THE NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards¹ provides measurement and technical information services essential to the efficiency and effectiveness of the work of the Nation's scientists and engineers. The Bureau serves also as a focal point in the Federal Government for assuring maximum application of the physical and engineering sciences to the advancement of technology in industry and commerce. To accomplish this mission, the Bureau is organized into three institutes covering broad program areas of research and services:

THE INSTITUTE FOR BASIC STANDARDS . . . provides the central basis within the United States for a complete and consistent system of physical measurements, coordinates that system with the measurement systems of other nations, and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. This Institute comprises a series of divisions, each serving a classical subject matter area:

—Applied Mathematics—Electricity—Metrology—Mechanics—Heat—Atomic Physics—Physical Chemistry—Radiation Physics—Laboratory Astrophysics²—Radio Standards Laboratory,² which includes Radio Standards Physics and Radio Standards Engineering—Office of Standard Reference Data.

THE INSTITUTE FOR MATERIALS RESEARCH . . . conducts materials research and provides associated materials services including mainly reference materials and data on the properties of materials. Beyond its direct interest to the Nation's scientists and engineers, this Institute yields services which are essential to the advancement of technology in industry and commerce. This Institute is organized primarily by technical fields:

—Analytical Chemistry—Metallurgy—Reactor Radiations—Polymers—Inorganic Materials—Cryogenics²—Materials Evaluation Laboratory—Office of Standard Reference Materials.

THE INSTITUTE FOR APPLIED TECHNOLOGY . . . provides technical services to promote the use of available technology and to facilitate technological innovation in industry and government. The principal elements of this Institute are:

—Building Research—Electronic Instrumentation—Textile and Apparel Technology Center—Technical Analysis—Center for Computer Sciences and Technology—Office of Weights and Measures—Office of Engineering Standards Services—Office of Invention and Innovation—Clearinghouse for Federal Scientific and Technical Information.³

National Bureau of Standards Monograph 35—Supplement 1

Issued May 31, 1967

Library of Congress Catalog Card Number: 61-64961

Foreword

This bibliography is a supplement to the Bibliography and Index on Vacuum and Low Pressure Measurement issued in 1961 as NBS Monograph 35. It lists technical publications issued during 1960-1965 inclusive, together with some issued earlier but omitted in Monograph 35. As in preparing the original Monograph, the aim has been to meet the needs of scientists, engineers, and others for a general source of information on vacuum measurement. For this purpose, the author and subject indices should be particularly helpful.

This publication was compiled as part of the work on vacuum standards which is now in progress under the supervision of E. C. Lloyd, Chief of the Mechanical Measurements Branch of the NBS Mechanics Division, and S. Ruthberg, Chief of the Vacuum Measurements Section.

BIBLIOGRAPHY AND INDEX ON VACUUM AND LOW PRESSURE MEASUREMENT
January 1960 to December 1965

W. G. Brombacher

The bibliography, a supplement to NBS Monograph 35, of the same title, covers the years 1960 to 1965, inclusive, and includes 109 references for prior years not listed in Monograph 35. It contains 1787 references, 38 of which are to books. The references, besides those directly concerned with pressure measurement, include those on vacuum technology which may bear on the technique of vacuum measurement, such as on adsorption and desorption, diffusion of gases into solids, gas conductance and hardware such as pumps, seals and traps. Author and subject indices are provided.

KEY WORDS: bibliography, low pressure measurement, techniques of vacuum measurement, vacuum index, vacuum measurement.

This bibliography is an extension to 1965 of the bibliography completed in 1960 and published as NBS Monograph 35 under the same title. For convenience, some of the Introduction of Monograph 35 will bear repetition, suitably modified.

Abstracts of current literature on vacuum technology are available in a) Vacuum (since 1951), Pergamon Press, London, and by title only in b) Le Vide (since 1946), Société Française des Ingénieurs des Techniciens du Vide, Paris, France. Other abstract journals or publications containing a significant number of pertinent abstracts include c) Physics Abstracts, Institution of Electrical Engineers, London, d) Chemical Abstracts, American Chemical Society, Columbus, Ohio, e) Engineering Index, Engineering Index, Inc., New York, f) Physikalische Berichte, Deutsche Gesellschaft für Technische Physik, Braunschweig, g) Vakuum-Technik, Deutsche Arbeitsgemeinschaft Vakuum, Rudolf A. Lang Verlag, Esch, Taunus, Germany. The above publications have been freely drawn upon in preparing this bibliography.

As in Monograph 35, this paper has three major parts: a) the bibliography, b) an author index and c) an index of the subject matter covered by the bibliography. The bibliography is divided into a list of books and a list of papers and reports, all listed chronologically, by years. Books are designated by the letter "B" followed by two digits indicating the year of publication and by a single digit identifying the order of listing. For example, B645 indicates a book published in 1964, listed fifth in the book list for 1964. Papers and reports are designated by four, or five digits where necessary, the first two indicating the year of publication or issue, and the last two or three the order of listing. Thus 65229 indicates the 229th in the list for 1965.

The bibliography contains 1787 references of which 38 are books. An effort was made to list all significant publications on vacuum and low pressure measurement. Vacuum technology and vacuum phenomena are covered, if of some interest in making valid vacuum measurements. References are therefore listed on such phenomena as adsorption, degassing, outgassing, surface reactions, leak detection, diffusion and permeation of gases into solids, and gas conductance. Hardware for vacuum systems, such as vacuum pumps, controlled gas leaks, seals, and valves, are covered with,

it is hoped, few omissions. The literature on mass spectrometers, field emission microscopy and sorption phenomena is extensive, so that limited coverage was advisable. The selection of references for inclusion has been somewhat arbitrary, but it is hoped that none of the more pertinent papers have been omitted. References on evaporated film technology, which are also extensive, have been omitted as not germane.

Papers on the various designs of micromanometers both liquid and mechanical, are listed.

With minor exceptions, neither catalogs, nor announcements in trade journals of new instruments without technical data, nor patents, are listed. Reports on vacuum measurement issued as separates have, with some exceptions, not been listed. They appear rarely to justify the labor involved in locating them, in view of the fact that if important, their essence is ultimately published in a periodical.

It will be noticed that all of the references, over 140, for 1960 given in Monograph 35 are repeated in the present bibliography. This gives full coverage here for the years 1960 to 1965 inclusive.

Over 100 references are for years prior to 1960 and in effect are desirable additions to Monograph 35. To preserve continuity with Monograph 35, the identifying numbers start where those in Monograph 35 leave off.

In general the number of references cited is unlisted. Where such listing might aid in judging their adequacy of a review or indicate a significant source of published information, the number of references cited is given when easily available.

Low pressure measurement is here defined to apply to instrumentation used to measure absolute or differential pressures in the range from about 10^{-4} to 10 mm of mercury with the ability to detect pressure changes of less than about 0.01 mm of mercury. The instruments are generally known as micromanometers, which divide into liquid and mechanical types. The liquid types generally involve a U-tube, filled with either mercury, oil or water. The sensitivity used as a criterion to justify listing is about 0.01 mm of the column height of the filling liquid.

INTRODUCTION - - continued:

Standard terminology has been proposed by the American Vacuum Society (58148, Monograph 35, 6376) and others (see Subject Index). The American proposed standard terminology has been largely followed in the subject index, including the classification of degrees of vacuum. The latter is:

Condition	Pressure range, torr
High vacuum	10^{-3} to 10^{-6}
Very high vacuum	10^{-6} to 10^{-9}
Ultra-high vacuum	10^{-9} and below

The torr equals 1/760 of one atmosphere of pressure (1,013,250 dynes per cm^2) or at pressures in the vacuum range, one millimeter of mercury for all practical purposes.

The subject index is preceded by a discussion of the headings used.

SUBJECT INDEX

The subject index covers the material in the references as completely as possible, based usually on a perusal of the reference, in some cases on an abstract and rarely only on the title.

The headings require some discussion. Outgassing and degassing are indexed under "Degassing" for convenience. The phenomena are in many cases too closely related to be easily separated. For the same reason, papers on permeability and diffusion are indexed under "Diffusion into or through solids."

Gettering action has been covered under five headings: "Getters," under which gettering materials are covered; "Traps" which has some overlap with the former; "Ion pumps"; "Getter-ion

Absorption, see Adsorption, Degassing, Diffusion of gases

Gases in liquids, see Solubility of gases in liquids

Accommodation coefficient

Defined 62126

Method of measurement 6149 6528

Various vapors, glass surface 6528

Adhesives, 61114 65110

Insulating 65218

Adsorption, see also Getters; Adsorption, activated, Traps; Degassing; Pumps, cryogenic

Application

Pressure measurement 6146

Argon 63296

Activated carbon 64173 64230

Glass 62225 63317 6490 65319

Impact on glass releases Krypton 62112

Molybdenum 6156

Molybdenum disulphide 60108

Nickel 64194

Platinum 6156

Pyrex 63214

Quartz 65181

Re-emission, bombarded by noble gases
63156

Iron 65295

Molybdenum 65295

Nickel 65295

Platinum 65295

Silver powder 2607

Tantalum 65295

Titanium 65295

Tungsten 65295

Carbon monoxide

Aluminum film 6082

Evaporated metal films 65334

Germanium 6152

Ionization gage grid 6337

pumps"; and "Gettering action, ionization gages" which seemed to warrant a separate heading.

Micromanometers cover the class of low pressure instrumentation of interest. Two main headings are used: "Micromanometers, liquid U-tube" and "Mechanical pressure and vacuum gages." In addition see also "Vapor pressure measurement" and "Pressure measurement."

Two primary indices are given in the index. Under the heading "Pressure measurement" all types of vacuum gages and micromanometers are listed under the various nomenclatures in use. It would serve to locate the heading in the index under which references will be found. The same has been done for pumps under the heading "Pumps."

Adsorption (cont'd)

Carbon monoxide (cont'd)

Nickel 65293

Tungsten 6030 62109 64169

Conductance effect 60178

 - Gate 63290 6497 6591 65283
 - Gate seal, conoseal 61119
 - High speed, electrically operated
 - Produces gas pulses 61137 61191
 - Hoke, modified 6514
 - Hydraulically operated 65113 65250
 - Indium-tin eutectic 6576
 - Linear motion operates 60145 60146 6117
 - Ball valve 65260
 - Bellows used 58171 6236 65260
 - Gold wire seal 65112
 - Indium-tin eutectic 6576
 - Knife-edge seal into copper 64182
 - Magnetically operated 61173
 - Fast operation 6074 63140 65215
 - Glass ball 6203
 - Piston-cylinder design 65250
 - Sliding plate 63187
 - Sealed by atmospheric pressure 61145
 - Mass spectrometry 6315
 - Micro pulse valve 65215 65266
 - Needle, controls minute flow 60101
 - Optical flat glass 6363
 - Pressure bursts during operation 65217
 - Review B642 6497
 - Slide 6497
 - Tele controlled, specifications for 64101
 - Throttle 6497
 - Ultra-high vacuum
 - All metal 60145 60146 6117
 - Vacuum lock valve 61195

- Valves (cont'd)
 Valve stem seal 64100
- Vapor pressure
 Amoil-S 4724
 Butyl phthalate 4724
 Cerium 64202
 Cesium 6059
 Hydrogen 6245
 Iridium 63213
 Krypton 64266
 Lanthanum 64202
 Liquids, low temperature 61157 6347
 Nitrogen 6245
 Octoil 4724
 Octoil-S 4724
 Organic compounds 5170 60197
 Pump oils 65296 65322
 Rare earth metals (14) 64202
 Ruthenium 63213
 Theoretical extrapolations 6444
 Titanium 6273 65304
 Xenon 61141 64266
- Vapor pressure measurement, vacuum range 58172
 Cesium in photoelectric tube
 Flash technique 6058
 Dead weight disk valve, see Mechanical pressure and vacuum gages
 Dew point method 4724
 Effusion-torsion method 4728 59179 60188 6116
 64202
 Theory 5278
 Mass spectrometer used
 Metals 6380
 Organic liquids 5170
 Microbalance used
 Quartz spring
 Force against disk measured 4634
 Tungsten spring
 Linear transformer measures deflection 6470
- Review 2911
- Tensimeter
 Pressure balanced by inert gas 3011
- Vapor pressure equalized with air pressure
 3011 59190
- Weight, loss and gain measured
 Metals 6380
- Viscosity vacuum gages
 Molecular drag, theory
 Vibrating cylinder 63231
 Vibrating plate 63231
- Oscillating filament
 Bifilar 2409
 Log decrement proportional to pressure
 61131 6214
- Oscillating vane
 Theory 9701
- Resonance, oscillating filament
 Angular oscillations, amplitude proportional to pressure
 Performance 6183 61124
 Theory 6183
 Constant amplitude pendular oscillations, power measured 61126
 Theory 6255 6420
- Pendular oscillations, amplitude measured 62142
- Reva gage 61126 6420
- Review 6541
- Viscosity vacuum gages (cont'd)
 Rotating disk or cylinder (viscous drag)
 Design B621 1307 1503 6318
 Magnetically suspended, decrement measured 6205
 Performance 6318
 Theory B621 1503
- Rotating sphere
 Magnetically suspended, decrement measured 6205 6509
 Performance 60144 6205
 Theory 60144 6205
- Rotating vane system
 Electrically driven, frequency varies with pressure 60117 6250
 Theory 6255
- Theory
 Molecular drag, vibrating plate and cylinder 63231
- Water vapor
 Adsorption, see
 Degassing, see
 Desiccants, see
 Diffusion in solids, see Diffusion into or through solids
 Reactions in electron tubes 6032
- Window seal, see Seals
- X-ray limit, ionization gages, see Ionization gages
- Zeolites, see Traps
