS by H. S. Parker by heating MoO₃ in a Mo boat for 20 hours at 372 °C in an atmosphere of 95% N₂ and 5% H₂ gases. This was followed by heating at 590 °C for 90 hours under the same conditions.

Color

Black

Structure

Monoclinic, P2₁/n (14), Z = 4. Distorted rutile structure. The structure of MoO₂ was studied by Magnéli et al. [1952] and by Magnéli and Andersson [1955]. The structure was refined by Brandt and Skapski [1967]. The latter gave the structure using the P2₁/c form of the space group.

Lattice constants of this sample

a = 5.6068(7) Å

b = 4.8595(9)

c = 5.5373(9)

β = 119.37°

a/b = 1.1538

c/b = 1.1395

Volume

131.48 Å³

Density

(calculated) 6.463 g/cm³

Figure of merit

Neodymium Tantalum Oxide, NdTaO₄

Synonym

Neodymium tantalate

CAS registry no.

12344-26-4

Sample

The sample was prepared at NBS by heating Nd₂O₃ and Ta₂O₅ overnight at 1000 °C, grinding and reheating at 1600 °C for a period of 16-20 hours, and quenched.

Color

Very pale violet

Structure

Monoclinic, I2/a (15), Z = 4. The structure of NdTaO₄ has been determined using neutron powder diffraction by Santoro et al. [1980]. This phase was earlier reported to be in space group Ia(5) by Komkov [1959]. NdTaO₄ is isostructural with other rare earth niobates and tantalates [Roth et al., 1977]. The structure type is a distorted scheelite called beta-fergusonite (Ce) or brocenite. [Kuo et al., 1975].

Lattice constants of this sample

$$a = 5.5136(7) \text{ Å}$$

$$b = 11.2356(8)$$

$$c = 5.1151(5)$$

$$\beta = 95.717(11)^\circ$$

$$a/b = 0.4907$$

$$c/a = 0.4553$$

Volume

$$315.30 \text{ Å}^3$$

Density

$$(\text{calculated}) 8.199 \text{ g/cm}^3$$

Polymorphism

When heated to about 1320 °C NdTaO₄ undergoes a readily reversible phase change to a tetragonal structure of the fergusonite type, very similar to scheelite, CaWO₄ [Stubican, 1964].

Figure of Merit

$$F_{30} = 101.2(0.007, 41)$$

Additional pattern

Neodymium Titanium Oxide, Nd_2TiO_5

Synonym

Neodymium titanate

CAS registry no.

12058-94-5

Sample

The sample was obtained from Alfa Products, Thiokol/Ventron Division, Danvers, MA. The material was heated at 1450 °C for 5½ days, then reheated at 1550 °C for 6½ days in a platinum crucible. Material appears to be slightly rich in TiO_2 .

Color

Pale blue

Structure

Orthorhombic, Pnam (62), $Z = 4$, isostructural with La_2TiO_5 . The structure of Nd_2TiO_5 was determined by Müller-Buschbaum and Scheunemann (1973).

Neodymium Titanium Oxide, $\text{Nd}_2\text{Ti}_2\text{O}_7$

Synonym

Neodymium titanate

CAS registry no.

12035-31-3

Sample

The sample was prepared at NBS by solid state reaction of stoichiometric amounts of Nd_2O_3 and TiO_2 . The mixture was heated at 1200 °C for 1 day, then ground and heated at 1425 °C for 6 days.

Color

Unground, light violet
Ground, very light purplish blue

Structure

Monoclinic, $P2_1$ (4), $Z = 4$. [Kimura et al., 1974].

Lattice constants of this sample

$$a = 13.008(2) \text{\AA}$$

$$b = 5.4648(7)$$

$$c = 7.679(2)$$

$$\beta = 98.56(2)^\circ$$

$$a/b = 2.3803$$

$$c/b = 1.4052$$

Volume

$$539.79 \text{ \AA}^3$$

Density

$$(\text{calculated}) 6.107 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 41.7(0.012, 61)$$

Additional pattern

PDF card 29-923 [Smith, C. and McCarthy (1977). Pennsylvania State Univ., University Park, PA]

Neodymium Titanium Oxide, $\text{Nd}_4\text{Ti}_9\text{O}_{24}$

Synonym

Neodymium titanate

Sample

The sample was prepared at NBS using BaTiO_3 , TiO_2 , and very low alkaline content Nd_2O_3 . Stoichiometric amounts of the constituents were blended with mortar and pestle, then calcined in a platinum crucible, with periodic grindings. An initial calcine at 1250 °C for 1 day, followed by a second heating at 1350 °C for about 3 days was sufficient to yield a single phase product.

Color

Very light purplish blue

Structure

Orthorhombic, Fddd (70), determined from a single crystal, by Kolar et al. [1981]. $Z = 16$ is consistent with the density of 5.13, measured by Kolar et al. [1978].

Lattice constants of this sample

$a = 14.475(2)$ Å

$b = 35.304(5)$

$c = 13.996(2)$

$a/b = 0.4100$

$c/b = 0.3964$

Volume

7152.3 Å^3

Density

(calculated) 5.171 g/cm³

(observed) 5.13 [Kolar et al., 1978]

Figure of merit

$F_{30} = 53.1(0.011, 51)$

Additional patterns

Kolar et al. [1981]

Kolar et al. [1978], labeled $\text{Nd}_2\text{Ti}_4\text{O}_{11}$

Nickel Titanium Oxide, NiTiO₃

Synonyms

Nickel titanate
Nickel metatitanate

CAS registry no.
12035-39-1

Sample

The sample obtained from Alfa Products, Thiokol/Ventron Division, Danvers, MA was a mixture of oxides. It was heated at 1050 °C for 4½ days in order to obtain a single phase.

Color

Medium yellow

Structure

Hexagonal, R̄3 (148), Z = 6, isostructural with FeTiO₃, Taylor [1930]. The structure of NiTiO₃ was determined by Sullivan and Pavlovic [1962].

Lattice constants of this sample

a = 5.0302(2) Å
c = 13.7905(11)

c/a = 2.7415

Potassium Fluoride Hydrate, $\text{KF} \cdot 2\text{H}_2\text{O}$

Synonym

Potassium fluoride dihydrate

CAS registry no.

7789-23-3

Sample

The sample was obtained from the Fisher Scientific Co., Fair Lawn, NJ. It was somewhat deliquescent.

Color

Colorless

Structure

Orthorhombic, Pb_{21}m (26), $Z = 2$. The structure was determined by Anderson and Lingafelter [1951].

Lattice constants of this sample

$$a = 5.1848(7) \text{ \AA}$$

$$b = 8.8328(12)$$

$$c = 4.0850(6)$$

$$a/b = 0.5870$$

$$c/b = 0.4625$$

Volume

$$187.08 \text{ \AA}^3$$

Density

$$(\text{calculated}) 1.671 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 110.4(0.009, 32)$$

Additional pattern

Potassium Iron Cyanide, $K_4Fe(CN)_6$

Synonym

Potassium ferrocyanide

CAS registry no.
13943-58-3

Sample

The sample was prepared by heating reagent $K_4Fe(CN)_6 \cdot H_2O$ at 115 °C for 3 weeks.

Color

Pale yellow

Structure

Orthorhombic, Bmmm (65), Z = 4. The cell was found by use of the Visser program [1969]. The space group was assigned by consideration of the absences in the powder pattern.

Lattice constants of this sample

$$a = 14.010(7) \text{ \AA}$$

$$b = 21.027(6)$$

$$c = 4.1751(13)$$

$$a/b = 0.6663$$

$$c/a = 0.1986$$

Volume
 368.35 \AA^3

Density
(calculated) 1.989 g/cm³

Figures of merit

$$F_{30} = 24.1(0.015, 83)$$

$$M_{20} = 20.7$$

Potassium Vanadium Oxide, KV₃O₈

Synonym

Potassium vanadate

Sample

The sample was prepared at NBS by fusing K₂CO₃ and V₂O₅.

Color

Greyish pink

Structure

Orthorhombic, Pmab (57), Z = 4, isostructural with NH₄VO₃ [Evans and Block, 1954]. The structure was determined by Petrásová et al. [1958].

Lattice constants of this sample

a = 5.6955(12) Å

b = 10.7961(10)

c = 5.1796(3)

a/b = 0.5276

c/a = 0.4798

Volume

Silicon Nitride, β -Si₃N₄

Synonym
Trisilicon tetranitride

CAS registry no.
12033-89-5

Sample

The sample was prepared at NBS by J. Waring by heating Si₃N₄ obtained from GTE Products, Towanda, PA to 1785 °C for 1 hr at 15 psig. The sample was contained in a Si₃N₄ crucible within a molybdenum crucible.

Color
Greyish white

Structure
Hexagonal, P6₃/m (176), Z = 2. The structure was determined by Hardie and Jack [1957] and confirmed by Borgen and Seip [1961].

Lattice constants of this sample

$$a = 7.6044(2) \text{ \AA}$$

$$c = 2.9075(1)$$

$$c/a = 0.3823$$

Volume
145.61 \AA^3

Density
(calculated) 3.200 g/cm³

Polymorphism

Turkdogan and Ignatowicz (1957) established the existence of two forms of Si₃N₄. These two forms α and β generally occur together. Ruddlesden and Popper (1958) reported the possibility of a third form having still a different stacking sequence.

Figure of merit
 $F_{30} = 108.2(0.009, 32)$

Silicon Oxide (Quartz-low), α -SiO₂

Synonym

Silicon dioxide

CAS registry no.

7631-86-9

Sample

The sample was obtained from the Glass Section at NBS. The material was ground single crystals of optical quality.

Color

Colorless

Structure

Hexagonal, P3₁21 (152), Z = 3, Bragg and Gibbs [1925]. Iwai et al. [1969] and Smith and Alexander [1963] refined the structure. Thermal effects have also been studied by these authors.

Lattice constants of this sample

a = 4.9133(2) Å

c = 5.4053(4)

c/a = 1.1001

Volume

113.00 Å³

Density

(calculated) 2.649 g/cm³

Polymorphism

Silicon oxide, SiO₂, crystallizes in many other polymorphic forms.

Figure of merit

F₃₀ = 77.6(0.013,31)

Reference intensity

I/I_{corundum} = 4.32(3)

Additional pattern

PDF card 5-490 [Swanson et al., 1954], pattern redone to reflect improved techniques for measuring intensities. Citation to many additional patterns is made in the above reference.

Sodium Aluminum Oxide, β -NaAlO₂

Synonym

Sodium aluminate

CAS registry no.

1302-42-7

Sample

The sample was obtained from ICN-K&K Laboratories, Inc., Plainview, NY. It was partially hydrated and was heated in air to 875 °C for 1 hour. It changed back readily to a hydrate.

Color

Colorless

Structure

Orthorhombic, Pna2₁ (33), Z = 4, isostructural with orthorhombic sodium ferrite, β -NaFeO₂. The unit cell and space group were determined by Théry and Briançon [1964].

Lattice constants of this sample

$$a = 5.3868(11) \text{ Å}$$

$$b = 7.0334(15)$$

$$c = 5.2182(10)$$

$$a/b = 0.7659$$

$$c/b = 0.7419$$

Volume
197.70 Å^3

Density

$$(\text{calculated}) 2.754 \text{ g/cm}^3$$

Polymorphism

There is a tetragonal γ -form, stable at high temperatures. The temperature of transformation $\beta \rightarrow \gamma$ is 470 °C [ibid.].

Figure of merit

$$F_{30} = 58.6(0.013, 39)$$

Additional pattern

PDF card 19-1177 [ibid.]

Sodium Borate, NaBO₂

Synonym

Sodium metaborate

Sample

The sample was prepared by dehydrating NaBO₂·4H₂O obtained from the Fisher Scientific Co., Fair Lawn, NJ.

Color

Colorless

Structure

Hexagonal, R3c (167), Z = 18. The structure was redetermined by Marezio et al. [1963]. The structure had been determined earlier by Fang [1937], [1938].

Lattice constants of this sample

a = 11.9217(7) Å
c = 6.4182(5)

c/a = 0.5384

Volume
789.99 Å³

Density

(calculated) 2.490 g/cm³

Figure of merit

F₃₀ = 64.8(0.012,39)

Sodium Niobium Oxide (Lueshite), NaNbO_3

Synonym

Sodium niobate

CAS registry no.

12034-09-2

Sample

The sample was obtained from Shieldalloy Corp., Newfield, NJ. It was annealed at 1275 °C for 4 days.

Color

Colorless

Structure

Orthorhombic, Pbma (57), $Z = 8$. It has a distorted perovskite structure which was refined by Sakowski-Cowley et al. [1969] after earlier work [Vousden, 1951; Wells and Megaw, 1958].

Lattice constants of this sample

$a = 5.5687(5)$ Å
 $b = 15.523(2)$
 $c = 5.5047(6)$

$a/b = 0.3587$
 $c/b = 0.3546$

Volume
 475.84 Å^3

Density

(calculated) 4.575 g/cm^3

Polymorphism

NaNbO_3 becomes tetragonal at about 225 °C, and cubic near 435 °C [Wood, 1951]. Wood et al. [1962] described a field-induced ferroelectric polymorph which has a cell similar to the orthorhombic phase except that the c is halved. Bulakh et al. [1962] described a new mineral, natroniobite, which is principally NaNbO_3 and presumably monoclinic.

Figure of merit

$F_{30} = 35.1(0.010, 82)$

Sodium Nitrosyl Iron Cyanide Hydrate, $\text{Na}_2(\text{NO})\text{Fe}(\text{CN})_5 \cdot 2\text{H}_2\text{O}$

Synonyms

Sodium nitroprusside dihydrate
Sodium nitroferricyanide dihydrate
Sodium nitrosylpentacyanoferate dihydrate.

CAS registry no.
13755-38-9

Sample

The sample was obtained from Alfa Products,
Thiokol/Ventron Division, Danvers, MA.

Color

Unground, deep reddish brown
Ground, light yellow pink

Structure

Orthorhombic, $Pnmn$ (58), $Z = 4$. [Cooke,
1946]. The structure was determined by
Manoharan and Hamilton [1963].

Lattice constants of this sample

$a = 11.908(4)\text{\AA}$
 $b = 15.564(4)$
 $c = 6.2031(14)$

$a/b = 0.7651$
 $c/b = 0.3986$

Volume
 1149.7 \AA^3

Density

(calculated) 1.721 g/cm^3

Figure of merit

$F_{30} = 36.6(0.012, 68)$

Additional pattern

Sodium Vanadium Oxide, α -NaVO₃

Synonym

Alpha-sodium metavanadate

CAS registry no.

11126-25-3

Sample

The sample was contributed by Riedel-de Haën, Hannover, West Germany. It was labeled NaVO₃·H₂O.

Color

Colorless

Structure

Monoclinic, I2/a (15), Z = 8. [Marumo et al., 1974]. This phase has been reported to be in space group Cc (9) [Feigelson et al., 1972].

Lattice constants of this sample

a = 10.333(2) Å
b = 9.473(2)
c = 5.880(2)
 β = 104.20(2) $^{\circ}$

a/b = 1.0908
c/b = 0.6207

Volume
557.90 Å³

Density
(calculated) 2.903 g/cm³

Polymorphism

Beta NaVO₃ changes irreversibly to α -NaVO₃ at about 404 °C. [Lukacs and Strusievici, 1962].

Figure of merit

F₃₀ = 43.2(0.014, 48)

Sodium Vanadium Oxide, β -NaVO₃

Synonym

Beta-sodium metavanadate

CAS registry no.

11126-25-3

Sample

The sample was prepared from NaVO₃ \cdot H₂O, which was crystallized from an aqueous solution, by heating at 300 °C for 4 days.

Color

Colorless

Structure

Orthorhombic, Z = 4. [Perraud, 1974]

Lattice constants of this sample

a = 5.3625(15) Å

b = 14.155(6)

c = 3.6499(11)

a/b = 0.3788

c/b = 0.2579

Volume

277.06 Å³

Density

(calculated) 2.923 g/cm³

Polymorphism

Beta-NaVO₃ changes irreversibly to α -NaVO₃ at about 404 °C. [Lukacs and Strusievici, 1962]

Figure of merit

F₂₈ = 17.8(0.018,88)

Strontium Iron Oxide, $\text{SrFe}_{12}\text{O}_{19}$

Synonyms

Strontium hexaferrite
Dodecairon strontium 19-oxide

CAS registry no.
12023-91-5

Sample

The sample was prepared at NBS from a stoichiometric mixture of SrCO_3 and Fe_2O_3 , heated at 1000 °C for 1 day, then at 1200 °C for 5 days with periodic grinding. It was then held at 1390 °C for 8 h and cooled at 2° per hour to 500 °C.

Color

Blackish blue

Structure

Hexagonal, $P6_3/mmc$ (194), $Z = 2$, isostructural with magnetoplumbite, $\text{PbFe}_{12}\text{O}_{19}$, [Adelsköld 1938]. Stacking faults seemed to occur in the 00ℓ direction, without final annealing of the sample.

Lattice constants of this sample

$a = 5.8868(5)\text{\AA}$
 $c = 23.037(2)$

$c/a = 3.9133$

Volume
 691.38 \AA^3

Density
(calculated) 5.100 g/cm^3

Figure of merit
 $F_{30} = 53.2(0.011, 51)$

Thorium Carbide, ThC

Synonym

Thorium monocarbide

CAS registry no.

12012-16-7

Sample

The sample was obtained from Alfa Products Thiokol/Ventron Division, Danvers, MA. It contained some semi-amorphous carbon and was somewhat unstable; therefore the intensities are subject to some error.

Color

Grey

Structure

Cubic, Fm3m (225), Z = 4. [Wilhelm and Chiotti, 1950]. ThC has a NaCl type structure.

Lattice constant of this sample

$$a = 5.3313(7) \text{ \AA}$$

Volume

$$151.53 \text{ \AA}^3$$

Density

$$(\text{calculated}) 10.698 \text{ g/cm}^3$$

Thorium Nitrate Hydrate, Th(NO₃)₄·5H₂O

Synonym

Thorium nitrate pentahydrate

Sample

The sample was obtained from Allied Chemical, General Chemical Division, New York, NY. It was labeled Th(NO₃)₄·4H₂O.

Color

Colorless

Structure

Orthorhombic, Fdd2 (43), Z = 8, [Staritsky, 1956]. The structure of Th(NO₃)₄·5H₂O was determined by Taylor et al. [1966] and Ueki et al. [1966].

Titanium Carbide, TiC

CAS registry no.
12070-08-5

Sample
The sample was obtained from Kennametal,
Latrobe, PA.

Color
Dark gray

Structure
Cubic, Fm3m (225), Z = 4. The structure of
titanium carbide was qualitatively determined
by von Schwarz and Summa [1932].

Lattice constant of this sample
 $a = 4.3274(2) \text{ \AA}$

Volume
 81.037 \AA^3

Density
(calculated) 4.911 g/cm^3

Figure of merit
 $F_{10} = 121.6(0.008, 10)$

Additional pattern

Tungsten Oxide, WO_2

Synonym

Tungsten dioxide

CAS registry no.

12036-22-5

Sample

The sample was made at NBS by H. S. Parker by heating WO_3 in a W boat for 20 hours at 372 °C in an atmosphere of 95% N_2 and 5% H_2 gas. This was followed by heating at 590 °C for 90 hours under the same conditions.

Color

Dark brown

Structure

Monoclinic, $P2_1/n$ (14), $Z = 4$. Distorted rutile structure. The structure was studied by Magnéli et al. [1952] and by Magnéli and Andersson [1955]. The structure was discussed by Roger et al. [1969].

Lattice constants of this sample

 $a = 5.5754(7)$ Å $b = 4.8995(12)$ $c = 5.5608(9)$ $\beta = 118.869(12)^\circ$ $a/b = 1.1380$ $c/b = 1.1350$

Volume

133.03 Å³

Density

(calculated) 10.78 g/cm³

Figure of merit

 $F_{30} = 28.8(0.016, 67)$

Zirconium Fluoride, ZrF_4

Synonym

Zirconium tetrafluoride

CAS registry no.

7783-64-4

Sample

The sample was from Alfa Products, Thiokol/Ventron Division, Danvers, MA. It was heated to 300 °C for 3 days to dehydrate a small amount of the hydrate which was present.

Color

Colorless

Structure

Monoclinic, I2/a (15), $Z = 12$ [Schulze, 1934, Zachariasen, 1949]. The structure was determined by Burbank and Bensey [1956].

Lattice constants of this sample

$$a = 9.5585(13) \text{ \AA}$$

$$b = 9.9512(13)$$

$$c = 7.7071(14)$$

$$\beta = 94.520(1)^\circ$$

$$a/b = 0.9605$$

$$c/b = 0.7745$$

Volume

$$730.81 \text{ \AA}^3$$

Density

$$(\text{calculated}) 4.559 \text{ g/cm}^3$$

Polymorphism

Gaudreau [1965] prepared two other forms of ZrF_4 by heating $(\text{NH}_4)_3 \text{ ZrF}_7$ under various conditions. These forms were called alpha and gamma. Gaudreau called the form reported in the present work beta.

Figure of merit

$$F_{30} = 74.9(0.010, 40)$$

Zirconium Oxide Chloride Hydrate, $\text{ZrOCl}_2 \cdot 8\text{H}_2\text{O}$

Synonym

Zirconium oxychloride octahydrate

Sample

The sample was made by slow evaporation at room temperature of an aqueous solution of ZrOCl_2 .

Color

Colorless

Structure

Tetragonal, $P4_21c$ (114), $Z = 8$. [Clearfield and Vaughan, 1956]. The structure was refined by Mak [1968].

Lattice constants of this sample

$$a = 17.094(3) \text{ \AA}$$

$$c = 7.713(2)$$

$$c/a = 0.4512$$

Volume

$$2253.8$$

Density

$$(\text{calculated}) 1.899 \text{ g/cm}^3$$

Figure of merit

$$F_{30} = 35.2(0.015, 58)$$

Reference intensity

$$I/I_{\text{corundum}} = 1.22(12)$$

Additional pattern

PDF card 21-1499 [Dept. of Physics, University College, Cardiff, Wales]

INORGANIC NAMES

	Vol. or Sec.	Page		Vol. or Sec.	Page
Aluminum, Al	1	11	Ammonium aluminum fluoride, $(\text{NH}_4)_3\text{AlF}_6$	9m	5
Aluminum antimony, AlSb	4	72	Ammonium aluminum selenate hydrate, $\text{NH}_4\text{Al}(\text{SeO}_4)_2 \cdot 12\text{H}_2\text{O}$	9m	6
Aluminum bismuth oxide, $\text{Al}_4\text{Bi}_2\text{O}_9$	11m	5	Ammonium aluminum sulfate, $\text{NH}_4\text{Al}(\text{SO}_4)_2$	10m	5
Aluminum borate, $\text{Al}_{18}\text{B}_4\text{O}_{33}$	17m	5	Ammonium aluminum sulfate hydrate (tschermigite), $\text{NH}_4\text{Al}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	3
Aluminum chloride, AlCl_3	9m	61	Ammonium azide, NH_4N_3	9	4
Aluminum chloride hydrate (chloraluminite), $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$	7	3	Ammonium beryllium fluoride, $(\text{NH}_4)_2\text{BeF}_4$	3m	5
Aluminum copper, Al_4Cu_9	11m	79	Ammonium borate hydrate, $\text{NH}_4\text{B}_5\text{O}_8 \cdot 4\text{H}_2\text{O}$	17m	7
Aluminum fluoride hydroxide silicate, topaz, $\text{Al}_2(\text{F},\text{OH})_2\text{SiO}_4$	1m	4	Ammonium boron fluoride, NH_4BF_4	3m	6
Aluminum iron, AlFe	18m	5	Ammonium bromide, NH_4Br	2	49
Aluminum iron antimony oxide, bahianite, $\text{Al}_{5.66}\text{Fe}_{0.09}\text{Sb}_{2.95}\text{O}_{16}$	16m	87	Ammonium cadmium bromide, $(\text{NH}_4)_4\text{CdBr}_6$	15m	9
Aluminum iron oxide, AlFeO_3	15m	7	Ammonium cadmium chloride, NH_4CdCl_3	5m	6
Aluminum lithium, Al_4Li_9	10m	98	Ammonium cadmium sulfate, $(\text{NH}_4)_2\text{Cd}_2(\text{SO}_4)_3$	7m	5
Aluminum nickel, AlNi	6m	82	Ammonium cadmium sulfate hydrate, $(\text{NH}_4)_2\text{Cd}(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$	8m	5
Aluminum nitride, AlN	12m	5	Ammonium calcium sulfate, $(\text{NH}_4)_2\text{Ca}_2(\text{SO}_4)_3$	8m	7
Aluminum nitrate hydrate, $\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$	11m	6	Ammonium cerium nitrate, $(\text{NH}_4)_2\text{Ce}(\text{NO}_3)_6$	18m	6
Aluminum oxide (corundum), $\alpha\text{-Al}_2\text{O}_3$..	9	3	Ammonium chlorate, NH_4ClO_4 (orthorhombic)	7	6
Aluminum oxide hydrate (boehmite), $\alpha\text{-Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$	3	38	Ammonium chloride (salammoniac), NH_4Cl	1	59
Aluminum oxide hydrate, diaspore, $\beta\text{-Al}_2\text{O}_3 \cdot \text{H}_2\text{O}$	3	41	Ammonium chromium sulfate hydrate, $\text{NH}_4\text{Cr}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	7
Aluminum phosphate, $\text{Al}(\text{PO}_3)_3$	2m	3	Ammonium cobalt (II) chloride, NH_4CoCl_3	6m	5
Aluminum phosphate (berlinite), AlPO_4 (trigonal)	10	3	Ammonium cobalt fluoride, NH_4CoF_3	8m	9
Aluminum phosphate, AlPO_4 (orthorhombic)	10	4	Ammonium copper bromide hydrate, $(\text{NH}_4)_2\text{CuBr}_4 \cdot 2\text{H}_2\text{O}$	10m	6
Aluminum plutonium, Al_3Pu	15m	77	Ammonium copper chloride, NH_4CuCl_3	7m	7
Aluminum rhenium, AlRe	15m	79	Ammonium copper chloride hydrate, $(\text{NH}_4)_2\text{CuCl}_4 \cdot 2\text{H}_2\text{O}$	12m	6
Aluminum rhenium, Al_{12}Re	15m	80	Ammonium copper fluoride, NH_4CuF_3	11m	8
Aluminum rhodium, AlRh	15m	82	Ammonium gallium sulfate hydrate, $\text{NH}_4\text{Ga}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	9
Aluminum ruthenium, AlRu	15m	83	Ammonium germanium fluoride, $(\text{NH}_4)_2\text{GeF}_6$	6	8
Aluminum ruthenium, Al_6Ru	15m	84	Ammonium hydrogen arsenate, $\text{NH}_4\text{H}_2\text{AsO}_4$	16m	9
Aluminum samarium, AlSm_2	15m	86	Ammonium hydrogen carbonate (teschemacherite), $(\text{NH}_4)\text{HCO}_3$	9	5
Aluminum samarium, AlSm_3	15m	88	Ammonium hydrogen phosphate, $\text{NH}_4\text{H}_2\text{PO}_4$	4	64
Aluminum samarium, Al_2Sm	15m	90	Ammonium iodate, NH_4IO_3	10m	7
Aluminum samarium, Al_3Sm	15m	91	Ammonium iodide, NH_4I	4	56
Aluminum silicate (mullite), $\text{Al}_6\text{Si}_2\text{O}_{13}$	3m	3	Ammonium iridium chloride, $(\text{NH}_4)_2\text{IrCl}_6$	8	6
Aluminum sulfate, $\text{Al}_2(\text{SO}_4)_3$	15m	8	Ammonium iron chloride hydrate, $(\text{NH}_4)_2\text{FeCl}_5 \cdot \text{H}_2\text{O}$	14m	7
Aluminum technetium, Al_6Tc	15m	93	Ammonium iron fluoride, $(\text{NH}_4)_3\text{FeF}_6$	9m	9
Aluminum terbium, Al_2Tb	15m	95	Ammonium iron sulfate, $\text{NH}_4\text{Fe}(\text{SO}_4)_2$	10m	8
Aluminum terbium, Al_2Tb_3	15m	96	Ammonium iron sulfate hydrate, $\text{NH}_4\text{Fe}(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	6	10
Aluminum thorium uranium, Al_6ThU	15m	98	Ammonium lead chloride, $(\text{NH}_4)_2\text{PbCl}_6$	11m	10
Aluminum tungsten, Al_5W , δ -phase	15m	100	Ammonium magnesium aluminum fluoride, $\text{NH}_4\text{MgAlF}_6$	10m	9
Aluminum tungsten oxide, $\text{Al}_2(\text{WO}_4)_3$..	11m	7			
Aluminum vanadium, Al_{10}V	15m	102			
Aluminum vanadium, $\text{Al}_{10.25}\text{V}$	15m	104			
Aluminum vanadium, Al_{23}V_4	15m	106			
Aluminum vanadium, Al_{45}V_7 , α' -phase ..	15m	108			
Aluminum ytterbium, Al_2Yb	15m	111			
Aluminum yttrium, Al_3Y	15m	112			

Further work on this program is in progress, and it is anticipated that additional sections will be issued. Therefore, the cumulative index here is not necessarily the concluding index for the project.

m - Monograph 25.

A mineral name in () indicates a synthetic sample.

10. SUPPLEMENTARY NOTES Library of Congress Catalog Card Number: 53-61386 <input type="checkbox"/> Document describes a computer program; SF-185, FIPS Software Summary, is attached.				
11. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here) Standard x-ray powder diffraction patterns are presented for 58 substances. These experimental patterns, useful for identification, were obtained by diffractometer methods. The lattice constants were refined by least-squares methods, and reflections were assigned Miller indices consistent with space group extinctions. Relative intensities, calculated densities, literature references, and other relevant data are included.				
12. KEY WORDS (Six to twelve entries; alphabetical order; capitalize only proper names; and separate key words by semicolons) Crystal structure; densities; lattice constants; powder patterns; reference intensities; standard; x-ray diffraction.				
13. AVAILABILITY <input checked="" type="checkbox"/> Unlimited <input type="checkbox"/> For Official Distribution. NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH—The Journal of Research of the National Bureau of Standards reports NBS research and development in those disciplines of the physical and engineering sciences in which the Bureau is active. These include physics, chemistry, engineering, mathematics, and computer sciences. Papers cover a broad range of subjects, with major emphasis on measurement methodology and the basic technology underlying standardization. Also included from time to time are survey articles on topics closely related to the Bureau's technical and scientific programs. As a special service to subscribers each issue contains complete citations to all recent Bureau publications in both NBS and non-NBS media. Issued six times a year. Annual subscription: domestic \$13; foreign \$16.25. Single copy, \$3 domestic; \$3.75 foreign.

NOTE: The Journal was formerly published in two sections: Section A "Physics and Chemistry" and Section B "Mathematical Sciences."

DIMENSIONS/NBS—This monthly magazine is published to inform scientists, engineers, business and industry leaders, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on work at NBS. The magazine highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, it reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing. Annual subscription: domestic \$11; foreign \$13.75.

NONPERIODICALS

Monographs—Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

Handbooks—Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications—Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series—Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series—Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NBS under the authority of the National Standard Data Act (Public Law 90-396).

NOTE: The principal publication outlet for the foregoing data is the Journal of Physical and Chemical Reference Data (JPCRD) published quarterly for NBS by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements available from ACS, 1155 Sixteenth St., NW, Washington, DC 20056.

Building Science Series—Disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes—Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

Voluntary Product Standards—Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The standards establish nationally recognized requirements for products, and provide all concerned interests with a basis for common understanding of the characteristics of the products. NBS administers this program as a supplement to the activities of the private sector standardizing organizations.

Consumer Information Series—Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

Order the above NBS publications from: Superintendent of Documents, Government Printing Office, Washington, DC 20402.

Order the following NBS publications—FIPS and NBSIR's—from the National Technical Information Services, Springfield, VA 22161.

Federal Information Processing Standards Publications (FIPS PUB)—Publications in this series collectively constitute the Federal Information Processing Standards Register. The Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

NBS Interagency Reports (NBSIR)—A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Services, Springfield, VA 22161, in paper copy or microfiche form.
