AMERICAN RAILWAY ENGINEERING ASSOCIATION, STANDARD SPECIFICATIONS FOR CAST-IRON PIPE AND SPECIAL CASTINGS, MANUAL, 1922

CAST-IRON PIPE AND SPECIAL CASTINGS

(Identical with A. S. T. M., A44-04, given below.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CAST-IRON PIPE AND SPECIAL CASTINGS, DESIGNATION A44-04, 1904

CAST-IRON PIPE AND SPECIAL CASTINGS

DESCRIPTION OF PIPES

Section 1.—The pipes shall be made with hub and spigot joints, and shall accurately conform to the dimensions given in Tables 1 and 2. They shall be straight and shall be true circles in section, with their inner and outer surfaces concentric, and shall be of the specified dimensions in outside diameter. They shall be at least 12 feet in length, exclusive of socket. For pipes of each size from 4 to 24 inches, inclusive, there shall be two standards of outside diameter, and for pipes from 30 to 60 inches, inclusive, there

shall be four standards of outside diameter, as shown by Table 1.

All pipes having the same outside diameter shall have the same inside diameter at both ends. The inside diameter of the lighter pipes of each standard outside diameter shall be gradually increased for a distance of about 6 inches from each end of the pipe

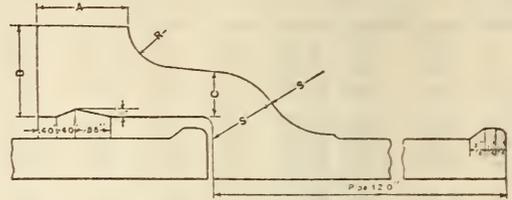

FIGURE 218.—General dimensions of pipes

so as to obtain the required standard thickness and weight for each size and class of pipe.

Pipes whose standard thickness and weight are intermediate between the classes in Table 2 shall be made of the same outside diameter as the next heavier class. Pipes whose standard thickness and weight are less than shown by Table 2 shall be made of the same outside diameter as the class A pipes, and pipes whose thickness and weight are more than shown by Table 2 shall be made of the same outside diameter as the class D pipes.

TABLE 1.—General dimensions of pipes

Nominal diameter	Classes	Actual outside diameter	Diameter of sockets		Depth of sockets		A	B	C
			Pipe	Special castings	Pipe	Special castings			
4	A-B	4.80	5.60	5.70	3.50	4.00	1.50	1.30	0.65
4	C-D	5.00	5.80	5.70	3.50	4.00	1.50	1.30	.65
6	A-B	6.90	7.70	7.80	3.50	4.00	1.50	1.40	.70
6	C-D	7.10	7.90	7.80	3.50	4.00	1.50	1.40	.70
8	A-B	9.05	9.85	10.00	4.00	4.00	1.50	1.50	.75

	C	64.20	65.20	65.20	5.50	5.50	2.25	4.20	2.25
	D	64.82	65.82	65.82	5.50	5.50	2.25	4.70	2.60

For pipes 4 to 12 inches, inclusive, one class of special castings shall be furnished, made from class D pattern. Those having spigot ends shall have outside diameters of spigot ends midway between the two standards of outside diameter as shown by Table 1, and shall be tapered back for a distance of 6 inches. For pipes from 14 to 24 inches, inclusive, two classes of special castings shall be furnished, class B special castings with classes A and B pipes, and class D special castings with classes C and D pipes, the former to be stamped "AB" and the latter to be stamped "CD." For pipes 30 to 60 inches, inclusive, four classes of special castings shall be furnished, one for each class of pipe, and shall be stamped with the letter of the class to which they belong.

ALLOWABLE VARIATION IN DIAMETER OF PIPES AND SOCKETS

Section 2.—Special care shall be taken to have the sockets of the required size. The sockets and spigots

will be tested by circular gages, and no pipe will be received which is defective in joint room from any cause. The diameters of the sockets and the outside diameters of the bead ends of the pipe shall not vary from the standard dimensions by more than 0.06 inch for pipes 16 inches or less in diameter; 0.08 inch for 18-inch, 20-inch, and 24-inch pipes; 0.10 inch for 30-inch, 36-inch, and 42-inch pipes; 0.12 inch for 48-inch pipes; and 0.15 inch for 54-inch and 60-inch pipes.

ALLOWABLE VARIATION IN THICKNESS

Section 3.—For pipes whose standard thickness is less than 1 inch, the thickness of metal in the body of the pipe shall not be more than 0.08 inch less than the standard thickness; and for pipes whose standard thickness is 1 inch or more, the variation shall not exceed 0.10 inch, except that for spaces not exceeding 8 inches in length in any direction, variations from the standard thickness of 0.02 inch in excess of the allowance above given shall be permitted.

TABLE 2.—Standard thicknesses and weights of cast-iron pipe

Nominal inside diameter	Class A—100-foot head, 43 pounds pressure				Class B—200-foot head, 86 pounds pressure			Class C—300-foot head, 130 pounds pressure			Class D—400-foot head, 173 pounds pressure			Nominal inside diameter

54	1.35	800.0	9,600	1.55	933.3	11,200	1.90	1,141.7	13,700	2.23	1,341.7	16,100	54	
60	1.39	916.7	11,000	1.67	1,104.2	13,250	2.00	1,341.7	16,100	2.38	1,583.3	19,000	60	

NOTE—The above weights are for 12-foot laying lengths and standard sockets; proportionate allowance to be made for any variation therefrom.

For special castings of standard patterns a variation of 50 per cent greater than allowed for straight pipe shall be permitted.

DEFECTIVE SPIGOTS MAY BE CUT

Section 4.—Defective spigot ends on pipes 12 inches or more in diameter may be cut off in a lathe, and a half-round wrought-iron band shrunk into a groove cut in the end of the pipe. Not more than 12 per cent of the total number of accepted pipes of each size shall be cut and banded, and no pipe shall be banded which is less than 11 feet in length, exclusive of the socket.

In case the length of a pipe differs from 12 feet, the standard weight of the pipe given in Table 2 shall be modified in accordance therewith.

SPECIAL CASTINGS

Section 5.—All special castings shall be made in accordance with the cuts and the dimensions given in the table forming a part of these specifications.

The diameters of the sockets and the external diameters of the bead ends of the special castings

shall not vary from the standard dimensions by more than 0.12 inch for castings 16 inches or less in diameter; 0.15 inch for 18-inch, 20-inch, and 24-inch pipes; 0.20 inch for 30-inch, 36-inch, and 42-inch pipes; and 0.24 inch for 48-inch, 54-inch, and 60-inch pipes. These variations apply only to special castings made from standard patterns.

The flanges on all manhole castings and manhole covers shall be faced true and smooth, and drilled to receive bolts of the sizes given in the tables. The manufacturer shall furnish and deliver all bolts for bolting on the manhole covers, the bolts to be of the sizes shown on plans and made of the best quality of mild steel, with hexagonal heads and nuts and sound well-fitting threads.

MARKING

Section 6.—Every pipe and special casting shall have distinctly cast upon it the initials of the maker's name. When cast especially to order, each pipe and special casting larger than 4 inches may also have cast upon it figures showing the year in which it was cast and a number signifying the order in

point of time in which it was cast, the figures denoting the year being above and the number below, thus:

1901	1901	1901
1	2	3

etc., also any initials, not exceeding four, which may be required by the purchaser. The letters and figures shall be cast on the outside and shall be not less than 2 inches in length and one-eighth inch in relief for pipes 8 inches in diameter and larger. For smaller sizes of pipes the letters may be 1 inch in length. The weight and the class letter shall be conspicuously painted in white on the inside of each pipe and special casting after the coating has become hard.

ALLOWABLE PERCENTAGE OF VARIATION IN WEIGHT

Section 7.—No pipe shall be accepted the weight of which shall be less than the standard weight by more than 5 per cent for pipes 16 inches or less in diameter, and 4 per cent for pipes more than 16 inches in diameter; and no excess above the standard weight of more than the given percentages for the several sizes shall be paid for. The total weight to be paid for shall not exceed for each size and class of pipe received the sum of the standard weights of the same number of pieces of the given size and class by more than 2 per cent.

No special casting shall be accepted the weight of which shall be less than the standard weight by more than 10 per cent for pipes 12 inches or less in diameter, and 8 per cent for larger sizes, except that curves, Y pieces, and breeches pipe may be 12 per cent below the standard weight, and no excess above the standard weight of more than the above percentages for the several sizes will be paid for. These variations apply only to castings made from the standard patterns.

QUALITY OF IRON

Section 8.—All pipes and special castings shall be made of cast iron of good quality, and of such character as shall make the metal of the castings strong, tough, and of even grain, and soft enough satisfactorily to admit of drilling and cutting. The metal shall be made without any admixture of cinder iron or other inferior metal, and shall be remelted in a cupola or air furnace.

TESTS OF MATERIALS

Section 9.—Specimen bars of the metal used, each being 26 inches long by 2 inches wide and 1 inch thick, shall be made without charge as often as the engineer may direct, and, in default of definite instructions, the contractor shall make and test at least one bar from each heat or run of metal. The bars, when placed flatwise upon supports 24 inches apart and loaded in the center, shall, for pipes 12 inches or less in diameter, support a load of 1,900 pounds, and show a deflection of not less than 0.30 inch before breaking; and, for pipes of sizes larger than 12 inches, they shall support a load of 2,000 pounds and show a deflection of not less than 0.32 inch. The contractor shall have the right to make and break three bars from each heat or run of metal, and the test shall be based upon the average results of the three bars. Should the dimensions of the bars differ from those above given, a proper allowance therefor shall be made in the results of the tests.

CASTING OF PIPES

Section 10.—The straight pipes shall be cast in dry sand molds in a vertical position. Pipes 16 inches or less in diameter shall be cast with the hub end up or down as specified in the proposal. Pipes 18 inches or more in diameter shall be cast with the hub end down.

The pipes shall not be stripped or taken from the pit while showing color of heat, but shall be left in the flasks for a sufficient length of time to prevent unequal contraction by subsequent exposure.

QUALITY OF CASTINGS

Section 11.—The pipes and special castings shall be smooth, free from scales, lumps, blisters, sand holes, and defects of every nature which unfit them for the use for which they are intended. No plugging or filling will be allowed.

CLEANING AND INSPECTION

Section 12.—All pipes and special castings shall be thoroughly cleaned and subjected to a careful hammer inspection. No casting shall be coated unless entirely clean and free from rust, and approved in these respects by the engineer immediately before being dipped.

COATING

Section 13.—Every pipe and special casting shall be coated inside and out with coal-tar-pitch varnish. The varnish shall be made from coal tar. To this material sufficient oil shall be added to make a smooth coating, tough and tenacious when cold, and not brittle nor with any tendency to scale off.

Each casting shall be heated to a temperature of 300° F. immediately before it is dipped, and shall possess not less than this temperature at the time it is put in the vat. The ovens in which the pipes are heated shall be so arranged that all portions of the pipe shall be heated to an even temperature. Each casting shall remain in the bath at least five minutes.

The varnish shall be heated to a temperature of 300° F. (or less if the engineer shall so order), and shall be maintained at this temperature during the time the casting is immersed.

Fresh pitch and oil shall be added when necessary to keep the mixture at the proper consistency, and the vat shall be emptied of its contents and refilled with fresh pitch when deemed necessary by the engineer. After being coated, the pipes shall be carefully drained of the surplus varnish. Any pipe or special casting that is to be recoated shall first be thoroughly scraped and cleaned.

HYDROSTATIC TEST

Section 14.—When the coating has become hard, the straight pipes shall be subjected to a proof by hydrostatic pressure, and, if required by the engineer, they shall also be subjected to a hammer test under this pressure.

The pressure to which the different sizes and classes of pipes shall be subjected are as follows:

	20 inches diameter and larger	Less than 20 inches diameter
	Lbs./in. ²	Lbs./in. ²
Class A pipe.....	150	300
Class B pipe.....	200	300
Class C pipe.....	250	300
Class D pipe.....	300	300

WEIGHING

Section 15.—The pipes and special castings shall be weighed for payment under the supervision of the engineer after the application of the coal-tar-pitch varnish. If desired by the engineer the pipes and special castings shall be weighed after their delivery, and the weights so ascertained shall be used in the final settlement, provided such weighing is done by a legalized weighmaster. Bids shall be submitted and a final settlement made on the basis of a ton of 2,000 pounds.

CONTRACTOR TO FURNISH MEN AND MATERIALS

Section 16.—The contractor shall provide all tools, testing machines, materials, and men necessary for the required testing, inspection, and weighing at the foundry of the pipes and special castings; and should the purchaser have no inspector at the works, the contractor shall, if required by the engineer, furnish a sworn statement that all of the tests have been made as specified, this statement to contain the results of the tests upon the test bars.

POWER OF ENGINEER TO INSPECT

Section 17.—The engineer shall be at liberty at all times to inspect the material at the foundry, and the molding, casting, and coating of the pipes and special castings. The forms, sizes, uniformity, and conditions of all pipes and other castings herein referred to shall be subject to his inspection and approval, and he may reject, without proving, any pipes or other castings which are not in conformity with the specifications or drawings.

INSPECTOR TO REPORT

Section 18.—The inspector at the foundry shall report daily to the foundry office all pipes and special castings rejected, with the causes for rejection.

CASTINGS TO BE DELIVERED SOUND AND PERFECT

Section 19.—All the pipes and other castings must be delivered in all respects sound and conformable to these specifications. The inspection shall not relieve the contractor of any of his obligations in this respect, and any defective pipe or other castings which may have passed the engineer at the works or elsewhere shall be at all times liable to rejection when discovered until the final completion and adjustment of the contract, provided, however, that the contractor shall not be held liable for pipes or special castings found to be cracked after they have been accepted at the agreed point of delivery. Care shall be taken in handling the pipes not to injure the coating, and no pipes or other material of any kind shall be placed in the pipes during transportation or at any time after they receive the coating.

DEFINITION OF THE WORD "ENGINEER"

Section 20.—Wherever the word "engineer" is used herein, it shall be understood to refer to the engineer or inspector acting for the purchaser and to his properly authorized agents, limited by the particular duties intrusted to them.

AMERICAN WATER WORKS ASSOCIATION, STANDARD SPECIFICATIONS FOR CAST-IRON WATER PIPE AND SPECIAL CASTINGS, 1908

CAST-IRON WATER PIPE AND SPECIAL CASTINGS

(Text of specifications identical with A. S. T. M., A44-04, given above, with the addition, in tabular form, of weights and dimensions of 72-inch and 84-inch pipe, weights and dimensions of pipe for high-pressure service, as well as weights and dimensions of the following special castings:)

- Branches, blow-off.
- Branches, blow-off with manhole.
- Branches, standard.
- Branches, Y.
- Caps.
- Curves, bell and spigot.
- Curves, bell and spigot, offsets.
- Lugs.
- Manhole pipe.
- Plugs.
- Reducers and increasers.
- Sleeves.

STANDARD DIMENSIONS OF PIPE

NOTE.—The above weights are per length to lay 12 feet, including standard sockets; proportionate allowance to be made for any variation.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIPE; WATER, CAST-IRON (BELL AND SPIGOT), WW-P-421, JULY 21, 1931

CAST-IRON WATER PIPE

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, or parts thereof that are indicated below, of the issue in effect on date of invitation for bids, shall form a part of this specification:

F. S. SS-C-191, Portland cement.

F. S. QQ-M-151 (F. S. B. No. 339), general specifications for metals. (See 600.0, p. 3.)

B. TYPES AND CLASSES

B-1. This specification covers bell and spigot cast-iron water pipe in the following types:

Type I.—Centrifugally cast in metal-contact molds in 12-foot and 18-foot lengths.

Type II.—Centrifugally cast in sand-lined molds in 16-foot, 16½-foot and 20-foot lengths.

Type III.—Horizontally cast in green-sand molds in 12-foot and 16-foot lengths.

B-2. This specification covers the following classes:

Class 150 for 150 pounds maximum water working pressure. (See par. I-6.)

Class 250 for 250 pounds maximum water working pressure. (See par. I-6.)

B-3. This specification covers sizes from 4 to 24 inches, inclusive, for Types I and II, and from 4 to 12 inches, inclusive, for Type III.

B-4. Pipe shall be furnished coated, unless cement-lined or uncoated pipe is required in the invitation for bids.

C. MATERIAL AND WORKMANSHIP

C-1. All pipe shall be made of cast iron of good quality and of such character as shall make the pipe strong, tough, and of even grain, and soft enough to admit of satisfactory drilling and cutting. Each pipe shall be smooth, free from cold shuts, scale, lumps, blisters, and sand holes, and defects of every nature which unfit it for the use intended. It shall be straight and shall be true circles in section with its inner and outer surfaces concentric. No plugging, filling, "burning in", or welding will be allowed.

D. GENERAL REQUIREMENTS

D-1. *Lengths.*—Pipe shall have nominal laying lengths of 12, 16, 16½, 18, or 20 feet. Not more than 10 per cent of cut pipe shall be accepted. Such cut pipe shall be not more than 1 foot under nominal laying length.

D-2. *Cleaning.*—All pipe shall be thoroughly cleaned, and any rough spots in bells or on spigot ends shall be removed before coating or lining.

D-3. *Coating.*—Unless otherwise specified all pipe shall be completely coated inside and out with coal-tar-pitch varnish, to which sufficient oil shall be added to make a smooth coating, tough and tenacious when cold, not "tacky" and not brittle.

D-4. *Cement mortar lining.*—When required in the contract or purchase order, pipe shall be lined with cement mortar. No coating shall be applied to the outside of pipe unless specifically provided for in the contract or order.

D-4a. *Preparation of pipe for lining.*—Pipe to be lined with cement mortar shall not be coated inside with tar or other asphaltum products. Its interior

surface shall be thoroughly cleaned of all core sand, mud, grease, foreign materials, or any sharp projections of iron which might project through the lining. Pipe shall be tested hydrostatically before being lined.

D-4b. *Cement.*—The cement used for making cement mortar shall be standard Portland cement, complying in all respects with the requirements of Federal specification SS-C-191 for Portland cement, referred to in paragraph A-1.

D-4c. *Sand.*—The sand for mortar shall be clean, sharp, hard, and silicious sand, free from loam, clay, organic matter, or other foreign substance considered as deleterious for good mortar. The sand shall be well graded and when tested by laboratory sieves shall meet the following specifications:

Total passing 12-mesh sieve, 100 per cent.

Total passing 100-mesh sieve, not over 5 per cent.

D-4d. *Water.*—The water for tempering the cement mortar shall be free from harmful amounts of oil, acid, alkali, organic, or vegetable matter.

D-4e. *Mortar.*—The cement mortar used for lining pipe shall be a mixture of the above-specified sand and cement in such proportions as to obtain a good, hard, dense lining, reasonably well bonded to the pipe, and with a smooth interior surface. (A mixture which has been found to give very satisfactory results consist of three parts cement to one part sand, by volume.) The cement mortar shall be thoroughly mixed, only sufficient water being added to form a workable mixture for placing in the pipe. Only sufficient cement mortar shall be mixed for the immediate requirements of lining.

D-4f. *Application of lining.*—Sufficient cement mortar shall be introduced to produce the required thickness of lining and shall be spread evenly over the interior surface of the pipe by any suitable means. A careful examination shall be made after this operation is completed to see that the inner surface of the pipe is completely covered with cement mortar. The shoulder of the bell and the end of the spigot may be covered with cement mortar by applying with a brush. Surplus cement mortar shall be removed from the interior of the bell so as not to interfere with proper keying of the joint. The work of lining the pipe shall be done in a building where the product shall be protected from the direct rays of the sun, and from extreme weather conditions, such as rain, frost, etc. The product shall not be put on the yard until the cement has set sufficiently to avoid injury or damage thereto. Patching of improperly lined pipe will not be permitted.

D-4g. *Smoothness of lining.*—The lining of pipe shall be smooth and substantially free from noticeable ridges, corrugations, projections, or depressions.

D-4h. *Thickness of lining.*—The thickness of lining shall be ½ inch + ¼, -0 inch for sizes 12 inches and under, and ⅝ inch + ¼, -0 inch for sizes over 12 inches. At the end of the pipe where the lining naturally tends to taper off to a thin edge, the full thickness of lining shall extend to within 1 inch of end of pipe. Linings of greater thickness shall be furnished when specified.

D-4i. *Curing of lining.*—Immediately after pipe is lined with cement mortar, it shall be protected in a suitable manner to prevent the too rapid withdrawal of moisture from the cement mortar and, if necessary, suitable means shall be provided to keep lining damp for a period of at least 24 hours after lining.

D-4j. No pipe shall be shipped until the lining is thoroughly set.

D-5. *Weighing.*—Each length of pipe shall be weighed and the weight plainly and indelibly marked on the pipe. Coated pipe shall be weighed after coating. Cement-lined pipe shall be weighed before

lining and the mark shall be placed on the outside surface.

D-6. *Hardness.*—The average Rockwell number shall not exceed 95 when tested in accordance with the method described in paragraph F-6.

D-7. *Handling.*—Care shall be taken in handling the pipes not to injure the coating, and no pipes or other material shall be placed in the pipes during transportation, or at any time after they have been coated.

D-8. *Marking.*—In addition to the weight being marked on the pipe as previously specified, each pipe shall have distinctly cast or stamped into the metal on the face or outside surface of the bell or on body near the bell the manufacturer's mark, and the year in which the pipe was cast. When so specified in the

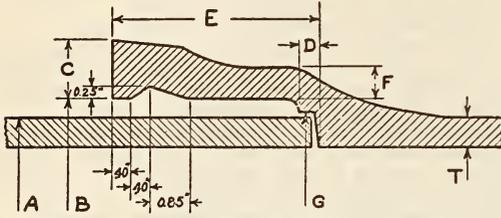

FIGURE 221.—Type I pipe, end details

invitation for bids each pipe shall also have cast upon it, or stamped into the metal, a designated symbol.

E. DETAIL REQUIREMENTS

E-1. *Tolerances in thickness.*—

E-1a. The tolerances in thickness of pipe, plus or minus, shall not exceed those listed below.

Nominal diameter	Tolerance, plus or minus
Inches	Inch
4	0.04
6	.045
8	.05
10	.055
12	.06
14	.08
16	
18	
20	
24	

E-1b. For all sizes of pipe, tolerances not exceeding 0.02 inch additional to above will be allowed for spaces not exceeding 8 inches in length in any direction.

E-2. *Tolerance in weight.*—The weight of no single pipe shall be less than the nominal tabulated weight by more than 5 per cent. The total weight of any order shall be not more than 2 per cent under nominal weight.

E-3. Type I.—*Centrifugally cast in metal-contact molds in 12 and 18 foot lengths.*—

E-3a. Type I pipe shall be of the bell and spigot type, centrifugally cast in metal-contact molds with plain spigot end, and with lead groove and self-centering shoulder in the bell.

E-3b. *Annealing.*—Type I pipe, after withdrawing from machines, shall be annealed to meet the hardness limits specified in paragraph F-6.

E-3c. *Physical requirements.*—Type I pipe shall have a secant modulus of elasticity (see par. F-4b) not to exceed 15,000,000 pounds per square inch, with a corresponding modulus of rupture not less than 45,000 pounds per square inch for sizes 12 inches and under, and 40,000 pounds per square inch for sizes over 12 inches.

E-3d. *Tolerances in diameter.*—The inside diameters of the bells and the outside diameters of the spigot ends of Type I pipe shall not vary plus or minus from the tabulated dimensions by more than

0.06 inch for pipe 12 inches and less in nominal diameter and 0.08 inch for pipe 14 inches and larger.

E-3e. *Dimensions and weights.*—Type I pipe shall conform to the dimensions and weights given in Figure 221 and Tables 1 and 2 for the respective classes and subject to the tolerances given in paragraphs E-1a, E-1b, E-2, and E-3d.

NOTE.—Calculated weight of pipe has been rounded off to nearest 5 pounds. Weight per foot is based on weight of pipe computed to nearest pound.

E-4. Type II.—*Centrifugally cast in sand-lined molds in 16, 16½, and 20-foot lengths.*—

E-4a. Type II pipe shall be of the bell and spigot type, centrifugally cast in sand-lined molds, with bead cast on spigot end, and with lead groove in the bell.

E-4b. *Physical requirements.*—Type II pipe shall have a secant modulus of elasticity (see par. F-4b) not to exceed 10,000,000 pounds per square inch, with a corresponding modulus of rupture not less than 40,000 pounds per square inch.

E-4c. *Tolerances in diameter.*—The inside diameters of the bells and the outside diameters of the spigot ends (exclusive of bead) of Type II pipe shall not vary plus or minus from the tabulated dimensions by more than 0.06 inch for pipe 12 inches and less in nominal diameter, and 0.08 inch for pipe 14 inches and larger.

E-4d. *Dimensions and weights.*—Type II pipe shall conform to the dimensions and weights given in Figure 222 and Tables 3 and 4 for the respective classes and subject to the tolerances given in paragraphs E-1a, E-1b, E-2, and E-4c.

NOTE.—Calculated weight of pipe has been rounded off to nearest 5 pounds. Weight per foot is based on weight of pipe computed to nearest pound.

E-5. Type III.—Horizontally cast in green-sand molds in 12 and 16 foot lengths.—

E-5a. Type III pipe shall be of the bell and spigot type, horizontally cast in green-sand molds with green-sand cores and multiple gates, and with spigot end bead and lead groove in the bell.

E-5b. *Physical requirements.*—Type III pipe shall have a secant modulus of elasticity (see par. F-4b) not to exceed 12,500,000 pounds per square inch, with a corresponding modulus of rupture not less than 42,500 pounds per square inch.

E-5c. *Tolerances in diameter.*—The inside diameters of bells and the outside diameters of the spigot ends (exclusive of bead) of Type III pipe shall not vary plus or minus from the tabulated dimensions by more than 0.06 inch for pipe 12 inches and less in nominal diameter.

E-5d. *Dimensions and weights.*—Type III pipe shall conform to the dimensions and weights given in Figure 222 and Tables 5 and 6 for the respective classes and subject to the tolerances given in paragraphs E-1a, E-1b, E-2, and E-5c.

TABLE 5.—Dimensions of Type III pipe

NOTE.—Calculated weight of pipe has been rounded off to nearest 5 pounds. Weight per foot is based on weight of pipe computed to nearest pound.

F. METHOD OF SAMPLING, INSPECTION, AND TESTS

F-2. *Casting record.*—A record of the melting and pouring temperatures of the iron shall be furnished when requested.

F-3. *Chemical analysis* shall be made by the manufacturer from each heat to determine graphitic and combined carbon or total carbon if the separate determinations are not available, manganese, phosphorus, sulphur, and silicon, and duplicate copies of test reports shall be furnished when requested. Sulphur shall not exceed 0.10 per cent and phosphorus 0.90 per cent in either ladle or inspection analysis.

F-4. *Tests of material.*—

F-4a. From each 300 lengths of pipe, or fraction thereof, of each size in the contract or order, one length of pipe shall be selected by the inspector before coating. From each sample pipe there shall be cut and machined one test strip 12 inches long, 0.50 inch deep, and the full thickness of the shell in width. This shall be tested as a beam (with machined surfaces top and bottom) on supports 10 inches apart with load applied at two points $3\frac{1}{2}$ inches from the supports. The strip shall be accurately calipered at point of rupture and stress calculated by the formula

$$S = \frac{PLc}{6I}, \text{ or for the above specimen } S = \frac{40P}{b}$$

F-4b. The secant modulus of elasticity at the breaking load shall be calculated by the formula

$$E = \frac{23PL^2}{1,296Iy}, \text{ or for the above specimen } E = S \frac{42.6}{y}$$

In these formulas—

S = modulus of rupture.

E = modulus of elasticity.

P = total load.

L = length of span.

c = distance to extreme fiber.

I = moment of inertia.

b = width of specimen (thickness of pipe).

d = depth of specimen.

y = center deflection at load P .

F-5. *Hydrostatic tests.*—Each length of pipe shall be subjected to a hydrostatic pressure of 500 pounds per square inch. The pipe shall be under this pressure at least one-half minute, and while under pressure shall be subjected to a hammer test. Any pipes showing defects by leaking, sweating, or otherwise shall be rejected.

F-6. *Rockwell tests.*—Upon the machined edges of each test strip there shall be made at well-distributed points not less than three determinations, using a 1.59-millimeter (one-sixteenth inch) ball and 100 kilogram load. The average Rockwell number shall not exceed 95. An additional determination shall also be made for pipe cast in metal contact molds, upon the outside of each pipe, using a portable type machine. The equivalent Rockwell number for the exterior shall not exceed 95.

F-7. *Cement lining.*—Not less than 1 per cent of pipe shall be tested, and in the event defects are discovered in the lining, testing shall proceed until the lining complies with the specification.

F-7a. The thickness of lining may be determined by means of spear measurements, using a hardened steel point not greater than one-sixteenth inch in diameter. The inspector shall pierce the lining immediately after it is placed in the pipe, and before cement has set, at four diametrically opposite points of the pipe at bell and spigot ends, making two sets of measurements at each end. The first set shall be not greater than 4 inches from the respective ends of the pipe and the second set shall be made as far into the interior of the pipe as can readily be obtained by reaching into the pipe without injuring the lining. All measurements shall be within the limits specified.

F-7b. For lining of the above-specified thickness or of greater thickness, failure of the lining to adhere completely to the wall of the pipe shall not be cause for rejection, if the lining conforms to these specifications in all other respects.

F-8. If any test specimen shows defective machining or obvious lack of continuity of metal, it may be discarded and replaced by another specimen selected by the inspector. If any of the test specimens selected fail to meet the requirements specified and the purchaser permits a retest, at least twice the

number of specimens that failed shall be selected by the inspector for replacement, all of which shall meet the requirements.

G. PACKING AND MARKING OF SHIPMENTS

G-2. *Packing.*—Unless otherwise specified, the subject commodity shall be prepared for standard commercial shipment so as to insure acceptance by common or other carriers, for safe transportation, at the lowest rate, to the point of delivery.

G-3. *Marking.*—Unless otherwise specified, shipments shall be marked with the number of the contract or order.

I. NOTES

I-1. Invitations for bids should state the number of linear feet of pipe desired and payment should be made on a per foot basis. No bids should be accepted on a tonnage basis.

I-2. Award of contract ordinarily will be made on the basis of evaluated cost per foot, in order to take into account the cost of jointing materials required.

I-2a. The cost per foot may be evaluated from the price bid per foot by the following formula:

$$E = A + KP$$

in which

E = evaluated cost per foot in dollars.

A = bid price per foot in dollars.

K = constant found in Table 7 opposite diameter of pipe and under length of pipe bid upon.

P = The price of lead⁶² in cents per pound current upon date of invitation for bids. The current price of lead may be obtained from the publication "Iron Age." Only New York prices shall be considered.

TABLE 7.—Values of constant "K" for evaluating prices bid per foot of cast-iron water pipe

[Based on total weight of lead and jute at 1 cent per pound required for one joint]

Nominal pipe diameter	Length of pipe (in feet)

18	.0290	.0218	.0212	.0193	.0174
20	.0319	.0239	.0234	.0212	.0191
24	.0379	.0284	.0278	.0252	.0227

Example.—If the bid price on 12-inch diameter pipe in 18-foot lengths is \$1.25 per foot, and the current price of lead is $6\frac{1}{2}$ cents per pound, the evaluated price per foot of pipe.

$$E = \$1.25 + (\$.0109 \times 6\frac{1}{2}) = \$1.25 + 0.0708 = \$1.3208 \text{ per foot}$$

I-3. If special symbol is desired (see par. D-8), it should be so stated or indicated in the invitation for bids. If not so stated, it will be assumed that none is desired.

I-4. For lines for water known to cause serious tuberculation, it is recommended that pipe be not coated, and that it be lined with cement mortar.

I-4a. When linings other than those specified in section D-4 are required, it should be so stated in the invitation for bids.

I-5. When American Water Works Association pipe is specifically required by the requisition or

⁶² The price of jute need not be considered.

order, such pipe shall conform to the requirements and tests of the A. W. W. A. specification. In such cases the desired A. W. W. A. class should be stated.

I-6. This specification is designed for average waterworks construction conditions. Where construction conditions involving excessive vibration, shock, bad trench conditions, corrosion, etc., are contemplated, due consideration should be given to the use of pipe of heavier weight.

I-6a. Cast-iron pipe of lighter or heavier weight than specified herein or with other than bell and spigot joint should be purchased under a separate specification.

I-7. As far as known at the time of promulgation of this specification type 3 pipe was produced regularly by but one company.

I-8. Bids shall clearly indicate the type and length of pipe which bidders will furnish.

I-9. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If for any particular purpose samples with bids are necessary, they should be specifically asked for in the invitation for bids and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

I-10. This specification governs all United States Government purchases of this commodity.

607.13 CAST-IRON PIPE FOR RAILINGS AND POLES.

(No nationally recognized specifications available.)

607.14 CAST-IRON PIPE FITTINGS AND CONNECTIONS.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

PIPE FITTINGS

(For general requirements see 607.4, p. 435.)

1. Cast iron and semisteel of the physical characteristics specified under iron castings (see 611.11, p. 635) may be used in the construction of valves and fittings for pressures not exceeding 300 pounds per square inch, and for temperatures up to 450° F. The minimum thickness in inches shall be determined by the formula:

$$t = \frac{\text{Working pressure} \times \text{internal diameter}}{3,000} + 0.25$$

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN STANDARD CAST-IRON PIPE FLANGES AND FLANGED FITTINGS FOR MAXIMUM WORKING SATURATED STEAM PRESSURE OF 125 POUNDS PER SQUARE INCH (GAGE), B16a-1928

Approved as American Standard by the American Standards Association, 6th February, 1928]

CAST-IRON PIPE FLANGES AND FLANGED FITTINGS 125 POUNDS PER SQUARE INCH

INTRODUCTORY NOTES

1. *Sizes.*—The sizes of the fittings in the following tables will be identified by the corresponding nominal pipe size.

⁶³ Sponsor organizations: American Society of Mechanical Engineers, Manufacturers' Standardization Society of Valve and Fitting Industry, and Heating and Piping Contractors National Association.

2. *Pressure rating.*—It is recommended that in addition to the maximum working steam pressure for which these fittings are intended, the sizes 12 inches and smaller may also be used for maximum nonshock working hydraulic pressure of 175 pounds per square inch (gage), at or near the ordinary range of air temperatures.

3. *Markings.*—All fittings must have marks cast on them indicating the manufacturer and the figures 125 indicating the maximum working steam pressure for which the fittings are intended.

4. *Material.*—The dimensional standards for cast-iron fittings covered herein are based on a high-grade product. The physical and chemical requirements of these flanges and fittings shall be in accordance with Table 1. These requirements are recommended, in the absence of similar data in the specifications of the A. S. T. M. applicable to cast iron intended for the manufacture of pipe flanges and fittings, pending the preparation of an acceptable specification.

TABLE 1.—Physical and chemical (cast test bar) requirements for cast iron for flanges and flanged fittings

Casting	Tensile strength, minimum	Sulphur, maximum
	Lbs./in. ²	Per cent
Light.....	20,000	0.12
Medium.....	21,000	.12
Heavy.....	24,000	.12

Light castings are those having any section less than ½-inch thickness.

Heavy castings are those in which no section is less than 2 inches in thickness.

Medium castings are those not included in either of the above classes.

5. *Facing.*—All 125-pound cast-iron flanges and flanged fittings shall be plain faced; that is, without projection or raised face.

An inspection limit of plus or minus one thirty-second inch shall be allowed on all center to contact surface dimensions for sizes up to and including 10 inches and plus or minus one-sixteenth inch on sizes larger than 10 inches. An inspection limit of plus or minus one-sixteenth inch shall be allowed on all contact surface to contact surface dimensions for sizes up to and including 10 inches and plus or minus one-eighth inch on sizes larger than 10 inches.

6. *Bolting.*—Drilling templates are in multiples of four, so that fittings may be made to face in any quarter.

Bolt holes shall straddle the center line. For bolts smaller than 1¼ inches the bolt holes shall be drilled one-eighth inch larger in diameter than the nominal size of the bolt. Holes for bolts 1¼ inches and larger shall be drilled one-fourth inch larger than nominal diameter of bolts.

Bolts shall be of steel with standard rough square heads and the nuts shall be of steel with standard rough hexagonal dimensions; all as given in the Tentative American Standard on wrench head bolts and nuts and wrench openings. For bolts, 1¼ inches in diameter and larger, bolt studs with a nut on each end are recommended.

Hexagonal nuts for pipe sizes 1 to 48 inches can be conveniently pulled up with open wrenches of minimum design of heads. Hexagonal nuts for pipe sizes 48 to 96 inches can be conveniently pulled up with box wrenches.

7. *Spot facing.*—The bolt holes of 125-pound cast-iron flanges and flanged fittings shall not be spot faced for ordinary service. When required the flanges and fittings in sizes 36 inches and larger may be spot faced or back faced to the minimum thickness of flange with a plus tolerance of one-eighth inch.

8. *Reducing fittings.*—Reducing elbows and side outlet elbows carry same dimensions center to face as straight size elbows corresponding to the size of the larger opening.

Tees, side outlet tees, crosses, and laterals, sizes 16 inches and smaller, reducing on the outlet or branch, have the same dimension, center to face and face to face as straight size fittings corresponding to the size of the larger opening. Sizes 18 inches and larger, reducing on the outlet or branch, are made in two lengths depending on the size of the outlet as given in the tables of dimensions.

Tees, crosses, and laterals, reducing on the run only, have the same dimensions center to face and face to face as straight size fittings corresponding to the size of the larger opening.

Reducers and eccentric reducers for all reductions have the same face-to-face dimensions for the larger opening as given in Table 7.

Reducing fittings listed in this standard shall be ordered by the designation of the outlets in their proper sequence as indicated in the sketches for steel flanged fittings. (See 607.4, p. 467.)

Special double branch elbows, whether straight or reducing, have the same dimension center to face

as straight size elbows corresponding to the size of the larger opening.

Side outlet elbows and side outlet tees shall have all openings on intersecting center lines.

9. *Elbows.*—Special degree elbows ranging from 1 to 45° inclusive have the same center to face dimension given for 45° elbows and those over 45° and up to 90°, inclusive, shall have the same center to face dimensions given for 90° elbows. The angle designation of an elbow is its deflection from straight line flow and is the angle between the flange faces.

10. *True Y's.*—The dimensions of true Y's straight sizes, are given in Table 6. Other forms are considered special and should be made to suit conditions.

11. *Laterals.*—Laterals (Y branches), both straight and reducing, sizes 8 inches and larger, shall be reinforced to compensate for the inherent weakness in the casting design.

(Illustrations showing method of designating outlets of reducing fittings when ordering are identical with those for steel flanged fittings 250, 400, 600, 900, and 1,350 pounds, except that in this case there is no provision for the raised face required for higher steam pressure steel flanged fittings. See 607.4, p. 467.)

TABLE 2.—*Templates for drilling*

96	113¼	4¼	108½	68	2¼	2½	11½	-----	205.56	5,415	96 by 106¼

¹ All 125-pound cast-iron standard flanges have a plain face.

² Drilling templates are in multiples of 4, so that fittings may be made to face in any quarter, and bolt holes straddle the center line. For bolts smaller than 1¾ inches the bolt holes shall be drilled ¼ inch larger in diameter than the nominal diameter of the bolt. Holes for bolts 1¾ inches and larger shall be drilled ¼ inch larger than nominal diameter of bolts.

³ The bolt holes on cast-iron flanged fittings are not spot faced for ordinary service. When required, the fittings and flanges in sizes 36 inches and larger can be spot faced or back faced, so that standard length bolts can be used.

⁴ Bolts shall be of steel with standard rough square heads, and the nuts shall be of steel with standard rough hexagonal dimensions; all as given in the American Tentative Standard on wrench head bolts and nuts, and wrench openings. For bolts 1¾ inches diameter and larger, bolt studs with a nut on each end are recommended. Hexagonal nuts for pipe sizes 1 inch to 48 inches can be conveniently pulled up with open wrenches of minimum design of heads. Hexagonal nuts for pipe sizes 48 inches to 96 inches can be conveniently pulled up with box wrenches.

⁵ The stress shown is that of internal pressure only, assumed to act on a circular area equal in diameter to the outside diameter of a ring gasket covering the flange to the inside of bolts.

⁶ Outside diameter.

42	53	2½	-----	-----	-----	-----	1,470
48	59½	2½	-----	-----	-----	-----	2,000

¹ All 125-pound standard flanges have a plain face.
² Sizes 14 inches and larger are to be used with outside diameter pipe of the same sizes.
³ All blind flanges for sizes 12 inches (19 inches outside diameter) and larger must be dished, with inside radius equal to the port diameter.
⁴ This column is the same as column for effective thread (E) in Table 1 of the American Pipe Thread Standard, published by the American Standards Association except in sizes 1¼, 1½, and 2 inches.
⁵ All weights listed are for flanges faced only, based upon minimum thicknesses given in the table above without allowances for variation. Cast iron is considered to weigh 0.26 pound per cubic inch.
⁶ Outside diameter.

TABLE 4.—Dimensions of elbows

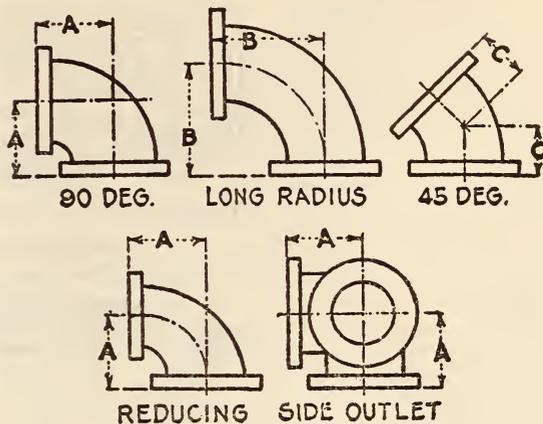

FIGURE 224.—Dimensions of elbows

[All dimensions given in inches]

Nominal pipe size ¹	Center to face elbow ^{1,4}	Center to face long radius elbow ^{2,3,4}	Center to face 45° elbow ³	Diameter of flange	Thickness of flange (minimum)	Metal thickness of body (minimum)

42	31	56½	21	53	2½	1½
48	34	64	24	59½	2½	2

¹ Size of all fittings listed indicates nominal inside diameter of port.
² Reducing elbows and side outlet elbows carry same dimensions center to face as straight size elbows, corresponding to the size of the larger opening.
³ Special degree elbows, ranging from 1° to 45° inclusive, have the same center to face dimensions given in 45° elbows and those over 45° and up to 90° inclusive shall have the same center to face dimensions given for 90° elbows. The angle designation of an elbow is its deflection from straight line flow and is the angle between the flange faces.
⁴ Side outlet elbows shall have all openings on intersecting center lines.
⁵ Outside diameter.

TABLE 5.—Dimensions of tees and crosses (straight sizes)

18	12	13	26	15½
20	14	14	28	17
24	16	15	30	19
30	20	18	36	23
36	24	20	40	26

¹ Short body patterns are used for sizes 18 inches and larger.
² Long body patterns are used when outlets are larger than given in the above table, and, therefore, have the same dimensions as straight size fittings.
³ In a side outlet tee the larger of the 2 side outlets governs the center to face dimension "J."
⁴ Outside diameter.
⁵ Fittings reducing on the run only carry same dimensions center to face and face to face as straight size fittings corresponding to size of the larger opening. Tees increasing on outlet, known as bull head tees, will have same center to face and face to face dimensions as a straight fitting of the size of the outlet. For example, a 12 by 12 by 18 inch tee will be governed by the dimensions of the 18-inch long body tee given in Table 5, namely, 16½ inches center to face of all openings and 33 inches face to face.
⁶ Side outlet tees, with outlet at 90° or any other angle, straight or reducing, carry same dimensions center to face and face to face as regular tees having same reductions.

42	-----	-----	-----	-----	42	53	2¾	1¾
48	-----	-----	-----	-----	48	59½	2¾	2

¹ Size of all fittings listed indicates nominal inside diameter of port.² Laterals both straight and reducing sizes 8 inches and larger, should be reinforced to compensate for the inherent weakness in the casting design.³ Laterals, 16 inches and smaller, reducing on the outlet or branch, use the same dimensions center to face and face to face as straight size fittings corresponding to size of the larger opening. Sizes 18 inches and larger, reducing on the outlet or branch, are made in 2-lengths depending on the size of the outlet as given in Table 8.⁴ Laterals, reducing on the run only, carry same dimensions center to face and face to face as straight size fittings corresponding to size of the larger opening.⁵ Reducers, and eccentric reducers, for all reductions, use the same face to face dimensions given in the above table of dimensions for the larger opening.⁶ Outside diameter.

TABLE 8.—Reducing laterals (short body pattern) ¹

30	14	39	39		42

¹ Long body patterns shall be used for fittings which are reducing on the run only.

² All reducing fittings, 1 to 16 inches inclusive, have the same center to face dimensions as straight size fittings.

³ Laterals both straight and reducing sizes, 8 inches and larger, shall be reinforced to compensate for the inherent weakness in the casting design.

⁴ Size of all fittings listed indicates nominal inside diameter of port.

⁵ Long body patterns are used when branches are larger than given in the above table, therefore have same dimensions as straight size fittings.

⁶ Outside diameter.

TABLE 9.—Dimensions of base elbows and base T's ^{1 2 3}

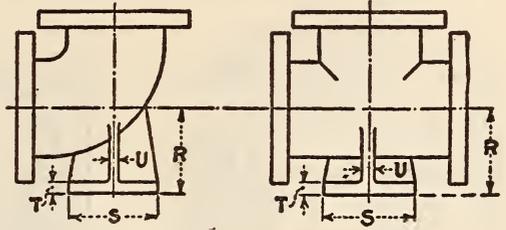

FIGURE 229.—Base elbows and base T's

[All dimensions given in inches]

20	16	13½	1½	1½	8
24	18½	13½	1½	1½	8

¹ Bases, when drilled, should be drilled to the template of the flange of the supporting pipe size.

² Dimensions for base fittings apply to straight and reducing sizes, and long and short body patterns.

³ Bases not finished unless so ordered.

⁴ For sizes larger than 24 inches, anchorage fittings are recommended.

⁵ Dimensions center to base is the same as the center to base for anchorage fittings for the same size fittings.

⁶ Size of base determined by size of largest opening of fitting.

⁷ Outside diameter.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN STANDARD CAST-IRON PIPE FLANGES AND FLANGED FITTINGS FOR MAXIMUM WORKING SATURATED STEAM PRESSURE OF 250 POUNDS PER SQUARE INCH (GAGE), B16b-1928

[Approved as American standard by the American Standards Association, 6¹ February, 1928]

CAST-IRON PIPE FLANGES AND FLANGED FITTINGS, 250 POUNDS PER SQUARE INCH

(This specification is identical with A. S. M. E., B16a, given above, except in the following particulars:)

INTRODUCTORY NOTES

1. *Sizes.*—The sizes of the fittings in the following tables will be identified by the corresponding nominal pipe size. This nominal pipe size is the same as the port diameter of fittings for pipe having inside diameters of 12 inches and smaller. For pipe 14 inches and larger the corresponding outside diameter of the pipe is given, and consequently the fittings will have a smaller port diameter.

2. *Pressure rating.*—It is recommended that in addition to the maximum working steam pressure

⁶² Sponsor organizations: American Society of Mechanical Engineers, Manufacturers' Standardization Society of Valve and Fittings Industry, and Heating and Piping Contractors' National Association.

for which these fittings are intended, the sizes 10 inches and smaller may also be used for maximum nonshock working hydraulic pressure of 325 pounds per square inch at a temperature of 250° F., and for maximum nonshock working hydraulic pressures of 400 pounds per square inch at or near the ordinary range of air temperatures.

3. *Marking.*—All fittings must have marks cast on them indicating the manufacturer and the figures 250 indicating the maximum working steam pressure for which the fittings are intended.

5. *Facing.*—All 250-pound cast-iron flanges and flanged fittings shall have a raised face one-sixteenth inch high of the diameters given in Table 2. The raised face is included in the minimum flange thickness and center to face dimensions.

6. *Bolting.*—Hexagonal nuts for pipe sizes 1 to 16 inches can be conveniently pulled up with open wrenches of minimum design of heads. Hexagonal nuts for pipe sizes 18 to 48 inches can be conveniently pulled up with box wrenches.

7. *Spot facing.*—The bolt holes of 250-pound cast-iron flanged fittings and flanges shall not be spot faced for ordinary service. When required, the fittings and flanges in sizes 36 inches and larger may be spot faced or back faced, to the minimum thickness of flanges with a plus tolerance of one-eighth inch.

(Illustrations showing method of designating outlets of reducing fittings when ordering are identical with those for steel-flanged fittings 250, 400, 600, 900, and 1,350 pounds. (See 607.4, p. 467.)

TABLE 2.—*Templates for drilling*

[All dimensions given in inches]

Nominal pipe size	Diameter of flange	Thickness of flange (minimum) ¹ 2	Diameter of raised face	Diameter of bolt circle	Number of bolts ³	Diameter of bolts	Diameter of drilled bolt holes ³	Length of bolts ⁴	Length of bolt studs with 2 nuts ⁵	Total effective area bolt metal	Stress pounds per square inch bolt metal ⁶	Size of ring gasket

¹ All 250-pound cast-iron standard flanges have a 1/16-inch raised face. This raised face is included in the face-to-face, center-to-face, and the minimum thickness of flange dimensions.

² For tongue-groove and male-female facings it is recommended that the dimensions given in Table 5 of the American tentative standards for steel pipe flanges and flanged fittings be used.

³ Drilling templates are in multiples of 4, so that fittings may be made to face in any quarter, and bolt holes straddle the center line. For bolts smaller than 1 3/8 inch the bolt holes shall be drilled 1/8 inch larger in diameter than the nominal size of the bolt. Holes for bolts 1 3/8 inches and larger shall be drilled 1/4 inch larger than nominal diameter of bolts.

⁴ The bolt holes on cast-iron flanged fittings are not spot faced for ordinary service. When required, the fittings and flanges in sizes 36 inches and larger can be spot faced or back faced, so that standard length bolts can be used.

⁵ Bolts shall be of steel with standard rough square heads and the nuts shall be of steel with standard rough hexagonal dimensions; all as given in the American tentative standard on wrench head bolts and nuts, and wrench openings. For bolts 1 3/4 inches diameter and larger, bolt-studs with a nut on each end are recommended. Hexagonal nuts for pipe sizes 1 to 16 inches can be conveniently pulled up with open wrenches of minimum design of heads. Hexagonal nuts for pipe sizes 18 to 48 inches can be conveniently pulled up with box wrenches.

⁶ The stress shown is that of internal pressure only assumed to act on a circular area equal in diameter to the outside diameter of the raised face.

⁷ Outside diameter.

(Illustrations showing dimensions of screwed companion and blind flanges are identical with those for 250-pound steel flanges. See 607.4, p. 465.)

TABLE 3.—Dimensions and theoretical weights (pounds) of screwed companion and blind flanges¹

¹ All 250-pound cast-iron standard flanges have a $\frac{1}{16}$ -inch raised face. This raised face is included in the minimum thickness of flange dimensions.

² Sizes 14 inches and larger are to be used with outside diameter pipe of the same sizes.

³ All blind flanges for sizes 10 inches (17 $\frac{1}{2}$ inches outside diameter) and larger must be dished, with inside radius equal to the port diameter.

⁴ This column is the same as column for effective thread (E) in Table 1 of the American Pipe Thread Standard, published by the American Standards Association except in sizes 1 $\frac{1}{4}$, 1 $\frac{1}{2}$, and 2 inches.

⁵ All weights listed are for flanges faced only, based upon minimum thicknesses given in the table above without allowances for variation. Cast iron is considered to weigh 0.26 pound per cubic inch.

⁶ Outside diameter.

TABLE 4.—Dimensions of elbows

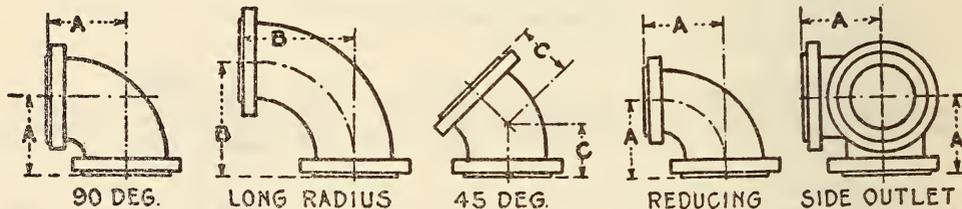

FIGURE 232

[All dimensions given in inches]

Nominal pipe size	Minimum inside diameter of fitting	Center to face to elbow ^{1,2,3,4}			Diameter of flange	Thickness of flange (minimum) ¹	Diameter of raised face ¹	Metal thickness of body (minimum)

¹ All 250-pound cast-iron standard flanges have a $\frac{1}{16}$ -inch raised face. This raised face is included in the face-to-face, center-to-face, and the minimum thickness of flange dimensions.

² Reducing elbows and side-outlet elbows carry the same dimensions center to face as regular straight size-elbows corresponding to the size of the larger opening.

³ Special degree elbows ranging from 1° to 45° inclusive have the same center-to-face dimensions given for 45° elbows, and those over 45° and up to 90° inclusive shall have the same center-to-face dimensions given for 90° elbows. The angle designation of an elbow is its deflection from straight-line flow and is the angle between the flange faces.

⁴ Side-outlet elbows shall have all openings on intersecting center lines.

⁵ Outside diameter.

(Illustrations showing dimensions of tees and crosses (straight sizes) are identical with those for 125-pound cast-iron fittings (see fig. 227) except for the addition, in the case of 250-pound fittings, of lines showing raised faces, similar to the raised faces shown in the illustrations accompanying Table 4 in this specification.)

¹ Tees, side-outlet tees, and crosses, 16 inches and smaller, reducing on the outlet, have the same dimensions center to face, and face to face as straight-size fittings, corresponding to the size of the larger opening. Sizes 18 inches and larger, reducing on the outlet, are made in two lengths, depending on the size of the outlet as given in Table 6.

² All 250-pound cast-iron standard flanges have a 1/16-inch raised face. This raised face is included in the face-to-face, center-to-face, and the minimum thickness of flange dimensions.

³ Tees and crosses, reducing on run only, carry same dimensions center to face and face to face as straight-size fittings corresponding to size of the larger opening.

(Illustrations showing dimensions of reducing tees and reducing crosses (short-body patterns) are identical with those for 125-pound cast-iron fittings (see fig. 226) except for the addition, in the case of 250-pound fittings, of lines showing raised faces,

similar to the raised faces shown in the illustrations accompanying Table 4 in this specification.)

TABLE 6.—Dimensions of reducing tees and reducing crosses (short-body patterns) ^{1 2 3}

24	16	17	34	21½
30	20	20½	41	25½

¹ All above reducing fittings, 1 to 16 inches inclusive, have the same center-to-face dimensions as straight fittings of the larger size.

² Fittings reducing on the run only carry same dimensions center to face and face to face as straight fittings corresponding to size of the larger opening. Tees increasing on outlet, known as bull-head tees, will have same center-to-face and face-to-face dimensions as a straight fitting of the size of the outlet. For example: A 12 by 12 by 18 inch tee will be governed by the dimensions of the 18-inch long-body tee, given in Table 5; namely 18 inches center to face of all openings and 36 inches face to face.

³ Short-body patterns are used for sizes 18 inches and larger.

⁴ Long-body patterns are used when outlets are larger than given in the above table, and, therefore have the same dimensions as straight-size fittings.

⁵ All 250-pound cast-iron standard flanges have a 1/16-inch raised face. This raised face is included in the face-to-face, center-to-face, and the minimum thickness of flange dimensions.

⁶ In a side-outlet tee the larger of the two side outlets governs the center to face dimension J.

⁷ Outside diameter.

(Illustrations showing dimensions of laterals, reducers, and true Y's (straight sizes) are identical with those for 125-pound cast-iron fittings (see fig. 227) except for the addition, in the case of 250-pound fittings, of lines showing raised faces, similar to the raised faces shown in illustrations accompanying Table 4 in this specification.)

TABLE 7.—Dimensions of laterals, reducers, and true Y's (straight sizes)

[All dimensions given in inches]

30	29	-----	-----	-----	-----	30	43	3	37¾	2

¹ All 250-pound cast-iron standard flanges have a ¼-inch raised face. This raised face is included in the face-to-face, center-to-face, and the minimum thickness of flange dimensions.

² Laterals, both straight and reducing, sizes 8 inches and larger, shall be reinforced to compensate for the inherent weakness in the casting design.

³ Laterals, 16 inches and smaller, reducing on the outlet or branch, use the same dimensions center-to-face and face-to-face as straight-size fittings corresponding to size of the larger opening. Sizes 18 inches and larger reducing on the outlet or branch, are made in two lengths depending on the size of the outlet as given in Table 8.

⁴ Laterals, reducing on the run only, carry same dimensions center-to-face and face-to-face as straight-size fittings corresponding to size of the larger opening.

⁵ Reducers and eccentric reducers, for all reductions, use the same face-to-face dimensions given in the above table of dimensions for the larger opening.

⁶ Outside diameter.

(Illustrations showing dimensions of reducing laterals (short-body pattern) are identical with those for 125-pound cast-iron fittings (see fig. 228) except for the addition, in the case of 250-pound fittings, of lines showing raised faces, similar to the raised faces shown in illustrations accompanying Table 4 in this specification.)

cast-iron fittings (see fig. 229) except for the addition, in the case of 250-pound fittings, of lines showing raised faces, similar to the raised faces shown in illustrations accompanying Table 4 in this specification.)

TABLE 8.—Dimensions of reducing laterals (short-body pattern)

¹ Outside diameter.

(Notes are identical with those for 125-pound fittings, with the following addition:) All 250-pound cast-iron standard flanges have a ¼-inch raised face. This raised face is included in the face-to-face, center-to-face, and the minimum thickness of flange dimensions.

(Illustrations showing dimensions of base elbows and base tees are identical with those for 125-pound

TABLE 9.—Dimensions of base elbows and base tees

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, CAST-IRON PIPE FLANGES AND FLANGED FITTINGS FOR MAXIMUM NON-SHOCK WORKING HYDRAULIC PRESSURE OF 800 POUNDS PER SQUARE INCH (GAGE), AT ORDINARY AIR TEMPERATURES, B16b1-1931

[Approved by American Standards Association⁴⁴ as American Standard B16b1-1931]

CAST-IRON PIPE FLANGED FITTINGS, 800-POUND

INTRODUCTORY NOTES

1. *Sizes.*—The sizes of the fittings in the following tables will be identified by the corresponding "nominal pipe size."

2. *Pressure rating.*—This standard shall be known as the "American 800-pound hydraulic cast-iron flange standard," said pressure designation being the recommended rating at ordinary air temperatures.

3. *Marking.*—All fittings shall have marks cast, engraved, or otherwise permanently attached identifying the manufacturer and including the figures "800," together with a suitable mark indicating that this is not a steam rating.

(This section will be revised later to harmonize with the system which is being developed by subcommittee No. 8 on marking of the sectional committee on pipe flanges and fittings.)

4. *Materials.*—The dimensions prescribed in this standard are based on gray iron castings of high quality produced under regular control of chemical and physical properties by a recognized process. The manufacturer shall be prepared to certify that his product has been so produced and that the

⁴⁴ Sponsor organizations; American Society of Mechanical Engineers, Heating and Piping Contractors National Association, and Manufacturers' Standardization Society of the Valve and Fittings Industry.

chemical and physical properties thereof, as proved by test specimens, are equal at least to the minimum requirements specified in A. S. T. M. Specifications A-126-30 for class B, higher strength gray iron, viz:

Sulphur, maximum.....per cent..	0.12
Phosphorus, maximum.....do.....	.75
Tensile strength, minimum.....lbs./in. ² ..	30,000

5. *Facing.*—All 800-pound cast-iron flanges and flanged fittings shall have a ¼-inch raised face not included in the flange thickness and of a diameter shown in Table 1. The illustrations above Table 1 show the application of raised face and male-female facings.

6. *Bolting.*—Drilling templates are in multiples of four, so that fittings may be made to face in any quarter.

Bolt holes shall straddle the center line. All bolt holes shall be drilled one-eighth inch larger in diameter than the nominal size of the bolt.

Bolts may be of steel or wrought iron with "rough square heads," and hexagon nuts.

7. *Spot facing.*—The bolt holes of 800-pound cast-iron flanges and flanged fittings need not be spot faced, unless so ordered.

8. *Reducing fittings.*—All reducing fittings, whether ells, tees, crosses, or reducers, and all double branch and side outlet fittings, shall have the same center to face and face to face dimensions throughout as for the largest opening.

9. *Elbows.*—Special degree elbows ranging from 1° to 45°, inclusive, shall have the same center to face dimension given for 45° elbows, and those over 45° and up to 90°, inclusive, shall have the same center to face dimensions given for 90° elbows. The angle designation of an elbow is its deflection from straight line flow and is the angle between the flange faces.

10. *Laterals.*—The use of this type of fitting when made of cast iron is discouraged. Where necessary use should be made of 600-pound steel-flanged laterals (B16e-1928) of which the flange dimensions and bolting are interchangeable with this standard

TABLE 1.—Facing dimensions for the American 800-pound hydraulic cast-iron flanges

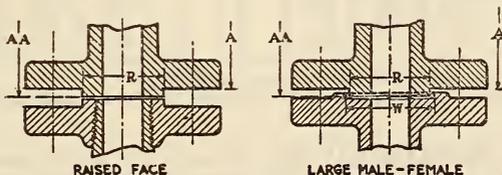

FIGURE 233.—800 pound hydraulic cast iron flanged fittings

[All dimensions given in inches]

Nominal pipe size	Inside diameter of fitting	Outside diameter of male ¹ R	Outside diameter of large female W	Metal thickness of fitting (minimum)	Outside diameter of flange	Thickness of flange (minimum) ^{1, 2}	Diameter of bolt circle	Number of bolts	Size of bolts	Diameter of bolt holes
2	2	3½	3¼	⅝	6½	1¼	5	8	⅝	¾
2½	2½	4½	4¼	⅝	7½	1½	5½	8	¾	⅞
3	3	5	5¼	⅝	8¼	1½	6½	8	¾	⅞
3½	3½	5½	5¼	¾	9	1½	7¼	8	⅞	1
4	4	6¼	6¼	¾	10¾	1½	8½	8	⅞	1
5	5	7¼	7¾	1½	13	2½	10½	8	1	1½
6	6	8½	8¼	1½	14	2¼	11½	12	1	1½
8	7½	10½	10¼	1½	16½	2½	13¾	12	1½	1½

¹ The raised face of 1/4 inch is not included in "Thickness of flange (minimum)."

² "Flange edge to flange edge" dimensions on tees and crosses are double the "Center to flange edge" dimensions given in the above table.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN TENTATIVE STANDARD CAST-IRON PIPE FLANGES AND FLANGED FITTINGS FOR MAXIMUM WORKING SATURATED STEAM PRESSURE OF 25 POUNDS PER SQUARE INCH (GAGE), B16b2-1931

[Approved as American Tentative Standard by the American Standards Association,⁶⁵ April, 1931]

CAST-IRON PIPE FLANGES AND FLANGED FITTINGS 25 POUNDS PER SQUARE INCH

INTRODUCTORY NOTES

1. *Size.*—The term size is used in all the following tables to indicate the nominal inside diameter of port.

2. *Pressure rating.*—It is recommended that in addition to the maximum working saturated steam

pressure for which these fittings are intended, the sizes 36 inches and smaller may also be used for maximum nonshock working hydraulic pressure of 43 pounds per square inch (gauge), or a maximum gas pressure of 25 pounds per square inch (gauge), at or near the ordinary range of air temperatures.

3. *Marking.*—All fittings must have marks cast on them indicating the manufacturer and the figures 25 indicating the maximum working steam pressure for which the fittings are intended.

4. *Material.*—The dimensions prescribed in this standard are based upon gray iron castings of high quality produced under regular control of chemical and physical properties by a recognized process. The manufacturer shall be prepared to certify that his product has been so produced and that the chemical and physical properties thereof, as proved by test specimens, are at least equal to the minimum requirements specified in A. S. T. M. specifications A-126 for class A, regular gray iron (see 611.11, p. 637), viz:

Sulphur, maximum.....	per cent.....	0.12
Phosphorus, maximum.....	do.....	.75
Tensile strength, minimum.....	lbs./in. ²	21,000

⁶⁵ Sponsor organizations: American Society of Mechanical Engineers, Manufacturers' Standardization Society of Valve and Fittings Industry, and Heating and Piping Contractors' National Association.

5. *Dimensions.*—The flange diameters, bolt circles, and number of bolts are the same as for the 125-pound American standard A. S. A. B16a-1928), given above, with a reduction in the thickness of flanges and bolt diameters as shown in Table 3, thereby maintaining interchangeability between the two standards.

The center to face and face to face dimensions of fittings are the same as for the 125-pound American standard cast-iron flanged fittings.

6. *Facing.*—All 25-pound cast-iron flanges and flanged fittings shall be plain faced; that is, without projection or raised face.

An inspection limit of plus or minus one-sixteenth inch shall be allowed on all center to face dimensions, and plus or minus one-eighth inch on all face to face dimensions.

7. *Bolting.*—Drilling templates are in multiples of four, so that fittings may be made to face in any quarter.

Bolt holes shall straddle the center line, and are drilled one-eighth inch larger in diameter than the nominal size of the bolt.

Bolts shall be of steel with standard rough square heads and the nuts shall be of steel with standard rough hexagonal dimensions.

8. *Spot facing.*—The bolt holes of 25-pound cast-iron flanges and flanged fittings shall not be spot faced for ordinary service. When required the

flanges and fittings in sizes 36 inches and larger may be spot faced or back faced to the minimum thickness of flange with a plus tolerance of one-eighth inch.

9. *Reducing fittings.*—(Same as for steam pressure of 125 pounds per square inch in B16a-1928, given above, except that in B16b2-1931 no reference is made to laterals, reducers, or eccentric reducers.)

10. *Elbows.*—(Same as for steam pressure of 125 pounds per square inch in B16a-1928, given above, with the following additional requirement:)

Where long radius fittings are specified it has reference only to elbows, which are made in two center to face dimensions and known as elbows and long radius elbows, the latter being used only when so specified.

11. *Screwed companion flanges.*—Screwed companion flanges shall not be thinner than the 125-pound American standard thickness on sizes 24 inches and smaller. Other types of flanges may have thicknesses as given in the table.

(Illustrations showing method of designating outlets of reducing fittings when ordering are identical with those for steel flanged fittings 250, 400, 600, 900, and 1,350 pounds, except that in this case reducing laterals are omitted and there is no provision for the raised face required for higher steam pressure steel flanged fittings. See 607.4, p. 467.)

TABLE 1.—*Templates for drilling*

[All dimensions given in inches]

84	2 3/4	1 1/4	1 3/8	7 1/4	57.14	3,005	84 by 94 1/4			
96	3	1 1/4	1 3/8	7 3/4	60.57	3,705	96 by 107 1/4			

1 All 25-pound cast-iron standard flanges have plain faces.

2 Screwed companion flanges "should not be thinner than the '125-pound American standard' thickness on sizes 24 inches and smaller. Other types of flanges may have thicknesses as given in the table above."

3 Drilling templates are in multiples of 4, so that fittings may be made to face in any quarter, and bolt holes straddle the center line. Bolt holes are drilled 1/8 inch larger in diameter than the nominal diameter of the bolt.

4 The bolt holes on cast-iron flanged fittings are not spot faced for ordinary service. When required, the fittings and flanges in sizes 36 inches and larger may be spot faced or back faced to minimum thickness of flange with a plus tolerance of 1/8 inch, so that standard length bolts can be used.

5 Bolts shall be of steel with standard rough square heads and the hexagon nuts shall be of steel with United States standard dimensions.

6 The stress shown is that of internal pressure only, assumed to act on a circular area equal in diameter to the outside diameter of a ring gasket covering the flange to the inside of bolts.

(Illustrations showing dimensions of elbows are identical with those for 125-pound cast-iron flanged fittings, in B16a, fig. 224, except that the side outlet is omitted in this specification.)

TABLE 2.—Dimensions of elbows

[All dimensions given in inches]

Nominal pipe size ¹	Center to face elbow ^{3 4 5}	Center to face long radius elbow	Center to face 45° elbow ³	Diameter of flange	Thickness of flange (minimum) ⁶	Metal thickness of body (minimum)
	A	B	C			
4					3/4	0.42
5					3/4	.44
6					3/4	.44
8					3/4	.46
10					7/8	.50
12	Dimensions identical with those for 125-pound cast-iron flanged fittings.				1	.54
14				1 1/8	.57	
16				1 1/8	.60	
18				1 1/4	.64	
20				1 1/4	.67	
24				1 3/8	.76	
30	1 3/2	.88				
36	1 3/2	.99				
42	1 3/4	1.10				
48				2	1.26	
54	39	71 1/2	27	66 1/4	2 1/4	1.35
60	44	79	30	73	2 1/4	1.39
72	53	94	36	86 1/2	2 1/2	1.62

¹ Size of all fittings listed indicates nominal inside diameter of port.

² The flange diameters, bolt circles, and number of bolts are the same as the 125-pound American standard (A. S. A. B16a-1928) with a reduction in the thickness of flanges and the bolt diameters as shown in Table 1, thereby maintaining interchangeability with the 125-pound American standard flanges.

³ The center to face dimensions of fittings are the same as the 125-pound American standard cast-iron flanged fittings.

⁴ Special degree elbows ranging from 1° to 45° inclusive shall have the same center to face dimensions given in 45° elbows, and those over 45° and up to 90° inclusive shall have the same center to face dimensions as given for 90° elbows. The angle designation of an elbow is its deflection from straight line flow and is the angle between the flange faces.

⁵ Side outlet elbows and side outlet tees shall have all openings on intersecting center lines.

⁶ Screwed companion flanges should not be thinner than the 125-pound American standard thickness on sizes 24 inches and smaller. Other types of flanges may have thicknesses as given in the table above.

(Illustrations showing dimensions of tees and crosses (straight sizes) are identical with those for 125-pound cast-iron flanged fittings in B16a, fig. 225.)

TABLE 3.—Dimensions of tees and crosses (straight sizes)

[All dimensions given in inches]

Nominal pipe size	Center to face tee and cross ^{1 2}	Face to face tees and crosses ¹	Diameter of flange	Thickness of flange, (minimum)	Metal thickness of body (minimum)
	A	AA			
4	6 1/2	13	9

36	28	56	46		
42	31	62	53		
48	34	68	59 1/2		
54	39	78	66 1/4		
60	44	88	73		
72	53	106	86 1/2		

(Notes same as for elbows in Table 2, except that Note 3 includes face-to-face dimensions, and for notes 4 and 5 in Table 2, substitute the following:)

¹ Tees, side outlet tees, and crosses, 16 inches and smaller, reducing on the outlet, have the same dimensions center to face and face to face as straight size fittings, corresponding to the size of the larger opening. Sizes 18 inches and larger, reducing on the outlet, are made in two lengths, depending on the size of the outlet as given in Table 4.

² Tees and crosses, reducing on run only, carry same dimensions center to face and face to face as a straight size fitting of the larger opening.

(Illustrations showing dimensions of reducing tees and reducing crosses (short body patterns) are identical with those for 125-pound cast-iron flanged fittings in B16a, fig. 226, except that the side outlet type is omitted in this specification.)

TABLE 4.—Dimensions of reducing tees and reducing crosses (short body patterns)

[All dimensions given in inches]

Nominal pipe size	Size of outlet and smaller	Center to face run	Face to face run	Center to face outlet
		H	HH	J
All reducing fittings sizes 16 inches and smaller have same center to face dimensions as straight size fittings				
18	Dimensions identical with those for 125-pound cast-iron flanged fittings.

54	4,565	3,970	7,500	6,250	6,880
60	6,000	5,140	9,675	8,000	10,250
72	9,320	7,525	14,175	12,150	13,450

¹ All weights listed are for fittings faced and drilled, based upon minimum thicknesses and dimensions given in preceding table without allowances for variation. Cast iron is considered to weigh 0.26 pound per cubic inch.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN TENTATIVE STANDARD CAST-IRON SCREWED FITTINGS FOR MAXIMUM WORKING SATURATED STEAM PRESSURES OF 125 AND 250 POUNDS PER SQUARE INCH (GAGE), B16d-1927

[Approved as American Tentative Standard by the American Standards Association,⁶⁶ December, 1927]

CAST-IRON SCREWED FITTINGS

INTRODUCTORY NOTES

1. *Pressure ratings.*—These standards shall be known as the American 125 and 250 pound cast-

⁶⁶ Sponsor organizations: American Society of Mechanical Engineers, Manufacturers' Standardization Society of Valve and Fittings Industry, and Heating and Piping Contractors, National Association.

iron screwed fittings standards, said pressure designation being the recommended maximum working saturated steam rating.

2. *Size.*—The size of the fittings scheduled in the following tables is identified by the corresponding nominal pipe size. For pipe 14 inches and larger, the corresponding outside diameter of the pipe is given.

In the case of reducing tees and crosses, the size of the largest run opening shall be given first, followed by the size of the opening at the opposite end of the run. Where the fitting is a tee, the size of the outlet is given next. Where the fitting is a cross, the largest opening of outlet is the third dimension given followed by the opening opposite. The straight line sketches (fig. 257) illustrate how the reducing fittings are read.

3. *Marking.*—Each fitting of the American 125-pound cast-iron screwed fitting standard shall be marked for identification with the maker's name or symbol.

Each fitting of the American 250-pound cast-iron screwed fitting standard shall be marked for identification by means of (a) maker's name or symbol, and (b) the numerals 250.

(In respect to metal thickness, threading, ribs, and fittings dimensions, this specification conforms to the A. S. M. E. specification for malleable iron screwed fittings, B16c (see 607.2, p. 422), except that in B16d laterals are omitted, there is no reference to the chamfering of male threads, and the inspection limits for center to end dimensions are as follows:)

Inspection limits for center to end dimensions

[All dimensions given in inches]

Nominal pipe size.....	¼	⅜	½	¾	1	1¼	1½	2	2½	3
Center to end±.....	0.04	0.05	0.06	0.06	0.07	0.07	0.08	0.08	0.10	0.10
Nominal pipe size.....		3½	4	5	6	8	10	12	14	16

¹ Outside diameter.

The 250-pound standard for screwed fittings covers only the straight sizes of 90° and 45° elbows, tees, and crosses.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN STANDARD CAST-IRON LONG-TURN SPRINKLER FITTINGS (SCREWED AND FLANGED) FOR MAXIMUM HYDRAULIC WORKING PRESSURES OF 150 AND 250 POUNDS PER SQUARE INCH (GAGE), B16g-1929

[Approved as American Standard by the American Standards Association, 6⁷ April, 1929]

CAST-IRON LONG-TURN SPRINKLER FITTINGS

INTRODUCTORY NOTES

1. *Pressure ratings.*—These standards shall be known as the American 150 and 250 pound cast-iron long-turn sprinkler fittings, said pressure designations being the maximum recommended ratings.

The following momentary test pressures shall be applied by insurance companies, underwriters, etc., only when passing upon the acceptability of this material for sprinkler service. This test shall

⁶⁷ Sponsor organizations: American Society of Mechanical Engineers, Manufacturers' Standardization Society of Valve and Fittings Industry, and Heating and Piping Contractors National Association.

be applied to representative fittings selected at random, the fittings being tested to destruction.

The 150-pound fittings, sizes 2½ to 6 inches, inclusive, shall be able to resist a momentary pressure of 750 pounds per square inch and the 8-inch size shall be able to resist a momentary pressure of 600 pounds per square inch.

The 250-pound fittings, sizes 2½ to 6 inches, inclusive, shall be able to resist a momentary pressure of 1,250 pounds per square inch and the 8-inch size shall be able to resist a momentary pressure of 1,000 pounds per square inch.

2. *Size.*—The term size shall be used in all the following tables to indicate the nominal inside diameter of port. These specifications are for long-turn cast-iron fittings for sizes 2½ to 8 inches, inclusive, for use in sprinkler work inside of buildings.

The sizes smaller than 2½ inches are the American 125 and 250 pound cast-iron screwed fittings standards, while the 8-inch sizes are the American 125 and 250 pound cast-iron flanged fittings standards.

3. *Markings.*—Each fitting produced with the intent of meeting the specifications of these American cast-iron long-turn sprinkler fittings, shall have marks cast on them indicating legibly:

- (1) Maker's name or trade-mark.
- (2) Identification symbol by means of which line of fittings can be distinguished.
- (3) Working pressure.

4. *Types.*—The various styles of elbows, tees, and crosses included in this standard are shown in Figure 238.

When one end of the fitting is flanged, it shall be the largest opening unless otherwise specified.

5. *Material.*—(Identical with that for cast-iron pipe flanges and flanged fittings for 125 pounds pressure in B16a, given above.)

6. *Facings.*—All the flanges for the 150-pound standard shall be plain faced. All the flanges for the 250-pound standard shall have a raised face one-sixteenth inch high of the diameters given in Table 5. The raised face is included in the flange thickness and center to face dimensions.

7. *Bolting.*—Drilling templates shall be in multiples of four, so that fittings may be made to face in any quarter. Bolt holes shall straddle the center line and shall be drilled one-eighth inch larger than the nominal diameter of bolts. Drilling templates are those of the American 125-pound and 250-pound cast-iron flanged fittings standards.

Bolts shall be of steel with standard rough square heads and the nuts shall be of steel with standard rough hexagonal dimensions; all as given in the tentative American standard on wrench-head bolts and nuts and wrench openings.

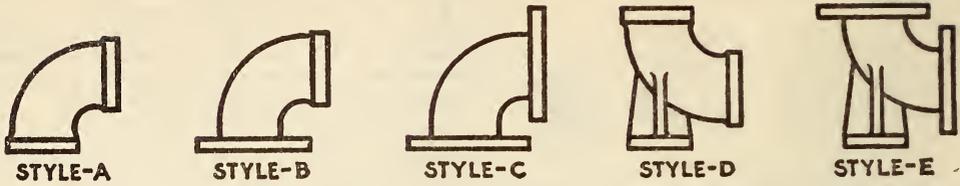

8. *Metal thickness.*—It is recognized that some variations are unavoidable in the making of patterns and castings. In order to define what may be considered a reasonable degree of accuracy in body thickness measurements of these fittings, the following inspection limits shall be allowed:

Body thickness measurements taken on any fitting at points diametrically opposite shall, when added together and divided by two, equal or exceed the minimum metal thicknesses given in these standards. Body thicknesses at no point shall be more than 10 per cent below the minimum metal thicknesses given in these standards.

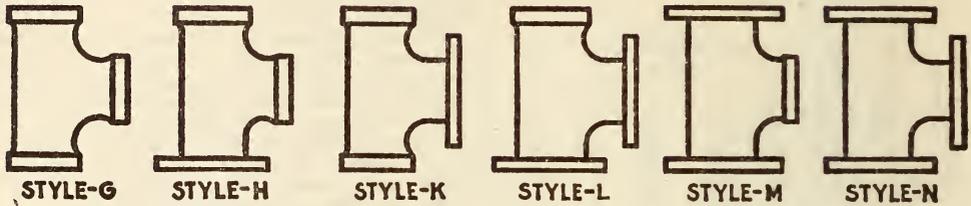

The minimum wall thickness of each outlet of reducing fittings shall be that given in Tables 2 and 5. Any changes of thickness necessary shall be made gradually.

9. *Reducing fittings.*—Fittings may be reduced by bushing in the sand any of the outlets one size smaller, but in reducing fittings, the total reduction of any outlet shall not be greater than 50 per cent

Elbows

Tees

Crosses

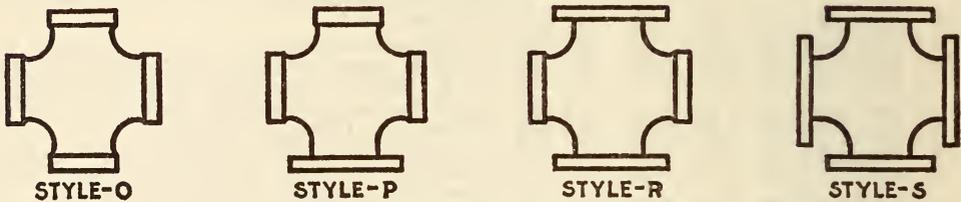

FIGURE 238.—Elbows, tees, and crosses

of the nominal diameter of the largest opening.

Reducing tees and crosses for 150 pounds pressure on sizes from 2½ to 6 inches, inclusive, shall have center-to-end dimensions as shown in Tables 3 and 4. Reducing sizes for 8-inch fittings have the same center-to-end dimensions as the straight sizes.

10. *Bosses, ribs, and lugs.*—Tapping through the bodies shall be permitted only for drain or test

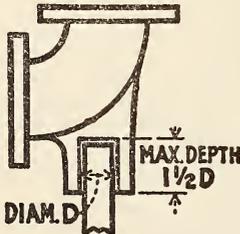

FIGURE 239.—Slip boss with blind hole

purposes, in which case fittings must be provided with bosses for tapping when required and when the location and size of tapping are specified. Slip bosses having blind holes shall be provided when required to act as sockets for support. (See fig. 239)

Fittings for sizes from 2½ to 6 inches, inclusive, may be tapped one-half inch on the side without a boss, and fittings larger than 6 inches may be tapped three-quarters inch without a boss.

The addition of ribs or lugs is not prohibited on any screwed fitting.

11. *Threading.*—Screwed fittings shall be threaded according to the American standard for pipe thread. (See A. S. A., B2-1919, and the 1924 Report of the National Screw Thread Commission.)

It is recommended that all internal threads be countersunk a distance equal to one-half the pitch of the thread and at an angle of 45° with the axis of the thread.

The length of the threads specified in Tables 2 and 5 shall be measured to include the countersink.

12. *Fitting dimensions.*—Screwed, flanged, and combination screwed and flanged fittings for 150 and 250 pound pressures shall have dimensions as shown in Tables 2 and 5, respectively. The 8-inch fittings are the regular American standard flanged fittings.

In describing tees and crosses, the run is first named and then the outlet or outlets.

Due to the unavoidable variations in the making of patterns and castings and in order to establish a reasonable degree of accuracy in the center-to-end dimensions of all screwed fittings, the following inspection limits shall be allowed.

¹ The 8-inch size is an American Standard 250 pound cast-iron flanged fitting.
² Fittings may be banded or have equivalent bead and band.
³ The minimum length of thread shall be measured to include countersink.
⁴ Drilling templates are in multiples of 4, so that fittings may be made to face any quarter, and bolt holes straddle the center line.

REFRIGERATING MACHINERY ASSOCIATION, AMMONIA PIPE FLANGES AND FLANGED FITTINGS FOR MAXIMUM WORKING PRESSURES OF 300 POUNDS PER SQUARE INCH, 1931

AMMONIA PIPE FLANGES AND FLANGED FITTINGS

INTRODUCTORY NOTES

1. *Rating.*—These standards shall be known as the American ammonia pipe flanges and flanged fittings standards. The maximum working pressure shall not exceed 300 pounds per square inch.

2. *Size.*—The sizes of fittings in the following tables are identified by the corresponding nominal pipe size.

3. *Materials.*—The dimensional standards covered by the following tables are based on a high-grade metal equal to that given in A. S. T. M., A-126, specification for gray-iron castings for valves,

(c) Drop-forged companion flanges are permissible as long as no change in the principal dimensions is made.

4. *Bolting material.*—Standard commercial steel bolts with rough square heads and rough or cold-punched hexagonal nuts, tensile strength 50,000 pounds per square inch, safety factor 10. Bolt holes in castings to be three-sixteenths inch larger than the bolt diameter and one-eighth inch larger for drop forgings and drilled holes.

5. *Metal thickness.*—Minimum metal thickness to be not less than one-fourth inch, all other sizes based on the modified Barlow formula of the A. S. M. E. boiler construction code:

For pipe size one-fourth inch to 5 inches

$$P = \frac{2S}{D} \times (t - 0.065) - 125$$

For diameters over 5 inches

$$P = \frac{2S}{D} \times (t - 0.1)$$

Where

P = working pressure, pounds per square inch, 300 pounds.

t = thickness of fitting wall, inches.

D = actual inside diameter of fitting, inches.

S = 2,500, 2,700, or 3,000 pounds per square inch depending on minimum dimensions of walls.

Where cylindrical parts meet in fittings like tees and crosses, the wall thickness is to be increased 50 per cent and be permitted gradually to run out into standard wall thickness.

6. *Fitting dimensions.*—In the design of fittings a fixed position of the flange must be maintained with reference to the body of the fitting as indicated in sketches and table.

(a) Note that the flange edge in one case is the face of the tongue in the male fitting as indicated on sketches.

(b) Elbows and angle valves to be provided with tongue and groove, likewise all straight runs of tees, crosses, and tee and globe valves. The lateral flange of tees will be provided with a tongue and the flange next to the underside of the valve disk will have a groove.

(c) An inspection limit of plus or minus one-thirty-second inch shall be allowed on all center to contact surface dimensions for sizes up to and including 10-inch fittings; and one-sixteenths inch for 12-inch fittings.

7. *Valve dimensions.*—The center to contact surface and contact surface to contact surface dimensions of globe, angle, tee, and check valves shall be the same as those prescribed for tees and elbows.

8. *Reducing fittings.*—Reducing fittings shall have same center to flange edge dimensions as those of straight-size fittings of the largest opening and tongues and grooves as under section 6.

9. *Side-outlet fittings.*—All side-outlet fittings shall have all openings on the intersection of center lines.

10. *Method of designating outlets of reducing fittings.*—It is recommended for manufacturers of such fittings to follow A. S. A. recommendation for standards B16d-1927, above. To maintain a minimum fitting stock, the use of reducing flanges is recommended.

11. *Marking.*—For marking of fittings, recommend following decisions of A. S. M. E. subcommittee No. 8 on marking of pipe fittings.

12. *Special flanges.*—To save space, special drop-forged flanges may be made for making up cooling coils as incorporated in tables and sketches.

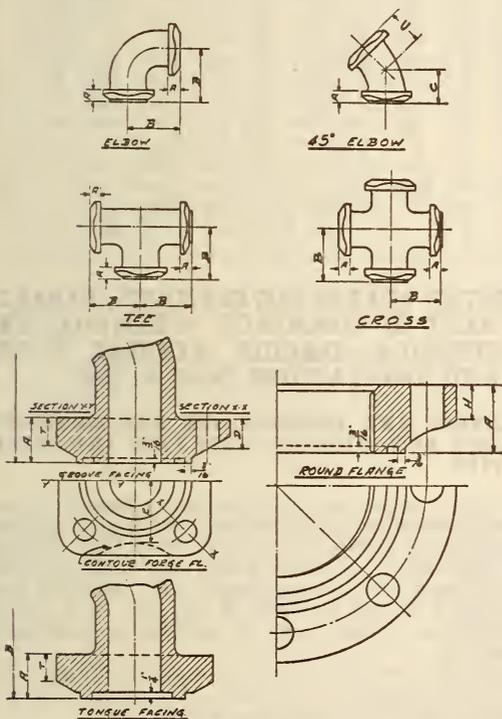

FIGURE 245

flanges, and pipe fittings, class B. (See 611.11, p. 637.)

(a) *Chemical composition.*—

	Per cent
Sulphur, not over	0.12
Phosphorus, not over75

(b) *Physical properties.*—A tension-test specimen shall not have less tensile strength than 30,000 pounds per square inch. However, in designing, the tensile strength calculated shall not exceed:

- 25,000 pounds per square inch for light castings of less than 1/2 inch thickness.
- 27,000 pounds per square inch for medium castings between 1/2 and 2 inch section.
- 30,000 pounds per square inch for heavy castings in which no section is less than 2 inches in thickness.

The terminal and intermediate flanges of all wrought-iron and homogeneous-steel feed and steam pipe over 2 inches in diameter, other than on pipe or coil boilers or steam generators, shall be made of wrought iron, homogeneous steel, malleable iron having a tensile strength of not less than 30,000 pounds per square inch of section, or equivalent material.

All such flanges shall have a depth through the bore of not less than one-half of the diameter of the pipe to which the flange is attached.

The bore shall increase slightly toward the face of the flange, and the end of the pipe shall be enlarged to fit the bore of the flange and shall be substantially beaded over or outward into a recess in the face of the flange.

Flanges on extra-heavy lapwelded steam pipe up to and including 5 inches diameter may be attached with screw threads and the joints in bends may be made with extra-heavy malleable-iron elbows or equivalent material.

Feed and steam pipe up to and including 3 inches diameter may be connected at intermediate joints by being screwed into flanges or extra-heavy fittings.

Flanges of cast iron, semisteel, or ferrous steel, having a tensile strength of not less than 20,000 pounds per square inch of section, may be employed in connecting extra-heavy lapwelded pipe by screw threads. Such flanges shall be extra heavy and have a depth through the bore of not less than the U. S. standard length of thread for the pipe to which the flange is attached plus depth of counter-

1 Length of fitting for lap of hose.

bore. The thickness of the flange, excluding hub, shall be not less than three-tenths of the diameter of the pipe plus 0.25 of an inch. The pipe shall fit snugly in the counterbore, which shall be not less than one-fourth the diameter of the pipe in depth.

Flanges of wrought iron or steel grooved in the bore to a depth equal to the thickness of the material in the pipe shall be allowed for use on all steam and feed pipe when the end of the pipe has been thoroughly annealed and expanded into the flange by approved machinery.

Flanges with hubs projecting not less than 1/4 inches from the back of the flange may be shrunk on lapwelded or riveted iron or steel, or seamless-drawn steel, steam pipes over 5 1/2 inches diameter where the pipe is brought to a true and parallel circle at the end and beaded over into a recess at the face of the flange, or flared to an angle of approximately 20°, or the bore of the flange may be tapered and the pipe expanded into the bore.

Flanges of cast steel, wrought iron, or homogeneous steel, equal in strength to the pipe to which it is attached, may be riveted to the pipe.

Flanges may be secured to pipe by expanding the pipe by proper and approved machinery and flaring the end of the pipe to an angle not exceeding 20°, taken in the direction of the length of the pipe, and having a depth of flare equal to at least one and one-half times the thickness of the pipe.

Flanges of cast steel, forged steel, or wrought iron may be used in any process of expanding the pipe into grooves in the bore of the flange and flaring the end of the pipe to an angle of 20°.

Flanges welded to lapwelded steam pipes of iron or steel may be used when the manufacturer furnishes an affidavit that the pipe has been properly annealed after all work requiring fire has been finished.

All flange connections made by the process of expanding, welding, or shrinking shall be subjected to a hydrostatic test of twice the working pressure without showing signs of weakness.

FLANGES ON COPPER PIPE

The flanges of all copper steam and feed pipe over 3 inches diameter shall be made of brass or bronze composition, forged iron or steel, or open-hearth steel castings. The end of the pipe shall be flanged over or outward to a width of not less than twice the thickness of the pipe and to a radius of not more than the thickness of the pipe, and the flange securely brazed or riveted to the pipe. If the pipe is properly formed with a fully reinforced taper through the flange the riveting or brazing may be dispensed with. The thickness of flanges shall be not less than four times the required thickness of the pipe plus 0.25 of an inch.

Any form of expanded, grooved, and flared joint will be allowed for copper pipe under the same regulations, restrictions, and tests applying to iron or steel pipe.

All flange joints shall be fitted with such number of bolts or rivets as will make the joint equal in strength to all other parts of the pipe.

Any form of joint which, in the judgment of local inspectors, is equal in strength and efficiency to the flange connections required by this rule shall be allowed on any and all classes of pipe.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIPE AND PIPE FITTINGS, SOIL, CAST IRON (COATED AND UNCOATED), NO. 343a, AUGUST 22, 1928. (CURRENT DESIGNATION: WW-P-401)

CAST-IRON SOIL PIPE AND FITTINGS

(See 607.11, p. 372.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIPE FITTINGS, CAST IRON (THREADED), NO. 489, 1927. (CURRENT DESIGNATION: WW-P-451)

THREADED CAST-IRON PIPE FITTINGS

(This specification conforms to A. S. M. E., B16d, given above, except for the addition of dimensions of end-to-end straight fittings of both the 125 and 250 pound classes, as shown below, and also the following:)

Dimensions for straight fittings				
Type A—125 pounds			Type B—250 pounds	
Nominal pipe size	End to end		Nominal pipe size	End to end
	45° Y	Coupling		45° Y
Inches	Inches	Inches	Inches	Inches
1/4	2.125		1/4	
3/8	2.250	2.250	3/8	
			1/2	
3/4	3.000	2.250	3/4	
1	3.500	2.500		
1 1/4	4.000	2.750	1	
			1 1/4	4 7/8
1 1/2	5.000	3.000	1 1/2	5 3/4
2	5.750	3.500	2	6 3/4
2 1/2	6.500	3.500	2 1/2	7 7/8
3	7.750	3.500	3	8 7/8
3 1/2	8.875	4.000	3 1/2	9 3/4
4	9.750	4.500	4	10 3/8
			5	
			6	15 1/4

METHOD OF INSPECTION AND TESTS

One fitting shall be selected by the inspector from each 20 of the same size and kind and subjected to an air pressure of 20 pounds per square inch under water. When impractical to make this test, fittings selected as above shall be subjected to the hydrostatic test stated below for one minute. Unless otherwise specified the following pressures shall be used.

For type A, 125-pound fittings.....	Lbs./in. ² ..	250
For type B, 250-pound fittings.....	do.....	500

PACKING AND MARKING OF SHIPMENTS

All shipments shall be marked with the name of the material, the name of the vendor, and the number of the particular contract or order.

Unless otherwise specified, 10 fittings of the same kind and size up to and including 1 inch shall be securely tied together, or a like number shall be packed in a suitable container.

Unless otherwise specified, five fittings of the same kind and size above 1 inch shall be securely tied together, or a like number shall be packed in a suitable container.

NOTES

Type A, 125-pound (standard) fittings are for use on steam and other systems where the working pressure does not exceed 125 pounds, or the total temperature does not exceed 450° F.

Type B, 250-pound (extra-heavy) fittings are for use on steam or other systems where the working pressure does not exceed 250 pounds, or the total temperature does not exceed 450° F.

Fittings commonly known as standard weight should be ordered as type A, 125-pound. Fittings commonly known as extra heavy should be ordered as type B, 250-pound.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, UNIONS AND COMBINATION UNION FITTINGS, BLACK AND GALVANIZED, FOR 300 POUNDS PRESSURE, RECOMMENDED PRACTICE, 1930

UNIONS AND COMBINATION UNION FITTINGS

1. *Scope.*—This specification covers malleable-iron and steel pipe unions and combination union fittings for use on locomotives under working pressures up to 300 pounds per square inch.

I. MANUFACTURE

2. *Process.*—The malleable iron shall be made in accordance with A. R. A. specifications for malleable iron, best commercial practice with respect to composition, melting, and annealing. Steel shall be made by the open-hearth or electric process. All castings shall be thoroughly annealed. Rolled steel to be used in forgings or manufacture by machining shall be solid and free from segregation. Nonferrous inserts shall be made of sound, tough brass or bronze. All inserts shall be securely attached to their supporting members. Galvanized unions shall be thoroughly and smoothly coated with zinc by the hot-dipping process.

3. *Proof test.*—Each individual union shall be tested by the manufacturer under water or oil with air at 150 pounds pressure. No copper or rusting solution, cement, or welding will be permitted.

II. PROPERTIES AND TESTS

4. *Finished unions.*—The weights and strengths of unions shall not be less than those shown in Table 1.

TABLE 1.

Size of pipe	Breaking load	Size of pipe	Breaking load
<i>Inches</i>	<i>Pounds</i>	<i>Inches</i>	<i>Pounds</i>
1 1/2	5,000	1 1/4	23,000
1 1/4	7,000	1 1/2	28,000
3/8	9,000	2	35,000
1/2	11,000	2 1/2	45,000
3/4	14,000	3	60,000
1	18,000		

5. *Method of test.*—Solid bars shall be screwed into both ends of union for gripping in tensile machine. The union nut shall be tightened solidly without undue strain. The assembly shall then be pulled at a crosshead speed of not more than one-eighth inch per minute. The load at failure shall be not less than that shown in Table 1.

6. *Number of tests.*—Three unions or union fittings of each size will be tested for the first 1,000, or less, of each size in each shipment, and one additional for each additional 1,000. If any fail to meet the required minimum load, two more will be tested for each one which fails. Both of these shall meet the requirements.

III. WORKMANSHIP AND FINISH

7. *Dimensions.*—Unions shall conform to the limiting dimensions shown on drawings forming a part of this specification.

8. *Finish.*—Surfaces which are to remain in the cast condition shall be reasonably smooth and free from scale, fins, lumps, cracks, cavities and other injurious defects. Machined surfaces shall be smooth and fit properly against the adjoining parts. All parts shall be finished and assembled in a workmanlike manner. All unions shall be well oiled, to prevent rust in transit or storage.

IV. MARKING

9. *Marking.*—Unions shall bear maker's name or symbol, the size, the designation 300-pounds and A. R. A. clearly cast or stamped into the metal.

V. INSPECTION AND REJECTION

(Inspection and rejection conform to the requirements specified in A. R. A., specifications for galvanized sheets. See 604.32, p. 243.)

5th SIDES UP TO AND INCLUDING 1 1/2" UNION
EIGHT SIDES 1 1/2" AND OVER

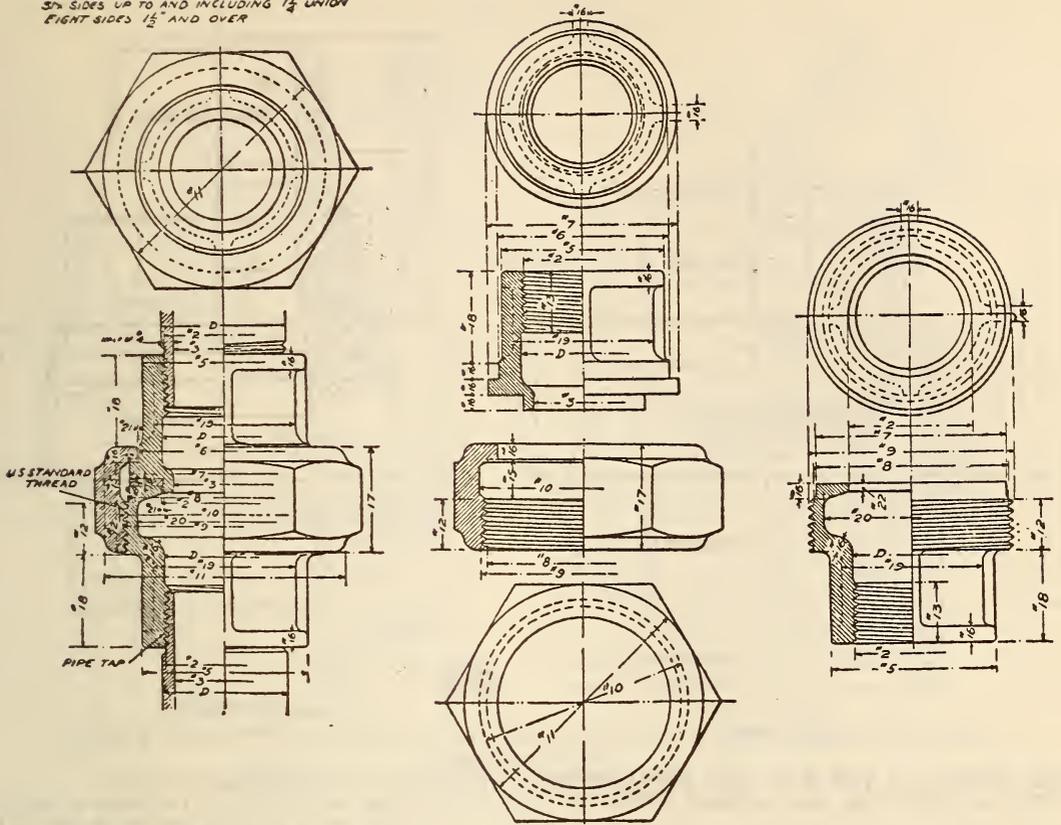

FIGURE 247.—Pipe unions

DESCRIPTION ACCOMPANYING TABLE OF MALLEABLE PIPE UNIONS

(For table see p. 416.)

Numbers at the Head of the Columns Above are Those Given in the Dimension Lines

Column No. 1 in table represents the nominal diameter of pipe.
 Column No. 2 represents diameter of pipe at one-half the height of full thread nearest solid section of pipe.
 Column No. 3 represents the internal diameter of the pipe.
 Column No. 4 represents the difference between columns Nos. 2 and 3, and is equal to twice the thickness of metal in pipe measured from inside line to one-half the height of thread as specified before.
 Column No. 5 represents the outside diameter of end of pipe union and is taken as No. 2, plus twice No. 4, plus an arbitrary increment.
 Column No. 6 is equal to No. 5 plus an increment varying from 0.04 to 0.07 of an inch. This increment was allowed for the purpose of being able to slip the nut over upper swivel end of union.
 Column No. 7 is No. 6 plus an amount varying between 0.15 and 0.25. This lip created is considerably in excess of what exists on present pipe unions for the reason that we find the surface between the lip and the corresponding part of nut is often damaged, and the bearing surface, when the full strength of the man is used on the wrench, is sufficient. We assume that a man would pull about 30 pounds on a wrench, with a possibility of using less force on pipes of small diameters. For that reason we made a variation in the width of lip, which lip, theoretically, would be uniform for all sizes of pipe. The nut itself has been strengthened to prevent the lip from deflecting upward.

Column No. 8 is No. 7 plus an increment varying from 0.02 to 0.04 of an inch.
 Column No. 9 is No. 8, plus twice the height of the thread.
 Column No. 10 is No. 9, plus an increment varying between 0.04 and 0.08 of an inch.
 Column No. 11 is No. 10, plus one and one-half times No. 4.
 Column No. 12 is two and one-half times No. 4, and was figured especially for bearing surface, so that the thread would not wear away too rapidly when the nut is occasionally removed.
 Column No. 13 has been assumed arbitrarily, but in all cases is greater than the length of full thread on standard pipe.
 Column No. 14 represents the number of threads per inch in length of nut. This thread, we believe, should be U. S. standard form and not sharp thread.
 Column No. 15 is taken arbitrarily, but is based on the probable requirements of manufactures for tapping out the nut.
 Column No. 16 is three-fourths of No. 4.
 Column No. 17 represents the full height of nut, and is equal to No. 12, plus No. 15, plus No. 16.
 Column No. 18 is the amount of projection outside of nut.
 Column No. 19 is No. 2, plus No. 4, plus an arbitrary increment.
 Column No. 20 is No. 7, less No. 16, with slight modifications.
 Column No. 21 represents the clearance at several points, as indicated on print.
 Column No. 22 is assumed arbitrarily.

NOTE.—Pipe unions should be branded A. R. A.
 All wrought-iron pipe for car work shall be threaded with a standard total taper of three-fourths inch in 1 foot, and all pipe fittings shall be tapped to suit the standard pipe thread with a total taper of three-fourths inch in 1 foot, so that the thread on pipe and fittings will be uniform and taper tight.

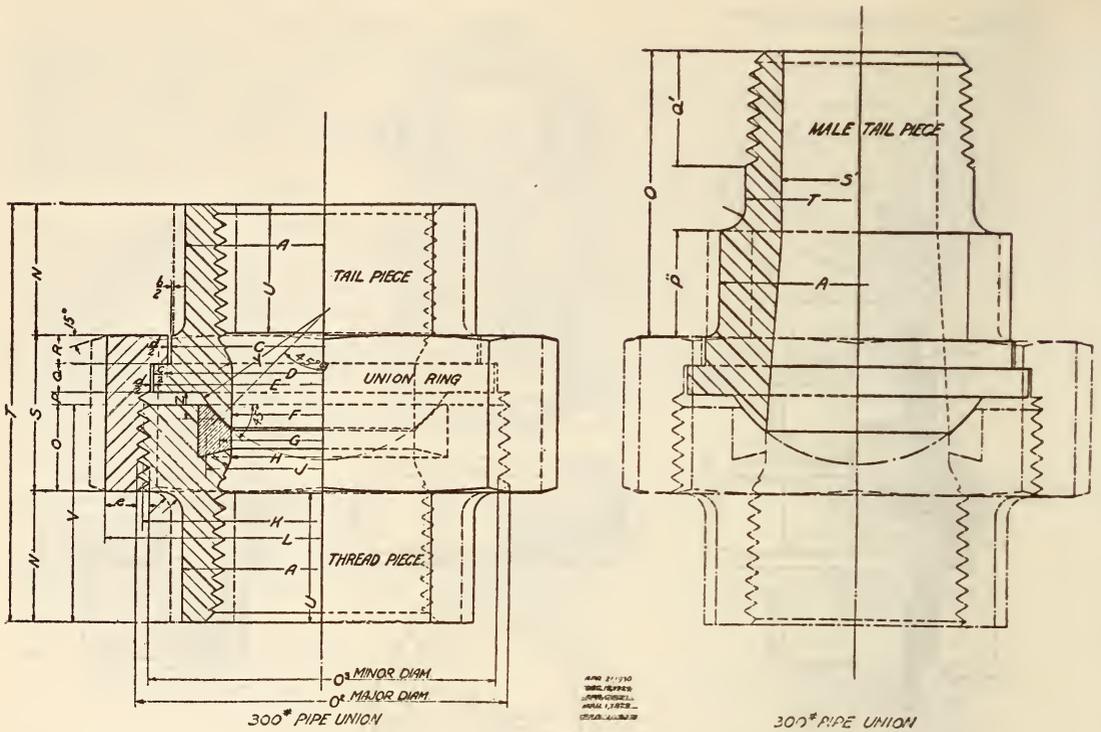

FIGURE 248.—Pipe unions of the nut and nipple type for locomotives, 300-pounds pressure

PIPE UNIONS OF THE NUT AND NIPPLE TYPE FOR LOCOMOTIVES, 300 POUNDS PRESSURE

The following formula is used to obtain the dimensions for the design of union fittings for maximum working pressure of 300 pounds steam:

- A= center to end, elbows and tees.
- B=length of thread.
- C= center to end, 45° elbows.
- F= inside diameter of fitting.

Same as 250-pound cast-iron American standard screwed fittings, the idea being that manufacturers can use the same core-box equipment both for cast iron as well as for this proposed 300-pound malleable-iron fitting. Note that this is now done on the 125-pound cast-iron and the 150-pound malleable-iron American standard screwed fittings. This applies to the screwed fittings.

- E= width of band.
- H= outside diameter of band.

Same as the 125-pound cast-iron American standard screwed fittings.

- G= thickness of metal.

The 250-pound cast-iron American standard screwed fitting metal thickness is approximately 150 per cent heavier than the 125-pound cast-iron American standard screwed fitting. The rating is double. The proposed 300-pound malleable-iron fitting is 150 per cent heavier than the 150-pound malleable-iron standard screwed fitting and this rating is also doubled.

- M= center to end of union elbow and tee.
 $\frac{1}{2}$ diameter "H" + "O" + distance "O"
 for die clearance when threading union end.

- N= center to end of union 45° elbow.

These are layouts on the bases of the 90° ells so as to have proper clearance for die to cut the thread.

- J= diameter of 45° seat bevel.
- J¹= inside diameter of union end.
- K= pitch diameter.
- O= length of thread.
- O¹= threads per inch.
- O²= major diameter.

NOTES.—The inspection limits for the center-to-end dimensions are those adopted by the American standard for all screwed fittings regardless of the working pressure.

All female threads shall be countersunk as provided in the American standard for all screwed fittings.

The American standards for screwed fittings referred to, are publications approved by the American Standards Association and are as follows:

150-pound malleable-iron screwed fittings.....	B-16c-1927
125-pound and 250-pound cast-iron screwed fittings.....	B-16d-1927

The following formula is used to obtain the dimensions for the design of the pipe unions for maximum working pressure of 300 pounds steam:

- A= across flats of octagon= the minimum possible to provide strength for the union ring and tailpiece.
- C= diameter of small shoulder.
- D= diameter of bore.
- E= diameter of shoulder.
- F= inside diameter.
- G= diameter of seat contact= midway between H and J.
- H= inside diameter.
- J= outside diameter of 45° seat.
- K= pitch diameter.
- L= across flats of octagon.

1	1.10	2.100	2.096	1.97	1.30	.50	11-N	2.159	2.147	.07
1 1/4	1.40	2.530	2.526	2.29	1.49	.55	10-N	2.595	2.582	.07
1 1/2	1.63	2.850	2.846	2.44	1.66	.55	10-N	2.915	2.902	.08
2	2.06	3.450	3.446	2.74	1.93	.55	10-N	3.515	3.502	.08
2 1/2	2.54	4.140	4.135	3.43	2.19	.75	8-N	4.221	4.206	.10
3	3.05	4.920	4.915	3.81	2.62	.75	8-N	5.001	4.986	.10

N=length of octagon=same length of band of the 250-pound cast-iron American standard screwed fitting.

O=length of thread= is based on 5 1/2 threads for 1/4-inch to 2-inch sizes (5 threads will be total allowing one-half thread for chamfer), 6 threads for 2 1/2-inch and 3-inch sizes because there are 8 threads per inch in the last two sizes.

O¹=threads per inch. (National form thread.)

O²=major diameter. (National form thread.)

O³=minor diameter. (National form thread.)

P=clearance= is reasonably provided to allow proper seating on ball joint.

Q=thickness of shoulder. (For tolerance see detail.)

R=thickness of shoulder. (For tolerance see detail.)

S=height of union ring.

T=height of pipe union.

U=depth of pipe tap=same length as 250-pound cast-iron American standard screwed fitting. This depth provides sufficient amount for a screwed-tight joint connection.

V=height of thread piece.

Y=radius of ball seat.

Z=height of contact for seat.

b=nominal clearance.

c=total nominal width seat bearing.

d=nominal clearance over collar.

NOTES.—The ball seat will make a better and tighter joint because there is a narrow seating contact between the ball seat and the 45° seat. When there is a broad contact between the seating surfaces, it is more difficult to obtain a tight joint.

Bronze seat ring thickness and depth were not dimensioned so that manufacturers can use their own bronze seat rings.

Inspection limits on all parts for over-all lengths are those adopted by the American standard for all screwed fittings regardless of the working pressure.

All female threads shall be countersunk as provided in the American standard for all screwed fittings.

Male tailpiece.

O = length of male tailpiece from small shoulder.

P = length of octagon = same as width of band on the 125-pound cast-iron American standard screwed fitting. Also used on union fittings.

Q¹ = length of thread = same as length of thread on street ells and tees of the 150-pound malleable-iron American standard screwed fittings.

S¹ = inside diameter = the maximum possible to provide for strength.

T = outside diameter = same as outside diameter of pipe.

NOTES.—The derivations of dimensions not shown on the male tailpiece. See dimensions on tailpiece.

All male threads shall be chamfered at an angle of 45° as provided in the American standard for screwed fittings.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN TENTATIVE STANDARD MALLEABLE-IRON SCREWED FITTINGS FOR MAXIMUM WORKING SATURATED STEAM PRESSURES OF 150 POUNDS PER SQUARE INCH (GAGE), B16c-1927

[Approved as American Tentative Standard by the American Standards Association, 8th December, 1927]

MALLEABLE-IRON SCREWED FITTINGS

150 POUNDS PER SQUARE INCH

INTRODUCTORY NOTES

1. *Pressure ratings.*—This standard shall be known as the American 150-pound malleable-iron screwed fittings standard, said pressure designation being the recommended maximum working saturated steam rating.

2. *Size.*—The size of the fittings scheduled in the following tables is identified by the corresponding nominal pipe size.

In the case of reducing tees, crosses, and Y branches (laterals), the size of the largest run open-

8th Sponsor organizations American Society of Mechanical Engineers, Manufacturers' Standardization Society of Valve and Fittings Industry, and Heating and Piping Contractors National Association.

ing shall be given first, followed by the size of the opening at the opposite end of the run. Where the fitting is a T or Y branch (lateral), the size of the outlet is given next. Where the fitting is a cross, the largest opening of outlet is the third dimension given followed by the opening opposite. The straight-line sketches, Figure 257, illustrate how the reducing fittings are read.

Where an external thread is wanted, the word "male" shall follow the size of that opening.

3. *Marking.*—Each fitting shall be marked for identification with the maker's name or symbol.

4. *Metal thickness.*—It is recognized that some variations are absolutely unavoidable in the making of patterns and castings. In order to define what may be considered a reasonable degree of accuracy

6. *Ribs.*—The addition of ribs or lugs shall not be prohibited on any screwed fittings.

7. *Fitting dimensions.*—Tables of center-to-end dimensions are given for both straight and reducing fittings.

The dimensions in the tables of reducing fittings are for use only when making patterns for the specific reducing fitting in question and do not apply when a larger size pattern is pushed to make the reducing fitting wanted.

It is recognized that some variations are absolutely unavoidable in the making of patterns and castings. In order to define what may be considered a reasonable degree of accuracy in the center-to-end measurements of these fittings, the following inspection limits shall be allowed:

Inspection limits for center-to-end dimensions

6	5.13	3.46	1.28	.900	6.625	6.725	.336	7.767
8	-----	-----	1.47	1.125	8.625	8.725	.403	9.995

in body-thickness measurements of these fittings, the following inspection limits shall be allowed:

Body-thickness measurements taken on any fittings at points diametrically opposite shall, when added together and divided by two, equal or exceed the minimum metal thicknesses set forth in this standard. Body thickness at no point shall be more than 10 per cent below the minimum metal thicknesses set forth in this standard.

5. *Threading.*—American standard pipe threads shall be used in threading fittings and variations in tapping and dieing shall be limited to one turn either way from the standard size as determined by the working gages prescribed by the American standard pipe thread (No. 3-1919) or its latest revision.

All female threads shall be countersunk a distance not less than one-half the pitch of the thread and at an angle of 45° with the axis of the thread, and all male threads shall be chamfered at an angle of 45° both for the purpose of easier entrance in making a joint and for protection of the thread.

The length of threads specified in all tables shall be measured to include the countersink or chamfer.

Dimensions for reducing elbows and reducing crosses are given in Table 2, and dimensions for reducing tees in Tables 3A and 3B.

3								0.231
3 1/2	0.248							
4	0.265							
5	0.300							
6	0.336							

¹ The outside radius of top is equal to 3×F.

TABLE 8.—Dimensions of close, medium, and open pattern return bends¹

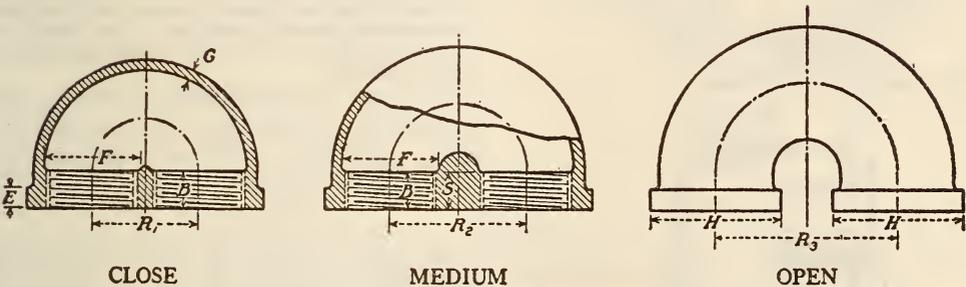

FIGURE 265.—Close, medium, and open pattern return bends

[All dimensions in inches]

Nominal pipe size	B ²	E	F		G	H	R ₁	R ₂	R ₃
	Length of thread, minimum	Width of band, minimum	Inside diameter of fittings		Metal thickness, minimum	Outside diameter of band, minimum	Center to center (close pattern)	Center to center (medium pattern)	Center to center (open pattern)
			Minimum	Maximum					
1/2	These dimensions are identical with those in Table 1.				0.116	Same as in Table 1.	1.000	1.25	1.50
3/4					.133		1.250	1.50	2.00
1					.150		1.500	1.875	2.50
1 1/4					.165		1.750	2.25	3.00
1 1/2					.178		2.188	2.50	3.50
2					.201		2.625	3.000	4.00
2 1/2					.244		3.250	3.75	4.50
3					.272		4.000	4.50	5.00
3 1/2					.295		4.500	5.00	5.50
4					.318		5.000	5.50	6.00
5					.360		6.50	7.50	7.50
6					.403		7.50	8.50	8.50

¹ It is regular practice to furnish close pattern return bends not banded. Close pattern return bends will not make up parallel coils, as the distance center to center of 2 adjacent bends is greater than the center to center of openings of a single bend.

² Dimensions "S" in cut is "face to point of radius" dimension and is same as dimension "B" in table.

HEATING AND PIPING CONTRACTORS
NATIONAL ASSOCIATION, WELDING
NECK FLANGES FOR STANDARD AND
EXTRA HEAVY PIPE, 1929

PIPE FLANGES

(See 607.14, p. 412.)

UNITED STATES GOVERNMENT, DEPART-
MENT OF COMMERCE, STANDARD
WEIGHT MALLEABLE IRON OR STEEL
SCREWED UNIONS, COMMERCIAL
STANDARD CS7-29, NOVEMBER 1, 1929

IRON OR STEEL SCREWED UNIONS

I. TYPES

Malleable iron or steel unions for use with stand-
ard-weight pipe are furnished in the following types:
Black, brass seated; galvanized, brass seated.

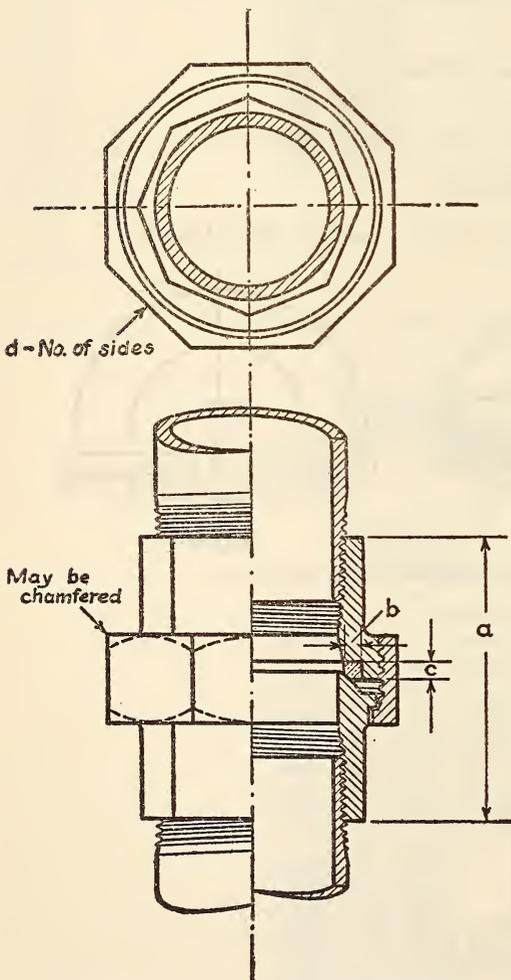

FIGURE 266.—Standard weight union

II. MATERIAL AND WORKMANSHIP

With the exception of the brass seats, all parts
shall be made of a high-grade malleable iron thor-
oughly annealed, or of mild steel. No copper or

rusting solution shall be used. Workmanship shall
be first class in every particular.

III. GENERAL REQUIREMENTS

All parts shall be sound, true to form, and free
from defects that may affect their serviceability.
They shall be thoroughly cleaned from sand and
scale.

Unions shall be tapped with taper threads in
accordance with American Standard B2-1919 for
pipe threads.

Seat and shoulder contact surfaces shall be
finished smooth and true.

Union pipe ends may be polygonal, round, or
round with lugs.

Representative unions from each lot shall be sub-
jected to not less than 20 pounds air pressure under
oil or water during production, and unions that show
any leakage shall be rejected. Additional pressure
tests shall be at the expense of the purchaser.

IV. DETAIL REQUIREMENTS

1. Dimensions shall conform to Table 1 and
Figure 266, which form part of this specification.

2. Unions shall be of either malleable iron or mild
steel. A brass ring shall be secured in the female
portion of the union so as to become an integral part
of same and to form a bearing for the male portion,
or the female portion may be manufactured of brass
or bronze. The seat of the male portion may be
either brass, malleable iron, or mild steel. Unions
shall be furnished with either ball and socket, ball
to cone, or cone to cone joint.

3. Galvanized unions shall be thoroughly zinc
coated by the hot-dipped process and so treated as
to assure a smooth surface. They shall be gal-
vanized inside and outside before machining and
thread cutting.

TABLE 1

Union dimen- sions (see illus- tration)	Size of pipe (in inches)								
	1/4	1/2	3/4	1	1 1/4	1 1/2	2	2 1/2	
a, ±0.125 inch....	1.484	1.641	1.766	2.000	2.141	2.500	2.703	2.875	3.234
b, Minimum....	.085	.090	.095	.105	.110	.120	.130	.140	.165
c, Minimum....	.105	.105	.109	.114	.119	.127	.133	.143	.171
d, Number of sides, maxi- mum.....	8	8	8	8	8	8	8	8	10

NOTE.—While dimensions for 2 1/2 and 3 inch sizes are not given
above, provision for these sizes is made in the tensile test require-
ments of Sec. V.

V. TENSILE TEST

Unions shall conform to the minimum tensile test
requirements given in Table 2. The tensile test
shall be conducted by inserting solid bars corre-
sponding in outside diameter to the pipe, threaded
and screwed into each end of the union.

TABLE 2

Size	Ultimate breaking load	Size	Ultimate breaking load
Inch	Pounds	Inches	Pounds
1/4	3,800	1 1/4	21,300
3/8	5,300	1 1/2	25,800
1/2	7,700	2	30,000
3/4	10,600	2 1/2	35,000
1	15,500	3	40,000

Purchaser, at his own expense, may require the testing, in accordance with above paragraph, of representative samples from any lot purchased. For each sample rejected by such test, two additional samples shall be tested, failure of either of which shall cause rejection of the entire lot represented by the samples.

VII. PACKING AND MARKING

The manufacturer's name, brand name, or trademark shall be permanently marked on each union

VII. NOTES

American Petroleum Institute line pipe threads are longer than commercial standard threads although of the same pitch diameter. (Reference A. P. I. Standards 5-L. Procurable from A. P. I. division of standardization, 1508 Kirby Building, Dallas, Tex.) Care should be exercised in furnishing fittings to the oil industry, that no interference exists in the threaded portion of the fitting that will prevent the projection of the longer A. P. I. line pipe thread beyond the end of the commercial standard thread in the fitting.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR UNIONS, MALLEABLE IRON OR STEEL, NO. 393, 1926. (CURRENT DESIGNATION: WW-U-531)

MALLEABLE IRON OR STEEL UNIONS

(Conforms with Commercial Standard CS7-29 given above, with the addition of tabulated dimensions on 2½ and 3 inch sizes.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR UNIONS, 300 POUNDS, MALLEABLE IRON OR STEEL, WW-U-536, MARCH, 1, 1932

MALLEABLE IRON OR STEEL UNIONS

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, of the issue in effect on date of invitation for bids, shall form a part of this specification (including such applicable cross references to other specifications as may appear in these Federal specifications):

Federal specification	Former No.	Title	See—
GGG-P-351	238	Standard Pipe Threads for Pipe and Pipe Fittings.	607.0, p.365.
QQ-M-151	339	General Specifications for Metals.	600.0, p. 3.

B. TYPES

B-1. Three hundred-pound malleable iron or steel unions shall be furnished in the following types as required:

- Type XA, black, brass seated.
- Type XB, galvanized, brass seated.
- Type XC, black, all iron or steel.
- Type XD, galvanized, all iron or steel.

C. MATERIAL AND WORKMANSHIP

C-1. With the exception of the brass seats, all parts shall be made of high-grade malleable iron or

of steel. Workmanship shall be first class in every particular.

C-2. All parts shall be sound, true to form, and free from injurious blowholes, porosity, embrittlement, seams, or other defects that may affect their serviceability. They shall be thoroughly cleaned of sand, scale, and all irregularities, and shall present a surface as smooth as that produced by thorough tumbling.

D. GENERAL REQUIREMENTS

D-1. Unions shall be tapped with threads in accordance with Federal specification for standard pipe threads for pipe and pipe fittings, referred to in paragraph A-1.

D-2. When union is closed, not less than four full threads shall be engaged by the nut.

D-3. All surfaces subjected to pressure in tightening the unions shall be finished smooth and true. Each union shall be ground or machined to insure proper seating.

TABLE 1.—Dimensions

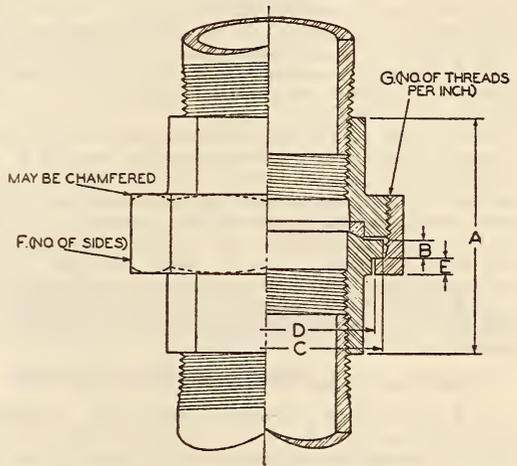

FIGURE 267.—Unions, 300 lb., malleable iron or steel

Nominal pipe size	Union dimensions (see fig. 267)					
	A (± 1/4 inch)	B (Minimum)	C minus D (minimum)	E (minimum)	F (minimum)	G (maximum)
<i>Inches</i>	<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inches</i>	<i>Inches</i>
1/4	1.63	0.124	0.086	0.124	6	16
3/8	1.81	.128	.100	.128	6	16
1/2	1.93	.138	.115	.138	6	14
3/4	2.24	.151	.133	.151	6	12
1	2.445	.169	.157	.169	6	11
1 1/4	2.795	.197	.184	.197	6	10
1 1/2	3.01	.216	.203	.216	6	10
2	3.39	.250	.240	.250	6	8
2 1/2	4.025	.280	.284	.280	8	8
3	4.29	.315	.332	.315	8	8

D-4. The minimum tensile strength of the unions when tested in accordance with section F-4 shall be as follows:

Iron pipe size	Ultimate load	Iron pipe size	Ultimate load
<i>Inches</i>	<i>Pounds</i>	<i>Inches</i>	<i>Pounds</i>
1/4	5,300	1 1/4	27,000
3/8	7,800	1 1/2	35,000
1/2	10,800	2	50,000
3/4	15,400	2 1/2	60,000
1	22,000	3	75,000

D-5. All unions shall pass the tests required in section F-2 without showing any leakage of air.

D-6. Union pipe ends may be polygonal, round, or round with lugs.

E. DETAIL REQUIREMENTS

E-1. Dimensions shall conform to Table 1 and Figure 267, which form part of this specification.

E-2. Type XA unions shall be of either malleable iron or steel. A brass ring shall be secured to the female portion of the union so as to become an integral part of same and to form a bearing for the male portion, or the female portion may be manufactured of brass or bronze. The seat of the male portion may be of either brass, malleable iron, or steel. Figure 267 indicates location of seat but not method of securing. Type XA unions shall be furnished with either ball or ball to cone joint.

E-3. Type XB unions shall be zinc coated (galvanized) by the hot process and so treated as to be thoroughly coated with a smooth, bright, solid surface of zinc, free from blisters, dross, dirt, bare spots, rust, and other defects in the coating. They shall be zinc coated inside and outside before machining and threading. In all other respects these unions shall conform to the requirements of type XA.

E-4. Type XC unions shall be of either malleable iron or steel with either ball or ball to cone joint.

E-5. Type XD unions shall be zinc coated (galvanized) by the hot process and so treated as to be thoroughly coated with a smooth, bright, solid surface of zinc, free from blisters, dross, dirt, bare spots, rust, and other defects in the coating. They shall be zinc coated inside and outside before machining and threading. In all other respects these unions shall conform to the requirements of type XC.

E-6. The manufacturer's name or trade-mark and the figure 300 shall be permanently marked on each union.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-2. All unions furnished under this specification shall be tested by the manufacturer with at least 60 pounds per square inch air pressure under water or light oil.

F-3. Representative unions shall be selected by the inspector and the dimensions checked with Table 1.

F-4. Two unions shall be selected by the inspector from each lot of 500 unions or less of the same size and subjected to the tension-test requirements of section D4. This test shall be conducted by inserting threaded bars, corresponding in outside diameter to the pipe.

F-5. For each sample rejected under F-4 above, two additional samples may be tested at the option of the inspector. Failure of either shall cause rejection of the entire lot represented by the samples.

F-6. Representative samples of malleable iron unions shall be selected by the inspector and tested by hammering or crushing to determine that the material has been properly heat treated and is free from embrittlement due to galvanizing.

G. PACKAGING, PACKING, AND MARKING OF SHIPMENTS

G-2. Unless otherwise specified 10 unions of the same size up to and including 1 inch shall be securely tied together or a like number shall be packed in a suitable container.

G-3. Unless otherwise specified five unions of the same size above 1 inch shall be securely tied together or a like number shall be packed in a suitable container.

I. NOTES

I-1. Purchasers should exercise all options offered herein and should specify type required.

I-2. The term 300 pounds as applied to unions herein is a commercial designation only and is not a limitation of working pressure. This specification covers all requirements for extra heavy unions.

I-3. Unions specified herein are intended for use up to pressures for which extra heavy pipe is applicable under conditions requiring frequent opening of the lines or when subject to vibration. They are intended for use with extra heavy pipe on oil filling, oil fuel, gas, air, fresh water, and steam lines.

I-4. Type XA and XB unions are not intended for use where the temperature exceeds 425° F.

I-5. Unions in accordance with this specification should be purchased by the piece.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIPE FITTINGS, MALLEABLE IRON (THREADED), 150 POUND, NO. 535, NOVEMBER, 1927. (CURRENT DESIGNATION: WW-P-471)

MALLEABLE IRON PIPE FITTINGS, THREADED

(This specification conforms to A. S. M. E. B16c, given above, with the following additional requirements in respect to method of inspection and test:)

One fitting shall be selected by the inspector from each lot of 20 of the same size and kind and subjected to an air pressure of 20 pounds per square inch under water. When impracticable to make this test, fittings selected as above shall be subjected to a hydrostatic test of 300 pounds per square inch. Under this test the fittings shall show no weakness or defect. In the event of failure of any fitting to pass either test, the lot represented shall be rejected. When 500 or more fittings of the same size and kind are submitted for inspection, 1 per cent shall be selected for test in lieu of the number required above.

Representative samples from each malleable iron heat where practicable, shall be taken by the inspector and tested by hammering or crushing to determine that the material has been properly heat treated and is free from embrittlement due to the zinc coating process.

607.3 WROUGHT-IRON PIPE, FITTINGS, AND CONNECTIONS.

AMERICAN PETROLEUM INSTITUTE, PIPE SPECIFICATIONS, STANDARD NO. 5-A (7TH ED.), JULY, 1931

STEEL AND IRON PIPE FOR OIL COUNTRY TUBULAR GOODS

(See 607.4, p. 444.)

AMERICAN PETROLEUM INSTITUTE, LINE PIPE SPECIFICATIONS, STANDARD NO. 5-L (4TH ED.), JULY, 1931

LINE PIPE

(Line pipe for the transportation of oil or gas, including iron line pipe, will be found under A. P. I., under classification number 607.4, p. 457.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, SPECIFICATIONS FOR WELDED WROUGHT-IRON PIPE, 1925

WELDED WROUGHT-IRON PIPE

SCOPE

1. These specifications cover standard weight, extra strong, and double extra strong black and galvanized welded wrought-iron pipe. All pipes to be used on locomotives and cars shall be of coiling or bending quality.

MANUFACTURE

2. (a) The iron shall be made from muck bars, made from all pig puddled iron, free from any admixture of iron scrap or steel.

(b) Pipe up to and including 1 inch may be butt welded. Pipe 1¼ and 1½ inches shall be furnished lap-welded, unless butt-welded is specified. Pipe 2 inches and over in diameter shall be lap-welded.

ETCH TEST

3. A cross section of the test specimen shall be polished and etched for a sufficient period to develop the structure. This test shall show the material to be free from steel. If there is any doubt as to the structure, microscopic examination may be made.

TEST SPECIMENS

4. (a) Test specimens shall consist of sections cut from a pipe. They shall be smooth on the ends and free from burrs.

(b) Tension-test specimens shall be longitudinal and shall consist of the whole pipe when it is within the capacity of the available testing machine. For larger sizes the test will be made on strips not less than three-fourths inch wide, machined from the pipe.

(c) All specimens shall be tested cold.

(In respect to definition of scrap, tensile properties, determination of yield point, hydrostatic tests, fracture tests, and bend tests, this specification conforms with A. S. T. M. A72-30, given below. It conforms with A. S. T. M. A53-30 (see 607.4, p. 476) in respect to number of tests, retests, standard weights, permissible variations, lengths, workmanship, ends, threads, couplings, finish, inspection, rejection, and reheating, with the addition of weights, dimensions, and hydrostatic pressures on 7, 9, and 11 inch pipes.)

AMERICAN RAILWAY ASSOCIATION, SIGNAL SECTION, 1-INCH WROUGHT-IRON SIGNAL PIPE, SPECIFICATION 12324, JULY, 1924

WROUGHT-IRON SIGNAL PIPE

(In respect to manufacture, tensile properties, and bend test, this specification conforms with A. S. T. M. A72-30, given below; in other respects it provides as follows:)

The tensile strength, limit of elasticity and ductility, and weld, shall be determined from a test piece cut from finished pipe. When required by the purchaser, the following tests shall be made: From each 1,000 feet of finished pipe, a piece 6 feet long shall be cut from a length selected at random, and subjected to the following tests:

(a) One specimen cut by hand, with standard stock and die, 1½ inches of thread.

(b) Punch two ¼-inch holes on welded seam, 2 inches and 4 inches from threaded end, without use of plug or filler piece.

(c) Twist piece through angle of 180° by clamping one end and turning the other end. After tests, if 20 per cent of the pieces show split or fracture at weld, the lot will be rejected.

The weight of 1 foot of 1-inch pipe before galvanizing should be 1.71 pounds, and in no case will pipe be accepted weighing less than 1.63 pounds per foot, weight of plug and coupling not included.

The outside diameter of pipe must conform to Briggs' standard. Any pipe less than 1.31 inches in diameter to result in flat thread will be rejected.

The manufacturer shall furnish all necessary facilities for making tests, and the tests shall be made at the mill.

Inside diameter of all pipe must be large enough to receive a hardened steel plug of sixty-three-sixty-fourths-inch diameter for a length of 6 inches. Not more than 1 per cent of pipe less than 15 feet long will be accepted; lengths of 17 feet and over preferred.

COUPLINGS

Pipe couplings must be galvanized, must be 2¼ inches long and ¾ inches outside diameter, of wrought iron, free from defects, faced at ends, tapped straight through, pitch diameter of thread to be such as to fit pipe as specified under threads in A. R. A.-S, specification 12227 (see 607.4, p. 463), 1.26 inches, varying not more than 0.003 inch.

(In respect to ends, threads, plugs, rivets, and drawings this specification conforms with A. R. A.-S, specification 12227, 1-inch welded steel pipe. See 607.4, p. 463.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR WELDED WROUGHT-IRON PIPE, DESIGNATION A72-31, 1931

WELDED WROUGHT-IRON PIPE

(This specification conforms with A. S. T. M. A53-30 (see 607.4, p. 476) except in the following respects:)

SCOPE

These specifications cover standard weight, extra strong, and double extra strong welded wrought-iron pipe. Pipe ordered under these specifications is intended for coiling, bending, flanging, and other special purposes. Butt-welded pipe is not intended for flanging and is not recommended for bending or coiling in sizes 1¼ inches or over.

MANUFACTURE

The pipe shall be made from wrought iron⁶⁹ and shall be free from any admixture of iron scrap or steel.

Iron scrap.—This term applies only to foreign or bought scrap and does not include local mill products free from foreign or bought scrap.

PHYSICAL PROPERTIES AND TESTS

The material shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	40,000
Yield point.....	do.....	24,000
Elongation in 8 inches.....	per cent..	12

The yield point shall be determined by the drop of the beam of the testing machine. The speed of

⁶⁹ *Wrought iron.*—A ferrous material aggregated from a solidifying mass of pasty particles of highly refined metallic iron with which, without subsequent fusion, is incorporated a minutely and uniformly distributed quantity of slag.

the crosshead of the machine shall not exceed three-fourths inch per minute.

A section of pipe 6 inches in length shall be flattened until broken by repeated light blows of a hammer or by pressure. The fracture developed shall have a fibrous appearance.

For pipe 2 inches or under in diameter, a sufficient length of coiling or bending pipe shall stand being bent cold through 90° around a cylindrical mandrel the diameter of which is 15 times the nominal diameter of the pipe, without developing cracks at any portion and without opening the weld. Double extra strong pipe over 1¼ inches in nominal size need not be subjected to the bend test.

In case of doubt as to the presence of steel, the purchaser may, at his own expense, make micro-graphic examination and chemical analysis to assist in determining whether the material meets the requirements.

For pipe up to and including 2 inches in nominal size, tension-test specimens shall be of the full section of the pipe. For pipe larger than 2 inches in nominal size, tension-test specimens may be strips not less than three-fourths inch in width, cut longitudinally from the pipe. The sides of such specimens shall be parallel and not flattened between gage marks.

All specimens shall be tested at room temperature. (This specification carries no reference to permissible variation of thickness of wall. The thickness, in inches, of the various kinds of pipe is as follows:)

Size (nominal inside diameter)	"Standard weight" pipe (thickness)	"Extra strong" pipe (thickness)	"Double extra strong" pipe (thickness)	Size (nominal inside diameter)	"Standard weight" pipe (thickness)	"Extra strong" pipe (thickness)	"Double extra strong" pipe (thickness)
Inches 1/8	Inch 0.070	Inch 0.098	-----	Inches 3 1/2	Inch 0.231	Inch 0.325	Inch 0.651
1/4	.090	.122	-----	4	.242	.344	.690
3/8	.093	.129	-----	5	.263	.383	.768
1/2	.111	.151	0.307	6	.286	.441	.884
5/8	.115	.157	.318	8	.283	-----	.895
1	.136	.183	.369	8	.329	.510	-----
1 1/4	.143	.195	.393	10	.284	-----	-----
1 1/2	.148	.204	.411	10	.313	-----	-----
2	.158	.223	.447	10	.372	.510	-----
2 1/2	.208	.282	.567	12	.336	-----	-----
3	.221	.306	.615	12	.382	.510	-----

One cubic inch of wrought iron weighs 0.2776 pound.

HEATING AND PIPING CONTRACTORS NATIONAL ASSOCIATION, EXTRA-HEAVY WELDING NECK FLANGES FOR STANDARD AND EXTRA-HEAVY PIPE, 1929

PIPE FLANGES

(See 607.14, p. 412.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, COMMERCIAL STANDARD FOR WROUGHT-IRON PIPE NIPPLES, CS6-31, MAY 1, 1931

WROUGHT-IRON PIPE NIPPLES

(A commercial standard that has been selected and accepted by industry.)

GENERAL REQUIREMENTS

Pipe nipples shall be made only from tested new black or zinc coated (galvanized) wrought-iron pipe, of full weight, in full or short lengths that are free from buckles, bends, kinks, cracks, laminations, imperfect welds, rust, injurious sand marks, or any other defects which might affect its strength or serviceability.

The pipe shall be made from wrought iron and shall be free from any admixture of iron scrap or steel. Pipe shall also conform in all respects to American Society for Testing Materials Specification for Welded Wrought-Iron Pipe, A72-31. (See above.)

NOTE.—Wrought iron is a ferrous material, aggregated from a solidifying mass of pasty particles of highly refined metallic iron with which, without subsequent fusion, is incorporated a minutely and uniformly distributed quantity of slag.

Nipples shall be reamed and chamfered at an angle of 25° to 45° to the central axis.

Nipples shall not exceed one-sixteenth of an inch under or over the specified length.

(Permissible diameter variations and permissible weight variations of the pipe from which wrought-iron pipe nipples are made are as given in Federal specification WW-P-441 for wrought-iron pipe. See United States Government Federal Specifications Board, WW-P-441, below.)

The wall thickness shall be not more than 12½ per cent under the nominal wall thickness at any point.

(Dimensions of standard weight, extra strong, and double extra strong pipe from which wrought-iron pipe nipples are made are the same as given in Federal specification WW-P-441 below.)

(Threading for both ends of pipe nipples is required to be in conformity with the taper pipe thread dimensions given in the standards of the National Screw Thread Commission. See 607.0, p. 365.)

(Stock sizes and lengths of wrought-iron pipe nipples are the same as given in Federal Specification WW-N-351 for wrought-iron pipe nipples. See United States Government, Federal Specifications Board, WW-N-351, under 607.4, p. 485.)

(In addition, this standard includes the following requirements on packing.)

TABLE 8.—Packing of standard-weight black or galvanized nipples

[Number contained in carton]

WELDED AND SEAMLESS STEAM AND WATER PIPES

(See 607.4, p. 483.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIPE, WROUGHT-IRON, WELDED, BLACK AND GALVANIZED, WW-P-441, AUGUST 18, 1931

WROUGHT-IRON PIPE

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, or parts thereof that are below indicated, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification	Former number	Title	See—
GGG-P-351	238	Pipe threads.....	607.0, p. 365.
QQ-M-151	339	General specifications for metals.	600.0, p. 3.

B. CLASSES

B-1. Wrought-iron pipe shall be furnished in the following classes, as required: Class A, standard weight; class B, extra strong; class C, double extra strong.

B-2. Wrought-iron pipe shall be furnished black or zinc coated (galvanized), as required.

C. MATERIAL AND WORKMANSHIP

C-1. The pipe shall be made from wrought iron and shall be free from any admixture of iron scrap or steel, except that the manufacturer's own iron skelp crop ends and finished iron pipe ends may be used.

C-2. Wrought iron is a ferrous material, aggregated from a solidifying mass of pasty particles of highly refined metallic iron with which, without subsequent fusion, is incorporated a minutely and uniformly distributed quantity of slag.

C-3. Pipe shall be straight and free from buckles, kinks, bends, cracks, blisters, laminations, imperfect welds, rust, injurious sand marks, or any other defects which might affect its strength or serviceability. All burrs at the ends of the pipe shall be removed. (Ordinary liquor marks incident to manufacture of welded material will not be considered cause for rejection.)

C-4. All pipe 1-inch iron pipe size and smaller shall be butt-welded; all 2½ inches and larger shall be lap-welded; 1¼, 1½, and 2 inch pipe may be either butt-welded or lap-welded unless pipe made by one of these processes is specifically ordered.

D. GENERAL REQUIREMENTS

D-2. The material shall conform to the following minimum requirements with respect to tensile properties:

Tensile strength.....	lbs./in. ² ..	40,000
Yield point.....	do.....	24,000
Elongation in 8 inches.....	per cent..	12

(Tensile properties are the same as required in A. S. T. M. specification A72-31, above.)

D-3. When required by the contract or order, the material shall conform to the following chemical requirements:

Carbon not over 0.08 per cent.
Manganese not over 0.08 per cent.

D-4. For pipe 1½ inches iron pipe size or under the outside diameter at any point shall vary not more than one-sixtyfourth inch over nor more than one-thirtysecond inch under the outside diameter as specified in Tables 1, 2, and 3. For pipe 2 inches iron pipe size or over, the outside diameter shall vary not more than 1 per cent over or under the outside diameter as specified in Tables 1, 2, and 3.

D-5. The weight of black pipe shall vary not more than 5 per cent over or under that specified in Tables 1 (class A, standard weight) and 2 (class B, extra strong), nor more than 10 per cent over or under that specified in Table 3 (class C, double extra strong).

D-6. The weight of zinc-coated pipe shall vary not more than 3 per cent under that given in Table 1 (class A, standard weight) and Table 2 (class B, extra strong), nor more than 8 per cent under that specified in Table 3 (class C, double extra strong).

D-7. Zinc-coated pipe shall be thoroughly and evenly coated with zinc by the hot process, both inside and outside, and shall be free from blisters and other defects. The weight of zinc coating shall be not less than 2 ounces per square foot of surface covered. The zinc bath shall contain not more than 2 per cent of elements other than zinc as determined from samples taken at a point half the depth of the bath. Unless zinc coating is specified in the invitation for bids black pipe shall be furnished.

D-8. All threads shall be in accordance with the standard threads for pipe as given in the Federal specification for pipe threads, GGG-P-351 referred to in paragraph A-1.

D-9. Before shipment all threads shall be adequately protected. Tapped rings or half-length couplings shall be provided on the end not protected by the coupling on all sizes of threaded pipe 2 inches iron pipe size or larger. Threads on smaller sizes shall be protected by having ends of bundles securely wrapped with burlap unless otherwise specified.

D-10. Unless exact lengths are specified, pipe shall be furnished in lengths of from 16 to 22 feet for standard weight pipe and 12 to 22 feet for extra strong and double extra strong pipe. When ordered in carload lots a maximum length of 24 feet will be accepted. Unless otherwise specified, not over 5 per cent of jointers, which are two pieces coupled together, will be accepted in standard weight pipe. When exact lengths are specified, no jointers will be permitted. Five per cent of extra strong and double extra strong pipe may be in lengths of 6 to 12 feet.

E. DETAIL REQUIREMENTS

E-1. Standard weight pipe shall, unless otherwise specified, be threaded at both ends and have a standard weight wrought-iron coupling tightly screwed on one end. Extra strong and double extra strong pipe shall, unless otherwise specified, be furnished with plain ends and without couplings. Zinc-coated (galvanized) couplings shall be furnished with zinc-coated pipe.

E-2. Each length of pipe over one-eighth inch I. P. S. shall have the name of the manufacturer rolled onto the pipe.

E-3. The dimensions, weights, and test pressures of standard weight, extra strong, and double extra strong pipe shall be as shown in Tables 1, 2, and 3.

TABLE 1.—Requirements for class A standard weight pipe

TABLE 2.—Requirements for class B extra strong pipe

TABLE 3.—Requirements for class C double extra strong pipe

(Sizes, outside diameters, and weights are the same as given in A. S. T. M. specification A53-30, Table 2. Test pressures are the same as specified in Table 1 of A53-30. See 607.4, p. 476. Wall thicknesses are as given in A. S. T. M. specification A72-31. See 607.3, p. 431.)

(Table 1 also includes weights of standard weight pipe with plain ends which does not appear in above references. See following.)

Weight requirements for class A standard weight pipe with plain ends:

Iron pipe size	Weight per foot	Iron pipe size	Weight per foot
<i>Inches</i>	<i>Pounds</i>	<i>Inches</i>	<i>Pounds</i>
$\frac{1}{8}$	0.244	3	7.575
$\frac{1}{4}$.424	$3\frac{1}{2}$	9.109
$\frac{3}{8}$.567	4	10.790
$\frac{1}{2}$.850	5	14.617
$\frac{3}{4}$	1.130	6	18.974
1	1.678	8	28.554
$1\frac{1}{4}$	2.272	10	40.483
$1\frac{1}{2}$	2.717	12	49.562
2	3.652	12	43.773
$2\frac{1}{2}$	5.793		

F. METHOD OF INSPECTION AND TESTS

F-1. *Hydrostatic test.*—Each pipe shall be tested at the mill to an internal hydrostatic pressure not less than that indicated in Tables 1, 2, and 3, respectively, for the classes specified. Any pipe which develops any defects shall be rejected. Pipe, while under pressure, shall be jarred with a hammer not less than 1 pound in weight.

F-1a. Hydrostatic tests shall be made in the presence of the inspector unless inspection is specifically waived, in which case the manufacturer shall furnish a certificate to the effect that the pipe has withstood satisfactorily the hydrostatic test required.

F-2. *Surface inspection.*—All pipe shall be surface inspected for defects by "rolling" on suitable supports, so that entire surface of each pipe may be properly inspected.

F-3. *Number of tests (regular).*—Unless otherwise specified one each of the tests specified in paragraphs F-4, F-5, F-6, and F-7 shall be made on a length of pipe selected by the inspector from each lot or fraction thereof as defined in Table 4 to insure that the pipe is of the material and quality required.

TABLE 4.—Lots for regular number of tests

Iron pipe, sizes	Number of lengths of pipe constituting "lot"
3 inches and under.....	100
Over 3 inches and not over 6 inches.....	50
Over 6 inches and not over 8 inches.....	25
Over 8 inches.....	10

F-3a. *Number of tests (alternate).*—When required in the order or invitation for bids, one each of the tests specified in paragraphs F-4, F-5, and F-6

shall be made on a length of pipe selected by the inspector from each lot of 500 lengths or fraction thereof of each size.

F-4. *Flattening test.*—A section of pipe 6 inches in length shall be flattened until broken by repeated light blows of a hammer or by pressure, having the weld at 90° from the point of application of load. The test piece shall show a sound weld and the fracture shall have a fibrous appearance. If any section fails to meet these requirements, two additional lengths may be selected by the inspector and samples taken. Should either of these fail, the lot of pipe shall be rejected.

F-5. *Tension test.*—For pipe up to and including 2-inch iron pipe size, tension-test specimens may be of the full section of the pipe. For pipe larger than 2 inches I. P. S., tension-test specimens may be strips not less than three-fourths inch in width, cut longitudinally from the pipe. The sides of such specimens shall be parallel, and specimens shall not be flattened between gage marks.

F-6. *Bend test.*—Pipe 2 inches I. P. S. or under shall withstand being bent cold under slowly applied pressure through 90° around a cylindrical mandrel the diameter of which is fifteen times the nominal diameter (I. P. S.) of the pipe, without developing cracks at any portion and without opening the weld. The bend test will not be required on double extra strong pipe over $1\frac{1}{4}$ inches I. P. S.

F-7. *Macroscopic examination (etch test).*—After removing all marks of the cutting-off tool and making sure that the end of the pipe is smooth, the end of the sample shall be suspended in a solution of 10 per cent hydrochloric acid (specific gravity 1.19), 30 per cent sulphuric acid (specific gravity 1.84), and 60 per cent water; or 25 per cent nitric acid (specific gravity 1.42), and 75 per cent water. After the end of the pipe has been immersed about an hour, the piece shall be removed, washed off and dried quickly with a soft rag. The end shall show ridges or rings indicating the silicious slag content of wrought iron.

F-8. *Microscopic examination and chemical analysis.*—Microscopic examination and chemical analysis may be made when required by the contract to assist in determining whether the material meets the requirements. These additional tests shall be at the expense of the Government. If upon microscopic examination of a test specimen, distinct pearlitic areas or improper distribution of slag is revealed, the lot represented shall be rejected.

F-8a. Drillings, millings, or clippings for chemical analysis shall be taken from several points around each piece selected for physical tests, and the chips from each lot combined and thoroughly mixed. The resultant sample shall be free from dirt, grit, and other foreign matter and shall consist of at least 2 ounces.

F-9. *Test for coating.*—If impracticable to obtain samples from the bath or to weigh pipe immediately before coating, the quality of the zinc coating and the weight per square foot may be determined from the average of samples 6 inches long taken from both ends of finished pipe. When quality of zinc is determined by the stripping test, iron shall not be counted as an impurity.

G. PACKING AND MARKING OF SHIPMENTS

G-1. *Packing.*—Unless otherwise specified, the subject commodity shall be delivered in such manner as to insure acceptance by common or other carriers for safe transportation, at the lowest rate, to the point of delivery.

G-2. *Marking.*—Unless otherwise specified, shipments shall be marked with the name of the material, the size, the class, and the quantity contained therein, as defined by the contract or order under

which the shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. Pipe is regularly designated by iron-pipe size, class (standard weight, extra strong, or double extra strong), black or zinc coated (galvanized).

I-2. Pipe under this specification should be ordered by number of feet required. In the case of pipe furnished with couplings the length includes the coupling when tightly screwed on pipe.

I-3. The pipe described in this specification is suitable in general for conveying steam, water, air, gas, and oil. The specification is not intended to cover pipe for oil country tubular goods.

I-4. Pipe 1¼ inches to 2 inches I. P. S., inclusive, as made by both the lap-welding and butt-welding processes, is covered by this specification. If either is specifically desired, the invitation for bids should so state, otherwise either lap-welded or butt-welded pipe of these sizes may be furnished and will be acceptable.

I-5. Standard weight couplings normally furnished with standard weight pipe have straight threads up to and including the 1½-inch size. Federal Specifications Nos. WW-P-501 and WW-P-521 cover cast-iron and malleable-iron couplings with tapered threads which should be used when such threads are required by practice or regulation.

I-6. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NIPPLES, PIPE, BRASS, STEEL, AND WROUGHT IRON, WW-N-351, JUNE 24, 1930

WROUGHT-IRON NIPPLES

(See 607.4, p. 485.)

607.4 STEEL PIPE, FITTINGS, AND CONNECTIONS.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

(This organization has prepared specifications relating to steel ship construction, including ship parts from keel to masts, boilers, propelling and other machinery, and electrical equipment. Specifications contained in the publication relating to ferrous and nonferrous metals have been placed in this compilation under their proper commodity headings, as follows:)

Commodity designation	Material	Page
607.14	Pipe fittings.....	385
607.4	General.....	435
607.6	Valves.....	492
642.23	Copper and brass pipes.....	1182
646.41	Bronze castings.....	1250

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

PIPE FITTINGS

1. All pipe fittings over 2 inches in diameter for working pressures over 150 pounds per square inch, and fittings over 3 inches in diameter for pressures over 100 pounds should be cast with flanged ends. For boiler mountings this requirement is to apply to fittings 1½ inches in diameter and over.

2. Fittings of 3 inches diameter and over for working pressures over 100 pounds, and fittings of all sizes for pressures in excess of 300 pounds, are to be subjected by the manufacturer to a hydrostatic test of not less than three times the working pressure. They should also be stamped with the trade-mark of the manufacturer and the maximum allowable working pressure.

3. *Flanges.*—Pipes 2½ inches diameter and over for working pressures over 150 pounds per square inch should be expanded into steel flanges, or, in the case of copper pipes, brazed to composition or steel flanges. On other pipes screwed flanges should be fitted in preference to screw unions. The screwed pipes of high pressure oil and steam lines should be expanded into the flanges in order to secure uniformly tight threads.

4. *Material of valves and fittings.*—Cast steel may be used in the construction of valves and fittings of any system and for all pressures and temperatures. The physical characteristics should be in accordance with those specified for steel castings (see 611.41, p. 706, par. 1). Manufacturers should make physical tests of each heat, and when required submit the results of such tests for the bureau's information. All steel castings must be thoroughly annealed. The minimum thickness in inches shall be determined by the formula:

$$t = \frac{\text{working pressure} \times \text{internal diameter}}{7,000} + 0.188$$

5. Cast iron and semisteel of the physical characteristics specified in the A. B. S. specification for iron castings (see 611.11, p. 635), may be used in the construction of valves and fittings for pressures not exceeding 300 pounds per square inch and for temperatures up to 450° F. The minimum thickness in inches shall be determined by the formula:

$$t = \frac{\text{working pressure} \times \text{internal diameter}}{3,000} + 0.25$$

6. Composition having the physical characteristics for grade 1 material specified in the A. B. S. specification for brass and bronze castings (see 646.41, p. 1250), may be used in the construction of valves and fittings for pressures not exceeding 300 pounds per square inch and temperatures up to 470° F. The minimum thickness in inches shall be determined by the formula:

$$t = \frac{\text{working pressure} \times \text{internal diameter}}{5,000} + 0.125$$

7. Bronze having the physical characteristics for grade 2 material specified for brass and bronze castings (p. 1250), or other approved material may be used in the construction of valves and fittings for pressures over 300 pounds per square inch and temperatures up to 550° F.

8. Pipes for working pressures over 150 pounds per square inch are to be tested and inspected by the bureau's surveyors in accordance with the requirements for steel pipes given above in materials for machinery, boilers, and piping.

9. Steel pipes for pressures up to 350 pounds per square inch may be lap-welded; for higher pressures they must be seamless drawn.

10. Butt-welded steel pipes over 2 inches in diameter are not to be used for pressures over 100 pounds per square inch.

11. The minimum thicknesses of pipes shall be determined by the following formulas:

Lap-welded iron and steel pipe,

$$t = \frac{DW}{10,000} + C$$

Seamless steel pipe, grade 1,

$$t = \frac{DW}{12,000} + C$$

Seamless steel pipe, grade 2,

$$t = \frac{DW}{14,000} + C$$

where t = thickness in inches.

D = internal diameter in inches.

W = working pressure in pounds per square inch. For feed pipes this should be 1.2 times the boiler pressure.

C = 0.12 inch for steam and water; 0.06 inch for air and oil.

12. The reduction in thickness at the outer radius of bent pipes is to be considered in determining the required thickness.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

STEEL PIPES

(For general information and requirements see 600.0, p. 1. For test requirements see 600.1, p. 7.)

1. Lapwelded steel pipes over 2 inches inside diameter, for a working pressure over 150 pounds per square inch are required to be tested and inspected by the surveyors in accordance with the following requirements:

2. The material shall be of a soft weldable quality. Pipes must be free from seams, cracks, or other defects. Test specimens are to be cut from pipes selected by the surveyor from each lot. At least one set of the following tests is to be made for each lot of 2,000 pounds or less.

3. *Tension test.*—A test piece 8 inches long, 1½ inches wide, shall show a minimum tensile strength of 45,000 pounds per square inch, a yield point of 55 per cent of the tensile strength, and a minimum elongation of 20 per cent.

4. *Flattening test.*—A section of pipe not less than 4 inches long shall stand flattening until the outside distance between the flat sides is not more than one-third the outside diameter of the pipe without showing cracks or flaws. The weld must be located at right angles to the flat sides.

5. *Hydrostatic test.*—All pipes shall be tested to a hydrostatic pressure of not less than three times the working pressure.

6. *Gaging and marking.*—The minimum thickness shall not be less than specified by the purchaser and required by the rules.

7. Upon satisfactory compliance with the requirements all pipes are to be legibly stenciled with the identification mark of the manufacturer, the test pressure, and **A. B.**, showing that they have been satisfactorily tested and inspected by a surveyor to the bureau. Pipes showing defects previous to or during their installation shall be rejected notwithstanding any previous acceptance.

SEAMLESS STEEL PIPES

8. Seamless steel pipes for a working pressure of over 150 pounds are to be tested and inspected by

the surveyors in accordance with the following requirements: Pipes are to be uniform in thickness and of good ductile material. They are to be annealed as a final process. Test tubes are to be selected by the surveyor, and at least one set of tests is to be made for each lot of 2,000 pounds or less.

9. *Physical test.*—A standard test piece must show the material to be of either of the following characteristics:

Grade	Tensile strength	Yield point	Minimum elongation
1.....	$\frac{Lbs}{in^2}$ 48,000-60,000	55 per cent of tensile strength..	Per cent 20
2.....	60,000-70,000	55 per cent of tensile strength..	18

(Flattening test, hydrostatic test, and gaging and marking are the same as those specified above for lapwelded steel pipes.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, SPECIFICATION FOR TUBULAR STEEL POLES, D11-26, 1926

[Approved as American Tentative Standard C13-1926, by the American Standards Association]

TUBULAR STEEL POLES

I. SCOPE

1. These specifications ⁷⁰ cover material for, and the manufacture of, tubular steel poles for electric line construction.

II. CONSTRUCTION OF POLE

2. *Selection of material.*—The material used in pole construction shall consist of lapwelded or seamless pipe conforming to the current standard specification of the American Society for Testing Materials for standard and extra strong pipe. (See A53-30, below.)

3. *Design.*—Each pole shall be built up of three pipe sections, butt, middle, and top, arranged as per Figure 268, with overlapping joints 18 inches long. The lapweld seams in the sections shall be set at an angle of 120° to each other. Each section shall be composed of steel pipe of the respective sizes and lengths shown in Table 1 for the pole selected.⁷¹

When specified, a ground sleeve shall be attached to the butt section of each pole consisting of a section of steel pipe 2 feet long and of one-half inch nominal thickness after attachment to the pole, with its bottom 5 feet 4 inches from the base of the pole, unless otherwise specified by the purchaser. Its top shall be beveled sufficiently to shed water and the joint shall be water-tight.

The use of a pole top is recommended to protect the inside of the pole from exposure to the weather.

4. *Method of fabrication.*—Overlapping joints may be made either by swaging or by drawing through a die. If the swaging method is used, the larger section shall be heated and the smaller one while cold inserted therein, the larger section while hot being then swaged tightly on the smaller one. If the die method is used, the larger section shall be drawn over the smaller one while they are either hot or

⁷⁰ The specifications include also a carefully selected list of pole sizes which the committee recommends for general use.

⁷¹ If any other design of pole is desired, its dimensions and test requirements shall be specified in the order.

¹ See notes under heading General information supplementing Table I, Figure 268, and text.

General Information Supplementing Table 1, Figure 268, and Text—General Deflection Formula

Computations in Table 1 were made by the following general formula for a 3-section tubular pole:

$$D = \frac{11.52L}{10^6} \left[\frac{B^2(2H+S)+3BS(H+S)}{I_1} + \frac{3M(S^2+T^2)-M^2}{I_2} + \frac{2T^3}{I_3} \right]$$

Definition of Symbols Used in Formula, Table 1, and Figure 268

F=length of pole, feet.

F₁=length of butt section, feet.

F₂=length of middle section, feet.

F₃=length of top section, feet.

H=height from ground line to point of application of load, feet.

B=length of butt section above ground, feet.

M=length of middle section above butt, feet.

T=length of top section above middle to point of application of load, feet.

S=length of pole above butt section to point of application of load, feet, S=M+T.

I₁=moment of inertia of butt section, a constant for any pole.

I₂=moment of inertia of middle section, a constant for any pole.

I₃=moment of inertia of top section, a constant for any pole.

L=load applied 18 inches from top of pole, pounds.

D=Deflection of pole at point of application of load, inches.

E=modulus of elasticity, 29,000,000.

P=load for permanent set, pounds.

NOTES

The above general deflection formula for a 3-section tubular pole was derived from the basic formula $D = \frac{LH^3}{3EI}$ for a single-section pole, in which the symbols have the same meaning as above except

that H is in inches and I is the moment of inertia of the single section.

In deriving the general formula, a factor of variation has been introduced to allow for variations in material, dimensions, and quality. This allowance is equivalent to the use of a modulus of elasticity of 25,000,000.

The load for permanent set, P, has been computed by using 27,000 pounds per square inch fiber stress and the normal section; that is, a pipe that is absolutely true to weight and shape, and free from all variations.

The deflection load, L, is approximately two-thirds of the set load.

AMERICAN MARINE STANDARDS COMMITTEE, TUBULAR STEEL CARGO BOOMS FOR SHIPS, H NO. 21-1927 TO H NO. 25-1927

TUBULAR STEEL CARGO BOOMS FOR SHIPS

(Capacities 5, 10, 15, 20, and 30 tons)

GENERAL NOTES

1. These standards are believed to cover the requirements for ordinary installations, but, where extraordinary conditions exist, due allowance should be made therefor in selecting or determining the boom to be provided. Eccentric loading and liability to bending and shock under live loads would be conditions requiring special consideration. Therefore the standards should be used only with due consideration to the actual conditions prevailing in each individual case.

2. In the calculations upon which the design of these standard booms is based, the following assumptions, formulas, and methods were used:

(a) *Strength of booms.*—

The booms were considered as columns with ends free or round.

The Rankine-Gordon formula was used, viz.:
 P = ultimate strength of column in pounds per square inch.
 f = crushing strength of material in pounds per square inch.
 L = length of column in inches.
 r = least radius of gyration of column in inches.
 a = constants; that is, $\frac{1}{9000}$ for mild steel, with ends free or round.

$$P = \frac{f}{1 + a \left(\frac{L}{r}\right)^2} \text{ and assuming } f \text{ as } 50,000$$

pounds per square inch for lapwelded pipe,

$$P = \frac{50,000}{1 + \frac{1}{9000} \left(\frac{L}{r}\right)^2}$$

A curve was made up for P for various values of $\frac{L}{r}$ from 0 to 200, from which the ultimate strength

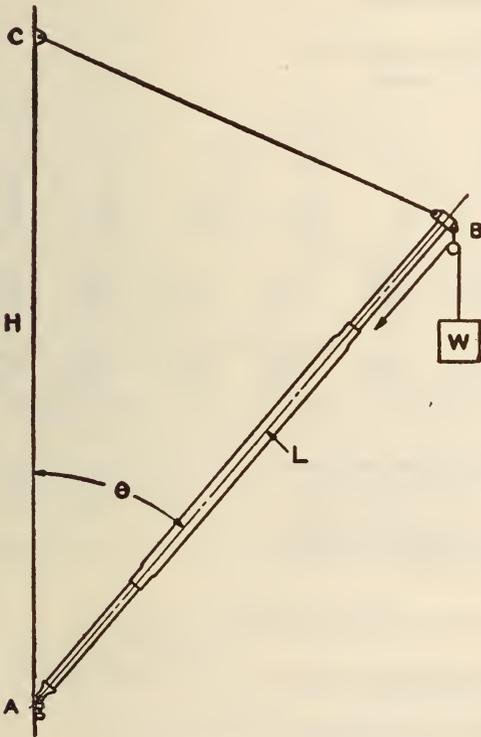

FIGURE 269

could be read off for any value of $\frac{L}{r}$. In figuring the strength of the booms a factor of safety of 5 was primarily used to determine the allowable working stress, but the pipes or tubes adopted for the various parts being the nearest commercial sizes over the calculated requirements the resultant factor of safety actually exceeds 5. This has been augmented in some cases by minimizing the variety of parts for the construction of the 26 different booms comprised in the standards by using identical sizes so far as deemed practicable and economical. Half the estimated weight of the boom was included in the load factor.

(b) *Thrust in booms.*—The thrust was calculated on the following basis. (Fig. 269.) This formula gives the thrust due to the dead load and the additional thrust due to the pull of the cargo whip:

W = load on boom.
 P = thrust in boom.
 L = length of boom (AB).
 H = height of topping lift above boom support (AC).
 n = number of parts in cargo whip.

(NOTE.—If height AC is kept constant, the thrust in the boom is the same at all angles of θ .)

$$P = W \left(\frac{L}{H} \text{ plus } \frac{1}{n} \right)$$

For these standard booms the value of n was assumed as follows:

5-ton booms.....	$n=1$
10-ton booms.....	$n=2$
15-ton booms.....	$n=3$
20-ton booms.....	$n=4$
30-ton booms.....	$n=6$

The allowable thrust in boom is the permissible working stress multiplied by the sectional area. It was calculated for three thicknesses of various sizes of pipe for three lengths with ratios of $\frac{L}{r}$ ranging from 100 to about 180. Curves were plotted for each size and thickness of pipe, giving allowable

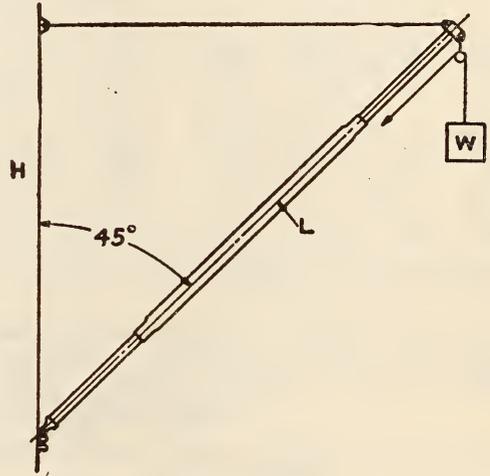

FIGURE 270

thrust for various lengths. These curves were used to determine the diameter and thickness at the middle of the boom. Curves were also plotted for various values of $\frac{L}{r}$ for allowable stress at different points in the length of the boom, from which to determine the permissible reductions of section at points away from the middle.

In standardizing booms for various loads and lengths some ratio of $\frac{L}{H}$ must be assumed, and as a basis for these standards the position of the boom was taken at 45° with the topping lift horizontal, as per Figure 270, viz:

$$\frac{L}{H} = \frac{1}{\cos. \theta} = \text{secant of } 45^\circ = 1.41421$$

When $\frac{L}{H}$ is greater than 1.414, the strength of the boom must be increased above standard.

When $\frac{L}{H}$ is less than 1.414, the strength of the boom may be decreased below standard.

3. *Joints of pipe sections.*—The sections are joined by swaging and shrinking. The joints are made by inserting the end of the smaller pipe cold into the end of the larger pipe heated to a full red heat, and while in this position swaging the larger pipe into close contact with the inserted cold pipe. The joint so swaged is then allowed to cool and shrink.

4. *Materials and workmanship.*—The pipe or tubing shall be open-heart steel having a tensile strength of not less than 50,000 pounds per square inch and an elongation in 8 inches not under 20 per cent. The dimensions of the pipe or tubing as given are commercial standards which are subject to the manufacturing tolerances allowed by the ship-classification authorities. The finished booms must meet the requirements of the ship-classification authorities.

AMERICAN MARINE STANDARDS COMMITTEE, FITTINGS FOR TUBULAR STEEL CARGO BOOMS, H NO. 30-1928, AND H NO. 31-1929

HEEL FITTINGS AND CAPS FOR 5, 10, 15, 20, AND 30 TON BOOMS

GENERAL NOTES

These standards are believed to provide safely for ordinary installations and the loads specified for the tubular steel booms to which they apply. Where extraordinary conditions exist, due allowance should be made therefor by installing larger booms and fittings. Eccentric loading and liability to extraordinary shock under live loads would be conditions requiring special consideration. Therefore, the standards should be used with due regard to the prevailing conditions in each individual case.

The quality of the materials and workmanship shall equal or exceed the requirements of the American Bureau of Shipping. The materials and the finished booms shall be subject to inspection and acceptance by that bureau or by other ship classification or inspection authorities as may be required by rules and regulations or by the contract or purchase order.

The method indicated for lubrication of the pin of the heel fitting should be regarded as typical.

Other means of lubrication having equal or superior merit may be substituted.

The American (National) standard of screw threads noted on Standard H No. 30-1928 is that sponsored by the Society of Automotive Engineers and the American Society of Mechanical Engineers,

and approved by the American Standards Association in May, 1924, as standard B1a-1924. It is in complete accordance with the report of the National Screw Thread Commission (Miscellaneous Publication No. 89, Bureau of Standards).

AMERICAN PETROLEUM INSTITUTE, PIPE
SPECIFICATIONS, STANDARD NO. 5-A
(7TH ED.), JULY, 1931

STEEL AND IRON PIPE FOR OIL COUNTRY
TUBULAR GOODS

MATERIAL COVERED

1. These specifications apply to lapwelded and seamless steel and iron tubular goods for oil country purposes; covering drill pipe, casing, and tubing. Where the term "pipe" is used in these specifications it is intended to cover all classes referred to.

Section I.—Manufacture

Process.—2. (a) The steel for casing and tubing shall be of good welding quality made by the Bessemer, open-hearth or electric process. The steel for lapwelded drill pipe shall be made by the open-hearth process, and the steel for all seamless

drill pipe shall be made by the electric or open-hearth process. Seamless drill pipe and its couplings shall be made of grade B or grade C steel. Upset end drill pipe to have upset of the diameters and lengths as indicated in tables appended.

(b) The wrought iron shall be made from muck bars made entirely from puddled pig iron, free from any admixture of iron scrap or steel. The term iron scrap applies only to foreign or bought scrap and does not include local mill products free from foreign or bought scrap.

(c) Open-hearth iron.

Section II.—Chemical Properties and Tests

3. (a) The steel shall conform to requirements as to chemical composition given in Table 1.

(b) Open-hearth iron shall not contain a total impurity content of more than sixteen one-hundredths of 1 per cent considering the elements carbon, sulphur, phosphorus, silicon, copper, and manganese as impurities.

TABLE 1.—Chemical properties

	Bessemer welded	Open-hearth welded		Seamless			
		Class I	Class II (rephosphorized) ¹	Grade A	Grade B	Grade C	Grade D
Manganese.....	Per cent 0.30-0.60	Per cent 0.30-0.60	Per cent 0.30-0.60	Per cent 0.30-0.60	Per cent 0.35-1.50	Per cent 0.35-1.50	Per cent (²) 0.04
Phosphorus, not over.....	.11	.045	.08	.04	.04	.04	0.04
Not less than.....			.045				
Sulphur, not over.....	.065	.06	.06	.06	.06	.06	.06

¹ Rephosphorized open-hearth pipe shall be marked by the letter "R" stamped with a steel die directly alongside the A. P. I. monogram, the size of the letter to be the same as the A. P. I. monogram.

² Manufacturer's option.

It will be noted in the table under "Physical properties and tests" that rephosphorized open-hearth welded pipe has higher tensile strength and higher yield point than Class I open-hearth welded pipe, and as a consequence is probably somewhat harder to bend. It probably has better threading and lap-welding properties.

4. (a) *Check analysis.*—Analyses of two lengths of pipe in each lot of 400 or less of each size under 6 inches, and in each lot of 200 or less of each size 6 inches or over, may be made by the purchaser from the finished pipe. By agreement between the manufacturer and the purchaser, the analyses may be taken from the skelp in cases of lapwelded pipe. When taken from the skelp, the number of analyses per lot shall be determined in the same manner as when taken from the finished pipe, except in no case shall there be less than one analysis for each heat.

(b) If the analysis of only one length of pipe or piece of skelp does not conform to the requirements specified, analyses of two additional lengths of pipe or pieces of skelp from the same lot or heat shall be made, each of which shall conform to the requirements specified.

(c) Drillings for analyses shall be taken from several points around each length of pipe or across the pieces of skelp selected for test.

(d) Ladle analyses on each heat of steel shall be furnished by the manufacturer if requested by the purchaser, and shall comply with the requirements of paragraph 3 (a).

Section III.—Physical Properties and Tests

5. (a) *Tension tests.*—The material shall conform to the minimum requirements as to tensile properties given in Table 2.

(b) The yield point shall be determined by the drop of the beam of testing machine, by dividers, or any other approved methods.

5. (a) *Hydrostatic tests.*—Each length of oil country tubular goods, whether butt or lap welded, or seamless, shall be tested at the mill to the hydrostatic pressure specified in tables appended, which pressure shall be maintained for not less than five seconds. Butt or lap welded pipe shall be struck near both ends, while under pressure, a blow with a 2-pound hammer or its equivalent.

TABLE 2.—Physical properties

	Steel							Wrought iron	Open-hearth iron
	Bessemer welded	Open-hearth welded		Seamless					
		Class I	Class II (rephosphorized)	Grade A	Grade B	Grade C	Grade D		
Tensile strength.....lbs./in. ² ..	50,000	45,000	48,000	48,000	70,000	75,000	95,000	42,000	42,000
Yield point.....do.....	30,000	25,000	28,000	30,000	40,000	45,000	55,000	24,000	24,000
Elongation in 8 inches.....per cent..	20	22	20					12	20
Elongation in 2 inches.....do.....				40	25	20	18		

Due to the necessity for placing carbon limits on line pipe for welding, it should be noted that the physical properties of grade B line pipe are slightly lower than for grade B material in A. P. I. standards No. 5-A.

(b) The hydrostatic test pressure on sizes or weights not listed should not exceed those required by the formula:

$$P = \frac{2St}{D}$$

in which

P = the pressure in pounds per square inch.
 S = allowable fiber stress, as follows:

Grade	Pounds per square inch
Lapwelded steel and grade A seamless.....	14, 000-16, 000
Grades B and C seamless.....	18, 000-20, 000
Grade D seamless.....	24, 000-26, 000
Wrought iron and open-hearth iron.....	12, 500-14, 000

For grade D seamless pipe in sizes up to and including 9 5/8 inches outside diameter, no test pressure need exceed 2,800 pounds per square inch, and for all other sizes and grades no test pressure need exceed 2,500 pounds per square inch.

t = thickness of the wall in inches.
 D = outside diameter in inches.

7. (a) *Flattening tests.*—The crop end cut from each end of each length of steel or open-hearth iron lapwelded pipe shall be flattened between parallel plates, with the lap weld at the point of maximum bending, until opposite walls of the pipe meet. No opening in the weld shall take place until the distance between the plates is less than two-thirds of the original outside diameter of the pipe. No cracks or breaks in the metal elsewhere than in the lap weld shall occur until the distance between the plates is less than one-third of the original outside diameter of the pipe. Evidence of laminations or burnt material shall not develop during the entire flattening process. If any section fails to meet these requirements, another piece may be cut. If the second test fails, additional tests may be made until the requirements are met or the length rejected, except that the finished pipe shall not be shorter than 80 per cent of its length after the first crop was cut. Precautions shall be taken so that crop ends can be identified with respect to the length from which they are cut.

(b) The crop ends cut from each length of lapwelded wrought-iron pipe shall be flattened until broken. The test shall be made with the weld approximately 45° from the point of maximum bend. The test piece must show a good lap weld and the fracture shall have a fibrous appearance. If any section fails to meet these requirements, another piece may be cut. If the second test should fail, additional tests may be made until the test meets the requirements, provided that the finished pipe shall not be shorter than 80 per cent of its length after the first crop has been made. Precautions shall be taken so that crop ends can be identified with respect to the length from which they are cut.

8. (a) *Drift tests.*—Each length of casing shall be drifted with cylindrical mandrels of the following dimensions:

	Diameter	Length
For sizes up to 8 5/8 inches outside diameter, inclusive.	1/8 inch smaller than nominal inside diameter of pipe.	Inches 6
For sizes over 8 5/8 inches outside diameter to 14 inches outside diameter, inclusive.	5/32 inch smaller than nominal inside diameter of pipe.	12
For sizes over 14 inches outside diameter.	3/16 inch smaller than nominal inside diameter of pipe.	12

(b) All tubing up to and including 2 1/2 inches shall be drifted to insure free passage of a plunger 4 1/2 inches long and three thirty-seconds of an inch smaller than tabulated inside diameter of tubing. On sizes larger than 2 1/2 inches the plunger shall be one-eighth inch smaller than tabulated inside diameter of tubing.

9. (a) *Test specimens.*—Tension-test specimens shall consist of sections cut longitudinally from either end of the pipe (when not pulled in full sections, as would probably be the case in the smaller sizes of pipe). They shall not be flattened before testing. The specimens from welded pipe shall be taken from a point approximately 90° from the weld, since this is to be a test of the material and not the weld. By agreement between the manufacturer and purchaser, the test specimens for welded pipe may be taken from the skelp.

(b) All testing shall be done cold.

10. *Number of tests.*—One of each of the tests specified in paragraph 5 (a) may be made on a length in each lot of 400 or less, of each size under 6 inches, and in each lot of 200 or less, of each size 6 inches or over. When taken from the skelp the number of tests shall be determined in the same manner as when taken from the finished pipe.

11 (a) *Retests.*—If the result of the physical tests of any lot or heat does not conform to the requirements specified in paragraph 5 (a), retests of two additional lengths or pieces of skelp shall be made, each of which shall conform to the requirements specified.

(b) If any specimen shows defective machining and develops flaws, it may be discarded and another specimen substituted. If the elongation of any tension-test specimen is less than that specified and any part of the fracture is outside of the middle third of the gage length as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

Section IV.—Standard Weights and Lengths

12. (a) The standard weights for oil country tubular material of A. P. I. sizes are given in tables appended.

(b) *Permissible variations.*—The weight of any length of pipe shall not vary more than 3 1/2 per cent under or 6 1/2 per cent over that specified; but the carload weight shall not be more than 1 1/4 per cent⁷² under the nominal weight. On upset pipe the nominal weight is based on 20-foot length and due allowance must be made for longer lengths when same are furnished. (The mills will prepare tables for the guidance of inspectors.) Each joint shall be weighed separately with couplings screwed on, but with thread protector removed. In arriving at carload weight proper allowances are to be made for thread protectors.

13. (a) *Lengths.*—Unless otherwise specified pipe shall be furnished as to minimum lengths in accordance with the following:

(b) Tubing and casing shall have an average length of not less than 20 feet for every carload shipped.

(c) On tubing, not over 5 per cent of any carload shall be under 20 feet in length, with a minimum of 18 feet for the length of any joint.

(d) On casing, not over 5 per cent of any carload shall be under 18 feet in length, with a minimum of 16 feet for the length of any joint. (See footnote.)

⁷² The weight of 1 cubic inch of steel is 0.2833 pound and that of wrought iron is 0.2778 pound, therefore a length of wrought-iron pipe made to full dimensions for thickness and diameter will weigh approximately 2 per cent less than a similar length of pipe made from steel, and due allowance should be made in the "weights per foot" given in tables. In view of this difference the carload weight for wrought-iron pipe shall not be more than 3 1/2 per cent under the nominal weight.

(e) Drill pipe shall be manufactured in two average lengths, of 20 to 22 feet or of 27 to 30 feet. On the 20 to 22 foot average length, not more than 5 per cent of any carload shall be less than 20 feet in length with a minimum of 18 feet and no single joint shall exceed 22 feet. On the 27 to 30 foot average length, not more than 5 per cent of any carload shall be under 27 feet with a minimum of 26 feet, and no single joint shall exceed 30 feet.

(f) Jointers (two short lengths, connected by couplings), the minimum length of the shorter piece to be 5 feet, may be shipped to a maximum of 5 per cent of the order for casing. No jointers shall be shipped on tubing or rotary drill pipe orders.

NOTE.—It is the sense of this committee that within a reasonable time the specifications as to the lengths of joints will be changed to give longer average lengths on all joints, and a longer minimum length of any joint of tubular goods, included in this specification; that great advantages could be effected for the consumer as well as the manufacturer if the lengths of tubular goods used in the oil business averaged 30 feet; and that due consideration should be given this recommendation by the pipe mills, as they have opportunities to make changes in their furnaces.

SECTION V. WORKMANSHIP AND FINISH

14. (a) All skelp entering into welded oil field tubular goods, whether casing, tubing, or drill pipe, must be scarfed.

(b) For pipe 1½ inches or under in nominal inside diameter, the outside diameter at any point shall not vary more than one sixty-fourth inch over nor more than one thirty-second inch under the standard size. For pipe 2 inches or over in nominal inside diameter, the outside diameter shall not vary more than 1 per cent over or under the standard size. The wall thickness of welded and seamless pipe shall not be more than 12½ per cent under the nominal wall thickness at any point. The thickness shall be determined from measurements on the body of the pipe, and the outside diameter of that portion of the pipe used for threading must be governed by the closer tolerances called for by the threading specifications.

(c) The finished pipe shall be reasonably straight and free from injurious defects, such as burnt material, bad welds, sand pits, ball cuts, pits, cinder spots, liquor marks, blisters, slivers, and laminations. Seamless pipe shall also be free from injurious seams. When the depth of sand pits, liquor marks, and cinder spots is in excess of 12½ per cent of the nominal wall thickness they shall be considered injurious defects; welding or patching of such defects will not be permitted. The threading on the pipe must be free from tears, shoulders, cuts, or any defects which may break the continuity of the thread.

(d) The inside diameter of the upset ends on drill pipe shall not vary more than $\pm\frac{1}{16}$ inch from the dimensions specified in Table 9.

15. (a) Ends.—Unless otherwise specified, pipe shall conform to the following regular practice:

(b) Each end of pipe shall be threaded and reamed to remove all burrs.

(c) The inside ends of casing and tubing, and the outside and inside ends of couplings therefor, shall be chamfered sufficiently to produce a round corner to prevent pipe or tools from hanging up in the hole. (See figs. 280, 283, and 284.) This chamfer shall not materially reduce dimension "R," width of bearing face on couplings.

16. Threads and gages.—The threads shall be in accordance with the American standard (as illustrated in thread and gage tables appended), and cut so as to make a tight joint when the pipe is tested at the mill to the specified internal hydrostatic pressure. The variation from the standard, when tested with the standard working gage, shall not exceed a maximum of one turn either way on 8 thread, ¾-inch taper, and one and one-half turns

either way on 10 thread and 11½ thread pipe. For thread diameters of A. P. I. tubular material, see thread tables appended.

(a). The crests and roots of all drill pipe threads shall be rounded, the radius at the crests being slightly greater than that at the root, to insure full flank contact, as illustrated and specified in Figure 282.

17. Threads in couplings and on casing and pipe shall be so nearly alike in form and size, and so well finished, that joints can be screwed together with suitable lubricant, far enough to make a tight joint, and unscrewed four times without injury to the threads. At the discretion of inspector, where the purchaser is represented by an inspector, at least one joint may be so tested out of a lot of 100 or more after joints have been made up at coupling screwing machine.

18. Pipe shall not be rounded out by hammering in order to get a full thread. There shall not be more than two black threads for ¾-inch taper nor more than five black threads for ⅝-inch taper among the perfect threads. (See dimension "E" in various A. P. I. thread tables.) Black threads should not be confused with imperfect threads such as torn, shaven, or broken threads.

19. Each manufacturer of A. P. I. tubular threaded material shall provide himself with certified plug and ring reference gages which have been manufactured in accordance with A. P. I. gage stipulations. (See 615.82, p. 894.)

20. Gaging shall be done to conform with A. P. I. gaging practice.

21. (a) Taper tests.—The taper of threads on both pipe and couplings shall be tested by approved methods at intervals sufficient to insure that taps and dies are in proper adjustment.

(b) The variations in taper shall not exceed the following limits:

	When taper ¹ per foot is specified as—		
	¾ inch	⅝ inch	⅜ inch
Maximum taper.....	Inch $\frac{1}{4}$	Inch $\frac{7}{16}$	Inch $\frac{13}{32}$
Minimum taper.....	Inch $\frac{3}{32}$	Inch $\frac{1}{32}$	Inch $\frac{23}{32}$

¹"Taper" as used herein means "total," or measured on the diameter.

22. (a) Thread protectors.—Solid tapped rings or the equivalent, designed to cover the full thread length of all casing, drill pipe, and tubing 2 inches and larger shall be provided. They must prevent water and dirt from accumulating around the thread and must protect the thread and end of pipe from damage during handling, transportation, and storage. On sizes under 2 inches for export shipment the ends shall be protected by suitable fabric wrappings.

(b) Threaded nipples or the equivalent to cover the total pipe thread length of all couplings for casing, drill pipe, and tubing shall be provided. They must prevent water and dirt from accumulating around the threads and must protect the threads from damage during handling, transportation, and storage.

23. Couplings.—Each length of threaded pipe shall be provided with one coupling having clean-cut threads of such a pitch diameter as to make a tight joint. Couplings may be made of wrought iron or steel, seamless or welded, and shall be free from blisters, pits, cinder marks, and any other injurious defects that would impair the efficiency of the coupling and break the continuity of the thread. When couplings are made of steel, they shall be

electroplated on the threads, heat treated or treated by some other method of manufacture which will minimize the chance of galling.

(a) The ends of couplings to be faced true at right angles to the axis and outside beveled so as to prevent catching on the ends of the joints of pipe through which they pass, but enough thickness should be left at the end of coupling to safely support the weight of the pipe on the elevator.

24. No tapers of couplings to be secured by expanding.

25. When couplings are screwed on at the mill, a high-grade lubricant shall be applied to coupling and pipe threads before making up the joint; and to prevent rust all exposed threads shall be thoroughly greased.

26. *Alignment test.*—The couplings shall be tapped concentric so that the axes of the threads of the two ends are closely in line. Couplings shall be tested for alignment by screwing onto a threaded piece carefully centered in a lathe; in the outer end of coupling is screwed a lathe-turned piece which will give a measured length of about 1 foot on which the alignment of the coupling threads may be determined by an alignment indicator when rotated in the lathe. Other approved means of measuring alignment may be used. Couplings shall be in line within three-fourths inch in a length of 20 feet on all tubular goods except drill pipe. Couplings on drill pipe shall be in line within one-half inch in a length of 20 feet. At least one coupling may be

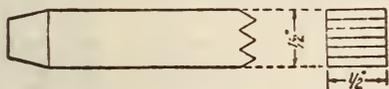

FIGURE 278.—Canceling die

taken from each lot of 100 or less, but this shall be left to the discretion of the inspector, where the purchaser is represented by an inspector. In case this coupling fails, two more couplings may be taken from the same lot, each of which must be within the alignment specified, otherwise the lot shall be rejected. In any case the manufacturer may test rejected couplings individually if desired.

27. (a) *Marking.*—The length, the test pressure in pounds, and class of material shall be stenciled on each length of pipe; and on sizes 6 inches and larger, except dipped or coated pipe, the weight of each length shall be stenciled. Approved abbreviations may be used. Weight per foot and A. P. I. monogram to be stamped with steel dies on each joint 1 foot from coupling on the shop end. The A. P. I. monogram shall also be stamped with a steel die on all couplings, the size of the monogram to be one-fourth inch high on all sizes of pipe, three-eighths inch high on couplings for pipe sizes from 2 to 6 $\frac{1}{2}$ inches, and one-half inch high on couplings for pipe sizes over 6 $\frac{1}{2}$ inches. (The upper and lower crossbar on the letter "I" in the A. P. I. monogram may be omitted when applied to pipe. See Appendix "E".) In addition to the above markings and in letters of similar size, the grades A, B, C, and D of seamless pipe shall be stamped with a steel die.

(b) All pipe manufactured in accordance with these specifications shall be marked, by stamping or rolling, with the manufacturer's private identifying mark. The manufacturer's mark or monogram

should be stamped within 3 inches of the thread on the coupling end; the size of the mark or monogram to be in conformity with the A. P. I. specifications for marking.

(c) Any manufacturer authorized to use the A. P. I. monogram on his product shall forfeit this right if the monogram is not used on material manufactured or sold in accordance with these specifications within a period of 12 months after such authority has been granted. It will be necessary for the manufacturer to make another application in order to be reinstated.

28. An item of equipment (such as drilling valves, casing heads, etc.) for which no specifications are given herein, but which carries a standard A. P. I. thread, may be marked with the letters "A. P. I.", the size, the manufacturer's name or mark, and the word "threads." For example, an item with a 5 $\frac{1}{4}$ -inch casing⁷³ thread could be marked as follows:

A. B. Co. 5 $\frac{1}{4}$ A. P. I. csg. thds.
(or mark)

When so marked, the threads on such equipment must be manufactured and gaged in accordance with the A. P. I. thread specifications thereon and the manufacturer must have in his possession duly certified gages.⁷⁴

The use of the A. P. I. monogram on such articles is expressly prohibited.

Section VI—Inspection and Rejection

29. (a) *Inspection.*—The inspector representing the purchaser shall have free entry at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which will concern the manufacture of the pipe ordered. The manufacturer shall afford the inspector, free of charge, all reasonable facilities to satisfy him that the pipe is being furnished in accordance with these specifications. All tests and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

(b) Where inspector representing purchaser desires to witness these tests, reasonable notice shall be given of the time at which the run is to be made.

30. *Rejection.*—Material which shows injurious defects subsequent to acceptance at manufacturer's works, or which proves defective when properly applied in service, may be rejected and the manufacturer shall be notified. No rejections, under these or any other specifications, are to be stamped with the A. P. I. monogram or sold as A. P. I. pipe, except where said pipe fails to comply with the weight specification alone, in which case it may be sold under a weight specification with which it does comply. When pipe stamped with the A. P. I. monogram is rejected, a canceling die, one-half inch square, per the following figure, shall be applied to such monogram in the following manner: The canceling die shall be applied twice, first with the lines of the die parallel to the axis of the pipe, the die then turned 90°, and applied the second time.

⁷³ When threaded for upset casing, mark "Up. Csg." When threaded for drill pipe, mark "D. P." When threaded for plain tubing, mark "Tbg." When threaded for upset tubing, mark "Up. Tbg."

⁷⁴ It is not necessary that authority to use the A. P. I. monogram be procured to purchase such gages, but the purchaser of such gages is subject to all the stipulations on certification and retest as given in the governing specifications.

TABLE 3.—A. P. I. standard casing

["Size" of A. P. I. casing indicates outside diameter. All dimensions in inches at 68° F.]

Size	Diameters			Thickness, "K"	Threads, number per inch, "B"	Taper, inches per foot, "b"	Weight per foot (pounds ¹)				Upset		Couplings				Test pressure (lbs./in. ²)

¹ See par. 12. (b).

See additional notes to Table 4 below.

Note.—The sizes given in Table 4 have been added from time to time on requests from various districts and were selected from sizes now in use and size changed to outside diameter. No attempt was made to change the threads or couplings (except as to thread classification) and the joints and threads are identical with diamond BX casing for (10 thread) and diamond B8 (for 8 thread). Complete information on threads, gages, etc., is contained herein.

A. P. I. Standard Casing

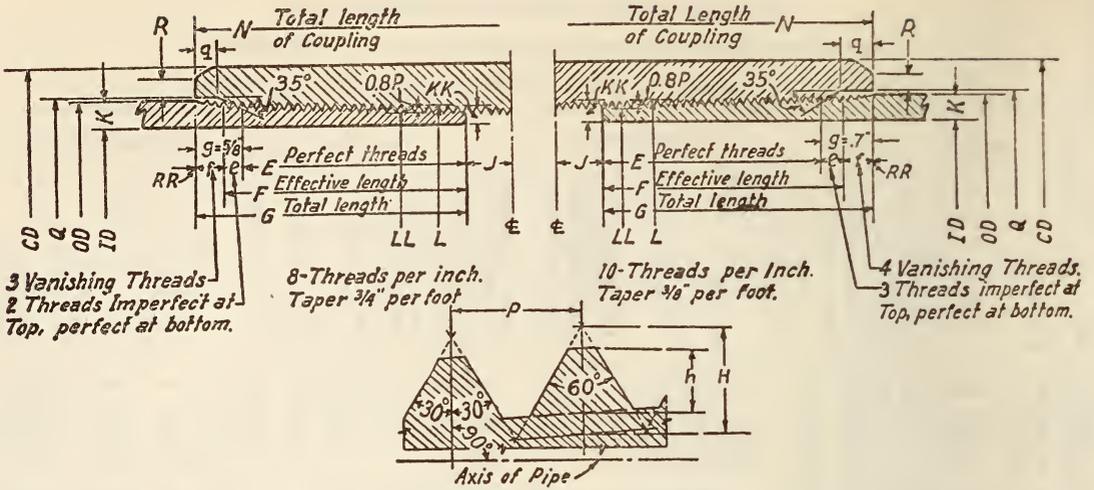

NOTES TO TABLES 3 AND 4

The column headed "Depth in feet for compression factor of safety of 2 for lap-weld steel" in the fourth edition has been eliminated and will be incorporated in greater detail in the A. P. I. Code on the Proper Care and Use of Oil Country Tubular Goods.

When joints are screwed tight the ends of casing shall be five-eighths inch from center of coupling and, when in this position, the outside diameter of thread in end of coupling to be that of the nominal outside diameter of casing. Beyond the threads at the end of coupling there shall be 2 threads perfect at the bottom on 8-thread and 3 threads on 10-thread casing. A slight variation from this provision is permitted in the supplementary sizes given in Table 4, as follows:

Sizes—	Number of threads per inch	Distance end of pipe from center of coupling	Number of threads perfect at bottom exposed beyond the threads in the coupling
4¾ inches, outside diameter	10	Inch 0.5625	2
6½ inches, outside diameter	10	.6125	2
7 inches, outside diameter	10	.6125	2
7½ inches, outside diameter	8	.6875	3
8½ inches, outside diameter	8	.6875	3
9 inches, outside diameter	8	.6875	3
9½ inches, outside diameter	8	.6875	3
11¾ inches, outside diameter	8	.6875	3

Bevel on coupling recess to be 35° to line parallel to axis of casing.

ENLARGED SECTION OF THREAD

SPECIAL NOTE

Dimension "A."—The stand-off "A" specified does not apply to materials used with drill pipe, such as tool joints, drill collars, etc., except where such materials have the same recess dimensions as the drill pipe couplings.

SPECIAL NOTE ON 7 7/8-INCH AND 8 5/8-INCH DRILL PIPE. SEE TABLES 9 AND 10

Data on the 7 7/8-inch and 8 5/8-inch size published for general information only. Due to the very limited demand for these sizes manufacturers are not required to supply themselves with certified master gages unless they desire to do so. Manufacturers will furnish these sizes with threads made as closely as possible to dimensions given, without certified gages. The A. P. I. monogram can not be used on these sizes unless the manufacturer has the necessary master gages. One weight only listed; consult manufacturers if other weights are desired.

AMERICAN PETROLEUM INSTITUTE, LINE-PIPE SPECIFICATIONS, STANDARD NO. 5-L (4TH ED.), JULY, 1931

STEEL AND IRON PIPE FOR LINE-PIPE PURPOSES

MATERIAL COVERED

1. These specifications apply to welded and seamless steel, and welded iron tubular goods for line-pipe purposes, commonly used to convey gas, water, or oil, and include light-weight, standard, and extra-strong classes.

Section I. MANUFACTURE

2. (a) *Process.*—The steel for welded pipe shall be of good welding quality made by the Bessemer, open-hearth, or electric process. The steel for all seamless pipe shall be made by the electric or open-hearth process.

2. (b) The wrought iron shall be made from muck bars made entirely from puddled pig iron, free from any admixture of iron scrap or steel. The term iron scrap applies only to foreign or bought scrap and does not include local mill products free from foreign or bought scrap.

(c) Welded pipe, 3 inches or under in nominal diameter, may be butt-welded unless otherwise specified. Welded pipe over 3 inches in nominal diameter shall be lap-welded.

(d) Open-hearth iron.

Section II. CHEMICAL PROPERTIES AND TESTS

(Chemical properties and tests are the same as specified for pipe given in A. P. I. standard No. 5-A above, with the following exceptions.)

(Table 1 of chemical properties given in A. P. I. standard No. 5-A above includes a grade D for seamless pipe which is not included as a grade in this specification for line pipe. Also a carbon content of 0.30 per cent is permitted on grade B line pipe because of field welding. In case grade C is to be joined by welding, the purchaser may wish to stipulate the carbon content by special agreement. It is contemplated that a limit will be included in this specification for this grade when engineering experience has established the highest satisfactory maximum.)

Section III. PHYSICAL PROPERTIES AND TESTS

(Tension-test requirements for line pipe are the same as given in A. P. I. standard 5-A, above, with the exception of the following differences in Table 2. Grade B of seamless steel line pipe shall have a

minimum tensile strength of 65,000 pounds per square inch and a yield point of 38,000 pounds per square inch. The elongation for Bessemer steel line pipe, welded, shall be as follows: For large sizes, 18 per cent in 8 inches; for ¾-inch and ½-inch butt-welded sizes, 18 per cent in 6 inches; for ⅜-inch and ¼-inch butt-welded sizes, 18 per cent in 4 inches; and for ⅛-inch butt-welded size, 18 per cent in 2 inches.)

(Hydrostatic tests and flattening tests for line pipe are the same as specified in A. P. I. standard 5-A, above, paragraphs 6 (a), (b), 7 (a), and (b). No drift tests are required for line pipe. Additional tests required of line pipe are as given below.)

7. (c) For butt-welded steel or open-hearth iron pipe over 2 inches in diameter, a section of pipe 6 inches long shall be flattened between parallel plates until the distance between the plates is 60 per cent of the outside diameter of the pipe with the weld located 45° from the point of maximum bend, without developing cracks. In the case of butt-welded wrought-iron pipe over 2 inches in diameter, a section of pipe 6 inches long shall be flattened until broken. The test piece must show a good weld and the fracture shall have a fibrous appearance.

8. *Bend tests.*—For butt-welded steel pipe 2 inches or under in diameter, a sufficient length of pipe shall stand being bent cold through 90° around a cylindrical mandrel, the diameter of which is twelve times the nominal diameter of the pipe, without developing cracks at any portion and without opening the weld. In the case of butt-welded iron pipe, the cylindrical mandrel for this test may be fifteen times the nominal diameter of the pipe. The weld shall be placed approximately 45° from the inside radius of the axis of bending.

(Selection of test specimens, number of tests, and regulations for retests are the same for line pipe as given in A. P. I. standard 5-A, above, paragraphs 9 (a), (b), 10, 11 (a), and (b), with the following additional requirement with respect to the number of tests.)

One each of the tests specified in paragraphs 7 (c) and 8 may be made on a length in each lot of 400 or less, of each size.

Section IV. STANDARD WEIGHTS AND LENGTHS

12. (a) The standard sizes and weights for pipe are given in tables appended. (See Tables 3, 6, 7, and 8.)

(b) *Permissible variations.*—The weight of any length of pipe listed in Tables 3, 6, and 8 shall not vary more than 3½ per cent under or 10 per cent over that specified, but the carload weight shall not

be more than $1\frac{1}{4}$ per cent ⁷⁵ under the nominal weight. The weight of any length of pipe listed in Table 7 shall not vary more than 5 per cent under or 10 per cent over that specified. Unless otherwise agreed upon, pipe sizes 4 inches and larger shall be weighed separately. Sizes smaller than 4 inches may be weighed in convenient lots. In the case of threaded line pipe, the pipe will be weighed with coupling screwed on but with thread protectors removed.

13. (a) *Lengths.*—Unless otherwise specified, threaded line pipe in standard weights and thicknesses, as listed in Table 3, shall be furnished with not over 5 per cent under 18 feet in length, with a minimum of 16 feet for the length of any joint. On this class of goods, jointers (two short lengths connected by a coupling), the minimum length of the shorter piece to be 5 feet, may be shipped to a maximum of 5 per cent of the order.

(b) Unless otherwise specified, plain-end line pipe as listed in Table 6 shall have an average length of not less than 17 feet 6 inches and no length shorter than 9 feet may be shipped. Plain-end pipe as listed in Table 7 in sizes up to 20 inches outside diameter shall have an average length of not less than 17 feet and no length shorter than 9 feet may be shipped. On sizes larger than 20 inches outside diameter the minimum and average lengths shall be furnished as agreed upon between purchaser and manufacturer at time of purchase.

(c) When the average length agreed upon by the purchaser and manufacturer for either welded or seamless line pipe is in excess of 20 feet, not over 10 per cent of the number of pieces furnished on the order shall be less than 75 per cent of the average length agreed upon, and no pipe will be accepted which is less than 40 per cent of the average length. The average length, however, shall be maintained. When specified by the purchaser the foregoing stipulation shall apply to each carload.

SECTION V. WORKMANSHIP AND FINISH

14. (a) All skelp entering into lapwelded pipe must be scarfed.

(b) For pipe $1\frac{1}{2}$ inches or under in nominal inside diameter, the outside diameter at any point shall not vary more than $\frac{1}{64}$ inch over nor more than $\frac{1}{32}$ inch under the standard size. For pipe 2 inches or over in nominal inside diameter, the outside diameter shall not vary more than 1 per cent over or under the standard size. The wall thickness of welded and seamless pipe shall not be more than $12\frac{1}{2}$ per cent under the nominal wall thickness at any point. The thickness shall be determined from measurements on the body of the pipe and the outside diameter of that portion of the pipe used for threading must be governed by the closer tolerances called for by the threading specifications.

(c) The finished welded pipe shall be reasonably straight and free from injurious defects, such as bad welds, sand pits, ball cuts, pits, cinder spots, liquor marks, blisters, slivers, and laminations. Seamless pipe shall be reasonably straight and free from injurious seams and defects. When the depth of defect of either seamless or welded pipe is in excess of $12\frac{1}{2}$ per cent of the nominal wall thickness, such defects shall be considered injurious. The welding of injurious defects shall be permitted at the discretion of the manufacturer, provided the depth does not exceed $33\frac{1}{2}$ per cent of the nominal wall thick-

ness, and provided the length of the repair in seamless pipe does not exceed 25 per cent of the nominal diameter of the pipe. On welded pipe repairing shall not be done closer than 1 inch to the weld. Defects must be thoroughly chipped out before welding. It should be understood that hydrostatic tests made on pipe repaired in this manner shall be made on the finished pipe. Welding of any defects in welded or seamless material is subject to the approval of the inspector, when the purchaser is represented by an inspector. The threading on the pipe must be free from tears, shoulders, cuts, or any defects that may break the continuity of the thread.

15. (a) *Ends.*—Unless otherwise specified, pipe shall conform to the following regular practice:

(b) Each end of threaded pipe shall be reamed to remove all burrs. Plain-end pipe for use with the Dresser or Dayton type coupling shall be reamed both inside and outside just sufficiently to remove any burrs or shall be beveled on the outside to an angle of 45° and with an average width of flat at the end of pipe of $\frac{1}{16}$ inch \pm $\frac{1}{32}$ inch. All such pipe shall be sufficiently free from indentations, projections, or roll marks for a distance of 8 inches from the end of the pipe to make a tight joint with the rubber-gasket type of coupling. All plain-end line pipe intended for Dresser or Dayton type joints, or for welding sizes $10\frac{1}{4}$ inches outside diameter and smaller, shall not be more than one sixty-fourth inch smaller than the nominal outside diameter for a distance of 8 inches from the end of the pipe and shall permit the passing for a distance of 8 inches of a ring gage which has a bore one-sixteenth inch larger than the nominal outside diameter of the pipe. Sizes larger than $10\frac{1}{4}$ inches outside diameter shall not be more than one thirty-second inch smaller than the nominal outside diameter for a distance of 8 inches from the end of the pipe and shall permit the passing for a distance of 8 inches of a ring gage which has a bore three thirty-seconds inch larger than the nominal outside diameter of the pipe.

(c) Plain-end pipe for welding, unless otherwise specified, shall be beveled to an angle of 45° and with a width of flat at the end of the pipe $\frac{1}{16}$ inch \pm $\frac{1}{32}$ inch. This class of material shall be reamed inside at the ends sufficiently to remove all burrs. Where material is ordered beveled to any other than a 45° angle, it shall be understood that the angle is to be measured from a line drawn perpendicular to the axis of the pipe. This means that a greater amount of material is removed with a 60° angle than with a 45° angle.

(d) Extra-strong pipe shall be furnished with plain ends, unless otherwise specified.

16 (a) *Threads and gages.*—When threaded line pipe is ordered, as specified in Table 3, the threads shall be in accordance with Table 4 and cut so as to make a tight joint when the pipe is tested at the mill to the specified internal hydrostatic pressure. The variation from the standard, when tested with the standard working gage, shall not exceed a maximum of one and one-half turns either way.

(b) When extra-strong pipe is ordered threaded, the threads shall be in accordance with Table 4 and shall be subject to the same requirements and tests as threads on line pipe.

(Other requirements for threads and gages are the same as given in paragraphs 17 to 20, inclusive, of A. P. I. standard No. 5-A, above, except that no requirements are included in this specification for $\frac{3}{8}$ -inch taper because line pipe is all $\frac{1}{4}$ -inch taper. Requirements on taper tests, thread protectors, and couplings are the same as given in A. P. I. standard No. 5-A, above, paragraphs 22 (a), 23, 24, and 25, with the following additional requirement for couplings: When couplings are furnished with extra-strong pipe, they shall be of the same weight and dimensions as the couplings specified for line pipe.

⁷⁵ The weight of 1 cubic inch of steel is 0.2833 pound, and that of wrought iron is 0.2738 pound, therefore a length of wrought-iron pipe made to full dimensions for thickness and diameter will weigh approximately 2 per cent less than a similar length of pipe made from steel, and due allowance should be made in the "weights per foot" given in tables. In view of this difference the carload weight for wrought-iron pipe should not be more than $3\frac{1}{2}$ per cent under the nominal weight.

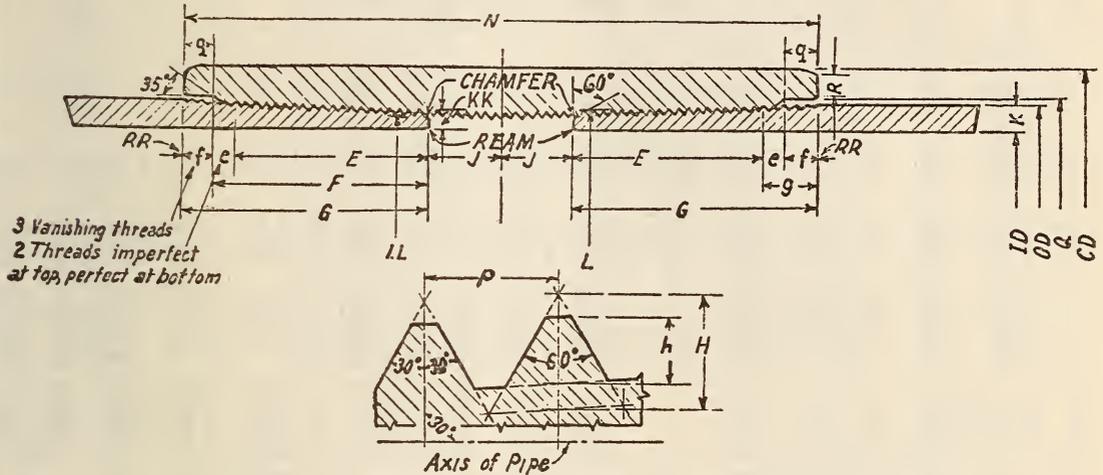

The alignment test is the same as specified in paragraph 26 of A. P. I. standard No. 5-A, above.)

27. (a) *Marking.*—The length, test pressure in pounds, and class of material shall be stenciled on each length of pipe, sizes 2 inches and larger, and on sizes 4 inches and larger; except dipped or coated pipe, the weight of each length shall be stenciled. Approved abbreviations may be used. The A. P. I. monogram shall be stamped with steel die on each joint, sizes 2 inches and larger, 1 foot from couplings on the shop end of threaded line pipe and about 1 foot from either end on plain-end line pipe. The A. P. I. monogram shall also be stamped with a steel die on all couplings for pipe sizes 2 inches and larger. The size of monogram to be one-fourth inch high on all sizes of pipe; three-eighths inch high on couplings for pipe sizes from 2 inches to 6 inches,

inclusive, and one-half inch high on couplings for pipe sizes over 6 inches. (The upper and lower crossbar on the letter "I" in the A. P. I. monogram may be omitted. On pipe sizes smaller than 2 inches, which are regularly bundled, the A. P. I. monogram will not be stamped on either the pipe or the couplings but will be stamped on the metal measurement tag which is attached to each bundle. In addition to the above markings and in letters of similar size, the grades A, B, and C of seamless pipe shall be stamped with a steel die.

(Other requirements under "marking" are the same as given in A. P. I. standard No. 5-A, above, paragraphs 27 (b), (c), and 28.)

(Requirements on inspection and rejection are the same as given in A. P. I. standard No. 5-A, above, paragraphs 29 (a), (b), and 30.)

ENLARGED SECTION OF THREAD

¹ See par. 12 (b).² Standard test pressures for butt-weld pipe are not figured by formula.³ The indicated working pressures are given for reference purposes only. They apply for a safety factor of 4 throughout, and do not take into account differences in pipe fabrication or in service requirements. To obtain the working pressures for other assumed factors of safety, multiply these pressures by 4 and divide by the safety factor desired.⁴ Outside diameter.

NOTE.—(Values in the first four and the seventh columns of Table 3 are the same as given in A. S. T. M. specification A53-30 for welded and seamless steel pipe, standard weight. See A. S. T. M. below. Column 5 of Table 3 agrees with Federal specification WW-P-431 given below under United States Government, Federal Specifications Board.)

¹ See par. 12 (b).

² The indicated working pressures are given for reference purposes only. They apply for a safety factor of 4 throughout and do not take into account differences in pipe fabrication or in service requirements. To obtain the working pressures for other assumed factors of safety, multiply these pressures by 4 and divide by the safety factor desired.

10	10.750	9.750	.500	54.735	-----	1,400
12	12.750	11.750	.500	65.415	-----	1,100

¹ See par. 12 (b).

NOTE.—For tests pressure on Grades A, B, and C seamless see corresponding sizes in Table 6; for test pressures not given in either Tables 6 or 8, see par. 6 (b) in No. 5-A, above.

¹ See par. 12 (b).

² The indicated working pressures are given for reference purposes only. They apply for a safety factor of 4 throughout and do not take into account differences in pipe fabrication or in service requirements. To obtain the working pressures for other assumed factors of safety, multiply these pressures by 4 and divide by the safety factor desired.

AMERICAN PETROLEUM INSTITUTE, SPECIFICATIONS FOR OIL-WELL PUMPS, STANDARD NO. 11-A AND SUPPLEMENT NO. 1, JULY, 1931

COLD-DRAWN WORKING BARRELS

(These specifications include dimensional standards for cold-drawn working barrels as shown in Table 1 below. Working barrels are tubular and threaded at each end. The specifications do not include chemical or physical properties of materials.)

TABLE 1.—Cold-drawn working barrels

[All dimensions in inches at 68° F.]

Size of working barrel	Diameters			Threads			Length of barrel, "D"
	Nominal outside "A"	Inside		Number threads per inch	Taper inch per foot	Total length of thread, "C"	
		"B"	Tolerance				
2.....	2.250	1.7810	±0.0082	11½	¾	1.375	} See note below.
2½.....	2.75	2.2500	±.0082	11½	¾	1.625	
3.....	3.25	2.7500	±.0082	11½	¾	1.625	
4.....	4.25	3.7500	±.0102	11½	¾	1.625	

NOTE.—For barrels of all diameters, lengths of 5, 6, 8, and 10 feet are considered standard; lengths of 4, 7, and 9 feet, and longer than 10 feet are considered special.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, 300-POUND SCREWED PIPE FITTINGS FOR STEAM LOCOMOTIVES, NO. D. V.-741, 1931

SCREWED PIPE FITTINGS

(See 607.2, p. 422.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, SPECIFICATIONS FOR WELDED AND SEAMLESS STEEL PIPE, 1925

WELDED AND SEAMLESS STEEL PIPE

(Substantially the same as A. S. T. M., A53-30, given below.)

AMERICAN RAILWAY ASSOCIATION, PURCHASES AND STORES DIVISION, STANDARDIZATION AND SIMPLIFICATION OF STORES STOCKS, PROCEEDINGS, 1928

MECHANICAL STEEL TUBING

(Recommended practice in stocking certain specified sizes of mechanical steel tubing. It is also recommended that in stating dimensions simplicity will be served by giving the outside diameter first, then the inside diameter.)

HOSE CLAMPS

(Recommended practice in stocking certain specified sizes of hose clamps, except clamps for tank hose.)

AMERICAN RAILWAY ASSOCIATION, SIGNAL SECTION, 1-INCH WELDED STEEL PIPE, SPECIFICATION 12227, JULY, 1927

WELDED STEEL PIPE

PURPOSE

(a) The purpose of this specification is to provide welded steel pipe for the operation of mechanical units.

CHEMICAL PROPERTIES

(a) The steel shall conform to the following requirements as to chemical composition:

Phosphorus, not more than.....	Per cent 0.11
Copper.....	0.20-.35

PHYSICAL PROPERTIES AND TESTS

(a) The steel shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	50,000
Yield point.....	do.....	30,000
Elongation in 8 inches.....	per cent..	18

(This is the same as for Bessemer in A. S. T. M., A53-30, listed below.)

(b) The yield point shall be determined by the drop of the beam of the testing machine.

(c) Weights, dimensions, and hydrostatic pressure shall be as follows:⁷⁶

PIPE	
External.....	1.315
Internal.....	1.047
Thickness.....	.134
Weight per foot (ungalvanized).....	1.712
Hydrostatic pressure.....	700

COUPLING	
External.....	1.750
Length.....	2.250
Weight.....	.688

(d) The outside diameter at any point shall not vary more than one-sixty-fourth inch from the size specified.

(e) The inside diameter of all pipe must be large enough to receive a steel plug sixty-three-sixty-fourths inch in diameter for a distance of 6 inches.

(f) The weight of the pipe and couplings shall not vary more than 5 per cent from that specified.

(g) The pipe shall be tested at the mill to the hydrostatic pressure specified above.

(h) A sufficient length of pipe shall stand being bent through 90° around a cylindrical mandrel the diameter of which is twelve times the nominal diameter of the pipe, without developing cracks at any portion and without opening the weld.

(i) A piece of pipe 1 foot long will be selected at random and be subjected to a flattening test by hammering the piece until the opposite sides are within the thickness of the wall from each other. The piece shall show no cracks in the steel except at the weld.

(j) *Specimens.*—(1) Test specimens shall consist of sections cut from a pipe, (2) tension-test specimens shall be longitudinal, and (3) all specimens shall be tested cold.

(k) One of each of the tests specified above may be made on a length in each lot of 500 or less. Each length shall be subjected to the hydrostatic test.

(l) If the results of the tests of any lot do not conform to the requirements specified, retests of

⁷⁶ All weights are nominal and are given in pounds. All dimensions are nominal and are given in inches.

two additional pipes shall be made, each of which shall conform to the requirements specified.

(m) Contractor shall give the purchaser sufficient notice of time when material will be ready for testing.

(n) Contractor shall provide, at point of production, apparatus and labor for making the required tests under supervision of the purchaser.

THREADS

Each length of pipe shall have a thread $1\frac{1}{8}$ inches long, three-eighths inch total taper per foot, $11\frac{1}{2}$ slightly rounded top and bottom V threads to the inch. The threaded portion of the pipe shall be of such diameter as to permit the coupling to be screwed on five turns by hand, with a permissible variation of one turn either way.

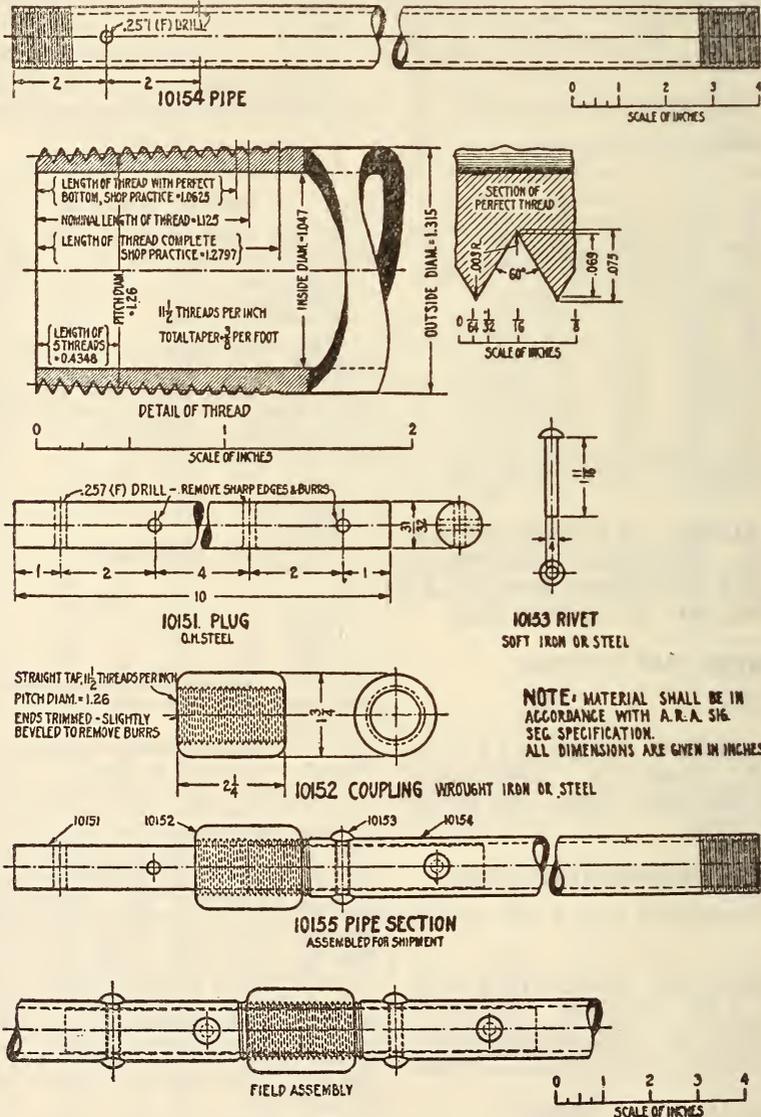

FIGURE 286.—One-inch signal pipe and coupling

(o) If tests are to be made at point of production, it shall be so stated. Purchaser will distinctly indicate which of the tests herein specified are to be made and what portion of the material shall be tested.

ENDS

(a) Ends of pipe must be cut square and two holes drilled 0.257 inch in diameter for two $\frac{1}{4}$ -inch rivets on one end only; first rivet hole shall be drilled 2 inches from the end, and the second 2 inches from this and at right angles to it.

COUPLINGS

Each length of threaded pipe shall be provided with one coupling faced at ends, tapped straight through, having clear-cut threads, and of such pitch diameter as to make a tight joint. Couplings shall be made of wrought iron or steel.

PLUGS

Plugs shall be open-hearth steel, 10 inches long, thirty-one-thirty-seconds inch in diameter, drilled 0.257 inch in diameter, for four $\frac{1}{4}$ -inch rivets,

spacing to be 1 inch, 2 inches, 4 inches, 2 inches, and 1 inch, the first and third holes to be in the same plane, and the second and fourth holes at right angles thereto.

RIVETS

Rivets must be made of soft iron or steel, one-fourth inch in diameter and $1\frac{1}{16}$ inches long, and galvanized when specified.

GALVANIZING

Finished pipe and couplings, when specified, shall be hot galvanized inside and outside. The galvanizing shall be in accordance with R. S. A. specification 2912. The coating on the outside of the pipe shall weigh not less than 2 ounces per square foot of coated surface.

LENGTHS

Pipe shall be in random lengths of 16 to 22 feet. Jointers (which are two pieces coupled together) will be rejected.

MATERIAL AND WORKMANSHIP

Material and workmanship shall be first class in every respect.

INSPECTION

(a) Purchaser may inspect the material at all stages of manufacture.

(b) Purchaser may inspect the completed product to determine that the requirements of this specification have been met.

(c) If the material has not been accepted at point of production and if, upon arrival at destination, it does not meet the requirements of this specification, it may be rejected, and the contractor, upon request, shall advise the purchaser what disposition is to be made of the defective material. The contractor shall pay all freight charges.

(d) If purchaser is to make inspection at point of production, it shall be so stated.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, STEEL PIPE FLANGES AND FLANGED FITTINGS, B16e-1927

[Approved as American Tentative Standard by the American Standards Association, 17 June, 1927]

STEEL PIPE FLANGES AND FLANGED FITTINGS

For Maximum Working Steam Pressures of 250, 400, 600, 900, and 1,350 Pounds Per Square Inch (Gage) at a Temperature of 750° F.

INTRODUCTORY NOTES

1. *Pressure ratings and tests.*—These standards shall be known as the American 250, 400, 600, 900, and 1,350 pound steel flange standards, said pressure designation being the recommended rating at a temperature of 750° F. Table 1 shows recommended ratings for various temperatures, together with hydrostatic shell test pressure

All tests shall be made with water at a temperature not to exceed 100° F.

2. *Size.*—The size of the fittings in the following tables is identified by the corresponding nominal pipe size. For pipe 14 inches and larger the corresponding outside diameter of the pipe is given.

3. *Marking.*—Each steel product (of a size permitting legible marking) produced with the intent

of meeting the specifications of these American steel flange standards shall be marked for identification by means of, first, maker's name or trade-mark; second, size, and, third, maker's symbol, by which the service may be determined for which the maker recommends the article.

On products of small size or shape which will not permit all of the above markings, they may be omitted to the degree which conditions require, in the sequence of, first, size; second, maker's identification symbol; third, maker's name or trade-mark. Size marking shall be by means of the numeral or numerals involved in the nominal size designation.

Knowledge of the maker's identification symbol and the service recommendations which are signified by their application to products shall be made available to the public by means of the maker's catalogue, engineering data, or other comprehensive literature.

TABLE 1.—Pressure-temperature ratings and hydrostatic shell test pressures

[All pressures are in pounds per square inch (gage)]

Maximum working steam-pressure rating at 750° F.	Maximum nonshock working hydraulic rating at 450° F., such as boiler feed lines	Maximum nonshock working hydraulic rating at or near the ordinary range of air temperatures	Hydrostatic shell test, maximum, 100° F.
250	325	500	750
400	500	750	1,000
600	720	1,000	1,500
900	1,080	1,500	2,000
1,350	1,625	2,250	3,000

4. *Materials—Steel castings.*—The dimensional standards for steel castings, covered herein, are based on a high-grade product equal to that given in A. S. T. M. standard specifications for carbon-steel castings for valves, flanges, and fittings for high-temperature service, A95-29, suitable for the maximum temperatures and pressures for which the standards are designed. It is strongly recommended that the material for such maximum service be ordered and made in accordance with the latest revision of A. S. T. M. specification A95. In any event the castings shall be heat treated and the physical and chemical characteristics shall be in accordance with Table 2, which requirements are taken from A. S. T. M. standard specification A95-29. (See 611.41, p. 709.)

Bolting material.—The dimensional standards for bolting material, covered herein, including nuts and washers, are based on a high-grade product equal to that given in A. S. T. M. standard specifications for alloy-steel bolting material for high-temperature service, A96 (see 622.1, p. 1130), suitable for the maximum temperatures and pressures for which the standards are designed. It is strongly recommended that the material for such maximum service be ordered and made in accordance with the latest revision of A. S. T. M. specification A96. The physical and chemical requirements shall be in accordance with Table 3, which requirements are taken from A. S. T. M. standard specification A96. (See 622.1, p. 1130.)

While carbon-steel bolts and bolt studs purchased under a definite specification will resist the calculated stresses, it is strongly recommended that for the maximum service in each class, material be ordered and made in accordance with the latest revision of A. S. T. M. specification A96.

77 Sponsor organizations: American Society of Mechanical Engineers, Manufacturers' Standardization Society of Valve and Fittings Industry, and Heating and Piping Contractors National Association.

It is also recommended that commercial steel bolts not be used at steam pressures over 160 pounds per square inch and/or temperatures over 450° F.

Nuts shall be of carbon steel

TABLE 2.—Physical and chemical requirements of steel castings for flanges, fittings, and valves

Tensile strength, minimum.....	lbs./in. ²	70,000
Yield point, minimum.....	do	36,000
Elongation in 2 inches, minimum.....	per cent.	22
Reduction of area, minimum.....	do	30
Phosphorus, maximum.....	do	0.05
Sulphur, maximum.....	do	.05

TABLE 3.—Physical and chemical requirements of alloy-steel bolting material

	Class A	Class B	Class C
Tensile strength, minimum.....	95,000	105,000	125,000
Yield point, minimum.....	70,000	80,000	105,000
Elongation in 2 inches, minimum.....	per cent.	20	20
Reduction of area, minimum.....	do	50	50
Phosphorus, maximum.....	1 0.05	1 0.05	1 0.05
Sulphur, maximum.....	do	.05	.05

The phosphorous requirement of 0.05 per cent for alloy-steel bolting material agrees with the limits in A. S. T. M. specification A96-27 specified for check analysis on finished material. For the sake of uniformity in giving the phosphorus content for castings, bolting material, and forged steel flanges, the 0.05 per cent requirement is retained instead of the mill or ladle analysis requirement of 0.04 per cent as given in the A. S. T. M. specification.

TABLE 4.—Physical and chemical requirements, forged steel flanges

	Flanges for forge welding—class A	Flanges not for forge welding	
		With hubs—class B	With or without hubs—class C
Carbon, maximum.....	0.17		
Tensile strength, minimum.....		60,000	70,000
Yield point, minimum.....		30,000	36,000
Elongation in 2 inches, minimum.....		per cent.	25
Reduction of area, minimum.....		do	38
Phosphorus, maximum.....	.05	0.05	0.05
Sulphur, maximum.....	.05	.05	.05

Washers when used under nuts shall be of forged or rolled carbon steel.

Forged steel flanges.—The dimensional standards for flanges covered herein are based on a high-grade product equal to class C steel given in A. S. T. M. standard specifications for forged or rolled steel pipe flanges for high-temperature service, A105-28, given below, suitable for the maximum temperatures and pressures for which the standards are designed. It is strongly recommended that the material for such maximum service be ordered and made in accordance with the latest revision of A. S. T. M. specification A105. The physical and chemical requirements shall be in accordance with Table 4 which requirements are taken from A. S. T. M. standard specification A105-28.

Where loose or unsupported flanges of classes A or B (Table 4) material are used they must be designed with adequate hubs. In the event that this can not be accomplished practically, the thickness of the flange shall be increased.

Where the yield point in steel flanges is below 36,000 pounds per square inch, hub or other reinforcement shall be provided to compensate for the lower efficiency in the strength of classes A and B materials used. Flanges forged integral with or forge welded to the walls of pipe or other structures shall be considered as being additionally reinforced.

5. **Facings.**—The raised face shall be the standard facing for fittings and valves. It shall be machined to the following dimensions:

Height of raised face—	
250-pound standard.....	1/16 inch on all sizes.
400-pound standard.....	
600-pound standard.....	1/4 inch on all sizes.
900-pound standard.....	
1,350-pound standard.....	
The raised face shall be provided in the following manner:	
250-pound standard.....	Included in the minimum flange thickness.
400-pound standard.....	
600-pound standard.....	Added to the minimum flange thickness.
900-pound standard.....	
1,350-pound standard.....	
Outside diameter of raised face.	
250-pound standard.....	
400-pound standard.....	As given in the accompanying Table 5 in column headed "Outside diameter—raised face, van stone, etc."
600-pound standard.....	
900-pound standard.....	
1,350-pound standard.....	

Table 5 also gives dimensions for tongue-groove and male-female types of joints for the 250, 400, 600, 900, and 1,350 pound standards. The projecting contact surfaces, that is, the tongues and males, are, as described above, one-fourth inch beyond the edge of the flange. The bottom or contact surfaces of the groove and female facings shall be in the same plane as the edge of the flange.

The outside diameters of raised face, van stone, large tongue, and large male are the same, being the minimum diameter considered practical for van stone. The outside diameters of groove and female shall be one-sixteenth inch larger than the corresponding outside diameters of tongue and male, and the inside diameters of the groove shall be one-sixteenth inch smaller than the corresponding inside diameters of the tongue.

A tolerance of plus or minus 0.016 inch (one sixty-fourth inch) is allowed on the inside and outside diameters of all facings. (See Table 5 for dimensions.)

The 1/16-inch raised face if applied to 400, 600, 900, and 1,350 pound standard fittings shall not be cut from the minimum flange thicknesses specified in the respective standards but shall be provided by facing down the 1/4-inch raised face.

Raised facings higher than one sixteenth-inch and tongue-groove and male-female facings may be specially required for 250-pound fittings, and when so required shall be furnished as follows: (a) No metal shall be cut from the minimum flange thickness specified in the standard; (b) the full flange thickness shall be first provided and then the raised—tongue or male—face shall be added thereto; (c) in the case of groove and female faces, the flange shall be built to full minimum thickness and sufficient metal added thereto so that the bottom or contact face of the groove or female is in the same plane with the face of flange edge of a full thickness flange.

6. **Bolting.**—Drilling templates are in multiples of four, so that fittings may be made to face in any quarter. Bolt holes straddle the center lines. Bolt holes are drilled one-eighth inch larger in diameter than the nominal size of bolt. Bolts or bolt studs threaded at both ends may be used and shall be equipped with cold-punched or cold-pressed semi-finished nuts of American standard rough dimensions, chamfered and trimmed.

All bolts and bolt studs having diameters from one-half inch to and including 1 inch and the corresponding nuts shall be threaded with the American (national) standard screw thread,⁷⁸ coarse thread series, medium fit (class 3). Bolts and bolt studs whose diameters are 1 1/2 inches and larger shall have special threads of the American (national) form whose pitch is one-eighth inch (8 threads per inch). It is recommended that these special threads be allowed a pitch diameter tolerance of -0.006 inch and a lead tolerance of ±0.002 inch.

Bolt studs with a nut at each end are recommended for high-temperature service.

⁷⁸ See Standards Pamphlet Bla-1924, "American Standard Screw Threads" published by the American Society of Mechanical Engineers, 29 West Thirty-ninth Street, New York, N. Y.

The allowable working fiber stress, considering internal allowable working pressure only, in bolting material for valve-bonnet flanges, clean-out flanges, etc., shall not exceed 9,000 pounds per square inch assuming the pressure to act upon an area circumscribed by the periphery of the outside of the contact surface.

7. *Spot facing.*—All flanges shall be spot faced or back faced parallel to the flange face. Metal re-

where

P = working pressure, pound per square inch.

t = thickness of wall of pipe, inches.

D = actual outside diameter of pipe, inches.

S = 7,000 pounds per square inch.

9. *Fitting dimensions.*—One of the principles of design in this standard is the maintenance of a fixed position for the flange itself with reference to the body of the fitting and the addition of any facing is beyond the outside edge of the flange except for the $\frac{1}{16}$ -inch raised face in the 250-pound standard. (See note 4 in Table 5.) Tables 8, 10, 12, and 14 show those dimensions which are made permanent to avoid pattern changes.

An inspection limit of $\pm \frac{1}{32}$ inch shall be allowed on all center to contact surface dimensions for sizes up to and including 10 inches, and $\pm \frac{1}{16}$ inch on sizes larger than 10 inches. An inspection limit of $\pm \frac{1}{16}$ inch shall be allowed on all contact surface to contact surface dimensions for sizes up to and including 10 inches, and $\pm \frac{1}{8}$ inch on sizes larger than 10 inches.

When elbows having longer radii than specified in the standards are required, the use of pipe bends is recommended.

10. *Laterals.*—The 45° laterals of the larger sizes may require additional reinforcement to compensate for the inherent weakness in this shape of casting.

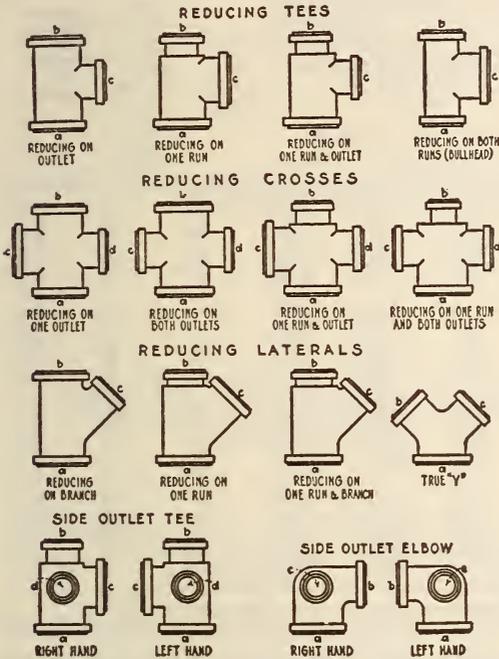

FIGURE 287.—Steel flanged fittings 250, 400, 600, 900, and 1,350 pounds

Method of Designating Outlets of Reducing Fittings when Ordering

In designating the outlets of reducing fittings the openings should be read in the order indicated by the sequence of the letters a, b, c, and d. In designating the outlets of side outlet reducing fittings, the side outlet is named last.

moved in spot facing or back facing shall not reduce the thickness of the flange below the minimum given in the tables. Spot facing does not apply to forged steel flanges if the back of the flange is parallel to the flange face.

8. *Metal thickness.*—Minimum metal thicknesses specified in the tables are based on an allowable fiber stress of 7,000 pounds per square inch using the modified Barlow formula of the A. S. M. E. boiler construction code, section P-23, for cylindrical sections and adding 50 per cent to the thickness thus determined to compensate for the shape of the fittings. The minimum commercial casting thickness is considered to be one-fourth inch, therefore the standards do not show thicknesses less than this. The minimum thickness in these standards means the minimum thickness in any part of the finished casting.

The modified Barlow formula as used in the A. S. M. E. boiler construction code is as follows:

For pipes having nominal diameters of from one-fourth inch to 5 inches.

$$P = \frac{2S}{D} (t - 0.065) - 125$$

For pipes of nominal diameters over 5 inches.

$$P = \frac{2S}{D} (t - 0.1)$$

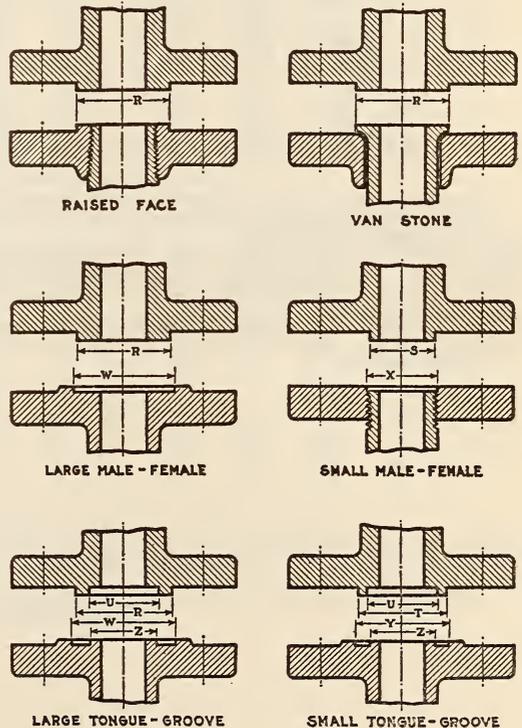

FIGURE 288

11. *Valve dimensions.*—The center to contact surface and contact surface to contact surface dimensions of 400, 600, 900, and 1,350 pound American standard steel flange gate (both single and double disk), globe, angle, and check valves shall be the same as those prescribed for tees in the respective 400, 600, 900, and 1,350 pound standards.

12. *Reducing fittings.*—Reducing fittings shall have same center to flange edge dimensions as those of straight size fittings of the largest opening.

13. *Side-outlet fittings.*—All side-outlet fittings shall have all openings on the intersecting center lines.

STEEL FLANGED FITTINGS

TABLE 5.—Facing dimensions for the American 250, 400, 600, 900, and 1,350 pound steel flanges

¹ A tolerance of plus or minus 0.016 inch (1/64 inch) is allowed on the inside and outside diameters of all facings.² Gaskets for male-female and tongue-groove joints shall cover the bottom of the recess with minimum clearances taking into account the tolerances prescribed in note 1.³ Care should be taken in the use of joints of these dimensions, as they apply particularly on lines where the joint is made on the end of pipe, to insure that pipe used is thick enough to permit sufficient bearing surface to prevent crushing the gasket.⁴ Regular facing for 250-pound flange standard is a 1/16-inch raised face included in the minimum flange thickness dimensions given in Table 6. A 1/16-inch raised face is also permitted on the 400, 600, 900, and 1,350 pound flange standards, but it must be added to the minimum flange thicknesses.⁵ Regular facing for 400, 600, 900, and 1,350 pound flange standards is a 1/4-inch raised face not included in minimum flange thickness dimensions given in Tables 8 to 13, inclusive. See illustrations with tables showing application of various facings.⁶ Outside diameter.

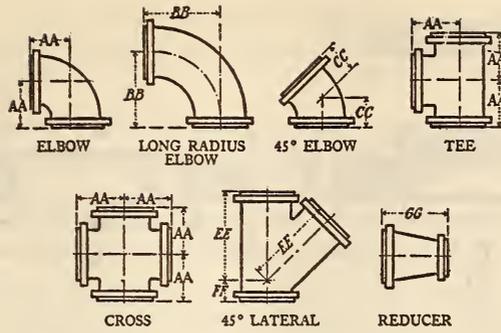

FIGURE 289.—250-pound steel flanged fittings

TABLE 6.—Dimensions of steel flanged fittings with projecting faces for maximum working steam pressure of 250 pounds per square inch at a temperature of 750° F.¹

[All dimensions given in inches]

Nominal pipe size	Inside diameter of fitting	Minimum metal thickness of fitting	Outside diameter of flange	Minimum thickness of flange ²	Diameter of bolt circle	Number of bolts	Size of bolts	AA	BB	CC	EE	FF	GG
								Center to contact surface of raised face, elbow, tee, and cross ^{2,3,4}	Center to contact surface of raised face, long radius ell ^{2,3,4}	Center to contact surface of raised face ell ^{2,3,4}	Long center to contact surface of raised face lateral ^{2,3,4}	Short center to contact surface of raised face lateral ^{2,3,4}	Contact surface to contact surface reducer ^{2,3,4}
For sizes below 2 inches, use the dimensions of 600-pound fittings given in Tables 10 and 11. When a 1/16-inch raised face is required, subtract 1/16 inch from center to contact surface dimensions given in Table 10 and add 1/16 inch to center to flange edge dimensions given in Table 11.

¹ The fittings incorporated in this table are suitable also for other pressure and temperature ratings shown in Table 1.

² A raised face of 1/16 inch is included in (a) minimum thickness of flanges, (b) center to contact surface dimensions, and (c) contact surface to contact surface dimensions. Inasmuch as the 1/16-inch raised face is cut from the flange thickness, the center to contact surface dimensions are the same as the center to flange edge dimensions in this standard for this type of facing.

³ Where facings other than the 1/16-inch raised face are used, the center to flange edge dimensions shall remain unchanged, and the new center to contact surface, or the new contact surface to contact surface dimensions shall be established to suit the facing used.

⁴ This standard provides for a 1/16-inch raised face on all openings of flanged fittings.

⁵ Outside diameters.

¹ All blind flanges for sizes 10 inches (17¹/₂ inches outside diameter) and larger must be dished with insiderradius equal to the diameter of port.

² These flanges are faced only and not drilled unless otherwise specified.

³ This column is the same as column for effective thread (E) in Table 1 of the American pipe thread standard, published by the American Society of Mechanical Engineers, except the 2-inch size.

⁴ A raised face of ¹/₁₆ inch is included in the minimum thickness of flanges.

400-Lb. STEEL FLANGED FITTINGS

(Elbow, 45° elbow, tee, cross, 45° lateral, and reducer illustrations are identical with those for 250-pound steel flanged fittings in Table 6.)

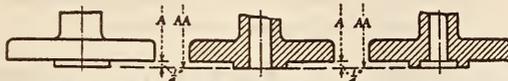

FIGURE 291.—400-pound steel flanged fittings

Raised face, male, and tongue facings for fittings

TABLE 8.—Center to contact surface dimensions for maximum working steam pressure of 400 pounds per square inch at a temperature of 750° F.¹

[All dimensions given in inches]

¹ The fittings incorporated in this table are suitable also for other pressure and temperature ratings shown in Table 1.
² A raised face of 1/4 inch is not included in (a) minimum thickness of flanges, (b) center to flange edge dimensions, or (c) flange edge to flange edge dimensions.
³ Where facings other than the 1/4-inch raised face are used the "center to flange edge" dimensions shall remain unchanged, and the new "center to contact surface" dimensions shall be established to suit the facing used.

1,350-POUND STEEL FLANGED FITTINGS

(Elbow, 45° elbow, tee, cross, 45° lateral, and reducer illustrations are identical with those for 250-pound steel flanged fittings in Table 6.)

(Raised face, male, and tongue facings for fittings illustrations are identical with those for 400-pound steel flanged fittings in Table 8.)

TABLE 14.—Center to contact surface dimensions for maximum working steam pressure of 1,350 pounds per square inch at a temperature of 750° F.¹

[All dimensions given in inches]

Nominal pipe size	Inside diameter of fitting	Metal thickness of fitting, minimum	Outside diameter of flange	Thickness of flange, minimum ²	Diameter of bolt circle	Number of bolts	Size of bolts ³	AA	CC	EE	FF	GG
								Center to contact surface of raised face elbow, tee, and cross ^{2,4}	Center to contact surface of raised face, 45° ell ^{2,4}	Long center to contact surface of raised face, lateral ^{2,4}	Short center to contact surface of raised face, lateral ^{2,4}	Contact surface to contact surface reducer ^{2,4}
1	7/8	3/8	5 7/8	1 1/8	4	4	7/8	5	3 1/2	9	2 1/2	5
1 1/4	1 1/8	3/8	6 1/4	1 1/8	4 3/8	4	7/8	5 1/4	4	10	3	5 3/4

	18 1/2	11	35	9 1/4	18 1/4							
20	12	38	10 1/4	19 3/4								

¹ The fittings incorporated in this table are suitable also for other pressure and temperature ratings shown in Table 1.

² A raised face of 1/4-inch is not included in (a) minimum thickness of flanges, (b) center to flange edge dimensions, or (c) flange edge to flange edge dimensions.

³ Class C bolt studs shall be used with these flanges. The physical and chemical requirements of class C bolt studs are given in Table 3.

⁴ Where facings other than the 1/4-inch raised face are used the "center to flange edge" dimensions shall remain unchanged and the new "center to contact surface" dimensions shall be established to suit the facing used.

(Appendix A to this specification is attached for information only; it does not form part of the standard. It gives the dimensions and weight of pipe for 250, 400, 600, 900, and 1,350 pound steam pressures and high temperatures. The data are the same as in Table 1 in A. S. T. M., A106-29, given below.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR WELDED AND SEAMLESS STEEL PIPE, DESIGNATION A53-30, 1930

WELDED AND SEAMLESS STEEL PIPE

1. *Scope.*—These specifications cover “standard weight,” “extra strong,” and “double extra strong” welded and seamless steel pipe. Pipe ordered under these specifications is intended for coiling, bending, flanging, and other special purposes. Butt-welded pipe is not intended for flanging. The purposes for which the pipe is intended should be stated in the order.¹⁹ Where seamless pipe is ordered for coiling, bending, or welding, the low-carbon grade should be specified.

MANUFACTURE

2. (a) *Process.*—The steel for welded pipe shall be soft weldable quality made by the Bessemer or by the open-hearth process. The steel for seamless pipe shall be made by the open-hearth or electric-furnace process.

(b) Welded pipe 3 inches or under in nominal diameter may be butt-welded, unless otherwise specified. Welded pipe over 3 inches in nominal diameter shall be lap-welded.

CHEMICAL PROPERTIES AND TESTS

3. (a) *Chemical composition.*—Ladle tests of open-hearth steel shall conform to the following requirement as to chemical composition:

	Lap-welded	Seamless
	Per cent	Per cent
Phosphorus, not over.....	0.06	0.045

(b) *Check analyses.*—Analyses may be made by the purchaser from each lot of 500 lengths or less of finished pipe. The phosphorus content thus determined shall not exceed that specified in section 3 by more than 25 per cent. Drillings for analysis shall be taken from several points around each pipe selected for analysis.

PHYSICAL PROPERTIES AND TESTS

5. (a) *Tension tests.*—The material shall conform to the following minimum requirements as to tensile properties:

¹⁹ *Double welding.*—Unless double-welded pipe is specifically called for on the order, single-welded pipe may be furnished. When double-welded pipe is ordered the flattening test on crop ends specified in sec. 9 shall be made with the weld on the side.

	Welded		Seamless	
	Bessemer	Open-hearth	Open-hearth low carbon	Open-hearth medium carbon
Tensile strength.....lbs./in. ²	50,000	45,000	48,000	62,000
Yield point.....do.....	30,000	25,000	26,500	35,000
Elongation in 8 inches...per cent.....	18	20	40	25
Elongation in 2 inches.....do.....		30		

¹ Gage distances for measuring elongation on welded Bessemer pipe of nominal sizes ¾ inch and smaller shall be as follows:

Nominal size:	Gage length
¾ and ½ inch.....	inches... 6
¾ and ¼ inch.....	do.... 4
½ inch.....	do.... 2

(b) The yield point shall be determined by the drop of the beam of the testing machine or other approved method.

6. *Hydrostatic tests.*—Each length of pipe shall be tested at the mill to the hydrostatic pressures specified in Table 1. Welded pipe 2 inches and larger shall be jarred near one end while under test pressure.

7. (a) *Flattening tests.*—The flattening test shall be made on standard weight and extra strong pipe over 2 inches in nominal diameter. It shall not be required for double extra strong pipe.

(b) For lap-welded and butt-welded pipe the test section shall be 4 to 6 inches in length and the weld shall be located 45° from the line of direction of the applied force.

(c) For seamless pipe the test section shall not be less than 2½ inches in length.

(d) The test shall consist in flattening a section of pipe, without developing cracks, between parallel plates until the distance between the plates is as follows:

For lap-welded pipe—One-third the outside diameter.

For butt-welded pipe—Sixty per cent of the outside diameter.

For low-carbon seamless pipe—One-third the outside diameter but in no case less than five times the thickness of the pipe wall.

For medium carbon seamless pipe—One-half the outside diameter but in no case less than seven times the thickness of the pipe wall.

8. *Bend tests.*—For pipe 2 inches or under in nominal diameter, a sufficient length of pipe shall stand being bent cold through 90° around a cylindrical mandrel, the diameter of which is twelve times the nominal diameter of the pipe without developing cracks at any portion and without opening the weld. When ordered for close coiling, the pipe shall stand being bent cold through 180° around a mandrel, the diameter of which is eight times the diameter of the pipe, without failure. Double extra strong pipe over 1½ inches in diameter need not be subjected to the bend test.

9. (a) *Test specimens.*—Tension-test specimens shall be cut longitudinally from the pipe and not flattened between gage marks. The sides of specimens shall be parallel between gage marks. If desired, the tension-test specimen may consist of a full section of the pipe. Where impracticable to pull a test specimen in full thickness the A. S. T. M. standard 2-inch gage length test specimen may be used.

TABLE 1.—Hydrostatic pressures for welded and seamless steel pipe

[Pressures expressed in pounds per square inch]

10	10.750	8	.307	35.00	---	---	---	---
10	10.750	8	.365	41.13	.500	54.74	---	---
12	12.750	8	.330	45.00	---	---	---	---
12	12.750	8	.375	50.71	.500	65.42	---	---

¹ Unless specifically stated on the order the lighter weights will not be furnished. Weights given in the table are for pipes up to and including 12 inches in nominal inside diameter, with threaded ends and couplings; sizes larger than those shown in the table are measured by the outside diameter and will be furnished with plain ends unless otherwise specified; for such sizes it will be necessary to accept manufacturers' weights or calculate the weights on the basis of 1 cubic inch of steel weighing 0.2833 pound.

10. (a) *Number of tests.*—One of each of the tests specified in sections 5, 7, and 8 shall be made on a length in each lot of 500 lengths or fraction thereof, of each size.

(b) In the case of welded pipe ordered for flanging, the crop ends cut from each length shall stand the flattening test specified in section 7 for lapwelded pipe.

For pipes over 12 inches in inside diameter, the test pressures should be calculated by the formula $P = \frac{2St}{D}$ in which P =pressure in pounds per square inch; S =fiber stress, 12,000 pounds per square inch; t =thickness of wall in inches; D =outside diameter in inches.

(b) Test specimens for flattening and bend tests shall consist of sections cut from a pipe. Specimens for flattening tests shall be smooth on the ends and free from burrs, except when made on crop ends taken from welded pipe.

(c) All specimens shall be tested at room temperature.

(c) Each length of pipe shall be subjected to the hydrostatic test specified in section 6.

11. (a) *Retests.*—If the results of the physical test of any lot do not conform to the requirements specified in sections 5, 7, and 8, retests of two additional pipes shall be made, each of which shall conform to the requirements specified.

(b) If any section fails when flattening tests are made on the crop ends of each length of welded pipe, other pieces from the length may be cut until satisfactory tests are obtained, otherwise the length shall be rejected.

WEIGHTS, DIMENSIONS, AND PERMISSIBLE VARIATIONS

12. (a) *Standard weights.*—The standard weights for pipe of various inside diameters are given in Table 2.

(b) Nipples shall be cut from pipe of the same weight and quality described in these specifications.

13. (a) *Permissible variations—weight.*—The weight of the pipe shall not vary more than 5 per cent for standard weight and extra strong pipe nor more than 10 per cent for double extra strong pipe from that specified in Table 2.

(b) *Diameter.*—For pipe 1½ inches or under in nominal diameter, the outside diameter at any point shall not vary more than one sixty-fourth inch over nor more than one thirty-second inch under the standard specified. For pipe 2 inches or over in nominal diameter, the outside diameter shall not vary more than 1 per cent over or under the standard specified.

(c) *Thickness.*—The minimum wall thickness at any point shall not be more than 12.5 per cent under the nominal wall thickness specified.

14. *Lengths.*—Unless otherwise specified, pipe lengths shall be in accordance with the following regular practice:

(a) Standard weight pipe shall be in random lengths of 16 to 22 feet, but not more than 5 per cent of the total number of lengths may be "jointers," which are two pieces coupled together. When ordered with plain ends, 5 per cent may be in lengths of 12 to 16 feet.

(b) Extra strong and double extra strong pipe shall be in random lengths of 12 to 22 feet. Five per cent may be in lengths of 6 to 12 feet.

WORKMANSHIP AND FINISH

15. Unless otherwise specified, pipe shall conform to the following regular practice:

(a) *Ends.*—Each end of standard weight welded pipe shall be threaded. Extra strong welded pipe and standard weight and extra strong seamless pipe and all double extra strong pipe shall be furnished with plain ends.

(b) *Threads.*—All threads shall be in accordance with the American standard pipe thread⁸⁰ and cut so as to make a tight joint when the pipe is tested at the mill to the specified internal hydrostatic pressure. The variation from the standard, when tested with the standard working gage, shall not exceed a maximum of one and one-half turns either way.

(c) *Couplings.*—Each length of threaded pipe shall be provided with one coupling, having clean-cut threads of such a pitch diameter as to make a tight joint. Couplings may be made of wrought iron or steel.

16. *Finish.*—The finished pipe shall be reasonably straight and free from injurious defects. All burrs at the ends of the pipe shall be removed.

⁸⁰ A complete description of American standard pipe threads applicable to pipe, valves, and fittings is contained in the pipe thread bulletin published by the American Standards Association, B2-1929.

INSPECTION AND REJECTION

(Requirements covering inspection and rejection conform with those specified in A. S. T. M. standard specifications for steel. (See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARBON-STEEL CASTINGS FOR VALVES, FLANGES, AND FITTINGS FOR HIGH-TEMPERATURE SERVICE, DESIGNATION A95-29, 1929

CASTINGS FOR HIGH TEMPERATURES

(See 611.41, p. 709.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR FORGED OR ROLLED STEEL PIPE FLANGES FOR HIGH-TEMPERATURE SERVICE, DESIGNATION A105-28, 1928

STEEL PIPE FLANGES

1. (a) *Scope.*—These specifications cover forged or rolled steel flanges to be attached to piping for high-temperature service (note 1).

(b) Three classes of material are covered, designated class A, B, and C, respectively. Class A is intended for forge welding and is classified by the chemical properties as specified in section 6 (a) and (b) and by the physical properties as specified in section 9 (a). Classes B and C are classified in accordance with their physical properties as specified in section 9 (a).

2. *Certification of test.*—Unless otherwise specified on the order, a certification that the material conforms to the requirements of these specifications shall be the basis of acceptance of the material.

MANUFACTURE

3. *Process.*—The steel may be made by either or both of the following processes: Open-hearth or electric furnace.

4. *Discard.*—A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

5. (a) *Heat treatment.*—Class A steel does not require heat treatment. (Note 2.)

(b) Classes B and C steels shall be heat treated. Heat treatment may consist of annealing or normalizing.

(c) *Annealing.*—The procedure for annealing shall consist in allowing the flanges, immediately after forging or rolling, to cool to a temperature below the critical range, under suitable conditions to prevent injuries by too rapid cooling. They shall then be uniformly reheated to the proper temperature to refine the grain (a group thus reheated being known as an "annealing charge") and allowed to cool uniformly in the furnace.

(d) *Normalizing.*—The procedure for normalizing shall consist in allowing the flanges, immediately after forging or rolling, to cool to a temperature below the critical range, under suitable conditions to prevent injuries by too rapid cooling. They shall then be uniformly reheated to the proper temperature to refine the grain (a group thus reheated being known as a "normalizing charge") and allowed to cool in still air.

(e) No flanges which have been quenched in any liquid medium shall be offered under these specifications.

CHEMICAL PROPERTIES AND TESTS

6. (a) *Chemical composition.*—The steel shall conform to the following requirements as to chemical composition:

	Class A	Classes B and C
	<i>Per cent</i>	<i>Per cent</i>
Manganese.....	0.35-0.60	0.40-0.80
Phosphorous, not over.....	.05	.05
Sulphur, not over.....	.05	.05
Silicon, not over.....	.40	-----

(b) The carbon content of class A material shall not exceed 0.20 per cent. The carbon content of class B and C material shall be a matter of agreement between the purchaser and the manufacturer.

7. *Ladle analysis.*—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of the elements specified in section 6.

8. (a) *Check analysis.*—An analysis may be made by the purchaser from one forged or rolled flange representing each melt. The chemical composition thus determined shall conform to the requirements specified in section 6, except that phosphorus and sulphur may not exceed 0.055 per cent.

(b) All drillings of analysis shall be taken at least one-fourth inch below the surface, or turnings may be taken from test specimens.

PHYSICAL PROPERTIES AND TESTS

9. (a) *Tension tests.*—Forged or rolled steel flanges shall conform to the following minimum requirements as to tensile properties:

	Flanges for forge welding		Flanges not for forge welding	
	Class A	Class B	Class C	
Tensile strength.....lbs./in. ² ..	54,000	60,000	70,000	
Yield point.....do.....	30,000	30,000	36,000	
Elongation in 2 inches.....per cent..	25.0	25.0	22.0	
Reduction of area.....do.....	38.0	38.0	30.0	

(b) The yield point shall be determined by the drop of the beam of the testing machine, or by dividers, at a speed of head of the testing machine not to exceed one-eighth-inch per minute. The tensile strength shall be determined at a speed of head not to exceed 1½ inches per minute.

10. (a) *Number of tests.*—One tension test shall be made from each melt or for each annealing or normalizing charge. If more than one melt is represented in any annealing or normalizing charge, a test shall be made from each melt.

(b) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any test specimen is less than that specified in section 9 (a) and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

(d) For purposes of testing, the necessary extra flanges shall be provided to furnish the specimens required in paragraph (a). The test specimen shall be cut tangentially from the flange portion approximately midway between the inner and outer surfaces

and approximately midway between the front and back faces.

11. (a) *Tension-test specimens.*—The tension-test specimens taken from the flanges shall conform to the dimensions shown in Figure 129 except as specified in paragraph (b). The ends shall be of a form to fit the holders of the testing machine in such a way that the load shall be axial.

(b) In the case of small sections which will not permit of taking the standard-test specimen specified in paragraph (a), the tension-test specimen shall be as large as feasible and its dimensions shall be proportional to those shown in Figure 129 in standard specifications for steel. (See 605.0, p. 247.) The gage length for measuring elongation shall be four times the diameter of the specimen.⁸¹

12. *Retests.*—If any of the results of the physical tests of any test lot do not conform to the requirements specified, the manufacturer may re-treat such lots one or more times and retests shall be made as specified in section 10 (a).

WORKMANSHIP AND FINISH

13. (a) *Workmanship.*—The flanges shall conform to the sizes and shapes specified by the purchaser.

(b) The flanges shall be free from injurious defects and shall have a workmanlike finish.

MARKING

14. *Identification.*—Identification marks shall be stamped legibly on each flange.

INSPECTION AND REJECTION

(Requirements covering inspection, rejection, and reheating conform with those specified in A. S. T. M. standard specifications for steel (see 605.0, p. 247), except that unless otherwise specified, any rejection based on tests shall be reported within 12 working days from the receipt of the samples.)

EXPLANATORY NOTES

(Note 1 is identical with that given in A. S. T. M. A95-29. See 611.41, p. 709.)

Note 2.—It is recommended that class A flanges and pipe be annealed or normalized following the forge-welding operation.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR LAPWELDED AND SEAMLESS STEEL PIPE FOR HIGH-TEMPERATURE SERVICE, DESIGNATION A106-29, 1929

PIPE FOR HIGH TEMPERATURES

1. *Scope.*—These specifications cover lapwelded and seamless steel pipe for 250, 400, 600, 900, and 1,350 pounds per square inch pressure and high temperatures. (Note 1.) Pipe ordered under these specifications shall be suitable for bending, flanging, and similar forming operations. (Note 2.)

MANUFACTURE

2. (a) *Process.*—(Same as in A53, given above.)

(b) Welded pipe 2 inches or over in nominal diameter shall be made by the lap welded process. All pipe 1½ inches or under in nominal diameter shall be made by the seamless process, and may be either hot finished or cold drawn and annealed.

⁸¹ These requirements are in accordance with the provisions of sec. 8 of the Tentative Methods of Tension Testing of Metallic Materials (serial designation: E8-27T), see Proc. Am. Soc. Testing Mats., vol. 27, Pt. 1, p. 1067, 1927; also 1928 Book of A. S. T. M. tentative standards.

(c) Unless otherwise specified, seamless pipe 2 inches or over in nominal diameter shall be furnished hot finished. Upon agreement, cold drawn and annealed pipe may be furnished.

CHEMICAL PROPERTIES AND TESTS

3. *Ladle analysis.*—The steel for welded and seamless pipe shall conform to the following ladle analysis requirements as to chemical composition:

	Welded	Seamless
	<i>Per cent</i> (Note 3) 0.06	<i>Per cent</i> 0.04
Phosphorus, not over.....	.05	.05
Sulphur, not over.....		

4. *Check analyses.*—Analyses may be made by the purchaser from each lot of 500 lengths or fraction thereof of finished pipe. The phosphorus and sulphur content thus determined shall not exceed that specified in section 3 by more than 25 per cent. Drillings for analysis shall be taken from several points around each pipe selected for analysis.

PHYSICAL PROPERTIES AND TESTS

5. (a) *Tension tests.*—(Requirements for welded pipe same as for welded open-hearth pipe; requirements for seamless, grade A pipe same as for seamless, open-hearth, low-carbon pipe; and requirements for seamless, grade B pipe same as for seamless, open-hearth, medium carbon pipe, all in A53, given above.)

(b) (Same as in A53, given above.)

6. *Hydrostatic tests.*—Unless otherwise agreed, each length of pipe ordered under these specifications shall be tested at the mill to the hydrostatic test pressures specified in the table below. Welded pipe shall be struck near both ends while under pressure, with a 2-pound hammer or equivalent.

(Working pressures and test pressures same as for carbon-steel castings for valves, flanges, and fittings for high-temperature service in A. S. T. M., A95. (See 611.41, p. 709.)

7. (a) *Flattening tests.*—For welded pipe, a section of pipe 6 inches long shall be flattened between parallel plates with the weld located at 90° from the line of direction of the applied force, until

opposite walls of the pipe meet. No opening in the weld shall take place until the distance between the plates is two-thirds of the original outside diameter of the pipe. No cracks or breaks in the metal elsewhere than in the lap weld shall occur until the distance between the plates is one-third of the original outside diameter of the pipe. Evidence of laminations or burnt material shall not develop during the entire flattening process. When double-welded pipe is furnished on special order, the flattening test shall show no opening at the weld until the distance between the plates is one-third of the original outside diameter of the pipe.

(b) (For grade A seamless pipe over 2 inches in nominal diameter, same as for low-carbon seamless pipe in A53, given above.)

(c) (For grade B seamless pipe over 2 inches in nominal diameter, same as for medium-carbon seamless pipe in A53, given above.)

8. *Bend tests.*—(Same as for welded and seamless steel pipe in A53, given above.)

9. (a) *Test specimens.*—Tension-test specimens shall be cut longitudinally from the pipe and not flattened between gage marks. The width shall not be less than the wall thickness of the pipe nor more than three times the wall thickness. The sides of specimens shall be parallel between gage marks. If desired, the tension-test specimen may consist of a full section of the pipe.

Specimens from welded pipe shall be taken at a point approximately 90° from the weld.

(b) and (c) (Same as for welded and seamless steel pipe in A53, given above.)

10. (a) *Welded—Number of tests.*—From each lot of 500 lengths or fraction thereof of each size of welded pipe, one length shall be selected for the tension test specified in section 5.

The flattening test specified in section 7 (a) shall be made on both crop ends cut from each length of welded pipe.

Each length of welded pipe shall be subjected to the hydrostatic test specified in section 6.

(b) *Seamless.*—From each lot of 500 lengths or fraction thereof of each size of seamless pipe, two lengths shall be selected for test. Upon one of these the tension test specified in section 5 shall be made. Upon both of them the test specified in sections 7 (b), (c), or 8 shall be made.

Each length of seamless pipe shall be subjected to the hydrostatic test specified in section 6.

TABLE 1.—Dimensions and weights of lapwelded and seamless steel pipe ¹ for high-temperature service ²

¹ While the thicknesses given in this table are theoretically ample to care for both bursting pressure and material removed in threading, it is recommended that where pipe is threaded, a weight at least equal to the 900-pound class be used to furnish added mechanical strength.

² This contemplates temperatures from 450° to 750° F. (230° to 400° C.), or at the discretion of the designing engineer, higher temperatures with appropriate pressures may be used.

³ All pressures in pound per square inch gage.

⁴ Wall thicknesses calculated from the modified Barlow formula given in par. P-23 of the 1927 edition of the A. S. M. E. Boiler Construction Code (as revised), increased to provide 12.5 per cent under thickness mill tolerance, then chosen as the next heavier commercial wall thickness.

11. (a) *Retests.*—If the results of any physical or chemical tests of any lot do not conform to the requirements specified in sections 3, 4, 5, 7 and 8, retests of additional pipes of double the original number shall be made, each of which shall conform to the requirements specified.

(b) Should a crop end fail in the flattening test, one retest may be made from the failed end.

DIMENSIONS, WEIGHTS, AND PERMISSIBLE VARIATIONS

12. (a) *Weights and dimensions.*—The nominal wall thicknesses and standard weights for pipe of various diameters are given in Table 1. (Note 4.)

(b) Nipples shall be cut from pipe of the same weight and quality as described in these specifications.

13. (a) *Diameter—Permissible variations.*—(Same as for diameter in A53, given above.)

(b) *Thickness.*—The minimum wall thickness at any point for welded and seamless pipe shall not be more than 12.5 per cent under the nominal wall thickness specified.

(c) *Weight.*—The weight of the pipe shall not exceed that specified in Table I by more than 5 per cent for the 250, 400, 600, and 900 pound per

square inch standards, nor more than 10 per cent for the 1,350-pound standard.

14. *Lengths.*—Pipe lengths shall be furnished in accordance with the following regular practice: (a) The lengths required shall be specified in the order and (b) no jointers are permitted unless otherwise specified.

WORKMANSHIP AND FINISH

15. *Ends.*—Unless otherwise specified, pipe shall be furnished with plain ends.

16. *Finish.*—The finished pipe shall be reasonably straight and free from injurious defects. All burrs at the ends of the pipe shall be removed.

MARKING

17. *Marking.*—Each length of pipe shall be marked with appropriate symbols to show by whom manufactured and that it conforms to these specifications.

INSPECTION AND REJECTION

(Requirements covering inspection and rejection conform with those specified in A. S. T. M. standard specifications for steel. (See 605.0, p. 247.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, STEEL PIPE NIPPLES, COMMERCIAL STANDARD CS5-29, JANUARY, 1929

STEEL PIPE NIPPLES

Pipe nipples shall be made only from tested new, full, or short length and full weight steel pipe free from buckles, bends, kinks, cracks, laminations, imperfect welds, rust, injurious sand marks, or any other defects which might affect its strength or serviceability.

(In respect to manufacture; hydrostatic tests; hydrostatic pressures for welded and seamless steel pipe; weights, dimensions, and permissible variations standard weights and dimensions of welded and seamless steel pipe; workmanship and finish, this specification conforms to A. S. T. M., A53-30, given above, with the following exceptions:)

The weight of galvanized pipe shall not vary more than 3 per cent under that specified in Table 1 (class A, standard weight pipe), in F. S. B. WW-431, given below; nor more than 3 per cent under that specified in A. S. T. M., A53-30, Table 11 (extra-strong pipe); nor more than 8 per cent under that specified in A. S. T. M., A53-30, Table 11 (double-extra-strong pipe), given above.

(Specifications covering taper-pipe-thread dimensions conform to those of the National Screw Thread Commission. See 607.0, p. 365.)

Pipe nipples shall be threaded on both ends in accordance with the latest issue of American standard for pipe thread B-2 of the American Standards Association. Gages used for inspection shall not vary from the basic dimensions more than one-half turn either way.

Inspection tolerances.—The maximum allowable variation in the commercial product is one turn plus or one turn minus from the gaging notch when using gages. This is equivalent to a maximum allowable variation of one and one-half turns from the basic dimensions on account of the tolerance of one-half turn on gages. Nipples shall be chamfered and reamed at an angle of 25° to 40° to the central axis. Nipples shall not exceed one-sixteenth inch under or over the specified length. Steel nipples are regularly made and stocked in the sizes shown

in Tables 1, 2, 3, and 4 in Federal Specifications Board specification WW-N-351, given below. They are packed as shown in the accompanying table.

Packing of standard-weight black or galvanized-steel nipples

IRON OR STEEL SCREWED UNIONS

(See 607.2, p. 428.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, WROUGHT-IRON AND WROUGHT-STEEL PIPE, VALVES, AND FITTINGS, SIMPLIFIED PRACTICE RECOMMENDATION NO. 57, 1926

WROUGHT-IRON AND WROUGHT-STEEL PIPE, VALVES, AND FITTINGS

(See 607.0, p. 365.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, STEAMBOAT INSPECTION SERVICE, GENERAL RULES AND REGULATIONS PRESCRIBED BY THE BOARD OF SUPERVISING INSPECTORS, MAY 4, 1929

WELDED STEAM AND WATER PIPES

From one-eighth of an inch inside diameter up to and including 30 inches inside diameter.

The pipe shall be made of wrought iron or mild steel, smooth, straight, and free from defects.

Threaded pipe of standard thickness shall be avoided as far as possible. In steam pipes it is a very serious matter and shall not be allowed in any case on standard pipe over 5 inches in diameter.

All pipe over 2 inches in diameter shall be lap-welded.

TESTS

The following tests shall be made before shipment by the manufacturer:

One-eighth inch inside diameter up to and including 3 1/2 inches inside diameter shall be tested before shipment to 600 pounds per square inch hydrostatic pressure and not subject to any other test.

For all diameters greater than 3½ inches inside:
 (a) *For steel.*—A test piece 2 inches in length cut from a pipe shall stand being flattened by hammering until the sides are brought parallel with the curve on the inside at the ends not greater than one-third the outside diameter of the pipe without showing cracks or flaws, the weld being 45° from the curve.

For iron.—A test ring three times the thickness in length cut circumferentially from lapwelded wrought-iron pipe shall be crushed down to an inner diameter of one-third the outside diameter of the pipe. Wrought-iron pipe will not stand this test without fracture, but no lapwelded wrought-iron pipe shall be accepted where the break is short or crystalline or shows evidence of defective material or bad welding, and in every case the fiber of the iron shall be shown.

(b) Pulling tests shall be made from every 50 pieces furnished, or fraction thereof, and shall show the following results:

For Bessemer steel.—Tensile strength not less than 50,000 pounds per square inch. Elongation in 8-inch specimen, not less than 20 per cent.

For open-hearth steel.—Tensile strength not less than 45,000 pounds per square inch. Elongation in 8-inch specimen, not less than 20 per cent.

For iron.—Tensile strength, 40,000 to 48,000 pounds per square inch. Elastic limit, 22,000 to 30,000 pounds. Elongation in 8-inch specimen, not less than 12 per cent.

All pipe from 4-inch diameter up shall be tested before shipment to not less than 500 pounds per square inch hydrostatic pressure.

SEAMLESS STEEL STEAM AND WATER PIPES

MATERIAL

The steel shall be made by the open-hearth process.

SURFACE INSPECTION

Pipe shall be free, inside and outside, from all surface defects that would materially weaken it or form starting points of corrosion. The defects to be especially avoided are snakes, checks, slivers, laps, pits, etc. Pipe shall be smooth and straight.

TESTS

The following tests shall be made before shipment by the manufacturer:

(a) A test piece, 2 inches in length, cut from a pipe, shall stand being flattened by hammering until the sides are brought parallel with the curve on the inside at the ends not greater than one-third the outside diameter of the pipe, without showing cracks or flaws.

(b) Pulling tests shall be made from every 50 pieces furnished, or fraction thereof, and shall show the following results:

Tensile strength, not less than 48,000 pounds per square inch.

Elongation in 8-inch specimen, not less than 12 per cent.

The name or brand of the manufacturer shall be legibly rolled in raised characters or stamped on the outer surface of each pipe.

MAIN STEAM PIPE

The thickness of and pressure allowed on main steam pipe constructed of riveted iron or steel plates that have been stamped and tested as required by

section 4430, Revised Statutes, shall be determined in the same manner as required by section 4433, Revised Statutes, to determine the pressure allowable on boilers.

The thickness of and steam pressure allowable on all lapwelded or solid-drawn steam pipe of wrought iron or steel shall be determined by the following formulas:

$$T = \frac{P \times D}{10,000} + 0.125$$

$$P = \frac{(T - 0.125) \times 10,000}{D}$$

Where

P = pressure of steam allowable in pounds.

T = thickness of pipe.

D = diameter of pipe.

Example

Given $P = 200$ pounds pressure. $D = 5$ inches in diameter. Substituting and solving for T

$$T = \frac{200 \times 5}{10,000} + 0.125 = 0.225 \text{ inch}$$

Substituting and solving for P

$$P = \frac{(0.225 - 0.125) \times 10,000}{5} = 200 \text{ pounds.}$$

STATEMENT OR CERTIFICATE OF MANUFACTURER OF STEAM AND WATER PIPES

When the manufacturers of steam and water pipes file with the supervising inspector general a certificate duly sworn to that all such pipes manufactured by them will stand all the tests and meet all the requirements of the foregoing rule, they shall be accepted by inspectors of the service and no other affidavit will be required.

Lapwelded or solid-drawn pipe of wrought iron or steel may be used for mud or steam drums not exceeding 24 inches in diameter for use on boilers when the ends of the pipe have been properly annealed before the holes are drilled or the heads are riveted in.

When pipe is used for steam lines where flanges are riveted on and calked, the ends of the pipe shall be properly annealed before drilling or riveting the flanges on.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATIONS FOR UNIONS, MALLEABLE IRON OR STEEL, NO. 393, 1926. (CURRENT DESIGNATION WW-U-531)

MALLEABLE IRON OR STEEL UNIONS

(Conforms with Commercial Standard CS7-29 (see 607.2, p. 428), with the addition of tabulated dimensions on 2½ and 3 inch sizes.)

(See 607.2 p. 429.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NIPPLES, PIPE; BRASS, STEEL, AND WROUGHT IRON, WW-N-351, JUNE 24, 1930

STEEL NIPPLES

APPLICABLE FEDERAL SPECIFICATIONS

The following Federal specifications in so far as the requirements thereof are applicable, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification No.	Former No.	Title	See
QQ-M-151	339	General specifications for metals.	600.0, p. 3.
WW-P-351	342	Seamless brass pipe, iron-pipe size, standard and extra strong.	645.23 p. 1217.
WW-P-431	162	Welded steel pipe, black and galvanized.	Below.
WW-P-441	242	Welded wrought-iron pipe, black and galvanized.	607.3, p. 433.
GGG-P-351	238	Pipe threads.....	607.0, p. 365.

GRADES, TYPES, AND SIZES

This specification covers wrought iron and steel nipples, coated and uncoated, in iron pipe sizes from 1/8 to 12 inches, inclusive, of standard lengths and brass nipples in iron pipe sizes from 1/8 to 6 inches, inclusive, of standard lengths.

Steel pipe nipples shall be of the following types, as required:

Type A. Standard weight (as defined by Federal specification WW-P-431).

Type B. Extra strong (as defined by Federal specification WW-P-431).

Type C. Double extra strong (as defined by Federal specification WW-P-431).

Wrought-iron pipe nipples shall be of the following types, as required:

Type A. Standard weight (as defined by Federal specification WW-P-441).

Type B. Extra strong (as defined by Federal specification WW-P-441).

Type C. Double extra strong (as defined by Federal specification WW-P-441).

Brass pipe nipples.

Brass pipe nipples shall be of the following types, as required:

Type A. Standard weight (as defined by Federal specification WW-P-351).

Type B. Extra strong (as defined by Federal specification WW-P-351).

Brass pipe nipples shall be of the following grades, as required:

Grade A (as defined by Federal specification WW-P-351).

Grade B (as defined by Federal specification WW-P-351).

Grade C (as defined by Federal specification WW-P-351).

MATERIAL AND WORKMANSHIP

Steel pipe nipples shall be made of pipe conforming to the requirements of Federal specification WW-P-431.

Wrought-iron pipe nipples shall be made of pipe conforming to the requirements of Federal specification WW-P-441.

Brass pipe nipples shall be made of pipe conforming to the requirements of Federal specification WW-P-351.

GENERAL REQUIREMENTS

Pipe nipples shall be threaded on both ends with the standard taper pipe threads conforming to Federal specification GGG-P-351.

Nipples shall be chamfered on the outside at an angle of 25° to 45° to the central axis. All burrs on the inside shall be removed.

A tolerance of plus or minus one-sixteenth inch in length is permitted.

DETAIL REQUIREMENTS

Wrought iron and steel pipe nipples shall be uncoated or zinc coated as specified. Zinc-coated nipples shall be made of zinc-coated pipe.

Wrought iron and steel pipe nipples shall be of the respective dimensions given in Tables 1, 2, 3, and 4. Special sizes and lengths may be specified when required. Special lengths shall not vary more than one-sixteenth inch over or under the lengths required by the purchase order.

TABLE 1.—Wrought iron and steel pipe nipples, type A, standard weight, uncoated, iron pipe sizes and lengths

METHOD OF SAMPLING, INSPECTION, AND TESTS

Unless otherwise specified, the pipe from which nipples are to be made shall be inspected and tested in accordance with methods of inspection and tests covered by the respective specification listed in paragraph A-1.

When impracticable to inspect and test the pipe, the nipples shall be inspected and tested to insure that the material conforms to the respective specifications.

Nipples shall be inspected for dimensions, threading, and surface defects.

PACKAGING, PACKING, AND MARKING

Packaging.—Unless otherwise specified, commercial packages are acceptable under this specification.

Packing.—Unless otherwise specified, the subject commodity shall be delivered in substantial commercial containers, so constructed as to insure acceptance by common or other carriers for safe transportation, at the lowest rate, to the point of delivery.

Marking.—Unless otherwise specified, shipping containers shall be marked with the name of the material, the size, the type and the quantity contained therein, as defined by the contract or order under which the shipment is made, the name of the contractor, and the number of the contract or order.

NOTES

The dimensions for pipe nipples given herein are those in which they are regularly furnished. Nipples of special dimensions may be specified when required.

Requisitions for pipe nipples should give iron pipe size, material (by reference to respective specification listed in section on "Material and Workmanship", type, length, number required, and, if of steel or iron, whether uncoated or zinc-coated nipples are required.

The dimensional requirements given herein correspond to those of United States Department of Commerce Commercial Standards CS5-29, CS6-29, and CS10-29.

It is the standard practice in some Government departments to use extra strong, right and left, wrought iron and steel nipples with standard weight wrought-iron and steel pipe. It is also the standard practice of some Government departments to use only grade A (Federal Specification WW-P-351) brass pipe nipples for installations of any grade of brass pipe.

It is believed that this specification is adequate and that normally no samples will be necessary to determine compliance with the requirements prior to award. If, for a particular purpose, samples with bids are necessary they should be specifically asked for in the invitation for bids.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIPE; WELDED-STEEL, BLACK AND ZINC-COATED, WW-P-431, OCTOBER 14, 1930

WELDED-STEEL PIPE

APPLICABLE FEDERAL SPECIFICATIONS

The following Federal specifications, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification No.	Former No.	Title	See
GGG-P-351 QQ-M-151	238 339	Pipe threads..... General specifications for metals.....	607.0, p. 365. 600.0, p. 3.

(In respect to classes of pipe this specification is identical with A. S. T. M., A120-28T, given above. In respect to manufacture, general requirements, and detail requirements it is substantially the same as A. S. T. M., A53-30, given above, with the following exceptions and additions:)

MATERIAL AND WORKMANSHIP

Pipe shall be straight and free from buckles, bends, kinks, cracks, laminations, imperfect welds, rust, injurious sand marks, or any other defects which might affect its strength or serviceability. Telescoped pipe shall not be furnished under this specification. All burrs at the ends of the pipe shall be removed. (Ordinarily liquor marks incident to manufacture of welded material shall not be considered cause for rejection.)

GENERAL REQUIREMENTS

Class B, extra-strong, and class C, double extra-strong pipe, shall conform to the following minimum requirements as to tensile properties:

Classes	Tensile strength per square inch	Yield point per square inch	Elongation in 8 inches
B and C.....	Pounds 45,000	Pounds 25,000	Per cent 18

The weight of zinc-coated (galvanized) pipe shall not vary more than 3 per cent under that specified in the accompanying table (class A, standard weight); nor more than 3 per cent under that specified in A. S. T. M., A53-30, Table 11 (extra-strong pipe); nor more than 8 per cent under that specified in A. S. T. M., A53-30, Table 11 (double extra-strong pipe).

TABLE 1.—Class A, standard-weight pipe

Iron pipe size	Weight per foot ¹		Iron pipe size	Weight per foot ¹	
	Plain ends	Ends threaded and coupling on 1 end		Plain ends	Ends threaded and coupling on 1 end
<i>Inches</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Inches</i>	<i>Pounds</i>	<i>Pounds</i>
1/8	0.244	0.245	3	7.575	7.616
1/4	.424	.425	3 1/2	9.109	9.202
3/8	.567	.568	4	10.790	10.889
1/2	.850	.852	5	14.617	14.810
5/8	1.130	1.134	6	18.974	19.185
1	1.678	1.684	8	28.554	28.809
1 1/4	2.272	2.281	10	40.483	41.132
1 1/2	2.717	2.731	12	49.562	50.706
2	3.652	3.678	12	43.773	45.000
2 1/2	5.793	5.819			

¹ Based on 20-foot lengths.

² This is special-weight pipe which shall not be furnished unless specified and shall conform to the requirements of class A standard-weight pipe.

Zinc coating (galvanizing) shall be done by the hot process, both inside and outside. The pipe shall be thoroughly and evenly coated and free from blisters and other defects. The increase in weight due to coating shall be not less than one-eighth pound per square foot of surface covered. The zinc bath shall contain not more than 2 per cent of elements other than zinc, as determined from samples taken at a point half the depth of the bath. Unless zinc coating is specified in the invitation for bids, black pipe shall be furnished.

All threads shall be adequately protected. Tapped rings or half-length couplings shall be provided on the end not protected by the coupling on all sizes of threaded pipe 2 inches iron pipe size or larger. Threads on smaller sizes shall be protected by having ends of bundles securely wrapped with burlap unless otherwise specified.

DETAIL REQUIREMENTS

Standard-weight pipe shall, unless otherwise specified, be threaded at both ends and have a standard pipe coupling of wrought iron or steel tightly screwed on one end. Extra-strong and double-extra-strong pipe shall, unless otherwise specified, be furnished with plain ends and without couplings. Zinc-coated (galvanized) couplings shall be furnished with zinc-coated pipe.

If impracticable to obtain samples from the bath or to weigh pipe immediately before coating, the quality of the zinc coating may be determined from the average of samples 6 inches long taken from both ends of finished pipe. In this event iron shall be disregarded as an impurity.

Hydrostatic tests shall be made in the presence of a Government inspector unless inspection is specifically waived, in which case the manufacturer shall furnish a certificate to the effect that the pipe has withstood satisfactorily the hydrostatic test required.

All pipe shall be surface inspected for defects by rolling on a set of wooden horses or other suitable supports, so that the entire surface of each pipe may be properly inspected.

The number of flattening and bend tests for classes A, B, and C, and tension tests for classes B and C shall be as follows for each size of pipe:

One test of each kind from each lot of 100 lengths of pipe 3 inches I. P. S. or less.

One test of each kind from each lot of 50 lengths of pipe over 3 inches and not over 6 inches I. P. S.

One test of each kind from each lot of 25 lengths of pipe over 6 inches and not over 8 inches I. P. S.

One test of each kind from each lot of 10 lengths of pipe over 8 inches I. P. S.

NOTE.—If the number of lengths is less than specified as lots in the above, one test of each kind shall be made.

NOTES

Pipe is regularly designated by iron-pipe size, class (standard weight, extra strong, or double extra strong), black, or zinc coated (galvanized).

Pipe under this specification should be ordered by number of feet required. In the case of pipe furnished with couplings, the length includes the coupling when tightly screwed on the pipe.

Pipe 1¼ inches to 3 inches I. P. S., inclusive, is made by both the lap-welding and butt-welding processes. If either is specifically desired, the invitation for bids should so state, otherwise either lap-welded or butt-welded pipe between these sizes may be furnished and will be acceptable.

607.5 Sheet Iron and Steel Pipe.

AMERICAN ASSOCIATION OF STATE HIGHWAY OFFICIALS, TENTATIVE STANDARD SPECIFICATION FOR BASE METAL FOR CORRUGATED METAL SHEETS FOR CULVERTS, M-36, 1931

METAL-PIPE CULVERTS, CORRUGATED

Corrugated metal-pipe culverts shall be fabricated from corrugated galvanized sheets, the base metal of which shall be made by the open-hearth process.

The base metal shall conform to the following chemical requirements:

Elements	Chemical composition by ladle analysis; position of base metals does not indicate preference					Tolerance by check analysis of finished sheets
	Pure iron	Copper-bearing pure iron	Copper iron	Copper-molybdenum steel	Copper steel	
Carbon, maximum	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>	<i>Per ct.</i>
Manganese, maximum						
Phosphorus, maximum	0.015	0.015	0.015	0.015	0.050	0.010
Sulphur, maximum	.040	.040	.040	.040		
Silicon, maximum						
Copper, minimum		.20	.20	.40	.20	.02
Molybdenum, minimum				.05		
Sum of first 5 elements, maximum		.10	.25	.25	.70	.04
Sum of first 6 elements, maximum	.10					.04

AMERICAN ASSOCIATION OF STATE HIGHWAY OFFICIALS, METHOD OF TEST AND INSPECTION OF CORRUGATED METAL CULVERT, TENTATIVE METHOD T-64, 1931

TESTING CORRUGATED METAL CULVERT

1. Corrugated metal culvert shall be subject to inspection at the factory, trench, or other point of delivery by the engineer or other authorized representative.

2. The inspector shall determine the gage of the metal, inside diameter, depth and spacing of the corrugations, width of lap, rivet spacing, weight per linear foot of the finished pipe, condition of spelter coating, and other requirements as called for under the specifications. He shall also take a sample of the pipe material, approximately 6 inches wide and the full diameter of the pipe, for measurements, chemical analysis, and the determination of the amount of galvanizing or spelter coating.

3. Chemical analysis will be made of all metal culvert pipe, including rivets, to determine whether the requirements of the specifications as to quality of the material are met.

4. The amount of galvanizing or spelter coating will be determined in accordance with the methods for testing the amount of spelter coating on culvert metal.

5. Chemical analysis to be conducted in accordance with the standard method of chemical analysis of plain carbon steel in A. S. T. M., A33. (See 600.1, p. 10.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, DESIGN OF SMALL BRIDGES, CULVERTS, AND TRESTLES, B209-26, 1926

DESIGN OF PIPE CULVERTS

In the design of any pipe culvert adequate head walls should be provided. This is especially true for the upstream side.

The maximum diameters of pipe recommended are:

	Inches
Vitrified pipe.....	36
Cast iron.....	84
Reinforced concrete.....	84
Corrugated iron.....	84

Figure 295 shows current practice in the design of head walls for pipe culverts.

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR CORRUGATED METAL CULVERT PIPE FOR RAILROAD USE, 1930

(1) *General*.—Pipe shall be straight, of true circular form, and of lengths and net internal diameters indicated.

(2) *Base metal*.—Corrugated metal-pipe culverts shall be fabricated from corrugated galvanized sheets, the base metal of which shall be made by the open-hearth process, unless otherwise specified in the contract.

(3) *Analysis.*—The base metal shall conform to one of the following chemical requirements. Bidder shall state classification he is bidding on.

Chemical composition.—(Identical with A. A. S. H. O., given above.)

(4) *Gage.*—U. S. standard gage for sheet-metal designation shall be used in specifying the thickness and weight of culvert-pipe sheets.

(5) *Sheets.*—All sheets shall be of first quality, prime stock, and free from injurious defects such as laminations, ragged edges, etc.

Corrugations.—Corrugations in sheets shall not exceed $2\frac{3}{4}$ nor be less than $2\frac{1}{2}$ inches in width, summit to summit, and not less than one-half inch nor more than three-fourths inch in depth.

(6) *Weight and tolerance.*—The average weight per square foot of the culvert sheets, as determined by weighing in lots of not less than 3,000 pounds and not exceeding 6,000 pounds, shall not vary

Longitudinal joints shall be riveted on not to exceed $2\frac{3}{4}$ -inch centers, with one row of rivets in pipe 21 inches or less in diameter and two rows of rivets in pipe of larger diameters.

Circumferential joints of pipe of all diameters shall be riveted on not to exceed 5-inch centers.

The upsetting of the end of the rivets on the inside of the pipe shall give full hemispherical heads accomplished in such manner as not to remove or destroy the galvanizing, shall insure a tight joint, and shall present a neat and workmanlike job.

Rivets shall be driven without bending and must completely fill the holes.

(9) *End reinforcement.*—Culverts of 12-gage material and lighter shall have the ends reinforced by an iron rod of not less than one-half inch in diameter and a length equal to the circumference of the pipe, folded into the outer edge of the sheet forming the end section, or by use of a flat iron bar or other

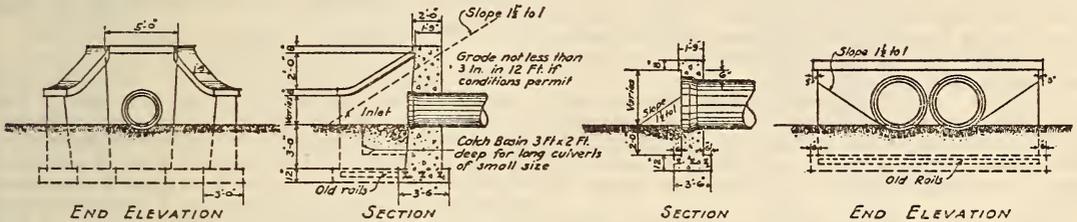

FIGURE 295.—Head walls for pipe culverts

from the theoretical weight by more than 5 per cent either way.

(7) *Joints.*—The various diameters of pipe shall have a lap of metal for longitudinal joints as follows:

Diameter	Lap (for each longitudinal seam or joint)
6 to 10 inches.....	Not less than 2.5 inches.
11 to 15 inches.....	Not less than 3.0 inches.
16 to 21 inches.....	Not less than 3.5 inches.
22 to 27 inches.....	Not less than 4.0 inches.
28 to 36 inches.....	Not less than 4.5 inches.
37 to 45 inches.....	Not less than 5.0 inches.
46 inches and over.....	Not less than 6.0 inches.

(8) *Riveting.*—All rivets shall be manufactured of the same base metal as are the sheets. The rivets shall be of round head type, thoroughly galvanized with zinc spelter. The sizes of rivets to be used with different thicknesses of sheets shall be as follows:

Sheets	2 thicknesses		3 thicknesses	
	Diameter	Length	Diameter	Length
	Inch	Inch	Inch	Inch
16 gage.....	$3\frac{1}{16}$	$3\frac{5}{8}$	$5\frac{1}{16}$	$3\frac{5}{8}$
14 gage.....	$3\frac{1}{8}$	$3\frac{5}{8}$	$5\frac{1}{8}$	$3\frac{5}{8}$
12 gage.....	$3\frac{3}{8}$	$3\frac{3}{4}$	$5\frac{3}{8}$	$7\frac{5}{8}$
10 gage.....	$3\frac{5}{8}$	$3\frac{3}{4}$	$5\frac{5}{8}$	$7\frac{5}{8}$
8 gage.....	$3\frac{7}{8}$	$7\frac{5}{8}$	$5\frac{7}{8}$	1

All rivets shall be placed with heads on outside of pipe in the recess or valley of corrugations. Where two lines of rivets are required, the minimum distance from center of rivet to edge of sheet shall not be less than two and one-half times and maximum distance not more than four times the diameter of the rivet.

Before placing the rivets the sheets shall be tightly and evenly clamped together to prevent the swelling of the rivets between the sheets.

stiffener, riveted to or suitably attached to the end of the pipe, by folding back the end of the sheet or by other suitable means, and in such manner that the galvanizing will not be broken or flecked off, as may be specified by the purchaser.

(10) *Galvanizing.*—In all cases the sheets shall be corrugated and all shearing done before galvanizing, and in the case of perforated pipe the perforations also shall be punched before the galvanizing is done.

Sheets shall be uniformly coated with not less than 1 ounce of prime quality zinc spelter per square foot of surface of sheet, counting each surface of the sheet separately.

The galvanizing shall be free from cracks, peels, blisters, pinholes, uncoated spots, or imperfections of any kind, and, so far as is practically possible, shall be of uniform thickness over all surfaces of the metal.

(11) *Marking.*—(a) All sheets shall be conspicuously branded or stenciled on the outside to show manufacturer's name, brand or quality of material, gage of sheet, and stock-card number (or heat number) of base metal so that complete data covering the manufacturing history of the sheet before galvanizing can be obtained.

(b) All culverts shall have a metal tag of durability equal to that of the culvert riveted to the inside of the pipe on the upstream end which will suitably identify the maker, kind of base metal, and year fabricated. Pipe ordered for use as drains shall have the identification tag attached on the outside of the pipe at least once each 300 feet.

(12) *Field joints.*—Unless otherwise specified, corrugated pipe may be furnished in as long sections as can be shipped economically, except that where the purchaser specifies a definite total length of pipe for any location, the lengths of joints shall be adjusted so that no section of less than 8 feet in length must be used.

Coupling bands or suitable devices for joining the pipes securely together shall be shipped with the pipe.

(a) Coupling bands for pipe shall be of sufficient width to engage full corrugations on each side of the end of the pipe and be equipped with lugs or equivalent fastenings, as follows:

Pipe diameters, inclusive	Minimum number corrugations to be engaged on each section	Number of lugs
6 to 15 inches.....	1½ full corrugations.....	2
16 to 42 inches.....	2 full corrugations.....	3
43 inches and larger.....	3 full corrugations.....	4

Coupling bands shall be made of the same gage and quality of material used in the pipe.

(b) Lugs, or fastenings, on bands shall consist of forged wrought iron or such other material as may be specified by the purchaser and shall be fully galvanized to the same extent as required for the other material used in the culvert. Each half of the fastening lugs or other appliance shall be riveted to the band with not less than four rivets of three-eighths inch diameter or larger.

The draw bolts shall be of not less than one-half inch diameter, with 3½ inches or more, threaded, for pipe 30 inches or less in diameter, and of not less than three-fourths inch diameter with 4 inches or more threaded, for pipe of diameters above 30 inches.

Bolts and nuts must be galvanized after threading.

At the option of the purchaser, culverts of 54 inches diameter and larger shall be fabricated for field riveting, in which case necessary rivets, as specified under paragraph (8) "Riveting," must be furnished with the pipe. In such cases proper appliances for enlarging and tightening the sheets of end rings shall also be supplied.

(13) *Workmanship*.—Each section of pipe must be fabricated in a neat and workmanlike manner, of correct dimensions and true lines.

(14) *Handling*.—All material, during fabrication and in the loading and shipping of the finished pipe, must be so handled that the galvanizing or zinc coating shall not be broken or damaged.

(15) *Inspections and rejections*.—The failure of any section of pipe delivered to conform to these specifications in any particular shall constitute cause for rejection thereof.

UNITED STATES GOVERNMENT, DEPARTMENT OF AGRICULTURE, BUREAU OF PUBLIC ROADS, SPECIFICATIONS FOR FOREST ROAD CONSTRUCTION, 1929

CORRUGATED GALVANIZED METAL PIPE

DESCRIPTION

This item shall consist of furnishing sheet-metal pipe conforming to these specifications and of the sizes and dimensions required on the plans, and installing such pipe where and as designated on the plans or by the engineer and in conformity with the lines and grades given. This item shall include the furnishing and construction of such joints, and such connections to existing pipes, catch basins, end walls, etc., as may be required to complete the work as shown on the plans.

MATERIAL AND MANUFACTURE

The pipe shall be fabricated from corrugated galvanized sheets, the base metal of which shall be made by the open-hearth process.

(The chemical requirements are identical with those for corrugated metal pipe culverts of the A. A. S. H. O., given above.)

Corrugated metal pipe culverts shall be fabricated from corrugated galvanized sheets, the base metal of which shall be made by the open-hearth process. The base metal in the finished sheets shall conform to the following chemical requirements:

The total amount of carbon, phosphorus, sulphur, manganese, and silicon shall not exceed 0.7 per cent. If the total of these five elements equals or exceeds 0.20 per cent, the metal shall contain not less than 0.17 per cent of copper and not more than 0.06 per cent of sulphur. If the total of these five elements is less than 0.20 per cent, the presence of copper is optional and sulphur shall not exceed 0.04 per cent.

All rivets shall be of the same material as the base metal specified for the corrugated sheets. They shall be thoroughly galvanized or sherardized.

The weight of the culvert sheets, as determined by weighing in lots not exceeding 6,000 pounds, shall not vary from the theoretical weight by more than 5 per cent either way for each lot of one gage and size.

WEIGHT OF SPELTER COATING

The base-metal sheets shall be uniformly galvanized on both sides by the hot process. A uniform coating of prime western spelter shall be applied at the rate of not less than 2 ounces per square foot of metal. If the average spelter coating as determined from samples shows less than 2 ounces of spelter per square foot of metal, or if any one sample shows less than 1.8 ounces of spelter per square foot of metal, the shipment shall be rejected. Sheets having blister spots, holes, or other imperfections in the galvanizing after corrugating shall be rejected.

No metal will be accepted under these specifications and no bids will be considered for the materials above described until after the sheet manufacturer's certified analysis and manufacturer's guarantee have been passed upon by the engineer and accepted.

Misbranding or other misrepresentation, and non-uniformity of product, will each be considered a sufficient reason to discontinue the acceptance of any brand under these specifications, and notice sent to the sheet manufacturer of the discontinuance of acceptance of any brand will be considered to be notice to any culvert companies which handle that particular brand.

The manufacturer of each brand shall file with the engineer a certificate setting forth the name or brand of metal to be furnished and a typical analysis showing the percentage of each of the five chemical elements. The certificate shall be sworn to for the manufacturing company by a person having legal authority to bind the company.

The manufacturer of the sheets shall submit with the certified analysis a guarantee providing that all metal furnished shall conform to the certified analysis filed, shall bear a suitable identification brand or mark, and shall be replaced without cost to the purchaser when not in conformity with the specified analysis, gage, or spelter coating; and the guarantee shall be so worded as to remain in effect so long as the manufacturer continues to furnish material.

No culverts will be accepted unless the metal is identified by a stamp on each section showing: First, name of sheet manufacturer; second, name of brand; third, the gage.

The identification brands shall be placed on the sheets by the manufacturer of the sheets in such a way that when rolled into culverts such identification shall appear on the outside of each section of each pipe. Pipe having any sections not so stamped shall be promptly rejected.

Laboratory tests shall follow the methods of the United States Department of Agriculture Bulletin No. 1216, revised.

If the engineer so elects, he may have the material inspected at the rolling mill or the culverts inspected

in the shop where they are fabricated. He may require a chemical analysis from the mill for any heat, also a physical test of the properties of the metal taken from any heat, to be made by the mill. The inclusion in any shipment of any material which has been rejected at the mill or shop will be considered sufficient cause for the rejection of the entire shipment.

CONSTRUCTION

(Details of construction include shape of culverts, maximum and minimum diameters, other dimensions and weights, corrugations, rivets and riveting, coupling bands, workmanship and inspection, laying of pipe, and sampling.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR EAVES TROUGH, CONDUCTOR PIPE, CONDUCTOR ELBOWS, AND FITTINGS, R29, JULY 1, 1925

EAVES TROUGH AND CONDUCTOR PIPE

(Simplified practice recommended and accepted by industry establishing a limited list of standard sizes and weights.)

CONDUCTOR PIPE SIZES

Plain round conductor pipe, 2, 3, 4, 5, and 6 inches diameter. Round corrugated conductor pipe, 2, 3, 4, 5, and 6 inches diameter. Square corrugated conductor pipe, 2, 3, 4, and 5 inches on side.

EAVES TROUGH SIZES

Eaves trough, 3½, 4, 5, 6, 7, and 8 inches wide.

CONDUCTOR PIPE ELBOWS

No. 1, 45°; No. 2, 60°; No. 3, 75°; No. 4, 90°.

1. Along with the elimination of certain sizes of conductor pipe and eaves trough goes also the elimination of the fittings formerly used therewith.

2. No eaves trough or conductor pipe to be made lighter than 28 gage full weight; 27 gage is to be eliminated.

3. All elbows, shoes, miters, and all accessories, including ridge rolls, valleys, gutters, and so on, are to be of 28 gage full weight (0.0156 inch before galvanizing).

4. All eaves trough, conductor pipe, shoes, miters, and all accessories, including gutters, valleys, ridge rolls, and so on, when made of copper, to be not lighter than 16 ounces per square foot (equivalent to thickness of 0.0216 inch).

607.6 VALVES, COCKS, AND HYDRANTS, FERROUS AND NONFERROUS.

AMERICAN BOTTLERS OF CARBONATED BEVERAGES, STANDARDS FOR BEVERAGE MANUFACTURING EQUIPMENT AND RECOMMENDED PRACTICES, EDUCATIONAL BULLETIN NO. 4, 1930

CARBONATE WATER AND SIRUP VALVES

A. B. C. B. RECOMMENDED PRACTICE

Valves now used on carbonated water and sirup lines are of very great variety. While there are a few of them of notable construction, most are not suited to the service conditions encountered in

carbonated water or sirup lines and are not in line with the sanitary trend of the bottling industry.

As a constructive suggestion for valves complying with the requirements of the beverage plant, a

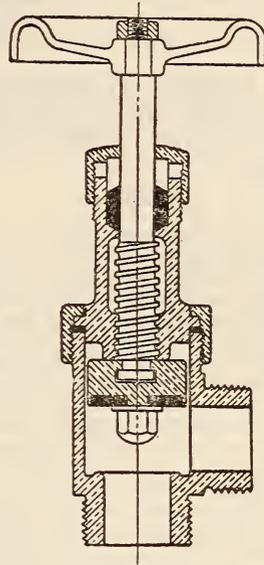

FIGURE 296.—Carbonated water valve

carbonated water valve and a sirup valve are shown in Figures 296 and 297.

Figure 296 shows a high-pressure carbonated water valve which offers an unobstructed flow to the carbonated water when wide open. The construction of the valve body is designed along very

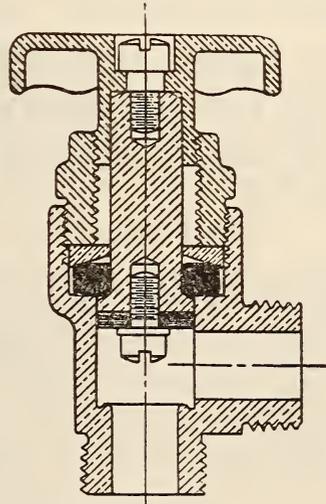

FIGURE 297.—Sirup valve

simple lines, therefore it is particularly suited for the manufacturing properties of the various materials which withstand corrosive action of carbonated water, many of which are difficult to obtain in the form of cored castings. The valve is easily taken apart for cleansing, inspection, or repair.

Figure 297 illustrates low-pressure sirup valve. This valve was designed with the idea of reducing the possibility of bacterial contamination to a minimum. As will be noted, the valve has no pockets of any kind where bacteria can lodge, besides the liquid does not come into contact with the threads at any point. It can be readily taken apart for cleansing without removing it from the line.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

VALVES

(For material of valves see 607.4, p. 435.)

1. All cast-iron and cast-steel valves to have flanged ends, bolted bonnets, and composition spindles, seats, and disks. Composition valves over 2 inches, for pressures over 100 pounds per square inch, and boiler stop and check valves are to have flanged ends and bolted bonnets. All valves intended for a working pressure exceeding 100 pounds per square inch shall bear the trademark of the manufacturer, legibly stamped or cast on the body of the valve, also the pressure in pounds per square inch that the manufacturer guarantees the valve to stand without distortion.

2. Valves 2 inches and over for working pressures exceeding 100 pounds per square inch, and valves below 2 inches for pressures of more than 300 pounds per square inch, are to be tested at the place of manufacture to not less than three times the working pressure.

AMERICAN GAS ASSOCIATION, APPROVAL REQUIREMENTS FOR GAS WATER HEATERS, SEPTEMBER 1, 1931

GAS WATER HEATERS

(See 614.2, p. 855.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, STANDARD SPECIFICATIONS FOR DETERMINING THE SIZE OF SAFETY VALVES, THEIR APPLICATION TO LOCOMOTIVES, AND THEIR REPAIR, 1912

SAFETY VALVES

1. Formula for determining the size of valve required, assuming valves have 45° seat.—

D = the total of the actual diameters of the inner edge of the seats of valves required.

H = total heating surface of boiler in square feet. (Superheating surface not to be included.)

L = vertical lift of valve in inches.

P = absolute boiler pressure in pounds per square inch.

$$D = 0.036 \times \frac{H}{L \times P}$$

Example

$$\frac{0.036 \times 2,878}{0.1 \times 200} = 5.2 \text{ inch diameter}$$

Which would require two 3-inch valves.

2. Method of determining maximum capacity of safety valves.—The only accurate method of determining the capacity of safety valves is by actual

test in a testing plant, with safety valves fully equipped with springs, as in actual road service. In order that it should be positively known that safety valves will prevent undue rise in pressure under extreme conditions, they should be subjected to a road test.

3. Number and size to be applied.—Every locomotive should be equipped with not less than two, and not more than three, safety valves, the size to be determined as per formula in paragraph 1. Safety valves to be set as follows: First, boiler pressure; second, 2 pounds in excess, and third, 3 pounds above second, or 5 pounds in excess of first.

4. Metal recommended for valves and valve seats.—Bronze alloys should be used in the manufacture of valves and valve seats.

5. Stamping lift on valves.—Manufacturers should be required to stamp on the valve the lift in inches and the discharge capacity in pounds per minute, as determined by actual test, with valve in working condition, and set for a blow-back of not to exceed 3 pounds.

6. Estimating steam discharge.—Steam discharge from safety valves of given size can be estimated

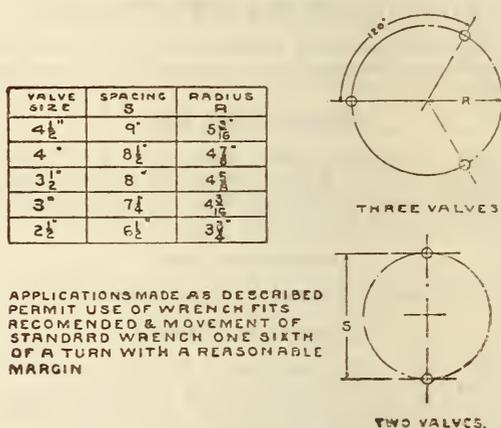

FIGURE 298.—Determining the size of safety valves, their application to locomotives, and their repairs

closely by the use of Napier's rule for flow of steam, as follows: Flow of steam per second—Absolute pressure in pounds per square inch, multiplied by area in square inches of discharge opening, divided by 70. Multiplied by 3,600 gives flow in pounds per hour.

7. Location of valves on boiler.—Safety valves should be located at the highest point on the boiler, where clearance limits will permit, in vertical position, avoiding the use of piping, long nipples, and ells between safety valves and boiler.

8. Spacing in dome.—Where safety valves are located on an independent dome, they should be spaced as per Figure 298. The opening from boiler into dome and the area between supporting ribs in dome should not be less than inlet area of valves.

9. Hydrostatic and other tests.—The screwing down of the safety valve spring during a hydrostatic test of boiler should not be practiced. Valves with springs designed for certain pressures should not be subjected to extreme pressures. One safety valve should be removed and replaced with a special high-pressure valve, and the other valves should be removed and replaced with caps or plugs during test.

10.—Standard connections.—In order to make valves of different manufacture interchangeable,

standard thread and diameter of valves at connection should be used as follows:

Safety valve	U. S. standard pipe thread	Threads to inch
<i>Inches</i>	<i>Inches</i>	
2½	2½	8
3	3	8
3½	3½	8
4	4	8
4½	4½	8

Valves of above sizes to be made for U. S. standard wrench fit.

11. *Inspection of old springs.*—Old springs should be tested as to their deflection under load before being used in repaired valves.

12. *Repairs to safety valves.*—Safety valves should be thoroughly overhauled and put in good condition whenever the locomotive is in shop for general repairs. Standard gages should be used in order that important dimensions may be maintained as originally designed.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, 5-INCH TANK CAR SAFETY VALVE, 1916 DESIGN, APPLICATION OF WASHER AND JAM NUTS TO VALVE STEM, CIR. NO. S-111-90

TANK CAR SAFETY VALVE

Figure 9 (a) shown in the tank car specifications, revised 1916, includes a design of spring follower with three lugs on the under side to engage the single nut on the end of the valve stem. It was found in service that instead of the valve stem turning on its conical seat in the valve disk, when the disk was rotated to clear its face and seat of rust, etc., the stem turned in the nut and caused a change in the pressure setting of the valve. The design of the follower was therefore changed in 1918 to eliminate these lugs and double jam nuts applied to prevent the stem turning in the nut when the valve disk is rotated.

In the meantime a number of these valves were put into service. To avoid the frequent adjustment necessary to maintain the proper setting of the valves with this design of spring follower, it is desirable that when the valves are removed from the car for the adjustment of the spring setting a washer be introduced between the bottom of the follower and the nut, so that the lugs will not engage the nut; and that two nuts be applied, jammed against one another by the use of two wrenches, to prevent unscrewing when the valve disk is rotated. It may be found that the present stem is not long enough to permit the application of the washer and two nuts after the valve has been properly set, in which case a new stem of the dimensions shown should be used.

Figure 299 shows the application of the washer and nuts to the 1916 design.

NOTE.—Washer can be made of ¾-inch pipe, or punched from ¾-inch plate.

When the spring has been properly set for the required pressure the nuts on the valve stem should be jammed against one another by the use of two wrenches.

If the stem is not long enough to permit the application of the washer and double nuts when the spring has been properly set, it should be replaced by a new stem of the dimensions shown.

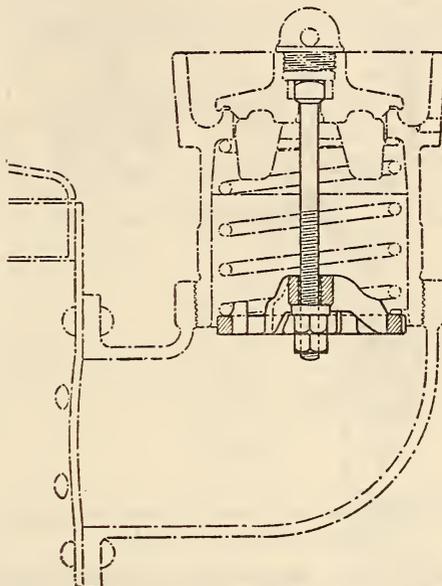

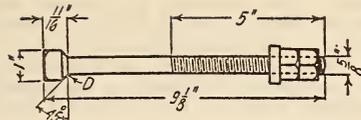

FIGURE 299.—Five-inch tank car safety valve, 1916 design

Application of washer and jam nuts to valve stem, K-46-1931

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, TRIPLE-VALVE, TEST REQUIREMENTS FOR FREIGHT SERVICE, RECOMMENDED PRACTICE, 1911

TRIPLE-VALVE TESTS

CONDITION OF TESTS

Construction of rack.—Triple valves will be tested on a rack representing the piping of a 100-car train. All cocks, angles, and connections will be as nearly as possible identical with those in train service. The rack shall conform to blue print No. C-11379 (rev. 3-9-09) in the hands of the committee, which gives the proper fittings, piping, cylinders, auxiliary reservoirs, main reservoirs, automatic brake valves, etc.

Reservoir capacity.—The main reservoir capacity shall be approximately 57,000 cubic inches.

The capacity of each auxiliary reservoir shall be such as will, with a pressure of 70 pounds, produce 50 pounds pressure in its brake cylinder when fully equalized in service application with 8 inches piston travel.

Air supply.—The air supply for the test rack shall be obtained from a locomotive type of air compressor having a capacity of from 80 to 120 cubic feet of free air per minute. The compressor to be controlled by a single top-pump governor adjusted to maintain 110 pounds main reservoir pressure.

Brake-pipe pressure.—Tests will be made with a brake-pipe pressure of 70 pounds, except when otherwise specified.

Brake-pipe leakage.—With brake-pipe and auxiliary reservoirs charged to 70 pounds, the section of

should reduce the pressure in the auxiliary reservoir not to exceed 3 pounds, until equalization takes place. The pressure in the brake pipe should not be more than 3 pounds lower than the equalized pressure in the brake cylinder and reservoir at equalization.

Section C.—(Holding test.) Three valves, selected at random, will be taken for this test and each tried separately on the first brake on the rack, using the brake pipe only of the locomotive and the first car, having the triple valves cut out on engine and tender. The one brake will be applied, admitting as nearly as may be 15 pounds, into the brake cylinder following a service application. Record of pressures in the auxiliary reservoir cylinder and brake pipe will be taken as follows: First, at completion of application; second, in 5 minutes; third, in 10 minutes; and fourth, in 15 minutes.

In this test, when a constant brake-pipe pressure is maintained, the brake-cylinder pressure must not be increased more than 5 pounds in five minutes.

Section D.—(Release test.) Three triple valves, selected at random, shall be taken for this test and each tried separately. They will be tried on the first brake of the rack, using the brake pipe only of the first car and locomotive having the engine and tender brakes cut out. When the triple goes to normal release position it must exhaust the air from the brake cylinder from 50 to 0 pounds in not more than 15 seconds.

When the triple goes to retarded-release position it must exhaust the air from the brake cylinder from 50 pounds to 0 pounds in not more than 40 seconds.

No. 3.—Emergency Application Tests

(To determine sensitiveness to quick action)

Three triple valves, selected at random, shall be taken for this test and tried separately on the first brake of the rack. During this test the locomotive and tender triples are to be cut out.

Section A.—These triple valves must give a quick-action application when the brake-pipe pressure is reduced by direct discharge to the atmosphere through disk with a $1\frac{1}{64}$ -inch orifice.

Section B.—These triple valves must not give a quick action application when the brake-pipe pressure is reduced by direct discharge to the atmosphere through a disk with a $1\frac{1}{64}$ -inch orifice.

Section C.—(Holding test.) Three triple valves, selected at random, shall be taken for this test and tried separately on the first brake on the rack.

The brake will be applied in quick action by moving the brake-valve handle to emergency position, where it must remain until completion of test for the purpose of insuring the discharge of all brake-pipe pressure. Record of pressure in auxiliary reservoir and brake cylinder will be taken as follows: First, at completion of application; second in 5 minutes; third, in 10 minutes; and fourth, in 15 minutes.

In this test, the auxiliary reservoir and brake-cylinder pressure must not show a reduction of more than 5 pounds in five minutes.

RACK TESTS

No. 4.—Service Application Tests

Section A.—(Service equalization.) With a service reduction of 25 pounds from brake-pipe pressure, a brake-cylinder pressure of not less than 48 pounds, nor more than 52 pounds, must be obtained.

Section B.—(Graduating test.) 1. A reduction of 5 pounds in brake-pipe pressure should apply lightly the 100 brakes. However, the brake-cylinder pressure may not be sufficient to show on all test gages.

2. A further reduction of 4 pounds to 6 pounds should increase the cylinder pressure of all brakes.

3. A further reduction, making a total of 25 pounds, should equalize the pressure between the auxiliary reservoirs and brake cylinders.

Section C.—(Service application time.) Brakes will be applied by reducing brake-pipe pressure 10 pounds.

There shall not be more than 25 seconds difference in the time of obtaining 10 pounds pressure in the cylinders of the first and one-hundredth brakes.

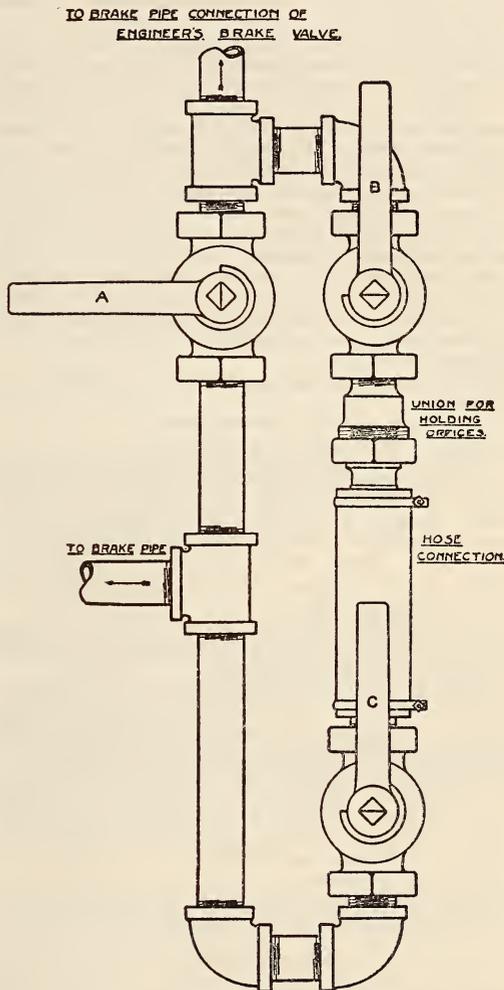

FIGURE 302.—Triple valve

No. 5.—Emergency Application Tests

Section A.—(Quick action, time, and pressure.)

The one-hundredth brake must be applied with at least 45 pounds pressure in $6\frac{1}{4}$ seconds from the movement of the brake-valve handle to emergency position and at least 55 pounds in seven seconds. The final maximum pressure in this test must not be less than 15 per cent nor more than 20 per cent above the pressure given by the same brake in full service application.

This test will also be made to determine that quick action is obtained with: First, 4 inches piston travel; and second, 12 inches piston travel.

NOTE.—The object of this test is to secure, as nearly as possible, uniformity of pressures in brake cylinders in an emergency application and uniformity of time required to obtain the pressures; to secure a minimum length of stop and a minimum of shock, and of trains parting.

Section B.—(To determine whether quick action will follow a service application.) Using the 100 brakes, make a service reduction such as will give 20 pounds cylinder pressure on the first brake. Then place the brake-valve handle in emergency position, which should cause quick-action operation of all triple valves.

The pressure in the first cylinder will be increased or decreased by steps of about 5 pounds until the point at which quick action commences or ceases is determined.

Section C.—(Quick-action jumping test.) With brakes Nos. 1, 2, and 3 cut out, quick action should be obtained with the remainder of the brakes by an emergency reduction, and the time, from the movement of the brake-valve handle to emergency position to obtain 45 and 55 pounds cylinder pressure on the one-hundredth brake, should not be increased more than one second over that required to obtain the same pressures with all brakes cut in.

This test should be repeated with groups of three brakes cut out, consisting of Nos. 2-3-4, 3-4-5, 4-5-6, and 5-6-7, and the time from the movement of the brake-valve handle to emergency position to obtain 45 and 55 pounds cylinder pressure in the one-hundredth brake should be the same as with all brakes cut in.

These tests will also be made with piston travel of 4 inches.

No. 6.—Holding Tests

Section A.—(Following a service application.) The 100 brakes will be applied, admitting, as nearly as may be, 15 pounds into the cylinder of the first brake. Record of pressures in the auxiliary reservoirs and cylinders will be taken at all record points as follows: First, at completion of application; second, in 5 minutes; third, in 10 minutes; and fourth, in 15 minutes.

In this test any increase of brake-cylinder pressure should be in proportion to the reduction in brake-pipe pressure due to leakage.

Section B.—(Following a quick-action application.) The 100 brakes will be applied in quick action by placing the brake-valve handle in emergency position, where it will be left until completion of test, for the purpose of insuring the discharge of all brake-pipe pressure. Record of pressures in auxiliary reservoirs and cylinders will be taken at all record points as follows: First, at completion of application; second, in 5 minutes; third, in 10 minutes; and fourth, in 15 minutes.

The results of this test must not indicate an excessive amount of back leakage into brake pipe.

No. 7.—Release Tests

Section A.—(Release time.) The 100 brakes shall be applied with an 18-pound service reduction of brake-pipe pressure and brake valve, then placed in release position. Time will be taken from the movement of the brake valve into release position until pressure is reduced to 5 pounds in the cylinder of the first brake.

The pressure in the cylinder of the first brake should not reduce to 5 pounds in less than 18 seconds nor more than 25 seconds.

NOTE.—Main reservoir pressure must be 110 pounds at time of release.

AMERICAN RAILWAY ENGINEERING AS- SOCIATION, WATER SERVICE AND SAN- ITATION, 1929 MANUAL OF THE ASSO- CIATION

HYDRANTS AND VALVES

(The 1916 specifications for hydrants and valves of the American Water Works Association have been adopted by this association and reprinted in its manual. For text of specifications see A. W. W. A. below.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARBON-STEEL CASTINGS FOR VALVES, FLANGES, AND FITTINGS FOR HIGH-TEMPERATURE SERVICE, DESIGNATION A95-29, 1929

CASTINGS FOR HIGH TEMPERATURES

(See 611.41, p. 709.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR GRAY-IRON CASTINGS FOR VALVES, FLANGES, AND PIPE FITTINGS, DESIGNATION A126-30, 1930

GRAY-IRON CASTINGS

(See 611.11, p. 637.)

AMERICAN WATER WORKS ASSOCIATION, STANDARD SPECIFICATIONS FOR HYDRANTS AND VALVES, JUNE 9, 1916

HYDRANTS

1. *Size.*—The size of hydrant shall be designated by nominal diameter of the valve opening, which must be at least 4 inches for hydrants having two 2½-inch hose nozzles; 5 inches for hydrants having three 2½-inch nozzles; and 6 inches for hydrants having four 2½-inch nozzles; and shall be classed as 1-way, 2-way, 3-way, or 4-way, etc., according to the number of 2½-inch hose outlets for which they are designed.

The net area of the hydrant at the smallest part, when the valve is wide open, must not be less than 120 per cent that of the valve opening.

All hydrants must be fitted with bell ends to fit standard cast-iron pipe, or if flanged they must be fitted with flanges of the standard dimensions corresponding to the pressure under which they are to be used; connecting pipe or flange from main to hydrant in no case to be less in diameter than the valve opening. (The standards referred to are those adopted or that may be adopted by this association.)

2. *General design.*—(These design requirements are substantially the same as those of the Associated Factory Mutual Fire Insurance Companies' specifications for hydrants (see below, sec. 38 of A. F. M. F. I. C. specifications) with the following exceptions:)

With a 5-foot hydrant discharging 250 gallons per minute through each 2½-inch outlet, the total friction loss of the hydrant must not exceed 2 pounds for 2-way, 3 pounds for 3-way, and 4 pounds for 4-way hydrants.

Hydrants must be so designed, particularly as regards the pitch of the thread of the operating stem, so that when properly operated, the water hammer will not be caused which will give an increased pressure to exceed the working pressure when such pressure is over 60 pounds, nor increase the pressure more than 60 pounds when operated under less working pressure than 60 pounds.

(The A. W. W. A. specification contains no safety factor requirement on design for pressure as is given in the A. F. M. F. I. C. specification.)

3. *Material.*—(This specification contains the same requirements for material as given in the A. F. M. F. I. C. specification for hydrants given below, secs. 39 and 40, with the following exceptions. This specification requires that the cast iron have a tensile strength of 22,000 pounds

per square inch instead of 21,000; that the specimen bars be loaded with 2,200 pounds and show a deflection of not less than 0.35 inch instead of the A. F. M. F. I. C. values of 1,900 and 0.30, respectively; and that wrought iron have a tensile strength of 45,000 pounds per square inch instead of 48,000. Under composition metal the A. W. W. A. specification contains no requirements on elongation and no special strength requirements for inside hose valve stems.)

4. *Hose nipples and valves.*—Hose nipples must be of bronze or suitable noncorrodible metal, either threaded with a fine thread into the hydrants and securely pinned in place or carefully locked and calked in place.

Hose threads on all hydrants to be installed in any given community must of necessity be interchangeable with those already in service, but where practicable threads should conform to the national standard.

5. *Hydrant seat and gate.*—(This section is the same as the requirements under hydrant valve, sec. 42, of the A. F. M. F. I. C. specification for hydrants given below.)

6. *Drip valve.*—(Requirements the same as in A. F. M. F. I. C. specification given below, sec. 43.)

7. *Operating parts.*—The operating threads of the hydrant must be so arranged as to do away with the working of any iron or steel. Either the operating screw or the operating nut must be made of non-corrodible metal and must be sufficiently strong to perform the work for which it is intended.

(The requirements for top nut are the same as in A. F. M. F. I. C. specifications below.)

8. *Stuffing box and gland.*—

9. *Hydrant top.*—

10. *Hose cap.*—

12. *Testing.*—

(The above four sections are the same as the equivalent sections in the A. F. M. F. I. C. specifications for hydrants given below except for the size of the lettering on hydrant tops which is required by A. W. W. A. to be one-half inch high and one-eighth inch in relief.)

11. *Markings.*—The hydrant must be marked with the name or particular mark of the manufacturer. All letters and figures must be cast on the hydrant barrel above the ground line.

VALVES

Castings.—(Requirements on general quality of castings and on dimensions and testing of test bars of cast iron are substantially the same as given in the specifications of the Associated Factory Mutual Fire Insurance Companies for outside-screw-and-yoke valves, par. 3, b, below, with the following exceptions. This specification requires that the cast iron have a tensile strength of 22,000 pounds per square inch instead of 21,000, and that the specimen bars be loaded with 2,200 pounds and show a deflection of not less than 0.35 inch instead of the A. F. M. F. I. C. values of 1,900 and 0.30, respectively.)

Name.—Each valve shall have the maker's name cast upon it.

Wrought iron.—All wrought iron used shall be of the best quality or refined iron of a tensile strength of at least 45,000 pounds per square inch.

Composition metals.—All composition metals to be of the best quality, and except for stems, to have a tensile strength of not less than 30,000 pounds per square inch, with 5 per cent elongation in eight diameters and 5 per cent reduction of area at breaking point.

Face joints.—All joints shall be faced true and smooth so as to make a perfectly water-tight joint when suitable gaskets are used.

Fitting and interchangeable parts.—The fitting of all parts must be such as to make perfect joints and all parts of the valves of the same make and the same size shall be interchangeable. Valves to open as specified by the engineer.

Bolts and nuts.—All bolts and nuts in valves to be made from the best quality of double refined wrought iron or steel. Heads, nuts, and threads are to be of standard size.

Kind of valves.—Valves shall be fully mounted with bronze or suitable noncorrodible metal, and be either of the double disk or made-up gate type with bronze or suitable noncorrodible metal mounted wedging devices or have wedge-shaped gates with double faces and seats, designed to work equally well with pressure on either side of the gate. The gates (or disks) shall be of cast iron with bronze or suitable noncorrodible metal faces. These faces shall be machined, dovetailed, and driven into corresponding machined grooves in gates (or disks) or riveted on with bronze or suitable noncorrodible metal rivets. The seats for composition rings in body of valve shall be turned and threaded before rings are screwed in.

Seat and gate rings.—Both seat rings and gate (or disk) rings shall have smooth and true faces and make a perfectly water-tight joint. Valves shall have hub ends suitable for laying with classes B and C of American Water Works Association standard pipe. All valves 24 inches in diameter and larger shall be geared.

By-passes.—Where by-passes are required they shall, unless otherwise specified, be of the following sizes:

Size of valve	By-pass	Size of valve	By-pass
Inches	Inches	Inches	Inches
16	3	30	4
18	3	36	6
20	3	42	6
24	4	48	8

Weight.—Valves without by-passes shall be approximately not less than the following weights for the respective sizes:

Size of valve	Weight	Size of valve	Weight
Inches	Pounds	Inches	Pounds
3	67	18	1,290
4	85	20	1,700
6	180	24	2,750
8	255	30	5,200
10	400	36	8,500
12	500	42	12,000
14	780	48	18,000
16	900		

Valve stems.—Valve stems shall be made of solid brass or suitable noncorrodible metal, free from defects, and shall have a tensile strength of not less than 45,000 pounds per square inch.

Threads on the stems are to be square, acme, or 1/2V, and cut in most perfect manner, so as to work true and smooth and in perfect line throughout the lift of the valve.

Valve stems at the bottom or base of the thread shall not be less than the following sizes in diameter:

Size of valve	Diameter stem	Size of valve	Diameter stem
Inches	Inches	Inches	Inches
3	4 ⁵ / ₁₆	14	11 ³ / ₁₆
4	5 ⁵ / ₁₆	16	12 ³ / ₁₆
5	5 ⁵ / ₁₆	18	12 ³ / ₁₆
6	1	20	14 ⁵ / ₁₆
7	1	22	14 ⁵ / ₁₆
8	1	24	16 ³ / ₁₆
9	1 ³ / ₁₆	30	21 ³ / ₁₆
10	1 ³ / ₁₆	36	23 ³ / ₁₆
12	1 ¹ / ₂	42	24 ³ / ₁₆
		48	32 ³ / ₁₆

The wrench nut on stem shall be 2 inches square with arrow cast on showing direction which valve is to turn to open.

Painting.—All iron work, after being thoroughly cleaned, to be painted throughout with asphaltum varnish, or suitable paint, or dipped in suitable coating material.

Testing.—Valves must be tested for leakage and distortion as follows: On double disk or made-up gate type, the body of the valve shall be drilled and tapped with a hole for pipe and a removable plug inserted, through this hole a hydraulic pressure of 300 pounds per square inch shall be applied; the wedge-shaped gate type by an hydraulic pressure of 300 pounds per square inch applied, first between one end and the gate, second between the opposite end and the gate, and third in the bonnet with gate open.

ASSOCIATED FACTORY MUTUAL FIRE INSURANCE COMPANIES, RUBBER FACINGS FOR DRY PIPE VALVES AND CHECK VALVES, 1923

VALVE FACINGS

SERVICE REQUIREMENTS

1. Rubber must not adhere to metal seat rings.
2. Rubber must be tough to withstand cutting and abrasion.

CHEMICAL TESTS

1. **Gum.**—The facings shall be made from a compound containing not less than 40 per cent of washed and dried fine Para rubber or its equivalent and shall have all the characteristics of such a compound. They must not contain any kind of rubber substitute, old vulcanized or reclaimed rubber, or any substance injurious to rubber.

2. **Acetone extract.**—The organic acetone extract shall not exceed 5 per cent of the gum as found by chemical analysis.

3. **Free sulphur.**—The free sulphur shall not exceed 3 per cent of the gum as found by chemical analysis.

4. **Alcoholic potash ether extract.**—The saponifiable matter extracted by alcoholic potash after the acetone extraction has been made shall not exceed 3 per cent of the gum as found by chemical analysis.

5. *Total sulphur.*—The total sulphur, exclusive of that which may be contained in the mineral matter as barytes, shall not exceed 10 per cent of the gum as found by chemical analysis.

PHYSICAL TESTS

All physical tests shall be performed upon samples one-half inch wide cut from the facings.

(The physical tests include plasticity on a sheet or section one-eighth inch thick, tensile strength not less than 1,800, and elongation at a uniform rate of 20 inches per minute.)

MARKING

The facings must be molded with the name of the manufacturer, the year of manufacture, and the identification mark in 1/4-inch letters raised on a depressed surface on one side of the facing and so placed that no portion of them shall extend more than three-eighths inch from the inside edge.

NOTE.—Manufacturers in submitting samples for approval should submit one facing and a test sheet one-eighth inch thick. The test sheet should be at least 7 by 6 inches, from which test pieces for tensile-strength and permanent-set determinations may be cut.

ASSOCIATED FACTORY MUTUAL FIRE INSURANCE COMPANIES, VALVES, INDICATOR POSTS, AND HYDRANTS, JANUARY, 1930

OUTSIDE-SCREW-AND-YOKE VALVES

1. *Size.*—(a) The following will be recognized as standard sizes in fire protection work: 3/4, 1, 1 1/4, 1 1/2, 2, 2 1/2, 3, 3 1/2, 4, 5, 6, 7, 8, 10, 12, and 14 inches.

Larger sizes may occasionally be required, and the smaller ones of this type will probably have only limited use.

(b) Any given size of gate valve shall, when wide open, give an unobstructed waterway the nominal size of the pipe.

2. *Type.*—(a) Shall be of the straightway type. Either solid or split wedge or built-up parallel seat gate is acceptable.

(b) Valves shall be designed to withstand safely a working pressure of 150 pounds, with a factor of safety of at least 5 at the working pressure, for sizes less than 8 inches, and of at least 4 for sizes 8 inches and larger. Where the working pressure is greater than 150 pounds a heavier valve shall be used.

For example, a valve less than 8 inches in size whose working pressure is 150 pounds shall resist a pressure of 750 pounds before breaking and valves 8 inches or larger designed for the same pressure shall resist a pressure of 600 pounds. This test shall not be made in a press.

In the average protective equipment it is expected that in time of fire about 100 pounds will be carried, this pressure coming from pumps if gravity supplies do not furnish it. When pumps are running, this pressure is likely to be increased somewhat, and it is always desirable to have some margin; therefore, it is required that the apparatus withstand a somewhat higher working pressure and 150 pounds is specified, as this standard practice.

Manufacturers shall determine that valves will withstand the high-pressure tests before submitting samples for approval. Valves so tested may have been dangerously stressed, and therefore should be destroyed, submitting for approval only untested samples.

3. *Body and bonnet.*—(a) The body and bonnet of valves 2 inches and smaller shall be made of bronze or other suitable noncorrodible metal.

(b) For larger sizes the body and bonnet shall be made of cast iron or some other hard, close metal so distributed as to insure sound castings and freedom from shrink cracks.

The metal for all iron castings must be of good quality and of such character as shall make the metal strong, tough, and of even grain, and soft

enough satisfactorily to admit of drilling and machining. The metal must be made without any admixture of cinder iron or other inferior metal, and must be remelted in a cupola or air furnace. The castings must be smooth, free from scale, lumps, blisters, sand holes, and defects of every nature which unfit them for the use for which they are intended. No plugging or filling will be allowed.

Specimen bars of the metal used, each being 26 inches long by 2 inches wide and 1 inch thick must be made without charge as often as the inspection department may direct, and in default of definite instructions, the manufacturer must make and test at least one bar from each heat or run of metal. The bars when placed flatwise upon supports 24 inches apart, and loaded in the center, must support a load of 1,900 pounds, and show a deflection of not less than 0.30 of an inch before breaking; or if preferred, tensile bars may be made which must show a breaking point of not less than 21,000 pounds per square inch, bars to be cast as nearly as possible to the dimensions without finishing, but corrections may be made by the inspection department for variations in width and thickness, and the corrected result must conform to the requirements.

For floor-controlling valves a 1/4-inch drain outlet may be provided in the valve body, the nipple to be tapped into a boss cast on body.

(c) The guides shall be cast integral with the body and shall be of unequal width if the gate can not be safely reversed.

All valves with built-up gates and the best solid wedge gates are reversible. In a few designs, however, the gates are not reversible, and the guides shall be of unequal width to prevent assembling the valve with the gate in the wrong position.

TABLE 1

[150 pounds per square inch]

Size of pipe	Diameter of flange	Flange thickness at edge	Diameter of bolt circle	Number of bolts	Size of bolts
<i>Inches</i> 3/4	<i>Inches</i> 3 1/2	<i>Inch</i> 1 1/2	<i>Inches</i> 2 1/2	4	3/8
1	4	3/8	3	4	7/16
1 1/4	4 1/2	1 3/8	3 3/4	4	7/16
1 1/2	5	7/16	3 3/8	4	1/2
2	6	1/2	4 3/4	4	5/8

(For 2 1/2-inch size and larger refer to A. S. M. E. standard for cast-iron pipe flanges and flanged fittings, serial B16a-1928, Table No. 2. See 607.14, p. 385.)

(d) Valves may have threaded, flanged, or bell ends.

Flanges are preferred to screw ends for sizes 3 1/2 inches and larger, as the valves can be more readily removed for repairs.

(e) Valves with threaded ends shall have American standard threads. (See United States Government National Screw Thread Commission, 607.0, p. 365.)

(f) For flanges the standard sizes and bolt layouts shall be used as per Table 1. Where working pressure is from 151 to 250 pounds, the standard for heavy flanges shall be used as per Table 2. Holes are not to be drilled on the center line, but symmetrically each side of it.

(g) Bell ends shall fit American Water Works Association standard pipe. (For dimensions, see A. W. W. A. under 607.12, p. 379.)

TABLE 2

(250 pounds per square inch)

Size of pipe	Diameter of flange	Flange thickness at edge	Diameter of bolt circle	Number of bolts	Size of bolts
Inches ¾	Inches 4	Inch ¼	Inches 2½	4	Inch ½
1	4½	½	3¼	4	½
1¼	5	¾	3¾	4	½
1½	6	¾	4½	4	¾
2	6½	¾	5	4	¾

(For 2½-inch size and larger refer to A. S. M. E. standard for cast-iron pipe flanges and flanged fittings, serial B16a-1928, Table No. 2. See 607.14, p. 385.)

(h) The body and bonnet shall be bolted together in 2½-inch valves and larger and the bolting of the bonnet shall be of such strength that the maximum stress at the bottom of the screw threads will not exceed 7,500 pounds per square inch for a water pressure of 150 pounds per square inch computed on an area out to center line of bolts.

(i) The yoke shall be of such proportions and secured to the bonnet in such a manner that it will be as strong relatively as other parts of the valve. The yoke shall be bolted on in valves larger than 4 inches. The design shall be such that the hand can

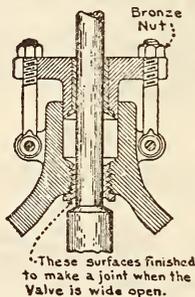

FIGURE 304

not be jammed between the yoke and the handwheel.

(j) Bolts, cap screws, or studs for attaching the yoke to the bonnet shall be at least one-half inch in diameter on valves larger than 4 inches.

Through bolts are preferred, as they are more readily replaced if broken off.

(k) Valves shall be plainly marked with the name or trade-mark of the manufacturer, the size of the valve, the year of manufacture, and the pressure for which it is designed. Valves designed for 125 pounds steam pressure shall be considered acceptable for 150 pounds working water pressure. Some identification mark satisfactory to the underwriters having jurisdiction shall be used only on approved valves so that these may be readily distinguished from those that are not approved. All letters and figures shall be placed upon the body or bonnet of the valve. They may be arranged part on body and part on bonnet if desired, with the exception that on iron valves the identification mark must be placed on the bonnet. The marking shall be easily readable and as large as possible, except that in no case need the letters or figures be higher than 1 inch, or raised more than one-eighth inch on the casting. Engraved letters may be used on bronze valves.

In Factory Mutual work this identification mark must consist of the letters FM between two triangles as follows: ◀FM▶

4. Gates.—(a) The gates for valves 2 inches and smaller shall be entirely of bronze or other suitable

noncorrodible material. For larger sizes they may be of cast iron fitted with bronze rings.

(b) The surface of the iron gate inclosed by the bronze ring shall be so constructed as to clear the seat ring in all positions. The central part of the bronze gates larger than 1 inch shall be recessed.

(c) In built-up iron gates at least one wedge surface shall be of bronze or bronze mounted; the other may be of cast iron if the wedge parts fit loosely in the gate, and if not both shall be made of bronze or bronze mounted. In built-up gates for iron-bodied valves, guides or links must be provided to prevent the brass gate rings rubbing on the cast-iron body or bonnet during operation.

Experience has shown that bronze and cast iron work well together as wedge surfaces and do not cause trouble by rusting of the iron. Separate gate parts made of cast iron are liable to rust and become cemented together if not fitted loosely. Bronze is therefore required where close fitting is necessary.

5. Gate and seat rings.—(a) All iron bodies shall be fitted with bronze seat rings.

(b) All gate and seat rings shall have machined faces.

(c) The rings shall be held in place by a screw thread or by cold swaging, the former being preferred.

6. Stem.—(a) Stems shall be made of rolled bronze having a tensile strength of not less than 32,000 pounds per square inch, and preferably not less than 50,000 pounds.

(b) The threads shall be acme, modified acme, half V, or square.

An acme standard thread is preferred. (For thread see United States Government National Screw Thread Commission., under 608.0, p. 529.)

(c) The stem and attached parts shall be so designed that all parts shall be equally strong. The connection between the stem and the gate shall be so made that they can not separate in use, and so that the stem will not be cramped when the gate seats.

(d) Valves 2½ inches and larger shall be so designed that when operated under severe conditions, such as forcing the gate against its seat, no part will break or the stem cripple before the failure of the yoke cap or stem nut.

It is of special importance that the stem be reliably connected to the gate, as any failure at this point would make it impossible to open the valve.]

(e) The twisting moment in foot-pounds required on the handwheel to produce this failure shall not be less than that given in the following table:

Size of valve (inches)-----	2½	3	3½	4	5	6	7	8	10	12	14
Foot-pounds-----	150	150	200	250	300	300	400	400	600	900	900

(f) The stem nut shall be of bronze.

(g) For valves 5 inches and larger a bronze washer shall be provided between the yoke and the handwheel, unless the design of the stem nut is such that the yoke and handwheel do not come in contact.

(h) The stem shall be so constructed as to make a joint with the underside of the bushing at the stem opening in the bonnet when the gate is wide open. (See fig. 304.)

This is required in order that the valve may be repacked with water on.

An acceptable construction is to provide a tightly fitted tapered collar on the stem.

In bronze-body valves, 2 inches and smaller, the required joint may be obtained by machining the underside of the bonnet at the stem opening.

(i) The diameters of the unthreaded sections of the stems and of the outside of the threads shall not be less than those given in the following table:

Size of valve (inches).....	¾	1	1¼	1½	2	2½	3	3½	4	5	6	7	8	10	12	14
Diameter of stem, working pressure not over 150 pounds (inches).....	⅜	⅜	½	½	⅝	¾	¾	¾	1	1½	1½	1¾	1¾	1¾	1¾	1¾
Diameter of stem, working pressure 151 to 250 pounds (inches).....	½	½	⅝	⅝	¾	¾	1	1	1½	1½	1¾	1¾	1¾	1¾	1¾	1¾

7. *Stuffing box.*—(a) The width of the stuffing boxes between stem and inner wall shall not be less than that given in the following table:

Size of valve (inches).....	¾	1	1¼	1½	2	2½	3	3½	4	5	6	7	8	10	12	14
Width (inch).....	½	½	⅝	⅝	¾	¾	¾	¾	1	1	1½	1½	1¾	1¾	1¾	1¾

The depth of stuffing box shall be four times the width of the packing space.

The stuffing boxes shall be fully packed with a good packing such as long-fiber hemp saturated in hot tallow or a woven nonmetallic packing.

(b) With cast-iron valves, the opening through the bonnet for the stem shall be bushed with bronze, finished on the underside to make a joint with the stem when the gate is wide open, and the follower or gland shall be either of bronze or bushed with bronze. The bottom of the stuffing box and the end of the gland should be beveled, as per Figure 304.

The construction shown in the sketch is satisfactory, and any other method of bushing equivalent to this will be acceptable.

(c) The gland shall be retained by bolts or studs and the diameters in 2½-inch valves and larger shall not be less than those given in the following table:

Size of valves (inches).....	2½	3-4	5-14
Diameter gland bolts (inch).....	⅝	½	⅝

(d) Gland bolts or studs may be of bronze, iron, or steel. The nuts shall always be of bronze.

With bronze nuts such slight rusting of the iron bolts as is liable to occur will not cause the nuts to stick, as might be the case if iron nuts were used. Through bolts are preferred and T bolts may be used if desired.

8. *Handwheel.*—(a) The handwheel shall be designed so as to furnish a ready grasp for the hands.

(b) Assuming the observer to be looking at the top of the handwheel, then the handwheel shall be turned counterclockwise to open.

(c) An arrow showing the direction to turn the handwheel to open the valve, with the word "OPEN" at the feather end, or in a break in the shaft, shall be cast on the rim of the handwheel, so as to be easily readable.

(d) On valves 2½ inches and smaller the arrow shall be 1¼ inches long, on valves 3 inches to 5 inches the arrow shall be 2½ inches long, and on valves 6 inches and over the arrow shall be 4 inches long. If the shaft is broken to admit the word "OPEN" the sum of the parts of the arrow shall be at least three-fourths as long as specified for the unbroken arrow.

(e) The outside diameters of the handwheels shall be not less than those given in the following table:

Size of valve (inches)....	¾	1	1¼	1½	2	2½	3	3½	4	5	6	7	8	10	12	14
Diameter of handwheel (inches).....	3	3	4	4	4	5	7	8	10	10	12	12	14	16	16	18

9. *Tests.*—(a) All valves shall be tested to twice the working pressure for leakage and distortion before leaving the factory: First, between one end and the gate; second, between the opposite end and the gate; third, in the bonnet with the gate open.

(b) Valves shall occasionally be taken at random from the regular output and tested by removing all of the packing from the stuffing box, opening the gate wide, applying the working pressure and noting the leakage through the stuffing box.

Valves will be considered as passing the tests specified if they show no leakage through body or bonnet, no distortion, and only a slight weeping past the gates and through the stuffing boxes.

INSIDE-SCREW VALVES

FOR UNDERGROUND WORK

10. *Size.*—The following will be recognized as standard sizes in fire-protection work: 4, 6, 8, 10, 12, and 14 inches.

Larger sizes may occasionally be required, in which case they should be designed to conform to these specifications as far as they apply.

11. *General construction.*—(a) Shall conform to the specifications for outside-screw-and-yoke valves as

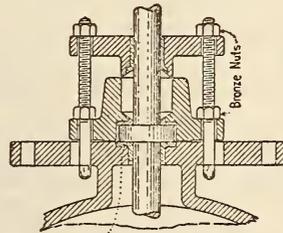

FIGURE 305

far as they apply as given above under sections 1 (b); 2 (a) and (b); 3 (b), (c), (d), (f), (g), (h), and (k); 4 (a), (b), and (c); 5 (a), (b), and (c); 6 (b), (c), (f), and (i); 7 (a), (c), and (d); 9 (a) and (b).

(b) Stem shall be of bronze having a tensile strength of not less than 32,000 pounds per square inch and preferably not less than 50,000 pounds.

(c) The threaded stem nut shall be either a solid bronze casting or else bronze cast into a cast-iron member.

(d) When valve is closed the stem shall enter the stem nut a distance equal to at least one and one-fourth times the outside diameter of the stem.

(e) The bearing of the stem collar on the bonnet bushing shall be finished to make a joint when the gate is wide open, thereby allowing the valve to be repacked with water on. (See fig. 305.)

(f) The diagonal of the base of the square tapered end of the stem on which the wrench nut fits shall be at least equal to the diameter of the stem.

(g) The valve shall be so designed that when operated under severe conditions, such as forcing the gate against its seat, no part will break before the stem fails.

(h) The twisting moment in foot-pounds required on the wrench nut to cause the stem to fail shall not be less than that given in the following table:

Size of valve (inches).....	4	6	8	10	12	14
Foot-pounds.....	200	300	400	600	900	900

The twisting moment at which failure occurs is the highest value obtained previous to the first halt or decrease in force required.

(i) The wrench nut shall be 1⁵/₁₆ inches square at the top, 2 inches square at the base, and 1³/₄ inches high, with a flange base upon which shall be

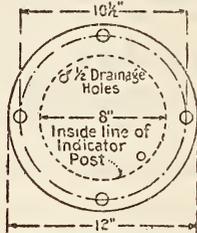

FIGURE 306

cast an arrow at least 2 inches long showing the direction of opening and the word "OPEN" in distinct letters at least 1/2 inch high.

(j) The lower part of the stuffing box and opening through the bonnet for the stem shall be bushed with bronze, and the follower or gland must be either of bronze or bronze bushed. The bottom of the stuffing box and the end of the gland should be beveled as per Figure 305.

The construction shown in the sketch is satisfactory, and any method of bushing equivalent to this will be acceptable.

12. *Indicator post flange.*—(a) All valves for indicator posts shall have a flange cast on the bonnet. For valves larger than 4 inches the flange shall be circular or square, of dimensions shown in Figure 306. The flange shall be at least five-eighths inch thick and be drilled for four 5/8-inch bolts. For smaller valves a smaller flange may be cast on bonnet, and an annular flange of standard dimensions bolted to it.

(b) At least two holes one-half inch diameter shall be provided in the flange for drainage of the post.

13. *Direction of opening.*—(a) To open counter-clockwise as specified for outside-screw-and-yoke valves, except where existing underground valves in the equipment open to the right, in which case the new valves should turn the same as the old ones for uniformity.

STRAIGHTWAY HOSE VALVES

15. *Size.*—The size of valves for use on fire pumps and hydrants is 2 1/2 inches, and for standpipes 1, 1 1/4, 1 1/2, 2, and 2 1/2 inches.

16. *General construction.*—(a) Shall conform to the specifications given above, as far as they apply, as given in the following sections: 1 (b); 2 (a) and (b); 3 (a), (c), (d), (e), (f), (h), and (k); 4 (a) and (b); 5 (a), (b), and (c); 6 (b), (c), (f), and (i); 8 (a), (b), (c), (d), and (e); 9 (a) and 11 (b), (d), and (f).

Item 3, h does not apply to valves having bonnets screwed to body.

(b) Valves for use on fire pumps and standpipes shall be made entirely of bronze or other suitable noncorrodible metal, with the exception of the hand-

wheel. In this type of valve the bonnet may be threaded to the body.

(c) The bodies and bonnets of valves for use on hydrants may be made of cast iron bolted together following the requirements of 3, h. The remainder of the valve with the exception of the handwheel should be of bronze.

(d) In pump and standpipe valves the guides shall be of unequal width so that the gate can not be reversed unless the design and construction are such that when gate is reversed the valve will be tight.

In hydrant valves a single-faced gate may be used.

(e) Pump and standpipe valves shall be fitted at inlet end with "American standard" female pipe thread. (See United States Government National Screw Thread Commission, 607.0, p. 365.)

Hydrant valves shall be designed for attachment to the hydrant barrel by two 3/4-inch tap bolts spaced horizontally 5 3/8 inches on centers.

(f) The stuffing box shall be of sufficient size to contain at least four rings of packing 1/8 inch square for 1-inch valves and 3/16 inch square for the other sizes. A follower nut may be used to retain the gland.

(g) In cast-iron valves the entire stuffing box shall be of bronze and the opening through the bonnet shall be bronze bushed.

17. *Hose nipples.*—(a) Nipples shall be of bronze cast in one piece with the body of bronze valves, and in cast-iron valves they shall be threaded into the body and pinned. A boss shall be provided in bronze valves at the bottom which may be tapped for a 1/8-inch petcock.

(b) Hose threads for 2 1/2-inch valves must of necessity be interchangeable with those already existing in the city in each case, but where practicable and not otherwise specified shall conform to the national American standard adopted by the National Fire Protection Association. The essential features of the national American standard thread are a 60° V thread, outside diameter on male threads of 3 3/16 inches, and 7 1/2 threads per inch.

18. *Hose caps.*—(a) Hose caps are not necessary with pump and standpipe valves, but shall be provided on hydrant valves. The caps may be of cast iron.

(b) They shall be securely fastened to the hydrant body with a suitable chain made of stock not less than one-eighth inch diameter.

(c) A leather, rubber, or lead washer shall be provided in the hose cap set in a groove to prevent its falling out when the cap is removed.

(d) The hose cap nut shall be of the same size and shape as the stem nut of the hydrant.

ANGLE HOSE VALVES

19. *Size.*—The sizes of valves for use on standpipes are 1, 1 1/4, 1 1/2, 2, and 2 1/2 inches.

20. *General construction.*—(a) Shall conform to the specifications given above, as far as they apply, as given in the following sections: 2 (b); 3 (d), (e), and (k); 6 (a), (b), (c), and (i); 8 (a), (b), (c), (d), and (e); 9 (a) and (b); 11 (e); 16 (b), (e), (f); 17 (a) and (b); and 18 (a).

(b) Valves shall have outlet at right angles to inlet.

(c) The seat shall not extend into the valve beyond line of near side of hose nipple.

(d) The width of the seat (A, fig. 307) shall be that given in the following table:

Size of valve (inches).....	1	1 1/4	1 1/2	2	2 1/2
Width of seat (inch).....	1/8	1/8	3/16	7/32	1/4

21. *Disk*.—(a) The lift of the disk shall be at least that given in the following table:

Size of valve (inches).....	1	1¼	1½	2	2½
Lift of disk (inches).....	¾	⅞	1	1⅝	1¾

(b) The disk holder shall be free to turn on the stem.

This is necessary in order that the disk may find its seat without any rotary motion that would be liable to injure its face.

(c) When a lock nut is used to secure the disk holder to the stem it shall be pinned to the disk holder.

(d) The disk holder shall contain a suitable non-metallic material having the same dimensions as the

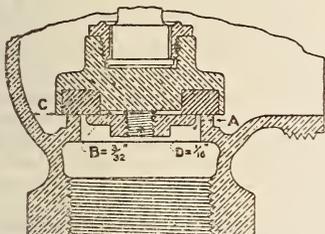

FIGURE 307

standard Jenkins disk (see Table 4), firmly secured and so arranged that it can be easily replaced. The disk holder shall extend over the outside edge of the disk until its edge is flush with the face of the disk. In order to prevent distortion, the support for the inside edge of the disk should extend to within three thirty-seconds inch of its face (B, fig. 307).

TABLE 4

Size of valve	Outside diameter	Inside diameter	Thickness
<i>Inches</i> 1	<i>Inches</i> 12⅝ ₄	<i>Inches</i> ¾ by ⅝	<i>Inch</i> 9 ₃₂
1¼	15⅞	1⅝ ₁₆ by 25 ₃₂	11 ₃₂
1½	2	1¼ by 1⅝ ₃₂	13 ₃₂
2	219 ₃₂	119 ₃₂ by 119 ₃₂	3 ₈
2½	313 ₆₄	233 ₃₂ by 131 ₃₂	15 ₃₂

(e) The disk nut or clamping ring shall be pinned in place.

(f) The clearance (C, fig. 307) between the edge of the disk holder and the inside of the body shall not be less than that given in the following table:

Size of valve (inches).....	1	1¼	1½	2	2½
Clearance between disk and body (inch).....	⅛	3 ₁₆	3 ₁₆	¼	¼

(g) The clearance (D, fig. 307) between the inside of the seat and the disk nut or clamping ring shall be one-sixteenth inch.

SWING CHECK VALVES

REGULAR TYPE

22. *General construction*.—(a) Shall conform to the specifications given above, as far as they apply, as given in the following sections: 1 (a) and (b); 2

(b); 3 (a), (b), (d), (e), (f), (g), (h), and (k); 4 (a) and (b); and 5 (a) and (b).

The more important items of the specifications as applied to a valve are shown in Figure 308.

(b) Iron-body check valves when wide open shall have a waterway equal to the area of the pipe to permit the passing of large foreign bodies, and the toe of the clapper shall be free to raise above the waterway. In bronze valves the toe of the clapper shall raise at least as high as the upper edge of the seat opening. The body shall be as smooth inside as good foundry practice will permit and of such form as to minimize the danger of the clapper be-

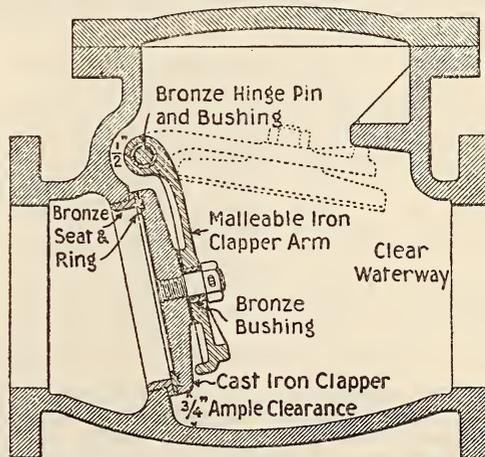

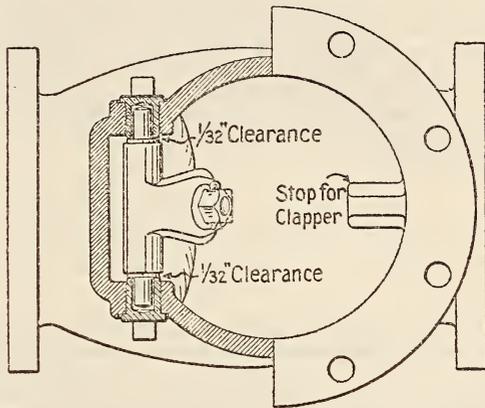

FIGURE 308.—*Swing check valve*

coming wedged when open and the chances of sediment lodging against the seat ring.

(c) The seat, clapper, and arm shall be so arranged that the clapper will close by gravity.

(d) The seat ring shall be screwed in position in iron-bodied valves.

(e) All working parts shall be removable through the bonnet opening.

23. *Clapper and clapper arm*.—(a) The clapper shall be of bronze for valves 2 inches and smaller. For larger valves it may be of cast iron, in which case it shall be provided with a bronze ring or a facing of leather or rubber.

(b) The facing for valves larger than 2 inches shall be protected for two-thirds of its thickness at its outer edge and clamped at least one-half inch at

its inner edge. It shall be wide enough to overhang the seat at least one-eighth inch on the outside, one-fourth inch on the inside, and shall be backed up its full width by a finished surface on the clapper. The clamping ring shall be of bronze. It shall be turned concentric with clapper stud and come to a stop against a shoulder to prevent clamping too tightly.

(c) The clapper of valves 2 inches and smaller may be faced with a suitable nonmetallic material having the same dimensions as the standard Jenkins disk (see Table 4) firmly attached, but so that it can be readily replaced. It shall be protected for two-thirds its thickness at its outer edge and its inner edge shall be supported for a distance equal to three thirty-seconds inch less than its thickness to prevent distortion. The clearance between the inside of the seat and the clamping ring shall be one-sixteenth inch. The clamping ring shall be turned concentric with the clapper stud. The width of the seat for use with the above facing shall be that given in the following table:

Size of valve (inches).....	¾	1	1¼	1½	2
Width of seat (inch).....	⅜	½	⅝	¾	⅞

(d) The clapper shall be secured to its arm by means of a bronze connection in such a manner that the parts can not separate in use, and so that there can be no leakage at this point. Sufficient play shall be allowed so that the clapper will find its seat properly.

(e) The diameter of the flat bearing between clapper and arm and the length of the bearing of the clapper stud in the arm must be not less than as follows:

Size of valve	Diameter of flat	Length of bearing
<i>Inches</i>	<i>Inches</i>	<i>Inch</i>
2½	1¼	⅝
3	1¼	⅝
3½	1½	¾
4	2	¾
5	2¼	¾
6	2½	¾
7	2¾	¾
8	3	¾
10	3½	1¼
12	4	¾

(f) The clapper arm for valves 2 inches and smaller shall be bronze. For larger valves it may be of malleable iron, bronze bushed where the hinge pin and clapper stud pass through. The bushing for the hinge shall project one-eighth inch beyond the iron, or the side plug shall extend inside the body a like amount. All bushings shall be a tight fit.

(g) The clapper arm shall extend beyond the center of the clapper to a point near the rim in order to form a stop which will prevent the clapper tipping and catching under the seat ring in case the connection between the clapper and arm becomes badly worn.

(h) When the clapper is wide open the clapper arm shall bear on a definite stop. If this stop is on the cover, the latter shall be so designed that it will be impossible to assemble it incorrectly. The point of contact shall be located so that the reaction of the water will not tend to twist or bend the parts.

A stronger and mechanically better valve is obtained when the clapper arm and not the clapper comes against the stop. If the stop is not placed in the center line a twisting force will be exerted on the parts when the clapper is wide open.

24. *Hinge*.—(a) The clapper arm shall be supported by a pin of rolled bronze which can not be thrown out of alignment.

(b) For valves larger than 2 inches, the diameters of the holes in the clapper arm and those in the body or side plugs used to support the hinge pin shall be from 0.03 inch to 0.05 inch larger than that of the pin.

(c) If side plugs are used to hold the pin, the hole shall be drilled concentric with the screw thread.

(d) The hinge pin shall be supported at each end for a distance at least equal to its diameter.

(e) The over-all length of bearing of the hinge pin in the hub of the clapper arm shall not be less than that given in the following table:

Size of valve (inches).....	2½	3	3½	4	5	6	7	8	10	12	14
Length of bearing (inches).....	1¼	1⅞	2¼	2¼	2¾	3	3½	4	4¾	5½	7

25. *Clearances*.—(a) The clearance between the rim of the clapper and the inside of the body in every position of the clapper from closed to wide open shall be at least three-fourths inch for iron-body valves, one-eighth inch for the ¾-inch and 1-inch, and one-fourth inch for the 1¼-inch, 1½-inch, and 2-inch bronze valves.

(b) There shall be a clearance of at least one-half inch around the hub of the clapper arm for iron-body valves and one-eighth inch for the ¾-inch to 2-inch bronze valves, inclusive.

(c) The length of the hub of the clapper arm in the iron valves shall be one-sixteenth inch less than the distance between the bearings.

26. *Tests*.—All valves shall be tested before leaving the factory to twice the working pressure for leakage and distortion, first, between the downstream end and the clapper, and, second, with the clapper blocked off its seat.

TARGET TYPE OF INDICATOR POST

VERTICALLY MOVING TARGET

27. *Barrel*.—(a) The post barrel must be at least three-eighths of an inch thick and must have an inside diameter of not less than 4 inches at any part throughout its length, and for a length of 10 inches from bottom of lower part the inside diameter must be 8 inches; the length of the barrel must be such that the middle of the target windows will be at least 30 inches above the ground level; and when the post is made adjustable, the upper part must extend about 12 inches below the ground, and telescope over the lower part at least 12 inches.

(b) When the post is telescopic, the parts shall be clamped together by two ¾-inch set screws placed one above the other and so arranged as to prevent separation or rotation of the upper part. This may be accomplished by providing either, first, deeply slotted holes in the lower part for the ends of the set screws or, second, a series of horizontal ribs, spaced the same distance apart as the set screws, to prevent separation; and four vertical ribs cast on the lower part, to prevent rotation.

The upper part must be cylindrical or somewhat tapered, with a smooth outside surface, having no flange or other projection by which the action of frost may lift the part.

(c) The post must be provided with a flange of design and dimensions described in article 12, Figure 306 (specifications for gate and check valves), drilled for four ⅝-inch bolts to secure the post to a similar indicator post flange on the valve bonnet.

(d) Two opposite window openings at least 1¼ inches high and at least one-half inch wider than

the words "OPEN" and "SHUT" and designed to show the targets clearly must be provided near the top of the post.

(e) The windows must be made of glass at least one-half inch thick and must be held in place by a suitable brass or malleable-iron ferrule or grating with brass screws.

Posts for use where the windows are especially likely to be broken should have a grating of bars one-eighth inch wide and one-fourth inch deep, arranged with one central horizontal bar and several vertical bars, the latter to come between the target letters. There should be a space of at least one-fourth inch between the grating and the glass. The grating is to be furnished only on special order.

28. *Extension rod.*—(a) The extension rod must be made of the best quality wrought iron or mild steel having a tensile strength of at least 45,000 pounds per square inch and should have a sectional area at least 1 square inch throughout. It may be of other suitable material having a proper sectional area to give an equivalent torsional strength.

(b) The extension rod must be secured to the valve stem nut in such a manner as to permit the axis of the rod to swing in any direction at least 5° off the vertical, thus allowing for the nonalignment of parts.

A cast-iron coupling, cored to fit loosely the turning members, with two bronze cotter pins at least one-fourth inch diameter, one through the coupling and stem nut and the other with axis at right angles to the former through the coupling and extension rod, both pins to be tight in the coupling but loose in other members, forms a satisfactory method of meeting the requirements. The strength of the joint must not be made dependent upon the shearing strength of the pins.

29. *Post cap.*—The cap must be weatherproof, must be secured by bolts at least one-half inch diameter, and must furnish a suitable bearing for the operating stem, with provision for lubrication.

30. *Operating stem.*—(a) The stem must be made of bronze, cored at least 4 inches deep to fit freely the extension rod, and its upper end must be finished in a solid nut 1¼ inches square by 1 inch high except for post to be installed where existing posts have different shape or size of nut, in which case additional posts must have the same operating nut as the old ones for uniformity.

(b) The stem must turn freely in its bearings and must be so designed that it can not become clamped to its bearings by lock nut or be prevented from turning by the target nut in any position.

(c) Stems of same make must be interchangeable, regardless of number of turns or size of valve, the range of valves being from 4 to 12 inches, inclusive.

31. *Wrench and handwheel.*—(a) Either a wrench or handwheel must be provided with each post.

(b) The wrench must be of malleable iron 12 inches long from center of operating nut to end.

(c) The handwheel must be of heavy cast iron 14 inches in diameter.

32. *Target.*—(a) The target-nut threads must be made of bronze.

(b) The words "OPEN" and "SHUT" must be used on the target and each word must be on a separate plate of aluminum or other suitable non-corrodible white metal. The letters must be 1 inch high and raised one-eighth of an inch on the casting. The face of the letters should be finished smooth one-eighth inch wide and the background painted black. The words must be at least 3 inches wide. The proper word must be visible at both windows when the gate is open or shut, but they must not show when the target nut travels off the thread at top or bottom of stem.

(c) The target plates must be adjustable relative to each other to suit the number of turns required

by the different sizes of the make of valve for which the post was designed. Plates shall also be interchangeable to suit either right or left hand valves.

(d) The target mechanism must be of such design and construction that it will not be liable to be wrongly assembled or become disarranged in operation.

33. *Sealing and locking.*—(a) Provision must be made for strapping or otherwise sealing the operating stem in both the open and shut positions.

(b) A secure locking arrangement must be furnished on special order.

34. *Marking.*—(a) The post must be plainly marked well above the ground line with the name or trade-mark of the manufacturer, the year of manufacture, and some identification mark satisfactory to the inspection department having jurisdiction, to be used only on approved posts. All letters and figures should be about three-fourth inch high, and raised one-eighth inch on the casting.

This identification mark may be a word, number, letter, or other character by means of which this line of posts may be easily distinguished from all others of the same make.

In Factory Mutual work this identification mark must consist of the letters FM inclosed in a diamond as follows: 

These markings should be so placed as to allow ample room for stenciling or otherwise marking the post vertically with the service which the valve controls, as, for example, the name or number of a building.

(b) The post cap must be marked "OPEN" with letters 1 inch high and raised one-eighth inch on the casting, and also with an arrow 4 inches long raised one-eighth inch on the casting.

ROTATING TARGET TYPE

One acceptable design shown in Figure 309.

35. *General construction.*—(a) This shall conform to the specifications above for vertically moving target indicator posts as far as they apply, as given in the following sections: 27, (a), (b), (c), (d), and (e); 28, (a) and (b); 29; 30, (a) and (b); 31, (a) and (b); 34, (a) and (b).

36. *Target.*—(a) Threads and gears shall be of bronze and where other moving parts are in contact at least one must be bronze.

(b) The words "OPEN" and "SHUT" shall be at least 3 inches wide and 1 inch high with letters raised one-eighth inch. The face of the letters shall be finished smooth and the background painted black. Letters shall be of aluminum or other suitable white metal, and if the post is adjustable for different sizes of valves, each word shall be on separate plates. The proper word shall be visible at both windows when the valve is open or shut.

(c) The target mechanism shall not limit the turning of the operating stem if the valve or extension rod is broken or disconnected. It shall be of such a design and construction that it will not be liable to be wrongfully assembled or become disarranged in operation.

SPECIFICATIONS FOR HYDRANTS

FOR MILL YARDS

These specifications are broad, covering only the more essential features of hydrants. The aim has been simply to require hydrants which are strong and reliable, and which as far as possible agree with present shop practices. The acceptable hydrant must, in addition to conforming with these specifications, be satisfactory in the construction of the parts, composition of the metals, and in workmanship.

37. *Size.*—(a) Hydrants shall be designated by the number of 2½-inch hose outlets for which they are designed, the nominal diameter of the valve opening being at least 5 inches for 2-way and 6 inches for 3 and 4 way hydrants.

For example, a hydrant having two 2½-inch hose outlets would be known as "2 way," if fitted with three 2½-inch outlets, "3 way," etc. If a steamer connection is also provided the hydrant would be designated, for example, "2 way and steamer connection."

(b) The net area of the waterway at the smallest part other than at the valve opening when the hydrant is wide open must not be less than 120 per cent that of the valve opening, and there must be

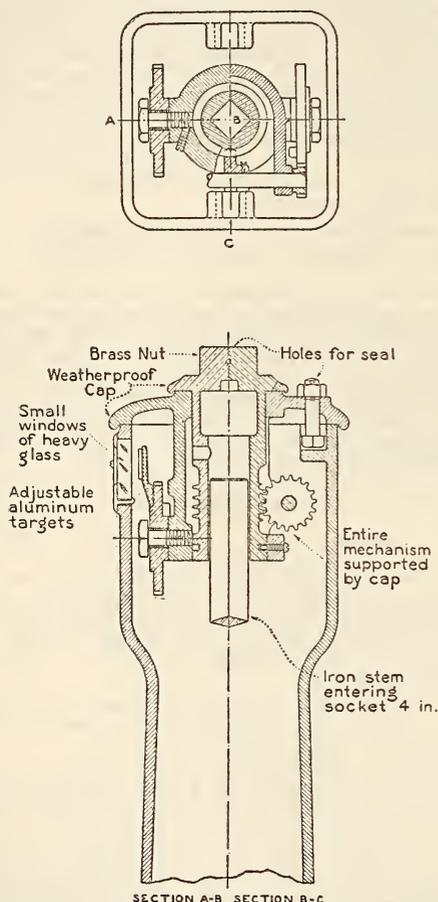

FIGURE 309.—Rotating target type indicator post

sufficient clear waterway through the hydrant when wide open to allow the passage of a ball at least 1½ inches in diameter for a 2-way and 2¾ inches for 3 and 4 way hydrants.

In new designs it is recommended that inside diameter of hydrants, especially at the outlets, be 7 inches for 2-way and 8 inches for 3 and 4 way hydrants.

(c) Hydrants must be fitted with bell ends to fit American Water Works Association standard pipe (see 607.12, p. 379) or with flanges of standard dimensions and having standard bolt layouts, as given in Table 2 of A. S. M. E. standard for cast-iron pipe flanges, and flanged fittings, serial B16a-1928. (See 607.14, p. 385.) Holes are not to be drilled on the center line, but symmetrically each side of it.

(In Factory Mutual work the standard sizes for pipes as adopted by the New England Water Works Association September 10, 1902, are also acceptable.)

38. *General design.*—(a) Hydrants may be of compression or gate type.

(b) Hydrants must be designed to withstand safely a working pressure of 150 pounds, with a factor of safety of at least 5 at the working pressure. For example, a hydrant whose working pressure is 150 pounds must resist a pressure of 750 pounds before breaking. Where the working pressure is greater than 150 pounds a heavier hydrant must be used.

(c) Valve when shut must remain reasonably tight when upper portion of barrel is broken off.

(d) Any changes in diameter of the water passage through the hydrant must have easy curves, and all outlets must have rounded corners of good radius.

(e) With the hydrant discharging 250 gallons per minute through each 2½-inch hose outlet, the total friction loss of the hydrant must not exceed 1¾ pounds for 2-way, 2¼ pounds for 3-way, and 3 pounds for 4-way hydrants, except when fitted with inside hose gate valves, in which case the loss must not exceed 2¾ pounds for 3-way and 3½ pounds for 4-way hydrants.

(f) Hydrants must be so designed that with extraordinary usage they will not cause an increase of pressure in the system above normal of more than 60 pounds.

(g) Hydrants must be fitted with two lugs so that the leaded joint underground can be strapped.

(h) When hydrant barrel is made in two sections, the upper flange connection must be at least 2 inches above the ground line.

(i) All hydrant barrels must have a hole through the case, back of and level with the outlets, tapped for ¼-inch iron pipe thread, and plugged with a brass plug with large square head.

This tapped hole is desired for connecting a pressure gauge during field tests of pipe systems, etc., which may be made from time to time through the hydrants.

39. *Material of body.*—(a) The hydrant body must be made of cast iron.

40. *Materials.*—(a) (General quality requirements and strength-test requirements for cast iron are the same as specified above for outside-screw-and-yoke valves. See sec. 3 (b) above.)

(b) All wrought iron or mild steel used must be of the best quality of refined iron, and have a tensile strength of at least 48,000 pounds per square inch.

(c) All composition or other noncorrodible metal used must be of the best quality, and have a tensile strength of not less than 32,000 pounds per square inch, with 5 per cent elongation in eight diameters and 5 per cent reduction of area at breaking point. Composition for inside hose valve stems must have a tensile strength of not less than 55,000 pounds per square inch and an elastic limit of not less than one-half the tensile strength.

41. *Hose valve and nipples.*—(a) Hydrants must have at least two hose connections. If more than two hose connections are used each outlet must have a hose gate valve.

Steamer connections should never be on mill-yard hydrants when such hydrants are already connected with a fire pump.

(b) The hose gate valves may be of the outside detachable type or be built inside the barrel. The outside hose gate valves must be made in accordance with the specifications for this type of valve. Each valve must be bolted to the hydrant by two ¾-inch tap bolts, spaced horizontally 5½ inches on centers. The valves must not project further than necessary, and must be of the inside-screw type, placed in a vertical position, with the handwheel at least 3 inches below the base of the operating nut.

Inside hose gate valves must have composition metal working parts and be of rugged design, and must not introduce an unnecessary friction loss. There must be ample clearance between the gate and the hydrant body when the gate is in any

position. The gate and parts should be interchangeable, and the valves should be located so as to be as accessible as possible for repairs. The gate must be designed so that it can not come off in use. The top of the stem must be below the level of the hydrant stem nut, so that the hydrant wrench can be freely operated.

(c) Hose nipples must be of composition metal threaded with a fine thread into the hydrant, and securely pinned in place. If desired, the nipple may be cast with two side lugs and be bolted to the hydrant.

(d) Hose threads on all hydrants to be installed in any given mill yard must of necessity be interchangeable with those already in service, but, where practicable, threads should conform to the national standard adopted by the National Fire Protection Association. The essential features of the national standard thread in the 2½-inch size are a 60° V thread, outside diameter on male threads of 3¼ inches, and 7½ threads per inch.

(e) The stems of hose valves must be not less than three-fourths inch in diameter for the 2½-inch valves, and not less than seven-eighths inch in diameter for the valves at the steamer connections.

(f) The stem nut of all inside hose and steamer-connection gate valves must be one-half inch square.

42. *Hydrant valve.*—(a) The valve seat must be made of composition metal securely fastened in place.

(b) The valve must be faced with a yielding material, such as rubber or leather, except that if of the gate type a bronze ring may be used. The valve must be designed so that it can be easily removed for repairs without digging up the hydrant.

(c) The clearance of parts must be such that corrosion will not make the parts inoperative.

43. *Drip valve.*—(a) A positively operating non-corrodible drip valve must be provided and arranged so as to drain the hydrant when the main valve is shut.

A drip valve operated by springs or gravity is not acceptable.

(b) The seat of the drip valve must be made of noncorrodible material and must be securely fastened in the hydrant. All other parts of the drip mechanism must be designed to be easily removed without digging up the hydrant.

44. *Operating stem.*—(a) The threaded section of the operating stem when located in the waterway must be of composition or other noncorrodible metal, but when above the stuffing box it may be of wrought iron. The operating stem where it passes through the stuffing box and gland, must be of composition metal or be fitted with a composition metal covering. The diameter of the operating stem at base of thread must be not less than 1¼ inches for gate type of hydrant and 1 inch for compression and toggle types. The remainder of stem may be of iron and the diameter must be not less than 1¼ inches for gate type of hydrant and 1¼ inches for compression and toggle types. The operating stem must be attached so that in operation it will be impossible for it to become detached.

If iron or steel is used, the threaded sections should receive the best of care and be kept oiled.

(b) The stem must terminate at the top in a nut of pentagonal shape, finished with slight taper to 1¼ inches from point to flat, except for hydrants to be installed where existing hydrants have different shape or size of nut, in which case the additional hydrant must have the same operating nut as the old ones for uniformity. The nut socket in the wrench must be made without taper so as to be reversible.

(c) The thread which operates the valve must be acme, half V, or square.

The acme standard thread is considered preferable. (For thread see United States Government National Screw Thread Commission, under 608.0, p. 529.)

45. *Stuffing box and gland.*—(a) The stuffing box and gland must be of composition metal or bushed with it. If a packing nut is used, it must be of composition metal. The bottom of the box and the end of the gland or packing nut must be slightly beveled.

(b) Gland bolts or studs must be of composition metal, iron, or steel, at least one-half inch in diameter. The nuts must always be of composition metal.

46. *Hydrant top.*—(a) The hydrant top must be designed so as to make the hydrant as weatherproof as possible, and thus overcome the danger of water getting in and freezing around the stem. Provision must be made for oiling both for lubrication and to prevent corrosion. A reasonably tight fit should be made around stems.

(b) There must be cast on the hydrant top, in characters raised one-eighth inch, an arrow at least 2½ inches long, showing direction to open, and the word "OPEN" in letters three-fourths inch high.

47. *Hose caps.*—(a) Hose caps must be provided for all hose outlets, and must be securely chained to the barrel with a welded chain of wire, not less than one-eighth inch in diameter.

(b) The hose cap nut must be of the same size and shape as the operating nut.

(c) A leather or rubber—or if requested, lead—washer or disk must be provided in the hose cap, set in a groove or otherwise so retained as to prevent its falling out when the cap is removed.

48. *Marking.*—(a) Hydrants must be marked with the name or trade-mark of the manufacturer, the year of manufacture, the pressure for which they are designed, and some identification mark as agreed upon by the Underwriters having jurisdiction, to be used only on approved hydrants, so that these may be readily distinguished from those that are not approved. All letters and figures must be cast on the barrel well above the ground line. They must be 1 inch high, and raised one-eighth inch on the casting, except the date mark which may be smaller if legible.

This identification mark may be a number, letter, word, or other character by means of which this line of hydrants may be easily distinguished from all others of the same make.

In Factory Mutual work this identification mark must consist of the letters FM inclosed in a diamond as follows: 

49. *Testing.*—(a) Hydrants, after being assembled, must be tested to at least 300 pounds per square inch before leaving the factory. If the working pressure is over 150 pounds per square inch, the hydrants must be tested to twice the working pressure. The test should be made with the valve open in order to test the whole barrel for porosity and strength of hydrant body. A second test should be made with the valve shut in order to test the strength and tightness of the valve.

(b) Hydrants must be fully opened and closed before shipping, in order to test the freedom and strength of the parts. The conditions of the test should be as severe as are liable to occur in service, when using a hydrant wrench at least 17 inches long.

50. *Direction to open.*—(a) All hydrants must open to the left, except where existing hydrants open to the right, in which case additional hydrants should turn the same as the old ones for the sake of uniformity.

CHLORINE INSTITUTE (INC.), SPECIFICATIONS FOR THE CHLORINE INSTITUTE STANDARD VALVE FOR 100, 105, AND 150 POUND CONTAINERS, DECEMBER 7, 1928

VALVE FOR 100 TO 150 POUND CONTAINERS

I. *General.*—The valve shall be of the internal thread type, repackable under pressure, provided with outlet connection to accommodate present

standard connections; that is, the 3/4-inch straight pipe thread union and the standard Mathieson yoke and adapter. For assembly of valve see Figure 310. (Other detail dimension drawings of the valve parts may be obtained from the Chlorine Institute (Inc.), 30 East Forty-second Street, New York, N. Y.)

II. *Body*.—Brass forging consisting of 58 to 61 per cent copper, 1 1/2 to 2 1/2 per cent lead, and the remainder zinc.

(a) *Outlet connection*.—External 3/4-inch straight pipe thread, 14 pitch, V form; pitch diameter 0.9830 inch plus 0.000 inch, minus 0.0005 inch to minus 0.0035 inch limits. Inside of outlet boss to be counterbored; diameter of counterbore to be 0.5625 inch plus 0.003 inch minus 0.003 inch; depth

IV. *Stem*.—Monel metal with five-eighths inch by 8 Acme right-hand thread, rotating type. Top of stem to be three-eighths inch square. No handle required.

V. *Packing nut*.—Brass, external type, 1 1/2 inches by 18 thread.

VI. *Packing gland*.—Brass, shaped to compress packing to stem. Clearance between follower and stem to be increased a short distance from the lower end to avoid freezing.

VII. *Packing ring*.—Brass, loose collar shaped to compress packing to stem.

VIII. *Outlet cap gasket*.—One-sixteenth-inch Garlock No. 902 or equivalent, diameter 0.960 inch.

IX. *Outlet cap*.—Brass, hexagonal in shape. Dimension from flat to flat of hexagon shall be same as

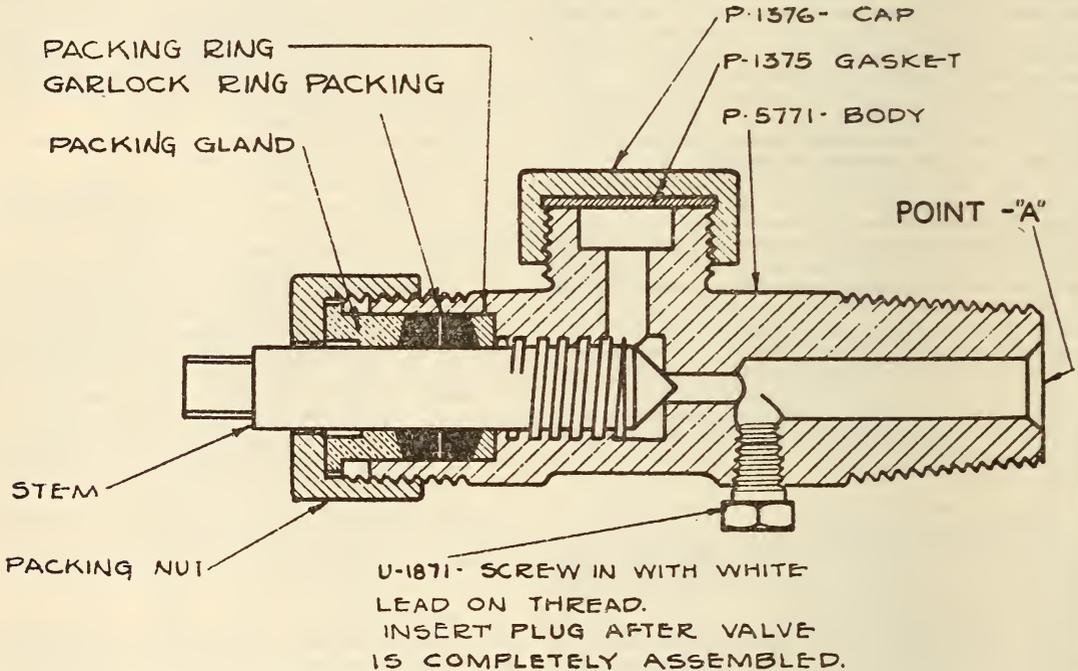

FIGURE 310.—Valve for 100 to 150 pound containers

TEST

Apply 250 pound air pressure at point A with valve stem closed and outlet cap removed, inspect for leak through valve seat and fusible metal plug

Place on outlet cap, open valve stem and inspect for leak through packing

fifteen sixty-fourths inch plus one sixty-fourth inch minus 0.000 inch; outer end of boss and bottom of counterbore to be machined smooth and flat to accommodate gaskets.

(b) *Shank thread*.—Standard Briggs pipe taper of such size as to enter a 1/4-inch Briggs standard pipe gage one-half to one turn. Threads to be 1 1/2 inches long; increased diameter to be in accordance with Briggs standard taper for overlength threads. Standard oversize for oversize cylinder threads shall be same as above with exception that the thread shall be one-sixteenth inch oversize in pitch diameter. In both cases the thread shall conform to the Briggs standard pipe thread without flats.

(c) *Seat*.—Integral with body, not renewable. Three-sixteenths-inch opening for 100, 105, and 150 pound containers.

III. *Fusible plug and fusible metal*.—The fusible plug shall consist of a threaded bronze container to screw into the valve body. The fusible metals shall be Niagara Alkali Co.—that is, Jaeger Salts formula.

that of packing nut so that the same wrench may be used for both.

X. *Packing*.—Shall consist of two self-lubricating split ring type packing such as Garlock No. 343 or equivalent, free of oil, inside diameter one-half inch, outside diameter seven-eighths inch, thickness of each ring one-fourth inch.

CHLORINE INSTITUTE (INC.), SPECIFICATIONS FOR THE CHLORINE INSTITUTE STANDARD VALVE FOR 1-TON CONTAINERS, DECEMBER 7, 1928

VALVE FOR 1-TON CONTAINER

(This valve is the same as the standard valve for 100, 105, and 150 pound containers except that it has no fusible plug containing fusible metal and the opening through the valve seat is one-fourth inch instead of three-sixteenths inch.)

HEATING AND PIPING CONTRACTORS NATIONAL ASSOCIATION, RADIATOR VALVES, ROUGHING-IN DIMENSIONS, 1929

STANDARD ROUGHING-IN DIMENSIONS

Angle-type valves

Size of valve	Dimension A, steam and hotwater angle valves and union elbows, effective Jan. 1, 1926	Dimension A, modulating valves, effective Jan. 1, 1926	Dimension A, return line vacuum valves, effective Jan. 1, 1925
Inches	Inches	Inches	Inches
1/2	2 1/4	2 3/4	3 1/4
3/4	2 3/4	2 3/4	
1	3	3	
1 1/4	3 1/2	3 1/2	
1 1/2	3 3/4	3 3/4	
2	4 1/4	4 1/4	
Tolerance	± 1/8	± 1/8	

Connecting ends shall be threaded and gaged as to threading according to the American (taper) pipe thread standard, A. S. A. No. B2-1919. (See United States Government, National Screw Thread Commission, Bureau of Standards miscellaneous publication No. 89, under 607.0, p. 365.)

The standardization of the roughing-in dimensions of angle steam and hot water, and modulating radiator valves was made possible by the cooperation of the Manufacturers Standardization Society of the Valves and Fittings Industry.

NATIONAL BOARD OF FIRE UNDERWRITERS, INSTALLATION, MAINTENANCE, AND USE OF EMERGENCY GAS SHUT-OFF VALVES, 1924

GAS SHUT-OFF VALVES

(This specification does not cover the design of emergency gas shut-off valves or the material of which they are made other than to require that such valves shall be simple and substantial in construction and so designed that the parts are not liable to stick or become clogged, or fail to close by the application of ordinary manual force. It is also required that valves on the operating stems shall be encased in suitable valve boxes, manholes, or vaults, and be adequately protected against water that might freeze. Automatic operation of such valves is not recommended, but provision is made for valves with positive mechanical connection to a control located at some readily accessible point.)

UNDERWRITERS' LABORATORIES, STANDARD FOR CONSTRUCTION AND PERFORMANCE OF HAZARDOUS LIQUID VALVES, MAY, 1930

HAZARDOUS LIQUID VALVES

GENERAL

This standard covers the construction and performance of hazardous liquid valves that are intended to be incorporated in the assembly of discharge devices designed for dispensing motor fuels at automobile filling stations and intended for installation in accordance with the regulations of the National Board of Fire Underwriters for the installation of containers for storing and handling flammable liquids, or similarly employed in lines handling gasoline, kerosene, etc.

In this standard, the following words are used as defined below:

- “Shall” is intended to indicate requirements.
- “Should” is intended to indicate recommendations, or that which is advised but not required.

In this standard “valves” are divided into three groups: Shut-off valves (gate, globe, angle, needle), hose nozzle valves, and hose drain valves.

SHUT-OFF VALVE

Body

1. Bodies of valves shall be made of a good quality cast brass, or of other corrosion-resisting metal. They shall be free from sand holes and similar imperfections likely to permit leakage. The walls shall be not less than three thirty-seconds of an inch in thickness.

2. All joints between liquid-handling parts shall consist of metal-to-metal seating surfaces not requiring the use of gaskets to effect tightness against leakage.

3. (a) Plugs, caps, bonnets, spuds, etc., threaded into the valve body shall engage with at least five full threads of the body.

(b) Inlet and outlet openings of gate, angle, globe, and needle valves shall be threaded in accordance with the American pipe thread standard and the threads recessed or cored at the inner end, thereby providing sufficient clearance between the end of the thread and projections inside the body to reduce the possibility of the end of a pipe cutting into webs and projections or the pipe being kept from tightening sufficiently to prevent leakage.

Stuffing Box

4. (a) Stuffing boxes should be located on the open side of the valve so as not to be subjected to pressure when the valve is closed.

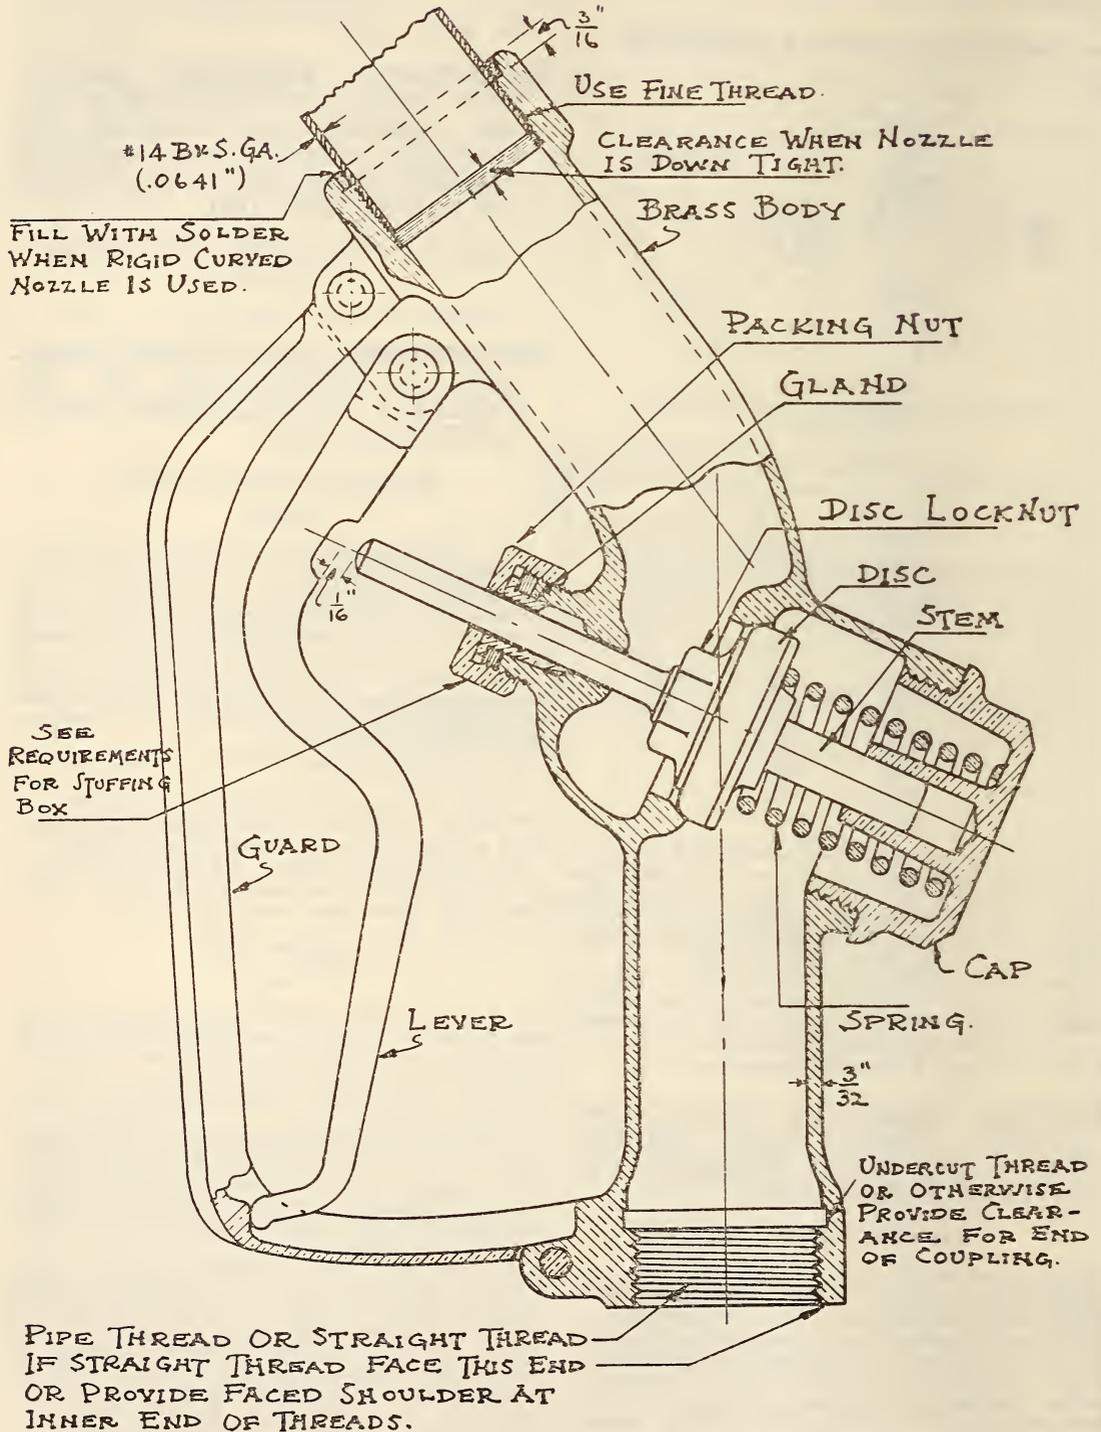

FIGURE 312.—Conventional design of hose nozzle valve

(b) Acceptability of the construction submitted will be determined by the results of operating tests. (See secs. 27 and 28.)

5. (a) The stuffing box shall be provided with a removable, shouldered, unthreaded follower gland. The valve shall be designed with a nut or other acceptable means for adjusting the gland to maintain pressure on the packing as wear occurs.

(b) Packing nuts of hose nozzle and other self-closing valves should be knurled to permit being adjusted by the fingers rather than requiring the application of a wrench.

6. The gland shall be made of corrosion-resisting material and shall be beveled at the lower end to conform to a corresponding angle of bevel that shall be provided in the bottom of the stuffing box recess. This construction is intended to assist in compressing the packing against the stem when force is applied to the gland. For rotating stems, the angle of bevel shall be not less than 25°, and for reciprocating between 35° and 45°, measured from the perpendicular to the axis of the stem.

7. Automatic spring take-up for glands of valves, when supplied, shall employ a spring made of corrosion-resisting material or one acceptably coated to retard corrosion. Its fully compressed length and its strength shall be such that when the gland has entered the stuffing box only one-fourth inch the nut will be permitted to engage readily with at least one-fourth inch of the threaded section of the boss. The spring shall be of such length and strength that it will automatically advance the gland over one-half the length of its travel without requiring further adjustment of the packing nut and still exert sufficient force to reduce leakage to a minimum when the device is subjected to the required test pressure. (See sec. 28.)

8. Before the valve is shipped, the stuffing box shall be fully packed with a suitable type of pliable packing material, the impregnation of which is not noticeably affected by contact with gasoline.

Stem

9. The valve stem should be of sufficient length to permit repacking the stuffing box without requiring the removal of the operating lever or handle. The stem shall be made from either cast or rod brass or other metal not readily affected by corrosion and shall possess sufficient strength to preclude the possibility of its being twisted off or distorted by normal operation.

10. Stems shall be so designed that they can not be backed out of the valve, and threads of stems shall not enter the stuffing box. Valve disks should be attached to the lower end of the stem in such a manner as to permit swiveling, thus allowing the disk to seat properly.

HOSE NOZZLE VALVE

Body

(See also secs. 1, 2, and 3.)

11. An illustration of a conventional type of hose nozzle valve is shown by Figure 312. They shall be self-closing. If desired, the body may be of special shape or design to facilitate hanging or locking in place on the discharge device during intervals between operating periods.

12. Each valve shall incorporate an operating lever guard designed to guide the free end of the operating lever and to prevent opening of the valve and injury to the operating parts when the valve is dropped. The guard shall be of such strength as to permit operation of the valve subsequent to being subjected to rough usage tests. (See sec. 26.)

13. The valve seat shall be of ample width and if beveled shall be beveled at an angle not more acute

than 45°, measured between the line of bevel and the axis of the valve stem.

14. The inlet opening shall be tapped either in accordance with the American pipe thread standard for taper pipe or with straight threads. When straight threads are used, either the outer edge of the body or a shoulder located at the inner end of the threads shall be faced for the seating of a gasket that is provided with the hose to secure a tight joint.

15. The discharge opening shall be tapped with straight fine threads for attachment of the nozzle, which shall be threaded and drawn tight in the opening before the inner end strikes webs or projections in the body. The outer end of the threaded opening of the body shall be recessed at least three-sixteenths inch and the annular space shall be flooded with solder when a curved rigid nozzle is used.

Nozzles

16. Either flexible, or straight or curved non-flexible nozzles, not exceeding 12 inches in length,

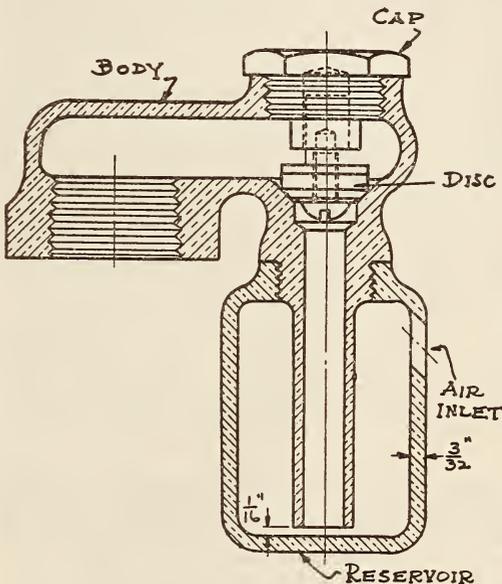

FIGURE 313.—Conventional design of hose drain valve

may be used. Nonflexible nozzles shall be made from hard drawn seamless brass tubing having a wall thickness of not less than No. 14 B. & S. gage (0.0641 inch).

17. Flexible nozzles should be fitted with a securely attached threaded adapter that overlaps the end at least three-fourths inch for attachment to the body of the valve. The discharge end should terminate in a smooth ferrule. Tinning of ends of nozzles will assist materially in sweating the joints during assembly.

Operating Parts

18. Operating levers shall possess ample strength to resist bending or breaking in normal service and during operating tests, and shall be securely attached to the valve, the free end being guided by the lever guard. It shall be shaped and pivoted so that the contact of the valve stem with the lever is practically on the axis of the stem, thereby causing a minimum of side thrust on the stuffing box. A clearance of at least one-sixteenth inch shall be provided between the lever and the end of the valve stem to allow for wear of the disk, thus permitting it to seat though worn after continued use.

19. Stuffing boxes and valve stems shall conform to the requirements of sections 4, 5, 6, 8, 9, and 10. The operating spring shall be made of corrosion-resisting material or acceptably coated to retard corrosion.

20. The valve shall close with the flow of liquid and the stem shall be guided to insure proper seating of the disk. The disk shall consist of acceptable resilient material not readily affected by the liquids handled and shall be securely attached to the valve stem. Care shall be exercised to prevent clamping washers or retaining cups from interfering with proper seating of the disk.

HOSE DRAIN VALVE

Body

(See also secs. 1, 2, and 3.)

21. A conventional type of hose drain valve is shown by Figure 313. Valves of this type are designed to permit the entrance of air into a hose or other liquid-handling parts of discharge devices that are installed on the discharge side of shut-off valves. While thus assisting to secure ready drainage of parts following operation of the device, the hose drain valve is subjected to liquid pressure during operation. The conventional valve consists essentially of some form of check valve and a small cup designed to retain liquid which may leak past the check during operation. The retained liquid is intended to be drawn back into the discharge line with the incoming air when the hose is drained.

22. In view of the difficulty experienced in obtaining perfectly round balls for the ball check type of valve, manufacturers are urged to develop other types of valves more reliable in reducing, to an acceptable degree, leakage into the retention cup.

23. The retention cup shall be of sufficient capacity to contain the amount of liquid that passes the valve during discharge of liquid through the hose or other part to which it is attached. The relation of the depth and diameter of the cup and the location and size of the air inlet openings with respect to the diameter and length of the dip tube shall be such that the liquid collected in the cup during operation will be drawn into the discharge line when the hose is drained. The device shall be capable of being operated repeatedly in conjunction with the discharge device without permitting leakage or spilling of liquid through the air inlet openings.

24. (a) It is evident that the capacity of the retention cup that is required to prevent leakage and spilling of liquid during operation will depend on the tightness of the valve and to some extent on emptying the cup each time the hose is drained.

(b) To assist in obtaining the required results, the dip tube should extend to a point close to the bottom of the cup to aid in drawing collected liquid from the chamber. The air inlet openings should be placed at a high level and should be so proportioned and located as to permit a rapid inrush of air when the hose is drained.

Tests

25. (a) Each globe, angle, gate, needle, and hose nozzle valve body and stuffing box assembly shall be able to withstand without leakage or injury to operating parts, an internal hydrostatic pressure test, employing kerosene, of 300 pounds per square inch, held for one minute.

(b) The manufacturer shall test each globe, angle, gate, and needle valve body, valve seat, and stuffing box assembly, and each hose nozzle valve body and stuffing box to at least 25 pounds per square inch air pressure, with the valve immersed in water. Samples that show leakage at any point shall be rejected.

(c) An air pressure test of 5 to 10 pounds per square inch shall be used by the manufacturer in testing the tightness of the seat of each hose nozzle valve.

26. The strength of the hose nozzle valve operating lever guard shall be sufficient to protect the lever and valve operating parts from injury when the valve is attached to a 10-foot length of hose and dropped from a height of 6 feet onto a concrete floor at least 10 times.

27. Each hose nozzle, gate, angle, globe, and needle valve shall be capable of withstanding, without injury to the seat, spring, or stuffing box resulting in leakage, an operating test of 100,000 cycles of opening and closing. At the end of the test, the seat and stuffing box shall not show leakage under an air-pressure test of at least 50 pounds per square inch.

28. In the case of valves equipped with automatic spring take-ups, as described by section 7, following the test specified by section 27, the packing shall be removed from the stuffing box to permit the gland to advance over one-half the length of its travel. The remaining packing shall be firmly compressed and the valve shall again be operated in this condition for 1,000 cycles of operation subsequent to which the stuffing box shall not show leakage under a 50-pound air-pressure test.

29. Hose drain valves shall be capable of being operated repeatedly in conjunction with a dry hose type of discharge device without permitting escape of liquid through air inlet openings. The manufacturer shall test each seat and find it tight under a hydrostatic pressure of 5 pounds per square inch. Each retention cup shall be closely examined for pores or other imperfections likely to permit leakage.

Marking

30. Each valve shall be identified by a proper symbol agreed upon between the manufacturer and the laboratories which will be reserved for use only on such of his product as complies with the foregoing specifications.

UNDERWRITERS' LABORATORIES, STANDARD FOR PRESSURE REGULATORS OR REDUCING VALVES, MARCH 13, 1928

PRESSURE REGULATORS OR REDUCING VALVES

The following specifications apply to pressure regulators or reducing valves used in connection with oxygen, hydrogen, acetylene, and other gases employed in welding and cutting operations. They are designed to reduce the storage-cylinder pressures of these gases to the pressures required for blowpipes or torches.

DESIGN AND CONSTRUCTION

(a) Devices of this type shall be of substantial construction and made of materials suitable for the purpose intended.

(b) Noninterchangeable union connections not requiring gaskets shall be provided for hose connections and for attachment to high-pressure cylinders.

NOTE.—It is recommended that the International Acetylene Association standard be followed. This provides for left-hand thread on fuel-gas fittings and right-hand thread on oxygen fittings.

It is also recommended that there be no shut-off or check valve on the outlet from the low-pressure compartment of oxygen welding regulators.

(c) These devices shall be marked with the name or registered trade-mark of the manufacturer. They shall also be marked with the proper type or style designation.

(d) The workmanship shall be such as to insure a degree of uniformity suitable for devices of this character.

(e) Gauges reading over 1,000 pounds per square inch, if provided by the regulator manufacturer, shall conform with Underwriters' Laboratories' standard specifications for high-pressure gauges.

PERFORMANCE TESTS

Normal-operation test.—The regulator shall, when connected to a gas cylinder and to a proper blow-pipe and subjected to normal operation, maintain the pressure within the limits required for proper operation of the blowpipe at any load within the rating of the regulator. Two samples of each type or style shall be tested.

Excess-pressure test.—The regulator shall be so constructed that if subjected to sudden application of full cylinder pressure to the low-pressure compartment, it shall either retain or safely release the pressure. Three samples of each type or style shall be tested. Each sample shall be connected to a full cylinder of oxygen and the cylinder valve opened manually as suddenly as possible.

UNDERWRITERS' LABORATORIES, STANDARD FOR OUTSIDE-SCREW-AND-YOKE GATE VALVES, 1921

(These specifications are the same as those of the Associated Factory Mutual Fire Insurance Companies' specifications for outside-screw-and-yoke valves given above.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, WROUGHT-IRON AND WROUGHT-STEEL PIPE, VALVES, AND FITTINGS, SIMPLIFIED PRACTICE RECOMMENDATION NO. 57, 1926

WROUGHT-IRON AND WROUGHT-STEEL PIPE, VALVES, AND FITTINGS

(See 607.0, p. 365.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, STEAMBOAT INSPECTION SERVICE, GENERAL RULES AND REGULATIONS, MAY 4, 1929.

LEVER SAFETY VALVES

All common lever safety valves to be hereafter applied to the boilers of steam vessels shall be constructed in material, workmanship, and principle according to the requirements for a safety valve referred to in this section. When this construction of a safety valve is applied to the boilers of steamers navigating rough waters, the link may be connected direct with the spindle of the valve: Provided, always, that the fulcrum or points upon which the lever rests are made of steel, knife or sharp edged, and hardened; in this case, the short end of the lever shall be attached directly to the valve casing. In all cases the link requires but a slight movement not exceeding one-eighth of an inch.

REQUIREMENTS IN CONSTRUCTION OF LEVER SAFETY VALVES

All the points of bearing on lever shall be in the same plane.

The distance of the fulcrum shall in no case be less than the diameter of the valve opening.

The length of the lever shall not exceed the distance of the fulcrum multiplied by ten.

The width of the bearings of the fulcrum shall be not less than three-fourths of 1 inch.

The length of the fulcrum link shall be not less than 4 inches.

The lever and fulcrum link shall be made of wrought iron or steel and the knife-edged fulcrum points and bearings for the points shall be made of steel and hardened. But the chambers and saddle flanges of this and all other types of safety valves attached to boilers may be made of cast iron or other suitable material.

The valve, valve seat, and bushing for the stem or spindle shall be made of composition (gun metal) when the valve is intended to be attached to a boiler using salt water; but when the valve is to be attached to a boiler using fresh water and generating steam of a high pressure the parts named, with the exception of the bushings for the spindle, may be made of cast iron.

The valve shall be guided by its spindle, both above and below the ground seat and above the lever, through supports either made of composition (gun metal) or bushed with it.

The spindle shall fit loosely in the bearings or supports.

When the valve is intended to be applied to the boilers of steamers navigating rough waters, the fulcrum link may be connected directly with the spindle of the valve; providing always that the knife-edged fulcrum points are made of steel and hardened, and that the vertical movement of the valve is unobstructed by any lateral movement.

In all cases the weight shall be adjusted on the lever to the pressure of steam allowed in each case by a correct steam gauge attached to the boiler. The weight shall then be securely fastened in its position and the lever marked for the purpose of facilitating the replacing of the weight should it be necessary to remove the same, and in no case shall a line or any other device be attached to the lever or weight except in such a manner as will enable the engineer to raise the valve from its seat. (Sec. 4418, R. S.)

CAST STEEL, SEMISTEEL, FERROSTEEL, CAST IRON, MALLEABLE IRON, COMPOSITIONS MADE OF COPPER, TIN, AND ZINC, AND OTHER COMPOSITIONS PROPOSED TO BE USED IN THE MANUFACTURE OF VALVES, FITTINGS, AND OTHER APPLIANCES

Cast-steel fittings of any size or character and for any pressure and for any temperature may be used for any and all steam and feed pipe connections, and for valves, cocks, and all appliances subject to steam or water pressure when made by regular processes and by manufacturers who stamp such fittings and appliances with their trade-mark or identifying stamp and who guarantee the castings to possess the following physical characteristics: Tensile strength, minimum, 50,000; maximum, 78,000 pounds per square inch; elastic limit, minimum, not less than 45 per cent of tensile strength; elongation in 2 inches, minimum, 25 per cent. There shall be taken from each heat an annealed coupon or coupons, for the purpose of determining the physical tests, and the manufacturers shall furnish coupons to the local inspectors for tests when so required. All steel castings shall be thoroughly annealed.

The minimum thickness of steel fittings shall be determined by the following formula:

$$T = \frac{P \times D}{7000} + 0.188$$

(where)

P = working pressure in pounds.

D = diameter in inches.

T = thickness in inches.

Cast iron, semisteel, or ferrosteel, possessing a tensile strength of not less than 22,000 pounds to the sectional square inch, may be used in the construction of valves and fittings for pressures not exceeding 300 pounds when such valves and fittings of 3 inches diameter or over are stamped with the trade-mark or identifying stamp of the manufacturer, and made in accordance with the following formula:

$$T = \frac{P \times D}{3000} + 0.25$$

(where)

T = thickness of casting in inches.
 P = pressure of steam allowable in pounds.
 D = internal diameter of the largest opening contained in the cylindrical part of the casting.

The above materials may also be used in the construction of manhole and handhole plates.

The headers of superheaters may be made of semi-steel (so-called) in which the constituent part of high-grade uniform steel thereof shall be not less than 25 per cent and that the material shall have a tensile strength of not less than 28,000 pounds per square inch. The material must be soft and close grained, and the castings shall be tight under a hydrostatic pressure of 850 pounds per square inch.

Malleable iron possessing a tensile strength of not less than 30,000 pounds to the sectional square inch may be used in the construction of valves and fittings up to and including 6 inches in diameter, and for pressure not exceeding 300 pounds. Such valves and fittings of 3 inches diameter or over shall be extra heavy, the fittings beaded or banded, and the valves and fittings stamped with the trade-mark or identifying stamp of the manufacturer.

Hard brass, bronze, and other compositions, of which 95 per cent is copper, tin, and zinc, possessing a tensile strength of not less than 30,000 pounds to the square inch, may be used in the construction of all valves and fittings up to and including 12 inches in diameter, and for all pressures not exceeding 300 pounds per square inch. All such fittings of 3 inches in diameter or over shall be stamped with the trade-mark or identifying stamp of the manufacturer.

VALVES

Each and every valve for marine service shall have the trade-mark of the manufacturer cast or stamped on the chamber. All such valves of 2 inches diameter and over shall be subjected by the manufacturer before shipment to a hydrostatic pressure of three and one-half times the working pressure which the manufacturer guarantees them to stand without distortion, and shall also be stamped with such working pressure and also the letters "M. S." which shall plainly indicate that the valve has met the test and requirements for marine service. All valves of over 2 inches diameter without regard for the service for which they are intended, installed after April 30, 1917, shall have bolted bonnets. Valves of 2 inches diameter or less connected directly to the boiler shall be of cast steel, hard brass, or bronze. Screwed bonnets on cast-iron valves of any size or for any character of service are positively prohibited. On all boilers built after July 1, 1896, a stopcock or valve shall be placed between all check valves and boiler, and between all steam and water pipes and boiler: Provided, that this section shall not apply to safety valves that have been approved by the board of supervising inspectors.

PIPE FITTINGS

The term "pipe fittings" refers to all hollow cylindrical fittings, and does not apply to flanges or valves.

All pipe fittings of more than 3 inches internal diameter shall be subjected by the manufacturer to

a test of three and one-half times the pressure to which they will be subjected in service.

Where the thickness of the material in the boiler or drum, or the heads thereof, is not less than one-half inch, or where such boiler, drum, or head thereof has been reinforced by having a pad or flange riveted on the same, to make the thickness not less than one-half inch, pipes or fittings of 2 inches in diameter or under may be screwed directly into the same. Where steam or feed pipes of 2 inches in diameter or under are screwed into the boiler, the stop valve shall be connected to the boiler by as short a nipple as it is possible to use, nipples to be of extra-heavy thickness.

All boiler connections of over 2 inches in diameter, except the connections for safety valves, shall be permanently flanged and attached directly to the boiler by bolts, studs, or rivets. Where the connecting point on the boiler is of circular form, distance pieces shall be allowed in order to square the point of attachment of the flanged fittings. Flanged distance pieces of not more than 8 inches between flanges may be allowed between stopcocks or valves and the boiler when necessary to care for and conveniently handle the valves, when such distance pieces are constructed of wrought material of sufficient thickness and strength to withstand any pressure to which they may be subjected and securely riveted to the boiler.

Cast-steel flanged fittings, when conforming strictly with the requirements for steel castings, may be used for the purpose of connecting main and auxiliary stop valves and other steam outlets, including safety valves, distance from axis of outlets of such fittings to point of connection with boiler to be as short as practicable.

Valves and fittings of 3 inches and under may be connected by screw threads at their intermediate joints in pipe lines, but at point of connection with boiler all valves and fittings over 2 inches diameter shall be flanged and properly secured by bolts, studs, or rivets, and no fitting shall be of greater length than specified by the "Manufacturers' Standard."

Cast nozzles shall not be used when exposed to the direct action of the fire.

All sea valves or cocks secured to the skin of the vessel by bolts and connected to the engines or boilers by pipes shall be arranged so as to be accessible at all times, so that if a leak or defect occurs it can be reached. All parts of said valves except the chamber shall be made of brass or bronze when used on wooden-hull vessels navigating salt water; but in the case of vessels of iron or steel the brass or bronze bolts may be dispensed with.

ALLOWABLE TEMPERATURES

Cast iron, malleable iron, semisteel, and ferrosteel may be used in connection with temperatures up to and including 450° F.

Hard brass, bronze, and other compositions, of which 95 per cent is copper, tin, and zinc, may be used in connection with temperatures up to and including 470° F., but this temperature may be increased to 550° F. when the manufacturer of the valves or fittings stamps them with the temperature they are guaranteed to stand without disintegration. This paragraph will also apply to any composition meeting the above physical requirements and stamped in accordance therewith.

For temperatures exceeding 550° F. no valves or fittings other than steel or of a composition whose tensile strength has been demonstrated to exceed 50,000 pounds per sectional square inch with an elongation of 10 per cent in a length of 2 inches shall be allowed. Such valves and fittings shall be stamped as above required.

The manufacturer of valves and fittings shall file with the supervising inspector general a certificate duly sworn to that all valves and fittings furnished by him for use on steam vessels comply with the requirements of the foregoing rule.

After July 1, 1911, local inspectors shall refuse to allow the use of any valves or fittings on steam vessels until notified by the supervising inspector general that such certificate is on file in his office. This shall not apply to valves and fittings installed previous to July 1, 1911.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION: FF-P-451)

PLUMBING FIXTURES (FOR LAND USE)

(See 617.73, p. 1062.)

607.7 METALLIC HOSE, FERROUS AND NONFERROUS.

AMERICAN MARINE STANDARDS COMMITTEE, SPECIFICATION FOR 3/4-INCH AND 2-INCH FLEXIBLE METALLIC HOSE, O NO. 2—1926

FLEXIBLE METALLIC HOSE

1. *Purpose.*—The hose is intended to be used for steam, water, oil, or air, and it shall be suitable for working pressures up to 50 per cent of the straight test pressure specified herein.

2. *Description.*—Hose shall be made of copper, bronze, brass, or galvanized steel, as required. A sample showing the construction of hose offered must be submitted with bid. When galvanized steel hose is required, the coating shall be smooth and free from pinholes and must not interfere with the flexibility of the hose. Coverings of wire, wire and braid, rubber, and fabric shall be fitted when specifically required, and shall be of such a nature as not to be injurious to the operator's hands. The hose shall be so constructed as to be flexible and prevent excessive wear and breakage due to actual service.

3. *Tests.*—Each length or section of hose when lying straight shall be subjected to the hydrostatic test pressure given in the table. After satisfactorily withstanding this test, hose shall be coiled into a circle of the diameter specified in the table, and then the circle shall be rolled the entire length of hose while subjected to the hydrostatic test pressure given in the table. No leakage shall be in evidence during either of these tests. Oil shall be used for testing steel hose.

Test table

Inside diameter of hose	Inside diameter of bend	Test pressure per square inch, straight	Test pressure per square inch, bent
<i>Inches</i> 3/4	<i>Inches</i> 13	<i>Pounds</i> 500	<i>Pounds</i> 400
<i>Inches</i> 2	<i>Inches</i> 28	<i>Pounds</i> 300	<i>Pounds</i> 200

4. *Fittings, screw couplings.*—All hose shall be provided, unless otherwise specified, with couplings of the following description:

Unless otherwise specified, couplings shall be made of composition in accordance with the latest

issue of Navy Department specifications for valve bronze—composition "M." Couplings shall be of an approved type designed for use with an ordinary monkey wrench. Dimensions and threads shall be as specified in purchase order. The female coupling shall be of the swivel type, to permit of coupling without twisting the hose. The coupling shall withstand the pressure specified above and be substantial, of good workmanship, and designed so that it can readily be removed from or attached to the hose.

5. *Exclusion of unsatisfactory brands.*—Failure of any brand of hose to give satisfactory service, even though it meets the requirements outlined above, will operate to exclude the further purchase of the brand and type in question.

6. *Hose lengths.*—All hose shall be furnished in 50-foot, 25-foot, 20-foot, 10-foot, or other commercial lengths, as specified.

SOCIETY OF AUTOMOTIVE ENGINEERS, ELECTRICAL EQUIPMENT; FLEXIBLE STEEL CONDUIT AND TUBING, S. A. E. RECOMMENDED PRACTICE, JULY, 1926

FLEXIBLE STEEL CONDUIT AND TUBING

(Contains general specifications; tensile, breaking, and corrosion tests; dimensions, weights, stresses, and minimum bending radii for flexible steel conduit for insulated electric cables, for carburetor tubing, and for exhaust and heater tubing.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, SCREW THREADS, STANDARD, 1926

SCREW THREADS

The Sellers or Franklin Institute (United States standard) system of screw threads, boltheads, and nuts is the standard of the association, except for pipe work and special locomotive work, in which case either recommended practice or standards which have been adopted by the association should be used.

A set of gages for standard screw threads and a standard inch scale, 2 feet long, are held in the office of the secretary for reference.

Proportion of thread.—See Figure 314. Angle of thread, 60°. Divide the pitch, or side of thread, into eight equal parts; take off one part from the top (c), and fill in one part in the bottom of the thread (d), then the flat top and bottom will each equal one-eighth of the pitch; the wearing surface will be three-quarters of the pitch, and the diameter of the screw at the bottom of the thread will be expressed by the formula:

$$\text{Diameter} = \frac{1.299}{\text{number of threads per inch}}$$

**AMERICAN RAILWAY ASSOCIATION,
TELEGRAPH AND TELEPHONE SECTION,
SPECIFICATION FOR POLE LINE HARD-
WARE, 1-A-20, NOVEMBER, 1927**

(See also 608.2, p. 574 and 608.31, p. 589.)

POLE LINE HARDWARE

PURPOSE

1. The purpose of this specification is to guide the seller or contractor in the manufacture of pole line hardware for use in the telegraph and telephone plant.

GENERAL

2. The quality of the material used and the method of manufacture shall be such as to insure

GALVANIZING

6. When galvanizing is specified on the drawing, it shall be done by the hot-dip process and shall conform to general specification for galvanizing for iron and steel.

SAMPLES

7. Samples for detailed examination and test may be selected at random by the inspector in such quantities as fairly to represent the shipment. Such samples as are rendered unfit for use by testing shall be furnished free of cost.

PREPARATION FOR SHIPMENT

8. The material shall be so prepared as to permit convenient handling and to protect against loss or damage during shipment. The quantities and the method of packing shall be as specified by the purchaser.

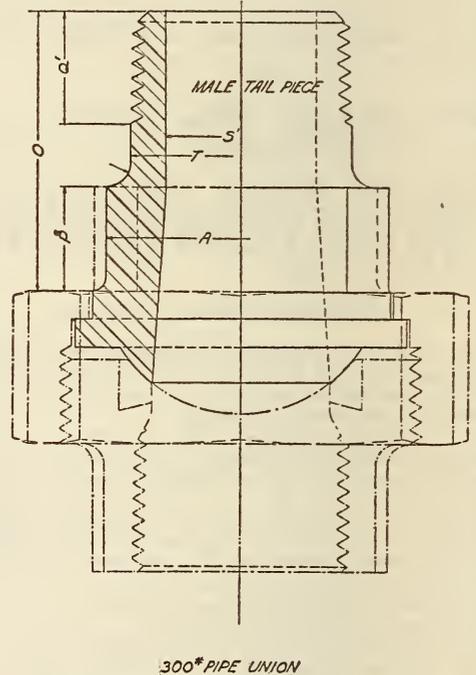

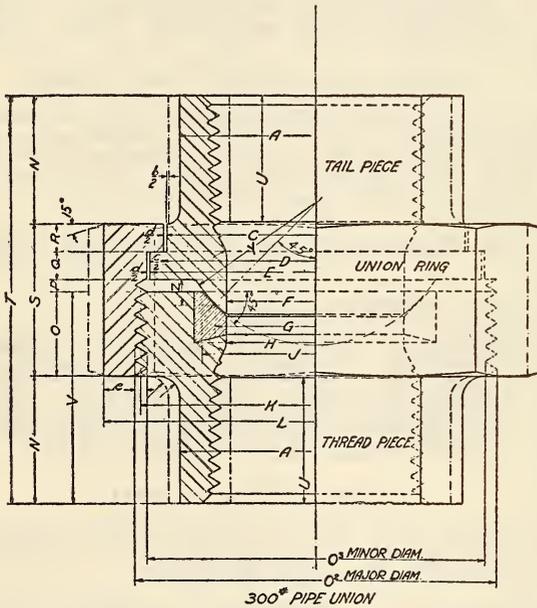

FIGURE 314.—Pipe unions of the nut and nipple type for locomotives, 300 pounds pressure

for the completed hardware the properties called for in this specification.

3. The specification and drawings are intended to cooperate with and supplement each other so that any details indicated in one and not in the other shall be executed the same as if indicated in both, unless exceptions are specifically mentioned within the body of this specification.

4. The seller or contractor must make sure that all material and work is in accordance with the specification before the hardware is offered.

DESIGNS AND DIMENSIONS

5. Designs and dimensions shall conform to the drawings. Allowable variations shall be within the limits specified; otherwise reasonable correspondence to the stated figures is required, consistent with good commercial practice.

**AMERICAN SOCIETY OF MECHANICAL
ENGINEERS, AMERICAN STANDARD
SCREW THREADS FOR BOLTS, MACHINE
SCREWS, NUTS, AND COMMERCIAL
TAPPED HOLES, B1a-1924**

[Approved as American standard by the American Standards Association, 1924]

STANDARD SCREW THREADS

(Joint sponsor with the Society of Automotive Engineers under the auspices of the American Standards Association. Screw threads for bolts, machine screws, nuts, tapped holes, etc., for general use, prepared in collaboration with the National Screw Thread Commission. Substantially the same as Tables 1 to 14 in United States Department of Commerce, Bureau of Standards, Miscellaneous Publication No. 89, given below.)

**SOCIETY OF AUTOMOTIVE ENGINEERS,
SCREW THREADS, S. A. E. (AMERICAN)
STANDARD, FEBRUARY, 1926**

[Approved as American standard by the American Standards Association]

STANDARD SCREW THREADS

(Joint sponsor with the American Society of Mechanical Engineers under the auspices of the American Standards Association. Screw threads for bolts, machine screws, nuts, tapped holes, etc., for general use, prepared in collaboration with the National Screw Thread Commission. Substantially the same as corresponding tables in United States Department of Commerce, Bureau of Standards, Miscellaneous Publication No. 89, given below, with the following additional data on extra-fine-thread series and fine-thread series over 1½ inches in diameter:)

The extra-fine-screw-thread series was adopted by the society in 1915 as the S. A. E. fine series for aeronautic and other applications where screw-threads finer than the present S. A. E. fine-screw thread series are necessary.

The extra-fine-screw-thread series is suited to parts (1) in which the thickness of the metal supporting the thread is not great, as in tubing, (2) which have a relatively light section, such as nuts, (3) which require fine adjustment, (4) where jar and vibration are very important factors, and (5) where assembly is made without the use of wrenches.

TABLE 14.—Basic diameters and thread data for the extra-fine-thread series

[Dimensions in inches]

Size	Threads per inch	Basic major diameter	Basic pitch diameter	Basic minor diameter	Pitch ¹	Basic depth of thread

¹ Basic diameter. Dimensions given are allowable only with tap having theoretically sharp corners. Threaded hole must not reject correct basic "Go" gage by interference with rounded roots due to worn tap. Minimum flat at root equals ¼ × p.

² Basic diameter.

³ The tolerances specified for pitch diameter are cumulative and include errors of lead and angle.

SCREW THREADS; TAP-DRILL REFER-
ENCE TABLES, MARCH, 1925**

TAP-DRILL REFERENCE TABLES

GENERAL INFORMATION

The following reference tables give the nearest drill sizes for the basic, maximum, and minimum minor diameters specified in the American standard for screw threads. Where possible, drill sizes are specified that are within the minor-diameter limits, but drill sizes without the limits are so noted unless they are without the minor-diameter limits by less than one-half of 1 per cent of the major diameter. The tables serve to determine:

1. Dimensions of minor-diameter-limit gages.
2. The sizes of tap drills within the limits.
3. The desired diameters of tap reamers.

The tap-drill tables give the tap drills recommended for general use. It should be noted that:

1. Sizes not marked by the superior letter "a" or "b" lie near the mean, favoring the high limit where the pitch is coarse relative to the screw size, and the low limit where the pitch is fine relative to the screw size; thus favoring the taps of small diameters and guarding against shallow threads in the large diameters. Used under normal conditions, these drills should produce holes that, when tapped, will be within the minor-diameter limits.

2. Sizes marked "a" are not recommended if the drill is allowed to cut larger than its nominal size.

3. Sizes marked "b" are preferable where the lengths of thread are less than three-fourths the major diameters in the smaller diameters, or are less than about two-thirds the major diameters in the larger diameters.

4. The size of drill best suited to a specific application is dependent upon the material, the nature of the cutting lubricant, the methods of drilling and tapping and the condition of the drill. To insure minor diameters acceptable to standard limit gages, the drills may have to be specially selected to meet these conditions.

Minor diameters for extra-fine threads with nearest drill sizes

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, AMERICAN NATIONAL STANDARD SCREW THREADS (COARSE AND FINE THREAD SERIES) COMMERCIAL STANDARD CS24-30, 1930

STANDARD SCREW THREADS

(This commercial standard makes available for convenient use six of the most essential tables of dimensions of fastening screws as published in the 1928 report of the National Screw Thread Commission. The tables are identical with Tables 1, 2, 15, 16, 107, and 108 in Miscellaneous Publication No. 89, of the Bureau of Standards, given below.)

^a Not recommended if drill is allowed to cut larger than its nominal size.
^b Preferable for thread lengths less than two-thirds of the nominal screw size.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, AMERICAN NATIONAL SPECIAL SCREW THREADS, COMMERCIAL STANDARD CS25-30, 1930

SPECIAL SCREW THREADS

(This commercial standard presents in compact form the tables of dimensions of special screw threads having the American national form of thread (60°) as published in the 1928 report of the National Screw Thread Commission. The tables are identical with Tables 27, 28, 29, 30, 31, 87, and 88 in Miscellaneous Publication No. 89, of the Bureau of Standards, given below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BOLTS, NUTS, STUDS, AND TAP RIVETS (AND MATERIAL FOR SAME), FF-B-571, OCTOBER 13, 1931

BOLTS, NUTS, STUDS, AND TAP RIVETS

A. APPLICABLE FEDERAL SPECIFICATIONS

Federal Specification QQ-M-151 (F. S. B. No. 339).—Metals; general specifications for, of the issue in effect on date of invitation for bids, forms a part of this specification.

B. TYPES

B-1. *Bolts*.—Shall be of the following types:

- A. Squarehead bolts.
1. Rough machine bolts.
 2. Semifinished machine bolts.
 3. Finished machine bolts.
- B. Hexagonal-head bolts.
1. Rough machine bolts.
 2. Semifinished machine bolts.
 3. Finished machine bolts.
- C. Round unslotted head bolts.
1. Machine bolts, button head.
 2. Carriage bolts, square neck.

B-2. *Nuts*.—Shall be of the following types:

- A. Hexagonal nuts.
1. Rough and semifinished regular nuts.
 2. Finished regular nuts.
 3. Castellated nuts.
 4. Finished and semifinished jam nuts.
 5. Light nuts.
- B. Square nuts.
1. Rough and semifinished regular nuts.
 2. Finished regular nuts.

B-3. *Tap rivets*.—Shall be of but one type.

C. MATERIAL AND WORKMANSHIP, ETC.

C-1. *Material*.—

C-1a. Unless otherwise specified, all steel rods from which bolts, studs, and tap rivets are to be manufactured shall be of uniform quality.

C-1b. Unless otherwise specified, nuts for class A, B, or C steel bolts shall be of class C steel.

C-1c. Ferrous materials not covered in paragraph E-1a and nonferrous materials from which bolts, nuts, studs, and tap rivets are to be made, shall con-

form, except as to dimensional requirements, to the issue, in effect at date of invitation for bids, of the applicable Federal specifications.

C-2. *Workmanship*.—

C-2a. The workmanship shall be compatible with the type and grade of product and class of fit and finish specified. The product shall be free from abnormal scale, fins, seams, or other defects. All bolts, nuts, studs, and tap rivets shall be free from any defects which might affect their serviceability.

C-2b. Unless the method of manufacture is specifically stated in the purchase order, the method of manufacture employed for the production of screw threads on bolts, nuts, studs, and tap rivets shall be by chasing, milling, tapping, die cutting, or rolling. Rolled threads on studs will not be permitted.

D. GENERAL REQUIREMENTS

D-1. *System of measurement*.—All dimensions are stated in inches.

D-2. *Screw threads*.—Screw thread notation shall conform to Figure 315 under National Screw Thread Commission, subject matter, "screw threads," given below. The form of thread profile shall be the American national form, as covered by Figure 317, also given below under National Screw Thread Commission, subject matter, screw threads.

D-3. *Classes of fit and tolerances*.—The class of fit of mating screw threads specified shall be class 1, loose fit; class 2, free fit; class 3, medium fit; class 4, close fit; or class 5, wrench fit—as established by the National Screw Thread Commission and determined by thread gages as specified below under National Screw Thread Commission, subject matter, screw threads.

D-4. *Thread series*.—Unless otherwise specified the number of threads per inch shall be that specified for the national coarse-thread series or the national fine-thread series, as covered by Table 1. Threads shall be of the coarse-thread series, unless otherwise specified.

TABLE 1.—*American national coarse and American national fine thread series*

Bolt size	Threads per inch		Bolt size	Threads per inch	
	Coarse	Fine		Coarse	Fine
No. 10.....	24	32	1 inch.....	8	14
No. 12.....	24	28	1¼ inches.....	7	12
¼ inch.....	20	28	1½ inches.....	7	12
⅜ inch.....	18	24	1¾ inches.....	6	12
½ inch.....	16	24	2 inches.....	5	10
⅝ inch.....	14	20	2 inches.....	4½	10
¾ inch.....	13	20	2¼ inches.....	4½	8
⅞ inch.....	12	18	2½ inches.....	4	8
1 inch.....	11	18	2¾ inches.....	4	8
1¼ inch.....	10	16	3 inches.....	14	8
1½ inch.....	9	14	3 inches.....	3½	8

¹ Optional. Standard for marine work.

E. DETAIL REQUIREMENTS

E-1. *Bolts, studs, and tap rivets*.—

E-1a. Unless otherwise specified, bolts, studs, and tap rivets shall be of class A, B, or C steel, as defined below. (See Par. I-6.)

Physical and chemical requirements

Class of steel	Kind of steel	Tensile strength per square inch (minimum)		Yield per square inch (minimum)	Elongation (minimum) ¹	P (maximum)	S (maximum)	Bend
		Lbs.	Lbs.					
A	Open-hearth alloy or carbon steel.	75,000	40,000	Pct. 21	Pct. 0.04	Pct. 0.045		Cold bend 18° about an inner diameter equal to one-half the thickness of the test specimen for diameters up to and including 1 inch, and equal to the thickness for diameters over 1 inch.
B	Open-hearth carbon steel.	58,000	30,000	26	.04	.045		Cold bend flat back through 180°.
C ¹	Commercial steel.	-----	-----	-----	-----	-----		-----

¹ Elongation for rods 1/2-inch and less in diameter shall be measured in an original length equal to 12 times the diameter of the test specimen; for material over 1/2-inch up to and including 1 inch in diameter the elongation shall be measured in a length of 8 inches; and for material over 1 inch in diameter up to and including 2 inches in diameter the required percentage of elongation, measured in a length of 8 inches, shall be reduced by 1 for each increase in diameter of 1/4 inch or fraction thereof above 1 inch. All test specimens shall be tested in full size when practicable. When the material is too large to so test and type 1 test specimen is used, an increase in elongation of 2 units of per cent over that specified in the table will be required.

² Class C shall not be tested unless considered necessary by the inspector to show that the material is equal to common steel of commercial quality. When tested the tensile strength shall be not less than 48,000 pounds.

E-2. Bolts and studs.—

E-2a. The length of bolts and studs shall not vary from the specified length by more than the following:

Up to and including 6 inches, ± 1/32 inch.

Over 6 inches in length, ± 1/16 inch.

E-2b. The dimensions and tolerances for body diameters of bolts and studs shall be as covered by Tables 64 and 65, given below, under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench head openings; introductory notes.

E-3. Bolts.—

E-3a. The tops of heads of square and hexagonal bolts shall be flat and chamfered. The angle of chamfer with the top surface shall be 30° for hexagonal bolts and 25° for square bolts. The diameter of the top flat circle shall be from 85 to 100 per cent of the width across flats.

E-3b. The thickness of heads of square and hexagonal bolts shall be the distance from the top to the bearing surface.

E-3c. The width across flats of square and hexagonal boltheads shall be measured at the widest point of the heads. The total taper of any two opposite sides of boltheads shall not exceed 4°.

E-3d. The length of machine bolts shall be measured from the extreme point to the bearing surface of the head. The length of the thread shall be measured from the extreme point to the last perfect thread.

E-3e. Heads of all types of bolts shall be concentric with the body, within a tolerance of 3 per cent of the width across flats.

E-3f. The minimum length of thread of all types of bolts shall, unless otherwise specified, conform to Table 66, under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench openings; machine bolts. (See 608.31,

p. 605.) (Note that in FF-B-571, with diameter of bolt ranging from 5/8 to 1 1/4 inches and bolt length of 1 to 1 1/2 inches, the bolt is threaded to the head. This is also true of bolts of diameter 1 to 1 1/4 inches and 1 1/8 to 2 inches long, of bolts of diameter 1 1/8 and 1 1/4 inches and 2 1/8 to 2 1/2 inches long, and of the 1 1/4-inch bolt 2 3/8 to 3 inches long. Note also that here the 3/8-inch bolt 1 1/8 to 2 inches long is threaded for 1 1/8 inches instead of 1 1/4 inches.)

E-3g. When bolts and nuts are ordered together, one nut shall be delivered on each bolt, which shall fit the bolt as specified. Bolts ordered separately shall be of the class of fit specified.

E-3h. Rough machine bolts, types A-1 and B-1, shall be threaded class 1, loose fit. Head dimensions shall conform to the requirements covered by Table 67, under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench openings; machine bolts. (See 608.31, p. 605.) Heads shall be at right angles to the body, within 3°.

E-3i. Semifinished machine bolts, types A-2 and B-2, shall be threaded class 3, medium fit, or class 2, free fit, as specified. They need not be machined except that the bearing surfaces shall be finished smooth, the ends shall be chamfered, and heads shall conform to the requirements covered by N. S. T. C. Table 67, referred to in the preceding paragraph. Heads shall be at right angles to the body, within 2°.

E-3j. Finished machine bolts, types A-3 and B-3, shall be threaded class 3, medium fit, unless otherwise specified. They shall conform to the requirements covered by Table 68, under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench openings; machine bolts. (See 608.31, p. 605.) Heads shall be at right angles to the body, within 2°. All finished bolts shall be washer faced. The thickness of the washer face shall be about one-sixty-fourth inch. The diameter of the bearing surface of the washer face shall equal the width across flats, within plus or minus 5 per cent.

E-3k. Button-head machine bolts, type C-1, and carriage bolts, square neck, type C-2, shall be furnished in sizes from No. 10 to three-fourths inch, inclusive, as required. Unless otherwise specified, they shall be furnished in the coarse-thread series, class 2, free fit. Each bolt shall be furnished with one nut assembled on the bolt.

E-3k (1). The radius of fillet on types C-1 and C-2 bolts shall be as follows:

No. 10 to one-half inch, inclusive, 1/32-inch fillet.

Nine-sixteenths to three-fourths inch, inclusive, 1/16-inch fillet.

E-3k (2). Head dimensions of button-head machine bolts, type C-1, shall conform to Table 5 of American Society of Mechanical Engineers in B18e-1928. (See 608.31, p. 595.) Length of thread shall also conform to this Table 5.

E-3k (3). Head dimensions of carriage bolts, round head, square neck, type C-2, shall conform to Table 1 of American Society of Mechanical Engineers in B18e-1928. (See 608.31, p. 590.) Length of thread shall also conform to this Table 1.

E-3l. When zinc-coated (galvanized) bolts are required they shall conform to the dimensional requirements before coating. The coating shall be thoroughly and evenly applied by the hot process. The bolt shall be threaded class 1, loose fit, before coating. After coating, a tolerance of 0.010 inch (maximum) will be permitted for the body diameter and height of head. The width across flats shall be less than the minimum wrench opening (National Screw Thread Commission). The nuts threaded to fits required shall assemble with the coated bolts.

E-3m. When cadmium-coated bolts are required they shall meet all dimensional requirements after

coating. Coating shall be performed after threading, and the threads shall be completely coated.

E-4. Studs.—

E-4a. Studs shall be furnished one-fourth inch and over in diameter and threaded on each end as specified.

E-4b. The length of the stud is measured from extreme end to extreme end. The length of threads is measured from extreme end to the last perfect thread.

E-4c. Studs shall be made to the thread series, class of fit, and finish specified.

E-4d. Unless otherwise specified, stud bolts shall be threaded as follows:

The stud end shall be threaded for a length equal to one and one-half times the diameter. The nut end shall be threaded for the respective length covered by Table 66 of the National Screw Thread Commission referred to above in paragraph E-3f, with notations thereon. In case the stud is too short to permit such threading, the threading shall be equal length on each end to center.

E-5. Nuts.—

E-5a. Unless otherwise specified, semifinished or finished nuts shall be either cold punched or machined from bar stock. Rough nuts may be cold or hot punched or hot forged.

E-5b. When nuts are furnished with bolts the threads of the nuts shall, unless otherwise specified, be of the same thread series and class of fit as the threads of the bolts. When nuts are ordered separately the threads shall be of the thread series and class of fit specified.

E-5c. Unless otherwise specified, the washer face of finished nuts shall be at right angles to the axis of the threaded hole, within a tolerance of 1°. The bearing face of the rough and semifinished nuts shall be within 2° of right angles of the axis of the holes.

E-5d. All finished and semifinished hexagonal and square regular nuts, castellated nuts, and hexagonal light nuts shall be washer faced. The thickness of the washer face, including that of jam nuts having a washer face, shall be about one sixty-fourth inch. The diameter of the bearing surface of the washer face shall equal the width across flats, within plus or minus 5 per cent. The thickness of the nut shall be the distance from the top to the bearing surface.

E-5e. The tops of regular square and hexagonal nuts when not castellated, of jam nuts, and of hexagonal light nuts when not castellated shall be flat and chamfered. The angle of chamfer with the top surface shall be 30° for hexagonal nuts and 25° for square nuts, and the diameter of the top flat circle shall be from 85 to 100 per cent of the width across flats.

E-5f. The width across flats of nuts shall be measured at the widest point. The total taper of any two opposite sides of nuts shall not exceed 4°.

E-5g. Rough and semifinished regular nuts, types A-1 and B-1, shall conform to Table 69 under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench openings; nuts. (See 608.32, p. 610.)

E-5h. Finished regular nuts, types A-2 and B-2, shall conform to Table 70 under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench openings; nuts. (See 608.32, p. 610.)

E-5i. Castellated nuts, type A-3, shall conform to Table 71 under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench openings; nuts. (See 608.32, p. 611.)

E-5j. Finished and semifinished jam nuts, type A-4, shall conform to Table 72 under National Screw Thread Commission, subject matter, wrench

head bolts and nuts, and wrench openings; nuts. (See 608.32, p. 611.) Unless otherwise specified, jam nuts shall be double chamfered. If a single chamfer is specified, the opposite side shall be washer faced.

E-5k. Hexagonal light nuts, type A-5, shall conform to Table 73 under National Screw Thread Commission, subject matter, wrench head bolts and nuts, and wrench openings; nuts. (See 608.32, p. 611.)

E-5l. When zinc-coated (galvanized) nuts are required they shall conform to the dimensional requirements before threading or coating. The coating shall be thoroughly and evenly applied by the hot process. Threading shall be performed after coating.

E-5m. When cadmium-coated nuts are required they shall meet all dimensional requirements after coating. Threading shall be performed before coating, and the threads shall be completely coated.

E-6. Tap rivets.—

E-6a. The dimensions of tap rivets shall conform to Table 1 under Federal Specifications Board specification FF-B-571, subject matter, tap rivets. (See 608.4, p. 615.) They shall have flat countersunk heads, except that square projections shall be provided on the tops of heads whereby they may be screwed into place. The length of the rivet shall be measured from the extreme point to the maximum bearing surface of the head. Tap rivets shall be threaded class 3, medium fit. The body of the rivet shall be threaded its entire length to the taper of the head.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. Bolts, studs, and tap rivets.—

F-1a. Material from which bolts, studs, and tap rivets are to be manufactured shall, when so specified in invitation for bids, be tested by either melts or lots. When tested by melts, not less than two tension tests and two bend tests shall be selected from each size rod or bar from each melt. When the melt can not be identified the material shall be inspected and tested by lots. Each lot shall consist of 2,000 pounds or fraction thereof from each size submitted, from which two tension and two bend tests shall be selected. The physical properties shall conform to the requirements of the contract.

F-1b. The finished product shall pass the following physical tests: Bolts, studs, and tap rivets shall be tested whether or not the rod or bar stock has been tested before fabrication.

F-1b (1). *Test specimens.*—For purposes of inspection the finished product shall be divided into lots of not more than 1,000 pounds. There shall be selected not less than two specimens from each lot of the same material, having the same diameter, submitted for final inspection. One-half of the specimens so selected from each lot shall be used for bending tests and the other half for tension tests.

F-1b (2). Tension tests.—

F-1b (2)a. The tension-test specimens, selected as specified above, shall be subjected to a tension test, and the bolt, stud, or tap rivet shall meet the tensile strength specified for the material called for by the contract or order. The load shall be applied in an axial direction on the bearing surfaces of the head and a nut or threaded plate into which the bolt, stud, or tap rivet has been screwed a depth of one diameter. The test load shall be applied at a pulling speed of not more than 2 inches per minute.

F-1b (2) b. Test specimens for bolts, studs, or tap rivets larger than 1½ inches in diameter may be prepared by turning therefrom 1¼-inch studs. The axis of the stud shall be halfway between the axis of the bolt and the outside diameter, or as near thereto as consistent. These studs shall be tested in a

manner as specified for testing bolts, by fitting a 1¼-inch nut on each end.

F-1b (2) c. In determining the tensile strength of bolts, studs, or tap rivets, the effective area will be the cross-sectional area based on pitch diameter for ferrous materials and on minor diameter for non-ferrous materials. For this purpose the areas in Table 16 shall be used.

TABLE 16.—Cross-sectional areas of American national coarse and American national fine thread series

F-1b (2) d. Bolts of lengths and corresponding diameters shown below, and bolts longer than shown, shall be tested after fabrication:

Diameter.....	In.										
Length.....	1	1	1¼	1¾	1¾	1½	1½	1¾	2	2½	3
	¼	⅜	½	⅝	¾	¾	1	1¼	1½	1¾	2

Materials for bolts shorter than provided for in the above table shall be tested before fabrication in accordance with paragraph F-1a.

F-1b (3). *Bending tests.*—

F-1b (3) a. Unless otherwise specified, no bending tests shall be made on nonferrous bolts, studs, or tap rivets.

F-1b (3) b. Ferrous bolts, studs, or tap rivets, unless of special material, shall be tested as follows:

F-1b (3) b 1. When the bolts are of sufficient length in the unthreaded portion to permit cold bending, the bolt selected for test shall withstand being bent 180°, without fracture, to a curve, the inner radius of which is equal to the radius of the bolt.

F-1b (3) b 2. When the bending test can not be applied, the test specimen shall withstand flattening cold to a thickness equal to one-half of its original diameter, without showing cracks. Casehardened bolts shall not be subjected to the above bending and flattening tests.

F-2. *Nuts.*—

F-2a. Unless otherwise specified, physical tests for nuts shall be made as follows:

F-2a (1). *Tests specimens.*—For purposes of inspection the product shall be divided into lots of not more than 1,000 pounds. There shall be selected not less than two specimens from each lot of the same material and of the same size ready for final inspection.

F-2a (2). *Tests.*—One-half of the specimens so selected shall be drifted cold until they break. The fracture must show normal uniform material.

F-2a (3). Unless otherwise specified, one-half of the specimens so selected shall withstand flattening axially, cold, to one-half of the original thickness without showing cracks. In the case of castellated nuts, the castellated portion shall be cut off before making this test. Casehardened nuts shall not be subjected to the above tests.

F-3. *Gaging of dimensions.*—

F-3a. *Inspection of dimensions.*—Unless otherwise specified, the thread dimensions of bolts, nuts, studs, and tap rivets shall be gaged in order to insure that the manufactured product conforms to the specified dimensions within the limits of variations establishing the closest and loosest conditions of fit permissible for the class of fit specified. This requires the use of gages representing the limit of maximum metal, known as "go" gages, which control the minimum looseness or maximum tightness in the fit of mating parts and which accordingly control interchangeability, and the use of gages representing the limit of minimum metal, known as "not go" gages, which limit the amount of looseness between mating parts, and thus control in large measure the proper functioning of the parts. The body or head dimensions of bolts, nuts, and screws shall likewise be inspected by means of suitable gages or measuring instruments.

F-3b. *Inspection gages.*—Unless otherwise specified, the manufacturer shall make available to the inspector the necessary inspection gages, the accuracy of which shall be certified in a manner satisfactory to the inspector. In case of controversy the certification of the U. S. Bureau of Standards, based on the latest report of the National Screw Thread Commission, shall govern.

F-3c. *Test specimens.*—One specimen of each size shall be selected by the inspector from each lot of 100 or fraction thereof and shall be tested for accuracy of dimensions.

F-3d. *Rejection.*—The failure of any one test specimen to pass the dimensional requirements will result in the rejection of the lot from which the specimen was selected. If more than 10 per cent of the

lots representing the entire submission or order fail, the entire submission or order shall be rejected.

F-4. *Zinc coating (galvanizing) and cadmium coating.*—Bolts, nuts, and studs shall be surface inspected to determine whether zinc coating (galvanizing) or cadmium coating is satisfactory.

G. PACKAGING, PACKING, AND MARKING

G-1. *Packing.*—

G-1a. *Bolts and studs.*—

G-1a (1). Bolts and studs when fitted with nuts, or ordered separately, shall be packaged as follows, as specified in the contract or order:

(a) In cardboard boxes, cartons, or paper wrappers.

(b) In bulk in accordance with best commercial practice.

G-1a (2). When packaged in accordance with paragraph G-1a (1) (a) the packages shall contain 25 units or multiples thereof not in excess of 100 units.

G-1a (3). Each package of bolts or studs shall contain one size only.

G-1a (4). No bolts or studs of sizes larger than those specified below shall be packaged in accordance with paragraph G-1a (1) (a):

$\frac{1}{4}$ -inch bolts up to 8 inches long.

$\frac{5}{16}$ -inch bolts up to 10 inches long.

$\frac{3}{8}$ -inch bolts up to 12 inches long.

$\frac{7}{16}$ -inch bolts up to 12 inches long.

$\frac{1}{2}$ -inch bolts up to 12 inches long.

$\frac{5}{8}$ -inch bolts up to 8 inches long.

G-1a (5). When packaged in accordance with paragraph G-1a (1) (a), the bolts or studs shall be delivered in substantial commercial wooden cases or boxes so constructed as to insure acceptance by common or other carrier for safe transportation at the lowest rate to the point of delivery.

G-1a (6). When packed in accordance with paragraph G-1a (1) (b), in cases or kegs, the bolts or studs shall be delivered in substantial commercial wooden containers so constructed as to insure acceptance by common or other carrier for safe transportation at the lowest rate to the point of delivery, and each case or keg shall contain one size, only.

G-1b. *Nuts.*—

G-1b (1). When nuts are ordered separately they shall be packed in accordance with either paragraph G-1a (1) (a) or G-1a (1) (b), as specified in the contract or order.

G-1b (2). When packaged in accordance with paragraph G-1a (1) (a), the packages shall contain 25 nuts, or multiples thereof, not in excess of 100 units.

G-1b (3). Each package of nuts shall contain one size only.

G-1b (4). When packaged in accordance with paragraph G-1a (1) (a), the nuts shall be delivered in substantial commercial wooden cases, or boxes so constructed as to insure acceptance by common or other carrier for safe transportation at the lowest rate to the point of delivery.

G-1b (5). When packed in accordance with paragraph G-1a (1) (b), in cases or kegs, the nuts shall be delivered in substantial commercial wooden containers so constructed as to insure acceptance

by common or other carrier for safe transportation at the lowest rate to the point of delivery, and each case or keg shall contain one size only.

G-1c. *Tap rivets.*—

G-1c (1). Tap rivets shall be packed in substantial wooden cases or kegs so constructed as to insure acceptance by common or other carrier for safe transportation at the lowest rate to the point of delivery. Each case or keg shall contain one size only, unless the various sizes are properly packaged.

G-2. *Marking.*—

G-2a. *Individual packages.*—Each package of bolts, nuts, or studs shall bear a label stating the name of the manufacturer, the number of units, type, length of bolts or studs, type of nut, and also a mark designating the diameter, threads per inch, thread series, and class of fit; for example:

National coarse-thread series:

To specify a threaded part 1 inch diameter, 8 threads per inch, class 1 fit.----- Mark 1"-8-NC-1

National fine-thread series:

To specify a threaded part 1 inch diameter, 14 threads per inch, class 4 fit.----- 1"-14-NF-4

G-2b. *Cases, boxes, or kegs.*—Cases, boxes, or kegs containing bolts, nuts, or tap rivets shall be stenciled with a description of the contents, as required by paragraph G-2a, for individual packages, and also with the name of the contractor, the number of the contract or order, the item or items contained in the case, box, or keg, and the gross weight in pounds. One end and one side and the top and bottom of the cases, boxes, or kegs shall be free from marks.

I. NOTES

I-1a. In ordering bolts, nuts, studs, or tap rivets, the following, as applicable, should be stated in the requisition or order:

I-1a. *Quantity.*—Bolts and nuts, when ordered together, or separately, should be ordered by the number of pieces.

I-1b. Type of bolt or nut.

I-1c. Nominal diameter.

I-1d. Thread series and class of fit.

I-1e. Length of bolt or stud.

I-1f. Kind and grade of material (referring to governing Federal specifications).

I-2. Square-head and hexagonal-head bolts shall be furnished $\frac{1}{4}$ inch in diameter and over.

I-3. Screw threads specified herein for bolts, nuts, and studs are in agreement with the report of the National Screw Thread Commission, revised 1928 (Bureau of Standards Miscellaneous Publication No. 89).

I-4. Boltheads and nuts herein specified are in agreement with the forms and dimensions specified in the standards issued by the American Standards Associations (report B18b-1927). In case oversize boltheads or nuts are manifestly necessary for a particular application the dimensions in the tables herein listed may be ignored and the dimensions actually required shall be specified by the purchaser.

I-5. In the purchase of material from which bolts, nuts, studs, and tap rivets are to be manufactured it is recommended that Table 19, which contains proper tolerances, be used.

TABLE 19.—Limiting dimensions of round-bolt stock and hexagon bolt and nut stock for American national coarse and fine thread series, classes 2, 3, 4, and 5 fits

GENERAL REQUIREMENTS

1. *Physical requirements.*—Screws shall meet the physical requirements specified by the Government department concerned.
2. *Assembly requirements.*—When screws are ordered with nuts, a nut shall be assembled on each.
3. *Screw threads.*—Screw threads shall be in accordance with the following specifications:
 - (a) *Notation.*—Screw-thread notation shall be in accordance with Figure 316. (See National Screw Thread Commission, below.)
 - (b) *Thread form.*—The form of thread profile shall be the national form, as shown in Figure 317. (See National Screw Thread Commission, below.)
 - (c) *Classes of fit and tolerances.*—The class of fit of mating screw threads specified shall be class 1, loose fit; class 2, free fit; class 3, medium fit; or class 4, close fit; as established by the National Screw Thread Commission and determined by thread gages specified below.

DETAIL REQUIREMENTS

1. *Thread series.*—The diameters and threads per inch shall be those specified as the national coarse thread series, or the national fine thread series, as shown below in Tables Nos. 7 and 13 of the National Screw Thread Commission.
2. *Body diameters.*—The dimensions and tolerances for body diameter of screws shall be as in Tables 64 and 65 of the National Screw Thread Commission, given below.
3. *System of measurements.*—Unless otherwise specified, all dimensions are stated in inches.
4. *Tolerances on length.*—(Same as National Screw Thread Commission, given below.)

METHODS OF INSPECTION AND TESTS

In addition to such prior tests of the unfinished material as may have been specified in the order, the finished product shall, unless otherwise specified, pass the following tests, which shall be at the expense of the contractor.

1. *Physical tests for screws.*—Physical tests for screws shall be as follows:

(a) *Test specimens.*—For purposes of inspection the product shall be divided into lots of not more than 1,000 pounds. There shall be taken not less than two specimens from each lot of the same material having the same diameter and ready for final inspection. One-half of the specimens so selected from each lot shall be used for bending tests and the other half for tensile tests.

I-6. In the purchase of bar stock for the manufacture of bolts complying with the requirements for class A steel and class B steel bolts, it is suggested that the minimum tensile strength per square inch be increased to 79,000 pounds and 62,000 pounds, respectively, in order that the finished bolts may meet the requirements of paragraph E-1a.

I-7. In accepting material before fabrication which complies with the requirements of the contract or order, no responsibility is assumed by the Government in the matter of tensile strength of finished bolts, studs, or tap rivets made therefrom.

I-12. Cap screws, set screws, machine screws, and stove bolts are covered by Federal Specification FF-S-91 (F. S. B. No. 548). (See below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR CAP SCREWS, SET SCREWS, MACHINE SCREWS, AND STOVE BOLTS, NO. 548, 1928. (CURRENT DESIGNATION: FF-S-91)

MACHINE SCREWS AND STOVE BOLTS MATERIAL AND WORKMANSHIP

1. *Material.*—For special purposes, the material shall be in accordance with the requirements of the

(b) *Tension tests.*—The tension-test specimens selected as specified above shall be subjected to a tension test, and the screw shall meet the tensile strength specified for the material called for by the order. The force shall be applied in an axial direction on the bearing surfaces of the head and a nut or threaded plate into which the screw has been screwed to a depth of one diameter. The test load shall be applied at a pulling speed of not more than 2 inches per minute.

When the order calls for screws too short to apply the foregoing tension test, the number of tension-test specimens specified above may be selected from the rods from which short screws are to be made. In determining the tensile strength of the screw, the effective area will be the cross-sectional area based on pitch diameter for ferrous metals and on minor diameter for nonferrous metals. For this purpose the areas given in Table 26 in F. S. B. FF-B-571, above, shall be used.

(c) *Bending tests.*—When specified, bending tests shall be made as required in the United States Government master specification covering the material, or specifications of the Government department concerned.

(1) Unless otherwise specified, no bending tests shall be made on nonferrous screws.

(2) Ferrous screws, unless of special material, shall be tested as follows:

When the screws are of sufficient length in the unthreaded portion to permit cold bending, the test specimen shall withstand being bent 180°, without fracture, to a curve the inner radius of which is equal to the radius of the bolt.

When the bending test can not be applied, the test specimen shall withstand flattening cold to a thickness equal to one-half of its original diameter, without showing cracks.

2. *Gaging of dimensions.*—(a) *Inspection of dimensions.*—Unless otherwise specified, the thread dimensions of screws shall be gaged in order to insure that the manufactured product conforms to the specified dimensions within the limits of variation establishing the closest and loosest conditions of fit permissible for the class of fit specified. This requires the use of limit gages, namely “go” gages, representing the limit of maximum metal which must assemble with the product, and “not go” gages, representing the limit of minimum metal which must not assemble with the product. The body or head dimensions of screws shall likewise be inspected by means of suitable gages or measuring instruments.

Unless otherwise specified, the manufacturer shall make available to the inspector for the purchaser the necessary inspection gages, the accuracy of which shall be certified in a manner satisfactory to the purchaser. In case of controversy the certification of the Bureau of Standards, based on the latest report of the National Screw Thread Commission, shall govern.

(b) *Test specimens.*—When screws are made to class 1, loose fit; or class 2, free fit specifications; at least one specimen of each size shall be taken by the inspector from each lot of 100, or fraction thereof, and shall be tested for the accuracy of dimensions.

When screws are made to class 3, medium fit, or class 4, close fit specifications, at least five specimens of each size shall be taken by the inspector from each lot of 100, or fraction thereof, and shall be tested for the accuracy of dimensions.

3. *Rejection.*—The failure of any one test specimen to pass the foregoing requirements will result in the rejection of the lot from which the specimen was taken. If more than 10 per cent of the lots representing the entire submission or order fail,

the entire submission or order shall be rejected. Rejected material shall not be resubmitted.

PACKING AND MARKING OF SHIPMENTS

1. *Outside packing.*—Unless otherwise required, screws shall be delivered packed in accordance with best commercial practice.

2. *Inside packing.*—In addition to the above outside packing unless otherwise required, screws and stove bolts shall be packed in strong cartons, pasteboard boxes, or suitable paper wrappings. Each of these packages shall contain the same number; standard commercial packing may be either on the basis of a gross, a hundred, or fraction thereof. Each of such packages shall be marked with the name of the material and contents, type of head, length, diameter, threads per inch, quantity, the manufacturer's name, and description of contents as specified below. Packages containing one item only shall be neatly labeled on one end with the number and description of contents.

3. *Marking of packages.*—The description, which includes the type, style, finish, diameter, threads per inch, thread series, and class of fit, shall be in accordance with the system of marking specified by the National Screw Thread Commission, as follows:

The method of designating a screw thread by means of symbols is by the use of the initial letters of the thread series, preceded by the diameter in inches (or the screw number) and number of threads per inch, all in Arabic characters, followed by the classification of fit in Arabic numerals.

For example, to specify a bolt 5 inches long, 1 inch in diameter, 8 threads per inch, national coarse thread series, class 1 fit, write

-----5 inches by 1 inch-8-N-C-1
To specify a cap screw 3 inches long, 1 inch in diameter, 14 threads per inch, national fine thread series, class 4 fit, write

-----3 inches by 1 inch-14-NF-4

NOTES

1. *Items to be stated in requisition.*—In ordering screws, the following items should be stated in the requisition:

Kind of material and physical requirements. (Material should conform to the applicable United States Government master specification wherever possible.)

(a) Type of screw and shape of head or nut.

(b) Size, length, thread series, and class of fit.

Machine screws are not furnished with nuts unless specified.

2. *Screw thread specifications.*—Screw threads specified herein for screws are in agreement with the report of the National Screw Thread Commission, revised 1928. (Bureau of Standards miscellaneous publication No. 89; also with report B18c-1930, of the American Standards Association.)

3. *Screw thread practice.*—The usual commercial practice as to application of thread series and class of fit is indicated in Table 120 of the National Screw Thread Commission, given below.

4. *Screw lengths.*—Screws, except for special requirements, should be ordered in the following increments of length:

Length (inches)	Increment
1/16 to 1/2	1/16
Over 1/2 to 1 1/4	1/8
Over 1 1/4 to 3	1/4
Over 3	1/2

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

SCREW THREADS

(This report consists of 261 pages of text, tables, and illustrations. Included is a brief history of screw-thread standardization in the United States, beginning with the appointment of the special com-

shaft. In the fit of a plain hole and shaft only three elements are taken into account in securing a given class of fit, namely, rotundity, diameter, and length; whereas in a screw-thread fit it is necessary to consider rotundity, length, major diameter, pitch diameter, minor diameter, angle of thread, and pitch or lead. A variation in any one of these elements of a screw thread will prevent a good fit, so that it is much more difficult to make a good screw-thread fit than it is to make a plain bearing fit.

ARRANGEMENT OF REPORT

There are included in the body of the report specifications for threaded products and gages, embodying sufficient information to permit the writing of definite and complete specifications for the purchase of screw-thread products. In the appendixes there is arranged supplementary information of both a general and technical nature, including such specifications as are not intended to be mandatory.

The specifications in the report have been arranged, as far as possible, by products. For example, one section deals with threads for bolts and nuts, etc., another with hose-coupling threads, another with pipe threads, etc. As far as practicable, each section is arranged in the following order: (1) Form of thread, (2) thread series, (3) classification and tolerances, (4) tables of dimensions, and (5) gages.

TERMINOLOGY

In this report there are utilized, as far as possible, nontechnical words and terms which best convey

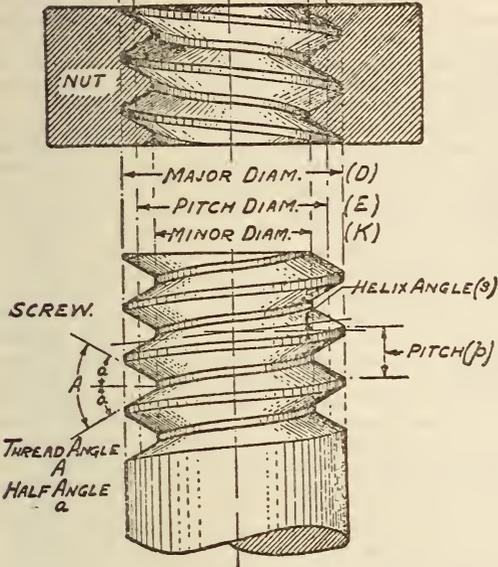

FIGURE 315.—Screw thread notation

mittee by the Franklin Institute on April 21, 1861, down to the act of Congress, on April 16, 1926, creating a self-perpetuating commission for the standardization of screw threads. In view of present-day manufacturing requirements the need of definite screw-thread specifications is set forth in some detail, extracts from which include the following):

NEED OF DEFINITE SPECIFICATIONS

A prerequisite of the present-day quantity production of machine parts is standardization of form and dimensions of parts, which involves also the specification of standard limiting dimensions of the manufactured product in order that interchangeability may be established. The economic advantages of producing interchangeable machined parts, particularly when made in different manufacturing plants located at a distance from each other, which will assemble without difficulty and in a dependable manner, are generally recognized.

The standardization of screw threads, involving as it does the specification of sizes which are necessary to industry, the elimination of unnecessary sizes, and the securing of interchangeability, is especially important because of their use in enormous quantities in all varieties of mechanisms. Such standardization is important to the user of a machine, as well as to the manufacturer, as the user should be able to buy locally a screw or nut for replacement in case of breakage or wear.

A screw-thread fit can not be accurately made with the same facility as the fit of a plain hole and

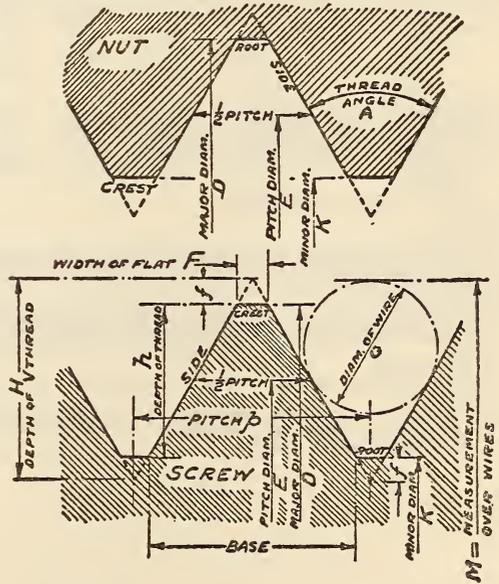

FIGURE 316.—Screw thread notation

alike to the producer and user of screw threads the information presented.

AMERICAN NATIONAL FORM OF THREAD

The form of thread profile specified, known previously as the United States standard or Sellers' profile, is adopted by the commission and shall hereafter be known as the American national form of thread.

The American national form of thread shall be used for all screw-thread work except when otherwise specified for special purposes.

THREAD SERIES

It is the aim of the commission, in establishing thread systems for general use, to eliminate all unnecessary sizes and, in addition, to utilize as far as possible present predominating sizes. While from certain standpoints it would have been desirable to make simplifications in the thread systems and to establish more thoroughly consistent standards, it is believed that any radical change at the present time would be out of place and interfere with manufacturing conditions, and would involve great economic loss.

The testimony given at the various hearings held by the commission is very consistent in favoring the maintenance of the present coarse-thread and fine-

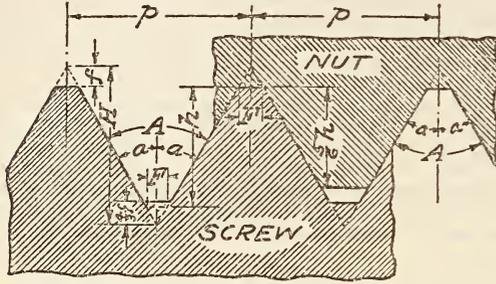

FIGURE 317.—American national form of thread

NOTE.—No allowance is shown. This condition exists in class 2, free fit, and class 3, medium fit, where both the minimum nut and the maximum screw are basic.

NOTATION

n = number of threads per inch.
 H = $0.866025 p$ depth of 60° sharp v thread.
 h = $0.649519 p$ depth of American national form of thread.
 $\frac{5}{8}h$ = $0.541266 p$ maximum depth of engagement.
 F = $0.125000 p$ width of flat at crest and root of American national form.

f = $\begin{cases} = 0.108253 p \\ = \frac{1}{8}H \\ = \frac{1}{16}h \end{cases}$ depth of truncation.

Class 1, loose fit:

Includes screw-thread work of rough commercial quality, where the threads must assemble readily, and a certain amount of shake or play is not objectionable.

Class 2, free fit:

Includes the great bulk of screw-thread work of ordinary quality, of finished and semifinished bolts and nuts, machine screws, etc.

Class 3, medium fit:

Includes the better grade of interchangeable screw-thread work.

Class 4, close fit:

Includes screw-thread work requiring a fine snug fit, somewhat closer than the medium fit. In this class of fit selective assembly of parts may be necessary.

thread series, the coarse-thread series being the United States standard threads, supplemented in the sizes below one-fourth inch by sizes taken from the standard established by the American Society of Mechanical Engineers. The fine-thread series is composed of standards that have been found necessary, and consists of sizes taken from the standards of the Society of Automotive Engineers and the fine-thread series of the American Society of Mechanical Engineers.

CLASSIFICATION AND TOLERANCES

There are established for general use four distinct classes of screw-thread fits as specified in the following brief outline. These four classes of fits, together with the accompanying specifications, are for the purpose of insuring the interchangeable manufacture of screw-thread parts throughout the country.

It is not the intention of the commission arbitrarily to place a general class or grade of work in a specific class of fit. Each manufacturer and user of screw threads is free to select the class of fit best adapted to his particular needs. The tolerances and dimensions for four classes of fit are given in Tables 3 to 14, inclusive, and summarized in Tables 15 and 16.

An examination of the dimensional specifications for the various classes of fit shows that a screw made to one class of fit may be used with a nut or tapped hole made to some other class of fit. The resulting quality of fit may represent an intermediate class or may approximate one of the classes of fit adopted as standard. The use of different classes of fit on the screw and threaded hole may be justified when equipment available is such that one member can be economically produced to a higher accuracy than the other. For instance, common commercial machine screws are made to class 2, free fit, while machine screw nuts are commonly supplied in class 1, loose fit; or, ground taps may make it practicable to produce class 3 nuts for use with class 1 or class 2 screws.

(a) AMERICAN NATIONAL COARSE-THREAD SERIES

In Table 1 are specified the nominal sizes and basic dimensions of the American national coarse-thread series.

The American national coarse-thread series is recommended for general use in engineering work, in machine construction where conditions are favorable to the use of bolts, screws, and other threaded components where quick and easy assembly of the parts is desired, and for all work where conditions do not require the use of fine-pitch threads.

TABLE 1.—American national coarse-thread series

¹ Optional. Standard for marine work.

(b) AMERICAN NATIONAL FINE-THREAD SERIES

In Table 2 are specified the nominal sizes and basic dimensions of the American national fine-thread series.

The American national fine-thread series is recommended for general use in automotive and aircraft work, for use where the design requires both strength and reduction in weight, and where special conditions require a fine thread.

TABLE 2.—American national fine-thread series

Identification		Basic diameter			Thread data						
Sizes	Threads per inch <i>n</i>	Major diameter <i>D</i>	Pitch diameter <i>E</i>	Minor diameter <i>K</i>	Metric equivalent of major diameter	Pitch <i>p</i>	Depth of thread <i>h</i>	Basic width of flat <i>p/8</i>	Minimum width of flat at major diameter of nut <i>p/24</i>	Helix angle at basic pitch diameter <i>s</i>	Basic area of section at root of thread $\frac{\pi K^2}{4}$

¹ The tolerances specified for pitch diameter include all errors of pitch diameter, lead, and angle. The full tolerance can not therefore be used on pitch diameter unless the lead and angle of the thread are perfect. Columns 4 and 5 give, for information, the errors in lead (per length of thread engaged) and in angle, each of which can be compensated for by half the tolerance on the pitch diameter given in column 3. If lead and angle errors both exist to the amount tabulated, the pitch diameter of a bolt, for example, must be reduced by the full tolerance or it will not enter a basic nut or gage.

² Between any 2 threads not farther apart than the length of engagement.

¹ Dimensions given for the maximum minor diameter of the screw are figured to the intersection of the worn tool arc with a center line through crest and root. The minimum minor diameter of the screw shall be that corresponding to a flat at the minor diameter of the minimum screw equal to 1/8 X p, and may be determined by subtracting the basic thread depth, h (or 0.6495p), from the minimum pitch diameter of the screw.

² Dimensions for the minimum major diameter of the nut correspond to the basic flat (1/8 X p), and the profile at the major diameter produced by a worn tool must not fall below the basic outline. The maximum major diameter of the nut shall be that corresponding to a flat at the major diameter of the maximum nut equal to 1/2 X p, and may be determined by adding 1 1/4 X h (or 0.7939p) to the maximum pitch diameter of the nut.

¹ Dimensions given for the maximum minor diameter of the screw are figured to the intersection of the worn tool arc with a center line through crest and root. The minimum minor diameter of the screw shall be that corresponding to a flat at the minor diameter of the minimum screw equal to $\frac{1}{8} \times p$, and may be determined by subtracting the basic thread depth, h (or $0.6495p$), from the minimum pitch diameter of the screw.

² Dimensions for the minimum major diameter of the nut correspond to the basic flat ($\frac{1}{8} \times p$), and the profile at the major diameter produced by a worn tool must not fall below the basic outline. The maximum major diameter of the nut shall be that corresponding to flat at the major diameter of the maximum nut equal to $\frac{1}{24} \times p$, and may be determined by adding $1\frac{1}{2} \times h$ (or $0.7939p$) to the maximum pitch diameter of the nut.

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

SCREW THREADS OF SPECIAL DIAMETERS, PITCHES, AND LENGTHS OF ENGAGEMENT

The tolerances specified above in relation to standard threads apply in general to bolts, nuts, and tapped holes of standard pitches and diameters. They are based on the pitch of the thread and a length of engagement equal to the basic major diameter, but are used for lengths of engagement up to one and one-half diameters.

In addition to the foregoing threaded components, there are large quantities of threaded parts produced, such as hub and radiator caps in the automotive industry, threaded collars on machine tools, etc., where the diameters are larger, the pitches finer, and the lengths of engagement shorter than for bolt and nut practice.

FORM OF THREAD

The American national form of thread profile as specified above shall be used.

THREAD SERIES

It is recommended that one of the following pitches be selected whenever it is necessary to use a screw thread of special diameter and pitch: 4, 6, 8, 10, 12, 14, 16, 18, 20, 24, 28, 32, 36, 40, 48, 56, 64 threads per inch.

Basic thread data for these pitches are given in Table 26. The use of 12 threads per inch, wherever possible, is recommended for all applications requiring special threads. This pitch is very convenient for a variety of miscellaneous work in machine construction, as for thin nuts on shafts and sleeves, on threaded studs, etc. It is the coarsest pitch, for a thread of basic depth, which will permit a threaded collar which screws onto a threaded shoulder to slip over a shaft, the difference in diameter between shoulder and shaft being one-eighth inch.

Below are given the limiting dimensions for 12 pitch threads of the following sizes: $\frac{1}{2}$, $\frac{3}{16}$, $\frac{5}{8}$, $\frac{11}{16}$, $\frac{3}{4}$, $\frac{13}{16}$, $\frac{7}{8}$, $\frac{15}{16}$, 1, $1\frac{1}{16}$, $1\frac{1}{8}$, $1\frac{1}{4}$, $1\frac{3}{8}$, $1\frac{1}{2}$, $1\frac{3}{4}$, 2, $2\frac{1}{4}$, $2\frac{1}{2}$, $2\frac{3}{4}$, and 3 inches. Sizes up to and including $1\frac{3}{4}$ inches are widely used in railroad practice, and die-head chasers for these sizes are stocked by manufacturers.

CLASSIFICATION AND TOLERANCES

There are established herein for general use four classes of screw-thread fits, which are named and numbered to correspond to the regular classification of fits given above. These four classes, together with the accompanying specifications, are intended to insure a uniform practice for screw threads not included in the American national coarse or fine thread series.

It is not the intention of the commission arbitrarily to place a general class or grade of work in a specific class of fit. Each manufacturer and user of screw threads is free to select the class of fit best adapted to his particular needs.

(General specifications applying to all classes of fit specified for screw threads of special diameters, pitches, and length of engagement are included in this publication. These specifications cover tolerances, diameters, classification of fits, and rules for the use of the tables. The several classifications, with accompanying tables are as follows:)

Class 1, loose fit.—This class is intended to cover the manufacture of threaded parts where quick and easy assembly is necessary and a considerable amount of shake or play is not objectionable.

This class is made with an allowance on the screw, so as to permit ready assembly, even when the threads are slightly bruised or dirty.

Class 2, free fit.—This class is intended to cover the manufacture of threaded parts which are to assemble nearly or entirely with the fingers, and where a slight amount of shake or play between the assembled threaded members is not objectionable. It is the same in every particular as class 1 except that it has no allowance and the tolerances are smaller.

Class 3, medium fit.—This class is intended to cover the manufacture of the higher grade of threaded parts which are to assemble nearly or entirely with the fingers, and must have the minimum amount of shake or play between the threaded members. It is the same as class 2 in every particular except that the tolerances are smaller.

Class 4, close fit.—This class is intended to cover the manufacture of threaded parts of the finest commercial quality, where very little shake or play is desirable, and where a screw driver or wrench may be necessary for assembly.

TABLE 27.—Thread dimensions of special screw threads, classes 1, 2, 3, and 4 fits

Threads per inch	SCREW SIZES									NUT SIZES			
	To obtain maximum dimensions for major pitch and minor diameters, subtract the values in the "maximum" columns from the basic major diameter. Apply tolerances minus. See Tables 28, 29, 30, and 31 for pitch diameter tolerances.									To obtain minimum dimensions for minor, pitch, and major diameters, subtract the values in the "minimum" columns from the basic major diameter. Apply tolerances plus. See Tables 28, 29, 30, and 31 for pitch diameter tolerances.

¹ Dimensions given for the maximum minor diameter of the screw are figured to the intersection of the worn tool arc with a center line through crest and root. The minimum minor diameter of the screw shall be that corresponding to a flat at the minor diameter of the minimum screw equal to $\frac{1}{8} \times p$, and may be determined by subtracting the basic thread depth, A (or $0.6495p$) from the minimum pitch diameter of the screw.

² Dimensions for the minimum major diameter of the nut correspond to the basic flat ($\frac{1}{8} \times p$), and the profile at the major diameter produced by a worn tool must not fall below the basic outline. The maximum major diameter of the nut shall be that corresponding to a flat at the major diameter of the maximum nut equal to $\frac{1}{8} \times p$, and may be determined by adding $1\frac{1}{2} \times A$ (or $0.7999p$) to the maximum pitch diameter of the nut.

1 Standard size of the American national coarse-thread series. 2 Standard size of the American national fine-thread series. NOTE.—It is preferable to avoid the use of tolerances set in italics by choosing a closer fit, shorter length of engagement, coarser pitch, or smaller diameter.

SCREW THREADS OF SPECIAL DIAMETERS, 12 THREADS PER INCH (INCLUDING RAILWAY SIZES)

Where special threads are required, it is sometimes essential to select a certain pitch as standard for a range of sizes. Also, in general practice, where the pitch of a special thread is optional, the uniform use of a selected pitch is advantageous. For such applications the 12 pitch is widely used, particularly for two distinct purposes as given below, but for different reasons.

Sizes of 12-pitch threads from one-half inch to and including 1 3/4 inches are used in railroad practice, which require that worn stud holes be retapped with a tap of the next larger size, the increment being one-sixteenth inch throughout most of the range.⁸²

The 12-pitch threads are also widely used in machine construction, as for thin nuts on shafts and sleeves. From the standpoints of good design and simplification of practice, it is desirable to maintain shoulder diameters to 1/8-inch steps. The 12 pitch is the coarsest, for a thread of basic depth, which will permit a threaded collar which screws onto a threaded shoulder to slip over a shaft, the difference in diameter between shoulder and shaft being one-eighth inch.

There are, therefore, presented herein, supplementary to screw threads of special diameters, pitches, and lengths of engagement, given above, specifications and data covering a range of sizes of screw threads from 1/2 to 3 inches, inclusive, having 12 threads per inch, and based on a length of engagement of 1 inch.

FORM OF THREAD

The American national form of thread profile as specified above shall be used.

THREAD SERIES

The nominal sizes and basic dimensions of the American national 12-pitch thread series are specified in Table 87.

CLASSIFICATION AND TOLERANCES

The general specifications and classification of fits referred to above are applicable to the American national 12-pitch thread series. The dimensions and tolerances for four classes of fit, based on a length of engagement of 1 inch, and derived from Tables 27 to 31, given above, are given in Table 88.

TABLE 87.—American national 12-pitch thread series

1 Standard size screw and nut of the American national coarse-thread series.
 2 Standard size screw and nut of the American national fine-thread series.
 3 Dimensions given for the minimum diameter of the screw are figured to the intersection of the worn tool arc with a centerline through crest and root. The minimum minor diameter of the screw shall be that corresponding to a flat at the minimum diameter of the nut correspond to the basic flat (3/8X2), and the profile at the major diameter produced by a worn tool must not fall below the basic outline. The maximum major diameter of the nut shall be that corresponding to a flat at the major diameter, not equal to 1/2 X P, and may be determined by adding 0.0062 inch to the maximum pitch diameter of the nut.
 4 Dimensions for the minimum major diameter of the nut correspond to the basic flat (3/8X2), and the profile at the major diameter produced by a worn tool must not fall below the basic outline. The maximum major diameter of the nut shall be that corresponding to a flat at the major diameter, not equal to 1/2 X P, and may be determined by adding 0.0062 inch to the maximum pitch diameter of the nut.

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, AMERICAN NATIONAL SCREW, BOLT, AND NUT PROPORTIONS. BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

WRENCH HEAD BOLTS AND NUTS, AND WRENCH OPENINGS

INTRODUCTORY NOTES

These sizes of boltheads and nuts are intended to supersede all existing standards which have grown up for commercial standard boltheads and nuts. Through simplification of outside dimensions of boltheads and nuts by eliminating thirty-second inch sizes, and elimination of sizes little used, it has been possible to reduce the number of wrench openings required.

In all cases the basic widths across flats of boltheads and nuts are taken as maximum sizes and the tolerances on boltheads and nuts are minus only. The minimum wrench openings are made to provide a positive clearance between maximum nut and minimum wrench, and the tolerances on wrench openings are plus only. This insures a fit of the wrench to the bolthead and nut, whereas the tolerances allowed are as great as possible without causing the deformation of the corners of boltheads or nuts by the wrenches.

GENERAL REQUIREMENTS

(a) *Workmanship.*—It is recommended that workmanship be compatible with the type and grade of product, and class of fit and of finish specified; and that the product be free from abnormal scale, fins, seams, or other defects.

(b) *Screw threads.*—The form of thread profile is the American national form and the diameters and threads per inch are those specified as the American national coarse-thread series, or the American national fine-thread series.

(c) *Body diameters.*—The dimensions and tolerances for body diameter of bolts and screws are given in Tables 64 and 65.

(d) *Tolerance on length.*—The length of all bolts and screws up to and including 6 inches in length does not vary from the nominal length by more than $\pm \frac{1}{32}$ inch; and the length of all bolts and screws more than 6 inches in length does not vary from the nominal length by more than $\pm \frac{1}{16}$ inch.

(e) *Bolt and screw lengths.*—Bolts and screws, except for special requirements, should be ordered in the following increments of length:

Length (inches)	Increment
	<i>Inches</i>
$\frac{1}{16}$ to $\frac{1}{8}$	$\frac{1}{16}$
Over $\frac{1}{8}$ to $\frac{1}{4}$	$\frac{1}{8}$
Over $\frac{1}{4}$ to $\frac{3}{8}$	$\frac{1}{4}$
Over $\frac{3}{8}$ to 6.....	$\frac{1}{2}$
Over 6 to 10.....	1
Over 10.....	2

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

AMERICAN NATIONAL ACME SCREW THREADS STANDARD PRACTICE

(a) Specifications

1. *Angle of thread.*—The angle between the sides of the thread measured in an axial plane shall be 29°. The line bisecting this 29° angle shall be perpendicular to the axis of the screw thread.

2. *Depth of thread.*—The basic depth of the thread shall be equal to one-half of the pitch.

3. *Thickness of thread.*—The basic thickness of the thread at a diameter smaller by one-half the pitch than the basic major diameter shall be equal to one-half of the pitch.⁸³

4. *Clearance at minor diameter.*—A clearance shall be provided at the minor diameter for class 1 Acme by making the minor diameter of the screw 0.020 \sqrt{p} smaller than basic, and for classes 2, 3, and 4 Acme by making the minor diameter 0.005 \sqrt{p} smaller than basic.

5. *Clearance at major diameter.*—A clearance shall be provided at the major diameter for all classes by making the major diameter of the nut or threaded hole at least 0.020 inch larger than basic.

6. *Fillets at minor diameter.*—Fillets at the juncture of sides and root of the thread of the screw will develop on account of the rounding of the corners of the threading tool and the side cutting action of mill-

⁸³ The diameter at which the thickness of thread is measured corresponds to the basic pitch diameter of 60° screw threads used for bolts, nuts, etc. On threads whose included angle is equal to 45° or more, the thickness of the thread is controlled and measured by the pitch diameter. On threads whose included angle is less than 45°, the thickness of the thread should be controlled directly.

ing cutters when these threads are milled. It will be necessary, therefore, on tapped holes for all classes of fits, to provide a fillet or bevel at the minor diameter of the tap to remove the corner of the crest of the thread of the tapped hole. This fillet, or bevel, should be at least 0.010 inch for pitches of 3 threads per inch and finer, and at least 0.020 inch for pitches coarser than 3 threads per inch.

(b) Illustration

The basic form of this thread is shown in Figure 318.

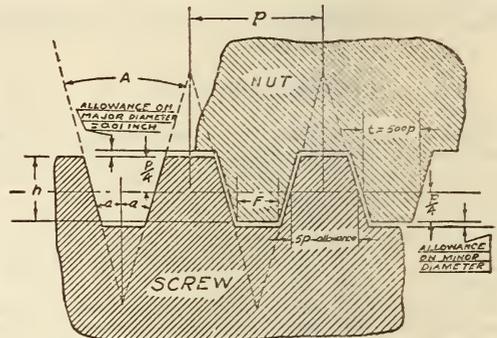

FIGURE 318.—American national acme form of thread

NOTATION

- A = 29° 00'.
- a = 14° 30'.
- p = pitch.
- n = number of threads per inch.
- N = number of turns per inch.
- h = 0.5p, basic depth of thread.
- t = thickness of thread.
- F = 0.37069p = basic width of flat.

THREAD SERIES

As these threads are used for such a wide variety of purposes, it is not feasible arbitrarily to select and designate any given combinations of diameters and pitches as standard. It is recommended, however, that as far as practicable, some one of the pitches shown in Table 77 be used; also, that the diameter be not less than the minimum diameter specified for each pitch. If a greater lead is required on a given diameter than that corresponding to the recommended maximum pitch, it is advisable to use a multiple thread of finer pitch rather than a single thread of coarser pitch.

TABLE 77.—Recommended pitches and corresponding minimum major diameters for American national acme threads

¹ These recommended diameters correspond to a maximum helix angle (at the minor diameter) of approximately 5°.

CLASSIFICATION AND TOLERANCES

There are established herein for general use four distinct classes of fit of American national acme screw threads. They are designated as follows:

- Class 1. For general use.
- Class 2. Adjusting screws with limited side play.
- Class 3. Commercial lead screws.
- Class 4. Precision lead screws.

In designating the various classes of fit in these specifications the class number is followed by the word "acme" in order to distinguish this classification from that applied to the various fits of fastening screws as given above.

(General specifications applying to all classes of fit specified for acme screw threads form part of this specification. These specifications cover tolerances, diameters, classification of fits, and examples of formula application. The several classifications are as follows:)

Class 1 acme.—This class is intended to cover the manufacture of threaded adjusting screws for gen-

eral purposes where a considerable amount of shake or play, both side play and end play, is not objectionable.

This class is made with large allowances to permit ready assembly even when the threads are rough or dirty.

Class 2 acme.—This class is intended to cover the manufacture of threaded adjusting screws for general purposes, where the amount of side play must be kept to a minimum, such as valve stems, etc.

This class is made with allowances to permit ready assembly and lubrication.

Class 3 acme (commercial lead screw).—This class is intended to cover the manufacture of threaded lead screws used on machine tools, etc.

This class is made with allowances to permit ready assembly and lubrication.

Class 4 acme (precision lead screw).—This class is intended to cover the manufacture of precision threaded lead screws used in machine tools for tool room use, etc.

This class is made with allowances to permit ready assembly and lubrication.

THREAD SERIES

The range of sizes from 1/4 to 1 1/2 inches, inclusive, of the American national coarse-thread series and the American national fine-thread series of sizes and pitches, given above, are recommended for general use for class 5, wrench fit for threaded studs.

Definition.—The wrench-fit class is intended to cover the manufacture of threaded studs and holes

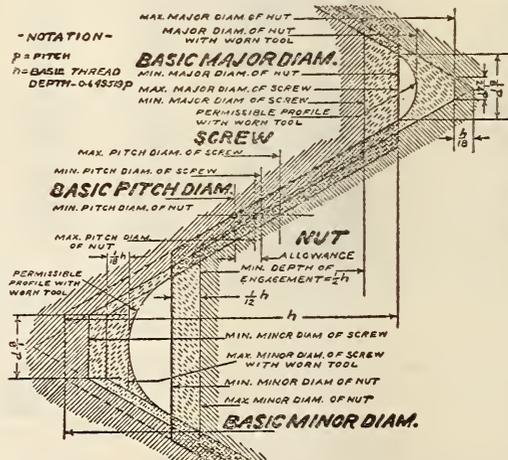

FIGURE 319.—Illustration of tolerances, allowance, and crest clearances for class 5, wrench fit for threaded studs

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION No. 89, JUNE 22, 1928

CLASS 5, WRENCH FIT FOR THREADED STUDS

(Tentative specifications)

FORM OF THREAD

The American national form of thread profile shall be used. The thread form of the tapped hole is modified, however, by truncating the crest of the thread a greater amount than that specified for threads of strictly American national form. This truncation is such that the minimum depth of thread engagement is one-half of the basic thread depth. The maximum depth of engagement is governed by the tolerances specified for the major diameter of the stud and the minor diameter of the tapped hole.

which are to be assembled permanently by the application of power.

(General specifications applying to all materials for class 5, wrench fit for threaded studs, American national coarse-thread series and American national fine-thread series are included in this publication. These specifications cover pitch diameters, length of engagement, interferences, and tolerances. The relations of the maximum and minimum major, pitch, and minor diameters of stud and tapped hole are shown in Figures 319, 320, and 321.)

CLASSIFICATION

Allowance and tolerance values.—Allowances and tolerances are specified in Tables 116 and 117, inclusive, for coarse-threaded and fine-threaded

TABLE 116.—Class 5, wrench fit for threaded studs, allowances and tolerances for studs and tapped holes, coarse-threaded studs in hard materials

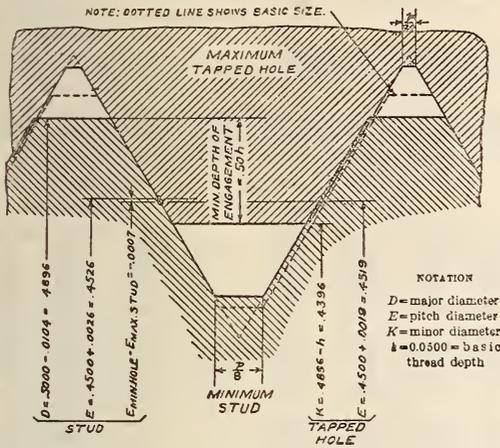

FIGURE 320.—Illustration of loosest condition for class 5, wrench fit for threaded studs, one-half inch, 13 threads, set in hard materials

studs set in hard materials, namely, cast iron, steel, and bronze. These are based upon data obtained in an experimental investigation and fulfill the conditions outlined in the above specifications.

TABLES OF DIMENSIONS

Tables 118 and 119 give recommended thread dimensions of studs and tapped holes which meet

Sizes	Threads per inch	Interference on pitch diameter		Pitch diameter tolerances ¹		Errors in half-angle consuming one-half of pitch diameter tolerances	
		Minimum	Maximum	Stud	Tapped hole ²	Stud	Tapped hole
1	2	3	4	5	6	7	8
1/4	20	Inch 0.0003	Inch 0.0018	Inch 0.0007	Inch 0.0008	° ' 0 16	° ' 0 25

1 1/8	7	.0011	.0065	.0024	.0030	0 19	0 24
1 1/4	7	.0012	.0065	.0023	.0030	0 18	0 24
1 1/2	6	.0013	.0070	.0021	.0036	0 14	0 25

¹ Inasmuch as a moderate difference in lead between stud and tapped hole (about 0.005 inch per inch) has been shown to improve the quality of a stud fit having minimum pitch-diameter interference, no lead tolerance is specified. Therefore, the tolerances specified for pitch diameter include all errors of pitch diameter and angle but not of lead. Excessive lead errors, however, should be avoided, as they increase the tendency of the stud to loosen when subjected to load. Columns 7 and 8 give, for information, the errors in angle which can be compensated for by half the tolerance on pitch diameter given in columns 5 and 6.

² The tolerances on the tapped hole given in column 6 are the same as those specified for class 4, close-fit screws and nuts, with the exception of the 1/4-inch size.

TABLE 117.—Class 5, wrench fit for threaded studs, allowances and tolerances for studs and tapped holes, fine-threaded studs in hard materials

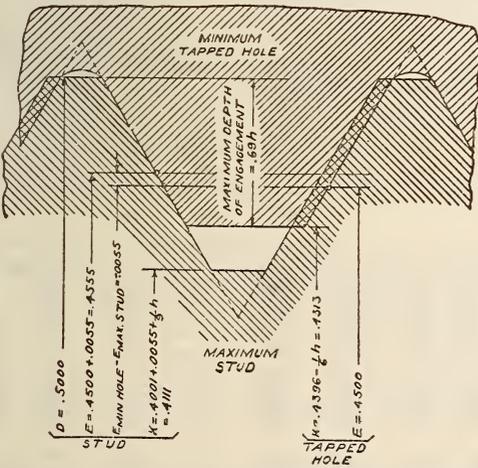

FIGURE 321.—Illustration of tightest condition for class 5, wrench fit for threaded studs, one-half inch, 13 threads, set in hard materials

NOTATION

- D=major diameter.
- E=pitch diameter.
- K=minor diameter.
- h=0.0500=basic thread depth.

the above specifications for coarse-threaded and fine-threaded studs set in hard materials. Also the limiting values of the torques at full engagement (lever arm times force) which may be expected in the assembly of studs and tapped holes made to these dimensions are given.

¹ Dimensions given for the maximum minor diameter of the screw are figured to the intersection of the worn tool arc with a center line through crest and root. The minimum minor diameter of the screw shall be that corresponding to a flat at the minor diameter of the screw equal to 1/8 x p, and may be determined by subtracting the basic thread depth, h (or 0.6495p), from the minimum pitch diameter of the screw.

² Dimensions for the minimum major diameter of the tapped hole correspond to the basic flat (1/8 x p), and the profile at the major diameter produced by a worn tool must not fall below the basic outline. The maximum major diameter of the tapped hole shall be that corresponding to a flat at the major diameter of the tapped hole equal to 1/24 x p, and may be determined by adding 1 1/2 x h (or 0.7939p) to the maximum pitch diameter of the nut.

³ Selective assembly in the case of the 1/4-inch size may be required on account of the small tolerances necessary on pitch diameter. To avoid breaking a mild-steel stud the maximum interference on pitch diameter of 0.0018 inch must not be exceeded.

The maximum major diameter of the tapped hole shall be that corresponding to a flat at the major diameter of the tapped hole equal to 1/24 x p, and may be determined by adding 1 1/2 x h (or 0.7939p) to the maximum pitch diameter of the nut.

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, APPENDIX NO. 6, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

COMMON PRACTICE AS TO THREAD SERIES AND CLASS OF FIT FOR SCREWS, BOLTS, AND NUTS

The usual commercial practice as to application of thread series and class of fit to screws, bolts, and nuts is indicated in the accompanying table.

Product	Thread series	Class of fit
1	2	3
Rough machine bolts.....	Coarse.....	Class 1, loose fit.
Semifinished machine bolts:		
General applications.....	do.....	Class 2, free fit.
Automotive vehicles.....	Fine.....	Class 3, medium fit.
Finished machine bolts:		
General applications.....	Coarse.....	Do.
Automotive vehicles.....	Fine.....	Do.
Aircraft.....	do.....	Do.
Machine screws.....	Coarse or fine.....	Class 2, free fit.
Machine-screw nuts:		
Numbered sizes.....	do.....	Class 1, loose fit.
Fractional sizes.....	do.....	Class 2, free fit.
Cap screws.....	do.....	Do.
Stove bolts.....	Coarse.....	Class 1, loose fit.
Carriage bolts.....	do.....	Class 2, free fit.
Step bolts.....	do.....	Do.
Button-head machine bolts.....	do.....	Do.
Set screws.....	do.....	Class 3, medium fit.
Threaded studs:		
Nut end.....	do.....	Class 2, free fit.
Stud end.....	Fine.....	Class 3, medium fit.
Tap bolts.....	Coarse or fine.....	Class 5, wrench fit.
Tap rivets.....	Coarse.....	Class 2, free fit.
	do.....	Class 3, medium fit.

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, AMERICAN NATIONAL SCREW THREAD TABLES FOR SHOP USE, STANDARD THREADS (COARSE AND FINE THREAD SERIES), BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 98, 1929

STANDARD SCREW-THREAD TABLES FOR SHOP USE

(This publication makes available for convenient use six of the most essential tables of dimensions of fastening screws as published in the 1928 report of the National Screw Thread Commission. These tables cover the basic sizes, limiting dimensions, tolerances, and tap-drill sizes for the American national coarse and fine thread series. They are identical with Tables 1, 2, 15, 16, 107, and 108 in Miscellaneous Publication No. 89 of the Bureau of Standards, given above.)

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, AMERICAN NATIONAL SCREW THREAD TABLES FOR SHOP USE, SPECIAL THREADS, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 99, 1929

SPECIAL SCREW-THREAD TABLES FOR SHOP USE

(This publication presents in compact form the tables of dimensions of special screw threads having

the American national form of thread (60°) as published in the 1928 report of the National Screw Thread Commission. These tables cover the basic sizes, limiting dimensions, and tolerances for the American national 12-pitch thread series and other screw threads of special diameters, pitches, and lengths of engagement. They are identical with Tables 27, 28, 29, 30, 31, 87, and 88 in Miscellaneous Publication No. 89 of the Bureau of Standards, given above.)

608.1. NAILS, BRADS, STAPLES, AND TACKS.

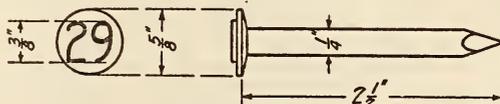

608.11. NAILS.

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR DATING NAILS, 1931

DATING NAILS

MATERIAL

The nails shall be made of iron or steel, galvanized with a coating of zinc (prime western, or equal)

1 2 3 4 5 6 7 8 9 0

FIGURE 322

evenly and uniformly applied by the hot-dip process so that it will adhere firmly to the surface of the iron or steel.

CHEMICAL REQUIREMENTS

(a) The sample shall be immersed in a standard solution of copper sulphate for one minute and then immediately washed in water thoroughly and wiped dry. This process shall be repeated. If after the fourth immersion there is a copper-colored deposit on the sample, or the zinc has been removed, the lot from which the sample was taken shall be rejected.

(b) The standard solution of copper sulphate is prepared by dissolving 36 parts of crystallized copper sulphate in 100 parts of water, then adding enough cupric oxide to neutralize any free acid. The solution is filtered or allowed to settle and decanted, then diluted with water until its specific gravity is 1.186 at 65° F. While nails are being tested, the temperature shall be at no time less than 60° F. nor more than 70° F.

DESIGN

The shank of nail shall be one-fourth inch in diameter and 2 1/2 inches long; the head of nail shall be five-eighths inch in diameter and one-sixteenth inch thick, and shall bear two raised figures designating the year, the figures to be three-eighths inch long and raised one-sixteenth inch, and of the following type.

(Inspection conforms to A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR HEAVY-WEIGHT SLATE-SURFACED ASPHALT ROLL ROOFING AND HEAVY-WEIGHT SLATE-SURFACED ASPHALT SHINGLES, DESIGNATION D249-27, 1927

ROOFING NAILS

(For body of specification see Standards and Specifications for Nonmetallic Minerals and their Products, p. 156., publication M110 of Bureau of Standards.)

Nails.—The gage of the wire shall not be greater than A. S. & W. No. 10 (0.135 inch) nor thinner than No. 12 (0.105 inch); the head shall be not less than three-eighths inch in diameter, and not less than 0.025 inch in thickness; the shank shall be between three-fourths and 1 inch long for slate roll roofing, and for shingles 1 inch long when laid on solid sheathing, or 1½ to 1¾ inches when laid over old shingles. The lower end of the shank shall be pointed and either smooth or barbed, and, if the latter, then the barbings shall not increase the diameter of the lower two-thirds more than 0.01 inch. The nails shall be zinc coated with not less than one-half ounce nor more than 1¼ ounces per square foot of nail surface. Hot-galvanized, electro-galvanized, or sherardized coatings will be accepted. There shall be furnished per square of slate roll roofing not less than an average of 252 nails for 36-inch and not less than an average of 275 nails for 32-inch roofing. For shingles, the nails shall be purchased separately, and the number required per square will depend upon the size and form of the shingles and shall be agreed upon by the purchaser and seller.

ASPHALT SHINGLE AND ROOFING INSTITUTE, SPECIFICATIONS FOR NAILS TO BE USED FOR LAYING COMPOSITION SHINGLES, 1921

NAILS FOR COMPOSITION SHINGLES

Gage of wire.—To be not thicker than 10½ nor thinner than 12.

Length.—To be not less than 1 inch nor greater than 1¼ inches.

Heads.—To be not less than three-eighths inch in diameter, nor less than 0.02 inch thick.

Shanks.—To be either smooth or barbed, and, if the latter, the barbings should not increase the diameter of the lower two-thirds of the shank more than 0.01 inch. The lower end of the shank to be pointed.

Count.—The count per pound for any given type of nail in different lots received from nail manufacturers shall not vary more than 2 per cent.

Protective coating.—Zinc-coated nails are recommended for composition shingles. The minimum amount of zinc shall be one-half ounce and the maximum 1¼ ounces per square foot of nail surface.

ASPHALT SHINGLE AND ROOFING INSTITUTE, SPECIFICATIONS FOR NAILS TO BE USED FOR LAYING ROLL ROOFINGS, 1920

NAILS FOR ROLL ROOFINGS

Gage of wire.—To be not thicker than 10½ nor thinner than 12.

Length.—To be not less than three-fourths inch nor greater than 1 inch.

NOTE.—¾-inch nails are recommended for light-weight roll roofings and 1-inch nails for slate-surfaced roll roofings.

Heads.—To be not less than seven-sixteenths inch in diameter nor less than 0.025 inch thick.

Shanks.—To be either smooth or barbed, and, if the latter, then the barbings shall not increase the diameter of the lower two-thirds of the shank more than 0.01 inch. The lower end of shank to be pointed.

Count.—The count per pound for any given type of nail in different lots received from nail manufacturers shall not vary more than 2 per cent.

NOTE.—It is recommended that each manufacturer furnish not less than 238 nails for a square of 36-inch roll roofing nor less than 307 nails for a square of 32-inch roll roofing. This will be sufficient for 1 long seam and 2 end seams, when the nails are spaced 2 inches in 1 row along the long seam and 2 rows along each end seam.

Protective coating.—Nails to be zinc coated when so required. The minimum amount of zinc shall be one-half ounce and the maximum amount shall be 1¼ ounces per square foot of nail surface.

UNDERWRITERS' LABORATORIES, SPECIFICATIONS FOR CLASS C ASPHALT RAG-FELT SHEET ROOFING AND SHINGLES, 1929

NAILS FOR SHEET ROOFING

Dimensions.—The diameter of wire shall not be greater than No. 10 (0.135 inch) nor thinner than No. 12 (0.105 inch); the heads shall not be less than three-eighths inch in diameter nor less than 0.025 inch thick; the shank shall be not less than three-fourths inch long and shall be either smooth or barbed, and, if the latter, then the barbings shall not increase the diameter of the lower two-thirds more than 0.01 inch. The lower end of the shank shall be pointed.

Protective coating.—Nails shall be zinc coated with not less than one-half ounce nor more than 1¼ ounces per square foot of nail surface. Hot-galvanized, electro-galvanized, or sherardized coating will be accepted.

Quantity.—There shall be furnished per square an average of not less than 252 nails for 36-inch, 275 for 32-inch, 504 for 18-inch, and 550 for 16-inch roll roofings, respectively. Roofers' rolls shipped in carload lots need not contain nails.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR CUT TACKS AND SMALL CUT NAILS, R47-28, JULY 1, 1928

CUT TACKS AND SMALL CUT NAILS

(Simplified practice recommended and adopted by industry establishing a limited list of standard styles, sizes, and methods of packing.)

The following styles, sizes, and methods of packing will be considered a simplified list. Any sizes and styles not listed will be manufactured as special goods.

HARDWARE LIST

[This list is based on a redesignation from numbers to length in fractions of an inch and numbers]

Items in the simplified schedule shall be measured as follows:

(a) Nails with flat head or with square shoulder under head, and all tacks, are measured under head to end of point.

(b) Brad head, flat countersunk head, headless, and cement-coated nails are measured over all; that is, top of head to end of point.

(c) Oval and round countersunk head nails are measured from the top of countersink (largest diameter) to end of point.

BILL POSTER

Style and finishes	Designation	Sizes of packages
Bright, blued, tinned.....	No. 2½, or ¾-inch..... No. 3, or ⅝-inch..... No. 4, or ⅞-inch..... No. 6, or 1½-inch..... No. 8, or ⅞-inch..... No. 10, or ⅞-inch..... No. 12, or 1¼-inch..... No. 14, or ¾-inch.....	Pounds ½, 1, 5, 25, 100

CARPET

Bright, blued, tinned, copper-plated.....	No. 3, or ⅝-inch..... No. 4, or ⅞-inch..... No. 6, or 1½-inch..... No. 8, or ⅞-inch..... No. 10, or ⅞-inch..... No. 12, or 1¼-inch..... No. 14, or ¾-inch..... No. 16, or 1⅜-inch.....	¼, ¼, ½, 1, 25, 100
---	---	---------------------

UPHOLSTERER

Bright, blued, tinned.....	No. 1, or ¾-inch..... No. 1½, or ⅞-inch..... No. 2, or 1-inch..... No. 2½, or ⅞-inch..... No. 3, or ¾-inch..... No. 4, or ⅞-inch..... No. 6, or 1½-inch..... 	No. 3, or 5/16-inch.....	
	No. 3 1/2, or 1 3/32-inch.....	
	No. 4, or 3/8-inch.....	
	No. 6, or 1 1/8-inch.....	
	No. 8, or 3/4-inch.....	

All special trade names for tacks, such as the following, have been eliminated: American cut, Swedes cut (substituting the name trimmers), Sweden carpet, baling, canvas, cheese-box, curtain, shade, broom, stamp, gagers, railroad, roofing, looking-glass, truckers, and berry-box tacks.

All tacks shall be labeled as designated in the above simplified schedule (by both number and size) on both outside and inside of package or individual container.

The conference recommends that the sale of tacks by count be discontinued, and that tacks shall be sold by weight only.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NAILS, SPIKES, TACKS, AND STAPLES: FF-N-101, MAY 3, 1932

NAILS, SPIKES, TACKS, AND STAPLES

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES AND CLASSES

1. The types and classes of articles covered by this specification are limited to those named in the following list:

- (a) *Nails*.—
 - (1) Barbed.
 - (1a) Barrel.
 - (2) Basket.
 - (3) Boat.
 - (4) Box.
 - (5) Broom.
 - (6) Car.
 - (7) Casing.
 - (8) Cement.
 - (9) Clinch.
 - (10) Clout.
 - (11a) Common brads.
 - (11b) Common nails.
 - (11c) Cut nails.
 - (11d) Copper-clad.
 - (11e) Copper and brass.
 - (11f) Cut copper.
 - (12) Double-head.
 - (13) Dowel (pins).
 - (14) Escutcheon (pins).
 - (15) Fence.
 - (16) Finishing.
 - (16a) Finishing, cut.
 - (17) Flooring.
 - (18) Foundry.
 - (19) Heel.
 - (20) Hinge.
 - (21) Hob.
 - (22) Horseshoe.
 - (23) Lath.
 - (24) Molding.
 - (25) Plaster-board.
 - (26) Purlin.
 - (27) Roofing.
 - (28) Saddle.
 - (29) Saddlery.
 - (30) Sheathing.
 - (31) Shingle.
 - (32) Shoe.
 - (33) Siding.
 - (34) Slating.
 - (35) Stem nails.
 - (36) Storm (rivets).
 - (37) Upholsterer's.
- (b) *Spikes*.—
 - (1) Barge.
 - (2) Boat.
 - (3) Common (cut).
 - (4) Gutter.
 - (5) Round Wire.
 - (6) Track.
- (c) *Tacks*.—
 - (1) Bill poster's.
 - (2) Carpet.
 - (2a) Copper.
 - (2b) Galvanized.
 - (3) Double pointed.
 - (4) Gimp.
 - (5) Saddle.
 - (6) Shoe.
 - (7) Upholsterer's.

- (d) *Staples*.—
 - (1) Electrician's.
 - (2) Metal lath.
 - (3) Poultry netting.
 - (4) Wire fence.

III. MATERIALS AND WORKMANSHIP

1. *Materials*.—Articles included in this specification may be of any of the following materials, as designated by the purchaser: (a) Iron or steel, (b) copper, (c) zinc, (d) brass, (e) muntz (yellow) metal, (f) tin (coating only), and (g) copper-bearing steel.

2. *Quality of Materials*.—(a) *Iron or steel*.—(1) Iron or steel articles made from wire shall withstand cold bending 180° flat on themselves without fracture.

(2) Iron or steel articles made from bars or plate, or made from rods (and not requiring to be hardened), shall withstand cold bending 180° over a mandrel of the same diameter as the article to be tested, without fracture.

(3) Specially hardened steel articles shall break off square before bending 60° and show a fine crystalline texture where broken.

(b) *Copper*.—(1) Copper shall show on analysis not less than 98 per cent pure copper.

(2) Copper-clad articles shall show on the normal section a thickness of copper not less than one-twelfth of the over-all diameter.

(3) Copper articles and copper-clad articles shall have the same ductility as required for articles of iron or steel wire. III, 2 (a) (1). Copper-clad articles shall not show any separation of the metals when tested for ductility.

(c) *Zinc*.—Zinc (except for coating) shall be equal to grade D of United States Government master specification for slab zinc (spelter), Federal Specifications Board specification No. 91 (current designations: QQ-Z-351). (See 683.1, p. 1311.)

(d) *Brass*.—(1) *Composition*.—Copper, 59 to 63 per cent; tin, 0.5 to 1.5 per cent; iron, maximum, 0.06 per cent; lead, maximum, 0.2 per cent; and zinc, remainder.

(2) *Ductility*.—Same as required for articles of iron or steel wire. III, 2, (a), (1).

(e) *Muntz metal*.—*Composition*.—Copper, 59 per cent to 62 per cent; zinc, 38 per cent to 41 per cent; lead, maximum, 0.6 per cent; and iron, maximum, 0.2 per cent.

(f) *Copper-bearing steel*.—(1) *Composition*.—Not less than 0.20 per cent of copper.

(2) *Ductility*.—Same as required for articles of iron or steel wire. III, 2, (a), (1).

3. *Workmanship*.—Articles of any type shall be true to shape, well finished, and be reasonably free from imperfectly formed or misshapen pieces and not vary in their principal dimensions more than the tolerances herein specified. All articles shall be clean and free from corrosion.

4. *Finish*.—(a) *Formation*.—(1) Smooth and (2) barbed.

(b) *Color*.—(1) Black (annealed), (2) bright, (3) blued, and (4) coppered.

(c) *Coatings*.—(1) Zinc-coated articles shall be reasonably smooth and free from fins or lumps of zinc, and black or uncoated spots.

(2) Zinc-coated articles shall carry a coating of not less than the following percentages of zinc to the weights of the uncoated articles for the diameters or thicknesses given.

(3) These percentages are equivalent to approximately 1 ounce of zinc per square foot of surface.

(4) Minimum percentages of zinc for coating articles of the diameters or thicknesses given:

U. S. steel-wire gage, circular sections			U. S. sheet-steel gage, square sections		
Gage No.	Diameter	Percentage (zinc)	Gage No.	Thickness	Percentage (zinc)
	<i>Inch</i>			<i>Inch</i>

3-----	.2437	3.0		$\frac{7}{16}$	1.55
2-----	.2625	2.7		$\frac{1}{2}$	1.4
1-----	.283	2.4		$\frac{9}{16}$	1.3
0-----	.3065	2.15		$\frac{5}{8}$	1.2
00-----	.331	2.0			

(5) Tin coating shall be smooth and bright.
 (6) Brass plating shall be smooth and bright.
 (7) Cement coating shall be evenly applied and shall not be sticky or gummy in any normal temperatures or atmospheric conditions.

(8) Cement-coated articles shall show an average increase in holding power, above that of identical uncoated articles, of not less than 50 per cent when tested as herein specified.

IV. GENERAL REQUIREMENTS

1. *Dimensions.*—(a) Nails with flat head or with square shoulder under head, and all tacks, are measured under head to end of point.

(b) Brad head, flat countersunk head, headless, and cement-coated nails are measured over all, that is, top of head to end of point.

(c) Oval and round countersunk head nails are measured from top of countersink (largest diameter) to end of point.

Dimensions of staples shall be inside measurements.

Lengths and widths are given herein in inches and common fractions; diameters are given herein in common fractions when multiples of one-sixty-fourth inch; otherwise diameters are given in decimals of an inch. Diameter of pointed nails, tacks, etc., shall be measured near the gripper marks.

Gage numbers given herein for wire are U. S. steel-wire gage.

2. *Tolerances.*—Variation in diameter of articles made from wire shall not exceed one-quarter gage above or below the dimensions specified.

Variations in diameters of articles made from rods shall not exceed one-thirty-second inch above nor one-sixty-fourth inch below the dimension specified.

Measurements of diameters shall not include coatings.

Variation in length for articles 1½ inches long or less shall not exceed one-thirty-second inch and for articles over 1½ inches long shall not exceed one-sixteenth inch from the length specified, except that variations in length for articles one-half inch or more in diameter shall not exceed one-eighth inch for articles up to 10 inches in length, and not more than one-fourth inch for articles 10 inches or over in length.

Articles intended for use in nail-driving machines shall be so sorted as to contain no pieces of different sizes or shapes.

V. DETAIL REQUIREMENTS

1. The articles herein listed shall conform to the descriptions for the classes named and to the dimensions given within the tolerances specified. The approximate number per pound when given, is for the purchaser's information and is not to be taken as accurate within any specified limits.

2. The finish, where more than one finish is specified, shall be as stated in the purchase order.

3. In the tables included herein the various dimensions, etc., are indicated as follows:

- S = nominal size or trade designation.
- L = length in inches.
- D = diameter in inches.
- G = gage.
- H = width of head.
- No./lb. = Approximate number per pound.

(a) *Nails*—
 (1) *Barbed nails.*—Flat head, diamond point, cement coated, brass and steel.

2½	9	.148	40	38

4. *Packing and marking.*—Containers shall be substantial and so constructed as to preserve the contents in good condition; they shall be so made that the contents may be removed without destroying the containers.

Containers shall be marked with the type, class, material, finish, and length (in inches) of the article contained; and shall also be marked with the net weight of the contents or with the count number, and with the name of the manufacturer.

Articles intended for use in automatic driving machines shall be so labeled.

VI. METHOD OF INSPECTION AND TESTS

1. *Inspection.*—Inspection shall be made by the purchaser after delivery (unless otherwise agreed upon) by examining not less than one package in every 25 packages, or portion thereof, of each type and class included in the order. The articles will be examined for type, class, material, size, finish, workmanship, and net weight. The count numbers will be verified when orders are based on count numbers.

2. *Tests.*—Test specimens in such numbers as required shall be taken from the packages examined.

(a) *Tests for ductility.*—Articles tested for ductility shall be bent 180° and flattened on themselves as required in III 2 (a) (1), or bent 180° over a mandrel as required in III 2 (a) (2), by any suitable means available.

(b) *Tests for hardness.*—Articles tested for hardness shall be held rigidly in a vice and bent by means of a clamp or similar device, so attached to the free end of the specimen that the bend shall be confined to a length not exceeding two times the diameter of the specimen, and suitable means be provided for measuring the angle through which the specimen is bent before breaking.

(c) *Tests of zinc coating.*—The articles to be tested shall be weighed on scales sensitive to 0.05 per cent, and then immersed in concentrated hydrochloric acid (specific gravity 1.20) to each 100 c c of which has been added 5 c c of a solution made by dissolving 20 g of antimony trioxide in 1,000 c c of concentrated hydrochloric acid.

The specimens shall be immersed for one minute, then washed and scrubbed in running water to remove deposited antimony, and dried and reweighed. The loss in weight represents the weight of the zinc coating.

(d) *Tests of cement coating* shall be made by removing the coating from one-half of the number of test specimens. An equal number of the cement-coated and uncoated specimens, not less than 10 of each, shall be driven into sound, dry, shortleaf yellow pine, hemlock, fir, or larch, perpendicular to the grain, with heads protruding one-fourth inch. The specimens shall be withdrawn by apparatus that will exert a direct pull and indicate the force

applied. The force required to start the withdrawal shall be taken as the resistance. This shall be expressed in percentages of the average resistance of the cement-coated above that of the uncoated for each group of identical specimens tested. Thus, if the average resistance of the uncoated is 100 and that of the cement-coated 160, the increased holding capacity would be 60 per cent.

3. *Methods of analysis for copper, zinc, brass, yellow metals, and copper steel.*—In all cases the sample must be clean and free from foreign substances.

(a) *Copper.*—Dissolve 5 g of the sample in a mixture of 25 c c of water, 10 c c of concentrated sulphuric acid, and 7 c c of concentrated nitric acid. Boil gently to remove nitrous oxides, dilute to 225 c c and electrolyze for about 18 hours with a current of 0.5 ampere and 2.0 to 2.5 volts, using gauze electrodes. Remove the cathode without interrupting the current; wash with water, then with alcohol; dry for a few minutes at 100° C.; and weigh.

If tin and antimony are present, decompose a 5 g sample with 50 c c of nitric acid (1 : 1) and boil to remove nitrous oxides. Dilute to 150 c c and digest on the steam bath for several hours or over night. Filter and wash with a hot 1 per cent solution of nitric acid. Add 10 c c concentrated sulphuric acid to the filtrate and evaporate to expel nitric acid. Dilute to about 225 c c with distilled water, add 7 c c of concentrated nitric acid, and electrolyze as described above.

(b) *Zinc.*—Dissolve 1 g of the sample in 20 c c of nitric acid (1 : 1) and boil to remove nitrous fumes. If a precipitate forms, filter it off. Add 10 c c of concentrated sulphuric acid and evaporate to expel all nitric acid. Dilute to 300 c c with distilled water and saturate with hydrogen sulphide. Filter and boil the filtrate to remove the hydrogen sulphide.

Neutralize the acid with ammonia, using methyl orange as indicator, dilute to about 900 c c with distilled water, and make 0.008 to 0.009 *N* with sulphuric acid. Cool to room temperature and pass a rapid stream of hydrogen sulphide through the solution for about 40 minutes. Allow the precipitate to settle for one-half hour to two hours, filter, and wash with cool distilled water. Ignite at as low a temperature as possible until the paper is consumed. Increase the heat to 750° to 800° C., complete the conversion of sulphide to oxide, and then heat at a temperature of not over 900° C. for about five minutes. Cool; ignite, and weigh as zinc oxide.

(c) *Brass and muntz metal.*—Dissolve 1 g of the sample in 20 c c of nitric acid (1 : 1) boil to expel nitrous oxides, and, if a precipitate forms, dilute to 150 c c with hot water, digest on the steam bath for several hours or overnight. Filter and wash with a hot 1 per cent solution of nitric acid. Ignite the filter at as low a temperature as possible until carbon is consumed, then blast in an oxidizing flame for three to five minutes. Cool, and weigh as stannic oxide. Neutralize the filtrate with ammonia, add an excess of 7 c c of concentrated nitric acid, dilute to 225 c c, and electrolyze for about 18 hours with a current of 0.5 ampere and 2.0 to 2.5 volts. Remove the solution from the electrodes without interrupting the current, and wash the electrodes with water as fast as they are exposed. Finally rinse thoroughly in water and then in alcohol. Dry the cathode for a few minutes at 100° C. and weigh. Dry the anode at 210° C. for one-half hour, weigh as PbO₂, and use the factor 0.866 to calculate the amount of lead. Add a slight excess of ammonia to the electrolyte, boil, filter, and wash the precipitate with hot water. Ignite and weigh as Fe₂O₃, or dissolve the precipitate and determine the iron by volumetric procedure. Pass hydrogen sulphide into the ammoniacal

filtrate. A white precipitate shows the presence of zinc, which is then reported by difference.

(d) *Determination of copper in copper steel by precipitation with hydrogen sulphide.*—Dissolve 10.00 g of steel in 100 c c of dilute sulphuric acid (1 : 1) and, when solution is complete, dilute to at least 500 c c with water. Heat to boiling and saturate with hydrogen sulphide. Digest a while, filter on paper or paper pulp, and wash with acidulated hydrogen sulphide water. Ignite the residue and paper in a porcelain crucible and fuse with a small amount of alkali pyrosulphate. Dissolve the cooled melt in the crucible in 1 to 2 c c of hydrochloric acid (specific gravity 1.19) and a few c c of water, transfer to a 200 c c beaker, dilute to 100 c c, and add sodium hydroxide (5 per cent) solution in slight excess. Boil, digest, and filter, in order to separate such elements as vanadium, tungsten, and molybdenum. Dissolve the precipitate in hot dilute nitric acid (1 : 1), add 5 c c of sulphuric acid (specific gravity 1.84), evaporate to the appearance of fumes of sulphuric acid, cool, dilute to 40 c c, filter, and, add 10 c c of ammonium hydroxide (specific gravity 0.90). Heat the feebly acid solution to boiling and saturate with hydrogen sulphide. Digest a while, filter, wash thoroughly with acidulated hydrogen sulphide water, and proceed according to method 1 or 2 below.

(1) *Electrolytic method.*—Dissolve the sulphides obtained as above in hot dilute nitric acid (1 : 1), and electrolyze after the addition of sulphuric acid according to usual procedures.

(2) *Gravimetric method.*—Ignite the sulphide obtained as above and weigh as copper oxide. As this compound is somewhat hygroscopic, care must be observed to prevent the absorption of moisture.

VII. PACKING AND MARKING OF SHIPMENTS

Shall be in accordance with best commercial practice unless otherwise specified.

VIII. NOTES

Requisitions or orders should give lengths in inches.

Copper should be used in work exposed to salt or brackish water.

Muntz metal should not be used in work exposed to salt water or brackish water.

Copper or Muntz metal or zinc, or zinc-coated articles, should be used in work of the best grade when exposed to salt air, and should be used in connection with roofing work of the best grade.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BOXES; WOOD, NAILED AND LOCKED CORNER, NN-B-621, DECEMBER 9, 1930

BOX NAILS

(Contains tables showing sizes of cement-coated steel wire nails, and sizes of cement-coated, cooler, sinker, and box nails for unstrapped boxes.

608.12 BRADS.

AMERICAN RAILWAY ASSOCIATION, PURCHASES AND STORES DIVISION, STANDARDIZATION AND SIMPLIFICATION OF STORES STOCKS, PROCEEDINGS 1928

WIRE BRADS

(Recommended practice in stocking certain specified sizes of wire brads, ranging from one-half inch No. 20 to 2 inch No. 14.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATIONS FOR NAILS, SPIKES, TACKS, AND STAPLES, FF-N-101, MAY 3, 1932.

COMMON BRADS

(Common brads are included in above Federal specification No. 534 (FF-N-101) for nails, etc. See 608.11, p. 560.)

608.13 STAPLES.

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR STANDARD RIGHT-OF-WAY FENCES, 1926

STAPLES FOR RIGHT-OF-WAY FENCES

The staples used for fastening the longitudinal wires to the posts shall be made of No. 9 galvanized steel wire. They shall be 1 inch long for hardwood and 1½ inches long for softwood.

(For A. R. E. A. specifications for right-of-way fences see 603.43, p. 191.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NAILS, SPIKES, TACKS, AND STAPLES, FF-N-101, MAY 3, 1932.

ELECTRICIAN'S STAPLES, METAL LATH STAPLES, POULTRY NETTING STAPLES, WIRE FENCE STAPLES, DOUBLE-POINTED TACKS

(Above items are included in Federal specification FF-N-101 for nails, etc. See 608.11, p. 560.)

608.14 TACKS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, CUT TACKS AND SMALL CUT NAILS, SIMPLIFIED PRACTICE RECOMMENDATION R47-28, JULY 1, 1928

CUT TACKS AND SMALL CUT NAILS

(See 608.11, p. 558.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NAILS, SPIKES, TACKS, AND STAPLES, FF-N-101, MAY 3, 1932.

TACKS

(Bill posters' tacks, carpet tacks, copper or brass tacks, galvanized tacks, double-pointed tacks, gimp tacks, saddle tacks, shoe tacks, upholsterers' tacks, are included in Federal specification No. 534 (FF-N-101) for nails, etc. See 608.11, p. 560.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR THUMB TACKS, FF-T-311, DECEMBER 8, 1931

THUMB TACKS

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPES AND GRADE

B-1. Thumb tacks shall be of the highest grade and of the following types:

- Type I. Nickel-silver heads.
- Type II. Brass or steel heads.
- Type III. Stamped steel.
- Type IV. Center pull.
- Type V. Colored heads.

C. MATERIAL AND WORKMANSHIP

C-1. *Material.*

C-1a. Type I heads to be made from the best rolled stock.

C-1b. Type II heads to be of the best commercial stock.

C-1c. Type III to be of the best material suitable for the purpose.

C-1d. Type IV heads may be of nickel-silver or steel.

C-1e. Type V heads may be enameled or celluloid.

C-2. *Workmanship.*—Shall be of the best and points of pins shall register accurately with centers of heads.

D. GENERAL REQUIREMENTS

D-1. *Sizes.*—Sizes shall be as specified in the invitation for bids.

D-2. *Samples.*—In all respects not specifically covered by this specification the thumb tacks shall be equal to sample submitted. (See Sec. I.)

E. DETAIL REQUIREMENTS

E-1. *Type I heads.*—Heads shall be as thin as practicable, top surface convex in section or flat with bevel edges. The under edges of heads shall be slightly beveled or rounded to permit the ready insertion of extracting tool without injury to paper. The steel pins shall be shouldered, screwed, and riveted into heads. Pins to be tool steel properly tempered and to have at least two complete threads and to be turned to a needle point.

E-2. *Type II heads.*—Heads and pins shall be swaged together but in such manner that pins do not extend through the heads. The pins are to be needle pointed and the swaged end to be headed. Steel heads shall be nickel plated.

E-3. *Type III.*—These tacks shall be nickel plated and shall be made from one piece of metal having the pins stamped out of the center of the head but not disconnected therefrom. The pins shall be turned to a needle point.

E-4. *Type IV heads.*—Heads of center-pull thumb tacks shall have holes or slots for the insertion of the pulling instrument. Thumb tacks may be turned from a solid piece of steel, or the pins may be screwed into nickel-silver or steel heads with at least two complete threads and riveted thereto, or the pin may have a shoulder integral with the pin to prevent it being forced through head, the top of the pin being solidly riveted in place. Pins shall be of steel, needle pointed.

E-5. *Type V heads.*—Heads shall be of metal and shall be covered with colored celluloid or enameled in colors. Pins shall be of steel, needle pointed, and swaged to the heads.

E-6. *Finish.*—Metal heads shall be highly polished.

F. METHOD OF INSPECTION AND TESTS

F-2. Thumb tacks will be cut open so as to expose the heads of the pins to show the manner of construction.

G. PACKAGING, PACKING, AND MARKING

G-2. *Packaging.*

G-2a. Type I thumb tacks shall be mounted on cork board in sets of 1 dozen and packed in cardboard boxes containing 12 dozen.

G-2b. Type II thumb tacks shall be mounted on blocks in sets of 1 dozen or packed in boxes of 100 each, as required.

G-2c. Type III thumb tacks shall be packed in cardboard boxes containing 100 each.

G-2d. Type IV thumb tacks shall be packed in cardboard boxes containing 1 dozen, or shall be mounted on cork board in sets of 1 dozen. One extracting tool for each 1 dozen center-pull thumb tacks shall be furnished for the type requiring same.

G-2e. Type V thumb tacks shall be mounted on blocks in sets of 1 dozen of one color and packed in boxes containing 12 dozen, or packed loose in boxes containing 100 in assorted colors, as required.

G-3. *Packing.*—Unless otherwise specified, the subject commodity shall be delivered in standard commercial containers, so constructed as to insure acceptance by common or other carriers, for safe transportation, at the lowest rate, to the point of delivery.

G-4. *Marking.*—Each box shall be plainly marked on the outside to indicate size, brand, manufacturer's name, and type of thumb tacks contained therein. Shipping containers shall be marked with the name of the material, the type, size, and the quantity contained therein, as defined by the contract or order, the name of the contractor, and the number of contract or order.

I. NOTES

I-1. Purchasers should exercise all options offered herein and should specify type, grade, class, etc., required.

I-2. Unless otherwise specified, samples are required with bid for the purpose of determining compliance with this specification as to composition of material, character of construction, and finish.

I-2a. *Samples.*—One dozen of each of the smallest and largest sizes of each type of metal thumb tacks and one of each color of the colored thumb tacks shall be submitted with the bids.

I-2b. The name of the manufacturer shall be indicated on the samples.

I-3. This specification governs all United States Government purchases of this commodity.

608.15 SPIKES.

(Railroad track spikes. See 606.5, p. 357.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NAILS, SPIKES, TACKS, AND STAPLES, FF-N-101, MAY 3, 1932.

SPIKES

(Barge and boat spikes, common cut iron or steel spikes, gutter spikes, round wire spikes, and track spikes are included in Federal specification No. 534 (FF-N-101) for nails, etc. See 608.11, p. 560.)

608.2 SCREWS.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, OVERHEAD LINE MATERIAL FOR DIRECT AND CATERINARY SUSPENSION, RECOMMENDED SPECIFICATION, D102-30, 1930

OVERHEAD LINE MATERIAL

(D102-30, paragraph 311, includes requirements for lag screws. For specification see 611.29, p. 682.)

FIGURE 324.—One-half inch fetter drive screw

(For general specifications see 608.0, p. 516; for grades, tests, and workmanship see 608.31, p. 589; requirements covering inspection and rejection conform in general to those specified in A. S. T. M., standard specifications for steel, see 605.0, p. 247.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, WRENCH HEAD BOLTS AND NUTS AND WRENCH OPENINGS, B18b-1927

[Approved as American tentative standard by the American Standards Association, February, 1927]

(See also 608.31, p. 590; 608.32, p. 606; and 615.42, p. 883.)

FINISHED HEXAGONAL CAP SCREW HEADS

(Dimensions of finished hexagonal cap screw heads are identical with those given below in National Screw Thread Commission, Table 75. The footnotes conform to the N. S. T. C. specifications for hexagon head cap screws, given below. Formulas for computing dimensions are appended.)

SET SCREW HEADS

(Dimensions of set screw heads are identical with those given below in Federal Specifications Board, No. 548 (current designation: FF-S-91), Table 24. The footnotes conform to the F. S. B. specifications for set screws, given below. Formulas for computing dimensions are appended.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, SLOTTED-HEAD PROPORTIONS, MACHINE SCREWS, CAP SCREWS, AND WOOD SCREWS, B18c-1930

[Approved by American Standards Association, April, 1930]

MACHINE SCREWS, CAP SCREWS, AND WOOD SCREWS

FLATHEAD MACHINE SCREWS

1. The flathead screw has a flat surface for the top of the head and a countersink angle of 82°. This type of head is standard for machine screws, cap screws, and wood screws.

(Dimensions of flathead machine screws are identical with those given below in Federal Specifications Board No. 548 (FF-S-91), Table 14. Formulas for computing dimensions are appended as footnotes to the A. S. M. E. table.)

NOTE 1.—The unthreaded body diameter of machine screws will have approximately the same tolerances as the pitch diameter of the threads shown in the American national standard for screw threads, class 2, free fit, where the number of threads per inch is the same.

ROUND-HEAD MACHINE SCREWS

1. The round-head screw has a semielliptical-shaped head. This type of head is standard for

machine screws, cap screws, and wood screws, but for the cap screw it is called "button head."

(Dimensions of round-head machine screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 15. Formulas for computing dimensions are appended

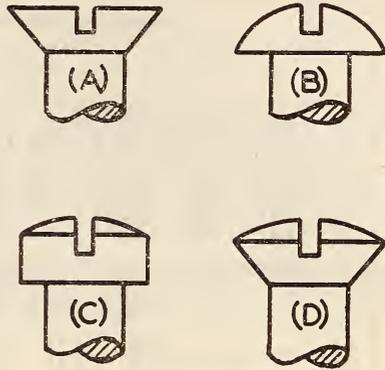

FIGURE 325

(A), flat-head screw. (B), round-head screw. (C), fillister-head screw. (D), oval-head screw

as footnotes to the A. S. M. E. table. Note 1 is similar to note 1 under flathead machine screws.)

OVAL-HEAD MACHINE SCREWS

1. The oval-head screw has a rounded surface for the top of the head and a countersink angle of 82°. This type of head is standard for machine screws and wood screws.

(Dimensions of oval-head machine screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 17, except that the latter carries two additional sizes—seven-sixteenths inch and one-half inch. Formulas for computing dimensions are appended to the A. S. M. E. table. Note 1 is similar to note 1 under flathead machine screws.)

FILLISTER-HEAD MACHINE SCREWS

1. The fillister-head screw has a rounded surface for the top of the head, the remainder of the head being cylindrical. This type of head is standard for machine screws and cap screws.

(Dimensions of fillister-head machine screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 16, except for slightly lower values for maximum total height of head in the F. S. B. table. Formulas for computing dimensions are appended to the A. S. M. E. table. Note 1 is similar to note 1 under flathead machine screws.)

2¾					F	FRP	F	F	F	F	
3					F	FRP	F	F	F	F	

NOTE 1.—The table of screw lengths reproduced above is intended only as a guide to the users of these screws. A number of the listed sizes and lengths will not be regularly stocked by the manufacturers but will be available on order of a sufficient quantity. Letters in the vertical column under the nominal screw sizes indicate the style of head for a particular length of screw; hence, F=flat head, R=round head, O=oval head, P=fillister head.

NOTE 2.—Tolerance in length (L) = -3 per cent; but not less than -0.025 inch.

NOTE 3.—Where length of screw (L) is 1¼ inches or less, the length of thread (l) will extend to as near the head as is practicable. Where the length of screw is over 1¼ inches, the thread length shall not be less than 1¼ inches.

FLAT-HEAD CAP SCREWS

1. *Cap screw lengths.*—The length shall be measured from the largest diameter of the bearing surface of the head to the extreme point, on a line parallel to the axis of the screw.

2. The difference between consecutive lengths of screw:

For screw lengths ¼ to 1 inch shall be ¼ inch.
For screw lengths 1 to 4 inches shall be ¼ inch.
For screw lengths 4 to 6 inches shall be ½ inch.

3. The tolerance in screw length shall be 3 per cent of the nominal length, with a minimum tolerance of 0.030 inch; one-third of the tolerance to be applied minus, and two-thirds plus.

4. *Thread lengths.*—Slotted-head cap screws shall be regularly threaded coarse pitch, and when so threaded shall have a length of thread equal to $2D + \frac{1}{4}$ inch. Screws too short to allow the formula length of thread may be threaded as close to the head as practicable.

5. *Screw points.*—The points of all cap screws shall be flat, the flat being normal to the axis of the screw; and shall be chamfered at an angle of 35° with the surface of the flat, +5°, -0°; the chamfer to extend to the bottom of the thread. The edge of the chamfer is to be slightly rounded.

(Dimensions of flat-head cap screws are substantially the same as those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 14, for screws ranging in size from 1/16 to 3/4 inch. Dimensions of other sizes not covered by F. S. B., No. 548 (FF-S-91), Table 14, are as follows:)

[All dimensions are in inches]

Nominal size	Maximum diameter	Head diameter		Height of head, nominal	Width of slot		Depth of slot	
		Maximum	Minimum		Maximum	Minimum	Maximum	Minimum
1/4	0.250	1/4	0.477	0.146	0.070	0.058	0.073	0.053
5/16	.3125	5/8	.598	.183	.079	.065	.091	.066
3/8	.375	3/4	.719	.220	.088	.074	.110	.080

(Formulas for computing dimensions are appended to the A. S. M. E. table. Note 1 is similar to note 1 under flat-head machine screws.)

BUTTON-HEAD CAP SCREWS

(Dimensions of button-head cap screws are substantially the same as those given below in Federal

[All dimensions are in inches]

Nominal size	Maximum diameter	Head diameter		Height of head		Width of slot		Depth of slot		Height of oval		Total height of head	
		Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum
1/4	0.250	3/8	0.363	1 1/4	0.157	0.070	0.058	0.097	0.077	0.044	0.038	0.216	0.195

(Formulas for computing dimensions are appended to the A. S. M. E. table. Note 1 is similar to note 1 under flat-head machine screws.)

WOOD SCREWS

(Dimensions of round-head, flat-head, and oval-head wood screws are identical with those given below in National Screw Thread Commission, wood screws, Tables 56, 57, and 58, respectively. Formulas for computing dimensions are also identical with those of the N. S. T. C.)

(Length tolerances of round-head wood screws are in agreement with those of the National Screw Thread Commission, wood screws, given below in Table 61. Lengths of flat-head and oval-head wood screws are substantially the same as those of the N. S. T. C., wood screws, given below in Table 60.)

BRASS WOOD SCREWS

(Standard sizes of brass wood screws are identical with those of the National Screw Thread Commission, wood screws, given below in Table 63.)

STEEL WOOD SCREWS

(Standard sizes of steel wood screws are identical with those of the National Screw Thread Commission, wood screws, given below in Table 62.)

Specifications Board, No. 548 (FF-S-91), Table 15, for screws ranging in size from seven-sixteenths to three-fourths inch. Dimensions of other sizes not covered by F. S. B., No. 548 (FF-S-91), Table 15, are as follows:)

[All dimensions are in inches]

Nominal size	Maximum diameter	Head diameter		Height of head		Width of slot		Depth of slot	
		Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum
1/4	0.250	7/16	0.418	0.191	0.175	0.070	0.058	0.117	0.097
5/16	.3125	9/16	.541	.246	.226	.079	.065	.151	.126
3/8	.375	3/4	.602	.273	.251	.088	.074	.167	.137

(Formulas for computing dimensions are appended to the A. S. M. E. table. Note 1 is similar to note 1 under flat-head machine screws.)

FILLISTER-HEAD CAP SCREWS

(Dimensions of fillister-head cap screws are substantially the same as those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 16, for screws ranging in size from 1/16 to 1 inch. Dimensions of other sizes not covered by F. S. B., No. 548 (FF-S-91), Table 16, are as follows:)

SOCIETY OF AUTOMOTIVE ENGINEERS, CAP SCREWS, BOLTS AND NUTS, AND WRENCH OPENINGS, S. A. E. STANDARDS, JANUARY, 1930

[Approved by American Standards Association, April, 1930]

(See also 608.31, p. 600; 608.32, p. 606; and 615.42, p. 883.)

CAP SCREWS, BOLTS AND NUTS, AND WRENCH OPENINGS

1. The following specifications have been adopted as standard for all cap screws, bolts, and nuts for general use.
2. Cap screws, bolts, and nuts not conforming to these specifications will be considered special.

CAP SCREWS

1. Cap screws when threaded coarse pitch shall have a length of thread equal to 2D + 1/4 inch. When threaded fine pitch the length shall be 1 1/2 D + 1/4 inch. (D equals body diameter of screw.) Screws too short to allow the formula length thread may be threaded as close to the head as practicable.

2. Body lengths of all cap screws shall be measured from the largest diameter of the bearing under the

head to the extreme point in a line parallel to the axis of the screw.

3. Points of all cap screws shall be flat, the flat being normal to the axis of the screw; the point shall be chamfered at an angle of 35° to the surface of the flat, with a tolerance of +5° and -0°, the chamfer to extend to the bottom of the thread.

4. *Material.*—All cap screws unless otherwise specified shall be made of steel.

5. *Slots, cotter-pin holes, heat treatment.*—Hexagon-head cap screws are made regularly without slots or cotter-pin holes. If slots, cotter-pin holes, or special heat treatments are desired, these should be specified by the purchaser.

FINISHED HEXAGONAL CAP SCREWS

(Dimensions of finished hexagonal cap screws are identical with those given below in National Screw Thread Commission, hexagon-head cap screws, Table 75, except that the S. A. E. table includes threads per inch. The footnotes conform to the N. S. T. C. specifications for hexagon-head cap screws, given below.)

SET SCREWS

(Dimensions of set screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 24, except that the S. A. E. table includes threads per inch. The footnotes conform to the F. S. B. specifications for set screws, given below.)

FLAT-HEAD MACHINE SCREWS

(Dimensions of flat-head machine screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 14. Note 1 is identical with note 1 under flat-head machine screws, American Society of Mechanical Engineers, given above. Formulas for computing dimensions are appended.)

OVAL-HEAD MACHINE SCREWS

(Dimensions of oval-head machine screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 17, except that the latter carries two additional sizes—seven-sixteenths inch and one-half inch. Note 1 is similar to note 1 under flat-head machine screws. Formulas for computing dimensions are appended.)

FILLISTER-HEAD MACHINE SCREWS

(Dimensions of fillister-head machine screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 16, except for slightly lower values for maximum total height of head in the F. B. S. table. Note 1 is similar to note 1 under flat-head machine screws. Formulas for computing dimensions are appended.)

ROUND-HEAD MACHINE SCREWS

(Dimensions of round-head machine screws are identical with those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 15. Note 1 is similar to note 1 under flat-head machine screws. Formulas for computing dimensions are appended.)

SLOTTED-HEAD CAP SCREW LENGTHS

(Specifications covering cap screw lengths, thread lengths, and screw points are identical with those of the American Society of Mechanical Engineers, given above.)

FLAT-HEAD CAP SCREWS

(Dimensions of flat-head cap screws are substantially the same as those given below in Federal Specifi-

fications Board, No. 548 (FF-S-91), Table 14, for screws ranging in size from seven-sixteenths to three-fourths inch. Dimensions of one-fourth, five-sixteenths, and three-eighths inch flat-head cap screws are identical with those of the American Society of Mechanical Engineers, given above. Note 1 is similar to note 1 under flat-head machine screws. Formulas for computing dimensions are appended.)

FILLISTER-HEAD CAP SCREWS

(Dimensions of fillister-head cap screws are substantially the same of those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 16, for screws ranging in size from 7/16 to 1 inch. Dimensions of one-fourth, five-sixteenths, and three-eighths inch fillister-head cap screws are identical with those of the American Society of Mechanical Engineers, given above. Note 1 is similar to note 1 under flat-head machine screws. Formulas for computing dimensions are appended.)

BUTTON-HEAD CAP SCREWS

(Dimensions of button-head cap screws are substantially the same as those given below in Federal Specifications Board, No. 548 (FF-S-91), Table 15, for screws ranging in size from seven-sixteenths to three-fourths inch. Dimensions of one-fourth, five-sixteenths, and three-eighths inch are identical with those of the American Society of Mechanical Engineers given above. Note 1 is similar to note 1 under flat-head machine screws. Formulas for computing dimensions are appended.)

WOOD SCREWS

(Dimensions of round-head, flat-head, and oval-head wood screws are identical with those given below in National Screw Thread Commission, wood screws, Tables 57, 56, and 58, respectively. Formulas for computing dimensions are also identical with those of the N. S. T. C.)

(Length tolerances of round-head wood screws are in agreement with those of the National Screw Thread Commission, wood screws given below in Table 61. Lengths of flat-head and oval-head wood screws are substantially the same as those of the N. S. T. C., given below in Table 60.)

SOCIETY OF AUTOMOTIVE ENGINEERS, CAP SCREWS, BOLTS, AND NUTS; SLOT AND COTTER-PIN HOLE DIMENSIONS, JANUARY, 1927

SLOT AND COTTER-PIN HOLE DIMENSIONS

Cap screws and bolts

Nominal cap screw and bolt diameter	Cotter-pin hole diameter	Head slots		Center of cotter-pin hole to extreme point of screw ¹
		Width	Depth	
<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
3/4	3/8	1/16	3/32	7/64
5/16	3/8	1/16	7/64	1/8
3/8	1/2	3/32	1/8	3/32
7/16	1/2	3/32	1/8	5/32
1/2	1/2	3/32	1/8	11/64
9/16	5/8	3/32	1/8	3/16
5/8	5/8	3/32	1/8	3/16
3/4	5/8	3/32	1/8	7/32
7/8	5/8	3/32	1/8	1/4
1	5/8	3/32	1/8	1/4
1 1/8	7/8	3/32	7/32	3/32
1 1/4	7/8	3/32	7/32	3/32
1 1/2	1	3/16	1/4	3/16

¹ It is suggested that this dimension be used to determine the distance from the cotter-pin hole to the under face of the head of the screw or bolt.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
SLOTTED-HEAD WOOD SCREWS, 1930**

WOOD SCREWS

(Same as the standards of the National Screw Thread Commission for wood screws, see U. S. Gov., N. S. T. C., below.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, COMMERCIAL STANDARD FOR STEEL BONE PLATES AND SCREWS, CS37-31, 1931

SCREWS FOR BONE PLATES

(See 622.9, p. 1138.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SCREWS; WOOD, FF-S-111, APRIL 28, 1931

WOOD SCREWS

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPES

B-1. Wood screws shall be furnished in three types, namely, flat, oval, or round head, as specified in the invitation for bids.

B-2. Wood screws shall be made of steel or brass as specified in the invitation for bids.

(General requirements, standard size numbers, diameters, and pitches of screws, standard head proportions, tolerances on length, and standard stock sizes of steel screws and of brass screws are the same as given in the standards of the National Screw Thread Commission for wood screws (see 608.2, p. 584), with the exceptions noted below.)

Minimum height of head for flat-head and for oval-head wood screws

Nominal size	Height of head, minimum	Nominal size	Height of head, minimum
	<i>Inches</i>		<i>Inch</i>
0.....	0.026	9.....	0.091

¹ Plus tolerance=0.

F. METHODS OF SAMPLING INSPECTION AND TESTS

F-1. Approximately 2 per cent of each size of screws in a given shipment may be taken at random and measured for compliance with the detail dimensions and number of threads.

G. PACKAGING, PACKING, AND MARKING OF SHIPMENTS

G-2. *Packaging*.—Unless otherwise specified, commercial packages are acceptable under this specification.

G-3. *Packing*.—Unless otherwise specified, the subject commodity shall be delivered in substantial commercial containers so constructed as to insure acceptance by common or other carriers, for safe transportation, at the lowest rate, to the point of delivery.

G-4. Unless otherwise specified, shipping containers shall be marked with the name of the actual manufacturer, the length, the numbered size, the material, and the quantity contained therein, as defined by the contract or order under which shipment is made, the name of the contractor and the number of the contract or order.

I. NOTES

I-1. Wood screws are designated commercially by the length and the numbered size. The length is given first, for example: 1½ inch, No. 12.

I-2. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids and the particular purpose to be served by the bid samples should be definitely stated, the specification to apply in all other respects.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR CAP SCREWS, SET SCREWS, MACHINE SCREWS, AND STOVE BOLTS, NO. 548 (CURRENT DESIGNATION: FF-S-91), MARCH 5, 1928

MACHINE SCREWS AND STOVE BOLTS

(For material and workmanship, general requirements, detail requirements, methods of inspection and tests, packing and marking of shipments, and notes, see F. S. B. No. 548 (FF-S-91), under commodity designation 608.0, p. 527.)

CAP SCREWS

(Specifications for cap screws conform to National Screw Thread Commission specifications for hexagon-head cap screws, given below, except in the following particulars:)

1. (a) *Cap screws*.—Cap screws, one-fourth to one-half inch, are identical with machine bolts and machine screws when supplied with the same style of head, and they may be used interchangeably.

(b) *Flat-head cap screws*.—The head dimensions of flat-head cap screws shall be in accordance with Table 14.

Flat-head cap screws shall be threaded the full length under the head.

(c) *Button-head cap screws*.—The head dimensions of button-head cap screws shall be in accordance with Table 15.

The profile of the head shall be a semiellipse.

(d) *Oval fillister-head cap screws*.—The dimensions of oval fillister-head cap screws shall be in accordance with Table 16.

(e) *Finished hexagon-head cap screws.*—(Dimensions are identical with those given below in National Screw Thread Commission, hexagon-head cap screws, Table 75.)

MACHINE SCREWS

(Specifications for machine screws conform to National Screw Thread Commission specifications for hexagon-head cap screws, given below, except in the following particulars:)

1. *Machine screws.*—Machine screws are regularly furnished in standard numbered sizes to No. 12, and in fractions of an inch from one-fourth to one-half inch, inclusive. They are furnished with various styles of slotted heads. Machine screws, sizes one-fourth to one-half inch, are identical with cap screws when supplied with the same style of head, and they may be used interchangeably. They are furnished with or without nuts as required.

2. The length of machine screws is measured from the largest diameter of the bearing surface of the head to the extreme point. The length of thread is measured from the extreme point to the last perfect thread.

3. Machine screws having flat, round, oval, or flillister heads shall have the dimensions as specified in Tables 14, 15, 16, or 17.

SET SCREWS

1. *Set screws.*—Set screws are regularly furnished in coarse-thread series unless otherwise specified, with square heads, ¼ to 1½ inches, inclusive, in diameter, with recessed (safety) heads, and headless slotted No. 5 to three-fourth-inch, inclusive.

2. They are provided with round point, cup point, conical point, and pivot (dog) point, as required. Set screws are hardened and tempered or case-hardened, as required.

3. *Headless set screws.*—Threaded the entire length. Set screws with heads are threaded from the under side of the head to the largest diameter of the point. The length of headless set screws is the over-all length. The length of set screws with heads is measured from under the head to the extreme end.

4. *Headed set screws.*—The head dimensions of headed set screws shall be in accordance with Table 24.

5. Headed set screws may be necked unless otherwise specified, and when necked set screws are furnished the neck shall not be longer than twice the pitch of the thread. When not necked the head shall be beveled not more than 40° on the under side.

6. The radius of the crown of the head shall be approximately two and one-half times the diameter of the screw.

7. The threads of headed set screws shall extend from the under side of the head to the extreme point. When necked the threads shall extend from the neck to the extreme point.

8. *Headless slotted set screws.*—Headless slotted set screws shall have the slot dimensions as given in Table 25.

9. Headless slotted set screws shall be threaded their entire length.

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, AMERICAN NATIONAL SCREW, BOLT, AND NUT PROPORTIONS. BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

(See also 608.0, p. 551; 608.31, p. 604; 608.32, p. 609; 615.42, p. 833.)

HEXAGON-HEAD CAP SCREWS

Cap screws are usually manufactured by upsetting or by machining. They are usually threaded

definite lengths for each diameter irrespective of length of screw. They are furnished without nuts. The smallest diameter regularly furnished is one-fourth inch.

The length of cap screws is measured from the bearing surface of the head to the extreme point. The length of thread is measured from the extreme point to the last perfect thread.

The head is at right angles to the body within 2°, and concentric with the body within a tolerance of 3 per cent of the width across flats.

Cap screws 1 inch in length and under are threaded from the extreme point to the head. For cap screws longer than 1 inch, the minimum length of thread is one and one-half times the diameter plus one-fourth inch.

The dimensions of finished hexagon-head cap screws are given in Table 75.

The tops are smooth, flat, and chamfered, the maximum angle of chamfer with the top surface is 30°, and the diameter of the top flat circle is from 85 to 100 per cent of the width across flats.

All finished hexagon cap-screw heads are washer faced. The thickness of the washer face is about one sixty-fourth inch. The diameter of the bearing surface of the washer face is equal to the width across flats within plus or minus 5 per cent. The thickness of the head is the distance from the top to the bearing surface.

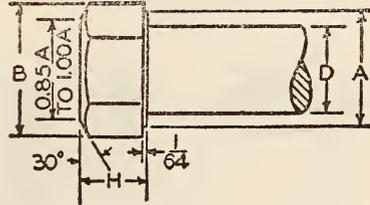

FIGURE 332.—Hexagon cap screw heads

1	1.3125	1.292	1.473	3/4	.768	.733		
1 1/8	1.5000	1.477	1.684	27/32	.863	.824		
1 1/4	1.6875	1.663	1.896	1 1/16	.959	.916		

NOTE.—Cap screws with hexagon heads are similar to machine bolts with hexagon heads, Table 68, and they may be used interchangeably. (See 608.31, p. 605.)

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, AMERICAN NATIONAL WOOD-SCREW SIZES, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

WOOD SCREWS

GENERAL SPECIFICATIONS

(a) *Types.*—Wood screws shall be furnished in three types, namely, flat, round, or oval head, as specified.

(b) *Material and workmanship.*—Wood screws shall be made of steel or brass, as specified, and

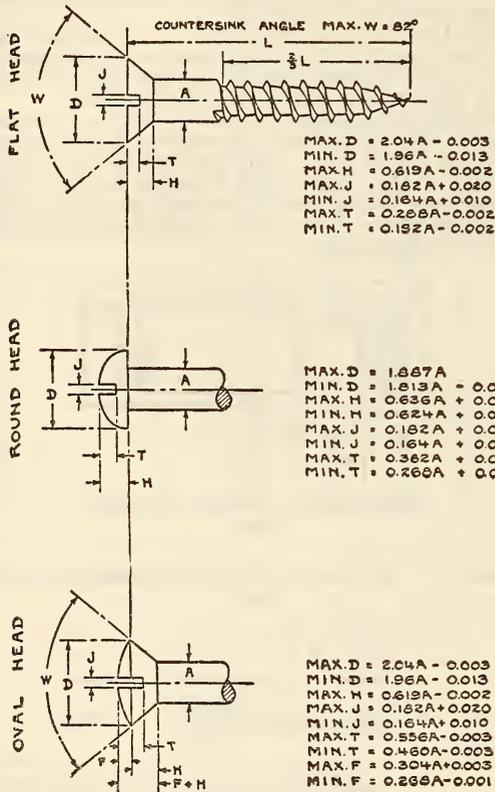

FIGURE 333.—Wood screws

shall be free from any defects which would affect their serviceability.

(c) *Measurement of lengths.*—The length of all screws shall be measured from the largest diameter of bearing surface of the head to the extreme end of the point measured parallel to the axis of the screw.

(d) *Measurement of diameters.*—The diameter shall be measured on the body of the screw under the head.

(e) *Tolerance on diameter.*—The maximum variation on diameter permitted is from +0.004 to -0.007 inch.

(f) *Tolerance on number of threads per inch.*—The maximum variations in the number of threads per inch permitted are plus or minus 10 per cent.

(g) *Points.*—Standard screws shall be furnished with gimlet points. Cone and diamond pointed screws are special.

(h) *Finish.*—Wood screws shall be furnished plain, uncoated, unless blued, nickel plated, or other special finish is specified.

(i) *Head proportions and length of thread.*—The proportions of the head and length of thread shall be as indicated in Figure 333 and Tables 56, 57 and 58.

608.3 BOLTS AND NUTS, EXCEPT RAILWAY TRACK BOLTS.

608.31 BOLTS.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, OVERHEAD LINE MATERIAL FOR DIRECT AND CATERINARY SUSPENSION, RECOMMENDED SPECIFICATION, D102-30, 1930

OVERHEAD LINE MATERIAL

(D102-30, paragraph 304, includes requirements for bolts and nuts. For specification see 611.29, p. 682.)

AMERICAN MARINE STANDARDS COMMITTEE, SPECIFICATION E NO. 11, PROPELLER HUB STUDS, NUTS, AND LOCK SCREWS, A. M. S. C. 30, SEPTEMBER 20, 1927

(See also 608.2, p. 574; 608.32, p. 605; and 646.59, p. 1257.)

HUB STUDS

(Contains specifications, dimensions, and illustrations of propeller hub studs, nuts, and lock screws.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; SPECIFICATIONS FOR MATERIALS, BOLTS AND NUTS, 1916

BOLTS AND NUTS

1. *Scope.*—These specifications shall apply to all bolts and nuts.

MANUFACTURE

2. *Process.*—The bolts and nuts may be wrought iron or steel, made in accordance with A. R. A. specifications for refined wrought-iron bars or mild-steel bars (see 603.1, p. 137).

CHEMICAL PROPERTIES AND TESTS

3. *Chemical composition.*—The steel for the bolts shall conform to the requirements of the A. R. A. specifications for mild steel.

PHYSICAL PROPERTIES AND TESTS

4. *Tension tests.*—The wrought iron or steel conform to the physical properties as specified in the A. R. A. specifications for refined wrought-iron bars or mild-steel bars.

PERMISSIBLE VARIATIONS

5. *Gage of bolts.*—Rods shall conform to the limits as specified in A. R. A. specifications for refined wrought-iron bar or mild-steel bars.

SPECIFICATIONS FOR BOLTS AND NUTS

6. *Threads.*—Nuts shall be so tapped that a U. S. standard plug gage of normal size will pass through the nut, and in that position be snug and not show an appreciable shake. Bolts to be threaded so as to fit the nut in such a manner that it may be turned to within one of the threads of the threaded portion of the bolt. When in this position there shall be no appreciable shake.

7. *Dimensions of boltheads and nuts.*—Finished bolts and nuts shall conform to dimensions in Table No. 1. Short diameter of rough boltheads and nuts may vary from this table as follows: For nuts under one-half inch, one-sixteenth inch under and one

sixty-fourth inch over; for nuts one-half inch and larger, one-sixteenth inch under and three sixty-fourths inch over. All other dimensions of nuts and heads of bolts may vary one-sixteenth inch either way, except that for bolts and nuts under one-half inch, only 1/32-inch variation either way will be permitted.

8. *Tapping of nuts.*—The nuts shall be tapped so that, when applied, the angle between the bearing surfaces shall not exceed 2°, as shown by the cut.

9. *Length.*—The finished length of the bolt shall not vary more than one-eighth inch from the ordered dimension and unless otherwise specified, the threads shall be cut two and one-half times the diameter of the bolt.

WORKMANSHIP AND FINISH

10. *Workmanship.*—The heads of all bolts shall be neatly formed, firmly joined to the body of the bolt, free from large projecting fins, and no nicking or reduction of the size of the body of the bolt by dies.

11. *Threads.*—Bolts and nuts shall be cut with a U. S. and A. R. A. standard thread, the threads being cut full and clean. Unless otherwise specified, each bolt shall be furnished with a nut screwed on.

12. *Finish.*—Where the keyways are cut in the ends of bolts, they shall be full and clean, and the metal around them shall show that it has not been injured by cutting the keyways more than is necessary.

INSPECTION AND REJECTION

(Substantially the same as American Society for Testing Materials, specifications for steel. (See 605.0, p. 247).)

AMERICAN RAILWAY ASSOCIATION, PURCHASES AND STORES DIVISION; STANDARDIZATION AND SIMPLIFICATION OF STORES STOCK, NO. D V1, 135, 1926

BOLTS AND RIVETS

(Contains tables showing the standard sizes of boiler lagging, flat and curved; carriage bolts; square-head machine bolts; locomotive-boiler rivets; and structural rivets that should be carried in stock by railway companies.)

AMERICAN RAILWAY ASSOCIATION, PURCHASES AND STORES DIVISION; STANDARDIZATION AND SIMPLIFICATION OF STORES STOCK, PROCEEDINGS, 1928

FLEXIBLE STAY BOLTS

1. As a means of reducing the number of sizes carried, the committee recommends 1-inch steps in lengths of the most generally used sizes; and, in the longer lengths, the listing of lengths in 2-inch steps. Most roads confine diameters to 1, 1 1/16, 1 1/8, 1 1/4, and 1 1/2 inches.

STOVE BOLTS

(The stocking of 20 different sizes of flat-head stove bolts, and 24 different sizes of round-head stove bolts, is recommended. The flat-head stove bolts range in size from 3/16 by 1/2 inch to 3/8 by 3 inches. The round-head stove bolts range in size from 1/2 by 1 inch to 3/8 by 3 inches.)

AMERICAN RAILWAY ASSOCIATION, TELEGRAPH AND TELEPHONE SECTION; SPECIFICATION FOR POLE LINE HARDWARE, 1-A-20, NOVEMBER, 1927

BOLTS

(For general specifications see 608.0, p. 516.)

GRADE OF STEEL

1. The hardware shall be made from grade A or grade B steel, as designated, unless a special grade of steel is specifically called for in the drawings.
2. Grade A steel used in the manufacture of pole line hardware, herein specified, shall be a mild steel and shall conform to the physical properties and tests as shown below.

PHYSICAL PROPERTIES AND TESTS

3. Tension tests.—The material shall conform to the following requirements as to tensile properties:

Tensile strength.....lbs./in. ² ..	55,000-65,000
Yield point, minimum, 0.5 tensile strength, but in no case less than.....lbs./in. ² ..	30,000
Elongation in 8 inches, minimum...per cent..	1,400,000 Tensile strength
Elongation in 2 inches, minimum...do....	22

4. The yield point shall be determined by the drop of the beam of the testing machine.

MODIFICATION OF ELONGATION FOR STRUCTURAL STEEL

5. The percentage of elongation in 8 inches specified above is dependent upon the diameter and thickness and shall be reduced as follows: (a) By one for each 1/2-inch increase in thickness or diameter above three-fourths inch to a minimum of 18 per cent; and (b) two and one-half for each 1/4e-inch decrease in thickness or diameter below five-sixteenths inch.

BEND TESTS

6. The test specimen for plates, shapes, and bars shall bend cold through 180° without cracking the steel on the outside of the bent portion, as follows:

Thickness of material (in inches)	Specimen to bend—
3/4 or under.....	Flat on itself.
Over 3/4 to and including 1 1/4.....	Around a pin the diameter of which is equal to the thickness of the specimen.
Over 1 1/4.....	Around a pin the diameter of which is equal to twice the thickness of the specimen.

7. Test specimens.—Test specimens shall be prepared from the material in its rolled or forged condition, except where it is to be annealed.

8. Test specimens for annealed material shall be prepared from the material as annealed for use, or from a short length of a full section similarly treated.

9. Grade B.—Grade B shall be a good grade of mild steel.

WORKMANSHIP

10. Workmanship shall be of a good commercial grade.

ANCHOR RODS, BOLTS, AND SPINDLES

11. Bolt and anchor-rod eyes shall be drop-forged. Heads and nuts shall have one face rounded or chamfered, unless otherwise noted. Threads shall conform in size, pitch, and number per inch to the U. S. standard, except for steel pins with wood cobs.

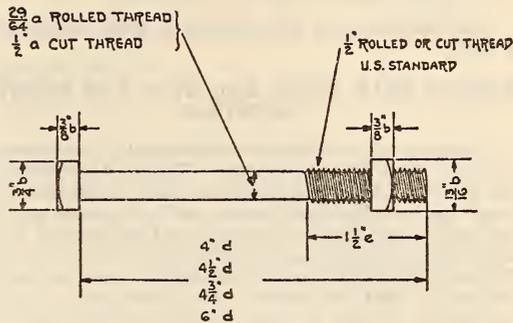

FIGURE 334.—One-half inch machine bolt

Material.—Mild steel (grade A).
Finish.—Galvanized.
Assembly.—Before packing nut to be run down to at least two threads beyond end of bolt.

	Allowable variations	
	Over	Under
	Inch	Inch
a	1/64	1/64
b	1/32	1/32
d	1/8	1/8
e	1/4	1/4

No scale.

12. Threads shall be full, clean, and concentric and formed so that, unless otherwise specified on the drawings, the nut can be run for one-half the length of the thread (in no case less than the thickness of the nut) without undue forcing with the fingers, and the remaining length with a 6-inch wrench without undue forcing.

13. Zinc coating on the threaded portion of nuts may be omitted.

INSPECTION AND REJECTION

(Requirements covering inspection and rejection conform in general to those specified in A. S. T. M. standard specifications for steel. See 605.0, p. 247. The illustrations for cross-arm bolt, double-arming bolt, and carriage bolt are identical with the illustrations for through bolt, double-arming bolt, and carriage bolt, respectively, in A. E. R. E. A. D102-30. See 611.29, p. 682. Figure 334, shown herewith, illustrates the 1/2-inch machine bolt.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, T SLOTS, THEIR BOLTS, NUTS, TONGUES, AND CUTTERS, B5a-1927

[Approved by the American Standards Association, March, 1927.]

T SLOTS, THEIR BOLTS, NUTS, TONGUES, AND CUTTERS

(Contains dimensions of T slots, T bolts, T nuts, T slot cutters, tongues and tongue seats for single-width T slots, and reversible tongues and tongue seats for slots for two sizes of T bolts.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, WRENCH HEAD BOLTS AND NUTS AND WRENCH OPENINGS, B18b-1927

[Approved as American tentative standard by the American Standards Association, February, 1927]

(See also 608.2, p. 575; 608.32, p. 606; and 615.42, p. 883.)

WRENCH HEAD BOLTS AND NUTS AND WRENCH OPENINGS

(Introductory notes are substantially the same as those of the National Screw Thread Commission. See 608.0, p. 551. Specifications and dimensions for rough and semifinished square and hexagonal regular boltheads and finished square and hexagonal boltheads are the same as those given below under the National Screw Thread Commission, machine bolts, Tables 67 and 68, except that formulas for computing the several tabular dimensions are appended to the A. S. M. E. tables. These formulas are, however, not of general application.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, ROUND UNSLOTTED-HEAD BOLTS; CARRIAGE, STEP, AND MACHINE BOLTS, B18e-1928

[Approved by the American Standards Association, February, 1928]

ROUND UNSLOTTED-HEAD BOLTS

1. All screw threads are to be American standard, coarse-thread series, free fit, class 2, with special major diameter tolerances provided for unfinished hot-rolled material. (See Table 8, National Screw Thread Commission, 608.0, p. 534.)

2. The threads on these bolts shall be produced by cutting or rolling. When rolled, the shank diameter will necessarily be smaller than the shank diameter for corresponding cut threads.

3. The tables of bolt and thread lengths reproduced below are intended as a guide to the users of these bolts. A number of the listed sizes and lengths will not be regularly stocked by the manufacturers but will be available on order of a sufficient quantity.

T to S means threaded to square as near as is practicable. Radius of fillet between body and head 1/32 inch on sizes No. 10 to 1/2 inch, inclusive, and 1/16 inch on sizes 9/16, 5/8, and 3/4 inch.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, PLOW BOLTS, B18f-1928, APRIL, 1928

[Approved as American tentative standard by the American Standards Association, 4 April, 1928]

PLOW BOLTS

INTRODUCTORY NOTES

Round head, square neck, countersunk type.—This is generally used in steel parts where countersink-

ing the holes is necessary. It is also used to some extent where the hole can be either dry sand or green sand cored. With an included angle of the head of 80°, the hole can be countersunk conveniently leaving a sufficiently strong head without too much top surface which might be objectionable in soft center moldboards where scouring is essential.

Square head, countersunk type.—This bolt is used only in cast iron or malleable parts, where the hole is green sand cored. The head with the 80° angle is rather flat and, therefore, is desirable for use in cast shares that are very often quite thin. The 80° angle was adopted for this bolt as a fair compromise

* Sponsor organizations: American Society of Mechanical Engineers and Society of Automotive Engineers.

and because it is now used by two of the largest plow manufacturers.

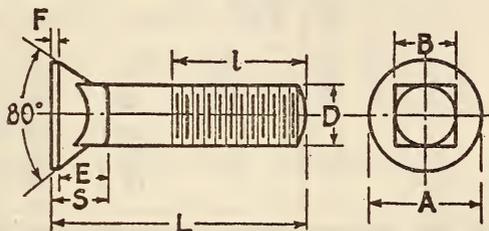

Round head, heavy key, countersunk type.—This bolt is used in chilled and cast moldboards where the holes are always dry sand cored. This bolt with its 40° angle of head was adopted for the reason that three of the largest plow manufacturers now use it.

Round head, reverse key, countersunk type.—This bolt is used in steel parts. The key on this bolt being larger on the bottom makes it very desirable for parts of plows such as the moldboard for the reason that the head can wear down with the surface of the board without wearing away the entire key. The key does not extend outside of the top portion

of the bolt, and therefore, if the key on the bolthead does not fill the entire slot in the hole, this is not noticeable. The 60° angle on this bolt makes it very desirable for plow bottom work as the head is not any larger than necessary. It is very important that the soft head of a bolt in a highly tempered and polished moldboard should be no larger than necessary on account of difficult conditions of scouring. The 60° angle of head was adopted for this bolt because it is now used by several of the large plow manufacturers.

Screw thread.—The threaded parts of these four standard plow bolts are to conform to the American National Standard Coarse-Thread Series—Free Fit (class 2).

¹ The reference letters corresponding to the dimensions of the repair bolts are identical with those of the regular bolts but are printed in lower-case type.

² To distinguish the repair bolts from regular bolts of the same type, a large "R" shall be stamped on the top of its head or this top surface shall be painted red.

³ The tolerance on the included angle shall be plus 2°.

(The dimensions given above for square neck are for cold upset wire.)

¹As stated in the "Introductory notes" these threads are to conform to the American Standard B1a-1924.

"T to H" means threaded to head as near as practicable.

The table of bolt and thread lengths reproduced above is intended as a guide to the users of these bolts. A number of the listed sizes and lengths will not be regularly stocked by the manufacturers but will be available on order of a sufficient quantity.

¹ Minimum length of usable threads.

Recommended practice for material is S. A. E. Steel No. 2330 or 3130. Heat treatment should give a Brinell test of from 223 to 285.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
AERONAUTIC; PLAIN HEXAGON-HEAD
BOLTS, S. A. E. STANDARD, AUGUST,
1928**

PLAIN HEXAGON-HEAD BOLTS

PHYSICAL PROPERTIES

Assembled bolts shall show required minimum tensile strength when tested in tension between the head and the nut.

Bolts shall stand cold-bending in the plain part without fracture through an angle of 180° over a diameter equal to the diameter of the bolt. In short bolts the test may be made in threaded part, the angle of the bend to be through 35°.

MARKING

Bolts conforming to these specifications shall be marked in some distinctive manner where shown.

Bolts conforming entirely to Army-Navy material specifications shall be marked with X.

Bolts not marked in either manner will be understood to be made from low-strength material.

¹ Threads are American standard (NF), with class 3 tolerances. NF indicates national fine pitch.

² Finished sizes include plating or protective coating.

Bolt lengths 1/4 to 8 inches by 1/8-inch increments.

Where L is shorter than F, bolt is to be threaded entire length.

¹ Finished sizes include plating or protective coating.

² Threads are American standard (NF), with class 3 tolerances. NF indicates national fine pitch.

³ Where length of bolt (L) is shorter than C (thread length), bolt is to be threaded entire length. (See illustration.)

⁴ Standard bolt lengths (L) 1/4 to 8 inches by 1/8-inch increments. Tolerances on length, +3/64, -1/64. (See illustration.)

Tolerances are ±0.010 except where otherwise indicated.

(Physical properties and marking are identical with those specified for plain hexagon-head bolts, given above.)

SOCIETY OF AUTOMOTIVE ENGINEERS, AERONAUTIC; PROPELLER-BLADE CLAMP RINGS, BOLTS, AND NUTS, S. A. E. RECOMMENDED PRACTICE, JUNE, 1929

PROPELLER-BLADE CLAMP RINGS, BOLTS, AND NUTS

Passenger cars-----	1 1/4, 1 1/2, 1 3/4, and 2-----	3/16	24
	2 1/4 and 2 1/2-----	3/8	24
Motor trucks-----	2-----	3/16	24
	2 1/4, 2 1/2, and 3-----	3/8	24
	3 1/2 and 4-----	7/16	20
	Over 4-----	1/2	20

TABLE 2.—Center-bolt dimensions

[All dimensions in inches]

Body diameter A	Pitch of thread	Head diameter B	Head height C	Slot width		Slot depth	
				Maximum	Minimum	Maximum	Minimum
3/16	24	1/2	3/8	0.079	0.065	0.115	0.090
3/8	24	3/4	3/8	.088	.074	.142	.112
7/16	20	5/8	1/2	.098	.083	.168	.133
1/2	20	3/4	1/2	.110	.094	.188	.148

All threads American standard (NF), class 2 fit. Thread length to be 1 1/2 A + 1/4 inch. The edge of the bolt head shall have a maximum chamfer or rounding of 1/32 inch. Where passenger-car springs are more than 2 1/2 inches wide, center bolts specified for motor-truck springs of similar width shall be used.

Center-bolt nuts.—Standard cold-pressed hexagon blanks shall be used for spring center-bolt nuts.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, PLOW BOLTS, SIMPLIFIED PRACTICE RECOMMENDATION NO. 23, 1925

PLOW BOLTS

(This recommendation confines itself to nominal diameters and threads per inch of the four standard types of plow bolts, the data on which are in agreement with the American Society of Mechanical Engineers, given above.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, PACKING OF CARRIAGE, MACHINE, AND LAG BOLTS, SIMPLIFIED PRACTICE RECOMMENDATION NO. 60, MARCH 15, 1930

PACKING OF CARRIAGE, MACHINE, AND LAG BOLTS

(Contains tabular matter covering dimensions, quantity, and weights of cut or roll thread carriage, machine, and lag bolts in containers accepted as standard by industry.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR CAP SCREWS, SET SCREWS, MACHINE SCREWS, AND STOVE BOLTS, NO. 548 (CURRENT DESIGNATION: FF-S-91), MARCH 5, 1928

STOVE BOLTS

(For material and workmanship, general requirements, detail requirements, methods of inspection and tests, packing and marking of shipments, and notes, see F. S. B. No. 548 under commodity designation 608.0, p. 527.)

1. Stove bolts are regularly furnished in coarse-thread series standard sizes of one-eighth, five thirty-seconds, three-sixteenths, seven thirty-seconds, one-fourth, five-sixteenths and three-eighths inch. The first four are interchangeable with the machine-screw sizes Nos. 5, 8, 10, and 12, coarse-thread series. They are furnished with flat or round heads, slotted. Stove bolts are furnished with square nuts. (See National Screw Thread Commission, Table 74, under commodity designation 608.32, p. 611.)

2. Stove bolts 2 inches and under in length are usually threaded from the extreme point to the least diameter of the bearing surface of the head. Stove bolts over 2 inches in length are usually threaded about two-thirds of their length. The length of stove bolts is measured from the largest diameter of the bearing surface of the head to the extreme point.

3. Stove bolts having flat and round heads shall have the dimensions specified in Federal Specifications Board specification No. 548 (FF-S-91), Tables 14 and 15. (See 608.2, p. 579.)

4. The head shall be at right angles to the body within 2° and concentric with the body within a tolerance of 3 per cent of the diameter of the head.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR BOLTS, NUTS, STUDS, AND TAP RIVETS (AND MATERIAL FOR SAME), FF-B-571, OCTOBER 13, 1931

BOLTS AND STUDS

(For detail specifications covering applicable Federal specifications, types, material and work-

manship, general requirements, detail requirements—including references to tabular matter in other specifications, such as National Screw Thread Commission and the American Society of Mechanical Engineers—methods of sampling, inspection, and tests; packaging, packing, and marking; and notes, see FF-B-571 under commodity classification 608.0, p. 522.)

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, AMERICAN NATIONAL SCREW, BOLT, AND NUT PROPORTIONS. BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

(See also 608.0, p. 551; 608.2, p. 583; 608.32, p. 609; 615.42, p. 883.)

WRENCH-HEAD BOLTS AND NUTS, AND WRENCH OPENINGS

MACHINE BOLTS

Machine bolts are regularly furnished one-fourth inch and over in diameter and with hexagon or square heads. They are furnished with square or hexagon nuts. They are threaded for a length dependent upon the diameter and length.

The length of a machine bolt is the measurement from the extreme point to the bearing surface of the head. The length of thread is measured from the extreme point to the last perfect thread.

The tops of bolt heads are flat and chamfered; the maximum angle of chamfer with the top surface is 30°, and the diameter of the top flat circle is from 85 to 100 per cent of the width across flats.

The width across flats of bolt heads is measured at the widest point. The taper of the sides of bolt heads does not exceed 4°.

Bolt heads are concentric with the body within a tolerance of 3 per cent of the width across flats.

The minimum lengths of thread, unless otherwise specified, are given in Table 66.

The thickness of the head is the distance from the top to the bearing surface.

(a) *Rough and semifinished bolts.*—Rough bolts are made by cold or hot pressing, punching, or forging. They are threaded but not machined.

Semifinished bolts are those which meet the tolerances prescribed without regard to the amount of machining needed to meet such tolerances, except that the bearing surfaces are finished smooth.

The dimensions of rough and semifinished bolts are given in Table 67.

Rough and semifinished boltheads are at right angles to the body within 3°.

(b) *Finished bolts.*—Finished bolts and nuts are machined all over, and threaded.

The dimensions of finished bolts are given in Table 68.

Finished boltheads are at right angles to the body within 2°.

All finished bolts are washer faced. The thickness of the washer face is about one sixty-fourth inch. The diameter of the bearing surface of the washer face is equal to the width across flats within plus or minus 5 per cent.

TAP BOLTS

Tap bolts are the same as machine bolts, except that they are threaded to the head, and they may be used interchangeably. Tap bolts are regularly furnished in the coarse-thread series one-fourth inch and over in diameter, without nuts, and with square or hexagon heads. The length of bolt is measured from the extreme point to the bearing surface of the head.

TABLE 66.—Minimum length of threaded portion of machine and tap bolts

Length of bolt, L (inches)	Diameter of bolt, D (inches)					
	¼	⅜	½	⅞	1	1½
	Length of threaded part, l					
1 to 1½	¾	¾	¾	¾	1	1
1½ to 2	1	1	1	1	1	1
2½ to 2½	1	1	1	1	1	1
2½ to 3	1	1	1	1	1	1
3½ to 4	1	1	1¼	1¼	1¼	1¼
4½ to 8	1	1	1¼	1¼	1¼	1¼
8½ to 12	1	1	1¼	1¼	1½	1½
12½ to 20	1	1	1½	1½	2	2

Length of bolt, L (inches)	Diameter of bolt, D (inches)					
	⅝	¾	⅞	1	1½	1¾
	Length of threaded part, l					
1 to 1½	1¼	1¼	1¼	1¼	1¼	1¼
1½ to 2	1¼	1½	1½	1½	1½	1½
2½ to 2½	1¼	1½	1½	1½	1½	1½
2½ to 3	1¼	1½	1½	1½	2	2¼
3½ to 4	1½	1½	1½	2	2½	2½
4½ to 8	1½	1½	2	2¼	2¾	3
8½ to 12	1¾	2	2¼	2¼	3	3¼
12½ to 20	2	2	2½	3	3¼	3½

NOTE.—Machine bolts under 1 inch in length are threaded to the head. Machine bolts of any diameter, over 20 inches in length, and bolts over 1¼ inches in diameter, if length permits, are threaded a length equal to three times the diameter unless otherwise specified.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
CAP SCREWS, BOLTS, AND NUTS;
GAGING OF CASTLE-NUT SLOTS, FEBRU-
ARY, 1925**

GAGING OF CASTLE-NUT SLOTS

GENERAL INFORMATION

1. The method of gaging castle-nut slots that is indicated in the accompanying table permits as much variation in the location of the cotter-pin hole in the screw as in the location of the cotter-pin slot in the nut. Some approximations will have to be made in the application of this method, owing to differences of bore due to the drilling and to the tapping of the nut. The errors can be reduced by the nut manufacturer by making the diameter of the plug suitable for the minimum drilled hole, and by the user by making the plug suitable for the minimum minor-diameter of the threaded hole.

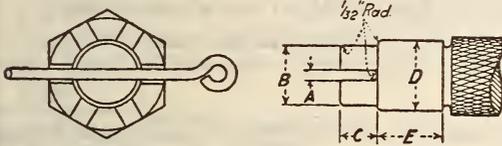

FIGURE 352.—Gaging castle-nut slots

[All dimensions in inches]

Nut	Slot width ¹	Cotter-pin diameter ²	Drill rod		A	B	C	D ¹	E
			No.	Inch					
1/4	5/16	1/16	49	0.072	0.072	0.182	5/32	0.2113	1/4
5/16	3/8	1/16	49	0.072	0.072	19/64	5/32	.2674	19/64
3/8	1/2	3/32	34	.110	.110	19/64	3/16	.3299	11/32
7/16	1/2	3/32	34	.110	.110	11/32	3/16	.3834	25/64
1/2	1/2	3/32	34	.110	.110	19/32	1/4	.4459	7/16

The drill rod shall preferably be tempered and should fit in the slot of the gage without shake.

¹ Minimum minor-diameter for free fit (class 2) nuts. If the nuts are not threaded in accordance with the American standard for screw threads (see 608.0, p. 529), the diameter shall be the same as the diameter of the "go" plug gage for the bore.

² S. A. E. standard dimensions.

2. The diameter of the gaging pin is intended to be the mean of the width of the slot in the gage and the diameter of the cotter pin, the drill-rod size nearest this dimension, but larger, being used. The diameter of the slotted part of the gage plug is made smaller so as to clear the burrs resulting from the blanking and the slotting of the nut.

¹ The counterbore indicated is optional.

All screw threads shall be in accordance with the free (class 2) fit as given in the American standard for screw threads. (See 608.0, p. 529.)

The angle of chamfer shall not exceed 40° with the top face of the nut.

0.6250— $\frac{3}{4}$ -----	18	$1\frac{1}{8}$	$1\frac{5}{32}$	$\frac{5}{16}$

¹ Finished sizes include plating or protective coating.
² Threads are American standard (NF), with class 3 tolerances. NF indicates national fine pitch.
³ For full-strength nuts $N = 3A/4$. For check nuts and thin nut for shear bolts $\frac{1}{4}$ inch diameter and larger $N = A/2$.

Tolerances are ± 0.010 except where otherwise indicated.

PHYSICAL PROPERTIES

Nuts shall be manufactured from bar steel having the following physical properties:

Tensile strength (minimum).....	lbs./in. ² ..	70,000
Yield point (minimum).....	do.....	50,000
Elongation (minimum), in 2-inch.....	per cent..	10
Reduction of area (minimum).....	do.....	40

Nuts shall withstand being increased 25 per cent of their original internal diameter without fracture and decreased 25 per cent of their internal diameter without failure.

WRENCH-HEAD BOLTS AND NUTS, AND WRENCH OPENINGS

NUTS

Nuts are commonly either hot forged, cold punched, or machined from bar stock.

The tops of regular square and hexagon nuts when not castellated, of jam nuts, square and hexagon machine screw nuts, and of hexagon light nuts when not castellated are flat and chamfered; the maximum angle of chamfer with the top surface is 25°; and the diameter of the top flat circle is from 85 to 100 per cent of the width across flats.

The width across flats of nuts is measured at the widest point. The taper of sides of nuts does not exceed 4°.

All finished hexagon and square regular nuts, castellated nuts, and hexagon light nuts are washer faced. The thickness of the washer face, including that of jam nuts having a washer face, is about one sixty-fourth inch. The diameter of the bearing surface of the washer face is equal to the width across flats within plus or minus 5 per cent. The thickness of the nut is the distance from the top to the bearing surface.

(a) *Rough and semifinished regular nuts.*—Rough nuts are made by cold or hot pressing, punching, or forging. They are threaded but not machined.

Semifinished nuts are those which meet the tolerances prescribed without regard to the amount of machining needed to meet such tolerances, except that the bearing surfaces are finished smooth.

The dimensions of rough and semifinished square and hexagon regular nuts are given in Table 69.

Semifinished nuts are faced on the bearing surface and are at right angles to the axis of the threaded hole within 3°.

(b) *Finished regular nuts.*—The dimensions of finished square and hexagon regular nuts are given in Table 70.

The axis of the threaded hole is at right angles to the washer face within a tolerance of 2°.

(c) *Castellated nuts.*—The dimensions of castellated nuts are given in Table 71.

The axis of the threaded hole is at right angles to the washer face within a tolerance of 2°.

(d) *Finished and semifinished jam nuts.*—The dimensions of finished and semifinished jam nuts are given in Table 72. Jam nuts are either single or double chamfered as specified. If a single chamfer is specified, the opposite side is washer faced.

The axis of the threaded hole is at right angles to the washer or finished face within a tolerance of 2°.

(e) *Hexagon light nuts.*—The dimensions of hexagon light nuts are given in Table 73.

(f) *Hexagon and square machine screw nuts and square stove-bolt nuts.*—The dimensions of hexagon and square machine screw nuts and square stove-bolt nuts are given in Table 74.

Machine screw nuts, when made from hexagon bar stock, are faced on the bearing surface and this surface is at right angles to the axis of the threaded hole within 5°.

608.4 RIVETS, IRON OR STEEL.**AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; QUALITY AND TESTING OF MATERIALS—SHIP CONSTRUCTION, 1930****STEEL AND IRON RIVETS**

(For general information and requirements see 600.0, p. 2.)

A sufficient number of sample steel or iron rivets are to be selected by the surveyor from each diameter of rivet and are to be tested hot and cold by bending, crushing, or in such other way as may be required. The shank must stand being doubled together cold without fracture, and the rivet head must stand being flattened hot until its diameter is two and one-half times the diameter of the shank.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN STANDARD SMALL RIVETS, $\frac{7}{16}$ INCH NOMINAL DIAMETER AND UNDER, B-18a-1927

[Approved by American Standards Association, July 1927]

SMALL RIVETS**INTRODUCTORY NOTES**

The standard types of small rivets covered by this report are designated, respectively, as flathead, countersunk head, button head, pan head, and truss or wagon-box head. All other types of small rivets within the limits of diameters given are to be considered special.

Tabular diameters.—The diameters of rivets in fractions of an inch as given for the respective types of rivets on Tables 1, 2, 3, 4, and 5 shall be considered standard. Other values for diameters of rivets, as in Birmingham wire gage numbers, may be used in catalogues in conjunction with the standard diameters, it being recommended, however, that the data be in such form as will make clear which diameters are standard and which are not standard.

Proportions and dimensions.—The proportions and dimensions indicated in the tables for the heads of the respective rivets shall be standard; other proportions or dimensions are to be considered special. Where nonstandard diameters are given for rivets, the proportions of heads will follow the diagrammatic proportions given in the respective diagrams, in terms of the diameter of body.

Fillets.—Rivets, other than of the countersunk type, shall be acceptable with fillets under the head up to one thirty-second inch radii.

Tolerances.—The tolerances on the nominal diameters of the shanks shall be those given in the following table:

Body diameters (inclusive)	Tolerances	
	Plus	Minus
$\frac{3}{32}$ to $\frac{5}{32}$	0.002	0.004
$\frac{3}{16}$ to $\frac{1}{4}$003	.006
$\frac{5}{32}$ to $\frac{11}{32}$004	.008
$\frac{3}{8}$ to $\frac{1}{2}$005	.010

No standard tolerances for the dimensions of the heads are contemplated. For work where restrictions as to head tolerances are necessary these shall be considered special.

Rivet material—composition and physical properties.—(a) The steel from which the rivets are manufactured shall be made by the open-hearth process and conform to the following:

	Per cent
Manganese.....	0.30-0.50
Phosphorus, not over.....	.04
Sulphur, not over.....	.05

(b) The material, when tested, shall conform to the following:

Tensile strength, lbs./in.², 45,000 to 55,000.

Yield point, lbs./in.², 0.5 tensile strength.

Elongation in 8 inches (minimum per cent) = $\frac{1,500,000}{\text{Tensile strength}}$

The elongation need not, however, exceed 30 per cent.

The preceding requirements are not applicable to tests on finished rivets. They are for general information only in regard to the production of suitable rivet material.

Physical tests.—Rivets selected at random from each size shall comply with the following:

(a) *Cold test for ductility.*—One-half of the rivets selected for each test shall be flattened to one-fourth of their original diameter and then bent through 180° flat on themselves and shall show no signs of cracks, flaws, or any other defects.

(b) *Hot test for ductility.*—The remaining rivets shall be heated to a red heat and flattened to one-fourth of their original diameter, then reheated and bent through 180° flat on themselves and shall show no signs of cracks, flaws, or any other defects.

(c) *Hardness test.*—The hardness of rivets shall register between No. 20 and No. 26, inclusive, when tested by the Shore scleroscope. Any other degrees of hardness shall be considered special.

Finish.—The finished rivets shall be free from injurious defects.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, TENTATIVE AMERICAN STANDARD TINNERS', COOPERS', AND BELT RIVETS, B-18g-1928

[Approved as American tentative standard by the American Standards Association, May, 1928]

TINNERS', COOPERS', AND BELT RIVETS
 INTRODUCTORY NOTES

The standard types of small rivets covered by this report are designated, respectively, as tanners',

coopers', belt. All other types of rivets for this class shall be considered special.

Tabular sizes.—The sizes of rivets as given for the respective types of rivets on Tables 1, 2, and 3 shall be considered standard. Other values for sizes of rivets may be used in catalogs in conjunction with the standard sizes; it being recommended, however, that the data be in such form as will make clear which are standard and which are not standard.

Proportions.—The proportions indicated below, in Tables 1, 2, and 3, for the heads and points of the respective sizes of rivets shall be standard; other proportions are to be considered special. In non-standard sizes of rivets, the heads and points shall be of the same proportions; the lengths of rivets covered by Tables 1 and 2 being determined from the table by interpolation.

Tolerances.—The tolerance on the nominal diameter of belt rivets shall be plus 0.002 inch and minus 0.004 inch.

The tolerances on the body diameters of coopers' and tanners' rivets shall be those given in the following table:

Size (inclusive)	Tolerances	
	Plus	Minus
8 ounces to 2½ pounds.....	0.002	0.004
3 pounds to 10 pounds.....	.003	.006
12 pounds to 16 pounds.....	.004	.008

No standard tolerances for the dimensions of the heads are contemplated. For work where restrictions as to head tolerances are necessary, these shall be considered special.

Finish.—The finished rivets shall be free from injurious defects.

(Rivet material: Composition and physical properties, physical tests, and finish are the same as for small rivets, given above.)

FLAT-HEAD PINS

[All dimensions in inches]

Nominal pin size	A	B	C	D	Drill H	X	Minimum single shear strength in pounds
					No.		
1/8	1/4	3/64	3/64	0.124	50 (0.070)	0.035	940
3/16	5/16	3/64	3/64	.186	48 (.076)	.038	2,130
1/4	3/8	1/16	1/16	.248	48 (.076)	.038	3,770
5/16	7/16	1/16	5/64	.311	36 (.1065)	.053	6,000
3/8	1/2	1/16	5/64	.373	36 (.1065)	.053	8,650
7/16	9/16	3/32	5/64	.436	36 (.1065)	.053	11,840
1/2	5/8	3/32	5/64	.497	36 (.1065)	.053	15,400
9/16	11/16	3/32	5/64	.560	28 (.141)	.070	19,550
5/8	3/4	3/32	5/64	.622	28 (.141)	.070	24,150

It is recommended that pins of three-eighths to seven-sixteenths inch in diameter be carried up to 3 inches in length only, and that pins one-half to five-eighths inch in diameter be carried up to 4 inches in length, as there is no known demand for greater lengths.

On pins longer than 2 inches the tolerance should be changed from +0.000 -0.002 to +0.000 -0.003.

Pins to be ordered in increments of one-sixteenth inch only.

NOTE.—All key ways shall be cut on a diametral center line.

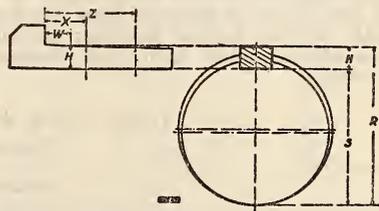

FIGURE 374 1/2.—Projection of taper key under maximum and minimum tolerances

The numerical values of *R* and *S* are computed as follows:

$$R = (T + H/2 - 0.017) \begin{matrix} +0.006'' \\ -0.000'' \end{matrix}$$

$$S = (T - H/2) + 0.000'' \begin{matrix} -0.006'' \end{matrix}$$

Where

R = The diameter of the bore to the bottom of key way, in inches.

S = The diameter of shaft to the bottom of key way, in inches.

T = Nominal diameter of shaft, in inches.

The reason for deducting 0.017 inch from the nominal depth of the key way in the bored member is to establish the minimum projection of the key greater than *W*.

A difference of 0.001 inch in H is equivalent to a movement of 0.096 inch measured parallel to the base of the key from W .

W = The distance from the gib head at which the values for H are computed.

X = Minimum projection of key with key ways (R minus S) at maximum depth and height of key (H) at minimum.

Z = Maximum projection of key with key ways (R minus S) at minimum and height of key (H) at maximum.

AMERICAN PETROLEUM INSTITUTE, TRANSMISSION STANDARDS, A. P. I. STANDARDS NO. 7, JANUARY, 1930

SHAFTING AND KEYS

MATERIAL COVERED

These specifications apply to the following material: Shafting and keys.

The standards contained and illustrated herein are dimensional only, and apply to new equipment. These specifications do not include either chemical or physical properties of material, except as to finish.

WORKMANSHIP AND FINISH

All machined or mating surfaces shall be finished in a good and workmanlike manner and shall be free from burrs, rough edges, etc.

All castings shall be of good quality, free from blowholes, rough edges chipped or ground off, and shall be thoroughly cleaned.

MARKING

All material manufactured in accordance with these specifications shall be marked or stamped with the manufacturer's name or other identifying mark.

Where the A. P. I. monogram is specified on mill roll or forged material it shall be applied with a steel stencil, size of monogram to be one-half inch high.

SHAFTING AND KEYS

4-a. Shafting and keys selected from Tables 1, 2, and 3 shall be standard.

4-b. In order to reduce the number of sizes of shafting, the following range of sizes was adopted:

One-half to four inches diameter (inclusive) in variations of one-eighth inch; this eliminates the $\frac{1}{16}$ -inch sizes.

Four and one-fourth to six inches diameter (inclusive) in variations of one-fourth inch; this eliminates the $\frac{1}{16}$ and $\frac{1}{8}$ inch sizes.

Over 6 inches diameter, in variations of one-half inch; this eliminates the $\frac{1}{16}$, $\frac{1}{8}$, and $\frac{1}{4}$ inch sizes.

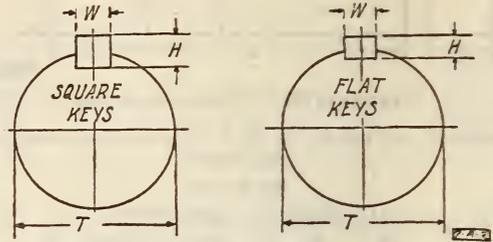

FIGURE 375.—Shafting and plain keys

¹ Keys.—These tolerances are negative and represent the maximum allowable variation below the exact decimal size. For instance, the standard stock square key for a 2-inch shaft has a maximum size of 0.500 by 0.500 inch, and a minimum size of 0.4975 by 0.4975 inch. It is understood that these keys are to be cut from cold-finished stock and are to be used without further machining.

Note.—Shafting.—The shafting diameters contained in Table 1 are standard. No tolerances are specified, due to different methods used by various manufacturers in manufacturing shafting; that is, machine turned or ground from hot finished and cold finished. When specified items requiring the use of shafting are standardized, the tolerances on the shafting must be specified to insure interchangeability.

¹ The minimum stock length of keys is equal to 4 times the key width, and the maximum stock length of keys is equal to 16 times the key width. The increments of increase in length are equal to 2 times the width.

² The height H of the key is measured at the distance W from the large end.

Letters indicating dimensions are the same as in Figure 372 in shaft keys and key ways, given above.

¹ This height of the key is measured at the distance W from the large end.
² The minimum stock length of keys is equal to 4 times the key width, and the maximum stock length of keys is equal to 16 times the key width. The increments of increase of length are equal to 2 times the width.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN STANDARD WOODRUFF KEYS, KEY SLOTS, AND CUTTERS, B17f-1930

[Approved as American Standard by the American Standards Association, December, 1930]

WOODRUFF KEYS, KEY SLOTS, AND CUTTERS

(Dimensions of keys and key slots conform to those of the Society of Automotive Engineers, given below. In addition, this specification contains the Woodruff key-slot cutter dimensions shown in the accompanying table.)

Key-slot cutters.—Two series of key-slot cutters, fine and coarse teeth, both of the shank type and having a shank diameter of one-half inch for all sizes have been adopted as best suited to the re-

quirements. The key numbers established to designate the size of key apply also to the corresponding cutters. The over-all dimensions, number of teeth for both fine and coarse series, tolerances, and general design features are given in Table 3.

It should be noted that a back clearance of 0.006 to 0.010 inch per inch (20 to 40 minutes of arc) shall be ground on each side of the cutter and that each side face may be recessed to a depth of not more than one-quarter of the cutter width.

The accuracy in grinding shall be such that the cutting edges of the teeth will be concentric within 0.002 inch and both sides will be parallel within 0.0005 inch indicator reading.

In order that the cutters may be centered accurately for regrinding, provision for which has been made in the maximum dimensions (note 2,

Table 3), both ends of the shank shall be drilled and countersunk with a 60° angle in accordance with the following:

[All dimensions given in inches]

Key No.	Maximum countersink diameter	Drill diameter	Depth of drilled hole below countersink
402	3/32	1/16	1/16
408-708	1/8	1/16	1/16
806-1212	3/16	3/32	3/32

All cutters shall be marked on the shank with the key number or nominal size and the maker's name or trade-mark.

1211	3/8 by 1 3/4	14	10	1.395	1.390	.3745	.3740	-----	.467	-----	1/4	1/32	1/32	1 1/16	
1212	3/8 by 1 1/2	16	12	1.520	1.515	.3745	.3740	-----	.467	-----	1/4	1/32	1/32	3/4	

¹ Key numbers indicate the nominal key dimensions. The last 2 digits give the nominal diameter (B) in eighths of an inch and the digits preceding the last 2 give the nominal width (A) in thirty-seconds of an inch. Thus, 204 indicates a key 3/32 by 1/2 or 1/16 by 1/2 inch; 1210 indicates a key 1 3/32 by 1 1/4 or 3/8 by 1 1/4 inches.

² The maximum diameters of cutters given in Table 3 will permit regrinding once or twice, depending on the widths.

³ The minimum cutter width is equal to the minimum key-slot width plus 0.0005 inch. The width of the key slot cut by the maximum cutter will be found in the majority of cases to be slightly less than the maximum key-slot width given in Table 2.

⁴ For keys larger than No. 810, cutters with cylindrical necks are specified, in which case E is the small radius between the cylindrical neck and shank.

Width A.—Dimensions shown are set with the minimum key width as basic.

Tolerance on all key widths to be 0.001.

Maximum key width is basic plus tolerance.

Diameter B.—Dimensions shown are set with maximum diameter as basic.

Tolerance on all key diameters to be 0.010.

Minimum key diameter is basic minus tolerance.

Height C.—Dimensions shown are set with maximum height as basic.

Tolerance on all key heights to be 0.005.

Minimum key height is basic minus tolerance.

Height D.—Keys of this type are standard with some manufacturers. Dimensions shown have been furnished by those manufacturers.

Height E.—This dimension is given for convenience of draftsmen. Weights.—Weights shown are approximate.

Material.—S. A. E. Steel 1035 or 2330 as specified. Keys of nickel steel are marked with depressions on the edges to distinguish them from carbon-steel keys. Nickel-steel keys are heat treated.

KEY SLOT

Width A.—Dimensions shown are set with the maximum key-slot width as that figure which will receive a key with the greatest amount of looseness permissible to assure the key sticking in the slot.

Minimum key-slot width is that figure permitting the largest shaft distortion acceptable when assembling maximum key in minimum key slot.

The largest shaft distortion acceptable in all calculations was 0.0003 not more than 16 inches from side of assembled key.

Depth B.—Dimensions shown are set with the maximum as that figure which receives a key of maximum height and permits the key to project above the shaft a distance equal to one-half the basic width.

Tolerance on all key-slot depths 0.005.

Minimum key-slot depth is maximum minus tolerance.

NOTE.—The word "depth" as applied to "key slot" should be construed to mean the depth of the key slot taken at the side.

KEY ABOVE SHAFT

Height C.—Dimensions shown are set with one-half the basic key as basic height. Tolerance on key height above shaft plus or minus 0.005.

NOTE.—The wording "key above shaft" and "height" should be construed to mean the amount of key exposed after being fitted into place.

KEY WAY

Width D.—Dimensions shown are determined by using for width of key way the maximum width of key minus 0.000 plus 0.002 for class 2 and minus 0.000 plus 0.005 for class 1.

Depth E.—Dimensions shown are determined by using for depth of key way the maximum key in the minimum key slot minus 0.001 plus 0.006.

Details of Woodruff key slots, keys above shaft, and key ways

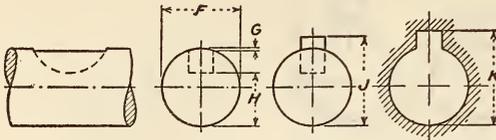

FIGURE 381

[All dimensions in inches]

Woodruff size	Shaft diameter		Versed sine	Bottom of key slot to opposite side		Top of key to opposite side		Bottom of key way to opposite side	
	F			H		J		K	
	Fraction	Decimal	G	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum

(General information covering machined dimensions are appended to this specification. Included are data on key slots and key ways for a graduated range of shaft diameters, 2 inches being the maximum diameter, as machined to accommodate the 27 different sizes of Woodruff keys. These data are tabulated under the form shown above. The dimensions are obtained as shown below:)

Shaft diameter F.—Decimal equivalents are given to four places and all figures in the remaining columns are calculated from these basic dimensions. Any change in the shaft diameter from basic will necessarily change all other figures and, in this case, should accurate dimensions be required, the formula in the next paragraph should be used.

Versed sine G.—The versed sines specified are determined from the following formula.

$$G = \frac{F}{2} - \sqrt{\frac{F^2 - A^2}{4}}$$

A being the basic width of the key slot.

Bottom of key slot to opposite side of shaft H.—These figures are obtained by subtracting the versed sine G and the depth of the key slot B, from the shaft diameter F.

Top of key to opposite side of shaft.—These figures are obtained by adding to the dimension, H, the height of the key C, these figures being as follows:

Key diameter	Key height	
	Minimum	Maximum
<i>Inches</i>	<i>Inch</i>	<i>Inch</i>
1/2	0.198	0.203
5/8	.245	.250
3/4	.308	.313
7/8	.370	.375
1	.433	.438
1 1/8	.479	.484
1 1/4	.542	.547
1 3/8	.589	.594
1 1/2	.636	.641

Bottom of key way to opposite side of bore.—These figures are obtained by first subtracting the versed sine G from the shaft diameter F and then adding to this figure the depth of the key way E.

Temper test.—After compressing the lock washer flat, the reaction shall be sufficient to indicate necessary spring power, and on a subsequent compression to flat, the lock washer shall manifest no appreciable loss in reaction.

Toughness test.—Forty-five per cent of the lock washer, including one end, shall be secured firmly in a vise, and forty-five per cent, including the other end, shall be secured firmly between parallel jaws of a wrench. Movement of wrench at right angles to the helical curve shall twist the lock washer through 45° without it showing signs of fracturing, and shall twist the lock washer entirely apart within 135°.

608.7 TURNBUCKLES.

AMERICAN MARINE STANDARDS COMMITTEE, RIGGING FITTINGS FOR SHIPS, H No. 6-1928 AND H No. 7-1928

RIGGING SCREWS

GENERAL NOTES

Materials and Workmanship

1. The turnbuckles, screws, and pins are to be of mild steel of tensile strength of 55,000 to 65,000

pounds per square inch. It is intended that the materials and workmanship shall conform to the requirements of the American Bureau of Shipping, but inspection and tests shall be required only when specified in the purchase order.

2. The dimensions tabulated correspond to sizes and strengths of ropes given in the rules of the American Bureau of Shipping; if ropes of lesser or greater strengths are used, rigging screws of corresponding strengths should be selected from the table and their end connections adapted to fittings required to suit the rope actually used.

3. Mast shrouds and stays should be served for a length of 6 feet from the lower end. Other wire ropes should be finished as follows:

- Those under five-eighths inch nominal diameter should be parceled and single served only in way of splices and thimbles.
- Those of five-eighths inch nominal diameter and over should be single served in way of splices, and wormed, parceled, and single served in way of thimbles.

4. The materials used to serve wire ropes should be as follows:

- Marline for wire ropes up to and including seven-sixteenths inch nominal diameter.
- Houseline for wire ropes from one-half inch to 1½ inches nominal diameter, inclusive.
- Hambroline for wire ropes from 1¼ to 2¾ inches nominal diameter, inclusive.

(The nominal diameter of wire rope is the overall diameter.)

5. Details and dimensions of open and closed sockets for various sizes of wire rope are shown by American Marine Standard H No. 9-1926. The size of the pin required in the socket must in every instance be specified when ordering these fittings from manufacturers, as the sizes required might not be commercial standards.

6. Socketing of rope should be done according to the best practice. Zinc (not lead or babbitt) should be used for filling the socket.

7. All screw threads are to be of medium fit and conform to the American (national) standard, sponsored by the Society of Automotive Engineers and the American Society of Mechanical Engineers, and approved by the American Standards Association in May, 1924, as standard B1a-1924. This standard is in complete accordance with the report of the National Screw Thread Commission (revised, 1928). (Miscellaneous Publication No. 89, Bureau of Standards.)

8. Pins of diameters not conforming to standard screw-thread sizes shall have their threaded end of the standard screw-thread size next below the pin size.

¹ Use chain plate size No. 8.

² Use chain plate size No. 10. See standard H No. 8-1926.

Letters within circles designate approximate dimensions. Jaws of sockets and shackles are required to fit the male fittings with a minimum of working clearances. Sufficient thread is allowed for fitting lock nuts on ends of turnbuckle if desired. All parts of rigging are to be galvanized.

Extra length of socket bolt may be required for sheer bar under nut.

CABLE EYE

PHYSICAL PROPERTIES

Turnbuckle cable eyes shall be subjected to a tensile test after plating and shall withstand the test load specified.

The shanks shall be machined, preferably from heat-treated cold-drawn or cold-rolled bars. If shanks are not made from heat-treated cold-drawn or cold-rolled bars, they shall be heat treated after machining to give the physical properties specified.

Turnbuckle shanks meeting the tensile test without breaking shall be held in a square-nose vise and bent through an angle of 90° without failing or cracking.

611. CASTINGS AND FORGINGS**611.0 GENERAL ITEMS.**

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

SAMPLES OF CAST IRON

(The Bureau of Standards prepares and sells standard samples of cast iron and other materials for use by industrial organizations and others as comparison standards for checking the accuracy of analysis of cast iron, etc. Each sample is accompanied by a certificate giving the analysis of that particular sample. Samples number 4d, 5f, 6d, 7b, and 74 are cast iron, sample No. 55 is ingot iron, and sample No. 82 is nickel-chromium cast iron.)

611.1 GRAY-IRON CASTINGS.**611.11 GRAY CAST IRON.**

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

IRON CASTINGS

(For general information and requirements see 600.0, p. 1. For test requirements see 600.1, p. 7.)

1. Iron castings subject to test and inspection shall be made by the cupola or other approved process. The material must be of uniform grain, free from blowholes, porous spots, or other defects. The physical characteristics of the material shall be determined by a tension-test piece (similar in outline to test piece shown in A. B. S. 600.1, p. 7.) With a sectional area of 0.5 square inches, or by arbitration bar $1\frac{1}{4}$ inches diameter and 15 inches long.

2. The minimum tensile strength of the material as shown by the tension test shall not be less than 20,000 pounds per square inch. The minimum breaking strength of the material under transverse load as shown by the arbitration bar shall not be less than 2,500 pounds with the points of support 12 inches apart. Satisfactory evidence must be furnished the surveyor to identify the arbitration bar as representing the material to be tested.

3. Semisteel castings subject to test and inspection shall comply with the general requirements for cast iron. The materials must have a minimum tensile strength of 28,000 pounds per square inch.

4. The number of tests for iron and semisteel castings is to be in accordance with the requirements for steel castings. (See 611.41, p. 706, par. 2.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, SPECIFICATION FOR MATERIALS FOR USE IN THE MANUFACTURE OF SPECIAL TRACK WORK, W104-28, 1928

(Approved as American tentative standard by the American Standards Association, January 23, 1929)

SPECIAL TRACK-WORK MATERIALS

(For gray-iron castings see W104-28, under 606.3, p. 342.)

AMERICAN RAILWAY ASSOCIATION, SIGNAL SECTION, GRAY-IRON CASTINGS, SPECIFICATION NO. 1630, JULY, 1930

GRAY-IRON CASTINGS

(Same as A. S. T. M. A48-29, given below, except for the following items:)

DRAWINGS

Contractor shall furnish, with his tender, drawings forming an essential part thereof.

TENDER

The tender shall be for apparatus meeting the requirements of this specification. If the contractor wishes to vary from the specification, a tender may be submitted covering the apparatus he desires to furnish. This tender shall be accompanied by full information showing wherein the requirements of the specification are varied from.

MATERIAL AND WORKMANSHIP

The manufacturer's pattern number must appear on each casting and be so located that it will not wear off or interfere with the fitting of other parts to the casting.

TESTS

Tests may be made at point of production, or on samples submitted, and may also be made at destination.

Contractor shall give the purchaser sufficient notice of time when material will be ready for testing.

Contractor shall provide, at point of production, apparatus and labor for making the required tests under supervision of the purchaser.

The arbitration test bar shall conform to that shown in A. S. T. M. A124-29. (See 600.1, p. 18.)

PACKING

Material shall be so prepared as to permit convenient handling and to protect against loss or damage during shipment.

MARKING

Purchaser's order, requisition, and package numbers; name of consignor; and name and address of consignee shall be plainly marked on outside of package.

Detail list of loose pieces, containers, and their contents shall be furnished for each shipment. Where carload shipments are made, routing and car identification shall be shown.

Where carload shipments are made, name and address of consignee may be omitted.

WARRANTY

Contractor shall warrant the material covered by this specification to be free from defects in material and workmanship under ordinary use and service, his obligation under this warranty being limited to making, at point of production, any part or parts to replace those which shall be found defective within one year after shipment to the purchaser. This warranty shall not apply to any apparatus which shall have been repaired or altered in any way by anyone other than the manufacturer thereof, so as to affect, in the contractor's judgment, its proper functioning or reliability, or which has been subject to misuse, negligence, or accident.

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR BUILDINGS FOR RAILWAY PURPOSES

CAST IRON

(The association indorses American Society for Testing Materials specification A48, for high-test gray-iron castings (below).)

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR STEEL RAILWAY BRIDGES, 1924

(See also 605.11, p. 249; 611.41, p. 707; and 611.51 p. 753.)

CAST IRON

(In respect to process, finish, chemical composition, classification, test bar, tension tests, number of tests, and deflection at rupture, this specification is identical with A. S. T. M., A48-29, given below. In respect to transverse tests it provides that:)

Transverse tests.—A transverse test of each bar cast shall be made. The supports shall be spaced 12 inches apart and the load applied at the middle. The load on the test bar at rupture shall be not less than the following:

	Pounds
Light castings.....	2,500
Medium castings.....	2,900
Heavy castings.....	3,300

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR GRAY-IRON CASTINGS, DESIGNATION A48-29, 1929

(A48-32T has recently been issued)

GRAY-IRON CASTINGS

SCOPE

1. These specifications cover three classes of gray-iron castings, as follows:

(a) *Light castings*, those having any section less than one-half inch in thickness;

(b) *Heavy castings*, those in which no section is less than 2 inches in thickness;

(c) *Medium castings*, those not included in either of the above two classes.

BASIS OF PURCHASE

2. The tension test will be made only when specified by the purchaser and at his expense.⁵⁴

MANUFACTURE

3. The castings shall be made by the cupola process, unless furnace iron is specified.

CHEMICAL PROPERTIES AND TESTS

4. (a) Drillings taken from the fractured end of the transverse test bars shall conform to the following requirements as to sulphur:

	Per cent
Light castings, not over.....	0.10
Medium castings, not over.....	.10
Heavy castings, not over.....	.12

(b) One sulphur determination shall be made for each mold of test bars cast in accordance with the standard methods of sampling and chemical analysis of pig and cast iron in A. S. T. M., A64-27. (See 601.20, p. 119). In case of dispute, the standards of the Bureau of Standards shall be used for comparison.

PHYSICAL PROPERTIES AND TESTS

5. (a) The transverse test specimens (arbitration test bars) specified in section 7 (a), when placed horizontally upon supports 18 inches apart and tested under a centrally applied load, shall conform to the following minimum requirements, interpreted in accordance with section 9:

	Class of casting		
	Light	Medium	Heavy
Load at center.....pounds..	1,500	1,750	2,000
Deflection at center.....inches..	0.20	0.20	0.20

(b) The rate of application of the load shall be such that a central deflection of 0.10 inch is produced in from 20 to 40 seconds.

6. When tension tests are specified, the tension-test specimen shall conform to the following minimum requirements as to tensile strength:

	Lbs./in. ²
Light castings.....	18,000
Medium castings.....	21,000
Heavy castings.....	24,000

7. (a) *Arbitration test bar.*—The arbitration test bar shall be in accordance with the standard specifications for the arbitration test bar and tension-test specimen for cast iron in A. S. T. M., A124-29. (See 600.1, p. 18.)

(b) *Tension-test specimen.*—When tension tests are specified, the tension-test specimen shall conform to the requirements specified in the standard specifications A124-29.

8. (a) Two sets of two arbitration test bars each shall be cast from each melt, one set from the first and the other set from the last iron going into the castings. Where the melt exceeds 20 tons, an additional set of two bars shall be cast for each additional 20 tons or fraction thereof. In case of a change of mixture during the melt, one set of two bars shall also be cast for every mixture other than the regular one. Each set of two bars shall be cast in a single mold.

(b) All arbitration test bars cast shall be tested as specified in section 5 (a).

⁵⁴ It is recommended by the committee that the tension test shall not be made, for the reason that cast iron is almost devoid of elasticity and hence any deviation from an absolutely straight pull in commercial testing machines yields inaccurate results.

9. One arbitration test bar of each set cast shall conform to the requirements specified in section 5 (a); otherwise the castings represented by such bars shall be rejected.

WORKMANSHIP AND FINISH

10. The castings shall be true to pattern, and free from cracks, flaws, and excessive shrinkage. In other respects they shall conform to whatever points may be specially agreed upon between the manufacturer and the purchaser.

INSPECTION

(Conforms to paragraph 7 of A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF SAMPLING AND CHEMICAL ANALYSIS OF PIG AND CAST IRON, DESIGNATION A64-27, 1927

CHEMICAL ANALYSIS OF CAST IRON

(See 601.20, p. 119.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR HIGH-TEST GRAY-IRON CASTINGS, DESIGNATION A88-31, 1931

HIGH-TEST GRAY-IRON CASTINGS

(In respect to rate of application of transverse test load, arbitration test bar, tension-test specimen, number of tests, test requirements, and workmanship and finish, this specification is identical with A. S. T. M., A48, given above, including the references in A48 to A. S. T. M., A124. Otherwise it provides as follows:)

SCOPE

These specifications cover all classes (note) of gray-iron castings (free from massive cementite) which conform to the minimum physical requirements specified herein.

NOTE.—These specifications cover the so-called semisteels, pearlitic irons, special alloy irons, and any other gray irons which conform to the requirements for physical properties.

MANUFACTURE

The castings may be made by the cupola, air-furnace, electric-furnace, or any other generally approved process. Where heat treatment, heated molds, or other expedients are utilized for modification of the properties of the casting, the equivalent of these shall be used in the preparation of test bars

PHYSICAL PROPERTIES AND TESTS

(a) The transverse test specimens (arbitration test bars, see A48, given above) when placed horizontally upon supports 18 inches apart and tested under a centrally applied load, shall withstand a minimum load of 2,500 pounds and deflect under this load at least 0.24 inch at the center.

When tension tests are specified, the tension-test specimen shall show a minimum tensile strength of 33,000 pounds per square inch.

When a large casting is made for which test bars are required, the test bar shall be cast from the same ladle of iron used to pour the casting. If two ladles are used for pouring the casting, the iron for the test bars shall be poured from a ladle of iron caught between the pouring of these two ladles. In

either case the test bars shall be poured at as near as practicable the same temperature at which the casting is poured.

INSPECTION

(Conforms to paragraph 7 of A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR THE ARBITRATION TEST BAR AND TENSION-TEST SPECIMEN FOR CAST IRON, DESIGNATION A124-29, 1929

CAST-IRON TEST SPECIMEN

(See 600.1, p. 18.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR GRAY-IRON CASTINGS FOR VALVES, FLANGES, AND PIPE FITTINGS, DESIGNATION A126-30, 1930

GRAY-IRON CASTINGS FOR VALVES

SCOPE

1. These specifications cover gray iron for castings such as valve bodies, fittings, flanges, including parts to be assembled into valves, manufactured in advance and supplied for sale from stock by the manufacturer, jobber, or other dealer.

Two classes of castings are included as follows:

Class A.—Regular gray iron.

Class B.—Higher-strength gray iron including the so-called semisteels used in valves and fittings.

MANUFACTURE

2. The iron shall be made by the cupola, air-furnace, electric-furnace, or other approved process. The iron shall be produced under regular chemical and physical control and shall be gray iron of high quality.

CHEMICAL PROPERTIES AND TESTS

3. Drillings taken from test ingots, broken test specimens, or from castings shall conform to the following requirements as to chemical composition:

	Per cent
Sulphur, not over.....	0.12
Phosphorus, not over.....	.75

PHYSICAL PROPERTIES AND TESTS

4. (a) The tension-test specimen shall conform to the following requirements as to tensile strength:

Class A, regular gray iron....	Lbs./in. ² ..	Not less than 21,000
Class B, higher-strength gray iron....	do..	Not less than 30,000

(b) After reaching a stress of 15,000 pounds per square inch, the speed of the crosshead of the testing machine shall not exceed one-eighth inch per minute.

5. (a) The transverse test shall be optional. When transverse tests are made, the transverse-test specimen, when placed horizontally upon supports 12 inches apart and tested under a centrally applied load, shall conform to the following requirements:

	Regular gray iron	Higher-strength gray iron
Load at center.....pounds..	Not less than 2,500.	Not less than 3,300.
Deflection at center.....inches..	Not less than 0.10.	Not less than 0.12.

(b) The rate of application of the load shall be such that a central deflection of 0.10 inch is produced in from 20 to 40 seconds.

(c) In case the transverse-test specimen varies from the specified diameter of 1.20 inches, a correction factor conforming to the following shall be applied:

(For table of diameters of transverse-test specimens and correction factors see A. S. T. M., A124-29. See 600.1, p. 18.)

6. One mold containing one or more tension-test specimens and, when desired, one transverse-test specimen, made as indicated in Figure 393 shall be poured at least twice a day from each heat from which castings are made under these specifications. The molds for these test specimens shall be made from plate pattern, on a standard molding machine if possible, from the same lot of sand and in the same general way as that in which molds for the castings are made. Each specimen shall be marked to show cupola or furnace number and date and hour when

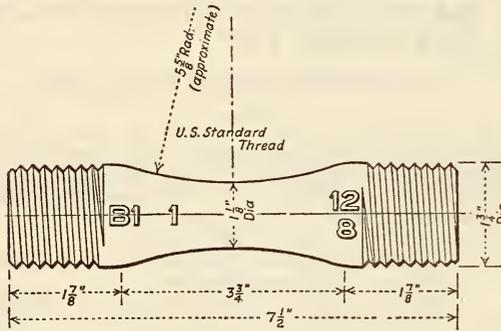

FIGURE 393.—Tension test specimen

the mold is poured by either casting in the mold or stamping the specimens as soon as possible after shaking out.

NOTE.—The numbering shown on the test specimens in Figures 392 and 393 is intended simply to illustrate a method of designation. In the particular method shown 1 3/4 refers to December 8, B1 is the cupola number, and the numeral 1 which follows shows the hour cast (1 p. m.). (For fig. 392 see insert facing p. 69.)

7. Tension-test specimens, cast as illustrated in Figure 392, shall conform to the dimensions shown in Figure 393, shall be reasonably smooth and round at breaking section, and shall be tested without machining except that the enlarged ends shall be threaded (1 3/4-inch U. S. standard threads are recommended). The cross-sectional area at the breaking section shall be within ± 5 per cent of 1 square inch and the ultimate stress shall be calculated on the minimum cross section.

8. Ball-and-socket specimen holders or spherical-seated bearings or other device which will insure that the specimen, when under load, will be as nearly as possible in pure axial tension without transverse stress shall be used in making the tension test.

NOTE.—Suitable ball-and-socket specimen holders and spherical-seated bearing devices are shown in Figures 30 and 32 and described in section 13 of the tentative methods of tension testing of metallic materials in A. S. T. M., E8-27T (see 600.1, p. 34).

9. Records of the chemical composition of the iron and physical properties of the test specimens shall be systematically made and maintained.

WORKMANSHIP AND FINISH

10. The castings shall be sound, clean, free from sand, of workmanlike finish, and soft enough to machine well.

CERTIFICATION

11. Upon request of the purchaser, the manufacturer shall be prepared to certify that his product conforms to the requirements of these specifications.

EXPLANATORY NOTE

NOTE.—Reference may be made to the dimensional standards for pressures and temperatures formulated by the sectional committee on standardization of pipe flanges and fittings functioning under the procedure of the American Standards Association, A. S. A. Project No. B16, and more specifically to American Standards B16a-1928, B16b-1928, and B16b1, referring respectively to the 125, 250, and 600 pounds per square inch cast-iron pipe flanges and flanged-fittings standards (see 607.14, pp. 385, 395, 401).

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR HIGH-TEST GRAY-IRON CASTINGS (SEMISTEEL), QQ-I-656, FEBRUARY 2, 1932

HIGH-TEST GRAY-IRON CASTINGS

(This specification is the same as Federal specification QQ-I-651 given below, with the exceptions noted herewith.)

(Under material and workmanship, specification QQ-I-656 includes the following:) Steel scrap may be added to the melt.

(Detail requirements in Federal specification QQ-I-656 are as follows:)

DETAIL REQUIREMENTS

4-A. The chemical requirements shall be as shown in Table 1.

B. When not otherwise stated in the contract or purchase order, the requirements for transverse strength shown in Table 1 shall be complied with.

TABLE 1

Class	Chemical	Transverse test		Tension test
	Sulphur maximum	Load at center	Deflection at center	Minimum pounds per square inch
	Per cent	Pounds	Inches	
Light castings.....	0.11	2,100	0.24	28,000
Medium castings.....	.11	2,250	.24	30,000
Heavy castings.....	.11	2,400	.24	35,000

(Under Method of Inspection and Tests, Federal specification QQ-I-656 contains the following requirement in addition to those given in Federal specification QQ-I-651.)

When required by the contract or purchase order a sample of the iron shall be taken from the first ladle of metal poured and shall be chilled in a cast-iron mold as shown in Figure 394. The sample shall be allowed to cool in the mold until it is dark red or almost black, when it shall be knocked out and quenched in water. This chill-test specimen, on being broken, shall show a close-grain gray iron, with a well-defined border of white iron at the bottom of the fracture. The depth of the white iron shall not be less than one-sixteenth inch as measured at the center line.

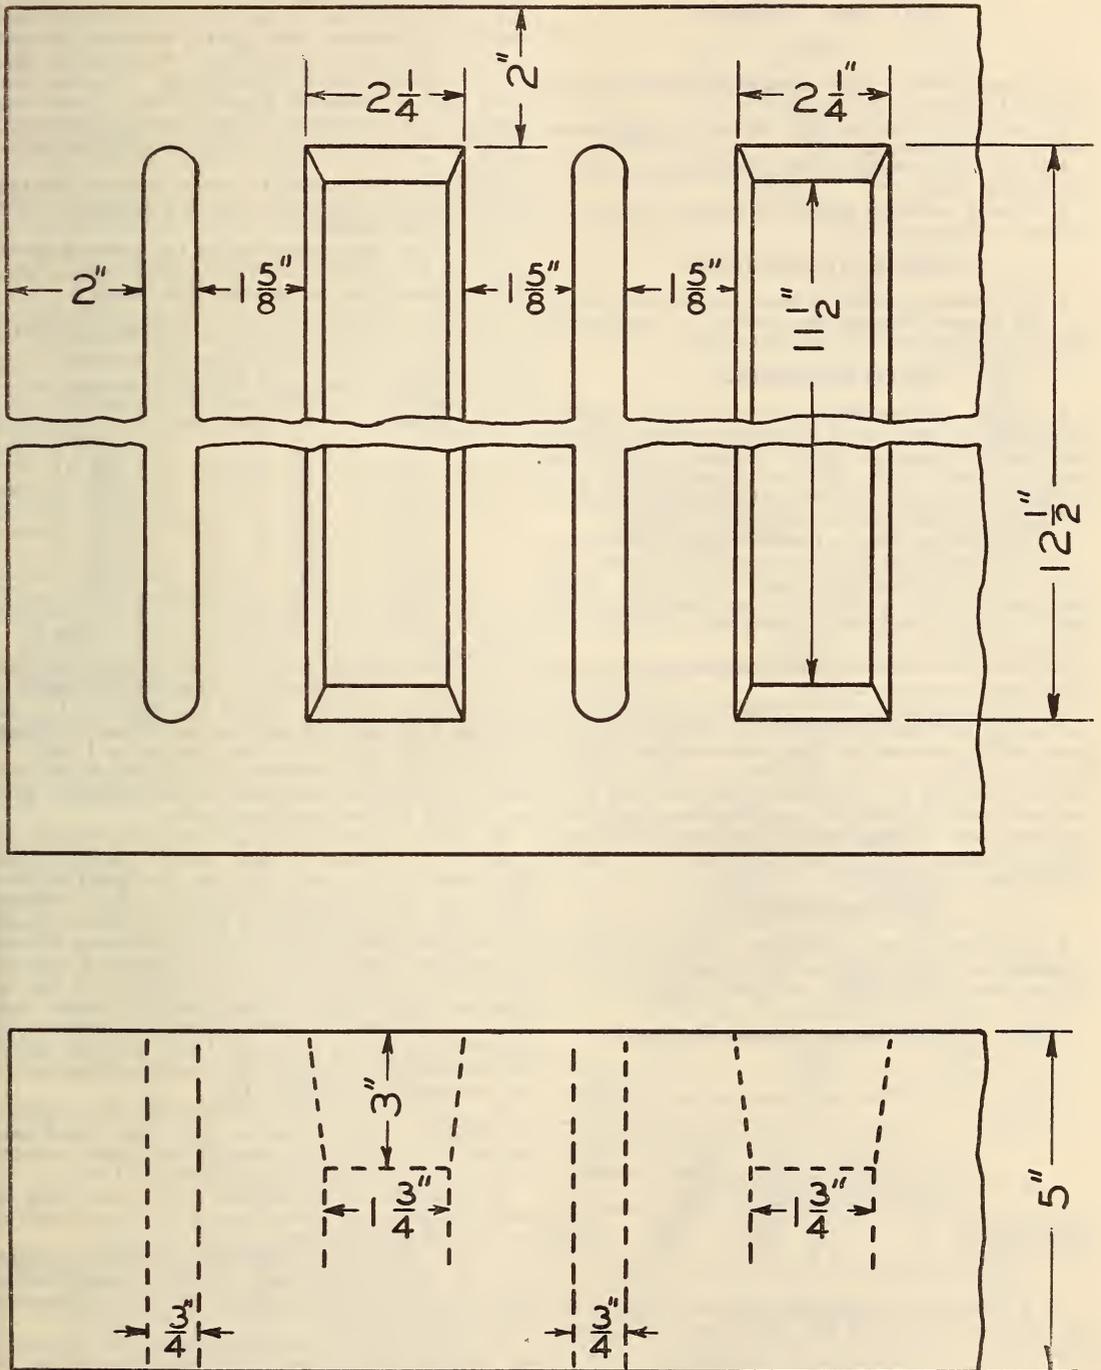

FIGURE 394.—Mold for chill test specimen

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR GRAY-IRON CASTINGS, QQ-I-651, FEBRUARY 2, 1932

GRAY-IRON CASTINGS

CLASSES

1. There shall be three classes of gray-iron castings, as follows:

A. Light castings, having a section less than one-half inch in thickness.

B. Medium castings, falling outside the remaining classes, and

C. Heavy castings, having no section less than 2 inches in thickness.

MATERIAL AND WORKMANSHIP

2. The castings shall be made from iron melted by any process, unless the process is specifically stated in the contract or purchase order.

GENERAL REQUIREMENTS

3-A. The castings shall be of uniform quality and condition, free from blowholes, porous places, hard spots, shrinkage defects, cracks, or other injurious defects, and shall be smooth and well cleaned before inspection by sand blasting, tumbling, pickling, or other approved process.

B. All castings shall be commercially machinable.

C. Castings shall not be repaired, plugged, or welded without permission from the inspector. Such permission will be given only when the defects are small and do not adversely affect the strength, use, or machinability of the casting.

D. Distinctive marks shall be placed around welds prior to shipment of castings.

E. The responsibility of furnishing castings that can be laid out and machined to the finished dimensions within the specified tolerances as shown on the drawings, and that will conform to such gages as may be specified in individual cases, shall rest with the contractor. Sufficient stock shall be allowed for shrinkage and, where required, for finishing. Castings unreasonably in excess of the specified size or weight may be rejected.

DETAIL REQUIREMENTS

4-A. Unless otherwise specified in the contract or purchase order, the chemical and physical properties of gray iron castings shall conform to Table 1.

TABLE 1.—Chemical and physical requirements

Class	Chemical	Transverse test		Tension test
	Sulphur (maximum)	Load at center min.	Deflection at center min.	Minimum tensile strength
	<i>Per cent</i>	<i>Pounds</i>	<i>Inch</i>	<i>Lbs./in.²</i>
Light castings.....	0.11	1,500	0.20	18,000
Medium castings.....	.11	1,750	.20	21,000
Heavy castings.....	.11	2,000	.20	24,000

C. An analysis of each melt shall be furnished by the contractor showing the percentage of sulphur present.

METHOD OF INSPECTION AND TESTS

5-A. Transverse test bars shall have the form and dimensions of the arbitration test bar for cast iron as shown in Figure 13. The mold may be made in cores or in dry sand, but in either case it shall be made in accordance with Figure 13 as to the amount of sand as well as the dimension of the bars.

When the mold is made in dry sand the flask shall be rammed up with green molding sand—a little damper than usual, well mixed and put through a No. 8 sieve, with a mixture of 1 to 12 bituminous facing. The mold shall be rammed evenly and fairly hard, thoroughly dried, and not cast until it is cold. The bottom of the bar shall be 0.05 inch smaller in diameter than the top to allow for draft and for the strain of pouring. The pattern shall not be rapped before withdrawing. The test bars shall not be removed from the mold until cold enough to be handled. It shall not be rumbled or otherwise treated, being simply brushed off before testing.

B. The pattern shall be made of such size that the arbitration test bar will have a diameter of 1.20 inches at the center.

C. In case the transverse-test bar varies from the specified diameter of 1.20 inches, a correction factor shall be applied in accordance with Table 2.

TABLE 2.—Arbitration test bar correction factors

Diameter of arbitration test bar (inches)	Correction factor	Diameter of arbitration test bar (inches)	Correction factor
1.10	0.770	1.21	1.025
1.11	.791	1.22	1.051
1.12	.813	1.23	1.077
1.13	.835	1.24	1.103
1.14	.857	1.25	1.130
1.15	.880	1.26	1.158
1.16	.903	1.27	1.185
1.17	.927	1.28	1.214
1.18	.951	1.29	1.242
1.19	.975	1.30	1.271
1.20	1.000		

D. If the test bar is not round the correction factor can not be obtained from Table 2 and shall be calculated as follows: Square the depth of the bar measured at point of application of load, multiply by the width, and divide the product by 1.728.

E. In order to correct to a diameter of 1.20 inch the breaking load obtained in testing, the bar shall be divided by the correction factor.

F. When physical tests are required two sets of transverse-test bars (2 bars per set) shall be cast from each melt, one set from the first and the other set from the last iron going into the castings. Where the melt exceeds 20 tons, an additional set of two bars shall be cast for each additional 20 tons or fraction thereof. In case of a change of mixture during the melt, one set of two bars shall also be cast for every mixture other than the regular one. Each set of two bars shall be cast in a single mold as shown in Figure 13. One transverse-test bar of each cast shall conform to the requirements specified in paragraphs 5-G and 5-H.

G. The transverse-test specimens, when placed horizontally upon supports 18 inches apart and tested under a centrally applied load, shall conform to the minimum requirements shown in Table 1.

H. The rate of application of the load shall be such that a central deflection of 0.10 inch is produced in from 20 to 40 seconds.

I. The tension-test specimen may be turned from any of the broken pieces of the transverse-test specimens and shall conform to the dimensions shown in Figure 14.

K. Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative, and without cost to the contractor. The chemical composition thus determined shall conform to the requirements specified.

L. *Umpire method of analysis.*—Suitable methods for umpire analysis are being developed and will be added in a later revision.

PACKING AND MARKING

6-A. Large castings shall be stamped with the melt or lot number and, where practicable, with the pattern number.

B. Small castings shall be properly separated by melts or lots when presented for inspection and when shipped and shall be so marked that their identity will be clear at the point of delivery.

C. A lot shall consist of castings poured from the same melt, unless otherwise mutually agreed upon by the contractor and the inspector.

D. If special packing be necessary to secure the acceptance of castings by common or other carriers for safe transportation at the lowest rate to the point of delivery, such packing shall be provided by the contractor without additional expense to the purchaser.

ADDITIONAL INFORMATION

7-A. All patterns furnished by the purchaser shall be properly cared for, and when being returned to the purchaser shall be suitably boxed or crated by the contractor to prevent damage or breakage. Before shipment from the foundry, patterns shall be inspected by the representative of the purchaser and report made by him if found to be in unsatisfactory condition.

B. All purchase orders must state the physical test desired; it is intended to test the material for physical properties and to reject castings for failure to comply with the physical requirements.

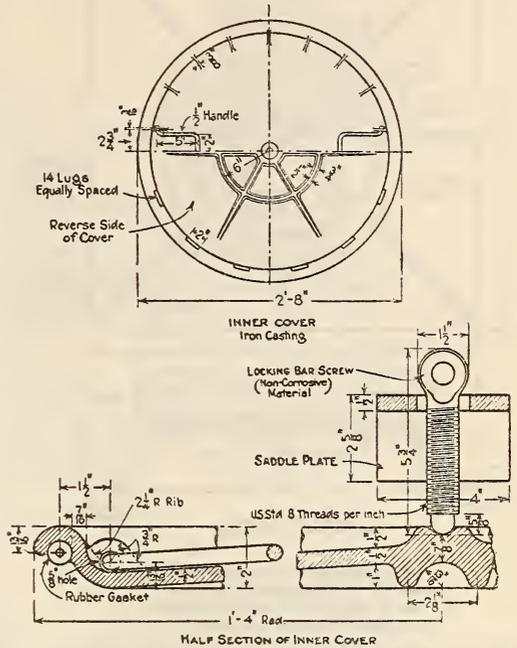

611.12 MANHOLE AND CONDUIT CASTINGS.

AMERICAN RAILWAY ASSOCIATION, TELEGRAPH AND TELEPHONE SECTION, COMMUNICATION UNDERGROUND CONDUIT CONSTRUCTION, 1-C-1, 1927

MANHOLE AND HANDHOLE FRAMES AND COVERS

Manhole and handhole frames and covers should be of cast iron or other approved material.

Type A frames, which are equipped with double covers, should only be used in special situations

FIGURES 397 and 398.—Manhole inner cover, type A

where required by local regulations or municipal ordinances.

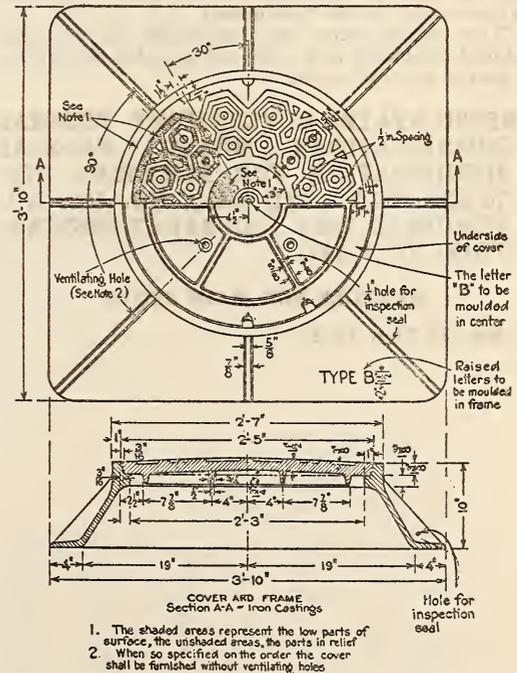

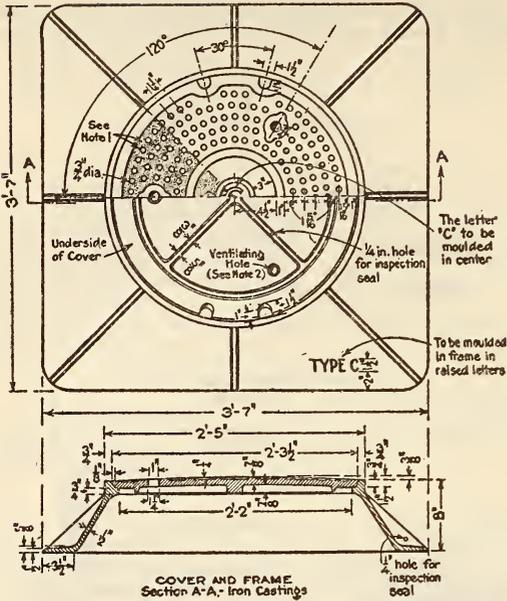

FIGURE 399.—Manhole frame and cover, 27-inch opening, type B

FIGURES 395 and 396.—Manhole frame and cover, 30-inch opening, type A

Three standard types of manhole frames and covers are shown in the accompanying illustrations. (See figs. 395, 399, and 400)

Type B frames and covers should be used in city construction or in other cases where the manhole covers will be subjected to heavy loads.

- 1 The shaded areas represent the low parts of surface, the unshaded areas the parts in relief.
- 2 When so specified on the order, the cover shall be furnished without ventilating holes.

FIGURE 400.—Manhole frame and cover, 26-inch opening, type C

Type C frames and covers, or type C covers resting upon special cast-iron rings set in concrete collars, may be used in situations where only very light service loads will be experienced.

(This specification also provides for cast-iron reduced couplings and cast-iron caps for connecting U guards to pipe bends.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION; FF-P-451)

MANHOLE FOR MAIN SEWER

(See 617.73, p. 1062.)

611.13 SLUICE GATES AND MOORING BITTS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, AMERICAN MARINE STANDARDS COMMITTEE, MOORING BITTS, CAST IRON, H NO. 2—1925

MOORING BITTS

GENERAL NOTES

1. Where this type of bitt, in excess of the 7-inch size, is intended for towing, the next size larger than required for mooring should be installed.
2. The material is to be gray-iron casting, in accordance with the specifications of the American Bureau of Shipping. (Sec. 40, par. 9, of the bureau's rules.) Inspection by the bureau shall be required only when specified in the purchase order.
3. Holes for fastenings may be cored and reamed to size, or they may be drilled as preferred.
4. The countersink for the heads of the fastenings is to have an angle of $22\frac{1}{2}^\circ$ (45° center angle) and a depth equal to half the diameter of the fastening.
5. The bottom faying surfaces of castings shall be rough planed for flat surfaces, or chipped to fit uneven surfaces.
6. The wearing surfaces where rough are to be chipped or ground smooth.
7. The numbers and diameters of rivets or bolts are in accordance with the British standard No. 3005-1922, from which the following rules in regard thereto are quoted:

$$\text{Number of rivets or bolts} = \frac{A}{2} + 3:$$

Where the result is an odd number, the nearest lower even number to be used.

$$\text{Diameter of iron rivets in eighths of an inch} = \frac{A}{2} + 4:$$

Where the result is not a whole number the nearest one-eighth below to be used, but no rivet to be less than seven-eighths, except for 4-inch bollards.

If bolts are used they should be of the same diameter as the rivets but should be of steel.

8. There are two cases, viz, sizes 14 and 18 inch, the bolt sizes for which do not conform to the American (national) screw-thread standard series. In those cases if bolts are desired to conform to the screw-thread standards they should be $1\frac{1}{2}$ inches instead of $1\frac{3}{8}$ inches diameter for the 14-inch size and $1\frac{3}{4}$ inches instead of $1\frac{5}{8}$ inches diameter for the 18-inch size.

611.16 PULLEYS.

AMERICAN PETROLEUM INSTITUTE, SPECIFICATIONS FOR MANILA CORDAGE, STANDARD NO. 9-B, 4TH ED., JANUARY, 1930

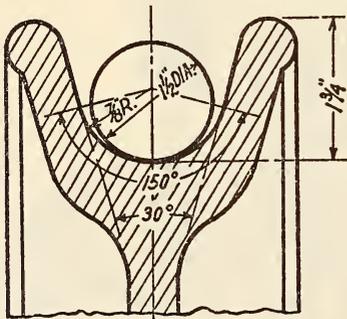

STANDARD SIZE AND FORMS OF CORDAGE GROOVES

No standard shall be approved for a crown pulley having a combination groove for both manila and wire lines.

The bull rope grooves in the tug rims of the bull wheel and band wheel shall be made for 2½-inch

A.P.I. STANDARD GROOVE FOR CROWN SHEAVES

A.P.I. STANDARD GROOVE FOR DERRICK OR CAT LINE SHEAVES

FIGURE 405

rope as standard; the included angle between the sides of each groove shall be preferably 60°, but in no case greater than 80°; the depth of groove shall be not less than 1½ inches nor more than 2½ inches (allowances must be made in the die to produce the minimum depth of 1½ inches specified on the product. It is recommended, where practicable, that the groove be rolled slightly deeper so that the bull rope will not ride the bottom of the groove); the bottoms of the grooves shall be rounded to a radius of one-half inch with a tolerance of minus 0 inch plus one-eighth inch; the top edges of the grooves shall be rounded to a radius of not less than one-half inch.

The standard groove for manila drilling cable shall be made for the 2¼-inch cable. The bottom of the groove shall be an arc with a radius of 1½

inches. The sides of the groove shall be tangent to the ends of this arc, and shall have an included angle of 30°. The depth of the groove shall be 2½ inches. (See fig. 405.)

The groove in the derrick line sheave shall be made for 1½-inch manila rope. The bottom of the groove shall be an arc with a radius of seven-eighths inch. The sides of the groove shall be tangent to the ends of this arc, and shall have an included angle of 30°. The depth of the groove shall be 1¾ inches. (See fig. 405.)

For sheaves for any other size manilla drill lines, and other manila lines, the bottom of the groove shall be an arc having a radius equal to

$$R = (D+t)/2 + 1/8''$$

where

R = radius of bottom of groove, inches.

D = nominal diameter of line, inches.

t = specified tolerance in line diameter, inches.

The depth of the groove shall be one and one-eighth times the nominal diameter of the line.

The sides of the groove shall be tangent to the ends of the arc forming the bottom of the groove and shall have an included angle of 30°.

NOTE.—The radius "R" should be expressed in values not less than sixteenths of an inch. Should the solution of the above equation result in a fractional part of an inch smaller than one-sixteenth-inch, the value found should be increased to the next higher sixteenth.

AMERICAN PETROLEUM INSTITUTE, MISCELLANEOUS ROTARY STANDARDS, STANDARD NO. 7-A, 4TH ED., JULY, 1931

MEASUREMENT OF SHEAVES AND HOISTING BLOCKS

The diameter of all sheaves shall be the outside diameter, as shown by A in Figure 406.

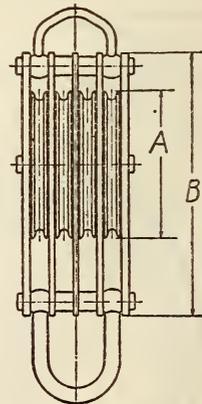

FIGURE 406.—Hoisting blocks

The size of hoisting or traveling blocks shall be determined by the length of the side bar or B in Figure 406.

GROOVE FORM IN SHEAVES

The form of groove in all sheaves shall be as stipulated in the A. P. I. specifications for wire rope and manila cordage. It is recommended that the A. P. I. standard form of groove be used on all sheaves in crown blocks, or any other equipment involving the use of sheaves not specifically mentioned herein. See A. P. I. Standards No. 9-A: "Wire Rope"; and A. P. I. Stds. No. 9-B: "Manila Cordage." (See below.)

MARKING

The size of the A. P. I. groove form and the diameter of the sheave shall be stamped or cast on the outer rim of the groove of the sheave, and this information shall also be stamped on the name plates of complete crown and hoisting blocks. For example, a 30-inch sheave with 1½-inch A. P. I. groove should be marked as follows:

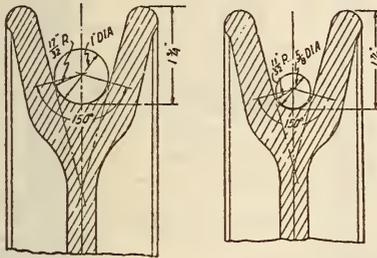

1½-A. P. I.—30

AMERICAN PETROLEUM INSTITUTE, SPECIFICATIONS FOR WIRE ROPE, STANDARD NO. 9-A, 8TH ED., JULY, 1931

GROOVES FOR SHEAVES FOR WIRE ROPE

(Appendix B of Standard No. 9-A includes the following requirements on sheave grooves.)

B-5. The grooves of drilling and casing line sheaves shall be made for 1-inch rope as standard.

A.P.I. STANDARD GROOVE FOR CASING AND DRILLING LINE SHEAVES
A.P.I. STANDARD GROOVE FOR SAND LINE SHEAVES

FIGURE 407

To the above groove radius may be added a manufacturing tolerance = +1/64" - 0".

The bottom of the groove shall have 150° arc of support with a radius of seventeen-thirty-seconds inch with a sheave-manufacturing tolerance of plus one-sixty-fourth minus 0. The depth of the groove shall be one and three-fourths times the diameter of the rope. The sides of the groove shall be tangent to the ends of the bottom arc. See paragraph B-6 for size of rope other than 1 inch.

B-6. The groove for any other size of drilling and casing line is to be specified by the purchaser, the radius of the bottom of the groove to be:

$$R = \frac{D+t}{2} + \text{Sheave manufacturing tolerance of } +\frac{1}{64}'' - 0''.$$

where
R = radius of the bottom of the groove, in inches.

D = nominal diameter of line, in inches.

t = specified plus tolerance of line, in inches.

The depth of the groove to be one and three-fourths times the nominal diameter of the rope, and to have a 150° arc of support.

B-7. The groove for sand-line sheaves shall be made for 5/8-inch rope as standard. The bottom of the groove shall have a 150° arc of support, with a radius of eleven thirty-seconds inch with a sheave manufacturing tolerance of plus one sixty-fourth-inch minus 0. The depth of the groove shall be three times the diameter of the rope. The sides of the groove shall be tangent to the ends of the bottom arc.

B-8. Sheaves having grooves made according to the foregoing specifications should be marked plainly with the size of line for which the sheave is designed.

B-9. It is recommended that the hole in the rope socket and sockets for swivels be five thirty-seconds-inch larger than the line to be inserted.

B-10. Combination sheaves for manila and wire lines are not recommended.

B-11. Grooves on rollers of oil savers should be made to the same tolerances as the grooves on the sheaves.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, CAR LIGHTING, RECOMMENDED PRACTICE, 1927

FLANGED PULLEYS

(This specification covers the design and application of electric-light equipment to passenger equip-

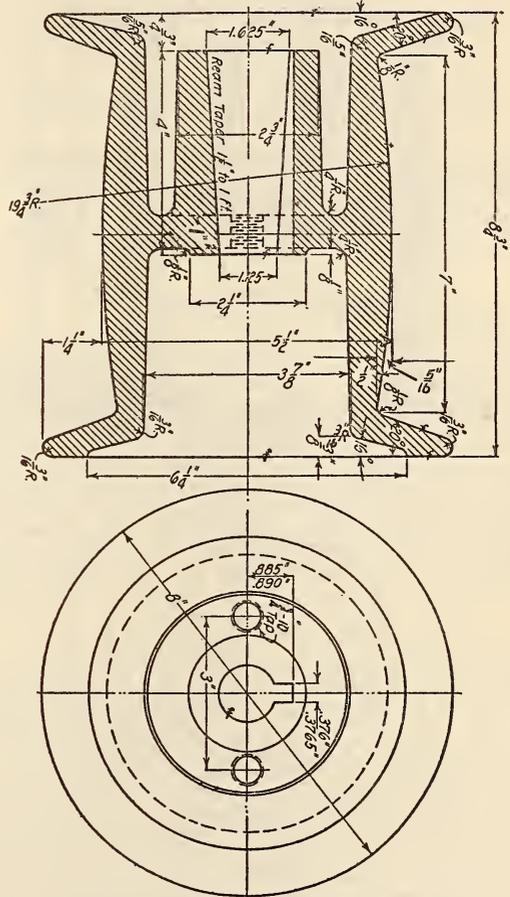

FIGURE 408.—Generator pulley, 5½-inch

ment cars. A component part of this lighting equipment consists of various kinds of pulleys, the specifications for which are as follows:)

Axle pulley.—(a) The diameter of the axle pulley shall be as large as the construction of the car will permit with proper clearance, preferably 21 inches.

(b) The hub of the axle pulley shall have a uniform internal diameter of 7½ inches; the length of the hub shall not be less than 6½ inches.

Axle pulley bushing.—The bushing, when used, shall preferably be secured to the axle by the clamping action of the pulley; shall have an external diameter throughout its length of 7½ inches, and shall be not less than 8½ inches in length.

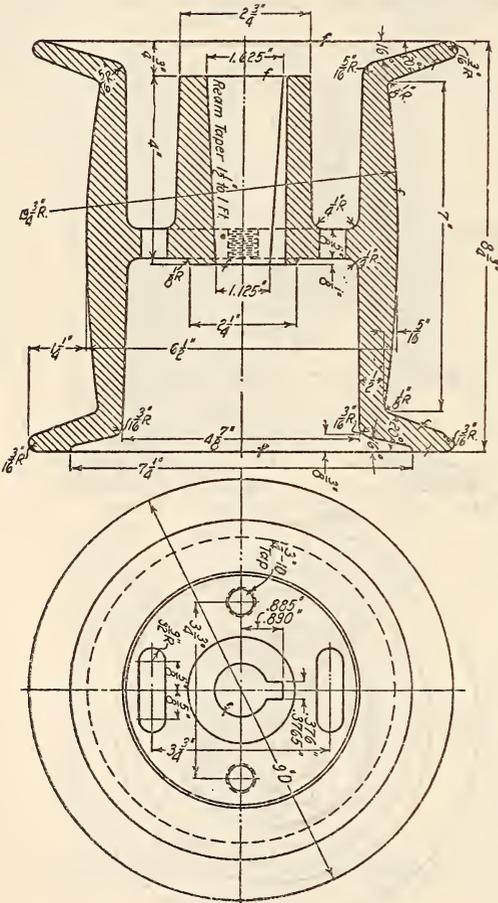

FIGURE 409.—Generator pulley, 6½-inch

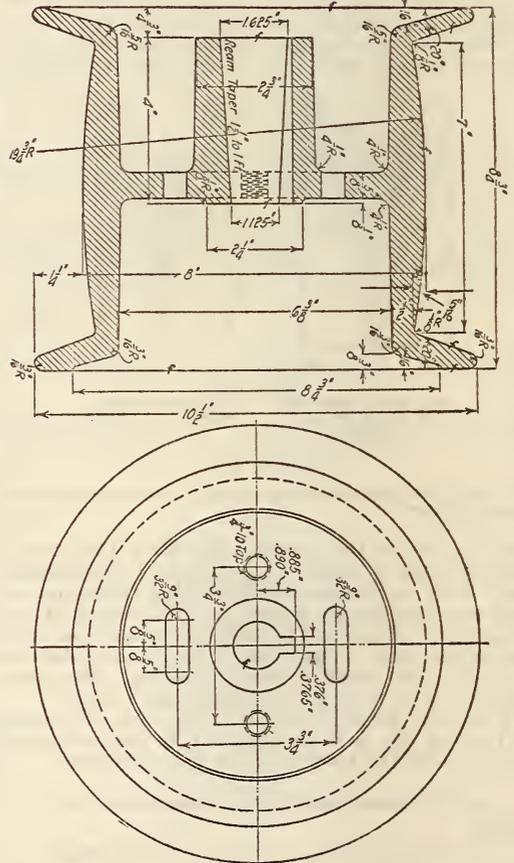

FIGURE 410.—Generator pulley, 8-inch.

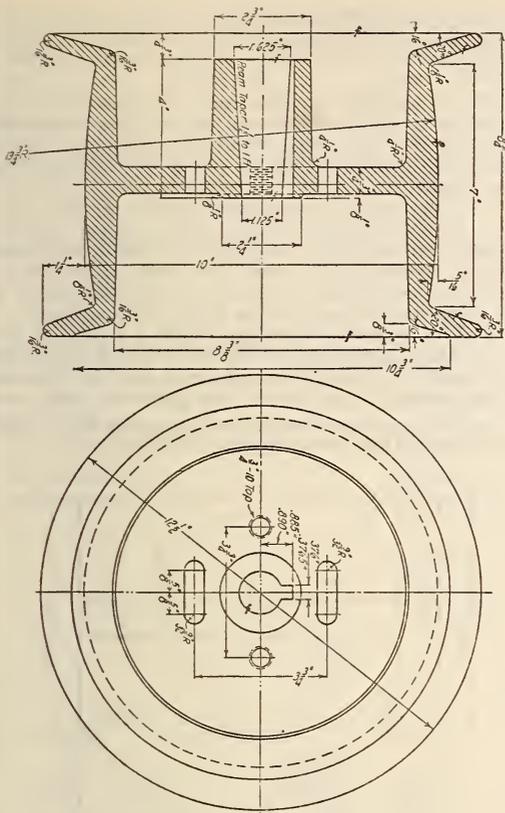

FIGURE 411.—Generator pulley, 10-inch

Generator pulley.—(a) The generator pulley shall be flanged and crowned and shall be in accord with the dimensions shown in the accompanying illustrations.

(b) The generator pulley shall be in perfect mechanical balance.

NATIONAL MACHINE TOOL BUILDERS' ASSOCIATION, DRIVING SPEEDS, STANDARD NO. T-1, OCTOBER 12, 1927

MACHINE PULLEYS

(Among this association's recommended standards for drive speeds for machine tools and speeds for constant-speed motors for machine-tool drives are the following recommended pulley sizes.)

As standard sizes for machine pulleys, the following diameters are recommended: 8, 10, 12, 14, 16, 18, 20, and 24 inches.

611.17 HEATING AND COOKING VESSELS.

(No nationally recognized specifications available.)

611.18 CAST IRON WHEELS.

TREAD AND FLANGE CONTOUR FOR CAST-IRON WHEELS

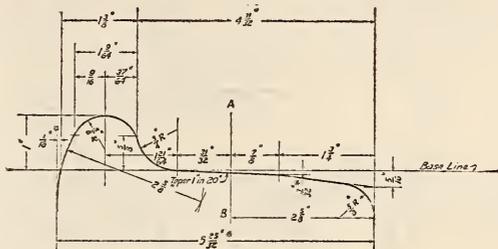

FIGURE 412.—Tread and flange contour for cast-iron wheels

These dimensions should not be used in layout of contour. They are approximate and for information purposes only.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; WHEELS, CAST IRON, FOR LOCOMOTIVES, TENDER, AND CARS, RECOMMENDED PRACTICE, 1928

CAST-IRON WHEELS

(In respect to scope, material, chemical composition, sample and check analyses, shipment, patterns, dimensions, drop test, chill test, thermal test, taping, weights, test specimens, additional tests, marking, and rejection limits, this specification conforms to A. S. T. M., A46, given below, except that in chemical composition the total carbon desired, minimum, is in this case 3.35 per cent, and the phosphorus desired, maximum, is 0.35 per cent. In respect to inspection this specification conforms to paragraph 7 of A. S. T. M. standard specifications for steel. (See 605.0, p. 247.) Otherwise this specification provides as follows:)

WORKMANSHIP AND FINISH

1. *Workmanship.*—(a) Chill shall have an inside profile that, in the finished wheel, will produce the exact form of flange and tread contour as shown by A. R. A. drawings.

(b) The depth of clear white iron shall not exceed seven-eighths of an inch at the throat and 1 inch at the center line of tread and must not be less than one-half of an inch at the center line of tread and seven-sixteenths inch at the throat. These limits apply to all weights of wheels. The blending of clear white iron with the gray behind it shall be without any distinct line of demarcation, and the iron shall not have a mottled appearance in any part of the wheel at a greater distance than 1 1/4 inches from the throat and the tread. The depth of clear white iron shall not vary more than one-fourth inch around the tread in any one plane in the same wheel.

2. *Finish.*—(b) All wheels shall be thoroughly cleaned by removing all sand and foreign substances. Wheels offered for inspection shall not be covered with any substance which will hide defects. The body of the wheel shall be smooth and free from slag, shrinkage or blow holes, swollen rims, or other defects. The tread and throat shall be smooth and free from deep and irregular wrinkles, slag, sand wash, or chill cracks and sweat. The

hub core shall not be more than one-sixteenth inch out of center.

3. *Rejection at destination.*—Wheels which show injurious defects while being finished by the purchaser, or which crack while being pressed on axle,

NOTE.—The drillings shall be obtained from the end of the test block, the first drillings shall be discarded, the drilling continued, and the resultant chips, etc., dumped from the hole and taken for sample, or the block may be broken and the drillings taken at the point of fracture.

(b) An analysis may be made for each block and recorded or, at the option of the manufacturer, the samples may be mixed of equal quantities, but at least one analysis shall be made to represent the day's heat.

8. *Irregularities.*—The irregularities in the foundry, which produce failure from seams, broken flanges, broken rims, and broken treads are almost entirely traceable to care and preparation of the lades for service and failure to pour the metal at the proper speed and at the proper temperature.

9. *Temperature.*—The iron shall be melted and poured at a temperature sufficiently high to eliminate any possibility of cold-iron defects, such as wrinkles in the tread, blowholes in the plates or rims, etc.

NOTE.—It is recommended that the temperature of the molten metal as poured into wheel molds be not less than 2,400° F.

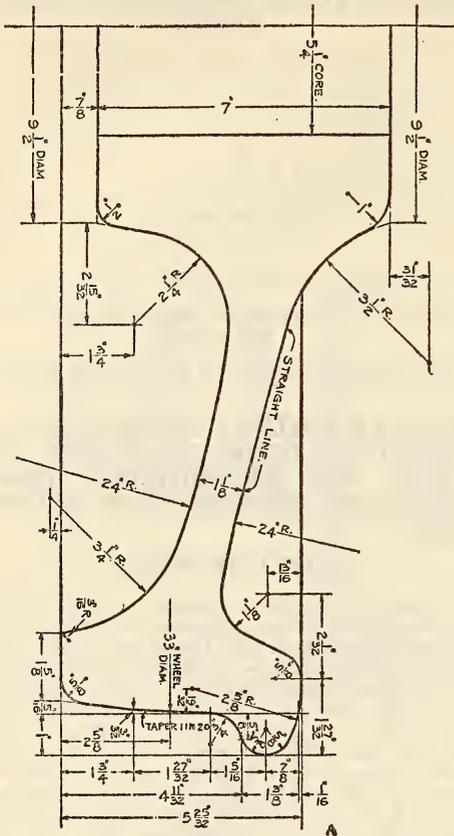

FIGURE 413.—Wheels, cast-iron, 33-inch diameter, for cars of maximum gross weight not to exceed 103,000 pounds
650-pound wheel for 4 1/4 by 8 inch axle.

shall be rejected provided the axle pressure is not excessive and the bore of the wheel shows no evidence of faulty machine work or gouging.

4. *Rehearing.*—Samples for chemical analysis which represent rejected material shall be preserved for 14 days from date of test report, so that, in case of dissatisfaction with the results of the test, the manufacturer may make claim for rehearing within that time.

FOUNDRY-PRACTICE REQUIREMENTS

5. *Composition.*—The composition of the mixture shall be such that it will produce the analysis specified and an adequate depth of chill in the wheel.

6. *Chill-test block.*—A chill-test block must be taken at least once out of every 10 wheels poured. The size of the test bar shall be 1 1/2 by 3 by 6 1/2 inches, the 1 1/2-inch face to be placed against the chiller.

NOTE.—The depth of chill measurements shall be recorded in sixteenths.

7. *Analysis-test block.*—(a) A test block 3 by 3 inches minimum shall be cast, preferably in dry sand, to represent each 40 wheels.

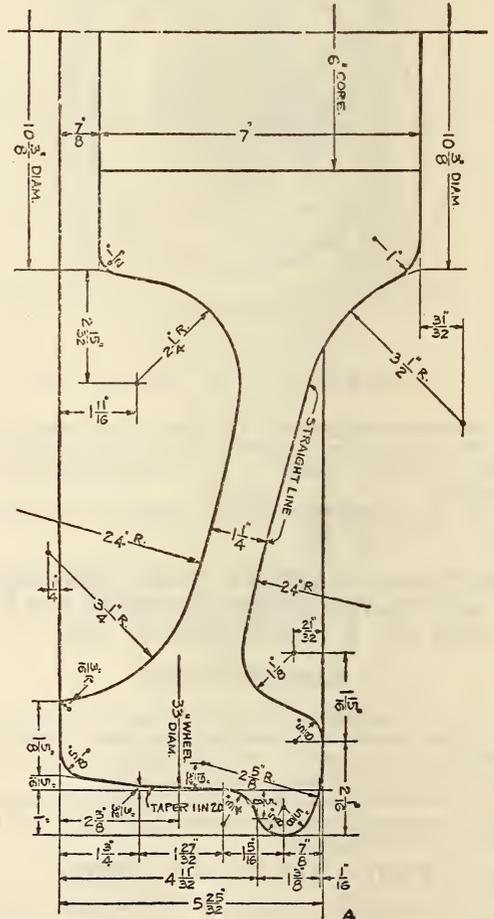

FIGURE 414.—Wheels, cast-iron, 33-inch diameter, for cars of maximum gross weight not to exceed 136,000 pounds
700-pound wheel for 5 by 9 inch axle.

10. *Lades.*—(a) During the heat, the bull ladle, which shall be of the teapot type, shall be kept at least half full of molten metal, for better mixing of the metal and for preserving a uniform temperature. (b) The bull ladle and small lades shall be thoroughly heated prior to use.

**AMERICAN RAILWAY ASSOCIATION,

CIRCUMFERENCE MEASURE FOR CAST-
IRON, CAST-STEEL, WROUGHT-STEEL,
AND STEEL-TIRED WHEELS, STANDARD,
1919**

**WHEEL CIRCUMFERENCE MEASURE FOR CAST
IRON**

(See A. R. A.-M., solid wrought carbon steel wheels, 611.53, p. 783.)

**AMERICAN RAILWAY ENGINEERING
ASSOCIATION, AXLE ASSEMBLY, 1929
AXLE ASSEMBLY**

(See 611.52, p. 770.)

**AMERICAN SOCIETY FOR TESTING
MATERIALS, STANDARD SPECIFI-
CATIONS FOR CHILLED CAST-IRON
WHEELS, DESIGNATION A 46-24, 1924**

CAST-IRON WHEELS

MATERIAL

1. Wheels shall be made of a mixture of such composition that will produce the required chill in the tread and not show any mottled iron in the plates except around the chaplets, where it shall not extend more than one-half inch (12.7 mm). (The use of steel chaplets is preferred.)

CHEMICAL REQUIREMENTS

2. (a) The wheels shall conform to the following requirements as to chemical composition:

	Mini- mum	Maxi- mum
	Per cent	Per cent
Total carbon.....	3.25	0.85
Combined carbon.....		.75
Silicon.....	.45	.75
Manganese.....	.50	.40
Phosphorus.....		1.17
		2.16
		3.15
Sulphur.....		4.14

1 For 1923 to 1924, inclusive.
2 For 1925 to 1926, inclusive.
3 For 1927 to 1928, inclusive.
4 For 1929 and thereafter.

(b) The minimum percentage of manganese shall be not less than three times the sulphur content.

3. Analysis shall be made by the manufacturer from test blocks poured during the day's melt from each cupola from which wheels purchased under these specifications are poured to determine the percentages of total carbon, manganese, phosphorus, sulphur, and silicon. The chemical composition thus determined shall be reported to the purchaser or his representative upon request.

4. Drillings for check chemical analysis shall be taken from drill hole bored entirely through the back double plate of the wheel midway between the core leg holes.

DIMENSIONS, WEIGHT, AND DESIGN OF WHEELS

5. Patterns and chillers shall be such that they will produce wheels according to the dimensions shown on drawings furnished by the purchaser.

6. The normal circumference conforming to the specified diameter shall be measured at a point $1\frac{23}{32}$ inches (43.65 mm) from the gaging point on the throat

of the flange. Wheels shall not vary more than seven-sixteenths inch (11.11 mm) above or below normal size, measured on the circumference, but only five-sixteenths inch (7.94 mm) variation above or below normal size shall be allowed for any day's cast from one cupola.

The thickness of the flange shall be regulated by a maximum and minimum flange thickness gage which shall be not more than one-sixteenth inch (1.59 mm) over nor more than one-sixteenth inch (1.59 mm) under the normal flange.

7. All wheels shall be taped with a standard design of wheel circumference tape and have the numbers 1, 2, 3, 4, and 5 stamped one-eighth inch (3.18 mm) apart, the figure "3" to represent normal tape size limited by one-sixteenth inch (1.59 mm) over or under the standard circumference, which for 33-inch (838.2 mm) wheels will be 103.67 inches (2,633.2 mm). The figure "1" shall represent the smallest diameter, and the figure "5" the largest diameter. Tape sizes shall be stenciled in plain figures on the plate of the wheel or otherwise designated, as may be required by the purchaser.

8. (a) If wheels are ordered in accordance with A. R. A. standard drawings the weights shall be as follows:

Maximum gross weight of car		Normal weight of wheel	Minimum weight of wheel
Lbs.	kg	Lbs. kg	Lbs. kg
95,000	43,000	650 295	640 290
132,000	59,750	700 317	690 313
169,000	76,500	750 340	740 335
210,000	95,250	850 385	835 380

(b) In the case of wheels ordered with cores smaller in diameter than the standard, the additional weight shall be considered as additional to the normal weight given in the above table and be paid for by the purchaser.

(c) In any shipment where the average weight of wheels is above the normal weight given in the above table the excess weight shall be at the expense of the manufacturer.

INSPECTION

(Inspection conforms to paragraph 7 of A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

10. The body of the wheel shall be free from slag, shrinkage, or blowholes. The tread and throat shall be free from irregular wrinkles, slag, sand wash, chill cracks, or sweat. Wheels will not be rejected on account of cracks around the circumference of the center core commonly known as "drawn hubs" or slight shrinkage holes on the face of the hub which will not interfere with the proper mounting of the wheels.

11. All wheels shall be marked and numbered consecutively in accordance with instructions issued by the purchaser. All wheels shall have the initials of the purchaser, wheel number, weight of wheel, month, day, and year when made plainly cast on the inside plate of the wheel. No wheels shall have duplicate numbers and all indistinct or duplicate numbers may be corrected only after having received the approval of the inspector. All wheels shall have the name of the manufacturer and place of manufacture cast on the outside plate of the wheel.

12. When ready for inspection, the wheels shall be arranged in groups, all wheels of the same date being grouped together, and for each 102 wheels which pass inspection and are ready for shipment, two representative wheels shall be taken, one of which shall be subjected to the thermal test and the other shall be used for the drop test.

13. (a) In making the thermal test the wheels shall be laid with the flange downward in the sand and a channel way $1\frac{3}{4}$ -inches (44 mm) in width at the center of the tread for all wheels up to and including 700 pounds in weight and 2 inches (51 mm) in width at the center of the tread for all wheels over 700 pounds in weight and 4 inches (102 mm) deep shall be molded in green sand around the wheel, the tread of the wheel to form one side of the channel way and the clean flange forming as much of the bottom as its width will cover. This channel way shall be filled with molten cast iron which shall be hot enough when poured, so that the ring cast, when the metal is cold, will be solid and free from wrinkles. The time when pouring ceases shall be noted and after two minutes has elapsed an examination of the wheel shall be made. If any cracks develop in any part of the wheel, all wheels bearing the same tape size as represented by the sample shall be rejected.

(b) In order to prevent spitting while pouring, the tread and flange may be covered with a coat of shellac. Wheels selected for test which are wet or which have been exposed to snow or frost may be warmed sufficiently to dry them or remove the frost before testing, but under no circumstances shall the thermal test be applied to a wheel that in any part feels warm to the hand.

14. (a) The anvil of the drop-testing machine shall be supported on rubble masonry or a concrete foundation at least 2 feet (610 mm) deep and shall weigh not less than 1,700 pounds (770 kg). The striking face of the tup shall be 9 inches (229 mm) in diameter and flat. The face of each of the three bosses supporting the wheel under test shall be flat and measure 5 inches (127 mm) in width.

(b) The test wheel shall be so placed on the three supports with the flange down, that the tup will strike centrally on the hub. The test wheel shall pass the requirements given in Table 1 without breaking in two or more pieces. If the test wheel fails, all wheels bearing the same tape size shall be rejected.

TABLE 1

Weight of wheel	Weight of tup	Height of drop	Number of blows
<i>Lbs. kg</i>	<i>Lbs. kg</i>	<i>Ft. m</i>	
650 295-----	250 113	9 2.75	12
700 317-----	250 113	10½ 3.20	12
750 340-----	250 113	12 3.65	12
850 385-----	250 113	15 4.60	12

(c) If the test wheel cracks before the twelfth blow it shall be required to stand 15 blows before breaking in two or more pieces.

15. The wheel selected for the drop and thermal test shall, following such test, be broken so that the chill may be examined at at least four different portions of the wheel. The depth of pure white iron shall conform to the following requirements:

Weight of wheel	Maximum depth			Minimum depth at throat
	At middle of tread	At throat	At middle of tread	
<i>Lbs. kg</i>	<i>Inst. mm</i>	<i>In. mm</i>	<i>In. mm</i>	<i>In. mm</i>
650 295	1 25.5	$\frac{3}{8}$ 22.2	$\frac{1}{2}$ 12.7	$\frac{3}{8}$ 9.5
700 317	1½ 27	$\frac{3}{8}$ 22.2	$\frac{1}{2}$ 12.7	$\frac{7}{16}$ 11.1
750 340	1½ 28.6	$\frac{3}{8}$ 22.2	$\frac{1}{2}$ 12.7	$\frac{1}{2}$ 12.7
850 385	1½ 28.6	$\frac{3}{8}$ 22.2	$\frac{1}{2}$ 12.7	$\frac{1}{2}$ 12.7

The depth of the chill shall not vary more than one-quarter inch (6.35 mm) in the middle of the tread on the different portions measured. If the sample does not conform to the requirements stated,

all wheels of the tape size represented by the sample shall be rejected.

NOTE.—The chill and physical tests specified only cover 33-inch wheels of the weights listed. Requirements for wheels of other sizes are to be supplied by the committee.

RETEST

16. Should the test wheel selected for the drop test, thermal test, or chill test fail to meet the requirements specified, all wheels bearing the same tape size shall be rejected. (Secs. 13, 14, and 15.) The inspector shall then select another wheel of a different tape size, which shall be submitted to the same test as the wheel which failed and if it passes the requirements of the test the remainder of the lot shall be accepted, provided the requirements of all other tests have been met.

REJECTION

17. The numbers of all wheels which have been rejected because of failure to meet the requirements of the drop test, thermal test, or chill test shall be noted and such wheels shall not be submitted for test at any future time.

18. Individual wheels shall be rejected if: (a) They are under the minimum weight specified, (b) they have surface defects mentioned in section 10, and (c) they are over or under the specified dimensions.

(The appendix is identical with that in A46-30T, given below, except that in A46-24 the first 33-inch wheel weighs 650 pounds with a maximum load per wheel of 11,875 pounds; the second 33-inch wheel weighs 700 pounds, with a maximum load per wheel of 16,500 pounds; and the first 36-inch wheel weighs 740 pounds, with a maximum load per wheel of 12,000 pounds.)

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR CHILLED-TREAD CAST-IRON WHEELS, DESIGNATION A 46-30T, 1930

CAST-IRON WHEELS

MANUFACTURE

1. Wheels shall be made of a mixture of such composition that, with good foundry practice and proper annealing, they will have the required chill in the tread, and otherwise meet the requirements of these specifications.

2. The fracture shall show a soft, clean, gray iron free from defects such as holes more than one-fourth inch in diameter containing slag or dirt, or clusters of holes honeycombing the hub, or white iron in the plate or hub.

CHEMICAL PROPERTIES AND TESTS

3. The wheels shall conform to the following requirements as to chemical composition:

	Minimum	Maximum
	Per cent	Per cent
Total carbon-----	3.00	-----
Combined carbon-----	-----	0.90
Manganese-----	.50	-----
Phosphorus-----	-----	.50
Sulphur ¹ -----	-----	.14

¹ Sulphur content.—The essential condition of chemical composition of chilled tread wheels is a balance between sulphur, carbon, and manganese, and variation in these constituents must not disturb this relation. If, on check analysis, the sulphur is found to be not more than 0.02 per cent greater than that specified, it shall not be considered sufficient cause for the rejection of the wheels, provided that the wheels conform to all physical and inspection requirements, and provided that the manganese content is at least three and one-half times the sulphur content. Such failure to conform to the specifications should be called to the attention of the manufacturer, and subsequent shipments or lots shall conform to the specifications.

4. Analyses shall be made by the manufacturer from test blocks poured during the day's melt from each cupola from which wheels purchased to these specifications are poured. The percentages of manganese, phosphorus, and sulphur shall be determined. The determination of carbon shall also be furnished merely for information. A copy of the analysis shall be furnished the purchaser or his representative on request.

5. An analysis may be made by the purchaser from one of the test wheels representing each 100 wheels. The sample for analysis shall be taken from drillings obtained by drilling a hole into the back of the plate of the wheel midway between the flange and the hub. The chemical composition thus determined shall conform to the requirements for manganese, phosphorus, and sulphur specified in section 3.

6. Chemical analyses shall be determined in accordance with the standard methods of sampling and chemical analysis of pig and cast iron A. S. T. M. A64. (See 601.20, p. 119.)

7. The purchaser shall not require the manufacturer to hold all lots of wheels until check analysis can be obtained unless it has been found that the manufacturer's product has not been conforming to these specifications.

PHYSICAL PROPERTIES AND TESTS

8. (a) In making the thermal test, the wheel shall be laid with the flange downward in the sand with the channel way molded in green sand around the wheel, 4 inches deep and of a width as shown in the following table. The tread of the wheel shall form one side of the channel way, the clean flange forming as much of the bottom as its width will cover. This channel way shall be filled with molten cast iron, which shall be hot enough when poured so that the cast ring, when cold, will be solid and free from wrinkles. The time when pouring ceases shall be noted, and after the time specified in the following table has elapsed, the wheel shall be examined. If a crack develops in the wheel within the time limit specified in the table all wheels bearing that same tape size shall be rejected.

Weight of wheel	Cooling time	Width of channelway
Pounds	Minutes	Inches
650	3	2
700	5	2
750	5	3
850	7	3

(b) The use of a permanent mold for making the thermal test in place of the sand mold described in paragraph (a) is permissible. The permanent mold shall consist of an iron ring and bottom board of such dimensions that the wheel to be tested can be immediately placed in the mold and centered to the required channel way.

(c) In order to prevent spitting while pouring, the tread and flange may be covered with a coat of chiller paste. Wheels selected for test which are wet or which have been exposed to snow or frost may be warmed sufficiently to dry them or remove the frost before testing, but under no circumstances shall the thermal test be applied to a wheel that in any part feels warm to the hand.

9. (a) The test wheel shall conform to the drop-test requirements given in the following table without

breaking in two or more pieces. If the test wheel fails all wheels bearing the same tape size shall be rejected:

Weight of wheel	Weight of tup	Height of drop	Number of blows
<i>Lbs. kg</i>	<i>Lbs. kg</i>	<i>Ft. m</i>	
650 295	250 113	9 2.75	12
700 317	250 113	10½ 3.20	12
750 340	250 113	12 3.65	12
850 385	250 113	15 4.57	12

(b) If the test wheels crack in the plate with three blows or less, they shall be considered as having failed.

(c) *Apparatus.*—The anvil of the drop-testing machine shall weigh not less than 1,700 pounds (770 kg) and shall be supported on a foundation of rubble masonry or concrete at least 2 feet (61 cm) in depth. The striking face of the tup shall be flat and 9 inches (229 cm) in diameter. The face of each of the three bosses supporting the wheel under test shall be flat and 5 inches (12.7 cm) in width. The test wheel shall be so placed on the three supports, with the flange down, that the tup will strike centrally on the hub.

10. (a) After having been subjected to the thermal and drop tests, the test wheels shall be broken so that the chill may be examined at at least four different portions of the wheel. The depth of pure white iron shall conform to the following requirements and the depth of the chill shall not vary more than one-fourth inch (6.35 mm) in the middle of the tread on the different portions measured:

Weight of wheel	Maximum depth	Minimum depth
<i>Lbs. kg</i>	<i>Ins. mm</i>	<i>In. mm</i>
650 295	1 25.5	¾ 9.5
700 317	1½ 27	¾ 11.1
750 340	1¾ 28.6	½ 12.7
850 385	1¾ 28.6	½ 12.7

(b) If the test wheel does not conform to the requirements specified, all wheels of the tape size represented by the test wheel shall be rejected.

NOTE.—The physical properties and tests specified cover only 33-inch wheels of the weights listed. Requirements for wheels of other sizes are to be supplied by the committee.

11. (a) *Sampling.*—When ready for inspection, the wheels shall be arranged in groups, all wheels of the same weight being grouped together, and for each 102 wheels which pass inspection and are ready for shipment, two representative wheels shall be taken, one of which shall be subjected to the thermal test, and the other shall be used for the drop test.

(b) When ordered in lots of 100 or more of each weight, the manufacturer shall arrange to cast them in sufficient quantity so that at least one test wheel may be taken from the wheels cast each day.

DIMENSIONS, WEIGHT, AND DESIGN OF WHEELS

12. Patterns and chillers shall be such that they will produce wheels in accordance with the dimensions shown on drawings furnished by the purchaser.

13. The normal circumference conforming to the specified diameter shall be measured at a point 1¾ inches (43.65 mm) from the gaging point on

the throat of the flange. When measured on the circumference, wheels shall not vary more than five-sixteenths inch above or below the normal size. Each wheel shall be so nearly circular that a true metallic ring, placed on its tread and bearing somewhere on the cone, shall at no point, be more than one thirty-second inch from the tread. The thickness of the flange shall be determined by a minimum and maximum flange thickness gage which shall be regulated to not more than one thirty-second inch (0.794 mm) over nor more than one-sixteenth inch (1.59 mm) under the normal flange thickness.

14. All wheels shall be taped with a standard design of wheel circumference tape. The wheels shall have the figures 1, 2, 3, 4, and 5 cast on the back plate in three-sixteenths inch (4.76 mm) raised figures, three-fourths inch in height, and one-eighth inch apart. The figure "3" shall represent normal tape size limited by one-sixteenth inch (1.59 mm) over or under the standard circumference (which for 33-inch (838.2 mm) wheels will be 103.67 inches $\pm \frac{1}{16}$ inch (2,633.2 mm ± 1.59 mm)). The figure "1" shall represent the smallest diameter, and the figure "5" the largest diameter. When taping a wheel the figure representing the tape size shall be chipped off. Tape sizes shall either be stenciled in plain figures on the plate of the wheel or as may be otherwise designed by the purchaser.

15. (a) If wheels are ordered in accordance with A. R. A. standard drawings the weights shall be as follows:

Maximum gross weight of car		Normal weight of wheel	Minimum weight of wheel	
Lbs.	kg	Lbs. kg	Lbs.	kg
103,000	46,700...	650 295	640	290
136,000	61,000...	700 317	690	313
169,000	76,500...	750 340	740	335
210,000	95,250...	850 385	835	380

(b) In the case of wheels ordered with cores smaller in diameter than the standard, the additional weight shall be considered as additional to the normal weight given in the above table and shall be paid for by the purchaser.

(c) In any shipment where the average weight of wheels is above the normal weight given in the above table the excess weight shall be at the expense of the manufacturer.

FINISH

16. The body of the wheel shall be free from slag, shrinkage, or blowholes. The tread and throat shall be free from irregular wrinkles, slag, sand wash, chill cracks, or sweat. Wheels will not be rejected on account of cracks around the circumference of the center core commonly known as "drawn hubs" or slight shrinkage holes on the face of the hub which will not interfere with the proper mounting of the wheels.

MARKING

17. All wheels shall be marked and numbered consecutively in accordance with instructions issued by the purchaser. All wheels shall have plainly cast on the inside plate of the wheel the initials of the purchaser, the wheel number, weight of the wheel, and the month, day, and year when cast. No wheels shall have duplicate numbers and all indistinct or duplicate numbers may be corrected only after having received the approval of the inspector. All wheels shall have the name of the manufacturer and the place of manufacture cast on the outside plate of the wheel.

INSPECTION AND REJECTION

(Inspection conforms to paragraph 7 of A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

19. (a) Should the test wheel selected for the drop test, thermal test, or chill test fail to conform to the requirements specified, all wheels bearing the same tape size shall be rejected. (See secs. 8, 9, and 10.) The inspector shall then select another wheel of a different tape size, which shall be submitted to the same test as the wheel which failed, and if it passes the requirements of the test the remainder of the lot shall be accepted, provided the requirements of all other tests have been met.

(b) The numbers of all wheels which have been rejected because of failure to meet the requirements of the drop test, thermal test, or chill test shall be noted, and such wheels shall not be submitted for test at any future time.

(c) *Individual rejection.*—Individual wheels shall be rejected in accordance with the following: (1) If they are under the minimum weight specified, (2) if they have surface defects described in section 16, and (3) if they are under the specified dimensions.

APPENDIX

As information of possible value to the users of these specifications, committee A-3 on cast iron wishes to state that the Association of Manufacturers of Chilled Car Wheels has adopted recommended designs of chilled-tread car wheels of 24, 26, 28, 30, 33, 36, 39, and 42 inch diameter. The designs for the 33-inch diameter single plate wheels have been approved by the American Railway Association. The wheels for which designs have been made, the standard for maximum load and estimated weight of the wheels are given below:

Diameter of wheel	Standard for—		Diameter of wheel	Standard for—	
	Maximum load per wheel	Estimated weight		Maximum load per wheel	Estimated weight
<i>Inches</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Inches</i>	<i>Pounds</i>	<i>Pounds</i>
24	6,000	320	33	12,875	650
24	9,000	360	33	17,000	700
24	12,000	400	33	21,125	750
24	16,000	440	33	26,250	850
26	6,000	360	36	16,000	800
26	9,000	410	36	20,000	860

30	16,000	615			

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS, CHILLED-TREAD WHEELS FOR LOCOMOTIVES, TENDERS, AND CARS, 1930

CHILLED-TREAD WHEELS

(In respect to surface and rejections at destination this specification conforms to A. R. A.—M. specification for cast-iron wheels, given above. In respect to illustration of tread and flange contour it is identical with A. R. A.—M. standard wheel tread and flange for cast-iron wheels, also given above. In respect to analysis, check analyses, patterns and

chillers, dimensions, taping, cores, marking, sampling, thermal test, drop test, chill test, and individual rejection, this specification conforms to A. S. T. M., A46-24, likewise given above. It differs from the above-referred-to specifications in the following particulars:)

Section I. WHEELS FOR STANDARD RAILWAY USES

Scope.—These specifications cover all 33-inch (838.20 mm) wheels and over in diameter for railway service for loads of maximum gross weights not exceeding 12,000, 16,000, 20,000, and 25,000 pounds per wheel.

MANUFACTURE

Composition.—The composition of the mixture shall be such that it will produce the analysis specified and an adequate depth of chill in the wheel.

Chill.—(c) The depth of chill shall not be less than one-half inch and not more than 1¼ inches at the center line of tread. The blending of the chill with the gray iron shall be without any distinct line of demarcation. The depth of chill shall not vary more than one-fourth inch around the tread in any one plane in the same wheel. These limits apply to all weights of wheels.

Chemical composition.—Wheels shall conform to the following requirements as to chemical composition:

	Per cent
Combined carbon, maximum.....	0.90
Manganese, minimum.....	.50
Phosphorus, maximum.....	.50
Sulphur, maximum.....	.14

Sulphur content.—The essential condition of chemical composition of chilled-tread wheels is a balance between sulphur, carbon, and manganese, and variation in these constituents must not disturb this relation. If, on check analysis, the sulphur is found to be not more than 0.02 per cent greater than that specified, it shall not be considered sufficient cause for the rejection of the wheels, provided that the wheels conform to all physical and inspection requirements and provided that the manganese content is at least three and one-half times the sulphur content. Such failure to conform to the specifications should be called to the atten-

tion of the manufacturer and subsequent shipments or lots shall conform to the specifications.

Chemical analysis procedure.—Chemical analyses shall be determined in accordance with the standard methods of sampling and chemical analysis of pig and cast iron in A. S. T. M., A64. (See 601.20, p. 119.)

Dimensions.—39-inch wheels shall not vary more than seven-sixteenths inch (11.11 mm) and 42-inch wheels seven-sixteenths inch (11.11 mm) above or below normal size, measured on the circumference.

Taping.—All 39-inch (990.6 mm) and all 42-inch (1066.8 mm) wheels shall be taped in a like manner (to the taping of 33-inch and 36-inch wheels) except that the tape shall be marked with numbers from 0 to 6, inclusive, each of which shall be stamped one-eighth inch (3.18 mm) apart. The figure 0 shall represent the smallest circumference and the figure 6 the largest circumference.

Diameter		Normal circumference		Maximum allowable variation in circumference above or below the normals
<i>Ins.</i>	<i>cm</i>	<i>Ins.</i>	<i>cm</i>	<i>In.</i> <i>mm</i>
33	83.82	103.67	263.3	5/16 7.9
36	91.44	113.10	287.3	5/16 7.9
39	99.06	122.52	311.2	3/16 11.1
42	106.68	131.95	335.2	3/16 11.1

A tape number plate shall be cast on the back plate of the wheel. When taping a wheel the number of this plate representing the tape size shall be chipped off. Under no circumstances are these numbers to be removed after the wheel is received from the foundry.

At the request of the purchaser, tape sizes may in addition be stenciled in plain figures with white paint on the front plate of the wheel, or as otherwise designated, without extra cost to the purchaser.

Weights.—Wheels shall be furnished in accordance with the weights shown in the accompanying table, based on standard drawing:

Diameter		Maximum gross load on wheel		Core size	To bore	Nominal weight	Minimum weight
<i>Ins.</i>	<i>cm</i>	<i>Lbs.</i>	<i>kg</i>	<i>Ins.</i> <i>mm</i>	<i>Ins.</i> <i>mm</i>	<i>Lbs.</i> <i>kg</i>	<i>Lbs.</i> <i>kg</i>
33	83.83	12,000	5,443	5¼ 133.35	5¾ 146.05	650 295	640 290

TABLE 9—Continued

DOUBLE PLATE

Single plate diameter	Maximum permissible load per wheel		Nominal weight
<i>Ins.</i>	<i>cm</i>	<i>Lbs.</i>	<i>kg</i>
24	60.96	6,000	2,722
24	60.96	9,000	4,082
24	60.96	12,000	5,443
24	60.96	16,000	7,257
26	66.04	6,000	2,722
26	66.04	9,000	4,082
26	66.04	12,000	5,443
26	66.04	16,000	7,257
28	71.12	6,000	2,722
28	71.12	9,000	4,082
28	71.12	12,000	5,443
28	71.12	16,000	7,257
30	76.20	6,000	2,722
30	76.20	9,000	4,082
30	76.20	12,000	5,443
30	76.20	16,000	7,257

The thickness of the flange shall be regulated by a maximum and minimum flange gage, which thickness shall not vary in an individual wheel more than one-sixteenth inch (1.59 mm) over or more than one-sixteenth inch (1.59 mm) under the normal flange.

Taping.—Manufacturers shall not be required to tape wheels under 24 inches (609.6 mm) in diameter. Wheels 24 inches (609.6 mm) to 30 inches (762.0 mm) in diameter shall be taped in accordance with the requirements for locomotive, tender, and car wheels.

Weights.—(1) The maximum permissible loads under normal conditions for wheels of various weights and diameters are shown in Table 9 (which table is based on association standards). Wheels will be furnished in accordance with these weights.

In the case of either single or double plate wheels the width of tread or length of hub may be increased, or the diameter of the core reduced as required, but the additional weight shall be considered as addi-

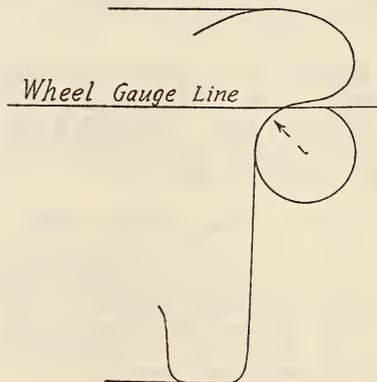

FIGURE 418

24	60.96	10,000	4,536

tional to the normal weight given in the table above and be paid for by the purchaser.

In the case of double-plate wheels ordered with cores smaller in diameter than the standard, the additional weight shall be considered as additional to the normal weights given in the table above and shall be paid for by the purchaser.

In any shipment of wheels ordered with standard core sizes, where the average weight of the wheels is above the normal weight for such shipment, the excess weight shall be at the expense of the manufacturer.

Inspection

General conditions and surface shall be governed by requirements referred to above under car wheels.

Marking.—Shall be as provided for in A. S. T. M., A 46, given above under car wheels, except that no tape-number plate shall be required on wheels under 24 inches (609.6 mm) in diameter on account of lack of space on the inside or back plate of these wheels.

Sampling.—Wheels, when ready for inspection, shall be arranged in groups and where purchaser requires tests for each 51 wheels which pass surface inspection and are ready for shipment, one repre-

sentation shall be furnished by the manufacturer without expense, to be broken for chill test. Where there are less than 50 wheels to be inspected the test wheel or wheels taken for chill test shall be paid for by the purchaser unless by special agreement with the manufacturer.

Drop and thermal tests.—No drop or thermal test shall be required on wheels of 10 inches (254.0 mm) to 30 inches (762.0 mm) diameter inclusive.

Chill test.—The wheel selected for chill test shall be broken so that the chill may be examined. The depth of pure white iron shall conform to requirements give above under "chill." If the sample does not conform to requirements stated, all wheels submitted shall then be taped and the inspector shall select another wheel. If this wheel does not meet the requirements, all wheels of the same tape size shall be rejected and the test continued on other tape sizes. The inspector shall then select another wheel of a different tape size, which shall be broken for chill test as specified, and if it passes the requirements the remainder of the lot shall be accepted provided the requirements of all other tests have been met.

Rejection.—If any lot of wheels fails to meet requirements of chill test or fails to meet chemical requirements, such wheels shall be rejected. Individual wheels may be rejected as provided for above, and wheels may be rejected at destination as provided for above under "car wheels."

Rehearing on check analyses.—Shall be as provided for above under "car wheels."

ASSOCIATION OF MANUFACTURERS OF CHILLED CAR WHEELS, STANDARD PRACTICE FOR FOUNDRIES AND SPECIFICATIONS FOR TESTS, CHILLED TREAD WHEELS, 1930

CHILLED TREAD WHEEL TESTS

(In respect to composition, chill-test block, temperature of molten metal, ladles, last iron, pouring, pits, pit covers, pyrometers, selection of test wheels, plant operation, and records, this specification conforms to A. R. A.—M. cast-iron wheels for locomotives, tenders, and cars, given above, with the following exceptions and additions:)

Chill-test block.—The size of the test bar shall be 1½ inches wide, 3 to 4 inches thick, and 6½ to 8 inches long.

Analysis-test block.—(a) A test block 3 by 3 inches minimum section and 4½ inches minimum in length shall be cast, preferably in dry sand, one test bar poured from the first and one from the last tap, and at least two bars from intermediate parts of the heat.

(b) The drillings shall be obtained from the end of the test block. The first drillings shall be discarded, the drilling continued, and the resultant chips, etc., dumped from the hole and taken for sample, or the block may be broken and the drillings taken at the point of fracture.

(c) An analysis may be made for each block and recorded, or, at the option of the manufacturer, the samples may be mixed of equal quantities, but at least one analysis shall be made to represent the day's heat.

Ladles.—Ladles may be heated in specially designed ovens in which they can be thoroughly baked throughout, or they may be heated by the use of a forced-blast fire using coke, oil, or gas as fuel; in which case, before using, the ladles shall be filled at least two-thirds full of molten iron. After two minutes the metal shall be discarded and the ladle immediately placed in service.

Pouring.—The rate of pouring off the heat should be held constant with the melting rate of the cupola. The number of ladles used shall be so regulated that there will be no long wait between taps. Ladles held 4 minutes shall be drained, and if not used for 10 minutes or more shall be treated as a green ladle and reheated or washed before being used.

Shaking out.—(a) Wheels shall be shaken out from the mold as quickly as permissible without bleeding. The interval of time between pouring and shaking out must not exceed the following limits:

Weight of wheel	Single plate	Double plate
Pounds	Minutes	Minutes
650	45	35
700	50	40
750	55	45
850	60	50

(b) After the wheels are shaken out they must be transferred to the annealing pit and pitted, not to exceed six minutes for the entire operation; the average time should not exceed four minutes. The time shall start with the lifting of the cope.

(c) The surface of the plate of the wheel shall not be less than 1,350° F. when pitted.

Pits.—(a) At the time of pitting, the temperature of the air in the middle of the primary pit, with the cover closed, shall be not less than 700° F., preferably 900° F. or over.

(b) When the temperature of the pit drops below the minimum, artificial means shall be used for raising the temperature.

(c) Temperatures of not less than five representative primary pits shall be taken and recorded before refilling.

Annealing temperatures.—(a) The rate of cooling shall be such that approximately 24 hours after the pit is closed the temperature of the top wheel shall be not less than 900° F., after two days not less than 750° F., and after three days not less than 650° F.

(b) Temperatures of not less than five representative top-pit wheels shall be taken and recorded at time of removal.

(c) When secondary pits are not used, the top-pit wheel must either be repitted or cover wheels used.

Pit covers.—(a) The cover shall be so insulated as to prevent, as far as possible, rapid transfer of heat from the top wheel. A space equal to at least one wheel shall exist between the bottom of the cover and the top of the wheel, but if by this method the temperature of the plate of the top wheel at the end of approximately 20 hours is less than 900° F., a space equal to two wheels shall exist between the bottom of the cover and the top wheel.

(In respect to drop test and thermal test, this specification conforms to A. S. T. M., A46, given above, with the following exceptions and additions:)

Drop test.—(a) In addition to the requirements of paragraph 9 (c) of A. S. T. M., A46, given above, care should be taken to see that the tup falls free in the guides and that the supporting bosses are solidly anchored to the large base plate, and so located that only the back of the flange rests on them. The space between the hub of the wheel and the base plate shall be kept free from sand and broken pieces of wheel.

(b) The tup shall weigh 250 pounds when first placed in service, and shall be removed when found to weigh less than 247 pounds.

(c) If test wheel cracks in the plate with nine blows or less, it will be considered as having failed.

(d) The drop tests shall be to destruction. (After 36 blows the height of drop may be increased or big drop used.)

Thermal test.—

Weight of wheel	Double plate	
	Cooling time	Width of channel-way
<i>Pounds</i>	<i>Minutes</i>	<i>Inches</i>
650	2	1 1/4
700	2	1 3/4
750	2	2
850	2	2

The wheel shall be observed for at least 10 minutes after the ring is poured to note and record any structural failure.

Chill on wheels.—The depth of chill shall be not less than one-half inch and not more than 1 1/4 inches at the center line of tread. The blending of the chill with the gray iron shall be without any distinct line of demarcation. The depth of chill shall not vary more than one-fourth inch around the tread in any one plane in the same wheel. These limits apply to all weights of wheels.

Tape lines.—Tape lines should be checked daily on a car wheel used as a master. This wheel shall be an exact tape 3 as checked by association master tape line. The exact weight of the master wheel should also be determined and the correct weight stamped on same, so that it may be used for checking the scales used for weighing the new wheels.

NATIONAL ELECTRICAL MANUFACTURERS ASSOCIATION, WHEEL CONTOUR, RECOMMENDED PRACTICE, 1923

WHEEL CONTOUR

The standard contour of locomotive wheels shall be as in Figure 419.

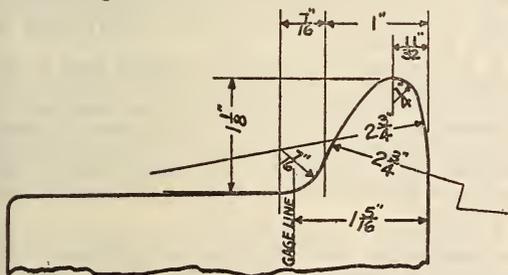

FIGURE 419.—Wheel contour

611.19 MISCELLANEOUS MANUFACTURES OF GRAY CAST IRON.

AMERICAN MARINE STANDARDS COMMITTEE, SPECIFICATION FOR BUILT-UP PROPELLERS, E NO. 23-1928

BUILT-UP PROPELLERS

(A) GENERAL CONDITIONS

1. This specification is issued only for general guidance. It defines a complete propeller but is intended to apply only to the items actually included in the contract or purchase order. Such details as may be omitted in whole or in part in this specifica-

tion and which are included in the purchase order in form of either material or workmanship shall be supplied in accordance with the best modern practice.

2. In all cases where propellers are to be subject to inspection and approval by ship-classification societies, the requirements of such societies shall govern as to compositions, grades, and tests of the materials, also thicknesses of blades.

(B) COMPONENT PARTS

1. For the purpose of this specification, a complete built-up propeller shall be understood to consist of the following parts unless exceptions are made in the purchase order: (a) hub; (b) blades, including spares, if ordered; (c) blade studs, including spares, if ordered; (d) stud nuts, including spares, if ordered; (e) lock screws for stud nuts, including spares, if ordered; (f) studs, nuts, and split pins for fair-water cap; and (g) plugs fitted in filling holes.

2. The following additional parts, or either of them, shall be furnished with the propeller wheel if specifically ordered by the purchaser: (a) A fair-water cap fitted and secured on the hub and (b) A packing gland conforming to American Marine Standard E No. 12-1927 (publication A. M. S. C. 31), complete, with studs, nuts, and split pins.

(C) MATERIALS

1. The purchaser should specify the characteristics of the materials desired in asking for quotations and in purchasing. When the characteristics of the materials are not definitely specified, the minimum requirements for grade and tests of any of the materials hereinafter mentioned shall be those specified by the American Bureau of Shipping. (See A. B. S. rules for building and classing steel vessels, secs. 33 and 40.) The standard specifications of the American Society for Testing Materials may be used in conjunction herewith to define the characteristics of the materials to be furnished, provided that their requirements are not less than those of the American Bureau of Shipping.

2. *Hubs.*—These may be of either cast iron, semi-steel, or cast steel, as specified by the purchaser in asking for quotations and in ordering.

(a) *Cast-iron hubs.*—These shall be high-grade gray-iron castings of uniform grain, without blowholes, porous spots, or other defects that might impair strength or lasting quality of the propeller in service.

(b) *Semisteel hubs.*—These shall be high-grade gray-iron castings, containing a proper proportion of good steel scrap. The steel scrap shall be introduced into the iron in the cupola and not in the pouring ladle. The castings shall be of close grain, without blowholes, porous spots, or other defects that might impair strength or lasting quality of the propeller in service.

(c) *Cast-steel hubs.*—The castings shall be of the kind generally referred to in trade as soft steel. They shall be sound, without blowholes, porous spots, or other defects that might impair strength or lasting quality of the propeller in service, and they shall be annealed.

3. *Blades.*—These shall be either of cast steel or of manganese bronze, as specified by the purchaser in asking for quotations and in ordering.

(a) *Cast-steel blades.*—(1) The castings shall be of the kind generally referred to in trade as soft steel. They shall be sound, without blowholes, porous spots, or other defects that might impair strength or lasting quality of the propeller in service. They shall be annealed in a suitable furnace of ample proportions to bring the whole casting to a uniform annealing temperature. They must not be removed

from the annealing furnace until the temperature has dropped to 700° F. or lower.

(2) Local heating, bending, or straightening of annealed blade castings shall be permitted only if approved by representatives of the purchaser and the inspection authorities.

(b) *Bronze blades.*—(1) The actual manganese-bronze composition of the castings shall be left to the manufacturer unless the purchaser should specify his own requirements, in which case the latter shall govern.

(2) The castings shall be sound, without blow-holes, sponge, dross, cold shuts, seams, cracks, and all other defects which might impair the strength or lasting quality of the propeller in service. All surfaces shall be smooth.

(3) Scrap shall not be used in the castings, but metal of identical composition remaining from propeller castings made by the same manufacturer may be used to a proportion not exceeding 50 per cent.

(4) Only virgin copper pigs 99.8 per cent pure and spelter 99.7 per cent pure shall be used in the manganese-bronze ingots which shall form at least 50 per cent of each heat.

4. *Blade studs.*—The studs shall be of high-grade forged steel. Cold-rolled or cold-drawn steel shall in no case be used.

5. *Stud nuts.*—The nuts shall be of high-grade bronze having physical characteristics equivalent to those required for bronze blades.

6. *Lock screws for stud nuts.*—These shall be of high-grade rolled bronze having characteristics equivalent to those required for bronze blades.

7. *Fair-water cap.*—This shall be of cast iron, semisteel, cast steel, or bronze as may be specified by the purchaser in asking for quotations and in ordering. In any case the castings shall be of the same grade as hereinbefore specified for castings of the respective materials, and they shall be equally free of defects.

8. *Studs, nuts, and split pins for fair-water cap.*—The studs shall be of steel for cast-iron, semisteel, or cast-steel propellers, and of high-grade bronze for bronze propellers. The nuts shall be of high-grade bronze in all cases, but of different composition from bronze studs. The split pins shall be of commercial standard bronze.

9. *Plugs for filling holes.*—These shall be commercial standard cast-brass pipe plugs.

10. *Packing gland.*—If included in the order, the gland shall be cast of high-grade bronze possessing physical characteristics equivalent to those required for bronze propellers. The studs shall be of high-grade steel for cast-iron, semisteel, or cast-steel propellers, and of high-grade rolled bronze for bronze propellers. The nuts shall be of high-grade bronze in all cases, but of different composition from bronze studs. The split pins shall be of commercial standard bronze.

(D) TESTS AND INSPECTION OF MATERIAL

1. When the conditions of purchase call for physical tests and chemical analyses of any of the materials, the manufacturer shall furnish to the purchaser the requisite certificates of tests and analyses, identified with the test coupons or samples and the materials they represent. The tests and analyses shall be made and certified by a recognized testing laboratory, and the cost of the testing shall be borne by the manufacturer.

2. For vessels classing with any of the ship-classification societies, test coupons shall be marked by the surveyor for identification before they are detached from the castings. Corresponding marks shall be placed on the castings. On blade castings this mark shall be placed in line with the point of attachment of the coupon.

3. All physical tests shall be made in the presence of representatives of the purchaser and the inspection authorities. This, however, may be waived by agreement if the said representatives are willing to accept matching of fractures.

4. Each blade casting shall be hung free and hammered for detection of possible shrinkage cracks and other flaws.

5. Any casting or other material developing defects in the process of machining shall be replaced without cost to the purchaser, notwithstanding any prior acceptance of the unfinished casting or material.

(E) MACHINING

(Included in this specification are details of machine work on hubs, blades, blade studs, nuts, lock screws, screw threads, boltheads, and nuts.)

(F) ACCURACY OF DIMENSIONS AND PITCH

1. Castings shall be true to drawings or patterns furnished by the purchaser. Variations from the designed dimensions when the pattern is furnished by the manufacturer or from the pattern dimensions when the pattern is furnished by the purchaser must not exceed the proper tolerances generally allowed in modern foundry practice.

2. All necessary facilities shall be furnished by the manufacturer for measuring the pitch of the blades. The pitch shall be carefully set and verified in the presence of the representative of the purchaser.

3. When each blade is mounted on the hub with the pitch accurately set to that called for by the design at a radius between 66 to 75 per cent (preferably 70 per cent) of the radius to the blade tip, the variation from the designed pitch at any other radius shall not, unless otherwise specified in the purchase order, exceed 2 per cent plus or minus if the pattern is made by the manufacturer, or 2 per cent plus or minus from the pitch of the pattern when the latter is furnished by the purchaser.

(G) ASSEMBLING AND BALANCING

1. All blades shall be interchangeable on all faces of the hub, and in case of doubt on this point they shall be assembled to the hub to verify their fit before shipment.

2. In the case of 4-bladed propellers each of the blades, including spares, shall be weighed. The two nearest the same weight shall be mounted on opposite sides of the hub. The pair next nearest the same weight shall be mounted on the remaining opposite sides of the hub. The blades and the hub shall be marked to identify the location of each blade thus placed.

3. Assembled propellers shall be balanced as may be specified in the conditions of purchase. The purchaser's requirements should in all cases be ascertained, as the degree of accuracy of balance required depends upon the service conditions for the propeller.

NOTE.—It is recommended that wheels for high-speed work be brought to a perfect static balance. For low or medium speed work, the final difference in weight to be allowed between blades should not exceed the equivalent of the weights specified below, applied at the tip of the blade:

Propeller diameter:	Weight (pounds)
7 to 9.5 feet.....	0.25
9.5 to 12 feet.....	.50
12 to 15 feet.....	1.00
15 to 18.5 feet.....	2.00
18.5 to 21 feet.....	3.00

4. If the propeller is to be permanently assembled at the place of manufacture before shipment, the spaces in the blade flanges surrounding the studs when the blades are finally set shall be solidly filled with hardwood properly fitted in natural dry con-

dition. White metal shall be used for filling instead of wood if specified in the conditions of purchase.

(H) MANUFACTURER'S GUARANTY

When the conditions of purchase do not require tests of the materials to determine their physical characteristics, the manufacturer shall, if required by the purchaser, guarantee that the materials furnished by him will not break due to defects within one year from the date of shipment when the ship is operated under normal conditions in free water. Should disagreement arise between the manufacturer and purchaser in case of breakage apparently due to defective material, the question shall be determined by a representative of ship-classification societies to be designated by the purchaser and a representative of the manufacturer designated by him. Should these two fail to agree, they shall appoint a third party, satisfactory to the manufacturer and purchaser, whose decision shall be final.

(J) MARKINGS

1. When the blades are assembled on the hub at the pitch called for by the purchase order or drawing, coinciding index lines shall be marked on each flange and the hub, for guidance in reassembling the propeller and setting the blades at the proper pitch. These index lines shall also be put on the spare blades. If included in the conditions of purchase, brass pins shall be tapped into the flanges of cast-steel blades to receive these lines. The lines shall be identified on 3-bladed propellers by stamping the blades with the numbers 1, 2, and 3, respectively, and on 4-bladed propellers by stamping the blades with the numbers 1, 2, 3, and 4, respectively. Corresponding numbers shall be stamped near the lines on the hubs.

2. Nuts, studs, and lock screws shall, in general, be interchangeable, but, in order to provide for the contingency of slight differences which might cause difficulty in reassembling, they shall be marked by stamping and corresponding marks shall be stamped at their respective locations on the various parts for individual identification as fitted.

3. The manufacturer's name and location of his plant shall either be cast in raised letters not less than one-eighth inch high, or stamped on the fillet on the back of each blade. Under this shall be stamped the name of the ship if known, also the manufacturer's order number, weight of blade, and date of manufacture. Spare blades shall be stamped "Spare," in addition to the other markings, in a conspicuous manner on both sides of the blade. All markings shall be put on before shipment.

(K) SHIPMENT

1. The parts shall be completely assembled for shipment or shipped separately as directed by the purchaser. If shipped separately, all shall be marked for proper assembling as hereinafter specified.

2. In preparing assembled propellers or separate parts for shipment the manufacturer shall place adequate protection over all finished parts to safeguard them against damage or deterioration under normal conditions in handling or in transit. Hubs may be shipped with studs, nuts, and lock screws in place, provided that they are properly protected.

3. The manufacturer shall be responsible for proper loading and blocking of assembled propellers or parts so as to comply with transportation regulations.

4. If spare blades or studs are included in the order, they shall accompany the shipment unless otherwise directed by the purchaser.

AMERICAN MARINE STANDARDS COMMITTEE, SPECIFICATION FOR PROPELLERS CAST IN ONE PIECE, E NO. 25-1928

CAST PROPELLERS

(In respect to general conditions, characteristics of materials, tests and inspection of material, accuracy of dimensions and pitch, balancing, manufacturer's guaranty, and shipment, this specification is like A. M. S. C., E23, given above. It differs from E23 in the following particulars:)

(B) COMPONENT PARTS

1. Unless otherwise specified, the order for a solid propeller shall be understood to cover the propeller wheel only, fully machined, with plugs fitted in filling holes.

2. The following additional parts or either of them shall be furnished with the propeller wheel if specifically ordered by the purchaser:

(a) A fair-water cap fitted and secured on the hub.

(b) A packing gland conforming to American Marine Standard E No. 12-1927 (publication A. M. S. C., 31), complete with studs, nuts, and split pins.

(C) MATERIALS

1. Solid propellers may be required of cast iron, semisteel, cast steel, or bronze. The purchaser shall specify which one of the materials is to be furnished.

2. *Cast-iron propellers.*—These shall be high-grade gray-iron castings of uniform grain, without blowholes, porous spots, or other defects that might impair strength or lasting quality of the propeller in service.

3. *Semisteel propellers.*—These shall be high-grade gray-iron castings, containing a proper proportion of good steel scrap. The steel scrap shall be introduced into the iron in the cupola and not in the pouring ladle. The castings shall be of close grain, without blowholes, porous spots, or other defects that might impair strength or lasting quality of the propeller in service.

4. *Cast-steel propellers.*—(a) The castings shall be of the kind generally referred to in trade as soft steel. They shall be sound, without blowholes, porous spots, or other defects that might impair strength or lasting quality of the propeller in service. They shall be annealed in a suitable furnace of ample proportions to bring the whole casting to a uniform annealing temperature. They must not be removed from the annealing furnace until the temperature has dropped to 700° F. or lower.

(b) Local heating, bending, or straightening of annealed castings shall be permitted only if approved by representatives of the purchaser and the inspection authorities.

5. *Bronze propellers.*—(a) The actual manganese-bronze composition of the castings shall be left to the manufacturer unless the purchaser should specify his own requirements, in which case the latter shall govern.

(b) The castings shall be sound, without blowholes, sponge, dross, cold shuts, seams, cracks, and all other defects which might impair the strength or lasting quality of the propeller in service. All surfaces shall be smooth.

(c) Scrap shall not be used in the castings, but metal of identical composition remaining from propeller castings made by the same manufacturer may be used to a proportion not exceeding 50 per cent.

(d) Only virgin copper pigs 99.8 per cent pure and spelter 99.7 per cent pure shall be used in the manganese-bronze ingots which shall form at least 50 per cent of each heat.

6. *Fair-water cap.*—If included in the order and unless otherwise specified, the fair-water cap shall be cast of the same material as the propeller and shall be equally free of defects.

7. *Studs, nuts, and split pins for fair-water cap.*—The studs shall be of steel for cast-iron, semisteel, or cast-steel propellers, and of high-grade bronze for bronze propellers. The nuts shall be of high-grade bronze in all cases, but of different composition from bronze studs. The split pins shall be of commercial standard bronze.

8. *Plugs for filling holes.*—These shall be commercial standard cast-brass pipe plugs.

9. *Packing gland.*—If included in the order, the gland shall be cast of high-grade bronze possessing physical characteristics equivalent to those required for bronze propellers. The studs shall be of high-grade steel for cast-iron, semisteel, or cast-steel propellers, and of high-grade rolled bronze for bronze propellers. The nuts shall be of high-grade bronze in all cases, but of different composition from bronze studs. The split pins shall be of commercial standard bronze.

(E) MACHINING

(Included in this specification are details of machine work on hubs, blades, screw threads, bolt-heads, and nuts.)

(J) MARKINGS

Each propeller shall be marked with the manufacturer's name and location of his plant and the name of the ship if known; also with the manufacturer's order number and date of manufacture. These markings shall either be cast on in raised letters not less than one-eighth inch high, or stamped in a conspicuous place other than on the face of the blades.

AMERICAN MARINE STANDARDS COMMITTEE, BOLLARDS AND CLEATS FOR DOCKS, P NO. 1 TO P NO. 4, 1931

BOLLARDS AND CLEATS

(This specification covers five sizes of single bollards, cleats, and bollard cleats, and three sizes of double bollards for both cast-iron and cast-steel construction. The external forms and dimensions are identical for both metals, the variations being in the thicknesses and cores. Iron castings conform to A. S. T. M., A48, steel castings conform to class B steel castings in A. S. T. M., A27, steel for bolts and nuts conforms to A. S. T. M., A9. Screw threads in bolts and nuts conform to A. S. A., B1a-1924, while the dimensions of bolt-heads and nuts conform to A. S. A., B18b-1927.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; WELDING WIRE AND RODS, RECOMMENDED PRACTICE, 1924

WELDING WIRE AND RODS

(See 603.41, p. 156; 631.31, p. 1157; and 645.11, p. 1203.)

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR RAILWAY BUILDINGS, ORNAMENTAL AND MISCELLANEOUS METAL WORK, 1929

CASTINGS

Ornamental castings shall be made in stove plate molding sand. Cast metal shall be uniform in thickness throughout, free from sand, holes, or other defects. Ornamental castings shall not exceed three-eighths inch thickness unless shown on drawings or otherwise permitted. Ornamental details shall be strictly adhered to and profiles made in accordance with full-size drawings. Surface lines and straight-line moldings shall be hand filed, ground, and soft wheeled. Ornamental detail shall be modeled in clay and then cast directly from the plaster reproduction of the clay model. No ornamental detail shall be cast from wood patterns or molds.

The exposed surfaces of ornamental castings shall be perfectly clean and sharp with the ornamental detail brought out clear and strong, well modeled in good relief and undercut when necessary, and with all lines, arrises, profiles, and ornaments true and in accordance with details and approved models. Pierced work shall have openings and outlines free from irregularities. Castings shall be neatly filed and chased to remove any superficial imperfections, and shall be altered if necessary until they are satisfactory to the engineer in all respects.

(For bronze castings, see 646.41, p. 1250.)

BRAKE SHOES

(See 611.43, p. 726.)

NATIONAL BOARD OF FIRE UNDERWRITERS, BUILDING CODE, CONSTRUCTION, STEEL AND IRON, 1931

STEEL AND IRON CONSTRUCTION

General.—Except as otherwise specifically provided in this ordinance or in rules duly promulgated by the building official, the standard specification for structural steel for buildings, and the code of standard practice as adopted and amended from time to time by the American Institute of Steel Construction, shall be deemed to be the generally accepted good practice in steel construction. (The A. I. S. C. indorses specification A9 of the American Society for Testing Materials. (See 605.12, p. 252.) (In addition, this specification contains structural details, such as thicknesses of cast-iron and steel columns, cast-iron bases and lintels, lintel spans, bolting of beams, thickness of web in riveted girders, riveting, bolting, welding, gas cutting, and protection against corrosion.)

ROOF DRAINS

(See 617.73, p. 1062.)

611.2 MALLEABLE-IRON CASTINGS.

611.21 MALLEABLE CAST IRON.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, SPECIFICATION FOR MATERIALS FOR USE IN THE MANUFACTURE OF SPECIAL TRACK WORK, W104-28, 1928

Approved as American tentative standard by the American Standards Association, January 23, 1929]

SPECIAL TRACK WORK MATERIALS

(See 606.3, p. 342.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; MALLEABLE-IRON CASTINGS, RECOMMENDED PRACTICE, 1928

MALLEABLE-IRON CASTINGS

(Identical with A. S. T. M., A47, given below, except that the yield point is 30,000 pounds per square inch and the percentage of elongation in 2 inches is 15 instead of 10. Inspection and rejection conform to A. R. A. galvanized sheets. See 604.32, p. 243.)

AMERICAN RAILWAY ASSOCIATION, SIGNAL SECTION; MALLEABLE-IRON CASTINGS, 1930

MALLEABLE-IRON CASTINGS

(Conforms to A. S. T. M., A47, given below, except that yield point is 30,000 instead of 32,500 pounds per square inch.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR MALLEABLE CASTINGS, DESIGNATION A47-30, 1930

MALLEABLE CASTINGS

1. These specifications cover malleable castings for railroad, motor vehicle, agricultural implement, and general machinery purposes.

MANUFACTURE

2. The castings shall be produced by either the air-furnace, open-hearth, or electric-furnace process.

PHYSICAL PROPERTIES AND TESTS

3. (a) The tension-test specimens specified in section 5 shall conform to the following minimum requirements as to tensile properties:

Tensile strength	lbs./in. ²	50,000
Yield point, minimum	do	32,500
Elongation in 2 inches	per cent.	10.0

(b) The yield point may be determined by the drop of the beam of the testing machine or by the divider method.

4. (a) All castings, if of sufficient size, shall have cast thereon test lugs of a size proportional to the thickness of the casting, but not exceeding five-eighths by three-fourths inch in cross section. On castings which are 24 inches or over in length, a test lug shall be cast near each end. These test lugs shall be attached to the casting at such a point that they will not interfere with the assembling of the castings, and may be broken off by the inspector.

(b) If the purchaser or his representative so desires, a casting may be tested to destruction. Such a casting shall show good, tough malleable iron.

5. (a) Tension-test specimens shall be of the form and dimensions shown in Figure 420. Specimens whose mean diameter at the smallest section is less than nineteen thirty-seconds inch will not be accepted for test.

(b) A set of three tension-test specimens shall be cast from each melt, without chills, using heavy risers of sufficient height to secure sound bars. The specimens shall be suitably marked for identification with the melt. Each set of specimens so cast shall be placed in some one oven containing castings to be annealed.

6. (a) After annealing, three tension-test specimens shall be selected by the inspector as represent-

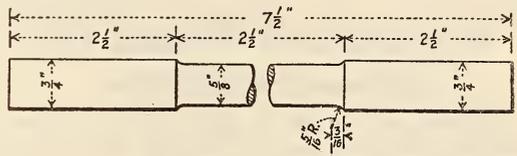

FIGURE 420.—Test specimen

ing the castings in the oven from which these specimens are taken.

(b) If the first specimen conforms to the specified requirements, or if, in the event of failure of the first specimen, the second and third specimens conform to the requirements, the castings in that oven shall be accepted, except that any casting may be rejected if its test lug shows that it has not been properly annealed. If either the second or third specimen fails to conform to the requirements, the entire contents of that oven shall be rejected. In case one of the retest specimens contains a flaw which results in the failure of the bar to meet the specifications, at the discretion of the inspector additional test specimens from the same oven may be tested, or test specimens may be cut from castings.

7. Any castings rejected for insufficient annealing may be reannealed once. The reannealed castings shall be inspected and if the remaining test lugs, or castings broken as specimens, show the castings to be thoroughly annealed, they shall be accepted; if not, they shall be finally rejected.

WORKMANSHIP AND FINISH

8. The castings shall conform substantially to the patterns or drawings furnished by the purchaser, and also to gages which may be specified in individual cases. The castings shall be made in a workmanlike manner. A variation of one-eighth inch per foot will be permitted.

9. The castings shall be free from injurious defects.

MARKING

10. The manufacturer's identification mark and the pattern numbers assigned by the purchaser shall

be cast on all castings of sufficient size in such positions that they will not interfere with the service of the castings.

INSPECTION AND REJECTION

11. (a) The inspector representing the purchaser shall have free entry, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture of the castings ordered. The manufacturer shall afford the inspector, without charge, all reasonable facilities to satisfy him that the castings are being furnished in accordance with these specifications. All tests and inspection shall be made at the place of manufacture prior to shipment, unless otherwise specified, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

(b) The manufacturer shall be required to keep a record of each melt from which castings are produced, showing tensile strength and elongation of test specimens cast from such melts. These records shall be available and shown to the inspector whenever required.

12. Castings which show injurious defects subsequent to their acceptance at the manufacturer's works may be rejected and, if rejected, shall be replaced by the manufacturer free of cost to the purchaser.

MALLEABLE IRON RESEARCH INSTITUTE, MALLEABLE-IRON CASTINGS, 1929

MALLEABLE-IRON CASTINGS

(Identical with A. R. A., given above, including references therein to A. S. T. M., A47, and A. R. A. specifications for galvanized sheets.)

MALLEABLE IRON RESEARCH INSTITUTE, MALLEABLE-IRON CASTINGS FOR RAILROADS, MOTOR VEHICLES, AGRICULTURAL IMPLEMENTS, AND GENERAL MACHINERY, 1922

MALLEABLE-IRON CASTINGS

(Identical with A. S. T. M., A47, given above.)

SOCIETY OF AUTOMOTIVE ENGINEERS, IRON AND STEEL SPECIFICATIONS, MARCH, 1922

MALLEABLE-IRON CASTINGS

(For prefatory remarks, see 600.0, p. 2. This specification is substantially the same as A. S. T. M., A47-30, given above. It differs only in respect to tensile strength and percentage of elongation in 2 inches, and in omitting the minimum yield point. It provides that:)

Tensile strength.....	lbs./in. ² ..	45,000
Elongation in 2 inches.....	per cent..	7.5

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR IRON, MALLEABLE; CASTINGS, QQ-I-666, FEBRUARY 2, 1932

MALLEABLE-IRON CASTINGS

(This specification includes F. S. B. No. 339a (current designation: QQ-M-151). (See 600.0, p.

3.) In many respects it is similar to A. S. T. M., A47, given above, including diagram of test specimen. It differs from A47 in the following particulars:)

GRADE AND TYPES

B-1. *Grade*.—Malleable-iron castings shall be of but one grade.

B-2. *Types*.—Malleable-iron castings shall be of two types, as follows:

Type A.—Black (ungalvanized).

Type B.—Zinc coated (galvanized).

C-5. Zinc coating (galvanizing) shall be accomplished by the hot-dipping process.

D. GENERAL REQUIREMENTS

D-1. The responsibility of furnishing castings that can be laid out and machined to the finished

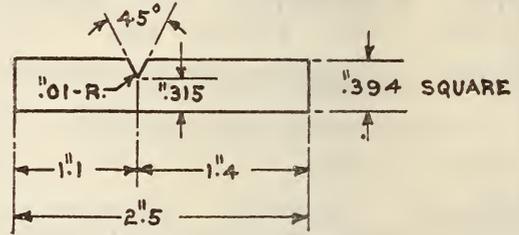

FIGURE 421.—Izod

dimensions within the specified tolerances as shown on the drawings, and that will conform to such gages as may be specified in individual cases, shall rest with the contractor. Sufficient stock shall be allowed for shrinkage and, where required, for finish-

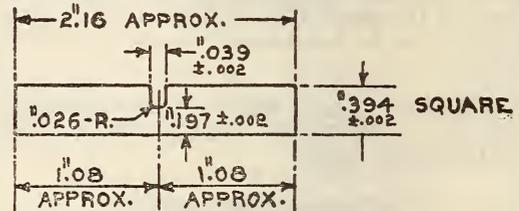

FIGURE 422.—Charpy

ing. Castings unreasonably in excess of the specified size or weight may be rejected.

E. DETAIL REQUIREMENTS

E-1. The physical properties shall conform to the respective requirements of Table 1.

TABLE 1

Type	Tensile strength, pounds per square inch	Elongation, per cent in 2 inches, minimum	Impact strength, foot-pounds	
			Izod, minimum	Charpy, minimum
Ungalvanized.....	50,000	10	5	7
Galvanized.....	50,000	10	5	7

F-4. Impact-test specimens shall be cast to the form and dimensions shown in the annexed diagrams (according to impact-test method employed) except that the notch shall not be cast in the specimen but shall be machined in either case.

F-6. When annealed, test specimens shall be so located as to receive the least favorable annealing of any of the castings.

F-7. Tension and impact test specimens representing zinc-coated (galvanized) malleable iron shall be zinc coated (galvanized) with the castings they represent and the impact specimens machined for test after having been galvanized.

F-8. Three tension and three impact test specimens (the latter for zinc-coated (galvanized) castings only) representing each melt in each annealing charge will be tested. If more than one of each group of three fail to conform to the requirements, the charge represented by that group shall be rejected.

F-9. Any black (ungalvanized) malleable-iron castings rejected for insufficient annealing may be reannealed once.

F-10. Malleable-iron castings shall not be reannealed or reheated after zinc coating (galvanizing), to above 350° F.

G. PACKAGING, PACKING, AND MARKING

G-1. Packing—

G-1a. Small castings shall be properly separated by melts or lots when shipped. A lot shall consist of castings poured from the same melt, unless otherwise mutually agreed upon by the contractor and the inspector.

G-1b. If special packing be necessary to secure the acceptance of castings by common or other carrier for safe transportation at the lowest rate to the point of delivery, such packing shall be provided by the contractor without additional expense to the Government.

G-2. Marking—

G-2a. Small castings shall be so marked that their identity will be clear at the point of delivery.

G-2b. Large castings shall be stamped with the melt or lot number and, where practicable, with the pattern number.

G-2c. Shipping containers shall be marked with the name of the material, the size, the type, and the quantity contained therein as defined by the contract or order under which shipment is made; the name of the contractor; and the number of the contract or order.

611.22 JOURNAL BOXES.

FIGURE 435.—Driving and engine truck boxes

In its treatment of driving-box design, the committee has not attempted to cover the design of cellars, nor has it taken up the matter of fitting and grooving brasses, as the arrangement of these details depends very largely upon the kind of lubricant used, and there is an extremely wide variation in the practices of the different railroads. Practically all engine-truck boxes are lubricated with oil that is fed to the journal from waste-packed cellars. Believing that the amount of packing carried in engine-truck cellars of most modern locomotives is not as large as it should be, the committee has provided for the greatest depth of cellar which is felt could be applied in connection with the 30-inch diameter engine-truck wheel while maintaining 1 1/2 inches of clearance between the pedestal binder and the bottom of the engine-truck box and cellar, as well as a clearance of not less than 2 1/2 inches between the top of rail and the lowest part of the engine-truck frame. The several diagrams in Figure 436 show the construction recommended for boxes of 2-wheel engine trucks using plate springs of the semielliptical type. With suitable modifications at the top this box becomes applicable to four-wheel front trucks of the type generally used on passenger locomotives.

Material recommended for both driving and engine-truck boxes is cast steel as per A. R. A. specifications for carbon-steel castings adopted as recommended practice, 1923. (See 611.41, p. 707.)

**AMERICAN RAILWAY ASSOCIATION
MECHANICAL DIVISION; STANDARD
SPECIFICATIONS FOR DUST GUARDS,
1930**

DUST GUARDS

(See figs. 437 and 438)

- Purpose.**—To exclude dust from the journal box and to retain the oil.
- Requirement.**—To serve its purpose when new guard is applied, it must fit the axle with not more than one thirty-second of an inch clearance all around.
- Material.**—Material in contact with axle must be of such composition that it will not cut the axle in service.
The inside dimension of guard must be such that it can be easily applied to the axle and of such outside dimension that it can easily enter the box.
The guard must not bind when applied.
- A wedge or plug shall be applied to close the top of the guard well in the box, or provision made in the construction of the guard to close this opening in order to exclude dirt.
- Service.**—The service life of the guard shall be equal to at least the service life of a pair of new wheels.

A wood dust guard to meet these specifications must not be less than three-ply laminated and secured by use of water-resisting glue.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; STANDARD JOURNAL BOXES A AND B, 1930

JOURNAL BOXES

Section of box may be made either circular or square below the center line and material may be cast iron, when alloyed for proper strength and wearing qualities, malleable iron, pressed steel, or cast steel, provided all the essential dimensions are adhered to.

When journal box is made of material other than cast iron, reduction in thickness of metal and coring to lighten weight is permissible provided all the essential dimensions which affect interchangeability and the proper fitting of contained parts are adhered to.

If the method of manufacture does not permit of placing the letters "A. R. A." on the side of the journal box, they may be placed on the top between the hinge lug and seat of truck sides.

When used with side frames of such design that the bottom tie bar is omitted, or is not an essential strength member for carrying the load, the bottom box lugs may be omitted.

When used in connection with other side frames, the bottom box lugs must be equivalent, both in location and strength, to those shown.

The lid face of bar should be reasonably straight and smooth. For journal boxes used on passenger-train equipment, a machine fit is recommended.

Figure 439 shows details for journal box A for journal 3¼ by 7 inches.

Figure 440 shows details for journal box B for journal 4¼ by 8 inches.

SPECIFICATIONS FOR JOURNAL BOXES, C, D, E, AND F

Arrow heads, without figures, indicating radii, represent one-fourth inch radius.

Dimensions for tolerances underscored are plus or minus one-sixteenth inch; lesser tolerances are given with the dimensions. Other dimensions of lesser importance may vary, plus or minus, one-eighth inch.

Metal thickness given in table under "T" is minimum.

Section of any box may be made either circular or square, below center line.

The metal may be cast iron, malleable iron, pressed steel, or cast steel, provided all of the essential dimensions, which affect interchangeability and the proper fitting of contained parts, are adhered to.

When used with side frames of such design that the bottom tie bar is omitted, or is not an essential strength member for carrying the load, the bottom box lugs may be omitted.

When used in connection with other side frames, the bottom box lugs must be equivalent, both in location and strength, to those shown.

If the method of manufacture does not permit the placing of letters "A. R. A." on the side of the journal box, they may be placed on the top, between the hinge lugs and the seat of truck sides.

The lid face of box should be reasonably straight and smooth. For journal boxes used on passenger-train equipment, a machine fit is recommended.

**AMERICAN RAILWAY ASSOCIATION,
MECHANICAL DIVISION, STANDARD
SPECIFICATIONS FOR JOURNAL-BOX
LIDS, 1929**

JOURNAL-BOX LIDS

1. *Scope.*—This specification covers all lids for use on A. R. A. standard journal boxes.

2. *Material.*—Lids when made of malleable iron or cast steel to be not less than one-eighth inch in thickness. When made of pressed steel, thickness to be not less than five thirty-seconds of an inch and material to have a carbon content of at least 0.25 per cent.

3. *Functions.*—(a) Lid must protect the packing by preventing the entrance into the journal box of dust, sand, fine coal, snow, water, or other foreign matter.

4. *Construction.*—(a) Lid to be attached to the journal box by means of a pin, bolt, or rivet one thirty-second of an inch less in diameter than the size of the hinge lug hole in the box. The use of separable cotter pins or split keys is prohibited.

(b) Springs of the coiled type to be used, and preferably so located that the force on the lid in closed position shall be at or near the center of the lid.

(c) The above lid fastenings to be so arranged that the lid can be easily opened and closed and retain itself in a fully opened position without danger of closing.

(d) When closed, the tension between the lid and fastening must be sufficient to prevent vibration of lid or any parts thereof.

(e) Lids of the hinged type to have the hinge located at the top of the journal box so arranged that the lid will open outward and upward to at least an angle of 90° with the lid face of the journal box. Lids of other types should provide an equivalent opening.

(f) A tight contact between the lid and the face of the journal box must be maintained in order to meet the requirements as stated under item No. 3.

For journal boxes used on passenger-train equipment a machined fit is recommended for the lid as well as the journal box. Die forming of lids, after pressings or casting to insure a smooth, flat surface where lid bears against face of box, will be considered equivalent to machining.

(g) A ledge, flange, or other suitable arrangement must be provided on the inside of the lid, particularly along the lower part, so that oil thrown against the inside face will drain back into the box.

(h) Top and side lips at least one-fourth of an inch in projection to be located around the outside edge of the lid, except that side lips may be omitted where the lid itself is ground or machined.

(i) The hinge lug must be housed.

(j) The eyes of cast lids must be integrally closed their full length.

Pressed-steel lids to have the eyes carefully welded their full length, or to have each eye secured by not less than two 3/8-inch rivets.

The eyes of the lid must be parallel with the contact face and gaged so as to insure a tight lid fit.

(k) The inspection of lids that will insure compliance with the above requirements is recommended.

611.23 ROWLOCKS.

(No nationally recognized specifications available.)

**611.29 MISCELLANEOUS MANUFACTURES OF
MALLEABLE CAST IRON.**

**AMERICAN ELECTRIC RAILWAY ENGI-
NEERING ASSOCIATION, OVERHEAD
LINE MATERIAL FOR DIRECT AND CAT-
ENARY SUSPENSION, RECOMMENDED
SPECIFICATION, D102-30, 1930**

OVERHEAD LINE MATERIALS

I. SCOPE

101. This specification covers material used in overhead trolley construction, both direct and catenary suspension, and overhead-feeder cable construction.

II. MATERIALS

201. *Nonferrous alloy castings.*—(a) Nonferrous alloy castings shall be of such proportions of copper, tin, zinc, lead, and/or other metals as to produce an alloy suitable for the duty for which the casting is designed.

(b) Alloys shall be highly resistive to the corrosive action of severe atmospheric pollution due to the products of combustion, steam, and to salt fogs.

(c) Alloys used in current-carrying parts shall be of the highest electrical conductivity consistent with the strength requirements, and the size and design of such parts shall be such as to provide the necessary conductivity with the alloy used.

(d) Alloys shall have tensile strength not less than those shown in table below.

Use	Minimum tensile strength
	Lbs./in. ²
For main tension members, such as splicers, sockets, etc.	30,000
For parts where stiffness is a prime requisite, such as frogs, crossings, clips, jaws, etc.	28,500
For parts which must be bent cold, such as clinch ears, approaches, etc.	26,000
(Yield point not in excess of 40 per cent of tensile strength.)	

202. *Copper.*—Copper shall conform to the requirements for low-resistance lake of current specification designation B-4 for lake copper, or to the current specification designation B-5 for electrolytic copper, both of the A. S. T. M. (See 641.11, p. 1173.)

203. *Malleable iron.*—(a) Malleable-iron castings shall conform to the current specification designation A-47 for malleable castings of the A. S. T. M. (See 611.21, p. 665.)

(b) Such castings shall not show brittleness after galvanizing nor shall their tensile strength or ductility be reduced to values less than those given in the above specification after any heat treatment to remove embrittlement.

204. *Steel.*—Steel shall conform to the current specification designation A-7 for structural steel for bridges of the A. S. T. M. (See 605.11, p. 249.)

209. *Wrought iron.*—Wrought iron shall conform to the current specification designation A-41 for refined wrought-iron bars of the A. S. T. M. (See 603.1, p. 139.)

210. *Protective coatings.*—(a) Zinc protective coatings shall conform to the current specification manual section D6 for galvanizing or sherardizing

on iron and steel of the American Electric Railway Engineering Association. (See 600.3, p. 60.)

(b) Other protective coatings may be used provided they furnish a degree of protection not less than that of zinc.

211. *Nonferrous materials.*—Nonferrous materials may be used, notwithstanding the specification herein of iron or steel, provided adequate strength and satisfactory dimensions are realized.

III. DESIGN

301. *Drawings.*—Drawings which accompany these specifications shall be considered a part thereof.

302. *Protection.*—All ferrous materials and fittings shall have a zinc or other approved protective coating, firmly adherent, uniform, and smooth.

A. GENERAL OVER-HEAD LINE MATERIAL

303. *Scope.*—This specification covers material used in overhead line construction of all kinds, including feeder and trolley wire construction.

304. *Bolts and nuts, general.*—(a) Bolts and nuts shall be of steel or of nonferrous materials as specified. Heads and nuts shall be finished with one face rounded or chamfered.

(b) Bolt threads may be cut or rolled as specified and shall be full, clean, and concentric with shank. They shall conform in size, pitch and number per inch to the U. S. standard given below:

Nominal diameter of bolt	Threads per inch
Inch	
1/4	20
3/8	16
1/2	13
5/8	11
3/4	10
7/8	9
1	8

When rolled thread is used, the diameter specified applies to the threaded portion and the shank may be slightly less in size.

(c) Nuts shall be square or hexagonal as specified and must develop the full strength of the bolt. They shall be symmetrically formed, with hole central and at right angles to face, tapped to fit corresponding thread so that they can be run the entire length of the thread by the fingers without undue forcing or without noticeable play or rocking. When hot galvanized, the galvanizing may be omitted upon the threaded portion of the nut.

(d) Various types of bolts and nuts shall be of dimensions shown in the following figures:

- Carriage bolt..... Figure 449.
- Eyebolt..... Figure 450.
- Double arming (spacing) bolt. Figure 451.
- Machine (through) bolt..... Figure 452.

It shall be understood that they are to be furnished complete with nuts as shown in figures.

312. *Steps, pole.*—Pole steps shall be of steel of dimensions shown in Figure 459. They may be either the hook-head type with fetter drive, or the button-head type with twist drive.

313. *Strand (guy wire) (messenger).*—(a) Strand for guys, backbones, messengers, and similar purposes shall consist of concentrically stranded wires. (Steel strand is usually left-hand lay, and copper and bronze right-hand lay. The direction of lay desired should be specified for both strand and fittings.)

(b) Galvanized-steel strand cable shall conform to the current specification designation A-122 for zinc-coated (galvanized) steel wire strand of the A. S. T. M. (See 603.42, p. 181.)

c	1/16	1/16
d	3/8	3/8
m	1/16	0

(b) Wood insulator pins and standard malleable-iron or forged-steel corner pins shall be of dimensions shown in Figure 463. They shall have standard 1-inch pin threads.

(c) Various types of metallic pins using 5/8-inch or 3/4-inch bolt through arm, having forged or malleable body or spacer, and having integral or separate lead tips with pin thread, or steel, malleable or zinc separable thimbles with machine screw or pin threads, are available and give greater strength than wood pins. If not cemented into insulator they shall have standard 1-inch pin threads. The body or spacer shall have a base of such shape as to fit the arm or surface to which attached.

C. MATERIAL FOR DIRECT TROLLEY SUSPENSION

324. *Scope.*—This specification covers material used principally in direct suspension over-head trolley construction, for voltages not exceeding 750 volts.

325. *Arms, bracket (see fig. 464).*—(a) Bracket arms shall be of grade C structural steel tubing, or of steel T or other structural shapes.

(b) For light service, tubing shall be 1.9 inches external diameter with walls 0.145 inch thick, weighing 2.68 pounds per foot.

(c) For heavy service, tubing shall be 2.375 inches external diameter, with walls 0.154 inch thick, weighing 3.6 pounds per foot.

326. *Bands, pole.*—Pole bands for tubular steel pole shall be of steel. They may be either one piece or two piece with dimensions shown in Figure 465.

327. *Bolts.*—All stud bolts or machine (tap) bolts of any type for the suspension of line-material devices shall be of steel, five-eighths inch diameter with U. S. standard thread, 11 threads per inch threaded at least thirteenth-sixteenths inch and of proper length to project five-eighths inch to eleven-sixteenths inch below shoulder or seat of suspensor device.

328. *Bracket intermediate fittings (see fig. 464).*—(a) Bracket intermediate fittings for tubular arm shall be of malleable iron.

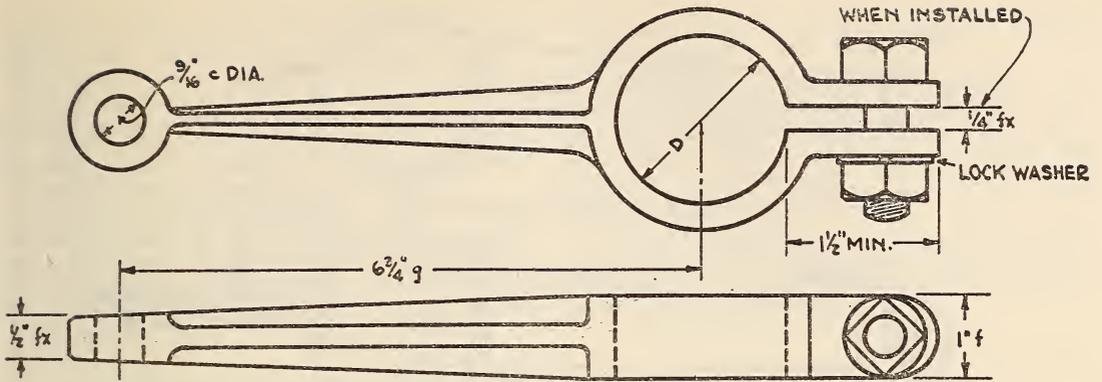

FIGURE 466.—Bracket intermediate fitting

fx	1/4	0
hx	1/2	0

330. *Crossings.*—(a) Crossings shall consist of a malleable-iron or bronze body or pan, with separable bronze approaches, and may be either rigid, with fixed angularity, or adjustable.

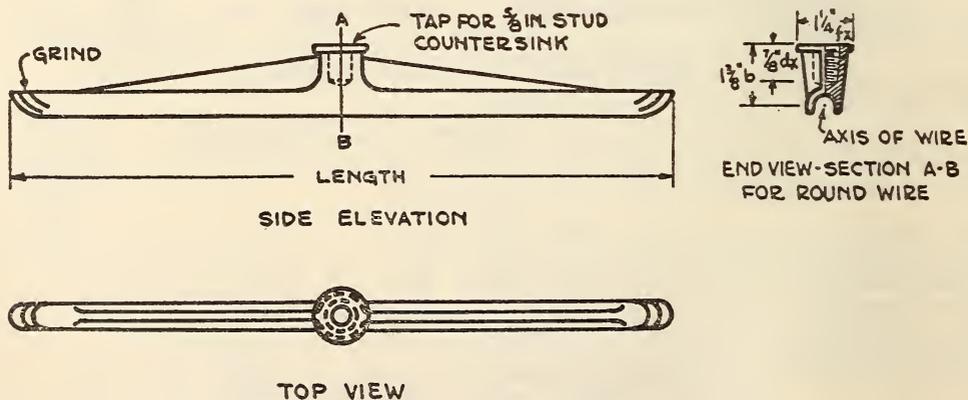

(b) Crossings shall be of such design that both trolley wires of any standard size can be carried through without cutting or excessive bending and that adjustment along the wires can be made after installation. The clamping devices shall hold the wires securely without slipping and without injury to the wires.

(c) Body design shall be such as to give sufficient rigidity against bending due to maximum trolley tensions, and such as to prevent wheel or harp of dewired pole from catching. Rigid-type crossings shall have at least two pull-off eyes. All separable parts shall be cotter pinned or otherwise suitably locked to prevent working loose.

(d) Runners shall be of such cross section as to permit satisfactory operation of the current-collecting device, and of such design and so guarded as to cause collector to track without dewirement and to reduce arcing to a minimum. For wheel operation the design of the runners and the pan shall be such that either a standard new wheel or an old wheel with groove worn to a depth of 1 1/2 inches shall pass with minimum abruptness.

(e) The bronze approaches shall be tapered, easily applied, and securely retained in position and shall be adapted for any of the standard round or grooved trolley-wire sizes.

331. *Crossings, insulated.*—(a) Insulated crossings, in addition to general requirements for crossings, shall provide suitable wood or other insulation between the two wires in such fashion that dust, snow, or sleet can not bridge the insulation.

TOP VIEW

FIGURE 469.—Clinch ear

	Allowable variations	
	Over	Under
b	1/32	1/32
f	1/4	1/4
dx	1/8	0
fx	1/4	0

(b) The runner for one wire shall be of wood or fiber for at least 4 inches on either side of gap, and shall be readily removable for replacement or repair.

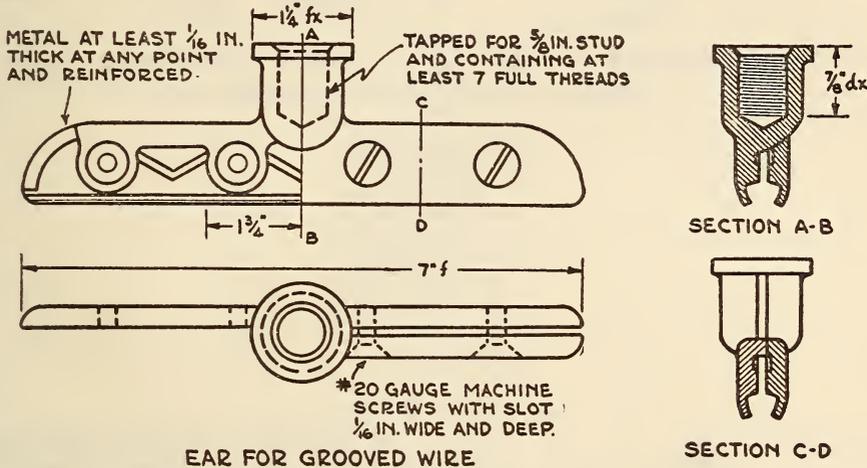

332. *Ears, clinch.*—(a) Clinch ears shall be of bronze of dimensions shown in Figure 469. The standard lengths shall be 9 inches, 12 inches, and 15 inches. The central boss shall be slightly countersunk and tapped for five-eighths inch U. S. standard thread, 11 threads per inch.

(b) Groove in ear for round wire shall be milled smooth and shall be of such dimensions as to fit size of wire used, and hold wire with axis $1\frac{1}{8}$ inches below top of boss. Lips shall be ground thin and smooth at edges and ends. They shall be of such

shape and length as to form properly about the wire, meeting for at least the center two-thirds of the length, and of such thickness as to offer the least resistance to current collector.

(c) Groove in ear for grooved or figure 8 wire shall have lips designed to spring into the groove of the wire by hand. They shall be of such shape, length, and thickness that, after crimping, they will hold the wire securely with its axis $1\frac{1}{8}$ inches below top of boss, and will not interfere with current collector.

(d) Ears having separate boss or rib of bronze or other metal, or having copper lips, or of the underslung or clip type are approved if they fulfill the general requirements above.

EAR FOR GROOVED WIRE

	Over	Under
<i>f</i>	$\frac{1}{4}$ Inch	$\frac{1}{4}$ Inch
<i>dx</i>	$\frac{1}{8}$	0
<i>fx</i>	$\frac{1}{4}$	0

333. *Ears, screw clamp.*—(a) Screw clamp ears shall be of malleable iron or bronze, with four No. 20 steel or bronze machine screws. They shall conform to the requirements for boss threading, height dimension, and clearance in paragraph 332 and shall have dimensions shown in Figure 470.

(b) Cross section shall be such as to permit internal stiffening ribs such that when installed ear can not be buckled sufficiently to offset its grip on the wire.

(c) Lips shall be of such size and shape as to take desired size of round, grooved, or figure 8 wire as specified.

334. *Frogs.*—(a) Frogs shall be of malleable iron or bronze, with separable bronze approaches.

(b) Frogs shall be of such design that trolley wires of any standard size can be carried through without cutting or excessive bending and that adjustment along the wires can be made after installation. The clamping devices shall hold the wires securely without slipping and without injury to the wires.

(c) Body design shall be such as to give sufficient rigidity against bending due to maximum trolley tensions, and such as to prevent the wheel

or harp of a dewired pole from catching. Frogs shall have at least four pull-off eyes. All separable parts shall be cotter pinned or otherwise suitably locked to prevent working loose.

(d) Runners shall be of such cross section as to permit satisfactory operation of the current-collecting device, and of such design and so guarded as to cause collector to track without dewirement, and to reduce arcing to a minimum. For wheel operation the design of the runners shall be such that either a standard new wheel or an old wheel with groove worn to depth of $1\frac{1}{8}$ inches shall pass with minimum abruptness.

(e) The bronze approaches shall be tapered, easily applied, and securely retained in position, and shall be adapted for any of the standard round or grooved trolley-wire sizes.

338. *Rods, over-support.* (See fig. 464.)—(a) Over-support rod shall be of round steel, not less than one-half inch diameter. The end next the pole shall be threaded for 6 inches and the end next the bracket shall either be threaded for 2 inches or shall have a button head.

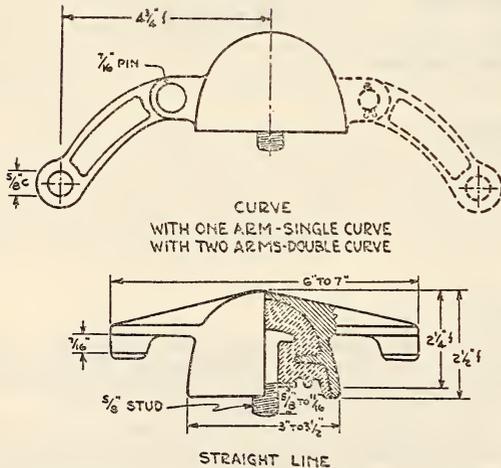

FIGURE 472.—Suspension (hanger) round top type

	Allowable variations	
	Over	Under
c	Inch 1/16	Inch 1/16
f	Inch 1/4	Inch 1/4

(b) The length of the over-support rod for bracket arms from 9 feet to 12 feet in length shall be 18 inches greater than the length of the arm.

(c) Rod shall be furnished with one nut for each threaded end and one beveled cast-iron washer.

339. Sockets, pole, for bracket arms. (See fig. 464.)—Pole sockets for bracket arms shall be of malleable iron of dimensions shown in Figure 471. They shall have internal socket diameters as follows: For light service (1 1/2-inch) bracket arms, 2 inches; for heavy service (2-inch) bracket arms, 2 7/16 inches.

340. Splicers, trolley wire.—(a) Splicers shall be of bronze, steel, or other suitable material, the whole device to have a strength and conductivity at least equal to that of the wire on which it is used.

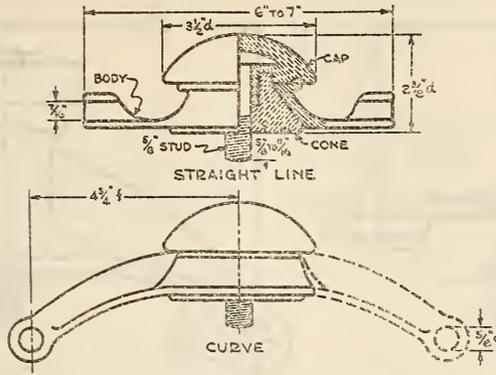

(b) The center of gravity shall be low and the shape and design such that the current collector will pass satisfactorily without shock or blow and with a minimum of arcing.

(c) The wire passages shall be of such size that the trolley wire can be easily threaded through, and the clamping devices shall be capable of securely holding either new or worn wire without reducing the strength of the wire.

341. Suspensions (hangers).—(a) Suspensions, as to form of insulation, shall be of four general types:

1. Round top type (fig. 472).
2. Cap and cone type (figs. 473 and 474).
3. Insulated bolt (west end) type (fig. 475).
4. Yoke (uninsulated) type (fig. 476).

They shall be of malleable iron, with steel studs or bolts, and (except the yoke type) with molded composition insulation of suitable shape and dimensions for their use.

346. *Clamp feed.* (See fig. 483.)—(a) Contact wire feed clamp shall be of bronze.

(b) Clamp shall be so designed that it grips contact wire and has suitable provision for attaching a flexible top of 0000 AWG size.

(c) Clamp shall be of such design as to avoid interference with satisfactory operation of current collector, and shall conform to the shape of contact wire so as to form a good gripping surface and prevent slipping along contact wire.

347. *Clamp, messenger dead end.* (See fig. 484.)—
 (a) Messenger dead end clamp shall be of wrought iron, steel, malleable iron, or bronze.
 (b) Clamp shall be so designed as to grip messenger without damage to messenger strands.

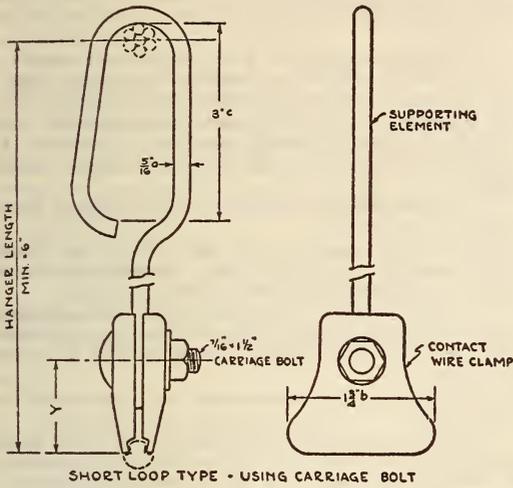

FIGURE 485.—Catenary hangers

c	1/2	0

(c) Clamp shall be so designed that when properly installed on messenger, it shall be capable of withstanding a tension not less than 85 per cent of the breaking strength of messenger, without slippage.
 (d) Clamp shall have a suitable eye or clevis for the dead ending guy.

348. *Crossings.*—Crossings for pantograph operation shall conform to the specifications of similar devices used in direct suspension, so far as they apply, and shall be of such design as to provide sufficient clearance for pantograph on both wires.
 349. *Frogs.*—Frogs shall conform to the specifications of similar devices used in direct suspension. When both pole and pantograph current collectors are used, the design of frog shall be such that both types of collectors will pass satisfactorily.

350. *Hanger, catenary.* (See figs. 485 and 486.)—
 (a) Catenary hanger shall be of such design that it grips the contact wire securely and suspends it a fixed distance from the messenger.
 (b) Hangers for use where contact wire is maintained in the same vertical plane as the messenger

I	.55	.66
J	.65	.67
K	.75	.68

(as on tangent track or on curves with pull-over construction) shall be of the flexible type, so arranged that hanger may be lifted up from messenger and permit the distance between contact wire and messenger at hanger to be less than hanger length.

(c) Hangers for use on curves with "inclined catenary" where contact wire is not in the same vertical plane as messenger may be either of the flexible type with a loose fitting loop around messenger or of the rigid type arranged to clamp the messenger so that the distance between contact wire and messenger at hangers can not change.

(d) Contact wire clamp of hanger shall be of steel, malleable iron, or bronze, as specified.

(e) Contact wire clamp shall be of such design as to avoid interference with satisfactory operation of current collector (see fig. 486) and shall conform to the shape of contact wire so as to form a good

gripping surface and prevent clamp from slipping along contact wire, and shall have the necessary strength to support the weight.

(f) Messenger clamp of rigid hanger shall be of steel, malleable iron, or bronze.

(g) Messenger clamp of rigid hanger shall be of such design as to clamp securely in place on messenger without injury to messenger strands.

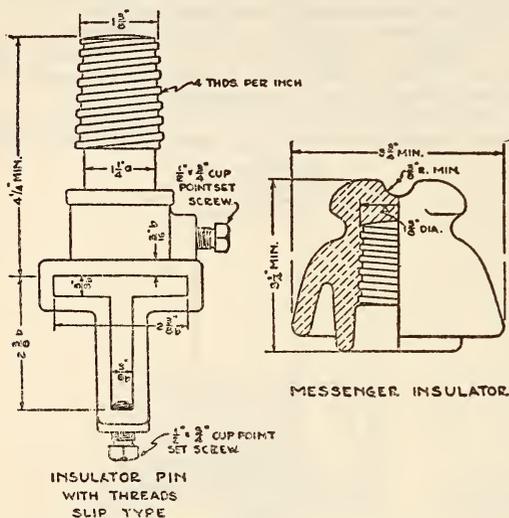

FIGURE 487.—Messenger insulator and pin

		Allowable variations	
		Over	Under
a	Inch $\frac{3}{8}$	Inch $\frac{3}{8}$	
b	$\frac{1}{16}$	0	

(h) Supporting element of hanger shall be of steel, bronze, copper, or other suitable material.

(i) Supporting element of flexible hanger shall be made with a loop, which will permit a vertical movement of hanger and shall be designed to prevent hanger from becoming detached from messenger.

(j) Hangers for "inclined catenary" shall have the assembly of supporting element and contact wire clamp such as to provide the desired angle between a vertical line through contact wire and the axis of supporting element.

(k) The length of a catenary hanger shall be the distance from the center line of messenger to the lower edge of contact wire clamp. (In ordering hangers, the diameter of messenger must be specified.)

351. *Hanger, cross-span messenger.*—(a) Cross-span messenger hanger shall be of malleable iron or bronze.

(b) Messenger hanger shall be of such design as to provide for attaching messenger to cross span or steady span. It may be either of two types—one for attachment to simple cross span, and the other for attachment to steady span with provision for suspension from cross span located above steady span.

(c) Messenger hanger shall prevent lateral movement of messenger.

354. *Links, spacer.* (See fig. 487.)—(a) Spacer link assembly shall hold two paralleling contact wires at a desired distance between centers.

(b) Spacer links may be either nonadjustable (fixed center between contact wires) or adjustable. Link shall consist of two or more clamps connected by a bar.

(c) Contact wire clamps shall be of malleable iron or bronze.

(d) Contact wire clamp shall be of such design as to avoid interference with satisfactory operation of current collector and shall conform to shape of contact wire, so as to form a good gripping surface and prevent clamp from slipping along contact wire. In the case of the adjustable link, it shall have suitable provision for securely locking to link bar.

(e) Link bar for nonadjustable link shall be of formed steel, bronze, copper, or other suitable material, either solid or tubing. Link bar for adjustable link shall be a straight pipe of suitable length.

355. *Messenger.*—Messenger shall be of a material suitable for the condition to be met as regards conductivity, mechanical strength, and liability of corrosion. In all cases the desired breaking strength and yield point shall be given in addition to the other physical characteristics necessary. Stranding shall be in accordance with commercial standards.

356. *Pin, messenger insulator.* (See fig. 488.)—(a) Messenger insulator pin shall be of standard wrought iron, mild steel, or malleable iron, as specified.

(b) Pin shall be so designed that it can be either slipped over bracket arm and securely locked or clamped in place.

(c) Pin shall be furnished with $1\frac{1}{8}$ -inches standard pin threads or be of such design that messenger insulator may be cemented on.

(d) Pins provided with pin threads shall be so designed that when insulator is tightened pin may be rotated to bring wire groove in insulator in alignment with messenger, and then locked to prevent further rotation.

(e) Pin shall withstand, without fracture or serious deflection, a bending moment of not less than 5,000 inch-pounds.

357. *Pull over, flexible.* (See fig. 489.)—(a) Flexible pull over shall be of iron, steel, or bronze of such size and design as to withstand without permanent distortion a direct pull of 150 pounds.

(b) Pull over shall be of such design that when properly installed it will pull the contact wire into alignment without decreasing the vertical movement or flexibility of the overhead system.

(c) Pull over shall be designed to give a vertical clearance of at least 6 inches at a distance of 30 inches from contact wire.

(d) Pull over shall have provision for a suitable clamping arrangement for attachment to contact wire and shall also have provision for attachment of pull-off wire.

358. *Steady, cross span.*—(a) Cross-span steady shall be of steel, malleable iron, or bronze.

(b) Steady shall be so designed that when attached to cross-span wire, it will restrain lateral movement of contact wire.

(c) Steady shall have provision for rigid attachment to cross-span wire and for suitable attachment to contact wire, ear, or clamp.

(d) Steady shall have sufficient clearance for current collector.

359. *Steady, pole bracket.* (See fig. 490).—(a) Pole bracket steady assembly shall be so designed that when attached to pole bracket it will restrain lateral movement but will not retard moderate vertical or longitudinal movement of contact wire.

(b) Assembly shall provide sufficient clearance for current collector.

(c) Bracket arm clamp shall be of steel, malleable iron, or bronze.

(d) Bracket arm clamp shall clamp securely to bracket arm at desired location.

(e) Insulation shall be provided between contact wire and bracket arm suitable for trolley voltage used.

(f) Rod shall be of steel or bronze not less than five-eighths inch in diameter if solid.

(g) Assembly shall have sufficient strength to prevent distortion by wind load on, or by side sway of contact wire.

IV. WORKMANSHIP AND FINISH

401. *General.*—The general workmanship shall be appropriate to the service for which the article is designed.

402. *Finish.* (a) Surfaces not in contact shall have such finish as results from good commercial practice in manufacture.

(b) Surfaces to be given a protective coating shall be of such character as properly to receive and retain the protective coat.

(c) Surfaces in fixed contact shall be so finished as to give good true bearing.

(d) Surfaces in moving contact shall be finished by machining or other process to make them suitable for the particular service.

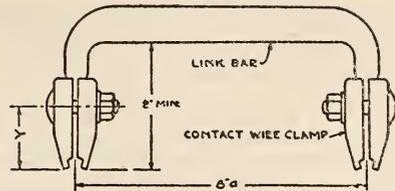

V. PACKING AND SHIPPING

501. *Packing.*—All material shall be so packed for shipment that it will be suitably protected from injury. Larger material should be bundled, baled, barreled, or crated. Smaller material should be packed in layers in cartons or boxes so that check of quantity is easily made.

502. *Marking.*—Each package shall be plainly marked, giving the description and quantity of material and the purchaser's order number.

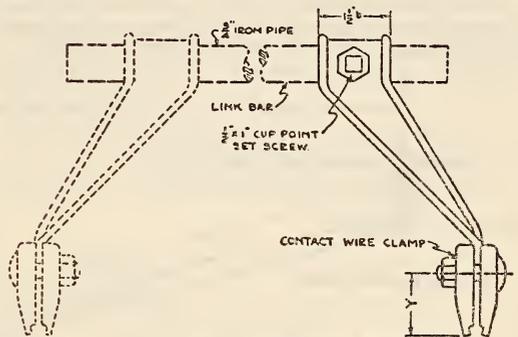

VI. INSPECTION AND REJECTION

601. *Facilities for inspection.*—Inspection shall, unless otherwise agreed, be made at the point of

NON-ADJUSTABLE SPACER LINK

DIMENSION	WHEEL	PANTOGRAPH
Y	1 3/8	1"

ADJUSTABLE SPACER LINK

FIGURE 488.—Spacer link

	Allowable variations	
	Over	Under
a	Inch 1/4	Inch 1/4
b	1/4	0

manufacture. The accredited representative of the purchaser shall be afforded every reasonable facility to satisfy himself that the material and workmanship conforms to this specification.

602. *Waiving inspection.*—If inspection of material at the point of manufacture is waived or is impractical, the manufacturer shall, at the demand of the purchaser, furnish certified copies of the manufacturer's inspection report for the approval of the purchaser prior to shipment of material.

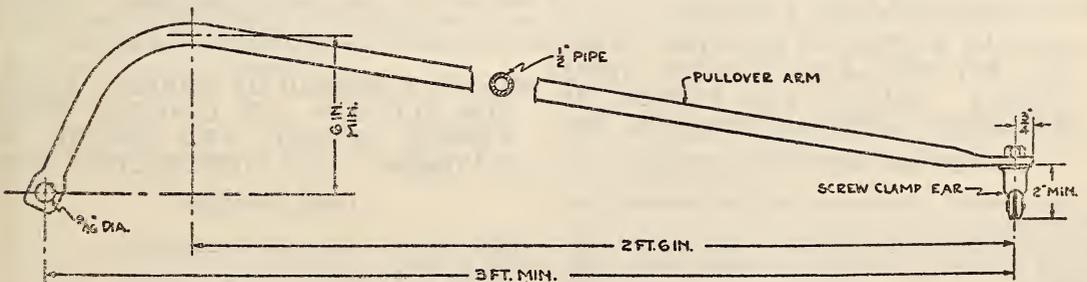

FIGURE 489.—Flexible pullover

603. *Method of inspection.*—Representative samples for inspection shall be selected at random, totaling not more than 10 per cent of shipments up to 500 pieces and not more than 5 per cent of larger quantities. In case of the failure of more than 20 per cent of the samples so selected to pass inspection, the manufacturer shall provide for the inspection of an additional number of samples equal to those in the first lot.

604. *Testing to destruction.*—The testing of material to destruction is liable to entail considerable expense and possible delay to shipments, and such tests shall be required only when specifically agreed by the purchaser and manufacturer.

605. *Rejection.*—All samples which fail to conform to the requirements of this specification shall be rejected, and the failure of 20 or more per cent of the samples in each of the two sample lots taken as above shall be cause for the rejection of the entire lot.

606. *Failure in service.*—Any material which fails in service due to inherent defects in either material or workmanship shall be replaced by the manufacturer free of charge, including transportation charges.

2. Anchors may be of either the ordinary or stockless type. The weight of the stock of an ordinary anchor is to be equal to one-fourth that of the anchor. The weight of the head of a stockless anchor is not to be less than three-fifths of the total weight of the anchor.

3. All anchors are to be tested under the inspection of a surveyor of the bureau, in a machine recognized for such purposes by the committee of the American Bureau of Shipping.

4. Prior to testing, the actual weight of the anchor is to be ascertained. The proof tests provide for anchors weighing from 56 pounds to 18,088 pounds in 28-pound gradations. The proof tests range from 6,400 pounds for the 56-pound anchor to 195,160 pounds for the 18,088-pound anchor. Anchors of the ordinary type are weighed without the stock.

5. After testing, all anchors shall be carefully examined—disassembled where necessary for this purpose—and if any evidence is found of flaw or material weakness the anchors shall be rejected. Any anchor which after being tested is found to have more than three-

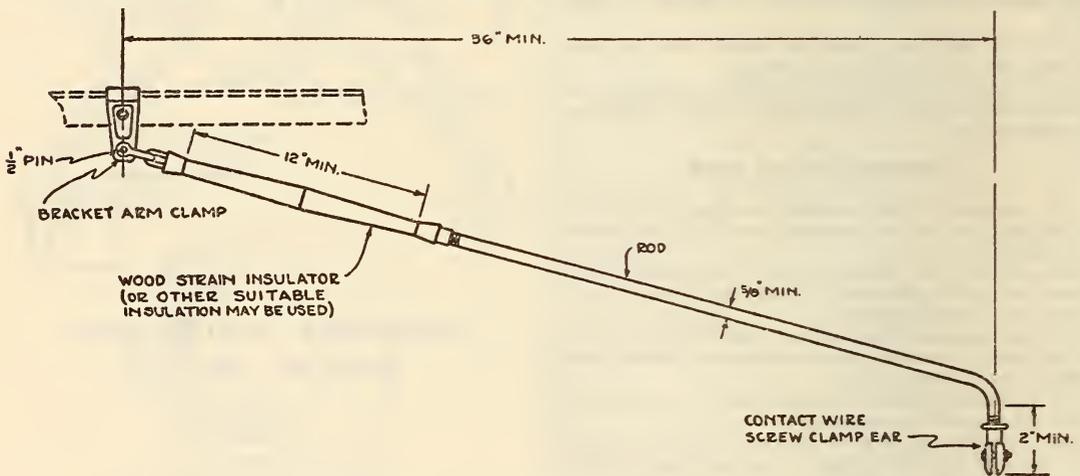

FIGURE 490.—Pole bracket steady assembly

(Appendixes to this specification cover studies of alloy and composite messenger cables, of pin and suspension type insulators, and data on catenary systems for railway electrification with copper, alloy, and composite messengers.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

BUILDERS' HARDWARE (NONTEMPLATE)

(See 617.0, p. 977.)

611.3 WROUGHT-IRON FORGINGS.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; QUALITY AND TESTING OF MATERIALS—SHIP CONSTRUCTION, 1930

FORGED WROUGHT-IRON ANCHORS

(For general information and requirements see 600.0, p. 2.)

1. Anchors are to be made of forged wrought iron, forged open-hearth ingot steel, or cast steel. The shackles may be of wrought iron or of forged steel, unwelded.

fourths inch permanent set shall be rejected. When an anchor which has already been in use is submitted for testing or retesting the certificate issued in regard to same will be marked in red: "This anchor is not new but has been previously used."

6. When anchors have satisfactorily passed the above requirements they are to be clearly stamped by the manufacturer. The stampings include identifying number, initials of surveyor, date of test, proof test, weight, and the bureau's mark of approval, A. B.

7. One side of the anchor should be reserved solely for these marks, and the other side be solely used for the maker's name or other trade-marks that may be desired. If the design of the anchor does not admit of the above marks being placed or grouped as indicated, a suitable boss should be cast on each arm, on which the marks should be stamped.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; QUALITY AND TESTING OF MATERIALS—SHIP CONSTRUCTION, 1930

IRON FORGINGS

(For general information and requirements see 600.0, p. 2.)

1. The test specimens are to be taken from the body of the forging. The material is to have a

tensile strength of 49,000 pounds per square inch, with an elongation of 20 per cent on a gage length corresponding to three and one-half times the diameter of the test specimen. Specimens 1 inch square are to stand being bent cold to 90° over a radius of 1½ inches without fracture.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

IRON FORGINGS

(For general information and requirements see 600.0, p. 1. For test requirements see 600.1, p. 7.)

1. The number of tests is the same as that prescribed for steel forgings. (See 611.51, p. 750, par. 3.) The physical characteristics of the material as shown by standard test pieces must meet with the following requirements:

Tensile strength.....	44,000-54,000 pounds per square inch
Yield point.....	50 per cent of tensile strength.
Minimum elongation.....	$\frac{1,100,000}{\text{Tensile strength}}$; 25 to 20 per cent.
Bend without fracture.....	120°; radius of bend 1½ inches.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR WROUGHT-IRON ROLLED OR FORGED BLOOMS AND FORGINGS FOR LOCOMOTIVES AND CARS, DESIGNATION A73-30, 1930

WROUGHT-IRON FORGINGS

SCOPE

1. These specifications cover two classes of wrought-iron blooms and forgings for locomotives and cars, as determined by the kind of material used in their manufacture: namely, class A, as defined in section 2 (a); class B, as defined in section 2 (b).

MANUFACTURE

2. (a) *Class A.*—Blooms and forgings of class A shall be made wholly from puddled pig iron. The puddle mixture and the component parts of the piles from which the blooms and forgings are made shall be free from any admixture of iron scrap or steel. The term "iron scrap" applies only to foreign or bought scrap, and does not include the manufacturer's own scrap from the same product and of equal quality.

(b) *Class B.*—Blooms and forgings of class B shall be made from selected No. 1 wrought-iron scrap, or a mixture of such scrap and the puddled iron described in paragraph (a).

3. Cross piling will not be permitted in either class of forging. In the final pile for the bloom or forging, all bars and slabs shall be of the full length of the pile.

CHEMICAL PROPERTIES AND TESTS

4. The iron shall conform to the following requirement as to chemical composition:

	Class A	Class B
Manganese, maximum.....	Per cent 0.07	Per cent 0.15

5. (a) An analysis may be made by the purchaser from each specimen used for the tension test. The

chemical composition thus determined shall conform to the requirement specified in section 4.

(b) Drillings or chips for analysis shall be so taken as to represent the full cross section of the specimen.

PHYSICAL PROPERTIES AND TESTS

6. (a) The iron shall conform to the following minimum requirements as to tensile properties:

	Blooms	Forgings, classes A and B
Tensile strength.....Lbs./in. ²	45,000	45,000
Yield point.....do.....	0.5 tensile strength.	0.5 tensile strength.
Elongation in 4 inches.....per cent.....	22	24
Reduction of area.....do.....	30	33

(b) The fracture shall be free from crystallization.

(c) The yield point shall be determined by the drop of the beam of the testing machine. The speed of the crosshead of the machine shall not exceed three-eighths inch per minute.

7. The entire cross section of the prolongation of the bloom or forging shall be ground or polished, and shall show no seams or flaws of injurious character. It shall then be etched⁸⁵ and, in class A blooms or

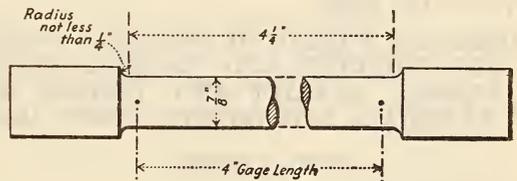

FIGURE 491

NOTE.—The gage length, parallel portions, and fillets shall be as shown, but the ends may be of any form which will fit the holders of the testing machine.

forgings, shall show freedom from steel.

8. (a) Tension-test specimens shall be taken from a full-size prolongation of the bloom or forging. The axis of the specimen shall be located at any point midway between the center and surface of the bloom or forging, and shall be parallel to the axis of the bloom or forging.

(b) The specimens shall conform to the dimensions shown in Figure 491. The ends shall be of a form to fit the holders of the testing machine in such a way that the load shall be axial.

9. Unless otherwise specified, one test shall be made from each lot of 10 blooms or less and from each lot of 4,000 pounds or less of forgings. These tests shall be made on prolongations the full size of the blooms or the largest section of the forging and, for test purposes, prolongations shall be furnished on at least 20 per cent of the blooms or forgings. In the case of small forgings, one forging may be used for test purposes, in which case one test will represent not more than 100 forgings.

MARKING

12. Identification marks shall be legibly stamped on each bloom or forging and on each test specimen. The purchaser shall indicate the location of such identification marks.

⁸⁵ A solution of 10 per cent hydrochloric acid (specific gravity 1.19), 30 per cent sulphuric acid (specific gravity 1.84), and 60 per cent water; or 25 per cent nitric acid (specific gravity 1.42), and 75 per cent water, is recommended for the etch test.

(Requirements covering workmanship and finish conform with those in A. S. T. M. A18-30. (See 611.51, p. 754.) Requirements covering inspection and rejection and reheating conform with those in A. S. T. M. standard specifications for steel, paragraphs 7, 8, and 9. (See 605.0, p. 247.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR LADLES, PLUMBERS' GGG-L-51 MARCH 1, 1932

PLUMBERS' LADLES

(See 615.9, p. 940.)

611.4 STEEL CASTINGS.

611.40 GENERAL ITEMS.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, STANDARD DROP-TEST MACHINE FOR A. R. A. COUPLERS AND AXLES, 1911

DROP-TEST MACHINE

(See 611.50, p. 750.)

611.41 CAST STEEL.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; QUALITY AND TESTING OF MATERIALS, SHIP CONSTRUCTION, 1930

STEEL CASTINGS

(For general information and requirements, see 600.0, p. 2.)

1. Where steel castings are to be used instead of forgings, every care is to be taken to avoid abrupt changes in sectional area. Each casting must be thoroughly annealed and subjected to percussive and hammering tests, as well as to tests for tensile strength and ductility. The castings are to be made by the open-hearth process, and are to be accurately molded and free from defects. The material is to have a tensile strength of not less than 58,000 pounds, and not exceeding 78,400 pounds per square inch, with a corresponding elongation varying from 20 per cent with 58,000 pounds to 15 per cent with 78,400 pounds, measured on the standard test specimens of the American Bureau of Shipping. (See fig. 5, 600.1, p. 8.)

2. The specimens for testing must have formed part of the actual casting submitted for approval, subjected to similar and simultaneous annealing, and are not to be detached from the casting until after the annealing is completed nor until they have been stamped by the surveyor. The piece for ductility test should not be less than 1 inch by three-fourths inch with edges rounded to a radius of one-sixteenth inch, and must stand being bent cold through an angle of 120° over a radius of 1 inch without any appearance of fracture.

3. Castings of stern frames, posts, single-plate rudder frames, brackets, and quadrants are to be raised to a height of 6 to 10 feet, according to the character and form of the castings, and dropped bodily on to a hard surface, holes being prepared to receive bosses or similar projections. When large stern frames are cast in one piece, they may be dropped through an angle of 45° instead of being lifted bodily. Castings of a complex design may, at the discretion of the surveyor, be exempted from

the drop test; and where the material is thin the limits of elongation may be reduced by 5 per cent. All castings are to be slung clear of the ground, and well hammered all over with a heavy sledge hammer to test the soundness of the material. All steel castings which have satisfactorily passed the requirements are to be clearly stamped A.B. and with the identification marks furnished by the surveyor.

4. In addition to the foregoing tests, large castings are to be drilled, as required by the surveyors for the purpose of examination, at locations where porosity, cavities, and contraction cracks usually occur. Such small holes are to be subsequently filled up with screwed plugs or the equivalent.

5. In the event of any casting proving unsatisfactory or defective in the course of preparation or fitting in the ship, such casting shall be rejected irrespective of any previous certificate of satisfactory testing.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

STEEL CASTINGS

(For general information and requirements, see 600.0, p. 1. For test requirements, see 600.1, p. 7.)

1. Steel castings subject to test and inspection must be made by the open hearth or by such other process as may be approved by the committee. All castings shall be thoroughly cleaned and must be annealed in an annealing furnace of ample proportions to bring the whole casting to a uniform annealing temperature. They must not be removed from the annealing furnace until the temperature has dropped to about 700° F. Local heating or cooling, also bending and straightening, of annealed castings is only permitted with the approval of the surveyor. Where the use of steel castings has been approved where ordinarily forgings are required, the castings must be submitted for the surveyor's inspection in the green. In the case of failure of the physical tests, castings may be reannealed and retested. The material shall comply with the following requirements:

Grade	Limits of tensile strength	Yield point	Minimum elongation	Bend without fracture	Stamp
1.....	58,000-68,000	45 per cent of tensile strength.	Per cent 23-20	120° to 1 inch radius.	A.B. 1
2.....	68,000-78,000do.....	20-17do.....	A.B. 2

Grade 1 required for castings to take the place of engine forgings and for propellers.

2. At least one tension and one bend test shall be made from each heat, and the test specimens must have formed part of the actual castings submitted for approval. Where a number of small castings are made from one heat and have been simultaneously annealed, test coupons should be cast on a sufficient number of the castings for the selection of the surveyor, and two tests shall be made from each heat. All castings are to be slung clear of the ground and hammered all over with a heavy sledge hammer to test the soundness of the material. Casting showing defects during this test shall be rejected, irrespective of satisfactory tension and bending tests.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, SPECIFICATIONS FOR STEEL CASTINGS, S-11, BOILER CONSTRUCTION CODE, SECTION II, 1930

STEEL CASTINGS

(Class A castings based on class A castings of A. S. T. M. specification A27-24, given below.)

(Class B castings based on grade A annealed requirements of A. S. T. M. specification A87-27, given below.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, SPECIFICATIONS FOR CARBON-STEEL CASTINGS FOR VALVES, FLANGES, AND FITTINGS FOR HIGH-TEMPERATURE SERVICE, BOILER CONSTRUCTION CODE, 1930

CARBON-STEEL CASTINGS

(This specification conforms with A. S. T. M., A95-29, given below.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR STEEL CASTINGS, DESIGNATION A27-24, 1924

STEEL CASTINGS

SCOPE

These specifications cover steel castings for general service and for ships. Two classes of castings are covered, namely, class A, castings for which no physical requirements are specified; class B, castings for which physical requirements are specified. These are of three grades; hard, medium, and soft.

MANUFACTURE

The steel shall be made by one or more of the following processes: Open-hearth, electric-furnace, converter, or crucible. Class A castings need not receive any heat treatment unless so specified, or unless the carbon content exceeds 0.30 per cent. Class A castings, in which the carbon content is over 0.30 per cent, and all class B castings, shall receive a heat treatment proper to the design and chemical composition of the castings.

(Details covering heat treatment, annealing, and normalizing are identical with those in A. S. T. M., A95-29, given below.)

CHEMICAL PROPERTIES AND TESTS

The steel shall conform to the following requirements as to chemical composition:

	Class A	Class B
	<i>Per cent</i>	<i>Per cent</i>
Carbon, not over.....	0.45	0.60
Acid, not over.....	.07	.06
Phosphorus:		
Basic, not over.....	.06	.05
Sulphur.....06

(Details covering ladle analyses and check analyses of class A castings are identical with those in A. S. T. M., A95-29, given below.)

Analyses of class B castings may be made by the purchaser from a broken tension-test specimen. The phosphorus and sulphur content thus determined shall not exceed that specified above by more than 20 per cent.

PHYSICAL PROPERTIES AND TESTS

(For Class B Castings Only)

The castings shall conform to the following minimum requirements as to tensile properties:

	Hard	Medium	Soft
Tensile strength...lbs/in. ² ..	80,000	70,000	60,000
Yield point.....do.....	0.45 tensile strength.	0.45 tensile strength.	0.45 tensile strength.
Elongation in 2 inches.....per cent..	17	20	24
Reduction of area.....do.....	25	30	35

The yield point shall be determined by the drop of the beam of the testing machine.

Bend tests.—Bend tests shall not be required for castings of the hard grade, and shall be required for castings of the medium and soft grades only when so specified in the order.

When a bend test is specified, the test specimen shall stand being bent cold without cracking on the outside of the bent portion, around a pin 1 inch in diameter through the following angles:

	Hard	Medium	Soft
Angle of bend.....	No bend test.....	° 90	° 120

Alternative tests to destruction.—The tensile properties of the castings shall be determined from test bars, unless in the case of castings weighing not over 150 pounds the manufacturer desires to offer, as an alternative, tests to destruction. Upon agreement with the inspector, the castings shall be grouped in lots, each lot containing castings from the same melt and from the same heat-treatment charge, and the inspector shall select from each lot one casting to represent the lot. The representative casting shall be tested to destruction as a substitute for the tension test. This test shall show the material to be ductile and free from injurious defects.

(Details covering test specimens, number of tests, retests, workmanship and finish, inspection, rejection, and reheating—all are identical with those in A. S. T. M., A95-29, given below. Tension-test specimens shall conform to the dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

SPECIAL REQUIREMENTS FOR CASTINGS FOR SHIPS

In addition to the preceding requirements, castings for ships, when so specified, shall conform to the following requirements:

All castings shall be of class B, medium or soft grade, and shall receive a proper heat treatment.

One tension and one bend test shall be made from each of the following castings: Stern frames, stern posts, twin-screw spectacle frames, propeller-shaft brackets, rudders, steering quadrants, tillers, stems, anchors, and other castings when specified.

When a casting is made from more than one melt, four tension and four bend tests shall be made from each casting.

A percussion test shall be made on each of the following castings: Stern frames, stern posts, twin-screw spectacle frames, propeller-shaft brackets, rudders, steering quadrants, tillers, stems, anchors, and other castings when specified.

For this test the casting shall be suspended by chains and hammered all over with a hammer of a weight approved by the purchaser or his representative. If cracks, flaws, defects, or weakness appear after such test, the casting may be rejected.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARBON-STEEL CASTINGS FOR RAILROADS, DESIGNATION A87-27, 1927

CARBON-STEEL CASTINGS FOR RAILROADS

SCOPE

1. (a) These specifications cover all carbon-steel castings for locomotive and car equipment, and for miscellaneous use, classified as grade A and grade B.

(b) The purposes for which the two grades are generally used are:

Grade A, unannealed, covers only such special castings as may be approved by the purchaser.

Grade A, annealed, covers such castings not covered by grade A, unannealed.

Grade B covers all castings for high stresses such as truck side frames, bolsters, couplers and coupler parts, locomotive frames, and locomotive driving and trailer wheel centers.

2. Grade A castings shall be furnished annealed unless otherwise specified by the purchaser.

Grade B castings shall be furnished annealed.

MANUFACTURE

3. The steel may be made by one or more of the following processes: Open-hearth, electric-furnace, crucible, or converter.

4. (a) The castings shall be allowed to become cool. They shall then be uniformly heated to the proper temperature to refine the grain, and allowed to cool uniformly.

(b) For the purpose of determining the quality of annealing of all castings weighing 150 pounds or over, and of such lighter castings as shall be required by the purchaser or his representative, there shall be provided for removal by the inspector after annealing and also after reannealing, if necessary, at least one and not more than two annealing lugs. The location of the annealing lugs shall be such that when removed by the inspector they shall be indicative of the character of annealing. The standard annealing lug shall be 1 inch in height and 1 inch in width and five-eighths inch in thickness where it joins the casting.

(c) If, in the opinion of the inspector, a casting is not properly annealed, he may at his option require the casting to be reannealed.

CHEMICAL PROPERTIES AND TESTS

5. The steel shall conform to the following requirements as to chemical composition:

	Grade A	Grade B
	<i>Per cent</i>	<i>Per cent</i>
Manganese, not over.....	0.85	0.85
Phosphorus, not over.....	.05	.05
Sulphur, not over.....	.05	.05

(Ladle analyses and check analyses are the same as in A. S. T. M., A95-29, given below.)

PHYSICAL PROPERTIES AND TESTS

8. (a) The steel shall conform to the following minimum requirements as to tensile properties:

	Grade A		Grade B, annealed
	Un-annealed	Annealed	
Yield point.....lbs./in. ²	29, 250	29, 250	36, 000
Elongation in 2 inches...per cent..	1, 450, 000	1, 600, 000	1, 600, 000
	Tensile strength	Tensile strength	Tensile strength
But in no case less than.....	22	24	22
Reduction of area.....per cent..	2, 250, 000	2, 600, 000	2, 500, 000
	Tensile strength	Tensile strength	Tensile strength
But in no case less than.....	30	35	30

(b) The tensile strength shall be reported as information.

(The yield point determination is the same as in A. S. T. M., A95-29, given below.)

9. (a) A sufficient number of test coupons from which the required test specimen may be prepared shall be cast, attached in the neighborhood of each end of each locomotive frame, attached to each locomotive cylinder, to each wheel center, and to miscellaneous castings weighing over 150 pounds. These test coupons shall remain attached to the castings throughout the annealing and until the castings are presented for inspection. If the design of the casting is such that the test coupons can not be attached, they shall be cast in runners outside of the casting, but attached to it, to represent each melt. The location of the test coupons, as well as the method of casting such coupons, shall be subject to mutual agreement between the inspector and the manufacturer. In the case of any orders for castings weighing under 150 pounds, the physical properties as required in section 8, may be determined from an extra or spare test bar cast with and attached to some other casting from the same melt.

(b) When sufficient coupons have not been cast, a test specimen may be cut from a finished casting at a location mutually agreed upon by the inspector and the manufacturer.

(c) Tension-test specimens shall conform to dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel in 605.0, p. 247. The ends shall be not less than seven-eighths inch in diameter and of a length and form to fit the holders of the testing machine in such a way that the load shall be axial.

10. (a) One tension test shall be made from the neighborhood of each end of each locomotive frame and both tests shall meet the requirements of the specifications. One tension test may be made from each wheel center and each locomotive cylinder casting, but of such castings at least one of each kind in each melt shall be tested. For miscellaneous castings from melts which do not include frames, wheel centers, or cylinders, one tension test shall be made from each melt, except as provided in section 11 (a).

(b) If the test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any tension-test specimen is less than that specified in section 8 and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

(d) No part of these specifications shall operate to cause any one tension test to apply to more than 40 tons of castings as offered for inspection.

11. (a) After 15 consecutive melts, which may contain any or all classes of castings (except frames, wheel centers, and cylinders) covered by these specifications, on one or more orders, have been tested and accepted in accordance with the above requirements, the manufacturer may group the succeeding melts in lots of five melts each, but each lot not to exceed 40 tons, the entire group to be accepted if the test specimen selected from the lot fulfills the chemical and physical requirements herein specified. If this test fails, a rehearing will be granted on the melt that the failed bar represents, and the other four melts of the group shall be tested individually.

(b) If there is a period of more than six months between shipments of the class of castings covered by these specifications, then each melt shall be tested individually until 15 consecutive melts have been accepted, after which the melts may again be grouped as in paragraph (a).

(c) If one or more melts are rejected, each succeeding melt shall be tested individually until 15 consecutive melts have been accepted, after which melts may again be grouped as in paragraph (a).

12. In case of small orders for bolsters, truck sides, draft arms, yokes, or castings weighing over 150 pounds where the size of the order and the available pattern and foundry equipment are such that not more than five castings can be cast in any one melt, the physical properties, as required in section 8, will be determined from an extra or spare test coupon cast with and attached to some other casting of the same melt.

13. If the results of the physical test lot do not conform to the requirements specified, the manufacturer may reanneal such lot not more than twice and retest shall be as specified in section 8.

14. In the case of orders including only castings not exceeding 150 pounds in weight, a test to destruction of one casting from each 100 castings or smaller lot may be substituted for the tension tests, at the option of the inspector. This test shall show the material to be ductile, free from injurious defects, and suitable for the purpose intended.

WORKMANSHIP AND FINISH

(Substantially the same as in A. S. T. M., A95-29, given below.)

MARKING

17. The manufacturer's name or identification mark and the specified pattern number shall be cast on all castings. In addition, the month and year when made shall be cast on all bolsters, truck sides, frames, wheel centers, cylinders, and similar castings. The location and size of numbers shall be agreed upon by the manufacturer and the inspector. In accordance with the standard practice of the individual foundry to identify individual castings, a serial number may be cast or the melt number may be stamped on bolsters, truck sides, frames, wheel centers, cylinders, and similar castings as agreed upon by the manufacturer and the inspector. The melt number shall be legibly stamped on all other castings weighing over 150 pounds.

INSPECTION AND REJECTION

(Inspection, rejection, and rehearing conform with A. S. T. M. standard specifications for steel. (See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARBON-STEEL CASTINGS FOR VALVES, FLANGES, AND FITTINGS FOR HIGH-TEMPERATURE SERVICE, DESIGNATION A95-29, 1929

CASTINGS FOR HIGH TEMPERATURES

SCOPE

1. These specifications cover carbon-steel castings for valves, flanges, and fittings for high-temperature service. (See explanatory note.)

MANUFACTURE

2. The steel shall be made by the electric-furnace, open-hearth or other process approved by the purchaser.

3. (a) All castings shall receive a heat treatment proper to the design and chemical composition of the castings.

(b) Heat treatment, unless otherwise specified by the purchaser, may consist of annealing, or of normalizing, or of normalizing followed by annealing, or of normalizing followed by a draw-back to a temperature below the critical range. No castings which have been quenched in any liquid medium shall be offered under these specifications.

(c) *Annealing*.—The procedure for annealing shall consist in allowing the castings to cool, after pouring, to a temperature below the critical range. They shall then be uniformly reheated to the proper temperature to refine the grain and allowed to cool uniformly in the furnace.

(d) *Normalizing*.—The procedure for normalizing shall consist in allowing the castings to cool, after pouring, to a temperature below the critical range. They shall then be reheated to the proper temperature to refine the grain and allowed to cool in still air.

CHEMICAL PROPERTIES AND TESTS

4. The steel shall conform to the following requirements as to chemical composition:

	Per cent
Carbon.....	0.15 to 0.45
Manganese, not under.....	.50
Silicon, not under.....	.20
Phosphorus, not over.....	.05
Sulphur, not over.....	.06

5. An analysis of each melt of steel shall be made by the manufacturer to determine the percentages of the elements specified in section 4. This analysis shall be made from drillings taken at least one-fourth inch beneath the surface of a test ingot obtained during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative and shall conform to the requirements specified in section 4.

6. Analyses may be made by the purchaser from the broken tension-test specimen or from a casting representing each melt. The chemical composition thus determined shall conform to the requirements specified in section 4. Samples for analysis shall be taken not less than one-fourth inch beneath the surface, except in the case of castings which are too thin, and shall be taken in such a manner as not to impair the usefulness of the casting.

PHYSICAL PROPERTIES AND TESTS

7. (a) The castings shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	70,000
Yield point.....	do.....	36,000
Elongation in 2 inches.....	per cent..	22
Reduction of area.....	do.....	30

(b) The yield point shall be determined by the drop of the beam of the testing machine at a cross-head speed not to exceed one-eighth inch per minute. The tensile strength shall be determined at a speed not to exceed 1½ inches per minute.

8. (a) Bend tests shall be required for castings only when so specified in the order.

(b) When a bend test is specified, the test specimens shall stand being bent cold through an angle of 90° around a pin 1 inch in diameter, without cracking on the outside of the bent portion.

9. Each casting shall be tested after machining to the hydrostatic pressures specified in the table below (note 1), and shall show no leaks. Castings ordered under these specifications, for working pressures other than those listed below, shall be tested to such pressures as may be agreed upon.

Class of castings, working steam pressure	Standard test pressure
Lbs./in. ²	Lbs./in. ²
250	750
400	1,000
600	1,500
900	2,000
1,350	3,000

10. (a) Tension-test specimens and, when a bend test is specified, bend-test specimens shall be taken from test bars cast attached to the castings where practicable. If the design of the castings is such that test bars should not be attached to the castings, the test bars shall be cast attached to special blocks, a sufficient number of which shall be provided for each lot of castings. Test bars from which tension and bend test specimens are to be taken shall remain attached to the castings or blocks they represent through heat treatment and until presented for inspection. Test bars shall be provided in sufficient numbers to furnish the tests required in section 11.

(b) If satisfactory to the manufacturer and inspector, tension-test specimens may be cut from heat-treated castings instead of from test bars.

(c) Tension-test specimens shall conform to the dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel. (See 605.0, p. 247.) The ends shall be of a form to fit the holders of the testing machine in such a way that the load shall be axial.

(d) Bend-test specimens shall be machined to 1 by one-half inch in section with the corners rounded to a radius of not over one-sixteenth inch.

11. (a) One tension test and, when specified, one bend test shall be made from each melt in each heat-treatment charge and, when specified, from each casting weighing 500 pounds or over.

(b) If any test specimen shows defective machining or develops flaws, it may be discarded, in which case another specimen from the same lot shall be substituted.

(c) If the percentage of elongation of any tension-test specimen is less than that specified in section 7 (a) and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

12. If the results of the physical tests for any lot do not conform to the requirements specified, such lot may be retreated, but not more than twice. Retests shall be made as specified in sections 7 and 8.

WORKMANSHIP AND FINISH

13. The castings shall conform substantially to the shapes and sizes indicated by the patterns and drawings submitted by the purchaser.

14. (a) The castings shall be clean and free from injurious defects.

(b) The castings shall not be peened to stop leaks.

(c) Defects which do not impair the strength of the castings may be welded by an approved process. The defects shall be cleaned out to solid metal, before welding, and when so required by the inspector, shall be submitted to him in this condition for his approval. All castings shall be heat treated after welding in accordance with the requirements in section 3, except that, with permission of the inspector, castings with minor welds need not be re-heat-treated.

INSPECTION AND REJECTION

(Requirements covering inspection and rejection conform with those specified in A. S. T. M. standard specifications for steel (see 605.0, p. 247) with the following exceptions:)

1. If, in the case of important castings for special purposes, surface inspection in the green state is required, this shall be so specified in the order.

2. Unless otherwise specified, any rejection based on tests made in accordance with section 6 shall be reported within 12 working days from the receipt of samples.

EXPLANATORY NOTE

This contemplates temperatures up to 750° F. (400° C.); or, at the discretion of the designing engineer, higher temperatures with appropriate pressures may be used. Reference may be made to the dimensional standards for pressures and temperatures formulated by the sectional committee on standardization of pipe flanges and fittings under the procedure of the American Standards Association, A. S. A. project No. B16, and, more specifically, to the American steel pipe flanges and flanged fittings standard B16-1927. (See 607.4, p. 465.)

**SOCIETY OF AUTOMOTIVE ENGINEERS,
IRON AND STEEL SPECIFICATIONS,
S. A. E. STANDARD, 1928**

STEEL CASTINGS

(For prefatory remarks, see 600.0, p. 2. This specification is substantially the same as that for class B castings in A. S. T. M., A 27-24, given above.)

Chemical composition

S. A. E. steel No.—	Carbon	Phosphorus, maximum	Sulphur, maximum
1235.....	As required by physical properties.	Per cent 0.05	Per cent 0.055

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR STEEL CASTINGS, QQ-S-681, MAY 3, 1932

STEEL CASTINGS

GRADES

1. Steel castings shall be furnished in five grades—special, hard, medium, soft, and common.

MATERIAL AND WORKMANSHIP

2. Unless otherwise required in detailed specifications, contract, or purchase order, steel castings may be made by one or more of the following processes: Electric, open hearth, converter, and crucible.

GENERAL REQUIREMENTS

3. (a) The responsibility for furnishing castings that can be laid out and machined to the finished dimensions within the tolerances given, without further straightening after final heat treatment, shall rest with the contractor. Castings of excessive size or weight shall not be furnished.

(b) Castings shall be well cleaned, with heads and gates removed, for inspection in the green. They shall be sound and free from injurious defects. When heads and gates are removed by burning, this burning shall be done at least one-half inch from the body of the casting, the remaining metal to be removed by grinding, cutting, or machining.

(c) Castings shall not be repaired, plugged, or welded without permission from the inspector. Such permission will be given only for welding to be completed prior to final heat treatment and when the defects, after being thoroughly cleaned out to sound metal, are judged not to affect the strength, use, or machinability of the castings. Distinctive marks

shall be placed around welds prior to shipment of the casting. No welding will be permitted on steam piping or any casting subjected to steam pressure. Shrinkage cracks shall not be welded without specific authority of the purchaser.

(d) Castings shall be annealed in a properly constructed pit or furnace, and they shall be held at the treatment temperature at least long enough for each casting to be uniformly heated throughout its mass. They shall not be removed from the furnace until they have been cooled down to a temperature of about 700° F. Rapid cooling of castings, or any further heat treatment other than reannealing, shall not be undertaken without specific authority from the purchaser.

(e) All castings shall be annealed so that the fracture of any part shall show to the eye a fine grain structure. If, in the opinion of the inspector, a casting has been improperly heat treated, he may require it to be retreated.

(f) Castings shall be well cleaned for final inspection by sand blasting, tumbling, pickling, or other approved process.

DETAIL REQUIREMENTS

4. (a) Castings shall conform to the chemical and physical requirements shown in Table 1.

TABLE 1

Grade	Chemical composition, maximum				
	C	Mn	P	S	Si
	Per cent	Per cent	Per cent	Per cent	Per cent
Hard.....	0.50	-----	0.05	0.06	-----
Medium.....	.45	-----	.05	.06	-----
Soft.....	.35	-----	.05	.06	-----
Common.....	.45	0.80	.07	.08	0.40

(Tensile properties for hard, medium, and soft grades are the same as given in A. S. T. M. specification A27-24. See 611.41, p. 707.)

For the special grade of castings chemical composition and physical requirements shall be as specified in detail specifications, contract, or purchase order.

For the common grade of castings physical requirements are not specified.

(The following cold bend-test requirements apply.)

Cold bend test

Grade	Angle of bend
Hard.....	No bend test.
Medium.....	90°.
Soft.....	120°.

(b) An analysis of each melt shall be furnished by the contractor, showing the percentage of the elements specified and, in addition, any alloying metal present in an amount greater than two-tenths of 1 per cent. This analysis shall be made from drillings taken at least one-quarter inch beneath the surface of the metal.

METHOD OF INSPECTION AND TESTS

5. (a) The inspector shall have free entry at all times to all parts of the contractor's works which concern the manufacture of the castings ordered. The contractor shall afford the inspector free of cost all necessary facilities to determine if all steps in the manufacture, such as melting, pouring, annealing,

etc., have been properly performed, either by exhibiting records, supplying data, or both, as requested.

(b) All castings shall be submitted and inspected in the green.

(c) The physical properties of common castings will not be determined unless the inspector has reason to doubt that the castings are of a quality suitable for the purpose for which intended.

(d) Large castings, when required by the inspector shall be suspended and hammered all over with a hammer weighing not less than $7\frac{1}{2}$ pounds. If cracks, defects, or unsoundness are indicated which may render the castings unfit for service, such castings shall be rejected.

(e) Whenever practicable, coupons from which tension and bend test specimens may be machined shall be cast on the body of a casting. Their number and location shall be such as thoroughly to exhibit the character of the metal throughout the casting, but the responsibility for furnishing sufficient test specimens shall rest with the contractor. Coupons shall not be detached from the casting until it has received its final heat treatment and until properly stamped and authorized by the inspector. The unauthorized chilling of test coupons shall cause rejection of the material represented.

(f) When cast-on coupons are not used, sufficient coupons shall be cast with and gated to castings to represent the lot, or the particular casting when necessary. When this is impracticable, the inspector may authorize: (1) Separate coupons to be cast from the same ladle as the castings they represent, and (2) additional castings to be made from which test specimens may be machined. In all cases separately cast coupons shall bear the inspector's identification stamp.

(g) At least one tension and one bend test will be required from each casting the estimated weight of which is 500 pounds or more, unless otherwise specified by the department concerned.

(h) At least two tension tests and one bend test will be taken from each lot of castings estimated to weigh less than 500 pounds, unless otherwise specified by the department concerned. A lot shall consist of: (1) Castings made from the same open-hearth, converter, or electric melt treated in the same furnace charge, and (2) castings made from the same pouring of a ladle containing a number of crucible heats, and heat treated in the same furnace charge.

(i) Tension-test specimens shall conform to the dimensions of type 1 specimen shown in Figure 1 of Federal specifications for metals No. 339a. (See 600.0, p. 3.) The ends shall be of a form to fit holders of the testing machine in such a way that the load shall be axial.

(j) Bend-test specimens shall be about 6 inches long and have a section 1 inch by one-half inch with long edges rounded to a radius of not over one-sixteenth of an inch. The specimen shall be bent cold around a pin 1 inch in diameter to the angle specified in the table above without cracking on the outside of the bent portion.

(k) When any test specimen shows defective machining or obvious lack of continuity of metal, it may be discarded and replaced by another specimen selected by the inspector. The nature of the flaw or lack of continuity of the metal, when deemed characteristic of the material under inspection, shall be taken into consideration when determining the acceptability of the material.

(l) If the percentage of elongation of a tension-test specimen is less than that specified and any part of the fracture is within one-quarter inch of the scribe marks made on the specimen before testing or outside the scribe marks, the inspector shall select another test specimen to replace it.

(m) Castings in which injurious defects are revealed subsequent to acceptance shall be rejected.

(n) Check analyses may be made by the inspector, or through him, by any Government laboratory or other designated representative and without cost to the contractor. The chemical composition thus determined shall conform to the requirements specified and be in substantial agreement with the contractor's analysis regarding the presence and amount of alloys. Drilling for analysis may be taken from broken test specimens or from a casting representing a melt. Castings shall be drilled in such a manner as not to impair their usefulness and drillings taken within one-fourth inch from the surface shall be discarded.

(o) Any casting may be subjected to macroscopic and microscopic examination.

PACKING AND MARKING

6. (a) Castings shall be marked with the pattern or mark number, and where possible with the melt or lot number, in a position on the casting where they will not be machined off.

(b) If special packing be necessary to secure the acceptance of castings for safe transportation at the lowest rate to the point of delivery, such packing shall be provided by the contractor without additional expense to the purchaser.

(c) All shipments shall be marked with the contract or order number, name of manufacturer, and contents.

ADDITIONAL INFORMATION

7. (a) Common-grade castings are intended for commercial fittings where structural strength is not involved. They ordinarily would have the following minimum values: Tensile strength, 55,000 pounds per square inch; yield point, 25,000 pounds per square inch; elongation in 2 inches, 15 per cent; reduction of area, 25 per cent.

(b) Soft-grade castings are intended for parts subject to tensile, vibratory, or shock stresses.

(c) Medium-grade castings are intended for the same general purpose as the soft grade, but where greater strength is required.

(d) Hard-grade castings are intended for all important parts subject to crushing stresses or surface wear only.

(e) Special-grade castings are intended for cases where specific properties not covered by the other grades are required.

(f) All patterns furnished by the purchaser shall be properly cared for and when being returned shall be suitably boxed or crated by the contractor to prevent damage or breakage. The patterns shall be examined by the inspector before shipment and report made if found in unsatisfactory condition.

GENERAL SPECIFICATIONS

8. General specifications for metals, Federal Specification No. 339a (current designation: QQ-M-151), in effect on date of issuance of proposals, shall form a part of this specification. (See 600.0, p. 3.)

611.42 RAILWAY BRAKE BEAMS.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, STANDARD BRAKE-BEAM GAGES, 1930

BRAKE-BEAMS GAGES

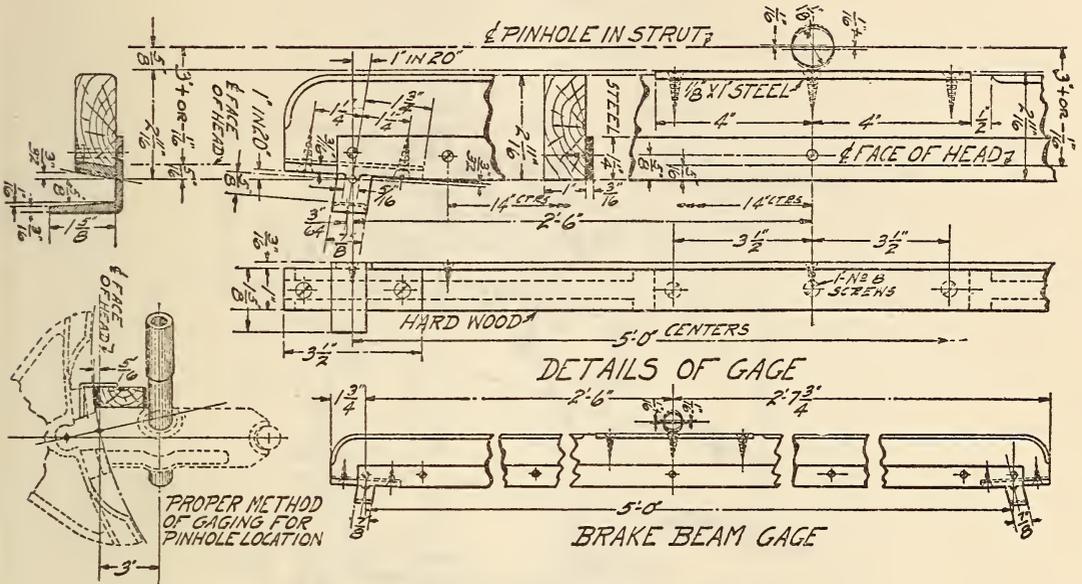

FIGURE 492.—Brake beam gage

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, STANDARD BRAKE-BEAM SPECIFICATIONS AND TESTS, 1917

BRAKE BEAMS

1. *Scope.*—This specification covers all complete brake beams for M. C. B. equipment cars.

I. MANUFACTURE

2. *Material.*—The tension member shall conform to the M. C. B. specifications for mild steel.

3. *Heads.*—The heads and struts, where struts are of malleable iron, shall conform to M. C. B. specifications for malleable iron.

II. PHYSICAL PROPERTIES AND TESTS

4. *Proof tests.*—The manufacturer shall give each beam a proof-test load equal to the deflection load, as shown in Table 1, before offering it for inspection and test.

5. *Deflection-measurement tests.*—The test beam will be mounted in the testing machine in accordance with section 8 and a load applied equal to deflection load as shown by Table 1 and then reduced to 500 pounds and the deflection instrument set at zero. The deflection load will then be reapplied, and the deflection shall not be more than 0.07 inch; in event this deflection is exceeded, no further tests will be made, but the lot will be rejected and held in accordance with paragraphs 15 (b) and 17.

6. *Set test.*—After the deflection measurements have been completed, the beam will be loaded to the set load shown in Table 1 and then released to 500 pounds, when the beam shall not show a set greater than 0.01 inch.

7. *Total-deflection test.*—The brake beam shall stand a total movement of the head of the test machine of not less than 2 inches without failure at any point. The speed of the head of the machine shall be 1 inch per minute.

Table 1

M. C. B. beam No.—	Deflection load	Set load	Ratio
	Pounds	Pounds	
1-----	6,500	14,000	47
2-----	12,000	24,000	50
2+-----	15,000	27,000	55
3-----	18,000	30,000	60
4-----	24,000	36,000	66.7
5-----	28,000	39,200	71.4
6-----	36,000	48,000	75

8. *Machine.*—The brake-beam testing machine shall have suitable castings to represent the tread of the car wheels so that the beam can be mounted with the load applied at the pinhole in strut.

9. *Test specimen.*—The test specimen shall consist of a complete brake beam and may, at the option of the inspector, be either right or left hand.

10. *Number of tests.*—The manufacturer shall have the brake beams piled according to size, regardless of requisition numbers, and sampled as follows: If the beams in a pile are either right or left hand, the lot shall consist of 501 beams or less, and if the pile consists of both right and left hand beams the lot shall consist of 502 beams; but in either case only one beam will be selected for test. The extra beam in the lot of 502 will be returned to stock. If the pile contains more than 501 of either right or left hand beams, or 502 of both right and left hand beams, and not more than 1,002 or 1,004, two samples will be taken, and so on for each additional 500 beams.

BEAM NUMBER	ROD DIA. IN.	BEAM CAPACITY	THREADING OF ROD
#2	1 3/8	12000*	US STD 1 1/2" THDS 2 1/2" LONG
#2+	1 3/8	15000*	US STD 1 1/2" THDS 2 1/2" LONG

Note.—A tolerance of 1/8 in. plus or minus in the camber of brake beam may be allowed.

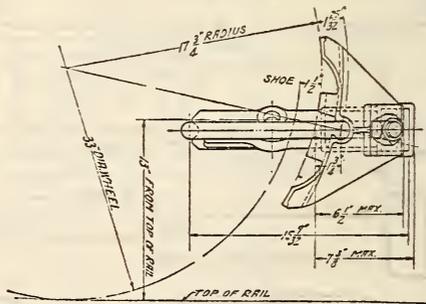

FIGURE 500.—Brake beams, complete

III. PERMISSIBLE VARIATIONS

11. *Gage.*—Brake beams shall conform to the dimensions shown below in A. R. A. brake-beam gages.

IV. WORKMANSHIP AND FINISH

12. *Workmanship.*—The beam shall be made in a workmanlike manner and be free from injurious defects.

13. *Finish.*—(a) Brake beams shall be free from rust, scale, paint, or any covering that will hide defects.

(b) After the beams are inspected and marked, they shall be given one coat of a quick-drying, black, protective paint.

V. MARKING

14. *Marking.*—The designation "A. R. A." and the capacity of the beam as "No. 2," "No. 2+," etc., shall be marked on the center strut where they can readily be seen when the beam is in place on the car. The letters and figures shall be not less than five-eighths inch high, being one-eighth inch

in relief on a cast strut and plainly stamped on a forged strut.

VI. INSPECTION AND REJECTION

(Inspection and rejection conform to A. R. A. specifications for galvanized sheets (see 604.32, p. 243) except in the following instances:)

15. *Inspection.*—(b) When the manufacturer's testing facilities are, in the judgment of the purchaser, adequate, tests shall preferably be made at the manufacturer's laboratory. The purchaser may, however, have tests made at his own or other laboratories, providing the facilities are adequate, and if the manufacturer desires he may witness such tests.

16. *Rejection.*—Material or completed beams which, subsequent to above tests at the manufacturer's plant or elsewhere, and their acceptance, develop weak spots or imperfections, or fail to pass any one of the tests herein required, such tests to be made within 30 days of the receipt of the material by the purchaser, will be rejected and shall be replaced by the manufacturer at his own expense.

611.44 RAILWAY COUPLERS, CAST STEEL AND FORGED STEEL

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, AUTOMATIC COUPLERS FOR INTERURBAN CARS AND RADIAL DRAFT RIGGING, RECOMMENDED SPECIFICATION E100-29, 1929

AUTOMATIC COUPLERS

1. For use on interurban cars, a coupler of the vertical-plane type is recommended which has contour lines of knuckle and guard arm automatically to couple with standard steam railroad couplers.
2. The carrier supports for couplers when mounted on cars of standard height should be located as closely to the coupler head as possible, and should not allow vertical movement sufficient to cause uncoupling due to sudden changes of grade.
3. The length of the radial coupler measured from the center of the pocket pin to the pulling face must not be less than 58 inches.
It is advisable at present to maintain a 1½-inch link slot and coupling pin hole in the knuckle of automatic couplers.
4. All couplers must be made to couple automatically by impact and to uncouple without the necessity of going between the cars.

5. All couplers should be mounted to operate over 35 feet center radius track curves broken from the point of tangency.
6. There should be an arrangement to release and open the knuckle without requiring the operator to pass between the cars.
7. The face of the knuckle vertically should be 16 inches maximum.
8. The height of drawbar center should be 31½ inches minimum loaded, and 34½ inches maximum above the head of the rail.
9. The coupling center of couplers must have a minimum projection of 6 inches beyond buffer faces at any point between the working limits of the couplers.
10. Couplers should be placed on both ends of the car.

11. The coupler head should have a guard arm on one side, and an abutting wall on the other in accordance with Figure 518.

12. The condemning point for worn knuckles shall be 5½ inches as measured by A. R. A. gages shown on page 500 of 1926 Manual of the A. R. A. Mechanical Division, or C. E. R. M. M. A. defect gage, page 12, Figure 6, C. E. R. A. Code of Rules.

(Requirements covering process, annealing, chemical composition, ladle and check analyses, tension tests, and yield point are identical with those specified below for A. R. A. couplers, knuckles, locks, and other parts.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, STANDARD SPECIFICATIONS FOR PURCHASE AND ACCEPTANCE OF A. R. A. STANDARD D COUPLERS, KNUCKLES, LOCKS, AND OTHER PARTS, 1925

COUPLERS, KNUCKLES, LOCKS

NOTE.—These specifications replace specifications for M. C. B. automatic couplers adopted in 1899. When couplers other than type D are ordered under these specifications, they shall conform to the requirements for quality of steel, workmanship, and details of inspection. No tests of the couplers as a whole will be required.

1. Scope.—These specifications cover all cast steel for complete couplers and for repair parts.

I. MANUFACTURE

2. Process.—The steel shall be made by the open-hearth or electric-furnace process and in accordance with the best foundry methods.

3. Annealing.—(a) Castings shall be allowed to become cool. They shall then be uniformly heated to the proper temperature to refine the grain and allowed to cool uniformly.

(b) Annealing lugs.—The location of the annealing lugs shall be as shown on Figures 519 and 520. These annealing lugs shall be cast with and attached to each casting when presented for inspection, and shall be removed by the inspector for the purpose of determining the character of the annealing.

(c) If, in the opinion of the inspector, a casting is not properly annealed, he may at his option require the casting to be reannealed.

(d) If, after annealing or reannealing, any casting is so much out of gage as to require heating in order to bring it within the gage limits, it shall be reannealed before it shall be accepted.

II. CHEMICAL PROPERTIES AND TESTS

4. Chemical composition.—The steel shall conform to the following requirements as to chemical composition:

	Per cent
Manganese, not over.....	0.85
Phosphorus, not over.....	.05
Sulphur, not over.....	.05

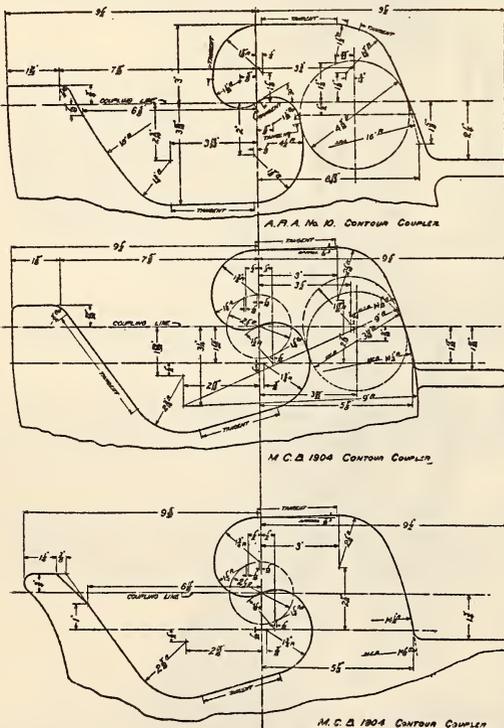

FIGURE 518.—Details of guard arm and abutting wall for automatic couplers

5. *Ladle analysis.*—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, phosphorus, sulphur, and silicon. This analysis shall be made from drillings taken at least one-fourth inch beneath the surface of a test ingot obtained during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative when requested, and shall conform to the requirements specified in section 4.

6. *Check analysis.*—An analysis may be made by the purchaser from the broken tension-test specimen or from a casting representing each melt. The chemical composition thus determined shall conform to the requirements specified in section 4. Drillings for analysis shall be taken not less than

minute. The tensile strength shall be determined at a speed not to exceed 1½ inches per minute.

8. *Test specimens.*—(a) A sufficient number of test coupons to provide a test for each melt shall be cast with and attached to the coupler bodies or knuckles when presented for inspection. The size of coupon shall be sufficient to provide for a machined test piece as required in paragraph (d), and shall be cast on the coupler bodies or knuckles at a location optional with the manufacturer.

(b) For the purpose of identifying each casting in a melt, the manufacturer shall keep a record by serial or heat numbers of the coupler bodies and knuckles which have been poured from that melt.

(c) When sufficient coupons have not been cast, a test specimen may be cut from the finished casting at

Markings for Standard A.R.A. D. Coupler and Fittings.

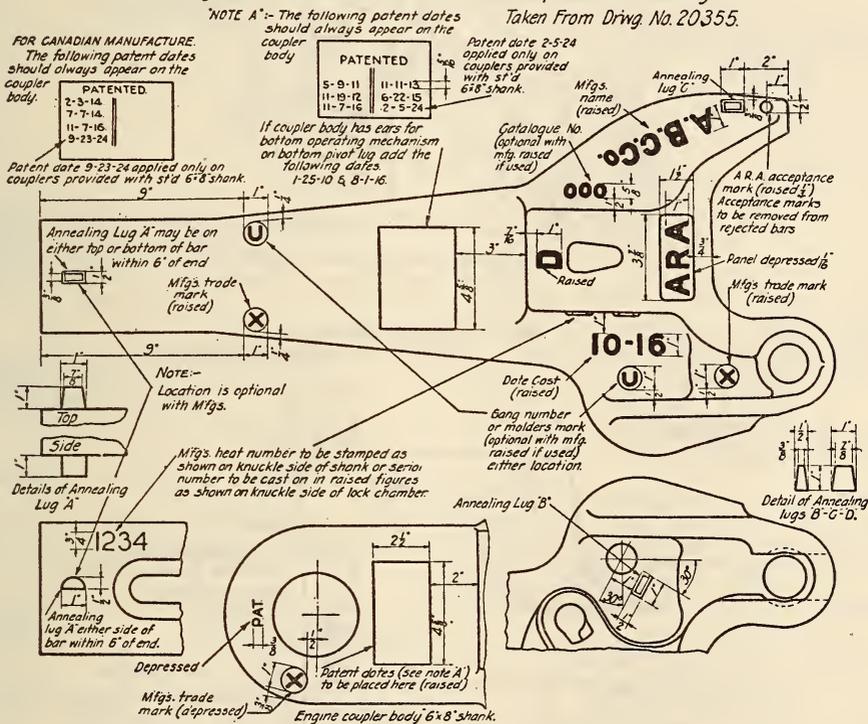

FIGURE 519

one-fourth inch beneath the surface, and shall be taken in such a manner as not to impair the usefulness of a casting.

III. PHYSICAL PROPERTIES AND TESTS

7. *Tension tests.*—(a) The steel shall conform to the following minimum requirements as to tensile properties:

Yield point.....	lbs./in. ²	36,000
Elongation in 2 inches.....	per cent.....	1,600,000
Elongation, not under.....	do.....	22
Reduction of area.....	do.....	2,500,000
Reduction of area not under.....	do.....	30

(b) The tensile strength shall be reported.

(c) The yield point shall be determined by the drop of the beam or by the dividers, the method being optional with the purchaser, and at a cross-head speed not to exceed one-eighth inch per

a location mutually agreed upon by the inspector and the manufacturer, and this casting replaced in the lot.

(d) Tension-test specimens shall be machined to 0.505 inch in diameter with a 2-inch gage length. The ends shall be not less than seven-eighths inch in diameter and of a length and form to fit the holders of the test machine in such a manner that the load shall be axial.

9. *Number of tests.*—(a) At least one chemical and physical test shall be made from each melt of steel except as provided in section 10 (a).

(b) If the test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any tension-test specimen is less than that specified in section 7 and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

(d) No part of these specifications shall operate to cause any one tension test to apply to more than 40 tons of castings as offered for inspection.

10. *Number of tests, consecutive melts.*—(a) After 15 consecutive melts have been tested and accepted in accordance with the above requirements, the manufacturer may group the succeeding melts in lots of five melts each, but each lot not to exceed 40 tons, the entire group to be accepted if the test specimen selected from the lot fulfills the chemical and physical requirements herein specified. If this test fails, a rehearing will be granted on the melt that the failed bar represents, and the other four melts of the group shall be tested individually.

shall preferably be from the same melt, and the manufacturer shall furnish the purchaser a copy of his record showing satisfactory chemical analysis and physical properties obtained from the melt of steel in question, and the annealing lug showing his proof of the appearance of the fracture of the annealing lugs.

13. *Grouping.*—The manufacturer shall have the material grouped in lots of 100 complete couplers or 100 detail parts, and this will be an inspection lot. Where possible, care should be taken to put all couplers of the same melt number in the same lot. The manufacturer should endeavor to cast as many parts from one melt on a given order as is possible.

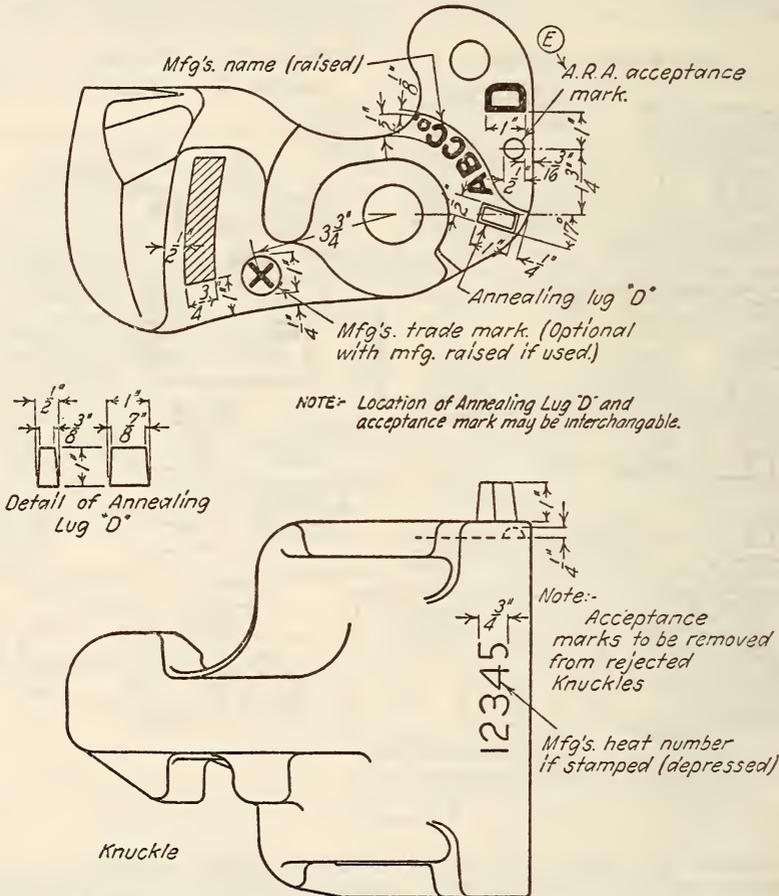

FIGURE 520

(b) If there is a period of more than six months between shipments of couplers or parts, then each melt shall be tested individually until 15 consecutive melts have been accepted, after which the melts may again be grouped as in paragraph (a).

(c) If one or more melts are rejected, each succeeding melt shall be tested individually until 15 consecutive melts have been accepted, after which melts may again be grouped as in paragraph (a).

11. *Retests.*—If the results of the physical test lot do not conform to the requirements specified, the manufacturer may reanneal such lot not more than twice and retest shall be made as specified in section 7.

12. *Waiving tests.*—Tests will be waived on orders for less than 10 complete couplers or less than 100 parts other than bars, in which event all castings

14. *Tests of knuckle pivot pins.*—For each two lots of 100 couplers or less, otherwise accepted, one pivot pin shall be removed from a complete coupler and subjected to the requirements of the A. R. A. specifications for heat-treated knuckle pivot pins. If this pin fails to pass the specifications, all pins in this lot of couplers will be rejected. Pins thus removed from the assembled couplers shall be replaced by the manufacturer by an additional pin after the test in order to complete the coupler.

IV. VARIATION IN WEIGHT AND GAGE

15. *Weight.*—(a) One detail part of the lots as established by section 13 shall be weighed and come within the limits as shown below. Failure of any part to come within the minimum weight shall reject that detail and each such detail in the entire

lot so represented shall then be weighed and every piece less than the minimum weight shall be rejected.

(b) When couplers are purchased complete and assembled, 10 per cent of the couplers in each lot of 100 or less shall be individually weighed and shall come within the limits as shown below. Upon the failure of a coupler to come within the limits as shown below, the weighing shall be extended to the entire lot. Failure of any coupler to come within the limits shall be sufficient cause to reject the coupler unless the weight can be adjusted by the manufacturer. Detail parts shall come within the limits as shown below, one coupler being dismantled in each 100 and weighed.

(c) When castings are more than the allowable maximum weight as shown below, and all other

the lot so represented. Failure of a lot to meet the gages will not be sufficient cause to reject a reoffering of the same lot on the same order after the manufacturer has adjusted these parts to the gages. After this adjustment by the manufacturer, the inspector will then gage 10 couplers or pieces selected at random in the lot, and failure of any to meet the

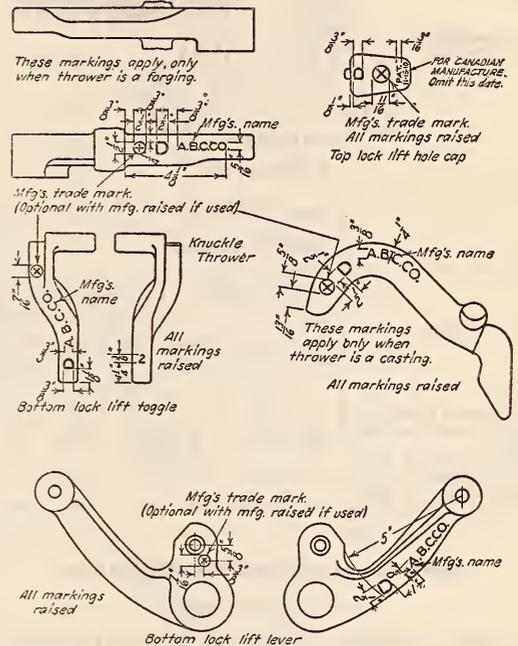

FIGURE 522

gages will reject the entire lot, which shall not again be offered.

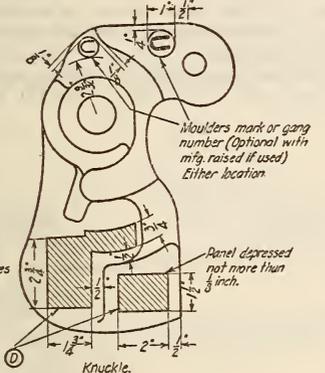

(c) The inspector shall inspect and gage each coupler in a lot in order to determine if they comply to the contour gage.

(d) Gages referred to above are listed below.

Limiting weights—"D" coupler

[All weights in pounds]

Coupler shank	Top operation			Bottom operation		
	Without fittings	Complete with 9 inch knuckle	Complete with 11-inch knuckle	Without fittings	Complete with 9-inch knuckle	Complete with 11-inch knuckle
6 by 8 inch shank—6-inch butt.	Minimum	270	389	271	393	397
	Normal	278	405	279	406	409
	Maximum	290	419	291	423	427
5 by 7 inch shank—6½-inch butt.	Minimum	259	378	260	382	386
	Normal	267	390	268	394	398
	Maximum	279	408	280	412	416
5 by 7 inch shank—9½-inch butt.	Minimum	267	386	268	390	394
	Normal	275	398	276	402	406
	Maximum	287	416	288	420	424

Markings indicated on knuckle to be located as shown. The following markings are to be placed upon the upper and lower surfaces of the knuckle tail within shaded areas indicated, to be raised unless otherwise specified.

Dates cast 10-16I—Not less than 5/8"

Patent dates PAT. 10-2-12—Not less than 5/8" 4-13-15

Mfgs serial No. if cast 12345 Not less than 5/8" Raised not more than 1/8"

When mfgs heat number is used in place of serial number it is to be stamped on back of knuckle as indicated.

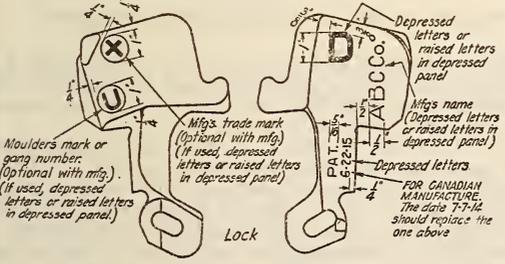

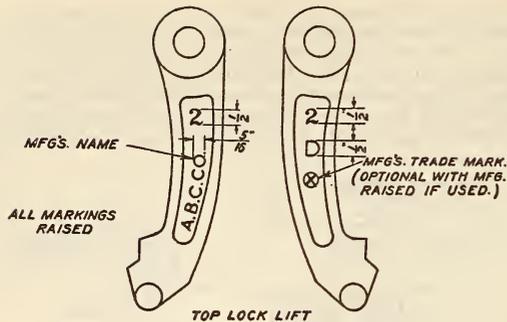

FIGURE 521

requirements are satisfactory, castings may be accepted at the maximum allowable weight, excess weight being at the expense of the manufacturer.

16. Gage.—(a) Castings shall conform to the prescribed limits and gages. Five per cent of each lot of 100 or less, but in all cases at least one of the complete couplers or separate parts in each, shall be completely gaged. Assembled couplers shall be dismantled before gaging.

(b) Failure of any part in the lot to come within the gages or limits shall be sufficient cause to reject

TOP LOCK LIFT

FIGURE 523

Weight of fittings

[All weight in pounds]

Gages to Insure Interchangeability of Coupler Parts

(Standard "D" coupler)

Class I, inspectors' gages.—To be used by inspectors for rejection of couplers and parts not conforming to same.

Gage No.

1. 13242 Knuckle thrower gage.
2. 13815 Movable point knuckle gage.
3. 13818 Inspectors' contour gage, No. 10 contour.
4. 13906 Knuckle pin protector gage.
5. 14220 Knuckle hub gage.
6. 14413 Drawbar pulling lug gage.
7. 14414 Drawbar pin protector gage.
8. 14437 Knuckle tail height gage.
9. 14480-1 Drawbar lock chamber gage.
10. 14487 Drawbar lock hole gage.
11. 14491 Lock thickness gage.
12. 14492 Lock contour gage—guard arm side.
13. 14513 Drawbar pivot lug gage.
14. 14514 Top lock lift gage.
15. 14604 Lock contour gage—knuckle side.
16. 14628 Knuckle pulling lug gage for top half.
17. 14643 Knuckle pulling lug gage for bottom half.
18. 14690 Lock slot gage.
19. 20843-1 Minimum gage—1½ by 6½ inch key slot.
20. 20843-2 Maximum gage—1½ by 6½ inch key slot.
21. 15014 Lock toggle hole gage.
22. 15037 Pivot pin used with gages Nos. 14413, 14414, and 14511.
23. 16652 Gage for hole in butt end of coupler.
24. 18334 Bottom lock lift and toggle assembly.

Class II, checking gages.—To be used by inspectors periodically, but not as rejection gages.

Gage No.

1. 13167 Top lock lift hole gage.
2. 14480-2 Maximum gage, lock chamber and lock hole.
3. 14511 Drawbar knuckle thrower hole gage.
4. 15077 Top operating anticreep gage.
5. 16259-1 Bottom lock lift lever gage.
6. 16259-2 Bottom lock lift toggle gage.
7. 16259-3 Bottom lock lift lever gage pin.

NOTE.—Drawings of the above gages are held by the secretary of the American Railway Association.

V. WORKMANSHIP AND FINISH

17. **Workmanship.**—(a) The castings shall conform to the size and shape as shown on A. R. A. standard drawings and shall be finished in a workmanlike manner.

(b) When assembled, knuckles and locking pins or blocks must work freely, but the lost motion be-

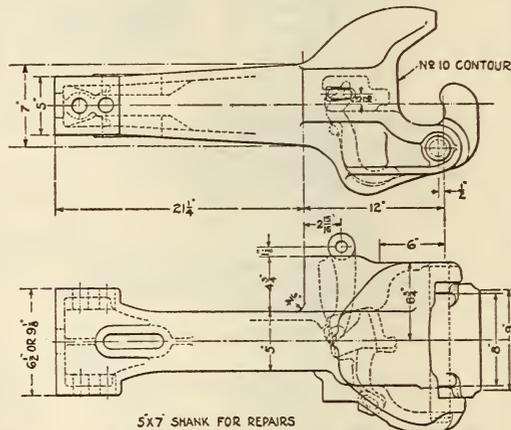

FIGURE 524.—Standard "D" coupler, 5 by 7 inch shank

For details of shank, butt end, and key-slot, see Figure 527.

tween knuckles and locks must be such that the knuckle can not be pulled forward by hand beyond the proper contour line, but 1/8 to 1/4 inch lost motion in opposite direction is desirable.

(c) In order to determine that the requirements of paragraph (b) have been complied with, not less than 10 couplers out of each lot of 100 shall be tried. Failure of any one to operate properly will be sufficient cause for rejection of the lot, but this does not prohibit the manufacturer reoffering the lot on the same order for inspection after adjustment, providing it is shown that all other requirements of the specifications have been complied with.

18. **Finish.**—The castings shall be free from blow-holes, sand pockets, shrinkage cracks, and other injurious defects.

19. **Sand or shot blast.**—All castings shall be properly cleaned by sand or shot blast or other approved process. The inspector may require that any or all castings again be subjected to sand or shot blast or cleaning in order to better examine for checks and shrinkage cracks which in his opinion would be detrimental to the strength of the castings.

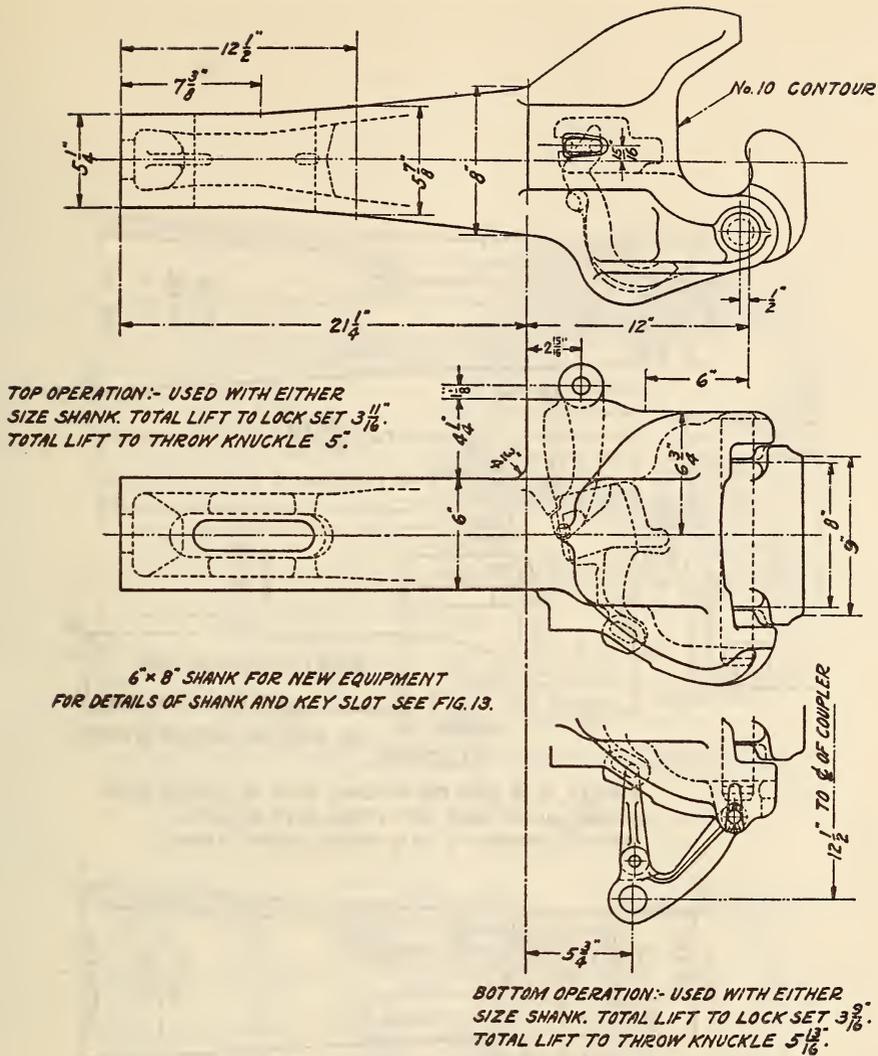

FIGURE 525.—Standard "D" coupler, 6 by 8 inch shank

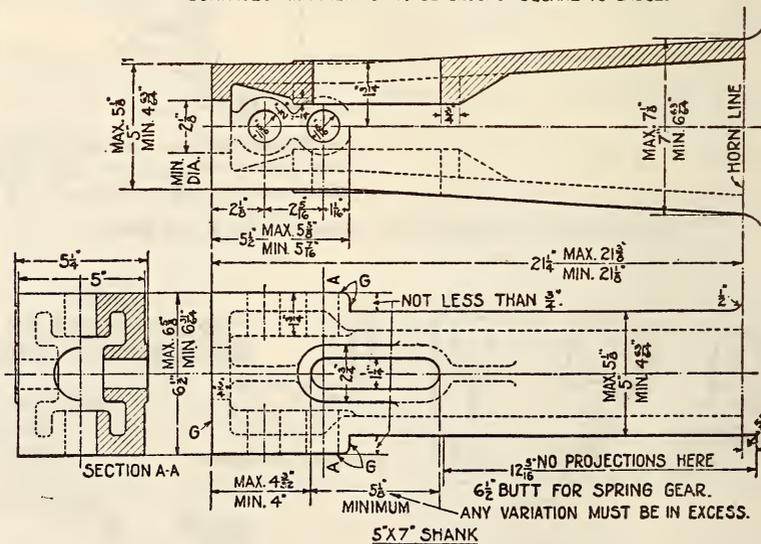

FIGURE 527.—Standard "D" coupler, 5 by 7 inch shank details

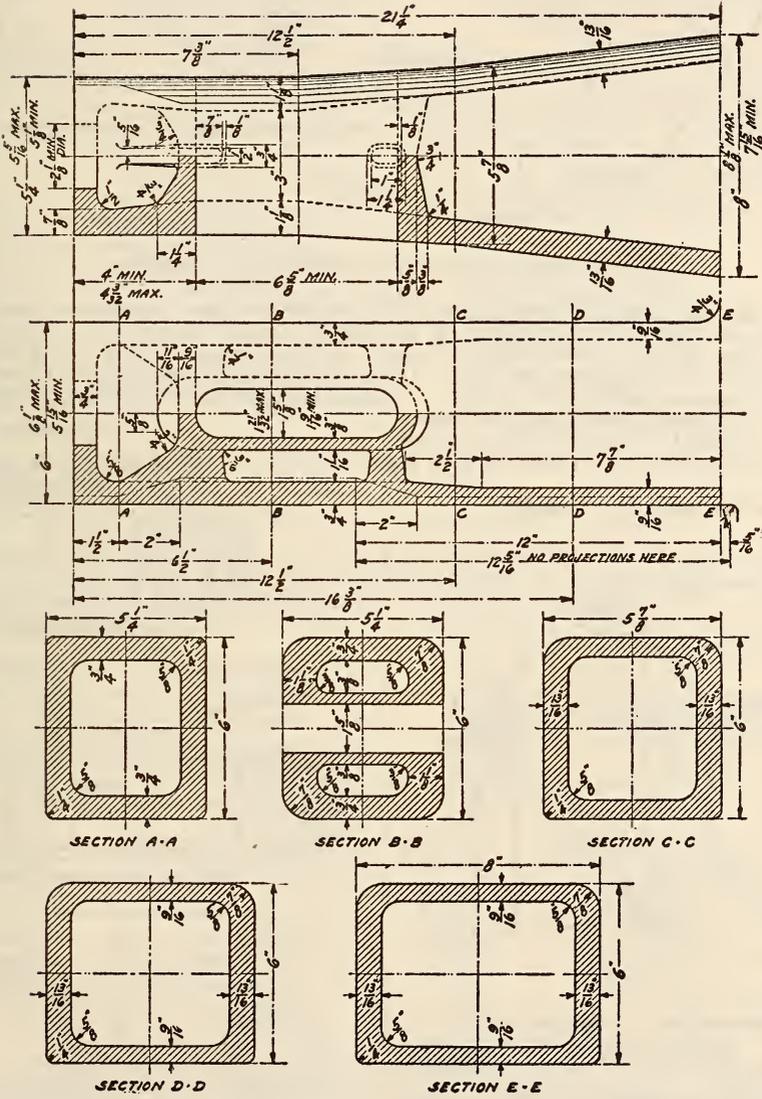

FIGURE 528.—Standard "D" coupler, 6 by 8 inch shank details

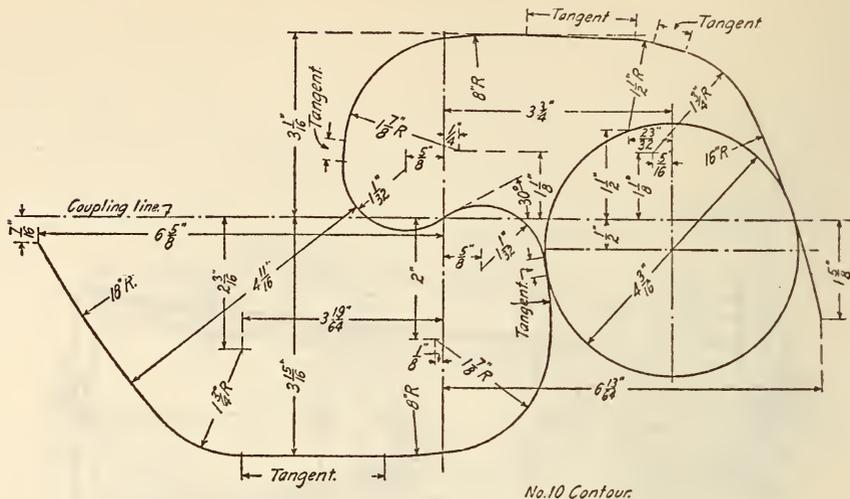

FIGURE 529.—Standard "D" coupler, No. 10 contour

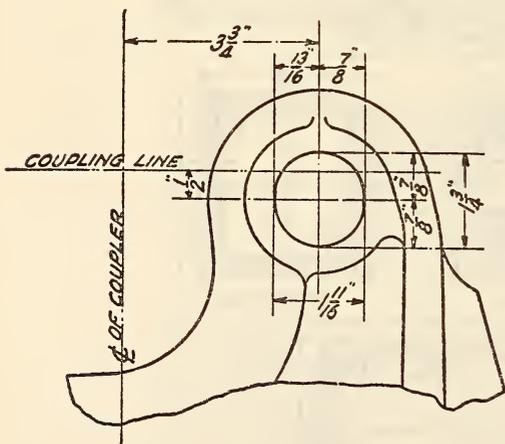

20. *Welding.*—Welding minor imperfections which do not impair the strength of the castings will be permitted when done under the jurisdiction of the inspector and by a practice approved by him. All castings shall be reannealed after such welding.

21. *Painting.*—The castings as offered for inspection shall not be painted or covered with any substance that will hide defects, nor rusted to such an

extent as to make defects invisible. numbers are used in place of serial numbers they shall be legibly stamped on each piece in the melt.

(b) The serial number for each manufacturer, when used, shall begin with "1" and continue consecutively throughout the month, when a new series

STANDARD "D" COUPLER

DETAIL OF KNUCKLE PIVOT PIN HOLE

FIGURE 530

extent as to make defects invisible. If the castings are to be painted, it shall be so specified on the order, but this shall only be done after complete inspection and acceptance of the material by the inspector, and then with a quick-drying paint.

22. *Lubrication.*—Couplers when assembled shall be properly lubricated.

23. *Marking.*—(a) All parts shall have the manufacturer's name or identification mark, and when required, serial numbers, and such additional marking as shown on Figures 519, 520, 521, 522, and 523, cast legibly in letters or figures of size, manner, and location as specified. Manufacturer to give purchaser list of serials in each melt. When melt

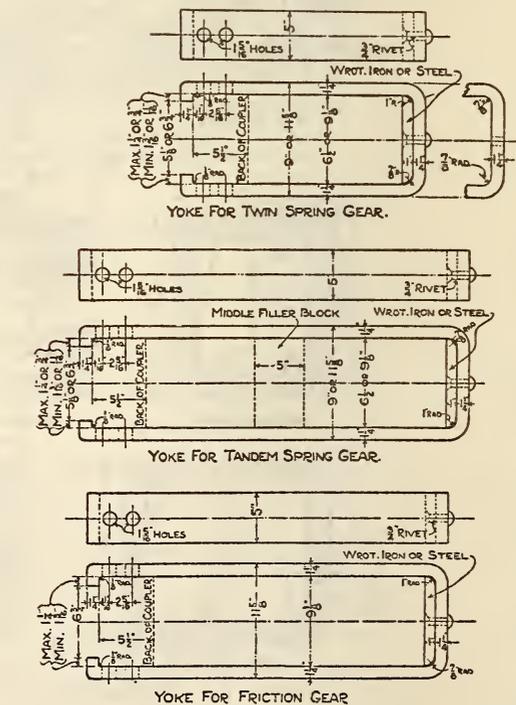

FIGURE 531.—Coupler yokes

shall be started. In all cases, however, a new serial number shall start at the beginning of each month.

(c) After the material has been inspected and is ready to be shipped, the inspector shall stamp each casting with his private mark.

VI. INSPECTION AND REJECTION

24. *Inspection.*—(a) The inspector representing the purchaser shall have free entry at all times while

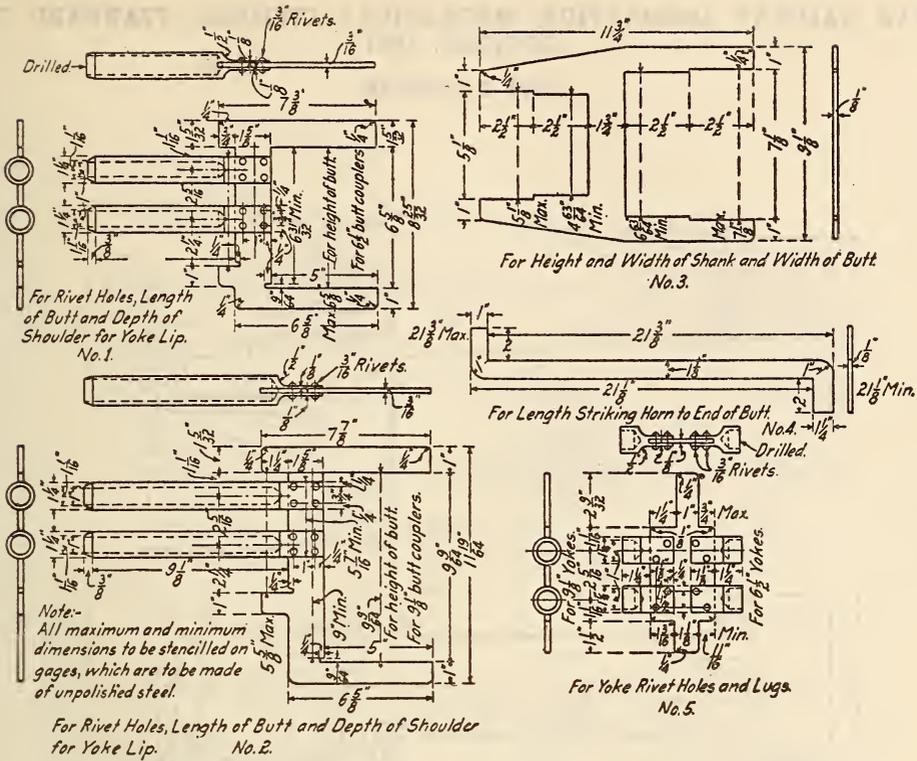

FIGURE 532.—Gages 1, 2, 3, 4, and 5 for coupler and yoke

work on the contract of the purchaser is being performed, to all parts of the manufacturer's works which concern the manufacture, test, and inspection of the material ordered. The manufacturer

of the purchaser, all remaining annealing lugs shall be removed and surface where located put in a workmanlike condition.

25. Rejections.—(a) If any of the test coupons or annealing lugs selected to represent the melt do not

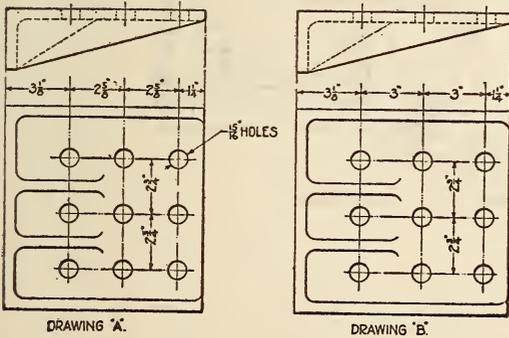

FIGURE 533.—Front and back stop

shall afford the inspector, free of charge, all reasonable facilities to satisfy himself that the material is being furnished in accordance with the specifications.

(b) The purchaser may make the chemical tests to govern the acceptance or rejection of the material in his own laboratory or elsewhere. Such chemical tests, however, shall be made at the expense of the purchaser.

(c) The physical tests may be made at the plant of the manufacturer, providing the purchaser is satisfied with the accuracy of the test machine.

(d) All tests and inspection shall be so conducted as not to interfere unnecessarily with the operation of the works.

(e) After the inspection and tests have been completed and before castings are loaded, at the option

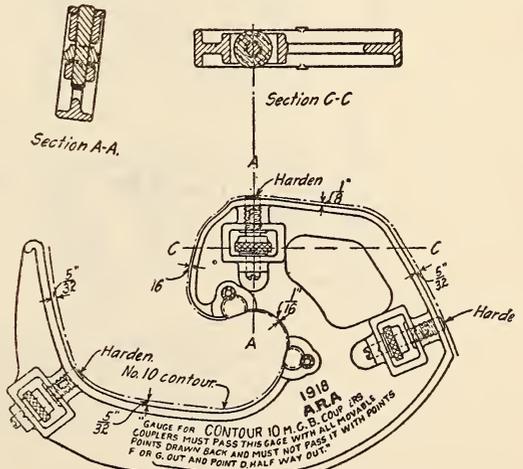

FIGURE 534.—Coupler limit gage

conform to the requirements specified in sections 3, 6, and 7, the lot will be rejected.

(b) All castings which show any injurious defects or do not conform to the weights or gages shall be rejected.

(c) From each bar or knuckle rejected by the inspector under these specifications, he shall cause to be chipped the A. R. A. acceptance mark shown on Figures 519 and 520.

FIGURE 539.—Type E coupler, detail of knuckle pivot pinhole

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, STANDARD SPECIFICATIONS FOR COUPLER KNUCKLE PIVOT PINS, 1928

COUPLER KNUCKLE PIVOT PINS

1. *Scope.*—These specifications cover all heat treated carbon steel knuckle pivot pins and other coupler pins; also bars for making pins.

I. MANUFACTURE

2. *Process.*—The steel shall be made by the open-hearth process.

3. *Heat treatment.*—The pins shall be properly heat treated to meet the requirements of the physical tests.

II. CHEMICAL PROPERTIES AND TESTS

4. *Chemical composition.*—The steel shall conform to the following requirements as to chemical composition:

	Per cent
Carbon.....	0.55-0.75
Manganese.....	.50-.90
Phosphorus, not over.....	.05
Sulphur, not over.....	.06

5. *Ladle analyses.*—An analysis shall be made by the manufacturer from a test ingot taken during the pouring of each melt, to determine the percentage of carbon, manganese, phosphorus, sulphur, and silicon. Drillings for analysis shall be taken not less than one-fourth inch beneath the surface of the test ingot. A copy of this analysis shall be given the purchaser or his representative. This analysis shall conform to the requirements specified in section 4.

6. *Check analyses.*—A check analysis shall be made from the finished material representing each melt, by the purchaser or his representative, and shall meet the requirements specified in section 4.

III. PHYSICAL PROPERTIES AND TESTS

7. *Drop test.*—(a) This test shall be made on a standard A. R. A. drop-test machine, or a drop-test machine that will give equivalent results, the pin resting on rounded supports held rigidly 10 inches center to center. If made on a standard A. R. A. machine, the pin shall be struck one blow by a tup

weighing 1,640 or 2,240 pounds falling from a height determined from the following formula:

$$\begin{aligned} \text{For 1,640 pounds tup: } H &= 1.16 d^2 \\ \text{For 2,240 pounds tup: } H &= 0.85 d^2 \end{aligned}$$

in which H is the height of the drop in feet and d is the diameter of the pin in inches. The height of drop for the standard 1½-inch pin shall be 3 feet (36 inches), for 1,640-pound tup and 2.25 feet (27 inches), for 2,240-pound tup.

(b) The pin shall show a deflection of not less than 15°, nor more than 30°, without cracking or breaking.

8. *Number of tests.*—The manufacturers shall furnish, free of charge, one extra pin with each lot of 200 or less.

IV. PERMISSIBLE VARIATIONS

9. *Permissible variations.*—The diameter of the pin may vary not more than plus or minus one-sixty-fourth inch from that specified. The length shall not vary more than one-eighth inch below or above that specified.

V. FINISH

10. *Finish.*—The finished pin shall be straight, have a smooth surface, be uniform in diameter and shall not be painted.

VI. MARKINGS

11. *Markings.*—The manufacturer's name or identification marks shall be stamped on the head of each pin.

VII. INSPECTION AND REJECTION

(Conform to A. R. A. specifications for galvanized sheets. See 604.32, p. 243.)

611.49 MISCELLANEOUS MANUFACTURES OF CAST STEEL.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; QUALITY AND TESTING OF MATERIALS, SHIP CONSTRUCTION, 1930

CAST-STEEL ANCHORS

(For general information and requirements see 600.0, p. 2. Specifications are the same as for forged wrought-iron anchors (see 611.3, p. 704) with the following additions):

1. Cast-steel anchors, or when such anchors are made of more than one piece, each piece shall be subjected to the following drop, hammering, and bending tests:

2. Each piece is to be thoroughly annealed, the annealing to extend over three days for castings of 1,700 pounds and under, and the time increased with increased weight. The castings are then to be stamped "annealed steel."

3. The anchor or piece shall be raised to a height of 12 feet and dropped on an iron slab. If this test is satisfactory the anchor or piece is to be slung clear of the ground and well hammered all over to test the soundness of the material.

4. A piece sufficient to provide two or three test specimens must be cast on each casting submitted for approval, and is not to be detached from the casting until after the annealing is complete nor until it has been stamped by the surveyor.

5. A specimen which should not be less than 1 by ¾ inch, with edges rounded to a radius of one-sixteenth inch, must stand being bent cold through an angle of 120° over a radius of 1 inch without any appearance of fracture.

AMERICAN MARINE STANDARDS COMMITTEE, MOORING BITTS, CAST STEEL, H NO. 17-1926

MOORING BITTS

(Specifications for cast-steel mooring bits are substantially the same as those for cast-iron mooring

bits (see 611.13, p. 642) except that the material is to be grade 1 steel, annealed, in accordance with American Bureau of Shipping specifications (sec. 40, par. 8, of the bureau's rules), and the thickness of metal of the top and base of the bitt is, in general, less than the dimensions for cast-iron bits of the same size.)

COUPLER YOKES

(See 605.13, p. 259.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, DRIVING AND TRAILER WHEELS FOR LOCOMOTIVES, RECOMMENDED PRACTICE, 1928

LOCOMOTIVE WHEELS

Cast-steel driving-wheel centers should preferably be uncut and shrinkage slots omitted; if cut, slots should be machined out and closed with solid cast-iron liners driven in. No lead or white metal should be used.

For wheel centers, when the permissible total weight of the locomotive will allow, the rims should preferably be cast solid without cores, so as to obtain the maximum section and have full bearing of tires; the section in square inches should be approximately 0.45 of the sectional area of the tire when new.

In presenting Figure 543, the committee recommends hubs and solid rim sections as shown in diagrams 5-b and 5-c for all locomotive designs in which limitations of weight and counterbalance will permit their use. These features, together with the spokes of diagrams 5-d and 5-e, greatly simplify pattern and foundry work in the manufacture of driving wheels. The solid rim also provides a better support for tires than a cored rim, and solid rims are therefore recommended in all cases where they can be used.

The demands for locomotives of increased power which must be built without exceeding certain very definite limits of weight and counterbalance effects have made it desirable to recognize and approve any feature of design that will reduce weight and for this reason the committee has included as an alternative practice the cored rim section of diagrams 5-f, 5-g, and 5-h, and the elliptical spoke section of diagrams 5-i and 5-j, which conform to the foundry practice usually followed in producing driving wheels with cored rims. Diagrams 5-j and 5-k show an arrangement of reinforcing webs between spokes, which is recommended as an optional feature on account of its extensive use on a number of roads.

The committee recommends solid counterweights cast as an integral part of the driving-wheel center in all cases in which the desired counterbalance can be secured with solid cast counterweights. Small lead pockets as shown by diagram 5-f are recom-

weights, the committee recommends the pocket construction shown by diagram 5-a, in which the pockets are arranged to be filled through cored holes in the rims of the wheels, these holes being entirely covered when tires are in place.

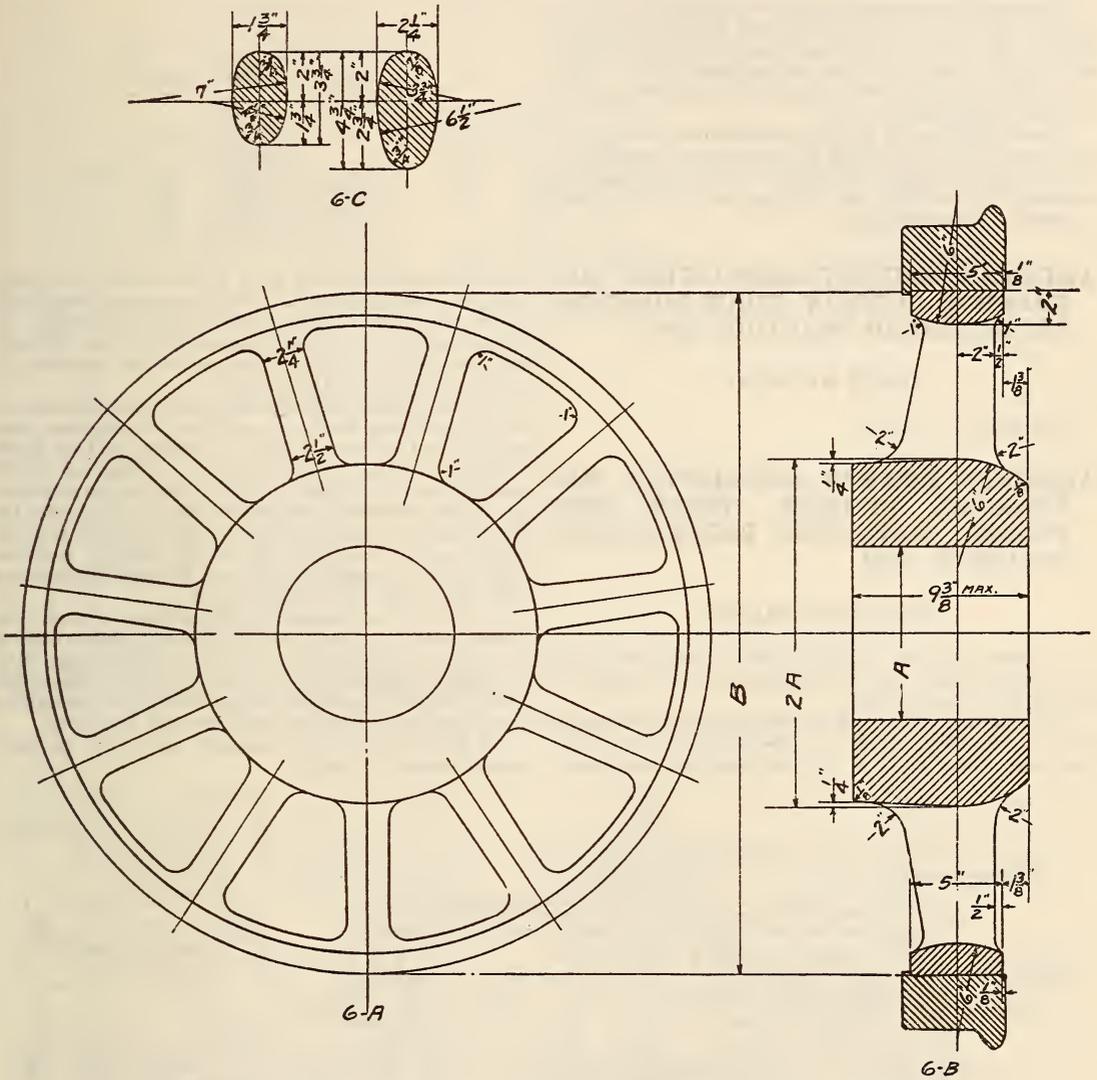

FIGURE 544.—Inside and outside hub faces to be machined to suit wheel seat on axle

mended for obtaining closer adjustments than can be had with solid counterweights. Solid cast counterweights can usually be used with entire satisfaction on all driving wheels other than main, and on some locomotives, particularly those having drivings wheels of relatively large diameters, solid counterweights can be used on main driving wheels. For driving wheels which require lead-filled counter-

The design of trailer wheels as shown by Figure 544 follows the lines laid down in connection with Figure 543 for driving-wheel design so far as hubs, rims, and spokes are concerned. While including among its recommendations a design of cast-steel trailer-wheel center of 33 3/4 inches in diameter, the committee feels that further consideration should be given to the development and manufacture of rolled-

steel wheels that will be entirely satisfactory for use on trailer trucks requiring wheel centers $3\frac{3}{4}$ inches in diameter or smaller. Some rolled-steel trailer wheels of this size are now in use, but their performance indicates that further development and improvement is desirable.

The experience of some of the roads has been that more trouble has been experienced with breakage of tires of the bolted type than has been experienced with plain shrinkage tires of the same sizes. The committee therefore feels that shrinkage tires should be used in all cases.

Cast steel as per A. R. A. specifications for carbon-steel castings, adopted as recommended practice in 1913 and revised in 1919, is recommended as the material to be used for driving and trailer wheel centers of these designs.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, TRUCK BOLSTERS, RECOMMENDED PRACTICE, 1929

TRUCK BOLSTERS

(See 605.13, p. 255.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, TRUCK SIDE FRAMES, CAST STEEL, RECOMMENDED PRACTICE, 1929

TRUCK SIDE FRAMES

1. *Scope.*—These specifications cover cast-steel side frames for freight equipment with integral or separable journal boxes.

2. *Material.*—Shall be of cast steel in accordance with grade B of A. R. A. specifications for steel castings, which form a part of these specifications.

(b) T sections, angles, and vertical web I beam sections are prohibited under these specifications.

4. *Test requirements.*—(a) The basis of test for side frames shall be the axle capacity (C) in accordance with the values given in Table 1.

TABLE 1

Size of journal	Capacity of axle C	Type of truck
5 by 9.....	Pounds 32,000	2C.
5½ by 10...	40,000	2D.
6 by 11.....	50,000	2E.
6½ by 12...	60,000	2F.

(b) The vertical-test load shall act on the spring base, or its equivalent. The transverse load shall act on the bolster guides, one-half on each guide, on a line located above the nominal center line through the two axles, an amount equal to the journal diameter of axle less $1\frac{1}{2}$ inches.

(c) The deflection measuring instruments shall be located midway between supports of specimen and shall be set at zero under an initial load of 5,000 pounds. In the vertical test only, a load of 20,000 pounds shall be applied to the frame for five minutes, and then released to 5,000 pounds. The load for the deflection measurement shall be 5,000 pounds additional to the load shown in Table 2, but the load for the permanent set and minimum breaking load shall be as given in Table 2.

5. *Tests.*—(a) At least two specimens of each new design shall be tested on a suitable static testing machine. The vertical and transverse tests shall be made separately. In the case of separable journal boxes, the boxes and parts shall be assembled and bolted into place for the vertical test only.

(b) Side frames shall comply with the requirements shown in Table 2.

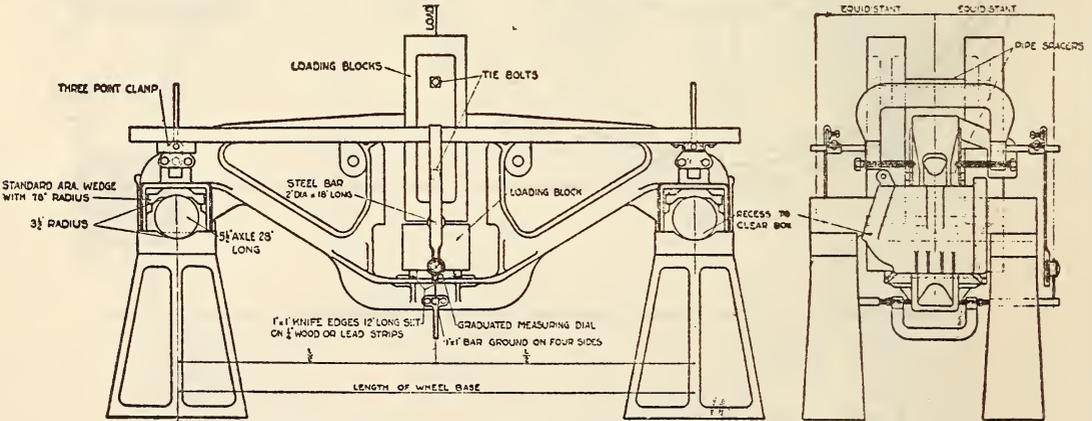

FIGURE. 545.—Truck side frames, cast steel design test requirements

3. *Design.*—(a) The basis of design shall be the axle capacity C. The maximum combined unit stress in the design shall not exceed 16,000 pounds per square inch. The vertical design load shall be taken as acting on the spring base (or its equivalent, for test) and shall be $1\frac{1}{2}$ C. The transverse load shall be taken as acting on the bolster guides, one-half on each guide—on a line located above the nominal center line through the two axles, an amount equal to the journal diameter of axle less $1\frac{1}{2}$ inches, and shall be 0.4 C.

TABLE 2

	Side frames	
	Vertical	Transverse
Load for zero setting of instrument.....pounds..	5,000	5,000
Load at 0.04 inch maximum deflection.....	2.25C	
Load at 0.07 inch maximum deflection.....		0.60C
Load at 0.01 inch maximum permanent set.....	4.50C	1.20C
Minimum breaking load.....	12C	

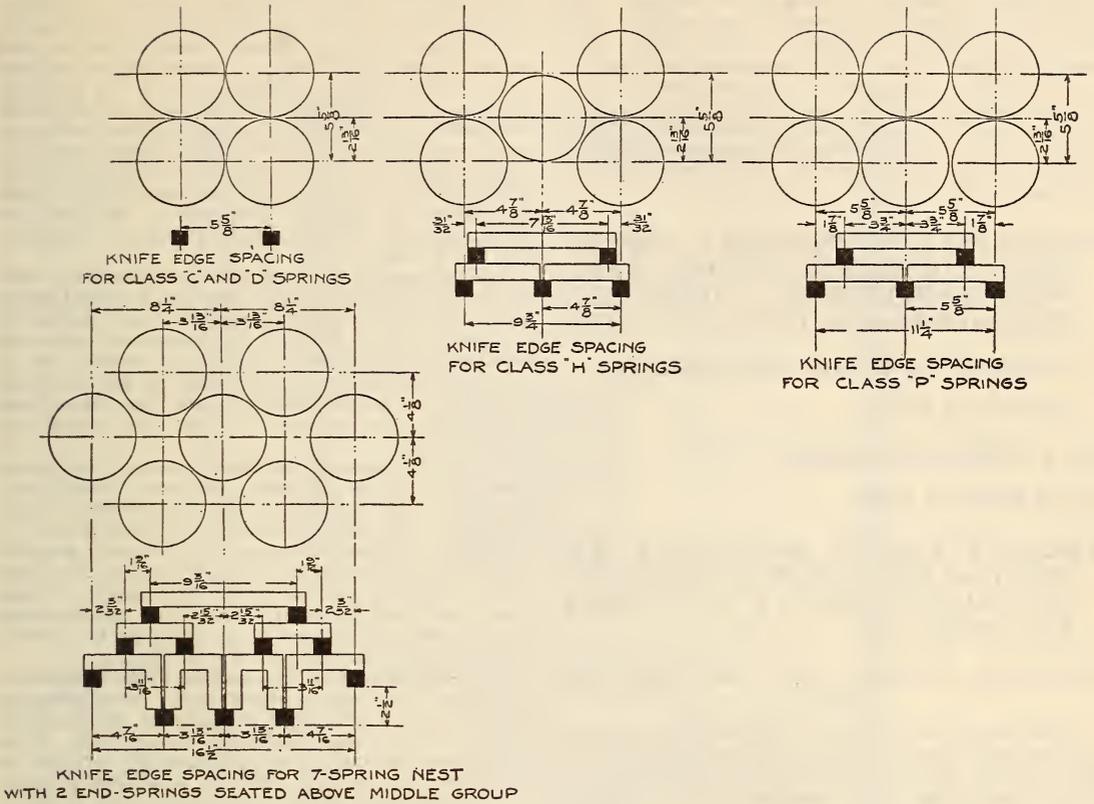

FIGURE 546.—Truck side frames, cast-steel knife-edge spacings for test loading

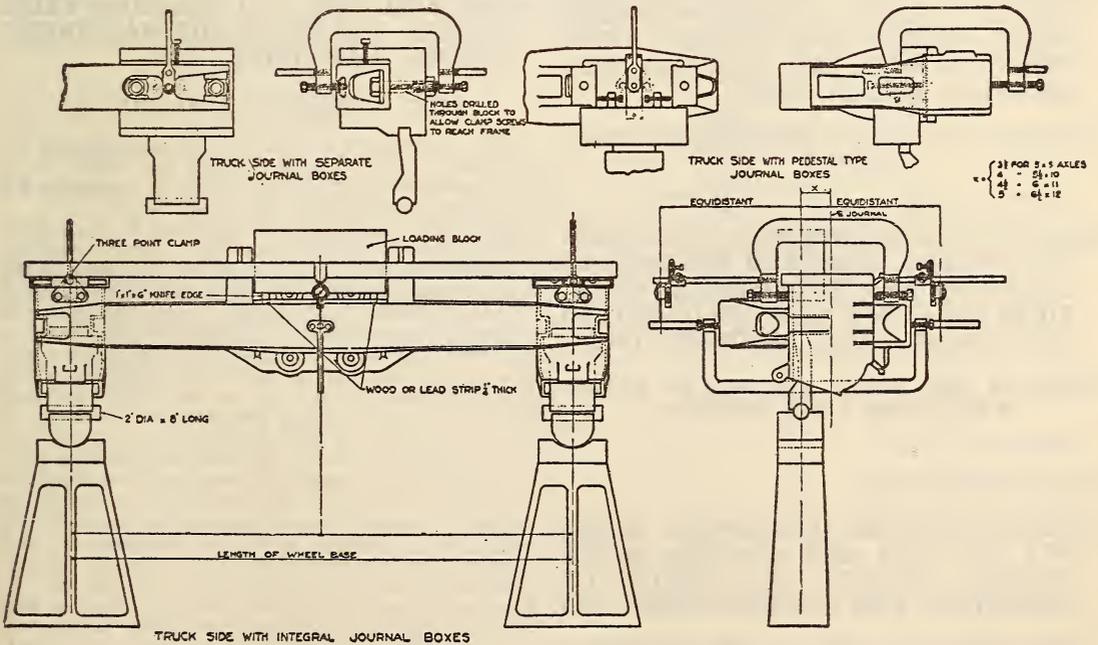

FIGURE 547.—Frames, cast-steel, design test requirements

6. *Loading diagrams.*—Figure 545 shows the recommended method of vertical-test loading. The knife-edges should be located in accordance with the spring grouping as shown in Figure 546. Figure 547 shows the method of transverse test loading.

7. *Marking.*—In addition to the requirements for marking given in A. R. A. specifications for steel castings, all truck side frames shall bear the cast letters A. R. A., followed by the date of adoption or revision of this specification to which they conform, such as "A. R. A.—29."

(See 600.1, p. 47.)

611.51 FORGED STEEL.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; QUALITY AND TESTING OF MATERIALS, SHIP CONSTRUCTION, 1930

INGOT STEEL AND WELDED STEEL FORGINGS

(For general information and requirements, see 600.0, p. 2.)

1. Ingot steel forgings are to be forged from sound ingots made by the open-hearth process. The sectional area of the body of the forging when it leaves the hammer should not exceed one-fifth and no part of the forging should exceed three-fourths the area of the original ingot. Forgings are to be properly annealed in an annealing furnace, and must be free from defect. The tensile strength of the forgings is to be from 60,000 to 72,000 pounds per square inch. The elongations are not to be less than 30 per cent with 60,000 pounds nor 25 per cent with 72,000 pounds tensile strength measured on the standard test specimens of the American Bureau of Shipping. (See fig. 5, 600.1, p. 8.)

2. Specimens 1 inch by three-fourths inch with edges rounded to $\frac{1}{16}$ -inch radius are to stand being bent cold to 180° without fracture over a radius of one-fourth inch. The test specimens are to be cut lengthwise from a part of the forging which is not of less sectional area than the body of the forgings. They are not to be detached until they have been stamped by the surveyors nor until the forging has been annealed.

3. One tension and one bend test are to be taken from each forging. Where a number of small forgings are made from one ingot, specimens which represent each end of the ingot will be sufficient.

4. All ingot steel forgings are to be legibly marked in such a way that they can be traced to the heat from which the material has been made. Those which have satisfactorily passed the requirements are to be clearly stamped A. B., and with the identification marks furnished by the surveyor.

5. Welded steel forgings may be made from especially soft open-hearth ingot steel. Such forgings are to have a tensile strength between the limits of 49,000 and 56,000 pounds per square inch. The elongations are not to be less than 35 per cent at 49,000 pounds, nor 32 per cent at 56,000 pounds. The remaining tests and requirements are to be as prescribed above for ingot steel forgings.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

STEEL FORGINGS FOR MACHINERY

(For general requirements covering materials for machinery, boilers, and piping, see 600.0, p. 1. For requirements covering tests of materials for machinery, boilers, and piping, see 600.1, p. 7.)

1. Steel forgings for machinery shall be made from ingots manufactured by the open hearth, crucible, or electric process. The cross-sectional area of the unmachined finished forging shall not exceed 20 per cent of the area of the ingot. Palms, flanges, and similar enlargements on forgings shall be reduced so as not to exceed 70 per cent of the area of the ingot.

2. Unless especially approved by the surveyor, the discard by weight shall not be less than 5 per cent from the bottom and 25 per cent from the top of poured ingots; or 3 per cent from the bottom, and 10 per cent from the top of fluid-compressed ingots.

3. All forgings must be sound and free from defects; they are also to be annealed in an annealing furnace of ample proportions to bring the whole forging to a uniform annealing temperature, and must not be removed from the annealing furnace until the temperature has dropped to about 700° F. Forgings for special purposes may be quenched and drawn in place of annealing if previously sanctioned by the surveyor or approved on the plans submitted. The test specimens are to be cut longitudinally in direction of forgings, and where practicable taken at one-half the outside radius of the finished forging

from a part having a sectional area of not less than the body of the forging; and they are not to be detached until they have been stamped by the surveyor and until the forging has received its final treatment.

4. One tension and one bend test are to be taken from each forging, except in the case of forgings over 7,000 pounds weight, and of all propeller shafts where tests will be required from each end of the forging. Where a number of bolts or pins are made from one larger forging, one tension and one bend test from the latter will be sufficient. Where one long forging is to be cut into two or more shafts, tests should be made from both ends of the forging.

5. All important forgings subject to test and inspection are to be examined during the process of manufacture when machined, or, in the case of shafts, when rough turned and when finished. Material of the following characteristics will be approved for the purposes noted:

Grade	Tensile strength	Yield point	Minimum elongation	Bend of 180° radius of bend
1.....	Lbs./in. ² 60,000-70,000	50 per cent of tensile strength.	Per cent 180,000 Tensile strength.	Inch ¼
2.....	70,000-80,000	do.....	180,000 Tensile strength.	¾
3.....	80,000-90,000	60 per cent of tensile strength.	180,000 Tensile strength.	½

Grade 1: Approved for all purposes.

Grade 2: Approved for all purposes, excepting propeller shafts.

Grade 3: Approved for all engine forgings, excepting main shafting, pistons, and connecting rods.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; SPECIFICATIONS FOR AXLES, SHAFTS, AND OTHER FORGINGS, CARBON STEEL, ANNEALED AND UNANNEALED, 1926

CARBON-STEEL FORGINGS

(See 611.52, p. 765.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; NORMALIZED AND TEMPERED CARBON-STEEL FORGINGS, 1929

CARBON-STEEL FORGINGS

1. *Scope.*—These specifications cover normalized carbon-steel shafts; driving, engine-truck, and trailer axles; crank pins; main and side rods; piston rods; straps; and other steel forgings for locomotives and cars as may be specified on the order.

2. *Basis of purchase.*—(a) The manufacturer shall employ the normalized and tempered method of heat treatment.

(b) Quenching in any liquid medium will not be permitted under these specifications.

3. *Process.*—The steel shall be made by the open-hearth or other process approved by the purchaser.

4. *Discard.*—A sufficient discard shall be made from each ingot to insure freedom from piping and segregation.

5. *Forging practice.*—The forgings may be made direct from the ingot or from billets, the total reduction from ingot to forging being not less than three to one.

6. *Prolongation for test.*—Full-sized prolongation shall be left on at least 20 per cent of the forgings for test purposes. For forgings with large ends or collars the prolongation may be of the same cross section as that of the forgings back of the large end or collar.

7. *Heat treatment.*—(a) After forging, the forgings shall be allowed to cool to below the critical range and shall then be subjected to a heat treatment consisting of normalizing and tempering as specified in this section.

(b) For normalizing, the forgings shall be uniformly heated to a proper temperature to refine the grain and, after being held a sufficient length of time at this temperature, shall be withdrawn from the furnace and allowed to cool in the atmosphere to below the critical range, protected from rain or snow. A group of forgings thus treated shall be known as a normalizing charge.

(c) For tempering, after the previous treatment, the forgings shall be uniformly heated to a temperature below the critical range and, after being held a proper length of time at this temperature, shall be allowed to cool uniformly either in the furnace or in the atmosphere, protected from rain or snow. A group of forgings thus treated shall be known as a tempering charge.

8. *Chemical composition.*—(a) The chemical composition of the forgings determined from samples taken as described in section 10 shall conform to the following:

	Per cent
Carbon.....	0.40-0.55
Manganese.....	.60-.90
Phosphorus, not more than.....	.045
Sulphur, not more than.....	.05
Silicon, not less than.....	.15

(b) The steel shall not show residual alloying metal impurities in excess of the following limits:

	Per cent
Chromium.....	0.18
Nickel.....	.25

9. *Ladle analyses.*—An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, phosphorus, sulphur, and silicon. This analysis shall be made on drillings taken at least one-fourth inch beneath the surface of the test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser, and shall conform to the requirements specified in section 8.

10. *Check analysis.*—(a) An analysis may be made by the purchaser from a forging representing each melt. The chemical composition thus determined shall conform to the requirements specified in section 8. Drillings for analysis may be taken with a ½-inch drill from the forging or from a full-sized prolongation of the same, at any point midway between the center and surface of solid forgings, and at any point midway between the inner and outer surface of the wall of bored forgings; or turnings may be taken from a test specimen.

(b) In addition to the complete analysis specified in paragraph (a), a carbon determination may be made by the purchaser on drillings taken with a ½-inch drill from the center of the forging or full-sized prolongation of the same, to determine by the variation in carbon the amount of segregation. This determination shall show the carbon content to be within 12 per cent of the amount found at any point midway between the center and surface. This requirement does not apply to bored forgings.

11. *Tension tests.*—(a) The forgings shall conform to the following minimum requirements as to tensile properties:

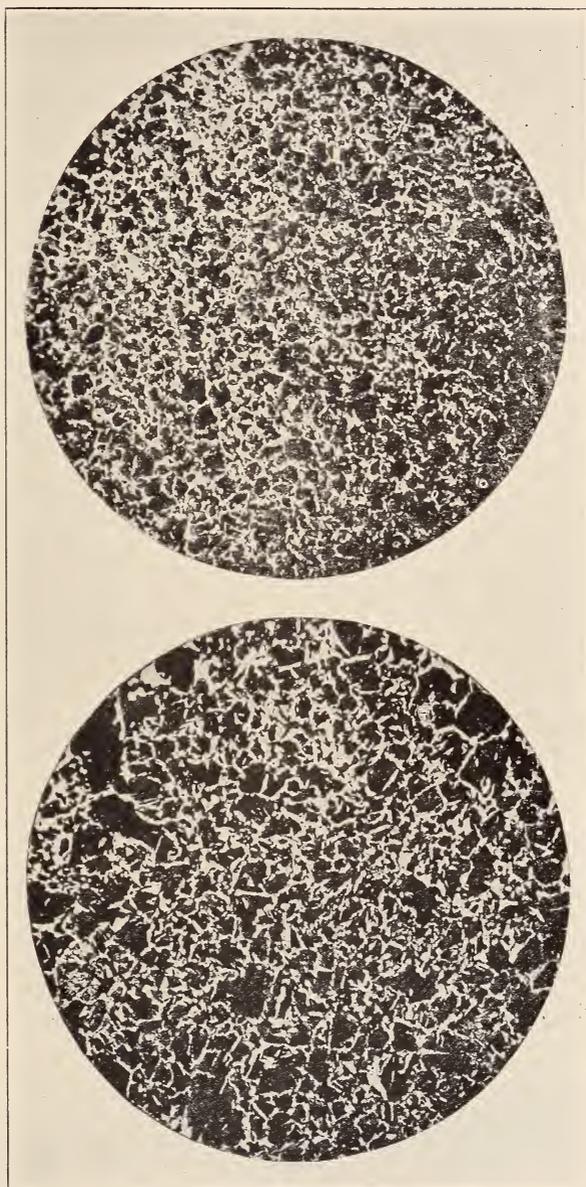

FIGURE 549.—Upper, *fine-grained uniform structure; desired.* Lower, *maximum grain structure; acceptable*
(For specification see p. 752.)

Size, outside diameter or over-all thickness	Tensile strength	Yield point, pounds per square inch	Elongation in 2 inches, per cent		Reduction of area, per cent	
			Inverse ratio	Not under	Inverse ratio	Not under
Not over 8 inch diameter or thickness, 4 inch maximum wall.	Lbs./in. ² 85,000	0.52 tensile strength	$\frac{2,300,000}{\text{Tensile strength}}$	25	$\frac{3,650,000}{\text{Tensile strength}}$	40
Over 8 to 12 inches outside diameter or thickness, 6 inch maximum wall.	83,000do.....	$\frac{2,100,000}{\text{Tensile strength}}$	24	$\frac{3,320,000}{\text{Tensile strength}}$	38
Over 12 to 20 inches outside diameter or thickness, 10 inch maximum wall.	83,000do.....	$\frac{2,000,000}{\text{Tensile strength}}$	23	$\frac{3,100,000}{\text{Tensile strength}}$	36

(b) The classification by size of forgings shall be determined by the specified finished diameter or thickness which governs the size of the prolongation from which the test specimen is taken.

(c) The yield point shall be determined by the drop of the beam or by the dividers; the method being optional with the purchaser, and at a crosshead speed of from one-sixteenth to one-fourth inch per minute. The tensile strength shall be determined at a speed not to exceed 1½ inches per minute.

12. *Tension-test specimens.*—(a) Tension-test specimens shall be taken from the full-sized prolongation of any forging or, at the option of the manufacturer, from an extra forging furnished for the purpose. The axis of the specimen shall be located at any point midway between the center and surface of the solid forging or full-sized prolongation, and at any point midway between the inner and outer surface of wall of bored forgings, and shall be parallel to the axis of the forging in the direction in which the metal is most drawn out.

(Tension-test specimens shall conform to the dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel under commodity designation 605.0, p. 247.)

13. *Micrographic tests.*—(a) A specimen representing each class by size of each melt of each heat-treated lot shall be taken for microscopic tests from the tension-test specimen. The sections for microscopic tests shall be cut from the large undistorted portion of the test specimen in such a way as will give one face normal and one face parallel to the axis of the specimen.

(b) Both faces shall be polished practically free from scratches. The transverse face shall be etched with 4 per cent solution of nitric acid in alcohol. The longitudinal face to be left unetched. The specimen shall be examined under a magnification of 100 diameters.

(c) The whole of the transverse section shall show uniform, well-broken-up, fine-grained structure, and shall conform to the requirements illustrated in photomicrographs, Figure 549. Only one irregular mesh as large as one-half inch in diameter shall be permitted in a field 3 inches in diameter, as shown on the screen or photomicrograph.

(d) For information only, the longitudinal unetched face will be examined for solid nonmetallic impurities and should show such impurities well scattered over the field.

14. *Macroscopic test.*—For information only, a coupon taken with a core drill or sawed normal to the axis of the forging shall be cut from the prolongation from which drillings for chemical analysis are obtained. This coupon representing one-half of the diameter of the prolongation shall be marked before detaching to indicate direction of forging and shall be used for macroscopic examination.

15. *Number of tests.*—(a) One tension and one microscopic etch test and, for information only, one

microscopic unetched and one microscopic etch test shall be made from each class by size of each melt of each heat-treated lot.

(b) If the test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any tension-test specimen is less than that specified in section 11, and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen, a retest shall be allowed.

(d) If the results of the tests of any lot do not conform to the requirements specified, the manufacturer may re-treat such lot, but not more than three times, and retests shall be made as specified in sections 11 and 13.

16. *Workmanship.*—The forgings shall conform to the sizes and shapes specified by the purchaser. When centered, 60° centers with clearance drilled for points shall be used. When forgings are drilled from both ends, and the hole thus drilled is out of line, the diameter of the hole may be increased by boring or reaming in order to make the hole smooth and continuous, but the diameter of the hole shall not be increased more than one-eighth inch.

17. *Finish.*—The forgings shall be free from injurious defects and shall have a workmanlike finish.

18. *Marking.*—(a) The forgings shall have the manufacturer's identification marks, melt number, forging number, and date legibly stamped on each forging with steel stencils at such location as shall be designated by the purchaser with letters and figures not less than three-eighths inch high. In case it is necessary to move the above markings, due to machining, it may be done only after permission has been obtained from the inspector.

(b) After the material has been inspected the inspector shall stamp each accepted forging with his private mark.

(Inspection, rejection, and reheating conform to A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR MOVABLE RAILWAY BRIDGES, FORGED STEEL, 1922

(See also 603.32, p. 151; 611.41, p. 707; 647.31, p. 1268; 692.1, p. 1320.)

FORGED STEEL

(With respect to workmanship, chemical analyses, and annealing requirements, this specification is similar to A. S. T. M., A18, given below. Its requirements for tensile tests of forgings whose maximum outside diameter or over-all thickness is not over 20 inches are identical with "E annealed" in

A18. With respect to test specimens, bend tests, retests, and marking, its requirements are similar to A20-29T, also given below. Otherwise it provides that:)

1. Steel for forging shall be made by the open-hearth or the crucible process and shall conform to the following chemical requirements:

	Per cent
Phosphorus, maximum.....	0.04
Sulphur, maximum.....	.05

2. Check analysis may be made by the engineer from a broken tension or bend test specimen. The phosphorus and sulphur content thus determined shall not exceed that specified by more than 20 per cent.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, BOILER CONSTRUCTION CODE, MATERIAL SPECIFICATIONS FOR SEAMLESS-STEEL DRUM FORGINGS, 1930

SEAMLESS-STEEL DRUM FORGINGS

(With respect to process, discard, ladle and check analyses, heat treatment, tests, finish, and marking, this specification is substantially the same as A. S. T. M., A20-29T, given below, with the following exceptions and additional requirements:)

1. *Forgings.*—The forgings shall be made from solid cast ingots, punched, bored, or hot trephined. The walls of the hollowed ingot shall be reduced in thickness at least one-half by forging on mandrels.

2. *Chemical composition.*—The steel shall conform to the following requirements as to chemical composition:

	Class 1	Class 2
	<i>Per cent</i>	<i>Per cent</i>
Carbon, maximum.....	0.35	0.45
Manganese.....	0.30-0.65	0.30-0.65
Phosphorus:		
Acid, maximum.....	.04	.04
Basic, maximum.....	.035	.035
Sulphur, maximum.....	.04	.04

3. *Tension tests.*—The forging shall conform to the following requirements as to tensile properties:

	Class 1	Class 2
Tensile strength, minimum.....lbs./in. ² ..	60,000	75,000
Yield point, minimum.....do.....	0.5 tensile strength.	0.5 tensile strength.
Elongation in 2 inches, minimum.....per cent..	26	24
Reduction of area.....do.....	42	38

4. One bend-test specimen shall be taken from the end of the forging corresponding to the top of the ingot. The axis of the specimen shall be in a diametral plane perpendicular to the axis of the forging. The bend-test specimen shall be 1 inch by one-half inch in section, with edges rounded to 1/16-inch radius.

5. Two tension tests and one bend test shall be made from each forging.

6. *Permissible variation.*—The thickness of the parallel wall of each forging shall not be less than that specified. If the thickness of a portion of the wall of the forging is less than that specified, due to accidental or unavoidable irregularity of bore, the forgings may be accepted by the purchaser, provided such irregularity will not require lowering

of the allowable working pressure below that for which the drum is designed.

7. The overweight limits are considered a matter of contract between the manufacturer and the purchaser.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARBON-STEEL AND ALLOY-STEEL FORGINGS, DESIGNATION A18-30, 1930

CARBON-STEEL AND ALLOY-STEEL FORGINGS

SCOPE

1. (a) These specifications cover the various classes of carbon-steel and alloy-steel forgings now commonly used and not covered by other existing specifications of the American Society for Testing Materials.

(b) The purposes for which these classes are frequently used are as follows:

Class A, for forgings which may be welded or casehardened.

Class B, for mild-steel forgings for structural purposes, for minor ship fittings, etc.

Class C, for mild-steel forgings for structural purposes, for ships, etc.

Classes D, E, F, G, H, and I, for various machinery forgings, choice depending upon design and upon the stresses and service to be imposed.

Classes K, L, and M, for various machinery forgings, choice depending upon design and upon the stresses and services to be imposed, and upon the character of machining operations to be done.

MANUFACTURE

2. The steel shall be made by either or both the following processes: Open hearth or electric furnace.

3. A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

4. Unless otherwise specified, for test purposes at least 20 per cent of the forgings shall be provided with prolongations or, at the manufacturer's option, a forging may be selected.

5. If boring is specified, the diameter of the hole shall be at least 20 per cent of the maximum outside diameter or thickness of the forging, exclusive of collars and flanges.

6. Heat treatment, if required, shall consist of either annealing or quenching and tempering, as specified.

(a) The procedure to be followed in annealing shall consist in allowing the objects, immediately after forging, to cool to a temperature below the critical range, under suitable conditions to prevent injury by too rapid cooling. They shall then be uniformly reheated to the proper temperature to refine the grain (a group thus heated being known as an annealing charge), and allowed to cool uniformly.

(b) The procedure to be followed in quenching and tempering shall consist in allowing the objects, immediately after forging, to cool to a temperature below the critical range, under suitable conditions to prevent injury by too rapid cooling. They shall then be uniformly reheated to the proper temperature to refine the grain (a group thus reheated being known as quenching charge), and quenched in some medium under substantially uniform conditions for each quenching charge. Finally, they shall be uniformly reheated to the proper temperature for tempering or "drawing back" (a group thus reheated being known as a tempering charge), and allowed to cool uniformly.

CHEMICAL PROPERTIES AND TESTS

7. (a) The steel shall conform to the following requirements as to chemical composition:

TABLE 1

Elements considered	Classes				
	A	B, C, D, E, F, G	H, I	K, L	M
Manganese.....	<i>Per cent</i> 0.30-0.60	<i>Per cent</i> 0.40-0.80	<i>Per cent</i> 0.40-0.80	<i>Per cent</i> 0.05	<i>Per cent</i> 0.04
Phosphorus:					
Acid, not over.....	.05	.05	.04	.05	.04
Basic, not over.....	.05	.05	.04	.04	.04
Sulphur, not over.....	.05	.05	.05	.05	.05
Nickel, not under.....			3.00		

(b) The composition of alloy steel, other than phosphorus and sulphur, to be used in forgings of classes K, L, and M, shall be agreed upon by the manufacturer and the purchaser.

8. An analysis of each melt of steel shall be made by the manufacturer to determine the percentage of carbon, manganese, and the elements specified in section 7. This analysis shall be made from a test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in section 7.

9. An analysis may be made by the purchaser from a forging representing each melt. The chemical composition thus determined shall conform to the requirements specified in section 7. Drillings for analysis may be taken from the forging or from a full-size prolongation of the same, at any point midway between the center and surface of solid forgings, and at any point midway between the inner and outer surfaces of the wall of bored forgings; or turnings may be taken from a test specimen.

PHYSICAL PROPERTIES AND TESTS

10. (a) The forgings shall conform to the requirements as to tensile properties specified in Tables 1, 2, and 3.

TABLE 1.—Tensile properties (classes A to F, inclusive)

[For forgings whose maximum outside diameter or over-all thickness is not over 20 inches]

Class	Size, outside diameter or over-all thickness	Tensile strength, minimum (except class A)	Yield point, minimum, pounds per square inch	Elongation in 2 inches minimum per cent		Reduction of area, minimum per cent	
				Inverse ratio	Not under	Inverse ratio	Not under
A, untreated.....	All sizes.....	<i>Lbs./in.²</i> 47,000-60,000	0.5 tensile strength.....	<u>1,500,000</u> Tensile strength	-----	<u>2,500,000</u> Tensile strength	-----
B, untreated.....	Not over 12 inches.....	60,000	do.....	<u>1,550,000</u> Tensile strength	22	<u>2,400,000</u> Tensile strength	35
	Over 12 to 20 inches, inclusive.....	60,000	do.....	<u>1,480,000</u> Tensile strength	21	<u>2,220,000</u> Tensile strength	32
C, annealed.....	Not over 12 inches.....	60,000	do.....	<u>1,700,000</u> Tensile strength	25	<u>2,700,000</u> Tensile strength	38
	Over 12 to 20 inches, inclusive.....	60,000	do.....	<u>1,600,000</u> Tensile strength	24	<u>2,520,000</u> Tensile strength	36
D, untreated.....	Not over 8 inches.....	75,000	do.....	<u>1,600,000</u> Tensile strength	18	<u>2,200,000</u> Tensile strength	24
	Over 8 to 12 inches, inclusive.....	75,000	do.....	<u>1,500,000</u> Tensile strength	17	<u>2,000,000</u> Tensile strength	22
	Over 12 to 20 inches, inclusive.....	75,000	do.....	<u>1,400,000</u> Tensile strength	16	<u>1,800,000</u> Tensile strength	20
	Not over 8 inches.....	75,000	do.....	<u>1,800,000</u> Tensile strength	20	<u>2,800,000</u> Tensile strength	33
E, annealed.....	Over 8 to 12 inches, inclusive.....	75,000	do.....	<u>1,725,000</u> Tensile strength	19	<u>2,640,000</u> Tensile strength	31
	Over 12 to 20 inches, inclusive.....	75,000	do.....	<u>1,650,000</u> Tensile strength	18	<u>2,400,000</u> Tensile strength	29
F, annealed.....	Not over 8 inches.....	80,000	do.....	<u>1,800,000</u> Tensile strength	20	<u>2,800,000</u> Tensile strength	32
	Over 8 to 12 inches, inclusive.....	80,000	do.....	<u>1,725,000</u> Tensile strength	19	<u>2,640,000</u> Tensile strength	30
	Over 12 to 20 inches, inclusive.....	80,000	do.....	<u>1,650,000</u> Tensile strength	18	<u>2,400,000</u> Tensile strength	28

(b) The classification by size of the forging shall be determined by the specified diameter or thickness which governs the size of the prolongation from which the test specimen is taken.

(c) The yield point shall be determined by the drop of the beam of the testing machine.

(d) The elastic limit called for by these specifications shall be determined by an extensometer reading to 0.0002 inch. The extensometer shall be attached to the specimen at the gage marks and not to the shoulders of the specimen nor to any part of the testing machine. When the specimen is in place and the extensometer attached, the testing

may be taken from the forging itself with a hollow drill, if approved by the purchaser.

(b) The axis of the specimen shall be located at any point midway between the center and surface of solid forgings, and at any point midway between the inner and outer surfaces of the wall of bored forgings, and shall be parallel to the axis of the forging in the direction in which the metal is most drawn out.

(c) The specimens shall conform to the dimensions shown in Figure 550. The ends shall be of a form to fit the holders of the testing machine in such a way that the load shall be axial. (This figure is identical with Figure 129 in standard specifications for steel. See 605.0, p. 247.)

12. Unless otherwise specified by the purchaser, tests shall be made as follows:

(a) For untreated forgings, one tension test shall be made from each melt.

(b) For annealed forgings, one tension test shall be made from each annealing charge. If more than one melt is represented in an annealing charge, one tension test shall be made from each melt.

(c) For quenched and tempered forgings, one tension test shall be made from each tempering charge. If more than one quenching charge is represented in a tempering charge, one tension test shall be made from each quenching charge. If more than one melt is represented in a quenching charge, one tension test shall be made from each melt.

(d) If more than one class of forgings by size is represented in any lot, one tension test from a forging of each class by size shall be made as specified in sections 10 and 11.

(e) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(f) If the percentage of elongation of any test specimen is less than that specified in section 10 (a), and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

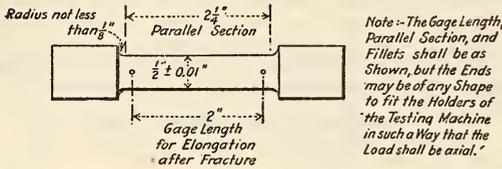

FIGURE 550.—Standard test piece

(This figure is identical with fig. 129.)

machine shall be operated so as to increase the load on the specimen at a uniform rate. The observer shall watch the elongation of the specimen as shown by the extensometer and shall note, for this determination, the load at which the rate of elongation shows a sudden increase. The extensometer shall then be removed from the specimen, and the test continued to determine the tensile strength.

(e) Tests of forgings shall be made only after final treatment.

11. (a) Tension-test specimens shall be taken from a full-size prolongation of any forging. For forgings with large ends or collars, the prolongation may be of the same cross section as that of the forging back of the large end or collar. Specimens

TABLE 2.—Tensile properties (classes G, H, and I)

[For forgings whose maximum outside diameter or thickness is not over 10 inches when solid, and not over 20 inches when bored]

Class	Size	Tensile strength, minimum <i>Lbs./in.²</i>	Elastic limit, minimum <i>Lbs./in.²</i>	Elongation in 2 inches, minimum, per cent		Reduction of area, minimum, per cent	
				Inverse ratio	Not under	Inverse ratio	Not under
G, quenched and tempered.	Up to 4 inches in outside diameter or thickness, 2-inch maximum wall.	90,000	55,000	$\frac{2,100,000}{\text{Tensile strength.}}$	20.5	$\frac{4,000,000}{\text{Tensile strength.}}$	39
	Over 4 to 7 inches in outside diameter or thickness, 3½-inch maximum wall.	85,000	50,000	$\frac{2,000,000}{\text{Tensile strength.}}$	20.5	$\frac{3,800,000}{\text{Tensile strength.}}$	39
	Over 7 to 10 inches in outside diameter or thickness, 5-inch maximum wall.	85,000	50,000	$\frac{1,900,000}{\text{Tensile strength.}}$	19.5	$\frac{3,600,000}{\text{Tensile strength.}}$	37
	Outside diameter or thickness not over 20 inches, 5 to 8-inch wall.	82,500	48,000	$\frac{1,800,000}{\text{Tensile strength.}}$	19	$\frac{3,400,000}{\text{Tensile strength.}}$	36
For forgings whose maximum outside diameter or over-all thickness is not over 20 inches							
H, nickel steel, annealed.	Outside diameter of over-all thickness not over 12 inches.	80,000	50,000	$\frac{2,000,000}{\text{Tensile strength.}}$	22	$\frac{3,600,000}{\text{Tensile strength.}}$	40
	Outside diameter or over-all thickness over 12 to 20 inches, inclusive.	80,000	50,000	$\frac{1,900,000}{\text{Tensile strength.}}$	21	$\frac{3,400,000}{\text{Tensile strength.}}$	38
For forgings whose maximum outside diameter or thickness is not over 10 inches when solid, and not over 20 inches when bored							
I, nickel steel, quenched and tempered.	Up to 4 inches in outside diameter or thickness, 2-inch maximum wall.	100,000	70,000	$\frac{2,200,000}{\text{Tensile strength.}}$	20	$\frac{4,500,000}{\text{Tensile strength.}}$	41
	Over 4 to 7 inches in outside diameter or thickness, 3½-inch maximum wall.	100,000	65,000	$\frac{2,100,000}{\text{Tensile strength.}}$	20	$\frac{4,300,000}{\text{Tensile strength.}}$	41
	Over 7 to 10 inches in outside diameter or thickness, 5-inch maximum wall.	90,000	60,000	$\frac{2,000,000}{\text{Tensile strength.}}$	20	$\frac{4,100,000}{\text{Tensile strength.}}$	41
	Outside diameter or thickness not over 20 inches, 5 to 8-inch wall.	85,000	55,000	$\frac{1,900,000}{\text{Tensile strength.}}$	20	$\frac{3,900,000}{\text{Tensile strength.}}$	41

TABLE 3.—Tensile properties (classes K, L, and M)

[For forgings whose maximum outside diameter or thickness is not over 10 inches when solid, and not over 20 inches when bored]

Class	Size	Tensile strength	Elastic limit, minimum	Elongation in 2 inches, minimum	Reduction of area, minimum
K, alloy steel, quenched and tempered.	Up to 2 inches in outside diameter or thickness, 1-inch maximum wall.	<i>Lbs./in.²</i> 95,000-115,000	<i>Lbs./in.²</i> 70,000	<i>Per cent</i> 20	<i>Per cent</i> 50
	Over 2 to 4 inches in outside diameter or thickness, 2-inch maximum wall.	90,000-110,000	65,000	20	50
	Over 4 to 7 inches in outside diameter or thickness, 3½-inch maximum wall.	90,000-110,000	65,000	20	50
	Over 7 to 10 inches in outside diameter or thickness, 5-inch maximum wall.	90,000-110,000	65,000	20	50
	Outside diameter or thickness not over 20 inches, 5 to 8 inch wall.	85,000-105,000	60,000	20	50
L, alloy steel, quenched and tempered.	Up to 2 inches in outside diameter or thickness, 1-inch maximum wall.	105,000-125,000	80,000	20	50
	Over 2 to 4 inches in outside diameter or thickness, 2-inch maximum wall.	100,000-120,000	75,000	20	50
	Over 4 to 7 inches in outside diameter or thickness, 3½-inch maximum wall.	100,000-120,000	75,000	20	50
	Over 7 to 10 inches in outside diameter or thickness, 5-inch maximum wall.	100,000-120,000	75,000	18	45
	Outside diameter or thickness not over 20 inches, 5 to 8 inch wall.	95,000-115,000	70,000	18	45
M, alloy steel, quenched and tempered.	Up to 2 inches in outside diameter or thickness, 1-inch maximum wall.	<i>Minimum</i> 125,000	105,000	16	50
	Over 2 to 4 inches in outside diameter or thickness, 2-inch maximum wall.	115,000	95,000	16	45
	Over 4 to 7 inches in outside diameter or thickness, 3½-inch maximum wall.	110,000	85,000	16	45
	Over 7 to 10 inches outside diameter or thickness, 5-inch maximum wall.	100,000	75,000	18	45
	Outside diameter or thickness not over 20 inches, 5 to 8-inch wall.	100,000	70,000	18	45

13. (a) When annealed or quenched-and-tempered forgings are specified, if the results of the physical tests of any test lot of forgings do not conform to the requirements specified, the manufacturer may re-treat such lot one or more times, and retests shall be made as specified in section 12.

(b) When untreated forgings (classes A, B, and D) are specified, if the results of the physical tests of any lot of forgings do not conform to the requirements specified, the manufacturer may anneal such lot one or more times, and retests shall be made as specified in section 12.

14. The forgings shall conform to the sizes and shapes specified by the purchaser. When centered 60° centers with clearance drilled for points shall be used.

(Requirements covering workmanship and finish, marking, inspection and rejection, and reheating conform with those specified in A. S. T. M. standard specifications for steel, paragraphs 5, 6, 7, 8, and 9. (See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR CARBON-STEEL FORGINGS FOR LOCOMOTIVES, DESIGNATION A20-31T, 1931

CARBON-STEEL FORGINGS FOR LOCOMOTIVES

SCOPE

1. These specifications cover untreated, annealed, and normalized-and-tempered carbon-steel driving axles, engine and trailing-truck axles, main and side rods, straps, crank pins, piston rods, and annealed car and tender axles.

2. The manufacturer may at his option furnish annealed forgings when untreated forgings are speci-

fied by the purchaser, provided they conform to the requirements specified for untreated forgings.

MANUFACTURE

(Requirements covering manufacture are practically the same as for carbon-steel and alloy-steel forgings in A18, given above, except that boring requirements differ, and the process of normalizing replaces that of quenching, as indicated in the following paragraphs.)

3. *Boring*.—If boring is required in the case of axles, shafts, and similar forgings, it shall be performed before heat treatment, and the diameter of the hole, unless otherwise specified, shall be at least 20 per cent of the maximum outside diameter or thickness of the forging, exclusive of collars and flanges.

3. (a) *Normalizing*.—For normalizing, the forgings shall be uniformly reheated to a proper temperature to refine the grain and, after being held a sufficient length of time at this temperature, shall be withdrawn from the furnace and allowed to cool uniformly in the atmosphere, protected from rain or snow, to a temperature below the critical range. A group of forgings thus heated shall be known as a normalizing charge. Normalizing, when specified, shall be followed either by annealing or by tempering.

CHEMICAL PROPERTIES AND TESTS

4. The steel shall conform to the following requirements as to chemical composition:

Manganese:	Per cent
For untreated forgings.....	0.50 to 0.80
For heat-treated forgings.....	.60 to .90
Phosphorus, not over.....	.05
Sulphur, not over.....	.05

(Chemical analysis is identical with that in A18, given above.)

PHYSICAL PROPERTIES AND TESTS

(The requirements covering tension tests are substantially the same as those for carbon-steel and alloy-steel forgings in A18, given above, except that no reference is made to elastic-limit tests by means of the extensometer, and the speed of the

machine for testing yield point is specified as to be not less than one-sixteenth inch nor more than one-eighth inch per minute. The minimum tensile requirements for untreated forgings not over 8 inches and over 8 to 12 inches, inclusive, are the same as for D untreated in A18, given above. Otherwise the minimum tensile requirements are as follows.)

TABLE 1.—Minimum tensile requirements

[For forgings whose maximum outside diameter or over-all thickness is not over 12 inches when untreated, and not over 20 inches when treated]

ANNEALED

Size, outside diameter or over-all thickness, in inches	Tensile strength Lbs./in. ²	Yield point Lbs./in. ²	Elongation in 2 inches, per cent		Reduction of area, per cent	
			Inverse ratio	Not under	Inverse ratio	Not under
Not over 8, 4-inch maximum wall.....	80,000	0.48 tensile strength...	$\frac{1,980,000}{\text{Tensile strength.}}$	22	$\frac{3,100,000}{\text{Tensile strength.}}$	35
Over 8 to 12, 6-inch maximum wall.....	80,000	...do.....	$\frac{1,900,000}{\text{Tensile strength.}}$	21	$\frac{2,900,000}{\text{Tensile strength.}}$	33
Over 12 to 20, 10-inch maximum wall.....	80,000	...do.....	$\frac{1,820,000}{\text{Tensile strength.}}$	20	$\frac{2,640,000}{\text{Tensile strength.}}$	31

NORMALIZED AND TEMPERED

Not over 8, 4-inch maximum wall.....	85,000	0.52 tensile strength...	$\frac{2,300,000}{\text{Tensile strength.}}$	25	$\frac{3,650,000}{\text{Tensile strength.}}$	40
Over 8 to 12, 6-inch maximum wall.....	83,000	...do.....	$\frac{2,100,000}{\text{Tensile strength.}}$	23	$\frac{3,320,000}{\text{Tensile strength.}}$	37
Over 12 to 20, 10-inch maximum wall.....	83,000	...do.....	$\frac{2,000,000}{\text{Tensile strength.}}$	22	$\frac{3,100,000}{\text{Tensile strength.}}$	35

5. Tests of forgings shall be made only after final heat treatment.

6. If specified by the purchaser, bend tests shall be made on annealed and normalized-and-tempered forgings as follows: The test specimen shall stand being bent cold through 180° around a pin one-half inch in diameter without cracking on the outside of the bent portion.

(Bend-test specimens are subjected to the same requirements as tension-test specimens in paragraph 11 (a) in A18, given above.)

7. Bend-test specimens shall be one-half inch square in section with corners rounded to a radius of not over one-sixteenth inch, and the length need not exceed 6 inches.

(Requirements covering tests on treated and untreated forgings are the same as given above in A18, except that bend tests are included here, when specified, and normalized forgings replace the quenched forgings specified in A18. In the matter of retests, this specification provides that:)

8. If the results of the physical tests of any test lot do not conform to the requirements specified, the manufacturer may re-treat such lot, but not more than three additional times unless authorized by the purchaser.

9. When annealed or normalized-and-tempered forgings are specified, if the fracture of any test specimen shows over 15 per cent crystalline a second test shall be made. If the fracture of the second specimen shows over 15 per cent crystalline, the forgings represented by such specimen shall be re-treated. The fracture shall be considered crys-

talline if the crystals which it contains are so large that the cleavage planes or sides of these crystals are easily visible to the naked eye.

WORKMANSHIP AND FINISH

10. The forgings shall conform to the sizes and shapes specified by the purchaser. Axles, shafts, and similar forgings, unless otherwise specified, shall be rough-turned all over with an allowance of one-eighth inch on the surface for finishing. In centering, 60° centers with clearance drilled for points shall be used.

(Requirements covering marking, inspection and rejection, and reheating conform to those specified in A. S. T. M. standard specifications for steel, paragraphs 6, 7, 8, and 9. See 605.0, p. 247.)

611.52 AXLES, SHAFTS, AND SIMILAR FORGINGS.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD DESIGN OF AXLES FOR ELECTRIC RAILWAY MOTORS, E3-30, 1930

RAILWAY MOTOR AXLES

(Axle, wheel, and gear data are summarized in tabular form in this specification, also axle stresses and journal loadings. Form, dimensions, and tolerances for axles of various capacities are shown in the diagrams accompanying the tabulated data.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD SPECIFICATION FOR QUENCHED AND TEMPERED CARBON-STEEL AXLES, SHAFTS, AND SIMILAR FORGINGS, E5-24, 1924

CARBON-STEEL FORGINGS

(In respect to manufacture, chemical properties and tests, physical properties and tests, workmanship and finish, inspection, rejection, and reheating, this specification conforms to the American Railway Association specification for axles, shafts, and other forgings, carbon steel, quenched and tempered, given below, including the references in the latter specification to A. S. T. M., A18-30, to A. S. T. M. standard specifications for steel in 605.0, and to the American Railway Association specification for alloy-steel forgings, quenched and tempered. This specification differs from the American Railway Association specification for axles, shafts, and other forgings, carbon steel, quenched and tempered, in the following particulars:)

(Boring requirements are omitted.)

The variation in thickness or diameter of forging, as determined by the specified diameter or thickness which governs the size of prolongation from which the test specimens are taken, shall not exceed 2 inches for forgings included in the same quenching or tempering charge.

TURNING

The forgings shall conform to sizes and shapes specified by the purchaser.

Unless otherwise specified by the purchaser, axles, shafts, and similar round forgings shall have a collar approximately 2 inches in width left rough forged on each forging, and the remainder of forging shall be rough turned, with an allowance of one-eighth inch on the surface for finishing.

Unless otherwise specified, all axles, shafts, and similar forgings shall have ends faced, with an allowance of one-eighth inch on each end for finishing, and shall be centered for 60° lathe centers, with clearance for points.

PHYSICAL PROPERTIES AND TESTS

Tensile tests.—After final treatment the forgings shall conform to the following minimum tensile properties:

Size	Tensile strength	Elastic limit	Elongation in 2 inches, not under	Reduction of area
Up to 4 inches in diameter or thickness	Lbs./in. ² 90,000	Lbs./in. ² 55,000	Per cent 20.5	Per cent 39
Over 4 inches up to 7 inches diameter or thickness	85,000	50,000	20.5	39

For forgings with large ends or collars (except axles), the prolongation may be of the same cross-section as that of the forging back of the large end or collar. For axles, the nominal diameter governing the size of the prolongation shall be the finished diameter of the motor-bearing seat.

MARKING

Each billet shall be legibly stamped with an identification number representing melt, which shall be

transferred to the final forging immediately after reduction of billet has been completed.

Before treatment, each forging shall be stamped with a shop identification number. These shop numbers are to permit of identifying the forgings in each quenching and tempering charge to determine the number of required physical tests.

The name or trade-mark of the manufacturer, identification number, and inspector's mark shall be legibly stamped on each finished forging in location indicated by the purchaser.

The manufacturer shall report to the purchaser upon each shipment, the number of quenching and tempering charges, together with the melt numbers and identification numbers of forgings included in each quenching and tempering charge.

REJECTION

Unless otherwise agreed upon between the purchaser and the manufacturer, any rejection based on test made in accordance with specified requirements shall be reported within 10 working days from the receipt of samples (instead of within five working days as specified in A. S. T. M. standard specifications for steel in 605.0, p. 247).

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD SPECIFICATION FOR ANNEALED CARBON-STEEL AXLES, SHAFTS, AND SIMILAR FORGINGS, E6-23, 1923

CARBON-STEEL FORGINGS

MANUFACTURE

(Requirements covering manufacture are practically the same as for carbon-steel and alloy-steel forgings in A. S. T. M., A18-30 (see 611.51, p. 754), including the heat treatment specified in paragraph 6 (a), but omitting the boring.)

TURNING

(Same as in American Electric Railway Engineering Association specification E5-24, given above.)

CHEMICAL PROPERTIES AND TESTS

Chemical composition.—(Same for maximum limit as for medium forgings, class B, in American Railway Association specification for axles, shafts, and other forgings, carbon steel, annealed and unannealed, given below, while ladle and check analyses are the same as in A. S. T. M., A18-30, with the addition of the following paragraph:)

In addition to the complete analysis, a phosphorus determination may be made by the purchaser from turnings from each tensile-test specimen, and this determination shall conform to the requirements for phosphorus specified.

PHYSICAL PROPERTIES AND TESTS

Tensile tests.—After annealing, the forgings shall conform to the following minimum tensile properties:

Tensile strength	lbs./in. ²	80,000
Elastic limit, (lbs./in. ²), per cent of tensile strength		50
Elongation in 2 inches	per cent	20
Reduction in area	do	32

Bend tests.—The bend-test specimen shall bend cold through 180° around a 1-inch flat mandrel having a rounded edge of 1/4-inch radius, without cracking on the outside of the bent portion.

Bend-test specimens shall be one-half inch square in section with corners rounded to a radius of not over one thirty-second inch, and need not exceed 6 inches in length.

(Requirements covering determination of elastic limit by means of the extensometer, tension and bend test specimens (including illustration), are the same as for carbon-steel and alloy-steel forgings in A. S. T. M., A18-30. See 611.51, p. 754.)

(Requirements covering number of tests and re-treating are the same as for axles, shafts, and other forgings, alloy steel, quenched and tempered, American Railway Association specification (see 622.6, p. 1136) except that annealing is substituted in E6 for tempering and quenching in the A. R. A. specification. Marking is the same as in E5-24, given above, while finish, inspection and rejection, and reheating conform to A. S. T. M. standard specifications for steel in 605.0, p. 247.)

AMERICAN PETROLEUM INSTITUTE, RIG-IRON STANDARDS, A. P. I. STANDARDS NO. 6, JANUARY, 1930

CRANKS AND SHAFTS

MATERIAL COVERED

These specifications apply to rig irons for oil-country purposes. Three sizes—4½ inch, 5 inch,

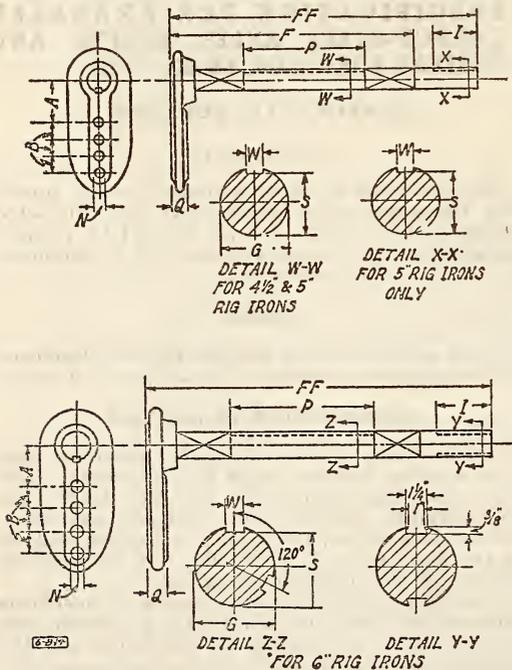

FIGURE 551.—Crank and shafts

and 6 inch are standard. The standards are dimensional only and apply to new material. These specifications do not include chemical or physical properties of materials.

WORKMANSHIP AND FINISH

All machined surfaces shall be finished in a good and workmanlike manner and shall be free from burrs, rough edges, etc.

All castings shall have rough edges chipped or ground off, shall be commercially clean, and shall be free from injurious defects. All cored bolt holes shall be drilled to insure free passage of proper sized bolts.

All forgings shall be free from injurious defects, and shall have a workmanlike finish.

MARKING

Rig irons manufactured in accordance with these dimensional standards shall be stamped or marked with the official A. P. I. monogram as stipulated in these specifications. No rig iron material shall be stamped with the A. P. I. monogram that does not comply with these specifications. Authority will be granted to use the A. P. I. monogram in accordance with the rules and conditions contained in the appendix.

All rig iron material manufactured in accordance with these specifications shall also be marked with the manufacturer's name or other identifying mark.

Where the A. P. I. monogram is specified on forged metal it shall be applied with a steel stencil, size of monogram to be one-half inch high as follows:

When the A. P. I. monogram is specified on cast material the design of the monogram shall be affixed to the pattern, letters to be 1½ inches long, in a 2-inch circle; height of letters and circle to be not less than one-eighth inch, substantially as follows:

Crank and shafts for A. P. I. standard rig irons shall be dimensioned as shown in Figure 551 and Table 1.

The crank and shaft shall be considered as one unit. They shall be so assembled that the crank is permanently attached to the shaft. Each shaft shall be the same diameter, within the tolerance specified herein, throughout its length, disregarding that part of the shaft in the crank.

All shaft diameters, keys, and keyways shall be as specified (for keys and keyways see 608.52, p. 616), except clutch keyways at end of 6-inch crank shaft, which shall be as shown in the accompanying figure.

All flange keyways, *P*, shall be cut the full length of that part of the shaft between the front and back jack-post boxes; other keyways as shown.

Shafts of 4½ and 5 inches shall have one flange keyway.

The 6-inch shaft shall have two flange keyways, spaced 120°, and located on the upper side of the shaft at 60° on either side of a vertical center line when the crank is in a downward vertical position.

One accessory keyway shall be provided for the 5-inch shaft in the 6-foot 6-inch length.

The 6-inch shaft shall have two clutch keyways, spaced 180°. The crank and shaft for 4½-inch rig irons shall be made in one length of shaft only.

The crank and shaft for 5-inch rig irons may be made in two lengths of shafts, namely, 5-foot 6-inch length with keyways for flanges only, 6-foot 6-inch length with keyways for flanges and for accessory equipment.

The crank and shaft for 6-inch rig irons may be made in two lengths of shafts—7 feet 6 inches and 8 feet.

The A. P. I. monogram shall be cast on the same side of the crank as the manufacturer's name or trade-mark, and shall be stamped with a steel die on the end of the shaft.

TABLE 1

[All dimensions in inches at 68° F., except length of shaft, which is given in feet]

	4½-inch rig irons		5-inch rig irons		6-inch rig irons	
	Dimension	Tolerance	Dimension	Tolerance	Dimension	Tolerance
Crank:						
"A" distance from center of shaft to first wrist-pin hole.....	11¼	-----	11¼	-----	12	-----
"B" distance between wrist-pin holes.....	3¾	-----	3¾	-----	5	-----
"N" diameter of wrist-pin hole.....	2.753 +0.002 - .000		2.753 +0.002 - .000		3.503 +0.002 - .000	
"Q" thickness of crank.....	3½	-----	3½	-----	4	-----
Shaft:						
Length "F-F".....			6'6"		{ 5'6" 8'0" }	
Length "F".....	5'6"		5'6"			
Keyways:						
Number of flange keyways required.....	1	-----	1	-----	2	-----
"P" length flange keyways.....						
Number of keyways required at end of shaft.....			1	-----	12	-----
Length "I".....			9	-----	12	-----

¹ The size of keyways for calf-wheel clutch shall be as shown in fig. 551 detail "y-y."

NOTE.—For shaft, key, and keyway dimensions, see 608.52, p. 616.

AMERICAN PETROLEUM INSTITUTE, DIMENSIONAL STANDARDS FOR LINE SHAFTS (FOR ROTARY DRILLING), A. P. I. STANDARDS NO. 7-C, JANUARY, 1930

LINE SHAFTS

MATERIAL COVERED

These specifications apply to line shafts (complete) used in rotary drilling. They are dimensional only, apply to new equipment, and do not include either chemical or physical properties or materials, except as to finish.

(Workmanship and finish, and marking, conform to the requirements specified for A. P. I. cranks and shafts, given above.)

Three sizes of line shafts are standard—4 inch, 5 inch, and 6 inch.

Shafts, bores in mating members, keys, and keyways for A. P. I. rotary line shafts manufactured in

accordance with Figures 552(a) and 552(b) and Table 1, Figure 552(c) and Table 2, and Figure 553 and Table 3 are standard.

Line shafts (bare) and keys manufactured in accordance with these specifications shall be stamped (by a steel die) with the A. P. I. monogram as follows:

Line shafts.—On the end.

Keys.—On the upper side, near the gib head, to be visible when in place.

(Requirements covering inspection and rejection conform to those specified in A. S. T. M. standard

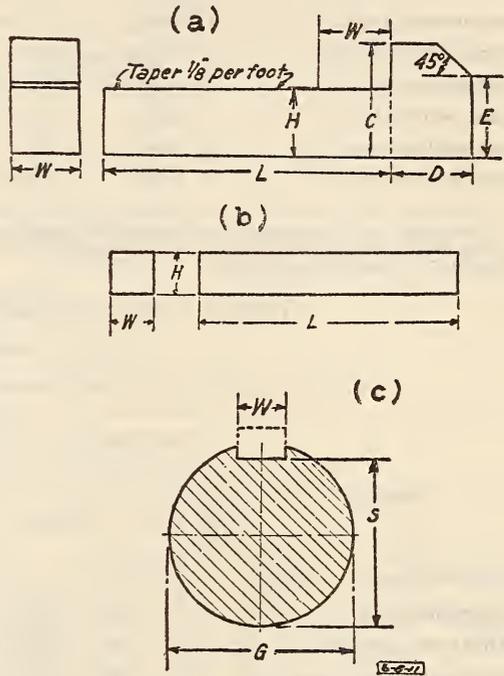

FIGURE 552

(a) Gib head taper key, (b) plain feather key, (c) shaft details

specifications for steel (see 605.0, p. 247) with the following additional provisions:

No rejections under these or any other specifications are to be stamped with the A. P. I. monogram. When material stamped or marked with the A. P. I. monogram is rejected, such monogram shall be canceled as follows: On cast material the loop in the letter P shall be chipped off; on forged or wrought material a steel canceling stencil one-half inch square shall be applied twice—first horizontally; the stencil then turned 90° and applied a second time.

TABLE 1.—Keys for A. P. I. standard rotary line shafts

[See fig. 552a and fig. 552b]

[All dimensions in inches at 68° F.]

Member	Nominal shaft size "T"	Keys							
		Type	Nominal size	Taper, inches per foot	Length "L"	Width		Height ¹	
						"W"	Tolerance	"H"	Tolerance
Tight members, keyed.....	4	Taper.....	1 by ¾.....	½	Optional.....	1.000	{ +0.000 - .003 }	0.750	{ +0.003 - .000 }
Sliding members, keyed.....	4	Feather.....	1 by 1.....		do.....	1.000	{ +.000 - .003 }	1.000	{ +.000 - .003 }
Tight members, keyed.....	5	Taper.....	1¼ by ⅞.....	½	do.....	1.250	{ +.000 - .003 }	.875	{ +.003 - .000 }
Sliding members, keyed.....	5	Feather.....	1¼ by 1¼.....		do.....	1.250	{ +.000 - .003 }	1.250	{ +.000 - .003 }
Tight members, keyed.....	6	Taper.....	1½ by 1.....	½	do.....	1.500	{ +.000 - .003 }	1.000	{ +.003 - .000 }
Sliding members, keyed.....	6	Feather.....	1½ by 1½.....		do.....	1.500	{ +.000 - .003 }	1.500	{ +.000 - .003 }

¹ The height "H" is measured at the distance "W" from gib on taper keys.

The dimensions indicated in fig. 552a and not shown in the above table are not essential to the fit; they can be obtained from A. P. I. Standards 7: "Transmission Standards."

TABLE 2.—Shaft details for A. P. I. standard rotary line shafts

[See fig. 552c]

[All dimensions in inches at 68° F.]

Member	Shaft diameter			Key		Keyway ¹			
	Nominal "T"	"G"	Tolerance	Type	Nominal size	Width		Diameter of shaft to bottom of keyway	
						"W"	Tolerance	"S"	Tolerance

Sliding members, not keyed.....	6	6.005	{ +.003 - .000						

¹ All keyways shall be cut on a diametral center line; see fig. 374 1/2 for explanation of tolerances on taper keys.

(Explanation of tolerances on taper keys is identical with that given in the A. P. I. specification for shaft keys and keyways. See 608.52, p. 616.)

at the center shall be purchased under the latest issue of specifications for annealed carbon steel axles. (See below.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, AXLES, CARBON STEEL, FOR CARS AND LOCOMOTIVE TENDERS, 1926

MANUFACTURE

Process.—The steel shall be made by the open-hearth or electric process.

CHEMICAL PROPERTIES AND TESTS

(The chemical composition is identical with that for medium forgings class A in the American Railway Association specification for annealed and un-annealed carbon steel forgings, given below, while the ladle and check analyses conform to the requirements specified in A. S. T. M. A18-30. See 611.51, p. 754.)

CARBON-STEEL AXLES

SCOPE

These specifications cover tapered axles up to and including those 6 1/2 inches in nominal diameter at the center. Axles over 6 1/2 inches in diameter

PHYSICAL PROPERTIES AND TESTS

Drop tests.—(a) The test axles shall be so placed on supports 3 feet apart that the tup will strike it midway between the ends. It shall stand without fracture five blows from a tup of 2,240 pounds falling from a height *H*, such that *H* in feet equals the square of the diameter of the axle at the center in inches, $H=d^2$. The axle shall be rotated through 180° after the first and third blows.

(b) Before an axle is drop tested, the center shall be calipered to the nearest one-eighth inch, and the height of drop in feet, to the nearest half foot, shall not be less than the square of the actual diameter, at the center, in inches.

(c) The permanent set produced by the first blow shall not exceed that given by the following formula, in which *L*=length of axle in inches and *d*=diameter of axle at center in inches:

$$\frac{L}{1.9d} - \frac{d}{2} + \frac{1}{2} \text{ inch.}$$

(d) The American Railway Association has adopted five standard sizes of axles, the requirements for which, based on the above formula, are given in the following table:

Classification of axles	Size of journal	Diameter of axle at center	Length of axle	Height of drop	Number of blows	Maximum permanent set
A.....	3¾ by 7	4¼ 4⅜ 4½ 4¾	83¼	18 19 20 22½	5	8¼ 8½ 8 7½
B.....	4¼ by 8	4⅜ 4½ 5	84¼	23½ 25 29	5	7¼ 7 6¼
C.....	5 by 9	5½ 5½ 5½	86½	30 31½ 34½	5	6 5¼ 5½
D.....	5½ by 10	6 6½ 6¾	88½	36 37½ 41½	5	5¼ 5 4¾
E.....	6 by 11	6¾ 6¾ 6¾	90¾	43 43 44½	5	4½ 4½ 4¼

(e) The permanent set is the difference between the distance from a straightedge to the middle point of the axle, measured before the first blow, and the distance measured in the same manner after the blow. The straightedge shall rest only on the end collars or the ends of the axle.

(f) The temperature of the test axle shall be between 40° and 120° F.

Drop-test machine.—The anvil of the drop-test machine shall be supported on 12 springs, as shown on the A. R. A. drawings, and shall be free to move in a vertical direction, and shall weigh 17,500 pounds. The radii of the striking face of the tup and of the supports shall be 5 inches.

Number of tests.—One drop test shall be made from each melt. The weight of axles offered from any one melt shall not be less than the equivalent of the weight of thirty 6 by 11 inch axles.

WORKMANSHIP AND FINISH

Workmanship.—(a) All axles shall be made and finished in a workmanlike manner, and all journals and wheel seats shall be rough turned. In centering, unless otherwise specified, 60° centers shall be used, with large diameter of countersink not less than seven-eighths inch and with clearance drilled one-half inch deep.

(b) Unless otherwise specified, axles shall be smooth forged, except the wheel seats and journals shall be rough turned in a workmanlike manner.

(c) Any straightening of axles, if required, shall be done at a temperature not below 1,100° F. (low red), and in such a manner as to leave the surface of the axles free from unnecessary scars.

Finish.—The axles shall be free from injurious defects and shall have a workmanlike finish.

PERMISSIBLE VARIATIONS AND WEIGHTS

Permissible variation.—(a) The axles shall conform in size and shape to the standard A. R. A. drawings. The length shall not be less than shown, and not more than one-eighth inch over.

(b) *Smooth forged axles.*—The diameters of the straight center portion of the axle and the black collars shall not be less than specified, and shall not be more than one-fourth inch over. The intermediate portion of the axles shall not be under the dimensions specified, and shall be forged to a straight taper in a workmanlike manner. The rough turned diameters of the journals and wheel seats shall be from one-eighth to one-quarter inch over the finished sizes to provide for proper finishing.

(c) *Rough-turned axles.*—The diameters of the straight center portion and the black collars shall not be less than specified. The straight center portion shall not be more than one-eighth inch over and the black collars not more than one-fourth inch over the diameters specified. The intermediate portion of the axle shall not be under the dimensions specified, and shall be turned to a straight taper in a workmanlike manner.

Weights.—The maximum weights of smooth-forged and rough-turned axles in any shipment shall not exceed those given below:

Classification of axles	Size of journal	Maximum weight	
		Smooth forged with rough-turned journals and wheel seats	Rough turned all over
A.....	3¾ by 7	435	425
B.....	4¼ by 8	530	520
C.....	5 by 9	705	695
D.....	5½ by 10	835	825
E.....	6 by 11	1,015	1,005

MARKING AND STORING

Marking.—Each axle shall have the manufacturer's name or brand legibly stamped on one of the black collars, and the melt number, the month and year when made stamped on the other.

Storing.—If, as a result of the inspection and tests, more axles are accepted than the order calls for, such accepted axles in excess shall be stamped by the inspector with his own name, and will then be piled and allowed to remain in stock at the works, subject to further orders from the purchasing agent. On receipt of further orders, axles once accepted will not be subject to further test. In all cases the inspector will keep an accurate record of the melt numbers and the number of axles in each melt which are stored and will transmit this information with each report.

INSPECTION AND REJECTION

(Requirements covering inspection, rejection, and reheating conform with those specified in A. S. T. M. standard specifications for steel, paragraphs 7, 8, and 9. See 605.0, p. 247.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, AXLES, SHAFTS, AND OTHER FORGINGS, CARBON STEEL, ANNEALED AND UNANNEALED, 1926

CARBON-STEEL FORGINGS

SCOPE

(a) These specifications cover two grades of forgings, distinguished, respectively, as "medium" and "mild," with the "medium" grade divided into class A for unannealed and class B for annealed forgings. Medium forgings are intended for the important large forged parts of locomotives, such as axles, rods, rod straps, pins, guides, etc. Mild forgings are to be used only where so ordered, for parts of minor importance, and those which are to be casehardened, etc.

(b) The manufacturer may, at his option, furnish annealed forgings when unannealed forgings are specified by the purchaser, provided they conform to the requirements specified for unannealed forgings.

(c) Unless otherwise specified, annealed material shall be furnished for medium forgings. Mild forgings may be furnished unannealed unless otherwise specified.

MANUFACTURE

Process.—The steel may be made by the open-hearth or electric process.

Prolongation for test.—The manufacturer and the purchaser shall agree upon forging on which a prolongation for test purposes shall be provided.

Annealing.—(a) For annealing, the forgings shall be allowed to become cold after forging. They shall then be uniformly reheated to the proper temperature to refine the grain (a group thus reheated being known as an annealing charge) and allowed to cool uniformly.

(b) Material ordered to these specifications must under no circumstances be quenched.

CHEMICAL PROPERTIES AND TESTS

Chemical composition.—The steel shall conform to the following requirements as to chemical composition:

	Medium forgings		Mild forgings
	Class A	Class B	
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Carbon.....	0.40-0.55	0.45-0.60	0.05-0.15
Manganese.....	.04- .70	.40- .70	.30- .60
Phosphorus, maximum.....	.05	.05	.05
Sulphur, maximum.....	.05	.05	.05

(Ladle and check analyses, classification by size, time of testing forgings, tension-test specimens (including illustration), number of tests—all conform to the requirements specified in A. S. T. M. A18-30 (see 611.51, p. 754) except that in this specification there is no reference to quenching, since it specifically provides that:)

Material ordered to these specifications must under no circumstances be quenched.

PHYSICAL PROPERTIES

(Tensile properties of forgings whose maximum outside diameter or over-all thickness is not over 12 inches when unannealed and not over 20 inches when annealed are identical, respectively, with class D untreated and class F annealed in A. S. T. M. A18-30.) Mild forgings of all sizes shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	Lbs./in. ²	47,000
Yield point.....	0.5 tensile strength	
Elongation in 2 inches.....	per cent	30
Reduction of area.....	do	45

The yield point shall be determined by the drop of the beam of the testing machine, the speed of the crosshead of the machine not exceeding one-half inch per minute. For the determination of tensile strength the speed shall not exceed 2 inches per minute.

(Retests are the same as in A. S. T. M. A20 (see 611.51, p. 757), while workmanship and finish, marking, inspection and rejection, and reheating conform to A. S. T. M. standard specifications for steel, pars. 5, 6, 7, 8, and 9 (see 605.0, p. 247).)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, AXLES, SHAFTS, AND OTHER FORGINGS, CARBON STEEL, QUENCHED AND TEMPERED, 1925

CARBON-STEEL FORGINGS

SCOPE

These specifications are to cover the various classes of carbon steel forgings now commonly used in locomotive construction, classified as class A and class B on the basis of size.

MANUFACTURE

(Requirements covering manufacture are practically the same as for carbon-steel and alloy-steel forgings in A. S. T. M. A18-30 (see 611.51, p. 754) including the heat-treatment specified in par. 6 (b).)

CHEMICAL PROPERTIES AND TESTS

Chemical composition.—The steel shall conform to the following requirements as to chemical composition:

Carbon:	Per cent
Class A.....	0.40-0.55
Class B.....	.45- .60
Manganese.....	.40- .70
Phosphorus, not over.....	.05
Sulphur, not over.....	.05

(Ladle and check analyses are the same as in A. S. T. M. A18-30, and include the additional paragraph in regard to phosphorus determination given in the American Railway Association specification for alloy-steel forgings, quenched and tempered. See 622.6, p. 1136.)

PHYSICAL PROPERTIES AND TESTS

Tension tests.—The forgings shall conform to the requirements as to tensile properties specified in Table 1.

TABLE 1

For forgings whose diameter or thickness is not over 10 inches when solid.

Size	Tensile strength	Elastic limit	Elongation in 2 inches, per cent		Reduction of area, per cent	
			Inverse ratio	Not under	Inverse ratio	Not under
Class A, up to 7 inches outside diameter or thickness when solid, or 3½-inch wall when bored.....	Lbs./in. ² 85,000	Lbs./in. ² 50,000	2,000,000 Tens. str.	20.5	3,800,000 Tens. str.	39
Class B, over 7 to 10 inches, inclusive, outside diameter or thickness when solid, or 5-inch maximum wall when bored....	85,000	50,000	1,900,000 Tens. str.	19.5	3,600,000 Tens. str.	37

(Requirements covering classification of forgings by size, determination of elastic limit by means of the extensometer, time of testing forgings, tension and bends test specimens (including illustration), are practically the same as for carbon-steel and alloy-steel forgings in A. S. T. M. A18-30. See 651.11, p. 754.)

The speed of the test machine shall not exceed one-fourth inch per minute until the elastic limit has been reached.

(Requirements covering bends tests, proof test, number of tests, and retests are identical with those in the American Railway Association specification for alloy-steel forgings, quenched and tempered. See 622.6, p. 1136.)

(Requirements covering workmanship and finish, marking, inspection and rejection, and reheating conform with those specified in A. S. T. M. standard specifications for steel, pars. 5, 6, 7, 8, and 9. See 605.0, p. 247.)

Freight charges.—All rejected forgings will be returned to the manufacturer who shall pay freight charges both ways.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, AXLES FOR LOCOMOTIVES, RECOMMENDED PRACTICE, 1927

AXLES FOR LOCOMOTIVES

(See figs. 554 to 558)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, JOURNAL LENGTH GAGE, RECOMMENDED PRACTICE, 1930

JOURNAL LENGTH GAGE

(See fig. 559)

This gage is to be used for measuring length of journals on classes A to F axles, inclusive. Classes A to F axles are defined under A. R. A. standard axles, given below.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, STANDARD AXLES, 1928

STANDARD AXLES

In 1899 it was decided that the standard axles should be known by letters. In 1920 the same classification was extended to journal boxes and contained parts, trucks, and cars; 2-axle trucks to be designated as 2A, 2B, 2C, etc.; 3-axle trucks to be designated as 3A, 3B, 3C, etc.; 4-axle cars to be designated as 4A, 4B, 4C, etc.; 6-axle cars to be designated as 6A, 6B, 6C, etc.

Axle A, with journals, 3¼ by 7 inches, is designed to carry 15,000 pounds.

Axle B, with journals, 4¼ by 8 inches, is designed to carry 24,000 pounds.

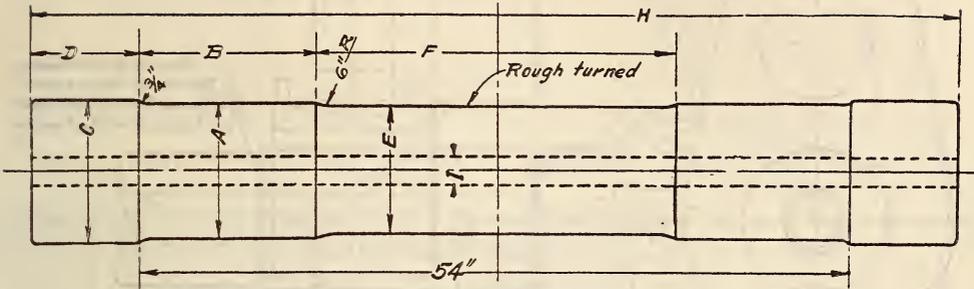

Axle C, with journals, 5 by 9 inches, is designed to carry 32,000 pounds.

Axle D with journals, 5½ by 10 inches, is designed to carry 40,000 pounds.

Axle E, with journals, 6 by 11 inches, is designed to carry 50,000 pounds.

Axle F, with journals, 6½ by 12 inches, is designed to carry 60,000 pounds.

In 1928 the standard axle drawing was revised to shown an increase in the length of wheel seat of three-eighths inch.

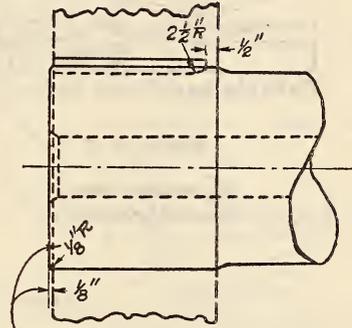

Bearing Sizes	A	B	C	D	E	F	H	I #	Max. Inl. Load	Pass. Fits
7X9"	7"	10"	7½"	7"	6½"	34"	68"	-	11000	12600
8X10	8	11	8½"	7½"	7½"	32	69	-	14000	16000
9X12	9	13	9½"	7½"	8½"	28	69	-	18900	21600
10X12	10	13	10½"	8	9½"	28	70	2	21000	24000
11X13	11	14	11½"	8	10½"	26	70	3	25000	28600
12X13	12	14	12½"	8	11½"	26	70	3	27300	31200
13X14	13	15	13½"	8	12½"	24	70	4	31800	36400
14X14	14	15	14½"	8	13½"	24	70	4	34300	39200

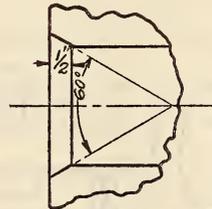

⊕ These dimensions apply to main axles. Length of wheel fits and journals on axles other than main to be governed by corresponding dimensions of main axle.

Axles may be solid or bored to diameter shown.

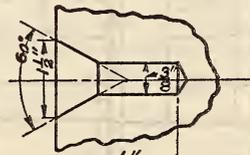

Note:- If ends of axle are to project ¼" beyond faces of hubs dimension (H) will be ¼" longer than shown in table.

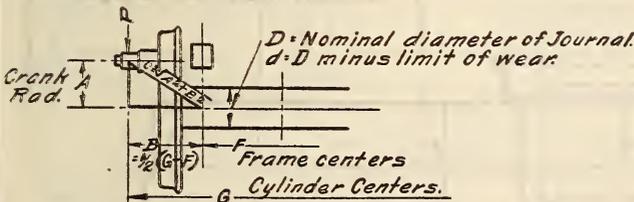

Optional:- End of axle may be flush with face of hub if desired.

Center for hollow axles.

Center for solid axles.

P = Piston thrust in lbs.
 Z = Modulus of circular or annular section having outside diameter equal to (d)
 FS = Fiber Stress.
 $\frac{F(B+C)}{2XZ} = FS \cdot 23000$ Maximum for steel axles.

Formula for calculating Stresses in axles.

¹ These tolerances are negative and represent the maximum allowable variation below the exact nominal size. For instance, the maximum diameter of the 1 13/16-inch shaft is 1.938 inches and its minimum allowable diameter is 1.935 inches.

Standard stock lengths for cold-finished shafting shall be: 16, 20, and 24 feet.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, CODE FOR DESIGN OF TRANSMISSION SHAFTING, B17c-1927

[Approved by American Standards Association, November, 1927]

TRANSMISSION SHAFT DESIGN

This code covers designing formulas for the cases most frequently met in the design of transmission shafting, also diagrams for use in designing shafting.

Appendix A covers the various stress conditions that may be set up in a transmission shaft; the various theories of elastic failure evolved from time to time leading to the many formulas found in engineering literature; the application and limitation of the various theories of elastic failure as applied to ductile ferrous material used in shafts; and the elastic shearing strength of ductile ferrous materials.

Appendix B covers designing stresses, shafting steels, effect of straining action upon working stresses, and the use of constant or base stress with shock and fatigue factors.

The formulas recommended in this report for the design of shafts subjected to torsion or bending only, are based upon the well recognized common theories of torsion and flexure. For such cases standardization is confined to the adoption of proper unit stresses suited to the material of which the shaft is made and to the operating conditions. For the case of a shaft subjected to torsion combined with flexure or end thrust, or both, no rational method of design has become recognized as standard in the literature of machine design. The formulas are perfectly general and apply to all cases of shaft design, even to shafts in special machines. The only limitation imposed is that these formulas provide only for strength and do not deal with the rigidity or deformation of the shafting system.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR QUENCHED-AND-TEMPERED CARBON-STEEL AXLES, SHAFTS, AND OTHER FORGINGS FOR LOCOMOTIVES AND CARS, DESIGNATION A19-27, 1927

CARBON-STEEL FORGINGS

SCOPE

When used for forgings for locomotives, these specifications cover quenched-and-tempered carbon-steel driving axles, engine and trailing truck axles, main and side rods, straps, crank pins, and piston rods.

MANUFACTURE

(Requirements covering manufacture are practically the same as for carbon-steel and alloy-steel forgings in A. S. T. M. specification A18-30 (see 611.51, p. 754), including the heat treatment specified in paragraph 6 (b).)

BORING

Unless otherwise specified by the purchaser, all forgings over 7 inches in diameter shall be bored, and all axles, shafts, and similar forgings shall be rough turned all over. The boring shall be done before quenching.

If boring is specified, the diameter of the hole shall be at least 20 per cent of the maximum outside diameter or thickness of the forging, exclusive of collars and flanges.

CHEMICAL PROPERTIES AND TESTS

7. The steel shall conform to the following requirements as to chemical composition:

Carbon:	Per cent
First class by size.....	0.25-0.60
Second class by size.....	.35-.60
Third class by size.....	.35-.65
Fourth class by size.....	.35-.70
Manganese.....	.40-.70
Phosphorus, not over.....	.05
Sulphur, not over.....	.05

(Ladle and check analyses are the same as in A. S. T. M. A18-30, and include the additional paragraph in regard to phosphorus determination given in the American Railway Association specification for alloy-steel forgings, quenched and tempered. See 622.6, p. 1136.)

PHYSICAL PROPERTIES AND TESTS

(Requirements covering classification of forgings by size, determination of elastic limit by means of the extensometer, time of testing forgings, tension and bend test specimens (including illustration), are

practically the same as for carbon-steel and alloy-steel forgings in A. S. T. M. A18-30. See 611.51, p. 754. The tensile properties are identical with those for grade G, quenched and tempered, in A18-30.)

(Requirements covering bend tests, proof tests, number of tests, and retests conform to those specified by the American Railway Association for quenched and tempered alloy-steel forgings. See 622.6, p. 1136.)

(Requirements covering workmanship and finish, marking, inspection and rejection, and reheating conform to those specified in A. S. T. M. standard specifications for steel, pars. 5, 6, 7, 8, and 9. See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR CARBON-STEEL FORGINGS FOR LOCOMOTIVES, DESIGNATION A20-31T, 1931

LOCOMOTIVE FORGINGS

(See 611.51, p. 757.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARBON-STEEL CAR AND TENDER AXLES, DESIGNATION A21-27, 1927

CARBON-STEEL AXLES

(Same as American Railway Association specification for axles, carbon steel, for cars and locomotive tenders, given above, including the references given in the latter to the A. R. A. specification for annealed and unannealed carbon-steel forgings, and additional references to A. S. T. M. specification A18-30, and standard specifications for steel in 605.0. In addition A21-27 provides that for axles 65 inches or under in length the permanent set produced by the first blow shall not exceed that given by the formula:)

$$\left(\frac{L}{1.9d} - \frac{d}{2}\right) + 1 \text{ inch}$$

NUMBER OF TESTS

One drop test shall be made from each melt. Not less than 15 tons shall be offered from any one melt unless otherwise specified.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR COLD-ROLLED STEEL AXLES, DESIGNATION A22-21, 1921

COLD-ROLLED STEEL AXLES

MANUFACTURE

The axles shall be cold-rolled to finished size from hot-rolled bars.

(Process and discard are the same as in A. S. T. M. A18-30. See 611.51, p. 754.)

CHEMICAL PROPERTIES AND TESTS

Chemical composition.—The steel shall conform to the following requirements as to chemical composition:

	Per cent
Carbon, not over.....	0.40
Manganese.....	0.40- .80
Phosphorus, not over.....	.05
Sulphur, not over.....	.05

(Ladle and check analyses are the same as in A. S. T. M. A18-30.)

PHYSICAL PROPERTIES AND TESTS

The axles shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	Lbs./in. ² ..	70,000
Elastic limit.....	do.....	60,000
Elongation in 2 inches.....	per cent..	18
Reduction of area.....	do.....	35

(Requirements covering determination of elastic limit by means of the extensometer, tension and bend test specimens (including illustration) are practically the same as for carbon-steel and alloy-steel forgings in A. S. T. M. A18-30. See 611.51, p. 754.)

Bend test.—The test specimen shall bend cold through 180° around a pin 1 inch in diameter, without cracking on the outside of the bent portion.

Bend test specimens shall be one-half inch square in section with corners rounded to a radius not over one-sixteenth inch, and need not exceed 6 inches in length.

Number of tests.—One tension and one bend test shall be made from each lot of 50 axles or less from each melt.

If any test specimen shows defective machining or develops flaws it may be discarded and another specimen substituted.

If the percentage of elongation of any tension-test specimen is less than that specified above, and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

WORKMANSHIP AND FINISH

The axles shall conform to the sizes and shapes specified by the purchaser and shall not vary more than 0.002 inch from the diameter specified. When centered, 60° centers with clearance drilled for points shall be used.

The axles, either finished or plain, shall be straight and free from injurious defects and shall have a workmanlike finish.

MARKING

Identification marks shall be legibly stamped on each axle, and on each test specimen. The purchaser shall indicate the location of such identification marks.

(Requirements covering inspection and rejection and reheating, conform to those specified in A. S. T. M. standard specifications for steel, pars. 7, 8, and 9. See 605.0, p. 247.)

NATIONAL MACHINE TOOL BUILDERS' ASSOCIATION, SHAFT DIAMETERS USED IN MACHINE-TOOL CONSTRUCTION, MAY 22, 1928

MACHINE TOOL SHAFT DIAMETERS

Diameters of shafts under 1 inch to be in sixteenths of an inch or even multiples thereof.

Diameters of shafts from 1 inch to 2¼ inches to be in eighths of an inch or even multiples thereof.

Diameters of shafts from 2¼ inches to 6 inches to be in fourths of an inch or even multiples thereof.

611.53 WHEELS AND TIRES, STEEL.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD SPECIFICATION FOR SOLID WROUGHT CARBON STEEL WHEELS FOR ELECTRIC RAILWAY SERVICE, E7-21, 1921

SOLID WROUGHT CARBON STEEL WHEELS

(Identical with A. S. T. M. A25, given below.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD LIMIT-OF-WEAR GAGES FOR A. E. R. E. A. AND A. R. A. STANDARD FLANGE CONTOURS, E8-26, 1926

LIMIT-OF-WEAR GAGES

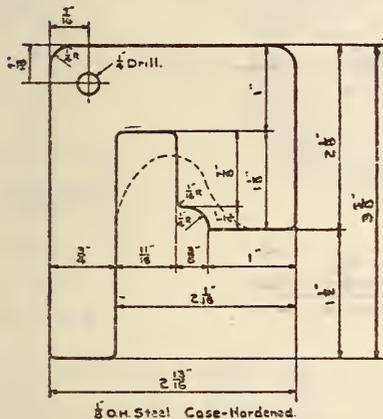

FIGURE 562—Limit-of-wear gage for 1 1/8 and 1 3/16 inch flanges

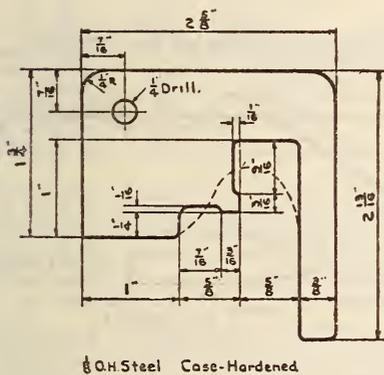

FIGURE 563—Limit-of-wear gage for 1-inch flange

Gages as shown are for use with rolled-steel wheels only. The same general dimensions apply to gages for use with cast-iron wheels except that the part which projects down the back of the wheel should be cut off in line with the tread face.

These gages are to be used only for testing wheels and not to determine their suitability for remounting.

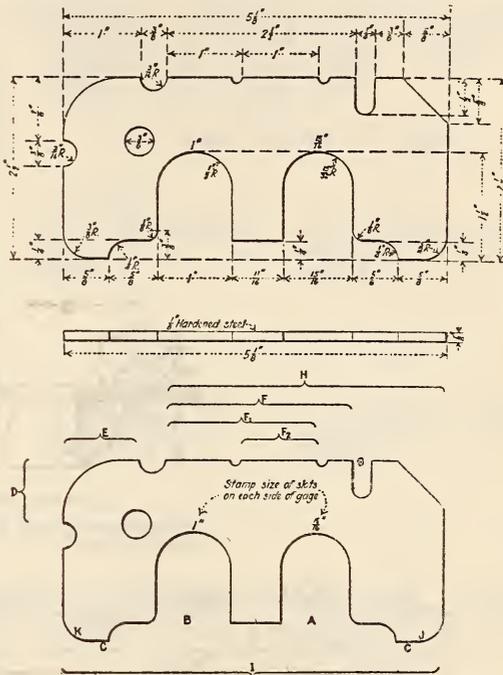

FIGURE 564.—Limit-of-wear gage for standard A. R. A. wheel contours

Slot G, one-fourth inch wide, is for gaging the thickness of worn journal collars.

Length H, 3 1/4 inch, is for gaging chipped rims.

Overall length I, 5 1/8 inch, is for gaging distance between point of knuckle and guard arm of couplers, measured perpendicularly to the guard arm.

Radii J and K, five-sixteenth inch and one-eighth inch, respectively, are for checking the fillets of journals.

Slots A and B, fifteen-sixteenth inch and 1 inch, respectively, are for gaging flanges worn thin; gage is to be used with heel C on tread of wheel.

Corners D and E, seven-eighth inch and 1 inch, respectively, are for measuring height of vertical wheel flange wear above tread.

Lengths F, F₁, and F₂ (2 1/2, 2, and 1 inch, respectively) are for gaging the length of shelled out or flat spots on wheel tread.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD PLANE GAGE FOR SOLID STEEL WHEELS, E9-19, 1919

PLANE GAGE FOR SOLID STEEL WHEELS

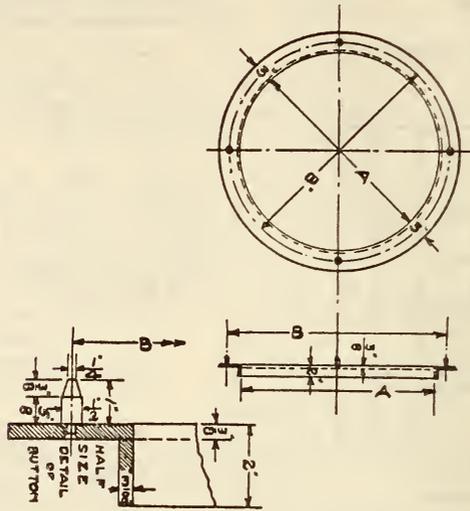

FIGURE 565.—Plane gage

Measurements *A* and *B* vary, depending on diameter of wheel to be gaged.

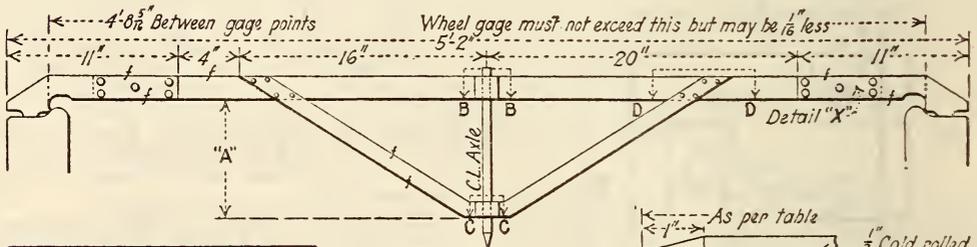

TABLE OF DIMENSIONS		
Diameter of wheels	Height of Brace dimension "A"	Length of center rod
21" to 28" Inc.	7 1/2"	15 1/2"
31" to 36" Inc.	13"	20"

Point → $\left\{ \begin{array}{l} \text{Cold rolled} \\ \text{steel rod} \\ \text{mild steel except} \\ \text{as specified} \end{array} \right.$

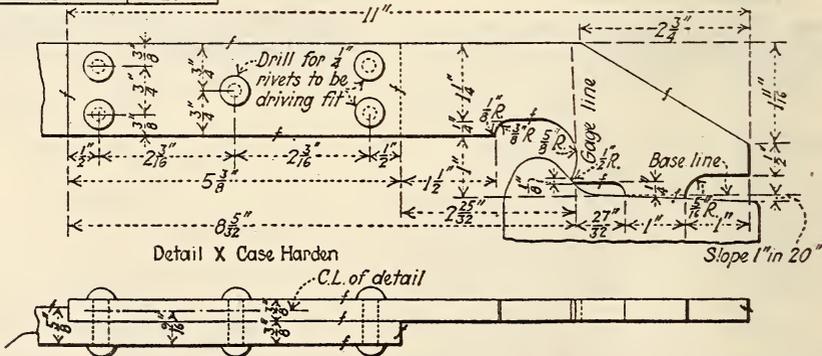

FIGURE 566.—Wheel mounting gage

This design of gage is for mounting wheels for contours: A-3, A-3 1/2, B-2 1/2, B-3, C-2 1/2, C-3, D-2 1/2, D-3 only. Wheel gage is shown applied to 1 1/4 inch flange for wheel contours A-3 and A-3 1/2. (See E10-25, p. 775)

There has been adopted as standard the plane gage for rolled-steel wheels shown in the figure. This is used in checking warped condition of wheels by placing it on the back of the rim. The tolerances allowed will be governed by the wheel specifications.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD WHEEL-MOUNTING GAGE, E10-25, 1925

WHEEL-MOUNTING GAGE

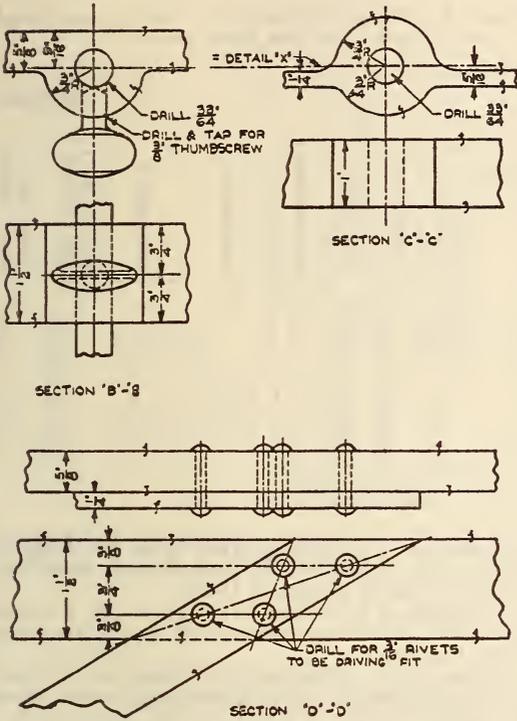

FIGURE 567.—Detail of wheel mounting gage

This gage is made with a pointer for the center line of the axle so that the first wheel will be pressed on from the center line of the axle, thereby insuring that the wheels will not only be located the proper distance from each other but will be located centrally on the axle.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD ROTUNDITY GAGE FOR SOLID-STEEL WHEELS, E11-19, 1919

ROTUNDITY GAGE

There has been adopted as standard the rotundity gage for steel wheels shown in Figure 589. (See A.

R. A. solid wrought carbon steel wheels, given below.) As all standard wheels have a taper of 1 inch in 20 inches in checking the wheel, the gage will be used that will become tight on the wheel about the center of the tread. The tolerances governing this are included in the wheel specifications.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD DESIGN FOR TREAD AND FLANGE OF WHEEL, NO. E13-26, 1926

TREAD AND FLANGE OF WHEEL

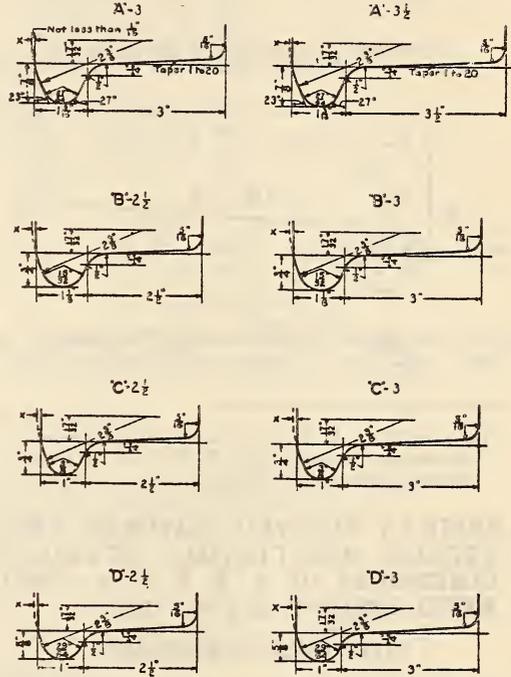

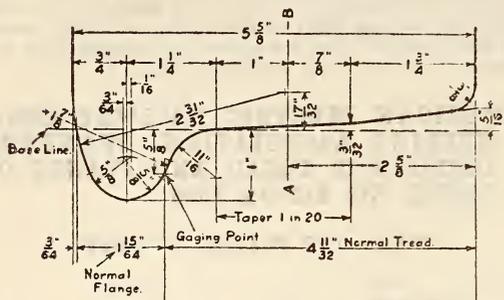

FIGURE 568.—A. E. R. E. A. standard tread and flange contours for steel and chilled iron wheels

Full lines.....steel wheels
Dotted lines.....chilled iron wheels
Dimension X = not less than $\frac{1}{16}$ inch.

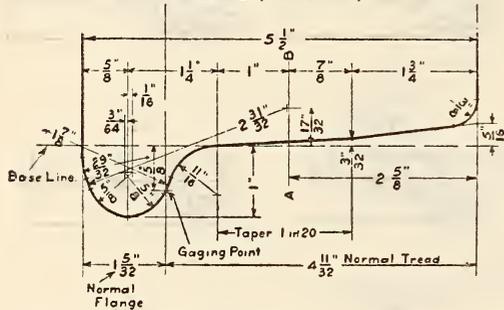

Tapers

Wheel tread..... 1 to 20
Flange-tread side..... 27°
Flange-guard side..... 23°

CONTOUR E FOR CHILLED IRON WHEELS (A.R.A. 1909)

CONTOUR F FOR STEEL & STEEL TIERED WHEELS (A.R.A. 1920)

Diameter of Wheel is to be measured on line A-B

FIGURE 569.—A. R. A. standard wheel contours adopted as standards of A. E. R. E. A. for service requiring wheels of this type

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD DIMENSIONS OF A. E. R. E. A. STEEL-WHEEL DESIGNS, E14-29, 1929

STEEL-WHEEL DIMENSIONS

The hub diameters given in the tables of steel-wheel designs should be looked upon merely as

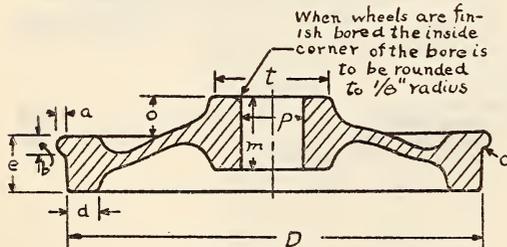

FIGURE 570

maximum limits to take care of eccentric bores. In the inspection and acceptance of wheels, A. E. R. E. A. Manual, section E7 (same as A. S. T. M., A25, given below) should govern in all cases, and wheels accepted or rejected on hub wall thickness within the tolerances given in the specifications.

Four holes should be included in standard wheel designs for electric railway service in order to pro-

vide for the bolting on of pads to reduce noise in operation. These holes should be at least 1 inch in diameter and should be located on a radius approximately 2 inches in from the inside diameter of the rim.

TABLE 1.—Flange thickness (b), 1 inch; flange height (a), 3/4 inch; tread and flange contour D-2 1/2

Wheel	Diameter D	Throat radius c	Rim width e	Rim thickness d	Hub diameter t	Hub length m	Hub projection	
							Track gage 4 feet, 8 1/2 inches	Track gage 5 feet, 2 1/2 inches
1	21	3/4	3 3/8	2	7	4 1/2 or 5	3 3/8	4 3/8
2	22	3/4	3 3/8	2	7 1/2	4 1/2 or 5	3 3/8	4 3/8
3	24	3/4	3 3/8	2	7 1/2	4 1/2 or 5	3 3/8	4 3/8
4	26	3/4	3 3/8	2	8 1/4 or 9 1/4	4 1/2 or 5	3 3/8	4 3/8
5	28	3/4	3 3/8	2	8 1/4 or 9 1/4	4 1/2 or 5	3 3/8	4 3/8
6	31	3/4	3 3/8	2	8 1/4 or 9 1/4	4 1/2 or 5	3 3/8	4 3/8
7	33	3/4	3 3/8	2 1/2	8 1/4 or 9 1/4	4 1/2 or 5	3 3/8	4 3/8
8	34	3/4	3 3/8	2 1/2	8 1/4 or 9 1/4	4 1/2 or 5	3 3/8	4 3/8

NOTE.—Minimum rough bore (p) 3 3/4 inches.

Table No. 2 is identical with Table No. 1 except that flange height (a) is three-fourths inch, and tread and flange contour is C-2 1/2.

Table No. 3 is identical with Table No. 1 except that tread and flange contour is D-3, and rim width (e) is 4 inches.

Table No. 4 is identical with Table No. 1 except that flange height (a) is three-fourths inch, tread and flange contour is C-3, and rim width (e) is 4 inches.

TABLE 5.—Flange thickness (b), 1 1/2 inches; flange height (a), three-fourths inch; tread and flange contour B-2 1/2

Wheel	Diameter D	Throat radius c	Rim width e	Rim thickness d	Hub diameter t	Hub length m	Hub projection	
							Track gage 4 feet, 8 1/2 inches	Track gage 5 feet, 2 1/2 inches
1	21	3/4	3 3/8	2	7	4 1/2 or 5	3 3/8	4
2	22	3/4	3 3/8	2	7 1/2	4 1/2 or 5	3 3/8	4
3	24	3/4	3 3/8	2	7 1/2	4 1/2 or 5	3 3/8	4
4	26	3/4	3 3/8	2	8 1/4 or 9 1/4	4 1/2 or 5	3 3/8	4
5	28	3/4	3 3/8	2	8 1/4 or 9 1/4	4 1/2 or 5	3 3/8	4
6	31	3/4	3 3/8	2	8 1/4 or 9 1/4	4 1/2 or 5	3	4
7	33	3/4	3 3/8	2 1/2	9 1/4 or 11 1/2	6	3 or 2	
8	34	3/4	3 3/8	2 1/2	9 1/4 or 11 1/2	6		
9	36	3/4	3 3/8	2 1/2	9 1/4 or 11 1/2	6		

NOTE.—Minimum rough bore (p) 3 3/4 inches.

Table No. 6 is identical with Table No. 5 except that tread and flange contour is B-3, and rim width (e) is 4 1/4 inches.

TABLE 7.—Flange thickness (b), $1\frac{1}{16}$ inches; flange height (a), seven-eighths inch; tread and flange contour, A-3.

Wheel	Diameter D	Throat radius c	Rim width e	Rim thickness d	Hub diameter l	Hub length m	Hub projection	
							Track gage 4 feet, $8\frac{1}{2}$ inches	Track gage 5 feet, $2\frac{1}{2}$ inches
1	21	$\frac{1}{2}$	$4\frac{3}{16}$	2	7	$4\frac{1}{2}$ or 5	$2\frac{15}{16}$	$3\frac{15}{16}$
2	22	$\frac{1}{2}$	$4\frac{3}{16}$	2	$7\frac{1}{2}$	$4\frac{1}{2}$ or 5	$2\frac{15}{16}$	$3\frac{15}{16}$
3	24	$\frac{1}{2}$	$4\frac{3}{16}$	2	$7\frac{1}{2}$	$4\frac{1}{2}$ or 5	$2\frac{15}{16}$	$3\frac{15}{16}$
4	26	$\frac{1}{2}$	$4\frac{3}{16}$	2	$8\frac{1}{4}$ or $9\frac{1}{4}$	$4\frac{1}{2}$ or 5	$2\frac{15}{16}$	$3\frac{15}{16}$
5	28	$\frac{1}{2}$	$4\frac{3}{16}$	2	$8\frac{1}{4}$ or $9\frac{1}{4}$	$4\frac{1}{2}$ or 5	$2\frac{15}{16}$	$3\frac{15}{16}$
6	31	$\frac{1}{2}$	$4\frac{3}{16}$	2	$8\frac{1}{4}$ or $9\frac{1}{4}$	$4\frac{1}{2}$ or 5	$2\frac{15}{16}$	$3\frac{15}{16}$
7	33	$\frac{1}{2}$	$4\frac{3}{16}$	$2\frac{1}{2}$	$9\frac{1}{4}$ or $11\frac{1}{2}$	6	$2\frac{15}{16}$ or $1\frac{15}{16}$	$3\frac{15}{16}$
8	34	$\frac{1}{2}$	$4\frac{3}{16}$	$2\frac{1}{2}$	$9\frac{1}{4}$ or $11\frac{1}{2}$	6		
9	36	$\frac{1}{2}$	$4\frac{3}{16}$	$2\frac{1}{2}$	$9\frac{1}{4}$ or $11\frac{1}{2}$	6		

NOTE.—Minimum rough bore (p) $3\frac{3}{4}$ inches.

Table No. 8 is identical with Table No. 7 except that tread and flange contour is A-3 $\frac{1}{2}$, and rim width (e) is $4\frac{1}{16}$ inches.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, WHEEL CHECKING GAGE FOR A. E. R. E. A. CONTOURS A, B, C, AND D, RECOMMENDED DESIGN, E112-26, 1926

WHEEL CHECKING GAGE

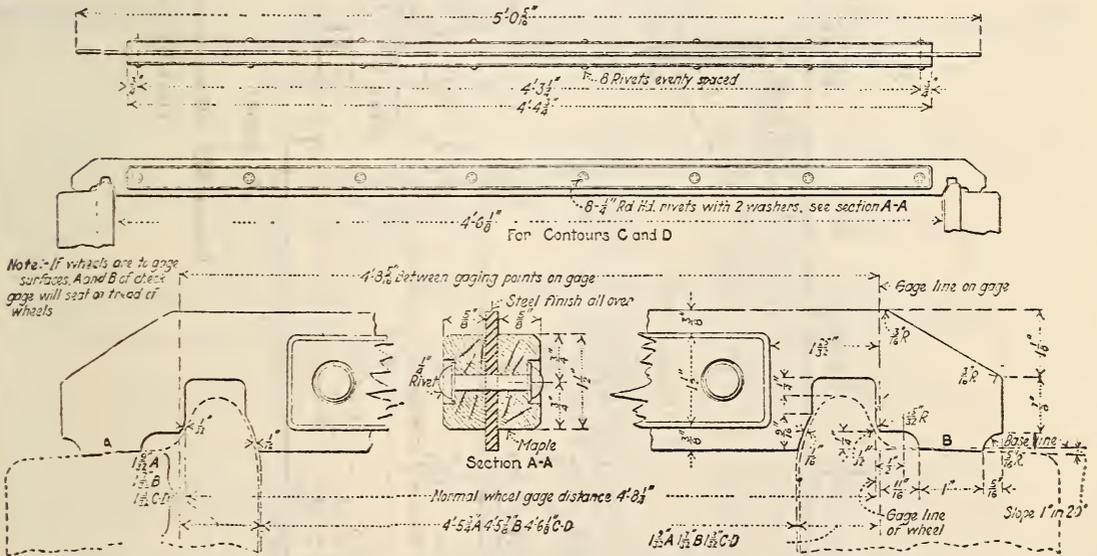

FIGURE 571.—Wheel checking gage for contours A, B, C, and D

The dimensions followed by letters A, B, C, and D apply to the gage itself, and not to the wheels which are shown dotted in the illustration. This gage is for use only in checking wheels in service and is not to be used for mounting wheels. Letters A, B, C, D are for corresponding wheel contours.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, WHEEL MOUNTING AND CHECK GAGE FOR A. R. A. CONTOURS E AND F, RECOMMENDED DESIGN, E113-26, 1926

WHEEL MOUNTING AND CHECK GAGE

In the mounting of wheels, new or second hand, the standard wheel mounting and check gage should be used in the following manner:

After one wheel is pressed into position, place the stop *A* or *B* of the check gage against the inside of the flange of the wheel with the thinner flange, with the corresponding tread stop *C* or *D* against the tread of the wheel. Press the other wheel on the axle until the opposite tread stop comes in contact with the tread and the corresponding gage point *E* or *F* is in contact with the outside of the thicker flange.

Wheels should be mounted centrally on the axle. All axles should be center punched and the center point of the gage should be used to locate the first wheel pressed on the axle from this center punch mark.

This gage is to be used for mounting and checking wheels with A. R. A. contours *E* and *F* only. It is the same as standardized by the American Railway Association in 1911 (for illustration of latter see A. R. A. M. solid wrought carbon-steel wheels, given below), except that a center point has been added. The wheel mounting and check gage as shown is designed for and applied to contour *E*. When used with contour *F* the clearance from the gage to the back of the flange will be increased to a maximum of five-sixty-fourth inch at the tread level.

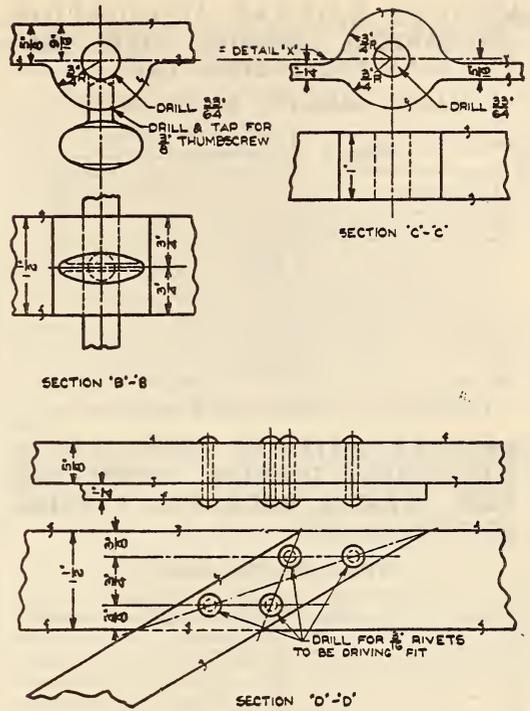

FIGURE 573.—Detail of wheel mounting and check gage

WHEELS AND TRACK GAGE

(See 606.0, p. 310.)

AMERICAN RAILWAY ASSOCIATION,
MECHANICAL DIVISION; WHEELS,
MOUNTING, RECOMMENDED PRACTICE, 1926

MOUNTING WHEELS

1. Standard table of mounting pressure:

Mounting pressures in tons

Axle	Wheel seat diameter	Cast iron wheels		Steel wheels	
		Minimum	Maximum	Minimum	Maximum
A	5 1/8	30	55	50	70
B	5 3/4	35	60	55	80
C	6 1/2	40	65	70	100
D	7	45	70	75	110
E	7 5/8	50	75	80	120
F	8 1/2	55	85	85	130

2. Wheels having flanges worn so as to take limit gages for remounting cast-iron wheels shown in accompanying illustrations shall not be remounted.

3. The thickness of flanges of wheels fitted on the same axle should be equal and should never vary more than one-sixteenth inch.

4. In mounting of wheels, new or second hand, the standard wheel mounting and check gage should

be used in the following manner (for illustration of this gage see A. R. A.-M, solid wrought carbon-steel wheels, given above):

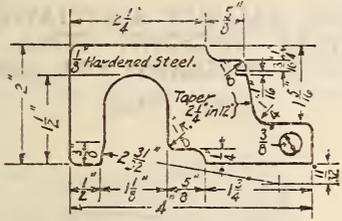

FIGURE 579.—For cast-iron wheels less than 80,000-pounds capacity; one-wear wrought-steel wheels and cast-steel wheels

WHEELS CAST IRON, LIMIT GAGES FOR REMOUNTING

After one wheel is pressed into position, place the stop A or B of the check gage against the inside of

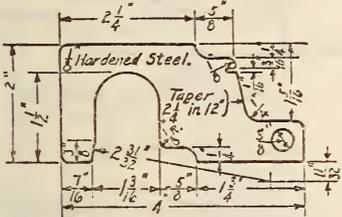

FIGURE 580.—For cast-iron wheels 80,000-pounds capacity and over

the flange of the wheel with the thinner flange with the corresponding tread stop C or D against the tread of the wheel. Press the other wheel on the axle until

the opposite tread stop comes in contact with the tread of the corresponding gage point E or F in contact with the outside of the thicker flange.

5. The wheel seats on all axles must be turned to uniform diameter throughout the entire length of each wheel seat and must be smooth and free from ridges so as to provide even bearing for the wheel fit throughout. The mounting of wheels on axles having the wheel fit tapered is not permissible. The wheels must also have a straight bore with the exception of the chamfering for not more than three-eighths inch at the back hub face which may be allowed to facilitate application to axles.

6. Wheels should be mounted centrally on the axle. All axles should be center punched and some form of gage be used to measure the location of the wheel from this center-punch mark. The central mounting of wheels is necessary in order to secure proper running of the wheels and to prevent hot boxes.

7. Wheels should ordinarily be fitted to axles and not axles fitted to the wheels. It is usually unnecessary to turn the wheel seat of second-hand axles unless they are found a tapered fit.

8. In mounting either new or second-hand wheels, care should be used to see that the wheels are of the same diameter. In the case of new wheels, the wheels should be taped in order to check the tape-size marking, and in no case should wheels of different tape sizes be applied to the same axle. In the case of new wrought-steel wheels, those mounted on the same axle should not differ in the carbon content by more than 0.05 per cent.

9. The alignment of axle lathe, the trueness of the centers, and the jaws on boring mills should be checked frequently in order to insure proper mounting of the wheels.

10. While the wheels are being bored, the high spots on the flange should be marked, and in mating the high spots should be put opposite low spots on the mate wheels.

NOTE. See below for wheel tread and flange for wrought-steel wheels and steel-tired wheels on cars and tenders.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; TIRES, SHRINKAGE ALLOWANCE FOR, 1907

TIRE-SHRINKAGE ALLOWANCE

Standard shrinkage allowances for steel tires are as follows:

For cast-iron and cast-steel centers less than 66 inches in diameter, one-eightieth inch per foot in diameter.

For cast-iron and cast-steel centers 66 inches and over in diameter, one-sixtieth inch per foot in diameter.

A25, to standard specifications for steel under 605.0, and to A. R. A. specification for ladle analysis under 621.32, with the addition of the following cuts showing contour of tread and flange of wheels and various kinds of gages:)

INSTRUCTIONS FOR USING STANDARD WHEEL CIRCUMFERENCE MEASURE FOR STEEL, STEEL-TIRED, AND CAST-IRON WHEELS

The wheel circumference measure is used for taping wheels in order to insure that wheels mounted

ably have ribs pressed into them to reduce a tendency to bend out of shape. In use, the tape should lie flat on the tread all the way around including the handle and lugs, so that kinks in the tape should not be tolerated; such kinks are a manufacturing problem except in cases where the tape has been abused. For taping cast-iron wheels exclusively, the tape tires may be put on the handle only and satisfactory tapes of this type are available from some of the wheel foundries for taping new cast-iron wheels. All wheel tapes should be checked periodically on a machine of known accuracy.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; TIRES, STEEL, LOCOMOTIVES AND CARS, RECOMMENDED PRACTICE, 1920

STEEL TIRES FOR LOCOMOTIVES AND CARS

(Identical with A. S. T. M., A26, given below, including references in A26 to A. R. A. specification for steel tank plates in 621.32, and A. S. T. M. standard specifications for steel in 605.0, except that in this case the steel shall be made by either the open-hearth or electric process, and the height of flange shall not be less but may be one-sixteenth inch more than that specified.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR WROUGHT SOLID CARBON-STEEL WHEELS FOR ELECTRIC RAILWAY SERVICE, DESIGNATION A25-24, 1924

WHEELS FOR ELECTRIC RAILWAYS

MANUFACTURE

1. The steel shall be made by the open-hearth process.
2. A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

CHEMICAL PROPERTIES AND TESTS

3. The steel shall conform to the following requirements as to chemical composition:

	Acid	Basic
Carbon.....	Per cent 0.60-0.80	Per cent 0.65-0.85
Manganese.....	.55-.80	.55-.80
Phosphorus, not over.....	.05	.05
Sulphur, not over.....	.05	.05
Silicon.....	.15-.35	.10-.30

LADLE ANALYSIS

(Same as for steel tank plates in American Railway Association specification. See 621.32, p. 1124.)

CHECK ANALYSIS

5. An analysis may be made by the purchaser from a wheel representing each melt. The chemical composition thus determined shall conform to the requirements specified in section 3. A sample may be taken from any one point in the plate; or two samples may be taken, in which case they shall be on radii at right angles to each other. Samples shall not be taken in such a way as to impair the usefulness

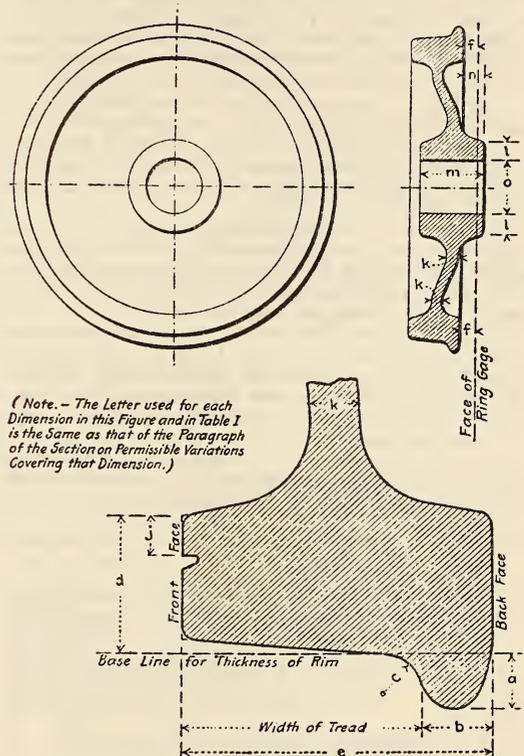

FIGURE 595.—Diagram showing points at which the dimensions covered by specifications are measured

For the permissible variations in these dimensions, see Table 1 or section 7.

of the wheel. Drillings for analysis shall be taken by boring entirely through the sample parallel to the axis of the wheel; they shall be clean and free from scale, oil, and other foreign substances. All drillings from any one wheel shall be thoroughly mixed together.

MATING

6. The wheels shall be mated as to tape sizes and shipped in pairs.

PERMISSIBLE VARIATIONS IN DIMENSIONS⁸⁶

7. The wheels shall conform to the dimensions specified within the following permissible variations:

FLANGE

(a) *Height of flange.*—The height of flange shall not vary more than one-sixteenth inch from that specified.

⁸⁶ To facilitate the use of these specifications, the various dimensions are illustrated in fig. 595, and the permissible variations in those dimensions are also given in tabular form in Table 1.

(b) *Thickness of flange.*—The thickness of flange shall not vary more than one-sixteenth inch from that specified.

(c) *Radius of throat.*—The radius of throat shall not vary more than one-sixteenth inch from that specified.

RIM

(d) *Thickness of rim.*—The thickness of rim shall not vary more than one-fourth inch over nor more than one-eighth inch under that specified. The thickness of rim shall be measured radially of the wheel on the front face and is the distance from the inner edge of the rim to the point at which a base line, drawn parallel to the axis of the wheel from the point of tangency of the throat and tread, meets the front face.

(e) *Width of rim.*—The width of rim shall not vary more than one-eighth inch from that specified.

(f) *Plane.*—The wheels shall be gaged with a ring gage placed concentric with and perpendicular to the axis of the wheel. For all points on the back of the rim equidistant from the center, the variation from the plane of the gage when so placed shall not exceed one-sixteenth inch.

(g) *Rotundity.*—The tread shall be gaged with a ring gage, and the opening between the tread and this gage at any point shall not exceed one-sixteenth inch.

(h) *Block marks on tread.*—Block marks shall not exceed one sixty-fourth inch in height.

(i) *Tape sizes.*—Wheels with treads under 3 inches in width shall not vary more than 6 tapes over nor more than 4 tapes under the size specified. Wheels with treads 3 inches or over in width shall not vary more than 9 tapes over nor more than 5 tapes under the size specified.

(j) *Limit-of-wear groove.*—When a limit-of-wear groove is specified, its location shall not vary more than one-sixteenth inch from that specified.

TABLE 1.—Permissible variations in dimensions of wrought-steel wheels for electric railway service

Dimensions	Permissible variations in dimensions	
	Over	Under
Flange:	<i>Inches</i>	<i>Inches</i>
(a) Height.....	$\frac{1}{16}$	$\frac{1}{16}$
(b) Thickness.....	$\frac{1}{16}$	$\frac{1}{16}$

Rim:		
(d) Thickness, from inner edge to intersection of throat and tread.....	$\frac{1}{4}$	$\frac{1}{8}$
(e) Width.....	$\frac{1}{8}$	$\frac{1}{8}$
(f) Maximum departure of any circle on back face from plane.....		$\frac{1}{16}$
(g) Maximum departure of tread from rotundity.....		$\frac{1}{16}$
(h) Maximum height of block marks on tread.....		$\frac{1}{64}$
(i) Tape sizes—		
1. For treads under 3 inches in width.....	6	4
2. For treads 3 inches or over in width.....	9	5
(j) Limit-of-wear groove: Maximum departure from specified position.....		$\frac{1}{16}$
Plate:		
(k) Thickness, variation for each one-eighth inch in thickness.....		$\frac{1}{32}$
Hub:		
1. Diameter.....	$\frac{3}{4}$	0
2. Minimum thickness of wall, for bore 6 inches or under.....		1
(l) 3. Minimum thickness of wall, for bore over 6 inches.....		$\frac{1}{4}$
4. Maximum variation in thickness of wall in any one wheel.....		$\frac{3}{8}$
(m) Length.....	$\frac{1}{8}$	$\frac{1}{8}$
(n) Projection beyond back face of rim.....	$\frac{1}{16}$	$\frac{1}{16}$
Bore: 1		
(o) Diameter of rough bore.....	$\frac{1}{16}$	$\frac{1}{8}$
(p) Maximum depth of black spots in rough bore within 2 inches of end of bore.....		$\frac{1}{16}$
(q) Maximum eccentricity of rough bore in relation to tread.....		$\frac{3}{64}$

¹ (If not specified, rough bore shall be one-fourth inch less than finished bore.)

NOTE.—The letter used for each dimension in this table and in fig. 595 is the same as that of the paragraph of sec. 7 covering that dimension.

PLATE

(k) *Thickness of plate.*—The plate may vary in thickness, but the variation less than that specified shall not exceed one thirty-second inch for each one-eighth inch in the thickness of the plate.

HUB

(l) *Diameter of hub.*—The diameter of hub shall not be less but may be three-fourths inch more than that specified. The thickness of wall of the finished bored hub, unless otherwise specified, shall not be less than 1 inch at any point for bores 6 inches or under in diameter, nor less than $1\frac{1}{4}$ inches for bores over 6 inches in diameter. The thickness of the hub wall in any wheel shall not vary more than three-eighths inch at any two points equidistant from the face of the hub.

(m) *Length of hub.*—The length of hub shall not vary more than one-eighth inch from that specified.

(n) *Projection of hub.*—The projection of the hub beyond the back face of the rim shall not vary more than one-sixteenth inch from that specified.

BORE

(o) *Diameter of rough bore.*—The diameter of rough bore shall not vary more than one-sixteenth inch over nor more than one-eighth inch under that specified. When finished-bore diameter only is specified, the rough-bore diameter shall be made one-fourth inch less with the permissible variations specified above.

(p) *Black spots in bore.*—Black spots deeper than one-sixteenth inch will not be permitted in rough bore within 2 inches of either face of the hub.

(q) *Eccentricity of bore.*—The eccentricity between the tread at its center line and the rough bore shall not exceed three-sixty-fourths inch.

FINISH

8. (a) The wheel shall be free from injurious defects and shall have a workmanlike finish.

(b) Wheels shall not be offered for inspection if covered with paint, rust, or any other substance to such an extent as to hide defects.

MARKING

9. (a) The name or brand of the manufacturer, date, and serial number shall be legibly stamped on each wheel in such a way that the wheel may be readily identified.

(b) The tape size shall be legibly marked on each wheel.

INSPECTION AND REJECTION

10. (a) The manufacturer shall provide suitable gages and tapes which shall conform to the contour and dimensions specified.

(Otherwise inspection and rejection conform to A. S. T. M. standard specifications for steel, paragraphs 7, 8, and 9 (see 605.0, p. 247) except that rejections shall be reported within 10 working days, and the rejected samples shall be preserved for one month from the date of the test report.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR STEEL TIRES, DESIGNATION A26-16, 1916

STEEL TIRES**SCOPE**

1. (a) These specifications cover three classes of tires.

(b) The purposes for which these classes are frequently used are as follows:

Class A, for driving tires for passenger locomotives.

Class B, for driving tires for freight locomotives and tires for locomotive-truck, tender-truck, trailer, and car wheels, and miscellaneous service.

Class C, for driving tires for switching locomotives.

MANUFACTURE

2. The steel shall be made by the open-hearth process.

3. A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

CHEMICAL PROPERTIES AND TESTS

4. The steel shall conform to the following requirements as to chemical composition:

Carbon:.....	Per cent
Class A.....	0.50-0.70
Class B.....	.60-.80
Class C.....	.70-.85
Manganese, not over.....	.75
Phosphorus, not over.....	.05
Sulphur, not over.....	.05
Silicon.....	.15-.35

LADLE AND CHECK ANALYSES

(Same as for steel tank plates in American Railway Association specification. See 621.32, p. 1124.)

PHYSICAL PROPERTIES AND TESTS

7. If tension tests from representative bars in accordance with section 8 are specified by the purchaser, the tensile properties shown shall conform to the following minimum requirements:

	Class A	Class B	Class C
Tensile strength.....Lbs./in. ² ..	105,000	115,000	125,000
Elongation in 2 inches.....per cent..	12	10	8
Reduction of area.....do.....	16	14	12

8. (a) The tension-test specimen representing each melt shall be taken from a test ingot taken during the pouring of the melt, and shall have received approximately the same amount of work as the tires which it represents.

(Tension-test specimens shall conform to the dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

9. (a) If specified by the purchaser, one tension test shall be made from each melt.

(b) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(c) If the percentage of elongation of any test specimen is less than that specified in section 7 and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

10. If the results of the tension test for any melt do not conform to the requirements of section 7, a retest may be made on a specimen cut from a tire of the same melt furnished at the expense of the manufacturer. This retest shall give results conforming to the requirements of section 7.

MATING

11. The tires shall be grouped as to outside diameters and shipped in sets.

PERMISSIBLE VARIATIONS IN DIMENSIONS

12. Tires may be furnished with all surfaces as rolled, and shall conform to the dimensions specified within the following permissible variations:

(a) *Height of flange.*—The height of flange shall not vary more than three thirty-seconds inch from that specified.

(b) *Thickness of flange.*—The thickness of flange shall not vary more than one-sixteenth inch from that specified.

(c) *Radius of throat.*—The radius of throat shall not vary more than one-eighth inch over nor more than one-sixteenth inch under that specified.

(d) *Width of tire.*—The width of tire shall not vary more than one-eighth inch over nor more than one-sixteenth inch under that specified.

(e) *Inside diameter.*—The rough inside diameter shall not be more, but may be one-fourth inch less than that specified. When finished inside diameter only is specified, the rough diameter shall be from three-sixteenths to seven-sixteenths inch less than this diameter.

(f) *Outside diameter.*—Unless otherwise specified, the outside diameter when 54 inches or under shall not be less but may be one-half inch more than that specified; and when over 54 inches shall not vary more than one-eighth inch under nor more than three-eighths inch over that specified.

(g) *Set diameters.*—The tires shall be furnished in sets and the variation in outside diameters in each set shall not exceed one-sixteenth inch for tires 33 inches or under in outside diameter nor three thirty-seconds inch for tires over 33 inches in outside diameter.

(h) *Rotundity.*—Tires shall not be out of round more than one-sixteenth inch for tires 33 inches or under in outside diameter nor more than three thirty-seconds inch for tires over 33 inches in outside diameter.

(Finish, marking, inspection, rejection, and reheating conform to A. S. T. M. standard specifications for steel, pars. 5, 6, 7, 8, and 9. See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR WROUGHT SOLID CARBON-STEEL WHEELS FOR STEAM-RAILWAY SERVICE, DESIGNATION A57-29, 1929

WHEELS FOR STEAM RAILWAYS

MANUFACTURE

1. The steel shall be made by either or both the following processes: Open hearth or electric furnace.

2. A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

CHEMICAL PROPERTIES AND TESTS

3. The steel shall conform to the following requirements as to chemical composition:

Carbon.....	Per cent
Manganese.....	0.65-0.85
Phosphorus, not over.....	.60-.85
Sulphur, not over.....	.05
Silicon, not less than.....	.05
	.15

LADLE ANALYSIS

(Same as for steel tank plates in American Railway Association specification. See 621.32, p. 1124.)

CHECK ANALYSIS

(Same as in A. S. T. M., A25, given above, except that drillings for check analysis shall be taken direct from the plate, or from a slug hot punched or drilled out of the plate, and shall be taken so as not to impair the usefulness of the wheel.)

MATING

- 6. (a) The wheels shall be mated as to tape sizes and shipped in pairs.
- (b) When so specified in the purchaser's order, wheels of each type and rough-bore diameter in each carload shall be so selected as to permit of mating so that the ladle analysis for any pair shall not show a difference in carbon content exceeding 5 points.

PERMISSIBLE VARIATIONS IN DIMENSIONS ⁸⁷

7. The wheels shall conform to the dimensions specified within the following permissible variations.

FLANGE

(Same as in A. S. T. M., A25, given above, except that the variation in the height of the flange may be one-eighth inch more than that specified.)

RIM

(d) Thickness of rim.—The thickness of the rim shall be measured radially of the wheel on the back

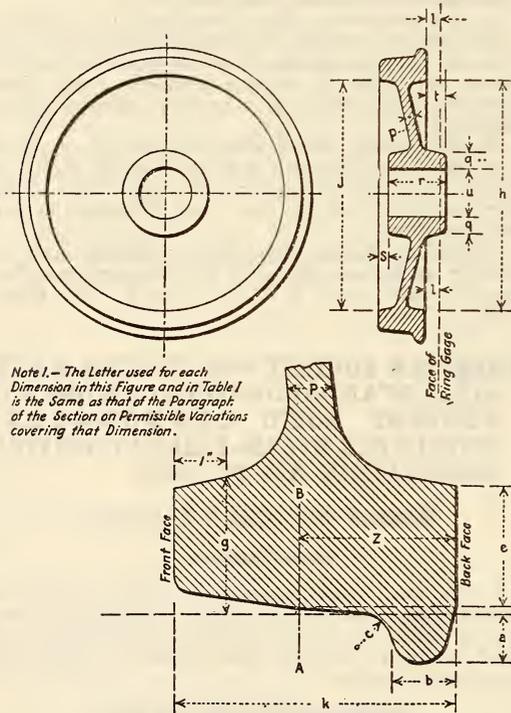

FIGURE 596.—Diagram showing points at which the dimensions covered by specifications are measured

For the permissible variations in these dimensions see Table 1 or section 7.

face of the rim, and is the distance between the inside diameter of the rim and the point at which the back rim of the wheel is cut by a line drawn parallel to the axis of the wheel through the intersection of the line A-B (fig. 596), and the tread of the wheel.

NOTE.—The line A-B (fig. 596), indicates the plane of the tread circle. In the standard American wheels with rims 5 1/2 inches wide the distance from the line A-B to the back face of the rim is 2 3/8 inches.

- (e) Thickness of rim thus measured shall be not less than that specified, and in any one wheel shall not vary more than one-eighth inch.
- (f) To facilitate measurement of rim thickness, the radius of the inside edge of the back face of rim shall not exceed one-eighth inch. A sharp corner is preferable.
- (g) The rim thickness measured radially on a plane 1 inch from the front face of the wheel shall not vary more than one-eighth inch in any one wheel. The contour of the inner surface of the rim shall be practically symmetrical on both sides of the plate.

TABLE 1.—Permissible variations in dimensions of wrought solid carbon-steel wheels for steam railway service

Dimensions	Permissible variations in dimensions	
	Over	Under
Flange:	Inches	Inch
(a) Height.....	1/8	0
(b) Thickness.....	1/16	1/16
(c) Radius of throat.....	1/16	1/16
Rim:		
(e) 1. Thickness, at back face of wheel.....	(1)	0
2. Maximum variation in rim thickness at back face in any one wheel.....		3/8
(g) Maximum variation in rim thickness measured 1 inch from front face of wheel.....	(1)	1/8
(h) Inside diameter of rim at back face of wheel.....		3/8
(j) Inside diameter of rim at front face of wheel in relation to inside diameter at back face of wheel.....	0	1/4
(k) Width of rim.....	1/8	1/8
(l) Maximum departure of any circle on back face from plane.....		1/16
(m) Maximum departure of tread from rotundity.....		1/16
(n) Maximum height of block marks on tread.....		3/64
(o) Tape sizes.....	14	0
Plate:		
(p) 1. Thickness, when minimum size is specified.....		0
2. When desired thickness is specified, variation less than that specified for each one-eighth inch of thickness.....		3/64
Hub:		
(g) 1. Diameter.....		(2)
2. Minimum thickness of wall.....		1/4
3. Maximum variation in thickness of wall in any one wheel.....		1/4
(r) Length.....	1/8	1/8
(s) Depression below front face of rim.....	1/8	0
(t) Projection beyond back face of rim:		
1. If finished machined.....	0	0
2. If not finished machined, allowance for finish to be not less than one-sixteenth inch nor more than three-sixteenth inch.....		
Bore:		
(u) Diameter of rough bore.....	1/16	1/8
(w) Maximum eccentricity of rough bore in relation to tread.....		3/64

¹ Limited by tape size. ² Limited by wall thickness.

NOTE.—The letter used for each dimension in this table and in Figure 596 is the same as that of the paragraph of section 7 covering that dimension.

- (h) The inside diameter of the rim at the back face of the wheel shall not vary more than three-eighths inch under that specified.
- (j) Diameter of rim.—The inside diameter of the rim at the front face of the wheel shall not exceed the inside diameter at the back face nor vary under that dimension by more than one-fourth inch.
- (Width of rim, plane, rotundity, and block marks on tread all are the same as in A. S. T. M., A25, given above.)
- (o) Tape sizes.—The tape sizes of the wheels shall not be less than that specified, and shall not exceed this by more than 14 tapes.

⁸⁷ To facilitate the use of the specifications, the various dimensions are illustrated in fig. 596, and the permissible variations in those dimensions are also given in tabular form in Table 1.

PLATE

(p) *Thickness of plate.*—The plate may vary in thickness. When the drawings specified with an order show minimum thicknesses for the plate, the plate thickness shall not be less than that shown. When the plate thicknesses shown by the drawings are not specified as minimum, the variation in plate thickness less than that shown by the drawings shall not exceed one thirty-second inch for each one-eighth inch in the thickness of the plate.

HUB

(q) *Diameter of hub.*—The diameter of the hub may vary, but unless otherwise specified the thick-

rim, or there shall be left on the back face of the hub not more than three-sixteenth inch nor less than one-sixteenth inch stock for finishing by the purchaser.

BORE

(u) *Diameter of bore.*—The diameter of rough bore shall not vary more than one-sixteenth inch over nor more than one-eighth inch under the dimensions specified. When not specified, the rough bore shall be one-fourth inch less in diameter than the finished bore, subject to the above limitations.

(v) *Black spots in bore.*—No wheels shall have black spots in the rough bore which will not be completely removed in finish boring.

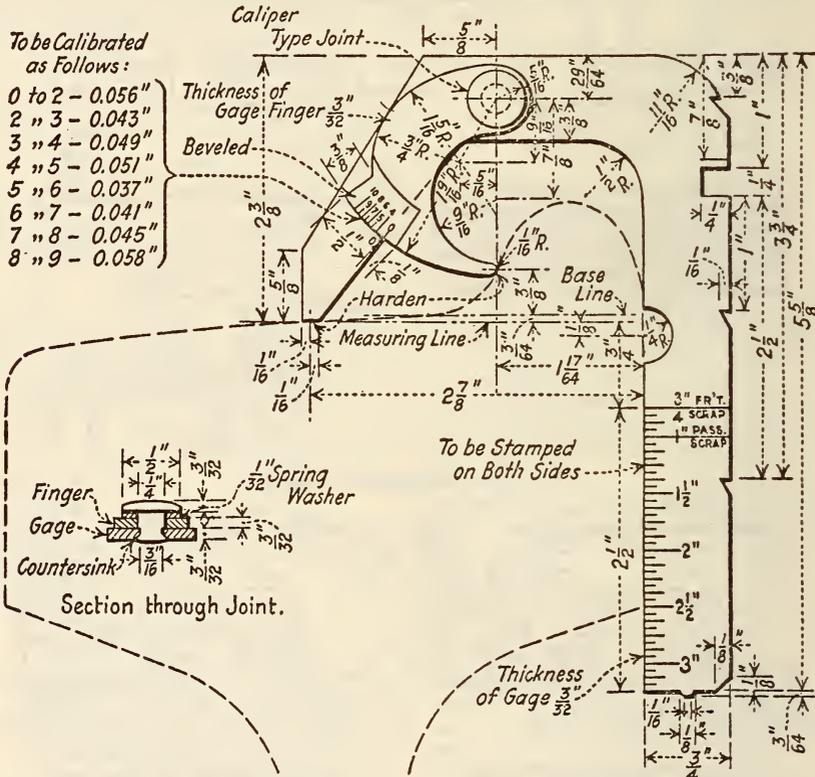

FIGURE 598.—Steel wire gage of American Railway Association, mechanical division

For use in measuring tread thickness, amount of metal to be turned off tread to restore flange contour, and limit of depth and location of witness groove in flange, slid flat spots, vertical flanges, chipped rims, and axle collar thickness.

ness of the wall of the finished bored hub shall not be less than $1\frac{1}{4}$ inches at any point. The thickness of the hub wall in any wheel shall not vary more than one-fourth inch at any two points equidistant from the face of the hub.

(r) *Length of hub.*—The length of hub shall not vary more than one-eighth inch from that specified.

(s) *Depression of hub.*—For car and tender wheels and wheels of similar design, with journal-box bearing on front face of the hub, the depression of the hub below the front face of the rim shall not be less but may be one-eighth inch more than that specified.

(t) *Projection of hub.*—For locomotive-truck wheels and wheels of similar design with journal-box bearing on back face of the hub, the wheels may be furnished with the back face of the hub smooth machined to the exact specified dimension for the projection of the hub beyond the back face of the

(w) *Eccentricity of bore.*—The eccentricity between the rough bore and the tread measured in the plane of the tread circle, as indicated by the line A-B in Figure 596, shall not exceed three sixty-fourth inch.

FINISH

(Same as A. S. T. M., A25, given above.)

MARKING

9. (a) The date (month and year), brand of manufacturer, manufacturer's serial number, and heat number shall be legibly stamped on the back face of the rim approximately one-fourth inch from the inner edge of the rim. The height of characters shall not be less than five-eighths inch for hot stamping or one-half inch for cold stamping.

(b) The tape size shall be plainly marked on the plate in figures at least 1 inch in height.

(c) When so specified in the purchaser's order, the wheels shall be stamped so as to indicate the carbon content shown by the ladle analysis.

INSPECTION AND REJECTION

10. (a) The gages and tapes used shall be based on American Railway Association standards, as illustrated in figures 597, and 598.

(Otherwise inspection and rejection conform to A. S. T. M. standard specifications for steel, paragraphs 7, 8, and 9. (See 605.0, p. 247.)

ASSOCIATION OF IRON AND STEEL ELECTRICAL ENGINEERS, GENERAL SPECIFICATIONS FOR ELECTRIC OVERHEAD TRAVELING CRANES, HEAVY-DUTY MILL SERVICE, 1921

BRIDGE AND CRANE TRACK WHEELS

TRACK WHEELS

(a) Track wheels shall preferably be of rolled or forged steel. Cast-steel wheels may be used if specified.

(b) The standard tread diameters of bridge track wheels shall be 18, 24, 27, and 30 inches, and tread shall be made to suit a standard rail not smaller than 85 pounds section. Treads for heavier rails to be made to suit.

(c) The standard bores of these wheels shall be as follows:

18-inch diameter.....	4 $\frac{1}{8}$ -inch bore.
24-inch diameter.....	5 $\frac{1}{8}$ -inch bore.
27-inch diameter.....	6 $\frac{1}{8}$ -inch bore.
30-inch diameter.....	7 $\frac{1}{8}$ -inch bore.

(d) A standard increase in diameter of one-eighth inch for all bridge track wheel axles in the wheel hubs is recommended.

(e) All bridge track wheels on same crane to be interchangeable.

(f) The A. I. & S. E. E. standard for bridge runway rails shall be an 85-pound open-hearth rail for ordinary cranes, and for special cranes requiring over an 85-pound rail, purchaser shall specify type and size of rail.

(g) The standard tread diameters of trolley track wheels shall be 12, 15, 18, 21, and 24 inches.

(h) The standard bores of these wheels shall be as follows:

12-inch diameter.....	3 $\frac{1}{8}$ -inch bore.
15-inch diameter.....	3 $\frac{3}{8}$ -inch bore.
18-inch diameter.....	4 $\frac{1}{8}$ -inch bore.
21-inch diameter.....	5 $\frac{1}{8}$ -inch bore.
24-inch diameter.....	5 $\frac{3}{8}$ -inch bore.

(i) With maximum load on crane, track wheel bearing pressures must not exceed 750 pounds per square inch projected area.

manufacturer and the purchaser shall agree upon the type and grade of the bars to be used, in which case the bars shall conform, for the respective types, to the standard specifications for carbon-steel bars for railway springs with special silicon requirements, A. S. T. M., A68 (see 603.33, p. 153); the standard specifications for silico-manganese steel bars for automobile and railway springs, A. S. T. M., A59 (See 621.34, p. 1128); or the standard specifications for chrome-vanadium-steel bars for automobile and railway springs, A. S. T. M., A60 (see 621.34, p. 1128).

(c) Drillings for chemical analysis shall be taken from pieces sheared from the bars during the process of manufacture, and not from a finished spring, unless otherwise agreed upon.

CHEMICAL PROPERTIES AND TESTS

3. (a) An analysis may be made by the purchaser from a sample representing each size of spring steel involved. The chemical composition thus determined shall conform to the requirements specified in section 2 (a) or (b).

(b) Drillings for analysis shall be taken from the unworked portion of the bars and shall represent the full cross section after rejecting any decarburized material.

(c) In case of dispute, check and arbitration analyses of carbon steel shall be made in accordance with the standard methods of chemical analysis of plain carbon steel, A. S. T. M., A33 (see 600.1, p. 10), the carbon being determined by the direct-combustion method; and of alloy steel, in accordance with the standard methods of chemical analysis of alloy steel, A. S. T. M., A55 (see 621.30, p. 1107).

WORKMANSHIP

4. The purchaser or his representative may examine all springs in each lot for workmanship and general dimensions.

5. (a) The springs shall be submitted for inspection complete in the condition required by the drawings, and shall conform to these drawings with the permissible variations specified in this section and section 7.

(b) The springs shall be of uniform pitch with ends tapered to give a reasonably square, firm bearing. The points of bars shall not protrude beyond the outside diameter of the springs.

(c) The outside dimensions of the springs, excepting the height, shall not vary more than one-sixteenth inch from those specified.

PHYSICAL PROPERTIES AND TESTS

6. (a) From each lot of springs which has met the requirements of section 5, the purchaser or his representative may select for physical tests at least 10 per cent, to be tested in accordance with the requirements of section 7 and the appendix.

(b) If any of the springs representing a lot fail to meet the requirements as to physical properties specified in section 7, but at least half of the springs representing a lot do meet these requirements, each spring of the lot shall be tested and those which meet the requirements shall be accepted. If more than half of the springs representing a lot fail to meet the requirements specified in section 7, the lot represented will be rejected.

7. The properties specified in paragraphs (a), (b), (c), and (d), modified if necessary to conform to the requirements of the appendix, shall be determined in the order specified. The spring shall not be rapped or otherwise disturbed during the test.

(a) *Solid height.*—The solid height is the perpendicular distance between the plates of the testing machine when the spring is compressed solid with a

FIGURE 607.—Springs and spring caps for freight cars, classes L, M, N, O, and P

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, BIBLIOGRAPHY ON MECHANICAL SPRINGS, 1930

Mechanical Springs

(A pamphlet of 72 pages containing 600-odd references to publications relating to mechanical springs. The items are arranged both alphabetically with respect to author's name and chronologically with respect to date of issue of the publication, beginning with Hooke in 1678. A comprehensive subject index associates each author with the particular aspect of spring treatment with which his work is identified.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR HELICAL STEEL SPRINGS FOR RAILWAYS, DESIGNATION A61-16, 1916

HELICAL RAILWAY SPRINGS

SCOPE

1. These specifications cover all helical steel springs for suspension, draft, and buffer purposes for locomotives, tenders, and cars.

2. (a) The springs shall be made of carbon-steel bars conforming to the requirements of the standard specifications for carbon-steel bars for railway springs, A. S. T. M., A14 (see 603.33, p. 152), unless otherwise specified.

(b) If carbon-steel bars with special silicon requirements or alloy-steel bars are specified, the

test load at least one and one-fourth times that necessary to bring all the coils in contact. The solid height shall not vary more than one-eighth inch from that specified.

(b) *Free height*.—The free height is the height of the spring when the load specified in paragraph (a) has been released, and is determined by placing a straight edge across the top of the spring and measuring the perpendicular distance from the plate on which the spring stands to the straight edge, at the approximate center of the spring. The free height shall not vary more than one-eighth inch from that specified.

(c) *Loaded height*.—The loaded height is the distance between the plates of the testing machine when the specified working load is applied. The loaded height shall not vary more than one-eighth inch over nor more than one-sixteenth inch under that specified.

(d) *Permanent set*.—The permanent set is the difference, if any, between the free height and the height (measured at the same point and in a similar manner) after the spring has been compressed solid three times in rapid succession with the test load specified in paragraph (a). The permanent set shall not exceed one thirty-second inch.

MARKING

8. (a) The name or brand of the manufacturer, the year and month of manufacture, and, if specified, the purchaser's class number shall be legibly stamped on each spring at a place not detrimental to the life or service of the spring.

(b) Any stamping by the inspector shall be so placed as not to be detrimental to the life or service of the spring.

INSPECTION AND REJECTION

(Conform to A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

REWORKING

12. Any springs which fail to meet the requirements as to dimensions or physical tests may be again submitted after being worked.

⁸⁸ This stress is given solely as a limiting stress not to be exceeded in testing by the methods covered by the specifications. It is not intended as a guide in the design of springs, as the proper working fiber stress will depend on the class and design of the spring and on the service for which it is intended.

APPENDIX

Test Fiber Stress

1. (a) The properties and methods of testing specified in section 7 of the specifications have been established for carbon-steel springs on the assumption that the maximum fiber stress under test shall not exceed 90,000 pounds per square inch.⁸⁸

(b) For alloy-steel springs practice has not been sufficiently well established to enable definite fiber stresses to be given. Unless otherwise agreed upon by the manufacturer and the purchaser, alloy-steel springs shall be tested under the conditions as to fiber stress specified for carbon-steel springs.

Relation Between Fiber Stress and Load

2. To find the maximum load under which the conditions of paragraph 1 (a) are fulfilled, the following formula shall be used:

$$P = \frac{3.1416 S d^3}{8 M} \quad (1)$$

where P = the load in pounds; S = the stress of the most strained fiber in pounds per square inch; d = the diameter of the bar in inches; and M = the mean diameter of the helix in inches—this is found by subtracting the diameter or thickness of the bar from the outside diameter of the spring.

Test of Springs Not in Accordance with Preceding Rule

3. If it is desired to purchase under these specifications springs in which the maximum fiber stress exceeds that specified in paragraph 1 (a), the tests shall be made as specified in section 7 except that the maximum test load to be applied in determining the properties specified in sections 7 (a) and (d) shall not be sufficient to compress the spring solid, but shall be the load which corresponds to a fiber stress of 90,000 pounds per square inch, as determined by equation (1).

Table to Facilitate Calculations

4. Table 1 is arranged to facilitate the calculations necessary to determine whether a spring can be tested in accordance with the specifications without exceeding the stress given in paragraph 1 (a). The table shows the loads at which springs of various sizes are stressed to 90,000 pounds per square inch. These are the test loads to be used for springs tested in accordance with section 15. In testing in accordance with section 7 (a) the load given in Table 1 for the given size of spring shall not be exceeded, unless with this load the spring is compressed solid.

TABLE 1.—Test loads for helical steel springs, in pounds, which will correspond to a maximum fiber stress of 90,000 pounds per square inch

Outside diameter of spring (inches)	Diameter of bar (inches)																			
	5/16	3/8	7/16	1/2	5/8	3/4	7/8	1 1/8	1 1/4	1 3/8	1 1/2	1 5/8	1 3/4	1 7/8	2	2 1/8	2 1/4	2 3/8

11 1/2	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	10,430	11,930	13,570
12	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	---	11,360	12,920

NOTE.—All values under 2,000 pounds have been shown to the nearest pound; those between 2,000 and 10,000 pounds, to the nearest 5 pounds and those over 10,000 pounds to the nearest 10 pounds.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ELLIPTICAL STEEL SPRINGS FOR RAILWAYS, DESIGNATION A62-16, 1916

ELLIPTICAL RAILWAY SPRINGS
SCOPE

1. These specifications cover all elliptic steel springs for suspension, draft, and buffer purposes for locomotives, tenders, and cars.

BASIS OF PURCHASE

(Requirements covering basis of purchase are identical with those in A. S. T. M., A61, given above, with the following additions:)

(c) The bands of the springs shall be made of wrought iron conforming to the requirements of the standard specifications for refined wrought-iron bars, A. S. T. M., A41 (see 603.1, p. 139), or if agreed upon, they may be made of "dead-soft" open-hearth steel, the carbon content of which shall not exceed 0.15 per cent. Bands of special design, subject to agreement between the manufacturer and the purchaser, may be made of steel castings conforming to the requirements of the standard specifications for steel castings, Class B, soft grade, A. S. T. M., A27. (See 611.41, p. 707.)

(e) In determining the loaded height and loaded length of the springs, the "compression" method of section 7 shall be used, unless the "release" method of section 8 is specified.

CHEMICAL PROPERTIES AND TESTS

(Same as A. S. T. M., A61, given above.)

WORKMANSHIP

(Same as A. S. T. M., A61, given above, paragraphs 4 and 5 (a), with the following additions and variations:)

(a) Dimensions which affect the contour only and do not affect the interchange or service of the springs need only be approximated.

(b) The springs shall have the leaves properly graduated in length, properly bent, and fitted to reasonably true circular arcs.

(c) The bands of the springs shall not vary from the specified dimensions more than one-sixteenth inch in width and one-thirty-second inch in thickness of straps, nor more than one-eighth inch in width across the spring.

PHYSICAL PROPERTIES AND TESTS

6. (a) From each lot of springs which has met the requirements of section 5, the purchaser or his representative may select for physical tests at least 25 per cent, to be tested in accordance with the "compression" method of section 7, or, if specified, in accordance with the "release" method of section 8, and the appendix.

(b) If any of the springs representing a lot fail to meet the requirements as to physical properties specified in section 7 or section 8 as required, but at least half of the springs representing a lot do meet these requirements, each spring of the lot shall be

tested and those which meet the requirements shall be accepted. If more than half of the springs representing a lot fail to meet the requirements specified in section 7 or section 8 as required, the lot represented will be rejected.

7. When the "compression" method is to be used, the properties specified in paragraphs (a), (b), and (c), modified if necessary to conform to the requirements of the appendix, shall be determined, in the order specified. The spring shall not be rapped or otherwise distributed during the test. The ends of half-elliptic springs shall be supported on roller or swing bearings.

(a) *Free height.*—The free height is the height of the spring after a test load of one and one-half times the specified working load has been applied and fully released.

(b) *Loaded height and loaded length.*—The loaded height and loaded length are, respectively, the height and length when the specified working load is applied. The load shall be applied gradually and in such a way that the specified working load shall not be exceeded. If it is exceeded, the load shall be released to not more than one-half the specified working load and then increased to the specified working load. The loaded height shall not be less but may be three eighths inch more than that specified. The loaded length shall not vary more than one-fourth inch from that specified.

(c) *Permanent set.*—The permanent set is the difference, if any, between the free height and the height after the test load of one and one-half times the specified working load has again been applied and fully released. The following two requirements shall be met:

(1) The permanent set shall not exceed one thirty-second inch.

(2) If there is any permanent set not exceeding one thirty-second inch the difference between the free height and the height after the test load of one and one-half times the specified working load has been applied and fully released two additional times, shall not be greater than the permanent set first measured.

8. When the "release" method is specified, the properties specified in paragraphs (a), (b), and (c), modified if necessary to conform to the requirements of the appendix, shall be determined in the order specified. The spring shall not be rapped or otherwise disturbed during the test. The ends of half-elliptic springs shall be supported on roller or swing bearings.

(a) *Free height.*—The free height is the height of the spring after a test load of one and one-half times the specified working load has been applied and fully released.

(b) *Loaded height and loaded length.*—The loaded height and loaded length are, respectively, the height and length when a test load of one and one-half times the specified working load has been applied and is slowly released to the specified working load. If released to less than the specified working load, the load shall again be raised to one and one-half times the specified working load and then released to the specified working load. The loaded height shall not be more, but may be three-eighths inch less than that specified. The loaded length shall not vary more than one-fourth inch from that specified.

(c) *Permanent set.*—The permanent set is the difference, if any, between the free height and the height after the test load of one and one-half times the specified working load has again been applied and fully released. The following two requirements shall be met:

(1) The permanent set shall not exceed one-thirty-second inch.

(2) If there is any permanent set not exceeding one thirty-second inch, the difference between the free height and the height after the test load of one and one-half times the specified working load has been applied and fully released two additional times, shall not be greater than the permanent set first measured.

MARKING

9. (a) The name or brand of the manufacturer, the year and month of manufacture, and, if specified, the purchaser's class number shall be legibly stamped on each spring at a place not detrimental to the life or service of the spring.

(b) Any stamping by the inspector shall be so placed as not to be detrimental to the life or service of the spring.

INSPECTION AND REJECTION

(Inspection, rejection, and rehearing conform to A. S. T. M. standard specifications for steel. See 605.0, p. 247. Reworking is identical with A. S. T. M., A61, given above.)

APPENDIX

Test Fiber Stress

1. (a) The properties and methods of testing specified in sections 7 and 8, have been established for carbon-steel springs on the assumption that the maximum fiber stress under test shall not exceed 127,500 pounds per square inch.⁸⁹

(b) For alloy-steel springs, practice has not been sufficiently well established to enable definite fiber stresses to be given. Unless otherwise agreed upon by the manufacturer and the purchaser, alloy-steel springs shall be tested under the conditions as to fiber stress specified for carbon-steel springs.

Relation Between Fiber Stress and Load

2. To find the maximum loads under which the conditions of section 1 (a) in appendix are fulfilled, the following formula shall be used:

$$P = \frac{2Snbh^2}{3L} \quad (1)$$

where P = the load in pounds; S = the stress of the most strained fiber in pounds per square inch; n = the number of plates in half-elliptic springs, or half the number of plates in full-elliptic springs; b = the width of each plate in inches; h = the thickness of each plate in inches; and L = the distance between supports, in inches, when the spring is loaded.

Test of Springs Not in Accordance with Preceding Rules

3. If it is desired to purchase under these specifications springs in which the maximum fiber stress exceeds that specified in section 1 (a) in appendix the tests shall be made as specified in section 7 or 8 except that the test load to be applied shall not be one and one-half times the specified working load but shall be the load which corresponds to a fiber stress of 127,500 pounds per square inch, as determined by equation (1).

Test of Springs for Which No Working Load is Specified

4. If springs are ordered to free height and length only, and no working load and no loaded dimensions are specified, the tests specified in sections 7 or 8

⁸⁹ This stress is given solely as a limiting stress not to be exceeded in testing by the methods covered by the specifications. It is not intended as a guide in the design of springs, as the proper working fiber stress will depend on the class and design of the spring and on the service for which it is intended.

shall be made using instead of the specified working load the load which corresponds to a fiber stress of 75,000 pounds per square inch, as determined by equation (1).

Table to Facilitate Calculations

5. Table 1 is arranged to facilitate the calculations necessary to determine whether a spring can be tested in accordance with the specifications without exceeding the stress given in section 1 (a) in appendix. The table shows, for various lengths and for various thicknesses of plate, the loads per inch of effective width of spring corresponding to a fiber stress of 127,500 pounds per square inch. These are the maximum allowable test loads, and shall not be exceeded in any tests.

The loads are given per inch of effective width of spring. The effective width of spring is understood to mean the width of the individual plate multiplied by the number of plates as defined in section 2 in appendix. Consequently the total load in pounds for any spring is found by multiplying the value from Table 1 by the product of the width of plate into the number of plates.

TABLE 1.—Test loads for elliptical springs, in pounds per inch of effective width, which will correspond to a maximum fiber stress of 127,500 pounds per square inch

Length of spring, inches	Thickness of plates, (inches)						
	3/16	1/4	5/16	3/8	7/16	1/2	5/8
20	150	265	-----	-----	-----	-----	-----
22	136	241	377	-----	-----	-----	-----
24	125	221	345	497	-----	-----	-----
26	115	204	319	460	625	-----	-----
28	107	190	296	427	581	760	-----
30	100	177	277	398	543	707	896
32	-----	166	259	374	509	665	840
34	-----	156	244	351	479	625	791
36	-----	148	230	332	452	590	748
38	-----	140	218	314	429	560	708
40	-----	133	208	298	407	531	673
42	-----	126	198	284	388	506	640
44	-----	-----	189	272	370	483	612
46	-----	-----	180	260	354	462	585
48	-----	-----	-----	249	339	443	561
50	-----	-----	-----	239	325	425	538
52	-----	-----	-----	-----	313	409	518
54	-----	-----	-----	-----	302	394	499
56	-----	-----	-----	-----	-----	380	481
58	-----	-----	-----	-----	-----	366	465
60	-----	-----	-----	-----	-----	354	450

straight; free from surface cracks, rolling seams, folds and flat areas, or other injurious defects.

3. The bars after being suitably tapered or otherwise prepared shall be heated slowly and uniformly to a temperature of approximately 1,700° F. (930° C.) and coiled on a preheated mandrel. No water shall be allowed to come in contact with the heated bar at any time.

4. After coiling, the springs shall be allowed to cool uniformly to a distinct black heat. They shall then be reheated uniformly to a temperature sufficient to refine the grain and quenched in an ample volume of oil. After quenching the springs shall be allowed to cool to at least 400° F. (200° C.) and shall then be reheated uniformly to a temperature below the critical, but sufficiently high to give a proper drawback or tempering effect.

SAMPLING

5. The springs offered for inspection shall be arranged in groups with 500 or fraction thereof of a size in a group. The inspector shall select one spring from each group to represent that group and shall suitably mark the sample so selected for identification.

CHEMICAL PROPERTIES AND TESTS

6. (a) Unless otherwise specified, the steel shall conform to the following requirements as to chemical composition:

	Per cent
Carbon.....	0.90-1.05
Manganese.....	.25-.50
Phosphorus, maximum.....	.05
Sulphur, maximum.....	.05
Silicon, maximum.....	.15

(b) Other grades of steel may be used when mutually agreed upon by the purchaser and the manufacturer.

7. One check analysis may be made by the purchaser from each 500 springs or fraction thereof of each size of bar.

8. For chemical analysis, a spring if small shall be taken or if large a piece weighing about one-half pound shall be cut off. If the sample is cut off hot it shall be cooled in such a way as not to permit it to harden. Drillings for check analysis shall be made from the samples so selected and the drill used shall be approximately one-half the diameter of the bar. The drillings for analysis shall be selected from the thoroughly mixed total drillings obtained by passing nearly through the section of the bar after discarding the surface drillings.

PHYSICAL PROPERTIES AND TESTS

9. From each group of springs described in section 5 which conform to the requirements of sections 15 and 16 (a) the inspector may select 10 per cent to be tested in accordance with the requirements of sections 10 and 11.

10. (a) The properties specified in paragraphs (b) to (f) shall be determined in the order enumerated. The springs shall not be rapped or otherwise disturbed during the test.

(b) *Solid height.*—The solid height is the perpendicular distance between the plates of the testing machine when the spring is compressed solid with a test load of approximately one and one-quarter times that necessary to bring all coils in contact.

(c) *Free height.*—The free height is the height of the spring when the load specified in paragraph (b) has been released and is determined by placing a straight-edge across the top of the spring and measuring the perpendicular distance from the plate on which the spring stands to the straight-edge at the approximate center of the spring.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR HEAT-TREATED CARBON-STEEL HELICAL SPRINGS, DESIGNATION A125-31T, 1931

HEAT-TREATED HELICAL SPRINGS

SCOPE

1. These specifications cover hot-coiled, helical compression springs made of round bars one-half inch and larger in diameter and suitable for use on railway equipment.

MANUFACTURE

2. The steel may be made by one or more of the following processes: Open hearth, crucible, or electric furnace. The rolled bars shall be practically

(d) *Loaded height*.—The loaded height is the perpendicular distance between the plates of the testing machine when the specified working load has been applied.

(e) *Uniformity of pitch*.—The pitch of the coils shall be sufficiently uniform that when the springs are compressed to a point where any two coils are in contact there shall be no space exceeding one-thirty-second inch between the other coils, excluding the tapered ends.

(f) *Permanent set*.—The permanent set is the difference, if any, between the free height and the height after the spring has been compressed solid three times with the test load specified in paragraph (b), measured at the same point and in the same manner.

11. (a) Springs having a free height of 10 inches and under shall conform to the following tolerances when tested in accordance with section 10:

Diameter.—The diameter of the springs up to 6 inches in outside diameter shall not vary more than one-sixteenth inch from that specified and for springs over 6 inches in outside diameter the diameter shall not vary more than one-eighth inch from that specified.

Solid height.—Not more than one-sixteenth inch over that specified.

Free height.—Not more than one-eighth inch over or under that specified.

Loaded height.—Not more than one-eighth inch over nor more than one-sixteenth inch under that specified.

Uniformity of pitch.—As specified in section 10 (e).

Permanent set.—Not more than one-thirty-second inch.

(b) For springs having a free height over 10 inches but not over 15 inches the tolerances specified in paragraph (a) shall be increased 50 per cent.

(c) For springs having a free height over 15 inches but not over 20 inches the tolerances specified in Paragraph (a) shall be increased 100 per cent.

(d) For springs having a free height over 20

inches the tolerances shall be mutually agreed upon by the manufacturer and the purchaser.

12. (a) The properties and methods of testing specified in sections 10 and 11 have been established on the assumption that the maximum fiber stress at the solid height shall not exceed 100,000 pounds per square inch and that the several heights specified are commensurate. The stress of 100,000 pounds per square inch referred to is given solely as a limiting stress not to be exceeded in testing. This stress is not intended as a guide in the design of springs, as the proper working fiber stress will depend upon the class of the spring and upon the service for which it is intended.

(b) Unless otherwise mutually agreed upon by the manufacturer and purchaser, springs which do not meet the conditions of paragraph (a) shall not be subject to the requirements of sections 10 and 11, but shall be submitted to a test load which corresponds to a maximum fiber stress of 100,000 pounds per square inch as determined in section 13. The free height as measured after application and release of such test load shall conform to the requirements of section 11.

13. The test load corresponding to a maximum fiber stress of 100,000 pounds per square inch shall be calculated from the following equation:

$$C = \frac{3.1416 S d^3}{8 M} \tag{1}$$

where

C = the capacity in pounds.

S = the stress at the most strained fiber = 100,000 pounds per square inch.

d = the diameter of the bar in inches.

M = the mean diameter of the helix in inches, found by subtracting the diameter of the bar from the outside diameter of the spring.

Table 1 shows test loads in pounds and deflection per turn in inches for helical springs, corresponding to a maximum fiber stress of 100,000 pounds per square inch for springs 2 to 12 inches in outside diameter.

TABLE 1.—Test loads in pounds and deflection per turn in inches for helical springs, corresponding to maximum fiber stress of 100,000 pounds per square inch

Outside diameter of spring, inches	Diameter of bar, inches																
	½	¾	⅝	⅞	1	1 1/16	1 1/8	1 1/4	1 3/8	1 1/2	1 5/8	1 3/4	1 7/8	2	2 1/8	2 1/4	
2	Load	3,272															
	Deflection	0.134

	Deflection																	2.086	1.981	1.885	

14. To determine whether or not the specified heights fulfill the conditions of section 12 (a) the calculations described in paragraphs (a) to (f), inclusive, shall be made.

(a) Divide the solid height by the diameter of the bar to obtain the number of turns in the spring. From the figure thus obtained subtract $1\frac{1}{2}$ to obtain the number of acting turns.

NOTE—There is one turn of inactive material at each end of a spring counting from the tip of the tapered bar. In measurements parallel to the axis of the spring, this is equal to one and one-half times the diameter of the bar, being made up of the two tips of the bar, each one-quarter of the bar diameter in thickness and one full bar diameter.

(b) The deflection corresponding to the load determined by the equation in section 13 shall be calculated from the following equation:

$$F = \frac{8.1416 S M^2 N}{G d} \quad (2)$$

where

S , M , and d are the same as in equation (1);

F = the deflection;

N = the number of active turns; and

G = the effective torsional modulus of elasticity.

For the grade of steel herein specified G shall be taken at 10,500,000 pounds per square inch.

Table 1 shows test loads in pounds and deflection per turn in inches for helical springs, corresponding to a maximum fiber stress of 100,000 pounds per square inch for springs 2 to 12 inches in outside diameter.

(c) The sum of the solid height and the total deflection F is the normal free height and should not be exceeded by the free height.

(d) In helical springs the loads and deflections are directly proportional. Therefore, the deflection, X , under any load, P , less than the capacity shall be determined from the ratio: $C : F :: P : X$ by solving for X .

(e) The sum of the specified loaded height and X is the required free height which shall not exceed the normal free height.

(f) Should the specified free height exceed the normal free height or be less than the required free height or both, the several specified heights are not commensurate.

WORKMANSHIP AND FINISH

15. Before offering springs for inspection they shall be compressed solid three times. The springs shall be submitted for inspection singly or grouped as may be shown by the drawings and shall conform to the drawings within the tolerances specified in section 11.

16. (a) The ends of the bars shall be properly tapered to give when coiled a reasonably square, firm bearing. The points of the bars shall be in approximate contact with the adjacent coil and shall not protrude beyond the outside diameter of the springs.

(b) When mutually agreed upon by the manufacturer and purchaser, the end bearing surfaces of the springs shall be ground to produce a uniform bearing of at least three-fourths of the circumference and square with the axis of the helix within one-eighth inch per foot of free length.

MARKING

17. (a) The name or brand of the manufacturer, the year and month of manufacture and, if specified, the purchaser's class number shall be legibly stamped on each spring at a place not detrimental to the life of the spring.

(b) Any stamping by the inspector shall be so placed as not to be detrimental to the life or service of the spring.

INSPECTION AND REJECTION

(Conform to the requirements of the American Railway Association for galvanized sheets (see 604.32, p. 243) in respect to inspection and reheating, with the following original requirements as to rejection and reworking:)

18 (a) If any of the springs representing a group fail to conform to the requirements specified in section 11, but at least one-half of the springs representing a group do conform to these requirements, each spring of the group shall be tested, and those which conform to the requirements shall be accepted. If more than one-half of the springs representing a group fail to conform to requirements specified in section 11, the group shall be rejected.

(b) Individual springs which, subsequent to inspection at the mills or elsewhere and their acceptance, show defects or imperfections will be rejected and shall be replaced by the manufacturer.

19. Springs which fail to conform to the requirements of the physical tests or conform to the specified dimensions may be again submitted after being reworked.

SOCIETY OF AUTOMOTIVE ENGINEERS, FRAMES AND SPRINGS; LEAF SPRINGS, S. A. E. RECOMMENDED PRACTICE, FEBRUARY, 1929

LEAF SPRINGS

All letter dimensions refer to the leaf-spring specification form herewith.

Load.—Load is the force in pounds to be applied by the testing machine to the spring in question. Load is to be read on the testing machine after rapping the spring.

Height.—See dimension E .

Clearance.—Clearance is the greatest distance in inches the spring may deflect after the specified load has been applied.

Opening.—See dimension F . Where the exposed surface of the main leaf comes below the center line of the spring eyes, when the spring is in the position illustrated, the dimension F shall be expressed as a minus quantity.

Rate (or flexibility).—Rate is one-half the force, measured in pounds, necessary to deflect the spring from F plus 1 inch to F minus 1 inch.

Finish.—Finish refers to the surface condition of the steel after heat treatments.

Finish No. 1.—Leaves shall be left in the same condition as that in which they come from the heat-treating process.

Finish No. 2.—All burrs on the bearing sides of the leaves shall be removed.

Finish No. 3.—The sheared and trimmed edges of the leaves shall be chamfered on their bearing sides.

Finish No. 4.—All loose scale shall be removed. Combinations of these numbers may be used to indicate the complete finish desired.

Leaf numbers.—Leaves shall be designated by their numbers, No. 1 leaf being the main leaf; No. 2 leaf being the leaf above and adjacent to it; and so on.

Nominal width of spring steel.—See dimension G .

Finished width of spring steel.—See dimension H . Spring ends shall be finished to a width of one-sixteenth inch less than the nominal width of the springs, with a plus or minus tolerance of 0.005 inch for passenger cars and 0.010 inch for motor trucks, to a point far enough back on the spring to allow free shackle movement or free sliding movement in case of flat-end springs.

Spring eyes and bushings.—See dimensions K and L .

TOLERANCES ON SPRING EYES AND BUSHINGS

Part	Diameter tolerance	
	Plus	Minus
Bushed eyes.....	Inch 0.001	Inch 0.003
Unbushed eyes.....	.001	.004

The nominal wall thickness of spring-eye bushings shall be one-eighth inch for all sizes of bushing.

LEAF-SPRING STEEL

Rolling tolerances for automobile concave spring steel.—The finished bars shall be of double-concave section with round edges.

Leaf-spring steel bars shall not have more than 1 inch curvature in 20 feet, or 1¼ inches in 25 feet, or 1½ inches in 30 feet.

The concavity, or difference between the thickness at the edges and at the center of the bar, shall be as specified in Table 3.

TABLE 3.—Allowable variations in concavity

Width	Nominal concavity	Maximum concavity	Minimum concavity
Inches	Inch	Inch	Inch
1½	0.007	0.009	0.004
1¾	.008	.010	.005
2	.010	.012	.006
2¼	.011	.013	.007
2½	.013	.015	.009
3	.016	.018	.012
3½	.018	.020	.013
4	.021	.023	.016
5	.029	.031	.023

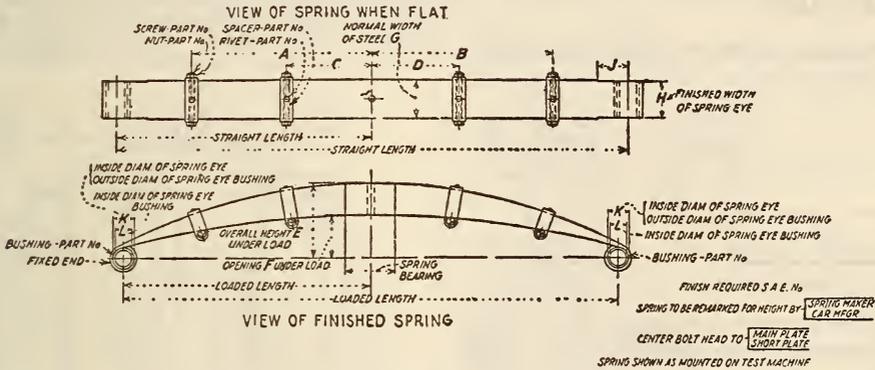

FIGURE 608.—Views of spring finished and flat

TABLE 1.—Width and thickness tolerances

Width of flat		Width		Thickness ¹	
Over—	To, inclusive—	Plus	Minus	Plus	Minus
Inches	Inches	Inch	Inch	Inch	Inch
0	2¼	½	0	0.005	0.005
2¼	3	¾	0	.006	.006
3	5	1½	0	.007	.007

¹ Thickness measurements shall be taken at the edge of the bar where the concave surface intersects the rounded edge.

The radii of the arcs of the two concave surfaces shall be of equal length.

Rolls to produce the round edges shall be turned to a radius equal to two-thirds the thickness of the bar.

All bars ordered to gage shall be rolled to the Birmingham wire gage.

All bars must meet the width and thickness tolerances specified in Table 1.

The difference in thickness between the two edges of each bar shall not be greater than those given in Table 2.

TABLE 2.—Differences in thickness

Width of flat		Difference in thickness
Over—	To, inclusive—	
Inches	Inches	Inch
0	2	0.002
2	3	.003
3	5	.003

LEAF-SPRING TESTS

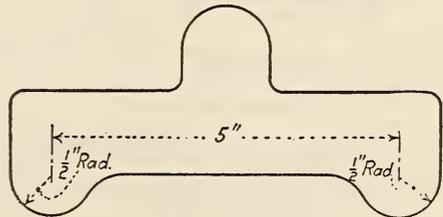

FIGURE 609

All leaf springs shall be tested in an upright position and supported so as to permit free movement.

All tests or inspection measurements shall be made after rapping the leaf spring in the test or inspection position.

TESTS FOR PARALLELISM OF SPRING EYES

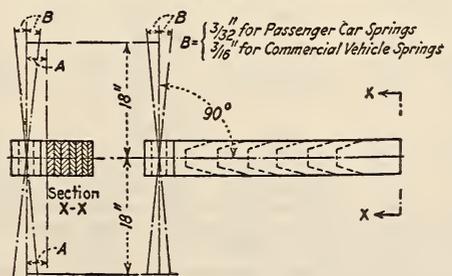

FIGURE 610

Eyes of main leaves shall be parallel and square (within specified limits) to the main leaf and parallel to each other.

The test shall be made by inserting two 3-foot bars in the eyes as shown.

SOCIETY OF AUTOMOTIVE ENGINEERS, FRAMES AND SPRINGS; SPRING CENTER-BOLTS, S. A. E. STANDARD; JANUARY, 1931

SPRING CENTER BOLTS

(See 608.31, p. 603.)

SOCIETY OF AUTOMOTIVE ENGINEERS, FRAMES AND SPRINGS; SPRING REBOUND CLIPS, SPACERS, AND BOLTS, S. A. E. RECOMMENDED PRACTICE, JANUARY, 1931

SPRING REBOUND CLIPS, SPACERS, AND BOLTS

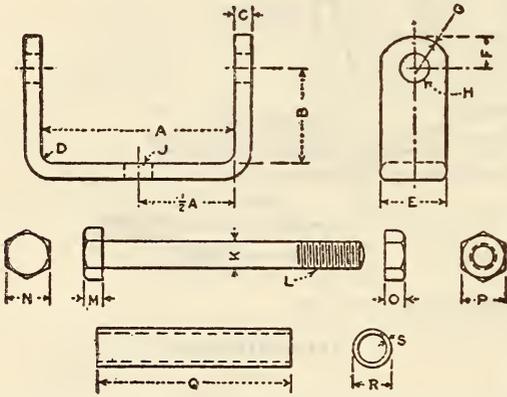

FIGURE 611.—Spring rebound clips, spacers, and bolts

[Dimensions in inches]

Dimensions	Passenger-car springs (except cantilevers or when wider than 2½ inches)	Motor-truck springs (also cantilevers on passenger cars)

1 Threads to be American standard (NC) coarse, class 2 fit, length 1¼K+¼ inch, with points rounded.

A To be ½ to ⅙ inch greater than nominal width of spring.
 B To be made to suit spring.
 Q To be ½ inch greater than nominal width of spring.
 Clearance between the rebound clip bolts (for spacer tubes if used) and spring plates shall not exceed ⅜ inch for passenger cars or ¼ inch for motor trucks.

611.55 PINIONS AND GEARS.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD WEB HOLES FOR RAILWAY GEARS, E15-24, 1924

WEB HOLES FOR RAILWAY GEARS

The number of web holes in railway gears shall be four.

(In addition to the above statement this specification consists of an extended table which contains the outside diameter in inches—the diameters ranging in size from 15.75 to 31.20 inches—supplemented by data on number of teeth, diametral pitch, width of face, thickness of rim, and hub diameter. Also diameters of holes and distance between hole centers, and the identifying pattern numbers assigned to these gears by the manufacturing concerns in the Pittsburgh district engaged in gear manufacturing. The following table contains a summary showing the number of railway-gear blanks for various web-hole diameters and centers:)

Diameter of holes	Hole centers	Number of blanks	Diameter of holes	Hole centers	Number of blanks
Inches	Inches		Inches	Inches	
1	17	1	2½	15	1

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, RECOMMENDED SPECIFICATION FOR CASEHARDENED FORGED STEEL AND QUENCHED AND TEMPERED FORGED CARBON-STEEL GEARS, E117-29, 1929

CARBON-STEEL GEARS

MANUFACTURE

101. *Material.*—All blanks for gears shall be made from open-hearth steel which has been worked thoroughly to secure a homogeneous dense material, free from all injurious defects.

CHEMICAL PROPERTIES AND TESTS

201. *Chemical properties.*—The steel shall conform to the following requirements as to chemical composition:

Element	Quenched and tempered forged carbon steel	Casehardened forged steel
Phosphorus.....	Not over 0.05 per cent.	Not over 0.05 per cent.
Sulphur.....	do.	Do.
Carbon.....	do.	0.20 per cent—not less than 0.12 per cent nor more than 0.23 per cent.
Manganese.....	do.	0.50 per cent—not less than 0.40 per cent nor more than 0.60 per cent.

These specifications cover a medium carbon steel, heat treated. It is not thought desirable to bind manufacturers specifically as to chemical composition for the reason that different heat treatments can be used for different analyses.

202. *Check analysis.*—A check analysis may be made by the purchaser or his representative from one or more gear blanks from each lot of 100 or fraction thereof ordered, and this analysis shall conform to the requirements specified above. The sample for check analysis is to be taken at the pitch line so that the blank will not be destroyed.

PHYSICAL PROPERTIES AND TESTS (FOR CASE HARDENED FORGED STEEL GEARS ONLY)

301. *Hardness.*—The hardness of casehardened forged-steel gears as shown by the scleroscope shall not be less than 80, taken at the center of the top of the tooth after treatment.

302. *Treatment.*—All casehardened forged-steel gears, after the teeth are cut, shall be carbonized to a depth approximately one-sixth of the thickness of the teeth on the pitch line.

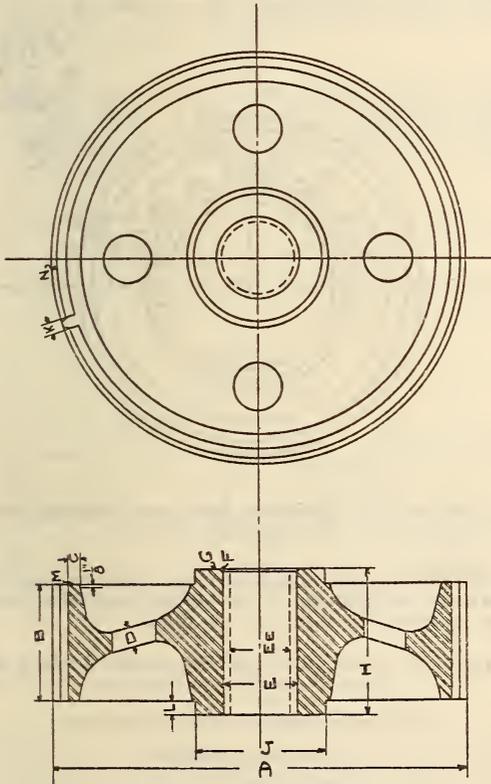

FIGURE 612.—Reference letters for gear dimensions

FINISH

401. *Dimensions.*—(a) The outside diameter (A) over the teeth as machined must not vary from that specified by more than plus 0 inch nor minus one thirty-second inch.

(b) The face (B) of the gears must not vary from the specified width by more than plus one thirty-second inch nor minus one thirty-second inch.

(c) The minimum thickness of the rim (C) under the teeth shall be as follows, measured one-eighth inch in from the edge of the rim:

Pitch	Thickness of rim
	Inch
2	1/2
2 1/4	1 1/4
2 1/2	7/16
3	3/8
3 1/2	3/8
4	3/8
4 1/4	3/8

402. *Web.*—The web (D) of all gears shall have four holes. The diameter and radius on which they are spaced shall be in accordance with the requirements of E15, referred to above.

403. *Bore.*—(a) The diameter for the bore of gears with hard centers shall be 0.001 inch per inch of diameter under that specified, and 0.0015 inch per inch of diameter for gears with soft centers to allow for press fit.

(b) The permissible variation from the finish bore shall be plus 0.001 inch and minus 0.001 inch.

(c) The diameter of rough bore (Ee) shall not vary more than one-sixteenth inch over nor one-eighth inch under that specified.

(d) The ends of finished bores shall be chamfered (F) one-sixteenth inch on motor side to avoid injury to shaft when mounting.

(e) Bores shall be measured with pin gage or inside micrometer.

404. *Hub.*—(a) The face (G) of hub (H) next to the lining is to have a smooth bearing finish and run true with the bore.

(b) The variation from the specified dimensions of hub (H) and hub extension (L) shall not exceed the following:

Length of hub (H) over all, plus 0 inch to minus 0.02 inch.

Length of hub extension (L), plus one thirty-second inch to minus one thirty-second inch.

Diameter of hub extension (J), plus 0 inch to minus 0.03 inch.

405. *Teeth.*—(a) The thickness (K) of the teeth at the pitch line must be to specified dimensions as a maximum or to specified dimensions minus 0.010 inch as a minimum.

The teeth, unless otherwise specified, shall be of one of the following three forms: (a) Brown & Sharpe standard 14 1/2° involute; (b) long and short addendum spur as shown in Table A, and (c) long and short addendum helical as shown in Table B. For new equipment, the use of tooth form (b) or (c) is recommended.

4	.8976	.3876	.1643	.4000	.4786	.5643	20½
4½	.7854	.3354	.1700	.3750	.4700	.5450	21
5	.7392	.3146	.1264	.3300	.3858	.4564	21½

NOTE.—Theoretical dimensions do not allow for backlash.

MARKING

501. *Marking.*—All gears shall be plainly stamped on motor side of rim (*M*) as follows:

Grade -----

Month, year, serial number of manufacturer consecutive for each month.

Name, initials, or trade-mark of manufacturer.

Long and short addendum spur gearing shall be distinguished from standard addendum by two grooves around the periphery of each gear and pinion.

INSPECTION AND REJECTION

601. *Inspection.*—(a) All gears shall be tested for smooth running. The teeth must be equally spaced so that the gear will run smoothly in both directions with a master pinion.

(b) Records of all chemical analyses and physical tests shall be kept by the manufacturer and shall be available to the purchaser for a period of one year.

602. *Rejection.*—The purchaser reserves the right to reject any portion of or all the material which does not conform to the above specifications in every particular.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, RECOMMENDED SPECIFICATION FOR CASEHARDENED FORGED STEEL AND QUENCHED AND TEMPERED FORGED CARBON-STEEL PINIONS, E118-29, 1929

CARBON-STEEL PINIONS

(This specification conforms to A. E. R. E. A., E117, given above, except in the following particulars:)

403. *Bore.*—(a) The taper for the bore of pinions shall be 1¼ inches on the diameter per 1 foot in length.

(b) All bores (*C-E*) must be finished after treatment. The diameter of the bore must be such that the standard plug gage (see section 601 (b)) will not project less than one-thirty-second inch nor more than one-sixteenth inch, measured at the large end of the bore (*C*) and have bearing the full length (*D*) of bore (*C-E*).

404. *Counterbore.*—(a) The depth (*H*) of the counterbore must not vary from that specified by more than plus 0 inch nor minus one-thirty-second inch.

(b) The diameter (*F*) of the counterbore must not vary from that specified by more than plus one-thirty-second inch nor minus 0 inch.

405. *Keyway.*—(a) The sides (*G*) of the keyway must be cut parallel with the center line of the pinion.

(b) The width (*L*) of the keyway must not vary from that specified by more than plus 0.003 inch nor minus 0 inch.

(c) The depth (*P*) of the keyway must not vary from that specified by more than plus one-sixty-fourth inch nor minus 0 inch.

(d) The fillet (*J*) at the bottom of the keyway may be a minimum of one-sixty-fourth inch radius.

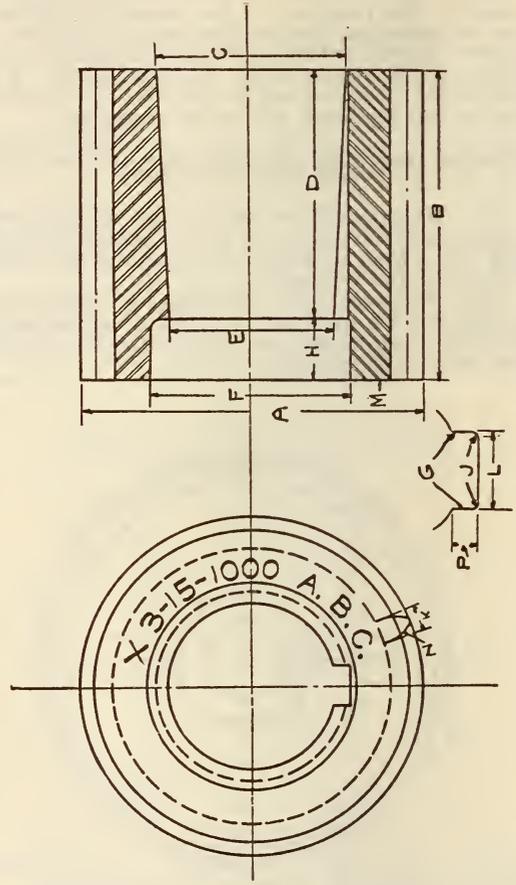

FIGURE 613.—Reference letters and marking for pinions

With this specification, a clearance shall be provided between the bottom of the keyway and the pinion key equal to the radius of the fillet.

TABLE A.—Tooth data and dimensions for long and short addendum spur gearing

Same as for gears in E117, given above.		0.8854	0.5290	0.4360	0.8400	Same as for gears in E117, given above.	
		.8099	.5982	.3605	.8887		
		.7120	.4560	.3420	.6980		
		.5911	.3530	.2750	.5280		
		.5100	.3143	.2500	.4786		
		.4500	.3000	.2450	.4700		
		.4246	.2594	.1970	.3858		

NOTE.—Theoretical dimensions do not allow for backlash.

601. *Finish.*—(b) All pinions shall be gaged with a standard taper plug gage which shall be the same size as the nominal size of the bore at the large end.

INSPECTION AND REJECTION

701. *Inspection.*—All pinions shall be free from any seams, cracks, or other defects that would in any way affect their service.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, AMERICAN TENTATIVE STANDARD SPUR-GEAR TOOTH FORM, B6b-1927

[Approved by American Standards Association, January, 1927.]

SPUR-GEAR TOOTH FORM

FOURTEEN AND ONE-HALF DEGREE COMPOSITE SYSTEM

1. Addendum.....	$\frac{1}{DP}$	$\frac{1}{\pi} CP$
2. Minimum dedendum.....	$\frac{1.157}{DP}$	$\frac{1.157}{\pi} CP$
3. Working depth.....	$\frac{2}{DP}$	$\frac{2}{\pi} CP$
4. Minimum total depth.....	$\frac{2.157}{DP}$	$\frac{2.157}{\pi} CP$
5. Pitch diameter.....	$\frac{N}{DP}$	$\frac{N}{\pi} CP$
6. Outside diameter.....	$\frac{N+2}{DP}$	$\frac{N+2}{\pi} CP$
7. Basic tooth thickness on pitch line.....	$\frac{1.5708}{DP}$	$\frac{1.5708}{\pi} CP$
8. Minimum clearance.....	$\frac{0.157}{DP}$	$\frac{0.157}{\pi} CP$

N = Number of teeth.
DP = Diametral pitch.
CP = Circular pitch.

NOTE.—The term diametral pitch is used up to 1 DP inclusive and the term circular pitch is used for 3 inches CP and over.

NOTE.—A suitable working tolerance should be considered in connection with all minimum recommendations.

NOTE.—Minimum clearance refers to the clearance between the top of the gear tooth and the bottom of the mating gear space, and is specified as "minimum" so as to allow for necessary cutter clearance for all methods of producing gears. At the present time this value can not be standardized.

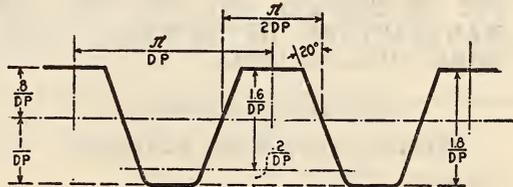

FIGURE 617.—Basic rack for 20° stub involute system for spur gears

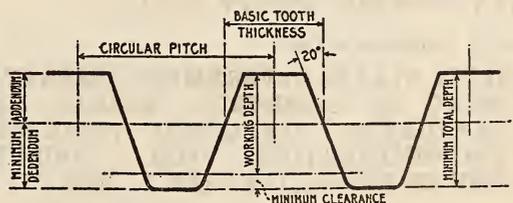

FIGURE 618.—Proportions for spur gears

Proportions for spur gears

	The use of both diametral and circular pitches—	
	In terms of diametral pitch	In terms of circular pitch
	<i>Inches</i>	<i>Inches</i>
1. Addendum.....	$\frac{0.8}{DP}$	$=0.2546 \times CP$
2. Minimum dedendum.....	$\frac{1}{DP}$	$=0.3183 \times CP$
3. Working depth.....	$\frac{1.6}{DP}$	$=0.5092 \times CP$
4. Minimum total depth.....	$\frac{1.8}{DP}$	$=0.5729 \times CP$
5. Pitch diameter.....	$\frac{N}{DP}$	$=0.3183 \times N \times CP$
6. Outside diameter.....	$\frac{N+1.6}{DP}$	$=PD+(2\text{addendums})$

N=Number of teeth.

PD=Pitch diameter.

DP=Diametral pitch.

CP=Circular pitch.

NOTE.—The term diametral pitch is used up to 1 DP inclusive and the term circular pitch is used for 3 inches CP and over.

NOTE.—These proportions are identical with those of the A. G. M. A. recommended practice for herringbone gears.

NOTE.—A minimum root clearance of 0.2 inch/diametral pitch is recommended for new cutters and gears. There is correct tooth action, however, between gears cut to this standard system and those cut to the Nuttall system, the only dimension affected being the clearance. Where the proposed gear tooth meshes with a Nuttall gear space there is a clearance of 0.1425 inch/diametral pitch, and where the Nuttall tooth runs with the proposed gear space there is a clearance of 0.2146 inch/diametral pitch.

612.11 POCKETKNIVES.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; SIMPLIFIED PRACTICE RECOMMENDATION FOR POCKET KNIVES, R99-30, JANUARY 1, 1930

POCKETKNIVES

On November 13, 1928, a general conference of representative manufacturers, distributors, and users

of pocketknives drafted a simplified-practice recommendation. The industry has since adopted, and approved for promulgation by the Department of Commerce, this recommendation which limits the varieties of pocketknives to those described herein.

The basis of this simplification is the shape and size of the haft or handle which are governed by the basic die. To aid in identification, 140 illustrations referred to are shown as complete knives in the Pocket Knife Manufacturers Standard Catalogue. The haft of these knives represent the shape and size of 140 basic dies.

Special attention is drawn to the fact that the covers, as well as the style of blade, size of blade, and number of blades, are shown only to aid in identifying the hafts. The dimension indicated beneath each illustration represents the length of the haft. It should be remembered that the shape and size of the haft is to be considered only as a means of identifying the pertinent approved basic die.

It is permissible for a pocketknife manufacturer to fit any standard haft, any required type of blade, or

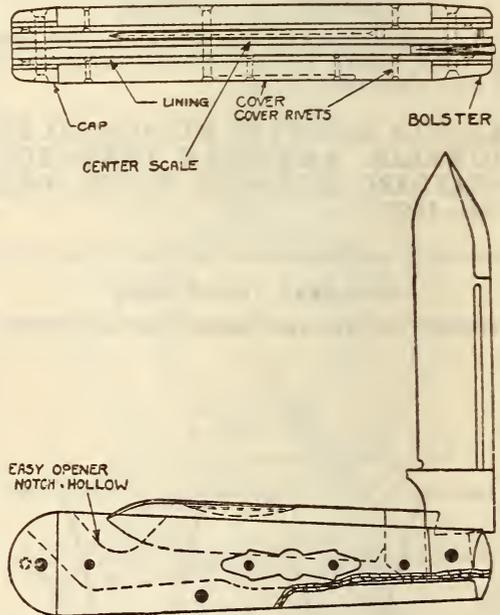

FIGURE 619.—Pocketknife

any number of blades, so long as the total variety in the line of knives produced by that manufacturer does not exceed 500.

One hundred and forty cuts are shown in the Pocket Knife Manufacturers Standard Catalogue, but it should be noted that any one manufacturer is limited to 107 basic dies, selected from the above-named catalogue. Moreover, any one manufacturer is allowed 5 basic dies not shown, provided his total does not exceed 107.

The haft-length tolerances or deviations are as follows: Up to and including $3\frac{3}{8}$ inches in length, one-sixteenth inch, plus or minus; longer than $3\frac{3}{8}$ inches, one-eighth inch, plus or minus. These deviations are allowed in order to accommodate the existing dies of manufacturers. It is further recognized that proportionate deviations in widths will occur.

Item 1. The number of styles or numbers should not exceed 500 knives in any one line; different colors of celluloid to constitute separate numbers.

Item 2. One hundred and seven basic dies shall not be exceeded in any one manufacturer's line.

Item 3. Fifteen standard colors of celluloid with 10 additional optional shall not be exceeded, these colors to be revised as necessary.

Item 4. The number of celluloid-handled knives in any manufacturer's line shall not exceed 200.

Item 5. The number of pearl knives in any manufacturer's line shall not exceed 75.

Item 6. Nickel-silver bolsters not sanctioned on pruners, barlows, and stabbers.

Item 7. Steel linings only sanctioned on pruners, barlows, and stabbers.

Item 8. Brass or nickel-silver linings sanctioned on all numbers except pruners, barlows, and stabbers.

Item 9. Black insides sanctioned only on pruners, barlows, stabbers, and such other patterns as may be developed from the stabber category; that is, basic dies Nos. 16 and 33 of the Pocket Knife Manufacturers Standard Catalogue.

Item 10. Pruners, barlows, and stabbers should have glaze-finished blades only.

Item 11. The catalogue shows illustrations of hafts or handles with or without easy-opener notch hollows, and these handles may be made either way without being considered as a deviation from the basic dies, each constituting a separate number.

Item 12. The 15 standard colors of celluloid are as follows:

White.	Red.
Black.	Ultra pearl.
Shell.	Golden pearl.
Candy stripe.	Abalone pearl.
Red horn.	Green pearl.
Buffalo horn.	Blue pearl.
Gray horn.	Smoke pearl.
Tinsel.	

612.12 RAZORS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR PACKAGING OF RAZOR BLADES, R69, JULY 1, 1928

PACKAGING OF RAZOR BLADES

In accordance with the unanimous action on March 31, 1927, of a general conference of representatives of manufacturers and distributors, the Department of Commerce, through the Bureau of Standards, recommends the establishment of the following schedule for packing razor blades:

Make	Packages Per carton	Blades per package
Arrow.....	20	5
Auto-Strop.....	20	5 and 10-10
Christy.....	20	5
Darwin.....	10	10
Durham Duplex.....	20	5
Enders.....	20	5
Ever-Ready.....	20	5
Gem.....	20	6
Gillette.....	20	5 and 10-10
Keen.....	10	10
Keen Kutter.....	20	5
Radium.....	20	5 and 10-10
Schick.....	20	5
Sexto.....	20	3 and 10-5
Vibro Shave.....	10	10 and 10-5

All cataloguing, listing, billing, or invoicing is to be by the decimal system.

612.13 SCISSORS AND SHEARS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATIONS FOR SHEARS AND SCISSORS, OFFICE, NO. 361A, MAY 14, 1929. (CURRENT DESIGNATION: GGG-S-101)

OFFICE SHEARS AND SCISSORS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES AND GRADES

1. The shears furnished under this specification shall be of two types, as follows:

Type A, Bankers, double pointed.

Type B, Straight trimmers, one point sharp and one blunt.

2. They shall be furnished in two grades as follows:

Grade 1, Mild steel frames with high carbon steel blades welded to the frame to provide the cutting edges.

Grade 2, Solid forged steel.

3. Both types and grades shall be furnished with nickel-plated blades and japanned handles, or full nickel plated, as specified.

4. The scissors furnished under this specification shall be double pointed, one point sharp, or both points blunt, as ordered, in solid forged steel, full nickel plated.

5. Shears and scissors to be furnished in the various sizes listed in recognized manufacturers' catalogues.

III. MATERIAL AND WORKMANSHIP

1. Blades of grade 1 shears shall be of 0.9 per cent to 1.1 per cent carbon steel.

2. Grade 2 shears and scissors shall be of 0.65 per cent to 0.75 per cent carbon steel.

3. Blades of all shears and scissors shall be joined together with a hardened, threaded steel screw except for straight trimmers 9 inches or larger, a steel bolt and nut shall be used. The latter method may also be employed for straight trimmers less than 9 inches in length, if specified.

4. All shears and scissors shall be properly hardened, tempered, adjusted, and set in accordance with the recognized practices of the trade. They shall be smoothly finished, free from defects or blemishes that may affect appearance and service.

IV. GENERAL REQUIREMENTS

See Section III, Material and workmanship.

V. DETAILED REQUIREMENTS

See Section III, Material and workmanship.

VI. METHOD OF INSPECTION AND TESTS

1. At least six pairs of shears and scissors shall be taken at random from each delivery. For large deliveries, tests shall be made at the rate of three pairs for each gross. These samples will be carefully examined for defects in workmanship or appearance, and shall be tested for proper operation of the blades. Chemical analysis to determine conformance to the requirements for grade of steel will be made at the option of the purchaser.

2. Each sample shall be tested by cutting the following materials:

(a) Tissue paper, weight 25 by 40, 500; 11.6 pounds (24 by 36, 500; 10 pounds).

(b) Cotton sheeting, weight 4.3 ounces per square yard.

3. The paper shall be thoroughly moistened with water before the test cuts are made.

(a) Cut one thickness of moistened paper as described above.

(b) Cut one thickness of cotton sheeting as described above.

(c) Cut multiple thicknesses of cotton sheeting using the number of thicknesses specified in the following table:

Type	Length (in inches)			
	Up to 6	6 to 8	9 to 10	Over 10
Scissors.....	4			
Shears:				
Bankers.....		4	2	2
Straight trimmers.....		8	16	16

(d) Cut one thickness of cotton sheeting.

(e) Cut one thickness of moistened tissue paper.

(f) All test cuts specified to be made three times as follows: 1 inch from point to point; from heel clear to point; 1 inch from point to point.

4. Failure to cleanly and accurately cut the test material specified shall cause rejection. The cut material shall fall away from the blades and any tendency of the shears or scissors to hold the material after the blades are completely closed shall be accepted as evidence of imperfect adjustment and shall cause rejection.

VII. PACKING AND MARKING OF SHIPMENTS

Each pair of shears or scissors shall be enclosed in a paper sleeve or sheath and packed not more than one dozen to a box. The box shall be properly labeled on one end to indicate size and description of the various articles contained.

612.14 TABLE AND KITCHEN CUTLERY.

(No nationally recognized specifications available.)

612.2 HOLLOW AND STAMPED WARE, IRON AND STEEL.

612.20 GENERAL ITEMS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, COMMERCIAL STANDARD FOR COLORS FOR COLORED SANITARY WARE CS30-31, JULY 1, 1931

COLORS FOR SANITARY WARE

On January 23, 1931, a general conference of representative manufacturers, distributors, and users of colored sanitary ware adopted six commercial standard colors for products in this field. The industry has since accepted and approved for promulgation by the Department of Commerce, through the Bureau of Standards, the commercial standard as described herein.

SCOPE

This standard designates colors to be used as a guide in production of sanitary ware, plumbing fixtures, and allied products made of vitreous china, porcelain (all-clay) enameled iron, metals, wood, or glass.

The development of individual colors for special pieces—for instance, drinking fountains—and the matching of colors for special work will not come within the scope of this commercial standard.

PURPOSE

Manufacturers of colored sanitary ware have encountered problems due to the multiplicity of colors that are expensive to manufacture, impracticable to stock, and unsatisfactory to sell. The increasing variety of colors has resulted in a lack of harmony, especially when one manufacturer supplies the vitreous china lavatory, another, the enameled iron bathtub, and still another the seat for the water-closet bowl. This standard is offered as a solution of these problems.

It is not the purpose of this standard to retard initiative on the part of the individual producers or to limit the introduction of new colors, but it is intended to provide an authoritative record of the recommendation of the industry as a whole based on composite experience.

METHOD OF MAKING COLOR COMPARISONS

When comparing colors of colored sanitary ware the line of observation shall be at right angles to the surface of the sample, which shall be so placed under the diffused light of a northern sky that minute shadows affecting the appearance of the colored surface will be reduced to a minimum, and the light source, reflections of lights, or differently colored surfaces should be prevented from being mirrored in the gross of the sample.

The two surfaces to be compared shall be covered by a mask of neutral gray paper at least 8 inches square, with a rectangular opening $1\frac{1}{2}$ by 4 inches cut in its center. The exposed area of each surface shall be approximately $1\frac{1}{2}$ by 2 inches. The purpose of the mask is to conceal the surrounding colors, to bring into immediate focus the single color to be examined, and to restrict the area of the fixture to that of the color sample with which it is compared.

The normal recovery of the eye from the natural fatigue occurring by examining colors is distinctly rapid. Nevertheless, some time should be permitted to elapse between making successive comparisons.

No attempt should be made to match colors from memory.

DETAIL REQUIREMENTS

The six colors recommended as standard colors for sanitary ware shall be designated as follows:

SC-11, green.	SC-40, blue.
SC-20, orchid.	SC-51, light brown.
SC-30, ivory.	SC-60, black.

The standard color samples shall be retained at the Bureau of Standards. Duplicate reference color samples may be obtained at a cost of \$1.50 per set from the secretary⁹⁰ of the Manufacturers' Advisory Committee on Colors for Sanitary Ware as a basis for production control. The manufacturers' advisory committee has fixed light and dark limits for each color, and samples are to be retained at the Bureau of Standards. Such samples will be available only for the settlement of disputes. While any color within these limits will no doubt conform with the requirements, it is understood that every effort will be made to conform as nearly as possible to the reference color samples.

The color of sanitary ware shall be considered to match the standard color sample when, on comparison of the ware with a duplicate reference color sample under the specified lighting conditions and by the specified method, there is no appreciable difference in color.

⁹⁰ G. W. Wray, Bureau of Standards, Washington, D. C.

The advisory committee recommends that secrecy in connection with the subject of colored glazes and enamels be eliminated. In order that manufacturers may have a thorough understanding concerning colored glazes the formulas, firing temperatures, and other pertinent information have been filed with the Bureau of Standards, and are available upon request.

It is recommended that all colored sanitary ware shall be considered as special rather than staple owing to the number of different types and shapes and the cost involved in stocking such a variety.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR TINWARE, GALVANIZED, AND JAPANED WARE, R55, JULY 1, 1926

TINWARE, GALVANIZED WARE, AND JAPANED WARE

(Simplified practice recommended and adopted by industry establishing a limited list of standard stock sizes and varieties.)

Descriptions contained in the following recommendations refer to catalogue numbers from catalogue No. 35 of the National Enameling & Stamping Co. and have been used as a matter of convenience, as they are well known to all sheet-metal ware manufacturers and to the trade.

In these descriptions the gages, sizes, and trade capacities are considered to be approximate and are intended to apply to those articles, produced by other manufacturers, which most nearly approach thereto or articles substantially similar in the described particulars and for the same use.

It is recommended that manufacturers work toward japaning bread boxes, flour boxes, round sugar boxes, and cake closets in white and gray or some other one color only.

The so-called "specialties" or articles made by one manufacturer only, which are not comparable with anything made by anyone else, have been omitted from consideration in the simplification program.

TABLE 1.—Stamped ware

Article	Catalogue number
Bowls:	
Wash ¹	06, 07, 07½, 08.
Dipper.....	12, 13, 14.
Colanders.....	104, 205, 306.
Collars, stovepipe ²	4, 4½, 5, 5½, 6, 7; 03, 04, 04½, 05, 05½, 06, 07.
Covers, cream can.....	8½ inches, shallow; 8½ inches, extra deep.

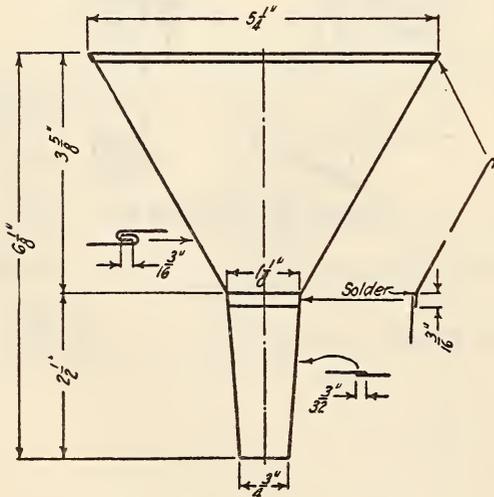

FIGURE 624.—One quart funnel

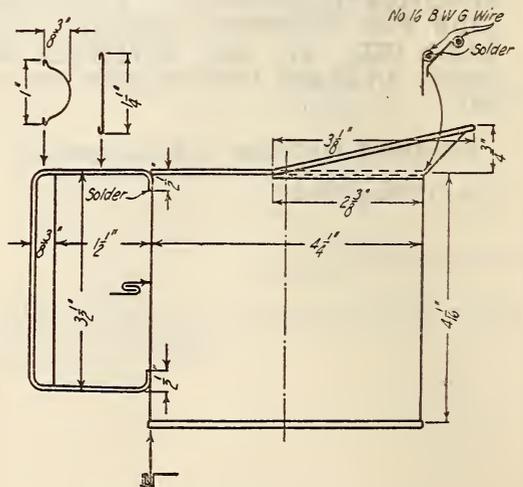

FIGURE 627.—One quart measure

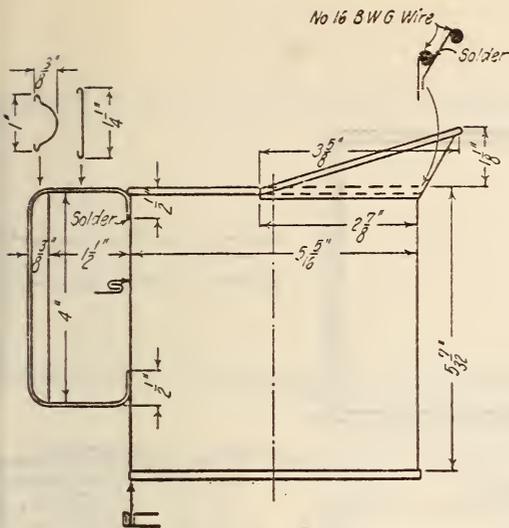

FIGURE 628.—Two quart measure

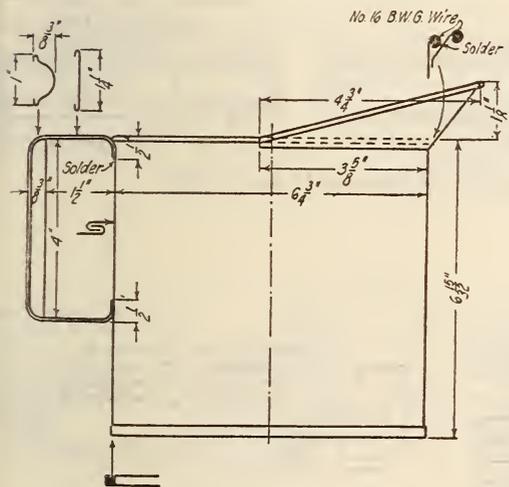

FIGURE 629.—One gallon measure

A universal form of marking pot.

A convenient and sanitary form of dust pan.

Three sizes of funnels which should take care of all requirements in the mechanical department.

One-pint, 1-quart, 2-quart, and 1-gallon measures. These measures are made with parallel sides to economize in labor and material.

All to be made of IX bright tin No. 28 B. W. G. or cold-rolled steel of suitable thickness.

613. METAL FURNITURE AND FIXTURES

613.1 BEDS, BED SPRINGS, COTS.

AMERICAN MARINE STANDARDS COMMITTEE, METAL FRAME BERTHS AND ACCESSORIES FOR SHIPS, H NOS. 53, 54, 55, 56, 59, AND 60, 1929

SHIP BERTHS

MATERIALS

(a) *Tubular parts of berth frames.*—To be commercial grade high-carbon brazed steel tubing of the following sizes and minimum thicknesses: Upper rail, 1.05 inches outside diameter No. 17 B. w. g. (0.058 inch). Lower rail, 1.25 inches outside diameter No. 15 B. w. g. (0.072 inch). Tubing of other metal, and of equivalent strength, may be substituted at the option of the purchaser.

(b) *Angle end rails of berth frames.*—To be commercial grade soft-steel rolled shape 1 1/2 by 1 1/2 by 3/16 inches.

(c) *Castings for berth frames and accessories.*—All castings shall be of malleable iron or equally suitable material. They shall be sound and free from defects that would impair their serviceability or good appearance. Should any part of the tubular frames be ordered of brass or other material to be bright-metal finished, the cast parts connecting them shall be of corresponding metal and their exposed surfaces shall be polished.

(d) *Stanchions for fixed berths.*—These shall be tubes 1 1/2 inches outside diameter. They may be of commercial grade high-carbon brazed steel tubing of minimum thickness equivalent to No. 14 B. w. g. (0.083 inch) or of other equally suitable material.

(e) *Stanchions for hinged berths.*—These shall be of ordinary 1 1/2-inch size commercial standard weight or extra strong pipe according to conditions.

(f) *Chains and hooks for hinged berths.*—To be of bright-steel wire unless specifically ordered of other material. The chains may be of any suitable commercial type having a breaking strength of at least 1,200 pounds.

WORKMANSHIP

All surfaces of berth frames and accessories shall be smooth and free of defects. Joints of assembled parts shall be closely fitted. Machining shall be required only as necessary for assembly and installation. Fastenings shall be well fitted and smoothly finished. Welding may be substituted for riveting at the option of the purchaser to fasten the parts of berth frames or to attach fittings to stanchions or to the ship structure. All welds shall be smoothly finished.

FINISH

The character of finish or coating and color desired shall be specified by the purchaser in asking for quotations and in ordering. If no finish or coating is thus specified, none shall be applied by the berth manufacturer.

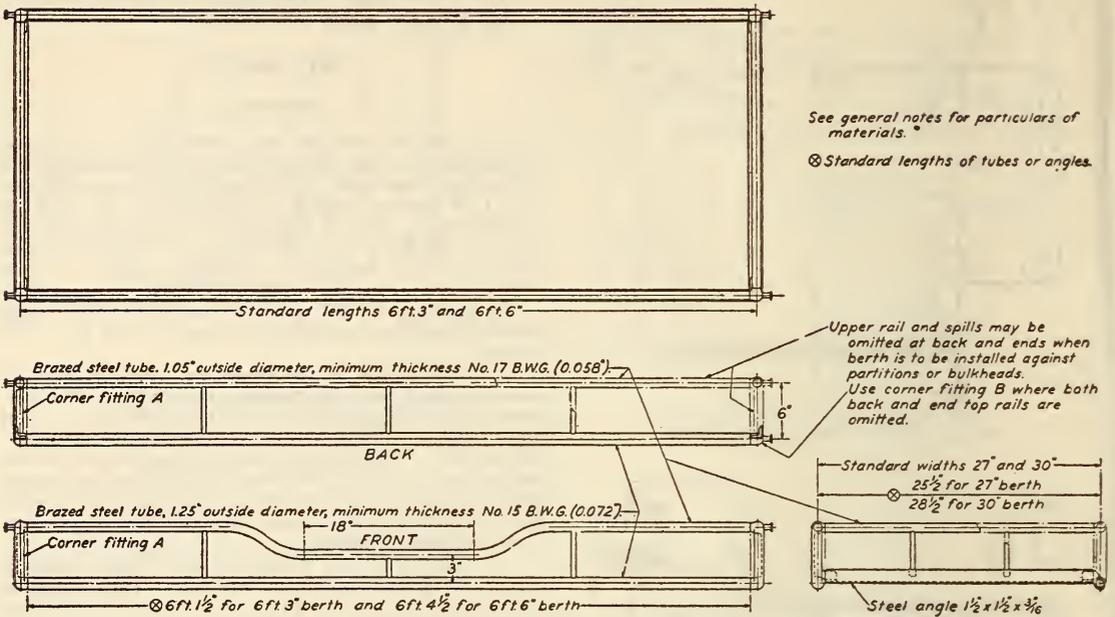

FIGURE 630.—Shallow berths, American Marine standard H No. 53-1929

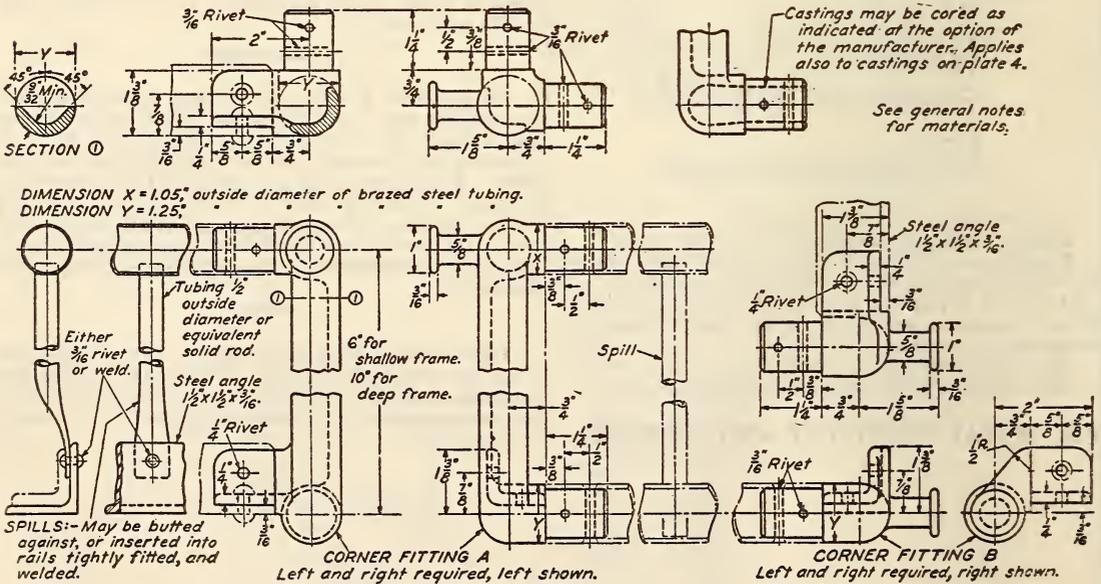

FIGURE 631.—Shallow berth details

PACKING AND MARKING FOR SHIPMENT

GUARANTY

Berth frames and fittings shall be tagged or otherwise marked for convenient identification with the items in the purchaser's order. They shall be packed for shipment in such manner as to insure safe and economical handling and transportation. Containers shall be marked to identify them with the number or date of the purchaser's order.

Berth frames, stanchions, or fittings furnished on the basis of these standards shall be guaranteed by the manufacturer against failure due to faulty material or workmanship. In case of any failure from such causes, the manufacturer shall furnish replacements without charge to the purchaser or shall reimburse the latter for the costs of necessary repairs.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR BEDSTEADS, SPRINGS, AND MATTRESSES, R2-30, SEPTEMBER 1, 1922

BEDSTEADS, SPRINGS, AND MATTRESSES

(Simplified practice recommended and accepted by industry establishing a limited schedule of standard sizes and types.)

TABLE 1.—Wooden beds

Type	Description	Size	Length		Width			
			Minimum length of side rails		Between rails			
Straight foot..... Do.....	Wood side rails..... do.....	Full..... Single.....	<i>Ft.</i>	<i>In.</i>	<i>Ft.</i>	<i>In.</i>		
			6	12				4
			6	12			3	3
			From head to foot panels					
Bow foot..... Do.....	do..... do.....	Full..... Single.....	6	12 3/4	4	6		
			6	12 3/4	3	3		
			Inside length between cross angles		Outside to outside of side rails	Inside to inside of side rails		
Straight foot..... Do.....	Metal side rails..... do.....	Full..... Single.....	6	2	<i>Ft.</i>	<i>In.</i>	<i>Ft.</i>	<i>In.</i>
			6	2	4	5 1/4	4	2 1/4
			6	2	3	2 1/4	2	11 1/4
			Inside opening, head to foot					
Bow foot..... Do.....	do..... do.....	Full..... Single.....	6	5	4	5 1/4	4	2 1/4
			6	5	3	2 1/4	2	11 1/4

¹ Where necessary to use blocks to hold bed rail hook pins, blocks must not extend over 3/8 inch inside rails.

² Crossbars or braces where necessary in bow ends shall be set even with, or below, the top of slat bearer. It is preferred these crossbars be eliminated if possible.

³ All bow-foot beds are to be made with radius not exceeding 7 inches.

TABLE 2.—Iron, steel, or brass beds

Type	Description	Size	Length		Width ¹			
			Inside length between cross angles		Outside to outside of side rails		Inside to inside of side rails	
Straight foot..... Do..... Do..... Do.....	Metal side rails..... do..... do..... do.....	Full..... 4' 0" 3' 3" Twin 3' 0"	<i>Ft.</i>	<i>In.</i>	<i>Ft.</i>	<i>In.</i>	<i>Ft.</i>	<i>In.</i>
			6	2	4	5 1/4	4	2 1/4
			6	2	3	11 1/4	3	8 1/4
			6	2	3	2 1/4	2	11 1/4
			6	2	2	11 1/4	2	8 1/4
			Inside opening, head to foot					
Bow foot..... Do.....	do..... do.....	Full..... Single.....	6	5	4	5 1/4	4	2 1/4
			6	5	3	2 1/4	2	11 1/4

¹ It is recommended that the top flange of side rails measure 1 1/2 inches in order that the inside openings of the established sizes of beds will conform to the recommended dimensions for the inside widths.

² All bow-foot beds are to be made with radius not exceeding 7 inches.

TABLE 3.—Springs

Class	Type	Size	Length	Width			
				Top	Bottom		
Spiral or coil wire.....	With metal bases.....	(Full.....	6	1	4	4	
		4' 0''.....	6	1	3	10¼	
		3' 3''.....	}	6	1	3	1
		Twin.....		3	1¼	3	1¼
		3' 0''.....		6	1	2	10¼
Metal frame.....	{ With link, slat, cable, or woven-wire fabric.	(Full.....	6	1	4	4¾	
		4' 0''.....	6	1	3	10¼	
		3' 3''.....	}	6	1	3	1¼
		Twin.....		6	1	2	10¼
		3' 0''.....		6	1	2	10¼
				Length of end rail	Width of hangers		

NOTE.—It is recommended that springs for bow-foot beds be provided with a 7-inch radius corner at the foot end to conform to similar radius in bow-foot beds.

MATTRESSES

It is recommended that mattresses be made to conform to spring dimensions given above.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION R24, JUNE 3, 1924

HOSPITAL BEDS

In accordance with the action of a general conference of representatives of various hospital interests, the United States Department of Commerce, through its Bureau of Standards, recommends that simplified sizes and varieties of hospital beds be established as follows:

1. For general hospital use:

(a) Length, inside distance between head and foot posts, 78 inches.

(b) Width of end angles of springs, 36 inches.

(c) Height from floor to top of springs, inclusive of casters, etc., 27 inches.

2. For certain institutional use the need for a narrower bed is recognized. In these cases the recommended width is 33 inches, with other dimensions the same as in (a) and (c) above.

3. For private-room use, where a wider than standard bed is desired, the recommended width is 39 inches, with other dimensions the same as in (a) and (c) above.

These recommendations are to become effective January 1, 1925, subject to regular annual revision by similar conference.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BEDS, HOSPITAL, NO. 186a, JULY 11, 1927. (CURRENT DESIGNATION: AA-B-201)

HOSPITAL BEDS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Hospital beds shall be of one type but subject to alternatives in connection with certain detail requirements.

III. MATERIAL AND WORKMANSHIP

Hospital beds shall be of first-class material and workmanship.

IV. GENERAL REQUIREMENTS

1. Hospital beds shall be constructed in three pieces, as follows: (a) Headpiece, (b) foot piece, and (c) spring bottom.

2. The general dimensions of the beds shall be as follows:

(a) Length, inside distance between head and foot posts, 78 inches.

(b) Width of end angles of spring bottom, dimension X (as specified by purchaser).

	Inches
Generally.....	36
For certain institutional uses.....	33
For private-room use.....	39

(c) Height of spring bottom from floor, including wood shoes, casters, etc. (all widths), 27 inches.

(d) Height above floor, including wood shoes, casters, etc., to top of headpiece, 52 inches.

(e) Height above floor, including wood shoes, casters, etc., to top of foot piece, 42 inches.

(2-a, 2-b, 2-c, above, are in conformity with simplified practice recommendation R24 of Bureau of Standards above.)

3. The finish of the bed shall be as specified in the contract or order.

4. A tolerance of 5 per cent above or below the dimensions specified will be allowed for butt-welded steel tubing.

V. DETAIL REQUIREMENTS

1. *Headpiece*—(a) *Continuous post*.—For the bed 36 inches in width this part of the headpiece shall be of hot-rolled butt-welded steel tubing 1.25 inches outside diameter by 0.089 inch thick, bent to form a continuous post having approximately 4-inch radius at bends and measuring approximately 34¼ inches center to center of the vertical legs. The width distance between centers of vertical legs of the continuous posts for beds 33 inches and 39 inches in width shall be appropriate for those widths, and suitable for the dimensions of the widths of the end angles of the spring bottom as stated in the foregoing.

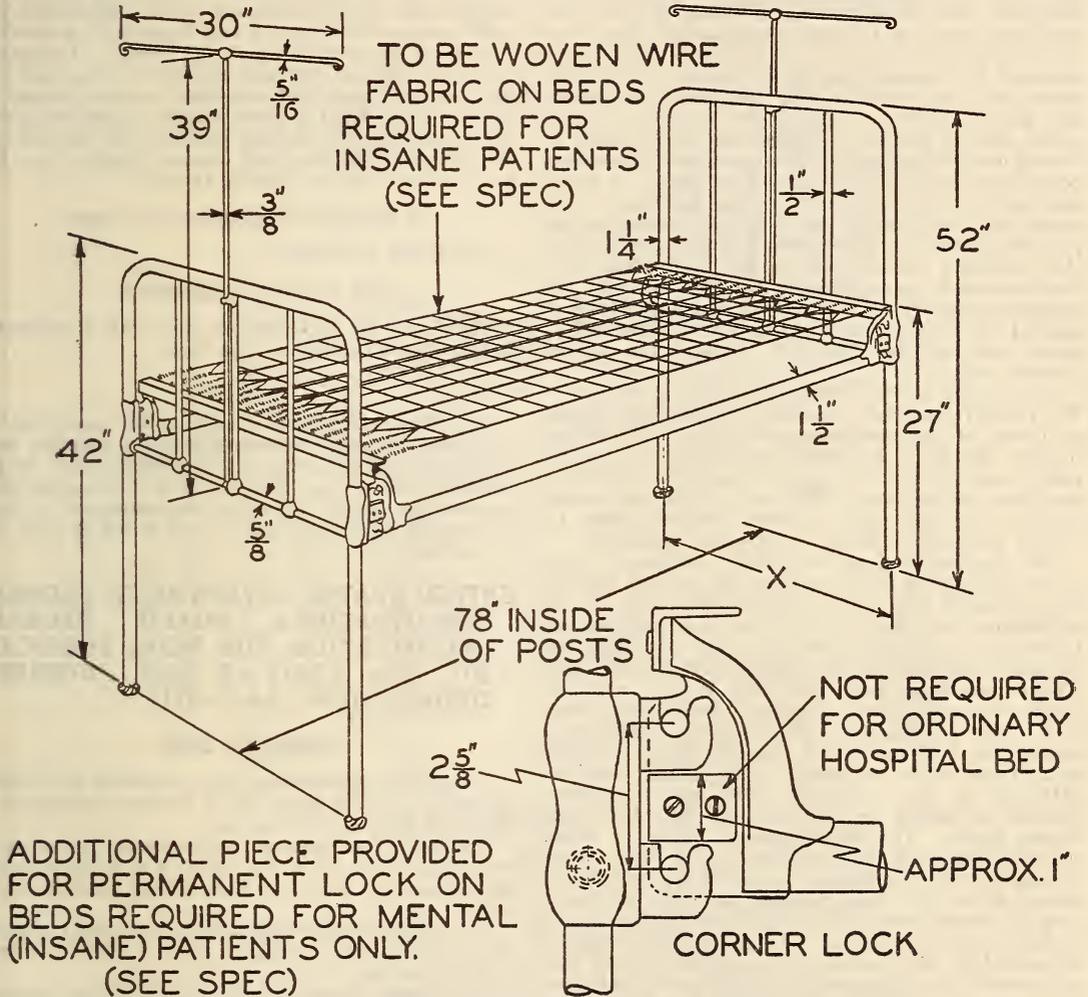

(b) *Cross rods*.—The cross rods shall be of butt-welded steel tubing 0.625 inch outside diameter by 0.069 inch thick connected to the vertical legs of the continuous post with cast chills located in the lower portion of and forming a part of the cast-chill connection securing the female hook parts of the corner

locks to the legs of the continuous post or at about 6 inches to center of cross rod below top of end angles of spring bottom.

NOTE.—This avoids the necessity for additional chills on the headpiece and at the same time admits of ample room for making beds without injury to the fingers of attendants.

(c) *Upright rods or fillers.*—The upright rods or fillers shall be three in number spaced at equidistant

(e) *Welded connections.*—Unless otherwise specified by the purchaser, welded connections may be used instead of the cast chills wherever specified herein; in which case the connections for the cross rods, fillers, etc., shall be made by inserting them into the connecting tubing to the full depth admissible by means of a driving fit and then welding completely around the entrance opening or joint.

HOSPITAL BED

FIGURE 636

intervals between the vertical legs of the continuous post. They shall be of butt-welded steel tubing 0.500 inch outside diameter by 0.065 inch thick connected to the top rail of post by insertion and welding and to the cross rod by cast chills. A square socket shall be provided in the lower cast chill connecting the center upright rod to the cross rod for the purpose of taking the lower end of the mosquito rod, and an eye casting shall be provided on the center upright at about 1 inch below the under side of the top rail of the continuous post for use as an upper socket for the mosquito rod.

(d) All cast chills shall be smooth and manufactured from pig iron and machinery scrap only.

The attachments for the mosquito rod may be by welded connections or other means as approved by the purchaser.

2. *Foot piece.*—The foot piece in all its parts shall be of the same design and construction as specified above for the headpiece except that the height to top of continuous post from floor, including wooden shoes, casters, etc., shall be 42 inches.

3. *Corner lock.*—The corner lock shall be a double-socket connection, as shown in the accompanying sketch which forms a part of this specification. The

NOTE.—A flat fracture bar will not be required, as the cross rod appears to be suitably located for that purpose.

female hook parts shall be chill cast to the upright posts. The risers of the spring bottom part shall be substantially constructed of malleable iron with nine-sixteenths inch diameter steel pins, so located as to accurately mesh with the female parts on center of 2½ inches as shown in the accompanying sketch. The malleable-iron risers shall have a socket to receive 1.500 inches outside diameter by 0.095 inch thick butt-welded straight tubular side rails. The height of the riser shall be such that the height of the fabric (spring bottom) shall be not less than 4½ inches above the top of the side rail. On beds as required for mental patients (insane), the corner locks shall be provided with the additional pieces and screws shown in sketch for fastening to the center web of the riser between the hook pieces to form a lock to prevent the head and foot pieces from being detached from the spring bottom. Or as an alternative, if approved by the purchaser, the corner lock may be of the contractor's own design, provided after investigation it is demonstrated that the proposed corner lock is the equivalent of a double-socket connection in rigidity and can be suitably arranged, if desired, for the special use of mental patients (insane) by an interlocking device which can not be detached without the use of suitable tools.

4. (a) *Fabric and fabric frame (spring bottom).*—The fabric frame shall consist of two straight tubular side rails of butt-welded steel tubing 1.500 inches outside diameter by 0.095 inch thick. The end rails shall consist of angles made of hot-rolled medium carbon steel. The size of the end angles shall be not less than 1½-inch vertical flange by 2-inch horizontal flange by ¾-inch thickness.

(b) The fabric shall be of the "national" type, about 16 squares long, and the size of the link for the square of the width shall be such that by the addition or subtraction of a line of squares of the fabric for the 36-inch bed the width of fabric can be made suitable for the 39-inch and 33-inch beds. The center links and links and V links shall be made of tinned drawn wire about 0.117 inch diameter. The 3-hole and 4-hole plates shall be of steel about 0.05 inch thick, flat and free from burrs and tinned after stamping. The fabric shall be attached to the end angles with an appropriate number of helical springs (not less than 19), black Japan finish. The helical springs shall be about three-fourths inch outside diameter, of high carbon spring wire, finely tempered, 0.1055 inch diameter, about 20 to 21 convolutions, and 3⅝ inches in length over all, not stretched (total stretch in length of bed about 1½ inches). Or as an alternative, if approved by the purchaser, the spring bottom may be made of any single-wire or double-wire fabric of the contractor's own design, and of a guaranteed rustless or electro galvanized finish, provided the proposed fabric is of a strength and tension equivalent to that described in the foregoing for the "national" type of fabric; and provided further that the spring bottom of the bed intended for the use of mental patients (insane) shall, in all cases, be of the best commercial quality, strong and durable woven-wire construction, fastened to the end angles securely, and in a manner to be approved by the purchaser.

5. *Mosquito bar rods.*—T mosquito bar rods of not less than three-eighths inch round steel or iron shall be furnished with the bed. They shall be 39 inches high with the cross rod 30 inches long. The cross rod shall be five-sixteenths inch round steel or iron and shall be connected to the upright portion with a chill or by weld. The lower end of the vertical portion of the rod shall be pointed and of squared cross section in order to rest in the square hole provided in the rod socket on the center

upright rod. The extreme ends of the cross rod shall be bent downward into the form of eyes. The holes so formed shall be one-half inch inside diameter.

6. *Wooden shoes or casters.*—The material of the shoes shall be of clear rock maple, or beech, well seasoned and sound. The ball shall be 1⅞ inches in diameter and 1⅝ inches long, slightly rounded at the top and bottom. The pin shall be 2½ inches high and shall taper so as to make a snug fit into the tubular legs of the continuous post. The entire pin shall be smoothly finished and thoroughly soaked in linseed oil for approximately 10 hours. If required by the purchaser, all four legs of the hospital bed shall be equipped with noiseless casters instead of wooden shoes, and the lower lengths of legs shortened so as to compensate for the height of the casters and yet maintain the specified over-all height from the floor to top of spring bottom fabric.

VI. METHOD OF INSPECTION AND TESTS

No details specified.

VII. PACKING OF SHIPMENTS

Packing shall be in accordance with commercial practice unless otherwise specified.

VIII. NOTES

The illustration accompanying this specification shows the general characteristics of a hospital bed, with cast-chill connections, "national" type fabric double-socket corner locks, and with an adaptable interlocking device for use in connection with beds for mental patients (insane) and is for general information only.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BEDS, SURGICAL, NO. 187a, APRIL 25, 1927. (CURRENT DESIGNATION: AA-B-211)

SURGICAL BEDS

(General specifications, type, material and workmanship, are the same as in Federal specification No. 186a (AA-B-201) above.)

(Section IV on general requirements is the same as Section IV of F. S. No. 186a (AA-B-201) except for paragraphs 2(b) and 2(d), which read as given below.)

(b) Width of end angles of mechanically adjustable spring bottom exclusive of riser plates of corner locks, 35 inches.

(c) Height of spring in mechanically adjustable bottom from floor, including wood shoes, casters, etc., 30 inches.

(Detail requirements for headpiece and foot piece are the same as given in F. S. 186a (AA-B-201) above for 36-inch beds, with the additional requirements given below.)

Height to center of cross rod above floor shall be about 22 inches.

CORNER LOCK

8. The corner lock shall be a double-socket connection as shown in the accompanying sketch which forms a part of this specification. The female hook parts shall be chill cast to the upright posts. The riser of the adjustable spring bottom part shall be a

NOTE.—The distance between the centers of vertical legs of headpiece (and foot piece) shall not vary more than plus or minus one-eighth inch from the approximate dimensions given above. The distance between inside surfaces of the vertical bracket plates on the outer angle frame of the adjustable spring bottom shall not be less than 35¼ inches.

plate of wrought iron or of malleable iron with nine-sixteenths inch diameter steel pins, securely fastened thereto, and so located as to accurately mesh with the female hook parts on posts on centers of 2 3/8 inches as shown in the accompanying sketch. This plate riser shall be thoroughly riveted to the outer frame of the adjustable spring bottom. As an alternative, if approved by the purchaser, the corner lock may be of the contractor's own design provided after investigation it is demonstrated that the pro-

Lifting handles shall be omitted as unnecessary with the mechanical adjusting device. The fabric of the movable portions shall be the "national" type, made of tinned drawn wire about 0.117 inch diameter. The plates shall be of steel about 0.05 inch thick, flat and free from burrs and tinned after stamping. The fabric shall be suspended to sides and ends of frame with a sufficient number of black Japanned helical springs, not less than 18 of No. 12 steel wire gage 0.105 inch diameter each side, and

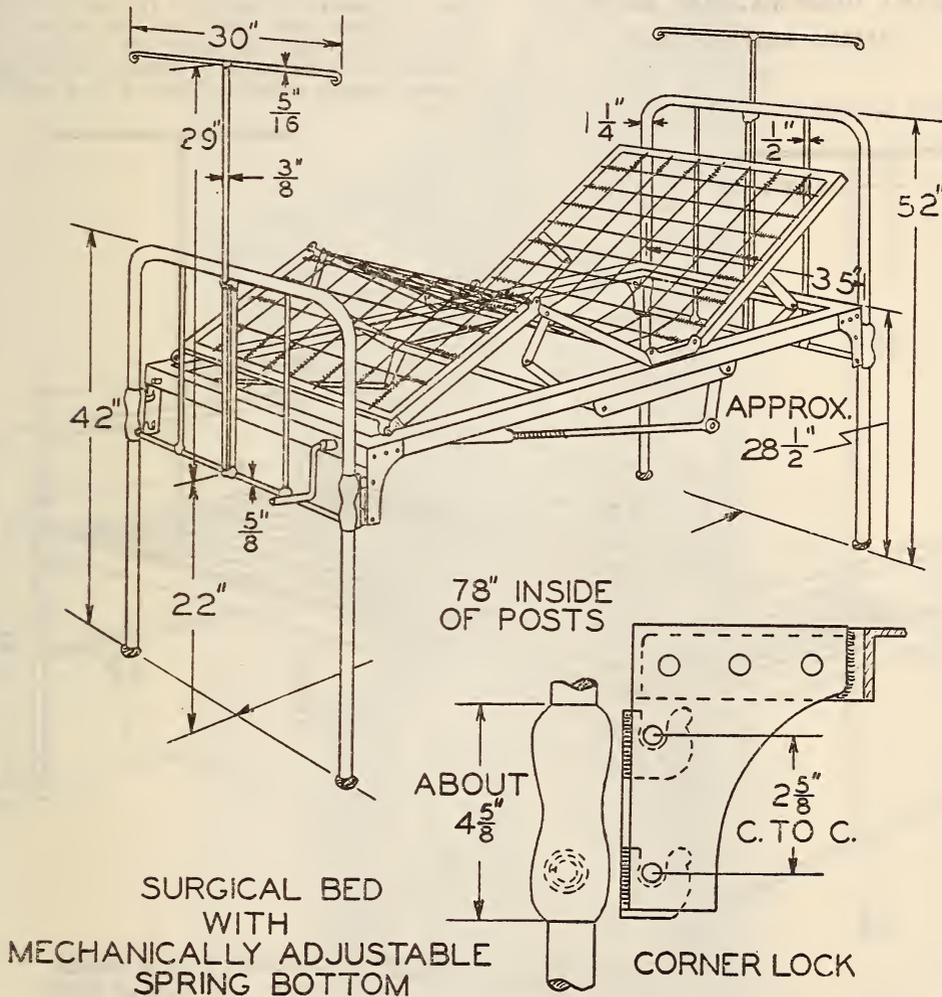

FIGURE 637

posed corner lock is the equivalent of a double-socket connection in rigidity.

not less than 2 and not more than 4 of No. 11 steel wire gage 0.12 inch diameter at each end.

(Detail requirements for mosquito bar rods and for wooden shoes or casters are the same as given in F. S. 186a (AA-B-201) above.)

FABRIC AND FABRIC FRAME (MECHANICALLY ADJUSTABLE SPRING BOTTOM)

VII. PACKING AND MARKING OF SHIPMENTS

9. The outer frame shall consist of 1 3/4 by 1 3/4 by 1/8 inch angles. The inner frame shall consist of four sections made of suitably sized angles for strength and rigidity—three of the sections to be movable and one section stationary. The movable sections shall be capable of being adjusted to a variety of heights and angles by means of mechanical levers operated by a removable handle located at the foot of the bed. The cross brace of the frame shall be bowed to allow sufficient space for sag of fabric with a heavy patient in bed, approximately 3 inches.

The fillers and cross rods shall be wrapped in paper and the posts shall be wrapped in excelsior pads, then both head and foot pieces complete to be protected by fiber board of a width not less than 6 inches narrower than the heights of these end pieces covering both sides. This covering shall be tied laterally and longitudinally, and then the end pieces securely mounted on the under side of the spring frame. The ends and sides of spring frame shall be wrapped in excelsior pads.

VIII. NOTES

The sketch (fig. 637) showing the adjustable spring bottom is illustrative only and is not intended to show exact construction.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FOLDING HOSPITAL COT, NO. 188, JULY 30, 1924. (CURRENT DESIGNATION: AA-C-581)

FOLDING HOSPITAL COT

TYPE

1. Folding hospital cots shall be of but one type:

DETAIL REQUIREMENTS

4. (a) *Ends.*—Ends made of butt welded or high carbon brazed tube (that will withstand bending without opening seams), outside diameter 1.05 inches with corners bent to a radius of not more than 6 inches so as to form continuous posts measuring $34\frac{1}{16}$ inches wide outside, head end to stand $34\frac{1}{4}$ inches high from the floor, foot end $32\frac{1}{4}$ inches from the floor.

(b) *Cross rods.*—There shall be one cross rod $\frac{7}{16}$ inch in diameter in each end $12\frac{3}{4}$ inches above the floor. These cross rods shall be carried at full thickness through the inside wall of pipe and be shouldered on the inside of outside wall of pipe and riveted against outside of pipe with a well-headed rivet.

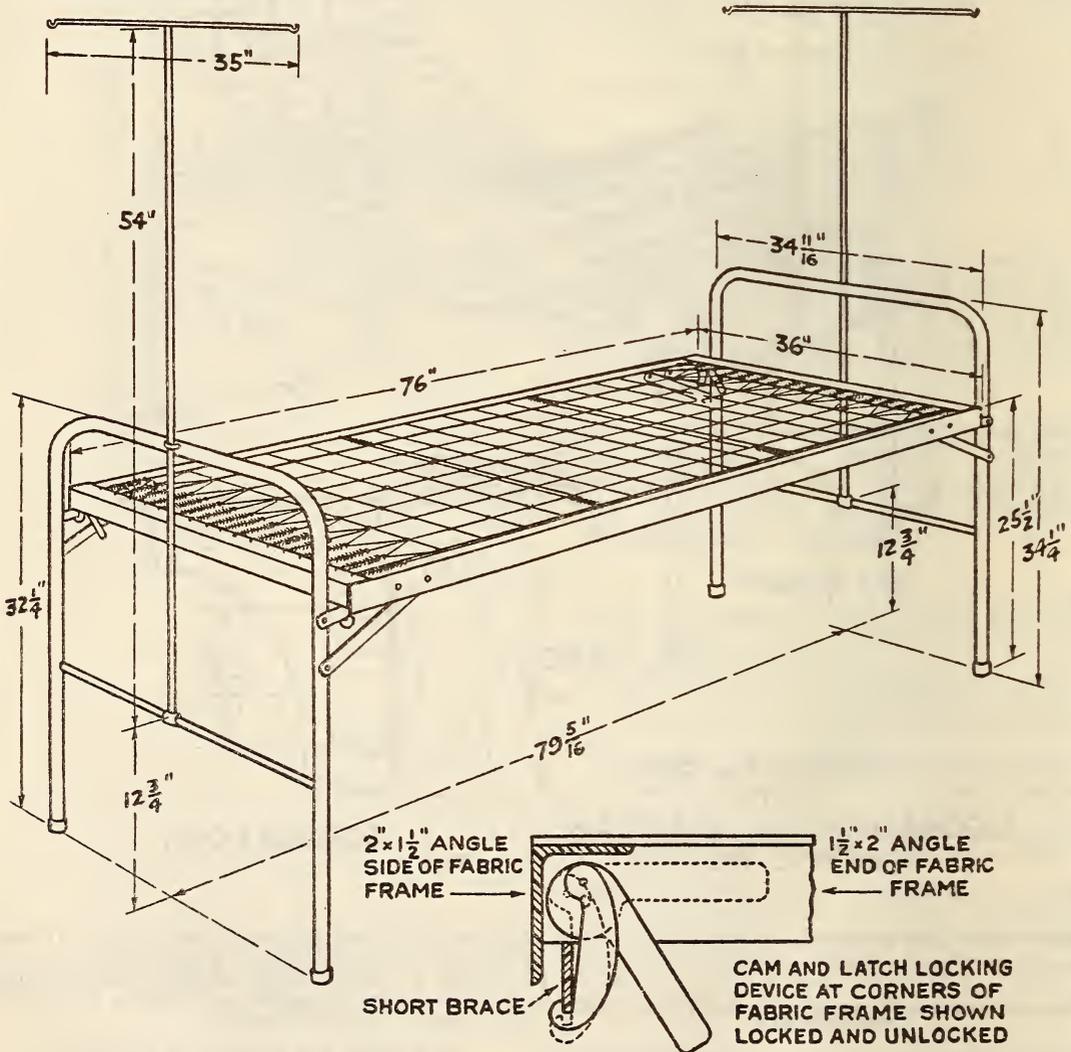

FIGURE 638.—Folding hospital cot

MATERIAL AND WORKMANSHIP, ETC.

2. Folding hospital cots shall be of first class material and workmanship.

GENERAL REQUIREMENTS

3. Each cot shall be plainly marked with the manufacturer's name in such a manner that marking can not be made illegible.

(c) *Steel caps.*—Steel caps shall be made of No. 20 gage steel or heavier, $\frac{3}{4}$ inch high crowned on end; to be firmly driven on ends of posts and center punched to hold same firmly in position.

(d) *Fabric frame.*—Fabric frame shall have side angles 76 inches long by 2 by $1\frac{1}{2}$ by $\frac{1}{8}$ inch and end angles 36 inches long, 2 by $1\frac{1}{2}$ by $\frac{1}{8}$ inch high carbon steel, securely riveted at corners and braced in two corners of one end by 1 by $\frac{3}{16}$ inch flat steel braces

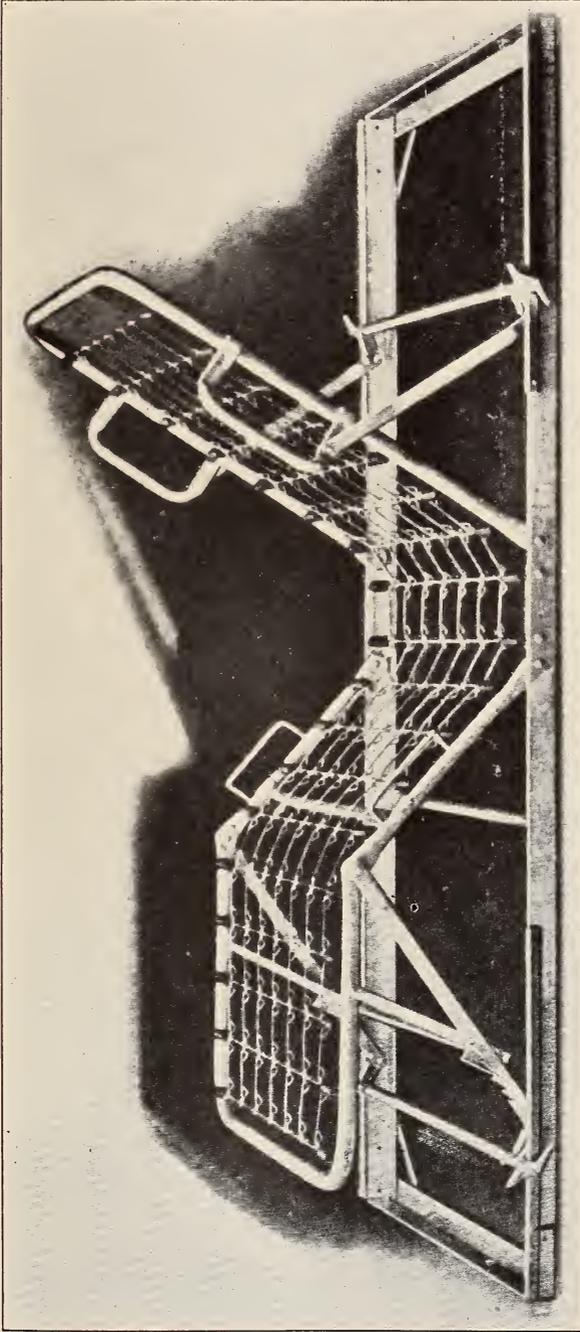

FIGURE 639.—*Adjustable spring bottom*
(For specification see p. 831.)

7 $\frac{3}{4}$ inches long, holes punched 6 $\frac{3}{4}$ inches on center, riveted to frame diagonally across corners; holes in frame to be punched 6 $\frac{1}{16}$ inches on center to prevent frame from twisting. These corner braces shall have offset of one-fourth inch to allow proper alignment of end helicals.

Ends shall fold under and within frame and be attached to frame at each corner by two 1 by $\frac{1}{2}$ inch flat steel braces. Short brace shall have rivet holes 6 inches on center; holes in long brace 10 inches on center; the short brace to be offset so as to clear in folding. In riveting braces which connect the head and foot ends to fabric frame, the heads of rivets shall be placed against the movable piece; height from floor to top of fabric to be 25 $\frac{1}{2}$ inches.

(e) *Locking device.*—There shall be placed at the four corners of the cot a locking device consisting of a cam latch riveted to the end angles of the cot. When the cot is set up the latch shall engage into the 1 by $\frac{1}{2}$ inch short brace, holding the cot firmly in position. The latch and lock bar shall be made in accordance with detail drawing forming a part of these specifications. Manufacturers are required to attach a tag to each bed showing action of locking device.

(f) *Fabric.*—Any double-wire link fabric made of not less than No. 14 steel wire gage galvanized wire 17 strands wide and not less than 15 links long, or any single link fabric of equal strength made of not less than No. 13 steel wire gage galvanized wire which can be interchangeable with a 17-strand double wire fabric, can be used subject to approval; fabric to be of a length that will insure proper tension when mounted on frame with helical springs as specified; fabric to be attached to frame at each end by 17 standard No. 12 steel wire gage 16-coil helical springs, high carbon steel, which are to be finished in black japan. No single continuous strand or wire fabric will be permitted.

(g) *Support.*—The support shall be made of fabric reinforced by two supporting bands made of 1-inch No. 22 gage hoop steel, attached to side rails by four No. 12 steel wire gage 16 coil high carbon steel helical springs. These shall be located 26 inches from each end of the frame.

(h) *T canopy.*—The canopy shall be made of seven sixteenth inch round iron, or soft steel; upright rod to be 4 feet 6 inches in length, extending through staple in the middle of head and foot ends on the outside as shown on detail drawing, forming a part of these specifications, and to rest in socket in the center of cross rod. Socket shall be made of 1 $\frac{1}{4}$ by $\frac{1}{2}$ inch flat bar iron pressed on center of cross rod. Top cross arms of canopy shall be connected at top of upright with T ball connection and shall extend 17 $\frac{1}{2}$ inches on opposite side of upright.

METHOD OF INSPECTION, TESTS, ETC.

5. Folding hospital cots shall be inspected as to conformity with these specifications.

ADDITIONAL INFORMATION

7. The sketch (fig. 638) accompanying these specifications is to be considered as forming a part thereof.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ADJUSTABLE SPRING BOTTOM (GATCH FRAME), NO. 189, JULY 30, 1924 (CURRENT DESIGNATION: AA-B-571)

ADJUSTABLE SPRING BOTTOM

(Gatch Frame)

TYPE

1. Adjustable spring bottoms shall be of but one type.

MATERIAL AND WORKMANSHIP

2. Adjustable spring bottoms shall be of first-class material and workmanship.

GENERAL REQUIREMENTS

3. The frames of the adjustable spring bottom shall be finished in black or in aluminum as required.

DETAIL REQUIREMENTS

4. *Fabric and fabric frame.*—The outer frame shall consist of 1 $\frac{1}{4}$ by 1 $\frac{1}{4}$ by $\frac{1}{2}$ inch angles. The inner frame shall consist of four sections made from 1.05 inches diameter butt-welded tubing (national tube standard). Three of these sections shall be movable and one stationary. (See sketch). The movable sections shall be capable of being adjusted to a variety of heights and angles. Head and foot sections shall operate independently of each other from either side of the bed. Catches controlling the movement of head and foot sections shall be of ratchet type. The cross braces of inner Gatch frame shall be made of butt-welded steel tubing 1.05 inches diameter (national tube standard), and be so shaped as to allow sufficient space between it and the fabric with a heavy patient in the bed. Lifting handles on inner Gatch frame shall be of five-eighths inch butt-welded steel bedstead tubing. The fabric of the movable bottom shall be of the "national" type, thoroughly coated with pure tin applied by the molten bath process after assembling the fabric and before attaching to the frame. The fabric shall be suspended on each side with 18 No. 12 steel wire gage (0.1055 inch diameter) black-japanned helical springs and on each end with 2 No. 11 steel wire gage (0.1205 inch diameter) black-japanned helical springs.

METHOD OF INSPECTION, TESTS, ETC.

5. Adjustable spring bottoms shall be inspected as to conformity with these specifications.

PACKING AND MARKING

6. Adjustable spring bottoms shall be first papered and then carefully packed in excelsior pads.

ADDITIONAL INFORMATION

7. The adjustable spring bottom described in Figure 639 is intended for use on the standard folding hospital cot. The outer frame of the adjustable bottom shall fit the dimensions of the folding hospital cot which is covered in separate specifications.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR LIBERTY STEEL COT, NO. 190, JULY 30, 1924. (CURRENT DESIGNATION: AA-C-591)

LIBERTY STEEL COT

TYPE

1. Liberty steel cots shall be of but one type.

MATERIAL AND WORKMANSHIP, ETC.

2. Liberty steel cots shall be of first-class material and workmanship.

(b) *Cross rods.*—There shall be one cross rod $\frac{7}{16}$ inch in diameter in each end 7 inches above the floor; these cross rods to be carried at full thickness through the inside wall of pipe and to be shouldered on the inside of outside wall of pipe and riveted against outside of pipe with a well-headed rivet.

(c) *Steel caps.*—Steel caps shall be made of No. 20 U. S. standard gage steel or heavier, three-fourths inch high crowned on end; to be firmly driven on ends of posts and center punched to hold same firmly in position.

(d) *Fabric frame.*—Fabric frame shall have side angles 76 inches long by 2 by $1\frac{1}{2}$ by $\frac{1}{8}$ inch and end angles 30 inches long, 2 by $1\frac{1}{2}$ by $\frac{1}{8}$ inch high carbon steel, securely riveted at corners and braced at two corners of one end by 1 by $\frac{3}{16}$ inch flat steel braces $7\frac{1}{4}$ inches long, holes punched $6\frac{1}{4}$ inches on

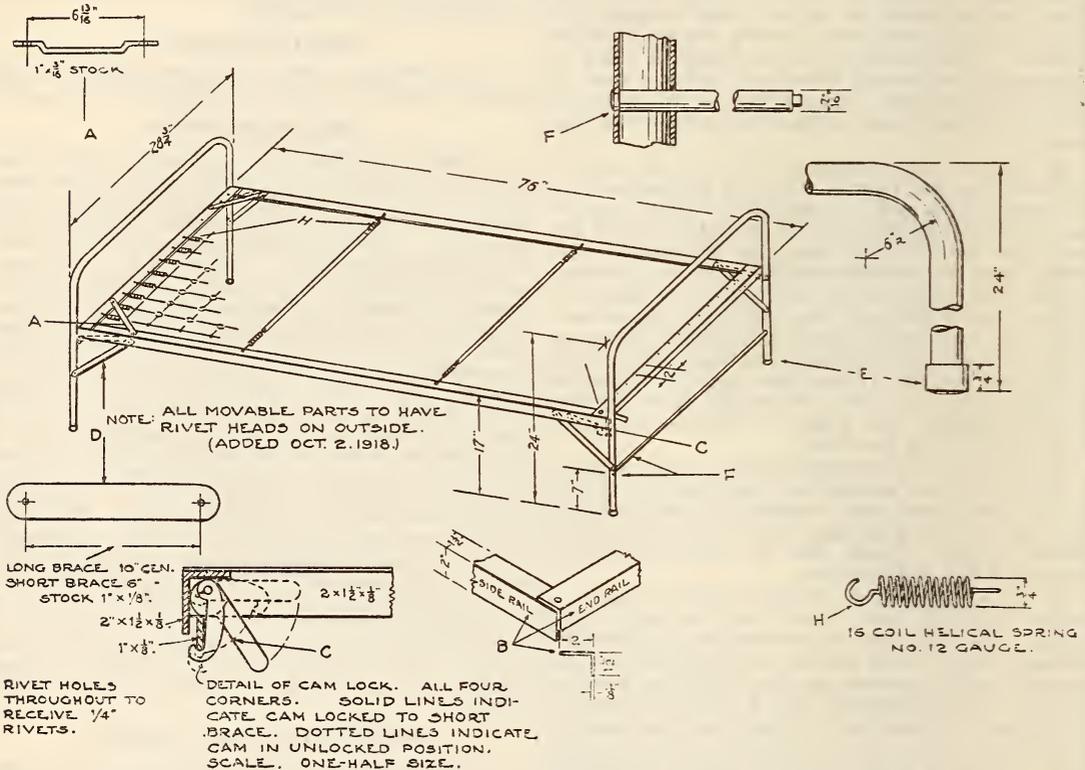

FIGURE 640.—Liberty steel cot

GENERAL REQUIREMENTS

3. (a) Entire cot shall be finished in gray or black japan or gray or black metallic paint, except fabric, which shall be made of galvanized wire. Support shall be finished in gray or black japan or gray or black metallic paint.

(b) Each cot shall be plainly marked with the manufacturer's name in such a manner that marking can not be made illegible.

DETAIL REQUIREMENTS

4. (a) *Ends.*—Ends shall be made of butt welded or high carbon brazed tube (that will withstand bending without opening seams) outside diameter 1.05 inches with corners bent to a radius of not more than 6 inches so as to form continuous posts, measuring $28\frac{3}{4}$ inches wide outside and to stand 24 inches high from the floor.

center, riveted to frame diagonally across corners; holes in frame to be punched $6\frac{1}{4}$ inches on center, to prevent frame from twisting. These corner braces to have offset of $\frac{1}{4}$ inch to allow proper alignment of end helicals.

Ends shall fold under and within frame and be attached to frame at each corner by two 1-by- $\frac{3}{8}$ -inch flat steel braces. Short brace to have rivet holes 6 inches on center; holes in long brace 10 inches on center; the short brace to be offset so as to clear in folding. In riveting braces which connect the head and foot ends to fabric frame the heads of rivets shall be placed against the movable piece; height from floor to top of fabric to be 17 inches.

(e) *Locking device.*—There shall be placed at two corners of the cot diagonally opposite a locking device consisting of a cam latch riveted to the end angle of the cot. When the cot is set up the latch shall engage into the 1 by $\frac{1}{2}$ inch short brace, holding the cot firmly in position. The latch and lock bar shall

be made in accordance with detail drawing. Manufacturers are required to attach a tag to each bed showing action of locking device.

(f) *Fabric*.—Any double-wire link fabric made of not less than 14 gage galvanized wire 14 strands wide and not less than 15 links long, or any single-link fabric of equal strength made of not less than No. 13 gage galvanized wire, which can be interchangeable with a 14-strand double-wire fabric can be used subject to approval; fabric to be of a length that will insure proper tension when mounted on frame with helical springs as specified; fabric to be attached to frame at each end by 14 standard No. 12 gage, 16-coil helical springs, high-carbon steel, which shall be finished in black japan. No single continuous strand or wire fabric shall be permitted.

(g) *Support*.—The support shall be made of fabric reinforced by two supporting bands made of 3/4-inch No. 22 gage hoop steel, attached to side rails by four No. 12 gage 16-coil high-carbon steel helical springs. These shall be located 26 inches from each end of the frame.

METHOD OF INSPECTION, TESTS, ETC.

5 Liberty steel cots shall be inspected as to conformity with these specifications

ADDITIONAL INFORMATION

7. Sketch (fig. 640) accompanying these specifications is to be considered a part thereof.

613.2 BOOK CASES.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FURNITURE AND CABINETS; OFFICE, SECTIONAL, STEEL, AA-F-791, NOVEMBER 11, 1930

BOOKCASE SECTIONS WITH DISAPPEARING GLASS DOORS

(Specifications for these sections will be found in the complete text of the specification AA-F-791. See 613.7, p. 850.)

613.3 CHAIRS AND STOOLS.

(No nationally recognized specifications available for metal chairs and stools.)

613.4 DESKS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR DESKS, STEEL, AA-D-191, MARCH 31, 1931

STEEL DESKS

A. APPLICABLE FEDERAL SPECIFICATIONS.

A-1. There are no Federal specifications applicable to this specification.

B. TYPE

B-1. This specification includes the following types of desks:

- B-1a. Flat top, single pedestal desks.
- B-1b. Flat top, double pedestal desks.
- B-1c. Flat top, double desks.
- B-1d. Typewriter desks, drop center, single pedestal, flat top.

B-1e. Typewriter desks, drop center, double pedestal, flat top.

B-1f. Typewriter desks, double pedestal, pedestal device, flat top.

B-1g. Roll top, double pedestal desks.

C. MATERIAL AND WORKMANSHIP, ETC.

C-1. All exposed sheet steel used for exposed surfaces to be open hearth steel, full pickled, full cold rolled, stretcher leveled, resquared, deoxidized, and oiled. All other sheets to be single pickled, full cold rolled, deoxidized, and oiled.

C-2. All workmanship shall be the best known to the trade.

D. GENERAL REQUIREMENTS

D-1. Sizes of the various desks to be approximate commercial dimensions, but minor variations will be permitted except in height, which shall be 30 1/2 inches from floor to top of writing bed.

E. DETAIL REQUIREMENTS

E-1. All desks shall be of the sanitary type; the distance from floor to bottom of pedestal shall be approximately 8 1/2 inches.

E-2. Construction shall be knock-down, permitting quick assembly or the replacement of any section that might become damaged or broken.

E-3. General construction shall be such as to insure rigidity.

E-4. All exposed edges of steel sheets, if not folded, beaded, or flanged, shall be so filed or otherwise smoothed as to avoid sharp cutting edges.

E-5. *Finish*.—

E-5a. All metal surfaces shall be thoroughly cleaned and free from dirt, oil, grease, and moisture before applying the finish.

E-5b. *Exposed surfaces*.—After a thoroughly reliable priming coat and filler, where necessary, the color coats shall be sufficient when properly dried so that a surface guaranteed not to crack or spall under severe usage will be produced. The final coat shall be a dull egg shell or satin finish. The final colors shall harmonize with the standard colors adopted by the General Supply Committee, Washington, D. C.

E-5c. All unexposed surfaces or component parts to be carefully coated to harmonize with outside color.

E-5d. In addition to the above requirements, whenever especially called for in the purchase specifications to take care of tropical climatic conditions, all bolts, nuts, screws, small levers, or similar parts, shall be made of brass or galvanized steel. All other parts shall be rust resistant metal or they shall be treated with a rustproof coating. Bidder shall give a complete description of the methods he proposes to use in applying the rust resisting coating and finish coat, in order to prevent the coating from chipping off.

E-6. *Hardware*.—

E-6a. Drawer pulls of hocked type similar in appearance to those supplied on wood desks, or bar pulls of brass or bronze brush finish may be used. Pulls shall be securely attached by concealed fasteners but in such a manner as to be easily replaced.

E-6b. Drawer locks shall be brass case cabinet locks, two flat keys each. Curtain locks shall have pin tumblers and corrugated flat keys. Shall lock into sweep arms, not into bed of desk, center drawer to have separate lock and to automatically lock all drawers on the sides. Drawer locking device shall be so built as to permit a drawer left open to be closed after center drawer is locked.

E-7. Drawers.—

E-7a. Double-wall construction shall be used for drawer fronts. Outside drawer heads shall be constructed of 20-gage steel, inner head of at least 24-gage steel, body of at least 24-gage steel, back of at least 22-gage steel. The top edges of sides shall be either folded, flanged, or beaded.

E-7b. Assembly shall be by electric spot welding or lock joints reinforced where necessary by acetylene or arc welding, to insure strength and rigidity. Box drawers shall be mounted in channel suspension slides, but progressive suspension slides will be preferred for letter file or similar drawers. All drawer suspensions shall be so constructed as to reduce friction and noise in operating the drawers.

E-8. Fittings.—

E-8a. Lower drawers in right side of flat and roll top desks, except typewriter desks, shall be double height and be fitted with vertical filing device fitted with compressor block or follower plates to support the drawer contents in its proper reference position. Double desks shall have both sides so fitted. Roll-top desks shall have pigeonhole case fitted with document box drawers and private compartment with door fitted with lock.

E-9. *Tops.*—Shall be of at least 18-gage steel, rigidly reinforced and covered with 1/8-inch battle-ship linoleum or equal, as approved. Linoleum to be uniformly cemented to steel tops in a manner that will insure permanent adhesion. Edges of linoleum to be protected and secured by rounded bronze strip, closely fitting to the linoleum, the strips to be attached with concealed screws or by other secure methods. If binding strip is not a sufficient width, the edge of top beneath the bronze strip shall be finished off by steel binding strip which shall be securely fastened by screws, rivets, or adequate means to the top, making the over-all thickness of top, including the linoleum not less than 1 1/2 inches. This strip may be an integral part of the top itself.

E-10. *Sliding shelves.*—Shall be of at least 18-gage steel, and pan-type construction. Linoleum top covering need not be furnished unless especially asked for in the purchase specifications. Suitable bumpers or coil springs shall be provided to stop shelf when shelf is extended to limit or forced into the pedestal.

E-11. *Legs.*—Shall be of at least 18-gage steel, approximately 2 by 2 inches square, closed on all sides below pedestal and securely attached to panel and pedestal by means of bolts, welding, or other secure methods or they may be designed so that by means of suitable slots, the panels may be fitted into them so as to be retained in the legs without use of bolts or other fastenings. When legs are not tubular their entire length a 16-gage angular or curved reinforcing member not less than 10 inches long, and extending not less than 5 inches above and below lower edge of pedestal, shall be welded to inside of each leg. Brass or bronze shoes at least 1 1/2 inches high, securely fastened to the legs shall be provided. The interior legs may be omitted.

E-12. *Panels.*—Outside panels shall be of at least 20-gage steel and inside panels shall be of at least 22-gage steel and all panels shall be flanged and reinforced or other suitable means shall be used to insure rigidity and prevent vibrations.

E-13. *Curtains or rolls.*—Shall be made of slats of at least 24-gage strip to provide interlocking of adjacent slats. Interlocking methods to provide flexibility of operation and security from pulling apart.

E-14. *Typewriter beds.*—Shall be rigid, give clearance over the desk bed for all standard ma-

chines, and shall be constructed of at least 16-gage sheet steel flanged on all sides and reinforced to prevent vibration. Device on which bed operates shall be substantial in construction, easily operated, and shall be securely attached to a rigid part of the desk.

F. METHOD OF INSPECTION AND TESTS

F-1. All desks may be inspected at the factory by a representative of the purchaser at any time during process of manufacture, the purpose of this inspection being to determine compliance with the terms of the specification as to workmanship, material, details of construction, hardware, and finish. Final inspection will be made at the point of delivery.

G. PACKING AND MARKING

G-1. Unless otherwise specified, the subject commodity shall be delivered in standard commercial containers, for safe transportation, at the lowest rate, to the point of delivery.

G-2. Each desk shall be clearly marked in an inconspicuous place showing the name of the manufacturer. Unless otherwise specified shipping containers shall be marked with the name of the material, the size, type, and the quantity contained therein, as defined by the contract or order under which the shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. All gages mentioned are United States standard gages.

I-2. Purchasers shall exercise all options offered herein and should specify type, grade, class, etc., required.

I-3. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids, and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

613.5 LOCKERS AND SAFES.**UNDERWRITERS' LABORATORIES, PROPOSED STANDARD ON MINIMUM BURGLARY RESISTANCE OF KEY-LOCKED SAFES (CLASS K L), 1927****KEY-LOCKED SAFES**

(Specification covers practicability and durability of safe and locking mechanism, time limit on resistance to burglar attack, mounting requirements, tests for lock picking, drifting and drilling, door sledging and wedging, dismounting and fishing test.)

UNDERWRITERS' LABORATORIES, STANDARD FOR RELOCKING DEVICES FOR SAFE AND VAULT DOORS, 1927**RELOCKING DEVICES**

(Applies to relocking devices for safes and chests, light vault doors, and heavy vault doors. Requirements cover design and construction, practicability, durability, reliability of operation, and tests for relocking when combination is tampered with.)

UNDERWRITERS' LABORATORIES, STANDARD FOR SAFES AND INSULATED CABINETS, 1918

SAFES AND INSULATED CABINETS

(Safes and insulated cabinets are classified according to their fire retardant and impact resistive properties. Safes are separated into three classes—class A, class B, and class C. All three classes are effective against fairly heavy impacts. As fire retardants, class A is effective against severe fires for at least four hours, class B for at least two hours, class C for at least one hour. Insulated cabinets are effective against fires of moderate severity for at least 45 minutes, but are not subject to impacts from falling or from falling bodies. Specification also includes general design, strength requirements, and fire stream tests.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR STEEL LOCKERS, R35-28, FEBRUARY 1, 1928

STEEL LOCKERS

(Simplified practice recommended and accepted by industry establishing a limited list of standard stock sizes for single, double, and multiple tier steel lockers.)

TABLE 1.—*Single tier*

Width ¹	Depth	Height	Maximum over-all height, including leg
<i>Inches</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
12	12	60	66
12	15	60	66
12	18	60	66
15	15	60	66
15	18	60	66
18	21	60	66
12	12	72	78
12	15	72	78
12	18	72	78
15	15	72	78
15	18	72	78
18	18	72	78
18	21	72	78

¹ This dimension does not include the projecting boltheads. When filling fixed spaces with rows of lockers allowance should be made for such projections.

TABLE 2.—*Double tier*

Width ¹	Depth	Height	Maximum over-all height, including leg
<i>Inches</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
12	12	30	66
12	12	36	78
12	15	36	78
15	15	36	78
12	15	42	² 90
15	15	42	² 90

¹ This dimension does not include the projecting boltheads. When filling fixed spaces with rows of lockers allowance should be made for such projections.

² When 3-inch legs are used the over-all height will be 87 inches.

TABLE 3.—*Multiple tier (box)*

Lockers per stack	Width ¹	Depth	Height	Maximum over-all height, including leg
	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
5 or 6.....	12	12	12	66 or 78
5 or 6.....	12	15	12	66 or 78
4.....	15	15	15	66
5.....	15	15	14½	78

¹ This dimension does not include the projecting boltheads. When filling fixed spaces with rows of lockers allowance should be made for such projections.

Lockers purchased as samples

- Single tier..... 12 by 15 by 60 inches.
- Double tier..... 12 by 15 by 36 inches.
- Multiple tier..... 12 by 15 by 12 inches (5 high).

Where recess installation is to be made, the recess height should be 4½ inches less than the maximum over-all height of corresponding leg lockers.

The recommended sizes for single, double, and multiple tier lockers are supplied in single row construction (wall type) and in double row construction (back to back type).

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR CABINETS; STATIONARY, STORAGE, AND CLOTHING (STEEL), AA-C-31, FEBRUARY 2, 1932

STEEL STORAGE CABINETS

B. TYPES

- Type I. Single-door clothing cabinet.
- Type II. Double-door clothing cabinet.
- Type III. Single-door stationery and storage cabinet.
- Type IV. Double-door stationery and storage cabinet.
- Type V. Janitors' single-door storage cabinet.
- Type VI. Janitors' double-door storage cabinet.

C. MATERIAL AND WORKMANSHIP

C-1. *General*.—Material shall be the best quality of the kind specified. It shall be free from defects and imperfections which impair the appearance or usefulness of the products.

C-2. *Steel sheets*.—Shall be open-hearth steel, cold rolled for tops, bases, sides, backs, shelves, and structural parts generally.

C-3. *Hardware*.—Hinges shall be of good quality commercial steel. Door handles shall be of formed or solid bronze or brass, malleable iron, cast steel, or formed steel suitable for the purpose.

C-4. *Workmanship*.—The workmanship on all parts shall be first class in every respect and of a type to insure rigidity of the assembled articles.

D. GENERAL REQUIREMENTS

D-1. Strength and rigidity of parts shall be secured by flanging or reinforcing so they will properly perform the function for which they are designed. Special precautions shall be used to insure proper alignment of doors with door openings or frames so that doors may be freely operated and latched. All bases shall be closed.

D-2. All cabinets shall have the maker's name in full or a trade-mark appearing in an inconspicuous place on same. The name and marks on cabinets for foreign shipment shall comply with existing export regulations.

D-3. Locks on equipment furnished on any order shall be different or alike, as ordered, and shall be master-keyed only if so ordered. Two keys shall be supplied with each cabinet and two master keys with each order when master keys are ordered.

D-4. The general assembly of parts shall be by electric spot-welding or oxy-acetylene welds or bolted together with rustproof bolts. No spot weld shall exceed three-sixteenths inch in diameter. If bolted, no exposed bolts shall show on front or ends. All bolt holes in adjoining parts shall be true and even.

D-5. *Finish.*

D-5a. All parts shall be thoroughly cleaned and dried before finishing materials are applied. The finish shall consist of not less than two coats of baked enamel or a baked primer and two coats of pyroxylin lacquer. The standard color to be olive green. When specifically ordered, cabinets shall be furnished in mahogany or walnut.

D-5b. Handles shall be finished in baked enamel or to resemble brass or bronze or nickel plated. The hinges shall harmonize with the finish of the cabinet or locker.

D-6. Patent features shall be owned or licensed by the manufacturer, who shall assume full responsibility and protect the purchaser.

E. DETAIL REQUIREMENTS

E-1. *Sizes of cabinets.*—Approximate outside dimensions:

E-1a. 36 inches wide (18 and 24 inches) deep and 72 inches high.

E-1b. 24 inches wide (18 and 24 inches) deep and 72 inches high.

E-2. *Interior equipment.*

E-2a. Clothing cabinets, Types I and II, shall be equipped with a hat shelf and one coat rod extending the full width of shelf.

E-2b. Stationery or storage cabinets, Types III and IV, shall be equipped with or without adjustable shelves as called for in the invitation for bids.

E-2c. Janitors' storage cabinets, Types V and VI, shall be equipped with one top shelf, underside fitted with not less than two ceiling hooks.

E-3. *Shelves.*—All cabinets shall provide for adjustment of shelves on not more than 2-inch centers. Extra shelves may be ordered for any cabinet if required.

E-4. *Doors.*—Single doors shall be used for widths up to 24 inches, and double doors for widths greater than 24 inches. Substantial hinges shall be provided, not less than three for each door; if of butt type, they shall have tight pins. Single doors or swinging doors of those in pairs shall have T or lever handles for operating the latching mechanism. The standing door of those in pairs shall be provided with a rigid T or lever handle, and a suitable means for interlocking with the other door. Each door shall be reinforced with flanged edges and a stiffening panel.

E-5. *Latching mechanism.*—Single doors and swinging doors of those in pairs shall be provided with a latching device that makes engagement at three points. The latching mechanism shall be controlled by a suitable flat key lock, master-keyed when so specified.

E-6. *Gages of parts.*—The following are minimum gages of parts—U. S. standard gage:

E-6a. Tops, No. 22 gage, 0.0306 inch.

E-6b. Backs, No. 22 gage, 0.0306 inch.

E-6c. Twenty-four inch bottoms, No. 20 gage, 0.0368 inch.

E-6d. Thirty-six inch bottoms, No. 18 gage, 0.0490 inch.

E-6e. Doors, No. 20 gage, 0.0368 inch.

E-6f. Shelves (36 inches), No. 18 gage, 0.0490 inch.

E-6g. Shelves (24 inches), No. 20 gage, 0.0368 inch.

E-6h. Sides, No. 22 gage, 0.0306 inch.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. The manufacturer shall permit a representative of the Government, at any time, to make inspections of all products during process of manufacture and such tests as may be necessary to ascertain that proper materials are being used. Final inspection will be made at point of delivery. All defective parts or articles shall be replaced by the manufacturer without cost to the purchaser.

G. PACKING AND MARKING

G-1. Articles when shipped from factory shall be so crated, packed or wrapped, as to insure delivery in first-class condition. Packages shall be clearly marked. When intended for foreign delivery, packing shall be in accordance with rules of the Department of Commerce.

G-2. Shipping containers or packages shall be marked with the name of the material, the type and quantity contained therein as defined by the contract or order under which shipment is made, the name of the contractor, and the number of the contract or order.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR CASES; TRANSFER, STEEL, AA-C-121, FEBRUARY 2, 1932

STEEL TRANSFER CASES

B. TYPES

B-1. *Type I.*—For invoice-size papers; outside depth, 25 inches; inside dimensions of drawer to be not less than 10 inches wide by 22 inches deep by 8½ inches high.

B-2. *Type II.*—For letter-size papers; outside depth, 25 inches; inside dimensions of drawer to be not less than 12 inches wide by 22 inches deep by 10½ inches high.

B-3. *Type III.*—For cap-size papers; outside depth, 25 inches; inside dimensions of drawer to be not less than 15¼ inches wide by 22 inches deep by 10½ inches high.

B-4. *Type IV.*—For sheets 10 by 16 inches; outside depth, 25 inches; inside dimensions of drawer to be not less than 16½ inches wide by 22 inches deep by 11¼ inches high.

C. MATERIAL AND WORKMANSHIP

C-1. All sheet steel shall be roller leveled and all workmanship shall be the best known to the trade.

D. GENERAL REQUIREMENTS

D-1. *Finish.*

D-1a. All metal surfaces shall be subjected to cleaning and shall be thoroughly dried before they are treated further.

D-1b. Parts and their members shall have a priming coat and all exposed surfaces, two coats of enamel baked on the finish coat to be an egg-shell gloss to match the general supply committee's

standard green, or other color designated by the contracting officer.

D-2. All sections shall intermember with and match in size the standard sections adopted by the general supply committee.

D-3. All exposed edges of steel sheets shall be so rounded or smoothed as to avoid sharp-cutting edges.

E. DETAIL REQUIREMENTS

E-1. Case body.

E-1a. The case body shall be constructed of sheet steel not lighter than 24-gage (0.0245 inch), shall have closed sides and back, and shall have front and back edges reinforced with a band in the body or back. The band shall be not less than one-eighth inch thick and not less than 1¼ inches wide.

E-2. Drawers.

E-2a. Shall have closed backs and shall operate on steel-roller bearings provided at the bottom front of the case body. These rollers shall be at least one-half inch in diameter and three-eighths inch wide. Drawer bottoms shall be so constructed or reinforced as to prevent these rollers from indenting or corrugating the bottom of the drawer when loaded to capacity.

E-2b. Drawer fronts shall be provided with suitable label holders and drawer pulls securely fastened thereto.

E-2c. Compressors shall be of durable construction, shall have strong positive grips and shall be capable of easy adjustment. They shall be readily removable and shall not operate upon a guide rod.

E-2d. Assembly of drawers and case body shall be by spot weld spaced not more than 4 inches apart.

E-2e. Front head of drawers shall be at least 22-gage (0.0306 inch), and sides and rear head shall be at least 24-gage steel (0.0245 inch).

E-2f. Bolts and holes shall be provided for interlocking the cases, horizontally at the front and back. A device shall be provided at the back to prevent the tilting of the case when the drawer is extended. This device shall operate independent of the interlocking bolts.

E-3. Leg bases.

E-3a. Shall be 8½ inches high, 25 inches deep, and 6 inches under the rail. At least 20 gage (0.0368 inch), sheet steel shall be used in the base construction.

E-3b. Legs shall be securely fastened to the rail, shall be approximately 2 inches square and so formed as to be rigid and give a sufficiently smooth bearing surface to prevent undue marring of floors.

F. METHOD OF INSPECTION AND TESTS

F-1. All sections may be inspected at the factory by a representative of the Government at any time during the process of manufacture. Final inspection will also be made at point of delivery.

G. PACKAGING, PACKING, AND MARKING

G-1. *Packaging.*—Unless otherwise specified, commercial packages are acceptable under this specification.

G-2. *Packing.*—Unless otherwise specified, the subject commodity shall be delivered in standard commercial containers so constructed as to insure acceptance by common or other carrier for safe transportation at the lowest rate to the point of delivery.

G-3. *Marking.*—Shipping containers or packages shall be marked with the name of the material, the type, and quantity contained therein, as defined by the contractor or order under which shipment is made, the name of the contractor, and the number of the contract or order.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SAFES, INSULATED, AA-S-81, DECEMBER 8, 1931

INSULATED SAFES

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. CLASSES

B-1. This specification covers three classes of safes as determined by fire resistance as follows:

- Class A. Having 4-hour fire resistance as defined in section E-2.
- Class B. Having 2-hour fire resistance as defined in section E-2.
- Class C. Having 1-hour fire resistance as defined in section E-2.

C. MATERIAL AND WORKMANSHIP

C-1. *Material.*—Structural shapes shall be of wrought iron or open-hearth steel and plates and sheets of open-hearth or Bessemer sheet stock, or other material of at least equal tensile strength.

C-2. *Workmanship.*—All joints between sheets, plates, and shapes shall be made to develop the required strength of the assembly, and to prevent undue openings when exposed to fire or impacts.

D. GENERAL REQUIREMENTS

D-1. *Insulation.*—The insulation and design of the safe shall be such as to prevent sweating and swelling from the insulation, appreciable loss of insulating value with age, or disruption from explosion of gases generated within it when exposed to fire. The insulation shall be so molded, jointed, or reinforced as to preserve its insulating function when safe is subjected to fire and impacts.

D-2. *Rollers and casters.*—The safes shall be supported on heavy swivel casters with antifriction bearings or on wheels properly proportioned for the weight of the safe. They shall be secured to the safe by means of screws or bolts in such a manner as not to unduly strain any portion thereof and make possible replacement from the outside. Steel housings may be welded to the supporting plate.

D-3. Door details.

D-3a. The outer surface of the doors shall be made to fit each other and the opening, with no greater face clearance than one-sixteenth inch. The maximum clearance within the door joint on at least one line shall not be more than one-sixteenth inch. A gasket of asbestos not more than one-eighth inch thick suitably filled and attached, a flexible steel strip not more than one-thirty-second inch thick, or equivalent of either of these, may be used to assist in meeting this requirement. The hinges shall be of steel, semisteel, or malleable iron, securely attached to the door and doorframe, reinforcing plates being used where necessary. Centers of hinges are to be placed not more than 9 inches from top and bottom edges of doors. When the distance between those centers exceeds 30 inches a third similar hinge shall be placed at the middle of the height. One hinge shall be added for each additional 18 inches in height. These maximum spacings apply to the heavier hinges. The lighter hinges must be given closer spacings.

D-3b. For doors weighing over 220 pounds, ball race bearings and hardened steel balls shall be provided between knuckles or other means to prevent undue wear and friction. Where the conditions of use require it, such as location of safe against a pier between windows or close to side walls, purchasing officers may specify a 250° swing for the door, or

may specify the maximum distance beyond the end faces of the safe that any portions of the door or doors must be swung in order to make the whole interior equipment of the safe removable. Doors shall be provided at the back or hinge side with not less than two fixed or hand-operated bolts, engaging suitably cupped holes, in addition to the regular locking bolts, or the hinge side of the door shall have one or more projecting heels fitting into continuous recesses in the jamb. The joint between double doors shall have one or more tongue and groove interlocks.

D-4. *Locking requirements.*—The safes shall be designed and equipped to provide such lock protection as is consistent with the general construction. All parts of the locking mechanism are to be suitably protected against corrosion and be metal inclosed or otherwise protected from dust, corrosion, or other effects from the insulation, and be protected against contact with the safe contents. The inside doorplate shall be removable to give access to lock and bolt work.

D-4a. *Locking bolts.*—All single doors or swinging doors of those in pairs shall have not less than two locking bolts and safes of 30-inch or greater inside height shall have not less than three bolts. For single doors over 30 inches high and for double door safes at least one bolt shall be a horizontal bolt engaging opening in the opposing door or jamb framing. The standing door of those in pairs shall have not less than two vertical bolts, one at the top and one at the bottom.

D-4b. *Modification for doorplate thickness.*—Safes having doorplate thickness accepted under section E-4b shall have not less than three locking bolts on separate drawbars or on middle or opposite ends of drawbars, that must be withdrawn before safe can be opened, not less than one bolt and adjacent portion of bar assembly of which must be protected on the outside by metal of thickness not less than that specified in section E-4a for the outer doorplate, or, such safes must have not less than four locking bolts on separate drawbars or on middle or opposite ends of drawbars that must be withdrawn before safe can be opened. Bolts between doors in double-door safes are not to be considered as effective in preventing opening of safe after all bolts in both doors engaging the jambs have been withdrawn.

D-4c. *Details of bolts.*—Locking bolts are to be of cold-rolled steel properly polished and finished to prevent corrosion, having well-cupped openings in doorframe and doors, cups to be tight and flush with the doorframe or jamb. A step may be provided to engage the bolts in lieu of cupped holes. The diameter of bolts shall not be less than five-eighths inch. They are to be yoked together for simultaneous response to levers or cams operated by lever or T handles. With doors in pairs provision shall be made to prevent locking of bolts in the swinging door while the bolts of the standing door are in unlocked position, and for preventing unlocking the bolts of the standing door while the bolts of the swinging door are in locked position.

D-4d. *Locks.*—The bolt-work system shall be checked by one combination lock having not less than three changeable tumblers in addition to the driving wheel; the tumblers shall be key changeable or hand changeable as will be specified. The hand-changeable lock must be made so that all numbers stamped on tumblers can be used. The instructions for changing combinations must be supplied with each safe. A device must be provided that will check the bolt-work automatically in case the lock tumblers are driven out of position, or that will securely maintain the door in closed position in case of burglarious attack. Unless the lock case is of material and is so mounted that it can not be driven

out of position with reference to the bolt-work, this device must be located outside of the lock case.

A guard plate made of drill-proof steel and sufficient in size to guard the lock and lock connection must be provided. This plate shall be not less than three-sixteenths inch thick. Two plates of drill-proof steel each not less than one-eighth inch thick, may be substituted for the single three-sixteenths inch thick plate, or a single one-eighth inch thick drill-proof plate may be used if backed with soft steel plates aggregating not less than three-sixteenths inch in thickness.

D-5. *Finish.*—The interior finish of the safes shall be of rich olive green and the exterior finish the Government standard olive green, unless otherwise specified. The unexposed surface of sheets and plates shall be suitably protected against corrosion unless the insulation forms a protective covering.

D-6. *Sizes.*—The sizes requisitioned shall be the commercial sizes, but preference will be given those safes the dimensions of which will most adequately accommodate the Government sectional furniture, the dimensions of which are as follows:

Small and horizontal sections, 16½ and 33 inches wide by 17 and 25 inches deep. These sections advance in height in multiples of 6½ inches.

E. DETAIL REQUIREMENTS

E-1. *Structural strength.*—Safes shall withstand an applied load maintained constant one week and equal to the weight of the safe without equipment plus three times the weight of contents, disposed and computed as given in section F-5, without deformation or sagging that interferes with easy operation of doors and locking bolts.

E-2. *Fire resistance.*

E-2a. Class A safes shall be able to withstand a standard fire test as described in section F-6 for four hours without attainment of temperatures within the safe at any thermocouple location higher than 350° F. (177° C.) either during or after the fire exposure.

E-2b. Class B safes shall be able to withstand a similar test for two hours without exceeding the same inside temperature limits.

E-2c. Class C safes shall be able to withstand a similar test for one hour without exceeding the same inside temperature limits.

E-2d. All safes shall withstand the explosion hazard test, in cases where this test is required, without development of explosive pressures sufficient to open forcibly the doors or distort the safe structure.

E-3. *Impact resistance.*

E-3a. Safes of classes A and B must preserve their contents in legible condition during a reheat test of one hour following a clear drop of safe of 30 feet while in heated condition from an initial fire exposure of one hour under the testing procedure described in section F-7.

E-3b. Safes of class C must meet the same requirements with the exception that the initial and reheat tests are to be of one-half hour duration.

E-4. *Shell thickness.*

E-4a. The metal thickness of the outer shell shall be not less than 0.05 inch (No. 18 gage) for class A and class B safes and not less than 0.0375 inch (No. 20 gage) for class C safes. The thickness of the outer doorplate shall be not less than 0.109 inch (No. 12 gage) for class A and class B safes and not less than 0.078 inch (No. 14 gage) for class C safes. The thickness of the inner shell and inner doorplate shall be not less than 0.0375 inch (No. 20 gage). The outer doorplate may be made of two sheets having combined thickness of not less than 0.109

inch, welded together at points not more than 6 inches apart.

If the outer doorplate is not continuous with the jambs it shall be welded to the jamb metal at intervals not exceeding 3 inches. The inner shell shall be suitably reinforced where necessary to safely support the safe contents without distortion.

E-4b. Modification for locking bolts.—The outer doorplate may be of the same minimum thickness as that specified above for the outer shell provided the number and distribution of the locking bolts conform with the requirements of section D-4b.

E-5. Weight.—The weight of safes without interior equipment or contents shall not exceed 325 pounds per square foot of floor area occupied for class A safes, 275 pounds per square foot for class B safes, and 225 pounds per square foot for class C safes. These weight limitations apply to safes not over 6 feet in body height.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. Information required.—When requested, the manufacturer shall supply with his proposal shop drawings showing and noting every detail of structural, heat insulating, and thief-resisting features for the different classes and sizes. Catalogues shall be supplied showing equipment items, finished appearance, weight of each safe in the lines proposed upon, both total and per square foot of floor area covered; and attested statements as to results of tests if available. These will be considered confidential and used only for the information of the Government in determining the acceptability of the safes.

F-2. Inspection.—The manufacturer shall provide facilities for such inspection of materials and process at the factory as may be deemed necessary. Purchasing officers should ascertain whether the given manufacturer's product is being regularly inspected by any Government department in order to avoid unnecessary duplication of inspection work. The safes will be finally inspected for acceptance at the point of destination.

F-3. Samples for test.—If requested two safes of each class proposed upon, one of medium size and one of the largest size it is proposed to furnish, with the interior equipped with open shelves and accompanied by shop drawings, shall be delivered by the successful bidder or contractor, free of expense to the Government, at the time and place designated by the purchasing officer. If the explosion hazard test is required an additional safe of medium or large size will be required for this test. These safes will be submitted to such examinations and tests as may be deemed necessary to determine their properties and performance. Two samples of insulation, 18 by 18 inches in area, of the same thickness and contained in the same manner as in the safes proposed upon shall be submitted with the sample safes.

F-4. Service tests.—Examination and tests of the unloaded safe will be made to determine ease of operations of doors, bolts, and lock under conditions of uniform support and support only at two or three corners. Determination will be made of the degree of swing of the door that is required to make possible removal of interior equipment and of the force required to move the safe on its base supports over a level floor.

F-5. Strength tests.

F-5a. The safe to be tested shall be weighed with all interior equipment that is not fixed in place removed. The inside volume of the safe shall then be determined, the depth to be taken as the distance between the inner doorplate and the back of the inner shell. In case fixed interior equipment is

present, this shall be included in the weight of the safe and the inside volume computed so as not to include the space occupied by such equipment. The weight of contents shall be taken as 25 pounds per cubic foot of inside volume or thrice the weight of contents as 75 pounds per cubic foot of inside volume.

F-5b. During the loading tests a plate not less than one-fourth inch thick shall be placed under one corner support so as to place the weight mainly on this and the diagonally opposite corner support. In case of single-door safes, the plate shall be placed under the corner adjacent to the lock side of the door.

F-5c. The load required under section E-1 shall be distributed as follows: One-half of the load shall be placed on the front central part of the upper door jamb with no portion of the load nearer than one-fourth of the outside width from the sides of the safe or one-third of the outside depth from the back.

F-5d. One-fourth of the load shall be placed on the front central part of the lower door jamb with no portion of the load nearer than one-fifth of the inside width from the sides of the inner shell or one-third of the inside depth from the back of the inner shell.

F-5e. One-fourth of the load shall be hung on the door of 1-door safes or symmetrically on the two doors of 2-door safes with center of support 2 inches from the door edge. During the test the doors shall be kept open to their maximum swing, but not more than 180° from the closed position.

F-5f. After the loads have been in place for one week, the whole door load and two-thirds of each of the top and bottom door-jamb loads shall be removed. With the plate remaining under the corner support there shall be no indications of binding or lack of easy closure or operation of doors and bolt work.

F-6. Fire endurance tests.—The sample used in this test shall be of medium size, and lightly loaded with loose papers and records. The time-temperature curve followed shall conform to that defined in American Tentative Standard A2-1926 of the American Standards Association. The flames and hot gases shall bathe the sample on not less than five sides without undue impingements, the door side to be always fully exposed. It is placed in the furnace on incombustible foundations with suitable equipment for measuring temperature on the inside, installed so as not to affect the insulating efficiency of the safe. Temperatures shall be measured at several representative points within the safe, including not less than two points 6 inches from the top, 1 inch from the sides opposite joints between door and jamb or between doors, and 2 inches from inside door or doorplate.

After exposure to the fire test for the duration specified for the pertaining class, the sample shall be allowed to cool in the furnace, with furnace doors closed, the inside safe temperature being measured until the maximum is reached.

F-7. Impact test.—The sample used in this test shall be the largest size on which proposal is made, loaded with a content of papers and records of 25 pounds per cubic foot of safe capacity, supported on shelves. The sample shall be subjected to the fire test defined in section F-6, for one hour for class A and class B rating and for one-half hour for class C rating, except that it shall be dropped base downward a clear distance of 30 feet while in the highly heated condition on a riprap of broken bricks. After cooling to normal temperature it shall be replaced in the furnace, bottom upward, and subjected to the standard fire test for one hour for class A and class B rating and for one-half hour for class C rating.

Safes are to withstand the fire, impact, and reheat test above specified without destroying the legibility of the records inside.

F-8. *Explosion hazard test.*—The sample used in this test shall be of medium or large size and lightly loaded with loose papers and records. It shall be subjected by any means to a very quick hot fire for about one-half hour, the intensity of which is to be considerably higher than that of the fire-endurance test described under section F-6.

G. PACKAGING, PACKING, AND MARKING

G-2. *Packing.*—Unless otherwise specified, the subject commodity shall be delivered in standard commercial containers, so constructed as to insure acceptance by common or other carriers, for safe transportation, at the lowest rate, to the point of delivery.

G-3. *Marking.*—Unless otherwise specified, shipping containers shall be marked with the name of the material and class as defined by the contract or order under which the shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. *Items to be specified.*—Purchasers should exercise all options specified herein and should specify class, finish, and size, the last being usually best stated in terms of minimum width, height, and depth inside of inner shell and inner doorplate, and whether hand-changeable or key-changeable lock combination is wanted. If a limit on the swing of the door or doors required to make the interior equipment removable is needed, or a 250° swing required, this should be specified. If the explosion hazard test is required, this should be stated.

On account of cost of samples and their transportation it is suggested that sample safes be not requested from all bidders, but that such requests be made only of the successful bidder or contractor per section F-3. For small orders it may be possible to base acceptance on examination of detail drawings and safe details and subsection of the sample or samples to the nondestructive loading tests outlined in section F-5. In such cases, fire endurance and fire and impact resistance of the safe might be judged from the information the manufacturer can supply as to results of such tests with the class of safe concerned. Where tests are required, the Bureau of Standards at Washington, D. C., is equipped to conduct for Government departments and establishments the examination and tests required by this specification.

I-2. *Scope of protection afforded.*

I-2a. The safes covered by this specification are intended mainly to afford protection against fire and theft and such resistance against forcible entry as is consistent with the general construction. They should not be considered as giving burglar protection approaching that afforded by burglar-resistive safes meeting requirements such as those of Federal Specification AA-S-71.

I-2b. For buildings of fire-resistive interior and exterior construction that can withstand a complete burning-out of contents without collapse of floors and supports, the maximum equivalent severity of the fire is fairly determinate and can be stated as not exceeding the fire resistance of class C safes where combustibles, such as wood and paper contained in building contents, finish floors, and trim, do not exceed 10 pounds per square foot, that of class B safes where not exceeding 20 pounds per square foot, nor that of class A safes where not exceeding 35 or 40 pounds per square foot. The weight of combustibles per unit of floor area can be obtained by dividing the total weight within rooms or areas not

exceeding approximately 25 by 30 feet, by the floor area involved. Extra high cabinets should not be placed closely adjacent to safes as the hot débris from them in contact with the safe may give a more severe exposure than the general room temperatures. For locations involving ordinary combustibles in excess of the amounts given above, safes of 4-hour or less fire resistance would afford temporary protection, and the contents would be saved provided the fire is extinguished at a sufficiently early stage or its severity diminished by this means or by other conditions present, that prevent development of a severity in excess of the protection afforded by the safe. Full protection against these severe fire conditions can be obtained by recourse to vaults having walls and supports of suitable material and thickness and well-insulated doors.

I-2c. For fire-resistive buildings the severity of the exposure is largely independent of the size, height, or location of the buildings.

I-2d. As concerns buildings with combustible or nonfire-resistive interior construction less definite estimates of the severity of the fire exposure to be expected can be made. While the duration of the fire before building collapse takes place may be relatively brief, a prolonged exposure from contact with hot ruins may follow. It is recommended that in such buildings, safes, of class B or higher fire resistance be used generally, although class C safes may be adequate in 1-story buildings not adjoining higher nonfire-resistive buildings and that house the lighter occupancies from the fire-hazard standpoint. The hazard increases with the height of the building and weight of combustible material present on account of possibility of greater volume of hot débris and severer impacts. Hot débris covering safes should be cooled with water or the safes removed as soon as conditions permit.

I-2e. Generally, considering possible changes in location and ownership, it is preferable to provide containers having fire resistance not less than that of class B safes. The safes with the higher fire resistance also afford better theft protection on account of thicker insulation and body plates.

I-3. This specification governs all United States Government purchases of this commodity.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR STERILIZERS, DRESSING CONTAINERS AND STANDS, PORTABLE LOCKERS FOR USE IN CONJUNCTION WITH STERILIZERS, ELECTRIC HEATERS, AND STEAM STERILIZING APPARATUS, NO. 68A, OCTOBER 25, 1923. (CURRENT DESIGNATION: GG-S-751)

PORTABLE LOCKERS

(The following requirements from the above specification are applicable to portable lockers for use in conjunction with sterilizers.)

TYPE

Portable lockers for use in conjunction with sterilizers shall be of but one type, as hereinafter covered in detail.

MATERIAL AND WORKMANSHIP

The material used in the manufacture of portable lockers for use in conjunction with sterilizers shall be as hereinafter covered.

All details of outfit, its design, material, workmanship, finish, and operation under service conditions shall be first class in every respect.

GENERAL REQUIREMENTS

Each complete apparatus shall be fitted with a single brass name plate in a conspicuous location in order that it may be read after installation. The name plate shall contain the following data:

- Name of manufacturer.
- Shop number.
- Year of manufacture.

DETAIL REQUIREMENTS

1. When ordered, portable lockers about 12 inches high, constructed of 0.05 inch terneplate and of about the depth of the tubular stand, with bottom not less than 4 inches above the deck, shall be located under the combination sterilizing outfits. Top, bottom, back, and sides of lockers shall be water-tight, and each locker shall be fitted with a tight-closing door or doors provided with hinges and fastenings of heavily nickeled brass.

2. Doors shall be suitably stiffened and door frames shall be fitted.

3. Lockers shall be finished with two undercoats and two finishing coats of high-grade white enamel baked on.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR LOCKERS; CLOTHES, STEEL, AA-L-486, FEBRUARY 2, 1932

STEEL LOCKERS

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no Federal specifications applicable to this specification:

B. TYPES AND CLASSES

- B-1. *Type I.*—Single-tier lockers.
 - Class (a). Semilouvered door.
 - Class (b). Full-louvered door.
 - Class (c). Full-perforated door.
 - Class (d). Open-mesh "Tropical."
- B-2. *Type II.*—Double-tier lockers.
 - Class (a). Semilouvered door.
 - Class (b). Full-louvered door.
 - Class (c). Full-perforated door.
 - Class (d). Open-mesh "Tropical."

C. MATERIAL AND WORKMANSHIP

C-1. *General.*—Material shall be the best quality of the kind specified. It shall be free from defects and imperfections which impair the appearance or usefulness of the products.

C-2. *Steel sheets.*—Shall be open-hearth steel, cold-rolled for tops, bottoms, sides, backs, shelves, and structural parts generally.

C-3. *Hardware.*—Hinges shall be of good quality commercial steel. Door handles shall be of malleable iron, cast steel, or formed steel suitable for the purpose.

C-4. *Workmanship.*—The workmanship on all parts shall be first class in every respect and of a type to insure rigidity of the assembled article.

D. GENERAL REQUIREMENTS

D-1. Lockers shall be furnished in single units or in groups of two or more units, but not exceeding 10 in one group for single-tier lockers, or 20 for double-

tier lockers, as ordered. Groups may be double, two rows back to back when so ordered, and so constructed as to provide for mutual back for such double rows or groups when so ordered.

D-2. Strength and rigidity of parts shall be secured by flanging or reinforcing so they will properly perform the function for which they are designed. Special precautions shall be used to insure proper alignment of doors with door openings or frames so that doors may be freely operated and latched.

D-3. All lockers shall have brass or aluminum number plates on the doors, the numbers to be consecutive, or otherwise to meet requirements. The scheme of numbering shall be supplied by purchaser. The manufacturer's name and location of factory shall also be placed on such number plates.

D-4. Locks on equipment furnished on any order shall be different and shall be master-keyed. Two keys shall be supplied with each locker and two master keys with each order. Built-in keyless or combination locks, self-locking type, shall be furnished in lieu of flat-key locks when specified by the purchasing officer. Provision shall be made for fastening by means of padlock, when specified by the purchasing officer, padlocks to be furnished by user.

D-5. The general assembly of parts shall be by bolts. Bolt holes in adjoining parts shall be true and even so that knock-down lockers may be set up without difficulty. All assembly bolts shall be rustproof.

D-6. *Finish.*

D-6a. All parts shall be thoroughly cleaned and dried before finishing materials are applied. The finish shall consist of not less than two coats of baked enamel or a primer and two coats of pyroxylin lacquer. The standard color to be olive green.

D-6b. Hardware shall be of rust-resisting finish, manufacturer's standard.

D-7. Patented features shall be owned or licensed by the manufacturer, who shall assume full responsibility and protect the purchaser.

E. DETAIL REQUIREMENTS

E-1. *Sizes of lockers.*—Approximate outside dimensions:

E-1a. *Type I.*—Single tier.

Width	Depth	Height	Over-all height, including legs
<i>Inches</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
12	12	60	66
12	15	60	66
12	18	60	66
15	15	60	66
15	18	60	66
12	12	72	78
12	15	72	78
12	18	72	78
15	15	72	78
15	18	72	78
18	18	72	78
18	21	72	78

E-1b. *Type II.*—Double tier.

Width	Depth	Height	Over-all height, including legs
<i>Inches</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
12	12	36	78
12	15	36	78
15	15	36	78
12	12	42	90
12	15	42	90

Width dimension does not include the projecting bolt heads. When filling fixed spaces with sections of lockers, allowance shall be made for such projections.

E-2. Interior equipment.

E-2a. Shelves.—Hat shelves shall be furnished for single-tier lockers only.

E-2b. Hooks.—A double-prong ceiling hook shall be furnished for each locker. Lockers 12 inches wide shall be provided with at least one hook on the back and one on each side. Lockers over 12 inches wide shall be provided with two hooks on the back and one on each side. Hooks shall be of malleable iron or cast steel and of rustproof finish.

E-3. Legs.—Each locker shall have four legs 6 inches long, with feet that may be secured to the floor. Legs may be separate members or extensions of framing parts. Vertical adjustment shall be provided either with the legs or foot.

E-4. Doors.

E-4a. Locker doors shall be reinforced with steel angle members or equal, along the vertical edges, with top and bottom edges flanged. Doors not over 36 inches high which are flanged only shall have oxyacetylene or electric welded corners. For "Tropical" lockers, class 4, hard steel angle frames shall be used for doors, which shall be assembled by oxyacetylene or electric welding. A reinforcing plate shall be provided, on which the handle and lock shall be mounted. Expanded metal not less than No. 14 gage, of three-fourths-inch diamond mesh, shall be welded to the angle door frame of "Tropical" lockers.

E-4b. Semilouvered doors shall have six louvers near top and six louvers near bottom of door. Full-louvered doors and full-perforated doors shall have as many louvers or perforations as may conveniently be placed without weakening structural strength.

E-5. Hinges.—Heavy steel butt hinges with tight pins shall be mounted, if possible, with ends concealed. Other types of approved standard hinges will be considered. Hinges to be bolted or riveted to door and riveted to door frames.

E-6. Latching mechanism.—The latching mechanism for doors up to 42 inches high shall make engagement at not less than two points, doors of greater size shall have a 3-point device. The latching-mechanism shall be controlled by a suitable flat key lock that is master-keyed, or built-in keyless lock, as specified in the invitation for bids.

E-7. Gages of parts.—The following are minimum gages of parts—United States standard gage:

E-7a. Tops, backs, bottoms, sides, and partitions, shelves No. 24 gage—0.0245 inch.

E-7b. Doors, when reinforced—No. 20 gage, 0.0368 inch.

E-7c. Doors, when flanged—No. 16 gage, 0.0613 inch.

F. METHOD OF SAMPLING, INSPECTION, AND TESTS

F-1. The manufacturer shall permit a representative of the Government at any time, to make inspections of all products during process of manufacture and such tests as may be necessary to ascertain that proper materials are being used. Final inspection will be made at point of delivery. All defective parts or articles shall be replaced by the manufacturer without cost to the purchaser.

G. PACKING AND MARKING

G-1. Articles when shipped from factory shall be so crated, packed, or wrapped, as to insure delivery in first-class condition. Packages shall be clearly marked. When intended for foreign delivery, packing shall be in accordance with rules of the Department of Commerce.

G-2. Shipping containers or packages shall be marked with the name of the material, the type and quantity contained therein, as defined by the contract or order under which shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

Lockers, which are usually simple to erect, are purchased more economically knocked down. The requirements as to assembling shall be stated by the purchaser.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SAFES; BURGLAR RESISTING, AA-S-71, NOVEMBER 11, 1930

BURGLAR-RESISTING SAFES

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, or parts thereof that are below indicated, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification	Former No.	Title	See
QQ-S-681	170	Steel castings (soft grade)....	611.41, p. 711.
QQ-B-691	172a	Bronze castings (grade No. 5)	646.41, p. 1252.
QQ-S-711	351a	Structural steel for bridges...	605.11, p. 251.

B. TYPES

B-1. The burglar-resisting safes covered by this specification shall be of the following types:

Type A.—Safes of this type shall offer resistance to edge-cutting tools, explosives, and heat destruction by the oxyacetylene torch or other heat devices.

Type B.—Safes of this type shall be the same as those of type A but having a higher degree of resistance to heat destruction by the oxyacetylene torch or other heat devices than that of type A.

C. MATERIAL AND WORKMANSHIP

C-1. General.—The material shall be of the best quality of the material specified. It shall be free from defects and imperfections which impair the appearance, burglar resistance, or usefulness of the safe.

C-2. Iron castings.—The iron castings shall be commercial cast iron.

C-3. Steel castings.—The steel castings shall comply with the requirements of Federal Specification QQ-S-681 (former No. 170) for steel castings, soft grade.

C-4. Structural steel.—The structural steel shall comply with Federal Specification QQ-S-711 (former No. 351a) for structural steel for bridges.

C-5. Machine steel.—The machine steel shall be commercial open-hearth steel.

C-6. Tool steel.—The tool steel shall be fine-grained, high-carbon crucible steel containing sufficient chromium to cause it to become glass hard, i. e., can not be penetrated with edge-cutting tools after it has been quenched from a high temperature in a large body of water at a temperature below 60° F.

C-7. Five-ply steel.—The 5-ply steel shall consist of two layers of tool steel and three layers of structural steel, arranged alternately. Each layer shall be uniform in thickness and the five layers welded

together, over their entire contact surfaces, by rolling under high pressure at a temperature sufficiently elevated for that purpose. Five-ply plates shall be uniform in thickness.

C-8. *Bronze.*—Bronze may be either bronze castings or rolled, drawn, or extruded bronze. The bronze castings shall comply with Federal Specification QQ-B-691 (former No. 172a) for bronze castings, grade No. 5. Rolled, drawn, or extruded bronze shall be of good commercial grade.

C-9. *Packing.*—The packing shall be nonabsorbent, acid proof, and fireproof.

C-10. *Workmanship.*—The workmanship on all parts of the safe shall be of the highest grade.

D. GENERAL REQUIREMENTS

D-1. *General.*—The construction of the walls and the door of the safe shall be what is known com-

D-3. *Intermediate layer.*—The intermediate layer, except on the back wall of the safe, shall consist of four splice plates to secure the door boxes to each other and a frame to reinforce the door jamb, made from rolled structural steel angles. The corners of the frame shall be solidly welded. Each splice plate shall be one piece, full width, between the frame and the inside of the rear box, and used over the joint between the two boxes. These plates, made from structural steel, shall be fitted closely into the space at the top and bottom and on both sides between the frame and the inside back of the safe.

D-4. *Inner layer.*—For type A the inner layer (plates and angles) of the safe body and of the outer door shall be cast iron. For type B the inner layer (plates and angles) of the safe body and of the outer door shall be cast-metal alloy or any material having a resistance to heat destruction by the oxy-acetylene torch or other heat devices of a greater

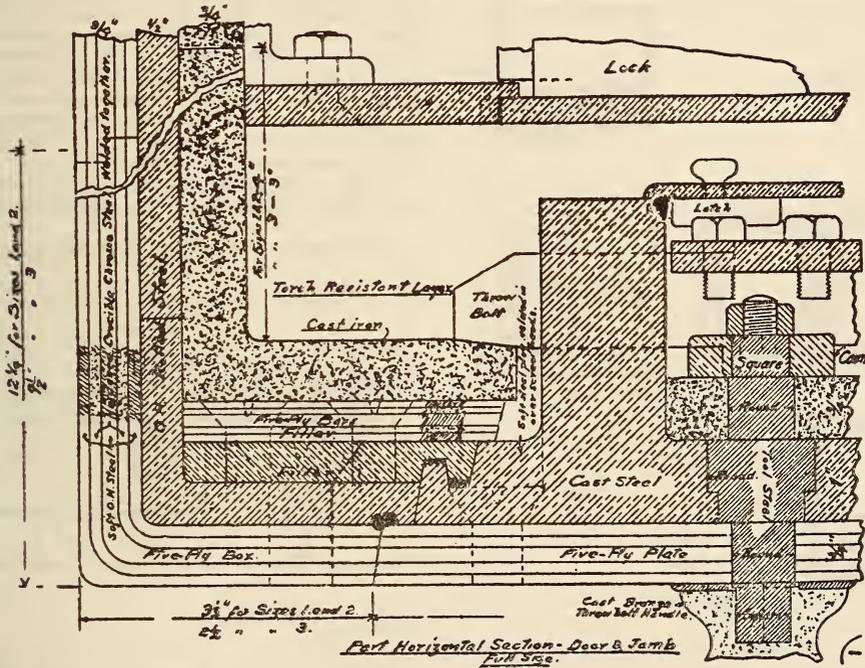

FIGURE 641

mercially as laminated. In this construction two or more separate layers of plates lie in close contact and are secured from within by countersunk flat-head machine screws. To prevent the introduction of liquid explosives into any space which may unavoidably be left between the layers, these spaces shall be filled completely with a self-hardening metallic cement.

D-2. *Outer layer.*—The outer layer of the body of the safe shall consist of six pieces only. The back and half of each side shall be formed from one piece. The ends of this U-shaped section shall be closed by fitting and welding in two plates, each of which will form half of the top and half of the bottom outer layer. The front and half of each side, top, and bottom shall be formed in the same manner. Each box section shall be made from 5-ply steel and have the ends welded in place before tempering. Each of the boxes formed shall have the edges of each side rebated and have the necessary holes for assembling screws drilled and tapped. The opening for the outer door of the safe shall be cut from the solid face of the box used as the front of the safe.

degree than that afforded by the material specified for type A, as measured by the tests hereinafter specified under section F-3.

D-4a. The inner layer shall consist of a frame, forming part of the door jamb, and machined-edge plates closely fitted on both sides, top, bottom, and back of the body of the safe. Each plate to be a single piece, full size, between the frame and inside face of back or sides and top and bottom of safe. The frame shall be made in the form of cast angles. The corners of the frame shall be mitered.

D-5. *Door jamb.*—The door jamb on the body of the safe shall be built up with fillers to the thickness necessary to form the stepping. These fillers shall be made from 5-ply and structural steel bars or plates.

D-6. *Safe door.*—The outer door of the safe shall be a steel casting forming the intermediate layer, with an outer and inner layer fastened to it. The intermediate layer casting shall have a rib integral with the casting around the top, bottom, and sides to form a continuous bolt frame. The width of this rib parallel to the face of the door shall not be less

than the diameter of the throw bolts, and the depth of the rib at right angles to the face shall not be less than two and one-half times the diameter of the throw bolts. The outer layer shall consist of a single plate of 5-ply steel. The inner layer shall consist of a single plate of material, as described under section C-4. The door may have rounded corners,

D-8b. The screws fastening the inner layer to the intermediate layer or to the outer layer at the back of the safe shall be one-half inch in diameter. The screws fastening the bars or plates (sec. C-5) used to "build up" the door jamb shall be one-half inch in diameter. They shall be driven from within, and the tapped holes in the intermediate layer shall extend through the plate or angle. The tapped holes in the back of the safe (outer layer) shall be "blind," i. e., they shall extend into the plate for three-fifths of its thickness.

D-9. *Screws for hinges and pressure bar.*—Each hinge bracket and each pressure-bar bracket shall be attached, at the proper location, to the front face of the safe body by two ½-inch screws through the intermediate layer and the outer layer, while the door brackets shall be attached by ½-inch studs, blind tapped into the outer layer of the door. The heads of all these screws shall be keyed to prevent back turnings, and their shanks shall extend through the outer layer, the hinge bracket, and into cylindrical nuts supplied with depressions for engaging a spanner wrench or screw driver. These depressions shall be filled, and the face of these blocks shall be smooth. Each hinge bracket and each pressure-bar bracket shall be counterbored for the cylindrical nuts, so that the outer surface of the nut is flush with the surface of the bracket.

D-10. *Stepping around door.*—The edge of the door and the jamb shall be stepped (or tongue and

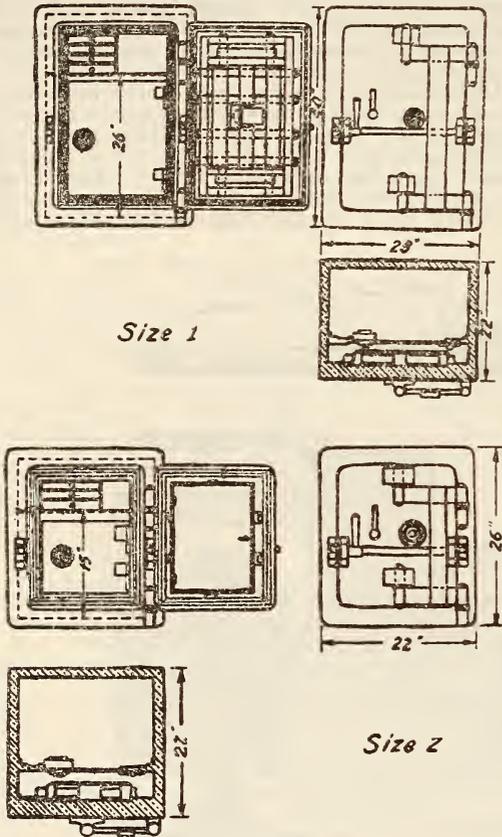

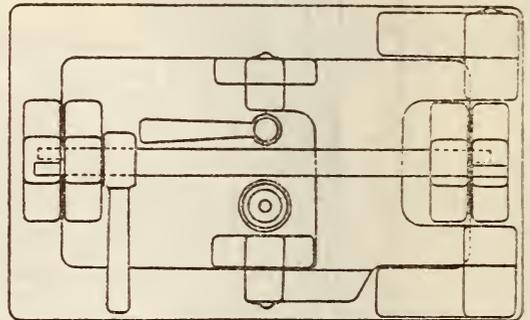

FIGURE 642

but they must fit snugly into the fillets in the door frame.

D-7. *Thickness of walls and of door.*—The top, bottom, and side walls of the body of the safe shall be not less than 2 inches thick. The back of the safe shall be not less than 1½ inches thick. The door jamb shall be not less than 3 inches thick. The outer door of the safe shall be not less than 2½ inches thick.

D-8. *Screws for body and door.*—The distance between screws shall be measured along lines perpendicular to the corners of the safe. The screws for securing one layer of the body of the safe to the next layer shall be spaced not less than 2 inches nor more than 6 inches from center to center of the screws, except that the screws fastening the intermediate layer (splice plates) at the top, bottom, and sides shall be 2 inches center to center of the screws. The distance from the center of a screw to the edge of a plate or of an angle shall not be less than 1 inch.

D-8a. The screws fastening the intermediate layer to the outer layer shall be of hardened 7-ply steel, three-fourths inch in diameter, except as shown in Figure 641. They shall be driven from within, and the tapped holes in the outer layer shall be through holes except in the back wall of the safe, where there is no intermediate layer.

Size 3

FIGURE 643

grooved), as shown in detail in Figure 641. The stepping on the door shall be machined from the steel casting and outer layer plate and be continuous around the edges of the door and jamb. Each step shall have the face (parallel to the face of the door) fitted so that the step on the door is in continuous surface contact with the step on the jamb.

D-10a. The beveled edges (surfaces at an angle to the face of the door) shall have no more clearance

than is necessary for operating the door, except that the tongue on the door shall bear, metal to metal, on the tongue on the jamb to prevent opening of the joint between the door and the jamb if wedges are used to introduce liquid explosive. The end of the tongue on the door and on the jamb shall be serrated.

D-11. *Recesses for packing.*—The recess in the door and in the jamb into which the serrated end of the tongue extends shall be suitable for packing. A recess shall also extend around the door at the inner angle of the first step on the jamb into which the inner corner of the first step on the door projects when the door is closed.

D-12. *Packing.*—In the completed safe the packing recesses shall be filled with a flat strip of packing which fits the recess tightly and is securely attached to the sides and bottom of the recess. When the door is fully closed the serrated tongues shall press heavily into the packing for its entire length.

D-12a. The recess in the first step shall have a round strip of packing calked into it which shall project so that the corner of the door, which shall be slightly chamfered, shall bear uniformly on the packing for its entire length at the same time that the face on the step on the door is in contact with the step on the jamb.

D-13. *Hardening of outer layer.*—After all machine work has been performed on the outer layer of the safe body and of the door, also the door jamb filler bars, these parts of the safe shall, before assembling, be hardened so that the tool-steel element therein becomes glass hard and can not be penetrated with edge-cutting tools. The tapped holes in these parts shall be filled with fire clay before hardening, and every care shall be taken to prevent injury to the threads while the parts are heated.

D-14. *Hinges.*—The door shall swing to the right of the entrance. The hinge shall be of the single-piece, gooseneck pattern, crane type. Each part of the hinge shall be large enough and have sufficient strength to carry the door without spring or sag. The hinge shall be made of cast steel. The hinge pins shall be tool steel, hardened and ground to size. They shall be of sufficient size to carry the weight of the door and shall fit their bearings closely. The end of each pin shall be covered by a suitable tip.

D-14a. Roller thrust bearings shall be provided on each bearing between the hinge arms and the jamb. These bearings shall consist of two hardened tool steel collars between which hardened tool steel rollers are fitted. Screws for adjusting the height of the door shall be provided in the arms at the hinge bearings on the door.

D-15. *Lock-bolt work.*—The safe outer door shall be fitted with a system of heavy, round lock-bolt work. This system shall consist of throw bolts, $1\frac{1}{4}$ inches in diameter, operating in the bolt frame, which is an integral part of the door casting and arranged in double-acting system. The throw bolts shall be cross connected and shall be operated from a common point. The ends of the bolts which project from the bolt frame shall be tapered. The number and the positions of the bolts are shown in Figures 642 and 643. The locking-bolt work shall be covered by a structural steel plate. This cover plate shall be attached to the door on one side by hinges and be provided with a thumb latch on the other side to hold it in the closed position. The bolt work shall be checked by a combination lock.

D-15a. The bolts shall seat in recesses on the inner face of the door jamb. These recesses shall be hand fitted to the taper of the locking throw bolts so that the bolts can only be thrown to their full travel when the door is fully seated; that is, the step on the door is in contact, metal to metal, with the step on the jamb. If the recesses are correctly fitted, the edge of the door will remain in

contact with the jamb after the pressure system is thrown off.

D-16. *Combination lock.*—The size of the combination lock shall not be less than $3\frac{1}{2}$ by $2\frac{1}{2}$ by $1\frac{3}{8}$ inches. It shall have four adjustable circular tumblers operated with a graduated dial handle in extension of the lock spindle. The dial shall rotate in a stop-mark ring and shall have its periphery uniformly graduated with short radial marks spaced not more than 3.6° apart, at least every tenth mark being numbered on the face of the dial (graduations from 0 to 20 may be omitted). The stop-mark ring shall be rigidly attached to the face of the door and shall bear upon its face two stop marks, one an upper mark at the top upon which to set up the combination for unlocking the safe door and another mark either to the right or left of the upper mark upon which to set up the combination for releasing the lock-case cover and also for inserting the changing key for the purpose of changing the combination numbers. The tumbler pin shall be a stud, shouldered and riveted into a hole, countersunk on the opposite side of the tumbler center. The sliding bolt shall be operated by a catch or drop lever, which is dependent only on the force of gravity for connection to the spindle. The combination lock shall be so placed in relation to the bolt work that the lock mechanism shall not be strained by the forces exerted by the throw bolts. The tumblers shall be of the key-changing type, and the inner and outer sections shall be held together by means of interlocking teeth.

D-16a. The cover of the lock case shall be locked on by the tumblers so that the combination must be set to the side mark on the dial ring before the cover can be removed. The escutcheon for the insertion of the key for changing the combination numbers must be located under the lock-case cover and can not be inserted into the tumblers except when combination has been set upon the side mark on the dial. This prevents changing or ascertaining of the numbers of the combination by an unauthorized person.

D-16b. The case of the combination lock with its gears, tumblers, and all internal parts shall be made of bronze, except the screws for attaching lock to door, which shall be of steel.

D-17. *Dials and bolt-throwing handle.*—The dials of the combination lock and the handle for throwing the bolts shall be made from bronze and be so connected with the mechanism on the inside of the door by shouldered spindles of such design and so placed in the door that they can neither be pulled out nor driven in. A heavy bar-bolt frame or bridge on the inner face of the door may be provided to prevent driving in of any spindle. This frame shall be fastened to the door by machine screws one-half inch in diameter. All spindles shall be hardened so that they can not be cut or penetrated with edge-cutting tools, and shall be fitted into the door so as to give a liquid-proof joint.

D-18. *Pressure bar.*—Each safe shall be provided with a pressure-bar system for forcing the safe door into contact with the jamb. The pressure bar, cams, and pins shall be one piece and shall be made from machinery steel. The pressure-bar brackets shall be steel. The sleeves shall be made from machinery steel and case-hardened. The pressure-bar handle shall be made from bronze.

D-19. *Finish of safe body and door.*—The entire interior metal surface of the safe, including the bolt frame and the plate on the door, but excluding steel contact surfaces, polished steel, and bronze parts shall be painted white.

D-19a. The exterior, including the crane hinge and the pressure-bar system with its brackets, shall be filled, rubbed to a smooth surface, finished in

black lacquer, and varnished. Striping shall be the only decoration permitted. Contact surfaces shall not be painted but shall be coated with petroleum jelly.

D-19b. In the center of the upper part of the door there shall be, in appropriate colors, the name of the bureau and the initials and emblem of the United States department for which the safe is ordered. Another inscription or emblem shall be substituted for the one described above, at the request of the purchaser.

D-20. *Finish of fittings.*—All bolt work on the interior of the door and the stepping on the safe (outer) door and the jamb shall be highly polished. The hinge tips, pressure bar, and handle, throw-bolt handle, and lock dial knob on the exterior of the door shall be triple nickel plated on copper ground. The face of the dial and rim shall be black lacquer, with the marks and figures incised in luminous (radium) paint.

D-21. *Lock-operating instruction.*—A copy of the manufacturer's instructions for operating and changing the lock combinations bearing the name and address of the manufacturer and the date of the contract shall be pasted to the inside face of the cover plate on the inside of the safe door so that the paper will not become detached. These instructions shall be printed on heavy white paper. They shall be so coated with waterproof varnish that the reading matter will remain perfectly legible.

E. DETAIL REQUIREMENTS

E-1. *Dimensions.*—The dimensions of the safe shall not be less than those given in Table 1 for the size ordered.

TABLE 1.—*Minimum dimensions of burglar-resisting safes*

Drawing No.	Height		Width		Depth	
	Out-side	Inside	Out-side	Inside	Out-side	Inside
Size 1, I and II.....	Inches 40	Inches 36	Inches 28	Inches 24	Inches 22	Inches 17½
Size 2, I and II.....	26	22	22	18	22	17½
Size 3, III.....	15	11	26	22	17	12½

Safes of size 1 and size 2 shall be fitted with sneak-proof compartment and drawer cabinet. Safes of size 3 shall not be fitted with sneak-proof compartment and drawer cabinet.

E-2. *Sneak-proof compartments.*—

E-2a. The sneak-proof compartment shall be formed by a front frame and a top of structural-steel plate. The top, which shall be put in place before the front frame, shall be one-fourth inch thick. The front frame may be formed of two or more pieces welded together after the front is in place in the safe. The door and front shall be one-half inch thick.

E-2b. The top and front shall fit snugly against the inside surface of the safe. They shall be attached to the safe by either lugs or ribs ¼ inch thick by 1½ inches wide. The top edge of the front shall fit snugly against the bottom surface of the top, and the joint shall be welded its full length.

E-2c. The inner door to the compartment shall be a single plate of structural steel. The edges shall be square (without stepping). The door-jamb edge of the front frame shall be machined around the opening to form one step, which shall have a depth equal to the thickness of the compartment door.

The edges of the door shall seat on this step without packing. The clearance between the edge of the door and the frame shall be no more than is necessary for the door to swing freely, allowing for the paint on the door and frame.

E-2d. This door shall swing to a position of 90° with the front frame and shall be as wide and as high as will permit it to take this position. On the edge of the door to which the hinges are attached there shall be two stationary back bolts, which shall prevent the door from being opened if the hinges are removed. These bolts shall be made from 3 by 3 by ¾ inch structural-steel plate. They shall be offset for the thickness of the frame and shall be attached to the door by rivets having countersunk heads flush with the outside surface of the door.

E-2e. The door shall be hung on center-pin, 5-knuckle, shutter-flap hinges. The hinges shall be made from bronze, except the pins, which shall be tool steel, hardened. The countersunk head machine screws shall be inserted from the inside of the door so that the heads are in the hinge flaps and the shanks are in tapped holes in the door and in the frame.

E-2f. The inner compartment door shall be secured with a combination lock having a size of not less than 3⅞ by 2⅞ by 1¼ inches. This lock shall be of the same pattern and material as hereinbefore described for the outer door, except that the lock shall have three key-changing tumblers instead of four.

E-3. *Cabinet.*—The space above the sneak-proof compartment shall be provided on the left-hand side with a cabinet of drawers made either from wood or metal, which shall be securely fastened to the safe. If the drawer case is made of wood, the wood shall be one-fourth inch thick and the drawer sides shall be dovetailed into front and back and bottom grooved into sides and nailed to back. Each drawer shall be furnished with a suitable type of drawer lock having duplicate keys. Each drawer shall be partitioned into compartments from side to side for United States paper money. These compartments shall have handholes. The drawers shall be fitted into a case and shall clear the outside door of the safe when withdrawn. There shall also be furnished with each safe a light, removable, wooden change tray which shall contain six cup depressions, one each for 1-cent, 5-cent, 10-cent, 25-cent, 50-cent, and \$1 silver pieces. This tray shall be of such size as to fit inside any of the drawers when partitions are removed. The cabinet, drawers, and change tray shall be neatly finished in clear varnish, rubbed down to a smooth surface.

F. METHOD OF SAMPLING, INSPECTION, AND TESTS

F-1. *Fit of safe (outer) door.*—White-lead paint shall be thinned with turpentine until it gives a thin continuous coating of white when spread on a metal surface. This liquid shall be used to coat all the edges of the safe (outer) door as thinly as possible. The door shall then be closed and locked. When opened the door jamb shall be examined, and if the white liquid has not been transferred to every portion of the jamb, the door and jamb have not come into continuous metal-to-metal contact. It is therefore not air-tight, and liquid explosive can be introduced if the packing is defective.

F-2. *Inspection.*—Unless otherwise stipulated in the invitation for proposals, inspection and tests will be made during the progress of the work at the shops of the manufacturer, who shall furnish all labor, tools, and material (test pieces) required for proof tests free of expense to the purchaser and conduct such tests in the manner to be directed by the duly authorized representative of the purchaser.

Tests shall be for the purpose of determining the quality of the material and the workmanship, as follows:

F-2a. *Quality of material.*—In addition to the drill tests for hardness of parts which the manufacturer should make for his own satisfaction, and oxyacetylene torch resisting property of the inner layer, tensile and ductility tests of cast steel, hardness of tempered tool steel and casehardened machine steel and fire and acid-proof quality of packing for grooves in door and jamb are to be made unless specifically waived in writing by the purchaser.

F-2b. *Workmanship.*—Workmanship shall cover in a careful manner the fitting of doors to jambs, lock and throw-bolt operating handle spindles, hinge pins, ball and roller bearings, throw-bolt bearings in frame and on jamb, connection of lock to throw bolt work, bearings of pressure-bar system, and general finish of machine work.

F-3. *Torch test.*—Type B only.

F-3a. The inspector shall select at random not fewer than 10 per cent of the plates for the inner layer of the safe before they are fastened into place in the safe. Each of these plates shall be tested to determine the resistance to the oxyacetylene cutting torch test and oxygen lance test (either one or both of the tests in the discretion of the inspector) in the following manner:

F-3b. The plate shall be placed in a vertical position, with its back at least 1 inch from the supports. The supports shall be fire brick or some similar non-conducting material. The supports may touch the back of the plate at not more than two places, and the area of the plate in contact with each of the supports at the back shall not be greater than 1 square inch.

F-3c. *Oxygen lance test.*—Each plate shall be attacked separately at any place on its surface selected by the inspector which is not less than 2 inches from the edge of the plate or holes therein. The attack shall be made by an oxygen lance consisting of a $\frac{1}{8}$ -inch steel pipe and a $\frac{3}{8}$ -inch-diameter steel rod. The pipe and the rod shall be held parallel and in contact, so that one end of the rod and one end of the pipe can be brought in contact with the plate. The other end of the pipe shall be connected to a tank containing not less than 100 cubic feet of oxygen. The pressure in the tank at the beginning of the test of any plate shall be not less than 1,100 pounds, and the pressure after the test is completed shall be not less than 200 pounds. The free end of the lance shall be placed close to the plate in a "well" formed by a $1\frac{1}{2}$ -inch-diameter perforation in the center of a block of fire clay, cast iron, or graphite. This block shall be not less than 6 by 6 by $1\frac{1}{2}$ inches and shall be clamped to the test plate.

F-3d. The free end of the lance for about $1\frac{1}{2}$ inches shall be brought to fusion temperature by an oxyacetylene welding torch. Oxygen shall then immediately be passed through the pipe under a pressure at the regulator on the oxygen tank of 50 pounds per square inch. The hose connecting the pipe and the oxygen tank shall not be longer than 25 feet, and the internal diameter shall not be less than one-fourth inch. The lance shall be kept in contact with the plate with a force not to exceed 5 pounds after the end of the lance has been heated by the welding torch. The end of the lance may be moved across the face of the plate as far as the "well" will permit. The end of the lance shall remain in contact with the portion of the plate within the "well" during this test until the plate has been perforated or until 50 cubic feet of oxygen has been consumed or the test has continued without interruption for five minutes. In any case the test shall then be discontinued and the plate examined. If the plate is penetrated to

a depth of one-half inch from the original surface where the attack was made, the plate shall be considered to have failed and no plates represented by the test specimen shall be used in the safe.

F-3e. *Cutting-torch test.*—Each plate shall be attacked separately at any place on its surface selected by the inspector which is not less than 2 inches from the edge of the plate or holes therein. The attack shall be made by an oxyacetylene cutting torch having at least four but not more than six preheating flames and having an oxygen outlet of approximately a No. 40 drill (0.098 inch in diameter).

F-3f. The torch shall be lighted and the pressure of the oxygen and of the acetylene shall be increased until the largest practicable neutral preheating flame is obtained. This flame shall be maintained as nearly as practicable throughout the test.

F-3g. The cutting torch, held with the longitudinal axis of the tip at a convenient angle with the plate, shall be used to melt the surface of the plate at the place selected by the inspector. The end of a fluxing rod shall be kept in contact or close proximity with the portion of the plate which is being tested. The fluxing rod shall be a steel rod three-eighths inch in diameter, 12 feet long. The amount of carbon in the fluxing rod shall not exceed 0.40 per cent.

F-3h. The test shall continue without interruption and without shifting to another place on the plate until the plate has been penetrated or until 9 feet of the fluxing rod have been consumed, when the torch and rod shall be removed and the plate be examined. If the plate is penetrated to a depth of one-half inch below the original surface of the plate, the plate shall be considered to have failed, and no plates represented by this test specimen shall be used in the safe.

G. PACKAGING, PACKING, AND MARKING

G-1. *Packaging and packing.*—Each safe with the combinations set in the unlocked positions shall be delivered at the destination named in the invitation for proposals in a substantial wooden crate, securely packed for reshipment.

G-2. *Marking.*—Shall be as follows:

G-2a. Each crate shall be marked with the number of the safe, size, type, contract number and date, and the name of the contractor.

G-2b. A copy of the manufacturer's instructions, inclosed in a substantial envelope appropriately marked, shall be securely attached to the inside of the crate in a conspicuous position.

I. NOTES

I-1. Type A safes are intended for use in places where the exposure to and likelihood of attack is a minimum, such as in United States Government department buildings, or other United States public buildings where a continuous (24-hour) watch service is provided, and on board of naval vessels in active commission.

I-2. Type B safes are intended for use in places where the exposure is maximum, such as United States public buildings remotely situated and without continuous watch service, at home or in foreign countries, navy yards, storage supply warehouses of the Army, Coast Guard Service, and the like.

I-3. This specification is not mandatory in the purchase of burglar-resisting safes of the special sizes and types required for use in vaults installed in Federal buildings erected under the supervision of the Supervising Architect and which are Federal property, nor to chests contained in insulated (fireproof) safes for use in leased post-office quarters.

I-4. It is believed that this specification adequately describes the characteristics necessary to secure the desired material and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples, with bids are necessary, they should be specifically asked for in the invitation for bids, and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

I-5. This specification governs all United States Government purchases of this commodity.

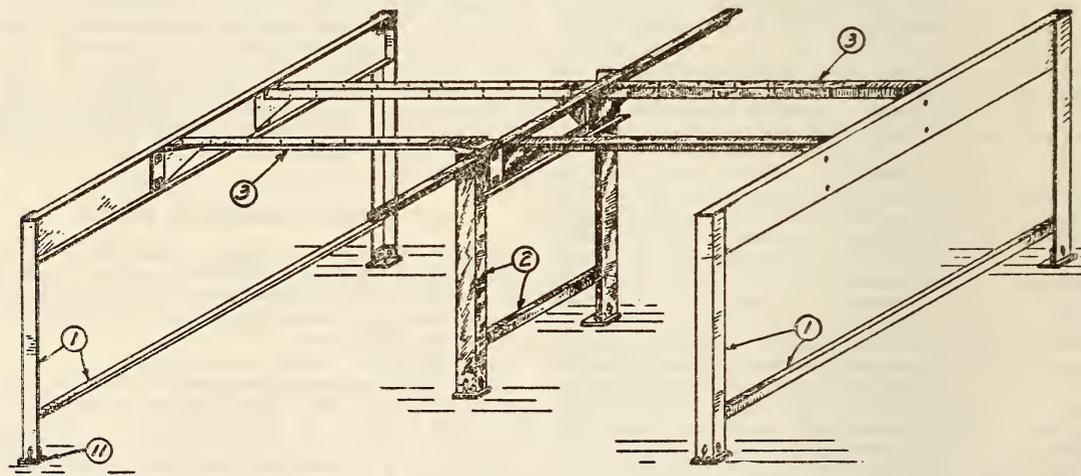

613.6 TABLES.

AMERICAN RAILWAY ASSOCIATION, TELEGRAPH AND TELEPHONE SECTION, SPECIFICATION FOR TELEGRAPH TABLE, 2-G-38, 1928

TELEGRAPH TABLE

PURPOSE

The purpose of this specification is to guide the seller or contractor in the manufacture of telegraph tables ARA-1-A for use in telegraph offices.

NOTE:—
INTERMEDIATE SECTION SHADED.

FIGURE 644.—Telegraph table ARA-1-A, assembly of steel framework

(The specification covers general items, number of units required for different lengths of table, material and workmanship, dimensions, finish, assembly, inspection, tests, packing, marking, and warranty. It is accompanied by 11 drawings, one of which is reproduced below, showing the assembly of steel framework. The metal requirements are as follows:)

MATERIAL AND WORKMANSHIP

Sheet steel.—The sheet-metal parts shall be mild steel, cold rolled and double annealed, free from buckle, and shall be roller leveled and pickled.

Angles.—The angles, bars, etc., used shall be Carnegie standard or equivalents.

Castings.—Castings shall be good quality gray cast iron.

Similar parts shall be identical in size so as to be strictly interchangeable.

FINISH

Metal parts that are to be framed shall be ground smooth. All metal parts shall be well cleaned and given a coat of durable mineral filler and painted, then given a coat of air drying olive F enamel. Finish is to be eggshell without gloss.

PACKING

Metal details shall be carefully wrapped in paper and so packed in substantial wood crates as to prevent damage to table during transit. Small details and screws shall be enclosed in a canvas sack securely nailed to the inside of the crate.

A detail list of loose pieces, containers and their contents shall be furnished for each shipment.

AMERICAN RAILWAY ASSOCIATION, TELEGRAPH AND TELEPHONE SECTION, SPECIFICATION FOR DISPATCHERS' TABLES ARA-1-A AND ARA-2-A, 2-G-39, 1928

DISPATCHERS' TABLES

PURPOSE

The purpose of this specification is to guide the seller or contractor in the manufacture of single

position dispatcher's table ARA-1-A and double position dispatcher's table ARA-2-A.

(This specification covers general items, material, manufacture, dimensions, finish, inspection, tests, packing, marking, and warranty. The metal requirements are as follows:)

MATERIAL

Except where otherwise stated, all steel is to be the best mild cold-rolled, pickled, double annealed, and patent leveled, free from scales and buckle. The plates used on exposed parts to be the particular special grade known as metallic furniture stock. Framing parts are to be built of rolled or formed shapes of mild steel. Drawer pulls, door handles and binding for linoleum top shall be of bronze. Footings for legs shall be bronze plated. Yale (or equivalent) paracentric locks shall be fitted in all drawer heads.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR LAUNDRY APPLIANCES, OO-L-131, APRIL 28, 1931

(Various types of laundry appliances are covered in above specification, of which the following requirements are applicable to laundry tables and to starch tables.)

LAUNDRY TABLES

There are no other Federal specifications applicable to this specification.

Household types of laundry appliances are not covered by this specification.

DETAIL REQUIREMENTS

Laundry Tables

Laundry tables shall have tops of approximately the following sizes—3 by 8 feet, 3 by 10 feet, 3 by 12 feet.

The table top shall be of not less than 1½-inch nonresinous, nonwarping white wood, thoroughly seasoned and dressed.

The top shall be smooth and constructed so as to prevent opening of the seams.

The table top shall be supported on cast-iron legs about 2 feet 9 inches high.

Tables shall have at least three legs, except those less than 10 feet long, which shall have at least two legs. The legs shall be shaped so as to insure stability of the table and be well secured to the table top.

If required, tables shall be suitable for mounting a seam dampener, collar shaper, and collar former and edger.

Starch Table

Starch tables shall have a top approximately 4 feet long by 2 feet 8 inches wide.

The top shall be made in accordance with one of the following methods:

Nonresinous, nonwarping white wood, thoroughly seasoned, not less than 1½ inches thick, and covered with zinc, tinned copper or an approved nickel-copper or other noncorrodible alloy.

Iron or steel coated with white porcelain fused on. The top shall be supported by at least two rigid iron or steel legs.

METHODS OF SAMPLING, INSPECTION, AND TESTS

Laundry appliances shall be inspected and tested to determine compliance with this specification.

613.7 FILING FURNITURE.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FURNITURE AND CABINETS; OFFICE, SECTIONAL, STEEL, AA-F-791, NOVEMBER 11, 1930

SECTIONAL FURNITURE AND CABINETS

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPE

B-1. This specification includes steel sectional office furniture, including small sections, horizontal sections, upright sections and cabinets, card filing.

C. MATERIAL AND WORKMANSHIP

C-1. All sheet steel shall be of the quality and grade known as first-grade metallic furniture steel. All workmanship shall be the best known to the trade; all materials shall be the best of the kind specified.

D. GENERAL REQUIREMENTS

D-1. The technical terms herein employed shall be interpreted in accordance with the highest and best known standards of actual commercial practice in the art of high-grade furniture construction and design.

D-2. All sections shall intermember with, and match in size, exterior appearance and design, the standard sections adopted by the General Supply Committee.

D-3. *Finish.*—

D-3a. All metal surfaces shall be thoroughly cleaned and free from dirt, oil, grease, and moisture, before applying the finish.

D-3b. After a thoroughly reliable priming coat and filler, where necessary, the color coats shall be sufficient when properly baked so that in connection with the varnish, a surface guarantee not to crack or spall under severe usage will be produced. Each coat to be baked and rubbed down separately. All exposed surfaces to receive a final varnish rubbing to a satin finish. Final colors shall match the standard colors adopted by the General Supply Committee.

D-3c. In addition to the above requirements, whenever especially called for in the purchase specifications to take care of tropical climatic conditions, all small bolts, nuts, screws, small levers, rods, guides or similar parts, shall be made of brass or galvanized steel. All other parts shall be treated with a rust-resistant alloy or tern coating. The tern coating shall be done after the fabrication. Bidder shall give a complete description of the methods he proposes to use in applying the rust-resistant coating and enamel in order to prevent the coating and enamel from flaking or chipping off.

D-4. *Hardware.*—

D-4a. Pulls, label holders, rod heads, and door knobs are to be solid cast bronze, brush finish. The mixture of metals for the bronze shall consist of 88 per cent copper, 10 per cent tin, and 2 per cent zinc.

D-5. *Drawer suspensions.*—

All vertical file drawers such as letter, legal and bill sizes and similar drawers with subdivisions, space permitting, shall be fitted with side-arm suspensions slides. Where the width of the cabinet will not permit the use of side-arm slides, bottom extension slides shall be used of the type known as progressive drawer slides. The steel used for the side-arm slides, for the housing in which the slides operate and for the runner attached to the drawers, shall be made rust resistant by electric galvanizing, nickel-plating, or by other equally effective process and not lighter than No. 16 gage. The slides shall travel easily and smoothly with the drawer and the mechanism shall be sufficiently strong to sustain the weight of the drawer when loaded to capacity, and fully open. All slide rollers shall have at least ¼-inch bearing surface and be accurately lathe-turned from drawn screw stock, not stamped or formed rollers will be permitted. Slides with traveling rollers or fixed rollers with ball bearings are preferred, but other methods will be considered. Special note will be made of the method of assembling the rollers and roller housings or retainers to the slide arm. Assembling of these parts shall be by solid or tubular riveting. Vertical file drawers more than 16 inches in width and 10 inches in height shall be fitted with two pairs of extension slides.

D-6. Vertical file drawers shall be equipped with suitable stops to relieve the shock and deaden the noise of opening and closing the drawers and to prevent the drawers from dropping out when opened, but the stops must be so constructed that the drawers may be readily removed and replaced. Drawers shall not be permitted to stop against the back of the files.

D-7. All card index and vertical file drawers shall be fitted with compressors of approved type. The compressors shall have strong, positive grips and shall be capable of easy adjustment. Vertical file compressors shall be removable and shall not operate upon the countersunk guide rod.

E. DETAIL REQUIREMENTS

E-1. *Small sections and horizontal sections.*—

E-1a. *Outside dimensions.*—Sixteen and one-half and thirty-three inches wide by 17 and 25 inches deep. These sections to advance in height in multiples of 6½ inches. The steel used in the manufacture of the various parts shall not be less than the gage specified below:

	No.	Inch
End.....	18	0.0490
Back.....	20	.0368
Top.....	20	.0368
Bottom.....	20	.0368
Partition, front.....	18	.0490
Partition, side.....	24	.0245
End lining.....	24	.0245
Card index drawer front.....	20	.0368
Vertical file drawer front.....	18	.0490
Card index drawer body.....	24	.0245
Vertical file drawer body.....	20	.0368
Shelf.....	20	.0368
Top section.....	18	.0490
Base frame.....	18	.0490
Base leg.....	18	.0490

E-1b. *Construction.*—Assembling shall be by electric spot welding. Tops and bottoms shall be welded to the flanges of the ends and back with spots not more than 3 inches apart. All sections shall have vertical and horizontal partitions between drawers. Partitions, where space permits, and ends and drawer fronts, shall be double-wall construction. The four front corners as well as the four back corners of the sections shall be joined by acetylene or arc welding for the purpose of strengthening and giving the sections a finished appearance. All surplus metal shall be filed off and sanded smooth. Top and bottom of section shall be tied together by wire brace rods or a similar device to prevent spreading. Sections shall be assembled so that spot welds shall not show on exposed portions. All drawer fronts shall be assembled by welding directly to the drawer body. Sections shall be fitted with interlocking device which shall prevent tilting of the sections when the loaded drawers are extended. Ends and backs of sections shall be smooth and flush and the raw edges of steel shall not protrude.

E-1c. All top sections shall be 2¼ inches high and base sections 9 inches or 16 inches high.

E-1d. All card index and box drawers shall be made with bail suspension, so that the drawers can be readily removed.

E-2. *Bookcase sections with disappearing glass panel doors.*—

E-2a. Outside dimensions shall be 33 inches wide by 13 inches deep by 12¾, 14¾, 16¾, or 18¾ inches high. Inside dimensions in the clear, when door is opened, shall be not less than 31 inches wide by 10½ inches deep by 9½, 11½, 14, or 16 inches high. Bookcase sections without doors shall have same outside dimensions and inside dimensions except

that the inside heights shall be 11, 13, 15, or 17 inches and the depth 12 inches.

E-2b. Construction shall be the same as for small and horizontal sections.

E-3. *Upright sections.*—

E-3a. Outside dimensions 52¾ inches high by 25 inches deep by such width as may be required. These sections shall be so constructed that the detachable leg bases 4¾ inches high may be attached, bringing the total height to 57 inches.

E-3b. The steel used in the manufacture of upright sections shall not be less than the gage specified below:

	No.	Inch		No.	Inch
End.....	18	0.0490	Shelf.....	18	0.0490
Back.....	18	.0490	Drawer body.....	20	.0368
Top.....	18	.0490	Drawer front.....	18	.0490
Bottom.....	18	.0490			

E-3c. Assembly shall be by electric spot welding or lock joints reinforced where necessary by acetylene or arc welding to insure strength and rigidity. Sections shall have shelves between drawers. Flanges of shelves shall be spot welded to the ends of the cabinets. Drawer fronts shall be spot welded directly to the drawer bodies. No spot welds are to appear on exposed portions of cabinet. Distance between spot welds shall not be more than 4 inches. Double-wall construction shall be used for drawer fronts. The four front and four back outside corners shall be acetylene or arc welded to prevent opening of joints. The two front top corners shall be reinforced by steel angles running from front to rear welded into position and reinforced by acetylene or arc welding.

E-3d. Double compartment card index drawers in upright sections shall have side slide suspensions, single drawers, bail suspension.

E-4. *Card index cabinets.*—

E-4a. Outside depths shall be either 12 inches or 16 inches.

E-4b. The steel used in the manufacture of the various parts shall not be less than the gage listed below:

	No.	Inch		No.	Inch
End.....	20	0.0368	Partition side.....	24	0.0245
Top.....	20	.0368	Drawer front.....	20	.0368
Bottom.....	20	.0368	Drawer body.....	24	.0245
Back.....	20	.0368	End lining.....	24	.0245
Partition front.....	20	.0368	False bottom.....	20	.0368

E-4c. Assembly shall be by electric spot welding reinforced where necessary by acetylene or arc welding to insure strength and rigidity. The distance between spot welding shall not be more than 4 inches. Cabinets shall have shelves between drawers. Flanges of shelves shall be spot welded to the ends of the cabinets. Drawer fronts shall be spot welded direct to the drawer bodies. No spot welds shall appear on exposed portions of cabinets. All four corners, both front and rear, shall be acetylene or arc welded to prevent opening of joints. Double-wall construction shall be used for drawer fronts.

E-4d. Double compartment card index drawers in the upright sections shall have side slide suspensions; single drawers, bail suspensions.

F. METHOD OF INSPECTION AND TESTS

F-1. The articles may be inspected at the factory, by a representative of the purchaser, at any time

during process of manufacture. The purpose of this factory inspection being to determine compliance with the terms of the specification as to workmanship, material, details of construction, hardware, and finish. Final inspection will also be made at point of delivery.

G. PACKING AND MARKING

G-1. *Packing*.—Unless otherwise specified, the subject commodity shall be delivered in standard commercial containers, for safe transportation, at the lowest rate, to the point of delivery.

G-2. *Marking*.—Each article shall be clearly marked in an inconspicuous place with the name of the manufacturer.

G-2a. Unless otherwise specified, shipping containers shall be marked with the name of the material, the size, type, and the quantity contained therein, as defined by the contract or order under which the shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. Purchasers should exercise all options offered herein and should specify type, grade, class, etc., required.

I-2. It is believed that this specification adequately describes the characteristics necessary to secure the desired material and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids, and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

I-3. This specification governs all United States Government purchases of this commodity.

613.9 MISCELLANEOUS METAL FURNITURE AND FIXTURES.

NATIONAL BOARD OF FIRE UNDERWRITERS, CONTAINERS FOR STORING AND HANDLING FLAMMABLE LIQUIDS, 1927

STORAGE CABINETS

Storage cabinets may be used where it is desired to keep more than 10 gallons of oils, varnishes, lacquers, or similar materials inside buildings, no individual container to exceed 5 gallons capacity. Not over 50 gallons should be stored in any one cabinet. Such cabinets shall be of construction conforming with or equivalent in fire resistance to the following requirements:

Bottom, top, and sides of cabinet shall be made of sheet iron at least No. 18 gage in thickness and double walled with 1½-inch air space. Joints shall be riveted or made tight by some equally efficient means. Doors shall be of construction equivalent to walls, provided with 3-point lock, and kept closed when not in use; door sill shall be raised at least 2 inches above bottom of cabinet. Cabinet shall be conspicuously labeled in red letters, "Flammable, Keep Fire Away."

NOTE.—When deemed necessary, cabinets shall be vented. Volatile flammable liquids shall be kept in metal safety cans, or other approved metal containers.

614.1 COAL STOVES AND RANGE BOILERS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR RANGE BOILERS AND EXPANSION TANKS, R8-29, NOVEMBER 1, 1929

RANGE BOILERS AND EXPANSION TANKS

(Simplified practice recommended and adopted by industry establishing a limited list of standard sizes and capacities.)

TABLE 1.—Range boilers

Size			Size		
Diameter ¹	Length ²	Capacity	Diameter ¹	Length ²	Capacity
12	36	18	18	60	66
12	48	24	20	60	82
12	60	30	22	60	100
14	48	32	24	60	120
14	60	40	24	72	144
16	48	42	24	96	192
16	60	52			

¹ Diameters refer to inside measurements.
² Lengths mean lengths of sheet, not over-all lengths of boilers.

NOTES.—Working pressure.—Range boilers may be made in two classes—"standard" 85 pounds working pressure and "extra heavy" 150 pounds working pressure.

Four side tappings.—The revision conference of April 18, 1928, felt that at this time the demand for range boilers with four side tappings is not sufficient to warrant inclusion in the simplified-practice recommendation. However, in deference to a resolution of the National Association of Master Plumbers, it is recommended that when orders are accepted for range boilers with four tappings, such tappings shall be placed in line in the side at 6, 18, and 26 inches from the bottom and 6 inches from the top.

It is further recommended that—

1. Range boilers have one side tapping 6 inches from the top and one 6 inches up from the bottom (measurements to be made from the edge of the shell plate), and two tappings in the top and one in the bottom. All tappings to be 1 inch (½-inch top and the ¼-inch side and bottom tappings on vertical boilers to be eliminated).

2. Five 1-inch openings to be considered as standard for horizontal boilers.

3. The 16 by 48 inch boiler be designated by its actual capacity (viz, 42 gallons), in lieu of "No. 18," to avoid confusion with the 18-gallon boiler.

4. All range boilers and combination boiler and gas water heaters be rated by their actual water capacities in gallons.

TABLE 2.—Expansion tanks

Size			Size		
Diameter	Length	Capacity	Diameter	Length	Capacity
12	20	10	16	30	26
12	30	15	16	36	32
14	30	20	16	48	42

NOTE.—Gage glass tappings to be 13¼ inches between centers to provide for exposure of 12 inches of vertical gage glass.

614.2 GAS STOVES, RANGES, AND WATER HEATERS.

AMERICAN GAS ASSOCIATION, APPROVAL REQUIREMENTS FOR GAS RANGES, MARCH 1, 1930

GAS RANGES

CONSTRUCTION REQUIREMENTS

Notes

1. Unless otherwise specified, all gages are U. S. standard.

2. The terms steel and iron are used interchangeably in these requirements. Either steel or iron is considered satisfactory.

Section 1. Sheet Metal

(a) No sheet-metal parts shall be less than No. 24 gage excepting rack supports, top back strip, and finishing strips, which may be No. 26 gage.

(b) Gage of enameled parts shall be not less than that herein specified for such parts.

Section 2. Front Frame and Top Frame

(a) All ranges shall be equipped with front and top frames. The top frame shall extend on all four sides of the cooking top.

(b) If made of cast iron, no part of frame must have a cross-sectional area less than one-fourth square inch.

(c) If made of angle iron, no part of frame must have a cross-sectional area less than one-eighth square inch.

(d) If made of sheet steel, frame must not be less than No. 18 gage and no part must have a cross-sectional area less than one-eighth square inch.

(e) When any other material is used, the strength of the part shall be at least equivalent to that specified for cast iron in (b), or for structural iron in (c) and (d) above.

(f) Band iron or other structural steel shapes shall have joints securely riveted or welded or bolted.

(g) Cast frames, when not cast in one piece, shall have joints securely fastened to give effectively a 1-piece construction.

Section 3. Base

(a) All ranges shall be equipped with a base.

(b) Bases extending around only the two sides and back of a range shall be of 1-piece construction with ends securely bolted to front frame, but in such cases no side shall be longer than 24 inches.

(c) Band iron, angle iron, or other structural steel shapes shall have joints securely riveted or welded.

(d) Sheet iron, when used, shall be not less than No. 18 gage and edges shall be reinforced, as by folding.

(e) Bases shall be strong enough to withstand without permanent vertical or horizontal deflection, as measured at the center of the long sides, an added weight of 300 pounds when applied for a period of five minutes. Application of load shall be made over a width of 8 inches and a depth of approximately that of cooking top. For cabinet ranges, the load is to be placed on inside half of cooking top, alongside of ovens; for other types of ranges it is to be placed in the middle of the cooking top, or in special cases as close to the middle as conditions permit.

Section 4. Oven and Broiler Tops

(a) The outside part of the tops of ovens on elevated and cabinet types of ranges, if of sheet metal, shall be not less than No. 20 gage.

Section 5. Oven and Broiler Linings

(a) Ovens and broilers shall be furnished with linings at sides and back to either (1) provide air-space insulation, or (2) inclose solid insulation.

(b) Where linings are used for air-space insulation solely there shall be not less than one-fourth inch noncirculating air space.

(c) Where the back space is used for flue purposes, there is to be not less than one-half inch space.

(d) Oven shall be furnished with a top lining, providing not less than one-half inch space.

(The full text of these approval requirements on construction of ovens includes requirements on removability and gage thickness of linings, structural requirements and thickness requirements for some of the sheet-metal parts for burner box and burner box lining, oven bottoms, extreme bottoms and broiler bottoms, rack supports, flue collars, doors, legs, bolts and screw sizes, open top grates, closed (solid) tops, end shelves, top and simmering burners, oven and broiler burners, oven-burner supports, lighters, mixer heads, air shutters, cocks, manifolds, burner trays, oven racks and broiler pans, solid insulation, air supply to elevated ovens, removal of piping on cabinet ranges, oven thermostats and their pilots, and assembly and name-plate requirements.)

PERFORMANCE REQUIREMENTS

Test Gases

In conducting the performance tests specified herein, gases with characteristics approximately as follows shall be used:

	Heating value (B. t. u. per cubic foot)	Specific gravity (air=1.0)
Gas A (natural gas).....	1,135	0.65
Gas B (manufactured gas).....	535	.38
Gas C (manufactured gas).....	400	.70

Pressures

(a) Normal pressures specified herein shall be 3.5 inches equivalent water column for gases B and C, and 7.0 inches equivalent water column for gas A.

(b) Unless otherwise stated, each test specified herein shall consist of a series of three tests: One made at normal pressure, on which the adjustment of air shutters shall be made without change in adjustment, one at 0.5 normal gas pressure, and one at 1.25 normal gas pressure.

Burner Capacities

(a) The gas-burning capacities of range burners shall be as follows:

Separate simmering burner, not less than 1,800 B. t. u. per hour.

Regular top burner, not less than 9,000 B. t. u. per hour.

Giant top burner, not less than 12,000 B. t. u. per hour.

Oven burner, not less than 8,000 B. t. u. per hour per cubic foot of oven space, when oven space does not exceed 2.4 cubic feet. For ovens larger than 2.4 cubic feet oven space, the manufacturer to furnish B. t. u. rating.

Broiler burner, not less than 140 B. t. u. per hour per square inch of broiling area.

Oven Heating Capacity

The capacity of all oven-burner controls shall be such that the oven temperature will reach 500° F. within 20 minutes.

Capacities at Low Pressure

All burners shall have sufficient capacity to burn gas at rates specified above when using gas A at 4 inches pressure and gas B at 2 inches pressure.

Burner Operating Characteristics

All burners shall fulfill the following requirements throughout a range of gas pressures from 1.25 normal to 0.5 normal with the same adjustment of the air shutter as provided for the normal pressure.

(a) Burners must not flash back upon immediate ignition, 2 to 20 seconds delayed ignition, or turning the gas cock until the gas supply is one fifth of the full supply at the test pressure.

(b) Burners shall ignite completely and without hesitation. In the case of top burners, this observation to be made with 7½-inch diameter (bottom) utensils over the burners.

(c) Burners shall operate without carbonizing flames. This observation to be made with 7½-inch diameter (bottom) utensils over the top burners.

(d) Burners shall extinguish without undue noise.

(e) Burners must not produce a back pressure in the mixers, causing a leakage of gas through the air inlets when consuming gas at a pressure 1.25 normal, nor at a pressure only high enough to support combustion at the ports.

Fire Hazard

The maximum temperature at points 6 inches from the back and sides of a gas range and on the floor under the range shall be not more than 90° F. in excess of the room temperature.

Flue Gas Analysis

A gas range shall produce no carbon monoxide. This requirement shall be deemed met when a concentration not in excess of 0.01 per cent is produced in a room of 1,000 cubic feet content with 4 air changes occurring during the combustion of an amount of gas liberating 60,000 B. t. u.

Oven Heat Distribution

The heat distribution in the oven shall be so uniform that biscuits distributed in the oven, heated to 450° F., will be evenly browned in not more than 20 minutes.

Broiler Heat Distribution

The heat distribution in the broiler shall be uniform. This requirement shall be deemed met when bread, covering entire broiling area, will be toasted to an even brown in not more than 10 minutes.

Relief for Explosion

The oven doors shall open when a pulling force of 50 pounds is applied at each door handle in a direction which is normal to the plane of the door.

Top Burner Thermal Efficiency

The thermal efficiency of gas range top burners shall be not less than 30 per cent.

Air Shutters

The air-gas ratio of the mixture in any gas range burner shall be not greater than 1.1, with the air shutter in the completely closed position when operating on gas B at the rated burner capacity.

(Other performance requirements given in the full text of these approval requirements for ranges using natural and manufactured gas, include performance requirements for lighters, adjustable orifices, oven thermostats, absence of leakage, rust-resisting oven interiors, test requirements for coated sheet steel, safety devices to prevent escape of unburned gas, temperature rise limits for gas-cock bodies, time clocks, and oven and broiler tops.)

(The full text of these approval requirements includes methods of test for determining if the performance requirements are met.)

(In addition to the above requirements for ranges using natural and manufactured gases, the full text of these approval requirements includes performance requirements for ranges using propane gas and for ranges using butane-air gas.)

AMERICAN GAS ASSOCIATION, APPROVAL REQUIREMENTS FOR GAS WATER HEATERS, SEPTEMBER 1, 1931

GAS WATER HEATERS

(The full text of these approval requirements contains construction requirements for gas water heaters including security and removability of burners, protection of pilot flames, construction of gas cocks, flue collars, draft hoods, and relief valves, provision of means independent of automatic devices for shutting off pilot and main gas supply, and a recommendation that automatic water heaters be equipped with a safety device to prevent escape of unburned gas.)

PERFORMANCE REQUIREMENTS

(Performance requirements are specified under the same test gas characteristics and pressures as given in the A. G. A. performance requirements for gas ranges, above.)

BURNER OPERATION

A water heater shall produce no carbon monoxide. This requirement shall be deemed met when a concentration of carbon monoxide not in excess of 0.02 per cent is present in the air-free products of combustion, when tested in a room with approximately a normal oxygen supply at gas pressures of normal, 50 per cent below normal, and 25 per cent above normal, and not in excess of 0.04 per cent when tested at a gas pressure of 50 per cent above normal.

GAS COCKS

Gas cocks shall show no evidence of leakage when subjected to an air pressure of 6.0 inches mercury column for one minute.

Gas cocks shall pass sufficient quantities of 500 B. t. u., 0.6 specific gravity gas to supply the manufacturer's B. t. u. input rating with a pressure drop through the cock not in excess of 0.5 inch water column.

THERMAL EFFICIENCY

The corrected thermal efficiency of all gas water heaters shall be not less than 65 per cent.

FIRE HAZARD

The maximum rise above room temperature, when the heater has been operated for one hour from a cold start at a gas pressure of 1.5 normal, shall not exceed 90° F. at points 6 inches from the nearest part of the heater jacket or flue and on the floor under the heater.

The maximum temperature of the products of combustion at the flue collar shall be not more than 550° F. during any test.

OTHER REQUIREMENTS

(The full text of the approval requirements includes performance requirements for pilot flame, water pressure relief valves, water temperature limiting devices, safety devices to prevent escape of unburned gas, thermostatic control, gas pressure regulators, draft hoods, and accuracy of capacity rating.)

(Prescribed methods of test are also included in the full text of these requirements for determining whether the device meets the above performance requirements. Methods are also prescribed for determining heat losses from storage vessels, and stand-by loss for automatic combination heaters and water storage vessels, Type 4-A-2, insulated.)

AMERICAN GAS ASSOCIATION, APPROVAL REQUIREMENTS FOR HOT PLATES AND LAUNDRY STOVES, 1929

HOT PLATES AND LAUNDRY STOVES

CONSTRUCTION REQUIREMENTS

(These approval requirements include structural requirements for burners, mixer heads, air shutters, cocks, manifolds, leg sheets and burner trays, and hose end nozzles. Materials and construction requirements for the body are given below.)

Unless otherwise specified, all gages are U. S. standard.

The terms steel and iron are used interchangeably in these requirements, either steel or iron is considered satisfactory.

TOP FRAMES

One-burner hot plates.—(a) If made of sheet steel, frames must not be less than No. 18 gage.

Two or more burner hot plates and laundry stoves.—(b) If made of cast iron, no part of frame must have a cross-sectional area less than one-fourth square inch.

(c) If made of angle iron, no part of frame must have a cross-sectional area less than one-eighth square inch.

(d) If made of sheet steel, frame must not be less than No. 18 gage, and no part must have a cross-sectional area less than one-eighth square inch.

(e) When any other material is used, the strength of the part shall be at least equivalent to that specified for cast iron in (b) or for structural iron in (c) and (d) above.

All hot plates and laundry stoves.—(f) Band iron or other structural steel shapes shall have joints securely riveted, welded, or bolted.

(g) Cast frames, when not cast in one piece, shall have joints securely fastened to give effectively a 1-piece construction.

BURNER BOXES

Sheet steel burner boxes, when used, shall have a rust-resisting finish. Painted, japanned, and enameled burner boxes shall meet the tests prescribed under performance requirements.

LEGS

(a) Legs, if detachable, shall be interchangeable and rigidly held in place.

(b) Sheet steel legs shall be of at least No. 18 gage.

BOLTS

(a) No bolts or screws shall be used in the general assembly of hot plates or laundry stoves excepting those having stove bolt threads. It is strongly urged that the following thread dimensions be used:

Nominal diameter	Actual diameter	Threads per inch
<i>Inch</i> 3/16	<i>Inch</i> 0.195	24
1/4	.250	18
5/16	.312	18
3/8	.375	16

(b) No bolts smaller than three-sixteenths inch shall be used (bolts for attaching name and number plates excepted).

(c) In general, through bolts with nuts shall be used throughout. Where tap bolts are used to attach air shutters and manifold supports, they are to be of rust-resisting material, or if of steel, to have a metallic rust-resisting coating.

(d) Where tap screws are used for attaching manifold supports, they are to be not less than one-fourth inch size.

OPEN GRATES

(Includes requirements on beveling of edges, interchangeability of grates, detachability, prevention of inversion of grates, and the following requirements:)

The top surface shall be raised at least five thirty-seconds inch above the level of the top frame.

Design of grate arms shall be such that they will support a utensil of 3½-inch diameter or greater when placed centrally over a burner.

PERFORMANCE REQUIREMENTS

General.—Normal pressure hereinafter specified shall be 3½ inches for manufactured gas and 7 inches for natural gas.

Burner capacities.—The gas-burning capacities of hot plates and laundry stove burners shall be as follows:

	B. t. u. per hour
Regular burner, not less than.....	9,000
Giant burner, not less than.....	12,000

Capacities at low pressure.—All burners shall have sufficient capacity to burn gas at the rates specified above when using natural gas at 4 inches pressure and coke-oven gas at 2 inches pressure.

Burner operating characteristics.—(These requirements are the same as given above in the A. G. A. approval requirements for gas ovens with the exception of the requirement for operation without carbonizing flames, which is as given herewith.)

Burners shall operate without carbonizing flames. This observation is to be made with a 7½-inch diameter (bottom) utensil over the burner in the case of a single-burner hot plate and with a No. 9 round-end wash boiler (22 by 12 inches on bottom) placed centrally over any two adjacent burners of a hot plate having two or more burners, or of a laundry stove.

Fire hazard, flue gas analysis, burner thermal efficiency.—(Requirements are the same as those given under similar headings in the performance requirements of the A. G. A. for gas ovens given above.)

(Other performance requirements included in the full text of these approval requirements cover lighters, adjustable orifices and cocks, absence of leakage, test requirements for coated sheet steel. Methods of test are also given for determining if performance requirements are met.)

AMERICAN GAS ASSOCIATION, APPROVAL REQUIREMENTS FOR SPACE HEATERS, DECEMBER 1, 1931

GAS-BURNING ROOM HEATER

CONSTRUCTION REQUIREMENTS

(These approval requirements include structural requirements for burners, air shutters, pilots, sizes and construction of cocks, manifolds, gas connections, flue outlets, and hose and nozzles. Materials and construction of body are as given below.)

MATERIALS AND CONSTRUCTION

(a) The construction of the body shall be substantial to the extent that it will support without damage the following weight applied uniformly over the top:

150 pounds for heaters weighing up to 50 pounds.
300 pounds for heaters weighing 50 pounds and over.

(b) A heater shall be solidly supported so that it can not be tipped by any reasonable pressure or pull.

METHOD OF TEST

For all heaters weighing up to 100 pounds, the heater shall be tipped in any direction at an angle of 15° from the vertical and shall not tip over when released.

For heaters weighing over 100 pounds, the heater shall not tip over when a horizontal pull, in any direction, equal to one-tenth of the heater weight is applied at the center of the top of the heater.

(c) Sheet metal heating elements and baffles on circulating type heaters shall be of not less than No. 20 gage.

(d) The outer casing or jacket and all other sheet metal parts, except heating elements, of circulating type heaters shall be of not less than 22 gage, except finish strips and ornamental trimmings.

(e) The construction of every part of the heater shall be such that it will not show undue signs of becoming so warped, bent, or broken as to negate the heater's compliance with any of these requirements.

(f) Materials shall be of such composition that they will not disintegrate to the extent that particles will separate and drop upon the burner, and affect combustion.

(g) The body finish shall be durable and uniformly applied. After the termination of all tests specified herein, it shall not show undue discoloration or deterioration.

(Among assembly requirements specified in these approval requirements are the requirements that joints of heating surfaces in vented types of heaters shall not depend primarily on cement for tightness.)

PERFORMANCE REQUIREMENTS

(Performance requirements are specified under the same test gas characteristics and pressures as given in the A. G. A. performance requirements for gas ranges, above.)

BURNER OPERATION

(a) A space heater shall produce no carbon monoxide. This requirement shall be deemed met when:

1. A concentration of carbon monoxide, not in excess of 0.02 per cent, is present in an air-free sample of the products of combustion, when tested in a room with approximately a normal oxygen supply.

2. A concentration of carbon monoxide, not in excess of 0.05 per cent, is produced in a 1,000 cubic

foot air-tight room with no air changes occurring during the combustion of an amount of gas liberating 20,000 B. t. u.

FIRE HAZARD

(a) The maximum temperature at points 6 inches from the back and sides of a space heater and on the floor under the heater and within 3 feet of it, shall be not more than 90° F. in excess of the room temperature except wall heaters and those designed for use only in fireproof fireplaces suitable for the combustion of solid fuels.

(b) The maximum temperature at points of a wall heater which comes into contact with walls and at points 6 inches below the bottom of the heater shall be not more than 90° F. in excess of the room temperature.

(c) The maximum temperature of the flue products, from a circulating type space heater, shall not exceed 550° F.

EXPLOSION HAZARD

The construction of the heater shall be such that, should sufficient gas accumulate before ignition so as to cause an explosion, the explosive force will vent itself without damage.

HEATING EFFICIENCY

(a) Flue connections shall not carry from the heater more than 35 per cent of the total heat input when operated at the manufacturer's B. t. u. rating.

(b) An appliance represented as a radiant heater shall have a radiant efficiency of not less than 28 per cent.

(In addition to the above, the full text of these approval requirements includes performance requirements as regards pilot operation, effect of orifice on air injection, absence of leakage of gas, permissible pressure drop through gas cocks, provision of safety guards and screens, operating features of draft hoods, venting requirements, permissible corrosion or oxidation of burner parts.)

GAS-FIRED STEAM AND HOT WATER RADIATORS

All gas-fired steam and hot water radiators shall meet the following requirements:

(a) They shall withstand, without leakage, a hydrostatic pressure test of 100 pounds per square inch.

(b) A relief valve shall be provided which shall operate at a pressure not more than 40 pounds per square inch.

(c) Double diaphragms or equivalent construction shall be provided in pressure or thermostatic controls to prevent steam or water from entering the gas lines.

(d) All radiators up to 33 inches in height shall be constructed or provided with a shield, screen, or other means, so that when installed under a window the curtains, drapes, or other inflammable materials hanging directly above and close to the top of a radiator will not be scorched or ignited from a delayed ignition of 10 seconds, at normal pressure, with the gas flowing at the manufacturer's hourly B. t. u. starting rating.

(e) The water-filling cup on all steam and hot water radiators shall be so constructed that when the cap is removed, it will break any vacuum that might be formed within the radiator.

(f) The average heat content of the flue gases of a gas-fired steam or hot water radiator, when measured at a point one-fourth inch below the escapement into the air, shall not be more than 35 per cent of the total B. t. u. input in the fuel gas for vented radiators nor more than 50 per cent of the total B. t. u. input in the fuel gas for unvented radiators, with the gas

burning at the manufacturer's hourly B. t. u. input rate.

(g) The ratings of gas-fired steam and hot water radiators shall be given in square feet of standard cast-iron column radiation. (Rules are included in the full text of these requirements for expressing the rating for vented and for unvented radiators.)

METHODS OF TEST

(The full text of these approval requirements includes methods of test for determining if the performance requirements are met for both gas-burning room heaters and gas-fired steam and hot water radiators.)

UNDERWRITERS' LABORATORIES, STANDARDS FOR CONSTRUCTION AND PERFORMANCE OF COMPRESSED GAS SYSTEMS OTHER THAN ACETYLENE FOR LIGHTING AND HEATING, FEBRUARY, 1928

COMPRESSED GAS SYSTEMS

(For class A systems introducing only gas into buildings and for class B systems introducing liquid into buildings, these standards include requirements on general design and thickness of metal for cabinets, permissible types of storage cylinders, permissible gas or liquid pressures, types and performance requirements of pressure regulators and of valves, sizes of connecting tubing and piping, types of connectors and fittings, working pressure capacity of expansion tanks, and the following requirements for stoves and ranges.)

STOVES OR RANGES

(For use with compressed gas other than acetylene)

The frame shall consist of noncombustible material rigidly assembled to provide ample strength for supporting the several parts of the stove and the materials likely to be placed on it. It shall be made to inclose the burners on the bottom and three sides.

Sheet metal supporting parts and braces used in the construction of the frame shall be of material at least No. 26 U. S. gage (0.01875 inch) and corrugated or otherwise stiffened where strength is needed.

(The full text of this standard includes general requirements on the provision of legs of proper height and the provision of drip pan or base that is removable or readily accessible for cleaning.)

Legs of stoves of class B systems, for stoves that weigh less than approximately 100 pounds, shall be provided with means for attachment to the floor to prevent the stove being moved and breaking the fuel line. Legs may consist of castings or sheet metal suitably designed and stiffened to carry the weight likely to be placed on them under ordinary service conditions. These legs shall be attached to the frame in a manner which will insure rigidity.

Shelves and cabinets located above the burners shall be constructed in a substantial manner, and shall be securely fastened to the stove. Valves of oven burners of class B systems shall be provided with interferences which make it necessary to open the broiler door before the valve can be opened.

BURNERS

Individual or utility burners for use under coffee urns, etc., shall be constructed with a drip pan or base, designed to serve as a heat deflector to protect wooden or other combustible materials on which it is installed.

(Requirements on the provision of operating instructions for stoves and gas systems are included in the full text of this standard.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, METHOD FOR TESTING GAS APPLIANCES TO DETERMINE THEIR SAFETY FROM PRODUCING CARBON MONOXIDE, PUBLICATION T304, 1926

TESTING GAS APPLIANCES

(This technologic paper covers the description of tests developed at the Bureau of Standards for testing gas appliances under forced operation and under normal operation conditions. It includes tests for the determination of flash-back, blow-off, and yellow-tip curves, determination of limit of complete combustion, and of normal injection curve. Typical test results are shown.)

614.3 OIL AND GASOLINE STOVES, RANGES, AND WATER HEATERS.

UNDERWRITERS' LABORATORIES, STANDARDS FOR CONSTRUCTION AND PERFORMANCE OF COMPRESSED GAS SYSTEMS OTHER THAN ACETYLENE FOR LIGHTING AND HEATING, FEBRUARY, 1928

(This standard includes requirements for stoves and ranges. See 614.2, p. 857.)

UNDERWRITERS' LABORATORIES, STANDARDS FOR CONSTRUCTION AND PERFORMANCE OF GASOLINE STOVES FOR COOKING AND HEATING, FEBRUARY, 1928

STATIONARY GASOLINE STOVES

These specifications apply to devices of the wickless type, intended for heating or cooking, that use gasoline either for securing generation or as a fuel.

FRAME

This shall consist of noncombustible material rigidly assembled to provide ample strength for supporting the several parts of the stove and the materials likely to be placed on it and shall have the ends and backs inclosed.

Sheet-metal supporting parts and braces used in the construction of the frame shall be of material at least No. 26 U. S. gage (0.01875 inch) and corrugated or otherwise stiffened where strength is needed.

(The full text of these standards includes general requirements on provision of legs of proper strength and length, provision of metal drip pan, rigid connection of shelves and cabinets that are located above burners, and provision for attachment to floor for those stoves equipped with outside storage tanks.)

FUEL SUPPLY

The fuel may be supplied to the burners either by gravity or by air pressure from a suitably designed pressure tank.

Liquid capacity of tanks located at the stove shall not exceed approximately one gallon and shall be rigidly supported at the stove. When made removable, an automatic valve shall be provided in the end of the fuel line to prevent leakage of fuel when the tank is removed.

Liquid capacity of pressure tanks installed outside of buildings shall not exceed approximately 6 gallons.

(The full text of this standard includes general requirements on permissible materials, shapes, types of joints, and structural features of fuel tanks, including the requirements given herewith.)

Material for lift-out tanks and founts to be as follows: Copper sheets shall be at least No. 24 B. & S. gage (0.0201 inch), brass sheets of at least No. 26 B. & S. gage (0.0159 inch), and steel sheets of at least No. 27 U. S. gage (0.0172 inch), measured under their coating. Founts shall be made with dished bottoms.

Pressure tanks shall be designed for a working pressure of not less than 30 pounds and shall possess a factor of safety of at least 6. The stove design shall be such that pressures in excess of 50 pounds per square inch will not be required for proper operation and the pumps supplied with the equipment should be of such capacity as to make it difficult to obtain pressures in excess of that for which the tank is designed. Two pressure tanks picked at random from each day's production shall be subjected to an intermittent hydrostatic pressure test lasting one-half hour with a pressure of 100 pounds per square inch, on for 5-minute periods and off for 1-minute periods during the test, and shall not show leakage or any permanent distortion. All pressure tanks shall be tested to at least twice the working pressure and proven tight.

Pressure tanks mounted on stove shall be cylindrical or elliptical in shape and constructed of at least No. 22 U. S. gage (0.0312 inch) steel sheet suitably protected from corrosion, or of brass or copper of a thickness which will provide necessary strength to withstand the pressure tests. (Other requirements included in the full text of the standard include the use of filler caps which will relieve tank pressure before opening tank, provision of pressure and fuel level gages and a positive shut-off valve in the fuel line.)

(Requirements on construction of tanks to be installed outside of buildings are also included in full text of this standard.)

GENERATORS AND BURNERS

Generators shall be initially heated by means which will obviate the use of an open gasoline drip cup or other open handling and exposure of gasoline.

(This standard also includes requirements on structural features and installation of generators, burners, valves, piping and fittings, material and thickness of fuel piping.)

PORTABLE HEATERS

In general, heaters of this class shall conform to the foregoing requirements but shall be provided with antiflooding devices in all cases and may not be designed for connection with tanks of larger capacity than approximately 1 gallon.

A portable heater shall be so constructed that its center of gravity is low to enable it to regain its stability on being tipped. It shall return to the upright position on being tipped forward or sideways to an angle of 30° from the vertical and likewise from a backward tip of 20° from the vertical when the fuel tank is practically empty.

UNDERWRITERS' LABORATORIES, STANDARDS FOR CONSTRUCTION AND PERFORMANCE OF KEROSENE STOVES FOR COOKING AND HEATING, AUGUST, 1927

KEROSENE STOVES

These specifications cover the construction and performance of the nonportable type of kerosene stoves.

FRAME

(Requirements on the construction of the frame are the same as for gasoline stoves given above except that there is no requirement that the ends and back be enclosed. It contains the additional requirement that burner flames shall be protected by a suitable enclosure around each burner or the frame of the stove shall be sufficiently inclosed on at least five sides.)

FUEL SUPPLY

Fuel may be supplied to the burner either by gravity or by a suitably designed pressure tank. If the feed mechanism is not designed to maintain the fuel level below the top edge of the fuel containing part of the burners, an antiflooding device shall be incorporated in the stove to prevent flooding of the burners.

Fuel tanks shall not exceed 2 gallons capacity and shall be rigidly supported at the stove. When made removable, means shall be provided to prevent leakage of fuel.

(With the exception that glass is permitted in the construction of lift-out tanks, the requirements for lift-out tanks and founts and for pressure tanks mounted at the stove are the same as given in the Underwriters' Laboratories standard for gasoline stoves, see above.)

GENERATORS AND BURNERS

(In addition to general requirements on construction and installation, type of joint permitted, etc., are the following requirements:)

Generators shall be initially heated by a means which will obviate the use of any fuel other than kerosene and may consist of either the individual or common type.

Burners may consist of either the wick, lighting ring, or wickless types. Wick type burners shall be provided either with a wick stop or with means to control the wick travel.

Burners of the lighting ring or wick types shall have the fuel level in the burners sufficiently far below the tops of the burner bowls or wick tubes to prevent danger of flooding when not set level, or leveling means shall be provided.

(The full text of this standard also includes structural requirements and operating features for valves, permissible materials and minimum sizes and wall thicknesses of piping, and permissible types of fittings.)

UNDERWRITERS' LABORATORIES, STANDARD REQUIREMENTS FOR CONSTRUCTION AND PERFORMANCE OF PORTABLE KEROSENE HEATERS, JUNE 2, 1924

PORTABLE KEROSENE HEATERS

1. INTRODUCTORY

These requirements are intended as minimum requirements which must be met by devices of this class under consideration in order to be judged acceptable.

2. DEFINITION

These standard requirements apply to portable oil heaters using kerosene as fuel, which is contained in a small reservoir and burned with a wick. These heaters consist commonly of a lower drum supported on legs and containing the reservoir on which the burner is mounted. An upper section or drum serves as a radiator and is usually attached to the lower section by a hinge and catch.

3. UPPER DRUM

The side walls of the upper drum may be of sheet iron or steel not less than No. 28 U. S. gage (0.016 inch). The vertical seam may be a hook seam or a riveted lap joint, or may be welded. The drum shall be stiffened by having corrugations rolled into it circumferentially, or by an equivalent means. A sufficient number of permanent openings shall be provided to prevent smoking when the top ventilator is closed.

A suitable window shall be provided in the side of the drum through which the height and condition of the flame may readily be observed. It should be covered with fine wire mesh screen or with a good grade of mica which should preferably be protected by a metal guard or framework.

4. TOP

The top may be of sheet iron or steel not less than No. 24 U. S. gage (0.025 inch) or of a suitable casting. The edge shall be flanged to provide stiffening and in some cases to provide for attachment to the drum. It may or may not be provided with an adjustable shutter. When the carrying handle is attached to it the top may be fastened to the drum by not less than four $\frac{1}{8}$ -inch rivets or two or more $\frac{3}{16}$ -inch tie bolts may be used to clamp the drum between the top and center section. If tie bolts are used, the ends of the drum should rest in suitable grooves in the top and center section. If the carrying handle is not attached to it the top may be fastened to the upper drum by at least three $\frac{3}{16}$ -inch bolts or the equivalent.

5. CENTER SECTION

The center section shall be of sheet iron or steel not less than No. 24 U. S. gage (0.025 inch) or of a suitable casting. It may be attached to the drum by not less than four $\frac{1}{8}$ -inch rivets or three $\frac{3}{16}$ -inch bolts or by tie rods, as mentioned under section 4. The flame collar should be securely attached to the center section and be of sheet iron or steel not less than No. 24 U. S. gage. It should have a suitable flange or shoulder on the lower edge for stiffening and for seating against the upper edge of the gallery.

6. CARRYING HANDLE

The bail should be of tinned or nicked steel wire not less than No. 8 W. & M. gage (0.162 inch). (Other recommendations include method of attachment of handle, that it be not closer than 1 inch to stove when in position of rest and not closer than 6 inches when in raised position, that it does not get uncomfortably hot, etc.)

7. LOWER DRUM

The walls of the lower drum should be of sheet iron or steel not less than No. 28 U. S. gage (0.016 inch). It should be perforated with a sufficient number of openings or otherwise arranged to permit adequate circulation of air and cooling of the reservoir. The upper edge shall be reinforced by being rolled over a wire or by means of a band or the equivalent. The lower edge should be riveted to the base ring by not less than four $\frac{3}{16}$ -inch rivets well headed over or by an equivalent method. A substantial ring or lugs attached securely to the drum or a part of the base ring shall be provided to support the reservoir. The base ring should be flanged or otherwise suitably stiffened and should be of sheet iron or steel not less than No. 20 U. S. gage (0.0375 inch).

8. LEGS

The heater should be supported by not less than four substantial legs curved or otherwise sufficiently

stiffened. They should be of sheet iron or steel not less than No. 20 U. S. gage (0.0375 inch) or of suitable castings and should be fastened to the base ring by at least two $\frac{3}{16}$ -inch rivets well headed over. If the legs are extensions of the base ring, they shall be not less than No. 19 U. S. gage (0.043 inch), and the legs should be shaped to provide sufficient stiffness.

9. HINGE—10. LATCH

(The full text of this standard includes requirements on material, minimum thicknesses of parts, and methods of attachment of hinge, general performance and ease of operation of latch.)

11. RESERVOIR

The reservoir may be of brass, terneplate, or the equivalent. If made of brass the bowl should be not thinner than No. 24 B. & S. gage (0.020 inch) and if of terneplate, not less than No. 26 U. S. gage (0.018 inch). The cover of the reservoir, if made of terneplate shall be at least No. 26 U. S. gage (0.018 inch) or if of brass, at least No. 26 B. & S. gage (0.0159 inch). The lower section shall be joined to the cover by a standing seam or the equivalent.

The inner wick tube, or draft tube may be of the same material as the fount. If the lower section of the fount does not include the wick tube as a part of itself, this tube should be seamed to the bottom and additionally soldered for tightness. Reinforcement of the bottom to prevent movement is desirable.

(Other requirements and recommendations in this standard deal with the provision, size, and attachment of handle to reservoir, structural features of pinion shaft for adjusting wick and method of attaching to reservoir, provision and performance requirements of fill plug for reservoir, gage for reservoir, wick stop, wick carrier, floor pan, and the following requirements.)

18. STABILITY

These heaters shall be so constructed that their centers of gravity are low and that they have a minimum tipping angle of 33° with the reservoir empty.

19. OPERATION

These heaters shall be capable of operating satisfactorily for a reasonably long time, requiring a minimum of care and attention.

The maximum flame obtainable shall be so limited and the heater so constructed that, when placed as close to a vertical wall as the legs will permit, it will not cause ignition of combustible materials on the wall during continued operation as long as the heater will burn on one filling of oil.

The maximum heat developed during continued operation shall not be such as to overheat and ignite the oil in the reservoir or to induce an abnormally high and smoky flame.

20. TEST OF RESERVOIR

Each reservoir shall be tested and proven tight against leakage under a pressure of 5 pounds per square inch.

614.4 HOUSE HEATING BOILERS, RADIATORS, AND HOT-WATER TANKS.

AMERICAN GAS ASSOCIATION, APPROVAL REQUIREMENTS FOR CENTRAL HOUSE HEATING GAS APPLIANCES, MAY 1, 1930

GAS BOILERS

(This specification includes requirements on the construction of gas burners; size and type of main

burner cock; method of connection, minimum size of supply pipe, and nonflash back requirements for pilot burners; structural and operating features of air mixers and electric-control valves; requirements on the provision of main control valve, limiting devices for steam pressures and hot-water temperatures, and gas pressure regulators.)

(The requirements for the construction of cast-iron boilers including the requirements for fittings and appliances are identical in nearly all provisions with the requirements for cast-iron low-pressure heating boilers given in the boiler construction code of the American Society of Mechanical Engineers. See p. 864.)

PERFORMANCE REQUIREMENTS

Section 1. Test Gases

In conducting performance tests for approval of gas boilers, two kinds of test gases shall be used:

- (a) Natural gas, approximately 1,125 B. t. u. per cubic foot, 0.65 specific gravity.
- (b) Manufactured gas, approximately 550 B. t. u. per cubic foot, 0.40 specific gravity.

Section 2. Normal Pressures

For the purpose of these requirements normal gas test pressures are defined as $3\frac{1}{2}$ -inch water column for manufactured gas and 7-inch water column for natural gas. Pressures shall be measured at the regulator inlet.

Section 3. Thermal Efficiency

Steam and hot-water boilers shall have a thermal efficiency of at least 75 per cent based on the total heating value of the gas.

Section 4. Burner Operation

(a) A gas boiler shall produce no carbon monoxide. This requirement shall be deemed met when a concentration not in excess of 0.04 per cent is present in an air-free sample of the products of combustion when the boiler is tested in an atmosphere with approximately a normal oxygen supply.

Section 5. Pilot Operation

(a) Pilot flames shall effectively ignite the gas at the burners and shall be adequately protected from drafts. A draft hood which meets the requirements of the American Gas Association shall be interpreted as fulfilling the second part of this requirement as far as chimney drafts are concerned.

(b) Luminous flame pilots shall not show carbon deposits during the period of test when adjusted according to the manufacturer's instructions.

(c) Where escapement pilots are used they shall ignite freely from a constant burning pilot.

Section 6. Steam Pressure Limiting Devices

(a) Boilers shall be provided with a device which will limit the maximum steam pressure to 10 per cent below that for which the safety valve is set.

(b) The limiting device shall be capable of maintaining a uniform steam pressure.

Section 7. Gas Pressure Regulators

Gas pressure regulators shall limit the manifold pressure to not more than one-half inch above that occurring with normal pressure at the regulator inlet.

Section 8. Allowable Pressure Drop

When the boiler is operated at the manufacturer's hourly B. t. u. rating with a gas of 0.6 specific

gravity and 500 B. t. u. per cubic foot, the pressure drop through all controls shall not exceed 1.0 inch water column.

Section 9. Fire Hazard

The maximum temperature rise at points 6 inches from the back and sides of the boiler shall not exceed 90° F. above room temperature when the boiler has been operating for one hour at the manufacturer's hourly B. t. u. rating.

(In addition to the above performance requirements, the full text of this specification includes detailed methods of test for determining whether the performance requirements are met.)

AMERICAN GAS ASSOCIATION, APPROVAL REQUIREMENTS FOR CENTRAL HOUSE HEATING GAS APPLIANCES, MAY 1, 1930

GAS WARM AIR FURNACES

(This specification includes requirements on the construction of gas burners; size and type of main burner cock, etc.; the same as for gas boilers above, first paragraph, excepting the requirements for limiting devices for steam pressures and hot water temperatures. In addition the following structural requirements apply to gas warm air furnaces.)

Section 8. Primary and Secondary Air Intake

All primary and secondary air for burners must be drawn from the outside of the furnace casing or from furnace openings which extend through the outside casing.

Section 9. Accessibility for Cleaning

The flue gas passage-way through furnaces shall be accessible for cleaning where:

1. The products of combustion are drawn below the level of the burner.

2. The temperature of the combustion products is less than 250° F. when the furnace is operated at normal pressure with the gas rate within ± 2 per cent of the manufacturer's hourly B. t. u. rating.

3. The inside walls of any heating surfaces are closer than $1\frac{1}{2}$ inches.

Section 10. Air Circulation in Floor Furnaces

(a) Floor furnaces shall be so constructed and designed that they will provide a constant circulation of heated air at all times during their operation. The difference in temperature between the heated air and that in the cold air return duct shall in no case be less than 90° F.

(b) The ratio of the net free area of the cold air returns to the net free area through the grating of the warm air section of floor furnaces shall in no case be less than 100 per cent.

Section 11. Draft Hoods

A suitably designed draft hood shall be furnished with each furnace. Such devices shall meet the approval requirements of the American Gas Association. No flue damper shall be used.

Section 12. Joints in Heating Surface

All joints of heating surfaces shall be of welded, brazed, screwed, lock seamed, machined and bolted, or of formed, slip joint, or flanged construction tightly bolted together and enclosing gaskets or other similar packing materials.

Section 13. Disposal of Combustion Products

The construction of the furnace shall be such that no part of the products of combustion becomes mixed with the warm air discharged by the furnace.

Section 14. Vent Connections

Vent connections shall extend beyond the furnace casing a sufficient distance to insure secure fastening of the vent pipe.

Section 15. Furnace Openings

Furnace openings other than vent connections, such as secondary air supplies, doors, etc., shall extend through the outside casing a sufficient distance to permit secure fastening of outside frames and to prevent possible leakage of combustion products into the warm air ducts.

Section 16. Thickness of Material

(a) Where outside casings are constructed of sheet iron or steel, they shall not be less than 26 U. S. gage for furnaces of less than 100,000 B. t. u. per hour input capacity. For furnaces with a capacity in excess of this amount, the thickness of the furnace casing shall not be less than 24 gage. Where reinforcing or a double construction is employed, strength equivalent to that afforded by weights of metals mentioned above shall be regarded as acceptable.

(b) Where sheet steel or iron is used in the construction of furnace heating surfaces, the thickness shall not be less than 22 U. S. standard gage.

Section 17. Fan Location

Furnaces which include fans as integral parts of their construction shall have the fans so placed that they discharge into the furnace casings.

Section 18. Fan Control

Furnaces which include fans as integral parts of their construction shall include means to prevent the temperature of the air in the warm air ducts exceeding 250° F. in the event of fan stoppage.

Section 19. Observation Doors

Observation doors of floor furnaces shall fit tightly and shall be so machined or of such weight and construction that they will not be displaced by any normal jar or pressure created during normal operation of the furnace.

Section 20. Ratings

All gas furnaces shall bear a permanent name plate on which shall appear in permanent form:

(a) The manufacturer's hourly B. t. u. input rating.

(b) The allowable warm air duct area in square inches, which shall be computed on the basis of not more than 100 per cent of the effective free area through the furnace.

PERFORMANCE REQUIREMENTS

(Performance requirements for warm air furnaces are the same as given above for gas boilers as given in sections 1, 2, 4, 5, 7, 8, and 9. In addition the following performance requirements are specified.)

Heating efficiency.—Warm air furnaces, except floor furnaces, shall have a heating efficiency of at least 70 per cent based on the total heating value of the gas.

Pilot operation.—Pilot flames shall not become extinguished when the main burners are turned on or off in a normal manner during the laboratory tests.

Allowable air temperature.—When tested at normal gas pressure, the furnace shall not discharge air at a temperature in excess of 220° F.

The temperature of the air discharged through any single warm-air opening, when the furnace is tested at normal pressure, shall not vary more than 30° F. from the average of the discharge temperature observed at all of the warm-air openings. In case the furnace is designed for discharge into a single warm-air duct, the test prescribed shall be carried out by dividing the outlet into four equal areas and observing the temperature at the center of each.

(In addition to the above performance requirements, the full text of this specification includes detailed methods of test for the various performance requirements.)

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS, CODE FOR TESTING RADIATORS, JANUARY, 1927

HOUSE HEATING RADIATORS

THE CONDENSATION METHOD FOR THE TESTING OF DIRECT RADIATORS

(This standard method of test includes requirements on size of test room, permissible window size, maintenance of uniform temperature and humidity, pressure and superheat of steam used in test, measurement of condensate, painting of radiator, standard formula for computing heating capacity.)

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS, PROPOSED CODE FOR TESTING STEAM HEATING BOILERS BURNING OIL FUEL, MARCH, 1931

BOILERS BURNING OIL FUEL

(This code provides standard methods for conducting and reporting tests to determine heat efficiencies and performance characteristics of steam heating boilers using oil fuel. It includes standard set-up of oil burner and boiler to be tested, types of instruments and set-up of test apparatus, sampling of fuel, duration of tests, starting and stopping continuous tests, starting and stopping of intermittent tests, test procedure, and standard data and test forms.)

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS, PIPE SIZES, 1930

PIPE SIZES FOR HEATING SYSTEMS

(The pipe sizes recommended by this society are the same as those recommended for steam heating by the Heating and Piping Contractors National Association. See H. & P. C. N. A., below.)

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS, COMMITTEE REPORT ON CODE FOR RATING OF HEATING BOILERS BURNING SOLID FUELS, JANUARY, 1929

RATING OF HEATING BOILERS

(The report of the committee presented a code by which the rating of a solid fuel boiler is determined

either from the performance in relation to flue gas temperature or the performance in relation to the coal burned per unit area of grate, the lower of the two outputs plus 30 per cent of their difference being chosen as the rating. The boiler to be rated is tested in accordance with the code for testing low-pressure steam heating boilers of the American Society of Heating and Ventilating Engineers. Performance curves plotted from the data obtained from the test are used in conjunction with a standard rating chart to determine the rating of the particular boiler. The code provides for an anthracite rating and a bituminous rating.)

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS, PERFORMANCE TEST CODE FOR STEAM HEATING SOLID FUEL BOILERS, CODE NO. 3, JUNE, 1929

PERFORMANCE TEST CODE FOR HEATING BOILERS

(This code specifies the tests to be conducted and standard methods for conducting and reporting tests to determine the efficiencies and performance of heating boilers. It includes types and arrangement of apparatus and instruments, connecting up of apparatus and boiler, methods of starting and stopping test, standard log sheets and test forms.)

AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS, STANDARD AND SHORT FORM HEAT BALANCE CODES FOR TESTING LOW-PRESSURE STEAM HEATING SOLID FUEL BOILERS, CODES 1 AND 2, JUNE, 1929

TESTING LOW PRESSURE HEATING BOILERS

(These standard test methods include definitions of grate area and combustion rate for solid fuel boilers, set-up of boiler to be tested, types of instruments and measuring apparatus required, sampling procedure for the fuel, duration of tests, new fire method of starting and stopping tests and the continuous firing method of starting and stopping tests, method of conducting tests, and standard form for recording test data and test results.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, BOILER CONSTRUCTION CODE; BOILERS USED EXCLUSIVELY FOR LOW-PRESSURE STEAM HEATING, HOT-WATER HEATING, AND HOT-WATER SUPPLY, 1927

I. STEEL-PLATE BOILERS

H-1. These rules for steel-plate boilers shall apply:

(a) To all steam boilers for operation at pressures not exceeding 15 pounds per square inch.

(b) To hot water boilers to be operated at pressures not exceeding 160 pounds per square inch, or temperatures not exceeding 250° F.

(c) For conditions exceeding those specified above, the rules for construction and setting of power boilers shall apply.

H-2. Wherever the term maximum allowable working pressure is used herein, it refers to gauge pressure or the pressure above the atmosphere in pounds per square inch.

H-3. The maximum allowable working pressure shall not exceed 15 pounds per square inch on a steel-plate boiler built under these rules to be used for low-pressure steam heating.

The maximum allowable working temperature at or near the outlet of a hot-water steel-plate boiler shall not exceed 250° F., or the maximum allowable working pressure 160 pounds per square inch.

H-4. The maximum allowable working pressure on the shell or drum of steel plate steam heating and hot-water boilers shall be determined by the strength of the weakest course, computed from the thickness of the plate, the tensile strength stamped thereon, as provided for in paragraph S-17 of Section II of the code, the efficiency of the longitudinal joint, or of the ligament between the tube holes in shell or drum (whichever is the least), the inside diameter of the course, and the factor of safety, but in no case shall the pressure on which the factor of safety is based be considered less than 30 pounds per square inch.

$$\frac{TS \times t \times E}{R \times FS} = \text{maximum allowable working pressure, pounds per square inch.}$$

where

TS=ultimate tensile strength stamped on shell plates, as provided for in paragraph S-17 of Section II of the code, pounds per square inch.

t=minimum thickness of shell plates in weakest course, inch.

E=efficiency of longitudinal joint or of ligaments between tube holes (whichever is the least).

R=inside radius of the weakest course of the shell or drum, inches.

FS=factor of safety, or the ratio of the ultimate strength of the material to the allowable stress.

For new constructions, FS in the above formula=5.

MATERIALS

H-5. Specifications are given in paragraphs S-1 to S-285 of Section II of the code, for the important materials used in the construction of boilers, and where so given the materials herein mentioned for boiler parts required to resist internal pressure shall conform thereto except as specified herein for autogenously welded boilers.

H-6. Steel plates for any part of a boiler where under pressure, also manhole and handhole covers and other parts subjected to pressure, and braces and lugs when made of steel plate, shall be of firebox or flange quality as designated in the specifications for steel boiler plate, except for base metal as specified for autogenous welding.

H-7. Braces when made of parts welded together shall be of wrought iron of the quality designated in the specifications for extra-refined bar iron.

ULTIMATE STRENGTH OF MATERIAL

H-8. Tensile strength of steel plate.—In determining the maximum allowable working pressure, the tensile strength used in the computations for steel plates shall be that stamped on the plates as herein provided, which is the minimum of the stipulated range, or 55,000 pounds per square inch for all steel plates except for special grades having a lower tensile strength.

H-9. Crushing strength of steel plate.—The resistance to crushing of steel plate shall be taken at 95,000 pounds per square inch of cross-sectional area.

H-10. Strength of rivets in shear.—In computing the ultimate strength of rivets in shear, the following

values, in pounds per square inch of the cross-sectional area of the rivet shank, shall be used:

Iron rivets in single shear.....	38,000
Iron rivets in double shear.....	76,000
Steel rivets in single shear.....	44,000
Steel rivets in double shear.....	88,000

The cross-sectional area used in the computations shall be that of the rivet shank after driving.

MINIMUM THICKNESS OF PLATES AND TUBES

H-11. The minimum thickness of any boiler plate under pressure shall be one-fourth inch.

H-12. The minimum thickness of shell plates, heads and tube sheets for various shell diameters of steel-plate heating boilers shall be as shown in Table H-1.

TABLE H-1.—Minimum allowable thickness of shell plates

Diameter of shell, tube sheet or head	Minimum thickness allowable under rules	
	Shell	Tube sheet or head
	Inch	Inch
42 inches or under.....	3/4	5/16
Over 42 to 60 inches.....	5/16	3/8
Over 60 to 78 inches.....	3/8	7/16
Over 78 inches.....	7/16	1/2

H-13. The minimum thickness of butt straps for double-strap joints shall be as given in Table H-2. For plate thickness exceeding three-fourths inch, the thickness of butt straps shall be not less than two-thirds of the thickness of the plate.

TABLE H-2.—Minimum thickness of butt straps

Thickness of shell plates	Minimum thickness of butt straps	Thickness of shell plates	Minimum thickness of butt straps
Inch	Inch	Inch	Inch
3/4	3/4	1 1/2	3/8
5/8	3/4	1 1/2	7/16
9/16	3/4	1 1/2	7/16
1 1/8	3/4	1 1/2	7/16
3/8	5/16	3/4	1/2
1 3/8	5/16	3/4	1/2
7/16	3/8		

H-14. (a) The minimum thickness of tubes used in water-tube or fire-tube boilers measured by Birmingham wire gage, shall be as given in Table H-3.

TABLE H-3.—Tubes for water-tube and fire-tube boilers

	Minimum thickness of tubes
Diameters 1 inch or over, but less than 2 1/4 inches.	No. 13 B. W. G.
Diameters 2 1/4 inches or over, but less than 3 1/4 inches.	No. 12 B. W. G.
Diameters 3 1/4 inches or over, but less than 4 inches.	No. 11 B. W. G.
Diameters 4 inches or over, but less than 5 inches.	No. 10 B. W. G.
Diameters 5 inches.....	No. 9 B. W. G.

(b) The minimum thickness of tubes, if of copper, either straight, bent, or coiled, for use in water-tube or fire-tube boilers, shall be as follows:

In water boilers where working pressures of over 30 pounds and not to exceed 160 pounds per square inch may be used:

$$t = \frac{D}{30} + 0.03$$

where

t = thickness of tube wall in inches, and

D = outside diameter of tube in inches.

For steam boilers to be used at pressures not exceeding 15 pounds per square inch, and water boilers where the maximum allowable working pressure does not exceed 30 pounds per square inch:

$$t = \frac{D}{45} + 0.03$$

In no case shall a tube thinner than No. 16 gage (B. W. G.) be used.

Par. H-15 to H-20 cover joint efficiency, lap riveting, length of longitudinal joints in butt-and-double-strap construction, and shaping of shell plate ends.

Par. H-21 to H-26 include a formula for calculating the maximum allowable working pressure in pounds per square inch, the shielding of the ends of stays fitted with nuts from direct radiant fire heat, the area of heads to be stayed, and a table giving the maximum allowable stresses for stay-bolts and stays or braces.

Boiler openings, including threaded openings, a table giving the minimum thickness of material for tappings, and requirements for flanged connections are covered in paragraphs H-27 to H-31.

Supports for horizontal-return tubular boilers 54 inches and up to and including 72 inches in diameter; also such boilers over 72 inches in diameter are covered in paragraphs H-32 to H-34.

Details of setting and installation, including connections for safety and water-relief valves are covered in paragraphs H-35 to H-42.

Fittings and appliances—in which are included safety valves, water-relief valves, minimum allowable sizes of safety valves for steam-heating boilers, also minimum allowable sizes of water-relief valves for water-heating boilers and for water-supply boilers, steam-gauges, pressure and altitude gauges, thermometers, temperature-combustion regulators, pressure-combustion regulators, bottom-blow-off, water-gage glasses, gauge cocks, water-column pipes, and fusible plugs—are covered in paragraphs H-43 to H-64.

HYDROSTATIC TEST

H-65. All hot-water boilers, the maximum allowable working pressure of which is not in excess of 30 pounds per square inch, and steam-heating boilers, shall be subjected to a hydrostatic test of 60 pounds per square inch at the shop where constructed. Hot-water boilers, the maximum allowable working pressure of which exceeds 30 pounds per square inch, shall be subjected to a hydrostatic test of one and one-half times the maximum allowable working pressure both at the shop where constructed and in the field when erected and ready for service.

Any hydrostatic-pressure test to be made on either a steam-heating boiler or hot-water boiler, after the boiler has been in service, shall be at a pressure one and one-half times the maximum allowable working pressure.

In making hydrostatic-pressure tests the pressure shall be under such control that in no case shall the required test pressure be exceeded by more than 6 per cent.

H-66. Individual shop inspection shall not be required for boilers which come under the rules of this exception, except for boilers constructed by autogenous welding. (See par. H-81.)

H-67. Each plate of a completed boiler shall bear the plate maker's name with brand and tensile strength, except that these marks need not appear on the butt straps after completion of boiler.

H-68. All boilers built according to these rules and no other boilers shall be marked A. S. M. E. Std.—Heat, and with the manufacturer's name and maximum allowable working pressure. These markings shall be stamped with letters and figures at least five-sixteenths inch high on some conspicuous portion of the boiler proper, preferably over or near the fire door. Boilers suitable for use for both steam and water shall have the stamps arranged substantially as follows:

A. S. M. E. STD.—HEAT
----- (Manufacturer's name)
Max. W. P., Steam 15 pounds, Water — pounds.

Boilers suitable for use for water only shall have the stamps arranged substantially as follows:

A. S. M. E. STD.—HEAT
----- (Manufacturer's name)
Max. W. P., Water — pounds.

These stamps shall not be covered with insulating or other material. The symbol authorized for use on power boilers shall not be used on heating boilers, nor shall any accessory or part of the boiler be marked A. S. M. E. or A. S. M. E. standard unless so specified in the code.

(The design, construction, and stamping of autogeneously welded boilers, including autogeneous welds, base-metal material, filling material, method of welding, longitudinal joint provisions, and welding of stay bolts into stayed plates are covered in paragraphs H-69 to H-83.)

II. CAST-IRON BOILERS

H-84. These rules for cast-iron boilers shall apply:

(a) To all steam boilers for operation at pressures not exceeding 15 pounds per square inch.

(b) To hot-water boilers to be operated at pressure not exceeding 160 pounds per square inch, or temperatures not exceeding 250° F.

(c) For conditions exceeding those specified above, cast-iron construction is not permitted.

H-85. Wherever the term maximum allowable working pressure is used herein, it refers to gauge pressure or the pressure above the atmosphere in pounds per square inch.

H-86. The maximum allowable working pressure shall not exceed 15 pounds per square inch on a cast-iron boiler built under these rules to be used exclusively for low-pressure steam heating.

The maximum allowable working temperature at or near the outlet of a hot-water cast-iron boiler shall not exceed 250° F.

BOILER OPENINGS

H-87. *Washout openings.*—All cast-iron steam and hot-water boilers shall be provided with suitable washout openings to permit the removal of any sediment that may accumulate therein. Washout open-

ings may be used for return pipe connections and the washout plug placed in a tee so that the plug is directly opposite and as close as possible to the opening in the boiler.

H-88. *Flanged connections.*—Flanged pipe connection openings in boilers shall conform to the American standard given in Tables A-5 or A-6 of the appendix to the code, for the corresponding pipe size, and shall have the corresponding drilling for bolts or studs.

H-89. *Threaded openings.*—Pipe connections if threaded shall be tapped into material having a minimum thickness as specified in Table H-9.

TABLE H-9.—Minimum thickness of material for threaded connections to boilers

Size of pipe connection (in inches)	Minimum thickness of material required
	<i>Inches</i>
¾ and under.....	⅝
1 to 2¼, inclusive.....	⅞
3 to 3½, inclusive.....	1
4 to 5, inclusive.....	1 ⅛
6 to 8, inclusive.....	1 ¼
9 to 12, inclusive.....	1 ½

(Details of installation, including connections for safety and water-relief valves, are provided for in paragraphs H-90 to H-95.)

(Under fittings and appliances will be found substantially the same requirements as specified for steel plate boilers.)

HYDROSTATIC TESTS

H-118. All hot-water boilers, the maximum allowable working pressure of which is not in excess of 30 pounds per square inch, and steam-heating boilers, shall be subjected to a hydrostatic test of 60 pounds per square inch at the shop where made, on each individual section. Hot-water boilers, the maximum allowable working pressure of which exceeds 30 pounds per square inch, shall be subjected to a hydrostatic test of two and one-half times the maximum allowable working pressure both at the shop where made, on each individual section, and in the field when erected and ready for service.

Any hydrostatic pressure test to be made on either a steam-heating boiler or hot-water boiler, after the boiler has been in service, shall be at a pressure of one and one-half times the maximum allowable working pressure.

In making hydrostatic pressure tests the pressure shall be under such control that in no case shall the required test pressure be exceeded by more than 6 per cent.

H-119. Individual shop inspection shall not be required for boilers which come under the rules of this section.

H-120. All boilers shall be plainly and permanently marked with the manufacturer's or distributor's name and the maximum allowable working pressure. All letters and figures shall be at least five-sixteenths inch high.

The maximum allowable working pressure shall be stamped, cast, or irremovably attached to the front and rear cored sections of vertical sectional cast-iron boilers and on the dome section of horizontal sectional cast-iron boilers. The marking of maximum allowable working pressure on cast-iron boilers suitable for use for steam or water shall be as follows:

Max. W. P..... Lb.
 Steam..... 15
 Water.....

Boilers suitable for use as water boilers only shall be marked as follows:

Max. W. P..... Lb.
 Water.....

All boilers built according to these rules, and no other boilers, shall be marked A. S. M. E. Standard, as follows:

A. S. M. E. STD.

The symbol authorized for use on power boilers shall not be used on heating boilers.

When an insulating or other form of covering is used that portion of the front cored section of vertical sectional cast-iron boilers, and the dome cored section of horizontal sectional cast-iron boilers bearing the foregoing marking, shall either be provided with a removable cover plate or be left uncovered.

(Pars. H-121 to H-136 have in this edition been placed in Sec. II as pars. S-264 to S-279.)

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, RULES FOR CONSTRUCTION OF UNFIRED PRESSURE VESSELS, A. S. M. E. BOILER CONSTRUCTION CODE, 1931

UNFIRED PRESSURE VESSELS

(See 605.23, p. 288.)

HEATING AND PIPING CONTRACTORS NATIONAL ASSOCIATION, ENGINEERING STANDARDS, 1930

FIGURING RADIATION

(Standard rules are given for determining the required amount of radiation area of radiators required to properly heat a given space, based on the heat required to offset the losses due to the transfer of heat through the walls, windows, floors, ceilings, and roofs, and the additional heat required to bring the air that leaks into that space up to the required temperature. Tables of data are included for amount of heat transmitted through various types of wall, ceiling, and floor constructions, for heat transmitted through windows and doors, and allowances are made in figuring the radiation such that various multiplication factors are applied dependent on the relative location of the room being heated as regards exposure to wind and the prevailing winter temperatures.)

NET SQUARE FEET RADIATION LOADS IN 70° F. RECOMMENDED FOR LOW PRESSURE HEATING BOILERS

(These recommendations are based on the use of direct cast-iron radiation and include allowances for heat loss in piping system, morning peak load, and attention factor. The maximum recommended net radiation area of radiators attached to a given boiler are given for various grate sizes and types of assemblies of round boilers and of cast-iron square boilers of straight draft or smokeless type. Recommendations are based on the use of bituminous coal of a given heat value and rules are given for making corrections to take care of fuel of other heat values. Rules are included for computing loads for other than cast-iron column radiation. Radiation loads are given for both hot water and steam radiation.)

PIPE SIZES

(These standards are recommended pipe sizes for various maximum capacities as measured in square feet of equivalent radiation for small and for large 1-pipe and 2-pipe steam systems, for 2-pipe vapor systems, for vacuum pump systems, and for gravity circulation hot water systems.)

INSTITUTE OF BOILER AND RADIATOR MANUFACTURERS, STEAM HEATING BOILER TESTING CODE, JANUARY, 1929

HEATING BOILERS

(This code specifies the tests to be conducted and provides a standard method for conducting and reporting tests to determine the efficiencies and performance of solid fuel burning, low pressure steam heating boilers. It is identical with code No. 3, performance test code for steam heating solid fuel boilers, of the American Society of Heating and Ventilating Engineers, briefly described above, except that a latent heat of evaporation of 970.4 is used in the I. B. & R. M. code as contrasted with the latent heat value of 971.7 used in the A. S. H. & V. E. Code.)

NATIONAL DISTRICT HEATING ASSOCIATION, STANDARD RULES FOR COMPUTING REQUIRED RADIATION, 1919

RADIATOR REQUIREMENTS FOR BUILDINGS

(These standard rules are applied to the computation of the required amount of radiating area for either steam or hot-water heating systems and take into consideration the heat required to warm up the air in the room assuming a certain number of air changes per hour and the heat lost through walls, ceiling, floor, doors, and windows. Data are included for the rate of heat transmission through various building materials and types of construction for walls, ceilings, etc. Correction factors are given for high ceilings, for room exposure other than southern, and for coefficient of heat transmission for various types and sizes of radiators.)

NATIONAL WARM AIR HEATING ASSOCIATION, THE AMERICAN SOCIETY OF HEATING AND VENTILATING ENGINEERS, AND NATIONAL ASSOCIATION SHEET METAL CONTRACTORS, STANDARD CODE REGULATING THE INSTALLATION OF GRAVITY WARM-AIR HEATING SYSTEMS IN RESIDENCES, SEPTEMBER 1, 1930

GRAVITY WARM-AIR HEATING SYSTEMS

(This code includes standard methods and formulas for determining sizes of warm-air pipes, wall stacks, and furnaces for use in residences, taking into consideration the type of wall, degree of exposure, number of windows and doors, etc. Regulations are given for the location and installation of furnace, casings, warm-air pipes, wall stacks, registers, smoke pipes, etc. The furnace rating formula is as given below.)

FURNACE RATING FORMULA

$$L=1.75 G (1+0.02 (R-20))$$

L = square inches of warm-air pipe connected to the furnace as calculated.

G = grate area in square inches; the area of the fire pot at the grate level, its most restricted area.

R = ratio of heating surface area to grate area.
1.75 = a constant based upon the results obtained in the association research on a furnace having 20 square feet of heating surface for each square foot of grate.

The above equation is based on the following: Efficiency of heater, 0.55; combustion rate of 7.5 pounds of coal per square foot of grate per hour; calorific value of fuel, 12,790 B. t. u. per pound; percentage of heat available at register, 0.75; average B. t. u. delivering value of 1 square inch of leader pipe area, assuming half of the heat is sent to each floor, 136; and on an operating temperature of 175° F. at the register.

The formula allows 1.75 square inches of warm-air pipe area for each square inch of grate area, for the furnace having a ratio of heating surface to grate surface of 20 to 1. For furnaces having other ratios of heating surfaces to grate surface, it adds 2 per cent or deducts 2 per cent for each unit above or below a ratio of 20.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED-PRACTICE RECOMMENDATION FOR HOT-WATER STORAGE TANKS, R25, JANUARY 1, 1925

HOT-WATER STORAGE TANKS

(Simplified practice recommended and accepted by industry establishing a limited list of standard dimensions and capacities.)

1. SIZES

Diameter ¹		Length ¹	Actual capacity	Diameter ¹		Length ¹	Actual capacity
Inches	Feet		U. S. gallons	Inches	Feet		U. S. gallons
20	5		82	42	7		504
24	5		118	42	8		576
24	6		141	42	10		720
30	6		220	42	14		1,008
30	8		294	48	10		940
36	6		318	48	16		1,504
36	8		423	48	20		1,880

¹ By diameter is meant inside diameter, length means length of sheet, not over-all length of tank.

2. WORKING PRESSURES, CLASSIFICATION, AND MARKING

(a) These sizes to be made in two working pressures, viz, 65 pounds per square inch, and 100 pounds per square inch.

(b) Those made for 65 pounds working pressure are to be classified as "STANDARD," and those for 100 pounds working pressure as "EXTRA HEAVY."

(c) Each tank is to be stenciled with its proper classification, working pressure, also the name and address of its manufacturer, as follows:

STANDARD
Guaranteed for 65 pounds working pressure
Manufacturer's name and address

or

EXTRA HEAVY
Guaranteed for 100 pounds working pressure
Manufacturer's name and address

3. FACTORS OF SAFETY, THICKNESSES, ETC.

These are to be in accord with the A. S. M. E. code for "Unfired pressure vessels." (See 605.23, p. 288.)

4. INTERCHANGEABILITY

The tanks above listed are to be made interchangeable for either horizontal or vertical installation.

5. TAPPINGS

There are to be six tappings in each tank, placed as follows: One in center of convex head; two in the

shell, in line (parallel with axis of tank), each to be centered 12 inches from the edge of the sheet; one 12 inches from the convex end and one 12 inches from the concave end; 3 in the shell, in line, said line to be diametrically opposite from the line of the 2 just mentioned. Of these three, one is to be centered 12 inches in from the convex end; another 24 inches in from that end; and the third is to be centered 12 inches in from the concave end. All measurements are taken from the edge of the sheet. There is no tapping in the concave, or bottom, end. All tappings in tanks up to but not including 30 inches in diameter are to be 1½ inches; from 30 inches up to but not including 48 inches are to be 2 inches; and from 48 inches upward, the tappings are to be 3 inches. All threads are to be American standard taper pipe threads. These tappings apply to either horizontal or vertical installations.

6. MANHOLES

These are to be standard size, 11 by 15 inches, and may be placed either in the shell or the head.

7. HANDHOLES

These are to be 4 by 6 inches, located as desired.

8. HEATING COILS

Coils for either horizontal or vertical installation of these tanks must not be less in size or total length than appears in the following table:

Tank dimensions		Size of pipe	Minimum length of heating coil	Tank dimensions		Size of pipe	Minimum length of heating coil
Diameter	Length			Diameter	Length		
Inches	Feet	Inches	Feet	Inches	Feet	Inches	Feet
20	5	1	14	42	7	1½	22
24	5	1½	14	42	8	1½	26
24	6	1½	18	42	10	1½	34
30	6	1½	18	42	14	1½	50
30	8	1½	26	48	10	2	34
36	6	1½	18	48	16	2	58
36	8	1½	26	48	20	2	74

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION: FF-P-451)

WATER HEATERS AND STORAGE TANKS

(See 617.73, p. 1062.)

614.9 MISCELLANEOUS HEATING AND COOKING EQUIPMENT.

AMERICAN OIL CHEMISTS' SOCIETY, OFFICIAL METHODS OF CHEMICAL ANALYSIS, AUGUST 1, 1930

JACKETED OVEN

(This society has adopted a standard design for a constant temperature oven for maintaining a temperature of 101° C. for use in testing cottonseed and cottonseed products. The oven is jacketed with glycerine and water and made of 48-ounce copper sheet with all seams brazed. Outside dimensions are 20½ inches long by 13¼ inches wide by 14 inches high, inside dimensions are 18 inches long, 11¼ inches

wide, and 10 inches high. It is supported from the floor by angle iron supports and legs at a height of 9 inches. Heat is supplied beneath the oven by electrical elements of approximately 2,000 watts capacity.)

VACUUM OVEN

This oven has been developed as the standard vacuum oven of the society with the idea of affording a simple and compact vacuum oven which will give as uniform temperature as possible on the shelf. It consists of a piece of 10-inch extra heavy iron pipe, with back and attachments welded on and turned down to dimensions. The front door can be made air tight by grinding into position with emery flour, or a gasket may be used. The single shelf is heated by means of a brass coil soldered on to the shelf, heat being supplied by vapor from boiling carbon tetrachloride which is circulated through the coil. (The boiling point of carbon tetrachloride varies from 76.1° C. at 743 millimeters of mercury pressure to 25° C. at 116 millimeters of mercury pressure.) The carbon tetrachloride is contained in a flask fitted with a reflux condenser and heated by means of a small electric hot plate. This flask and heater are outside the oven, and connection is made to the brass coil inside the oven by means of glass tubing connecting to the outside terminals of the coil. The advantage of heating by means of a constant boiling liquid, rather than by electric coils entailing the difficulties of electrical control, is considerable. Insulation of the oven is recommended, also attachment of a small pet cock at a point low down on the door to regulate circulation within the oven.

(Assembly drawings of both the official jacketed oven and the standard vacuum oven are shown in the Official Methods of Chemical Analysis of the American Oil Chemists Society.)

ASSOCIATED FACTORY MUTUAL FIRE INSURANCE COMPANIES, GRAVITY WATER TANKS AND STEEL TOWERS, VOLUME II, PIPING, FITTINGS, AND HEATING SYSTEMS, 1929

TANK HEATING EQUIPMENTS

(These rules and recommendations cover recommended construction and design of steam heaters, using steam coils, the water from the tank circulating through the heater and around the steam pipes by gravity; recommended makes of coal-burning heaters where the tank water circulates through chambers or pipe coils around or above the fire; special cases where steam may be led directly into the tank itself; and methods of determining necessary heater capacities.)

NATIONAL BOARD OF FIRE UNDERWRITERS, REGULATIONS FOR THE INSTALLATION AND OPERATION OF ACETYLENE EQUIPMENT FOR LIGHTING, HEATING, AND COOKING, MARCH 1, 1930

ACETYLENE FOR LIGHTING, HEATING, AND COOKING

(These regulations cover six classes of equipment—stationary automatic apparatus permitted for outside installation only, stationary automatic apparatus permitted for inside or outside installation, stationary nonautomatic apparatus for outside installation only, semiportable automatic apparatus permitted for inside installation, dissolved acetylene

under pressure, and portable generators for lighting. They include requirements on the location of generator; on the construction, ventilation, and heating of outside generator houses; on sizes and capacities of pipe; requirements for conductor and escape piping; operation of generators; storage and installation of cylinders; storage of calcium carbide.)

NATIONAL BOARD OF FIRE UNDERWRITERS, REGULATIONS FOR OVENS FOR JAPAN, ENAMEL, AND OTHER FLAMMABLE FINISHES, MARCH 15, 1931

OVENS

(These regulations cover the location and arrangement of ovens used in enameling and japanning, construction of oven as regards safety from explosion damage, adequacy of openings for bringing in fire hose in case of fire, constructed of brick, concrete, or of steel and approved noncombustible materials, regulations on type and amount of ventilation, permissible types and installation requirements for heating equipment for ovens, regulations on amount and permissible types of fire-extinguishing equipment.)

UNDERWRITERS' LABORATORIES, STANDARDS FOR CONSTRUCTION AND PERFORMANCE OF FUEL OIL BURNERS FOR DOMESTIC USE, JUNE, 1928

DOMESTIC OIL BURNERS

(These standards apply to burners designed for operation without an attendant constantly on the premises. These standards require that the burners be reliable and uniform in operation and free from hazardous carbonization; that they shall contain no chambers which allow the dangerous accumulation of gases; they shall have no oil conveying pipes or parts which are subject to intense heat. Minimum sizes of oil line connections and tubing are specified; strainers are to be accessible for cleaning with at least 4 square inches of effective screening area per gallon per hour of liquid flow; general regulations on the provision, performance requirements, and permissible types of draft regulators, pumps, packing, unions, valves, antiflooding devices, automatic valves, floats, overflow cups, overflow pipe, base, fire pots, gas pilot lights, electric ignition equipment oil pilot lights, etc. Structural features and safety provisions for steam generators used for atomizing, operating features of preheating and ignition devices, location of vacuum tanks, electrical wiring and equipment installation regulations are also covered.)

UNDERWRITERS' LABORATORIES, STANDARD SPECIFICATIONS FOR GAS GARAGE HEATERS, DECEMBER, 1917

GAS GARAGE HEATERS

(These standards relate to gas heaters with protected combustion chambers and include the following construction requirements.)

HEAT RADIATING DRUM

It should be of sufficient size to permit of ready passing of heat into the circulating air so as to prevent heating the drum to an unsafe temperature. It should be made of rust-resisting metal not less than No. 24 U. S. gage (0.025 inch thick). All joints should be double seamed or made in an

equivalent manner. The bottom of the drum should be at least 6 inches above the floor to permit of proper circulation of heat. Screens for air inlet openings should be mechanically secured in place without the use of solder. Perforated sheets should be used in this connection and the sheets should measure not less than 0.025 inch in thickness and the openings should not be larger than 0.027 inch and should aggregate 400 per square inch. Connections for flue and inlet pipes should not depend upon solder for security. The lowest portion of the drum should be connected with an accessible plugged or capped drain so as to permit of the removal of condensation.

(Other general provisions of these regulations deal with area and accessibility for cleaning of air inlet screens, provision of burners adaptable to both artificial and natural gas, installation of burners and air regulators, location and control of pilot light, and the following requirements for outside casing.)

OUTSIDE CASING

The heat radiating drum should be inclosed at the sides and ends by a casing placed at such distance from the drum that it can not become unduly heated (not less than 2 inches for unlined casing and 1 inch or more for casing lined with asbestos). The material used for such a casing should be galvanized iron and should measure not less than No. 24 U. S. gage (0.025 inch) in thickness over the galvanizing. The edges and corners of this casing should be reinforced and substantial plates provided for the attachment of legs and braces. A screen made of ¼-inch mesh galvanized iron wire should be substantially mounted and mechanically fastened at the top of the outer casing, and should be located at least 6 inches above the top of the heat radiating drum. The bottom of this casing may be open but should not extend more than 3 inches below the plane of the bottom of the drum.

FLUE AND AIR INLET PIPES

Flue and air inlet pipes should be made of not less than No. 26 U. S. gage (0.0187 inch) galvanized iron and should be mechanically secured to the drum. Joints should be made in the form of a hook joint having an offset. These pipes should be not less than 3 inches in diameter. Dampers should be of such design that they will not interfere with the operation of the burner when entirely closed.

(Other requirements in this standard deal with the provision of ventilators or rain caps for flue pipes, structural and operating features of doors, ignition devices, piping and valves.)

UNDERWRITERS' LABORATORIES, PROPOSED STANDARDS FOR OIL BURNER HIGH TENSION ELECTRIC IGNITION SYSTEMS, MAY, 1928

(These standards are the same as given for electric ignition under the Underwriters' Laboratories standards for construction and performance of fuel-oil burners for domestic use. See above.)

UNDERWRITERS' LABORATORIES, STANDARDS FOR CONSTRUCTION AND PERFORMANCE OF OIL-HEATED INCUBATORS (CLASS B), OCTOBER, 1927

OIL HEATERS FOR INCUBATORS

(This standard includes requirements on structural features of the incubator, protection of the end

of incubator case next to heater by heat-insulating material and sheet metal or having a lamp inclosure providing equivalent protection, prevention of direct heat from the oil flame from entering incubator case, insulating of hot-air pipe entering case, stability of case and attachment of legs, and the following requirements for the heater.)

The heater shall be constructed wholly of non-combustible material and installed at the end of the incubator case. It shall be so located that all parts are at least 1 inch from the case and that the center of the burners shall not be less than 5 inches from the end of the case. (Other provisions in the full text of the standard cover sizes of screws to be used and installation requirements of heater and provision and performance of inclosure for lamp.)

Lamps shall be made with seamless bottoms of not less than No. 28 U. S. gage metal suitably protected to retard corrosion. If galvanized, they shall be galvanized after forming, and if of terneplate, deep-drawing metal carrying at least an 8-pound coating shall be employed. Joints between the tops and bottoms shall be made mechanically secure in addition to soldering and so formed that the top will not provide a receptacle for dirt, oil, etc. Braces shall be provided between the tops and bottoms of bowls which will effectually prevent any bellows action.

The handle of the bowl shall be of such size and so located with respect to the filling opening that it will be impossible to replenish the fuel supply while the lamp is installed in the inclosure. (Other provisions include requirements on the sweating-in of bushings, provision of and general requirements for drip pan for each lamp.)

Burners shall be of substantial construction with wick tube and flame slot in proper alignment and must be provided with a guide ring to insure proper engagement with and positive seating of the bottom of the chimney. Chimney shall be made of metal.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED-PRACTICE RECOMMENDATION FOR FORGED TOOLS, R17-31, JULY 1, 1931

CHISELS

(A list of the standard sizes and varieties of track chisels will be found in Table 7 of the simplified-practice recommendation R17-31 for forged tools. Standard sizes and dimensions of blacksmith chisels will be found in Table 8, and standard sizes of rivet buster or side chisel will be found in Table 10 of R17-31. See 616.60, p. 960.)

615.12 DRILLS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR DRILLS, BREAST, NO. 417, JULY 9, 1926. (CURRENT DESIGNATION: GGG-D-651.)

BREAST DRILLS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Shall be the single-speed type of breast drills.

III. MATERIAL AND WORKMANSHIP

These drills shall be made of high-grade material and in accordance with the best commercial practice. They shall be free from all defects or blemishes which may affect their serviceability or appearance.

IV. GENERAL REQUIREMENTS

Breast drills shall have the manufacturer's name or trade-mark stamped or otherwise permanently marked on them.

V. DETAIL REQUIREMENTS

1. Breast drills shall consist of a stock, a spirit level, a breastplate, a chuck, a spindle, two or three gears, a crank, and two wooden handles.

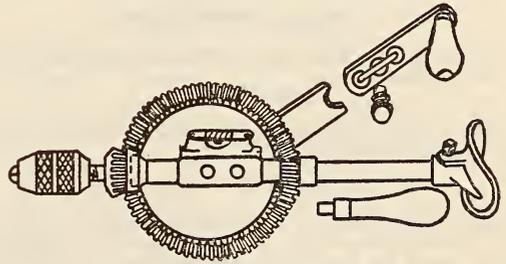

FIGURE 646.—Breast drill

2. The stock shall be made of steel, and shall have mounted thereon a spirit level within a metal case, secured by screws to the stock.

3. The breastplate shall be made of malleable iron, and shall be adjustable and secured to the stock by means of a set screw. It shall be polished on the bearing surface and painted on the underside.

4. The chuck shall be internally threaded to screw on the spindle, and shall be provided with steel jaws capable of securely gripping straight shanks or tapered square shanks of drills from one-eighth inch up to and including one-half inch diameter.

5. The spindle shall be made of one piece of steel and suitably shaped and threaded at one end to accommodate the chuck; the other end shall be provided with a bevel pinion. The spindle shall run on hardened steel balls bearing or hardened-steel ball races. It shall be operated by means of a driving plate gear which shall engage with the bevel pinion on the spindle. The ratio of the gears shall not be less than $4\frac{1}{2}$ to 1.

6. The driving plate gear shall be provided with a steel crank which shall be adjustable to lengths of $5\frac{1}{2}$ to 7 inches. There shall be provided either an idler pinion diametrically opposite the driving pinion or a guard near the driving pinion to counteract the outward thrust of the plate gear.

7. All gears shall be machine cut and shall operate freely. The plate gear shall be neatly finished with a smooth coat of paint, and all exposed metal parts except bearing surfaces shall be nickel plated and polished unless otherwise stated.

8. Two detachable handles shall be provided, one for a crank handle and the other for a grip handle, which shall be threaded to screw in the stock opposite the gear plate. The handles shall be made of hardwood and smoothly finished. The wood portion of the crank handle shall be free to rotate. The wood portion of the grip handle shall be rigidly secured to its shank.

9. These drills shall be similar to the following sketch: Length over all, about 15 inches.

Representative samples shall be taken from each lot delivered and inspected for compliance with this specification.

VII. PACKING AND MARKING

1. Breast drills shall be packed in accordance with the manufacturer's trade practice, unless otherwise specified.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR DRILLS, HAND, WITH HOLLOW HANDLES, NO. 509, JULY 11, 1927. (CURRENT DESIGNATION GGG-D-671.)

HAND DRILLS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

The drills shall be of the hollow-handle type, 0 to $\frac{3}{8}$ inch capacity.

III. MATERIAL AND WORKMANSHIP

The drills shall be made of high-grade material and in accordance with the best commercial practice. They shall be free from all defects or blemishes affecting their appearance or that may affect their serviceability.

IV. GENERAL REQUIREMENTS

See Section V.

V. DETAIL REQUIREMENTS

1. Hand drills shall be composed essentially of a frame, a spindle either two or three gears, a crank, a chuck, and two handles exclusive of the crank handle. Provision shall be made so that all bearing surfaces of these drills may be readily oiled. Each hand drill shall be marked in a permanent manner with the manufacturer's name or known trademark.

2. The frame shall be made of malleable iron or other material equally as suitable for the purpose. The frame shall be so designed as to withstand without injury the maximum strain to which it may be subjected under ordinary service conditions. It shall have a protective coating of paint or enamel.

3. The spindle shall be made of a good grade of steel and the lower portion shall be threaded so as to be a neat fit when screwed into the chuck. The upper portion of the spindle shall be provided with a bevel pinion made of a good grade of steel. The bevel pinion shall have machine-cut teeth. Ball or roller bearings shall be provided to facilitate ease with which the spindle may be operated. The

spindle shall be operated by means of a driving gear which shall engage with the bevel pinion on the spindle. The ratio of the gears shall be not less than 4 to 1.

4. The driving gear shall be made of high-grade iron or steel and shall be provided with a removable crank made of steel, nickel plated. The crank shall be securely held to the driving gear and shall be provided with a well-made hardwood handle. The teeth of the driving gear shall be machine cut and shall operate freely with the teeth of the pinion gear. There shall be provided either an idler pinion gear diametrically opposite the driving pinion gear or a guard near the driving pinion gear to counteract outward thrust of the driving gear. The driving gear shall have a coating of paint or enamel on all exposed surfaces except the teeth and rim. The rim of the gear shall be nickel plated.

5. The chuck shall be made of a good grade of steel or malleable iron, nickel plated on the outside, and shall be approximately $1\frac{1}{2}$ -inch diameter and 2 to $2\frac{1}{2}$ inches long. It shall be threaded internally to screw on the spindle. The chuck shall be knurled on the outside diameter so as to afford a good hand grip. The chuck shall be provided with three hardened tool steel jaws, so designed that the jaws will not become separated when the chuck is removed from spindle. Suitable springs shall be provided to hold the jaws firmly against the tapered bearing on the inside of the chuck. The jaws shall open and close as the chuck is revolved and they shall close evenly and center accurately round shanks from 0 to $\frac{3}{8}$ -inch diameter.

6. The handles of the drills shall be made of cocobola, rosewood, or other hardwood equally as suitable for the purpose. The handles shall be neatly finished and so shaped as to afford a good hand grip. A side handle or knob shall be provided with each drill. This handle shall have a suitable ferrule on the small end and it shall be removable from the frame of the drill. The large or main handle shall be securely fastened to the frame of the drill and a suitable ferrule shall be provided on the small end where it joins the frame. This handle shall be hollowed for holding wood-boring bit or drill points. A removable screw cap of suitable shape to fit the handle shall be a part of each handle. Eight wood-boring drill points ranging in size from one-sixteenth to eleven sixty-fourths inch in diameter shall be furnished with each drill.

7. The drills shall be not less than 13 inches nor more than 16 inches long, and shall weigh approximately 2 pounds.

VI. METHOD OF INSPECTION AND TESTS

1. Representative samples, at least three, shall be taken from each lot and inspected to determine whether the drills comply with this specification.

2. When so requested, bidders under requisitions or schedules shall submit, free of expense to the Government, for examination and test, sample hand drills similar to those they propose to furnish. Samples shall remain the property of the exhibitors, but a sample may be accepted as part of a delivery in the case of a successful bidder. However, the right is reserved to destroy the sample submitted if such action is considered necessary to determine the quality of material and method of manufacture, in which case no expense to the Government shall accrue. If award is made on samples submitted, it will be with the understanding that the hand drills furnished shall be equal in all respects to samples.

VII. PACKING OF SHIPMENTS

Hand drills shall be packed in accordance with the manufacturer's trade practice unless otherwise specified.

615.13 PUNCHES.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR FORGED TOOLS, R17-31, JULY, 1931

PUNCHES

(Standard sizes and varieties of tie plug punches and of track punches will be found in Table 7 of simplified practice recommendation R17-31 for forged tools. Standard sizes of blacksmith punches will be found in Table 8 and standard sizes of backing-out punches will be found in Table 10 of R17-31. See 616.60, p. 960.)

615.14. REAMERS.

(No nationally recognized specifications available.)

615.15. TAPS AND DIES.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, TAPS, CUT AND GROUND THREADS, B5e-1930

[Approved by American Standards Association, 1930]

TAPS

(Same as National Screw Thread Commission, given below, except for taper-tap and nut-tap cut threads, the maximum and minimum pitch diameters and major diameters of which are slightly smaller for coarse threads in the A. S. M. E. specification than in the N. S. T. C. report.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, DIE-HEAD CHASERS. BUREAU OF STANDARDS PUBLICATION SIMPLIFIED PRACTICE RECOMMENDATION R51-29, 1929

DIE-HEAD CHASERS

(For self-opening and Adjustable Die Heads)

A joint conference of manufacturers, distributors, and users of chasers for self-opening and adjustable die heads, held on December 4, 1925, drafted a simplified practice recommendation which was later accepted by the industry. This recommendation as revised by subsequent meetings of the standing committee on December 20, 1927, and May 20, 1929, and approved by the industry for promulgation by the Department of Commerce, establishes

the following simplified list of stock sizes and varieties:

NOTE.—While self-opening die heads have a diameter adjustment, all chasers not stamped as indicated in the following tables will be regarded as specials.

The stockable sizes shown are for right-hand threads only.

TABLE 1

American national coarse-thread series				American national fine-thread series			
Size	Threads per inch	Size	Threads per inch	Size	Threads per inch	Size	Threads per inch
5 1/8	40	3/4	10	6	40	7/8	14
6	32	7/8	9	8	36	1	14
8	32	1	8	10	32	1 1/8	12
10 1/2	24	1 1/8	7	12	28	1 1/4	12

9/16	12	2 3/4	4	5/8	18	3	8
5/8	11	3	4	3/4	16		

- 1 Identical with size 1/8-40.
- 2 This size should be used in place of size 3/16-24.
- 3 This size should be used in place of size 14-20.
- 4 This size should be used in place of size 3/16-32.
- 5 This size should be used in place of size 14-28.

The American national coarse-thread series is the "U. S. standard" threads, supplemented in the sizes below one-fourth inch by sizes taken from the standard established by the American Society of Mechanical Engineers. The fine-thread series is composed of standards that have been found necessary and consists of sizes taken from the standards of the Society of Automotive Engineers and the fine-thread series of the American Society of Mechanical Engineers.

(For both coarse and fine thread series, see National Screw Thread Commission, screw threads, 608.0, p. 529.)

TABLE 1A

S. A. E. standard spark plug thread		Regular bushing thread for spark plugs	
Size	Threads per inch	Size	Threads per inch

REFERENCES.—For detailed dimensions of pipe threads, see the 1928 Report of the National Screw Thread Commission, which is No. 89 of the Miscellaneous Publications of the National Bureau of Standards, or the 1919 Publication No. 3 of the American Standards Association.

RIGHT-HAND AND LEFT-HAND THREADING

While the question of right-hand and left-hand threading was not made the subject of a definite recommendation by the general conference, it developed during the period of acceptance of the proposed simplified practice that the industry is defi-

nitely of the opinion that in addition to the desirability of concentrating on thread sizes shown in the tables, it is important to make sure that all threads are "right-hand" except in very special cases where a left-hand thread is desirable. Left-hand threads are usually made to order by die-head manufacturers, and the demand is very small. A thread is always to be considered "right-hand" unless otherwise specifically stated.

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION; TAP SPECIFICATIONS, BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, JUNE 22, 1928

TAPS

1. TAP DIMENSIONS AND TOLERANCES

The dimensions and tolerances for cut and ground thread machine-screw, hand, taper, nut, and pulley taps given in Tables 99 to 103, inclusive, were prepared with the cooperation of a committee of representative tap manufacturers and users, and represent present practice for the production of tapped holes of the classes indicated below. These standards may, therefore, be regarded as representing the best present commercial practice. They should be regarded as suggestive only and in no way mandatory.

The use, however, of taps that are in conformity with these tables should not be taken as a guaranty that the tapped holes produced thereby will necessarily fall within any given class of fit. Taps may cut oversize an amount depending on the cutting speed, condition of the tapping machine, lubrication or cooling agent, relief and chamfer of tap, and other factors. In general, cut-thread taps made to these specifications, when used under normal conditions, should in the majority of cases produce holes within class 2 free-fit tolerances; ground-thread taps, within class 3, medium-fit tolerances.

The general dimensions contained in these tables do not pertain to screw threads, but are essential to the complete standardization of taps.

The point of measurement for the pitch diameter for all taps shall be at the first full thread.

The form of thread at the minor diameter is the American national form of thread, or sharper.

The maximum lead errors permitted are ±0.0030 inch in 1 inch of thread for cut-thread taps, and ±0.0005 inch in 1 inch of thread for ground-thread taps.

All taps have center holes at both ends, with the exception that cut thread taps up to and including five-sixteenths inch are pointed on the thread end.

Clearance on a ground thread tap may be provided by a slight radial relief or a back taper of 0.0005 to 0.0010 inch per inch.

TABLE 100.—Dimensions of hand taps, cut and ground threads, American national coarse and fine thread series

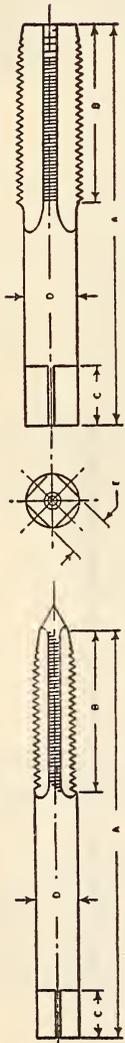

FIGURE 648.—Hand taps

Sizes, and threads per inch	Thread dimensions										General dimensions

2. TOLERANCES FOR TAPS FOR SPECIAL THREADS

Tables of tolerances for two classes of taps for threads of special diameter and pitch are given, namely, cut-thread taps and ground-thread taps. (See Tables 104 and 105.)

The selection of the tap will depend upon the pitch-diameter tolerance on the tapped hole. A tap should be selected whose tolerance does not exceed 75 per cent of the pitch-diameter tolerance on the tapped hole.

TABLE 104.—Tolerances for cut-thread taps, special diameters and pitches

From—	To—	Coarser pitches than American national fine-thread series				Finer pitches than American national fine-thread series			
		Major diameter		Pitch diameter		Major diameter		Pitch diameter	
		Minimum = basic major diameter plus	Minimum = minimum pitch diameter of hole plus	Tolerance, plus	Maximum = minimum pitch diameter of hole plus	Minimum = basic major diameter plus	Minimum = minimum pitch diameter of hole plus	Tolerance, plus	Maximum = minimum pitch diameter of hole plus
1	2	3	4	5	6	7	8	9	
1/4	3/8	0.0030	0.0005	0.0020	0.0025	0.0020	0.0005	0.0015	0.0020

615.3 PINCERS, PLIERS, PLIER CUTTERS, AND SHEARS.

615.31 PINCERS.

(No nationally recognized specifications available.)

615.32 PLIERS AND PLIER CUTTERS.

(No nationally recognized specifications available.)

615.33 SHEARS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR SHEARS, TINNERS' HAND (SNIPS), NO. 451, NOVEMBER 22, 1926. (CURRENT DESIGNATION: GGG-S-291.)

TINNERS' HAND SHEARS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES

The shears shall be of the following types: A, straight cut; B, circular cut.

III. MATERIAL AND WORKMANSHIP

The shears shall be of high-grade material and workmanship. They shall be smoothly finished and

free from all defects or blemishes affecting their appearance or that may affect their serviceability.

IV. GENERAL REQUIREMENTS

Shears shall have the maker's name or known trade-mark stamped or permanently marked thereon and shall be furnished left-hand cut unless otherwise specified.

V. DETAIL REQUIREMENTS

1. *Tinner's hand shears, straight cut, type A.*—These shears shall be made entirely of steel, with a durable cutting edge. The blades may be bimetallic with high-grade tool-steel cutting edge and mild-steel body. If bimetallic form of blade is furnished, the tool-steel cutting edge shall be such as to permit any number of grindings which may be required during the life of the shears. The cutting edges of all shears shall be suitably beveled and properly hardened, tempered, and ground. The blades shall be firmly held together with a finished steel bolt and nut, and adjustable in such manner as to insure easy and smooth cutting when the shears are in use. The bolt shall be flattened on the nut end or otherwise designed to prevent turning or working loose when the shears are operated. The bearing between the blades shall be accurately finished and of ample width to prevent the blades from springing open when cutting the maximum thickness of sheet steel or iron for which the shears are designed.

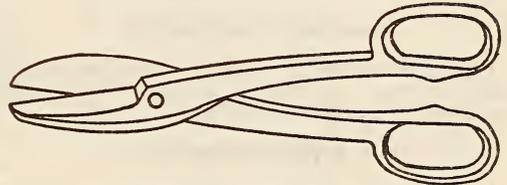

FIGURE 653.—Tinner's hand shears

2. The handles shall be bow shaped and shall provide a comfortable grip for the hand. The handles shall have a japan or enamel black finish.

3. The shears shall be similar to Figure 653 and of the weight and dimensions stated below:

Minimum weight.....	1 pound 14 ounces.
Length of cut.....	3 1/2 inches.
Minimum length over all.....	13 1/2 inches.

4. *Tinner's hand shears, circular cut, type B.*—These shears shall be similar, in all respects, to straight-cut shears, type A, except that the cutting edges shall be curved to approximately a 3 3/8-inch radius.

VI. METHOD OF INSPECTION AND TESTS

Representative samples, at least three, shall be taken from each lot submitted for inspection and tested as follows:

Each shear shall be used in cutting a dozen strips, about one-half inch wide by 12 inches long, from low-carbon sheet steel of a minimum thickness of 0.0201 inch. In this test the shears shall cut along the entire length of the blade. Two of the above-mentioned strips shall then be cut into one-half inch lengths or squares by placing them (one at a time) at the ends of the blades about 3 inches from the bolt. All cuts shall be made without unnecessary pressure being applied to the shear handles and without the blades springing apart or allowing the sheet steel to bend or wedge between the cutting surfaces of the shears. As a further evidence that the cutting edges are properly hardened and tempered, each pair of shears shall be required to sever a com-

mercial (common type) sixpenny wire nail (0.113 inch in diameter) without marring the cutting edges.

VII. PACKING AND MARKING

Packing and marking shall be in accordance with best commercial practice unless otherwise specified.

615.39 MISCELLANEOUS CUTTING TOOLS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR CUTTERS, PIPE, NO. 437, SEPTEMBER 25, 1926. (CURRENT DESIGNATION: GGG-C-771)

PIPE CUTTERS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Pipe cutters shall be of the 3-wheel cutter type.

III. MATERIAL AND WORKMANSHIP

Pipe cutters shall be made of good quality material and shall be of good workmanship and in accordance with best commercial practice.

IV. GENERAL REQUIREMENTS

Each pipe cutter shall have the manufacturer's name or known trade-mark stamped or otherwise permanently marked on the frame.

V. DETAIL REQUIREMENTS

1. Pipe cutters shall consist of a frame, a movable jaw, a threaded feed rod with handle, and three

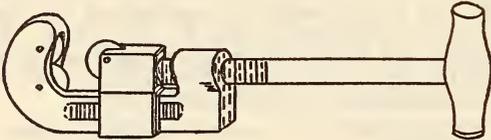

FIGURE 654.—Pipe cutters

cutter wheels. All parts of pipe cutters shall be fastened together so that no part may become detached while in use under ordinary service conditions.

2. The frame shall be made of malleable iron or steel and shall be finished where the movable jaw fits over the frame so that alignment of the cutters will be insured. The frame shall carry either one or two of the three cutter wheels, and shall be either tapped for insertion of the threaded feed rod or

there shall be a hardened nut fitted to engage with the threads of the feed rod, and held firmly in the frame so that it is immovable when adjustment is made.

3. The cutter wheels shall be made of tool steel, hardened and tempered; the hubs shall have ample bearing surface on the pins, or by other suitable means provision shall be made to hold the cutter wheels in alignment.

4. The movable jaw shall consist of one piece of steel or malleable iron and shall be equipped with one or two cutter wheels. The jaw shall be finished where sliding contact is made with the frame, and the jaw and frame shall not bind when adjustment is made.

5. The threaded feed rod shall be made of steel and shall have suitable threads to engage with the tapped hole in the frame or nut as required. This rod shall be fitted to the movable jaw so as to operate without possibility of becoming detached. A handle of malleable iron or steel shall be firmly fixed on the cutter end of the feed rod.

6. Pipe cutters shall be similar to Figure 654 and conform to the table below. The illustration is incorporated in this specification for the convenience of the supply officers and others interested. It is not intended that the illustration shall restrict purchase of pipe cutters that are otherwise in accordance with specifications.

No.	Pipe capacity	Minimum weight
	Inches	Pounds
1.....	$\frac{1}{8}$ to 1	3
2.....	$\frac{1}{2}$ to 2	$4\frac{1}{4}$
3.....	$1\frac{1}{2}$ to 3	7

VI. TESTS

A sufficient number of pipe cutters of each size shall be selected and each shall operate satisfactorily when cutting pipe of the respective sizes indicated above. The adjustment of each pipe cutter shall operate smoothly in both directions between the maximum and minimum limits.

VII. PACKING AND MARKING

1. Pipe cutters shall be packed in accordance with the best commercial practice unless otherwise specified.

615.4 VISES, WRENCHES, AND VISE CLAMPS.

WRENCH HEAD BOLTS AND NUTS AND WRENCH OPENINGS**WRENCH OPENINGS**

Wrench openings for open-end wrenches are given in Table 76. The sizes given in the table for the maximum and minimum columns are sizes of "go" and "not go" gage blocks used for inspecting wrenches and are not product sizes.

Wrenches should be marked with the basic width across flats (maximum width of nut), as shown in column 1.

TABLE 76.—Open-end wrench openings

Basic width across flats, bolt-heads and nuts	Clearance	Tolerance	Dimensions of measuring blocks for wrench openings	
			Maximum	Minimum

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BLADES, HACK SAW, NO. 415A, OCTOBER 1, 1928. (CURRENT DESIGNATION: GGG-B-451)

HACK-SAW BLADES

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES

Hack-saw blades shall be of the following types: A, hand frame blades, all hard; B, hand frame blades, flexible; C, machine blades, all hard; D, machine blades, all hard, for cutting corrosion-resisting steel.

III. MATERIAL AND WORKMANSHIP

Hack-saw blades shall be made of high-grade material and be free from all defects affecting their appearance or serviceability. They shall be of high-grade workmanship and made in accordance with the best commercial practice.

IV. GENERAL REQUIREMENTS

The teeth shall be accurately cut, evenly spaced, of uniform height, and properly set. The maximum set shall be not greater than is necessary for free, smooth, and rapid cutting. The length of blades shall be the distance from center to center of holes. The ends of all blades shall be in the annealed state in order to preclude probability of holes pulling out or the ends breaking when the saw is in tension between holders. Each hack-saw blade shall be stamped or otherwise permanently marked with the maker's name, brand, or trade-mark.

V. DETAIL REQUIREMENTS

1. *Hand-frame blades, all hard, type A.*—These blades shall be uniformly hardened throughout except the ends. They shall be made of alloy tool steel. They shall conform to dimensions in the following table:

Hand-frame blades, all hard

Length	Width	Thickness	Teeth per inch
<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	
8	$\frac{7}{16}$	0.025	18
10	$\frac{1}{2}$.025	18
10	$\frac{1}{2}$.025	24
12	$\frac{1}{2}$ or $\frac{9}{16}$.025	14
12	$\frac{1}{2}$ or $\frac{9}{16}$.025	24

NOTE.—A plus or minus tolerance of $\frac{3}{16}$ inch in distance between holes and a plus or minus tolerance of 0.003 inch in thickness will be allowed.

2. *Hand-frame blades, flexible, type B.*—These blades shall have soft backs and shall be hardened on the cutting edge only. They shall be identical otherwise to the type A all hard hand-frame blades as described under Section V 1 above. They shall conform to dimensions in the following table:

Hand-frame blades, flexible

Length	Width	Thickness	Teeth per inch
<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	
8	$\frac{7}{16}$	0.025	18
8	$\frac{7}{16}$.025	32
10	$\frac{1}{2}$.025	18
10	$\frac{1}{2}$.025	32
12	$\frac{1}{2}$ or $\frac{9}{16}$.025	14
12	$\frac{1}{2}$ or $\frac{9}{16}$.025	32

NOTE.—Flexible blades with soft centers will be accepted under this type, provided they are otherwise in accordance with specifications.

3. *Machine blades, all hard type C.*—These blades shall be uniformly hardened throughout except the ends. They shall be made of alloy tool steel. They shall conform to dimensions in the following table:

Machine blades, all hard

Length	Width	Thickness		Teeth per inch
		Minimum	Maximum	
<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	
12	$\frac{5}{8}$	0.029	0.035	14
14	$\frac{3}{4}$.046	.068	14
14	1	.046	.068	10
17	1	.046	.068	10

NOTE.—A plus or minus tolerance of $\frac{1}{2}$ inch in distance between holes will be allowed.

4. *Machine blades, all hard, for cutting corrosion-resisting steel, type D.*—These blades shall be similar to type C blades as described under Section V 3 above except that they shall be suitable for cutting corrosion-resisting steel and shall conform to dimensions in the following table:

Machine blades, all hard, for cutting corrosion-resisting steel

Length	Width	Thickness		Teeth per inch
		Minimum	Maximum	
<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	
14	1	0.058	0.068	10
17	1	.058	.068	10

NOTE.—A plus or minus tolerance of $\frac{1}{2}$ inch in distance between holes will be allowed.

VI. METHOD OF INSPECTION AND TEST

1. *Tests.*—Selective tests, as described herein, will be conducted to determine the work values of hack-saw blades submitted by the various manufacturers. The results obtained in these tests will be entered on the lists of work values maintained by the department concerned. Separate lists will be maintained, respectively, of the average work values for types A and B hand-frame blades, the work values for type C machine blades, and the work values for type D blades for cutting corrosion-resisting steel. Each list will also contain the name of the manufacturer, brand name, and the type or types of hack-saw blades represented by the respective work values.

Work value tests will be conducted on the following representative types and sizes of hack-saw blades conforming to this specification:

Type	Length	Teeth per inch
	<i>Inches</i>	
A-----	12	14
B-----	12	14
C-----	17	10
D-----	17	10

2. Hack-saw blades will be tested for work values in machines operated under uniform conditions for the respective type of blades, as follows:

Type	Tension on blade	Maximum feed pressure during stroke	Strokes per minute
A and B-----	<i>Pounds</i>	<i>Pounds</i>	
C-----	275	12	60
D-----	550	60	60
D-----	550	125	60

The types A, B, and C blades will be used to cut disks from annealed tool steel 3 inches in diameter of a grade specified by the department concerned. The type D blades will be used to cut disks from 3-inch diameter high nickel corrosion-resisting steel of a grade specified by the department concerned. All cutting shall be done without a lubricant.

3. Work values will be determined by testing three blades of each of the above types and sizes. Each blade will be tested to failure. Except when a blade is damaged accidentally, failure will be considered to have occurred when the blade cuts at an

angle, cuts at an excessively slow rate, suffers breakage of body or teeth, or becomes otherwise unfit for useful service in the machine used for testing.

4. Records of the tests will contain data on the number of strokes required to cut off each disk from the bar and the number of disks removed by each blade before failure occurs.

5. The work value for any set of three blades of the same type and description will be computed from the test data, as follows:

Blade No.	Number of disks removed before failure	Average strokes per disk
1	A	D
2	B	E
3	C	F

$$\frac{\text{Total number of strokes made by blade No. 1 before failure}}{A} = D$$

$$\frac{\text{Total number of strokes made by blade No. 2}}{B} = E$$

$$\frac{\text{Total number of strokes made by blade No. 3}}{C} = F$$

$$\frac{A+B+C}{3} = \text{Average disks per blade, } G$$

$$\frac{D+E+F}{3} = \text{general average strokes per disk, } H$$

$$\text{Work value} = \frac{G \times 10,000}{H}$$

6. The method of averaging the work value of hand-frame blades types A and B is as follows:

$$\text{Average work value for hand frame} = \frac{\text{Work value, type A} + \text{work value, type B}}{2}$$

7. *Inspection.*—From every four gross of blades under inspection or from the total number if less than four gross, three blades of each type and size shall be taken at random for test. Blades having 18 teeth per inch or less shall, under conditions of the original test, show a work value equal to that of blades of like description originally tested.

Hand-frame blades having more than 18 teeth per inch shall be tested as follows:

Teeth per inch	Test
24	6 cuts through commercial brass pipe, 3/4-inch iron pipe size.
32	6 cuts through commercial hard drawn brass tubing, wall thickness 0.041 to 0.057 inch.

Blades shall complete the six cuts without breakage of body or teeth.

If blades with 18 teeth or less fail under test to equal the original work value of blades of like description, or if 10 per cent of the number of sample blades with more than 18 teeth per inch, taken at random for test, fail to meet the tests specified, the entire shipment shall be rejected.

8. The right is reserved to reject bids on brands of handsaw blades which have not been subjected to the required tests and on those of which tests have been authorized but not completed by opening date of the bids. The attention of manufacturers is called to this requirement, and they are urged to forward as early as practicable samples of hack-saw blades which they propose to offer to the department concerned in the future in order that tests may be made. These tests will be conducted at the expense of the manufacturers. Information with reference to the expense involved and as to where the sample

should be sent will be supplied upon application to the department of the Government issuing the specification and invitation for bids. Hack-saw blades not marked in a permanent manner with the brand name, name, or trade-mark of the manufacturer will not be tested.

VII. PACKING AND MARKING OF SHIPMENTS

Hack-saw blades shall be packed and marked in accordance with best commercial practice, unless otherwise specified.

VIII. NOTES

1. Award of contract will be made to the bidder offering hack-saw blades having the highest selective factor and purchase of which it is considered would be to the best interest to the department concerned. Selective factors for hand-frame blades will be based on the average work values for hand-frame blades and the average price per dozen quoted for the respective makes of hand-frame blades. Selective factors for machine blades will be based on the work value for machine blades and the average price per dozen quoted for the respective makes of machine blades. Selective factors are computed by dividing the work value attained by each manufacturer's product in tests described in Section VI hereunder by the average price per dozen as quoted in his bid.

2. Hack-saw blades described in this specification are intended to cover the general needs of the Government. It is possible that other types and sizes may be needed from time to time. In such cases, requisitions should state the reasons for requiring the other types and sizes and wherein the hack-saw blades described in specification will not be suitable.

3. Requisitions should state type of blades, length, and number of teeth desired.

4. Typical uses of blades covered by this specification are as follows:

(a) Type A hand-frame blades, all hard are suitable for general purposes.

(b) Type B hand-frame blades, flexible, are suitable where awkward cutting positions are encountered and for use by unskilled workers, because of their flexibility and ability to withstand abuse.

(c) For hand-blades types A and B, recommended uses for the different teeth per inch are as follows:

- 14 teeth: For cutting soft steel, bronze, copper, and aluminum.
- 18 teeth: For cutting tool steel, cast iron, and brass.
- 24 teeth: For cutting iron-pipe, heavy tubing, and electrical conduit.
- 32 teeth: For cutting thin tubing and metal sheets of 0.050 inch thickness and under.

NOTE.—All hard blades preferable for cutting tool steel, cast iron, or brass.

(d) Type C machine blades are suitable for general purposes.

(e) Type D machine blades are suitable for cutting corrosion-resisting steel having a high nickel content and to meet other severe conditions that type C blades are not capable of withstanding.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FRAMES, HACK SAW, GGG-F-671, NOVEMBER 10, 1931

HACK-SAW FRAMES

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPES

B-1. Hack-saw frames shall be furnished in the following types, as specified: Type A, straight-handle, adjustable; type B, pistol-grip handle, adjustable; and type C, heavy, deep throat, solid.

C. MATERIAL AND WORKMANSHIP, ETC.

C-1. *Material*.—Hack-saw frames shall be made throughout of high-grade material suitable for the purpose.

C-2. *Workmanship*.—Shall be first class.

D. GENERAL REQUIREMENTS

D-1. *Marking of frames*.—All hack-saw frames shall be marked in a plain and permanent manner with the manufacturer's name or with a trade-mark of such known character that the source of manufacture may be readily determined.

D-2. *Handles*.—All handles shall be suitably shaped so as to provide a comfortable grip to the hand.

D-3. *Finish*.—All frames shall be smoothly finished. Except where made of stainless or corrosion-resisting material each frame shall be heavily plated in accordance with the best commercial practice with nickel, cadmium, chromium, or other equally suitable material which will resist corrosion and tarnishing.

D-4. *Threaded parts*.—A full thread shall be provided for all threaded parts. Such parts shall fit neatly together without undue looseness.

D-5. *Saw grips*.—Each frame shall have two saw grips, one at either end, for rigidly holding the blade in alignment under all service conditions. Means shall be provided for allowing the grips to be turned to any of four positions 90° apart, and for retaining them in these positions when the saw is tightened. While under a tension of 50 pounds between the saw grips, they shall retain the position to which they may be set without turning or damage to any part of the frame when a torsion strain of 35 inch-pounds is applied to either or both of the grips.

Each grip shall be fitted with a pin approximately one-eighth inch (0.124 to 0.130 inch) in diameter, driven through and rigidly secured to the grip to hold the blade, and inclined at a slight angle so as to force the blade against the grip when tightened. Both grips shall be machined to provide a flat bearing surface for the blade.

E. DETAIL REQUIREMENTS

E-1. *Type A*.—*Straight handle, adjustable, hack-saw frames*.

E-1a. *Design*.—These frames shall have a handle in normal alignment with the blade. The handle shall be made of hardwood of a suitable quality that will resist splitting. The handle shall be smoothly finished and protected from the absorption of moisture by a coating of varnish, paint, or enamel. The frames shall be adjustable to accommodate hack-saw blades of 8-inch, 10-inch, and 12-inch lengths and so designed that all parts of the frame shall be held together when the blade is not in place. Tension shall be applied to the blade either by means of a threaded sleeve within the handle engaging a threaded section of the rear saw grip or by a thumb nut engaging a threaded section of the forward saw grip.

E-1b. *Handle-tension style*.—In the case of the handle-tension style of frame, the sleeve within the handle shall be made of steel and secured to prevent it from turning or being withdrawn from the handle under service conditions. The end of the sleeve shall be flush with the end of the handle or bear upon a heavy ferrule secured in such manner that the tension of the blade shall not tend to withdraw

sleeve from handle. A friction washer shall be provided between the handle and the frame. The length of the threaded section of the sleeve shall not be less than the nominal diameter of the threaded section of the saw grip.

E-1c. *Thumb-nut tension style*.—If the thumb-nut-tension style of frame is provided, the rear saw grip shall be rigidly secured to the handle. The rear saw grip shall be held in position either by a shoulder or by a ferrule on the handle bearing on the frame. If the grip is held in position by a ferrule bearing on the frame, a pin shall pass through the ferrule and the grip to prevent the grip from being withdrawn from the handle. The length of the threaded section of the thumb nut shall be not less than the nominal diameter of the threaded section of the saw grip on which it operates. A friction washer shall be provided between the thumb nut and the frame.

E-1d. *Dimensions, weight, strength, etc.*—Type A hack-saw frames shall be similar to illustration Figure 656. They shall conform to the dimensions and weights and withstand without indications of weakness of any nature the proof test outlined in Table 1.

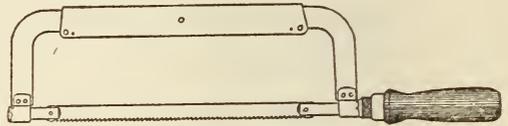

FIGURE 656

TABLE 1

Capacity (blade length)	Depth from teeth of blade to nearest inside edge or projection of frame		Weight complete		Tension between saw grips (minimum)
	Minimum	Maximum	Minimum	Maximum	
8, 10, 12 inches.....	Inches 2 $\frac{1}{8}$	Inches 3 $\frac{3}{8}$	Ounces 15	Ounces 18	Pounds 275

E-2. *Type B*.—*Pistol grip, adjustable, hack-saw frames*.

E-2a. *Design*.—These frames shall have a pistol-grip type of handle set at an angle of not less than 25° or more than 35° with relation to a perpendicular line drawn at right angles to the longitudinal axis of the frame and blade. Unless otherwise specified the handles shall be made of steel, malleable iron, or of a suitable composition which will withstand, without flaking off or breakage, a drop of 5 feet on a concrete floor. When specifically required the handles shall be of steel or malleable iron or of a nonconducting material which will withstand the above-mentioned drop test. Nonconducting styles of handles shall be designed so that no metal will be exposed at the handle end. Composition handles shall be supported by a steel shank securely fastened to the frame and extending into the handle a distance of not less than 2 inches. All handles of this type of frame shall be knurled or impressed to provide a secure grip. These frames shall be adjustable to accommodate hack-saw blades of 8-inch, 10-inch, and 12-inch lengths and so designed that all parts of the frame shall be held together when the blade is not in place. Tension shall be applied to the blade by means of a thumbscrew engaging a threaded section of one of the saw grips. If thumb nut is located on the rear saw grip sufficient clearance shall be provided between the handle and the thumb nut or

the end of the saw grip to preclude the operator's hand or fingers coming in contact with the thumb nut or the end of the saw grip under normal service conditions. The length of the threaded section of the thumb nut shall be not less than the nominal diameter of the threaded section of the saw grip on which it operates. A friction washer shall be provided between the thumb nut and the frame.

E-2b. *Dimensions, weight, etc.*—Type B hack-saw frames shall be similar to illustration Figure 657. They shall conform to the dimensions and weights and withstand without indications of weakness of any nature the proof test outlined in Table 2.

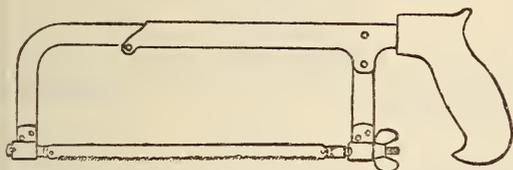

FIGURE 657

TABLE 2

Capacity (blade length)	Depth from teeth of blade to nearest inside edge or projection of frame		Weight complete		Tension between saw grips (minimum)
	Minimum	Maximum	Minimum	Maximum

E-3. *Type C.—Heavy, deep-throat, fixed, hack-saw frame.*

E-3a. *Design.*—These frames shall be fitted with the conventional style of carpenters handsaw handle secured to the frame by means of three telescopic oval head screws, the body diameters of which shall

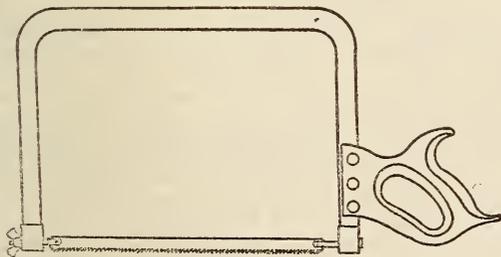

FIGURE 658

be not less than three-sixteenths inch. The handles shall be made of beech or other tough hardwood equally suited for the purpose. The grip portion of the handle shall set at an angle of not less than 40° or more than 50° with relation to the vertical portion of the frame to which the handle is secured. These frames shall be of the solid style to accommodate hack-saw blades of 12-inch length. Tension shall be applied to the blade by means of a thumb-screw engaging a threaded section of the forward saw grip. The length of the threaded section of the thumb nut shall be not less than the nominal diameter of the threaded section of the saw grips on which it operates. A friction washer shall be provided between the thumb nut and the frame.

E-3b. *Dimensions, weight, etc.*—Type C hack-saw frames shall be similar to illustration Figure 658. They shall conform to the dimensions and weights, and withstand without indications of weakness of any nature the proof test outlined in Table 3.

TABLE 3

Capacity (blade length)	Depth from teeth of blade to inside edge of frame		Weight complete		Tension between saw grips (minimum)
	Minimum	Maximum	Minimum	Maximum

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. All hack-saw frames shall be inspected to determine whether they conform to this specification. In addition to a careful surface inspection at least three samples (in no instance less than 2 per cent of the entire quantity under inspection) shall be taken at random for those under inspection and

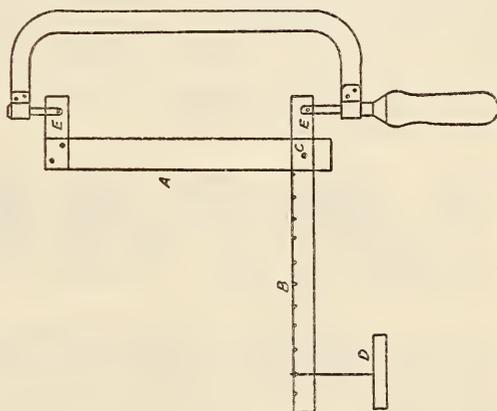

FIGURE 659

subjected to the test outlined hereunder to determine whether the frames meet the minimum strength requirements of this specification.

Center punch marks shall be applied near either end of the frame, preferably between the rivets securing the grip holders in place. The distance between these two punch marks shall be measured while the frame is subjected to a tension of 20 pounds between the grips. The contraction of the frame shall be not more than one-fourth inch when this tension is increased from 20 to 275 pounds and there shall be no permanent set when the load is decreased from 275 pounds to 20 pounds as indicated by a difference in the distance between punch marks at 20 pounds tension before and after the application of the 275 pounds tension. The adjustable frames types A and B shall be set to maximum capacity (for 12-inch blade) when subjected to the above strength test, and care shall be exercised to see that the load is applied to the saw grips.

NOTE.—The apparatus as shown in Figure 659 may be used and is approved for conducting the tension test on these frames.

G. PACKAGING, PACKING, AND MARKING

G-1. *Packaging.*—Unless otherwise specified, commercial packages are acceptable, provided that

not more than six frames shall be contained in any one box or package.

G-2. *Packing*.—Unless otherwise specified the subject commodity shall be delivered in standard commercial containers so constructed as to insure acceptance by common or other carrier, for safe transportation, at the lowest rate, to the point of delivery.

G-3. *Marking*.—Each box or package shall be plainly marked with the name of the article, the size, the quantity contained therein, and the name of the manufacturer.

G-3a. Unless otherwise specified, shipping containers shall be marked with the name of the article, the type, the size, and the quantity contained therein, as defined by the contract or order under which shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. The illustration is included for the convenience of those interested, and is not intended to preclude the purchase of hack-saw frames which are otherwise in accordance with this specification.

I-2. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids, and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATIONS FOR SAWS, NO. 480, APRIL 25, 1927. (CURRENT DESIGNATION: GGG-S-61)

(In this specification are included requirements for metal cutting band saws and for hand hack saws, wood cutting. See 616.17, p. 951.)

615.63 RASPS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR FILES AND RASPS, R6, NOVEMBER 1, 1923.

RASPS

(Simplified practice recommended and accepted by industry establishing a limited list of standard sizes and types.)

Cabinet rasps:

Second cut---} 6, 8, 10, 12, and 14 inch.
Smooth-----}

Half-round wood rasps:

Bastard-----} 6, 8, 10, 12, 14, and 16 inch.
Smooth-----}

Flat-wood rasps:

Bastard-----} 8, 10, 12, 14, and 16 inch.
Smooth-----}

Shoe rasps:

Flat-----} 8, 9, and 10 inch.
Half-round--}

Horse rasps, plain:

½ file, 12, 14, 15, 16, and 18 inch.
Slim (½ file), 16, 18, and 20 inch.

Horse rasps, tanged:

Regular, 12, 13, 13, 15, and 16 inch.

Slim, 14, 15, and 16 inch.

Thin, 12, 13, 14, 15, and 16 inch.

615.64 SCRIBERS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SCRIBERS, MACHINISTS', NO. 441, OCTOBER 28, 1926. (CURRENT DESIGNATION: GGG-S-111)

SCRIBERS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Machinists' scribers shall be of the double-point type.

III. MATERIAL AND WORKMANSHIP

Machinists' scribers shall be of the best material and workmanship and made in accordance with the best commercial practice. They shall be free from all defects or blemishes affecting their appearance or that may affect their serviceability.

IV. GENERAL REQUIREMENTS

See Section V.

V. DETAIL REQUIREMENTS

1. Machinists' scribers shall be marked in a permanent manner with the manufacturer's name or known trade-mark. They shall be made from a good grade of tool steel suitable for the purpose, and so designed as to be easily held, when in service, without cramping or turning in the fingers. The points of these scribers shall be properly hardened and tempered in such manner that they will not break off or bend under ordinary service conditions. One end of the scriber shall be straight and ground to a long, smooth, tapered sharp point not less than 1 inch long. The opposite end shall be bent at right angles to the scriber and ground to a smooth tapered, sharp point not less than three-eighths inch long, measured from the axis of the scriber proper to the end of the bent point. The total length of these scribers shall be approximately 9 inches. The round steel used in the manufacture of the scribers shall be not less than one-eighth inch in diameter. The knurled grip sleeve shall be not less than one-fourth inch diameter and not less than 2½ inches long. The grip sleeve may be adjustable along the scriber or may be fixed. If adjustable, the sleeve shall be provided with a locking nut so designed as to securely hold the sleeve to any desired location on the scriber. If fixed grip sleeves are provided, they shall be located at the center of the scriber and so designed as to firmly hold each point in position.

2. A tolerance of plus or minus 1 inch will be allowed in the over-all length.

VI. METHOD OF INSPECTION

Representative samples, at least three, shall be taken from each lot and inspected for compliance with this specification.

VII. PACKING AND MARKING

Packing and marking shall be in accordance with best commercial practice unless otherwise specified.

615.7 TINNERS' AND COPPERSMITHS' TOOLS.

615.71 SOLDERING COPPERS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR COPPERS, SOLDERING, NO. 439, SEPTEMBER 25, 1926. (CURRENT DESIGNATION: GGG-C-571)

SOLDERING COPPERS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES

Soldering coppers shall be of the following types, as required: A, regular tinner's point (pyramid), and B, flat point (wedge).

III. MATERIAL AND WORKMANSHIP

The entire copper, exclusive of handle and handle rod, shall be made of commercially pure wrought copper, free from cracks, seams, or imperfections. Workmanship shall be in accordance with the best commercial practice.

IV. GENERAL REQUIREMENTS

1. The cross section of the copper shall be approximately square, with chamfered edges. Weight per pair, including the iron handle, shall be not less than specified in contract or order.
2. Each soldering copper shall be provided with an iron or steel handle rod. The handle rod shall be suitably pointed for insertion in a wooden handle.
3. The handle rod shall be securely fastened to the copper by bending so as to form a loop, which shall be formed by passing the iron through the copper at right angles to its axis and then closing the loop by welding. The loop shall be so flattened

FIGURE 660

that its sides are imbedded in the copper and do not project beyond its lateral surfaces.

4. Soldering coppers shall be furnished without wooden handles.
5. The size (weight per pair) shall be deeply stamped on each copper.
6. Soldering coppers shall be of the dimensions given below:

Size (weight per pair)	Length of copper	Thickness of copper	Diameter of handle rod	Length of handle rod ¹
<i>Pounds</i>	<i>Inches</i>	<i>Inches</i>	<i>Inch</i>	<i>Inches</i>
2	3¾-4¼	¾-1	¾-½	8- 8½
3	4½-4¾	7⁄8-1½	¾-½	8- 9½
4	4¾-5	1-1½	½-¾	8-10
5	5-5½	1-1¼	½-¾	8-10
6	5½-6	1¼-1½	½-¾	9-11
8	6-6¾	1½-1¾	½-¾	10-12
10	6-6¾	1½-1¾	½-¾	10-12
12	6¾-7¼	1¾-1¾	½-¾	10-12
14	7-7½	1¾-2	¾-¾	10-12

¹ Length of handle rod is distance from point to first point of contact with the copper.

V. DETAIL REQUIREMENTS

1. Type A copper shall be pointed in the shape of a square pyramid, with sharp point removed. (See fig. 660.) The length of the pointed part shall be from one and one-fourth to one and one-half times the thickness of copper given in the table above.
2. Type B copper shall have two sides uniformly sloped to give a wedge-shaped point, with sharp edge removed (see fig. 661), of the same width as the thickness given in above table. Length of

FIGURE 661

the pointed portion shall be from one and one-fourth to one and one-half times the thickness given in the table.

VI. METHOD OF INSPECTION

Representative samples shall be taken from each lot delivered and inspected to determine whether they comply with this specification.

VII. PACKING AND MARKING

Soldering coppers shall be packed and marked in accordance with the manufacturer's trade practice unless otherwise specified.

615.72 BLOW TORCHES AND SOLDERING POTS.

(No nationally recognized specifications available.)

615.73 BENCH PLATES AND STAKES.

(No nationally recognized specifications available.)

615.8 MEASURING TOOLS.

615.81 CALIPERS AND DIVIDERS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR DIVIDERS GGG-D-351, MARCH 1, 1932

DIVIDERS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES

Dividers shall be of the following types: A, spring; B, firm joint; and C, wing.

III. MATERIAL AND WORKMANSHIP

Dividers shall be made of high-grade steel suitable for the purpose and in accordance with the best commercial practice. They shall be free from all defects or blemishes affecting their appearance or that may affect their serviceability.

IV. GENERAL REQUIREMENTS

1. Each divider shall have the maker's name or known trade-mark stamped or otherwise permanently marked thereon.
2. The points of all dividers shall be such as to avoid breakage, undue wear, or bending under ordinary service conditions.

V. DETAIL REQUIREMENTS

1. *Spring dividers, type A.*—These dividers shall be provided with a circular band spring at the hinged end which shall cause the dividers to open and be held in a rigid manner. The dividers shall be adjustable by means of a nut traveling over a finely threaded steel rod, which shall be hinged to one leg of the divider and pass through an attachment fastened to the other leg and terminating in a small ball end to prevent the nut from coming off the rod. The bearing surfaces where the nut or friction washer bears on the attachment fastened to one of the legs shall be smoothly and neatly finished to reduce friction when the nut is operated.

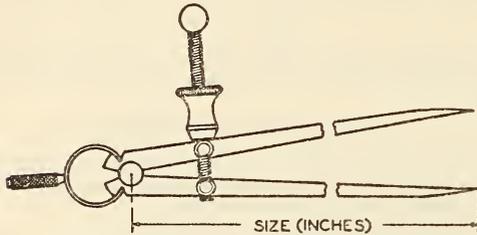

FIGURE 662.—Type A, spring dividers

The legs of these dividers shall be of either rectangular or round cross section. The legs shall be polished and straight, with the ends ground to a sharp point. The ends shall come evenly together when the dividers are in a closed position. A knurled finger and thumb attachment shall be provided and securely fastened to the circular band spring for convenience in handling the dividers when in use. The fulcrum stud shall be suitably hardened to reduce wear. These dividers shall be furnished in 3, 4, 6, and 8 inch sizes and shall be similar to the sketch incorporated herein. Size refers to the distance from the center of the fulcrum stud to the points.

2. *Firm-joint dividers, type B.*—These dividers shall be so designed as to give any degree of friction desired in the joint. The legs shall be polished, approximately parallel on the sides, tapered on the edges, and shall terminate in sharply ground points at

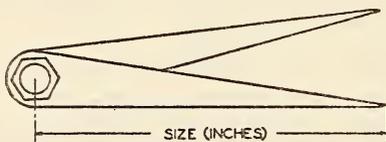

FIGURE 663.—Type B, firm joint dividers

the ends. The ends shall come evenly together when the dividers are in a closed position. These dividers shall be furnished in 6 and 12 inch sizes, and shall be similar to the sketch incorporated herein. Size refers to distance from the center of the joint to the points.

3. *Wing dividers, type C.*—These dividers shall be provided with an adjusting arc or wing, which shall pass through a slot in one leg of the divider. The threaded end of the adjusting arc shall pass through a hole in the other leg of the divider, after passing through an adjusting spring which shall be secured on inside of the leg. The adjusting spring shall be of a good grade of spring steel. The adjusting nut shall have a round head, which shall be knurled. The slotted leg of the dividers shall be provided with a thumbscrew for securing that leg to the adjusting arc. All arcs shall be of sufficient length to allow opening and adjusting of dividers to a minimum of 70°. The upper part of the legs

of these dividers shall be square, the lower part round, having a long taper terminating in sharply ground points at the ends. The ends shall come evenly together when the dividers are in a closed position. These dividers shall be furnished in 8, 12, and 24 inch sizes, and shall be similar to the sketch incorporated herein. Size refers to the distance from the center of the hinged joint to the points.

VI. METHOD OF INSPECTION

From each lot under inspection at least three dividers of each type and size shall be taken at random for inspection with a view of determining whether the dividers being furnished are in accordance with specifications. Results of inspection shall be considered as representative of the lot, and acceptance or rejection will be based thereon.

In addition to a careful surface inspection for size, design, finish, workmanship, marking requirements, etc., each sample shall also be subjected to the following practical test:

With the divider set to maximum capacity, at least 12 circles shall be scribed on metal which shall have a hardness equal to 45 to 50 scleroscope. Under this test there shall be no perceptible in-

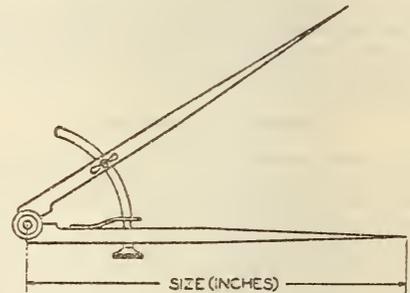

FIGURE 664.—Type C, wing dividers

crease in the width of the lines scribed nor shall there be any apparent damage to the points of the divider.

VII. PACKING AND MARKING

They shall be packed and marked in accordance with best commercial practice unless otherwise specified.

VIII. NOTES

1. The illustrations (figs. 662, 663, and 664) are included for the convenience of those interested and are not intended to prevent the purchase of dividers which are otherwise in accordance with specifications.

615.82 GAGES, DIMENSION.

GAGES

NOTE.—Gages for use with a particular item only will be found under the same commodity designation as that item.

AMERICAN PETROLEUM INSTITUTE, LINE-PIPE SPECIFICATIONS, NO. 5-L, 1931

TUBULAR GAGES (LINE PIPE)

Each manufacturer of A. P. I. threaded line pipe shall provide himself with plug and ring reference gages which have been manufactured in accordance with the gage tables appended, except that gages may be used which have been manufactured in accordance with the American engineering standards for pipe threads, in which case the additional length of thread specified for line pipe will project through the American standards ring gage; provided that

such existing gages are certified by the National Bureau of Standards to be in accordance with the gage tables appended before their use is authorized under this specification.

PLUG

The certified master plug shall be the control and shall be a physical reproduction of the thread on the pipe. A plug gage, within the following limits, shall be considered satisfactory. The lead and taper shall be measured over a length of axis beginning and ending not less than one full thread in from the ends of the threaded portion on gages up to 2 inches nominal size, inclusive, and not less than two full threads in from the ends of the threaded portion on gages over 2 inches nominal size.

Pitch	Lead	Taper	Pitch diameter	½ thread angle
27	Inch ±0.0002	Inch +0.0003 -0.0000	Inch ±0.0002	Minutes ±15
18	±.0002	+0.0004 -0.0000	±.0004	±15
14	±.0003	+0.0006 -0.0000	±.0006	±10
11½	±.0004	+0.0008 -0.0000	±.0007	±10
8	±.0005	+0.0010 -0.0000	±.0010	±10

The above tolerances are subject to the additional condition that the cumulative error must not exceed one-third turn for gages of ¼-inch taper per foot. This means that if the error in any element exceeds the specified unit tolerance some other element or elements must be a sufficient amount inside of the specified tolerance to compensate for the excess error.

RING

The ring is not standard and its definition of size is obtained by calibration from the certified master plug. To be a reliable transfer medium it must be certified for lead, taper, and form of thread. A ring gage, within the following limits, shall be considered satisfactory. The lead and taper shall be measured over a length of axis beginning and ending not less than one full thread in from the ends of the threaded portion on gages up to 2 inches nominal size, inclusive, and not less than two full threads in from the ends of the threaded portion on gages over 2 inches nominal size.

Pitch	Lead	Taper	½ thread angle
27	Inch ±0.0004	Inch -0.0002 -0.0006	Minutes ±20
18	±.0004	-0.0002 -0.0007	±20
14	±.0006	-0.0002 -0.0009	±15
11½	±.0008	-0.0002 -0.0012	±15
8	±.0010	-0.0002 -0.0014	±15

The above tolerances are subject to the additional condition that the cumulative error must not exceed one-third turn for gages of ¼-inch taper per foot. This means that if the error in any element exceeds the specified unit tolerance, some other element or elements must be a sufficient amount inside of the specified tolerance to compensate for the excess error.

GENERAL

Certified master plugs should preferably be of hardened and ground alloy steel properly heat treated and aged to prevent secular change of size.

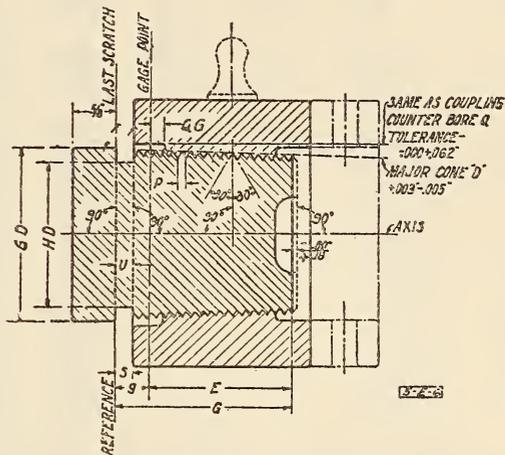

FIGURE 665.—Line pipe gage

- a, All measurements referred to shoulder marked "last scratch;"
- b, the small ends of gages are not measuring planes, but are finished square with axis to assist in certification; c, the length of the collar on plug gages, also the dimensions *GD*, *QG*, *U*, and *HD* are unimportant within the tolerances shown, and gages shall not be rejected for noncompliance, unless interfering with the proper use of the gage; d, the length of the threads in the ring gage should not be less than *E* minus 1½ pitches; e, the ring gage may be extended as shown to provide sockets for make-up bar; f, the outside diameter *GD* of the plug collar to be equal to the outside diameter *OD* of the pipe plus or minus 0.010 inch; g, the diameter *HD* of the notch *U* to be 0.060 inch less than the minor (root) diameter of the product thread at the gage point plus or minus 0.020 inch. *h*, the depth of counterbore *QG* on ring gages to be one-half pitch minimum; *i*, the crests of the threads on gages shall be truncated as indicated in column *h* in gage tables. The roots of the threads on gages shall be cut to a sharp *V* or, when ground, shall be undercut to prevent the gage from bearing on crest or root of the thread on the product.

Transfer ring gages up to 7 inches pitch diameter may be of soft steel with chased thread.

Transfer ring gages over 7 inches pitch diameter should preferably be of hardened and ground alloy steel. If the transfer ring is solid (not built up), a fitting plate may be attached to the large end face. If the transfer ring is solid and no fitting plate is attached the dimension *S* need not be held closely to a defined size. When fitting plate is used, the value *S* may be specified as an absolute amount at the option of the purchaser. In any case, the value *S* after calibration with the master plug, shall be stamped on the ring gage.

¹ The purchaser may specify the S dimension to suit his requirements, ignoring the values given. In the absence of definite specifications, for S from the purchaser, the values given in the table will be used. The calibrated value of S in any case must be stamped on the ring gage. Fitting plates may be added to gages if desired.

² Outside diameter.

AMERICAN PETROLEUM INSTITUTE, SPECIFICATIONS FOR STEEL AND IRON PIPE FOR OIL-COUNTRY TUBULAR GOODS, NO. 5-A, 1931

A. P. I. TUBULAR GAGES

Each manufacturer of A. P. I. tubular threaded material shall provide himself with plug and ring reference gages which have been manufactured in accordance with the gage tables appended; such reference gages to be checked and certified by the Bureau of Standards, or by the National Physical Laboratory, England.

SPECIFICATION FOR A. P. I. TUBULAR GAGES

Plug

The certified master plug shall be the control and shall be a physical reproduction of the thread on the pipe.

The lead may vary not more than ± 0.0003 inch from basic for gages of $3/8$ -inch taper per foot, and 0.0005 inch from basic for gages of $1/4$ -inch taper per foot, to be measured over a length of axis beginning and ending not less than two full threads in from the ends of the threaded portion.

The included taper on diameter in the length E shall lie between the limits (basic) and (basic $+ 0.0005$ inch) for gages of $3/8$ -inch taper per foot, and (basic) and (basic 0.0010 inch) for gages of $1/4$ -inch taper per foot, to be measured over a length of axis beginning and ending not less than two full threads in from the ends of the treaded portion.

The flanks of the tread may vary from the basic angle of 30° to the normal by not more than ± 10 minutes of arc.

Ring

The ring is not standard and its definition of size is obtained by calibration from the certified master plug.

To be a reliable transfer medium it must be certified for lead, taper, and form of thread.

The lead may vary not more than ± 0.0005 -inch from basic for gages of $3/8$ -inch taper per foot and 0.0008 inch from basic for gages of $1/4$ -inch taper per foot, to be measured over a length of axis beginning and ending not less than two full threads in from the ends of the threaded portion.

The included taper on diameter in the length "E" shall lie between the limits (basic $- 0.0002$ inch) and (basic $- 0.0012$ inch) for all sizes, to be measured over a length of axis beginning and ending not less than two full threads in from the ends of the threaded portion.

The flanks of the thread may vary from the basic angle of 30° to the normal by not more than 15 minutes of arc.

The above tolerances are subject to the additional condition that the cumulative error as calcu-

lated from the unit errors must not exceed one-half turn for gages of 3/8-inch taper per foot and one-third turn for gages of 1/4-inch taper per foot. This means that if the error in any element exceeds the specified unit tolerance, some other element or elements must be a sufficient amount inside of the specified tolerances to compensate for the excess error.

(General specifications are identical with those for tubular gages (line pipe), given above.)

Casing Gages

(Text and illustration are identical with Figure 665 in tubular gages (line pipe), given above. The latter illustration also carries the lettered dimensions referred to in the following table:)

¹ Pitch diameter as determined by thread micrometers.

² The purchaser may specify the *S* dimension to suit his requirements, ignoring the values given. In the absence of definite specifications for *S* from the purchaser, the values given above will be used. The calibrated value of *S* in any case must be stamped on the ring gage. Fitting plates may be added to gages if desired.

³ Data on the 7 5/8 and 8 5/8 inch sizes published for general information only. Due to the very limited demand for these sizes, manufacturers are not required to supply themselves with certified master gages unless they desire to do so. Manufacturers will furnish these sizes with threads made as closely as possible to dimensions given, without certified gages. The A. P. I. monogram can not be used on these sizes unless the manufacturer has the necessary master gages. One weight only listed; consult manufacturers if other weights are desired.

Tubing Gages

(Text and illustration are identical with Figure 665 in tubular gages (line pipe), given above. The latter illustration also carries the lettered dimensions referred to in the following table:)

¹ The purchaser may specify the S dimension to suit his requirements, ignoring the values given. In the absence of definite specifications for S from the purchaser, the values given above will be used. The calibrated value of S in any case must be stamped on the ring gage. Fitting plates may be added to gages if desired.

AMERICAN PETROLEUM INSTITUTE, SPECIFICATIONS FOR ROTARY-DRILLING TAPER JOINTS, NO. 7-B, FEBRUARY, 1931

ROTARY-TOOL JOINT GAGES

Anyone desiring to produce A. P. I. standard rotary-drilling taper joints shall provide himself with reference master gages which have been manufactured in accordance with the dimensions and tolerances given below, such reference gages to be checked and certified by any A. P. I. custodian or the Bureau of Standards.

SPECIFICATION FOR MASTER GAGES

All A. P. I. reference master gages (including grand and special reference masters) shall be hardened and ground steel gages, as specified in tables appended. They may be manufactured with a fitting plate or ring. The plug gage (or master pin gage) in all cases shall be the standard.

The thread form on these gages shall be the basic thread form specified for the rotary-drilling taper joints, except that the crests shall be truncated 0.04808 inch for four-thread and 0.03946 inch for five-thread in the 3 inch per foot taper, and 0.04820 inch for four-thread in the 2 inch per foot taper, while the roots may be undercut to prevent the gage from bearing on the crest of the thread on the product.

The first thread on both ends of the plug and ring gages shall be removed until the full form of the thread is obtained. (This provision is effective on new gages purchased subsequent to April 1, 1929.)

The lead and the taper on plug and ring gages shall be measured over a length of axis beginning and ending not less than one-half inch from the ends of the threaded portion.

The plug shall be the control.

The ring shall be controlled by its engagement with the mating plug, and the step value may vary between the limits 0.624 and 0.626 inch.

The pitch diameter at the gage point of the plug shall lie between the limits (basic ± TR/10,000

inches), but the limit for gages, the TR length of which is less than 4 inches, shall be (basic ± 4/10,000 inches); see Table 1.

The lead between any two threads within the lengths specified above may vary from the nominal by not more than the amounts shown in Table 1. (These provisions effective on new ring gages purchased subsequent to April 1, 1929.)

The included taper on diameter in the length TR shall be within the limits shown in Table 1.

The flanks of the thread may vary from the basic angle of 30° to the normal by not more than the following values:

For plug gages ± 7 minutes of arc.
For ring gages ± 15 minutes of arc.

The above tolerances are subject to the additional condition that plugs and rings must interchange with A. P. I. regional master ring and plug gages to step values within the limits of 0.621 and 0.629 inch.

TABLE 1.—Tolerances on rotary-tool joint gages

[All dimensions in inches at 68° F.]

[Values apply to either right or left hand threads]

Size	Pitch diameter tolerance	Lead tolerances		Taper (difference in diameter in TR length)		
		Plug	Ring	Nominal	Tolerances	
					Plug	Ring
1	2	3	4	5	6	7
2¾	±0.0004	±0.0004	±0.0006	0.59375	+0.0004 -0.0000	-0.0004 -0.0012
2½	±.0004	±.0004	±.0006	.71875	+0.0004 -0.0000	-0.0004 -0.0012
3½	±.0004	±.0004	±.0006	.78125	+0.0004 -0.0000	-0.0004 -0.0012
4½	±.0004	±.0004	±.0006	.90625	+0.0004 -0.0000	-0.0004 -0.0012
5½	±.0004	±.0004	±.0006	1.03125	+0.0004 -0.0000	-0.0004 -0.0012
6½	±.0004	±.0004	±.0007	.72917	+0.0004 -0.0000	-0.0004 -0.0012
7½	±.0005	±.0005	±.0007	1.15625	+0.0005 -0.0000	-0.0004 -0.0012
8½	±.0005	±.0005	±.0007	1.18750	+0.0005 -0.0000	-0.0004 -0.0012

Column 3. The tolerances on lead of plug gages whose *TR* length is less than 4 inches are based upon a tolerance of ± 0.0004 from basic, and for larger gages upon a tolerance of ± 0.0001 per inch of *TR* length.

Column 4. The tolerances on lead of ring gages whose *TR* length is less than 4 inches are based upon ± 0.0006 inch from basic, and for larger gages upon a tolerance of ± 0.00015 inch per inch of *TR* length.

Column 5. Above values show the difference in diameter over the *TR* length. The $6\frac{3}{8}$ -inch size is

based on a taper of 2 inches per foot; all others, 3 inches per foot.

Column 6. The tolerances on taper of plug gages whose *TR* length is less than 4 inches are based on a tolerance of (basic) and (basic + 0.0004 inch), and for large gages upon a tolerance of (basic) and (basic + *TR*/10,000 inch).

Column 7. The tolerances on taper of ring gages are based upon the limits of (basic - 0.0004 inch) and (basic - 0.0012 inch).

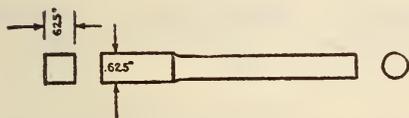

FIGURE 666.—Feeler gage

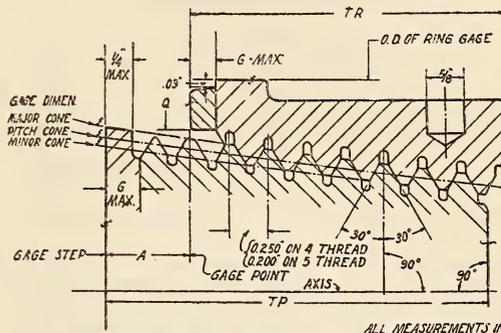

FIGURE 667.—Rotary drilling taper joint gages

NOTE.—*G* (fitting plates), which is a maximum dimension, equals 0.437 inch for $6\frac{3}{8}$, $7\frac{3}{8}$, and $8\frac{3}{8}$ inch sizes, and equals 0.375 for all other sizes.

TABLE 2.—Gage dimensions for A. P. I. standard rotary-drilling taper joints

[See figs. 666, 667, and 668. All dimensions in inches at 68° F. Taper joints shall be identified by the drill-pipe size]

Size of drill pipe	Nominal size of tapered joint	Pitch	Taper, inches per foot	Pitch diameter at gage point	Major cone diameter at gage step	Minor cone diameter at gage point	Total length plug gage <i>TP</i>	Total length ring gage <i>TR</i>	Outside diameter of ring gage <i>O. $8\frac{3}{8}$	7 by 8—4	1/4	3	7.66658	7.94206	7.54735	$5\frac{3}{8}$	$4\frac{3}{4}$	10.750	7.858	.625

The values contained in Table 2 apply to either right or left hand threads.

When ordering gages the purchaser should specify whether right-hand or left-hand threads are desired.

The gage point is to be 0.625 inch from the plug gage shoulder.

Tolerance:

Column 2 = ± 0.002 inch; column 3 = ± 0.002 inch; column 4 = ± 0.004 inch. Column 5 = ± 0.004 inch; column 6 = diameter ± 0.005 inch; column 7 = ± 0.015 inch.

AMERICAN PETROLEUM INSTITUTE, SPECIFICATIONS FOR OIL-WELL PUMPS (BARRELS, PLUNGERS, VALVES, ETC.), NO. 11-A, FEBRUARY, 1931

WORKING-BARREL GAGES

The inside diameters of cold-drawn working barrels and machined liners shall be of the dimensions

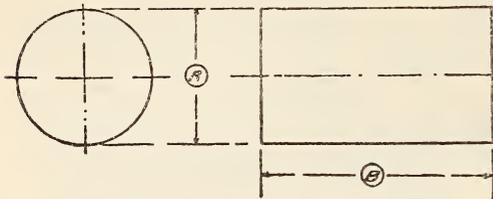

FIGURE 669.—Gage for cold-drawn working barrels

and within the tolerances stipulated. The use of the "go" plug gages specified by Figure 669 and Table 2, and Figure 670 and Table 6, is a necessary and sufficient check of straightness and minimum diameter. Use of an inside gage is necessary to insure that a barrel or liner is not oversize at any point. Gages other than those referred to may be used, but must be capable of measuring the diameter throughout the whole length and around the circumference. In any case it devolves upon the user

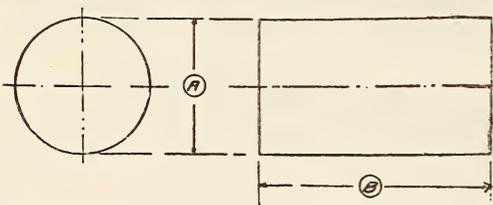

FIGURE 670.—Gage for machined working barrels

of the gage to demonstrate that the gage he chooses to use has an accuracy appropriate to the product being gaged.

TABLE 2.—Gages for cold-drawn barrels

4	3.7512	3.7498	3.7498	+0.0002 -.0000	12

NOTE.—The entire length of machined liners shall be checked with the "go" gage.

AMERICAN PETROLEUM INSTITUTE, SUCKER-ROD SPECIFICATIONS, NO. 11-B, JULY, 1931

SUCKER-ROD GAGES

Any manufacturer desiring to produce sucker-rod joints in accordance with A. P. I. standards shall

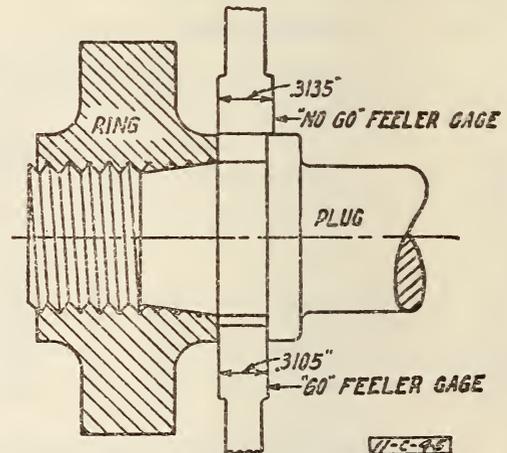

FIGURE 671.—Projection of mating gages

provide himself with a set of reference master gages, as specified below, such reference master gages to be checked and certified by the Bureau of Standards or by the National Physical Laboratory, England.

SPECIFICATION FOR A. P. I. GRAND MASTER AND REFERENCE MASTER GAGES

Grand master gages and manufacturer's reference master gages shall consist of the following for each size of joint:

A master "go" plug gage representing maximum thread and maximum cone of pin, and a mating reference ring for the master "go" plug. (See fig. 672 and Table 1.)

A master "no go" plug gage representing the minimum pitch diameter of the pin, and a mating reference ring for the master "no go" plug gage. (See fig. 673 and Table 2.)

A master "go" ring gage representing the minimum thread and minimum cone of box, and a mating reference plug for the master "go" ring. (See fig. 674 and Table 3.)

A master "no go" ring gage representing the maximum pitch diameter of the box, and a mating reference plug for the master "no go" ring gage. (See fig. 675 and Table 4.)

"Go" and "no go" feeler gages to check cone dimensions.

A. P. I. grand master and manufacturer's reference master gages shall be hardened and ground steel gages and shall be manufactured in accordance with dimensions and tolerances given in tables and figures appended.

The form of the threads for the A. P. I. sucker-rod gages shall be the thread form specified for A. P. I. sucker-rod threads.

The mates of "go" master gages shall be a good gage fit on their respective masters, and shall assem-

the thread may vary from the basic angle of 30° to the normal by not more than ±10 minutes of arc. A. P. I. gages shall be stamped with the certificate number, a suffix letter which indicates the name of the gage, the A. P. I. monogram, the nominal size of the rod, the words "go" or "no go," and the words "pin" or "box."

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; GAGES AND TESTING DEVICES, RECOMMENDED PRACTICE, 1930

LIMIT GAGES FOR ROUND IRON

Limit gages for 1 1/4-inch iron are recommended for use in procuring round iron to take the Sellers' standard screw threads; round iron used to be of such size as will enter the large or + end of the gage intended for that size, in any way, and also of such size as will not enter the small or - end in any way.

The limiting diameters for certain nominal sizes of iron, together with the maximum variation allowable by such use of these gages, are given in the following table:

Sizes of limit gages for round iron

Nominal diameter of iron	Large size + end	Small size - end	Total variation
<i>Inches</i>	<i>Inches</i>	<i>Inches</i>	<i>Inch</i>
3/4	0.2550	0.2450	0.010
5/8	.3180	.3070	.011
3/8	.3810	.3690	.012
7/16	.4440	.4310	.013
1/2	.5070	.4930	.014
5/16	.5700	.5550	.015
5/8	.6330	.6170	.016
3/4	.7585	.7415	.017
7/8	.8840	.8660	.018
1	1.0095	.9905	.019
1 1/8	1.1350	1.1150	.020
1 1/4	1.2605	1.2395	.021
1 3/8	1.3860	1.3640	.022
1 1/2	1.5115	1.4885	.023
1 5/8	1.6370	1.6130	.024
1 3/4	1.7625	1.7375	.025
1 7/8	1.8880	1.8620	.026

Round iron 2 inches in diameter and over should be rolled to nominal diameter.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; GAGES AND TESTING DEVICES, STANDARD, 1895

DECIMAL GAGE

The micrometer caliper should be used for laboratory and tool-room work, and in the shop when specially desired.

The solid notch gage should be used for general shop purposes. The form of this gage shall be an ellipse whose major axis is 4 inches, the minor axis 2.5 inches, and the thickness 0.1 inch, with a central hole 0.75 inch in diameter.

The notches in this gage shall be as follows:

<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
0.002	0.022	0.065	0.135
.004	.025	.070	.150
.006	.028	.075	.165
.008	.032	.080	.180
.010	.036	.085	.200
.012	.040	.090	.220
.014	.045	.095	.240
.016	.050	.100	.250
.018	.055	.110	-----
.020	.060	.125	-----

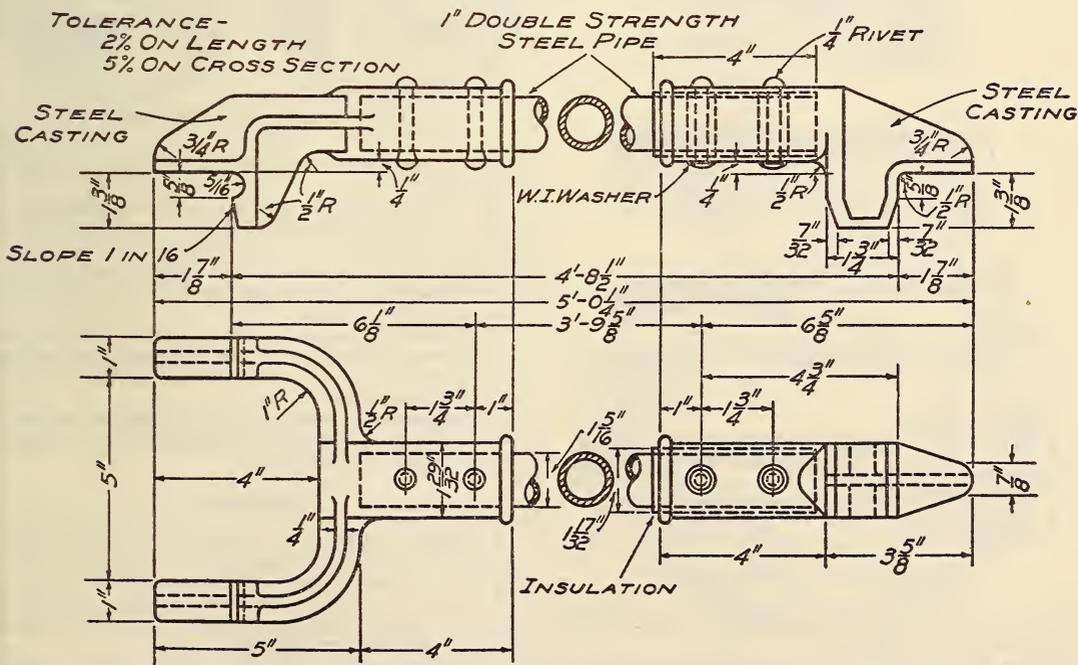

All notches to be marked as in above list.

The gage must be plainly stamped with the words "decimal gage" in capital letters 0.2 inch high, and below this the words "master mechanics."

In ordering material the term "gage" shall not be used, but the thickness ordered by writing the decimal as in above list. For sizes over one-fourth inch the ordinary common fractions may be used.

AMERICAN RAILWAY ENGINEERING ASSOCIATION, TRACK GAGE, SEPTEMBER, 1929

TRACK GAGE

APPROX. WT. 17 LBS.

FIGURE 676.—Track gage

NOTE.—Insulate by use of fiber bushings at both ends when required. Center line to be marked on gage when required. No tolerance allowed in gage distance.

AMERICAN SOCIETY OF MECHANICAL ENGINEERS, TENTATIVE AMERICAN STANDARD TOLERANCES, ALLOWANCES, AND GAGES FOR METAL FITS. APPROVED BY THE AMERICAN STANDARDS ASSOCIATION, DECEMBER, 1925, B4a-1925

TOLERANCES, ALLOWANCES, AND GAGES FOR METAL FITS

FUNDAMENTALS

1. *Direction of tolerance on gages.*—The extreme sizes for all plain limit gages shall not exceed the extreme limits of the part to be gaged. All varia-

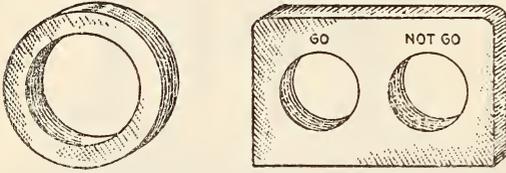

FIGURE 677.—Ring gages

tion in the gages, whatever their cause or purpose, shall bring these gages within these extreme limits. Thus a gage which represents a minimum limit may be larger, but never smaller, than the minimum size specified for the part to be gaged, likewise the gage which represents a maximum limit may be smaller,

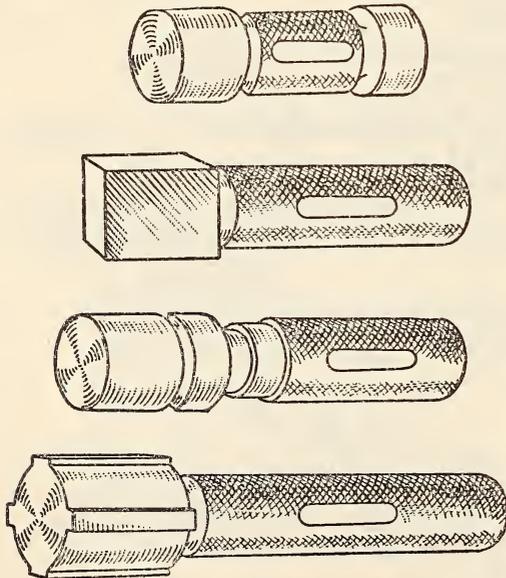

FIGURE 678.—Plug gages

but never larger, than the maximum size specified for the part to be gaged.

2. The temperature of 68° F. (20° C.) shall be the standard for plain limit gages.

3. The final result sought by gaging is interchangeable manufacture in some degree. This means that the parts of a mechanism can be assembled without fitting one part to another and when assembled the parts will function properly.

4. Applied to manufactured material, the result sought is sufficient uniformity in size and contour to adapt the material without further fitting to the requirements of the industries. The fundamental principle involved in interchangeable manufacture requires that "a system of standardization and classification of fits shall establish a clearly defined line at which interference between mating parts begins." Hence,

(a) The standard or basic size, as physically represented by a correct standard master gage, represents the line at which this interference begins between mating parts.

(b) It is the minimum size of the external members of all mating parts of standardized practice, regardless of the kind of fit.

(c) It is the maximum size of internal members of all mating parts where interference begins or that fit metal to metal.

The condition of (b) and (c) is represented by a mating pair of correctly fitting standard gages.

(d) The limits of the component as physically represented by the limit master gages shall not be

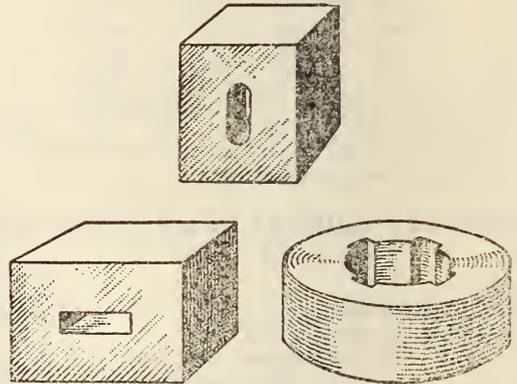

FIGURE 679.—Receiving gages

exceeded as a result either of tolerance or wear of the gages.

(e) "Go" gages, or the equivalent verification of all the factors involved in the fit, are necessary to prevent interference of mating parts.

In the case of force fits "go" gages are necessary to determine the maximum amount of interference between mating parts.

(f) "Not go" gages, or the equivalent verification of the determining factor are necessary to prevent the maximum looseness of mating parts exceeding the limits specified.

In the case of force fits, "not go" gages are necessary to determine the minimum amount of interference between mating parts.

DEFINITIONS

5. *Gaging.*—A process of measuring manufactured materials to assure the specified uniformity of size and contour required by the industries.

6. *Gage.*—A device for determining whether or not one or more of the dimensions of a manufactured part are within specified limits.

(a) *Ring gage.*—(Fig 677.) One whose inside measuring surfaces are circular in form. The measuring surfaces may be cylindrical or conical.

(b) *Plug gage.*—(Fig. 678.) One whose outside measuring surfaces are arranged to verify the specified uniformity of holes. A plug gage may be straight or tapered and of any cross-sectional shape.

(c) *Receiving gage.*—(Fig. 679.) One whose inside measuring surfaces are arranged to verify the specified uniformity of size and contour of manufactured material.

(d) *Indicating gage.*—(Fig. 680.) One that exhibits visually the variations in the uniformity of dimensions or contour, the amount of the variation being

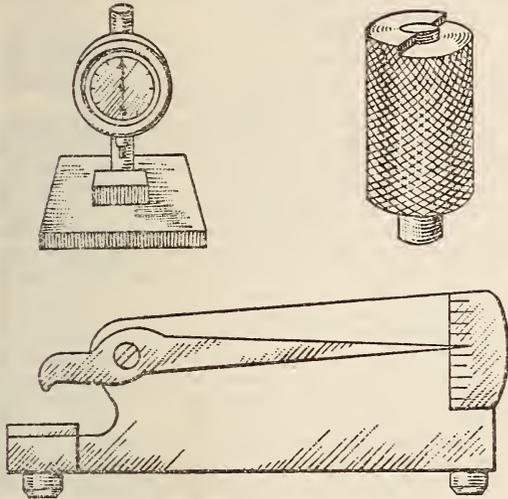

FIGURE 680.—Indicating gages

indicated by lever on graduated scale, dial, flush-pin, plunger gages, etc.

NOTE.—For detailed information concerning the design and use of plain gages see "Methods of Gaging and Specifications for Plain Limit Gages" a standard developed by the committee on plain limit gages for general engineering work, and published by the American Society of Mechanical Engineers, 29 West Thirty-ninth Street, New York, N. Y.

(e) *Snap gage.*—(Fig. 681.) A fixed gage arranged with inside measuring surfaces for caliper diameters, lengths, thicknesses, etc.

(f) *Caliper gage.*—(Fig. 682.) One which, for internal members, is similar to a snap gage, and for external members, is similar to a plug gage.

7. *Standard.*—A physical representation of a form, dimension or size established by law or by general usage and consent.

8. *Standard sizes.*—A series of recognized or accepted sizes corresponding to various subdivisions of a recognized unit of length such as the yard or the meter. These are usually expressed in inches or in millimeters; sometimes by arbitrary numbers or letters.

NOTE.—The industries by common consent have chosen several different series important for interchangeable manufacture. For instance the common fractions of an inch are commonly called standard sizes. Such as: $\frac{1}{8}$ inch, $\frac{3}{16}$ inch, $\frac{1}{4}$ inch, $\frac{5}{16}$ inch, etc.

9. *Nominal size.*—A designation given to the subdivision of the unit of length having no specified limits of accuracy but indicating a close approximation to a standard size.

10. *Basic size.*—The exact theoretical size from which all limiting variations are made.

11. *Allowance.*—(Neutral zone.) An intentional difference in the dimensions of mating parts; or, the minimum clearance space which is intended between mating parts. It represents the condition of the tightest permissible fit, or the largest internal member mated with the smallest external member. It is to provide for different classes of fit.

EXAMPLE.—A shaft dimensioned 0.874 inch and a hole dimensioned 0.875 inch represents an allowance of 0.001 inch. The same hole with

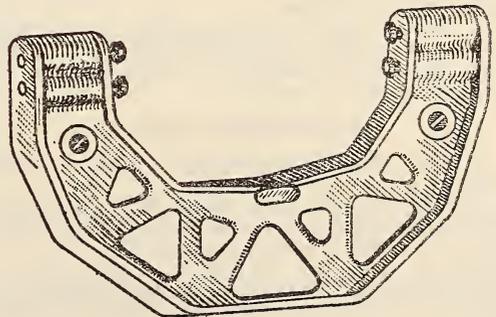

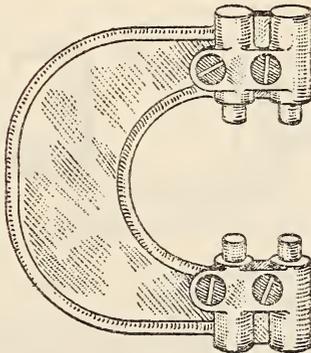

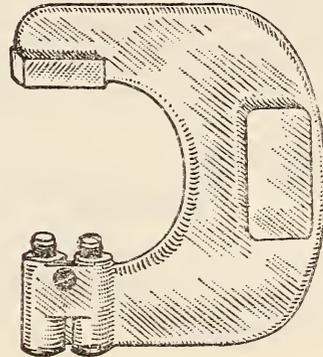

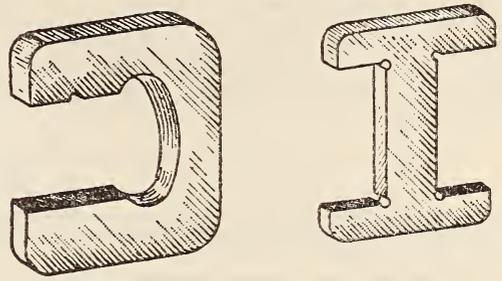

FIGURE 681.—Snap gages

a shaft dimensioned 0.876 inch represents an allowance of 0.001 inch also; but, as the shaft is larger than the hole, this allowance becomes a negative quantity. (See explanatory notes, below.)

12. *Tolerance.*—The amount of variation permitted in the size of a part.

NOTE.—In the example under allowance, the ideal condition and the tightest fit permissible have been given; but in manufacturing large numbers of pieces these sizes could not be produced exactly, so variations must be made that will not prevent their proper functioning but will enable them to be produced. These variations must therefore tend toward greater looseness. Therefore, if a manufacturing tolerance of 0.001 inch is required on each member, they would be dimensioned as follows:

	Inch
Shaft.....	0.874+0.000 - .001
Hole.....	.875+ .001 - .000

This defines a condition in which the greatest looseness is 0.003 inch and the greatest tightness gives a clearance of 0.001 inch. (See explanatory notes, below.)

13. *Neutral zone.*—(See allowance.)

14. *Limits.*—The extreme permissible dimensions of a part.

15. *Master gage.*—One whose gaging dimensions represent as exactly as possible the physical dimensions of the component. It is the gage to which all other gages and all dimensions of manufactured

pressures less than 600 pounds per square inch; also for sliding fits; and the more accurate machine-tool and automotive parts.

Snug fit (class 4)—*zero allowance.*—This is the closest fit which can be assembled by hand and necessitates work of considerable precision. It should be used where no perceptible shake is permissible and where moving parts are not intended to move freely under a load.

Wringing fit (class 5)—*Zero to negative allowance.*—This is also known as a “tunking fit” and it is practically metal to metal. Assembly is usually selective and not interchangeable.

Tight fit (class 6)—*Slight negative allowance.*—Light pressure is required to assemble these fits, and the parts are more or less permanently assembled, such as the fixed ends of studs for gears, pulleys, rocker arms, etc. These fits are used for drive fits in thin sections or extremely long fits in other sections and also for shrink fits on very light sections. Used in automotive, ordnance, and general machine manufacturing.

Medium force fit (class 7)—*Negative allowance.*—Considerable pressure is required to assemble these fits, and the parts are considered permanently assembled. These fits are used in fastening locomotive wheels, car wheels, armatures of dynamos and motors, and crank disks to their axles or shafts. They are also used for shrink fits on medium sections or long fits. These fits are the tightest which are recommended for cast-iron holes or external members as they stress cast iron to its elastic limit.

Heavy force and shrink fit (class 8)—*Considerable negative allowance.*—These fits are used for steel holes where the metal can be highly stressed without exceeding its elastic limit. These fits cause excessive stress for cast-iron holes. Shrink fits are used where heavy force fits are impractical, as on locomotive wheel tires, heavy crank disks of large engines, etc.

(Included in this tentative standard are tables showing the tolerances and allowances for establishing the limiting sizes of mating parts for interchangeable manufacture, and also tables showing the tolerances and allowances for establishing the limiting sizes for the manufacture of mating parts which are to be assembled by selection.)

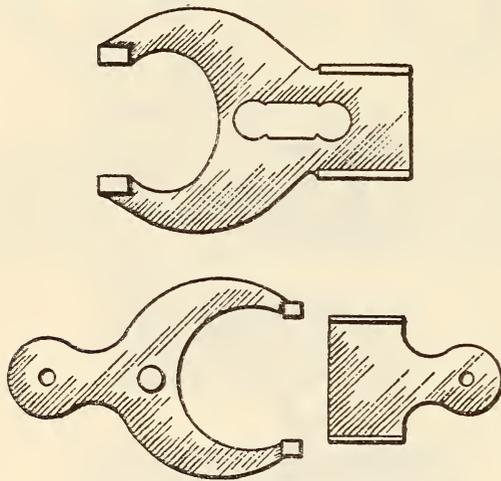

FIGURE 682.—Caliper gages

material are finally checked or compared, either by direct check or comparison.

16. *Inspection gages.*—Gages for the use of the manufacturer or purchaser in accepting the product. These gages must not accept any product which the master gages will reject.

17. *Working gages.*—Gages used by the manufacturer to check the work as it is produced. These gages should not accept any product which the inspection gages will reject.

CLASSIFICATION OF FITS

18. The following classification of fits is recommended:

Loose fit (class 1)—*Large allowance.*—This fit provides for considerable freedom and embraces certain fits where accuracy is not essential.

EXAMPLES.—Machine fits of agricultural and mining machinery; controlling apparatus for marine work; textile, rubber, candy, and bread machinery; general machinery of a similar grade; some ordnance material.

Free fit (class 2)—*liberal allowance.*—For running fits with speeds of 600 r. p. m. or over, and journal pressures of 600 pounds per square inch or over.

EXAMPLES.—Dynamos, engines, many machine-tool parts, and some automotive parts.

Medium fit (class 3)—*medium allowance.*—For running fits under 600 r. p. m. and with journal

EXPLANATORY NOTES

In the table reproduced below many of the terms in common use in the shops of the country are given with the equivalent term recommended by the committee on plain limit gages for general engineering work.

Greatest tightness.....	} Are all common terms which have the same meaning as—	} Allowance.
Least looseness.....		
Tightest fit.....		
Neutral zone.....	} Are all common terms which have the same meaning as—	} Allowance plus tolerances.
Maximum metal.....		
Least tightness.....		
Greatest looseness.....		
Loosest fit.....		
Minimum metal.....	} Now termed.....	} Tolerance.
Difference between largest and smallest permissible size of either members. Variation in the size allowed.		

The basis for the foregoing recommended allowances and tolerances is a classification of fits quite commonly known to the manufacturing public. Interference between mating parts takes place at the exact basic value of the dimension; hence an accepted pair of running standard gages become the “go” gages for mating parts which will prevent interference at the basic value of the dimension.

On account of the lack of a uniform and acceptable method of measuring the fitting surfaces of the external members of a pair of mating parts, it is recommended that plugs, blocks, disks, and rods govern the checking of external members for the reason that usually the same measuring device will check for accuracy both the internal member and the gage for the external member, thus avoiding an interference when both members appear to have the same dimension.

To illustrate: If a 2-inch hole be measured with an inside micrometer and a shaft be measured with an outside micrometer, and both measure exactly 2 inches, there is no assurance they will go together; but, unless there were a definite understanding in a contract, the pieces might be ruled acceptable by law. If, however, the 2-inch hole would receive a plug gage which measured exactly 2 inches by a measuring machine, it would also receive an accurately finished shaft of the same size when measured by the same machine.

It is well known that a correct pair of plug and ring gages 2 inches in diameter will each check parts that will go together. It is also well known that the character of fit depends on the rotundity, parallelism, size, and in some cases, contour of the mating parts, and that for cylindrical fits in mating parts, plug and ring gages are the only sure means of determining whether or not parts will go together. If either member of a pair of mating parts is three or five cornered, a snap gage or micrometer will not insure their going together.

In the foregoing allowances and tolerances, the best practice available was considered, and where

differences occurred a compromise was attempted. The tolerances on holes apply only to reamed holes, or holes having a finish equivalent to reaming. From the standpoint of satisfactory performance, the tightest and loosest fits permissible are the all-important considerations. From a manufacturing standpoint, tolerances are the important factors. Hence both the tightest and loosest fits permissible must combine the tolerance and allowance, and therefore both allowance and tolerance must be considered for all-around satisfactory conditions.

It is not deemed to be feasible to include in this report allowances and tolerances which will apply to all work. Many so-called standard fits are made in the industries which are not interchangeable, and an attempt to make them so would be prohibitive in cost. These fits, however, must be made on a production basis, and it is believed that the tables here given will be found to contain allowances and tolerances which are suitable for most work, even if some selection or individual fitting of parts is desired.

In choosing the class of fit for manufacture, the engineer should keep in mind that cost usually increases proportionately to the accuracy required, and no finer class of fit should be chosen than the functional requirements actually demand. It is axiomatic that the closer the fit the smaller the manufacturing tolerance, and usually the greater the cost. The length of engagement of the fit also plays an important part in the selection of the class of fit for a piece of work. It is obvious that a long engagement will tolerate more looseness than a short one, and due regard should be paid to this feature.

Formulas for recommended allowances and tolerances

Class of fit	Method of assembly	Allowance	Selected average interference of metal	Hole tolerance	Shaft tolerance
1. Loose.....	Strictly interchangeable.....	$0.0025\sqrt{d^2}$	-----	$0.0025\sqrt{d}$	$0.0025\sqrt{d}$
2. Free.....	do.....	$.0014\sqrt{d^2}$	-----	$.0013\sqrt{d}$	$.0013\sqrt{d}$
3. Medium.....	do.....	$.0009\sqrt{d^2}$	-----	$.0008\sqrt{d}$	$.0008\sqrt{d}$
4. Snug.....	do.....	.0000	-----	$.0006\sqrt{d}$	$.0004\sqrt{d}$
5. Wringing.....	Selective assembly.....	-----	0.0000	$.0006\sqrt{d}$	$.0004\sqrt{d}$
6. Tight.....	do.....	-----	$.00025d$	$.0006\sqrt{d}$	$.0006\sqrt{d}$
7. Medium force.....	do.....	-----	$.0005d$	$.0006\sqrt{d}$	$.0006\sqrt{d}$
8. Heavy force or shrink.....	do.....	-----	$.001d$	$.0006\sqrt{d}$	$.0006\sqrt{d}$

d = diameter of fit in inches.

The formulas for allowance values give the ideal condition of fit for classes 1 to 4.

The formulas for selected average interference of metal give the ideal condition of fit for classes 5 to 8.

GLASS CONTAINER ASSOCIATION OF AMERICA, GAGES FOR GLASS CONTAINERS, AUGUST 1, 1929

GLASS-CONTAINER GAGES

(This association has adopted as standard a number of different types of diameter and profile gages for glass bottles and jars. Details covering materials and dimensions of these gages are shown on blue prints issued by the standardization committee.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE; PLAIN AND THREAD PLUG AND RING GAGE BLANKS, COMMERCIAL STANDARD CS8-30, OCTOBER 21, 1930

[Approved as American standard (B47-1932) by the American Standards Association, May, 1932]

PLAIN AND THREAD PLUG AND RING GAGE BLANKS

TERMINOLOGY

The following glossary is intended to clarify the meaning of certain technical terms employed in this report. The definitions are not intended to be general; rather they are specific as to their application to the American gage design standards.

American gage design standard.—The caption "American gage design standard" has been adopted to designate gages made to the design specifications promulgated by the American gage design committee.

A plain cylindrical plug gage is a complete unthreaded internal gage of single or double ended type for the size control of holes. It consists of handle and gaging member or members, with suitable locking means.

A progressive cylindrical plug gage is a complete unthreaded internal gage consisting of handle and gaging member in which the "go" and "not go" gaging sections are combined in a single unit secured to one end of the handle.

A thread plug gage is a complete internal thread gage of either single or double ended type, comprising handle and threaded gaging member or members, with suitable locking means.

The gaging member is that integral unit of a plug gage which is accurately finished to size and is employed for size control of the work. In taper lock gages, the gaging member consists of a shank and a gaging section.

The gaging section is that portion of the gage which comes into physical contact with the work. In the plug range above 1.510 to and including 4.510 inches, the gaging section is identical with the gaging member.

The shank (applied to taper lock gages only) is that portion of the gaging member which is employed for fixing the gaging member to the handle.

The term "taper lock" designates that construction in which the gaging member has a taper shank, which is forced into a taper hole in the handle. This design is standard for plug gages in the range above 0.059 inch to and including 1.510 inches, is optional for plain cylindrical and thread plug gages in the range above 1.510 inches to and including 2.510 inches, and is standard for pipe-thread plug gages up to and including 2-inch nominal pipe size.

A reversible plug gage is a plain cylindrical or thread plug gage, in which three wedge-shaped locking prongs on the handle are forced into corresponding grooves in the gaging member by means of a single through screw thus providing a self-centering support with a positive lock. This design is stand-

ard for all plug gages in the ranges above 1.510 to and including 4.510 inches, with the exception of pipe thread plug gages, for which it is standard in the ranges above 2.510 to and including 4.510 inches.

Lightening holes are unfinished drilled holes provided in the heavier sizes of gaging members for the sole purpose of reducing the weight of the gage.

The handle is that portion of a plug gage which is employed as supporting means for the gaging member or members.

The drift hole or drift slot is a small hole or slot provided in the side of a taper lock gage handle near the "go" end through which a pin or drift may be inserted for the purpose of ejecting the gaging member from the handle.

A plain ring gage is an unthreaded external gage employed for the size control of external diameters. In the smaller sizes it consists of a gage body into which is pressed a bushing, the latter being accurately finished to size for gaging purposes.

A thread ring gage is an external thread gage employed for the size control of threaded work, means of adjustment being provided integral with the gage body.

The flange is that external portion of a large ring gage which is reduced in section for the purpose of lightening the gage.

The hub is the midsection of a flanged ring gage. It determines the length of the gaging section.

The thread ring gage locking device is a means of expanding and contracting the thread ring gage during the manufacturing or resizing processes. It also provides an effectual lock. It comprises an adjusting screw, a locking screw, and a sleeve. For detailed description and illustration see below.

Adjusting slots are radial slots provided in thread ring gages in order to facilitate expansion and contraction of gage size by means of the adjusting device. An adjusting slot always terminates in an adjusting slot terminal hole.

The locking slot is that slot which passes entirely through the wall of a thread ring gage. In conjunction with the thread ring gage locking device, it permits expansion and contraction of gage size.

DETAILS OF CONSTRUCTION, AMERICAN GAGE DESIGN STANDARDS

Plain Cylindrical Plug Gage Blanks and Handles

Two separate designs have been adopted for plain cylindrical plug gages—the taper lock design for the range from 0.059 to and including 1.510 inches, and the reversible design with reversible gaging members for the range from above 1.510 to and including 4.510 inches. For sizes above 0.240 inch to and including 2.510 inches, both straight and progressive gaging members are provided. Use of the taper lock design is optional for the size range from above 1.510 to and including 2.510 inches.

(a) *Taper lock design above 0.059 to and including 1.510 inches.*—It was felt that the taper lock design was particularly well suited for the smaller sizes of plain plug gages. This type of gage is simple and is economical of production and maintenance. The gaging member has a taper shank which is forced into a taper hole in the handle. When properly assembled, the taper lock gage possesses the rigidity of a solid gage and is entirely free of shake or "wink." Drift slots or drift holes are provided near one end of the handle, permitting gaging members to be removed when replacement is necessary. In the case of double-end gages, one end is removed by running a rod through the hollow handle. In the smaller size ranges above 0.059 inch to and including 0.240 inch, a groove is provided near one end of the handle to designate the "not go" end, as the length of the "go" member in this range is often insuffi-

cient clearly to distinguish it from the "not go" member. The groove is omitted as unnecessary above 0.240 inch.

Complete dimensional tolerances have been established for the mating parts of gaging members and handles, insuring absolute interchangeability of gaging members and handles wherever manufac-

grooves in the gaging member by a single through screw thus providing a self-centering support with a positive lock, and resulting in a degree of rigidity equivalent to that of a solid gage. The useful life of the plug is furthermore materially increased, as when one end is worn the plug can be reversed and is then, for most purposes, as good as new.

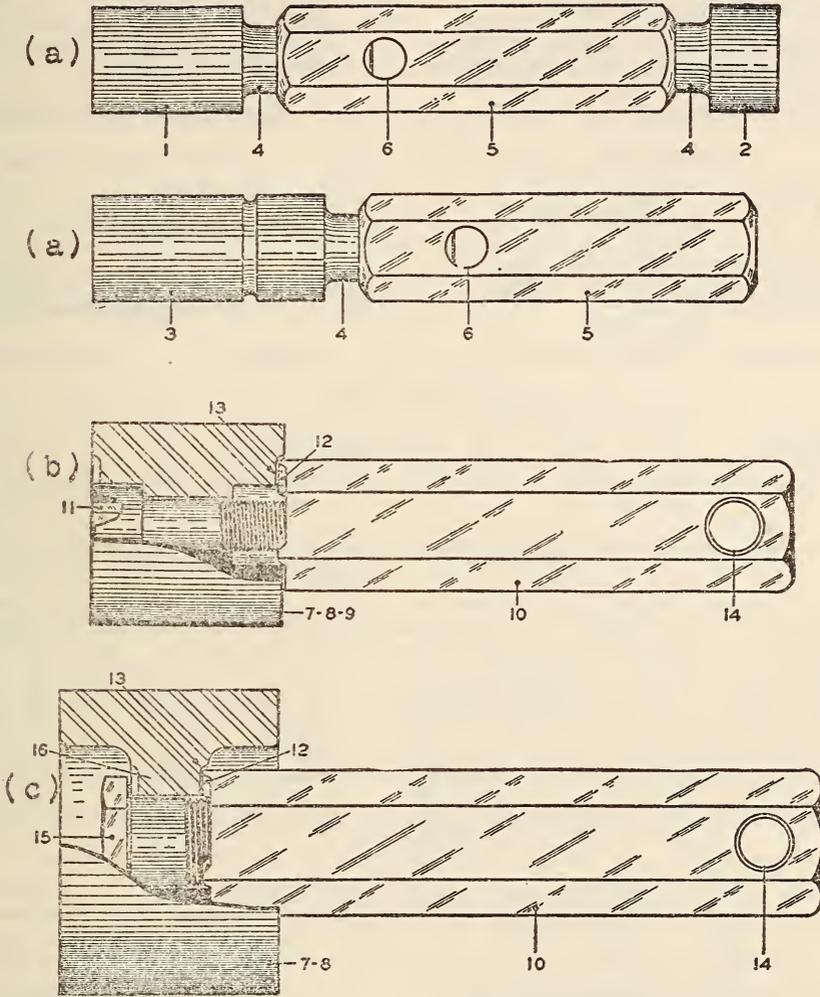

FIGURE 683.—American gage design standard plain cylindrical plug gages, details of construction

(a) Range: Above 0.059 to and including 1.510 inches; optional above 1.510 to and including 2.510 inches.

(b) Range: Above 1.510 to and including 2.510 inches.

(c) Range: Above 2.510 to and including 4.510 inches.

tured. General details of construction will be apparent from Figure 683. See also Tables 1 to 4.

(b) *Reversible design, above 1.510 to and including 4.510 inches.*—Considerations of rigidity of construction and long life have dictated the choice of the reversible design with reversible gaging members for the size range above 1.510 inches. With this construction there is no chance for shake or "wink" to interfere with the sensitive feel so necessary in gages of this type. Three wedge-shaped locking prongs on the handle are forced into corresponding

The construction is protected by carefully worked out dimensional limits, and interchangeability is insured between gaging members and handles wherever manufactured. Details of construction will be apparent from Figure 683 and Figure 688. See also Tables 5 and 6.

(c) *Handles.*—Handles for both taper lock and reversible gages are of the hexagonal type. However, the use of round medium-knurlled handles, while not recommended is made optional in all sizes.

Handles as designed for taper lock and reversible gages offer a feature of economy in that they may be disassembled from gaging members when the latter are worn out or discarded for any other reason, and may then be reassembled with new gaging members, thus giving them, with reasonable care, practically indefinite life.

Thread Plug Gage Blanks and Handles

The taper lock and reversible designs have been adopted for thread plug gage blanks and handles

and follow the plain cylindrical plug gage designs described above with the exception that the length of thread-gaging members is slightly different in some instances and the use of taper lock blanks and handles for pie-thread plug gages is standard to and including 2 inches nominal pipe size. General details of construction will be apparent from Figure 689. Data sheets for thread plug gages are set forth below. A separate table specifying the taper lock handles and gaging members for pipe-thread plug gages is shown in Table 11.

TABLE 1.—Plain cylindrical plug gage handles, taper lock design, range above 0.059 to and including 0.240 inch

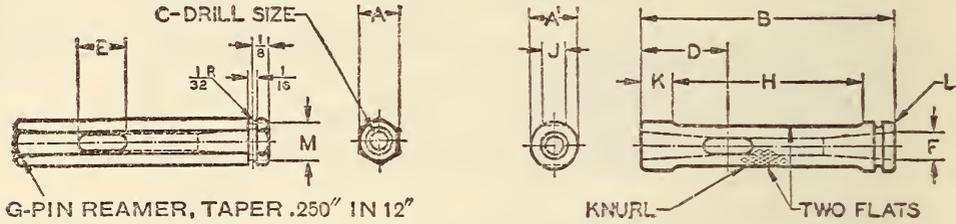

FIGURE 684

Handle size No.	Range, plain plug diameters		General dimensions														
	Above—	To and including—	A	A'	B	C Drill size	D	E	F		G	H	J	K	L	M
