¹ These blanks are intended for the American national coarse and fine thread series only.

² The use of taper lock thread plug gaging members and handles is optional for straight thread plug gages in the ranges above 1.510 to and including 2.510 inches, but the reversible design is recommended as standard. For taper pipe thread plug gages, see Table 11.

TABLE 11.—Pipe thread plug gage handles and gaging members, taper lock design, range 1/8 to 2 inches, inclusive

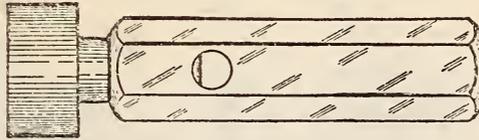

FIGURE 696

Taper lock gaging members and handles are standard for pipe thread plug gages to and including 2 inches nominal pipe size. The general dimensions of handles and gaging members which are referred to in this table are given in Tables 9 and 10.

Nominal pipe size	Handle No.	Gaging member, use "not go" blank for range—	Nominal pipe size	Handle No.	Gaging member, use "not go" blank for range—
1/8 inch.....	2	3/8 to 1/2 inch.	1 inch.....	5	1 1/4 to 1 1/2 inches.

(The illustration for thread plug gage handles, reversible design, range above 1.510 to and including 4.510 inches, is the same as for plain cylindrical plug gage handles shown above in Figure 688. The dimensions of socket head cap screw, No. 6 handle, in this instance are as follows:)

Plug	B	C	E
"Not go," all pitches. Go, 16 threads per inch and finer.....	Inches 1 1/2	Inch 3/8	Inches 1 1/4
"Go" pitches coarser than 16 threads per inch....	Inches 2 1/4	Inch 1 1/2	Inches 1 1/2

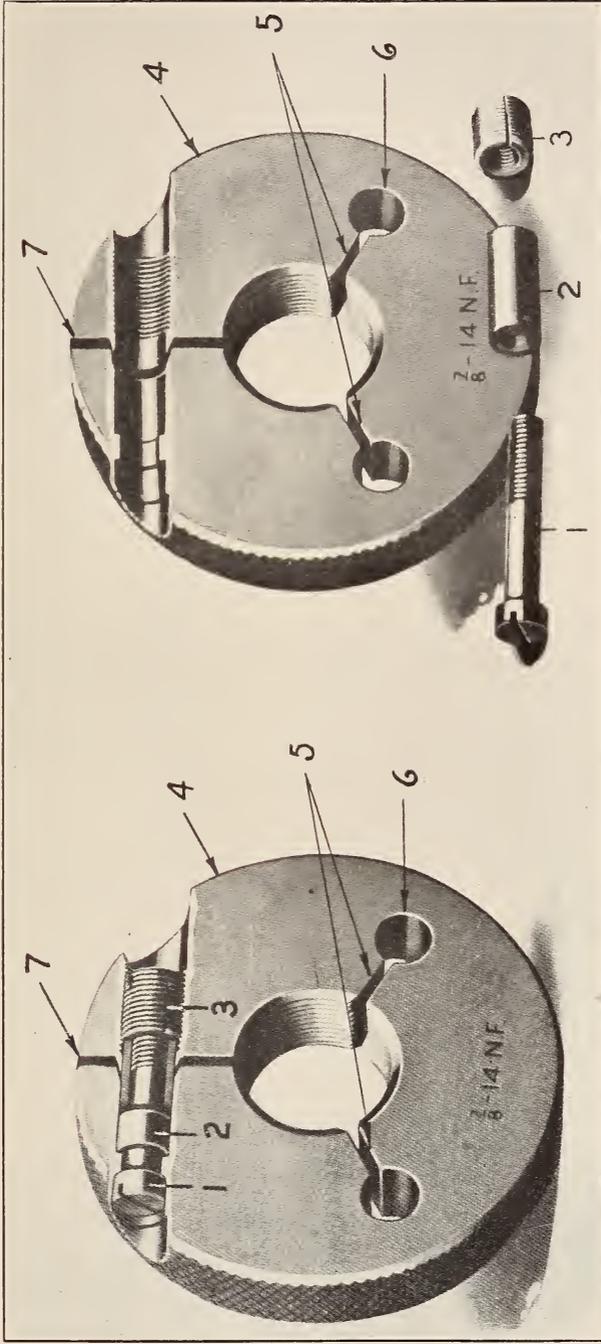

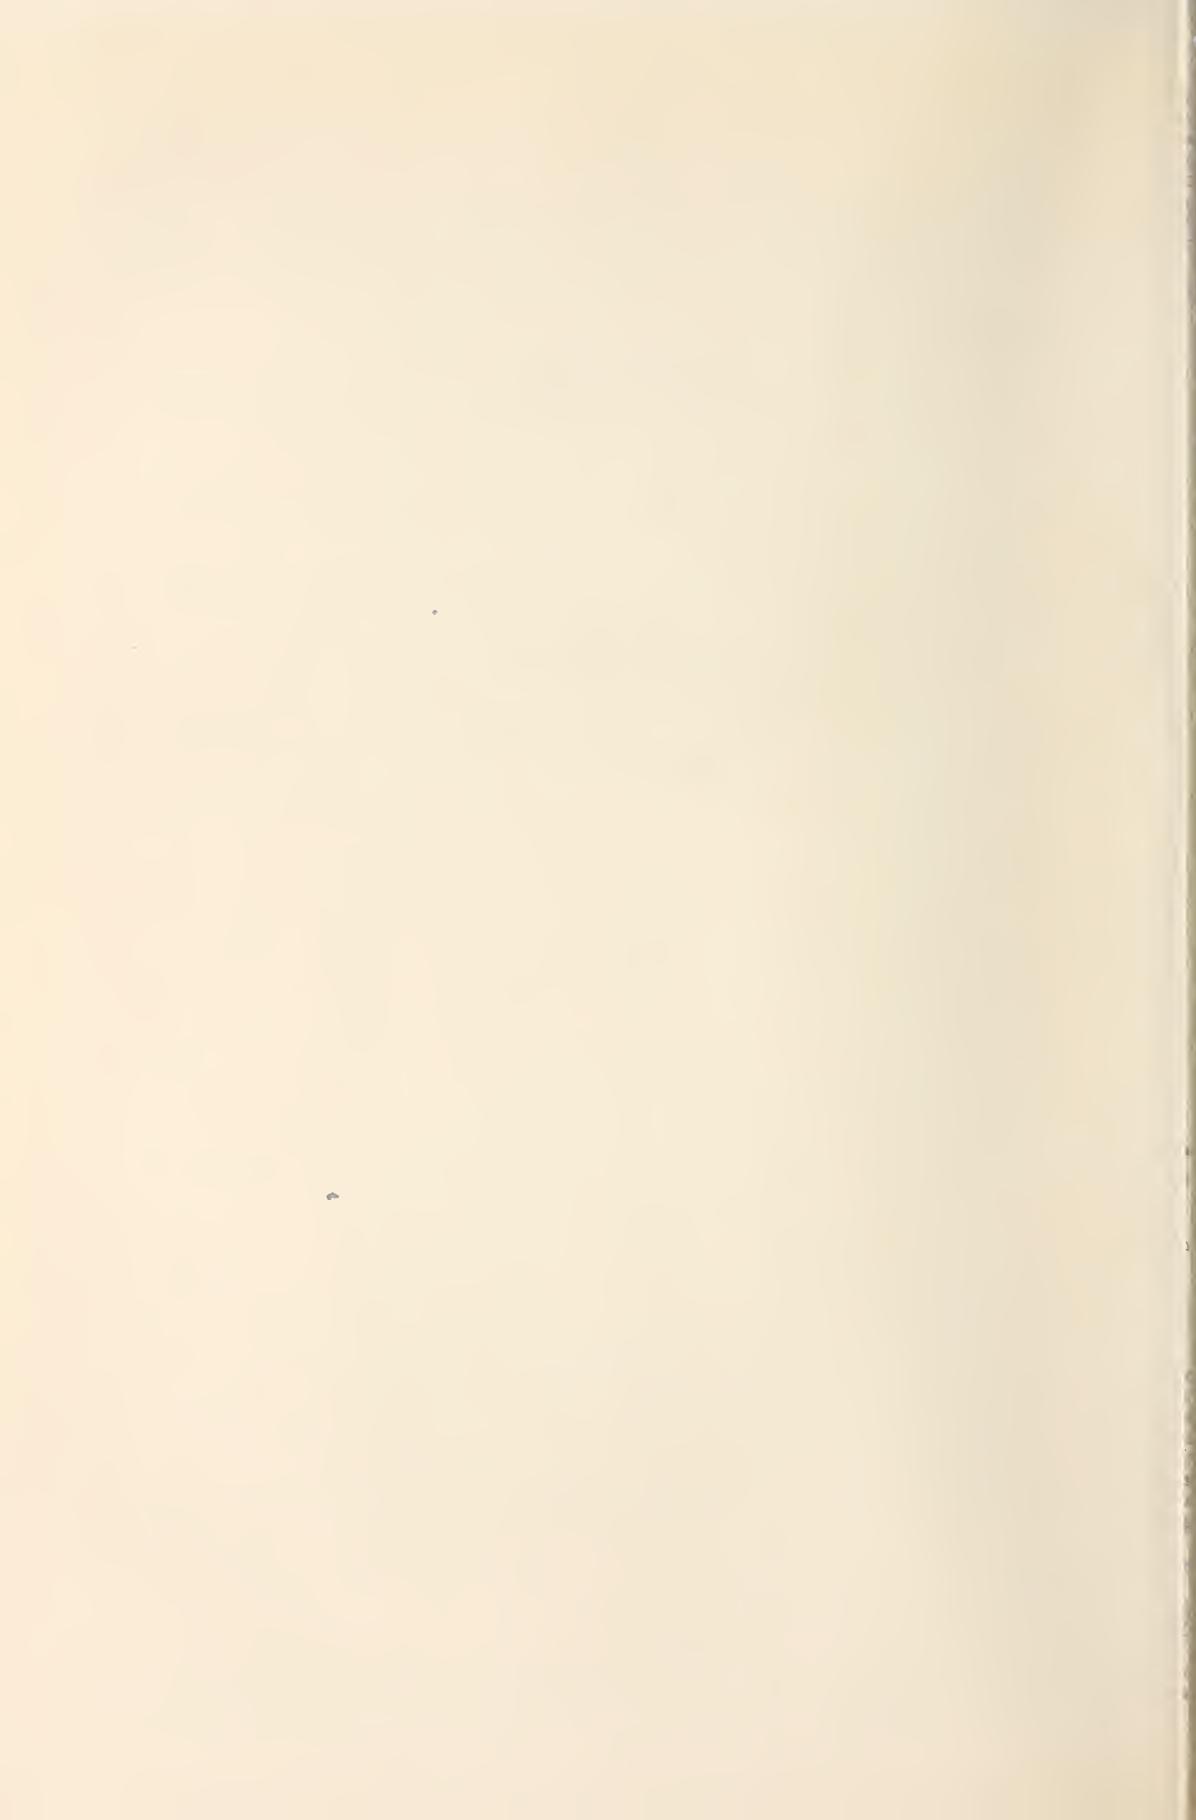

FIGURE 700.—American gage design standard thread ring gage locking device, details of construction, range No. 0 to $4\frac{1}{2}$ inches, inclusive
4, Locking screw; 2, sleeve; 3, adjusting screw; 4, body; 5, adjusting slot (one slot in range No. 0 to $\frac{3}{16}$ inch, two slots in range $\frac{3}{16}$ inch and larger); 6, adjusting slot
terminal hole; 7, locking slot.
(For specification see CS 8-30, p. 906.)

exerts a pull between the shoulder immediately under its head and the internal threads of the adjusting screw, 3, which causes the adjusting screw to expand into the threads in the wall of the gage, the thrust of this action being taken up longitudinally by the sleeve, 2. Therefore, the clamping is accomplished by expansion of the adjusting screw equally in all directions and not by the application of

one-half inch; (b) fine pitches,⁹¹ "go" and "not go," above one-half to and including 4½ inches; (c) coarse pitches, "not go" only, above one-half to and including 4½ inches.

3. A thick flanged type with two adjusting slots for all "go" coarse pitch gages, above one-half to and including 4½ inches.

Dimensions for thread ring gage blanks in the range from No. 0 to 4½ inches, inclusive, and of parts for the thread ring gage locking device, are given in Tables 16, 17, 18, and 19.

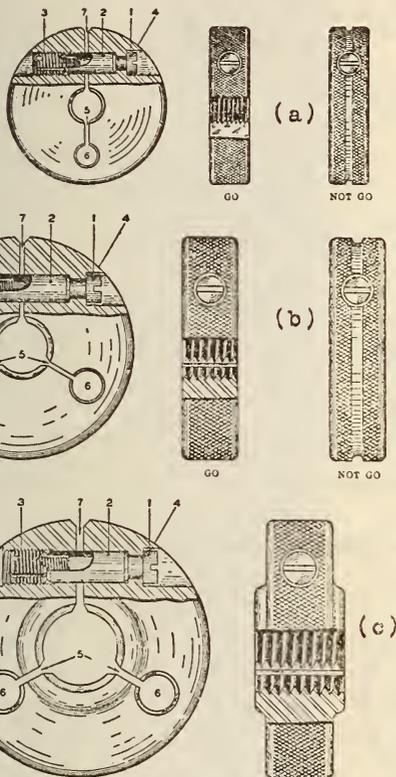

FIGURE 701.—American gage design standard thread ring gages, details of construction, range No. 0 to 4½ inches, inclusive

- (a) Range: No. 0 to and including 0.365 inch, "go" and "not go" gages, all pitches.
- (b) Range: 0.365 to and including 0.510 inch, "go" and "not go" gages, all pitches; 0.510 to and including 4.510 inches, "go" and "not go" gages, fine pitches; 0.510 to and including 4.510 inches, "not go" gages only, coarse pitches.
- (c) Range: 0.510 to and including 4.510 inches, "go" gages only, coarse pitches.

- 1, locking screw. 5, adjusting slot.
- 2, sleeve. 6, adjusting slot terminal hole.
- 3, adjusting screw. 7, locking slot.
- 4, body.

any eccentric forces that tend to distort the gage or upset the adjustment. The locking pressure, it is seen, is taken up centrally in the locking screw itself as the reacting support is directly under the head of the locking screw in the form of a shoulder in the gage. The sleeve, 2, being accurately fitted, serves as a large dowel to maintain the alignment of the gage.

Three types of thread ring gage blanks have been provided as illustrated in Figure 701, namely:

- 1. A thin flat disk type with one adjusting slot for all sizes and pitches, both "go" and "not go," No. 0 to 3/16 inch, inclusive.
- 2. A thin flat disk type with two adjusting slots for the following: (a) All sizes and pitches, "go" and "not go," above five-sixteenths to and including

Taper Plug and Ring Gages for Checking Taper Lock Handles and Gaging Members

It has been deemed advisable to formulate specifications for a complete set of finished gages for inspecting the taper shanks and handles of gages of taper lock design.

A complete set consists of a taper plug and a taper ring for each size range. General details of construction will be apparent from drawings, and Tables 20 and 21.

In the range above 0.059 to and including 0.240 inch, the taper limits established by the American gage design committee for taper lock handles and shanks may be readily maintained by the use of gages shown in Table 20, in which the taper plug gage is a double-end limit gage. Similarly, in the range above 0.240 to and including 1.510 inches, the taper limits established by the American gage design committee for taper lock handles and shanks may be readily maintained by the use of the gages shown in Table 21, in which the taper plug gage is of the single-end limit type, with a ground step representing the minimum size of hole. For either range equally satisfactory results may be secured by using a single-end taper plug gage, on which a scribed line represents the minimum size of hole and the shoulder of the gage represents the maximum size of hole. Both designs are sanctioned by the American gage design committee.

Official Monogram for Designating Products Made to American Gage Design Standards

The optional use of the monogram shown in Figure 702, to identify gages made to American

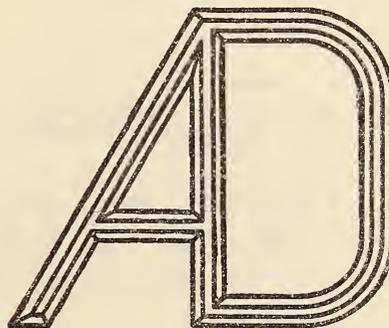

FIGURE 702.—Official monogram for designating products made to American gage design standards

gage design standards, is sanctioned by the committee. The monogram, it will be noted, consists of the initials "AD," the right-hand side of the "A" and the straight side of the "D" being common. The monogram, if used, should be placed adjacent to the maker's trade-mark.

⁹¹ Specific information as to the meaning of the terms "fine pitches" and "coarse pitches," as used above, is given in the footnote to Table 16.

Note.—This gage blank is to be used for all "not go" thread ring gages, all American national fine-thread "go" ring gages, and American national coarse-thread "go" ring gages up to and including the 1/4-inch size. Thick blanks are to be used for all American national coarse-thread "go" ring gages above the 1/4-inch size.

It is recommended that standard thread ring gage blanks be used for special pitches as follows:

No. 0 to 1/2 inch, inclusive, thin blanks for all pitches.

Above 1/2 inch to and including 1 1/4 inches, thin blanks for 12 threads per inch and finer, and thick blanks for all "go" gages in pitches coarser than 12 threads per inch.

Above 1 1/4 inches, thin blanks for 10 threads per inch and finer, and thick blanks for all "go" gages in pitches coarser than 10 threads per inch.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; THE MEASUREMENT OF TAPER GAGES, LC22, AUGUST 15, 1919

TAPER GAGES

(A description of the various methods used by the gage section of the Bureau of Standards in measuring plug gages having a single taper, double taper, or triple taper; taper ring gages; and profile gages having tapered surfaces.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; MEASUREMENT OF PITCH DIAMETER OF SCREW-THREAD GAGES, LC23, AUGUST 25, 1919

SCREW-THREAD GAGES

(A resumé of the methods used for the measurement of the pitch diameter of screw-thread gages.) It is stated that, of the various methods tried, the 3-wire method has been found to be the most accurate and satisfactory when properly carried out. This is the method used by the gage section of the Bureau of Standards. Appendixes to this publication contain in detail the complex mathematical relations involved in the measurement of pitch diameter by the 3-wire method.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; INTERFERENCE METHODS FOR STANDARDIZING AND TESTING PRECISION GAGE BLOCKS, NO. 436, MAY 2, 1922

PRECISION GAGE BLOCKS

Precision gages, which are blocks of metal (usually steel), having two opposite faces plane, parallel, and a specified distance apart, are used in the shop as reference end standards for checking micrometers and other measuring instruments, and also as distance pieces or size blocks for precise mechanical work. The extensive use of precision gages necessitated by the small tolerances allowed in the manufacture of interchangeable machine parts has required more accurately determined end standards and more rapid and precise methods for comparing gages with these standards than have been previously available.

Since comparisons of end standards with line standards by means of micrometer-microscopes and of precision gages with end standards by means of contact instruments are subject to appreciable errors, methods which make use of the interference of light waves were used in making these measurements. With the interference methods described in this article the planeness and parallelism errors of precision surfaces can be measured, and the length of standard gages can be determined by direct comparison with the standard light waves with an uncertainty of not more than a few millionths of an inch. The errors of other gages can be determined by comparison with these calibrated standards with equal precision. This process makes the standard light waves, which have been determined to one part in four or five million relative to the international meter, the standards of length for this work.

The apparatus used for calibrating standards and comparing other gages with these standards is illustrated by line drawings and thoroughly explained.

UNITED STATES GOVERNMENT, NATIONAL SCREW THREAD COMMISSION, SPECIFICATIONS FOR GAGES. BUREAU OF STANDARDS MISCELLANEOUS PUBLICATION NO. 89, 1928

GAGES

The following specifications are for the purpose of establishing definite limits for thread gages rather than for the purpose of specifying the gages required for the various inspection operations:

Classification of Gages, and Gage Tolerances

Screw-thread gages are classified according to accuracy into classes X, Y, and Z, the class X being the most accurate. The tolerance limits on classes Y and Z "go" gages are placed inside of the extreme product limits to provide allowance for wear of the gages. The tolerances on all "not go" gages, however, are applied from the extreme product limit as the starting point, as no allowance for wear is necessary. The selection of gages from among these classes for use in the inspection of threaded product depends entirely upon the specifications for the product. For example, in the production of parts to class 4, close fit specifications, class X gages may be required for all purposes. On the other hand, for parts made to class 1, loose fit specifications, class Z gages may be sufficiently accurate for all purposes.

(a) *Master gages.*—No fixed tolerances are specified for master gages. These should be made to the

basic size as accurately as possible and be within the tolerances specified for class X gages. The variations from basic size shall be plus. Each master gage shall be marked with an identification number or symbol, and be accompanied by a record of its measurement on major diameter, pitch diameter, lead, and angle. In case of question, the deviations of such gages from the exact standard shall be ascertained by the Bureau of Standards at Washington, D. C.

(b) *Class X gages.*—Class X gages should be suitable for inspection and setting gages for all classes of fits. They may also be necessary for working gages for the class 4 fit. The tolerances on these gages are given in Table 18. In all cases the tolerances shall be such that the gage does not fall outside of the component tolerances. For example, if a thread-plug gage is used as the "go" gage for checking a tapped hole, it can be larger, but not smaller than the minimum size specified. On the other hand, if a thread-plug gage is used as the "go" setting plug for thread-ring gages or for optical or other comparators, it can be smaller, but never larger, than the maximum size of the screw.

Class X tolerances, as given in Table 18, are specified for all "not go" gages.

(c) *Class Y gages.*—Class Y gages should be suitable for inspection gages for classes 1, 2, and 3 fits. They may also be desired as working gages for classes 2 and 3 fits. The tolerances on these gages are given in Table 19.

(d) *Class Z gages.*—Class Z gages should be suitable for working gages for class 1, loose fit. The tolerances on these gages are given in Table 20.

(e) *Wear on gages.*—"Go" gages may be permitted to wear to the extreme product limits. It is desirable, however, that working and inspection gages be so selected that the dimensions of the working gages are inside of the limiting dimensions represented by the inspection gages, in order that all parts passed by the working gage will be accepted by the inspection gage.

As to wear on "not go" gages, it is purely a question of economy as to when the "not go" gage should be discarded. Continued use reduces the available working tolerance on the product, and the resulting loss must be balanced against the cost of a new gage.

(f) *Tolerances on lead.*—The tolerances on lead given in Tables 18 to 20, inclusive, are specified as an allowable variation between any two threads not farther apart than the length of engagement of the assembled threaded product. When this length of engagement is equal to the diameter, the permissible progressive lead errors per inch may be determined by dividing these lead tolerances by the corresponding diameters.

(g) *Tolerances on angle of thread.*—The tolerances on angle of thread, as specified in Tables 18 to 20, inclusive, for the various pitches, are tolerances on one-half of the included angle. This insures that the bisector of the included angle will be perpendicular to the axis of the thread within proper limits. The equivalent deviation from the true thread form caused by such irregularities as convex or concave sides of thread, rounded crests, or slight projections on the thread form, should not exceed the tolerances permitted on angle of thread.

Tolerances for Plain Gages

For plain plug gages, plain ring gages, and plain snap gages required for measuring diameters of screw-thread work, the gage tolerances specified in Table 18 should be used. Attention is directed to the fact that the tolerances on thread diameters vary in accordance with the number of threads per inch. In manufacturing a plain plug, ring, or snap gage, in the absence of information as to the number

of threads per inch of the screw to be made, or for gage dimensions other than thread diameters, the tolerances for plain gages given in Table 21 may be used. This table contains recommended tolerances for classes X, Y, and Z gages, which have been tentatively adopted by the A. S. A. sectional committee on the standardization of plain limit gages for general engineering work.

Recommended Gage Practice

There are given in Table 17 the recommended uses for the foregoing classes of gages. Tables 22, 23, 24, and 25 give limiting dimensions of gages of the several classifications for the American national coarse and American national fine thread series.

TABLE 17.—Recommended uses for classes X, Y, and Z gages

Class of fit	Setting gage	Inspection gage	Working gage
1	2	3	4
Class 1, loose fit.....	Class X.....	Class Y.....	Class Z.
Class 2, free fit.....	do.....	do.....	Class Y.
Class 3, medium fit.....	do.....	Class X.....	Do.
Class 4, close fit.....	do.....	do.....	Class X.

TABLE 18.—Tolerances for class X "go" thread gages and all "not go" thread gages

Threads per inch	Tolerance on pitch diameter ¹		Tolerance on lead ² ±	Tolerance on half angle of thread ±	Tolerance on major or minor diameters ¹

3½...	.0000	.0004	.0004	0 5	.0000	.0009	

¹ On "go" plugs the tolerance is plus, and on "go" rings the tolerance is minus. On "not go" plugs the tolerance is minus, and on "not go" rings the tolerance is plus.

² Allowable variation in lead between any 2 threads not farther apart than the standard length of engagement, which is equal to the basic major diameter.

It is suggested that, in case of question between the manufacturer and purchaser of threaded products in regard to their size, if the manufacturer produces limit gages which do not measure outside of the specified limits for the threaded components and which pass the parts in question, they be accepted as meeting the specifications for size. In case the dimensions of the gages are questioned, their sizes shall be determined by a disinterested third party, preferably the Bureau of Standards at Washington, D. C., which maintains a department for this service.

Marking of Gages

Each gage shall be plainly and permanently marked, for identification, with the diameter, pitch, thread series, and class of fit.

For example: A 1-inch 8-pitch gage of the American national coarse-thread series, class 2, free fit, shall be marked 1"—8—NC—2.

A 1-inch 14-pitch gage of the American national fine-thread series, class 3, medium fit, shall be marked 1"—14—NF—3.

¹ The maximum minor diameter of the “go” thread ring gage is the same as the minimum minor diameter of the tapped hole.

² In order that the “not go” gage check pitch diameter only, it is necessary that the minor diameter of the “not go” ring gage be never less than that specified for the “go” ring gage. The limiting dimensions given in this table for the minor diameter of the “not go” ring gage represent this condition.

TABLE 24.—Limiting dimensions of thread plug gages for nuts of classes 1, 2, 3, and 4 fits, American national coarse-thread series

¹ The difference between these dimensions is not a manufacturing tolerance in the usual sense, but these dimensions represent the limits between which the dimensions may fall. In order that the "not go" gage check pitch diameter only, it is necessary that the crest of the thread be removed so that the major diameter of the "not go" plug gage be never greater than that specified for the "go" plug gage. The limiting dimensions given in this table for the major diameter of the "not go" plug gage represent this condition. On the other hand, it is desirable that the crest of the "not go" gage be truncated a considerable amount, in order to minimize the effect of angle error on the fit of the "not go" gage with the product. A truncation from basic dimensions corresponding to a width of flat equal to ¼Xp is recommended, and this condition is represented by the limiting dimensions given in this table as the minimum minor diameter of the plug gage. "Not go" plug gages may be made to any dimension between the limits given, but the manufacturing tolerances should preferably be applied from these latter limits as starting points.

GAGES FOR SPECIAL THREADS

Only one set of tolerances, namely, class X, is specified for "not go" gages.

Thread Form of Plug and Ring Thread Gages

The minor diameter of the "go" thread ring gage is the same as the minimum minor diameter of the nut or tapped hole with a minus gage tolerance. The minor diameter of the "not go" ring gage is the minimum minor diameter of the nut plus at least 0.0002 inch, with a plus gage tolerance. Also the maximum major diameter of the "not go" thread plug gage is at least 0.0002 inch less than the basic major diameter, with a minus gage tolerance.

A relief is provided at the root of the "go" thread plug or ring gage, the width of which is not greater than one-eighth of the pitch. Also a relief is provided at the root of the "not go" plug or ring gage, the width of which is approximately one-fourth of the pitch.

Thus contact of the "not go" thread gage on the sides of the threads, rather than at the corners of the crest and root, is assured.

(Recommended uses for classes X, Y, and Z gages are the same as given above. Tolerances for like number of threads per inch are also the same as given above.)

GAGES FOR AMERICAN NATIONAL FIRE-HOSE COUPLING THREADS

It is recommended that American national fire-hose coupling threads be inspected in the field by means of gages made within the tolerances given in Table 41. Limiting dimensions for these gages are given in Tables 42 and 43.

It is further recommended that American national fire-hose coupling threads be given final inspection by the manufacturer by means of gages made within the limiting dimensions given in Tables 42 and 43, by whatever amount may be desired, in order to avoid, as far as possible, disagreements which might otherwise arise as the result of slight differences in the sizes of gages.

TABLE 41.—Tolerances on gages for American national fire-hose coupling threads

¹ See footnote to Table 43.

TABLE 43.—Limiting dimensions of field inspection thread ring gages for coupling nipples (external threads)¹

Nominal size	Threads per inch	"Go" or maximum gage				"Not go" or minimum gage			
		Pitch diameter		Minor diameter		Pitch diameter		Minor diameter	
		Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum
1	2	3	4	5	6	7	8	9	10
2.500	7.5	<i>Inches</i> 2.9820	<i>Inches</i> 2.9810	<i>Inches</i> 2.9104	<i>Inches</i> 2.9094	<i>Inches</i> 2.9670	<i>Inches</i> 2.9660	<i>Inches</i> 2.9114	<i>Inches</i> 2.9104
3.000	6.0	3.5156	3.5146	3.4223	3.4213	3.4986	3.4976	3.4233	3.4223
3.500	6.0	4.1356	4.1346	4.0473	4.0463	4.1186	4.1176	4.0483	4.0473
4.500	4.0	5.5985	5.5975	5.4611	5.4601	5.5745	5.5735	5.4621	5.4611

¹ The minor diameters of plug gages and the major diameters of ring gages are undercut beyond the nominal diameters to give clearance for grinding or lapping. The allowable variation in lead between any 2 threads not farther apart than the length of engagement is ±0.000 inch. The allowable variation in one-half angle of thread is ±10 minutes.

GAGE FOR PIPE THREADS

In order properly to maintain interchangeability of pipe threads, gages should consist of "master," "check" or "setting," "inspection," and "working" gages. The same fundamentals apply as those outlined in the section covering gages for fastening screws, with the single exception that, with taper-threaded gages, separate "go" and "not go" gages are not necessary.

Classification of Gages

1. *Master gage.*—The master gage is a taper-threaded plug gage. The roots of the threads are

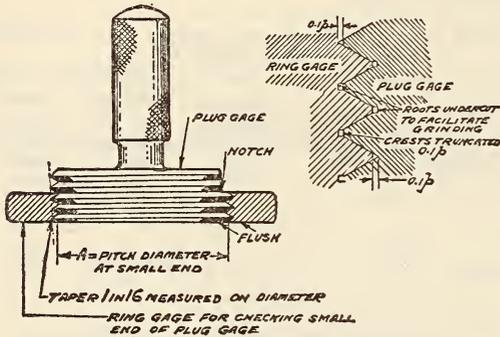

FIGURE 711.—Master gages or check gages for checking working gages

cut to a sharp V or may be undercut to facilitate the making of the thread. The crests are truncated an amount equal to $0.1 p$. (See fig. 711.)⁹² Basic dimensions of taper pipe thread gages are given in Table 55. This gage is provided with the gaging notch as illustrated in Figure 711. The master gage is the gage to which all other gages are ultimately referred, either by transfer of measurements or direct comparison by engagement. It is in-

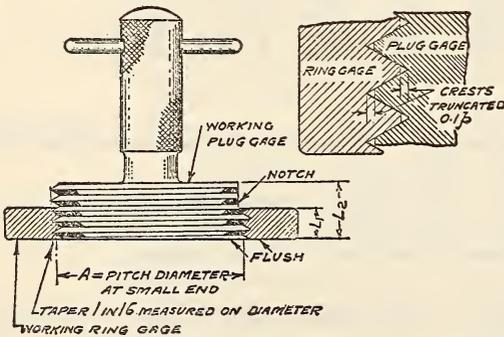

FIGURE 712.—Inspection or working gages for checking product

tended primarily for the use of gage and thread tool manufacturers.

2. *Check (or reference) gages.*—The check gages consist of a plug gage, similar in all respects to the master gage, and one ring gage. The ring gage has a thickness equal to dimension L_1 , is the same diameter at the small end as the small end of the plug gage, and is flush with the plug gage at the small end and at the gaging notch when screwed on tight

by hand. (See fig. 711.) The check plug gage is used to inspect inspection and working taper-threaded ring gages. The check ring gage is used to compare the check plug with the master plug, or the inspection and working plug gages with the check plug gage.

3. *Inspection gages.*—Inspection gages consist of one taper threaded plug gage and one taper threaded ring gage. The roots of the threads are cut to sharp V or may be undercut to facilitate making the thread. The crests are truncated an amount equal to $0.1 p$, but otherwise the gages are made to the dimensions given in Table 44.⁹² (See N. S. T. C. under 607.0, p. 367.) The ring gage has a thickness equal to dimension L_1 , and the same diameter at the small end as the small end of the plug gage. (See fig. 712.)

Inspection gages are for the use of the purchaser of pipe thread products. When used, the extreme tolerances on the work should be applied. This tolerance is one and one-half turns either way from the gaging notch in the case of internal threads inspected with the inspection plug gage, and when inspecting external threads the tolerance is one and one-half turns either way from the small end of the inspection ring. Inspection gages should be checked

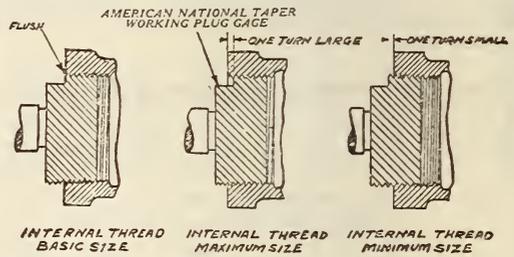

FIGURE 713.—Gaging of internal American national taper pipe threads

frequently against the check gages, and in use their errors should be taken into account.

4. *Working gages.*—The working gages consist of one taper-threaded plug and one taper-threaded ring gage. These gages are similar in all respects to the inspection plug and ring gages. The working gages are used by the manufacturer to inspect his product. In using the working gages, the tolerance to be applied is one turn either way from the gaging notch in the case of internal threads inspected with the plug gage, and in the case of external threads the tolerance is one turn either way from the small end of the working ring gage.

Gaging Practices

1. *Gaging internal threads.*—The inspection and working plug gages, Figure 713, should screw tight by hand into the fitting or coupling until the notch is flush with the face. When the thread is chamfered, the notch should be flush with the bottom of the chamfer. The fitting or coupling is within the working or net tolerance if the working gage notch is within one turn of the coupling or fitting face when screwed in tight by hand. In the same way the coupling or fitting is within the inspection or extreme tolerance if the inspection gage notch is within one and one-half turns of the coupling or fitting when screwed on tight by hand.

This method of gaging is used either for taper internal threads or for straight internally threaded couplings which screw together with taper external threads.

2. *Gaging taper external threads.*—The ring gage, Figure 714, should screw tight by hand on the pipe or external thread until the small end of the gage is

⁹² The object of truncating the crests on gages (truncation $0.1 p$) is to insure that, when gaging commercial threads cut with a slightly dull tool, the gage bears on the sides of the thread instead of on the roots.

flush with the end of the thread. The pipe or external thread is within the working or net tolerance if the working ring gage screws on until the end of pipe or external thread is within one turn of the small end of the gage. The pipe or external thread is within the inspection or extreme tolerance if the inspection ring screws on until the end of pipe is within one and one-half turns of the small end of the gage.

Specifications for Gages

1. *Master gages.*—Master gages shall be made within the closest possible limits of error. In no case

errors for comparison with column 2. In Table 53 the results of errors in angle are expressed in terms of diameter. In Table 54 the results of errors in pitch are expressed in terms of diameter.

For example: A three-fourths inch, 14-thread, pipe-thread plug gage is reported as follows:

Pitch diameter, large end, 0.98881 inch.
Pitch diameter, small end, 0.96775 inch.
One-half included angle of thread, 29° 58'.
Maximum error in lead, 0.00007 inch.

The correct pitch diameter at large end is 0.98886 inch. The error is 0.00005 inch. The correct pitch

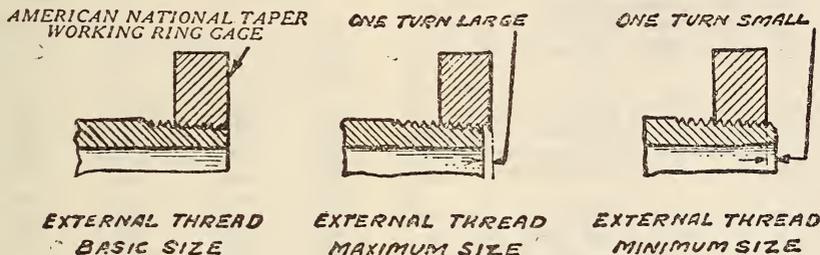

FIGURE 714.—Gaging of external American national taper pipe threads

shall the accumulative error exceed the total accumulative tolerance on diameter given in Table 51. Each master gage shall be accompanied by a report showing the error on each of the elements of thread and a statement of the accumulative error derived from the errors in the various elements. In case of question, the deviations of this gage from the basic size shall be ascertained by the Bureau of Standards at Washington, D. C.

2. *Check (or reference) gages.*—Column 2 of Table 51 gives the maximum allowable accumulation of

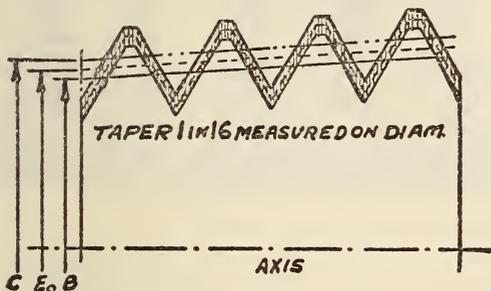

FIGURE 715.—Relation of tolerance to basic dimensions of a correct taper pipe thread gage

E_0 = basic pitch diameter at small end of gage.
 B = minimum pitch diameter at small end of gage.
 C = maximum pitch diameter at small end of gage.
 $B = E_0$, column 2 from Table 51 for check gages, or column 2 from Table 52 for new working gages.
 $C = E_0$, column 2 from Table 51 for check gages, or column 2 from Table 52 for new working gages.

NOTE.—No point of the thread surface of the gage should be outside of the zone of tolerance indicated by the shaded portion of the illustration. The dotted line indicates the outline of a correct gage made exactly to the basic dimensions.

all errors in the thread surface of a check gage expressed in terms of diameter, as illustrated in Figure 715. No point on the thread surface of the gage should be outside the zone of tolerance indicated by the shaded portion of the illustration. This column is used when checking gages by measurement. If the errors in the gage are reported in terms of pitch, angle of thread, and diameter, Tables 53 and 54 may be used to determine the accumulation of these

diameter at small end is 0.96768 inch. (See Table 44, N. S. T. C. under 607.0, p. 367.)

Error of 2' in angle is equivalent to 0.00005 inch; 0.00007 inch error in lead is equivalent to 0.00012 inch. (See Table 44.) The accumulative error at large end in terms of diameter = 0.00023 inch. The accumulative error at small end equals 0.00025 inch.

The gage falls within the limits of the check gage (0.00028 inch as given in Table 51).

Column 3 of Table 51 gives the equivalent of column 2, expressed in terms of distance parallel to the axis, and represents the maximum distance which a check ring gage of correct thickness, or a check plug gage of correct length from small end to gaging notch, may vary from being flush at the gaging notch, or at the small end, when referred to basic dimensions. It is equal to sixteen times column 2 because of the basic taper of 1 in 16, measured on the diameter. This column is used when checking check gages by comparison with a master gage. The necessary allowance must be made for the error in the master gage.

Column 4 of Table 51 gives the equivalent of column 3, expressed in terms of the decimal part of a turn. This column is also used when checking check gages by comparison with a master gage. The necessary allowance must be made for the error in the master gage.

A tolerance of plus or minus 0.0002 inch is allowed on the distance between the gaging notch and the small end of the check plug gage, or on the thickness of the check ring gage.

It is possible for check plug and ring gages, which come within all of the above tolerances, to vary from being flush with each other at the small end, or at the gaging notch, when screwed together tight by hand. The maximum variation which might occur, expressed in terms of distance, is given in column 5 of Table 51.

3. *Inspection gages.*—The tolerances on new inspection gages are the same as on working gages. (See Table 52.)

4. *New working gages.*—Column 2 of Table 52 gives the maximum allowable accumulation of all errors in the thread surface of new working gages, expressed in terms of diameter, as illustrated in Figure 715. No point in the thread surface of the gage should be outside of the zone of tolerance

indicated by the shaded portion of the illustration. This column is used when checking gages by measurement.

Column 3 of Table 52 gives the equivalent of column 2, expressed in terms of distance parallel to the axis, and represents the maximum distance which a new working ring gage of correct thickness, or a new working plug gage of correct length from small end to gaging notch, may vary from being flush at the gaging notch, or at the small end, when referred to basic dimensions. It is equal to sixteen times column 2, because of the basic taper of 1 in 16, measured on the diameter. This column is used when checking working gages by comparison with a gage the error of which is known. The necessary allowance must be made for this error.

Column 4 of Table 52 gives the equivalent of column 3, expressed in terms of the decimal part of a turn. This column is also used when checking working gages by comparison with a gage the error of which is known. The necessary allowance must be made for this error.

A tolerance of plus or minus 0.0005 inch is allowed on the distance between the gaging notch and the small end of the working plug gage, or on the thickness of the working ring gage.

It is possible for working plug and ring gages which come within all of the above tolerances to vary from being flush with each other at the small end or at the gaging notch, when screwed together tight by hand. The maximum variation which might occur, expressed in terms of distance, is given in column 5 of Table 52.

It is also possible for working plug and ring gages which come within all of the above tolerances to vary from being flush at the small end or at the gaging notch, when screwed tight by hand on a reference gage which comes within the tolerances specified for reference gages. The maximum variation which might occur, expressed in terms of distance, is given in column 6 of Table 52.

5. *Worn working gages.*—The maximum wear on working gages must not be more than the equivalent of one-half turn from the basic dimensions.

In order that no work passed by the working gage shall be rejected by the inspection gage it will be necessary to discontinue the use of the working gage when it has worn one-half turn; that is, the

working gage should always be kept within the tolerance equivalent of one turn from the basic dimensions.

¹ These dimensions are based on a crest truncation of 0.1*p* for pipe thread gages, which insures bearing of the gage on the sides of the thread, when cut with a slightly dull tool, instead of at the roots of the thread.
² Outside diameter.

GAGES FOR ACME THREADS

Limiting Dimensions

Tables 82, 83, and 84 given herein are for the purpose of establishing definite limits for gages used in the inspection of Acme threads, rather than for the purpose of specifying the gages required for the various inspection operations. The dimensions as given are in accordance with the principles: (a) That the "go" gage should check simultaneously as many elements as possible and a "not go" gage can effectively check but one element; and (b), that permissible variations in the gages be within the extreme product limits.

Tolerances on Lead

The tolerances on lead given in Table 82 are specified as an allowable variation between any two threads not farther apart than 12 inches.

Tolerances on Angles of Thread

The tolerances on angle of thread, as specified in Table 82 for the various pitches, are tolerances on one-half of the included angle. This insures that the bisector of the included angle will be perpendicular to the axis of the thread within proper limits. The equivalent deviation from the true thread form caused by such irregularities as convex or concave sides of thread, or slight projections on the thread form, should not exceed the tolerances permitted on angle of thread.

Fillets at Minor Diameter

"Go" threaded plug gages for nuts have fillets at the minor diameter, the radii of which are not less than 0.010 inch for pitches of three threads per inch and finer, and not less than 0.020 inch for pitches coarser than three threads per inch.

TABLE 82.—Tolerances for “go” and “not go” thread gages, American national acme threads

GAGES FOR STANDARD HOSE CONNECTIONS FOR WELDING AND CUTTING TORCHES

Dimensions and designs of gages for maintaining the hose connection standards for welding and cutting torches are recommended as follows:

NOTE.—In connection with screw-thread gages see also page 921.

Gage No.

- "Go" and "not go" gage for depth of threaded recess and shank bore—

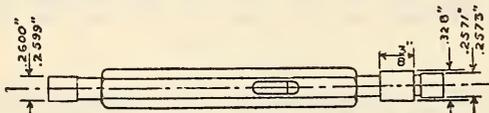

FIGURE 716.—"Go" and "not go" gage for depth of threaded recess, and shank bore, A size

- A size hose connection, as shown in Figure 716.
- B size hose connection, as shown in Figure 721.

- "Go" adjustable thread-ring gage for right-hand nipple thread—
 - A size, ⅜-24-NF-3
 - Minor diameter, maximum, 0.3299; minimum, 0.3294 inch.
 - Pitch diameter, maximum, 0.3477; minimum, 0.3474 inch.
 - B size, ⅜-18-NF-3
 - Minor diameter, maximum, 0.5024; minimum, 0.5019 inch.
 - Pitch diameter, maximum, 0.5262; minimum, 0.5259 inch.

- "Go" adjustable thread-ring gage for left-hand nipple thread—
 - A size, ⅜-24 L. H.-NF-3
 - Minor diameter, maximum, 0.3299; minimum, 0.3294 inch.
 - Pitch diameter, maximum, 0.3477; minimum, 0.3474 inch.
 - B size, ⅜-18 L. H.-NF-3
 - Minor diameter, maximum, 0.5024; minimum, 0.5019 inch.
 - Pitch diameter, maximum, 0.5262; minimum, 0.5259 inch.
- "Not go" adjustable thread-ring gage for right-hand nipple thread—
 - A size, ⅜-24-NF-3
 - Minor diameter, maximum, 0.3304; minimum, 0.3299 inch.
 - Pitch diameter, maximum, 0.3458; minimum, 0.3455 inch.
 - B size, ⅜-18-NF-3
 - Minor diameter, maximum, 0.5029; minimum, 0.5024 inch.
 - Pitch diameter, maximum, 0.5237; minimum, 0.5234 inch.
- "Not go" adjustable thread-ring gage for left-hand nipple thread—
 - A size, ⅜-24 L. H.-NF-3
 - Minor diameter, maximum, 0.3304; minimum, 0.3299 inch.
 - Pitch diameter, maximum, 0.3458; minimum, 0.3455 inch.
 - B size, ⅜-18 L. H.-NF-3
 - Minor diameter, maximum, 0.5029; minimum, 0.5024 inch.
 - Pitch diameter, maximum, 0.5237; minimum, 0.5234 inch.

6. "Go" and "not go" double-end threaded setting-plug gages for Nos. 2 and 4—
 A size, $\frac{3}{8}$ -24-NF-3
 "Go" end—
 Major diameter, maximum, 0.3750; minimum, 0.3740 inch.
 Pitch diameter, maximum, 0.3477; minimum, 0.3474 inch.
 "Not go" end—
 Major diameter, maximum, 0.3689; minimum, 0.3684 inch.
 Pitch diameter, maximum, 0.3458; minimum, 0.3455 inch.
 B size, $\frac{1}{16}$ -18-NF-3
 "Go" end—
 Major diameter, maximum, 0.5625; minimum, 0.5620 inch.
 Pitch diameter, maximum, 0.5262; minimum, 0.5259 inch.
 "Not go" end—
 Major diameter, maximum, 0.5548; minimum, 0.5543 inch.
 Pitch diameter, maximum, 0.5237; minimum, 0.5234 inch.

7. "Go" and "not go" double-end threaded setting plug gage for Nos. 3 and 5—
 A size, $\frac{3}{8}$ -24 L. H.-NF-3
 "Go" end—
 Major diameter, maximum, 0.3750; minimum, 0.3745 inch.
 Pitch diameter, maximum, 0.3477; minimum, 0.3474 inch.
 "Not go" end—
 Major diameter, maximum, 0.3689; minimum, 0.3684 inch.
 Pitch diameter, maximum, 0.3458; minimum, 0.3455 inch.
 B size, $\frac{1}{16}$ -18 L. H.-NF-3
 "Go" end—
 Major diameter, maximum, 0.5625; minimum, 0.5620 inch.
 Pitch diameter, maximum, 0.5262; minimum, 0.5259 inch.
 "Not go" end—
 Major diameter, maximum, 0.5548; minimum, 0.5543 inch.
 Pitch diameter, maximum, 0.5237; minimum, 0.5234 inch.

8. "Go" and "not go" double-end thread plug gage for right-hand nut thread—
 A size, $\frac{3}{8}$ -24-NF-3
 "Go" end—
 Major diameter, maximum, 0.3755; minimum, 0.3750 inch.
 Pitch diameter, maximum, 0.3484; minimum, 0.3481 inch.
 Gaging notch, 0.125 from back.
 "Not go" end—
 Major diameter, maximum, 0.3665; minimum, 0.3660 inch.
 Pitch diameter, maximum, 0.3503; minimum, 0.3500 inch.
 B size, $\frac{1}{16}$ -18-NF-3
 "Go" end—
 Major diameter, maximum, 0.5630; minimum, 0.5625 inch.
 Pitch diameter, maximum, 0.5269; minimum, 0.5266 inch.
 Gaging notch, 0.125 from back.
 "Not go" end—
 Major diameter, maximum, 0.5510; minimum, 0.5505 inch.
 Pitch diameter, maximum, 0.5294; minimum, 0.5291 inch.

9. "Go" and "not go" double-end thread plug gage for left-hand nut thread—
 A size, $\frac{3}{8}$ -24 L. H.-NF-3
 "Go" end—
 Major diameter, maximum, 0.3755; minimum, 0.3750 inch.
 Pitch diameter, maximum, 0.3784; minimum, 0.3481 inch.
 Gaging notch, 0.125 from back.
 "Not go" end—
 Major diameter, maximum, 0.3665; minimum, 0.3660 inch.
 Pitch diameter, maximum, 0.3503; minimum, 0.3500 inch.
 B size, $\frac{1}{16}$ -18 L. H.-NF-3
 "Go" end—
 Major diameter, maximum, 0.5630; minimum, 0.5625 inch.
 Pitch diameter, maximum, 0.5269; minimum, 0.5266 inch.
 Gaging notch, 0.125 from back.
 "Not go" end—
 Major diameter, maximum, 0.5510; minimum, 0.5505 inch.
 Pitch diameter, maximum, 0.5294; minimum, 0.5291 inch.

GAGES FOR 12-PITCH THREAD SERIES

The specifications for gages given above are applicable. Tolerances on diameter, lead, and angle for classes X, Y, and Z gages are given in Table 89.

TABLE 89.—Tolerances for thread gages, American national 12-pitch thread series

Class of gage	Tolerance on pitch diameter ¹		Tolerance on lead ² (±)	Tolerance on half angle of thread (±)	Tolerance on major or minor diameters ¹	
	From—	To—			From—	To—
1	2	3	4	5	6	7
Class X and all "not go".....	Inch 0.0000	Inch 0.0003	Inch 0.0003	° 0 10	Inch 0.0000	Inch 0.0006
Class Y.....	.0002	.0006	.0003	0 10	.0000	.0006
Class Z.....	.0004	.0011	.0004	0 10	.0000	.0006

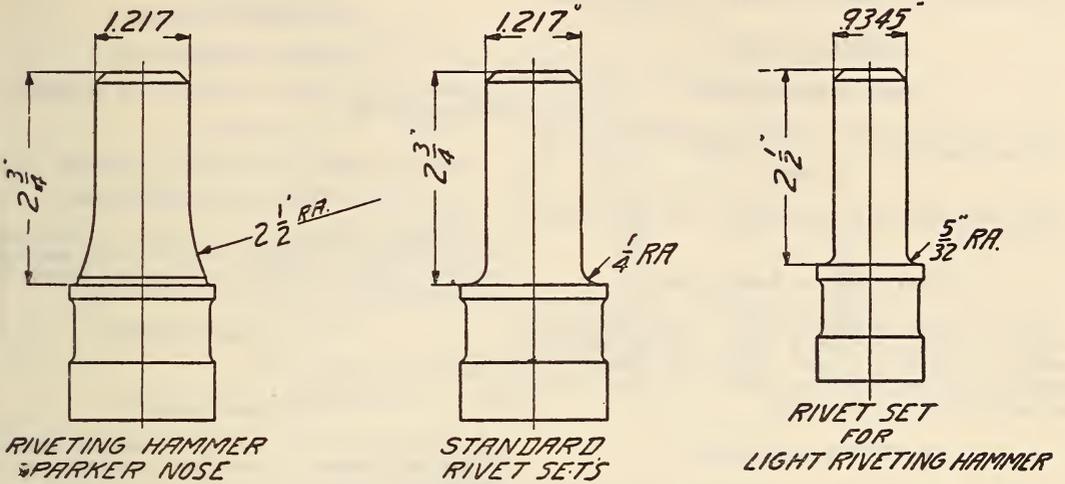

¹ On "go" plugs the tolerance is plus, and on "go" rings the tolerance is minus. On "not go" plugs the tolerance is minus, and on "not go" rings the tolerance is plus.

² Allowable variation in lead between any 2 threads not farther apart than the length of engagement.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SETS, HANDSAW, NO. 440, SEPTEMBER 25, 1926 (CURRENT DESIGNATION: GGG-H-101).

HANDSAW SETS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Saw sets shall be of the hinged lever type, operated by hand.

III. MATERIAL AND WORKMANSHIP

Saw sets shall be manufactured from high-grade material suitable for the purpose. They shall be made in accordance with the best commercial practice and free from any defects that may affect the serviceability of the tools.

IV. GENERAL REQUIREMENTS

1. Saw sets shall be so designed that by the movement of the operating lever a plunger shall be caused to move forward and impinge upon an anvil located in the head of the tool. The levers shall be returned to their open position by means of a spiral spring inclosing the plunger, which causes the plunger to press against the short arm of the operating lever.

2. The exterior parts of all sets shall be finished and polished.

3. Each saw set shall be marked in a permanent manner with the manufacturer's name or trademark.

V. DETAIL REQUIREMENTS

1. The anvil located in the head of the tool shall be made from tool steel properly hardened and tempered. The anvil shall be rigidly secured to the head and shall be capable of adjustment.

2. The underside of the head shall be provided with an adjustment device for regulating the amount of set given the saw tooth. The upper side of the head shall be open so as to permit operator to witness the operation of the tool.

3. The plunger shall be made of tool steel, properly hardened and tempered. The end of the plunger when in its normal position shall be approximately one-eighth inch from the anvil.

4. Saw sets shall have a capacity for setting saws, thickness on cutting edge 0.065 and less, teeth 4 to 16 points per inch.

VI. METHOD OF INSPECTION AND TESTS

1. At least three representative samples shall be taken from each lot submitted for inspection. Each sample inspected shall conform to the requirements of this specification.

2. Result of inspection shall be considered as representative of the lot and acceptance or rejection will be based thereon.

VII. PACKING AND MARKING

1. Saw sets shall be packed in accordance with the best commercial practice, unless otherwise specified.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR LADLES, PLUMBERS', GGG-L-51, MARCH 1, 1932

PLUMBERS' LADLES

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Plumbers' ladles shall be of the double-lip type.

III. MATERIAL AND WORKMANSHIP

Plumbers' ladles shall be made of high-grade material and in accordance with the best commercial practice. They shall be free from any defects that may affect the serviceability of the ladles.

IV. GENERAL REQUIREMENTS

See detail requirements.

V. DETAIL REQUIREMENTS

1. Each ladle shall have the maker's name or trade-mark stamped or otherwise marked on it in a permanent manner.

2. The ladles shall be made of wrought iron or mild steel and shall have a suitable handle attached to the bowl. The bowl shall be provided with two lips for pouring, one on each side, located at right angles to the center line of the handle. These ladles shall be similar to Figure 727 and shall conform to the requirements of table:

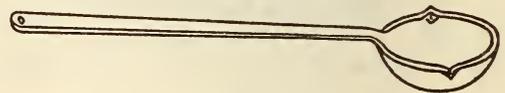

FIGURE 727.—Plumbers' ladle

Diameter of bowl (approximate)	Depth of bowl (approximate)	Length of handle (approximate)	Thickness of bowl	
			Minimum	Maximum
Inches 2½	Inches 1¼	Inches 11½	Inch ⅜	Inch ⅝
3	1½	11½	⅜	⅝
4	1¾	13½	⅝	⅞
5	2⅜	18½	⅝	⅞
6	2⅝	18½	⅝	⅞
7	2⅞	24	⅝	⅞

NOTE.—Where reference is made to approximate dimensions a plus or minus tolerance of 10 per cent from the specified dimensions will be allowed.

VI. METHOD OF INSPECTION

Representative samples (not less than three) shall be taken from deliveries and inspected for compliance with the requirements of this specification.

VII. PACKING AND MARKING OF SHIPMENTS

Plumbers' ladles shall be packed and marked in accordance with manufacturers' trade practice unless otherwise specified.

616. HAND TOOLS OTHER THAN METALWORKING TOOLS

616.1 EDGE TOOLS.

616.11 ADZES, AXES, AND HATCHETS.

AMERICAN RAILWAY ENGINEERING ASSOCIATION, PLANS FOR TRACK TOOLS, 1930

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR FORGED TOOLS, R17-31, JULY 1, 1931

TRACK ADZES

(See 616.60, p. 960.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR HATCHETS, NO. 433, SEPTEMBER 25, 1926. (CURRENT DESIGNATION: GGG-H-131)

HATCHETS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Hatchets shall be of the type known commercially as shingling hatchets only.

III. MATERIAL AND WORKMANSHIP

All hatchets to be made from high-grade material of good workmanship, and free from all defects or blemishes which may affect their serviceability or appearance.

IV. GENERAL REQUIREMENTS

Each hatchet shall be impress-stamped with the manufacturer's name.

V. DETAIL REQUIREMENTS

1. Hatchets

(a) *Physical requirements.*—They shall be made from high-grade forged tool steel.

Width of cutting edge, 4 inches tolerance plus or minus.....	10
Length from cutting edge to top, 6 1/2 inches tolerance plus or minus.....	10
Weight, 1 pound 7 ounces tolerance plus or minus.....	20

(b) *Treatment.*—They shall be properly hardened, tempered, and ground.

(c) *Shape and finish.*—They shall be properly shaped, neatly finished, and coated with a suitable paint or enamel, except the top and that part within about 1 1/2 inches of the cutting edge, which shall be polished. A slot shall be provided on the handle side of the blade for pulling nails.

2. Hatchet Handles

(a) All handles shall be furnished properly fitted and conforming to the requirements of the latest issue of United States Government master specifications for "hickory handles" in effect at opening of bids.

(b) Length of handle not less than 14 inches nor more than 15 inches.

VI. METHOD OF INSPECTION

Representative samples shall be taken from each lot delivered and inspected for compliance with this specification, and shall be considered as representative of the lot and acceptance or rejection shall be based thereon.

VII. PACKING AND MARKING

Hatchets shall be packed and marked in accordance with standard commercial practice, unless otherwise specified.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ADZES, No. 449, NOVEMBER 22, 1926. (CURRENT DESIGNATION: GGG-A-151)

ADZES

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES

Adzes shall be of the following types, as specified: A, carpenters' adze, plain; B, ship carpenters' adze,

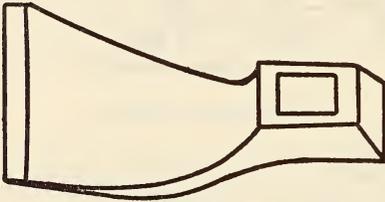

FIGURE 729.—Type A adze

plain; C, ship carpenters' adze, lipped; and D, railroad adze, plain.

III. MATERIAL AND WORKMANSHIP

1. All adzes shall be forged of high-grade tool steel and shall be furnished properly fitted with handles conforming to the requirements of United States Government master specification for "hickory handles" in effect at opening of bids.

2. All adzes shall be of good workmanship and made in accordance with the best commercial practice.

IV. GENERAL REQUIREMENTS

1. Adzes shall be properly hardened, tempered, and ground. They shall be furnished with a durable black finish, except that the part of the blade within about $2\frac{1}{2}$ inches of the cutting edge shall be polished.

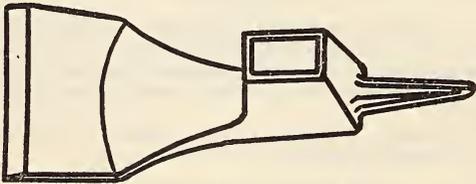

FIGURE 730.—Type B adze

2. All adzes shall be stamped, or otherwise permanently marked, with the manufacturer's name or trade-mark.

V. DETAIL REQUIREMENTS

1. *Carpenters' adze, plain, type A.*—These shall consist of a full flat head; a rectangular eyehole;

and a thin arching blade curving toward the handle and set at right angles to the handle. The blade shall have a beveled cutting edge. The bevel shall be on the side of the blade nearest the handle.

These adzes shall conform to the dimensions listed for this type in the table and be similar to Figure 729.

2. *Ship carpenters' adze, plain, type B.*—These shall consist of an octagonal spur head, which shall have a neat taper; a rectangular eyehole; and a thin

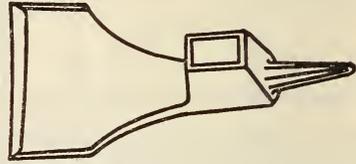

FIGURE 731.—Type C adze

arching blade curving toward the handle and set at right angles to the handle. The blade shall have a beveled-cutting edge. The bevel shall be on the side of the blade nearest the handle.

These adzes shall conform to the dimensions listed for this type in the table and be similar to Figure 730.

3. *Ship carpenters' adze, lipped, type C.*—These shall consist of an octagonal spur head, which shall have a neat taper; a rectangular eyehole; and a thin arching blade curving toward the handle and set at right angles to the handle. The blade shall have a beveled cutting edge. The bevel shall be on the side of the blade nearest the handle. The extreme

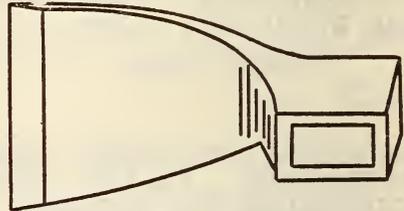

FIGURE 732.—Type D adze

ends of the blades shall be turned up at right angles to the surface of the blade.

These adzes shall conform to the dimensions listed for this type in the table and be similar to Figure 731.

4. *Railroad adze, plain, type D.*—These shall consist of a full flat head; a rectangular eyehole; and a thin arching blade curving toward the handle and set at right angles to the handle. The blade shall have a beveled cutting edge. The bevel shall be on the side of the blade nearest the handle.

These adzes shall conform to the dimensions listed for this type in the table and be similar to Figure 732.

VI. METHOD OF INSPECTION

Samples shall be selected by the inspector from each lot of the same type submitted, and inspected for compliance with this specification.

VII. PACKING

Adzes shall be packed in accordance with the best commercial practice unless otherwise specified.

Table of adze dimensions

	Type A (in inches)	Type B (in inches)	Type C (in inches)	Type D (in inches)
Length from cutting edge to top.	9¼ to 9¾	-----	-----	9¼-9¾.
Length from cutting edge to end of spur.	-----	10¼ to 11½	10¼ to 11½	-----
Curve of the blade in its length.	1¼ to 1¾	1¼ to 1½	¾ to 1½	1¼ to 1½.
Width of cutting edge.	3½ to 4½	4¼ to 4¾	4½ to 5½	5 to 6.
Length of eye-hole.	2¼ to 2¾	2¼ to 2¾	2¼ to 2¾	2¼ to 2¾.
Inside of small end eyehole.	1½ by 1 to 1¾ by 1½	Same as for type A.		
Inside of large end eyehole.	1½ by 1½ to 2¼ by 1½	-----		
Length of head.	1 to 1¼	-----	-----	1 to 1¼.
Length of spur.	-----	2¾ to 3	2¾ to 3	-----
Diameter of spur, small end.	-----	¾ to ¾	¾ to ¾	-----
Diameter of spur, large end.	-----	½ to ¾	½ to ¾	-----
Height of lips.	-----	-----	¾ to 1½	-----
Length of handle over all.	34 to 36	34 to 36	34 to 36	34 to 36.

Table of adze weights

	Type A	Type B	Type C	Type D
Weight without handle.	Pounds 3-4	Pounds 2½-3	Pounds 2½-3	Pounds 4½-7

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR AXES, GGG-A-926, NOVEMBER 10, 1931

AXES

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPE

B-1. Axes shall be furnished in the following types as specified: A, chopping ax, 4 pounds; B, chopping ax, 5 pounds, and C, fire ax with pick head, 6 pounds.

C. MATERIAL AND WORKMANSHIP

C-1. Material.

C-1a. *Body and bit.*—High-grade steel as herein after specified, free from all imperfections that may affect serviceability.

C-1b. *Handles.*—Good weight, live growth, hickory, free from all defects that may affect serviceability. Handles shall have not over 22 rings of annual growth per inch of radius and be supplied in white, red, or mixed white and red wood.

NOTE.—Above specification covers handles graded as "AW" and "AR" by Simplified Practice Recommendation No. 77 of the United States Department of Commerce.

C-2. *Workmanship.*—First class in every particular. Axes shall be smoothly finished throughout.

D. GENERAL REQUIREMENTS

D-1. *Construction.*—Axes shall be of bimetallic construction with bits of best-quality crucible tool steel overlaid or inserted by hammer welding to carbon-steel polls or heads, or they may be of one-piece construction, hammer forged from best-quality carbon or alloy tool steel. If of bimetallic construction, the welds shall be free from flaws, temper cracks, or other imperfections, and the crucible tool steel bit, which shall be properly hardened and tempered, shall be of not less than 1 inch depth, back from the cutting edge, to provide for maximum life of the ax. If of 1-piece construction the bit shall be properly hardened and tempered throughout for a distance not less than 1 inch back from the cutting edge.

D-2. *Eye.*—The difference in the thickness of the eye of any ax shall not exceed one thirty-second of an inch. A median line through the eye shall be in normal alignment parallel to the cutting edge of the ax. The eye section shall be of such size, shape, and strength as to prevent distortion.

D-3. *Handles.*—The handles shall be of oval cross section and of suitable size and shape throughout to provide a well-proportioned handle with a comfortable grip for the hands. Handles shall be properly fitted and secured to the head in such a manner as to preclude probability of the head working loose or flying off the handle under service conditions. When specifically required, the handles shall be dipped in hot linseed oil or some other equally effective coating to protect them from the powder-post beetle.

D-4. *Marking and labeling.*—Each ax shall be stamped or otherwise permanently marked in a legible manner on the side of the head with the manufacturer's name or known trade-mark and the weight. Each ax shall also be marked or labeled to show that the axes are the manufacturer's recognized first-quality brand. (Only the first-quality brand of a manufacturer will be acceptable.)

D-5. *Weights.*—The weights indicated herein shall be exclusive of the handles.

D-6. *Tolerances.*—A plus or minus tolerance of 5 per cent will be allowed in the weights herein specified. A plus or minus tolerance of 7 per cent will be allowed in the "approximate" dimensions herein specified.

E. DETAIL REQUIREMENTS

E-1. *Chopping axes, 4 pounds, type A.*—

E-2. *Style.*—Axes of this type shall be of the style commonly known as the "Dayton pattern" and shall be suitable for general purposes.

E-3. *Hardness.*—The bits of all axes of this type shall show a Rockwell hardness number of not less than C-52 nor more than C-62 at ¾ to 1 inch from the cutting edge. The eye and the head of axes of 1-piece construction shall show a Rockwell hardness number of not less than C-18.

E-4. *Finish.*—The top face of the head of these axes shall be smoothly finished and polished. That part of axes of bimetallic construction beginning at the cutting edge and terminating at a minimum of one-half inch above the welded joint shall also be smoothly finished and polished. The bits of axes of 1-piece construction shall be smoothly finished and polished a distance of not less than one-half inch back from the cutting edge. The unpolished portion of the bit and head of all axes shall be coated with a suitable paint or enamel to provide a rust-resisting finish. The cutting edge shall be ground and ready for service without further attention.

E-5. Axes of this type shall be similar to illustration Figure 733 and shall conform with the dimensions and weight outlined in Table 1.

TABLE 1.—Chopping ax, type A

FIGURE 733

Weight	Width at cutting edge (approximate)	Width at top of head (approximate)	Thickness at top of head (approximate)	Length of head (approximate)	Length of handle over all (approximate)
Pounds 4	Inches 4¾	Inches 3¾	Inches 1¼	Inches 7½	Inches 30

NOTE.—See paragraph D-6 for the tolerances in the above weight and dimensions.

E-6. Chopping axes, 5 pounds, type B.—

E-7. Axes of this type shall conform with the requirements outlined in sections E-2 to E-5, inclusive, for type A axes, except as to weight and dimensions. Axes of this type shall be similar to illustration Figure 733 and shall conform with the dimensions and weight outlined in Table 2.

TABLE 2

Weight	Width at cutting edge (approximate)	Width at top of head (approximate)	Thickness at top of head (approximate)	Length of head (approximate)	Length handle over all (approximate)
Pounds 5	Inches 5	Inches 3½	Inches 1¼	Inches 8	Inches 36

NOTE.—See paragraph D-6 for tolerances in the above weight and dimensions.

E-8. Fire axes with pick heads, type C.—

E-9. Style.—Axes of this type shall be of the style commonly known as fire or firemen's axes with pick head. They shall be suitable for tearing up floors, battering down doors, hacking through all kinds of material, and all other conditions likely to be encountered under ordinary service conditions.

E-10. Hardness.—The bits of these axes shall show a Rockwell hardness number of not less than C-50 nor more than C-58 at ¾ to 1 inch from the cutting edge. The picks shall show a Rockwell hardness number of not less than C-42 nor more than C-58 at approximately one-half inch from the point.

E-11. Finish.—The pick head and that portion of the bit about 4 inches back from the cutting edge shall be smoothly finished and polished. The remaining portion of the head and the entire surface of the handle shall be coated with good quality red paint or enamel.

E-12. Fire axes shall be similar to illustration Figure 734 and shall conform with the dimensions outlined in Table 3.

TABLE 3.—Fire ax with pick head, Type C

FIGURE 734

Weight	Width at cutting edge (approximate)	Length of head (approximate)	Length from center of handle to cutting edge (approximate)	Length from center of handle to pick end (approximate)	Length of handle over all (approximate)
Pounds 6	Inches 5	Inches 12	Inches 6	Inches 6	Inches 35

NOTE.—See paragraph D-6 for tolerances in the above weight and dimensions.

F. METHOD OF SAMPLING, INSPECTION, AND TESTS

F-1. Axes shall be submitted to a careful surface inspection to determine whether they are in compliance with the requirements of this specification. Special attention should be given to the welded joint of axes of bimetallic construction to see that no apparent imperfections exist, also to the quality of the cutting edge of all axes and as to whether the handles are secured to the head in a proper manner. Representative samples, at least three of each size and type, shall be taken from those under inspection and in addition to the Rockwell hardness tests should be used in practical cutting tests of such duration as may be considered necessary (in cutting hardwood knots, etc.) to determine whether the axes are in compliance with the requirements of this specification.

G. PACKAGING, PACKING, AND MARKING

G-1. Packaging.—Unless otherwise specified, commercial packages are acceptable, provided that not more than six axes (which shall be of the same type) shall be contained in any one box or package. Polished surfaces shall be coated with a rust preventive.

G-2. Packing.—Unless otherwise specified, the subject commodity shall be delivered in standard commercial containers so constructed as to insure acceptance by common or other carrier, for safe transportation, at the lowest rate, to the point of delivery.

G-3. Marking.—

G-3a. Unless otherwise specified, each box or package shall be marked with the name of the article, the size, the type, the quantity contained therein, and the name of the manufacturer.

G-3b. Unless otherwise specified, shipping containers shall be marked with the name of the article, the size, the type, and the quantity contained therein as defined by the contract or order under which shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. The illustrations are included for the convenience of those interested and are not intended to preclude the purchase of axes which are otherwise in accordance with this specification.

I-2. It is believed that this specification adequately describes the characteristics necessary to secure the desired material and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose samples with bids are necessary, they should be specifically asked for in the invitation for bids, and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

616.12 AUGERS AND CARPENTERS BRACES.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRACES, RATCHET, No. 416, JULY 9, 1926. (CURRENT DESIGNATION: GGG-B-671)

BRACES

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES

Ratchet braces shall be of one type only.

III. MATERIAL AND WORKMANSHIP

Ratchet braces shall be free from defects or blemishes which might affect their use. They shall be of good workmanship, and in accordance with the best commercial practice.

IV. GENERAL REQUIREMENTS

Each ratchet brace shall be stamped with the brand or manufacturer's name.

V. DETAIL REQUIREMENTS

1. Ratchet braces shall consist of a malleable iron or steel chuck with two forged steel jaws engaging a steel spindle which is operated by means of a ratchet in a socket secured to a steel sweep provided with wood center and head.

2. The chuck sleeve shall be 2¼ to 3¼ inches long, about 1½ inches outside diameter at socket end, and be neatly knurled, and shall have a well-made internal thread for screwing on to the spindle.

3. The chuck jaw shall be forged, and of the alligator type or a type equally efficient to take round bit shanks from one-eighth to one-half inch, as well as taper shank bits. They shall be held together by means of a steel wire spring so as to permit of a parallel movement of the jaws and in the case of alligator jaws a proper articulation of the jaw tooth. They shall have a longitudinal V-shaped groove of such depth as to permit gripping one-eighth inch round shanks.

4. The chuck spindle shall be made of steel in one piece and provided with square or acme cut threads; it shall have a rectangular slot at one end, cut ratchet teeth at the socket end, and a turned square shoulder against which bears a hardened steel antifriction washer for reducing the thrust friction between the spindle and the ratchet socket. The spindle shall be held in the socket by means of a washer entering the end of the spindle and bearing against a square shoulder about one-eighth inch below the upper end of the socket. The ratchet

tooth shall engage two steel pawls which are actuated by a spiral steel spring and are controlled by a neatly knurled slip ring. The ring shall be so designed as to permit the ratchet being operated in either direction or to lock same.

5. The sweep shall be solid and made of high-grade steel of such diameter as to resist bending under ordinary usage. The head of the sweep shall be made of cocobolo, rosewood, lignum-vitæ or other approved material, about 2¾ inches in diameter and 1 inch thick, and be secured to the sweep by means of a revolving upper thrust bearing in such a manner as not to require the sweep passing through the center of the wooden head. The thrust pressure shall be transmitted by hardened steel balls running on hardened steel ball races which are integral parts of the bearings. The balls shall be suitably protected from exposure to dirt, etc. The center grip of the sweep shall be made of cocobolo, rosewood, lignum-vitæ or other approved material and be reinforced by brass rings inserted in each end so as to prevent splitting and be held in place by collars secured to the sweep at each end of the grip.

6. All exposed metal surfaces shall be heavily nickel plated. The head and center grip shall be smoothly finished and polished.

7. The size of the brace will be designated by the sweep; that is, the diameter of the circle traversed

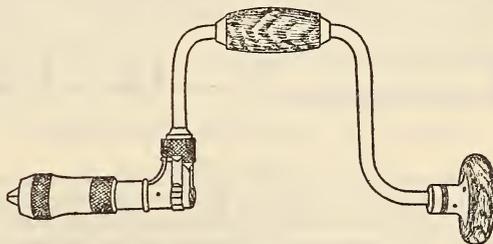

FIGURE 735.—Ratchet brace

by the center grip, and shall be 8, 10, or 12 inches, as may be specifically called for.

8. Ratchet braces shall be similar to Figure 735.

VI. METHOD OF INSPECTION AND TESTS

Ratchet braces shall be subjected to such inspection as will determine whether they comply with this specification.

VII. PACKING AND MARKING

Commercial packing and marking unless otherwise specified.

616.13 CHISELS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR CHISELS, GOUGES AND SLICKS, WOODWORKERS', GGG-C-311, MARCH 1, 1932

CHISELS, GOUGES, AND SLICKS

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPES

Woodworkers' chisels, gouges, and slicks shall be of the following types, as required: A, chisels, socket firmer; B, chisels, socket framing; C, chisels,

tanged turning; D, gouges, socket firmer, outside or inside bevel (as specified); E, gouges, tanged turning; and F, slicks.

III. MATERIAL AND WORKMANSHIP

Chisels, gouges, and slicks shall be made of high-grade material and be free from all defects affecting their appearance or that may affect their serviceability. They shall be of high-grade workmanship and made in accordance with the best commercial practice.

IV. GENERAL REQUIREMENTS

1. Each chisel, gouge, or slick shall have the manufacturer's name or trade-mark permanently marked on the blade or socket.

2. All tools shall have the blades properly hardened to within 2 inches of socket or tang, tempered and ground. The hardened portion of all blades shall show a Rockwell hardness number of not less than 56 nor more than 66 on the C scale. They shall be smoothly finished and polished, with the cutting edge sharpened and honed ready for use.

3. No welding of iron and steel shall be permitted on any tools that are less than 2 inches wide, except in the case of socket barrels and tangs, which may be of iron or steel. On tools that are more than 2 inches wide, the welding of an iron back on a steel face will be permitted.

4. Each tool shall be furnished with a handle as specified in description of details, Section V. The

FIGURE 736.—Chisel, socket firmer, Type A

handles shall be made of high-grade, well-seasoned, straight-grained hardwood, free from knots, checks, holes or any other defects that may affect serviceability, shall be smoothly finished, and shall be given at least one coat of shellac, varnish or other protective material to prevent the absorption of moisture.

5. A plus or minus tolerance of 5 per cent will be allowed in the dimensions herein specified for the width of the blades. Dimensions referred to as "approximate" shall be interpreted as allowing a plus or minus tolerance of 15 per cent from the dimension specified.

V. DETAIL REQUIREMENTS

1. *Chisels, socket firmer, type A.*—These chisels shall be of the bevel-edge type and shall be furnished in the following widths of blade, as specified: $\frac{1}{8}$, $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$, 1, $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, and 2 inches.

2. They shall have a minimum length of blade of 6 inches, exclusive of the socket.

3. Each of these chisels shall be furnished with a leather-tipped handle of second-growth hickory, of suitable size, having at least three thicknesses of high-grade leather firmly secured to the top of the handle. The tipped end shall be properly shaped to prevent being easily distorted. The tapered end of the handle shall be a good fit in the socket. The largest section of the handle shall have a diameter of 1 to $1\frac{1}{2}$ inches, and the length of the handle exclusive of the tapered portion shall be approximately $4\frac{1}{2}$ inches.

4. These chisels shall be similar to Figure 736.

5. *Chisels, socket framing, type B.*—These chisels shall be of the plain-edge type and shall be furnished in the following widths of blades, as specified: $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$, 1, $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, and 2 inches.

6. They shall have a minimum length of blade of 8 inches, exclusive of the socket.

7. Each of these chisels shall be furnished with a handle of second-growth hickory, of suitable size, having a steel or malleable iron ring firmly secured to the top of the handle. The ring shall be of proper size to prevent the handle from splitting. Handles with improperly fitted rings will not be accepted. The tapered end of the handle shall be a good fit in the socket. The largest section of the handle shall have a diameter of 1 to $1\frac{1}{2}$ inches, and the length of

FIGURE 737.—Chisel, socket framing, type B

the handle exclusive of the tapered portion shall be approximately $4\frac{1}{2}$ inches.

8. These chisels shall be similar to Figure 737.

9. *Chisels, tanged turning, type C.*—These chisels shall be of the regular skew type and shall be suitable for either right or left hand turning. The cutting edge shall be beveled from both the flat sides.

10. These chisels shall have a minimum length of blade of $6\frac{1}{2}$ inches, exclusive of the tang, and shall

FIGURE 738.—Chisel, tanged turning, type C

be furnished in the following widths as specified: $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$, 1, $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, and 2 inches.

11. Each turning chisel shall be furnished with a properly shaped handle of ash, birch, maple, or second-growth hickory, having a minimum over-all length of approximately 9 inches and a diameter at the largest section of 1 to $1\frac{1}{2}$ inches. The handle shall have a heavy brass ferrule firmly attached to it in such manner as to securely hold the tang of the

FIGURE 739.—Gouge, socket firmer, type D

chisel. Handles with loose or improperly fitted ferrules will not be accepted.

12. These chisels shall be similar to Figure 738.

13. *Gouges, socket firmer, inside or outside bevel, type D.*—These gouges shall be furnished with inside bevel or outside bevel, as required, and shall be of the regular sweep type. They shall have a minimum length of blade of 6 inches, exclusive of

FIGURE 740.—Gouge, tanged turning, type E

the socket, and shall be furnished in the following widths, as specified: $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$, 1, $1\frac{1}{4}$, and $1\frac{1}{2}$ inches.

14. Each of these gouges shall be furnished with a leather-tipped handle, as specified for socket firmer chisels, type A.

15. These gouges shall be similar to Figure 739.

16. *Gouges, tanged turning, type E.*—These gouges shall be of the regular sweep type. They shall have a minimum length of blade of $6\frac{1}{2}$ inches, exclusive of the tang, and shall be furnished in the following widths, as specified: $\frac{1}{4}$, $\frac{3}{8}$, $\frac{1}{2}$, $\frac{5}{8}$, $\frac{3}{4}$, $\frac{7}{8}$, 1, $1\frac{1}{4}$, $1\frac{1}{2}$, $1\frac{3}{4}$, and 2 inches.

17. Each of these gouges shall be furnished with a handle of about 9 inches length as specified for tanged turning chisels, type C.

18. These gouges shall be similar to Figure 740.

19. *Slicks, type F.*—These slicks shall be the oval back type carpenters' slick. They shall have a minimum length of blade of 10 inches, exclusive of the socket; the widths of blade shall be 2½, 3, 3½, and 4 inches. The over-all length of the blade and socket shall be approximately 15 inches.

20. Each slick shall be furnished with a handle having an over-all length of approximately 14 inches and a diameter of about 1¾ inches at the thicker section. The handle shall be of the regular commercial type, tapered on one end to fit the socket of the slick, the other end being rounded to suit the palm of the hand.

21. These slicks shall be similar to Figure 741.

VI. METHOD OF INSPECTION AND TESTS

From each lot under inspection, representative samples (at least three) shall be taken at random and submitted to the respective test outlined below

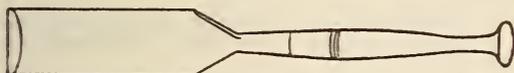

FIGURE 741.—Slick, type F

with a view to determining whether they are in accordance with specifications.

Chisels, types A and B, gouges, type D, and slicks type F, shall be required to cut through at least three ordinary knots (1 inch or more in diameter) as found in seasoned black spruce or yellow pine, without showing undue wear, such as turning over, or breaking out of any part of the cutting edge, or damage to the handles.

Turning chisels, type C, and turning gouges, type E, shall be used in turning hard oak or similar material under severe conditions for a period of at least 15 minutes, after which the cutting edges shall be carefully examined for undue wear, turning over, or breaking out of any part of the cutting edge.

The blade of each sample chisel, gouge, and slick shall also be subjected to a Rockwell hardness test to determine whether they are in compliance with the requirements prescribed in paragraph IV-5.

Chisels, gouges, or slicks failing to meet the above tests shall be considered as unsatisfactory and not in accordance with specifications.

VII. PACKING AND MARKING

Chisels, gouges, and slicks shall be packed and marked in accordance with best commercial practice unless otherwise specified. Not more than six tools of the same size and type shall be contained in any one box or package.

VIII. NOTES

1. The illustrations are included for the convenience of those interested, and are not intended to prevent the purchase of tools which are otherwise in accordance with specifications.

2. When so requested, bidders shall submit, free of expense to the Government, for examination and test, sample tools similar to those they propose to furnish. Samples shall remain the property of the exhibitors, but a sample may be accepted as a part of a delivery in the case of a successful bidder. However, the right is reserved to destroy the sample submitted, if such action is considered necessary to determine the quality of material and method of manufacture, in which case no expense to the Government shall accrue.

3. If award is made on samples submitted, it will be with the understanding that tools furnished shall be equal in all respects to samples.

616.14 DRILLS.

(No nationally recognized specifications available.)

616.15 KNIVES.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR KNIVES, SHOE, No. 442, OCTOBER 28, 1926. (CURRENT DESIGNATION: GGG-K-491

SHOE KNIVES

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

These shall be the commercial type of shoe knives.

III. MATERIAL AND WORKMANSHIP

Knife blades shall be made from the best quality crucible tool steel, properly shaped and hardened, tempered, and ground. The blades shall be of such design as to withstand ordinary usage with a minimum breakage, and shall be free from all defects or blemishes which may affect their appearance or serviceability. The handles shall be properly designed to afford a comfortable grip for the user and shall be smoothly finished.

IV. GENERAL REQUIREMENTS

All knives shall have the maker's name or trademark stamped or otherwise permanently marked on the blades.

V. DETAIL REQUIREMENTS

1. Shoe knives shall consist of a steel blade, a shank, and a wooden handle. The blade shall be square pointed. The shank shall be of proper length and inserted in a round wooden handle in a perma-

FIGURE 742.—Shoe knife

nent manner. The handle shall be fitted with a heavy metal ferrule which shall be firmly secured.

2. Shoe knives shall conform to the following approximate dimensions:

	Inches
Length of blade.....	4 - 5
Width of blade.....	¾ - 1
Thickness of blade at handle.....	¾ - 5/8
Length of handle.....	3¾ - 4½

3. These knives shall be similar to Figure 742.

VI. METHOD OF INSPECTION

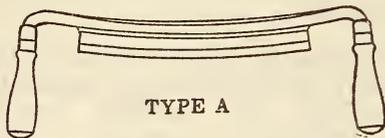

Representative samples shall be taken from each lot submitted and inspected for compliance with this specification.

VII. PACKING AND MARKING

Packing and marking shall be in accordance with the manufacturer's trade practice, unless otherwise specified.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR KNIVES, DRAWING, GGG-K-471, MARCH 1, 1932

DRAWING KNIVES

TYPE A

TYPE B

Type A and type B drawing knives

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPE

B-1. Drawing knives shall be furnished in two types, as specified.

- A. Fixed handle.
- B. Folding handle.

C. MATERIAL AND WORKMANSHIP, ETC.

C-1. *Material.*

C-1a. *Blades.*—Best quality tool steel.

C-1b. *Handles.*—Ash, birch, hard maple, hickory, or other wood of equal or better quality and suitable for the purpose.

C-1c. *Ferrules and caps.*—Brass or steel.

C-2. *Workmanship.*—Shall be first class.

D. GENERAL REQUIREMENTS

D-1. *Markings.*—The blade of each drawing knife shall be marked in a plain and permanent manner with the manufacturer's name or with a trade-mark or such known character that the source of manufacture may be readily determined.

E. DETAIL REQUIREMENTS

E-1. *Fixed handle drawing knives, type A.*—

E-1a. *Sizes.*—Unless otherwise specified, drawing knives shall be furnished in the 8, 10, and 14 inch sizes, size referring to the length of the cutting edge of the blades.

E-1b. *Shanks.*—The shanks or handle arms of drawing knives may be either an integral part of the blade or made from good quality mild steel securely welded to the blade. The shanks or handle arms shall be bent at an angle of approximately 90° to the cutting edge of the blade and the ends shall be peened over caps or washers at end of the handles in such a manner as to prevent the handles from working off the arms when the knives are in use.

E-1c. *Handles and ferrules.*—The handles shall be so shaped as to afford a comfortable grip for the hand and shall be trimmed with substantial ferrules. The ferrules shall be made of brass or steel. If made of steel other than corrosion resisting they shall be heavily plated in accordance with the best commercial practice with nickel, cadmium, chromium, or other substance equally suitable for the

purpose. The ferrules shall be smoothly finished and polished.

E-1d. *Blades.*—The blades of these knives shall have a polished finish. The cutting edges shall be suitably beveled and properly hardened, tempered, and ground. If welded form of knife is furnished, the tool steel portion shall have a minimum depth of 3/4 inch back from the cutting edge, so as to permit any number of grinds that may be required during the life of the knife.

E-1e. Drawing knives of this type shall be similar to illustration and shall also conform to the dimensions prescribed in Table 1.

TABLE 1

Sizes, inches	Full depth cutting edge to back of blade		Length han- dles		Diameter handles, ferruled cap end			
	Mini- mum	Maxi- mum	Mini- mum	Maxi- mum	Mini- mum	Maxi- mum	Mini- mum	Maxi- mum
8.....	1	1 3/4	3 3/4	5	3/4	1	1 1/4	1 3/4
10.....	1 1/4	1 3/4	3 3/4	5	3/4	1	1 1/4	1 3/4
14.....	1 3/4	1 3/4	3 3/4	5	3/4	1	1 1/4	1 3/4

E-2. *Folding handle drawing knives, type B.*—

E-2a. Drawing knives of this type shall conform to all the requirements above outlined for type A drawing knives except that the handles of the type B drawing knives shall be of the folding scale. The handles of this type of drawing knife shall be hinged near the outer ends of the shank so that the handles may be folded over in a manner to protect the cutting edge of the blade. The design shall be such that the handles are readily adjustable to the opened or closed position and securely fixed in these positions by turning wing or knurled thumb nuts mounted on the shank.

E-2b. Drawing knives of this type shall be similar to illustration.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS.

F-1. Representative samples, at least three of each type, shall be taken at random from those under inspection and in addition to a careful surface examination shall be subjected to the following test.

The blade of each sample shall be tested for hardness and shall show about one-eighth inch back from the cutting edge a Rockwell hardness number of not less than 52 nor more than 62 on the C scale. As a further evidence that the knives are suitable for the purpose the samples selected for test shall also be subjected to practical cutting tests on hard woods such as knots found in seasoned black spruce or yellow pine. These tests shall be of sufficient duration to satisfy the inspector as to whether the knives under inspection are in compliance with the requirements of this specification. Under these tests the blade shall not show undue wear, such as turning over or the breaking out of any part of the cutting edge.

F-2. Results of the above tests shall be considered as representative of all the drawing knives under inspection and acceptance or rejection shall be based thereon.

G. PACKAGING, PACKING, AND MARKING

G-1. *Packaging.*—Unless otherwise specified, commercial packages are acceptable provided that not more than six drawing knives shall be contained in any one box or package.

I. NOTES

I-1. The illustrations are included for the convenience of those interested and are not intended to preclude the purchase of drawing knives which are otherwise in accordance with this specification.

UNITED STATES GOVERNMENT FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR KNIVES, PUTTY AND SCRAPING, GGG-K-486, NOVEMBER 10, 1931

PUTTY KNIVES, SCRAPING KNIVES

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPES

B-1. These knives shall be furnished in two types, as specified: Type A, putty, and type B, scraping.

C. MATERIAL AND WORKMANSHIP

C-1. *Material.*

C-1a. *Blades.*—Best quality, putty knife or cutlery steel.

C-1b. *Handles.*—Cocobolo.

C-1c. *Bolsters.*—Rust-resisting metal suitable for the purpose.

C-1d. *Rivets.*—Brass.

C-2. *Workmanship.*—First class in every respect.

D. GENERAL REQUIREMENTS

D-1. Putty and scraping knives shall be composed of a blade the tang of which shall extend entirely through the handle, a handle of suitable size and shape to afford a comfortable grip to the hand, a bolster at the front end of the handle and a sufficient quantity of rivets securely headed to preclude likelihood of the handle becoming loose in service. These knives shall be of the common commercial shape and designed so as to withstand with minimum breakage conditions likely to be encountered in service. They shall be free from all imperfections that may affect serviceability.

D-2. *Marking.*—The blades of all knives shall be marked in a plain and permanent manner with the manufacturer's name or with a trade-mark of such known character that the source of manufacture may be readily determined.

D-3. *Finish.*—All knives shall be smoothly finished and polished throughout. The abrasive used in the final polish of the blades shall be not coarser than No. 150. The final polish shall be parallel with the long dimension of the blade, a distance not less than one-half its length, measured from the bolster to the extreme working edge of the blade.

E. DETAIL REQUIREMENTS

E-1. *Putty knives, type A.*

E-1a. *Blades.*—The blades of these knives shall be properly hardened and tempered during the process of manufacturing the blades. The blades shall be ground with a uniform taper from the end of the handle to the point of the blade and with a slight bevel at the extreme working edge. The thicker portion of the blade shall be at the handle end. They shall show at any position on the blade a Rockwell hardness of not less than 48 nor more than 58 on the C scale. These blades shall also be flexible and suitable for glazing work and other operations of a similar nature. They shall show no

permanent deformation or breakage when subjected to the bending test outlined under section F.

E-1b. Putty knives shall be similar to illustration Figure 743 and shall also conform with the dimensions outlined in Table 1.

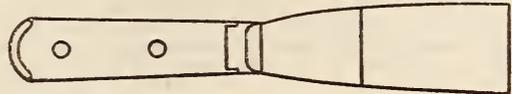

FIGURE 743

TABLE 1

Over-all length		Width of blade		Length of blade	
Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
Inches 7	Inches 8	Inches 1¼	Inches 1¾	Inches 3½	Inches 4

E-2. *Scraping knives, type B.*

E-2a. *Blades.*—The blades of these knives shall be properly hardened and tempered during the process of manufacturing the blades. The blades shall be ground with a uniform taper from the end of the handle to the point of the blade and with a slight bevel at the extreme working edge. The thicker portion of the blade shall be at the handle end. They shall show at any position on the blade a Rockwell hardness of not less than 48 nor more than 58 on the C scale. The blades of these knives shall be stiff unless otherwise specified. When specifically required they shall be flexible or semi-flexible. The blades of these knives shall be suitable for scraping operations. They shall show no permanent deformation or breakage when subjected to the bending test outlined under section F.

E-2b. Scraping knives shall be similar to illustration Figure 744 and shall also conform with the dimensions outlined in Table 2.

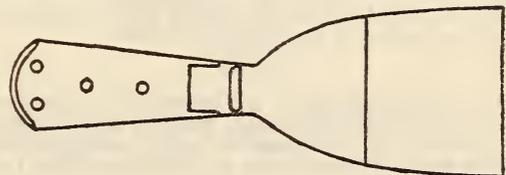

FIGURE 744

TABLE 2

Over-all length		Width of blade		Length of blade	
Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
Inches 7½	Inches 8½	Inches 2¼/16	Inches 3¼/16	Inches 4	Inches 4½

F. METHODS OF SAMPLING, INSPECTION AND TESTS

F-1. All putty and scraping knives shall be inspected to determine whether they are in compliance with the requirements of this specification. In addition to a careful surface inspection at least three samples of each type of knife (in no instance less than 2 per cent of entire quantity of each type under inspection) shall be taken at random

from those under inspection and subjected to the test outlined hereunder.

The Rockwell hardness of the blades shall be checked for compliance with the requirements outlined in section E.

The front end of each blade shall be gripped in an ordinary bench vise with the front edge of the blade parallel with and set one-fourth inch below the top surface of the vise jaws. The outer end of the handle shall then be moved each side of the perpendicular through the arc given below for the respective style of blade.

Style of blade	Arc
Flexible.....	45° from perpendicular (90° in all).
Semiflexible.....	30° from perpendicular (60° in all).
Stiff.....	15° from perpendicular (30° in all).

F-2. Knives failing to pass the above inspection test shall be rejected. Acceptance or rejection of entire quantity under inspection shall be based on the results of the above inspection test.

G. PACKAGING, PACKING, AND MARKING

G-1. *Packaging.*—Unless otherwise specified commercial packages are acceptable, provided that not more than six knives (which shall be of the same type) shall be contained in any one box or package.

G-2. *Packing.*—Unless otherwise specified the subject commodity shall be delivered in standard commercial containers so constructed as to insure acceptance by common or other carrier, for safe transportation, at the lowest rate, to the point of delivery.

G-3. *Marking.*

G-3a. Unless otherwise specified, each box or package shall be marked with the name of the article, the size, the type, the quantity contained therein, and the name of the manufacturer.

G-3b. Unless otherwise specified, shipping containers shall be marked with the name of the article, the size, the type, and the quantity contained therein as defined by the contract or order under which shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. The illustrations are included for the convenience of those interested, and are not intended to preclude the purchase of putty and scraping knives which are otherwise in accordance with this specification.

I-2. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

616.16 PLANES AND SCRAPERS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR SHAVES, SPOKE, GGG-S-271, MARCH 1, 1932

SPOKESHAVES

I. GENERAL SPECIFICATIONS

There are no general specifications applicable to this specification.

II. TYPE

Spokeshaves shall be of the raised-handle type.

III. MATERIAL AND WORKMANSHIP

All spokeshaves shall be made of high-grade material and be free from all defects that may affect their serviceability. They shall be of the best workmanship and shall be made in accordance with the best commercial practice.

IV. GENERAL REQUIREMENTS

See Section V.

V. DETAIL REQUIREMENTS

1. Spokeshaves shall be essentially composed of a frame with two handles, a cutter, and a cap iron into which a thumbscrew shall be fitted. Each spokeshave shall have the maker's name or known trade-mark stamped or otherwise permanently marked thereon.

2. The frame, handles, and cap iron shall be made of malleable or gray cast iron. The frame shall be finished on that portion where the cutter projects and which comes in direct contact with the work. The handles shall be japanned or enameled, of the raised type, and well proportioned to afford a good handgrip. The handles shall have a hole near the ends to enable the user to hang the tool up out of

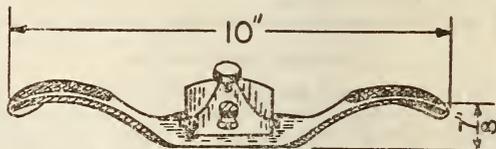

FIGURE 745.—Spokeshave

the way. The cutter shall be made of high-grade tool steel, properly hardened and tempered a distance from the cutting edge to at least one-half the length of the cutter, and shall be ground and sharpened ready for use. The cutter shall show about one-eighth inch back from the cutting edge a Rockwell hardness number of not less than 58 nor more than 68 on the C scale. The cutter shall be held in position with a cap iron fastened by a thumbscrew in such manner as to exert an even pressure on the cutter edge and also to allow adjustment of the cutter without the use of a screw driver or other tool.

3. Spokeshaves shall be 10 inches long over all and, the width of cutter shall be 2½ inches.

4. A tolerance of plus or minus 5 per cent is permitted in the above dimensions.

5. Spokeshaves shall be similar to Figure 745.

VI. METHOD OF INSPECTION AND TESTS

Representative samples, at least three, shall be taken at random from those under inspection and, in addition to a careful surface, inspection and test of the cutters for hardness, shall be subjected to practical cutting tests of sufficient duration to satisfy the inspector whether the tools are of satisfactory quality and in compliance with this specification.

VII. PACKING AND MARKING

Packaging.—Unless otherwise specified, commercial packages are acceptable, provided that not more than one spokeshave shall be contained in any one box or package.

616.17 SAWS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR SETS, HANDSAW, NO. 440, SEPTEMBER 25, 1926 (CURRENT DESIGNATION: GGG-H-101)

HANDSAW SETS

(See 615.9, p. 940.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SAWS, No. 480, APRIL 25, 1927. (CURRENT DESIGNATION: GGG-S-61)

SAWS

II. TYPES

Saws shall be of the following types, as specified: A, backsaw; B, miter-box saw; C, band saw, spring set, metal cutting; D, band saw, spring set, wood cutting; E, band saw, swage set, wood cutting; F, butcher saw; G, circular saw, crosscut; H, circular saw, rip; I, compass saw; J, crosscut saw, two-man; K, hack saw, hand; L, handsaw, crosscut; M, hand-saw, rip; N, keyhole saw; and O, web saw, fellow.

III. MATERIAL AND WORKMANSHIP

1. All saw blades, band saws and circular saws shall be made of the best grade crucible or electric-furnace steel, free from cracks, seams, imperfections, hammer marks, or other defects affecting their appearance or that may affect their serviceability. They shall be of good workmanship and equal in every respect to the best commercial product.

2. All handles furnished on saws covered by this specification shall be free from defects or blemishes and shall be made of thoroughly seasoned apple wood with the exception of those handles which are otherwise specified in Section V.

IV. GENERAL REQUIREMENTS

1. All handles shall have polished and rounded edges with the exception of those for two-man cross-cut saws, type J.

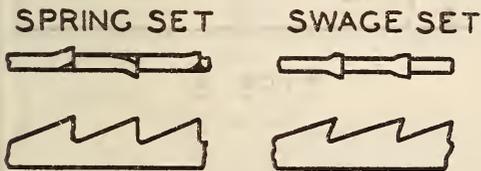

FIGURE 746

2. The nominal length of all saws shall be the length of the tooth edge, unless otherwise specified.

3. All saws furnished under this specification shall be etched, stamped, or otherwise permanently

marked with the manufacturer's name, and shall also be coated with oil or other rust preventive.

4. Saws shall be without set, with spring set, or with swage set, as specifically called for under Section V. Swage-set saws shall have every tooth swaged to the same width of cutting edge and the same clearance on each side of the body of the blade. Spring-set saws shall have every tooth set an equal amount, alternate teeth being set to the same side of the saw.

7 POINTS

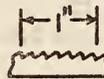

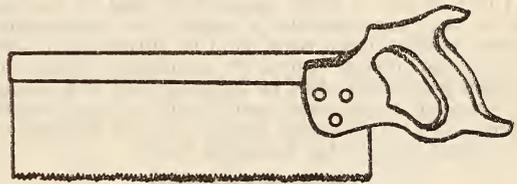

FIGURE 747

5. Points per inch shall be measured as shown in Figure 747.

V. DETAIL REQUIREMENTS

1. *Backsaws, type A.*—These saws shall be of uniform thickness throughout with the exception of a reinforcing steel back about seven-eighths inch wide and 0.109 inch thick. The teeth shall be spring set, bevel filed, and adapted for both crosscutting and ripping. The teeth shall be set to provide a proper clearance on each side of the blade.

The handle shall be secured to the blade by means of three brass screws and nuts. These saws shall be similar to Figure 748 and conform to the dimensions in the following table:

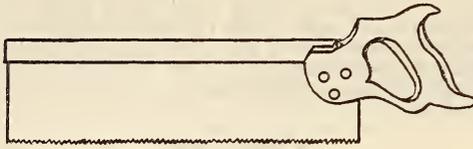

TYPE A

FIGURE 748

Length on cutting edge	Width under back	Points per inch	Thickness of blade	
			Minimum	Maximum
<i>Inches</i> 16 10	<i>Inches</i> 3½ 2½	12 14	<i>Inch</i> 0.032 .028	<i>Inch</i> 0.042 .035

2. *Miter-box saws, type B.*—These saws shall be of uniform thickness throughout with the exception of a reinforcing steel back about 1 inch wide and about 0.109 inch thick. The teeth shall be spring set, bevel filed, and adapted for both crosscutting and ripping. The teeth shall be set to provide proper clearance on each side of the blade. The tooth edge shall be 2 inches shorter than the length or size as specified in the table.

The handles shall be secured to the blade by means of three brass screws and nuts. These saws shall be similar to Figure 749 and conform to the dimensions in the following table:

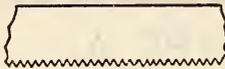

TYPE B

FIGURE 749

Full length of blade	Width under back	Points per inch		Thickness	
		Minimum	Maximum	Minimum	Maximum
<i>Inches</i> 26	<i>Inches</i> 4	11	12	<i>Inch</i> 0.035	<i>Inch</i> 0.049

3. *Band saw, spring set, metal cutting, type C.*—These saws shall be of uniform thickness throughout. The teeth shall be spring set, filed straight across, and shall provide a proper clearance on each side of the blade. These saws shall be tempered throughout or may be hardened and tempered on the tooth edge only; the temper shall be as high as possible consistent with allowing the teeth to be set. Every 14 feet or less of these band saws shall be marked with the manufacturer's name or trade-mark. Metal-cutting band saws shall be furnished in 200-foot coils, unless otherwise specified. When required these saws shall be furnished cut and brazed to specified lengths and ready to fit on band wheel. They shall be similar to Figure 750 and conform to the dimensions in the following table:

TYPE C

FIGURE 750

Width	Points per inch		Thickness	
	Minimum	Maximum	Minimum	Maximum
<i>Inches</i> $\frac{3}{8}$	8	10	<i>Inch</i> 0.022	<i>Inch</i> 0.028
$\frac{7}{8}$	8	10	.028	.035
$\frac{1}{2}$	14	16	.028	.035
1	14	16	.032	.042
1	22	24	.032	.042

4. *Band saw, spring set, wood cutting, type D.*—These saws shall be of uniform thickness throughout. The teeth shall be spring set, filed straight across, and adapted for either crosscutting or ripping. Every 14 feet or less of these band saws shall be marked with the manufacturer's name or trade-mark. The teeth shall be set to provide a proper clearance on each side. These saws shall be furnished in 200-foot coils unless otherwise specified. When required these saws shall be furnished cut and brazed to specified lengths and ready to fit on band

wheel. They shall be similar to Figure 751 and conform to the dimensions in the following table:

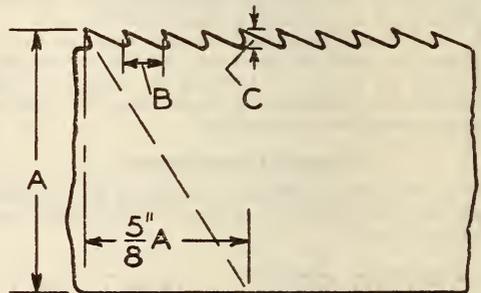

TYPE D

FIGURE 751

Width	Points per inch	Thickness	
		Minimum	Maximum
<i>Inches</i> $\frac{1}{4}$	6	<i>Inch</i> 0.025	<i>Inch</i> 0.032
$\frac{3}{8}$	5½	.028	.035
$\frac{1}{2}$	5	.028	.035
$\frac{3}{4}$	4	.028	.035
1	3½	.032	.042
1½	3	.035	.049
2	3	.035	.049

5. *Band saw, swage set, wood cutting, type E.*—These saws shall be of uniform thickness throughout and shall be crowned or uncrowned to suit the machine in which they will be used, as specified. The hook of the teeth shall be approximately five-eighths of an inch for each inch of width of the saw. The teeth shall be swaged to provide a proper clearance on each side of the blade. The length of the saws must be specified, also whether right or left hand; and the saws delivered shall be joined, set, and filed and ready to fit on the band wheels. These saws shall be similar to Figure 752 and conform to the dimensions in the following table:

TYPE E

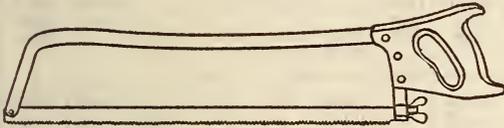

FIGURE 752

Width dimension A	Point to point dimension B	Depth of tooth dimension C	Thickness	
			Minimum	Maximum
<i>Inches</i> 2½	<i>Inches</i> 1¼	<i>Inch</i> ¾	<i>Inch</i> 0.035	<i>Inch</i> 0.049
3	1¼	¾	.035	.049
4	1¼	¾	.035	.049
6	1½	1½	.042	.058
8	1¾	5⁄8	.058	.072
10	1¾	¾	.065	.083
12	1¾	¾	.072	.095

6. *Butcher saws, type F.*—These saws shall include the frame and the blade. The frame shall be made of steel and bent to form. It shall have a flat

back with square or round edges and shall have a cross section of about three-fourths by one-fourth inch and suitable for blades 24 inches in length. A suitable winged nut or equivalent device shall be provided for tightening the blade in place. The handle shall be made of apple or beech wood and secured to the frame by means of three nickel-plated steel screws and nuts.

The blade shall be of uniform thickness throughout; the teeth shall be spring set and filed straight across. The teeth shall be set to provide a proper clearance on each side of the blade. All butcher saws, both frames and blades, shall be marked in accordance with "General requirements," Section IV. They shall be similar to Figure 753 and conform to the dimensions in the following table:

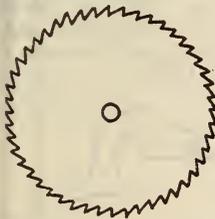

TYPE F
FIGURE 753

Length of blade	Width of blade	Points per inch	Thickness of blade	
			Minimum	Maximum
Inches 24	Inch ¾	11	Inch 0.022	Inch 0.028

7. *Circular saws, crosscut, type G.*—These saws shall be suitable for either right or left hand cutting and shall be of uniform thickness throughout. The teeth shall be spring set to provide a proper clearance on each side of the saw. The hook of the teeth shall be such that a line passing down the front or cutting edge shall go through the center of the saw. On the 44-inch saw there shall be a gullet extending into the front or cutting edge of the teeth. The depth of the teeth shall be approximately three-fourths of the point-to-point spacing.

These saws shall be tensioned for a rim speed of 10,000 feet per minute and shall be furnished with arbor holes as listed below. No undersize tolerance will be permitted on the arbor-hole diameter, but an oversize tolerance of 0.001 inch in diameter of hole will be allowed. Crosscut circular saws shall be similar to Figure 754 and conform to the dimensions in the following table:

SHAPE OF TEETH
44 INCH SAW

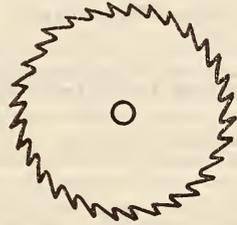

TYPE G
FIGURE 754

Diameter	Number of teeth	Thickness		Revolutions per minute	Arbor-hole diameter
		Minimum	Maximum		
Inches		Inch	Inch		Inches
12	90	0.065	0.083	3,180	1¼
14	90	.072	.095	2,730	1¼
16	80	.072	.095	2,390	1¼
18	80	.083	.109	2,120	1¼
20	80	.083	.109	1,910	1¼
24	70	.109	.134	1,590	1¾
44	90	.148	.180	870	1¾

8. *Circular saws, rip, type H.*—These saws shall be suitable for right or left hand cutting and shall be of uniform thickness throughout. The teeth shall be adapted for ripping and shall be spring or swage set. The teeth shall be set to provide a proper clearance on each side of the saw. The hook of the teeth where possible shall be such that a line passing down the front or cutting edge of the teeth shall, when extended, be tangent to a circle whose diameter is one-half that of the saw and whose center coincides with the center of the saw. The depth of the gullets shall be approximately equal to one-half the distance, point to point, of the teeth.

These saws shall be tensioned for a rim speed of 10,000 feet per minute and shall be furnished with arbor holes as listed. No undersize tolerance will be permitted on the arbor-hole diameter, but an oversize tolerance of 0.001 inch in diameter of hole will be allowed. Rip circular saws shall be similar to Figure 755 and conform to the dimensions in the following table:

TYPE H
FIGURE 755

Diameter	Number of teeth	Thickness		Revolutions per minute	Arbor-hole diameter
		Minimum	Maximum		
Inches		Inch	Inch		Inches
12	36	0.065	0.083	3,180	1¼
14	36	.072	.095	2,730	1¼
16	36	.072	.095	2,390	1¼
18	36	.083	.109	2,120	1¼
20	36	.083	.109	1,910	1¼

9. *Compass saws, type I.*—These saws shall be of uniform thickness throughout the length of the cutting edge. The butt or heel on the back may be of the same thickness as the tooth or cutting edge, in which case there shall be a gradual taper from the heel to the point; or the back may be of uniform thickness throughout, in which case the back shall be tapered thin with reference to the cutting edge. The teeth shall be spring set, bevel filed, and adapted for both crosscutting and ripping. The teeth shall be set to provide proper clearance on each side of the blade.

The handle shall be secured to the blade by means of two brass screws and nuts. These saws shall be similar to Figure 756 and conform to the dimensions in the following table:

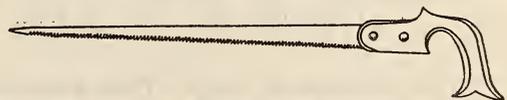

FIGURE 756

Length on cutting edge	Points per inch	Thickness on cutting edge		Thickness on back at point		Width at heel at entrance to handle
		Minimum	Maximum	Minimum	Maximum	
Inches		Inch	Inch	Inch	Inch	Inches
14	8	0.049	0.065	0.035	0.048	1¼
12	8	.049	.065	.035	.048	1½

10. *Crosscut saws, two-man, type J.*—These saws shall be taper ground toward the back. The cutting edge shall be of uniform thickness throughout the length. These saws shall be furnished with handles of thoroughly seasoned hardwood, the handles to be of the loop type and secured to the saw by means of the loop screwing up into an internally threaded nut in the handle. The handle shall be from 9½ to 10½ inches long and 1¼ inches largest diameter, the length to be exclusive of the loop.

These saws shall be furnished with a style of tooth as shown in Figure 757 and shall conform to the dimensions in the following table:

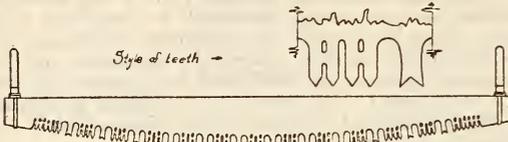

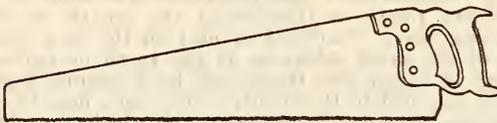

FIGURE 757.—Type J

Length on back	Thickness on cutting edge		Thickness on back at center		Thickness on back at ends		Width at center	
	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
Feet 5	Inch 0.072	Inch 0.095	Inch 0.035	Inch 0.049	Inch 0.058	Inch 0.072	Inches 5½	Inches 6½

11. *Hack saw, hand, type K.*—These saws shall be of the straight-back type and either taper ground or taper and hollow ground. They shall be of uniform thickness throughout the length of the cutting edge. The back of the saw may be of uniform gage throughout or may be tapered from the heel to the point. The teeth shall not be set but shall be milled straight across.

The handle shall be secured to the blade by means of four brass screws and nuts. These saws shall be similar to Figure 758 and conform to the dimensions in the following table:

TYPE K
FIGURE 758

Length on cutting edge	Points per inch		Thickness on cutting edge		Thickness on back at handle		Thickness on back at point	
	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
Ins. 18	12	15	Inch 0.042	Inch 0.049	Inch 0.032	Inch 0.035	Inch 0.022	Inch 0.025

12. *Handsaws, crosscut, type L.*—These saws shall be of the skewback type and shall be of uniform thickness throughout the length of the cutting edge. The back shall have a gradual taper from the heel to the point. The teeth shall be spring set, bevel filed, and adapted for crosscutting. The teeth shall be set to provide proper clearance on each side of the blade.

The handle shall be secured to the blade by means of four brass screws and nuts in the case of the

20-inch saw and five brass screws and nuts in the case of a longer saw. These saws shall be similar to Figure 759 and conform to the dimensions in the following table:

TYPE L
FIGURE 759

Length on cutting edge	Points per inch	Thickness on cutting edge		Thickness on back at point		Width butt	Width point, minimum
		Minimum	Maximum	Minimum	Maximum		
Inches 20 26	10 8	Inch 0.032	Inch 0.042	Inch 0.022	Inch 0.028	Inches 5½ 7¼	Inches 2¾ 2½

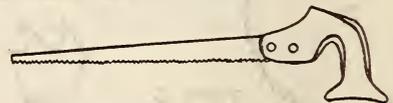

13. *Handsaws, rip, type M.*—These saws shall conform to the requirements for handsaws, crosscut, type L, except as to dimensions and that the teeth shall be filed straight across and adapted for ripping. These saws shall be similar to Figure 760 and conform to the dimensions in the following table:

TYPE M
FIGURE 760

Length on cutting edge	Points per inch	Thickness on cutting edge		Thickness on back at point		Width butt, minimum	Width point
		Minimum	Maximum	Minimum	Maximum

14. *Keyhole saws, type N.*—These saws shall conform to the requirements for compass saws, type I, except as to dimensions. They shall be similar to Figure 761—except the 6-inch saw, which shall have a metal handle or pad—and shall conform to the dimensions in the following table:

TYPE N
FIGURE 761

Length on cutting edge	Points per inch	Thickness on cutting edge		Thickness on back at point		Width at heel
		Minimum	Maximum	Minimum	Maximum	
Inches 12 6±½	10 10	Inch 0.042	Inch 0.058	Inch 0.032	Inch 0.042	Inch ¾ ½±¼

15. *Web saws, fellow, type O.*—These saws shall be of uniform thickness throughout the length of the cutting edge, tapering to a uniform thickness on the back. The teeth shall be spring set, bevel filed, and adapted for both crosscutting and ripping. The teeth shall be set to provide proper clearance on each side of the blade. These saws shall have holes at each end for use in fastening the saws in machines. The length or size shall be the distance over all. These saws shall be similar to Figure 762 and conform to the dimensions in the following table:

TYPE O
FIGURE 762

Length	Width	Points per inch	Thickness on back		Thickness on cutting edge	
			Minimum	Maximum	Minimum	Maximum

VIII. NOTES

1. When requisitions are prepared for type E band saws, all detailed information referred to in Section V should be furnished. If type C or D saws are required cut and brazed to length, the requisition should state the exact length desired.

616.18 GLASS CUTTERS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR CUTTERS, GLASS, (WHEEL TYPE), GGG-C-751, MARCH 1, 1932

GLASS CUTTERS

B. TYPES.

B-1. Glass cutters shall be of the following types, as specified: A. Single, fixed wheel. B. Single, renewable wheel. C. Turret head.

C. MATERIAL AND WORKMANSHIP, ETC.

C-1. *Material.*—Glass cutters shall be made of material of good quality throughout, which shall be suitable for the purpose.

C-2. *Workmanship.*—Shall be first class.

D. GENERAL REQUIREMENTS.

D-1. *Markings.*—Each glass cutter shall be marked in a plain and permanent manner with the manufacturer's name or with a trade-mark of such known character that the source of manufacture may be readily determined.

D-2. *Cutting wheels.*—The cutting wheels shall be of hardened tool steel, suitably designed with a cutting edge, ground and honed to the proper bevel for long life under service conditions. The cutting edge shall be continuous and free from perceptible dull spots or nicks.

D-3. *Spindle.*—The wheels shall be mounted on hard steel spindles, having a diameter of not less than 0.050 inch nor more than 0.060 inch.

D-4. *Clearances.*—A close working fit shall be provided between the hole in the wheel and the spindle on which it operates. The side fit or lateral clearance for the wheels shall not exceed 0.003 inch. All wheels shall operate freely.

E. DETAIL REQUIREMENTS.

E-1. Type A, single fixed wheel glass cutters.

E-1a. *Component parts.*—These cutters shall be composed essentially of a handle, and a shank with a cutting wheel mounted in a slot near the outer end of the shank.

E-1b. *Handle.*—Unless otherwise specified the handle shall be of metal and made integral with the shank. That portion of the handle adjacent to the shank shall be suitably shaped to provide a comfortable rest for the finger. The finger-rest portion of the handle shall be not less than seven-sixteenths inch nor more than nine-sixteenths inch in width. The upper portion of the handle which is held between the fingers under normal operating conditions shall have a diameter of not less than one-eighth inch nor more than three-sixteenths inch. The handle shall be smoothly finished and have a coating of baked enamel.

E-1c. *Shank.*—The shank shall be made of metal and provided with three glass grips or breakers. The depth of the grips or breakers shall be one-fourth inch subject to a tolerance of plus or minus one thirty-second inch. The widths of the grips shall be one-eighth inch, five thirty-seconds inch, and three sixteenths-inch, respectively, with an allowable tolerance of plus or minus one sixty-fourth inch in all these dimensions. The corners and edges of the grips shall be clean and true. The edges and outer corners shall be beveled slightly to prevent abrasion to glass rules. When specifically required the head of the shank shall have a thickness of three-sixteenth inch subject to a plus or minus tolerance of one sixty-fourth inch.

E-1d. *Wheels.*—The wheels of these cutters shall have a diameter of seven thirty-second inch subject to a plus or minus tolerance of one thirty-second inch.

E-1e. Glass cutters of this type shall be similar to illustration.

E-2. *Type B, single, removable wheel glass cutters.*

E-2a. Glass cutters of this type shall conform to the requirements outlined herein for type A glass cutters, with the following exceptions:

E-2a (1). *Mounting.*—The cutter wheel shall be mounted in a slot in the shank on a spindle of such quality that the useful life of the spindle will be equal to that of at least seven cutting wheels. The wheel spindle shall be so constructed that the worn wheel may be removed and replaced by a new wheel without damage to the spindle. Replacement of wheels shall be accomplished without the use of tools.

E-2a (2). *Handle.*—The outer end of the handle shall have a magazine or recess of ample size to contain six spare cutting wheels. The recess in the handle shall be threaded and capped with a metal screw to prevent loss of the spare wheels.

E-2a (3). *Spare cutting wheels.*—At least six spare cutting wheels shall be furnished with each of these glass cutters. The spare wheels shall be coated with a rust preventive and set in the recess in the handle.

E-2b. Glass cutters of this type shall be similar to illustration.

E-3. *Type C, turret head glass cutters.*

E-3a. *Component parts.*—These cutters shall be composed essentially of a handle, a shank, and a turret with at least six cutting wheels mounted thereon.

E-3b. *Handles.*—The handles may be integral with and of the same material as that of the shank or they may be of wood or other suitable material and be

separate from the shank. However, if other than integral construction is employed the handle shall be ferruled at the junction of the handle and shank and the handle shall be secured in a manner to prevent its working loose or coming off the shank in service. All handles shall be smoothly finished and have a coating of baked enamel.

E-3c. *Shank*.—The shank shall be made of metal and provided with two glass grips or breakers having a depth of one-fourth inch, subject to a plus or minus tolerance of one thirty-second inch. The width of these grips shall be five thirty-seconds inch and one-eighth inch, respectively, with an allowable tolerance of plus or minus one sixty-fourth inch. The corners and edges of the grips shall be clean and true. The edges and outer corners shall be beveled slightly to prevent abrasion to glass rules. When specifically required the wheel end of the cutter with wheels mounted on turret and attached to shank shall not exceed three-sixteenths inch in thickness, subject to a plus or minus tolerance of one sixty-fourth inch.

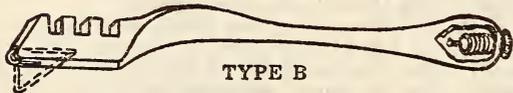

E-3d. *Turret*.—The turret shall be of hardened steel, circular in shape, and provided with at least six spindles, on each of which a cutting wheel shall be mounted. The turret shall be fastened to the shank of the cutter by a single, countersunk head, slotted, screw. When tightened the head of the screw shall not protrude above the face of the shank. Changing position of the cutter wheels shall be accomplished by loosening the retaining screw and revolving the turret. The turret shall be securely locked or clamped by tightening the retaining screw and when locked in position the side play between the wheel and the turret or the shank of the cutter shall not exceed the lateral clearance prescribed in paragraph D-4. The turret shall be marked on the exposed face with Figures 1 to 6, inclusive. Each of these figures shall appear opposite a cutting wheel.

E-3e. *Wheels*.—The wheels of these cutters shall have a diameter of five thirty-seconds inch subject to a plus or minus tolerance of one sixty-fourth inch.

E-3f. Glass cutters of this type shall be similar to either of illustrations for type C.

TYPE A

TYPE B

TYPE C

TYPE C

Glass cutter: Type A, single, fixed wheel; type B, single, renewable wheel; type C, turret head

F. METHODS OF SAMPLING, INSPECTION, AND TESTS.

F-1. *Work value tests*.—Tests as described herein will be conducted to determine the work values of glass cutters submitted by the various manufacturers. The results obtained in these tests will be entered on the list of work values maintained by the department concerned. The list will show the name of the manufacturer, the brand name, and the type of cutter.

F-2. *Test procedure*.—Work values will be determined by subjecting six sample glass cutting wheels to the following test:

Each sample cutter will be held, with the handle vertical, in a stationary position, and caused to bear, with pressure of 8 pounds, on a sheet of clear unpolished window glass, double strength, A quality, having a minimum thickness of 0.111 inch, a maximum thickness of 0.125 inch, and a weight of 24 to 25 ounces per square foot. (Type B clear window glass, Federal Specification DD-G-451.) The glass will be mounted on a reciprocating carriage having a 6-inch stroke and operated at 30 strokes per minute. Each wheel will be tested in periods of 100 revolutions of the crank operating the reciprocating carriage, with the wheel bearing in one groove for each period. No lubricant will be used in testing wheels. At the end of each period the cutter will be removed from the testing machine to be determined by hand if failure of the wheel has occurred. Failure will be deemed to have occurred when the wheel does not make a clean continuous scratch on glass under a pressure of 10 pounds (with glass lying on platform scale) or when the clearance becomes so great that the wheel will not operate in a straight line. The work value of the wheel will be taken as the number of strokes or twice the number of crank revolutions of the testing machine required to bring the wheel to the point of failure. The work value of each style or make of cutter will be taken as the sum of the work values of six test wheels. Any make or style glass cutter showing a work factor of less than 5,000 in the above-prescribed test will not be approved.

F-3. *Inspection*.—All glass cutters shall be inspected to determine whether they conform to the requirements of this specification. In addition to a careful surface inspection for workmanship and for general compliance with this specification, at least three samples (in no instance less than 2 per cent of the entire quantity of each type under inspection) shall be taken at random from those under inspection and subjected to the work value test prescribed herein. If any one of the test samples fails under inspection check test to equal 90 per cent of the original work value test, on which award was based, the entire quantity represented by the samples shall be rejected.

G. PACKAGING, PACKING, AND MARKING.

G-1. *Packaging*.—Unless otherwise specified, commercial packages are acceptable, provided that not more than twelve tools shall be contained in any one box or package and that suitable provision shall be made to prevent rust or corrosion of the cutting wheels and other finished parts of the tools.

616.2 AWLS, PUNCHES, AND SCREW DRIVERS.

616.21 AWLS.

(No nationally recognized specifications available.)

616.22 PUNCHES.

(For railway-track punches, see American Railway Engineering Association specifications for track tools. See 616.8, p. 969.)

(For standard sizes of blacksmith punches, see United States Government, Department of Commerce, Bureau of Standards, simplified practice recommendation R17-31 for forged tools. See 616.60, p. 960.)

616.23 SCREW DRIVERS.

(No nationally recognized specifications available.)

616.3 LEVELING AND MEASURING TOOLS.

616.31 BEVELS AND MITER BOXES.

(No nationally recognized specifications available.)

616.32 LEVELS AND PLUMBS.

(No nationally recognized specifications available.)

616.33 RULES.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATION BOARD; FEDERAL SPECIFICATION FOR RULES, NO. 419, JULY 18, 1928. (CURRENT DESIGNATION: GGG-R-791)

RULES

TYPES

Rules shall be of the following types, as specified: A, caliper rules; B, carpenter's folding rules; C, multiple-folding rules; and D, steel rules.

MATERIAL AND WORKMANSHIP

All rules shall be of high-grade material and workmanship and free from defects and blemishes which may affect the appearance or serviceability of the rules.

GENERAL REQUIREMENTS

1. All rules shall be stamped or otherwise permanently marked with the manufacturer's name or trade-mark.
2. Inch graduations shall be plainly marked with the proper figures. All graduations and figures shall be black in order that they may be clear and distinct.

DETAIL REQUIREMENTS

1. *Caliper rules, type A.*—These shall be left-hand type and made from thoroughly seasoned boxwood, with ends and joints bound with brass. They shall be of the folding type which folds into two equal parts. The middle joint located at the 6-inch division on rule shall be of the square-joint type.
2. The flanges or wings of the joints, of which there shall be two for each leg of the rule, shall cover the faces of the rule at the joint, and shall be held together by rivets passing through the flanges and the rule. One leg shall be slotted to receive the caliper slide.
3. The caliper slide shall be of brass, and machined to fit accurately the slot in the leg of the rule. It shall be graduated in inches, also sixteenths and thirty-seconds of an inch.
4. The body of the rule shall be graduated in inches, also eighths, tenths, twelfths, and sixteenths of an inch.
5. Caliper rules shall be 1½ inches wide, 1 foot length, double fold.
6. *Folding rules, type B.*—These shall be made from thoroughly seasoned sound boxwood with ends and joints bound with brass. Rules shall be of the folding type which fold into four equal parts. The middle joint located at the 12-inch division on rule, shall be of the type known as square joint, in which the flanges or wings of the joints, of which there shall be two for each leg of the

rule, shall cover the face of the rule at the joint and shall be held together by rivets passing through the flanges and the rule. The joints located at the 6 and 18 inch divisions of the rule shall be of the type known as edge-plate joint, in which the flanges or wings of the joint shall be fastened to the outer edges of the rules and shall be secured to same by rivets passing through both wood and flanges, holding all parts securely together.

7. These rules shall be graduated in inches, also eighths, tenths, twelfths, and sixteenths of an inch.

8. These rules shall be 1 inch wide, 2-foot length, fourfold.

9. *Multiple-folding rule, type C.*—These shall be made from thoroughly seasoned sound hardwood. They shall be of the multiple-folding type and capable of being folded upon themselves by means of folding joints placed every 6 inches along the rules. The joints shall be of the inclosed spring type, so that the rules can be opened full length and hold themselves rigid in order to measure vertical or horizontal surfaces. The joints shall be made of brass-plated metal securely fastened to the wood, and provided with rivets passing through the wood and the metal joints. The ends of the rivets shall be peened over a suitable washer, which will prevent the rivet pulling through the wood.

10. The joints shall be so designed that they can not become loose, weak, or permit any movement of the wood where secured to the same. The ends of the rules shall be provided with brass plated tips so as to protect the ends of the rules from injury. These tips shall be secured in such a way as not to interfere with reading of end graduations.

11. These rules shall be graduated in inches and sixteenths of an inch, reading consecutively from the outside of the rule to the total length of rule.

12. Multiple-folding rules shall be five-eighths inch wide, 6-foot length, and yellow enameled.

13. *Steel rules, type D.*—These shall be made of tool steel—properly hardened, tempered, and ground—and accurately graduated into inches on both sides. One side shall be graduated into eighths and sixteenths, the other side shall be graduated into thirty-seconds and sixty-fourths of an inch.

14. The edges shall be ground parallel, the ends shall be similarly ground and at right angles to the edges.

15. Steel rules shall be furnished in accordance with the sizes and dimensions called for in the following table:

Length	Width		Thickness	
	Minimum	Maximum	Minimum	Maximum
<i>Inches</i>	<i>Inch</i>	<i>Inches</i>	<i>Inch</i>	<i>Inch</i>
6	1¼/16	¾	3/64	1/20
12	3¼/32	1	3/64	¼/16
18	1	1¼	3/64	¼/16

INSPECTION

Representative samples shall be taken from each lot submitted for inspection. Each sample shall conform to the requirements of the specifications.

616.34 SQUARES.

(No nationally recognized specifications available.)

616.35 TAPES.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, WHEEL CIRCUMFERENCE MEASURING TAPE FOR CONTOURS A, B, C, AND D, RECOMMENDED DESIGN E115-26, 1926

WHEEL CONTOUR MEASURING TAPE

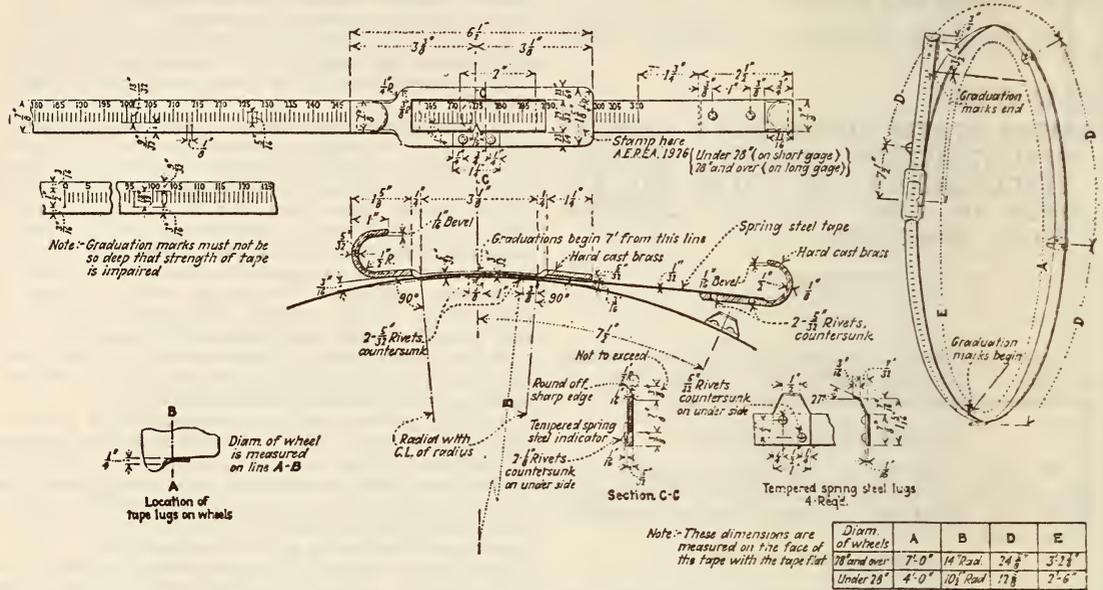

FIGURE 763.—Wheel circumference measuring tape for contours A, B, C, and D

MATERIAL AND WORKMANSHIP

Nail pullers shall be made of high-grade material and in accordance with the best commercial practice. They shall be free from all defects or blemishes that may affect the serviceability or appearance of the tools.

GENERAL REQUIREMENTS

Each nail puller shall have the maker's name or trade-mark legibly cast or impressed stamped on it.

DETAIL REQUIREMENTS

1. Nail pullers shall consist of a shank, at one end of which is located the long jaw and to which is riveted the short jaw, and at the other end a rammer which travels over the shank, and thereby produces the blow on the end of the shank.

2. *Jaws and shanks.*—The shank, the jaw which forms an integral part of the shank (known as the long jaw), and the movable jaw or foot (known as the short jaw) shall be made of tool steel. The long jaw and the short jaw shall be joined by and pivoted on a steel pin. The short jaw shall be so designed that the jaws shall be held in an open position by gravity. Jaws shall be properly shaped for pulling out nails which have been driven into wood without slipping from under the head of the nail as the nail is drawn from the wood. The jaws shall be properly treated to stand abrasion, bending, or dulling at the gripping jaws when used under ordinary service conditions. The shank shall be fitted with a suitable hand grip not less than 4 inches long nor more than 5 inches and a hand guard to prevent pinching the hand.

3. *Rammer.*—The rammer shall be made of a good-quality iron or steel and shall be not less than 11 inches long nor more than 14 inches. The axial movement of the rammer on the shank shall be not less than 5 inches nor more than 7 inches. The shank shall be retained in the rammer by means of a steel stop pin.

4. *Finish.*—The shank and jaws shall be natural steel finish or they may be polished or coated with japan or enamel. The rammer shall be japanned or black enameled.

5. The length of the nail puller when closed shall be not less than 17 inches nor more than 20 inches. The weight shall be not less than $3\frac{3}{4}$ pounds nor more than 6. The puller shall have a thrust of not less than 5 inches nor more than 7.

6. Nail pullers shall also be similar to the illustration.

TESTS

At least three nail pullers shall be taken at random from each lot submitted for inspection and tested as follows: In addition to a careful surface inspection, each sample nail puller shall be tested under service conditions by gripping and drawing 10 or more steel wire nails (common type) varying in size up to and including twelvepenny (148 mils diameter, $3\frac{3}{4}$ inches long) which have been driven with heads flush into softwood.

Under the above test the sample nail pullers shall show no indications of weakness such as chipping, breaking, or bending of any of the parts.

616.5 TOOLS FOR LINE-CONSTRUCTION MEN.

(For timber tongs, see American Railway Engineering Association specifications for track tools. See 616.8, p. 969.)

616.6 SOIL WORKING TOOLS.

616.60 GENERAL ITEMS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR FORGED TOOLS, R17-31, JULY 1, 1931

FORGED TOOLS

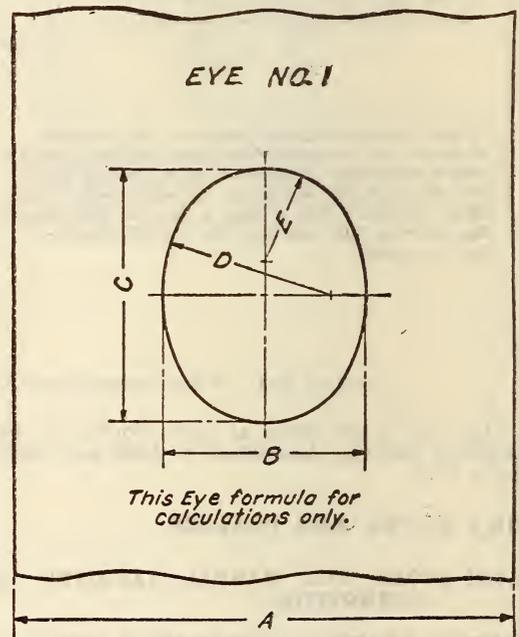

FIGURE 765

Eye formula:

A=Size of stock

B=40 per cent of A

C=1.25 per cent of B (approximate)

D=5/6 of B

E=To suit dimensions B, C, and D.

NOTE.—Manufacturers have a tolerance limit of $\frac{1}{16}$ inch above and $\frac{1}{32}$ inch under all eyes to allow for punch wear.

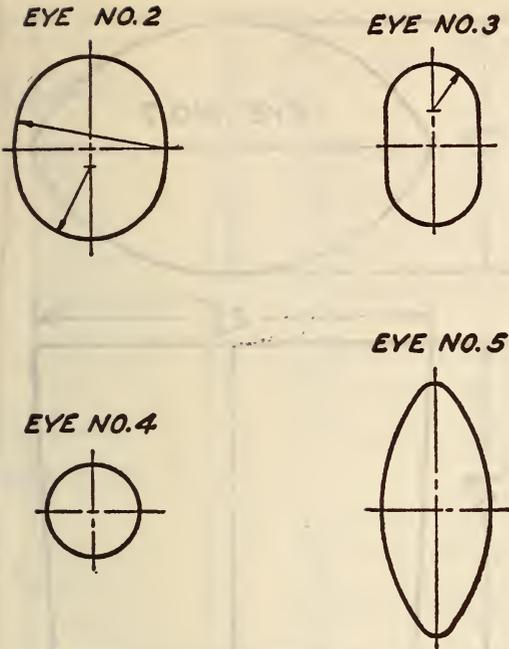

FIGURE 766

616.63 SCOOPS, SHOVELS, AND SPADES.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATIONS FOR SHOVELS, SPADES, AND SCOOPS, R48, JULY 1, 1927

SHOVELS, SPADES, AND SCOOPS

In accordance with the unanimous action of the general conferences of manufacturers, distributors, and users of shovels, spades, and scoops, the United States Department of Commerce, through the Bureau of Standards, recommends that the recognized stock grades, multiples, finishes, and sizes of shovels, spades, and scoops carried as stock items be limited to the following:

GRADES

Three grades of shovels instead of four, to be classified as: Class A, high-grade shovel (replaces former grade A); class B, medium-grade shovel (replaces former grade B); and class C, low-grade shovel (replaces former grades C and D).

No shovels of a lower grade to be manufactured.

The "narrow strap" to be used on class C.

The United States standard gage to be used.

No. 1 standard handle to be used in class C shovels, with waxing permitted if so desired.

Steel for class C shovels of the following types shall not be heavier than No. 15 United States standard gage, 0.0703: Plain back, hollow back, or riveted back, D handle, square; long handle, square; D handle, round; long handle, round.

Post, drain, and ditch spades to be made only in classes A and B.

All hollow-back sockets to be not less than 8 inches or more than 9 inches in the blank in length from head of blade to end of socket.

FINISHES

All plain back, riveted back, hollow back, and solid socket shovels, spades, and scoops of all grades shall be manufactured only in black or natural finish, full polished finish, and half polished finish.

The following is a description of finishes and manner in which they are to be produced:

1. *Black or natural finish.*—The blade to be left in its natural state, but it may be wire brushed to remove scale or rust, the blade not to be pickled before wire brushing. After brushing no further work or treatment of the blade is to be done, with the single exception of dipping the finished blade in shovel lacquer or lacquer with an asphaltum base.

2. *Full polished.*—The blade to be pickled, and the blades both on front and back, over their entire surface, to be finished on roughing and finishing polishing wheels. After polishing no further work is to be done on the blade, with the single exception of dipping the finished blade in the shovel lacquer or lacquer with an asphaltum base.

3. *Half polished.*—The lower half of the blade, both front and back, to be pickled and finished on roughing and finishing polishing wheels. The upper half, both front and back, to be left in the natural black condition or finished with a colored varnish, lacquer, or paint.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR BARS—CHISEL, CROW, PINCH AND WRECKING—GGG-B-101, MARCH 29, 1932

CHISEL BARS, CROW BARS, PINCH BARS

II. TYPES

These bars shall be of the following types, as specified: A, chisel bars; B, crow bars; C, pinch bars; D, wrecking, gooseneck; and E, wrecking, offset.

III. MATERIAL AND WORKMANSHIP

All bars shall be made of high-grade material and in accordance with the best commercial practice. They shall be free from scale, checks, cracks, or any other defects or blemishes which may affect their serviceability or appearance.

IV. GENERAL REQUIREMENTS

The bars shall have the maker's name or trademark stamped or otherwise permanently marked on them. A plus or minus tolerance of 5 per cent will be allowed in all dimensions referred to herein except for width of edge of type (A) chisel bars for which tolerances are otherwise provided.

V. DETAIL REQUIREMENTS

1. *Chisel bars, type A.*—Unless otherwise specified, chisel bars shall be made of octagon tool steel having a carbon content of 0.80 to 0.90 per cent and a maximum sulphur and phosphorus content of 0.04 per cent or of a high-grade alloy tool steel. One end of the bar shall be forged, hardened, tempered, and ground to a chisel-shaped edge. The width of this edge shall be from one-sixteenth inch to one-fourth inch wider than the short diameter of the stock from which the bar is made, the amount to be in proportion to the size of the stock. The striking end of the bar shall be chamfered. This end shall possess the quality of resisting deformation when struck by a hammer or maul under normal service conditions. These bars shall be similar to Figure 790 and conform to the following table of dimensions:

FIGURE 790.—Chisel bar, type A

Diameter octagon steel	Length over all
Inches	Inches
5/8	18
3/4	24
7/8	30
1	36

2. *Crow bars, type B.*—Unless otherwise specified, crow bars shall be made of tool steel having a carbon content of 0.60 to 0.90 per cent and a maximum sulphur and phosphorus content of 0.05 per cent, or of good-quality alloy tool steel. They shall be the type known commercially as pinch-point crow bars. The formed end shall be square, with a flat chisel-shaped edge, the body shall be octagonal in shape, and the handle shall be round, with a slight taper toward the end. These bars shall be furnished in 60-inch over-all length; the pointed end shall be 1 1/4 inches wide, and shall be properly

hardened and tempered. They shall be similar to Figure 791 and conform to the dimensions in the following table:

FIGURE 791.—Crow bar, type B

Diameter octagon steel	Weight		Length over all
	Minimum	Maximum	
Inches 1 1/4	Pounds 17	Pounds 20	Inches 60

3. Pinch bars, type C.—Unless otherwise specified, pinch bars shall be made of octagon tool steel having a carbon content of 0.70 to 0.90 per cent with a maximum sulphur or phosphorus content of 0.04 per cent or of good-quality alloy tool steel. One end shall have a rounded offset and shall be properly hardened and tempered. The other end shall be round, smoothly finished, and tapered for bringing holes in steel plates into alignment. These bars shall be similar to Figure 792 and conform to the following table of dimensions:

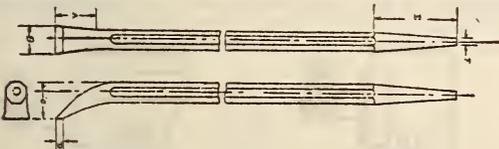

FIGURE 792.—Pinch bar, type C

Dimensions of type C, pinch bars

Diameter octagon steel	Length over all	Dimensions (inches)					
		A	B	C	D	E	F
Inch 3/4	Inches 26	1 1/2	1	1 1/4	5/16	3	3/16
7/8	30	1 3/4	1 1/4	1 1/2	3/8	3 1/2	3/8
1	36	2	1 1/4	1 3/4	7/16	4	7/16

4. Type D, wrecking bars (gooseneck, claw and pinch point).—These bars shall be made of 3/4-inch hexagon tool steel having a carbon content of 0.70 to 0.90 per cent, with a maximum sulphur and phosphorus content of 0.04 per cent or of good quality alloy tool steel. One end of the bar shall be bent in the form of a gooseneck and shall be provided with a claw suitable for pulling nails. The opposite end of the bar shall be wedge shaped and offset at an angle of approximately 30°. Both ends shall be properly heat-treated and tempered and the bars shall possess the quality of resisting bending or breaking under normal service conditions.

Bars of this type shall be furnished with over-all lengths of 30 or 36 inches as may be specified. They shall be similar to illustration Figure A-792 1/2 and shall conform to the dimensions given therein except that the dimensions may vary within the tolerances provided by paragraph IV.

5. Type E, wrecking bars (offset claw and pinch point).—These bars shall be made of hexagon tool steel of the same size and quality as that prescribed herein for type D wrecking bars. Both ends of

type E wrecking bars shall be offset at an angle of approximately 30°, in opposite directions. One end shall be wedge-shaped and the other end shall be provided with a claw suitable for pulling nails. Both ends shall be properly heat-treated and tempered and the bars shall possess the quality of resisting bending or breaking under normal service conditions.

Bars of this type shall be furnished with over-all lengths of 30 or 36 inches as may be specified. They shall be similar to illustration Figure B-792 1/2 and shall conform to the dimensions given therein except

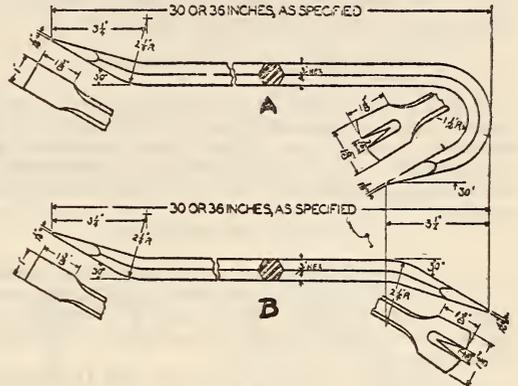

FIGURE 792 1/2

A. Type D, wrecking bars, gooseneck claw and pinch point.
B. Type E, wrecking bars, offset claw and pinch point.

that the dimensions may vary within the tolerances provided by paragraph IV.

VI. METHOD OF INSPECTION AND TESTS

1. Representative samples totaling at least 5 per cent of each type and size shall be taken at random from each delivery and submitted to chemical (if of carbon tool steel) and physical tests as follows:

(a) Chemical test.—Two ounces of drillings shall be obtained from each sample bar of carbon tool steel for chemical analysis, which shall be in accordance with requirement specified under detail requirements.

(b) Physical tests.—Each sample chisel bar selected for test shall be subjected, at the option of the inspector, to either or both of the methods specified in paragraphs (1) and (2) below.

(1) Chisel bars shall be securely held in a vertical position by a vise or clamp with the striking end of chisel bar resting on a solid foundation. A medium steel bar at least three-quarters inch in diameter shall be held at right angles with the cutting edge and struck a sufficient number of blows with a heavy hammer to make a cut in the bar one-eighth inch deep without the cutting edge chipping or showing undue wear.

(2) Chisel bars shall show a Rockwell hardness of not less than 42 nor more than 58 on the C scale (or equivalent Brinell of 398-587) about one-half inch back from the cutting edge.

F-1b (2). Crowbars and pinch bars shall show a Rockwell hardness of not less than 35 nor more than 48 on the C scale (or equivalent Brinell of 327-464) about 2 inches back from the chisel-shaped edge.

F-1c. Wrecking bars shall show a Rockwell hardness of not less than 35 nor more than 48 on the C scale (or equivalent Brinell of 327-464) about three-fourths inch back from the wedge-shaped ends.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR JACKS, No. 481, APRIL 25, 1927. (CURRENT DESIGNATION: GGG-J-51)

JACKS

II. TYPES

Jacks shall be furnished in the following types as required: A, bevel-gear screw jacks; B, bevel-gear journal jacks; C, hydraulic jacks; D, lever jacks, automatic; E, planer or leveling jacks; F, screw jacks; and G, motor-truck jacks.

III. MATERIAL AND WORKMANSHIP

All jacks shall be made from best-quality materials, and be free from all defects affecting their appearance or that may affect their operation or serviceability. They shall be of good workmanship and made in accordance with the best commercial practice.

IV. GENERAL REQUIREMENTS

1. All types of jacks shall be of safe construction for their rated capacity and shall have strong and rugged working parts. They shall be designed so that all parts will be readily accessible for repairs or lubrication.

2. Jacks, types A to D, inclusive, and G, shall be equipped with a warning device or stop to insure that the maximum lift is not exceeded.

3. The capacities stated for the various types and sizes of jacks shall be based on the head lift. The claw or foot lift shall be based on one-half of the head lift.

4. Each jack shall be smoothly finished, carefully japanned or painted, and plainly and permanently marked with the name of the manufacturer.

5. The caps, tops, or rams shall be roughened on the top to prevent the slipping of the load, except that this requirement need not apply to type E jacks.

V. DETAIL REQUIREMENTS

1. *Bevel-gear screw jacks, type A.*—These shall be of the type known as standard speed and shall be provided with a sleeve cast in one piece having a solid or removable top and equipped with a claw or ground lift. The base shall be of suitable size to prevent tilting over when load is placed on the claw. The following essential parts are included: A bevel gear and pinion; suitable shaft between the pinion and ratchet; sleeve, standard, and screw with suitable engaging threads in the standard lining; cap; ratchet; and lever. Handles shall also be provided for moving the jack from place to place.

The gear and pinion shall be made of steel and shall have machine-cut teeth. The pinion may be forged integrally with the part of the shaft between the pinion and ratchet or may be secured to the shaft in any other equally satisfactory manner. The design shall be such that the gear and pinion will be in proper mesh.

The ratchet shall be made of steel. The ratchet holder shall be made of malleable iron or steel. The pawl shall be of steel and shall engage the teeth of the ratchet gear. Means shall be provided to change the direction of operation of the jack.

The main bearing on which the screw rotates shall consist of two hardened steel plates, separated by balls or rollers made of hardened alloy steel. The bevel gear shall be securely fastened to the screw.

The sleeve shall be made of either steel or malleable iron. The standard and base shall be in one piece, and made of steel or malleable iron. A bushing

or nut of alloy bronze, threaded internally to engage with the screw, shall be fitted inside the standard. The caps of these jacks shall be roughened on top. The claw may be plain or roughened in accordance with the manufacturer's practice.

The screw shall be made of steel, the threads shall be carefully cut and finished. The threaded portion of the screw shall engage with the threads in the lining or nut in the standard, the other end shall project through the bearing plates. The end of the screw which passes through the bearing plates shall rotate freely. All parts of the jack shall be easily accessible for inspection or repairs to the working parts.

For jacks larger than 50 tons' capacity, compound gearing may be used.

Each jack shall be furnished with a suitable operating lever.

These jacks shall be provided with a warning device or stop which will prevent the screw coming out of the nut or bushing when the limit of rise is reached.

Bevel-gear screw jacks shall be plainly and permanently marked to indicate their maximum lifting capacity and the jacks shall be capable of retaining any weight up to their rated capacity at any height within the range. They shall be capable of lifting one-half their rated capacity on the claw to any height within their range.

These jacks shall be similar to Figure 793 and conform to the requirements of the following table:

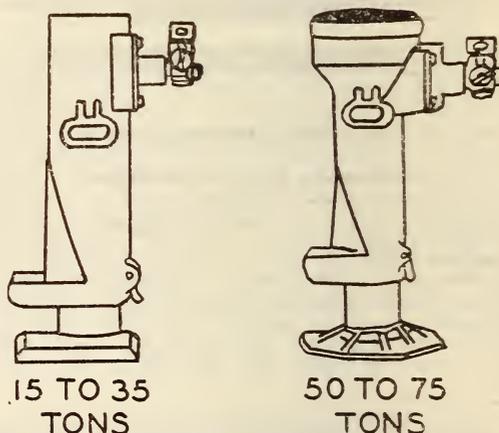

FIGURE 793.—Jack, type A

Capacity	Weight (minimum)	Closed height (approximate)	Rise (approximate)
Tons	Pounds	Inches	Inches
15.....	110	22	10
25.....	135	22	10
35.....	180	22	10
50.....	260	24	9
75.....	325	27	11

2. *Beveled-gear journal jacks, type B.*—These shall be of the same type as the bevel-gear screw jacks. They shall consist essentially of the following parts: A bevel gear and pinion; suitable shaft between pinion and ratchet; casing, ram, and screw with suitable engaging threads in the ram; ratchet; and ratchet holder with lever.

The gear and pinion shall be made of steel and shall have machine-cut teeth. The pinion may be forged integrally with the part of the shaft between

the pinion and ratchet or may be secured to the shaft in any other equally satisfactory manner. The design shall be such that the gear and pinion will be in proper mesh.

The ratchet shall be made of steel. The ratchet holder shall be made of malleable iron or steel. The pawl shall be of steel and shall engage the teeth of the ratchet gear. Means shall be provided to change the direction of operation of the jack.

The main bearing on which the screw rotates shall consist of two hardened steel plates separated by balls or rollers made of hardened alloy steel.

The casing of the jack shall be made of malleable iron or steel and equipped with a handle. The ram shall be made of malleable iron or steel, and fitted with a nut or bushing made of alloy bronze threaded to engage the threads of the screw.

The screw shall be made of steel; the threads shall be carefully cut and finished. One end of the screw shall screw into the ram, the other end shall be securely fastened to the bevel gear. These jacks shall be provided with a warning device or stop which will prevent the screw coming out of the nut or bushing when the limit of rise is reached.

Bevel geared journal jacks shall be plainly and permanently marked to indicate their maximum lifting capacity and the jacks shall be capable of retaining any weight up to their rated capacity at any height within the range.

Each jack shall be furnished with a suitable operating lever.

These jacks shall be similar to Figure 794 and shall conform to the requirements of the following table:

FIGURE 794.—
Jack, type B

Capacity	Weight (minimum)	Closed height (approximate)	Rise (approximate)
<i>Tons</i>	<i>Pounds</i>	<i>Inches</i>	<i>Inches</i>
15-----	25	9¾	4
25-----	50	11	5

3. Hydraulic jacks, type C.—These shall be of the independent pump type and shall be capable of being operated either vertically or horizontally.

The jack shall consist of a cylinder and ram connected to a pump by means of a flexible copper pipe.

The cylinder and ram shall be made from high-grade steel and free from welds or seams. They shall be accurately machined so as to insure a proper fit between the ram and the bore of the cylinder.

The cylinder shall have two handles suitable for carrying the jack from place to place, also a suitable connection for the copper pipe.

The pump shall be the single-plunger type and suitable for the rated capacity of the jack. It

shall be fitted with a suitable connection for the copper pipe. The reservoir shall be of ample capacity for the total displacement of the jack. The pump body shall be of bronze. The plunger shall be of tool steel properly hardened.

The connecting pipe shall be made of copper, annealed, and capable of withstanding a pressure of at least 10,000 pounds per square inch. It shall be approximately 8 feet in length and shall be furnished with suitable fittings for connecting it to the pump and the jack. All joints in the jack, pump, and copper pipe shall be designed to prevent leakage of liquid under maximum working pressure.

The jacks shall be provided with a warning device or stop which will prevent the ram coming out of the cylinder when the limit of rise is reached.

Hydraulic jacks shall be plainly and permanently marked to indicate their maximum lifting capacity, and the jacks shall be capable of retaining any weight up to their rated capacity at any height within the range. Each pump shall be furnished with a suitable operating lever.

These jacks shall be similar to Figure 795 and shall conform to the requirements of the following table:

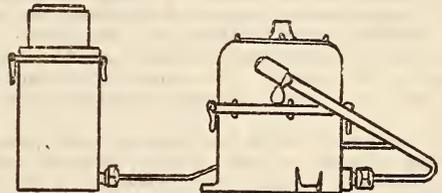

FIGURE 795.—Jack, type C

Capacity	Weight of jack (minimum)	Rise (approximate)	Closed height (maximum)
<i>Tons</i>	<i>Pounds</i>	<i>Inches</i>	<i>Inches</i>
60	200	8	16
100	340	12	21

4. Lever jacks, automatic, type D.—These shall be the single-acting automatic lever jacks which are operated on the downward stroke of the lever. They shall be essentially made up of the following: A base and frame, a rack bar, retaining and lifting pawls, trunnions, bearings, socket lever, and cap.

The base and frame shall be of one-piece construction and made of malleable iron or steel. The rack bar shall be solid and made of steel, properly hardened, and equipped with a claw or ground lift. The teeth shall be machine cut and smoothly finished.

The pawls shall be made of steel, properly heat treated, and so arranged in the jack mechanism that one or the other shall always be in mesh with the rack bar when the jack is under load.

The trunnions on which the pawls oscillate shall be made of steel and the bearings in which trunnions rotate shall be furnished with casehardened bushings.

The jacks shall be provided with a stop which will prevent the bar coming out of the frame when the limit of rise is reached.

These jacks shall be capable of retaining any weight up to their rated capacity at any height within the range.

Each jack shall be furnished with a suitable operating lever.

These jacks shall be similar to Figure 796 and shall conform to the requirements of the following table:

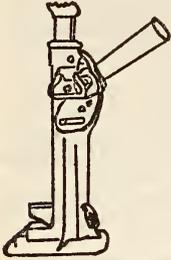

FIGURE 796.—
Jack, type D

Capacity	Weight (minimum)	Closed height (approximate)	Rise (approximate)
<i>Tons</i>	<i>Pounds</i>	<i>Inches</i>	<i>Inches</i>
10	70	21	10
15	110	28	17

5. *Planer or leveling jacks, type E.*—These shall be essentially the same as screw jacks, type F, with the following exceptions:

The barrel shall be made of iron or steel and properly threaded for the screw. It shall be provided with a large bearing surface at the base, the latter to be finished square to the axis of the screw.

The screw shall be made of steel and threaded to engage in the barrel. The screw, ball, and head shall be in one piece, all parts revolving with the screw.

The head may either be furnished with holes for inserting a lever to turn or may be made with a hexagonal head suitable for a wrench. A cap shall be fitted on the top of the ball and shall swivel on the ball.

These jacks shall be similar to Figure 797 and shall conform to the requirements of the following table:

FIGURE 797.—
Jack, type E

Closed height (approximate)	Rise (approximate)	Weight (approximate)
<i>Inches</i>	<i>Inches</i>	<i>Pounds</i>
3	1	1½
4	1½	3
5½	2¼	6
7½	4	12

6. *Screw jacks, type F.*—These shall be of the ordinary screw-jack type and shall consist essentially of a barrel, screw, head, and cap. The head shall be of the four or six way type.

The barrel shall be made of cast or malleable iron and threaded internally to engage the threads on the screw. It shall be the form known as a bell base or the equivalent, the barrel widening out to give a large bearing surface at the base. The bottom of the barrel shall be finished square to the axis of the screw. The barrel shall also be equipped with a suitable handle.

The screw shall be made in one piece, of a good grade of steel, and shall be externally threaded to engage the threads in the barrel. The upper end of the screw shall extend up through the barrel, and at the top a cap shall be fitted.

The head shall be fixed to the screw below the cap, and holes made for inserting a lever to turn the head and screw and lift the load. The cap shall be

made of steel and fastened to the screw so that there is no lateral motion. The cap, however, shall be free to rotate.

Each jack shall be furnished with a suitable operating lever.

These jacks shall be similar to Figure 798 and shall conform to the requirements of the following table:

FIGURE 798.—
Jack, type F

Capacity	Weight (minimum)	Closed height (approximate)	Safe rise of screw (approximate)	Diameter of screw (minimum)
<i>Tons</i>	<i>Pounds</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
5	9	9	4	1¼
8	16	10½	5	1½
12	25	14	8	1¾
15	35	16	9	2

7. *Motor-truck jacks, type G.*—These shall be similar to automatic lever jacks, type D, except that they may be either single or double acting and especially designed for motor trucks. Consideration will be given to bids offering motor-truck jacks differing from the automatic-lever type, provided that a full description of the jacks offered is furnished with bid.

These jacks shall be similar to Figure 799 and shall conform to the requirements of the following table:

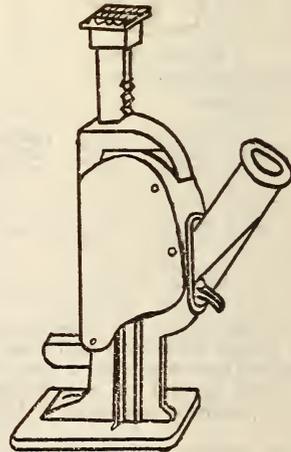

FIGURE 799.—Jack, type G

Capacity	Weight (minimum)	Closed height (maximum)	Rise (minimum)
<i>Tons</i>	<i>Pounds</i>	<i>Inches</i>	<i>Inches</i>
1	10	9¾	5
1	11	11¾	6
3	26	13½	6
5	32	13½	6

VI. METHOD OF INSPECTION AND TEST

1. Jacks, types E and F, will be carefully examined for defects in material and workmanship, and as to whether they comply with this specification.
 2. Jacks, types A, B, C, D, and G, will be required to raise loads equivalent to those specified in the following table:

Type	Kind of jack	Rated capacity of jack	Test load jacks shall lift		
			Head lift		Foot lift
			To 50 per cent of maximum rise	To maximum rise	To maximum rise
		Tons	Tons	Tons	Tons
A	Bevel-gear, screw	15	15	12	7.5
A	do	25	25	20	12.5
A	do	35	35	28	17.5
A	do	50	50	40	25
A	do	75	75	60	37.5
B	Bevel-gear, journal	15	18	15	
B	do	25	30	25	
C	Hydraulic	60	72	60	
C	do	100	120	100	
D	Lever, automatic	10		5	5
D	do	15		7.5	7.5
G	Motor-truck	3		3	1.5
G	do	5		5	2.5

3. In addition to the above, jacks, types A, D, F, and G shall withstand the compressive action of a load 20 per cent in excess of their rated capacity at 50 per cent of the maximum rise. They shall also sustain the compressive action of a load equal to their rated capacity at the maximum rise.

4. The jacks shall withstand all of the required tests without showing any signs of cracking, bending, or breaking, and shall also be free from mechanical defects at completion of tests.

616.92 MALLETS.

(No nationally recognized specifications available.)

616.93 TROWELS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR TROWELS, PLASTERING, CEMENT, BRICK, AND POINTING, GGG-T-671, MARCH 1, 1932

TROWELS

II. TYPES

Trowels shall be of the following types, as specified: A, plastering trowels; B, cement trowels; C, brick trowels; and D, pointing trowels.

III. MATERIAL AND WORKMANSHIP

1. Trowels shall be made of the best grade material, and of good workmanship and finish

throughout. They shall be free from all defects and blemishes affecting their appearance or that may affect their serviceability.

2. The blades of all trowels shall be made from high-grade tool steel, properly hardened and tempered.

IV. GENERAL REQUIREMENTS

1. Each trowel shall be furnished with a handle properly shaped, smoothly finished, and of well-seasoned sound wood, suitable for the purpose.

2. The blade of each trowel shall be clearly and distinctly marked in a permanent manner with the manufacturer's name or trade-mark.

3. A plus or minus tolerance of 10 per cent will be allowed in all dimensions specified herein as approximate.

V. DETAIL REQUIREMENTS

1. *Plastering trowels, type A.*—(a) The blade shall be smoothly and evenly ground on the face and edges. The face shall be rolled to the side edges for clearance in use under service conditions.

(b) The mounting shall be made from malleable iron or steel and shall be secured to the blade by at least five flathead steel rivets, the heads of which shall be ground flush with the surface of the blade. The mounting shall be so shaped as properly to reinforce the blade.

(c) The tang of the mounting shall pass through the handle, which shall be bored in a manner suitable to receive the tang. The handle shall be secured in position by a nut which may be tightened upon a threaded tang over a suitable washer, or by riveting the end of the tang over a suitable washer. The end of tang shall be smoothly finished by either method.

(d) Plastering trowels shall be similar to Figure 800 and shall conform to the requirements of the table following:

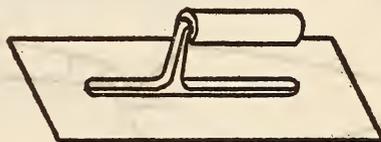

FIGURE 800.—Plastering trowels, type A

Dimensions of trowel, type A

Blade length plus or minus 0.125 (tolerance)	Blade width, plus or minus 0.125 (tolerance)	Blade thickness, plus or minus 0.003 (tolerance)	Handle length, approximate	Largest diameter of handle, approximate
Inches 11	Inches 4¾	Inch 0.032	Inches 4½	Inches 1½

2. *Cement trowels, type B.*—(a) These trowels shall conform in general to the type A plastering trowels described in Section V, 1, except that the face of the blade shall be straight, and the mounting be secured to the blade by at least three flathead rivets. Cement trowels shall be similar to Figure

801 and shall conform to the requirements of the table following:

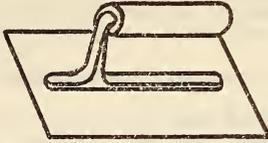

FIGURE 801.—Cement trowels, type B

Dimensions of trowel, type B

Blade length, plus or minus 0.125 (tolerance)	Blade width, plus or minus 0.125 (tolerance)	Blade thickness, plus or minus 0.003 (tolerance)	Handle length, approximate	Largest diameter of handle, approximate
Inches 5½	Inches 4	Inch 0.032	Inches 4	Inches 1½

3. *Brick trowels, type C.*—(a) The blade of these trowels shall be smoothly and evenly ground and shall taper uniformly in thickness from heel to point.

(b) The tang shall be an integral part of the blade and shall be properly shaped to hold the handle securely.

(c) The handle shall be driven onto the tang and the front end where the tang enters shall be fitted with a substantial steel ferrule not less than 1½ inches long.

(d) Brick trowels shall be similar to Figure 802 and shall conform to the requirements of the table following:

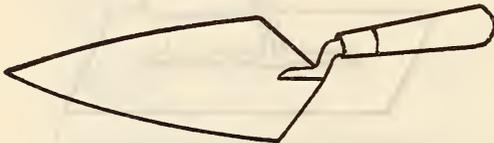

FIGURE 802.—Brick trowels, type C

Dimensions of trowel, type C

Blade length, point to point, plus or minus 0.125 (tolerance)	Blade width, at widest point, plus or minus 0.250 (tolerance)	Blade thickness, at heel, plus or minus 0.010 (tolerance)	Handle length, approximate	Largest diameter of handle, approximate
Inches 10½	Inches 5½	Inch 0.074	Inches 5½	Inches 1¼

4. *Pointing trowels, type D.*—These trowels shall conform in general to the type C brick trowels described in Section V, 3, except that the handle shall be furnished with a substantial metal ferrule

at least five-eighths inch long. Pointing trowels shall be similar to Figure 803 and shall conform to the requirements of the table following:

FIGURE 803.—Pointing trowels, type D

Dimensions of trowel, type D

Blade length, point to point, plus or minus 0.125 (tolerance)	Blade width, at widest point, plus or minus 0.250 (tolerance)	Blade thickness, at heel, plus or minus 0.010 (tolerance)	Handle length, approximate	Largest diameter of handle, approximate
Inches 6	Inches 2¾	Inch 0.067	Inches 4½	Inches 1

5. Trowels shall be packed in accordance with the manufacturer's trade practice, except that each package or box shall not contain more than six trowels, which shall be of one type and size.

VI. METHODS OF INSPECTION AND TESTS

1. All trowels shall be inspected to determine whether they are in compliance with the requirements of this specification.

2. *Sampling.*—For purposes of inspection at least three sample trowels of each type shall be taken at random from those under inspection and submitted to the inspection test prescribed herein.

3. *Inspection tests.*—In addition to a careful surface inspection for workmanship, finish, marking, compliance with dimensional requirements, etc., the samples shall be subjected to the following tests:

Types A and B Trowels

One of the edges in alignment with the handle of types A and B trowels shall be gripped in an ordinary bench vise, with the edge of the trowel parallel with and set five-sixteenths inch below the top surface of the vise jaws. The opposing edge of the trowel shall then be moved each side of the perpendicular a distance of not less than 2 inches.

Types C and D Trowels

The pointed end of types C and D trowels shall be gripped in an ordinary bench vise, with the trowel in a vertical position and the point 1½ inches below the top surface of the vise jaws. The heel end of the blade shall then be moved each side of the perpendicular a distance of not less than 3 inches. Type C trowels shall also be tested in cutting not less than three face bricks in half.

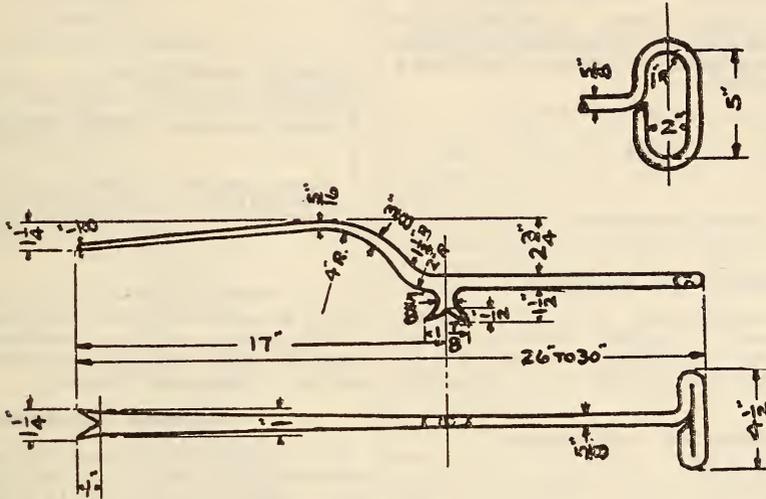

4. Trowels showing permanent set, breakage, or turning of the edges under the above tests shall be regarded as unsatisfactory and not in compliance with the requirements of this specification.

**616.99 HAND TOOLS NOT ELSEWHERE CLASSIFIED
AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION; STANDARD PACKING TOOLS FOR JOURNAL BOXES, 1928
PACKING TOOLS**

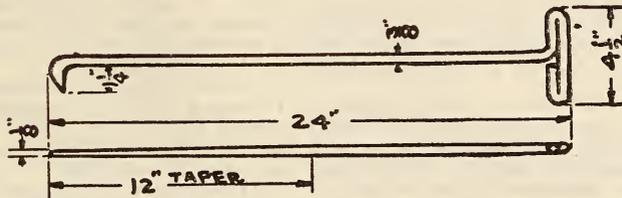

Two packing tools are required for packing journal boxes: (a) A packing iron, horn, or blade, and (b) a packing hook.

uniformity in subject matter being due to differing requirements, such as a commercial standard failing to meet a specific Government need, or a Government need being too special to find place as a commercial standard.)

(Contained in CS22-30 are rules, practices, finishes, types, and sizes which are recommended for standard use. The finishes are identical with those given in FF-H-101. (See below.) Items of build-

MATERIAL - SPRING STEEL

MATERIAL - SPRING STEEL

FIGURE 804

The design of the packing iron and packing hook shall be in accordance with drawing.

617. FURNITURE HARDWARE, BUILDERS' HARDWARE, AND PLUMBING

617.0 GENERAL ITEMS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE; BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

BUILDERS' HARDWARE (NONTEMPLATE)

(This publication is similar to Federal Specification FF-H-101, given below, the latter being, as far as practicable, based upon commercial standard requirements. In respect to corresponding type numbers the two publications are identical. Each publication, though, contains type numbers that are not found in the other, the departures from

ers' hardware (nontemplate) covered in detail in CS22-30 are as follows:)

- | | |
|------------------|------------------|
| Adjusters. | Holders. |
| Bars. | Hooks. |
| Bolts. | Keys. |
| Brackets. | Knobs. |
| Bumpers. | Latches. |
| Buttons. | Lifter, transom. |
| Catches. | Lifts. |
| Chains, transom. | Locks. |
| Cleats. | Pivots. |
| Closers, door. | Plates. |
| Escutcheons. | Pulleys. |
| Eyes. | Pulls. |
| Fasteners. | Rails. |
| Finishes. | Rests, shelf. |

| French windows. | Rollers, sash. |
| Handles. | Sheaves, sash. |
| Hangers. | Stops, door. |
| Hasps. | Turns, cupboard. |
| Hinges. | |

(In Federal specification FF-H-101, these items are listed under their respective commodity designations; that is, locks will be found under 617.21, latches under 617.22, bolts under 617.61, etc.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

BUILDERS' HARDWARE (NONTEMPLATE)

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications or parts thereof that are below indicated, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification	Former No.	Title	See
RR-C-271	348	Sash and transom chains....	603. 56, p. 212

B. TYPES, GRADES, AND CLASSES

B-1. These specifications cover such types, grades, and classes of builders' hardware as are enumerated under "Detail requirements" and do not include hardware for marine use or for hollow metal doors.

C. MATERIAL AND WORKMANSHIP

C-1. *Quality and fit.*—

C-1a. All hardware in each grade shall be free from all defects affecting the appearance and serviceability.

C-1b. All parts of hardware generally that are to be set flush when in place shall have accurately machined, true, parallel edges, except that edges of unfinished steel and iron and unpolished work need not be machine finished, but shall be smooth and reasonably true.

C-1c. Locks and knob latches, except types 4, 4A, 59, 80, and steel cabinet locks, shall have heavy and substantial working and moving parts, and springs of suitable nonferrous metal. Working and moving parts shall be accurately fitted to smooth close bearings and free from rattle.

C-2. *Finish.*—

C-2a. Exposed finished parts shall have such of the standard finishes enumerated under paragraph I-4a and I-4b as are specified.

C-2b. Bronze shall be polished with a bright finish, No. US9, when no other finish is specified.

C-2c. Plated work shall be heavily plated and buffed and of finish US9 for bronze and US14 for nickel when no other finishes are specified.

C-2d. When unfinished iron or steel is specified, galvanized, sherardized, japanned, coppered, or unfinished iron or steel may be furnished. Iron and steel shall be free from rust. Where wrought steel is specified, it is understood to include wrought iron.

C-3. *Nickel bronze.*—

C-3a. When nickel bronze (nickel silver or white metal) is specified or furnished, it shall be one of the following compositions according to whether cast nickel bronze or wrought nickel bronze is required. Nickel-bronze keys need not conform to either composition specified.

Cast nickel bronze:

Desired composition	Required minimum and maximum by weight
65 per cent copper.....	63 per cent minimum.
20 per cent nickel.....	19 per cent minimum.
4 per cent tin.....	6 per cent maximum.
5 per cent lead.....	10 per cent maximum.
6 per cent zinc.....	1 per cent manganese maximum.
	1 per cent iron and other impurities maximum.

Wrought nickel bronze:

Desired composition	Required minimum and maximum by weight
65 per cent copper.....	62 per cent minimum.
18 per cent nickel.....	17 per cent minimum.
17 per cent zinc.....	18 per cent maximum.
	0.5 per cent manganese maximum.

C-3b. Solid nickel-bronze trimmings and fittings will be acceptable in lieu of nickel-plated brass.

C-4. *Lacquer.*—All natural color or plated finish hardware unless otherwise specified shall have a coating of transparent lacquer.

D. GENERAL REQUIREMENTS

D-1. *Dimensions.*—Unless otherwise specified dimensions given herein are to be considered approximate. Sizes of locks refer to dimensions of case where not otherwise stated. Minimum dimensions covering cross section and throw of latch bolts and dead bolts are given to the nearest sixty-fourth of an inch. In general, locks and panic bolts of larger dimensions than those specified will be acceptable if suitable and of equal quality.

D-2. *Fastenings.*—

D-2a. Hardware hereinafter specified shall be furnished with all necessary screws, bolts, etc., for proper application, which shall be of suitable size and type, and shall harmonize with the hardware as to material and finish.

D-2b. Screw sizes where given are the minimum acceptable and shall be considered standard. Longer lengths or other special fastenings may sometimes be required.

D-3. *Lock fronts, strikes, and spindles.*—

D-3a. All locks shall have a flat front unless otherwise specified. When beveled fronts are specified, the bevel shall be one-eighth inch in 2 inches. When rabbeted fronts are specified the depth of rabbet shall be one-half inch.

D-3b. Armored fronts will be accepted in lieu of solid fronts on locks.

D-3c. All strikes shall be plain unless otherwise specified. Lips of strikes shall project not more than one-eighth inch beyond amount necessary to protect trim.

D-3d. Triplex spindles will be accepted in lieu of threaded spindles.

D-4. *Countersunk screw holes.*—The countersunk part of screw holes in butts must form a good seat for the screw heads, with no sharp edges at back.

D-5. *Japan coating.*—Japan coating, where specified, shall cling tenaciously to the work and be dry

and elastic. The surface shall be black and not subject to cracking, scratching, or flaking. The coating is considered to be dry when the pressure that can be exerted between the thumb and forefinger does not leave a mark which remains noticeable after the spot is lightly polished. The above test is to be made at room temperature (about 20° C.) (68° F.).

(For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

E. DETAIL REQUIREMENTS

(E-1. For detail requirements see individual items of builders' hardware. In this compilation these items have been placed under their proper commodity heading as follows.)

G. PACKAGING, PACKING, AND MARKING

G-2. *Packaging*.—Unless otherwise specified, commercial packages are acceptable under this specification.

G-3. *Packing*.—Unless otherwise specified, the subject commodity shall be delivered in substantial commercial containers, so constructed as to insure acceptance by common or other carriers, for safe transportation, at the lowest rate, to the point of delivery.

G-4. *Marking*.—Unless otherwise specified, shipping containers shall be marked with the name of the material, the size, type, and the quantity contained therein, as defined by the contract or order under which the shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

I-1. *Rules for hands of locks*.—

I-1a. The hand of a lock including locks for French doors is determined from the outside of the door to which it is applied. The outside of a cupboard, bookcase, or closet door is the room side. For other doors the outside is usually the "push" or jamb side.

I-1b. If, standing outside of a door, the butts are on the right, it takes a right-hand lock; if on the left, it takes a left-hand lock.

I-1c. If, standing outside, the door opens from you, it takes a lock with a regular-bevel latch bolt; if opening toward you, it takes a lock with a reverse-bevel latch bolt.

I-2. *Rules for hands of casement sash*.—

I-2a. The hand of casement sash is taken from the room side. If the butts are on the right, it is a right-hand sash; if on the left, it is a left-hand sash. It is necessary to state whether sash opens in or out.

I-3. *Dimensions*.—Where more than one dimension is given for items of builders' hardware, the vertical dimension is listed first.

I-4. *Finishes*.—

I-4a. Where practicable, finishes should be confined to bronze, solid or plated; nickel plated; galvanized; or japanned.

I-4b. Where finishes other than those given above are required, selection should be confined to the following standards adopted by the manufacturers as listed in Commercial Standard for Builders' Hardware (Nontemplate) CS22-30:

TABLE 1.—Standard hardware finishes

U. S. No.	General description	Metal applied to—	Samples selected as standard	Restrictions
USP	Primed for painting			
US1B	Bright japanned			
US1D	Dead black japanned			
US2C	Cadmium plated			
US2G	Electro galvanized			
US2H	Hot galvanized			
US2S	Sherardized			
US3	Bright brass	Iron, steel, wrought brass, cast brass.	Yale AZ10	
US4	Dull brass	do.	Corbin EA	
US5	Dull brass, oxidized and relieved.	do.	Russwin 9C	Limited to ornamental designs. Plain hardware to match to be finish US4.
US6	Sanded brass, oxidized and relieved.	do.	Sargent RD	
US7	Sanded brass, oxidized and relieved, raised ornamentation polished.	do.	Russwin 09B, edges not polished.	Limited to ornamental designs. Polishing confined to raised ornamentation, edges not polished.
US8	Antique copper	do.	Chantrell 24	Sample to show color only; mottling to be optional.
US9	Bright bronze	Iron, steel, wrought bronze, cast bronze.	Yale BZ10	Wrought designs limited to two-round corner and broad bevel.
US10	Dull bronze	do.	Corbin DB	
US11	Dull bronze, oxidized and relieved.	do.	Sargent 06P	Limited to ornamental designs. Plain hardware to match to be finish US10.
US12	Sanded bronze, oxidized and relieved.	do.	Penn SBZ	
US13	Sanded bronze, oxidized and relieved, raised ornamentation polished.	do.	Penn SBZ9	Limited to ornamental designs. Polishing confined to raised ornamentation, edges not polished.
US14	Nickel plated	Iron, steel, wrought brass, cast brass.	Russwin 4	
US15	Nickel plated, dull	do.	Lockwood 90	Also applicable to ornamental designs as Lockwood 91 or Sargent L5N.
US16	Nickel plated, sanded	Iron, steel, wrought brass, cast brass.	Yale NX10	
US17	Nickel plated, sanded, raised ornamentation polished.	do.	Penn SN9	Limited to ornamental designs. Polishing confined to raised ornamentation, edges not polished.
US18	"Rustproof" black	Wrought steel, cast iron	Yale FX80	Wrought designs limited to two-round corner and broad bevel.
US19	Sanded, dull black	Iron, steel, wrought brass, cast brass.	Yale BX80 (bronze), Yale FX90 (steel).	
US20	Statuary bronze	Wrought bronze, cast bronze.	Penn BBZ4	Wrought designs limited to two-round corner, and broad level. Limited on iron and steel to butts.
US20A	Statuary bronze, dark	do.	Sargent A3B	Do.
US21	Statuary bronze, sanded	do.	Penn SBZ4	Do.
US22	Verde antique	Cast bronze	Yale BX67	Limited on iron and steel to butts and on wrought bronze to kick plates, push plates, and butts.
US23	Silver plated, dull, oxidized and relieved.	Cast brass, cast bronze	Lockwood 72	Do.
US24	Gold plated, dull	do.	Corbin DG	
US25	White bronze	Cast nickel bronze, wrought nickel bronze in push plates, kick plates, and butts.	Sargent EM	
US26	Bright chromium plated			Polished surfaces.
US26D	Dull chromium plated			Do.

I-5. *Type numbers.*—Type numbers correspond, where the items are comparable, to those given in Commercial Standard CS22-30, Builders' Hardware (Nontemplate).

I-6. Purchasers should exercise all options offered herein and should specify type, size, finish, handing, and master-keying as required.

I-7. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids and the particular purpose to be served by

the bid samples should be definitely stated, the specification to apply in all other respects.

2	.187	.273	5	3, 4, 5, or 5 1/2	1 1/4	1	3	3	3

Screw holes shall be made to a minimum diameter of 0.438 inch and countersunk at 80° for No. 12 wood screws.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' TEMPLATE HARDWARE, COMMERCIAL STANDARD CS9-29, SEPTEMBER 13, 1929

(See also 617.21, p. 1020.)

BUILDERS' TEMPLATE HARDWARE

The following dimensions, clearances, tolerances, screw sizes, and varieties of template butt hinges are recommended as standard for application to hollow metal doors.

TEMPLATE BUTT HINGES

1. *Full mortise.*—All full mortise template butt hinges shall be of the exact size as shown (both leaves), with straight edges and square corners. The width of mortise butt hinges is purposely omitted from these standards, and shall be such as to suit the architectural details.

2. *Half surface, full surface, and half mortise.*—All half surface, full surface, and half mortise template butt hinges shall be of the exact size as shown with square corners and straight edges on the mortise leaf. The surface leaves shall have beveled edges.

3. *Tolerance on length.*—A tolerance of $\left\{ \begin{matrix} +0.000 \\ -0.015 \end{matrix} \right\}$ inch is allowed on the length of all butt hinges.

4. *Tolerance on hole spacing.*—A tolerance of ± 0.005 inch is allowed on dimensions for hole spacing.

5. *Tolerance on thickness.*—(a) Cast butt hinges shall be of uniform thickness without taper, and within $\left\{ \begin{matrix} +0.005 \\ -0.010 \end{matrix} \right\}$ inch of the specified thickness.

(b) A tolerance of ± 0.005 inch is permitted on thickness of wrought butt hinges.

6. *Paint clearance minimum.*—The clearance between the inner edges of the leaves and the barrel of the butt hinge shall be as follows:

(a) Butt hinges having gage of metal 0.090 or greater shall have a clearance of 0.090 plus or minus 0.008 inch.

(b) Butt hinges having gage of metal less than 0.090 shall be provided with a clearance of 0.050 plus or minus 0.008 inch.

(c) Cabinet butt hinges for painting shall be provided with a clearance of 0.40 plus or minus 0.005 inch between knuckles and edge of leaf.

7. *Template identification symbol.*—The first letter indicates thickness as A=regular thickness and B=extra heavy. The following numeral indicates template, as 1=regular template, and 2=narrow template. The next two digits indicate vertical height of butt hinge as 20=2-inch, 25=2 1/2-inch, 30=3-inch, 35=3 1/2-inch, etc. The last letter indicates type of butt hinge as M=full mortise, H=half surface, S=full surface, and HM=half mortise.

Thus A125M indicates a regular thickness, regular template, in 2cf inch size, full mortise butt hinge.

White metal, chromium-plated, colored, or rubber-covered hinges shall be considered as specials.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

(For types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests see 600.3, p. 70.)

BUILDERS, HARDWARE (NONTEMPLATE)

BLIND HARDWARE

Hinges for Blinds

Type 1801.—Wrought steel, end type, top and bottom patterns. Corrugated elbow. For frame construction. Hook mounted on hook plate drilled for wood screws. Hinge dimensions, 4 inches vertical by 5 inches horizontal. Width of hinge 1 inch, of hook plate 1½ inches. Offset 1 inch, throw 2 inches. Wood screws 1 inch by number 8, minimum of three in hook plate, four in hinge. Galvanized unless plain steel is specified.

Type 1801A.—Same as type 1801, except center pattern. Length 6 inches. Three screw holes.

Type 1802.—Same as type 1801, except for brick construction. Offset 2 inches, throw 4 inches.

Type 1802A.—Same as type 1801, except for brick construction. Center pattern. Offset 2 inches, throw 4 inches. Length 6 inches. Three screw holes.

Type 1803.—Cast iron or steel, galvanized, unless plain iron or steel is specified. Gravity type with

screws, right and left. Shall hold open and closed. Furnish with catch. Self-locking.

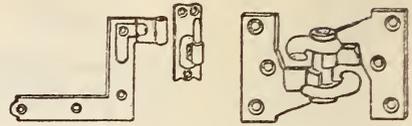

FIGURE 824.—*Hinges, for blinds, types 1801 and 1803*

2½	2¾ by 3½	1

BUTT HINGES

E-12. All butt hinges shall bear the trade-mark or name of the manufacturer.

E-13. Button tips shall be of the cylindrical type, having a square shoulder about one-eighth inch high and flush with the barrel of the butt hinge and having a flat or convex top. Where half surface, full surface, or other similar hinges (other than full mortise butt hinges) are necessary for the proper installation of metal or metal-covered doors in steel or metal frames, they shall be similar to and the equivalent of the types specified.

E-14. Clearance between the leaves of butt hinges when open with leaves parallel shall be one-sixteenth inch.

E-15. *Correct sizes of butt hinges for doors and transoms.*—

E-15a. The correct sizes of butt hinges for doors and transoms are as given in Table 3.

E-15b. Door sizes given are jamb opening dimensions.

E-15c. Butt-hinge sizes given refer to length of joint.

E-15d. Extra heavy butt hinges should be specified on doors where high-frequency service is expected. (See Table 4.) Extra heavy butt hinges are made in sizes 4 to 8 inches, inclusive. Whenever in Table 3, regular weight butt hinges are specified, but the door in question is of such a character as to come into the high-frequency classification, then extra heavy butt hinges of the same length and width should be substituted.

E-15e. *Underwriters requirements.*—Two butt hinges should be used for doors measuring 5 feet or less in height. Doors of a greater height shall require one butt hinge for each 2½ feet or fraction thereof in height.

TABLE 3.—Rules for sizes of nontemplate butt hinges

[Doors to and including 60 inches high take 2 butt hinges, over 60 to and including 90 inches high take 3 butt hinges, and over 90 to and including 120 inches high take 4 butt hinges. Transoms to and including 48 inches wide take 2 butt hinges, over 48 to and including 84 inches wide take 3 butt hinges.]

Bronze Butt Hinges

Type 2001.—Wrought bronze. Five knuckles. Ball bearings. Hardened steel ball races, hardened and polished steel balls. Ball bearings shall be attached to butts and shall be well packed with grease; retaining jackets when of visible type shall bear on one side only. Concealed ball bearings shall conform to tabulated requirements for size and number of balls. Inner edges of leaves shall be beveled. Nonrising, loose, steel pin with ball tips. Butt hinges for exterior doors opening out shall be so arranged that the pins can not be removed when the doors are closed.

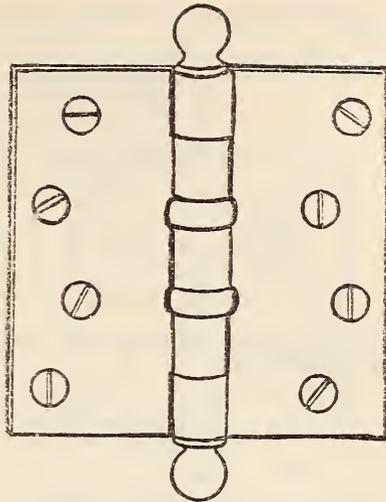

FIGURE 825.—Bronze butt hinge, 4 by 4 inch size, type 2001

	Pounds	Ounces
<i>Inches</i> 3½ by 3½	1	4
4 by 4	1	14
4½ by 4½	2	6

Cast-Iron Butt Hinges

Type 2008.—Cast iron, polished and plated. Five knuckles. Inner edges of leaves shall be beveled. Nonrising, loose, steel pin with ball tips. Butt hinges for exterior doors opening out shall be so arranged that the pins can not be removed when the doors are closed.

Size	Minimum weight per pair not including screws	
	Pounds	Ounces
<i>Inches</i> 3½ by 3½	1	2
4 by 4	1	10
4½ by 4½	2	2

Type 2008½.—Same as type 2008, except with button tips.

Type 2009.—Same as type 2008, except extra heavy.

Size	Minimum weight per pair not including screws	
	Pounds	Ounces
<i>Inches</i> 5 by 5	3	7
6 by 6	5	10

Type 2009½.—Same as type 2008, except extra heavy cast iron with button tips.

Size	Minimum weight per pair not including screws	
	Pounds	Ounces
<i>Inches</i> 5 by 5	3	7
6 by 6	5	10

Wrought Steel Butt Hinges

Type 2010.—Wrought steel, plated. Five knuckles. Ball bearings. Hardened steel ball races, hardened and polished steel balls. Ball bearings shall be attached to butt and shall be well packed with grease; retaining jackets when of visible type shall bear on one side only. Concealed ball bearings shall conform to tabulated requirements

for size and number of balls. Nonrising, loose, steel pin with ball tips. Butt hinges for exterior doors opening out shall be so arranged that the pins can not be removed when the doors are closed.

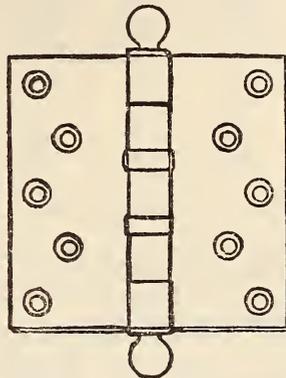

FIGURE 827.—Wrought steel butt hinge, 5 by 5 inch size, type 2010

Type 2015½.—Same as type 2015, except wrought steel, plated with button tips.

Type 2015B.—Same as type 2015, except wrought steel, polished and heavily plated. Inner edges of leaves shall be beveled.

Type 2015½B.—Same as type 2015, except wrought steel, polished and heavily plated. Inner edges of leaves shall be beveled. Button tips.

Light Loose Pin Butt Hinges for Cupboards

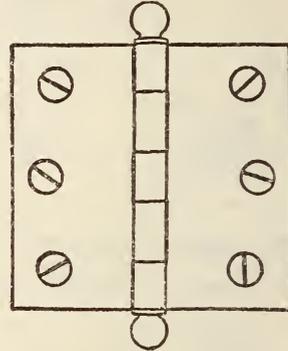

FIGURE 829.—Cast bronze light loose pin butt hinge for cupboards, 3 by 3 inch size, type 2017

Type 2017.—Cast bronze. Five knuckles, steel pin, ball tips. Sizes, 2½ by 2½ and 3 by 3 inches. Minimum weight per pair not including screws, 7 and 12 ounces, respectively.

Type 2017½.—Same as type 2017, except with button tips.

Type 2017A.—Wrought bronze. Five knuckles, steel pin, ball tips. Sizes, 2½ by 2½ and 3 by 3 inches. Minimum thickness of metal required 0.062 inch ± 0.005 inch and 0.071 inch ± 0.005 inch, respectively.

Type 2017½A.—Same as type 2017A, except with button tips.

Type 2018.—Wrought steel, plated. Five knuckles, steel pin, ball tips. Sizes, 2½ by 2, 2½ by 2½, and 3 by 3 inches. Minimum thickness of metal required 0.062 inch ± 0.005 inch, 0.062 inch ± 0.005 inch and 0.071 inch ± 0.005 inch, respectively.

Type 2018½.—Same as type 2018, except with button tips.

Type 2018½P.—Same as type 2018, except for painting. Furnish with priming coat. Button tips. Clearance for paint between barrel and inner edges of leaves 0.050 inch ± 0.010 inch for 2½-inch sizes and 0.090 inch ± 0.010 inch, for 3-inch size.

Light Narrow Butt Hinges

Type 2021.—Wrought brass, three knuckles on 1½ and 2 inch sizes, five knuckles on 2½ and 3 inch sizes. Loose steel pin with ball tips.

Size	Required thickness of metal ± 0.005 inch
<i>Inches</i>	<i>Inch</i>
1½ by 1½	0.047
2 by 1½	.062
2½ by 1½	.062
3 by 2	.071

Type 2022½P.—Same as type 2021, except wrought steel with priming coat for painting; clearance between barrel and inner edges of leaves, 0.050 inch \pm 0.010 inch. Button tips.

Transom Butt Hinges, Fast Pin

Type 2027.—Cast bronze. Five knuckles, steel pin, no tips. Inner edges of leaves shall be beveled.

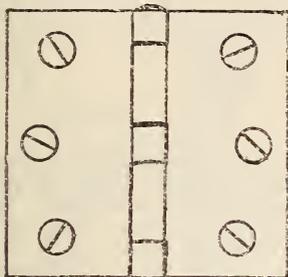

FIGURE 830.—Cast bronze transom butt hinge, fast pin, type 2027

Size	Minimum weight per pair not including screws	
	Pounds	Ounces
<i>Inches</i> 2½ by 2½	-----	7
3 by 3	-----	11
3½ by 3½	1	2
4 by 4	1	11

Type 2028.—Wrought bronze. Five knuckles, steel pin, no tips. Inner edges of leaves shall be beveled.

Scuttle Hinges

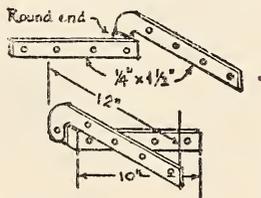

FIGURE 840.—Wrought iron scuttle hinge, type 2240

Type 2240.—Wrought iron, unfinished. Dimensions as shown. Right and left hand in pairs.

Type 2240A.—Same as type 2240, except wrought iron or wrought steel, japanned.

Type 2240B.—Same as type 2240, except galvanized.

Spring Hinges

Butt type

Type 2330.—Wrought bronze. Double acting. For hanging strip. Covered, adjustable tension, coil springs. Antifriction washers, or ball bearings. Ball tips.

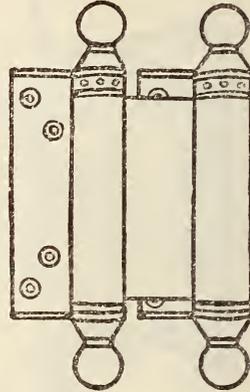

FIGURE 841.—Wrought bronze spring hinge, butt type, type 2330

Size length of flange	Minimum thickness of flange	Minimum diameter of barrel	Door, thickness	Door, maximum width	
				Feet	Inches
Inches 3 4 5 6 7 8 10 12	Inch 0.078 .081 .091 .102 .114 .128 .144 .162	Inches 0.875 .875 1.00 1.094 1.219 1.375 1.50 1.75	Inches 3/4-1 7/8-1 1/4 1 1/8-1 1/2 1 1/4-1 3/4 1 3/8-2 1 1/2-2 1/4 1 3/4-2 1/2 2 1/4-3	2 2 2 2 2 2 3 3	2 4 6 8 9 10 0 2

Type 2330A.—Same as type 2330, except wrought steel, plated.

Type 2331.—Same as type 2330, except single acting. Wrought bronze.

Type 2331A.—Same as type 2330, except single acting, wrought steel, plated.

Floor Surface Spring Hinges

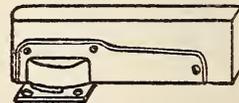

FIGURE 842.—Bronze mounted floor surface spring hinge, horizontal type, type 2334

Type 2334.—Double acting. Parts exposed to view, bronze. Hinge applied to bottom edge of door, with side plates to cover hinge mechanism. Socket and top pivot shall be provided. Weight of door carried on hardened steel balls and raceways.

Parts subjected to thrust of spring to be casehardened steel, or malleable iron. Adjustable door alignment. Adjustable or nonadjustable spring tension acceptable. Automatic hold back when door is opened at or past 90°.

Size I. For doors 1 1/8 inches to 1 1/4 inches thick.

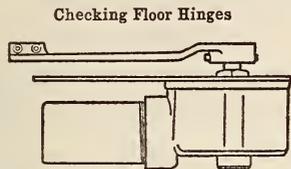

FIGURE 843.—Bronze mounted checking floor hinge, type 2350

Type 2350.—Liquid-controlled type, double acting, centrally pivoted under door. Mechanism set in floor. Exposed parts bronze. Where necessary, furnish separate outer case to be built into floor. Mechanism to operate in nonfreezing, lubricating, checking fluid. Closing speed controlled by accessible needle valve. Means for adjusting door alignment. Top pivot adjustable by screw. Automatic hold open unless nonhold open is specified:

Size I. For light, interior doors not over 2 feet 8 inches wide.

Size II. For medium weight interior doors not over 2 feet 10 inches wide.

Size III. For medium weight interior doors not over 3 feet 0 inches wide.

Type 2350A.—Liquid-controlled type, double acting, centrally pivoted under door. Mechanism set in floor. Where necessary, furnish separate outer case to be built into floor. Exposed parts bronze. Mechanism to operate in nonfreezing, lubricating, checking fluid. Ball-bearing pivot for carrying weight of door. Closing speed controlled by accessible needle valve. Top pivot adjustable by screw. Nonhold open type only.

Size I. For extra heavy or wide interior doors.

For ordinary entrance and vestibule doors not over 2 feet 10 inches wide.

Size II. For heavy entrance and vestibule doors over 2 feet 10 inches wide.

Type 2350B.—Same as type 2350A, but for single-acting doors. Nonhold open unless hold open is specified.

Size I. For light interior doors not over 3 feet 0 inches wide.

Size II. For medium and heavy interior doors not over 3 feet 6 inches wide.

For entrance and vestibule doors not over 2 feet 10 inches wide.

Size III. For heavy entrance and vestibule doors over 2 feet 10 inches wide.

Type 2352.—Liquid-controlled offset pivot type, single acting. Mechanism set in floor. Where necessary, furnish separate outer case to be built into floor. Exposed parts bronze. Mechanism to operate in nonfreezing, lubricating, checking fluid. Ball-bearing pivot for carrying weight of door. Closing speed controlled by accessible needle valve. Nonhold open unless hold open is specified.

Size I. For light interior doors not over 3 feet 0 inches wide.

Size II. For medium and heavy interior doors not over 3 feet 6 inches wide.

For entrance and vestibule doors not over 2 feet 10 inches wide.

Size III. For heavy entrance and vestibule doors over 2 feet 10 inches wide.

Lavatory Door Spring Hinges

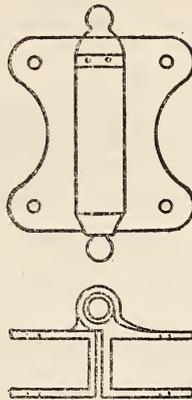

FIGURE 844.—Bronze lavatory door spring hinge, type 2360

Type 2360.—Bronze, nickel plated. Single acting; self-opening, unless self-closing is specified. Covered, adjustable tension, coiled springs. Box flanges for 1 1/4-inch stiles, adjustable for 1 1/8 to 1 3/8 inches. Size 4 inches (length of flange). Minimum thickness of metal at flanges, 0.090 inch. Fastenings, through bolts with rounded hexagonal heads and cap nuts.

Type 2360A.—Same as type 2360, except nickel bronze.

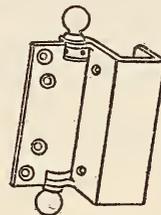

FIGURE 845.—Bronze single-action clamp flange spring hinge, type 2362

Type 2362.—Four-inch single-action clamp flange spring hinge for partitions without hanging stile and with doors opening in. To hold door open (reverse acting) unless otherwise specified. Bronze, nickel plated. One, nonadjustable clamp flange. One butt flange. Barrel seven-eighth inch minimum outside diameter. Minimum thickness of metal at flanges 0.090 inch. Fastenings for clamp flanges, sleeve bolts with flat-head screws. For partition thickness 1, 1 1/4, 1 1/2, and 1 3/4 inches.

Type 2362A.—Same as type 2362, except nickel bronze.

Type 2363.—Same as type 2362, except with two butt flanges for two doors opening in.

Type 2363A.—Same as type 2362, except of nickel bronze with two butt flanges for two doors opening in.

Type 2364.—Same as type 2362, except with one wall flange in place of clamp flange. Fastenings for wall flange, bolts or wood screws as required.

Type 2364A.—Same as type 2362, except of nickel bronze with one wall flange in place of clamp flange. Fastenings for wall flange, bolts for wood screws as required.

AMERICAN MARINE STANDARDS COMMITTEE, LOCKS AND ACCESSORIES FOR SHIP DOORS, H NO. 61-1930

SHIP-DOOR LOCKS

Section I. STANDARD TYPES AND VARIATIONS

Type A. Rim Lock, Regular Bevel, for Ordinary Wood Doors

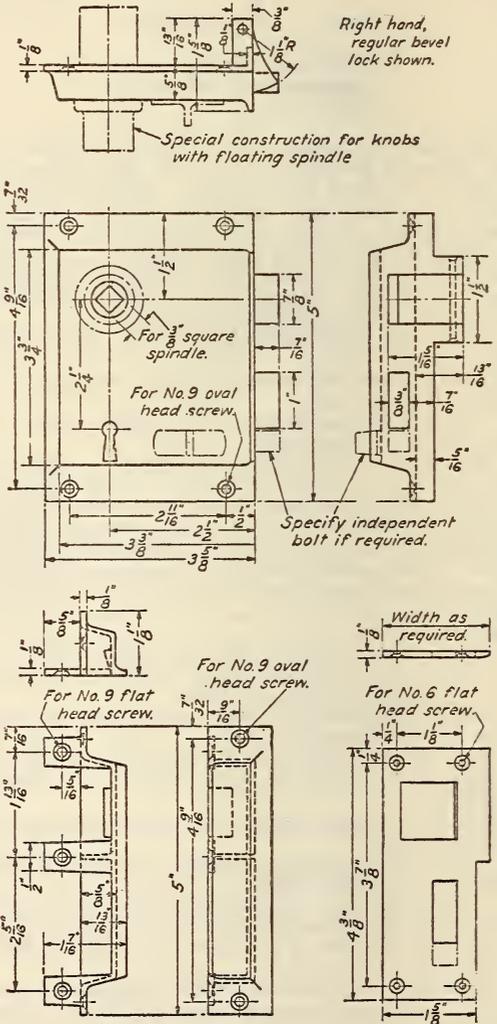

FIGURE 848.—Rim lock, type A, regular bevel

This lock has a nonreversible swinging latch and must be ordered for either right or left hand.

Application.—Interior doors which swing into the space that they close.

Tumblers and key changes.—Either one tumbler capable of at least 40 changes to be operated by one master key, or three tumblers capable of at least 240 changes to be operated by one master key, as ordered.

Keeper.—Box or plate type, as ordered.

Escutcheons.—One escutcheon plate, 2 by 6 inches, as per Diagrams 1 or 2, or one rosette and key escutcheon, Diagrams 3 and 4, Figure 862, as ordered.

Knobs.—One knob of each type, Diagrams 5 and 6, Figure 863.

Finish.—Lock and accessories shall be polished and lacquered on exposed surfaces.

Special features not included in standard lock set.—
(a) *Special bolt.*—This lock may be ordered with an independent bolt as indicated on Figure 848.

(b) *Optional type of accessories.*—Ring handles, or a combination of one ring handle and one knob of appropriate types to be identified by Diagrams 5 to 10 on Figure 863, may be ordered in lieu of the standard knob set. This type of lock may also be ordered with knobs attached direct to the lock with floating spindle as per typical Diagram 11 on Figure 864.

Type B. Rim Lock, Reverse Bevel, for Ordinary Wood Doors

This lock has a nonreversible swinging latch and must be ordered either right or left hand.

Special features not included in standard lock set.—
(a) *Special bolt.*—This lock may be ordered with an independent bolt as indicated on Figure 849.

(b) *Optional type accessories.*—Ring handles, or a combination of one ring handle and one knob of appropriate types to be identified by diagrams on Figure 863, may be ordered in lieu of the standard knob set. This type of lock may also be ordered with knobs attached direct to the lock with floating spindle as per typical diagram 11 on Figure 864.

Type C. Rim Lock, Reverse Bevel, for Heavy Wood Doors

This lock has a nonreversible swinging latch and must be ordered for either right or left hand.

Application.—Exterior doors which swing outward from the space that they close.

Tumblers and key changes.—One or more tumblers capable of at least 40 changes to be operated by one master key.

Keeper.—Angle type only.

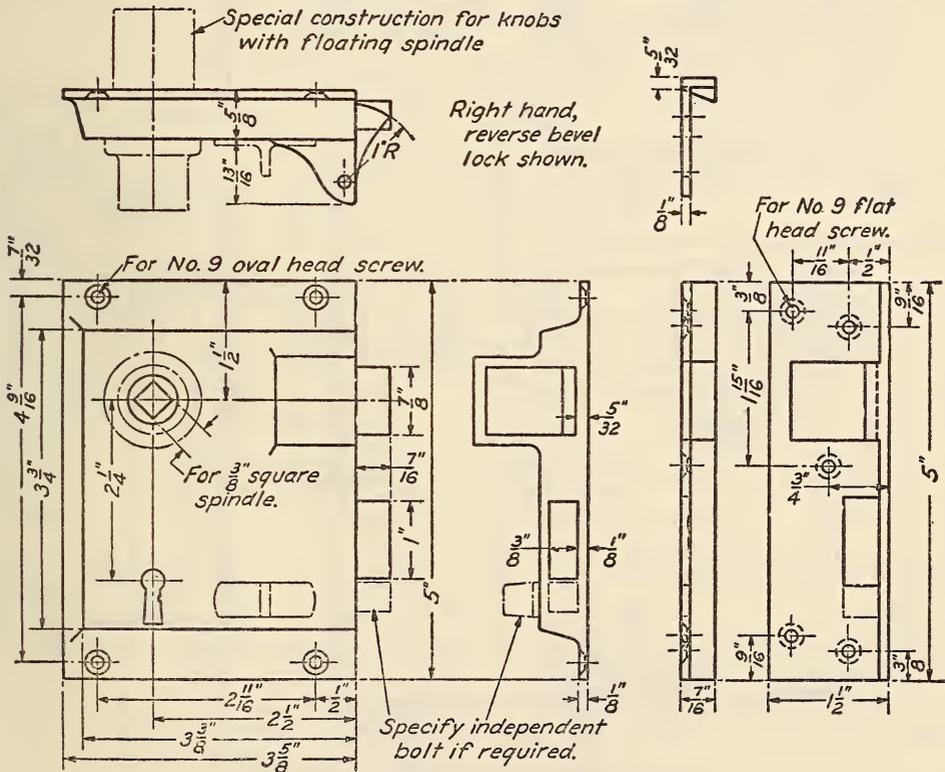

FIGURE 849.—Rim lock, Type B, reverse bevel

Application.—Interior doors which swing outward from the space that they close.

Tumblers and key changes.—Either one tumbler capable of at least 40 changes to be operated by one master key, or three tumblers capable of at least 240 changes to be operated by one master key, as ordered.

Keeper.—Angle type only.

Escutcheons.—One escutcheon plate, 2 by 6 inches, Diagrams 1 or 2, or one rosette and key escutcheon, Diagrams 3 and 4, Figure 862, as ordered.

Knobs.—One knob of each type, Diagrams 5 and 6, Figure 863.

Finish.—Lock and accessories shall be polished and lacquered on exposed surfaces.

Escutcheons.—One escutcheon plate, 2 by 6 inches, Diagrams 1 or 2, or one rosette and key escutcheon, Diagrams 3 and 4, Figure 862, as ordered.

Knobs.—One knob of each type, Diagrams 5 and 6, Figure 863.

Finish.—Lock and accessories shall be polished and lacquered on exposed surfaces.

Special features not included in standard lock set.—
(a) *Special bolt.*—This lock may be ordered with an independent bolt as indicated on Figure 850.

(b) *Optional type of accessories.*—Ring handles, or a combination of one ring handle and one knob of appropriate types to be identified by diagrams on Figure 863, may be ordered in lieu of the standard knob set. This type of lock may also be ordered with knobs attached direct to the lock with floating spindle as per typical Diagram 11 on Figure 864.

Type D. Rim Lock for Steel-Plate Doors, Unfinished

This lock has a reversible sliding spring latch only normally operated by knobs and locked by key.

Application.—Ordinary steel-plate doors where finished appearance is unimportant.

Tumblers and key changes.—One or more tumblers capable of at least 24 changes to be operated by one master key.

Keeper.—Box or plate type, as ordered.

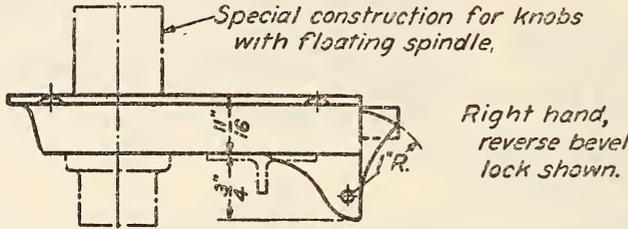

Escutcheon.—None to be furnished unless specifically ordered.

Knobs.—Two special T knobs shown on Figure 851.

Knobs.—For metal doors, two knobs, Diagram 5; for wood doors, one knob, Diagram 5 and one Diagram 6, Figure 863.

Finish.—Lock and accessories shall be polished and lacquered all over, except the bottom edge of the lock, which may be rough dipped only. Locks required for specific locations may be ordered with the side next to the door machined only for installation and unpolished.

Optional ring handles.—A pair of ring handles, or a combination of one ring handle and one knob of appropriate types to be identified by diagrams on Figure 863, may be ordered instead of the standard knob set.

For No. 9 flat head screw.

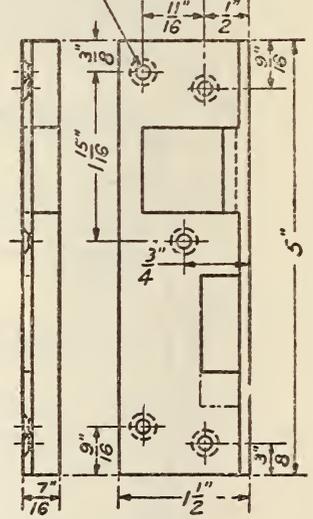

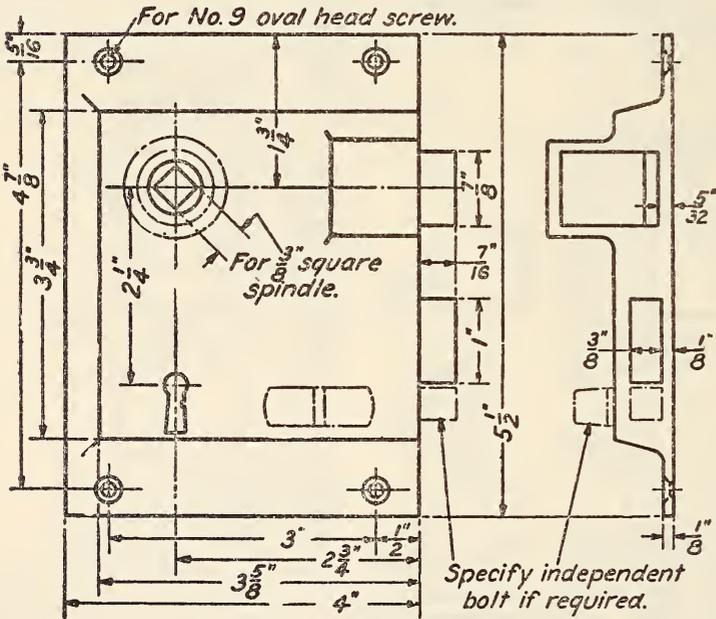

FIGURE 850.—Rim lock, type C, reverse bevel

Finish.—Lock and accessories shall be machined only where necessary for installation. Other surfaces shall be rough dipped.

Type E. Rim Lock, Reversible, for Ordinary Metal Doors

Application.—Comparatively light steel-plate doors where finished appearance is required. May be used also on wood doors where finished appearance is unessential.

Tumblers and key changes.—One or more tumblers capable of at least 60 changes to be operated by one master key.

Keeper.—Box, angle, or plate type, as ordered.

Escutcheons.—None required for metal doors unless specifically ordered. Locks for wood doors require one escutcheon plate, 2 by 6 inches, Diagrams 1 or 2, or one rosette and key escutcheon, Diagrams 3 and 4, Figure 862, as ordered.

Type F. Rim Lock, Reversible, for Heavy Metal Doors

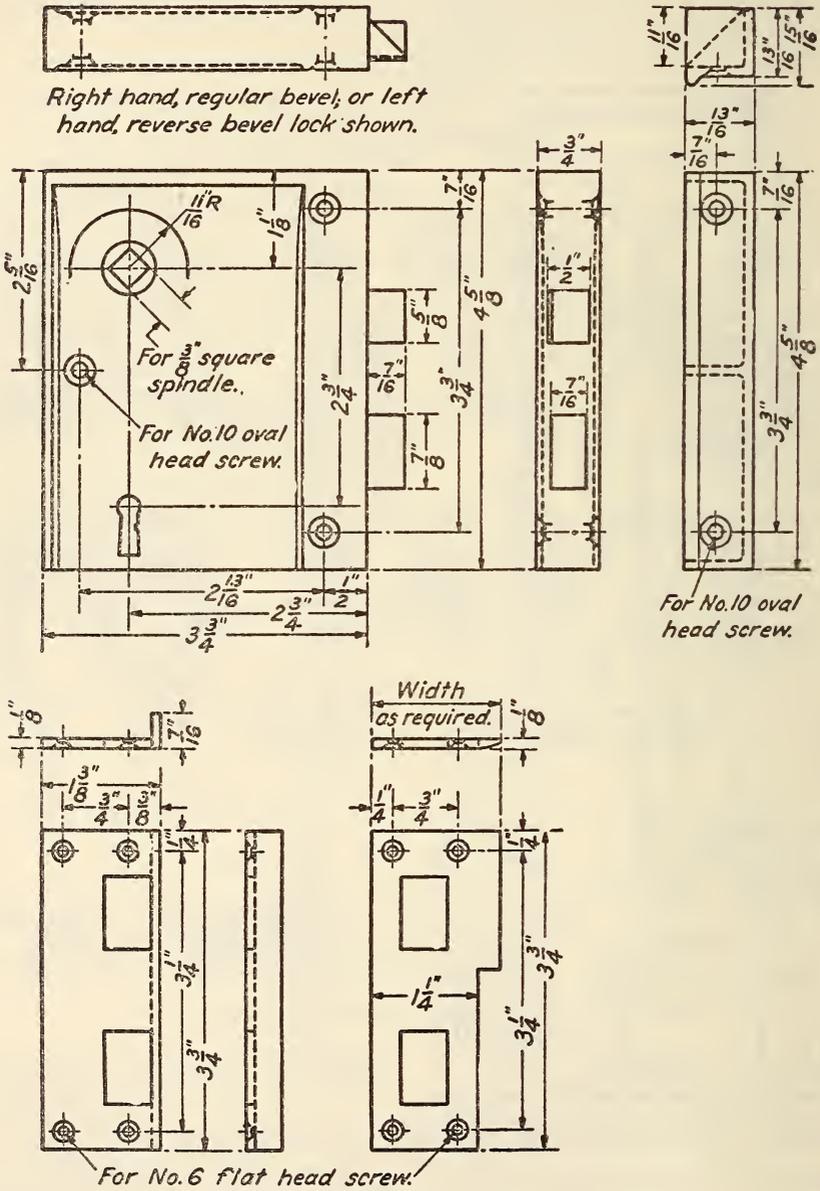

Application.—Heavy steel-plate doors where finished appearance is required. May be used also on wood doors where finished appearance is unessential.

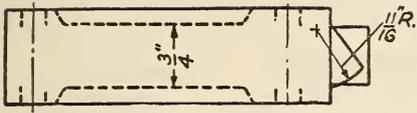

Tumblers and key changes.—One or more tumblers capable of at least 60 changes to be operated by one master key.

Keeper.—Box, angle, or plate type, as ordered.

Escutcheons.—None required for metal doors unless specifically ordered. Locks for wood doors require one escutcheon plate, 2 by 6 inches, Diagrams 1 or 2, or one rosette and key escutcheon, Diagrams 3 and 4, Figure 862, as ordered.

Knobs.—For metal doors, two knobs, Diagram 5; for wood doors, one knob, Diagram 5, and one, Diagram 6, Figure 863.

Right hand,
regular bevel;
or left hand,
reverse bevel
lock shown.

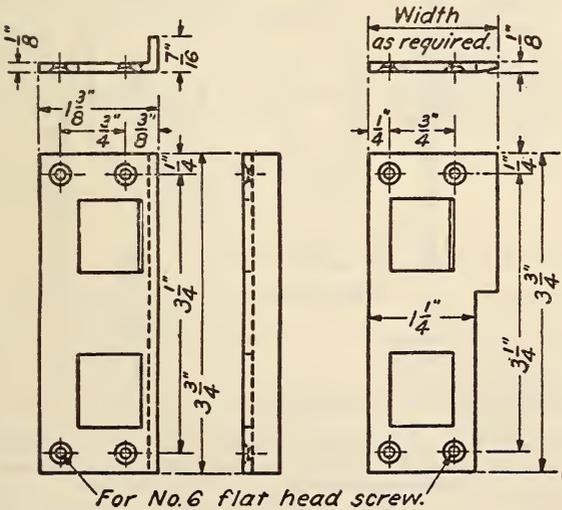

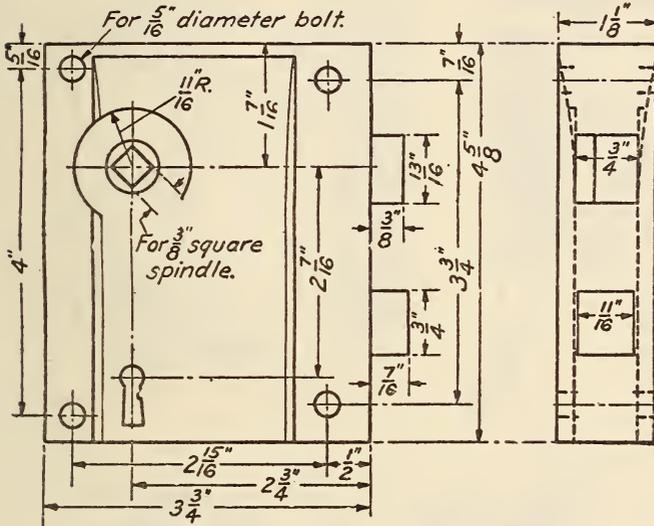

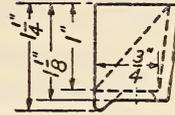

FIGURE 853.—Rim lock, type F

Finish.—Lock and accessories shall be polished and lacquered all over, except the bottom edge of the lock which may be rough dipped only. Locks required for specific locations may be ordered with the side next to the door machined only for installation and unpolished.

Optional ring handles.—A pair of ring handles, or a combination of one ring handle and one knob of appropriate types to be identified by diagrams on

Finish.—The lock shall be machine finished only where necessary for its proper installation. The exposed surfaces of escutcheon and knob shall be polished and lacquered.

Type H. Rim Lock, Reverse Bevel, for Small Locker and Cupboard Doors

This lock has a nonreversible sliding spring latch only, normally operated by knob and locked by key. It must be ordered for either right or left hand.

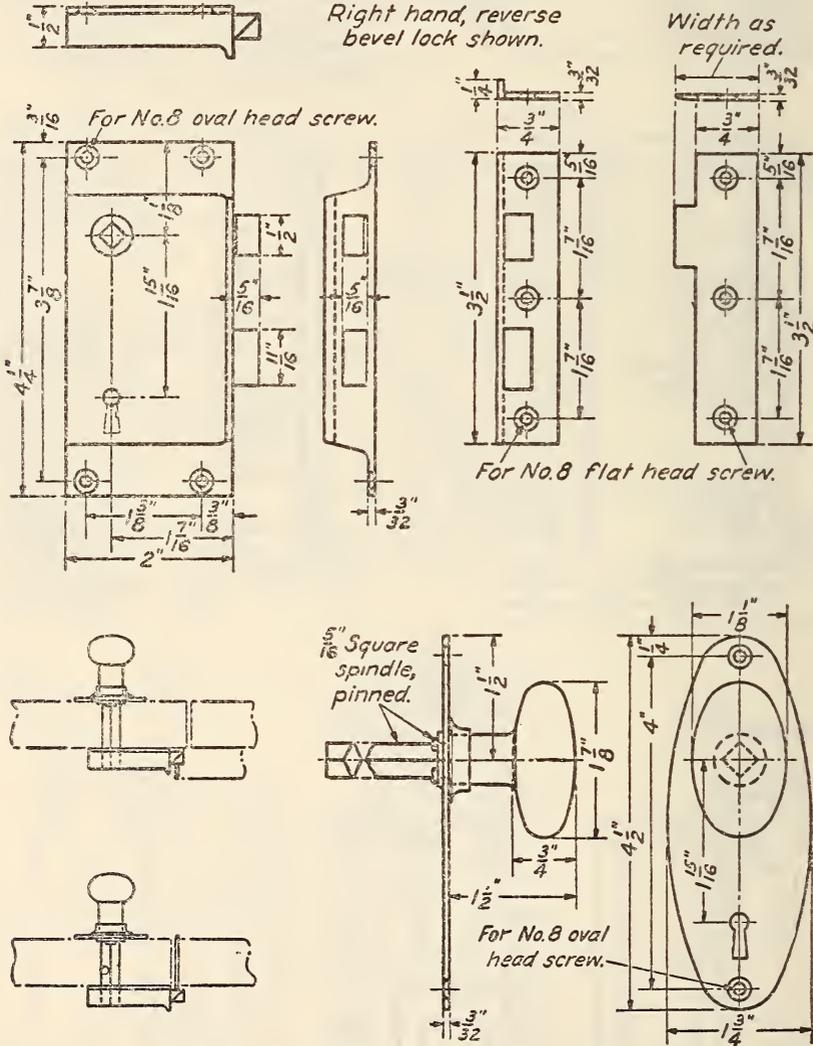

FIGURE 854.—Rim lock, type G, reverse bevel

Figure 863, may be ordered instead of the standard knob set.

Type G. Rim Lock, Reverse Bevel, for Wardrobe Doors

This lock has a nonreversible sliding latch and must be ordered for either right or left hand.

Application.—Wood doors to wardrobes, lockers, or similar spaces which swing outward.

Tumblers and key changes.—Tumblers capable of at least 240 changes to be operated by one master key.

Keeper.—Angle or plate type, as ordered.

Escutcheon and knob.—Special escutcheon plate with knob attached as shown on Figure 854.

Application.—Wood doors on wardrobes of the smaller size and locker and cupboard doors which swing outward.

Tumblers and key changes.—Tumblers capable of at least 240 changes to be operated by one master key.

Keeper.—Angle or plate type, as ordered.

Escutcheon and knob.—Special escutcheon plate with knob attached as shown on Figure 855.

Finish.—The lock shall be machine finished only where necessary for its proper installation. The exposed surfaces of escutcheon and knob shall be polished and lacquered.

Type I. Rim Latch, Reversible, for Light Wood Doors

Application.—Principally wood screen doors and lavatory-stall doors.

Keeper.—Box or plate type, as ordered. (Note alternative plate types.)

Rosette and knobs.—One rosette and two knobs of special type shown on Figure 856.

Finish.—All exposed surfaces of lock and accessories shall be polished and lacquered.

Optional ring handles.—A pair of ring handles, or a combination of one ring handle and one knob of appropriate types to be identified by diagrams on Figure 863, may be ordered instead of the standard knob set.

Type K. Mortise Lock, Reversible, for Heavy Wood Doors

Application.—Heavy interior wood doors of thicknesses over 1¼ inches.

Right hand, reverse bevel lock shown.

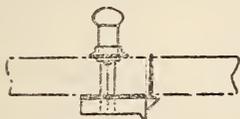

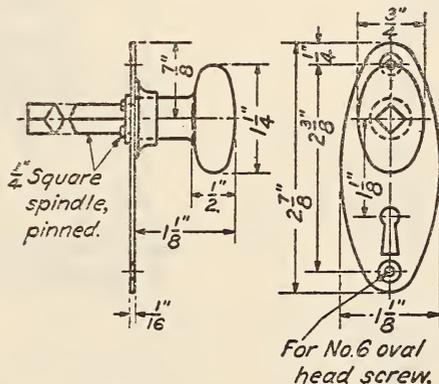

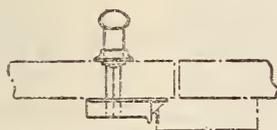

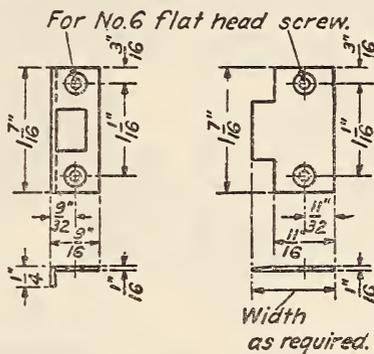

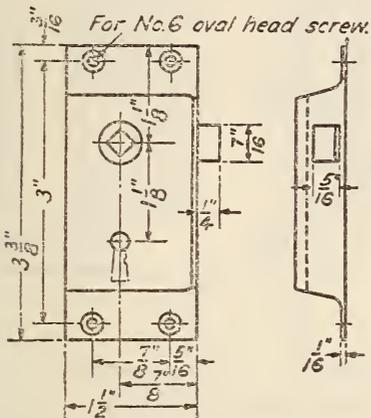

FIGURE 855.—Rim lock, type H, reverse bevel

Type J. Mortise Lock, Reversible, for Light Wood Doors

Application.—Interior wood doors of minimum thickness of 1½ inches.

Tumblers and key changes.—Either one tumbler capable of at least 24 changes to be operated by one master key, or three tumblers capable of 72 changes to be operated by one master key. (This type of lock can be made with tumblers capable of at least 200 changes for one master key in groups up to 72 locks.)

Keeper.—Reversible-plate type only.

Escutcheons.—Two escutcheon plates, 2 by 6 inches, both of which may be of type with low collar, Diagram 6, or one of each of types, Diagrams 5 and 6. Rosettes and key escutcheons may be ordered in lieu of escutcheon plates. All to be as shown on Figure 862.

Knobs.—Two knobs as per Diagram 6, Figure 863.

Finish.—The exposed surfaces of the lock and accessories shall be polished and lacquered.

Tumblers and key changes.—One or more tumblers capable of at least 40 changes to be operated by one master key.

Keeper.—Double-edged plate type only.

Escutcheons.—Two escutcheon plates, 2 by 6½ inches, both of which may be of type with low collar, Diagram 6, or one of each of types, Diagrams 5 and 6. Rosettes and key escutcheons may be ordered in lieu of escutcheon plates. All to be as shown on Figure 862.

Knobs.—Two knobs, Diagram 6, Figure 863.

Finish.—The exposed surfaces of the lock and accessories shall be polished and lacquered.

Special features not included in standard lock set.—Ring handles or a combination of one ring handle and one knob of appropriate types to be identified by diagrams on Figure 863, may be ordered in lieu of the standard knob set. This type of lock may also be ordered with knobs attached direct to the lock with floating spindle as shown by Diagram 12 on Figure 864.

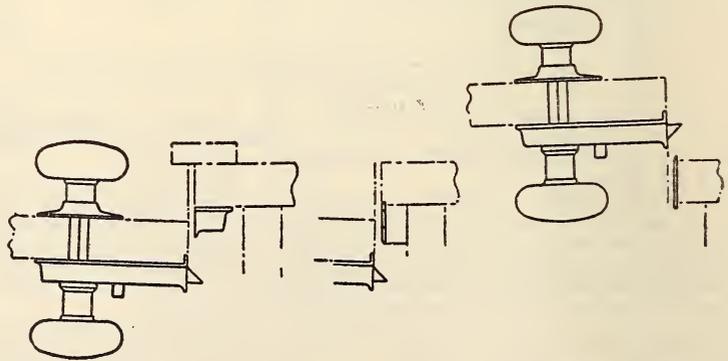

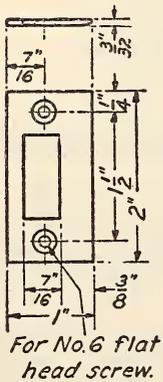

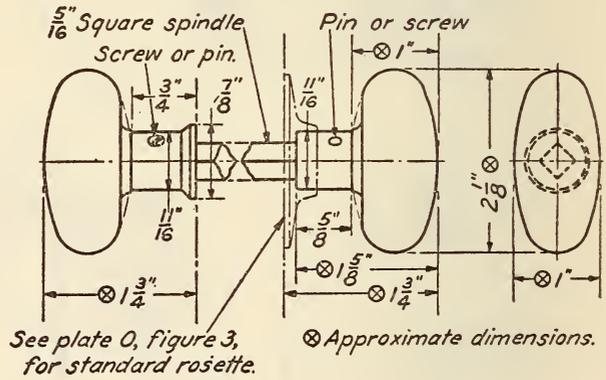

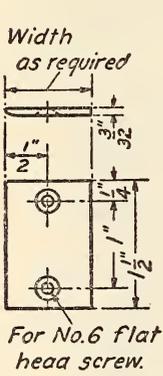

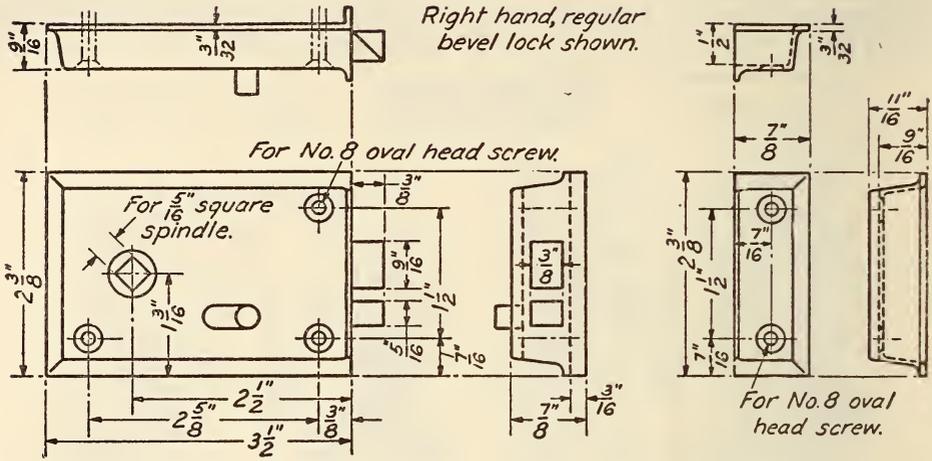

FIGURE 856.—Rim latch, type I

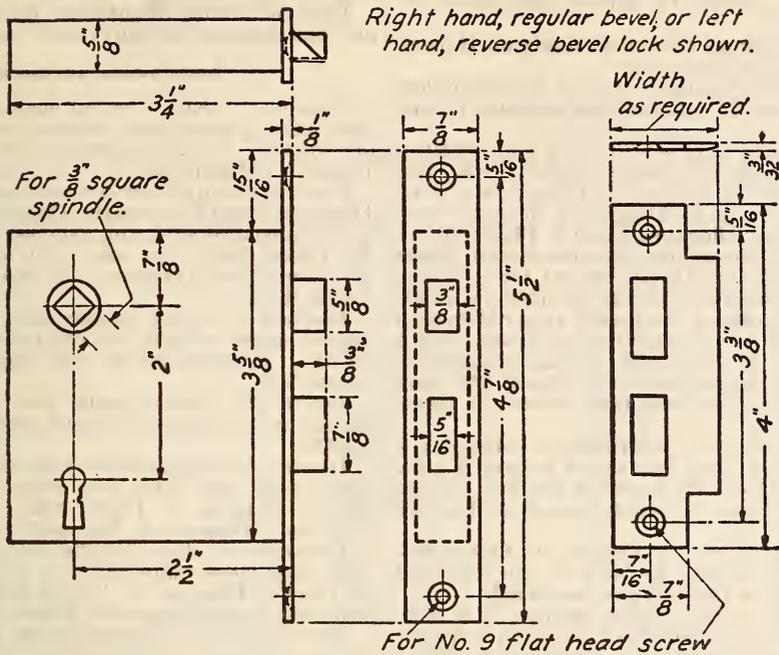

FIGURE 857.—Mortise lock, type J

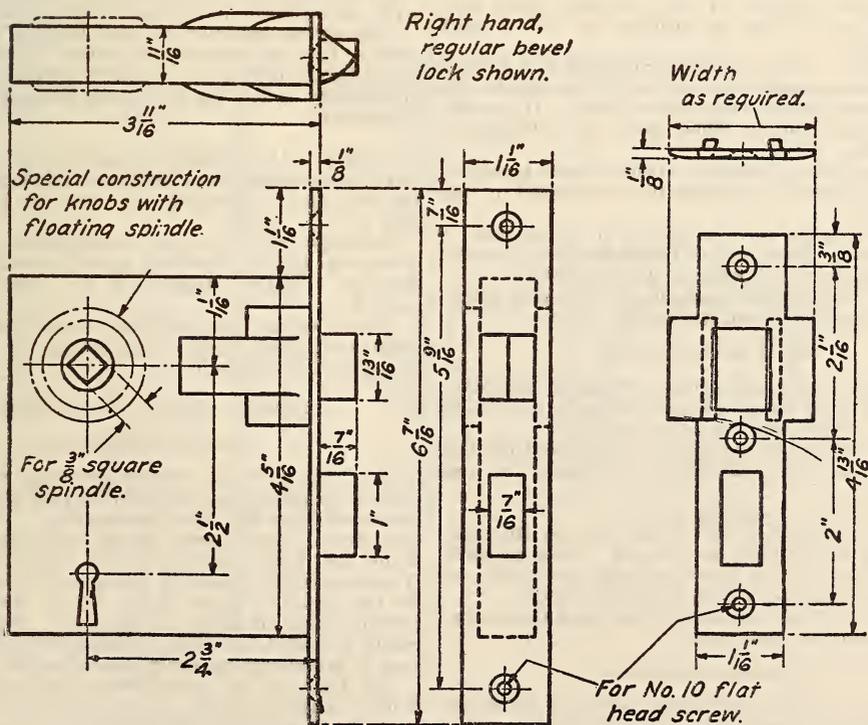

FIGURE 858.—Mortise lock, type K

Type L. Mortise Lock for Sliding Doors

Hook latch operated by spindle and locked by key.

Application.—Single or double sliding wood doors of thickness $1\frac{1}{2}$; inches or over.

Tumblers and key changes.—One or more tumblers capable of at least 24 changes to be operated by one master key.

Keeper.—Special form as shown on Figure 859.

Escutcheons.—(a) For single sliding doors, two standard escutcheon plates 2 by $6\frac{1}{2}$ inches of type with low collar shown by Diagram 2, or one of each of types shown by Diagrams 1 and 2, Figure 862.

(b) For double doors, identical escutcheon plates for use with knobs may be ordered for both the active and the inactive door as specified for single doors. In such case, a dead plate as per sketch on Figure 859 shall be furnished for the spindle on the inactive door. If preferred, special escutcheon plates with pull recess, shown on Figure 859, may be ordered for the inactive door instead of plates with knobs.

(c) Rosettes and key escutcheons, Diagrams 3 and 4, Figure 862, may be ordered instead of plate escutcheons for use with knobs or handles. These require a dead plate for knob spindle of inactive door.

Knobs.—Type shown by Diagram 6, Figure 863.

Finish.—The exposed surfaces of the lock and accessories shall be polished and lacquered.

Optional ring handles.—Ring handles, or a combination of one ring handle and one knob of appropriate types, to be identified by diagrams on Figure 863, may be ordered in lieu of the standard knob set.

Type M. Half-Mortise Lock, Nonreversible, for Sliding Doors

Hook latch operated by lever in hand recess and locked by key. Must be ordered for either right or left hand.

Application.—This lock has no knobs or handles; its latch is operated by levers set in recesses in the lock case and special escutcheon plate. It is suitable for single sliding wood doors of thickness 1 inch or over.

Tumblers and key changes.—One or more tumblers capable of at least 24 changes to be operated by one master key.

Keeper.—Special form as shown on Figure 860.

Escutcheon.—Plate with a recess for lever-handle-engaging latch as indicated on Figure 860.

Finish.—All exposed surfaces of lock and accessories to be polished and lacquered.

Type N. Mortise Dead Lock

Application.—Double-acting swinging or other wood doors with a minimum thickness of $1\frac{1}{2}$ inches on which a spring latch is not required.

Tumblers and key changes.—One or more tumblers capable of at least 12 changes operated by one master key.

Keeper.—Plate type only.

Escutcheons.—Either one or two key escutcheons, Diagram 4, Figure 862, as ordered. (One escutcheon for doors to lock from one side only; two escutcheons for doors locking from either side.)

Finish.—Exposed surfaces of lock and accessories to be polished and lacquered.

Escutcheons and Rosette

Diagram 1.—Plate escutcheon with low collar for use with knob, Diagram 6, or with ring handles, Diagrams 9 and 10, Figure 863.

Diagram 2.—Plate escutcheon with high collar for use with knob, Diagram 6, Figure 863, where screw or pin securing knob to spindle is not to be exposed.

Diagram 3.—Rosette for knob, Diagram 6, or ring handle, Diagrams 9 and 10, Figure 863.

Diagram 4.—Key escutcheon for use with rosette on wood doors, or without rosette on metal doors.

Knobs, Handles, and Spindles

Diagram 5.—Knob for use against metal surface (rim lock or metal door) without escutcheon plate or rosette. Interchangeable with ring handle, Diagram 7, Figure 863.

Diagram 6.—Knob for use with escutcheon plates, Diagrams 1 and 2, or rosette, Diagram 3, Figure 862. Interchangeable with ring handles, Diagrams 9 and 10, Figure 863, when used with escutcheon plate with low collar, Diagram 1, or rosette, Diagram 3, Figure 862.

Diagram 7.—Ring handle with socket for use against metal surface, without escutcheon plate or rosette. Interchangeable with knob, Diagram 5, Figure 863.

Diagram 8.—Ring handle with spindle for use against metal surface, without escutcheon plate or rosette.

Diagram 9.—Ring handle with socket for use with escutcheon plate with low collar, Diagram 1, or rosette, Diagram 3, Figure 862. Interchangeable with knob, Diagram 6, Figure 863.

Diagram 10.—Ring handle with spindle for use with escutcheon plate with low collar, Diagram 1, or rosette, Diagram 3, Figure 862. Interchangeable with knob, Diagram 6, Figure 863.

Spindles shall be of proper length to suit doors and types of locks. They shall, as far as practicable, be furnished securely attached to one knob or handle, with the other end drilled for pin or tapped for screw in several positions as necessary for adjustment. Bronze or brass washers of diameter matching the shank of the knob or handle shall be furnished with each spindle for intermediate adjustment.

Alternative construction with floating spindle (fig. 864).—This construction is extra to the standards hereinbefore defined and will be supplied only when specifically called for in asking for quotations and in ordering.

Diagram 11.—Typical construction of rim lock with knobs attaching directly to the lock and floating spindle. Applicable to locks of types A, B, and C.

Diagram 12.—Typical construction of mortise lock with knobs attaching directly to the lock and floating spindle. Applicable to mortise lock of type K.

Either of the constructions shown may be used with escutcheon plate and ferrule or with combined rose and ferrule.

Section II.—GENERAL REQUIREMENTS**1. Application of Drawings**

(a) The above-mentioned drawings and the following specifications collectively define the marine-standard locks and their accessories. The drawings give general dimensions deemed necessary to determine the types and to obtain interchangeability. The accessories shown on Figures 862 and 863 apply to rim locks of types A, B, C, E, and F, and to mortise locks of types, J, K, and L. Special accessories required for locks of types D, G, H, I, L, M, and N are shown on their respective figures.

(b) The use of escutcheon plates or rosettes, knobs or ring handles, is optional; the one wanted must be identified by the diagram number in asking for quotations and in ordering.

(c) The styles of accessories shown on Figures 862 and 863 shall be furnished unless otherwise specified in asking for quotations and in ordering. Different

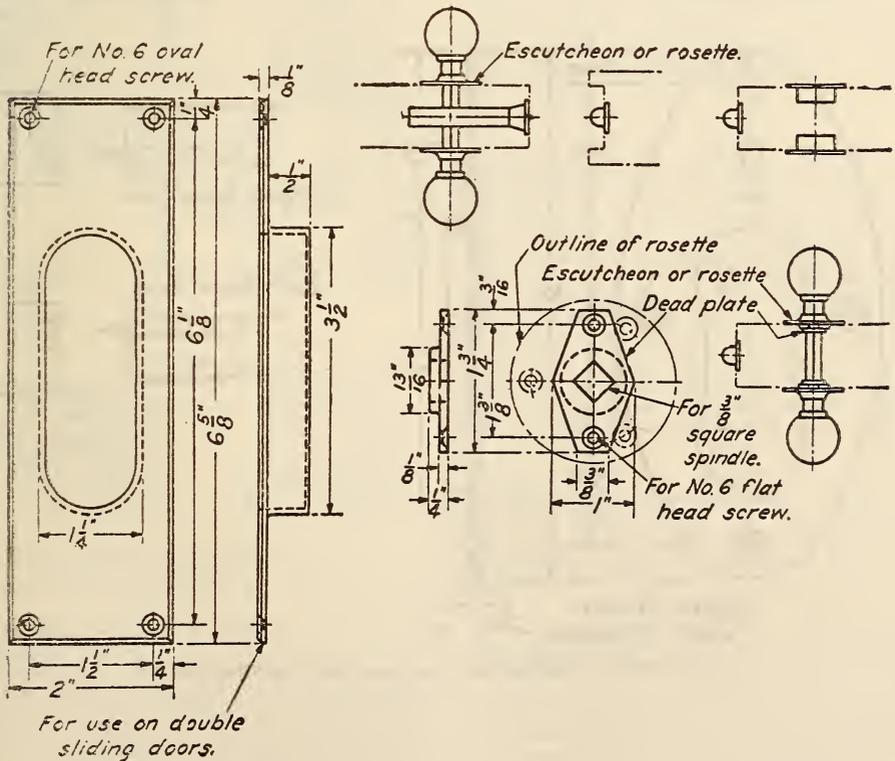

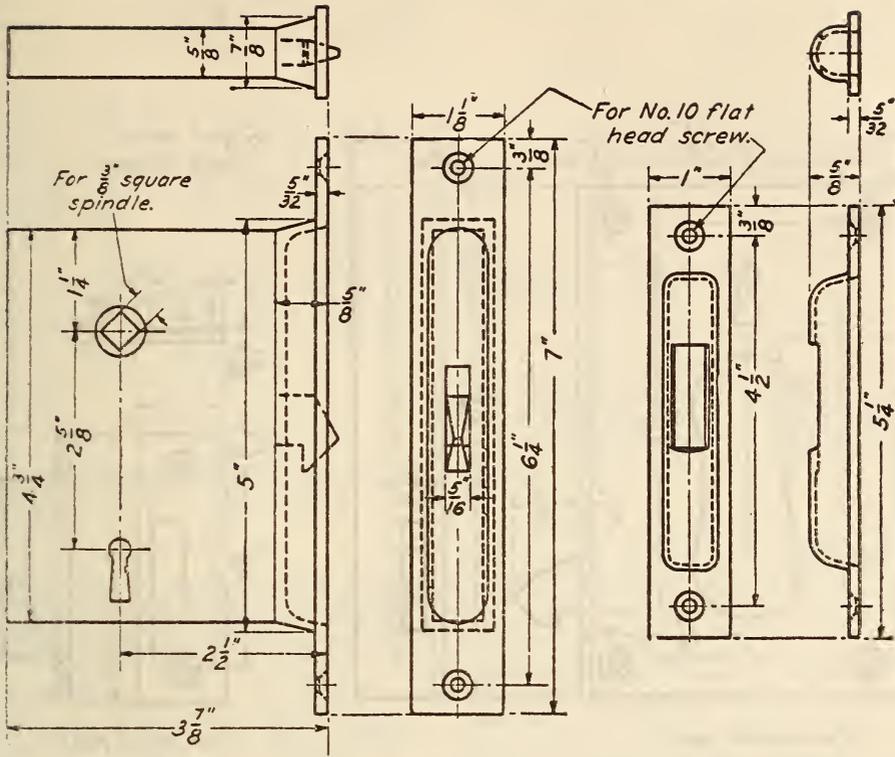

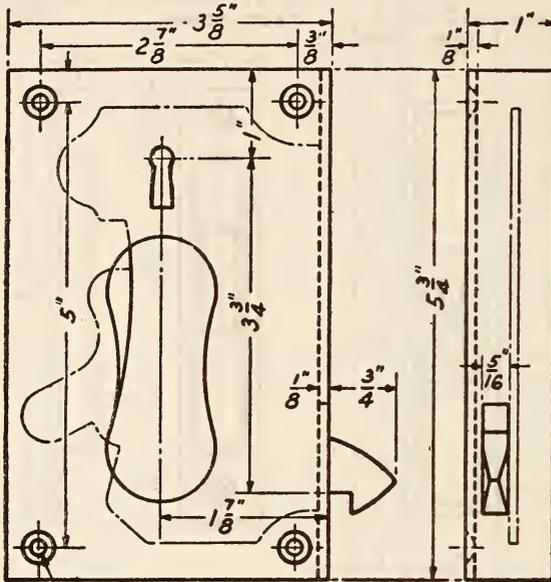

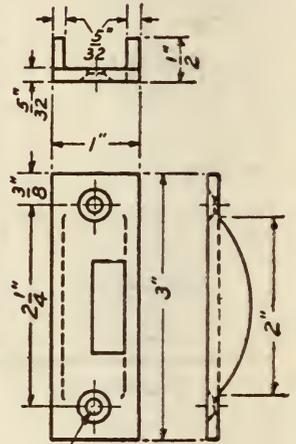

FIGURE 859.—Mortise lock, type L, for sliding doors

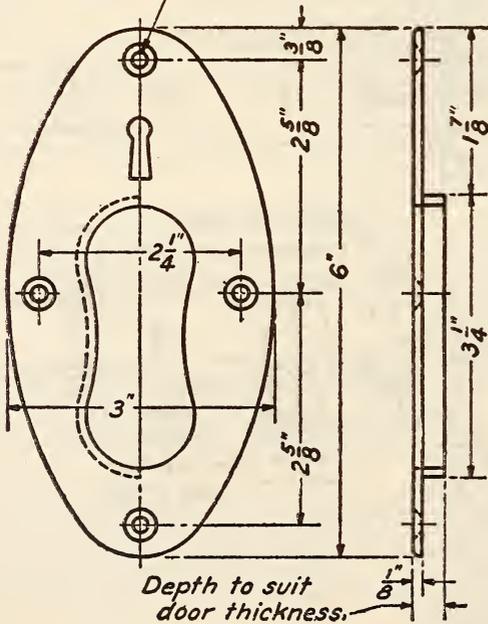

For No.10 oval head screw.

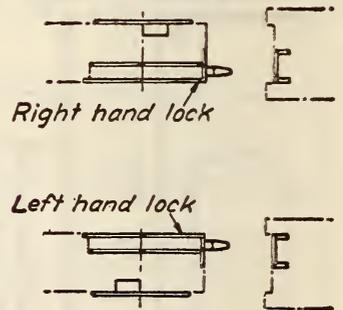

Right hand lock shown.

For No.10 flat head screw.

Depth to suit door thickness.

Right hand lock

Left hand lock

FIGURE 860.—Half-mortise lock, type M, for sliding doors

styles of knobs or handles, such as horizontal lever handles, etc., or of escutcheon plates or rosettes may be ordered, but in such cases the neck of the knob or handle, and the recess in the escutcheon

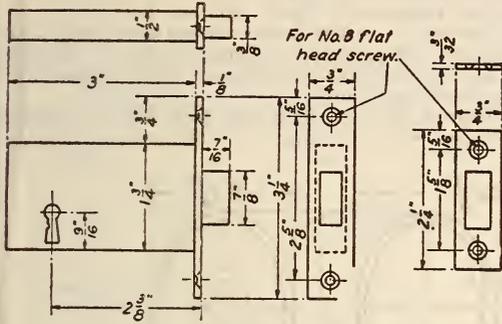

FIGURE 861.—Mortise dead lock, type N

plate or rosette, should be made of the standard form and dimensions shown by the drawings.

2. Materials

(a) Unless otherwise specified on the drawings or in purchasing, all parts of locks and accessories, except springs and spindles, shall be of high-grade cast bronze which shall comprise at least 80 per cent

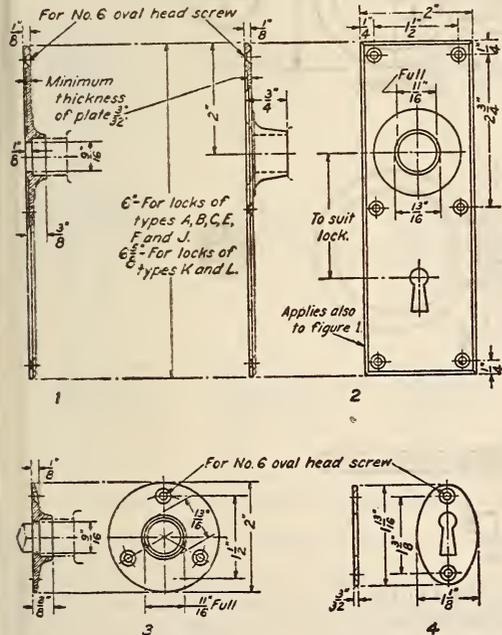

FIGURE 862.—Diagrams 1 to 4

See Figure 865 for typical applications.

of copper, not more than 5 per cent of lead, and no scrap metal.

(b) White bronze (nickel silver or white metal) may be ordered in lieu of the above. When ordered it is recommended that one of the following compositions be used, according to whether the white bronze is to be cast or wrought. White-bronze keys need not, however, conform to either of these compositions.

White bronze (percentages of components)

Components	Desired composition		Minimum and maximum by weight	
	Cast	Wrought	Cast	Wrought
Copper.....	65	65	Minimum 63	Minimum 62
Nickel.....	20	18	Optional. 19	17
Tin.....	4		Maximum 6	Maximum 18
Lead.....	5		10	18
Zinc.....	6	17	1	0.5
Manganese.....			1	
Iron and other impurities.....			1	

(See appended notes relative to white-bronze castings, p. 109.)

(c) All springs shall be of phosphor bronze.

(d) Spindles shall be of wrought bronze or brass, except where otherwise shown on drawings.

(e) All parts shall be free from defects or blemishes affecting their appearance, operation, or serviceability.

3. Construction

The outlines and dimensions of the locks, the positions and dimensions of holes for screws or bolts, spindles, keys, and other features which are to govern cutting of doors or adjacent framework to fit and attach the locks and their accessories shall be in such close accordance with the drawings that any lock or accessory may be quickly replaced by any other lock or accessory of the same standard type, without requiring additional cutting or fitting. Reasonable variations in other features will be allowed which do not prevent interchangeability or impair good appearance or serviceability of the lock and accessories. Particulars of interior mechanism of the locks are omitted from these standards in order to leave all manufacturers free to apply their skill and manufacturing practice. All parts of such mechanism, however, must be substantial and serviceable.

4. Screws

Screws shall be furnished with the locks and accessories for their proper attachment. They shall be of material and finish to match the piece that they are to secure. They shall be of appropriate type and length for the purpose intended. Screws required for softwood should be as long as consistent with their purpose. Unless lengths are specifically listed in purchasing, they shall be furnished in accordance with the manufacturer's practice. They shall, as far as applicable, be of the countersunk oval-head type. They shall conform to the standards approved by the National Screw Thread Commission. (Miscellaneous Publications, Bureau of Standards, No. 89.)

5. Keys

Unless otherwise ordered, each lock shall be furnished with two bronze keys. Each key shall be provided with a hole for key ring. Duplicate master keys shall, when ordered, be furnished with each group of locks susceptible of operation by one such key.

6. Workmanship and Finish

The workmanship on the locks and accessories shall be such as to produce good appearance and serviceability. It shall be so uniform in character as to insure interchangeability of all locks and accessories of like types. All parts shall conform to the standards herein defined to the satisfaction of the purchaser, and shall be guaranteed by the manufacturer or dealer for efficient operation and lasting service. The standard finish shall be as hereinbe-

fore specified for each type of lock, and will be furnished unless other finish is specifically called for in asking for quotations and in purchasing.

7. Marking and Packing

(a) Each lock shall be legibly impress stamped with the name or trade-mark of the manufacturer, the letters AMS, and with marks to identify individual and master keys. Each individual or master key shall be legibly stamped for identification with the particular lock or the group of locks it applies to.

Diagram 13.—Knobs, Diagram 5, Figure 863, applied to metal door and rim lock.

Diagram 14.—Rim lock on wood door, with knob, Diagram 5, Figure 863, on lock; and knob, Diagram 6, Figure 863, with plate escutcheon, Diagram 1, or rosette, Diagram 3, Figure 862, on door.

Diagram 15.—Rim lock on wood door, with knob, Diagram 5, Figure 863, on lock; and knob, Diagram 6, Figure 863, with escutcheon plate, Diagram 2, Figure 862, on door.

Diagram 16.—Mortise lock with knobs, Diagram 6, Figure 863, and both types of escutcheon plates,

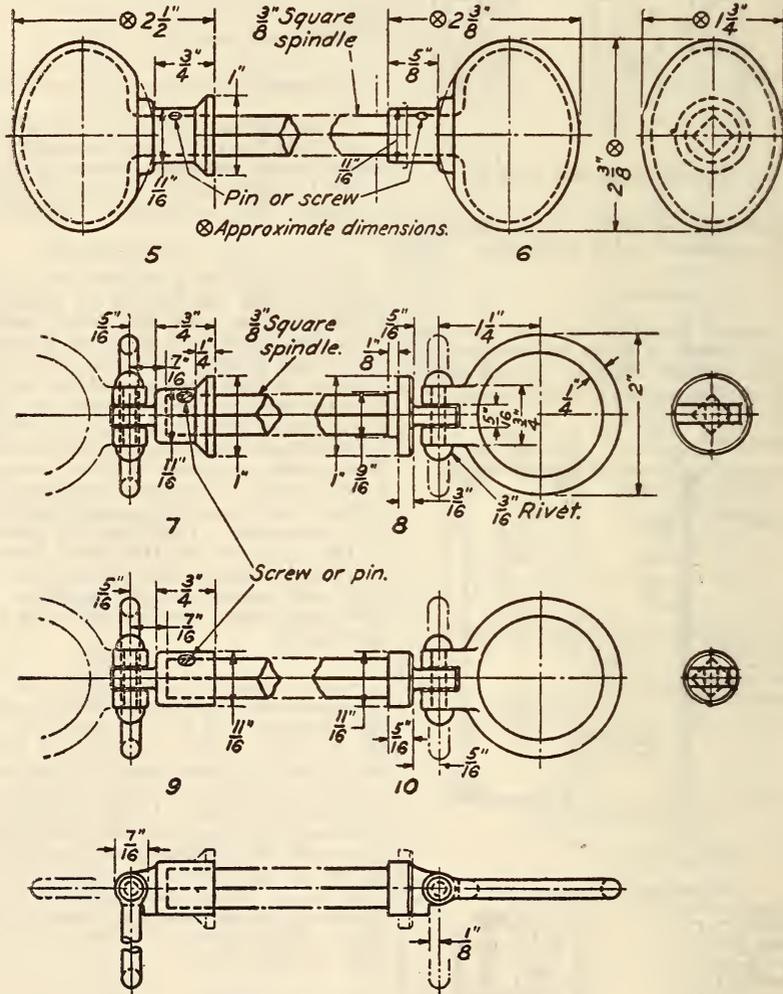

FIGURE 863.—Diagrams 5 to 10
See Figure 865 for typical applications.

(b) Locks, accessories, and screws shall, unless otherwise ordered, be packed one set in a carton, and the latter shall be properly labeled to show the type of the lock that it contains.

(c) Each container of a shipment shall be marked for identification of contents with the purchaser's order by number or date.

Section III.—GENERAL INFORMATION

1. Typical Applications of Standard Locks and Accessories

Figure 865 shows typical applications of the standard locks and accessories hereinbefore described as follows:

Diagrams 1 and 2, Figure 862. (Rosettes, Diagram 3, Figure 862, may be used instead of escutcheon plates.)

Diagram 17.—Ring handles, Diagrams 7 and 8, Figure 863, applied to metal door and rim lock.

Diagram 18.—Ring handles, Diagrams 7 and 10, Figure 863, applied to wood door and rim lock, using escutcheon plate, Diagram 1, or rosette, Diagram 3, Figure 862, on door.

Diagram 19.—Ring handle, Diagram 10, Figure 863, with escutcheon plate, Diagram 1, or rosette, Diagram 3, Figure 862, on door; and knob, Diagram 5, Figure 863, on rim lock. (Combination may be reversed by using knob, Diagram 6, with plate or

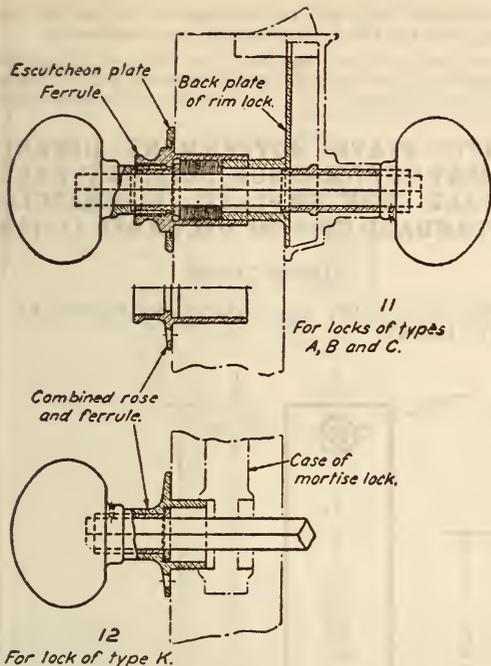

FIGURE 864.—Diagrams 11 and 12

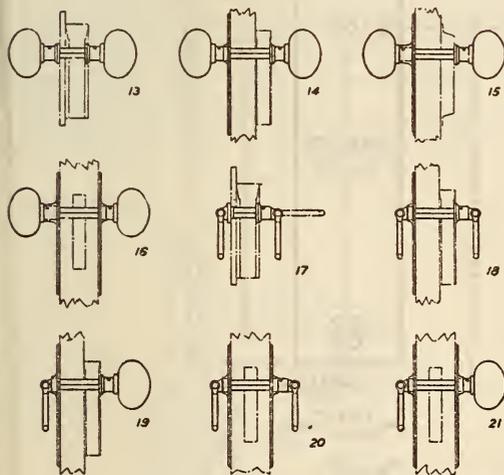

FIGURE 865.—Typical applications

rosette on door; and ring handle, Diagram 7, Figure 863, on rim lock.)

Diagram 20.—Ring handles, Diagrams 9 and 10, Figure 863, applied to wood door with mortise lock; with either escutcheon plates, Diagram 1, or rosette, Diagram 3, Figure 862.

Diagram 21.—Ring handle, Diagram 10, and knob, Diagram 6, Figure 863, applied to wood door with mortise lock, using escutcheon plates, Diagram 1, or rosettes, Diagram 3, Figure 862.

2. Hand and Bevel of Locks

Diagrams 22 to 27, inclusive, Figure 866, show typically the hand and bevel of locks as defined in

the hardware trade. These figures are included in these specifications for information and guidance in specifying correctly the hand and bevel in purchasing. Locks having a fixed bevel latch, being non-reversible, must be ordered specifically for either right or left hand. Those having reversible latches are adaptable to all conditions of door swing.

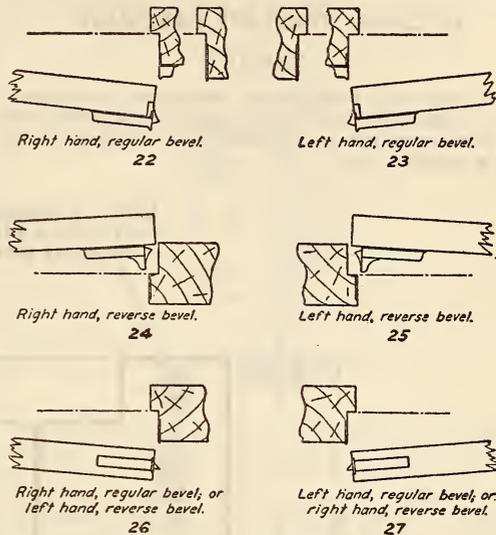

FIGURE 866.—Hand and bevel of locks, typical plan views

APPENDIX

Notes Relative to White-Bronze Castings

White-bronze fittings containing appreciably less than 20 per cent of nickel discolor and corrode badly even in locations on shore. Fittings of this class were recently observed on which it was practically impossible to remove surface corrosion which had accumulated in a few months. It was deemed expedient to remove these fixtures and to plate them with chromium to overcome the difficulty.

Experiments were made some years ago by the foundry section of the metallurgical division of the National Bureau of Standards to determine the causes of difficulties reported by manufacturers in producing sound castings of white bronze and in machining and polishing them.

The investigation was to determine the most suitable alloy from the standpoints of foundry practice, machining, polishing, and satisfactory color for hardware castings. Physical properties or ability of any of the compositions to withstand hydrostatic pressure were not determined. From the results and subsequent experience in manufacturing practice, the following conclusions have been reached:

1. Different compositions for cast and wrought white bronze are advisable.

2. Considering service requirements, the compositions specified under head of materials in the preceding specifications are the desirable alloys.

3. No difficulty should be experienced either in producing or machining castings of the composition specified, if proper methods are used and due care is exercised.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' TEMPLATE HARDWARE, COMMERCIAL STANDARD CS9-29, SEPTEMBER 18, 1929

(See also 617.12, p. 982.)

BUILDERS' TEMPLATE HARDWARE

GENERAL

The following dimensions, clearances, tolerances, screw sizes, and varieties of template cylinder locks are recommended as standard for application to hollow metal doors.

are required they will be furnished as a part of the door jamb by the hollow-metal manufacturers.

NOTE.—Details of lock, lock front, and strike given herein are arranged to suit mortise details given in Simplified Practice Recommendation R82-28, hollow metal single-acting swing doors, frames, and trim. (See 605.22, p. 280.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE; BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

DOOR LOCKS

(See 617.0, p. 977 also Federal specification FF-H-101 below).

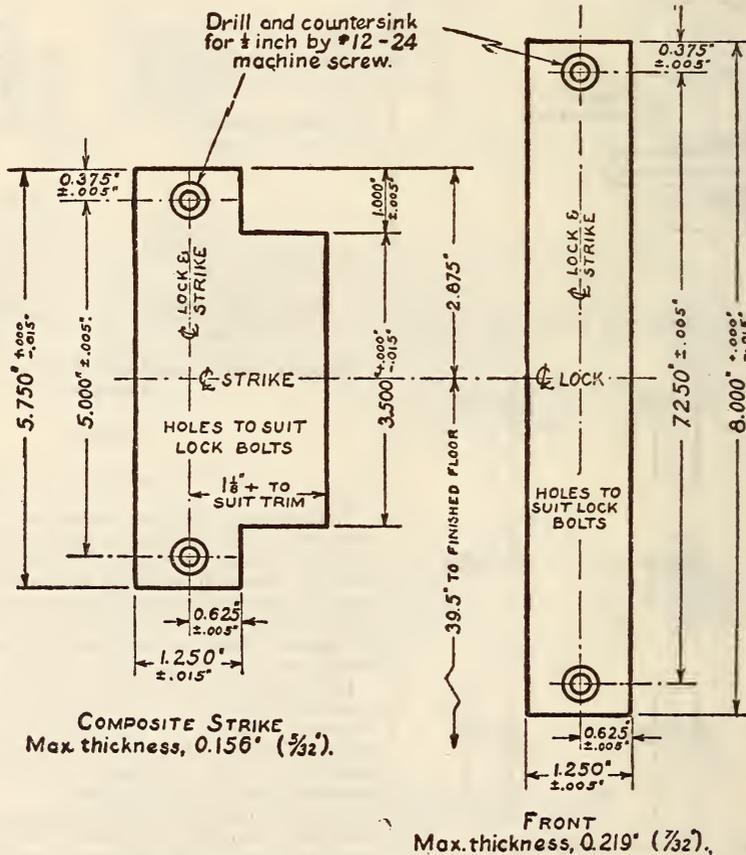

FIGURE 867.—Template front and flat strike for cylinder locks

TEMPLATE LOCKS

One and two bolt cylinder locks of following classification applicable to hollow metal doors shall be provided with standard fronts and strikes conforming to detail dimensions as shown below and in Figure 867. Such locks are as follows:

- Vertical dimension of case, 5 3/4 inches maximum; 5 inches minimum.
- Horizontal dimension of case, 4 1/4 inches maximum; 3 3/4 inches minimum.
- Thickness of case, 1/4 inch maximum; 1/8 inch minimum.
- Backset, 2 3/4 inches.
- Bevel of front, 1/8 inch in 2 inches.

Doors receiving such locks shall be reinforced to prevent more than one-eighth inch lateral movement of lock case at rear edge. When boxes for strikes

(For types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

DOOR LOCKS

E-2. All locks shall bear the trade-mark or name of the manufacturer.

Inside Door Locks

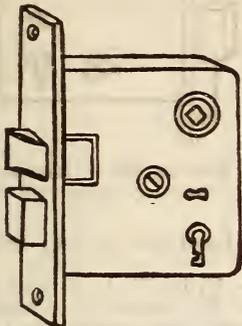

FIGURE 868.—*Inside door lock, inexpensive grade, type 4*

Inexpensive grade

Type 4.— $3\frac{1}{2}$ to $3\frac{3}{4}$ inches by $3\frac{1}{4}$ to $3\frac{1}{2}$ by $\frac{5}{8}$ inch japanned iron case. Backset $2\frac{1}{2}$ inches. Front $5\frac{1}{2}$ by 1 inch. Latch bolt, minimum $\frac{1}{16}$ by $\frac{1}{16}$ inch, minimum throw $\frac{3}{8}$ inch. Dead bolt, minimum $\frac{1}{16}$ by $\frac{3}{8}$ inch, minimum throw $\frac{1}{16}$ inch. Single extension easy spring; single compression spring, bar type; or double compression spring. Lock shall have one lever tumbler giving 24 changes. Cast bronze front and bolts. Bronze strike. One nickel-plated solid steel key.

Operation.—Latch bolt by knob from either side; dead bolt by key from either side. Reversible.

Medium grade

Type 4A.—Same as type 4, except three tumblers.

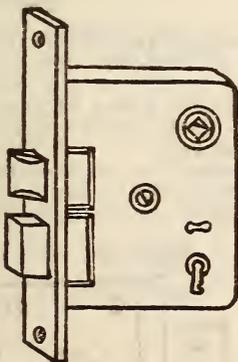

FIGURE 869.—*Inside door lock, best grade, type 7*

Best grade

Type 7.—4 to $4\frac{1}{4}$ inches by $3\frac{1}{2}$ by $\frac{5}{8}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Front $6\frac{1}{8}$ by $1\frac{1}{2}$

inch. Latch bolt, minimum $\frac{3}{8}$ by $\frac{1}{16}$ inch, minimum throw $\frac{3}{8}$ inch. Dead bolt, minimum $\frac{3}{8}$ by $\frac{3}{8}$ inch, minimum throw $\frac{1}{16}$ inch. Double compression easy spring. Lock shall have three-lever tumblers giving 54 changes. Cast bronze front and bolts. Brass hub. Bronze strike. One nickel-plated solid steel key.

Operation.—Latch bolt by knob from either side; dead bolt by key from either side. Reversible.

French Door Locks

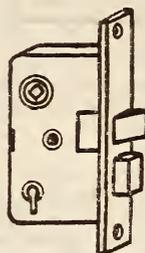

FIGURE 870.—*French door lock, type 12A*

Type 12A.— $3\frac{1}{2}$ by $3\frac{3}{4}$ by 2 by $\frac{5}{8}$ inch japanned iron case. Backset $1\frac{1}{2}$ inches. Front 5 by $\frac{7}{8}$ (minimum $\frac{3}{4}$) inch. Latch bolt, minimum $\frac{1}{2}$ by $\frac{3}{16}$ inch, minimum throw $\frac{3}{16}$ inch. Dead bolt, minimum $\frac{3}{8}$ by $\frac{1}{16}$ inch, minimum throw $\frac{5}{16}$ inch. Single extension or compression easy spring. Three-lever tumblers giving 18 changes. Bronze front and bolts. Bronze strike. One nickel-plated solid steel key.

Operation.—Latch bolt by knob from either side, dead bolt by key from either side. Reversible.

Type 12B.—Same as type 12A, except with rabbeted front.

Bathroom Door Locks

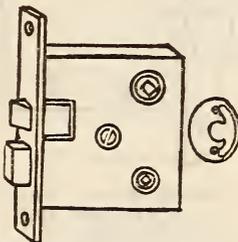

FIGURE 871.—*Bathroom door lock, type 17A*

Type 17A.— $3\frac{1}{2}$ to $3\frac{3}{4}$ inches by $3\frac{1}{2}$ by $\frac{5}{8}$ inch japanned iron case. Backset $2\frac{1}{2}$ inches. Front $5\frac{1}{2}$ by 1 inch. Latch bolt, minimum $\frac{3}{16}$ by $\frac{1}{16}$ inch, minimum throw $\frac{1}{16}$ inch. Dead bolt, minimum $\frac{3}{8}$ by $1\frac{1}{2}$ inch, minimum throw $\frac{1}{16}$ inch. Double-compression easy spring. One bronze turn knob. Bronze front, bolts, and strike. One emergency key.

Operation.—Latch bolt by knob from either side; dead bolt by turn knob from inside or emergency key from outside. Reversible.

Communicating Door Locks

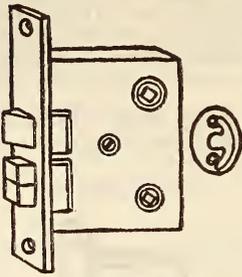

FIGURE 872.—Communicating door lock, type 20

Type 20.— $4\frac{1}{4}$ to $4\frac{1}{2}$ inches by $3\frac{1}{2}$ by $\frac{5}{8}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Front $6\frac{1}{8}$ by 1 inch. Latch bolt, minimum $\frac{1}{16}$ by $\frac{1}{16}$ inch, minimum throw $\frac{3}{8}$ inch. Dead bolt, minimum $\frac{1}{8}$ by $\frac{3}{8}$ inch, minimum throw $\frac{3}{8}$ inch. Double compression easy spring. Split dead bolt. Two bronze turn knobs. Cast bronze front and bolts. Bronze strike. Brass hub.

Operation.—Latch bolt by knob from either side; split dead bolt by turn knob from either side, each locking against the other. Reversible.

Front Door Locks

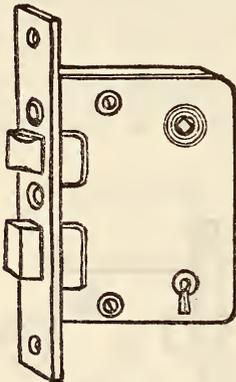

FIGURE 873.—Front door lock, type 22A

Type 22A.— $4\frac{3}{4}$ to 5 inches by $3\frac{5}{8}$ by $\frac{5}{8}$ inch japanned iron case. Backset $2\frac{1}{2}$ or $2\frac{3}{4}$ inches. Front 7 by 1 inch. Latch bolt, minimum $\frac{3}{8}$ by $\frac{1}{16}$ inch, minimum throw $\frac{3}{8}$ inch. Dead bolt, minimum $\frac{3}{8}$ by $\frac{1}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have three lever tumblers giving 24 changes. Bronze front, bolts, and strike. Two nickel-plated solid steel keys.

Operation.—Latch bolt by knob from either side; outer knob set by stop in face; dead bolt by key from either side; latch bolt by key from outside when outer knob is stopped. Latch and dead bolts shall be operated by the same key through same keyhole. Reversible.

Mortise Dead Locks

Type 38A.— $2\frac{1}{8}$ by $3\frac{1}{2}$ by $\frac{5}{8}$ inch japanned iron case. Backset $2\frac{1}{4}$ inches. Front 4 by 1 inch. Dead bolt, minimum $\frac{1}{8}$ by $\frac{1}{16}$ inch; minimum throw $\frac{1}{16}$ inch. Lock shall have three tumblers giving 54

changes. Cast bronze front and bolt. Bronze strike. One nickel-plated solid steel key.

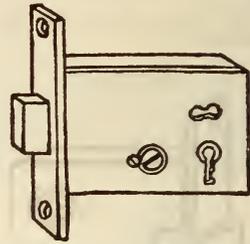

FIGURE 874.—Mortise dead lock, type 38A

Operation.—Dead bolt by key from either side. Reversible.

Type A40.— $4\frac{1}{2}$ by $3\frac{1}{2}$ by $\frac{5}{8}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Cast bronze front 7 by $1\frac{1}{8}$ inches. Dead bolt, minimum $1\frac{1}{16}$ by $\frac{1}{2}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have not less

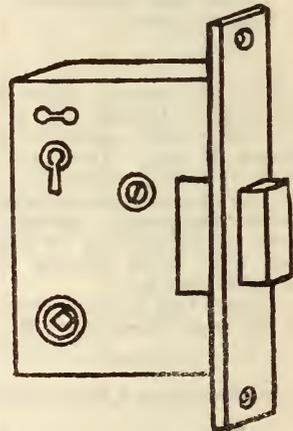

FIGURE 875.—Mortise dead lock, type A40

than three tumblers giving 54 changes. Keyhole above knob. Cast bronze bolt. One nickel-plated solid steel key.

Operation.—Dead bolt by knob from either side except when deadlocked by key from either side in locked or unlocked position. Reversible.

Elevator Door Lock

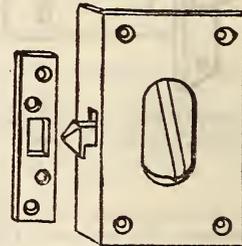

FIGURE 876.—Elevator door lock, type 47

Type 47.—5 by 2 inches cast bronze case. Backset $1\frac{1}{4}$ inches. Front $\frac{1}{8}$ inch wide. Latch bolt, minimum $\frac{1}{2}$ by $\frac{1}{16}$ inch, minimum lift of latch

$\frac{1}{2}$ inch. Escutcheon for key $1\frac{1}{4}$ by 1 inch. All cast bronze. One nickel-plated solid steel key.

Operation.—Latch bolt by finger pull from elevator side and by key only from outside. All locks in one project shall be operated by the same key unless otherwise specified. Reversible.

Upright Rim Knob Locks

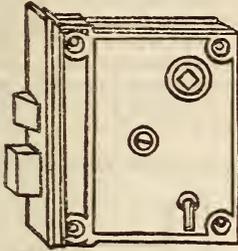

FIGURE 877.—Upright rim knob lock, type 59

Type 59.—4 by $3\frac{1}{4}$ by $\frac{3}{4}$ inch japanned iron case. Rim strike. Backset $2\frac{1}{2}$ inches. Lock shall have one tumbler. Two iron bolts with stop. Latch bolt, minimum $\frac{1}{2}$ by $\frac{7}{16}$ inch with $\frac{3}{8}$ inch throw. Dead bolt, minimum $2\frac{3}{32}$ by $\frac{3}{32}$ inch with $1\frac{1}{2}$ inch throw. One nickel-plated solid steel key. Screws for lock and keeper shall be not less than $1\frac{1}{4}$ inches long.

Operation.—Latch bolt by knob from either side; dead bolt by key from either side. Reversible.

Cylinder Locks

E-3. The key change number shall be stamped on shell or cam of all cylinder locks.

E-4. Except where otherwise specified bolts for cylinder locks shall have not less than $\frac{1}{2}$ -inch throw.

Cylinder Front Door Locks

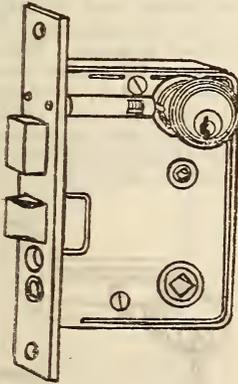

FIGURE 878.—Cylinder front door lock, type 88

Type 88.—5 to 6 inches by $3\frac{3}{4}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front 8 by $1\frac{1}{4}$ inches. Latch bolt, minimum 1 by $\frac{5}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Dead bolt, minimum $1\frac{1}{2}$ by $\frac{1}{2}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have one bronze cylinder, with or without removable and interchangeable core feature, with five or more pin tumblers, giving practically unlimited changes. Bronze front, bolts, and strike. Three nickel-bronze keys.

Operation.—Latch bolt by knob from either side; outer knob set by stop in face; when outer knob is stopped, latch bolt by key from outside; dead bolt by key from outside and turn knob from inside. Reversible.

Type 88B.—Same as type 88, except beveled front. Not reversible.

Cylinder Vestibule or Office Door Locks

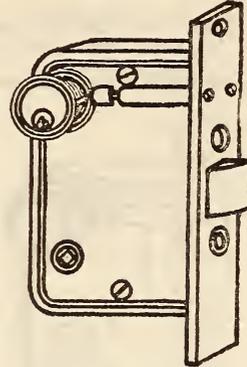

FIGURE 879.—Cylinder vestibule or office door lock, type 91

Type 91.—5 to 6 inches by $3\frac{3}{4}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front $7\frac{1}{4}$ by $1\frac{1}{8}$ inches. Latch bolt, minimum 1 by $\frac{5}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have one bronze cylinder, with or without removable and interchangeable core feature, with five or more pin tumblers, giving practically unlimited changes. Bronze front, latch bolt, and strike. Three nickel-bronze keys.

Operation.—Latch bolt by knob from either side; outer knob set by stop in face; when outer knob is stopped latch bolt by key from outside. Reversible.

Type 91B.—Same as type 91, except with two bronze cylinders and straight spindle. When knobs are stopped latch bolt shall be operated only by key from either side. Reversible.

Type 91C.—Same as type 91, except with no stop works. Outside knob always rigid. Reversible.

Cylinder Office Locks

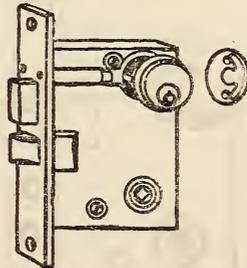

FIGURE 880.—Cylinder office lock, type 93

Type 93.—5 to 6 inches by $3\frac{3}{4}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front 8 by $1\frac{1}{4}$ inches. Latch bolt, minimum 1 by $\frac{5}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Dead bolt, minimum $1\frac{1}{2}$ by $\frac{1}{2}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have one bronze cylinder, with or without removable and interchangeable core feature, with five or more pin

tumblers giving practically unlimited changes. Bronze front, bolts, and strike. Three nickel-bronze keys.

Operation.—Latch bolt by knob from either side; dead bolt by key from outside and turn knob from inside. Reversible.

Type 93A.—Same as type 93, but with rabbeted front.

Type 94.—Same as type 93, but with two cylinders and no turn knob.

Type 94A.—Same as type 93, except with two cylinders and no turn knob and with rabbeted front.

Cylinder Office or Front Door Locks

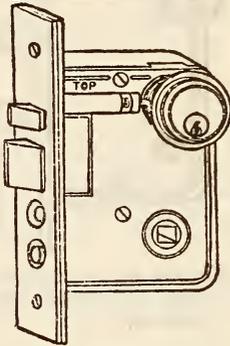

FIGURE 881.—Cylinder office or front door lock, type 97

Type 97.—5 to 6 inches by $\frac{3}{8}$ by $\frac{3}{4}$ inch, japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front $7\frac{1}{4}$ by $1\frac{1}{4}$ inches. Latch bolt, minimum 1 by $\frac{5}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have one bronze cylinder, with or without removable and interchangeable core feature, with five or more pin tumblers giving practically unlimited changes; auxiliary latch bolt and stop works. Bronze front, bolts, and strike. Three nickel-bronze keys.

Operation.—Latch bolt by knob from either side; by key from outside when outer knob is stopped. When door is closed auxiliary bolt shall deadlock the latch bolt. Not reversible.

NOTE: Either type of auxiliary bolt will be acceptable.

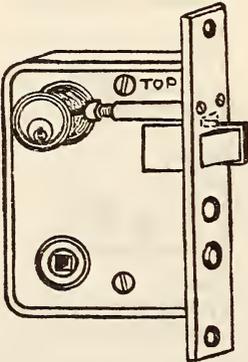

FIGURE 882.—Cylinder office or front door lock, type 102

Type 102.— $5\frac{1}{2}$ to 6 inches by $\frac{3}{8}$ to $4\frac{1}{2}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid flat front minimum $7\frac{1}{4}$ by $1\frac{1}{4}$ inches. Latch bolt, minimum 1 by $\frac{5}{8}$ inch, minimum throw $\frac{3}{4}$ inch.

Lock shall have one bronze cylinder with five or more pin tumblers giving practically unlimited changes; latch bolt and auxiliary bolt or slide, and stop works. Single or double compression spring. Front, bolts, and box strike bronze. Three nickel-bronze keys.

Operation.—Latch bolt by knob from either side; by key from outside only, when outer knob is stopped. Bolt and stop works shall be deadlocked by auxiliary bolt and deadlocking function shall be effective to the point where space between lock front and strike is five-sixteenths inch. Not reversible.

Type 102A.—Same as type 102, except with two cylinders. Inner cylinder shall operate stop works which are omitted from front of lock.

Cylinder Locks for Public Toilets: Room Doors

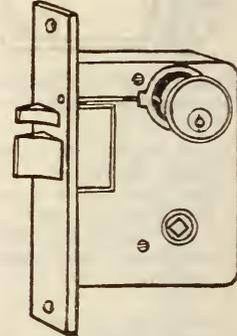

FIGURE 883.—Cylinder lock for public toilet room door, type 105

Type 105.—5 to 6 inches by $\frac{3}{8}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front $7\frac{1}{4}$ by $1\frac{1}{4}$ inches. Latch bolt, minimum 1 by $\frac{5}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have auxiliary latch bolt and two bronze cylinders with or without removable and interchangeable core feature, with five or more pin tumblers giving practically unlimited changes. Bronze front, bolts, and strike. Three nickel-bronze keys.

Operation.—Latch bolt by knob from either side; stop works controlled by inside cylinder; latch bolt by key from outside when outer knob is stopped; when door is closed auxiliary bolt shall automatically deadlock the latch bolt. Not required to be reversible.

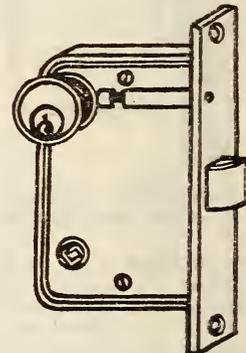

FIGURE 884.—Cylinder lock for public toilet room door, type 106

Type 106.—Same as type 105, except without auxiliary latch bolt. Reversible.

Cylinder Mortise Deadlocks

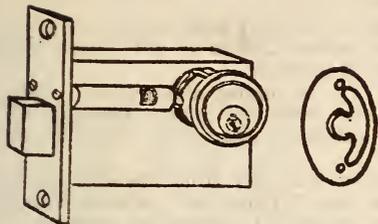

FIGURE 885.—Cylinder mortise dead lock, type 114

Type 114.— $2\frac{1}{2}$ by $3\frac{3}{8}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front $4\frac{1}{8}$ by $1\frac{1}{8}$ inches. Dead bolt, minimum $1\frac{1}{8}$ by $\frac{1}{2}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have one bronze cylinder, with or without removable and interchangeable core feature, with five or more pin tumblers giving practically unlimited changes. Bronze front, bolt, strike and turn knob. Three nickel-bronze keys.

Operation.—Bolt by key from one side and turn knob from the other. Reversible.

Type 115.—Same as type 114, except with two bronze cylinders and no turn knob.

Type 116.— $4\frac{1}{2}$ by $3\frac{3}{4}$ inch japanned iron case. Backset, $2\frac{3}{4}$ inches. Solid front $6\frac{7}{8}$ by $1\frac{1}{4}$ inches. Dead bolt, minimum $1\frac{1}{8}$ by $\frac{1}{2}$ inch, minimum throw $\frac{1}{8}$ inch. Lock shall have one bronze cylinder with or without removable and interchangeable core feature, with five or more pin tumblers giving practically unlimited changes. Bronze front, bolt, strike, and turn knob. Three nickel-bronze keys.

Operation.—Bolt by key from one side and turn knob from the other.

Special backsets.—When so specified this lock shall be furnished in one of the following backsets $1\frac{1}{2}$, 2, $2\frac{1}{2}$, or $3\frac{1}{2}$ inches. Reversible.

Type 117.—Same as type 116, except with two, bronze cylinders and no turn knob.

Cylinder Entrance Door Locks

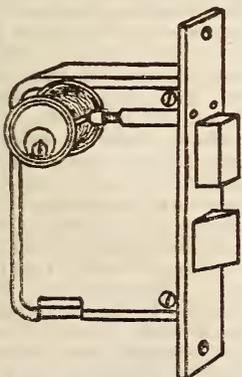

FIGURE 886.—Cylinder entrance door lock, type 125

Type 125.—5 to 6 by $3\frac{3}{4}$ by $1\frac{1}{8}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front $7\frac{1}{4}$ by $1\frac{1}{4}$ inches. Latch bolt, minimum 1 by $\frac{1}{2}$ inch, minimum throw $\frac{1}{2}$ inch. Dead bolt, minimum $1\frac{1}{8}$ by $\frac{1}{2}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have two bronze cylinders, with or without removable and interchangeable core feature, with five or more pin tumblers giving practically unlimited changes. Cast

bronze front and bolts. Bronze strike. Three nickel-bronze keys.

Operation.—Latch bolt by thumb piece (handle) from either side at all times. Dead bolt by key from either side. Reversible.

Type 125A.—Same as type 125, except rabbeted front.

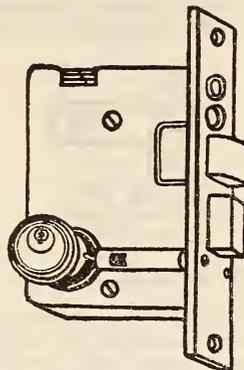

FIGURE 887.—Cylinder entrance door lock, type 126

Type 126.—5 by $3\frac{3}{4}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front $7\frac{1}{2}$ by $1\frac{1}{4}$ inches. Latch bolt, minimum $\frac{7}{8}$ by $\frac{5}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Dead bolt, minimum $1\frac{1}{8}$ by $\frac{1}{2}$ inch, minimum throw $\frac{1}{2}$ inch. Lock shall have one bronze cylinder, with or without removable and interchangeable core feature, with five or more pin tumblers giving practically unlimited changes. Bronze front, bolts, and strike. Three nickel-bronze keys.

Operation.—Latch bolt by thumb piece (handle) from either side, except when outside thumb piece is set by stops in face of lock. Dead bolt by turn knob on inside; both dead and latch bolts by key from outside. Reversible.

Type 126A.—Same as type 126, except rabbeted front.

Type 126B.—Same as type 126, except with beveled front.

Tubular Locks and Latches

E-5. Tubular locks and latches are applied to door by inserting tubular case into one hole bored in edge of door stile. The knob, cylinder, or other operating device is attached to case through opening in face of door stile. Front and strike plates require a shallow mortise.

E-5a. Suitable combinations of separate latch and lock units may be applied to door to secure additional operating features not obtainable in a single unit.

E-6. These locks provide, in general, only $\frac{3}{8}$ inch throw of bolt, and naturally do not offer the same protection nor safeguard against shrinkage or forceful entry as locks with $\frac{1}{2}$ inch or more throw of bolt.

E-7. The following general requirements apply to all types of tubular locks and latches covered by this specification: Case shall contain bolt, spring, and operating hub and shall be tubular, $\frac{7}{8}$ to 1 inch outside diameter, by not more than $3\frac{3}{4}$ inches long, and shall be of galvanized or cadmium plated steel, unless brass is specified, not less than 0.035 inch thick. Backset $2\frac{1}{2}$ inches except where specification admits $2\frac{3}{4}$ inches. Solid front $2\frac{1}{16}$ by $1\frac{1}{16}$ inches. Solid bolt not less than $\frac{5}{16}$ by $\frac{1}{2}$ inch, minimum throw $\frac{3}{8}$ inch except where otherwise specified. Compression spring. Key-controlled locks and latches shall have one or more brass or bronze cylinders, as required, with or without removable

and interchangeable core feature, each having five or more pin tumblers giving practically unlimited key changes. Brass or bronze bolt, front, and strike. Three nickel-bronze keys shall be supplied with all key-operated locks and latches. All units shall be reversible. (For knobs, spindles, escutcheons, etc., see types 205 to 330A, inclusive, under their respective commodity designations. For commodity designations, see under detail requirements in 617.0 p. 979.)

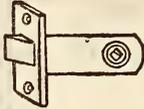

FIGURE 888.—
Knob latch,
type 150

Type 150.—Knob Latch: No cylinders required. (See par. E-7.)

Operation.—By knob from either side at all times.

Type 150A.—Same as type 150, except that operation shall be by knob one side, turn knob one side.

Type 150B.—Same as type 150, except that operation shall be on one side only.

Operation.—By knob.

Type 151.—Knob latch with stop one side. Same as type 150, except with stop one side. Stop shall control outside knob from inside and prevent operation from outside. Emergency access shall be provided.

Type 152.—Knob latch with stops both sides. Same as type 150, except with stop both sides. Stop on either side shall control knob on side opposite and prevent operation from that side.

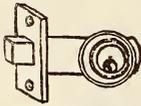

FIGURE 889.—
Dead bolt lock,
type 153

Type 153.—Dead bolt lock. Cylinder one side. Turn knob one side. Backset $2\frac{3}{8}$ or $2\frac{1}{2}$ inches, minimum throw of bolt $\frac{1}{2}$ inch. (See par. E-7.)

Operation.—Bolt by key from one side, by turn knob from one side. When locked it shall not be possible to force bolt back except by key or turn knob. Cylinder shall permit key to be withdrawn leaving bolt in unlocked position.

Type 153A.—Same as type 153, except that cylinder shall not permit key to be withdrawn leaving bolt in unlocked position.

Type 153B.—Same as type 153, except with cylinder on both sides.

Operation.—By key from both sides.

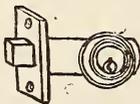

FIGURE 890.—
Dead bolt lock,
type 153C,
without turn
knob

Type 153C.—Same as type 153, except without turn knob.

Operation.—By key from one side only.

Type 153D.—Same as type 153, except without turn knob.

Operation.—By key from one side only. Cylinder shall not permit key to be withdrawn leaving bolt in unlocked position.

Type 154.—Cylinder night latch. Cylinder one side. Turn knob one side. Backsets $2\frac{3}{8}$ or $2\frac{1}{2}$ inches, minimum throw of bolt $\frac{1}{2}$ inch. (See par. E-7.)

Operation.—By key from one side, by turn knob from one side. Turn knob or slide stop shall permit latch to be held in retracted position. Cylinder shall permit key to be withdrawn leaving bolt in retracted position.

Type 154A.—Same as type 154, except that cylinder shall not permit key to be withdrawn leaving latch in retracted position.

Type 154B.—Same as type 154, except with cylinder on both sides.

Operation.—By key both sides.

Type 154C.—Same as type 154, except with cylinder on both sides.

Operation.—By key both sides. Cylinder shall not permit key to be withdrawn leaving latch in retracted position.

Cylindrical Case Locks and Latches

E-8. Cylindrical case locks and latches are applied to door by inserting cylindrical case into one large hole bored through face of door stile, and the separable bolt into a smaller hole bored in edge of door stile. Case is secured in door by escutcheons or flanges attached to case, bolt is secured by attachment to edge of door and to case or operating mechanism. Front and strike plates require a shallow mortise.

E-8a. These locks provide, in general, only three-eighths inch throw of bolt, and naturally do not offer the same protection nor safeguard against shrinkage or forceful entry as locks with one-half inch or more throw of bolt.

E-9. The following general requirements apply to all types of cylindrical case locks and latches covered by this specification: All cylindrical case locks and latches shall be furnished complete with knobs and escutcheons. Spindle or other members conveying knob or key action to retractor shall be an integral factory-assembled part of lock. Cylindrical case shall be firmly anchored in place by machine screws or through bolts. Solid front and bolt. Except where otherwise specified, bolt shall be not less than $\frac{3}{4}$ by $\frac{1}{2}$ inch, minimum throw $\frac{3}{8}$ inch. Compression springs. Key-controlled locks and latches shall have a cylinder in the center of one or both knobs, as required, each with not less than five pin tumblers giving practically unlimited key changes. Bronze bolt, front, and strike. Wrought-bronze escutcheons. Wrought-bronze knobs unless glass knobs are specified. Bronze knobs of spheroid type, 2 to $2\frac{1}{4}$ inches diameter. Glass knobs of octagon type, clear glass unless milk-white glass is specified, diameter 2 inches. All steel working parts shall be heavily rustproofed. Two nickel-bronze keys shall be supplied with all key-operated locks and latches. Reversible to all hands and applicable to doors having either flat or beveled edges.

Type 160.—Knob latch. (See par. E-9.) Backset $2\frac{3}{8}$ inches. Front not over 1 inch wide. Bolt shall be not less than $\frac{1}{2}$ by $\frac{3}{8}$ inch. Applicable to doors $1\frac{1}{16}$ to $2\frac{1}{4}$ inches thick.

Operation.—Latch bolt by knob from one side, by turn knob from one side.

Type 161.—Knob latch. (See par. E-9.) Backset $2\frac{3}{8}$ inches. Front 1 to $1\frac{1}{4}$ inches wide. Applicable to doors $1\frac{3}{8}$ to $2\frac{1}{4}$ inches thick.

Operation.—Latch bolt by knob from either side at all times.

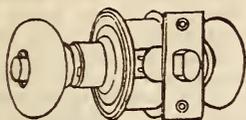

FIGURE 891.—Knob latch, type 162

Type 162.—Knob latch with stop one side. Same as type 161, except with stop one side. Stop shall control outside knob or both knobs from inside and prevent operation from outside. Lock shall provide for emergency access.

Type 163.—Knob latch with stop both sides. Same as type 161, except with stop both sides. Stop on either side shall control both knobs or knob on side opposite and prevent operation from that side.

Type 164.—Cylinder vestibule or office door lock. Same as type 161, except with cylinder in outside knob. Strike shall be of protected type.

Operation.—By knob from either side except when stop is set from inside, then from outside by key only.

Type 165.—Cylinder front or office door lock. Same as type 161, except with cylinder in outside knob. Strike shall be of protected type.

Operation.—By knob from either side except when stop is set by key from outside or push button from inside. When stop is set, outside knob shall be inoperative and latch bolt shall be securely and positively deadlocked. Stops shall be released by key from outside or by push button from inside.

Unit Type Locks and Latches

E-10. Unit type locks and latches are applied complete without disassembling—case, bolts, escutcheons, and knobs being assembled at factory as a unit which is slipped into a cutaway made in the door stile. The escutcheons are then fastened to the door securing the entire mechanism in place.

E-11. All unit type locks and latches shall be assembled complete by manufacturer at factory with knobs and escutcheons attached to a heavy cast frame. Each lock shall be a complete unit ready to slip into cutaway to be made in the door stile. Types which are key controlled shall have a cylinder in the center of one or both knobs as required, each with not less than five pin tumblers giving practically unlimited key changes. Knobs shall be of cast bronze, spheroid type (unless ellipsoid type is specified), of $2\frac{1}{4}$ inches minimum diameter. Escutcheons shall be vertical and shall be of cast bronze, not less than 8 by $2\frac{1}{2}$ inches, with bracket-bearing sleeve or thimble. The two escutcheons shall be clamped to door by at least one through bolt from the inside in addition to screw fastenings. Locks shall be so constructed as to permit of adjustment for slight variation in thickness of doors, and shall be furnished for doors $1\frac{1}{2}$ to 3 inches thick as ordered. Bolts shall be of cast bronze. Strikes shall be cast bronze

of the box type for metal jambs and of the protected box type for wood jambs. All locks shall be beveled $\frac{1}{8}$ inch in 2 inches.

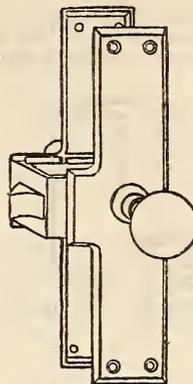

FIGURE 892.—Knob latch, type 170

Type 170.—Knob latch. (See par. E-11.) Case not less than 2 by $2\frac{3}{8}$ inches; backset $2\frac{3}{4}$ or 3 inches; heavy swinging latch bolt, minimum $\frac{5}{8}$ by $1\frac{1}{4}$ inch, minimum throw $\frac{5}{8}$ inch. Both knobs without cylinders.

Operation.—By knob from either side at all times.

Type 171.—Bathroom door lock. Same as type 170, except that inside escutcheon shall include a turn knob.

Operation.—Latch bolt by knob from either side. Turn knob on inside shall lock against outside by deadlocking the latch bolt.

Type 172.—Communicating door lock. Same as type 170, except that both escutcheons shall include a turn knob.

Operation.—Latch bolt by knobs from either side. Turn knob on each side shall lock against opposite side by deadlocking the latch bolt.

Type 173.—Cylinder front door lock. (See par. E-11.) Case not less than $2\frac{3}{8}$ by $2\frac{3}{8}$ inches; backset $2\frac{3}{4}$ or 3 inches; heavy swinging latch bolt, minimum $\frac{5}{8}$ by $1\frac{1}{4}$ inches, minimum throw $\frac{5}{8}$ inch; rectangular dead bolt, minimum $\frac{3}{16}$ by $\frac{7}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Stop works in face of lock. The outside knob shall contain the cylinder. Three nickel-bronze keys. Inside escutcheon shall include a turn knob.

Operation.—Latch bolt by knob from either side except when outer knob is set by stop in face. When outer knob is set by stop, latch bolt by key from outside; dead bolt by key from outside and turn knob from inside.

Type 174.—Cylinder vestibule or office door lock. (See par. E-11.) Case not less than 2 by $2\frac{3}{8}$ inches; backset $2\frac{3}{4}$ or 3 inches; heavy swinging latch bolt, minimum $\frac{5}{8}$ by $1\frac{1}{4}$ inches, minimum throw $\frac{5}{8}$ inch; stop works in face of lock. The outside knob shall contain the cylinder. Three nickel-bronze keys.

Operation.—Latch by knob from either side except when outside knob is set by stop in face, then by key from outside.

Type 174A.—Same as type 174, except both knobs shall contain a cylinder. Three nickel-bronze keys.

Operation.—By knob from either side except when both knobs are stopped; latch bolt shall then be operated by key from either side.

Type 174B.—Same as type 174, except with no stop works; outside knob always rigid.

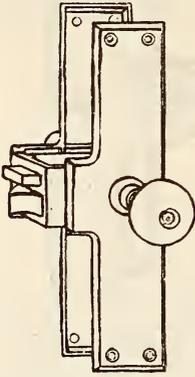

FIGURE 893.—Cylinder office lock, type 175

Type 175.—Cylinder office lock. (See par. E-11.) Case not less than $2\frac{3}{8}$ by $2\frac{3}{8}$ inches; backset $2\frac{3}{4}$ or 3 inches; heavy swinging latch bolt, minimum $\frac{5}{8}$ by $1\frac{1}{4}$ inches, minimum throw $\frac{1}{2}$ inch, rectangular dead bolt, minimum $\frac{3}{8}$ by $\frac{5}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Three nickel-bronze keys. The outside knob shall contain the cylinder. The inside escutcheon shall include a turn knob.

Operation.—Latch bolt by knob from either side at all times; dead bolt by key from outside and by turn knob from inside.

Type 175A.—Same as type 175, but with rabbeted strike for pairs of rabbeted doors.

Type 176.—Same as type 175, except without turn knob. Both knobs shall contain a cylinder. Three nickel-bronze keys.

Operation.—Latch bolt by knobs from either side at all times; dead bolt by key from either side.

Type 176A.—Same as type 175, except without turn knob. Both knobs shall contain a cylinder. Three nickel-bronze keys. Rabbeted strike for pairs of rabbeted doors.

Operation.—Latch bolt by knobs from either side at all times; dead bolt by key from either side.

Type 177.—Cylinder office or front door locks. (See par. E-11.) Case not less than $2\frac{3}{8}$ by $2\frac{3}{8}$ inches; backset $2\frac{3}{4}$ or 3 inches; heavy swinging latch bolt, minimum $\frac{5}{8}$ by $1\frac{1}{4}$ inches, minimum throw $\frac{5}{8}$ inch, and auxiliary latch bolt, stop works in face. The outside knob shall contain the cylinder. Three nickel-bronze keys.

Operation.—Latch by knob from either side except when outside knob is set by stop in face, then by key from outside. When door is closed auxiliary bolt shall automatically deadlock the latch bolt and stops.

Type 178.—Cylinder office or front door locks. (See par. E-11.) Case not less than $2\frac{3}{8}$ by $2\frac{3}{8}$ inches; backset $2\frac{3}{4}$ or 3 inches; heavy antifriction or swinging latch bolt minimum $\frac{5}{8}$ by $1\frac{1}{8}$ inch with $\frac{3}{4}$ inch minimum throw and auxiliary bolt. Stop works on inner knob or inner face. The outside

knob shall contain the cylinder. Three nickel-bronze keys.

Operation.—Latch bolt by knob from either side; by key from outside only when the outer knob is stopped. When door is closed the auxiliary bolt shall deadlock latch bolt. The deadlocking function shall be effective to the point where space between lock front and strike is $\frac{5}{16}$ inch.

Type 178A.—Same as type 178, except both knobs shall contain a cylinder. The cylinder in the inside knob shall operate concealed stop works to lock the outside knob. Retracing latch bolt by key from outside must not release the outside knob.

Type 179.—Cylinder locks for public toilet room doors. (See par. E-11.) Case not less than 2 by $2\frac{1}{2}$ inches; backset $2\frac{3}{4}$ or 3 inches; heavy swinging latch bolt, minimum $\frac{5}{8}$ by $1\frac{1}{4}$ inches, minimum throw $\frac{5}{8}$ inch, and auxiliary bolt; concealed stop works. Each knob shall contain a cylinder. Three nickel-bronze keys.

Operation.—Latch bolt by knobs from either side except when outside knob is set by key for inside cylinder; then by key from outside. Inside knob shall always be free. When door is closed auxiliary bolt shall automatically deadlock the latch bolt.

Type 179A.—Same as type 179, except without auxiliary latch.

Cabinet Locks

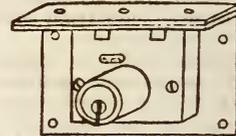

FIGURE 894.—Chest lock, type 501

Chest locks

Type 501.—Brass. Square seldedge; solid square box, screwed; three secure levers; double link; cylinder with two flat steel keys. Size $1\frac{1}{16}$ by 2 inches. Drop $\frac{7}{8}$ inch. Made for $\frac{3}{4}$ -inch wood. Minimum thickness of plate 0.040 inch.

Type 501A.—Brass. Square seldedge; solid square box, screwed; four secure levers; double link; cylinder with two flat steel keys. Size $2\frac{1}{4}$ by $3\frac{1}{2}$ inches. Drop $1\frac{1}{4}$ inches. Made for 1-inch wood. Minimum thickness of plate 0.040 inch.

Type 501A1.—Same as type 501A, except for $\frac{1}{4}$ -inch wood.

Type 501A2.—Same as type 501A, except for $\frac{1}{2}$ -inch wood.

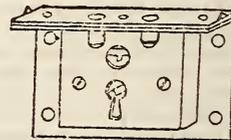

FIGURE 895.—Chest lock, type 520

Type 520.—Steel. Square seldedge; solid square box, screwed; double link; two secure levers; one barrel key. Size $1\frac{1}{8}$ by $1\frac{1}{2}$ inches. Drop $1\frac{1}{16}$ inch. Minimum thickness of plate 0.040 inch.

Type 520A.—Same as type 520, except size $1\frac{1}{16}$ by $2\frac{1}{2}$ inches, with $\frac{1}{16}$ -inch drop.

Cupboard locks

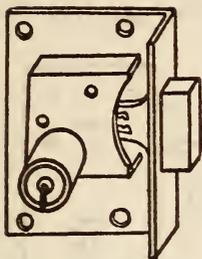

FIGURE 896.—Cupboard lock, type 540

Type 540.—Brass. Square selvedge; solid square box; broad, heavy bolt; three secure levers; cylinder with two flat steel keys; made for $\frac{1}{8}$ and $1\frac{1}{4}$ inch wood. Size $2\frac{1}{2}$ by $1\frac{1}{2}$ inches. Backset $\frac{3}{4}$ inch.

See also draw-lock cut for cupboard, type 655, made for $\frac{1}{8}$ -inch wood; size $1\frac{1}{4}$ by $2\frac{1}{4}$ inches, giving backset of $\frac{1}{8}$ inch.

Desk locks

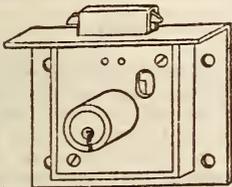

FIGURE 897.—Desk lock, type 601

Type 601.—All brass. Square selvedge; solid square box, screwed; three secure levers; double-hooked bolt; strike; cylinder with two flat steel keys. Size $1\frac{1}{2}$ by 2 inches. Drop $\frac{1}{8}$ inch. Minimum thickness of plate 0.040 inch.

Drawer locks

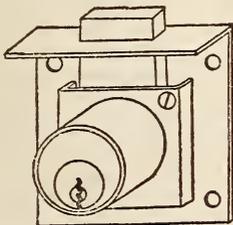

FIGURE 898.—Drawer lock, type 650

Type 650.—Brass. Pin tumbler; square selvedge; dead bolt; three keys. Drop 1 inch. Made for $\frac{1}{8}$ -inch wood. Size $1\frac{1}{4}$ by 2 inches. Cylinder $\frac{1}{8}$ -inch diameter. Minimum thickness of plate 0.045 inch.

Type 650A.—Same as type 650, except size $1\frac{1}{2}$ by $2\frac{1}{4}$ inches with $1\frac{1}{8}$ -inch diameter cylinder.

Type 650B.—Same as type 650A, except with spring bolt.

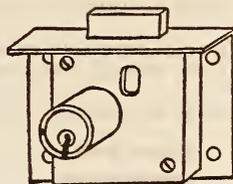

FIGURE 899.—Drawer lock, type 655

Type 655.—Brass. Cut for drawer or cupboard. Square selvedge; solid square box, screwed; broad heavy bolt; three secure levers; cylinder with two flat steel keys; made for $\frac{1}{8}$ -inch wood. Size $1\frac{1}{4}$ by $2\frac{1}{4}$ inches. Drop $\frac{1}{8}$ inch. Minimum thickness of plate 0.040 inch.

Type 655A.—Same as type 655, except steel.

Type 656.—Brass. Square selvedge; two secure levers; cylinder with two flat steel keys. Made for $\frac{1}{8}$ -inch wood. Size $1\frac{1}{16}$ by $1\frac{1}{4}$ inches. Drop $\frac{1}{4}$ inch. Minimum thickness of plate 0.040 inch.

Type 656A.—Same as type 656, except steel.

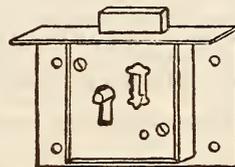

FIGURE 900.—Drawer lock, type 680

Type 680.—Steel, with brass bolt. Square selvedge; solid square box, screwed; broad heavy bolt; two secure levers; one barrel key. Size $1\frac{1}{16}$ by $2\frac{1}{8}$ inches. Drop $\frac{1}{8}$ inch. Minimum thickness of plate 0.040 inch.

Type 680A.—Same as type 680, except steel. Size $1\frac{1}{4}$ by $2\frac{1}{2}$ inches. Drop $\frac{1}{8}$ inch. Minimum thickness of plate 0.040 inch.

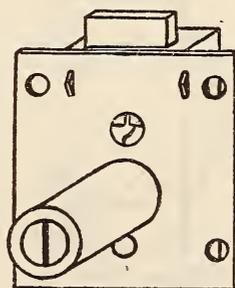

FIGURE 901.—Drawer lock, type 690

Type 690.—Brass. Surface; two secure levers; strike; cylinder with two flat steel keys. Size $1\frac{1}{8}$ by $1\frac{1}{8}$ inches. Drop $1\frac{1}{8}$ inches. Minimum thickness of plate 0.040 inch. Made for $\frac{1}{4}$ -inch wood,

Type 690A.—Same as type 690, except for 7/8-inch wood.

Type 690A1.—Same as type 690, except for 1 1/8-inch wood.

Type 690B.—Same as type 690, except steel.

Type 690B1.—Same as type 690, except steel for 7/8-inch wood.

Type 690B2.—Same as type 690, except steel for 1 1/8-inch wood.

Wardrobe Locks

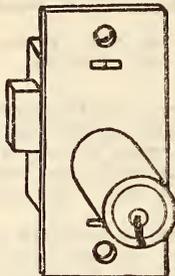

FIGURE 902.—
Wardrobe lock,
type 701

Type 701.—Brass. Solid square box; two secure levers; bolt shall shoot right and left; cylinder with two flat steel keys. Size 1 7/8 by 7/8 inches. Made for 7/8-inch wood. Minimum thickness of plate, 0.040 inch.

Type 701A.—Same as type 701, except steel with brass bolt.

Type 701B.—Same as type 701, except size 2 3/4 by 1 1/4 inches. Made for 7/8-inch wood.

Type 701B1.—Same as type 701B, except for 1-inch wood.

Type 701B2.—Same as type 701B, except for 1 1/8-inch wood.

Type 701C.—Same as type 701, except steel with brass bolt. Size 2 3/4 by 1 1/4 inches. Made for 7/8-inch wood.

Type 701C1.—Same as type 701C, except for 1-inch wood.

Type 701C2.—Same as type 701C, except for 1 1/8-inch wood.

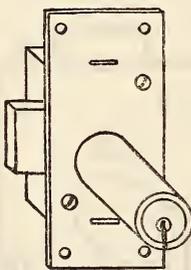

FIGURE 903.—
Wardrobe lock,
type 702

Type 702.—Brass. Solid square box, screwed; two secure levers; bolt shall shoot right and left; cylinder with two flat steel keys. Size 3 by 1 1/8 inches. Made for 7/8-inch wood. Minimum thickness of plate 0.040 inch.

Type 702A.—Same as type 702, except for 1-inch wood.

Type 702A1.—Same as type 702, except for 1 1/8-inch wood.

Type 702B.—Same as type 702, except steel with brass bolt. Made for 7/8-inch wood.

Type 702B1.—Same as type 702B, except for 1-inch wood.

Type 702B2.—Same as type 702B, except for 1 1/8-inch wood.

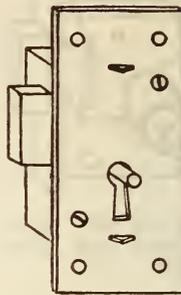

FIGURE 904.—
Wardrobe lock,
type 730

Type 730.—Brass. Solid square box, screwed; two secure levers; bolt shall shoot right and left; one barrel key. Size 2 3/4 by 1 1/4 inches. Minimum thickness of plate, 0.40 inch.

Type 730A.—Same as type 730, except steel with brass bolt.

I NOTES

I-5a. In Table 2 below are listed for convenient reference the minimum size and throw required for latch and dead bolts for the locks, latches, transom catches, and cupboard turns covered by this specification. (Lock requirements are given above. Latch, transom-catch, and cupboard-turn requirements will be found under their respective commodity designations as listed in detail requirements in 617.0, p. 979.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PADLOCKS, FF-P-101, JUNE 24, 1930

PADLOCKS

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no Federal specifications applicable to this specification.

B. TYPES AND SIZES

B-1. This specification covers the following general types and sizes of padlocks:

Type I.—Pin-tumbler mechanism, bronze or brass case. Sizes, 2, 1 3/4, and 1 1/2 inches.

Type II.—Pin-tumbler mechanism, push-up shackle, bronze or brass case. Size, 1 1/2 inches.

Type III.—Lever-tumbler mechanism, bronze or brass case. Size, 2 1/4 inches.

Type IV.—Lever-tumbler mechanism, bronze or brass case. Size, 1 1/4 inches.

Type V.—Lever-tumbler mechanism, brass-plated steel case. Size, 2 inches.

Type VI.—Lever-tumbler mechanism, bronze case. Steel shackle. Sizes, 1 1/2, 1 3/4, and 2 inches.

Type VII.—Warded mechanism secure type, laminated or solid steel case, cadmium plated. Sizes, 1 1/4, 1 3/4, and 1 1/8 inches.

C. MATERIAL AND WORKMANSHIP

C-1. Parts specified to be of bronze or brass may be of either material. No particular composition is required for nickel-bronze keys.

C-2. All interior parts of locks, except as noted, shall be of suitable noncorrosive metals.

C-3. Padlocks shall be of substantial construction designed to withstand sever usage. Working parts shall be accurately fitted. Lock mechanism shall be so constructed that it can not be jarred open. All parts of padlocks shall be well finished.

C-4. Chains, where called for, shall be secured to padlocks with suitable clevises so attached as not to interfere with the operation of the lock, and may be attached to either case or shackle, except where otherwise indicated. Clevises for brass or bronze padlocks shall be of brass or bronze.

D. GENERAL REQUIREMENTS

D-1. Unless otherwise specified, all padlocks in any one order shall be operated only by their individual keys, within the limit of the number of key changes specified below.

D-2. The name or trade-mark of the manufacturer shall be legibly stamped or cast on each padlock. The change number of the lock shall be legibly stamped in a distinctive noncommercial code on all padlocks and keys of the pin-tumbler type. The code symbol shall indicate to the manufacturer that it is a Government padlock. Duplicate keys shall not be furnished except on recognized authority. Additional identification marks shall be provided when specified.

D-3. The principal dimensions and weights given are approximate minimum requirements, however, a tolerance of 5 per cent under will be permitted.

D-4. Plugs used to close openings in lock case, through which mechanism is inserted, shall be secured in such a manner as to prevent easy removal of same.

E. DETAIL REQUIREMENTS

Type I.—Pin-tumbler mechanism, 4 or more tumblers. With or without removable and interchangeable core feature. Case and shackle bronze or brass, polished finish. Self-locking spring shackle extension type; shackle shall be locked at toe or at both toe and heel. Lock shall be capable of providing at least 3,200 key changes absolutely safe from key interchanging. Master-keyed when so ordered. Two nickel-bronze milled keys. Size, 2, 1 3/4, and 1 1/2 inches. Weight with 2 keys, 11, 9, and 5 ounces.

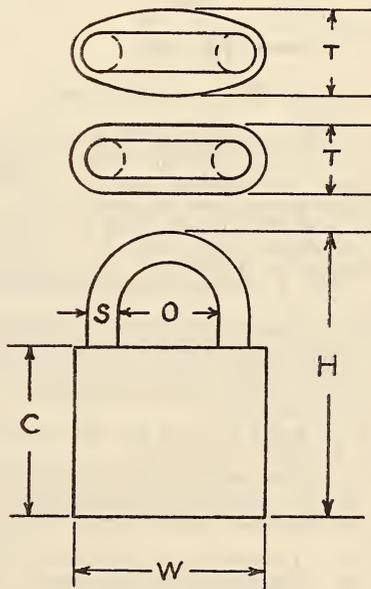

FIGURE 905.—Padlock, Type I

Size (inches)	Dimensions (inches)					Weight with 2 keys
	W	C	H	O	T	
2	-----	1 3/8	2 7/8	1 5/16	1 1/32	11
1 3/4	-----	1 5/8	2 5/8	1 3/16	5/16	9
1 1/2	-----	1 1/4	2 1/4	3/8	2 1/32	5

Type Ia.—Same as Type I, but with bronze or brass chain 9 inches long, plus or minus one link, attached to body of lock. Chain shall be either flat lock link 0.072-inch wire (No. 4 triumph type), or No. 0 sash chain, 0.028-inch metal.

Type Ib.—Same as Type I, but with casehardened steel shackle, rustproofed.

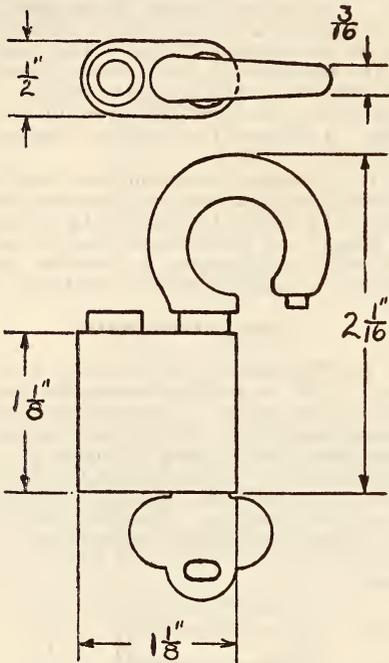

FIGURE 906.—Padlock, Type II

Type II.—Pin-tumbler mechanism, four or more tumblers. Case and shackle bronze or brass, polished finish. Self-locking push-up shackle type. Dutchman or key at base of shackle shall be steel. Lock shall be capable of providing at least 1,600 key changes absolutely safe from key interchanging. Two nickel-bronze milled keys. Shackle spring may be steel. Size, 1 1/2 inches. Weight with two keys, 3 3/4 ounces.

Type IIa.—Same as Type II, with bronze or brass chain 9 inches long, plus or minus one link, attached to body of lock. Chain shall be either flat lock link 0.072-inch wire (No. 4 triumph type) or No. 0 sash chain, 0.028-inch metal.

Type IIb.—Same as Type II, but with casehardened steel shackle, rustproofed.

Type IIc.—Same as Type II, but with shackle not less than 0.220 inch in diameter and such that it will readily pass through a hole five-sixteenths inch in diameter.

Type III.—Lever-tumbler mechanism, three secure levers. Case and shackle cast bronze or brass. Wheel finish. Self-locking spring shackle, hinged type. One-hundred and twenty changes when not master-keyed. Master-keyed when so ordered.

Two nickel-plated flat steel keys. Size, 2 1/4 inches. Weight, with two keys, 7 1/2 ounces.

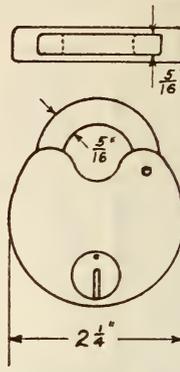

FIGURE 907.—Padlock, Type III

Type IIIa.—Same as Type III, but with bronze or brass chain 9 inches long, plus or minus one link. Chain shall be either flat lock link 0.072-inch wire (No. 4 triumph type) or No. 0 sash chain, 0.028-inch metal.

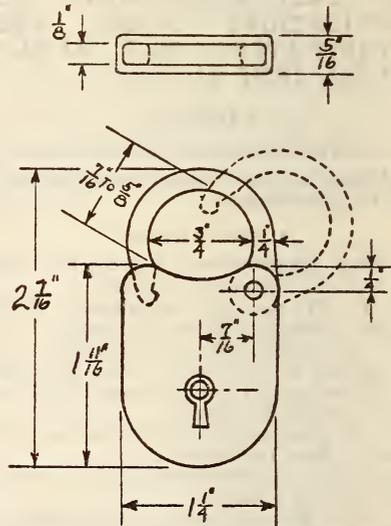

FIGURE 908.—Padlock, Type IV

Type IV.—Lever-tumbler mechanism, three or more tumblers. Case and shackle wrought bronze or brass. Self-locking spring shackle, hinged type, shall be of flat section indicated, or round section of equivalent cross-sectional area. Not required to be master-keyed. Two brass or bronze barrel keys. Size, 1 1/4 inches. Weight with two keys, 2 1/4 ounces.

Type IVa.—Same as Type IV but with No. 0 size, 0.021-inch bronze or brass safety chain 9 inches long, plus or minus one link.

Type V.—Brass-plated heavy steel case. Brass-plated malleable iron shackle; 6 lever tumblers; 12 changes. Two nickel-plated, double-bitted, drilled

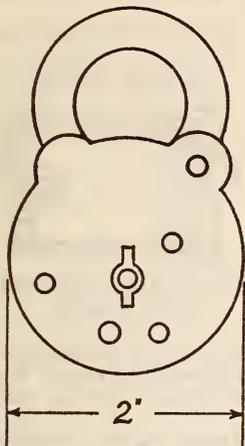

FIGURE 909.—Padlock, Type V

barrel keys. This lock is not required to pass the corrosion test. Size, 2 inches. Weight with two keys, 5½ ounces.

Type Va.—Same as Type V, but with chain 9 inches long plus or minus one link. Chain shall be either flat lock link, 0.072-inch wire (No. 4 triumph type) or No. 0 sash chain, 0.028-inch metal.

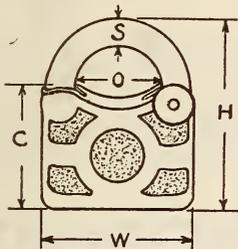

FIGURE 910.—Padlock, Type VI

Type VI.—Lever-tumbler mechanism. Cast bronze case, wheel finish. Round or square case-hardened steel shackle of self-locking hinged type. Not to be master-keyed. Two nickel-bronze or brass keys. This lock is not required to pass the corrosion test.

Size (inches) W	Key changes	Number lever tumblers	Dimensions (inches)				Weight with 2 keys
			C	H	O	S	
1½	48	3	1¼	2	1¾	¼	Ounces 5
1¾	72	4	1¾	2¼	1½	¾	6½
2	144	4	1½	2½	1¼	¾	9½

Type Via.—Same as Type VI, but with bronze or brass chain 9 inches long, plus or minus one link. Chain shall be either flat-lock link 0.072-inch wire (No. 4 triumph type) or No. 0 sash chain 0.028-inch metal.

Type VII.—Warded mechanism-secure type with two or more springs locking shackle. Laminated or solid steel case, unground, cadmium plated. Self-locking spring shackle, extension type. Minimum

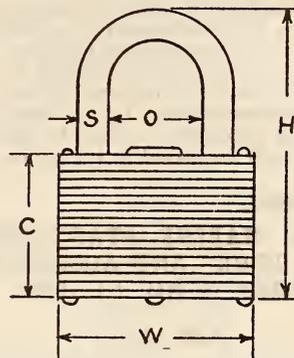

FIGURE 911.—Padlock, Type VII

number of key changes as specified in table. Master keyed when so ordered. Two nickel-plated steel keys.

Size (inches) W	Key changes	Dimensions (inches)				Weight without keys
		C	H	O	S	
1½	15	1	2	¾	¼	Ounces 5
1¾	56	1¼	2½	1¾	¾	8
1¾	56	1¾	3	1½	¾	12½

Type VIIa.—Same as Type VII except with cadmium-plated welded steel chain 9 inches long plus or minus one link. Twisted-wire type chain of 0.072-inch diameter wire.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. One lock per gross, or fraction thereof, shall be taken from any shipment and examined to determine whether they comply with this specification.

F-2. Samples of Types I, II, III, IV, and VII shall be subjected to the following corrosion test:

F-2a. Submerge padlock for 1 hour each day for one week in a 3.5 per cent (by weight) salt (sodium chloride) solution at room temperature (about 20° C. or 68°F.), and then hang to dry in the open air for 23 hours. At the end of the week the lock shall permit being opened by its own key without undue force, and shall permit of being relocked and opened without undue difficulty. Failure of samples to withstand this test will result in rejection of the entire delivery.

G. PACKING AND MARKING

G-1. Locks shall be packed separately with their keys in suitable containers.

G-2. Containers shall be labeled with the type, size, and number of locks contained.

G-3. Locks, when master keyed or when keyed alike, shall be packed in separate lots and labeled to indicate the method of keying.

G-4. Deliveries shall also be marked with the number of the contract or order under which delivery is made.

I. NOTES

I-1. If more than two keys are required for each lock, the number of keys per lock should be specified in the contract or order.

I-2. Each contract or order should state whether all padlocks are to fit the same key, all different keys, or the number of different keys required.

I-3. When master-keyed locks are required, the manufacturer should be required to lay out additional changes than covered by the order to provide for such future expansion as may be contemplated, and which should be stated in the order.

(For types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

(Tubular locks and latches, cylindrical case locks and latches, and unit type locks and latches will be found under 617.21, p. 1020.)

MORTISE KNOB LATCHES

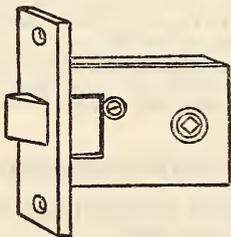

FIGURE 912.—Mortise knob latch, type 28

Type 28.— $2\frac{1}{2}$ by $3\frac{1}{2}$ by $\frac{3}{8}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Front $4\frac{1}{2}$ by 1 inch. Latch bolt, minimum $\frac{3}{4}$ by $\frac{1}{2}$ inch, minimum throw one-half inch. Double spring type. Cast bronze front and bolt. Brass hub. Bronze strike.

Operation.—Latch bolt by knob from either side. Reversible.

Type 34.— $2\frac{3}{8}$ by $2\frac{1}{4}$ by $\frac{3}{8}$ inch japanned iron case. Backset $1\frac{1}{2}$ inches. Front 4 by 1 (minimum $\frac{3}{8}$) inch. Latch bolt, minimum $\frac{3}{8}$ by $\frac{1}{16}$ inch, minimum throw $\frac{3}{8}$ inch. Bronze front and bolt. Brass hub. Bronze strike.

Operation.—Latch bolt by knob from either side. Reversible.

RIM KNOB LATCHES

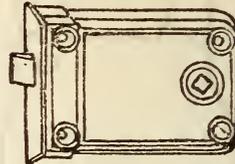

FIGURE 913.—Rim knob latch, type 80

Type 80.— $2\frac{5}{8}$ by $3\frac{3}{4}$ by $\frac{3}{8}$ inch japanned iron case. Rim strike. Backset $2\frac{3}{4}$ inches. Single iron latch. Latch bolt, minimum $\frac{1}{2}$ by $1\frac{13}{32}$ inch, with $\frac{3}{8}$ -inch throw.

Operation.—Latch bolt by knob from either side. Reversible.

CYLINDER MORTISE NIGHT LATCHES

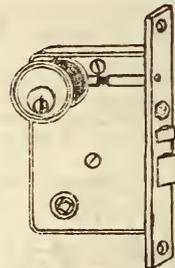

FIGURE 914.—Cylinder mortise night latch, type 111

Type 111.— $3\frac{1}{2}$ by $3\frac{3}{8}$ by $\frac{3}{4}$ inch japanned iron case. Backset $2\frac{3}{4}$ inches. Solid front 5 by $1\frac{1}{8}$ inches. Latch bolt, minimum $\frac{3}{4}$ by $\frac{3}{8}$ inch, minimum throw $\frac{1}{2}$ inch. Latch shall have one bronze cylinder with or without removable and interchangeable core feature, with five or more pin tumblers giving practically unlimited changes. Bronze front, bolts, hub, and strike. Three nickel-bronze keys.

Operation.—Latch bolt by knob from inside and key from outside. When door is closed, auxiliary bolt shall automatically deadlock the latch bolt. Bolt may be held back by stop in front. Not reversible.

RIM NIGHT LATCHES

Tubular

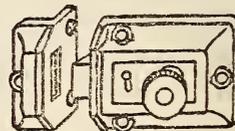

FIGURE 915.—Rim night latch, tubular, type 129

Type 129.— $2\frac{1}{4}$ by 3 inches, japanned iron case. Backset 2 inches. Latch bolt, minimum $\frac{3}{4}$ by $\frac{1}{16}$ inch, minimum throw $\frac{1}{16}$ inch. Latch shall have 12 changes. Bronze turn knob and slide stop. Bronze plated bolt and knob. Two polished steel flat keys.

Operation.—Latch by key from outside and by turn knob from inside. Slide stop. Reversible.

Standard cylinder

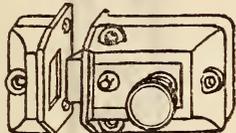

FIGURE 916.—Rim night latch, standard cylinder, type 134

Type 134.—2½ by 3 inches, japanned iron case. Backset 1½ or 2 inches. Latch bolt, minimum 1 by ⅝ inch, minimum throw ⅜ inch. Latch shall have one standard bronze cylinder, with or without removable and interchangeable core feature, with five or more pin tumblers providing practically unlimited changes. Screws for latch and strike shall be at least 1¼ inches long. Bronze bolt, knob, and slide stop. Three nickel-bronze keys.

Operation.—Latch by key from outside and by turn knob from inside. Slide stop. Reversible.

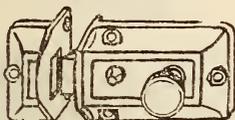

FIGURE 917.—Rim night latch, standard cylinder type 136

Type 136.—2½ by 3½ inches, japanned iron case. Backset 2½ inches. Latch bolt, minimum 1 by ⅝ inch, minimum throw ⅜ inch. Latch shall have one standard bronze cylinder, with or without removable and interchangeable core feature, with five or more pin tumblers providing practically unlimited changes. Bronze bolt, knob, and slide stop. Three nickel-bronze keys.

Operation.—Latch by key from outside and by turn knob from inside. Slide stop. Reversible.

Type 137.—Same as type 136, except all bronze.

SECRET GATE LATCHES

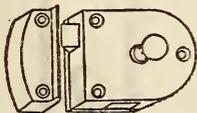

FIGURE 918.—Secret gate latch, type A1187

Type A1187.—Cast bronze. Single acting. Size 2 by 2½ inches.

THUMB LATCHES

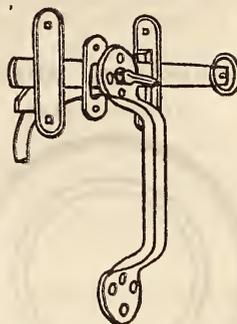

FIGURE 919.—Thumb latch, type 1189

Type 1189.—Extra heavy. Wrought steel, galvanized. For doors 1¼ to 2½ inches thick. Handle 10 inches.

Type 1189A.—Same as type 1189, except wrought steel, japanned.

Type A1196.—Duplex type. Extra heavy wrought steel, galvanized or japanned. For doors 1¼ to 2¼ inches thick. Handle plates 14½ inches, handles 10 inches long.

and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

CYLINDER COLLAR

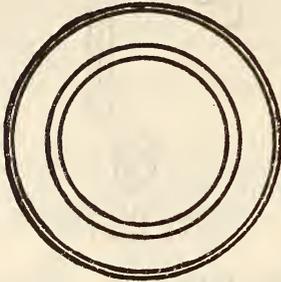

FIGURE 920.—*Cylinder collar, type 320*

Type 320.—Wrought or cast bronze, buffed. Diameter as required to fit cylinder.

ROSES

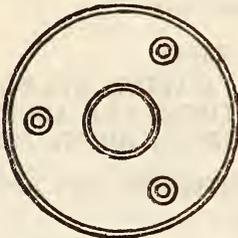

FIGURE 921.—*Rose, type 330*

Type 330.—Wrought bronze, buffed, with wrought bracket bearing type thimble to suit knob shanks. Size, 2 inch diameter.

Type 330A.—Same as type 330, except cast bronze and thimbles with machine-finished bearings.

KEY PLATES

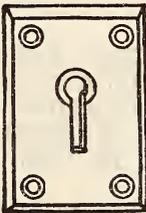

FIGURE 922.—*Key plate type 350*

Type 350.—Wrought bronze, buffed, with square corners, beveled edges, and two screw holes. Size $1\frac{1}{4}$ by $1\frac{1}{8}$ inches. Minimum thickness of plate 0.025 inch.

Type 350A.—Same as type 350, except cast bronze, and four screw holes.

Type 351.—Wrought bronze, buffed. Oval shape, 2 screw, plain surface. Size minimum $1\frac{1}{8}$ by $1\frac{1}{8}$ inches. Minimum thickness of plate 0.022 inch.

Type 352.—Thread escutcheon. Cast brass 1 by $\frac{5}{8}$ inch.

ESCUTCHEONS

For mortise cylinder locks

FIGURE 923.—*Escutcheon for mortise cylinder locks, type 300*

Type 300.—Wrought bronze, with square corners and medium beveled edges; drilled to suit cylinder, and shall have bracket bearing type thimble to suit knob shanks. Thimbles shall be reinforced at back with washers to bear against door. Approximate sizes, 7 by $2\frac{1}{4}$ and 10 by $2\frac{3}{4}$ inches. Minimum thickness of wrought plates, 0.028 and 0.035 inch, respectively.

Type 300A.—Same as type 300, except cast bronze and thimbles with machine-finished bearings.

For mortise bit key locks

FIGURE 924.—*Escutcheon for mortise bit key locks, type 301*

Type 301.—Wrought bronze, with square corners and medium beveled edges; cut to suit key; shall have wrought bracket-bearing type thimble to suit knob shanks. Thimble shall be reinforced at back with washers to bear against door. Approximate sizes, 7 by $2\frac{1}{4}$, 8 by $2\frac{1}{2}$, and 10 by $2\frac{3}{4}$ inches. Minimum thickness of wrought plates, 0.028, 0.028, and 0.035 inch, respectively.

Type 301A.—Same as type 301, except cast bronze, and thimbles with machine-finished bearings.

Type 302.—Wrought bronze, with square corners and medium beveled edges; complete with bracket-bearing thimble to suit knob shanks and 1 3/4-inch turn knob. Thimbles shall be reinforced at back

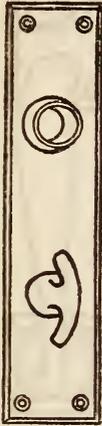

FIGURE 925.—
Escutcheon,
type 302

with washers to bear against door. Approximate sizes, 7 by 2 1/4, 8 by 2 1/2, and 10 by 2 3/4 inches. Minimum thickness of wrought plates, 0.028, 0.028, and 0.035 inch, respectively.

Type 302A.—Same as type 302, except cast bronze, and thimbles with machine-finished bearings.

PADLOCK EYES

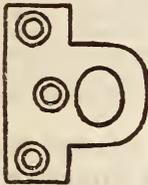

FIGURE 926.—
Padlock eye,
type 1430

Type 1430.—Galvanized steel. Size of plate about 2 1/2 by 1 1/8 inches. Size of hole about 3/4 by 5/8 inch.

617.3 KNOBS, HANDLES, AND PULLS.

617.31 DOOR KNOBS.

BUILDERS' HARDWARE (NONTEMPLATE)

DOOR KNOBS, METAL

For exterior doors

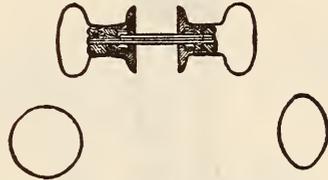

FIGURE 927.—Metal door knobs,
for exterior doors, types 210,
210A

Type 210.—Seamless all cast bronze, buffed, for bracket-bearing type shank. Each pair of knobs complete with 1/16-inch solid or swivel wrought steel spindle to fit and properly operate the lock for which required. Outside knob shall be secured to spindle with pin. Inside knob shall be secured with clamp or set screw. Shanks shall have machine-finished bearings. Spheroid type, size 2 1/4 inches diameter.

Type 210A.—Same as type 210, except ellipsoid type, 2 1/4 inches minimum diameter on major axis.

Type 210B.—Same as type 210, except seamless wrought bronze, minimum thickness of metal 0.033 inch. Machine-finished bearings not required.

For interior doors

Type 211.—Same as type 210, except with threaded or triplex spindle.

Type 211A.—Same as type 210, except ellipsoid type, 2 1/4 inches minimum diameter on major axis, and with threaded or triplex spindle.

617.32 DOOR AND DRAWER HANDLES.

AMERICAN MARINE STANDARDS COMMITTEE, LOCKS AND ACCESSORIES FOR SHIP DOORS, H NO. 61-1930

HANDLES

BUILDERS' HARDWARE (NONTEMPLATE)

ENTRANCE DOOR HANDLES

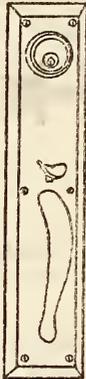

FIGURE 928.—
Entrance door handle, type 400

Type 400.—Wrought bronze plates with square corners and beveled edges, cut for cylinder or turn knob. Handles about 5-inch grip with thumb piece for operating latch bolt. Plates 14 by 3 inches. Minimum thickness of plate, 0.040 inch. Connections for handles shall have bosses on back to bear against door.

FIGURE 929.—
Entrance door handle, type 405

Type 405.—Cast iron, finish US18. Plate about 15 by 3 inches with round or square corners cut for cylinder or turn knob. Grip about 5½ inches on centers with thumb piece.

ENTRANCE DOOR HANDLES

Sectional trim

FIGURE 930.—
Entrance door handle, sectional trim, type 420

Type 420.—Cast bronze plates with square corners and beveled edges. Cylinder collar 2¼ by 2¼ inches. Grip about 5¼ inches. Plates to suit.

Dummy trim

Type 430.—Dummy trim shall be furnished only when specified. Thimbles shall be required for knobs and turns. Dummy trim shall match the escutcheons specified for the lock for which dummy trim is required. Spindles shall extend through door and have plates to hold knob rigid.

617.33 DOOR AND DRAWER PULLS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

DOOR PULLS

(See 617.0, p. 977, also Federal specification FF-H-101 below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

DOOR PULLS

FIGURE 931.—
Door pull,
type 1269

Type 1269.—Wrought bronze. Two screw holes; 3½ or 4¼ inch handle.
Type 1269A.—Steel, plated. Two screw holes; 3½ or 4¼ inch handle.
Type 1269B.—Steel, japanned. Two screw holes; 3½ or 4¼ inch handle.

FIGURE 932.—
Door pull,
type 1274

Type 1274.—Cast bronze. Four screw holes. 6 inches long.
Type 1274A.—Same as type 1274, except cast iron or wrought steel plated.
Type 1274B.—Same as type 1274, except cast iron or wrought steel, galvanized.
Type 1274C.—Same as type 1274, except cast iron or wrought steel, japanned.

KNOB PULLS

FIGURE 933.—
Knob pull,
type A1283

Type A1283.—Cast bronze. Not less than 1-inch diameter. With machine screw.

DRAWER PULLS

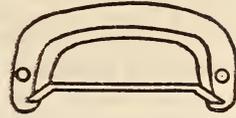

FIGURE 934.—Drawer
pull, type 1296

Type 1296.—Cup pattern. Flat edge. Steel, plated. Size, 3¼ inches.

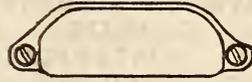

FIGURE 935.—Drawer
pull, type 1297

Type 1297.—Cup pattern. Narrow edge. Wrought bronze. Size, 3½ inches. Metal thickness not less than 0.035 inch.

Type 1298.—Cup pattern. Flat edge. Cast bronze. Size, 3¼ inches.

FIGURE 936.—Drawer
pull, type 1305

Type 1305.—Bar pattern. Rounded handle, rectangular ends. Cast bronze. With machine screws for fastening handles from inside. Size overall, 4 inches.

DOOR PULLS ON PLATE

Type 450.—Cast bronze with square corners and beveled edges. Size approximately 16 by 3½ inches. Pull handles shall be approximately 6 inches center to center, ¼-inch diameter at center of grip; and shall be secured with through bolts. Shall be drilled for cylinder outlets where same occur.

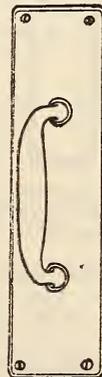

FIGURE 937.—
Door pull on
plate, type 451

Type 451.—Wrought bronze with rounded corners and edges. Size approximately 10 by 2¼ inches.

Minimum thickness of plate 0.035 inch. Cast bronze pull handle secured with through bolts. Grip approximately 5 inches on centers. Shall be drilled for cylinder outlets where same occur.

DOOR PULLS, SECTIONAL

Type 452.—Plain cast bronze grip with through bolts. Grip approximately 6 inches on centers. Minimum diameter at center of grip three-fourths inch. Separate round cast bronze bases minimum diameter $1\frac{1}{4}$ inches.

617.34 PUSH AND KICK PLATES AND BARS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

PUSH BARS, PUSH PLATES

(See 617.0, p. 977, also Federal specification FF-H-101 below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

(For types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coating; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

PUSH PLATES

FIGURE 938.—
Push plate,
type 460

Type 460.—Cast bronze with square corners and medium beveled edges. Size approximately 16 by $3\frac{1}{2}$ inches. Shall be drilled for cylinder outlets where same occur.

Type 461.—Cast bronze with square corners and medium beveled edges. Sizes 12 by $3\frac{1}{2}$ inches and 16 by $3\frac{1}{2}$ inches.

Type 461A.—Same as type 461, except wrought bronze. Minimum thickness of plate 0.040 inch.

Type 462.—Wrought bronze with rounded corners and edges. Size 10 by $2\frac{3}{4}$ inches. Minimum thickness of plate 0.035 inch.

Type 463.—Plate-glass push plates, polished, 12 by $3\frac{1}{2}$ inches, with beveled edges, rubber washers, bronze rosettes and screws. Nickel bronze or nickel-plated bronze rosettes and screws shall be used in locations where nickel-bronze hardware is specified.

KICK PLATES

FIGURE 939.—Kick plate, type 1224

Type 1224.—Wrought bronze. Square corners, beveled edges. Plates 0.064 inch thick. Sizes as required.

PUSH BARS

FIGURE 940.—Push
bar, type 1009

Type 1009.—Cast bronze bases approximately 2 inches diameter. Wrought bronze tubing 1 inch diameter and $\frac{3}{32}$ inch thick, or tubing may be $\frac{1}{2}$ inch thick tightly shrunk over a steel core. Projection $2\frac{3}{4}$ inches. Clearance $1\frac{1}{2}$ inches. Lengths 24, 30, or 36 inches.

Type 1009A.—For double acting doors. Same as type 1009 except with cast bronze flat bracket for inner end.

Type A1009.—Cast bronze brackets three-fourths inch wide for surface of stiles. Solid wrought bronze bars $\frac{1}{2}$ to $\frac{5}{8}$ inch diameter, or bronze tubing $\frac{1}{2}$ to $\frac{3}{4}$ inch outside diameter with wall not less than 0.045 inch thick, 3 inches on centers; projection 1 inch, clearance $\frac{1}{2}$ inch. Length of bracket 6 inches with two bars. Length of bars as required.

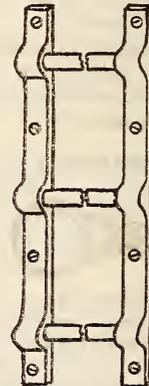

FIGURE 941—
Push bar,
type 1009A

Type A1009A.—Same as type A1009, except with length of bracket 9 inches and 3 bars. Length of bars as required.

Type A1009B.—Same as type A1009, except with length of bracket 12 inches and 4 bars. Length of bars as required.

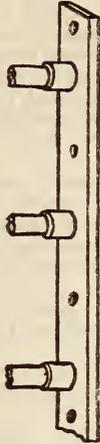

FIGURE 942.—
Push bar,
type B1009

Type B1009.—Cast bronze brackets 1 inch wide for inside edges of stiles. Solid wrought bronze bars ½-inch diameter, 3 inches on centers. Length of bracket 6 inches with two bars. Length of bars as required.

Type B1009A.—Same as type B1009, except with length of bracket 9 inches and 3 bars. Length of bars as required.

Type B1009B.—Same as type B1009, except with length of bracket 12 inches and 4 bars. Length of bars as required.

Type A1010.—Clothes-hanger bar, wrought steel telescoping tubing, plated; minimum wall thickness one thirty-second inch. Outer tube not less than 1 inch outside diameter. A metal wall plate shall be securely attached to each end of bar, and shall have at least two screw holes for attaching to hook strip in closet. Size 18 inches, adjustable from 18 to 30 inches; size 30 inches, adjustable from 30 to 48 inches; size 48 inches adjustable from 48 to 72 inches; and size 72 inches adjustable from 72 to 96 inches.

617.35 SASH LIFTS.

AMERICAN MARINE STANDARDS COMMITTEE, SASH HARDWOOD FOR SHIPS, H NO. 63-1930

SASH HARDWARE FOR SHIPS

For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLETE)

HOOK SASH LIFTS

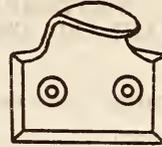

FIGURE 943.—
Hook sash lift,
type 1201

Type 1201.—Wrought bronze. Beveled edge. Size 1 by 1½ inches. Minimum thickness of metal 0.057 inch.

Type 1201A.—Wrought steel plated. Beveled edge. Size 1 by 1½ inches. Minimum thickness of metal 0.057 inch.

Type 1202.—Cast bronze. Beveled edge. Size 1¼ by 1½ inches.

FLUSH SASH LIFTS

FIGURE 944.—Flush sash lift, type 1208

Type 1208.—Wrought bronze. Beveled edge. Square corners. Deep cup with side screw holes. Size 1¼ by 3⅞ inches.

Type 1208A.—Same as type 1208, except wrought steel, plated.

Type 1212.—Cast bronze. Beveled edge. Square corners. Side screw holes. Size 1¼ by 3 inches.

BAR SASH LIFTS

FIGURE 945.—Bar sash lift, type 1219

Type 1219.—Cast bronze. 1½ by 4½ to 5 inches. Round corners. Minimum weight 3 ounces each.

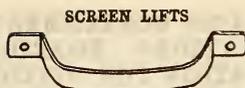

FIGURE 946.—Screen lift, type A1223

Type A1223.—Wrought brass. Length $3\frac{1}{2}$ inches.
Type A1223A.—Steel, japanned. Length $3\frac{1}{2}$ inches.

617.4 CHECKS, CATCHES, AND FASTENERS.

617.41 DOOR CLOSERS AND CHECKS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

DOOR CLOSERS

(See 617.0, p. 977; also Federal specification FF-H-101 below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

(For types, grades, and classes; material and workmanship; general requirements, detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

DOOR CLOSERS

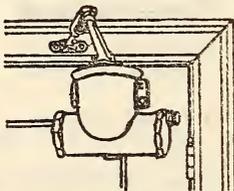

FIGURE 947.—Door closer, type 1128

Type 1128.—Overhead type, single acting, combined spring and liquid check. Springs shall have adjustable tension. Closers having helical torsion spring shall have provision to prevent overwinding. Checking regulation accessible and close. Shall close the door positively and quietly. If a glycerin-alcohol mixture is used the acidity shall not exceed 0.30 mg KOH per gram of liquid. If other liquids are used, they shall conform to the following requirements: Viscosity, Saybolt Universal, 60 to 70 seconds at 100° F.; pour point, minus 40° F. or lower; acidity not over 0.10 mg KOH per gram of oil. Crankshaft or spindle shall be of 1-piece steel with 3 main bearings, one on either side of and close to the crank, cam, or pinion, and one near the operating

lever, and 1 crank bearing if of crank type. When through shafts are used, they shall have 2 sets of packing, 2 main bearings, 1 crank bearing, if of crank type, and shall be provided with cap and gasket to completely cover lower end of shaft. Cams, arms, and brackets of forged steel or malleable iron. Arms and brackets finished to match case. Cases, cast bronze, unpolished. Closers shall be constructed so as to prevent the rise of liquid into the spring chamber and shall be equipped to prevent any leakage. Brackets shall be furnished when specified. Fastenings for sizes O, I, II, III, and IV shall be screws; for sizes V and VI, through bolts with washers and cap nuts. The following size designations are the equivalent of the various sizes designated by the manufacturers as suitable for the sizes and types of doors scheduled below:

O. For screen doors.

I. For screen, storm, pantry, closet, and very light interior doors not exceeding $1\frac{1}{8}$ inches by 2 feet 6 inches by 6 feet 6 inches.

II. For light interior doors not over 3 feet wide and exterior doors not exceeding $1\frac{3}{4}$ inches by 2 feet 8 inches by 7 feet.

III. For light exterior doors not over 2 feet 6 inches wide and ordinary interior doors.

IV. For very heavy interior doors and exterior doors not over 3 feet wide.

V. For heavy exterior doors 3 inches thick or less and doors operating against strong drafts.

VI. For extra-heavy exterior doors, tin-clad doors, and vault doors not exceeding 2,000 pounds in weight.

Type 1128A.—Same as type 1128, except with cast-iron case with smooth surface and prime coat suitable for painting.

Type 1128B.—Same as type 1128, except with cast-iron case commercial bronzed (sprayed).

617.42 CATCHES.

AMERICAN MARINE STANDARDS COMMITTEE, BOLTS AND CATCHES FOR SHIP DOORS, H No. 62-1930

BOLTS AND CATCHES FOR SHIP DOORS

BUILDERS' HARDWARE (NONTEMPLATE)

CASEMENT FASTENERS

Type 1131.—T handle. With rim strike. Cast bronze. Size $1\frac{1}{2}$ by $1\frac{1}{2}$ inches.

Type 1131A.—Same as type 1131, except cast iron, plated.

Type 1131B.—T handle. With surface strike. Cast bronze. Size $1\frac{1}{2}$ by $1\frac{1}{2}$ inches.

Type 1131C.—Same as type 1131B, except cast iron, plated.

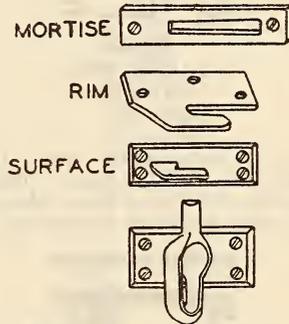

FIGURE 950.—Casement fasteners, types 1134, 1134A, 1134B

Type 1134.—D handle. With rim strike. Cast bronze. Size 3 by $1\frac{1}{2}$ inches.

Type 1134A.—Same as type 1134, except with mortise strike.

Type 1134B.—Same as type 1134, except with surface strike.

CELLAR-WINDOW FASTENERS

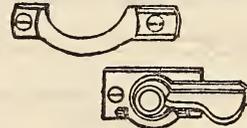

FIGURE 951.—Cellar-window fastener, type A1137

Type A1137.—Cast iron, galvanized. Size about $1\frac{1}{2}$ by $2\frac{1}{2}$ inches.

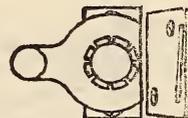

FIGURE 952.—Cellar-window fastener, type B1137

Type B1137.—Wrought steel, galvanized; Cam action and cam release with spring washer. Plates about $1\frac{1}{2}$ inches long. Universal strike.

Type B1137A.—Same as type B1137, except japanned.

SASH FASTENERS

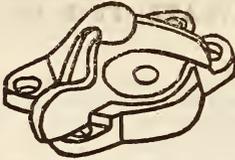

FIGURE 953.—Sash fastener, type 1139

Type 1139.—Crescent type. Cast bronze. Moving parts shall have cam action. For double-hung sash. Size of case about 1 by 2¾ inches, approximately 40 pounds to the gross (boxed with screws).

Type 1139A.—Same as type 1139, except cast iron, plated.

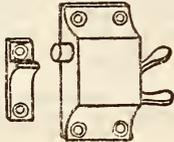

FIGURE 954.—Sash fastener, type 1146

Type 1146.—Car window type. Cast bronze approximately 2½ by 1¼ inches. Right and left hand. Furnish with three stops, about 1½ by ⅙ inch with ½ inch minimum projection.

SCUTTLE FASTENERS

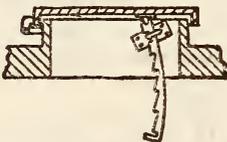

FIGURE 955.—Scuttle fastener, type A1148

Type A1148.—Wrought iron, galvanized. Size ¾ by 1½ by 30 inches.

WINDOW SCREEN FASTENER

FIGURE 956.—Window screen fastener, type 1650

Type 1650.—Galvanized, 10-inch size. To hold screen open or closed.

FASTENERS FOR BLINDS

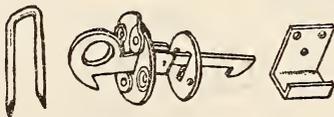

FIGURE 957.—Fastener for blinds, type 1811

Type 1811.—Wrought steel, galvanized, unless plain steel is specified. Double acting gravity

type with screws. When closed it shall not be possible to unlock blind from outside. Furnish with sill staple and back catch with screw holes for frame construction.

Type 1811A.—Same as type 1811, except with back catch shaped for driving into brick construction.

FIGURE 958.—Fastener for blinds, type 1812

Type 1812.—Combined fastener and holder type. Cast-iron fittings with wrought steel holding rod. Shall hold open at four positions including wide open. When closed, rod shall engage hook on blind. Japanned, with screws. Sizes, 7, 9, 10¼, and 14 inches for ⅙-inch rods; 16 and 18 inches for ⅜-inch rods; 20 and 22 inches for ⅞-inch rods; and 24 inches for 1-inch rods.

Type 1812A.—Same as type 1812, except zinc coated.

DOOR FASTENERS, WITH CHAIN

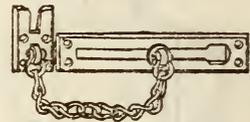

FIGURE 959.—Door fastener, with chain, type 1116

Type 1116.—Wrought bronze. Length of plates about 6 inches.

Type 1116A.—Wrought steel, plated. Length of plates about 6 inches.

Type 1118.—Cast bronze. Length of plates about 6 inches.

Type 1118A.—Cast iron, plated. Length of plates about 6 inches.

The above types (about 6 inches long) are suitable only for doors having stiles not less than 6 inches wide or having horizontal rails or muntins. When fasteners are specified for doors without horizontal rails or muntins or with stiles from 4 to less than 6 inches wide, their plates shall be 4 to 4½ inches long, as the case requires.

TURNBUCKLES FOR BLINDS

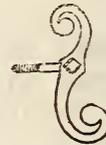

FIGURE 960.—Turnbuckle for blinds, type 1821

Type 1821.—Wrought steel S pattern right and left. Prime coat for painting. Minimum length, 6 inches. With lag screw.

Type 1821A.—Same as type 1821, except with back plate. Four screw holes.

Type 1821B.—Same as type 1821, except with drive pin for brick.

617.44 DOOR HOLDERS AND STOPS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

DOOR STOPS, DOOR HOLDERS

(See 617.0, p. 977, also Federal specification FF-H-101 below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLE), FF-H-101, AUGUST 19, 1930

DOOR HOLDERS

(For types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLE)

FIGURE 961.—Door holder, type A1149

Type A1149.—Overhead door holder, stop, and shock absorber. Folding disk jointed type. Locking handle adjustable for the neutral and locked positions. Cast bronze bearings and fittings, malleable iron arms, plated.

Size 1. For 24 to 28 inch doors. Minimum weight, 3 pounds 7 ounces.

Size 2. For 30 to 36 inch doors. Minimum weight, 3 pounds 10 ounces.

Size 3. For doors 36 inches and over. Minimum weight, 3 pounds 14 ounces.

Type A1149A.—Same as type A1149, except cast phosphor bronze.

Size 1. For 24 to 28 inch doors. Minimum weight, 3 pounds 12 ounces.

Size 2. For 30 to 36 inch doors. Minimum weight, 4 pounds 2 ounces.

Size 3. For doors 36 inches and over. Minimum weight, 4 pounds 9 ounces.

FIGURE 962.—Door holder, lever type, type B1149

Type B1149.—Lever type. Cast bronze. Provided with circular replaceable rubber tip. Shall swing up and remain securely held in vertical position when out of action. Length 4 to 4½ inches for doors with 2-inch or less floor clearance.

Type B1149A.—Same as type B1149, except with arm or lever 5 to 5½ inches long for doors with 3½-inch or less floor clearance.

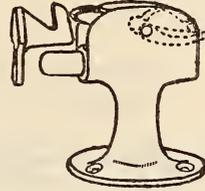

FIGURE 963.—Door holder, floor type, type C1149

Type C1149.—Floor type door holder, and bumper with an encased metal plunger and semiautomatic engagement of hook and tongue. Height 1¼ inches minimum.

Type C1149A.—Same as type C1149, and equipped with ½-inch steel stud and expansion shield.

FIGURE 964.—Door holder, plunger type, type 1151

Type 1151.—Plunger type. Wrought bronze case. Rubber tip removable. Releasing lip shall be plainly evident. Size about 6 inches.

Type 1151A.—Same as type 1151, except wrought steel, plated.

Type 1153.—Plunger type. Cast bronze case. Rubber tip removable. Releasing lip shall be plainly evident. Size 6 inches.

Type 1153A.—Same as type 1153, except cast iron, plated.

Type 1154.—Plunger type. Cast bronze case. Rubber tip removable. Releasing lip shall be plainly evident. Size 8 inches.

Type 1154A.—Same as type 1154, except cast iron, plated.

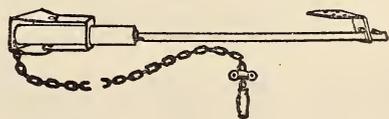

FIGURE 965.—Door holder, overhead garage type, type B1154

Type B1154.—Overhead garage type. Wrought steel japanned or galvanized. Bar not less than 30

inches long. Catch on end of bar shall prevent pulling through bumper plate. Equipped with cushion spring. Release chain approximately 44 inches long.

Type B1154A.—Same as type B1154, except without cushion spring.

DOOR STOPS

Wall type

FIGURE 966.—Door stops, wall type, type 1332

Type 1332.—Cast bronze, with rubber tip; 3-inch projection. To screw. Diameter of base about 1 inch.

Type 1332A.—Same as type 1332, except cast iron, plated.

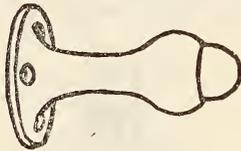

FIGURE 967.—Door stop, wall type, type 1334

Type 1334.—Cast bronze, with rubber tip; 3½-inch projection. Diameter of base about 2¼ inches. Regular fastenings, three wood screws. When specified, furnish expansion sleeves for attaching to marble or stone work.

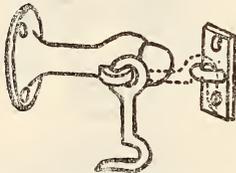

FIGURE 968.—Door stop, wall type, type 1336

Type 1336.—Same as type 1334, except with hook and keeper.

Floor type

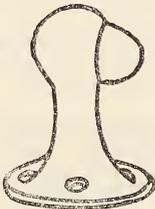

FIGURE 969.—Door stop, floor type, type 1340

Type 1340.—Cast bronze, with rubber tip. Height about 3 inches. Diameter of base about 2½ inches. Regular fastenings, three wood screws.

When specified, furnish expansion sleeves for attaching to marble or stone work.

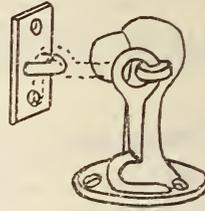

FIGURE 970.—Door stop, floor type, type 1341

Type 1341.—Same as type 1340, except with hook and keeper.

617.5 TRANSOM AND SASH DEVICES.

AMERICAN MARINE STANDARDS COMMITTEE, SASH HARDWARE FOR SHIPS, H NO. 63-1930

SASH HARDWARE FOR SHIPS

Meeting rail sash lock.—One size and hand only as shown by Figure 971.

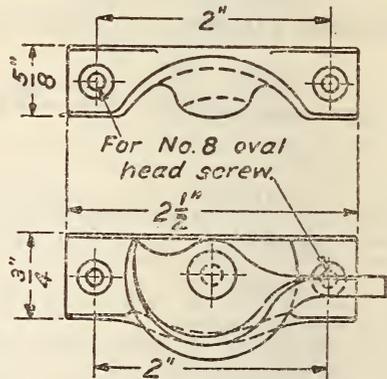

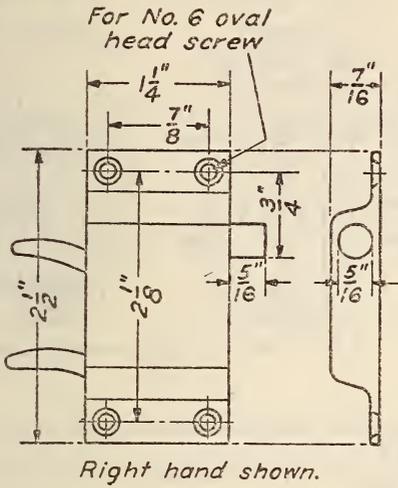

FIGURE 971

Spring bolt sash fastener.—One size only as shown by Figure 972(a). May be required of either right or left hand, with one or more individual ratchet stops or with multiples of the latter in form of strip, as indicated by Figure 972(b), or in lieu thereof, one or more individual plate keepers as shown by Figure 972(c). The hand of the fastener and full particulars of the stops or keepers must be given in asking for quotations and in purchasing.

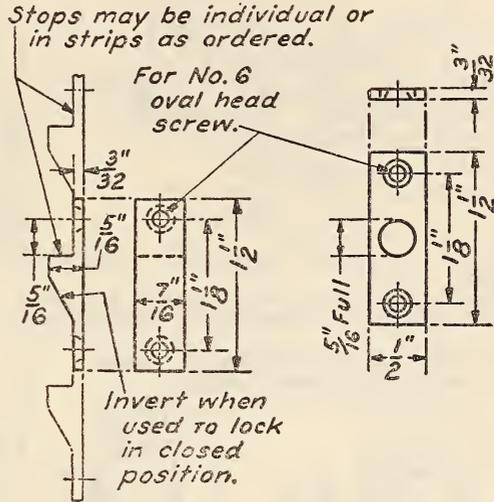

Hook sash fastener.—One type and size only as shown by Figure 973.

Pawl sash catch.—One size only as shown by Figure 974(a). May be required of either right or left hand, with one or more individual ratchet stops or with multiples of the latter in form of strip as shown by Figure 974(b). The hand of the catch and the particulars of the stop must be given in asking for quotations and in purchasing.

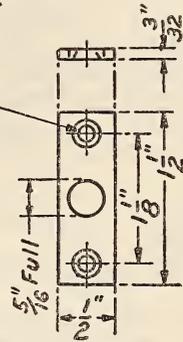

Antirattler, cam type.—One size only as shown by Figure 975. May be required for either left or right hand, the hand to be specified in asking for

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION RR-C-271 FOR STANDARD MISCELLANEOUS CHAIN AND ATTACHMENTS, DECEMBER 8, 1931

SASH ATTACHMENTS

(For general specifications, material and workmanship, general requirements, detail requirements, inspection and tests, packing and marking, see 603.50, p. 199.)

(See also 603.51, p. 201; 603.52, p. 204; 603.54, p. 211; 603.56, p. 212; 603.57, p. 217; 631.9, p. 1164; 642.9, p. 1191; 645.9, p. 1242; and 646.59, p. 1258.)

1. Sash attachments shall be as covered by the following sketches:

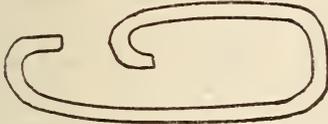

FIGURE 981.—Attachment to weight

Dimensions, 3/4 by 1 1/4 by 0.135 inches. Steel wire.

FIGURE 982.—Socket secured to sash

Dimensions, 1 by 3/4 by 0.070 inches. Sheet steel.

FIGURE 983.—Attachment to socket

Dimensions, 1 by 1 by 0.120 inches. Steel wire.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF - H - 101, AUGUST 19, 1930

(For types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

SASH CORD IRONS

FIGURE 984.—Sash cord iron, type B1118

Type B1118.—Cast iron, about 5/8-inch long with flat-head screw.

SASH OPERATORS

For vertically pivoted sash

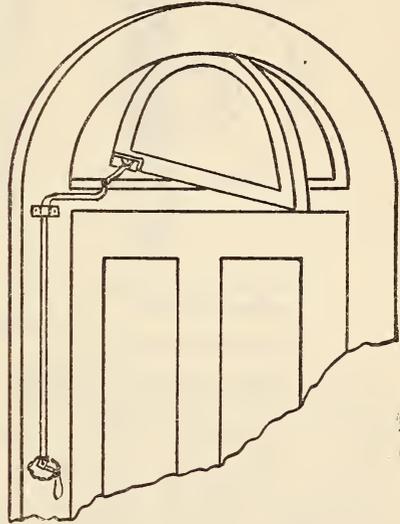

FIGURE 985.—Sash operator, type 1501

Type 1501.—Bronze.—Vertical rotating rod with arm and connection to sash. Jointed handle with locking mechanism. Rods 3/8-inch diameter; lengths 3, 4, 5, and 6 feet.

Type 1501A.—Same as type 1501, except steel, plated.

SASH WEIGHTS

FIGURE 986.—Sash weight, type 1701

Type 1701.—Cast iron, round, reasonably smooth, free from fins, with well-formed eyes. Weights as required.

Type 1701A.—Same as type 1701, except square.
Type 1701B.—Same as type 1701, except cast lead, round.
Type 1701C.—Same as type 1701, except cast lead, square.

SASH PULLEYS

Type 1248.—Polished iron or wrought steel wheels with round groove for cord. Plain iron or steel face for two wood screws. Wrought steel or cast-iron case, round ends. One-fourth inch plain steel axle.

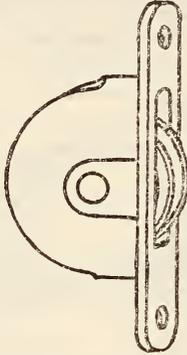

FIGURE 987.—Sash pulley, type 1248

[All dimensions in inches]

Size of wheel	Width of front	Length of front	Thickness of front
2	1 1/4	5	1/8
2 1/4	1 1/4	5	1/8
2 1/2	1 1/4	5 1/4	5/32

Type 1249.—Turned iron wheel, with combination groove for cord or chain. Polished and plated iron face for two wood screws. Cast-iron case, with round ends. Three eighths inch plain steel axle.

[All dimensions in inches]

Size of wheel	Width of front	Length of front	Thickness of front
2	1 1/4	5	1/8
2 1/4	1 1/4	5	1/8
2 1/2	1 1/4	5 1/4	5/32

Type 1249A.—Same as type 1249, except roller bearing with 1/4-inch minimum diameter axle.

Type 1249C.—Same as type 1249, except with wrought steel wheel and case. Metal of wheel not less than 0.024 inch thick. Metal of case not less than 0.031 inch thick. Metal of face plate not less than 0.050 inch thick.

Type 1249D.—Same as type 1249, except with wrought steel wheel and case, and with ball-bearing axle. Metal of wheel not less than 0.024 inch thick. Metal of case not less than 0.031 inch thick. Metal of face plate not less than 0.050 inch thick. Wheel sizes 2 1/4 and 2 1/2 inches.

Type 1250A.—Turned brass wheel, steel bushed with combination groove for cord and chain. Wrought bronze front. Cast-iron case with round ends. Roller bearing with 1/4-inch minimum diameter steel axle with rollers machined true.

[All dimensions in inches]

Size of wheel	Width of front	Length of front	Thickness of front
2	1 1/4	5	1/8
2 1/4	1 1/4	5	1/8
2 1/2	1 1/4	5 1/4	5/32

Type 1250B.—Same as type 1250A, except ball bearing with 1/4-inch minimum diameter axle.

Type 1250C.—Same as type 1250A, except with wrought steel case, wrought bronze face plate and wheel, with ball-bearing axle. Metal of wheel not less than 0.024 inch thick. Metal of case not less than 0.031 inch thick. Metal of face plate not less than 0.062 inch thick. Wheel sizes 2 1/4 and 2 1/2 inches.

Type 1250E.—Overhead type sash pulley. Turned face iron wheel. Wrought bronze front. Cast-iron case. Roller bearings, rollers machined true. Wheels fully housed to prevent chain from leaving wheel. Equipment shall include all necessary parts of suitable sizes for complete operation on double-hung counter-weighted sash in mullion windows without weights in the mullions.

TRANSOM OPERATORS

Type 1530.—For heavy sash, over 3 1/2 feet wide, horizontally hinged or pivoted. Operator shall connect to each side of transom with brass screw and traveling nut to control movement. The transmission shall consist of solid rod and miter gears. The operation shall be by hand crank through inclosed pair of miter gears. The mechanism shall provide smooth and even operations of transom and be self-locking at all points. Steel rods one-half inch diameter for transoms up to 5 by 4 feet not heavier than 100 pounds. Cast-iron brackets, plated.

Type 1530A.—Same as type 1530, except with 5/8-inch diameter steel rods for larger or heavier transoms, but not heavier than 175 pounds.

WINDOW STOP ADJUSTER

Type 1343.—Flat, adjustable steel washer with 1 1/4-inch No. 8 round-head screw.

Type 1344.—Cup type adjustable bronze washer with 1-inch No. 8 round-head screw.

TRANSOM CHAINS

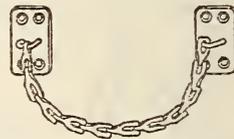

FIGURE 988.—Transom chain, type 1120A

Type 1120A.—Steel, plated. Four screws to each plate. Lengths 12 and 15 inches over all. Steel sash chain, 0.055-inch metal thickness as specified in Federal Specification RR-C-271.

Type 1120B.—Same as type 1120A, except galvanized.

FIGURE 989.—Transom chain, type 1122

Type 1122.—Heavy type, bronze. Lugs and plate made in one casting. Four screws to each plate. Lengths 12 and 15 inches over all. Bronze sash chain, 0.055-inch metal thickness as specified in Federal Specification RR-C-271.

TRANSOM EYES

Type 1268.—Cast bronze. Size 1 by 1 1/2 inches or 1 1/4 by 1 1/4 inches.

TRANSOM LIFTERS

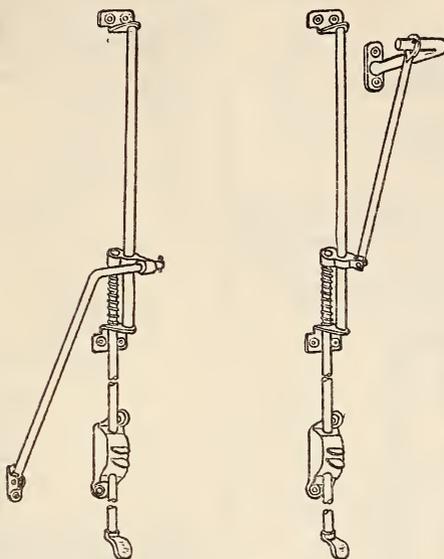

FIGURE 990.—*Transom lifters*

A and B lifters (spring not required on A).
C and D lifters (spring not required on D).

All transom lifters shall have automatic grips.

Type	Figure	For sash	Material	Diameter, rod	Lengths as required	Safety cushion spring

CASEMENT ADJUSTERS

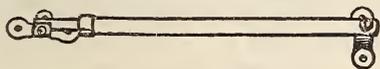

FIGURE 991.—*Casement adjuster, type 1000*

Type 1000.—Friction type. Wrought-bronze sliding rod and tube, 8-inch extension. Friction adjustable. For out or in swinging casements. Lengths, 10 and 12 inches.

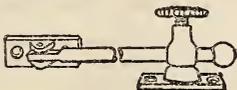

FIGURE 992.—*Casement adjuster, type 1002*

Type 1002.—For out-swinging casements. Bronze. Three-eighths-inch diameter round bar; swivel standard. Thumb-screw grip with broad-knurled rim for finger hold. Lengths, 10 and 12 inches.

Type 1002A.—Same as type 1002, except cast iron or steel, plated.

Type 1002B.—Same as type 1002, except cast iron or steel, galvanized.

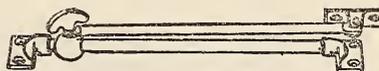

FIGURE 993.—*Casement adjuster, type 1003*

Type 1003.—Casement adjuster for outswinging sash, bronze, with solid stationary rod and solid movable rod, each five-sixteenths inch in diameter. Stationary rod shall have two cast base or sill plates, each about 3/4 by 1 1/4 inches. Movable rod shall have a cast sash plate about 5/8 by 1 3/4 inches and a thumb-set sliding connection on the stationary rod. Lengths over all approximately 9 and 13 inches, as specified.

Type 1003A.—Same as type 1003, except iron or steel, polished and plated.

Type 1006.—For in-swinging casements. Bronze. Three-eighths-inch diameter round bar. Thumb-screw grip with broad-knurled rim for finger hold. Lengths, 10 and 12 inches.

Type 1006A.—Same as type 1006, except cast iron or steel, plated.

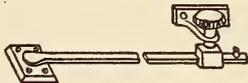

FIGURE 994.—Casement adjuster, type 1008

Type 1008.—For in-swinging casements. Cast bronze. Rectangular bar $\frac{5}{16}$ by $\frac{1}{2}$ inch. Thumb-screw grip with broad knurled rim for finger hold. Lengths, 12 and 15 inches.

SASH OR TRANSOM PIVOTS

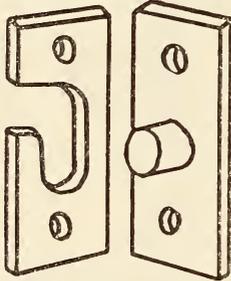

FIGURE 995.—Sash or transom pivot, type 1109

Type 1109.—Full mortise type. Cast iron, japanned. Plate $2\frac{1}{4}$ by $\frac{7}{8}$ inch, with open slot; $\frac{3}{8}$ -inch pin.

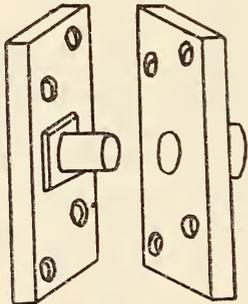

FIGURE 996.—Sash or transom pivot, type 1113

Type 1113.—Extra heavy full mortise type for vertical pivots. Cast iron, japanned. Plate 4 by $1\frac{1}{4}$ inches about $\frac{1}{16}$ inch thick with round hole; $\frac{1}{2}$ -inch pin.

Rabbeted

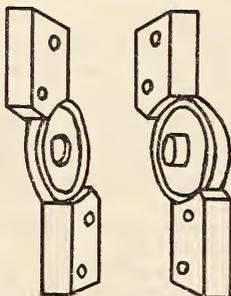

FIGURE 997.—Sash or transom pivot, rabbeted, type 1114

Type 1114.—With interlocking weatherproof grooves. For $\frac{1}{2}$ -inch rabbet. Cast bronze. Sizes, $3\frac{3}{4}$ by $1\frac{3}{8}$, $3\frac{3}{4}$ by $1\frac{3}{4}$, and $4\frac{1}{2}$ by $2\frac{1}{4}$ inches. For sash thickness, $1\frac{3}{8}$, $1\frac{3}{4}$ and $2\frac{1}{4}$ inches.

Type 1114A.—Same as type 1114, except cast iron, plated.

FIGURE 998.—Sash or transom pivot, rabbeted, type 1115

Type 1115.—Friction type, with corrugated friction washers. For $\frac{1}{2}$ -inch rabbet. Cast bronze, steel bushed or with steel balls and springs. Sizes $3\frac{3}{4}$ by $1\frac{3}{8}$, $3\frac{3}{4}$ by $1\frac{3}{4}$, and $3\frac{3}{4}$ by $2\frac{1}{4}$ inches. For sash thickness, $1\frac{3}{8}$, $1\frac{3}{4}$, and $2\frac{1}{4}$ inches.

Type 1115A.—Same as type 1115, except malleable iron, plated.

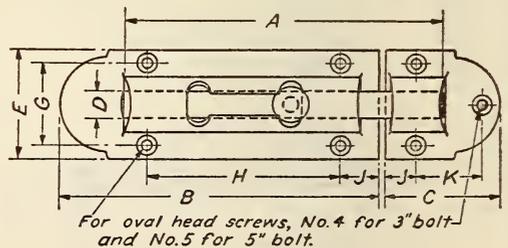

Type 1115B.—Same as type 1115A, except unfinished.

617.6 BOLT LOCKS, BRACKETS, AND HOOKS.

617.61 BOLT LOCKS.

AMERICAN MARINE STANDARDS COMMITTEE, BOLTS AND CATCHES FOR SHIP DOORS, H NO. 62-1930

BOLTS AND CATCHES FOR SHIP DOORS

For oval head screws, No. 4 for 3" bolt and No. 5 for 5" bolt.

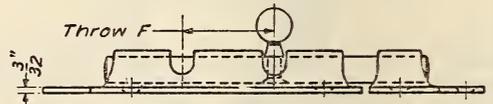

FIGURE 999.—Barrel bolt

Barrel bolts.—Two standard sizes as shown by Figure 999. These bolts are suitable for installation in horizontal position only.

[Dimensions in inches]

Size	A	B	C	D	E	F	G	H	J	K
3	3	$1\frac{1}{4}$	$\frac{3}{8}$	$1\frac{1}{16}$	$1\frac{5}{16}$	$\frac{7}{8}$	$1\frac{3}{4}$	$\frac{3}{8}$	$1\frac{1}{16}$	$\frac{1}{4}$

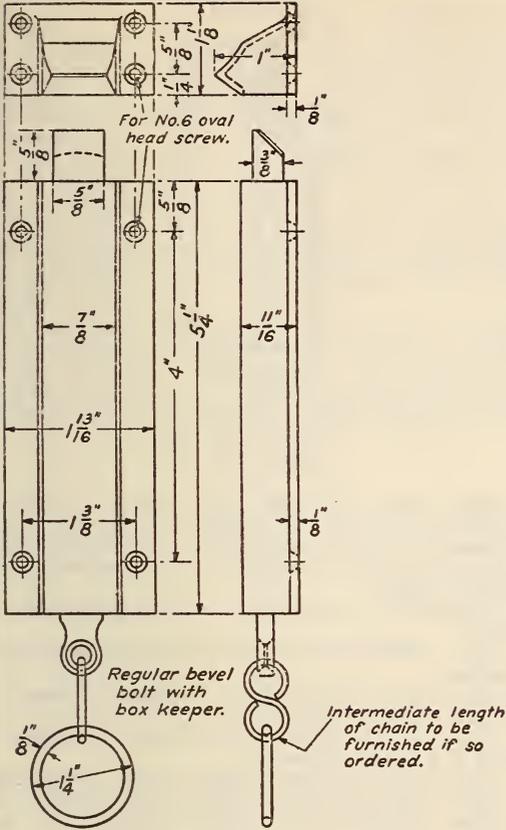

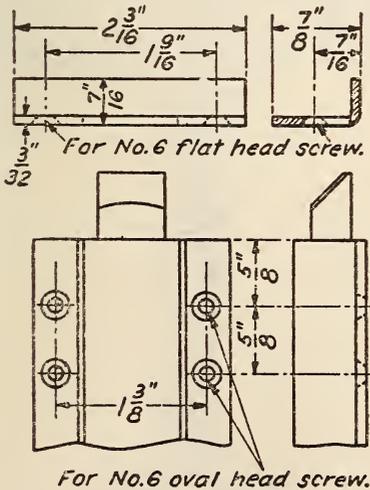

FIGURE 1006.—Spring bolt

Spring bolt (also known in the hardware trade as chain bolt).—One standard size as shown by Figure 1006. This bolt may be required of regular bevel with box keeper as per Figure 1006, or of reverse bevel with an angle keeper as per Figure 1007.

Reverse bevel bolt with angle keeper.

FIGURE 1007.—Spring bolt

The regular bevel bolt shall be attached by four screws; the reverse bevel bolt shall be attached by six screws. The standard includes a ring handle attached to the bolt by a short link as shown, but an intermediate length of chain shall be inserted in lieu of the short link when so ordered. This bolt is suitable for medium weight and heavy doors.
Turn catch for cupboard and locker doors.—One standard size as shown by Figure 1008.

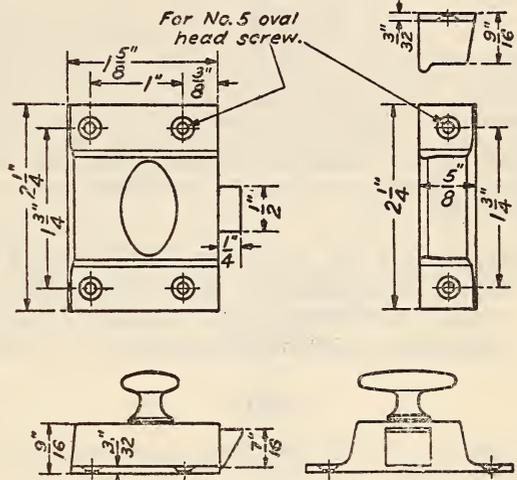

FIGURE 1008.—Turn catch for cupboard and locker doors

Elbow catch.—One standard size as shown by Figure 1009. This type of catch is applicable to the standing door of a pair of doors on cupboards and lockers.

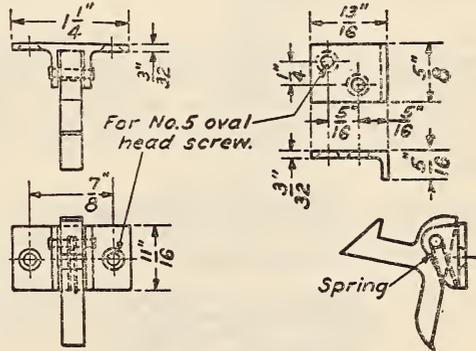

FIGURE 1009.—Elbow catch

GENERAL REQUIREMENTS

(In respect to materials, including percentages of components of white bronze, screws, and marking and packing, this specification conforms to A. M. S. C. H. No. 61-1930, specification for locks and accessories for ship doors. (See 617.21, p. 1004.) Otherwise it provides as follows:)

Construction.—The fittings shall conform to the standards herein defined to the satisfaction of the purchaser and shall be guaranteed by the manufacturer or dealer for efficient operation and lasting service. All features, including the positions and dimensions of holes for screws, which are to govern cutting of doors or adjacent framework to fit and attach the bolts, catches, and their accessories, shall be in such close accordance with the drawings that

any item may be quickly replaced by another one of the same standard type and size without requiring additional cutting or fitting. Reasonable variations in other features will be allowed which do not prevent interchangeability or impair good appearance or serviceability. Certain ones of the bolts may be required for metal doors and when ordered for such purpose, the underside of the base which is to fit on the metal door shall be machined to a true plane.

Workmanship and finish.—The workmanship shall be such as to produce good appearance and serviceability and shall be uniform in character. Exposed surfaces shall be polished and lacquered; other surfaces shall be rough dipped, except where machining is required for assembly, installation, and operation. This shall constitute the standard finish, and any variation desired therefrom must be clearly stated in asking for quotations and in purchasing.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

BOLTS

(See 617.0, p. 977, also Federal specification FF-H-101, below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930.

(For types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

BUILDERS' HARDWARE (NONTEMPLATE)

BARREL BOLTS

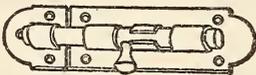

FIGURE 1010.—*Barrel bolt, type 1019*

Type 1019.—Heavy wrought steel, plated. Length of bolt, 3, 4, and 5 inches. Minimum thickness of plate, 0.051 inch.

Type 1019A.—Heavy wrought steel, galvanized. Length of bolt, 3, 4, 5, and 6 inches. Minimum thickness of plate, 0.051 inch.

Type 1019B.—Same as type 1019A, except janned.

Type 1019C.—Same as type 1019, except wrought brass.

Type 1020.—Cast bronze polished. Length of bolt, 3, 4, and 5 inches.

CHAIN BOLTS

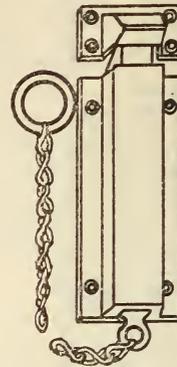

FIGURE 1011.—*Chain bolt, type 1022*

Type 1022.—Wrought steel, plated. Round or square case acceptable. Length of bolt, 3, 6, and 8 inches. Minimum thickness of plate, 0.040, 0.064, and 0.064 inch, respectively. (For use with type 1049 or 1050.)

Type 1022A.—Same as type 1022, except galvanized.

Type 1022B.—Same as type 1022, except janned.

Type 1025.—Cast bronze, polished. Length of bolt, 3, 6, and 8 inches.

Type 1025A.—Cast iron, plated. Length of bolt, 3, 6, and 8 inches.

Type 1025B.—Same as type 1025A, except galvanized. Length of bolt, 3, 6, and 8 inches.

Type 1025C.—Same as type 1025A, except janned. Length of bolt, 3, 6, and 8 inches.

CREMONE BOLTS

FIGURE 1012.—*Cremone bolt, type 1027*

Type 1027.—All bronze with wrought bronze rod one-half inch wide. Half oval or half round rods,

with guides for every 2 feet of rod. Constructed so as not to deface paint in operating. Oval knob or lever handle, right or left hand as specified. Quarter or half turn shall operate. Operation from inside only. Minimum size of knob $2\frac{1}{4}$ by $1\frac{3}{8}$ inches for French doors; and $1\frac{3}{4}$ by $1\frac{1}{8}$ inches for casement windows.

Type 1027A.—Same as type 1027, except with steel rod, and iron or steel cases and guides, unfinished. Bronze knob or handle.

Type 1027B.—Same as type 1027, except with steel rod, and iron or steel cases and guides, plated.

Type 1028.—Same as type 1027, except with $\frac{5}{8}$ -inch wrought bronze rod and bronze cases and guides.

Type A1028.—Extra heavy garage type, wrought steel, galvanized and japanned. Half oval rod $\frac{3}{4}$ inch wide, half oval bolt head $1\frac{1}{2}$ inches wide. Handle 7 inches long. Throw of bolts $1\frac{1}{2}$ inches. Standard for 8-foot doors with total adjustment of 6 inches. Furnished with extra floor keeper.

ESPAGNOLETTE BOLTS

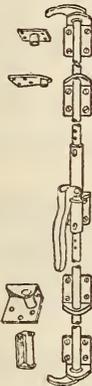

FIGURE 1013.—*Espagnolette bolt, type A1030*

Type A1030.—Extra heavy garage type, wrought steel, galvanized and japanned. Diameter of rod $\frac{5}{8}$ inch; 7-inch handle. Handle shall lock bolt when in closed position. Standard for 8-foot doors with total adjustment of $4\frac{3}{4}$ inches.

FLUSH BOLTS

FIGURE 1014.—*Flush bolt, type 1037B*

Type 1037B.—Wrought steel, plated; $\frac{1}{2}$ -inch square bolt with knob for mounting on face of door stiles. Plates $1\frac{1}{4}$ inches wide, minimum thickness 0.081 inch. Sizes 6, 9, 12, and 18 inches.

EXTENSION FLUSH BOLTS

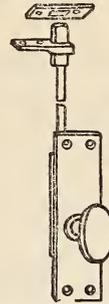

FIGURE 1015.—*Extension flush bolt, type 1014*

Type 1041.—Turn knob type for surface with oval turn knob. Cast bronze. Plate, $5\frac{1}{8}$ by $1\frac{1}{2}$ inches. Bolt head, $\frac{1}{2}$ inch. Length of rods, 9, 12, 18, and 24 inches.

Type 1041A.—Same as type 1041, except iron or steel, plated.

LEVER FLUSH BOLTS

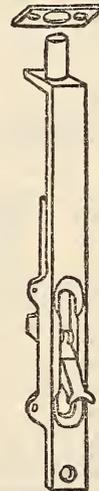

FIGURE 1016.—*Lever flush bolt, type 1043*

Type 1043.—Cast bronze. Plate, 6 by $\frac{5}{8}$ inch. Bolt head not less than $\frac{3}{8}$ -inch diameter with $\frac{5}{8}$ -inch throw.

Type A1043.—Cast bronze, plate 1 inch to $1\frac{1}{4}$ inches wide by 9, 12, or 18 inches long. Bolt head not less than $\frac{3}{8}$ inch.

EXTENSION-LEVER FLUSH BOLTS

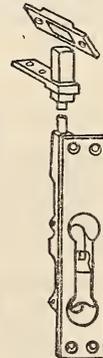

FIGURE 1017.—*Extension lever flush bolt, type 1044*

Type 1044.—Cast bronze. Plate, 6 by $\frac{5}{8}$ inch. Bolt head, $\frac{3}{8}$ inch. Length of rods, 12, 18, and 24 inches.

Type A1044.—Same as type 1044, except cast iron, plated.

Type 1044B.—Cast bronze. Plate $6\frac{3}{4}$ by $1\frac{1}{4}$ inches. Bolt head, $\frac{1}{2}$ inch. Length of rods, 9, 12, 18, and 24 inches.

Type B1044B.—Same as type 1044B, except cast iron, plated.

Type 1044D.—Same as type 1044B, except wrought bronze. Minimum thickness of plate 0.092 inch.

Type 1044E.—Same as type 1044B, except wrought steel, plated. Minimum thickness of plate 0.092 inch.

FOOT BOLTS

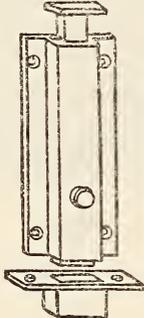

FIGURE 1018.—
Foot bolt, type 1047

Type 1047.—Cast bronze, polished foot bolts with trip. Sizes 4, 6, and 8 inches.

Type 1047A.—Cast iron, plated. With trip. Sizes 4, 6, and 8 inches.

Type 1047B.—Same as type 1047A, except galvanized. Sizes 4, 6, and 8 inches.

Type 1047C.—Same as type 1047A, except japanned. Sizes 4, 6, and 8 inches.

Type 1049.—Wrought steel, plated. With trip. Round or square case acceptable. Size, 3, 6, and 8 inches. Minimum thickness of plate, 0.040, 0.064, and 0.064 inch, respectively. (For use with type 1022.)

Type 1049A.—Same as type 1049, except galvanized. Sizes 3, 6, and 8 inches.

Type 1049B.—Same as type 1049, except japanned. Sizes 3, 6, and 8 inches.

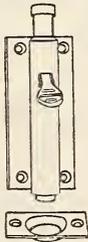

FIGURE 1019.—
Foot bolt, type 1050

Type 1050.—Wrought steel positive action foot bolts. Plated. Sizes 6 and 8 inches. (For use with type 1022.)

Type 1050A.—Same as type 1050, except galvanized. Sizes 6 and 8 inches.

Type 1050B.—Same as type 1050, except japanned. Sizes 6 and 8 inches.

Type 1051.—Extra heavy cane bolt. Galvanized steel rod, minimum diameter $\frac{3}{4}$ inch. Cast-iron guides, japanned. Strikes to be furnished for wood or concrete. Suitable stops shall prevent bolt from slipping out of guides. Length of bolt 20 inches, minimum throw 12 inches.

FIGURE 1020.—
Cane bolt, type 1051

Type 1051A.—Heavy wrought steel cane type. Galvanized steel rod, minimum diameter $\frac{5}{8}$ inch. Wrought steel guides japanned. Strikes to be furnished for wood or concrete. Suitable stops shall prevent bolt from slipping out of guides. Minimum throw 8 inches, length of bolt 18 and 24 inches.

LAVATORY DOOR BOLTS

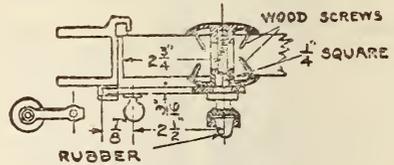

FIGURE 1021.—Lavatory door bolt, type A1051

Type A1051.—Bronze, nickel plated. Rubber stop on strike and rubber tip on knob. Adjustable for $1\frac{1}{8}$ to $1\frac{3}{8}$ inch door and stile. Strike secured with through bolts and cap nuts.

Type A1051A.—Same as type A1051, except nickel bronze.

FIGURE 1022.—Lavatory door bolt, type B1051

Type B1051.—Cast bronze, nickel plated. Reversible. Minimum length of bar 4 inches. Size of base about 2 by 2 inches.

Type B1051A.—Same as type B1051 except nickel bronze.

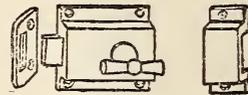

FIGURE 1023.—Lavatory door bolt, type C1051

Type C1051.—Cast bronze, nickel plated. T handle, without indicator. Rim or mortise strike. Size about $2\frac{1}{2}$ by $2\frac{3}{8}$ inches.

Type C1051A.—Same as type C1051, except nickel bronze.

MORTISE BOLTS

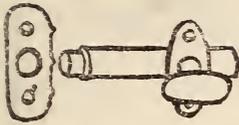

FIGURE 1024.—Mortise bolt, type 1053A

Type 1053A.—Wrought steel bolt. Approximate diameter of case $\frac{3}{16}$ inch. Bronze turn, plate and strike. Back-set $1\frac{3}{8}$ inches.

NECK BOLTS

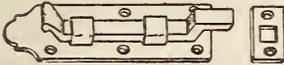

FIGURE 1025.—Neck bolt, type 1054

Type 1054.—Wrought brass plate and strike with wrought or cast brass bolt; size 3 inches, minimum weight 1.0 ounce each; size 4 inches, minimum weight 2.0 ounces each.

Type 1054A.—Same as type 1054, except cast brass. Size 3 inches, minimum weight 4.0 ounces each. Size 4 inches, minimum weight 5.6 ounces each.

Type 1056.—Wrought steel, japanned, plain square bolt, rust-proof spring. Minimum thickness of plate 0.033 inch. Minimum throw of bolt $\frac{1}{2}$ inch.

Size	Width of plate	Offset
Inches $2\frac{1}{2}$ 4	Inches 1 $1\frac{1}{8}$	Inch $\frac{1}{4}$ $\frac{3}{8}$

SQUARE BOLTS

Type 1058.—Cast brass square bolt, size 4 inches.

Type 1059.—Square bolt unfinished, $2\frac{1}{2}$, 3, and 4 inches with two strikes, flat and strap.

SURFACE BOLTS

FIGURE 1026.—Surface bolt, type 1060

Type 1060.—Wrought bronze. Three-eighths-inch half round or oval rod. One-inch throw. Two guides which shall prevent bolt from touching woodwork. Bolts shall not rotate, and shall be secure in both extended and withdrawn positions. Furnish with angle and universal strikes. Lengths 4 and 6 inches.

EXIT BOLT LOCKS

Type 800.—For use with exit bolt type 831. Rotary antifriction or roll-back latch bolt with auxiliary bolt. Japanned cast-iron case, $5\frac{3}{8}$ by $3\frac{3}{4}$ by $\frac{3}{4}$ inch. Solid front, 8 by $1\frac{1}{4}$ inch. Backset, $2\frac{3}{4}$ inches. Lock shall have one or more bronze cylinders with five or more pin tumblers giving practically unlimited changes. Bronze front, bolts, and strike, not reversible. Three nickel-bronze keys. Master-keyed if so ordered.

Operation.—From inside by slight push or pull, or both, on bar at all times. From outside by key when locked and by handle when unlocked. When locked, latch bolt shall be deadlocked by auxiliary bolt upon engaging strike, and action of auxiliary bolt shall permit of space $\frac{3}{16}$ inch between lock front and strike without releasing deadlocking function. Latch bolt shall be capable of being locked in retracted position.

Type 801.—Same as type 800, except operation from outside by knob when unlocked.

EXIT BOLTS

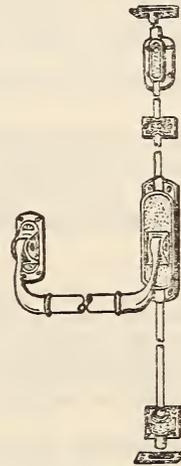

FIGURE 1027.—Exit bolt, type 830

Type 830.—Surface type for single exit doors only. Top and bottom locking. Shall require no outside trim. All cast bronze except wrought-bronze cross bar and vertical rods. One-inch cross bar, $\frac{3}{8}$ to $\frac{1}{2}$ inch rods, $\frac{3}{4}$ -inch (minimum $\frac{5}{16}$) top and bottom bolts with not less than $\frac{1}{2}$ -inch throw. Not reversible. Bar capable of being locked in inactive position with bolts retracted.

Operation.—By slight push or pull, or both, on cross bar. Bolts shall remain retracted until door is closed.

FIGURE 1028.—Exit bolt, side latching type, type 831

Type 831.—Side latching type, for single doors. All cast bronze except wrought-bronze cross bar, 1-inch diameter. For $4\frac{1}{2}$ -inch stiles. Bar capable

of being locked in inactive position with bolts retracted. To be used only with special lock, types 800 and 801.

Operation.—See type 800.

WINDOW SPRING BOLTS

FIGURE 1029.—*Window spring bolt, type A1060*

Type A1060.—Tinned or galvanized malleable iron or steel bolt. Tinned or galvanized wrought steel case. Brass spring. For sash $\frac{7}{8}$ to $1\frac{1}{8}$ inches wide.

617.62 BRACKETS, HANDRAIL AND SHELF.

BRASS LAVATORY AND SINK TRAPS

(See 645.4, p. 1234.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION: FF-P-451)

(See also 600.3, p. 70.)

PLUMBING FIXTURES (FOR LAND USE)

TYPES, GRADES, AND CLASSES

This specification covers such types, grades, and classes of plumbing fixtures as are enumerated under "Detail requirements," comprising vitreous ware and porcelain ware, enameled ironware, slate, soapstone, brass trimmings and fittings, supports, stops, cocks, valves, flushing mechanisms, pipe covering, etc.

(For vitreous ware, porcelain ware, slate, and soapstone, see "Standards and Specifications for Nonmetallic Minerals and Their Products," miscellaneous publication No. 110 of the Bureau of Standards.)

GENERAL REQUIREMENTS

Where United States Government specifications are referred to, the latest revision of such specifications shall apply in all cases.

Enameled Ironware

Quality of enameled ironware.—Enameled ironware shall be best quality cast iron of the necessary thickness to form fixtures of the best grade manufactured.

Ironware shall have a porcelain enamel coat thoroughly fused on required surfaces. Enamel shall be smooth and of even thickness, white, without discoloration, chips, or other flaws, and free from craze. Exterior exposed surfaces not required to be enameled shall be treated with one coat of filler at factory.

Dimensions and variations.—The dimensions shown on the plates shall be followed where given, but a variation of not more than 3 per cent plus or minus will be allowed.

Labeling enamel ware.—All fixtures shall have the manufacturer's guarantee label indicating first quality. Omission of this label may be sufficient cause for rejection.

Trimmings and Fittings

Quality.—All trimmings and fittings in connection with the plumbing system shall be of best quality, of heavy and substantial pattern.

The brass mixture, except for red metal and where fittings for tanks are used on salt water, shall contain not less than 65 per cent copper and not more than 5 per cent lead.

Composition for fittings where salt water is used shall contain not less than 88 per cent copper and not less than 8 per cent tin.

Composition for cast trimmings and fittings where red metal is required shall contain not less than 85 per cent copper, 5 per cent tin, and not more than 7 per cent zinc, nor more than 4 per cent lead.

When white metal is desired in lieu of brass it shall be called for in the specification for the work and shall be of the following composition: Copper, 54 to 58 per cent; nickel, 14 to 20 per cent; lead, 12 per cent, maximum; tin, 2½ per cent, maximum; zinc, 20 per cent, maximum; impurities, including iron and manganese, not more than 1 per cent.

Where red metal trimmings and fittings or salt-water fittings are desired, they will be called for in the specifications for the work.

Finish.—All exposed brass, except red metal, shall be heavily nickel-plated in a manner to produce a finish of high polish and durability, except where otherwise specified. When chromium plating is desired, it shall be so stated in the specifications for the work.

Red metal shall be highly polished and finished and of uniform color for all castings, tubing, and fittings.

Stamping or marking trimmings and fittings.—All faucets, ball cocks, and stops shall have manufacturer's name or trade-mark cast or stamped on body of the piece.

(For nickel-plating of plumbing fixtures see 600.3, p. 70.)

Compression Stops

Shall be standard weight designed for 100 pounds working pressure, globe pattern, with full area opening having raised seat and composition disk; shall be finished brass, nickel-plated, and provided with stuffing boxes and cast brass milled-wheel tee or cross handles. Angle pattern stops may be used where practicable.

Ball Cocks

For flushing tanks shall consist of ½-inch diameter brass, automatic, float-operated supply cock, guaranteed to close effectively against a water pressure of 100 pounds to the square inch, top supply pattern for high tanks, having brass refill and hush tube, and bottom supply with elevated ball cock and hush tube, or semielevated ball cock for low tanks. Float shall be of 16-ounce (0.0216 inch thickness) spun copper, vulcanized rubber, or of glass with brass stem connected to float and cock with screw threads; cock shall be constructed so it can readily be taken apart for repairs, pins forming bearings for levers shall be ½-inch brass cotter pins. Supports for ball cocks and lever fulcrum on high tanks shall be secured with through bolts and nuts to lugs cast on tanks having lead washers between tank lugs and supports.

Supply pipes to ball cocks shall be ½-inch diameter fitted with a compression stop.

Flushing Tank Mechanism

Flushing mechanism of high tanks shall consist of a cast brass gooseneck siphon with slotted guide sleeves and stable rubber washer. Siphons for urinal flush tanks shall be 1½ inches in diameter, and siphons for water-closet flush tanks shall be 1½ inches in diameter. Siphons shall be properly secured to the operating levers in such a manner that they will be properly balanced and guided to secure a straight lift and proper reseating. The lever post shall be provided with an adjustable stud bolt that will limit the pull on the lever and prevent the guide on the gooseneck siphon from being pulled out of its sleeve.

Flushing mechanism shall be operated by means of a nickel-plated brass plumber's chain not thinner than No. 20 Brown & Sharpe gage (0.032 inch), with a hardwood pull handle. Handle shall have a brass rod passing through same with nickel-plated brass ring nut and bottom nut sweated on rod. Chain shall be fastened to operating lever and ring nut by means of rings of 1/2-inch diameter nickel-plated brass with joints well soldered after chain is attached.

Flushing mechanism of low tanks shall be of rubber ball design, having a 2 3/4-inch diameter, best quality, rubber ball, reinforced at top and center, with necessary brass stem, guide, and lever. Operation shall be quiet in action, shall be controlled by means of a nickel-plated brass or china lever handle, set at front of tank. A brass standpipe not less than 1-inch diameter, of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch), shall be properly installed for overflow.

Each discharge shall be succeeded by an afterflush or refill that will fill the fixture trap to its overflow weir.

Flushing Valves

Shall be of a true flushometer type and of a pattern approved by the bureau or office concerned, operated either by push button, lever, or oscillating handle. If of lever or oscillating handle type, the handle shall be all brass, nickel-plated or white metal (nickel brass) and, in addition to this, if of lever-handle type, the handle shall be integral with the lever.

Flushing valves shall be easily operated by hand, and so designed that they will cause absolutely no water hammer in the piping system and if a regulating device is used to adjust the amount of water and give the proper afterfill, the regulating device shall be accessible without disconnecting or taking the valve apart.

Flushing valves for water-closets shall provide successful flushing of fixture and refill the fixture trap at each operation with a discharge of not more than 4 gallons of water, under a pressure ranging from 15 to 100 pounds. Flushing valves for urinals shall discharge not less than 1 gallon nor more than 2 gallons of water under a pressure ranging from 15 to 100 pounds.

Each flushing valve shall be provided with a cut-off cock adjacent to flushing valve and connected thereto with a nickel-plated brass union or nipple. A lock shield gate valve may be used in lieu of the cut-off cock.

Flushing valves for urinals shall have not smaller than 1/2-inch nor larger than 3/4-inch diameter supply pipe connection; flushing valves for water-closets shall have not smaller than 1-inch nor larger than 1 1/4-inch diameter supply pipe connection.

All exposed parts of flushing valves and cut-off cocks or gate valves shall be nickel-plated, finished brass, or white metal. All other parts of flushing valves shall be of very best noncorrodible metal that will withstand frequent operation of valve without wear or breakage.

Roof Drains

Shall be heavy pattern cast iron with integral cast-iron cup pattern fitting having an integral flange not less than 16 inches in diameter, and a satisfactory device for clamping or otherwise securing the roof covering so as to make a water-tight connection; or in lieu of the integral flange, shall have a 16-ounce (0.0216 inch) soft-rolled copper or a 5-pound sheet lead flashing flange with not less than 4-inch lap on all sides extending into the roofing.

For gravel or slag roofing the drain shall be provided with a suitable gravel stop.

Shall have a cast-iron beehive or dome shaped strainer, except on promenade roofs where strainer shall be flat. Openings in strainer shall have a combined area equal to twice the area of drain outlet.

Outlet shall be equipped with necessary parts to make proper connection to screw pipe or cast-iron pipe as required of same size as down spout.

When specified in specification for the work each roof drain shall be provided with a heavy pattern, cast brass or copper sleeve-expansion joint of thickness not lighter than No. 10 Stubbs gage (0.134 inch) constructed so as to form a water and air tight flexible joint. Gaskets and packing shall be of asbestos fiber, soft lead, or other suitable durable material which shall not be located in the flow line of the drainage. Means of adjustment shall be provided for tightening or replacing packing.

Piping

Cast-iron soil pipe, fittings, and connections.—Cast-iron soil pipe and fittings shall be in accordance with Federal specification No. 343. (Current designation WW-P-401.)

Wrought-iron pipe.—Shall be standard-weight genuine wrought-iron galvanized pipe in accordance with Federal specification WW-P-441.

Steel pipe.—Shall be standard weight galvanized steel pipe in accordance with Federal specification WW-P-431.

Fittings and connections for wrought-iron and steel pipe.—Fittings for soil and waste piping and for roof-drainage piping systems shall be cast iron, recessed and banded, screw-jointed drainage fittings, free from fins and burrs. Long-turn fittings shall be used where space and other conditions permit, and the consent of the Government representative shall be obtained before any short-radius fittings are installed. Fittings on soil, waste, and roof drainage piping may be galvanized or plain, uncoated.

Fittings for vent and water supply piping shall be standard banded cast or standard beaded or banded malleable iron. All fittings on water supply piping shall be galvanized. Cast fittings on vent piping may be galvanized or plain, uncoated. Malleable fittings on vent piping shall be galvanized.

Changes in pipe sizes shall be made with reducing fittings or fittings bushed in the sand.

Brass pipe, fittings, and connections.—Brass pipe shall be grade B or C in accordance with Federal specification WW-P-351.

When specified in specification for the work, brass pipe shall be nickel-plated.

Fittings and couplings on unfinished brass water-supply pipe shall be cast brass, beaded or banded malleable-iron pattern; couplings shall be brass.

Fittings on nickel-plated brass pipe shall be cast brass, malleable-iron pattern, finished and nickel-plated.

Unions on pipes 2 inches and smaller in diameter shall be heavy pattern, all brass, ground joint unions with both screw ends hexagonal or octagonal; shall be finished and nickel-plated on nickel-plated pipes. Unions on pipes 2 1/2 inches and larger in diameter shall be standard weight, galvanized, cast-iron flange unions with gasket of 1/16-inch thick best-quality rubber.

Pipe threads.—Where iron-pipe size pipe threads are specified, they shall conform to Federal specification No. 238. (Current designation GGG-P-351.)

Hangers, Supports, Etc.

All hangers and collars shall be of a size proportionate to the weight of the pipe supported. Chain, perforated bar iron, or wire hangers will not be permitted. Pipe supports shall be installed in an approved manner.

Valves

All gate valves shall be designed for a steam working pressure of 125 pounds per square inch, all globe and angle valves for a steam working pressure of 150 pounds per square inch, and shall have the name or trade-mark of the manufacturer and the guaranteed working pressure cast or stamped on the body.

Except as noted, valves 2 inches and smaller in diameter shall be all brass, screw ends with rough body and finished trimmings, except that those on nickel-plated brass pipe shall be finished and nickel-plated. Valves 2½ inches and larger in diameter

The globe valves shall weigh not less than the following: ½-inch, 1.25 pounds; ¾-inch, 2 pounds; 1-inch, 2.75 pounds; 1¼-inch, 4 pounds; 1½-inch, 5.5 pounds; 2-inch, 9 pounds. Unless otherwise specified, brass globe and angle valves of the union bonnet type with malleable-iron union ring and malleable-iron stuffing nut will be acceptable if the malleable-iron parts do not come in contact with water.

Check valves.—Shall be horizontal swing check valves with composition rubber, leather, or brass disks. Valves with brass disks shall be of the regrinding type.

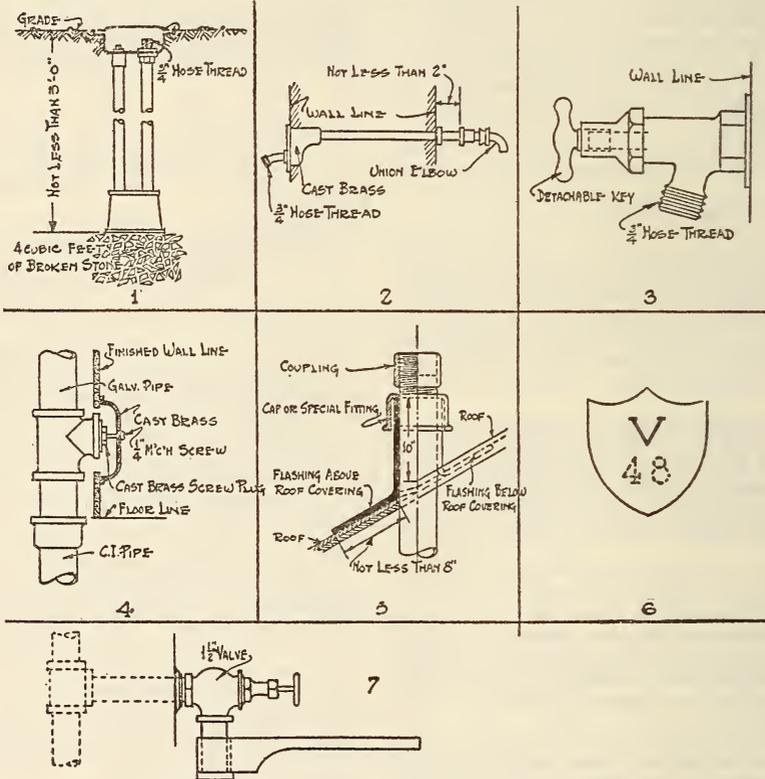

FIGURE 1039.—Miscellaneous plumbing fixtures

shall have iron body, brass mounted, and shall have either screw or flange ends.

Brass for valves shall have a minimum copper content of 80 per cent and a maximum lead content of 5½ per cent.

All valves shall be gate valves unless otherwise specified.

Gate valves in connection with sinks and laundry tubs, and gate or other valves in connection with boilers and hot-water tanks are not considered as a part of the fixtures, but shall be installed on supply pipes between fixtures and supply mains at the most convenient point as may be shown or specified.

Gate valves.—Shall be of the solid wedge pattern, double-seat rising or nonrising stems with gland stuffing boxes, and iron wheels. Shall weigh not less than the following: ½-inch, 0.93 pound; ¾-inch, 1.56 pounds; 1-inch, 2.18 pounds; 1¼-inch, 3.50 pounds; 1½-inch, 5 pounds; 2-inch, 7.19 pounds; 2½-inch (screwed), 31 pounds, and (flanged), 41 pounds; 3-inch (screwed), 42 pounds, and (flanged), 57 pounds; 4-inch (screwed), 65 pounds, and (flanged), 85 pounds.

Globe and angle valves.—Shall have renewable elastic disk, raised flat seats and gland stuffing boxes, iron wheel, ample lift and full-size openings.

Note

Trimmings and fittings for fixtures are generally specified to be nickel-plated brass. If white metal or red metal is desired, it should be so stated.

Miscellaneous

Detail No. 1—Street washers.—Shall be of type shown in Figure 1039; shall have an automatic non-freezing drain, and shall be set above not less than 4 cubic feet of clean broken stone which will pass 2-inch mesh screen.

The valve shall be in a cast-iron box placed not less than 36 inches below the ground; from this two ¾-inch pipes shall extend to surface and be connected to a cast-iron box with hinged cover marked "water," having top set level with grade. One of the pipes shall be fitted at upper end with cast-brass ¾-inch hose connection with jam nut; the other shall contain a brass valve operating rod. Furnish with each washer a short T-handle key; all wrought-iron parts shall be galvanized.

Detail No. 2—Wall hydrant.—Shall have brass face and detachable T-handle and nozzle for ¾-inch hose connection; shall be of sufficient length to go through wall with shut-off valve on inside of build-

ing wall and shall have heavy brass coupling and union elbow for 3/4-inch pipe, as shown in Figure 1039. The outer casing pipe passing through wall shall be galvanized and the inside operating rod shall be brass.

Detail No. 3—Sill cock.—Shall be all brass compression type, with integral flange tapped for 3/4-inch pipe, and a detachable T-handle key; hose connection shall be for 3/4-inch diameter hose.

Detail No. 4—Clean-out plug.—Shall be heavy cast-brass screw-jointed clean-out plug screwed into cast-iron screw-jointed tee pattern, 90° Y fitting as shown in Figure 1039. On pipes 4 inches and smaller in diameter plug shall be same size as pipe; on pipes larger in diameter than 4 inches plug shall be 4-inch diameter.

Drains, Traps, and Clean Outs

Detail No. 1—Drain.—Shall be cast-brass shower or urinal drain as shown, with removable strainer;

plug; shall be installed in manhole constructed for, and provided with cast-iron cover as shown. (Sketch 5, fig. 1040.) Cover shall have checkered top surface.

Down-Spout Nozzle, Floor Flanges

Down-spout nozzles.—Shall be unfinished cast brass of dimensions noted. Nozzle shall be screwed on pipe, screwed into drainage elbow at base of down spout, and extend beyond outside face of wall, as shown in Figure 1041.

Water-closet floor flanges.—Types A, B, and C shall be cast brass of dimensions shown. Type D shall be cast iron approximately of dimensions shown in Figure 1041.

Running Trap, Manholes

Detail No. 1—Running trap.—Where required shall be "extra heavy" cast iron, with fresh-air

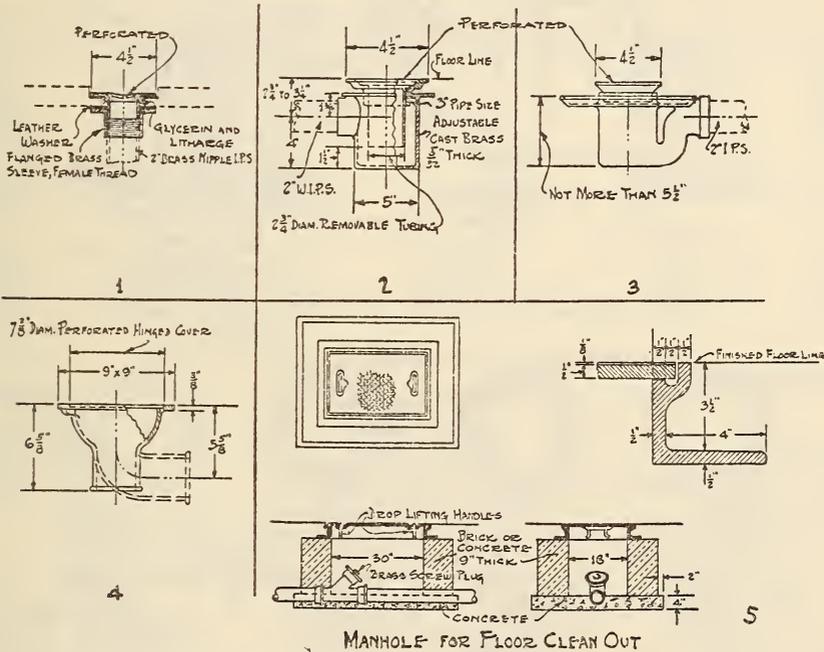

FIGURE 1040.—Drains, traps, and clean outs

nickel-plated or finished brass strainer and top flange. (Sketch 1, fig. 1040.)

Detail No. 2—Combined drain and trap.—Shall be cast-brass combined drain and trap as shown, with removable strainer; nickel-plated or finished brass strainer and top flange. Water seal shall be not less than 1 1/2 inches in depth. (Sketch 2, fig. 1040.)

Detail No. 3—Combined drain and trap.—Shall be heavy pattern cast iron combined drain and trap, as shown, with a cast-brass strainer. Strainer and top flange shall be nickel-plated or finished brass. Water seal shall be not less than 1 1/2 inches in depth. (Sketch 3, fig. 1040.)

Detail No. 4—Area cesspool.—Shall be extra heavy cast iron approximately of dimensions shown with perforated hinged cast-iron cover plate and with 3-inch connection for cast-iron pipe; without bell trap. (Sketch 4, fig. 1040.)

Side outlet cesspool shall be used only where space does not permit use of a bottom outlet type.

Detail No. 5—Clean out on cast-iron pipe.—Fitting shall be extra heavy cast-iron Y with heavy pattern brass ferrule and cast-brass screw jointed clean-out

inlet on house side and with heavy pattern brass ferrule and cast-brass screw-jointed clean-out plug on sewer side. Fresh-air inlet shall be extended about 2 feet as indicated, and shall be provided with return bend at top and a 3/4-inch diameter hole shall be drilled into air-inlet pipe near bottom of manhole; 4, 5, and 6 inch traps shall have 4-inch diameter fresh-air inlet and clean-out plug; 8-inch trap and larger shall have 6-inch diameter fresh-air inlet and clean-out plug. Shall be installed in a manhole constructed for and provided with cast-iron curb and perforated cover, as shown in Figure 1042.

Detail No. 2—Manhole for main sewer.—Shall be constructed for and provided with heavy-weight cast-iron curb and solid cover, as shown in Figure 1042.

Detail No. 3—Manhole for main sewer.—Shall be constructed for and provided with light-weight cast-iron curb and solid cover, as shown in Figure 1042.

Shower Fixtures

Outfit No. 48.—Shall consist of a shower fixture complete with curtain frame, and curtain for installation over a recessed or corner bathtub.

Shower fixture shall consist of a combination compression valve fixture with 1/2-inch supply to shower head, 1/2-inch union valves, elbows, and connections complete for connecting to concealed tees of bath faucet; cast-brass escutcheons at wall and support as shown in Figure 1043. All pipe and nipples shall be iron-pipe size and thickness brass pipe.

Shower head shall be cast-brass body and face. Face shall be threaded and removable, approximately 4 inches in diameter, with round perforations, not smaller than No. 58 drill (0.042-inch diameter) delivering a rain shower.

Curtain frame shall be straight for recessed tub and angle pattern for corner tub; shall be of suitable

the building are not part of the fixture, and shall be as specified in the specification for the work.

(Shower head is the same as for No. 48.)

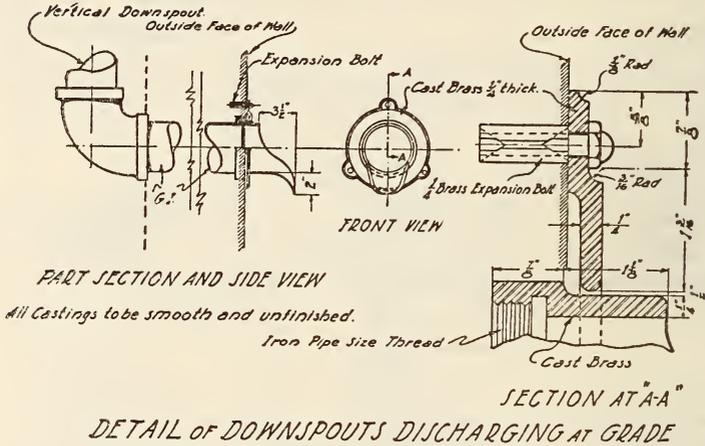

Drain No. 1, Figure 1040, shall be furnished except when specification for the work requires a combined floor drain and trap, in which case either drain No. 2 or No. 3, Figure 1040, shall be furnished.

Outfit No. 50.—Shall consist of a shower fixture complete with shower head, curtain, and curtain frame, and receptor as shown.

(Shower fixture is the same as for No. 49.)

(Shower head is the same as for No. 48.)

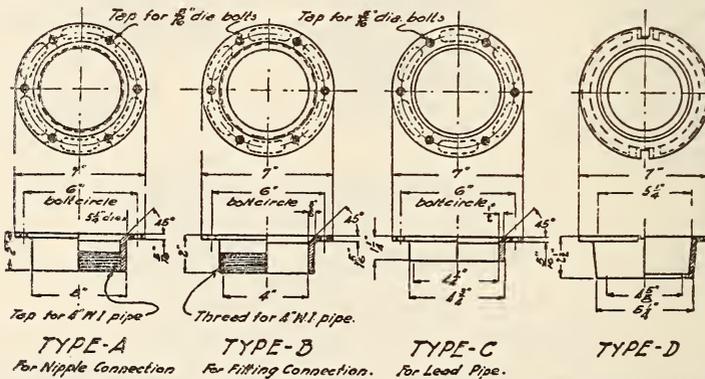

Curtain frame shall be of 3/4-inch steel pipe with cast-iron or steel flanges at wall and 3/8-inch steel

All Castings to be smooth and unfinished.

Iron Pipe Size Thread

DETAIL OF DOWNSPOUTS DISCHARGING AT GRADE

BRASS FLOOR FLANGES CAST IRON FLOOR FLANGE.

FIGURE 1041.—Down-spout nozzle, floor flanges

length for the recess and tub; shall be of not less than 7/8-inch diameter brass tubing, of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch), with cast-brass flanges at wall; curtain hook for each grommet in curtain and holdback for curtain, with wood screws.

All metal parts shall be nickel-plated brass.

Curtain shall be not less than 10-ounce white duck, 6 feet long; shall be of width suitable for the outfit and shall have nickel-plated brass grommets spaced not over 6 inches apart. Duck shall conform to Federal specification CCC-D-751.

Outfit No. 49.—Shall consist of a shower fixture complete for installation in a shower bath inclosure

Shower fixture shall consist of a combination compression valve fixture with 1/2-inch union valve connections and 1/2-inch supply to shower heads with supports as shown in Figure 1043. The supply piping from the union valves to the supply mains of

pipe ceiling support with flange. All parts shall be galvanized, and shall have a nickel-plated brass curtain hook for each grommet in curtain.

Curtain shall be not less than 10-ounce white duck 6 feet 6 inches long; shall be in two pieces, each not less than 3 feet wide and shall have nickel-plated brass grommets spaced not over 6 inches apart. Duck shall conform to Federal Specifications Board specification CCC-D-751.

Receptor shall be 1-piece porcelain of dimensions shown, glazed over all exposed surfaces.

Drain No. 1, Figure 1040, shall be furnished except when specification for the work requires a combined floor drain and trap, in which case either drain No. 2 or No. 3, Figure 1040, shall be furnished.

Mixing valve.—When outfit number is followed by the letters MV, as 48MV, or 50MV, the outfit shall be as specified for the respective numbers, except that the shower fixture shall have a mixing valve

between the two compression valves, which shall be of lock shield type.

Mixing valve shall be of heavy construction, compression type, and if of the yoke type shall have renewable seats, china, or brass index, and shall have a capacity to deliver not less than 10 gallons of cold or mixed water per minute with an initial pressure at inlets of 45 pounds per square inch. Mixing valve shall be of a type that admits cold water first.

Outfits

- No. 48. Shower fixture, with frame and curtain.
- No. 49. Shower fixture, with floor drain.
- No. 50. Shower fixture, with frame and curtain, receptor, and floor drain.
- No. 48MV. Shower fixture, with mixing valve, frame and curtain.
- No. 49MV. Shower fixture, with mixing valve, and floor drain.

lavatory shall be supported on two concealed hangers of suitable design.

When two or more lavatories are set in battery there shall be a space of 4 inches between lavatories.

Waste, supplies, etc.—Unless otherwise specified, each lavatory shall be provided with waste complete with lavatory plug, P or S trap, as required, chain stay, hot and cold water supplies with compression faucets and stops, supplies and waste connections to wall or floor, as required.

For details of waste and supply connections, and chain stay, see Figures 1052 and 1053.

Outfits

- No. 24CI.
- No. 21RCIB.
- No. 19CCIB.

Kitchen Sinks

Kitchen sinks.—Shall be 1-piece cast iron, approximately 6 inches deep, with roll rim and integral

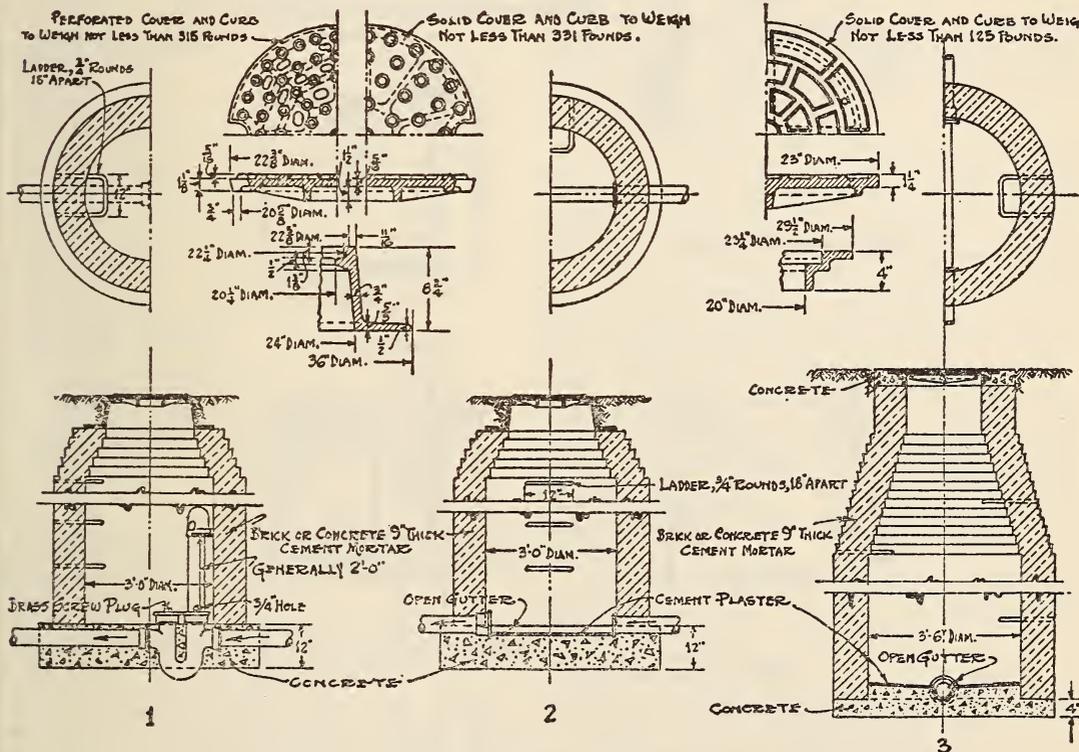

FIGURE 1042.—Running trap, manholes

No. 50MV. Shower fixture, with mixing valve, frame and curtain, receptor, and floor drain.

Cast-Iron Lavatories, Cast-Iron Sinks

Lavatories.—Shall be 1-piece cast iron with full apron, oval bowl, and integral overflow and roll rim—enameled on inside, over rim, apron, and back.

Bowls shall be of the following approximate sizes: No. 24CI, 12 by 15 inch bowl; No. 21RCIB, 10½ by 15 inches; No. 19CCIB, 10½ by 15 inches.

Overflow shall have a cross-sectional area of not less than 1½ square inches at every point.

Supports.—No. 24CI lavatory shall have a cast-iron pedestal base support, enameled on outside. No. 21RCIB lavatory shall be supported on a 1-piece concealed hanger of suitable design. No. 19CCIB

back. Sink No. 52CI shall have integral drain board.

Sinks shall be enameled on inside, over rim, back, and drain board, if any.

Supports.—Sinks Nos. 30CI and 36CI shall be supported on a 1-piece cast-iron concealed hanger of suitable design. Sink No. 52CI shall have two painted cast-iron legs and two cast-iron concealed hangers of suitable design.

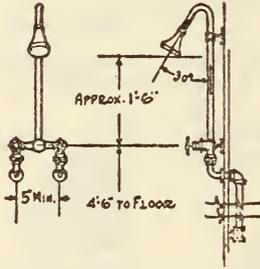

Waste, supplies, etc.—Unless otherwise specified, each sink shall be provided with sink plug and P trap with connection to wall or S trap with connection to floor as required and as detailed in Figure 1053, also one hot and one cold water ½-inch bibb, detail No. 5, Figure 1052. Cold-water bibb shall have hose thread.

The connections from the bibbs to the supply lines of the building shall be as called for in the specification for the work and are not parts of the fixtures.

Outfits

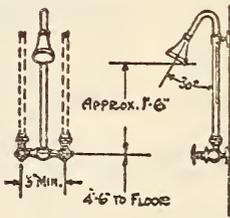

- No. 30CI.
- No. 36CI.
- No. 52CIR with right-hand drain board, as shown.
- No. 52CIL with left-hand drain board.

have tapped inlet to receive the threaded shank of the strainer. Trap standard for wall connection shall be tapped for 3-inch pipe and shall be adjustable as to height; trap standard for floor connection to cast-iron hub and spigot pipe shall be provided with spigot end at outlet below floor, and loose flange at base for caulking into hub of cast-iron pipe; trap standard for floor connection to screw pipe shall be provided with horn at outlet and a heavy brass

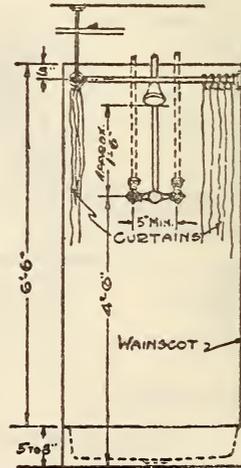

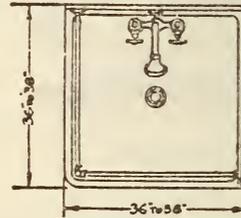

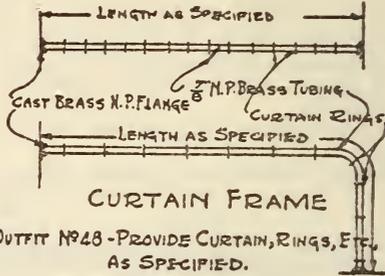

48

FOR USE OVER BATH TUB

49

FOR USE IN SHOWER INCLOSURE

50

FIGURE 1043.—Shower fixtures

Slop Sink

Slop sink.—Shall be 1-piece cast iron, at least 12 inches deep, with roll rim and integral back enameled inside and over rim and back. Shall have a nickel-plated brass strainer with cast-brass threaded shank; shall be supported on and secured to a trap standard.

Trap standard.—Shall be cast iron, open pattern, enameled inside, 3-inch diameter, without vent, with brass screw clean-out plug, and with water seal not less than 2 inches in depth; shall be for floor or wall connection, as required for the work, and shall

floor flange tapped for 3-inch pipe, or a cast-iron floor flange similar to type D, Figure 1041, shall be provided, with an asbestos-molded gasket and bolts for fastening fixture.

Supplies.—Each sink shall be provided with one hot and one cold water 3/4-inch bibb, detail No. 5, Figure 1052. Cold-water bibb shall have a hose thread.

Rim guard.—Shall be constructed of 3/8-inch brass tubing of thickness not less than No. 14 Brown & Sharpe gage (0.064 inch) in thickness with cast-brass knobs on ends of rods and cast-brass spacing and holding bars. Holding bars shall have brass

spring plates or thumbscrew attached for fastening guard to rim of sink. All parts of rim guard shall be nickel-plated.

Outfits

- No. 24SCL. Sink without rim guard.
- No. 24SCIG. Sink with rim guard.

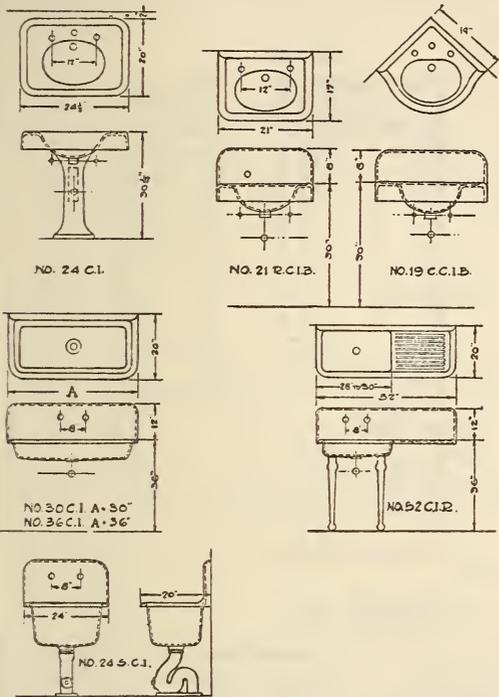

FIGURE 1044.—Cast-iron lavatories and sinks

Bathtubs

Recessed tubs.—Shall be 1-piece cast iron with flat rim at back and both ends, designed to be built into a recess and a full extended front, enameled on all exposed surfaces.

When 3-inch roll rim is required in lieu of the extended front it shall be so stated in the specification for the work. In such cases, tub shall be enameled on inside and over rim only.

Supplies shall consist of a concealed combination over rim nozzle supply fitting with 1/2-inch valves connected to the nozzle by means of I. P. S. brass pipe and cast-brass fittings. Valves may be at a higher elevation than the nozzle or at the same elevation as shown. Hot and cold water supplies shall be fitted with 1/2-inch compression stops and iron pipe size supplies furnished as a part of the fixture.

Valves shall be of the regular compression type with four arm china index handles and constructed so that the bonnet may be removed at the front after installation for repairs and renewals; shall have china escutcheons covering all metal parts except stem which shall be neld in place by adjustable threaded nuts; shall have ground joint unions for connections to 1/2-inch diameter hot and cold water supplies, and heavy pattern nozzle of proper length to discharge over rim of tub and shall be fitted with a china escutcheon at wall.

Waste shall consist of a concealed connected waste and overflow fixture of 1 1/2-inch brass tubing of

thickness not less than No. 17 Brown & Sharpe gage (0.045 inch) and cast-brass fittings; strainer on waste; strainer and chain stay on overflow. Attached to chain stay shall be a brass plumbers' chain of thickness not less than No. 20 Brown & Sharpe gage (0.032 inch) with 1 1/2-inch diameter rubber stopper. Chain shall be secured to chain stay and stopper with rings of 1/8-inch thick brass with joints well soldered.

The waste tee shall have on the outside a 1 1/2-inch standard male thread for a 1 1/2-inch pipe fitting, and shall have on inside a fine thread for 1 1/2-inch tubing. The tee shall be reversible so that the outlet may be set parallel with the waste arm.

Supplies and waste shall be at right or left end as called for in specification for the work.

All exposed metal parts of supply and waste shall be nickel-plated.

The trap indicated on figure and supplies from the compression stops to the building mains shall be as called for in the specification for the work and are not parts of the fixture.

Corner tubs.—Tubs shall be 1-piece cast iron with flat rim at back and at one end designed to be built into the wall with full extended front and other end. Tub shall be enameled on all exposed surfaces. Concealed supplies and waste as specified for recessed tub shall be furnished.

If 3-inch roll rim in lieu of the full extended front and end is desired, it shall be so stated in the specification for the work. In such cases tub shall be enameled on inside and over rim only. Supplies shall consist of an exposed combination compression-type faucet as shown on detail with 4-arm all brass, china index handles, and elbows with ground joint unions and connections with compression stops to floor or wall, as required. The outlet of faucet shall have a female thread to take the standard thread of a hose coupling. The minimum weight of faucet without elbows shall be 44 ounces.

Waste shall consist of an exposed connected waste and overflow fixture with chain stay, chain stopper, etc., as specified for recessed tubs, except that the waste tee is not required to be reversible. A cast-brass escutcheon shall be provided at floor to cover the unfinished fitting.

All exposed metal parts of supplies and waste shall be nickel-plated.

Free standing tubs.—Shall be 1-piece cast-iron flat bottom pattern with 3-inch roll rim, enameled on the inside and over rim. Tub shall set on four cast-iron feet or on separate 1-piece cast-iron base, as required by designation.

Supplies shall consist of a combination-type faucet as shown on detail with 4-arm all-brass china index handles and elbows with ground joint unions and connections with compression stops to floor or wall, as required. The outlet of faucet shall have a female thread to take the standard thread of a hose coupling. The minimum weight of faucet without elbows shall be 44 ounces.

Waste shall consist of a connected waste and overflow fixture of 1 1/2-inch brass tubing of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch) and cast-brass fittings; strainer on waste; strainer and chain stay on overflow. Attached to chain stay shall be a brass plumber's chain of thickness not less than No. 20 Brown & Sharpe gage (0.032 inch) with 1 1/2-inch diameter rubber stopper. Chain shall be secured to chain stay and stopper with rings of 1/8-inch thick brass with joints well soldered; shall have brass escutcheon at floor.

All metal parts of supply and waste shall be nickel-plated.

Connection from tailpiece of waste fitting shall be as called for in the specification for the work and is not part of the fixture.

Steel Scullery Sink

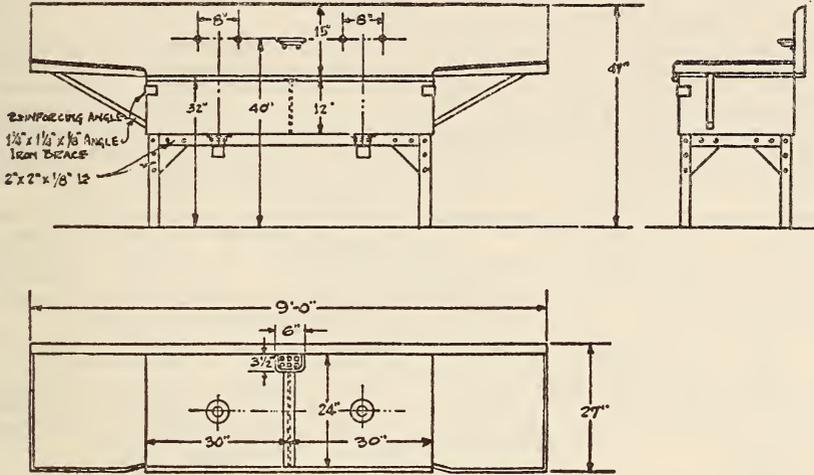

Sink.—Shall be two compartments, with or without integral drain boards; integral back; roll rim at front and on back, leaving space behind back for supplies. (Fig. 1046.)

Sink shall be constructed of No. 12 United States standard gage (0.109 inch thick before galvanizing) galvanized steel, welded or riveted. Partition shall be welded or riveted to the bottom and both sides,

gage (0.032 inch) brass, with 1/8-inch thick ring at stopper and bibb with joints well soldered. Waste from sink plugs to building drain including grease trap or interceptor is not part of the fixture and shall be as called for in the specifications for the work.

Outfits

No. 60DB, with drain boards, as shown.
No. 60, without drain boards.

60DB

FIGURE 1046.—Steel scullery sink

and bordered on each side and at top with 1-inch galvanized band iron, riveted on.

Supports.—Sink shall be supported on galvanized steel angle frame, as shown, riveted to sink and bolted to floor.

Supplies.—Each compartment of sink shall be supplied with one cold and one hot water 3/4-inch

Water Heater and Horizontal Storage Tank

Heaters.—Shall be circular in form and made of the best quality gray cast iron, free from imperfections. Inside surface of the fire section shall be corrugated and the fire pot not less than 14 inches deep. The design of the heater shall be such that

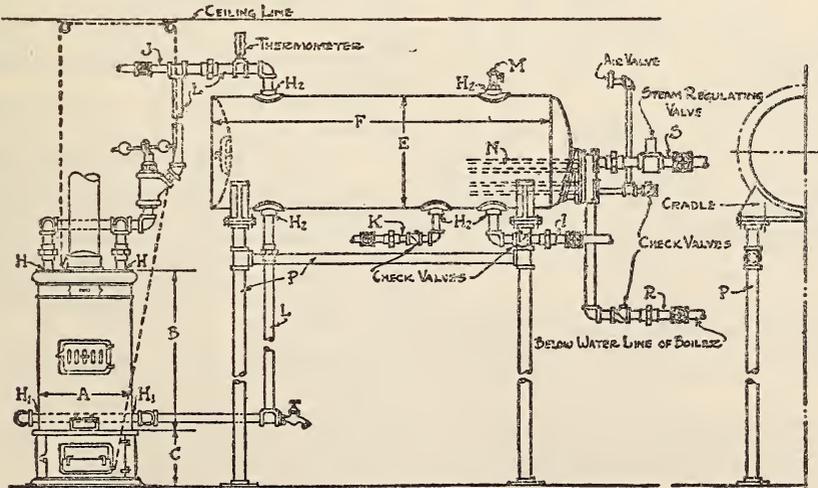

FIGURE 1047.—Water heater and horizontal storage tank

bibb, detail No. 5, Figure 1052. Cold-water bibb shall be provided with hose connections.

Waste.—Each compartment of sink shall have a 2-inch sink plug with strainer bars and brass stopper. Stoppers shall be fastened to bibbs with plumber's chain of not lighter than No. 20 Brown & Sharpe

all surfaces may easily be cleaned of soot and dust. (Figure 1047.)

All heater sections shall be tested to 100 pounds hydrostatic pressure at the shop and also when assembled on the premises where same will be used.

Grates shall be heavy cast iron, sectional, rocking and dumping, of sizes noted in figure, and easily removable without disturbing the heater. All doors and base shall be heavy cast iron.

Shaker lever and cleaning appliances shall be furnished.

Tanks.—Heads and shell shall be constructed of best quality homogeneous flange steel of a tensile strength between 55,000 and 65,000 pounds per square inch, and shall have all openings properly reinforced.

Tanks No. 20HP and 24HP shall have handhole in end; tank No. 36HP shall have a manhole in end. Handholes and manholes may be either in center of head or in head near bottom, and shall be provided with plate, yoke, and gasket.

Seams shall be riveted for not less than 100 pounds working pressure, and shall be tested at shop to a hydrostatic pressure of 150 pounds.

Marking.—The name of manufacturer and working pressure shall be marked on a brass plate secured to tank or be stenciled on the tank.

Supports.—Tank No. 20HP shall be supported from ceiling with strap hangers of 1½ by 5/16 inch strap iron or ¾-inch round iron around tank and secured to ceiling at both ends in an approved manner. Tanks No. 24HP and 36HP shall be provided with cast-iron cradles and supported from floor with a pipe frame as shown. Pipe frame shall be constructed of plain wrought iron or mild steel pipe, steam pattern fittings and floor flanges; floor flanges shall be fastened to floor and cradles with two bolts to each flange.

Trimmings.—Each tank shall be provided with a ¾-inch diameter spring loaded brass water-relief valve, set 25 pounds above high-water pressure, excepting fire pressure, and a ¾-inch angle pattern, hot-water mercury thermometer graduated from 40° to 240° F.

Heating section.—Each HP tank shall be provided with a removable heating section constructed of seamless drawn brass or seamless copper tubing either in the form of U bends or straight tubes with a floating head. The heating surface of coils shall be not less than noted on the figure.

• As specified.

When the letter P is omitted from designation of tank, the heating section and headpost shall be omitted, and all other requirements shall be the same as for the HP tanks.

Piping other than heating section is not part of the fixture, and shall be as called for in the specification for the work.

Regulator.—Each tank connected to a coal-burning heater shall be provided with a thermostatic regulator with necessary chains and pulleys

to operate the draft door and check draft on heater, adjusted so as to close draft door and open check draft when temperature of water is 140° F. in tank.

In case gas burners are used in the heater, regulator shall be connected to operate the gas supply to heater.

Each tank containing a steam coil shall be provided with a thermostatic regulator with necessary connections and valve to control the steam supply to the coil, adjusted so as to close steam valve when temperature of water is 140° F. in tank.

Regulator shall be inserted preferably in head of tank, and shall consist of a tube with necessary attachments containing a volatile liquid or an expanding tube containing a nonexpanding member, or both, the expansion and contraction of which shall operate valve direct or cause a metal diaphragm or metal bellows to expand and contract, thus controlling the steam supply.

Either type of regulator will be acceptable, viz, one that controls the steam supply to coil and operates the draft dampers or gas burners, as the case may be, or type that requires regulator for steam valve to coil with an independent regulator to control the dampers on heater.

Regulators that operate by water of the plumbing system will not be permitted.

Regulators shall have the name or trade-mark of manufacturer stamped or cast on body of valve, or shall have a separate plate with name of manufacturer bolted to valve.

Outfits

No. 100HP heater, No. 100CI, with No. 20HP tank having heating section.

No. 200HP heater, No. 200CI, with No. 24HP tank having heating section.

No. 300HP heater, No. 300CI, with No. 36HP tank having heating section.

No. 100H heater, No. 100CI, with No. 20H tank without heating section.

No. 200H heater, No. 200CI, with No. 24H tank without heating section.

No. 300H heater, No. 300CI, with No. 36H tank without heating section.

No. 20HP tank having heating section, without heater.

No. 24HP tank having heating section, without heater.

No. 36HP tank having heating section, without heater.

Water Heater and Vertical Storage Tank

Heaters.—Shall be circular in form and made of the best quality gray cast iron, free from imperfections. Inside surface of the fire section shall be corrugated and the fire pot not less than 14 inches deep. The design of the heater shall be such that all surfaces may easily be cleaned of soot and dust. (Fig. 1048.)

Thickness of concave head of tank.....	do.....	¾	¾	¾
Size of all pipe openings, <i>H</i>	do.....	1½	2	2

All heater sections shall be tested to 100 pounds hydrostatic pressure at the shop and also when assembled on the premises where same will be used.

Grates shall be heavy cast iron, sectional, rocking and dumping, of sizes noted on plate and easily removable without disturbing the heater. All doors and base shall be heavy cast iron.

Shaker lever and cleaning appliances shall be furnished.

Tanks.—Shall be constructed of best quality homogeneous flange steel of tensile strength of between 55,000 and 65,000 pounds per square inch, and shall have all openings reinforced. Handhole shall be provided with cover plate, yoke, and gasket, and when tank is set on stand, handhole shall be located in an accessible position.

Seams shall be riveted for not less than 100 pounds working pressure, and shall be tested at shop to a hydrostatic pressure of 150 pounds.

which shall operate the damper and check draft or regulator may be of the all-metal bulb type placed in pipe connection at *J*; within the bulb shall be an expandible metallic bellows surrounded by a volatile liquid, the expansion of which shall operate the damper and check draft.

Outfits

- No. 100B, heater No. 100CI, with tank No. 36V.
- No. 200B, heater No. 200CI, with tank No. 42V.
- No. 300B, heater No. 300CI, with tank No. 48V.

Trimnings for Water-Closet and Bath Inclosures

Trimnings for slab work shall be of the design and dimensions shown; shall be cast brass, exposed surfaces finished and nickel-plated, with slots of proper size for the marble, slate, etc.; standards shall be 1¼-inch brass tubing and all bracing shall

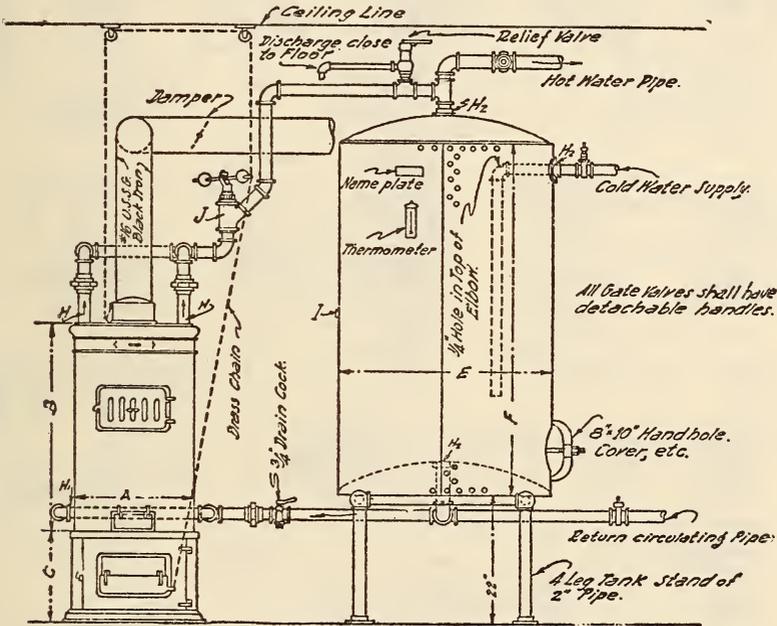

FIGURE 1048.—Water heater and vertical storage tank

Marking.—The name of manufacturer and working pressure shall be marked on a brass plate secured to tank or shall be stenciled on tank.

Supports.—Tanks shall be supported from floor with a pipe frame as shown, constructed of plain wrought iron or steel pipe, malleable railing fittings and floor flanges.

Trimnings.—Each tank shall be provided with a ¾-inch diameter spring loaded brass water relief valve set at 25 pounds above maximum water-supply pressure, excepting fire pressure, and a ¾-inch hot-water mercury thermometer graduated from 40° to 240° F.

Piping.—Piping indicated is not part of the fixture and shall be as called for in the specification for the work.

Regulator.—Each tank shall be provided with a thermostatic regulator with necessary chains and pulleys to operate the draft door and check draft on heater, adjusted so as to close draft door and open check draft when temperature of water is 140° F. in tank.

Regulator shall consist of either a tube inserted in tank at point marked *I* containing a volatile liquid or containing an expanding tube with a non-expanding member, the expansion or contraction of

be 1-inch outside diameter, of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch) polished and nickel-plated. (Fig. 1049.)

Hinge (*J*).—Shall be heavy pattern, cast or wrought brass, with clamp adjustable from 1½ to 1¾ inches, not thinner than 0.09 inch, with inclosed adjustable spring.

Accessories

All metal shall be brass with exposed parts finished and nickel-plated, except brackets for wood seat, detail 8, which may be unfinished brass. (Fig. 1050.) (For nickel-plating or plumbing fixtures, see 600.3, p. 70.)

Lavatory Supplies

All exposed parts shall be finished brass, nickel-plated. (Fig. 1052.) (For nickel-plating of plumbing fixtures see 600.3, p. 70.)

Detail No. 1—Lavatory supplies, with compression faucets.—Shall consist of a best quality cast-brass compression type faucet with 4-arm brass handles with china index; shank, tailpiece, and compression stop with connections to wall or floor of brass, iron pipe size pipe with cast-brass wall or floor flange as required. Stop shall be straight way or angle

pattern as required for the work. The minimum weight of faucets, including tailpiece, shall be 21½ ounces.

When self-closing faucets are called for in the specification for the work, the faucets shall be best quality cast-brass self-closing faucet with 4, 5, or 6 arm brass handle with china index shank and tail-piece. The mechanism of faucet shall be perfect in every respect; shall be closed against the water pressure by means of a phosphor bronze spring. The spring shall close faucet against 100 pounds

the compression type with brass lever index handles, shanks, and tailpieces and compression stops with connections from tailpieces to wall or floor of brass, iron pipe size pipe with cast-brass wall or floor flange as required. Stops shall be straightway or angle pattern as required for the work. The minimum weight of faucet, including tailpieces, shall be 57 ounces. Connections from faucets to wall or floor and wall or floor flange are parts of the fixtures.

Detail No. 4—Sink bibb.—Shall be full ½ or ¾ inch, as specified, brass compression type with 4-arm

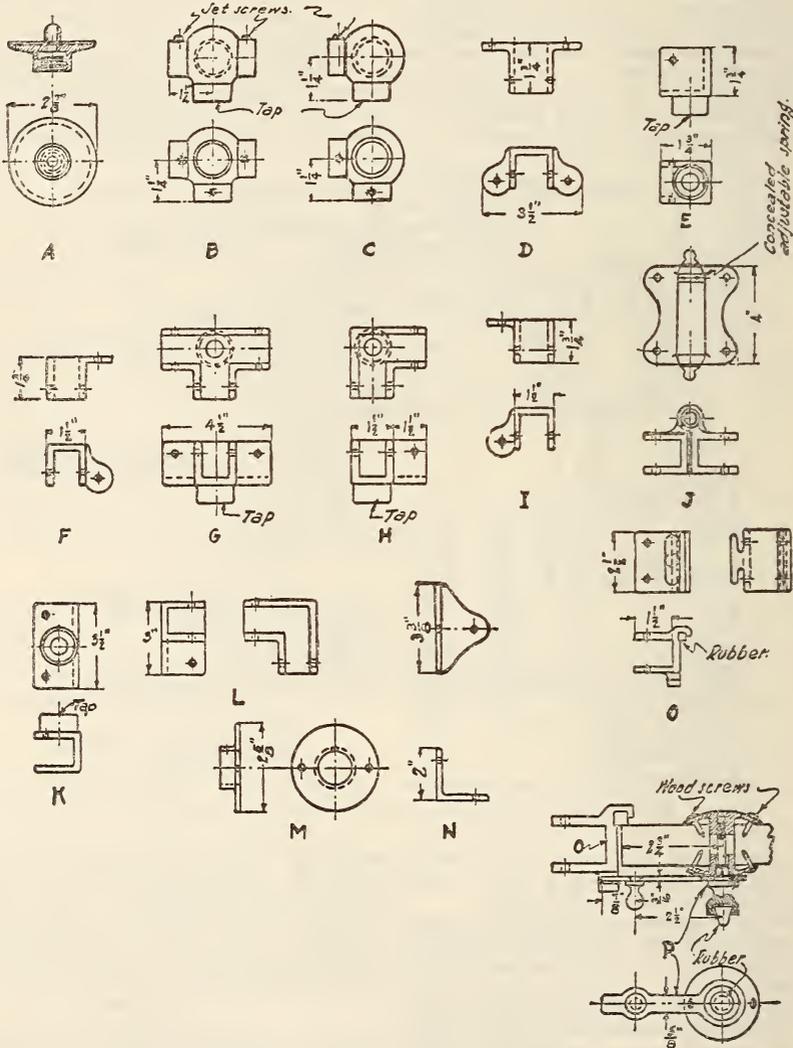

FIGURE 1049.—Trimmings for water-closet and bath inclosures

water pressure per square inch and the faucet shall be easily operated at any pressure up to 100 pounds. Faucet shall operate on ball or roller bearings, and check lugs or other suitable method shall be provided to prevent handle from making complete turns. The minimum weight of faucet including tailpiece shall be 26 ounces.

Connections from faucets to wall or floor, and wall or floor flange are parts of the fixtures.

Detail No. 2—Combination faucet.—Shall consist of a best quality cast-brass combination faucet of

china index handle and standard male thread. When hose connection is specified bibb shall be provided with thread for ¾-inch diameter hose. Minimum weight of ½-inch bibb shall be 14 ounces and of ¾-inch bibb shall be 18 ounces.

Detail No. 5—Sink bibb.—Shall be full ½ or ¾ inch, as specified, brass compression type with 4-arm china index handle, shank as shown, cast-brass adjustable flange with set screw or flange threaded on shank; standard male thread. When hose con-

nection is specified bibb shall be provided with thread for 3/4-inch diameter hose.

The minimum weight of 1/2-inch bibb, including flange, shall be 19 ounces, and the minimum weight of 3/4-inch bibb, including flange, 20 ounces.

Detail No. 6—Laundry tray bibb.—Shall be brass compression type stub pattern with brass T handle and integral female flange tapped for 1/2 or 3/4 inch pipe as specified; shall have thread for 3/4-inch diameter hose.

The minimum weight of 1/2-inch bibb shall be 12 1/2 ounces, and of 3/4-inch bibb shall be 13 ounces.

Detail No. 7—Chain stay.—For lavatories shall be

Detail No. 1—Lavatory plug.—Shall be cast brass with rod strainer and with overflow openings for vitreous or cast-iron lavatory as required, jam nut, leather washer, opening for 1 1/4-inch diameter rubber stopper; tailpiece of 1 1/2-inch brass tubing of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch).

Detail No. 2—Sink plug.—Shall be cast brass with removable strainer; jam nut and leather washer; coupling and 1 1/2-inch tailpiece of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch).

Detail No. 3—Tray plug.—Shall be cast brass with rod strainer and ground opening for 1 1/4-inch

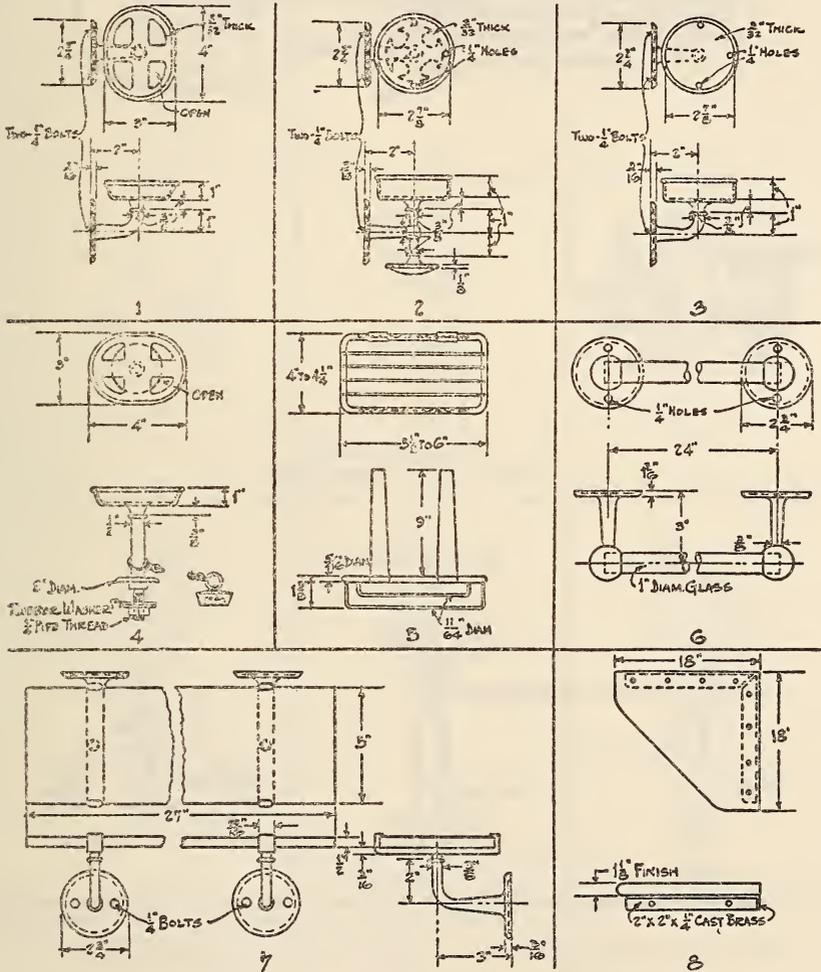

FIGURE 1050.—Accessories

cast-brass stay of dimensions shown. Attached to chain stay shall be a nickel-plated brass plumbers' chain not lighter than No. 20 Brown & Sharpe gage (0.032 inch) with 1 1/4-inch diameter rubber stopper, to fit the lavatory plug, detail No. 1, Figure 1053. Chain shall be attached to chain stay and stopper with rings of 1/2-inch brass with joints well soldered.

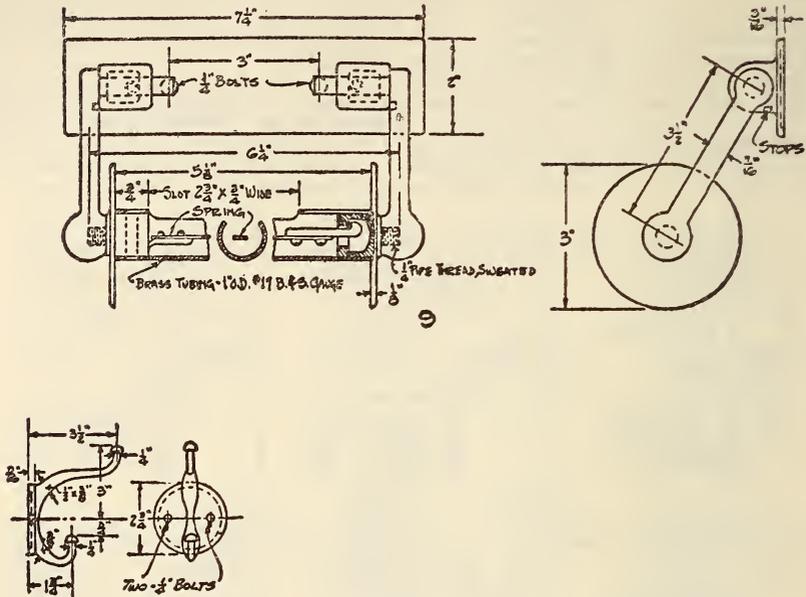

Lavatory Wastes

All exposed parts shall be finished brass, nickel-plated. (Fig. 1053.) (For nickel-plating of plumbing fixtures, see 600.3, p. 70.)

diameter metal stopper; jam nut and leather washer; coupling and 1 1/2-inch tailpiece of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch).

Detail No. 4—P trap.—Shall consist of a 1 1/2-inch cast-brass P trap with cast-brass clean-out plug; slip joint with cast-brass nut and rubber washer at inlet for connecting to the plugs, details Nos. 1, 2, or 3; band with a 1 1/2-inch standard pipe tap at outlet.

Connection and wall flange indicated in the figure are part of the lavatory waste.

10

FIGURE 1051.—Accessories

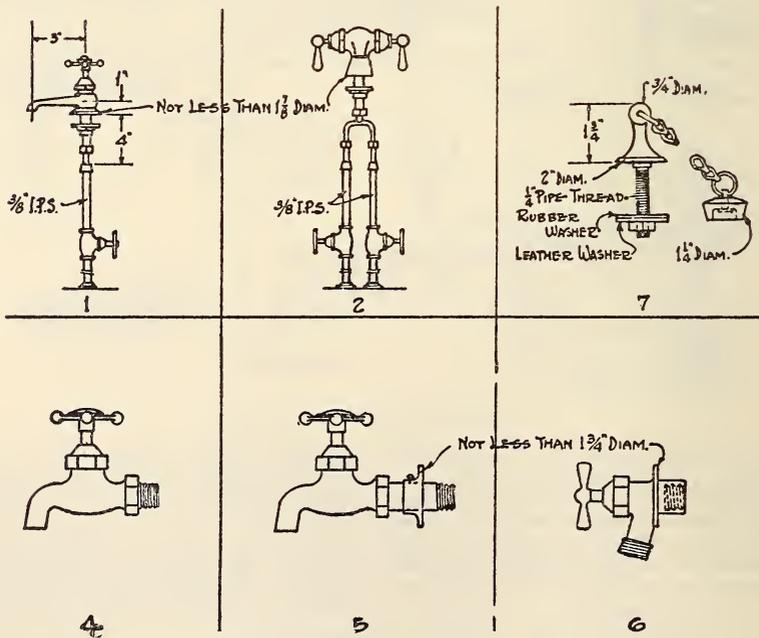

FIGURE 1052.—Lavatory supplies

Detail No. 5—S trap.—Shall consist of a 1½-inch cast-brass S trap with cast-brass clean-out plug; slip joint with heavy cast-brass nut and rubber washer at inlet for connecting to the lavatory plugs, details Nos. 1, 2, or 3; ground joint union with a standard 1½-inch pipe tap at outlet.

Connection and floor flange indicated on the plate are part of the lavatory waste.

Detail No. 6—Nonsiphoning trap.—Shall consist of a cast-brass nonsiphoning trap with a cast-brass

necting to the lavatory plugs, details Nos. 1, 2, or 3; slip joint or union connection at outlet. Connection and wall flange indicated in figure are parts of the lavatory waste, and shall be of thickness not less than No. 17 Brown & Sharpe gage (0.045 inch).

Detail No. 9.—Shall be as specified for trap in detail No. 8, except that tubing at outlet shall be for floor connection as shown.

Connection and floor flange indicated in figure are parts of the waste connection, and shall be of

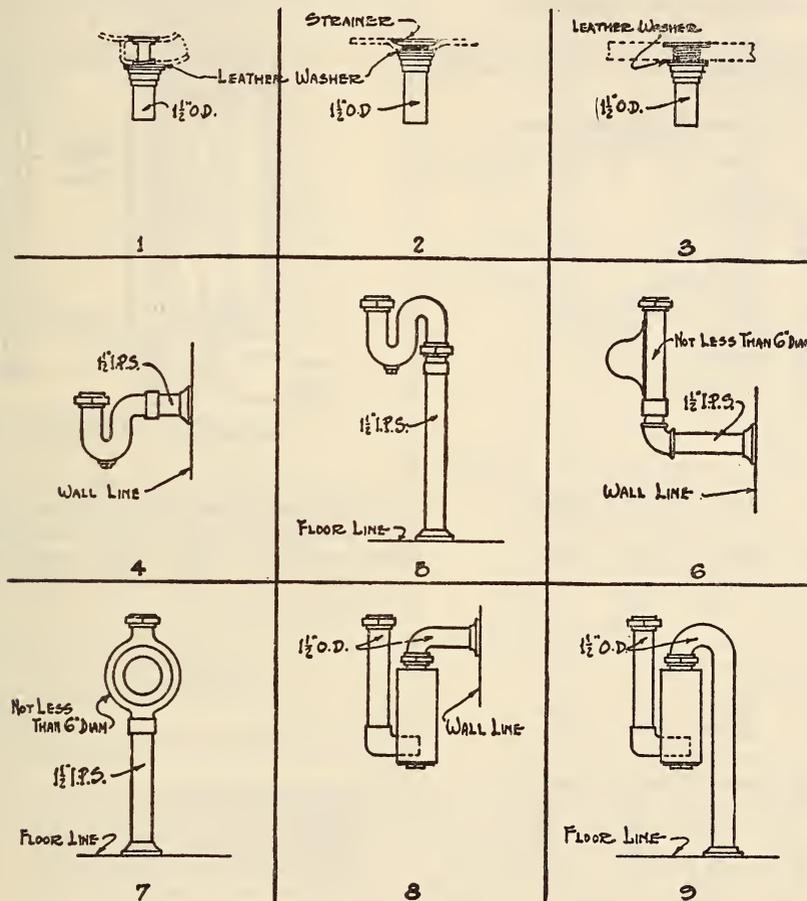

FIGURE 1053.—Lavatory wastes

interior partition, integral with body of the trap; slip joint with heavy cast-brass nut and rubber washer at inlet for connecting to the lavatory plugs, details Nos. 1, 2, or 3; band with a 1½-inch standard pipe tap at outlet.

Connection and wall flange indicated in the figure are part of the lavatory waste.

Detail No. 7—Nonsiphoning trap.—Shall be as specified for trap in detail No. 6.

Connection and floor flange indicated in figure are part of the lavatory waste.

Detail No. 8—Clean-sweep trap.—Shall consist of a cast-brass body trap (commercially known as the clean sweep or centrifugal), slip joint with heavy cast-brass nut and rubber washer at inlet for con-

thickness not less than No. 17 Brown & Sharpe gage (0.045 inch).

617.74 PLUMBING STOP COCKS AND VALVES.

(See 607.6, p. 491.)

617.75 PIPE, PLUMBING.

(Plumbing practice and symbols, see 600.6, p. 113. Cast-iron pipe, see 607.11, p. 369 and 607.12, p. 374. Malleable-iron pipe, see 607.2, p. 416. Wrought-iron pipe, see 607.3, p. 430. Steel pipe, see 607.4, p. 435. Eaves troughs and conductor pipe, see 607.5, p. 491. Copper pipe, see 642.23, p. 1182. Brass pipe, see 645.23, p. 1216.)

617.79 MISCELLANEOUS PLUMBING FIXTURES.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR METAL PARTITIONS FOR TOILETS AND SHOWERS, R101-29, JULY 1, 1929

TOILET AND SHOWER PARTITIONS

(Simplified practice recommended and accepted by industry establishing a limited list of standard sizes and dimensions.)

TOILET AND DRESSING ROOM INCLOSURES

Center-to-center dimensions.—30, 32, 34, and 36 inches.

Stock sizes, partitions.—

Depth	Height	Depth	Height
<i>Inches</i> 36	<i>Inches</i> 54	<i>Inches</i> 48	<i>Inches</i> 60
42	54	54	60
48	54		
54	54		
60	54		

Stock sizes, fronts.—

Width	Height	Width	Height
<i>Inches</i> 6	<i>Inches</i> 54	<i>Inches</i> 6	<i>Inches</i> 60
8	54	8	60
10	54	10	60
12	54	12	60

Stock sizes, doors.—

Width	Height	Width	Height
<i>Inches</i> 24	<i>Inches</i> 54	<i>Inches</i> 24	<i>Inches</i> 60
26	54	26	60
28	54	28	60
30	54	30	60
32	54	32	60
34	54	34	60

Stock sizes, posts.—All posts shall be 78 inches high (providing for head rail 12 inches above the tops of 54-inch partitions and 6 inches above tops of 60-inch partitions).

Hardware.—Standard hardware shall consist of the following: Self-closing hinge, latch, pull and bumper, and coat hook.

TYPICAL INCLOSURES

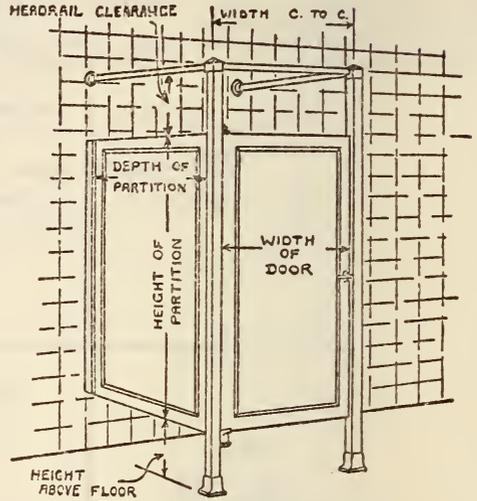

FIGURE 1054.—Metal toilet stall

Experience has shown that toilet inclosures of the following dimensions fulfill the requirements of the average installation, and these dimensions are recommended for use where special conditions do not make other dimensions preferable.

Arrangement	Size of inclosures	
	Width (center to center)	Depth
Inclosures without doors	<i>Inches</i> 32	<i>Inches</i> 42
Inclosures with full-width doors swinging out	32	48
Inclosures with angle fronts and narrow doors swinging in	32	54
Inclosures with full-width doors swinging in	32	60

Door clearances.—Figure 1055 and the accompanying table are to be used in determining the conditions under which an inswinging door will

clear the fixture, and the amount of such clearance, and to clarify terminology.

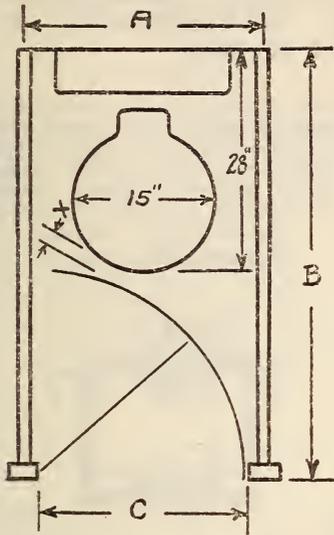

FIGURE 1055

A	B	C	X
Inches 30	Inches 54	Inches 28	Inches 1 $\frac{5}{8}$
32	54	30	1 $\frac{1}{2}$
32	60	30	5 $\frac{5}{8}$
36	60	34	2 $\frac{3}{8}$

A = Width of compartment.
 B = Depth of compartment.
 C = Door opening.
 X = Clearance.

NOTE.—It is an exceptional fixture that projects more than 28 inches from wall to outside of seat.

Style of fronts.—Fronts (front partitions or front panels) of the style termed “corner fronts” or “angle fronts” are preferred to that style termed center fronts” or “T fronts.”

Height off floor, partitions, and doors.—The standard clearance between the floor and bottom of partitions and doors shall be 12 inches.

Height off floor, backs.—Backs shall be terminated on curbs at least 4 inches above floor level.

SHOWER INCLOSURES

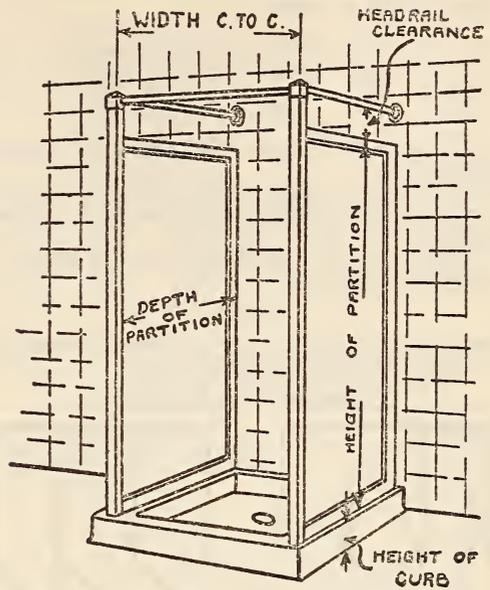

FIGURE 1056.—Metal shower stall

Center-to-center dimensions.—30, 36, and 42 inches, Stock sizes, partitions.—

Depth	Height	Depth	Height
Inches 36	Inches 66	Inches 36	Inches 72
42	66	42	72

Stock sizes, fronts.—

Width	Height	Width	Height
Inches 12	Inches 66	Inches 12	Inches 72
18	66	18	72

Stock sizes, posts.—All posts shall be 78 inches high (providing for head rail 12 inches above tops of 66-inch partitions and 6 inches above tops of 72-inch partitions).

Style of fronts.—Fronts (front partitions or front panels), of the style termed “corner fronts” or “angle fronts” are preferred to that style termed “center fronts” or “T fronts.”

Flush-type constructions.—Partitions and doors, panel-sheet steel shall be of 22 gage U. S. standard (0.0306 inch) or heavier.

Panel-type constructions.—In partitions of the following sizes or larger:

Depth	Height	Depth	Height
<i>Inches</i> 54	<i>Inches</i> 54	<i>Inches</i> 54	<i>Inches</i> 60
60	54	60	60

panel-sheet steel shall be of 16 gage U. S. standard (0.0613 inch).

In partitions smaller than above mentioned, panel-sheet steel shall be of 18 gage U. S. standard (0.0490 inch).

Doors, panel-sheet steel shall be of 18 gage U. S. standard (0.0490 inch).

FINISH

All material shall be finished in a prime coat, further finish to be considered an extra.

TERMINOLOGY IN DRAWINGS

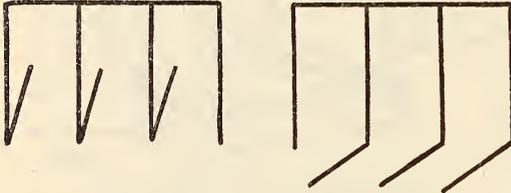

FIGURE 1057.—No fronts required, full width doors, inswinging and outswinging

The use of the following conventions is recommended in order to distinguish clearly between in-

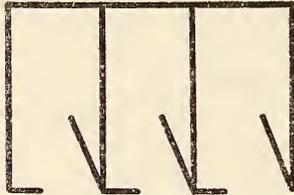

FIGURE 1058.—Angle fronts required, narrow doors

closure which are to be constructed with wide doors and without fronts, and those with angle fronts and narrow doors.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION: FF-P-451.)

SHOWER FIXTURES

(See 617.73, p. 1062.)

617.9 MISCELLANEOUS BUILDERS AND FURNITURE HARDWARE.

BUILDERS' HARDWARE (NONTEMPLATE)

(See 617.0, p. 977, also Federal specification FF-H-101 below.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

(For types, grades, classes; material and workmanship; general requirements; detail requirements packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

SCUTTLE OPERATORS

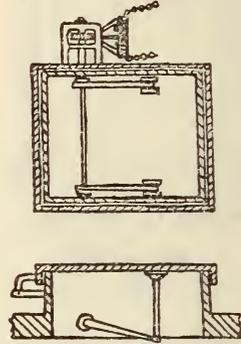

FIGURE 1059.—Scuttle operator, type 1510

Type 1510.—For heavy scuttles. Worm gear operated by sprocket wheel and endless chain. Rocker shaft $\frac{3}{4}$ -inch iron pipe. Arms and connections to scuttle of cast or wrought iron of lengths to open scuttle 60°. Gears and arms secured to shafts with set screws. Shaft bearings and brackets of cast iron. Length of shaft and chains as specified. Bearings, machine finished, and provided with oil holes. Worms and gears smoothly finished and close fitting. Fastening to scuttle, wood screws. Fastening to curb, through bolts. Finish, painted.

SKYLIGHT OPERATORS

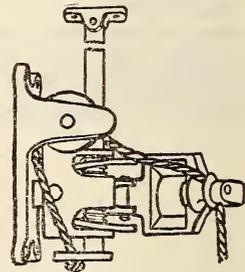

FIGURE 1060.—Skylight operator, type 1520

Type 1520.—Lifting rod operated by single cord, self-locking. Cord No. 10, braided cotton sash cord. Rods, steel, copper plated. If single rod, minimum diameter shall be one-half inch; if two rods, minimum diameter shall be three-eighths inch. Lift 18 inches.

DOOR BUTTONS

FIGURE 1061.—Door button, type 1069

Type 1069.—Cast iron or wrought steel, galvanized. Without plates. Lengths 1½ and 2 inches. With screws.

CUPBOARD TURNS

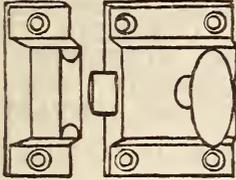

FIGURE 1062.—Cupboard turn, type 1082

Type 1082.—Cast bronze. Oval knob. Size, without strike, 1⅜ by 1⅜ inches. Latch bolt, minimum 1½ by ⅜ inch, minimum throw ⅜ inch.

Type 1082A.—Same as type 1082, except nickel plated.

Type 1082B.—Same as type 1082, except wrought bronze. Minimum thickness of case 0.040 inch. Latch bolt, minimum ⅜ by 1½ inch, with ⅜-¹/₂-inch minimum throw.

Type 1082C.—Same as type 1082, except cast iron or wrought steel, plated. Minimum thickness of case 0.040 inch. Latch bolt, minimum ⅜ by ⅜ inch, with ⅜-¹/₂-inch minimum throw.

Type 1083.—Cast bronze. Oval knob. Size, without strike, 2¼ by 1½ inches. Latch bolt, minimum ½ by ⅜ inch, minimum throw five-sixteenths inch.

Type 1083A.—Same as type 1083, except nickel plated.

Type 1083B.—Same as type 1083, except wrought bronze. Minimum thickness of case 0.040 inch.

Type 1083C.—Same as type 1083, except cast iron or wrought steel, plated. Minimum thickness of case 0.040 inch. Latch bolt, minimum ⅜ by ⅜ inch, minimum throw ⅜ inch.

¹ See sec. (b).

(a) All loads in excess of any maximum load herein listed may be furnished at the option of the individual loading company, in progressive-burning powders only.

(b) Powder-brand markings are to be eliminated from all gages and all grades of loaded paper shot

shells, with the exception of 12-gage trap loads in medium and high cup shells and progressive-burning powder loads in 10, 12, 16, and 20 gage.

All specified loads in all gages in medium and high cup smokeless shells, with the exception of 12-gage trap loads and progressive-burning powder loads, are to be marked in drams with the words "equivalent" or "equivalent to"; for example, 3-dram equivalent, or equivalent to 3 drams.

(c) Loads not covered by the above are to be supplied as standard loads only until the stock on hand January 1, 1931, shall have become exhausted; thereafter they may be supplied only as special loads.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIMPLIFIED PRACTICE RECOMMENDATION FOR METALLIC CARTRIDGES R62, JANUARY 1, 1927

METALLIC CARTRIDGES

In accordance with the unanimous action of representatives of manufacturers and distributors of metallic cartridges, the Department of Commerce, through the Bureau of Standards, recommends the establishment of the following simplified list of stock items:

TABLE 1.—Rim-fire cartridges (ball)

[The letter "x" indicates those cartridges recommended as standard]

of the manufacturer of the gun that the samples actually and correctly represent the material of the gun. Samples must be distinctly marked with the same number appearing on guns which they represent, so as to be readily identified by the inspector.

SHOULDER GUNS

The gun known as the shoulder gun may be used on steamers of 300 tons and under as a means of propelling a line-carrying projectile. This gun is an ordinary breech-loading rifle with barrel shortened and bore smoothed, using a blank cartridge of 40-75 or 50-70, propelling a projectile about 8 inches long, weighing about 8 ounces, attached to a line not less than 400 feet in length.

The projectile must be thrown a distance of not less than 250 feet without fouling or breaking the line. The gun shall be of a type approved by the steamboat inspection service. The manufacturer of the gun shall furnish purchasers with an affidavit that it is of approved type, of safe material, and good workmanship. Each shoulder gun shall be provided with 3 shot lines, 10 projectiles, at least 25 cartridges, and the other necessary equipment. Each vessel using the shoulder gun shall carry auxiliary thereto, to be used for no other purpose, at least 500 feet of 3-inch manila line.

PROJECTILES

The projectiles shall weigh not less than 18 pounds, be smoothly turned and finished, with a windage of not more than one sixty-fourth inch. No such projectile or means of propelling it shall hereafter be approved unless of such character that the projectile and propelling charge can be readily withdrawn from the gun when it becomes necessary or desirable to do so. Powder containers of center-fire type shall be of such construction that proper alignment of firing pin and percussion primer always obtains when propelling charge and projectile are set for use. When perforated metal powder containers are used, such perforations shall extend entirely around the base of such containers, and at least 25 efficient primers shall be carried for the firing thereof.

It is recommended that the charge of powder in actual service on shipboard shall be from 5 to 6 ounces, but may be exceeded under extraordinary circumstances, and in no case shall the charge exceed 8 ounces. The end of the line attached to the projectile should be thoroughly wet for a length of about 1 fathom.

REPORT OF TEST OF GUN

The supervising inspector shall furnish the manufacturer of any line-carrying gun a copy of the report on each gun tested and inspected.

619.2 MANUFACTURES OF SHEET IRON AND SHEET STEEL.

AMERICAN AUTOMOBILE ASSOCIATION, CATALOGUE, 1929

(Contains details of shapes, sizes, and colors of standard enameled sheet-iron signs conveying warnings, routes, speeds, etc.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, OVERHEAD LINE MATERIAL FOR DIRECT AND CATERPILLAR SUSPENSION, RECOMMENDED SPECIFICATION, D102-30, 1930

OVERHEAD LINE MATERIAL

(See 611.29, p. 682.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, STEAMBOAT INSPECTION SERVICE, GENERAL RULES AND REGULATIONS PRESCRIBED BY THE BOARD OF SUPERVISING INSPECTORS, OCEAN AND COASTWISE, 1929

LINE-CARRYING GUNS

All steam vessels of 150 gross tons and over navigating the ocean shall be equipped with at least three line-carrying projectiles and the means of propelling them, of a type and character which have been officially approved by the board of supervising inspectors.

ALLOY OF LYLE-TYPE GUNS

The material entering into the construction of cast-bronze guns for use on board steam vessels as a means of propelling line-carrying projectiles shall have a tensile strength of not less than 52,000 pounds per square inch of section and a reduction of area of not less than 25 per cent.

SAMPLE OF GUN FOR TESTING

At least one sample of the material shall be taken from the casting of each gun, and shall not be less than 7 inches in length, 2 inches in width, one-half inch in thickness, and have a section of 0.5 by 0.75 inch over a length of 2 inches.

(Specifications include provision for firing tests of both Lyle and Hunt guns.)

STEEL GUNS

Before any steel gun of the cannon type shall be approved, the manufacturer shall furnish the supervising inspector of the district where the gun is tested a sample of the material of which it is constructed. Such sample is to be of the following dimensions: 7 inches in length and approximately 1½ inches wide and 1 inch thick, with a section 2½ inches in the center turned down to ½-inch diameter, the sample to be accompanied by the same form of affidavit as required for bronze guns. That is, the samples for testing shall be furnished by the supervising inspector of the district where the gun is to be tested, and must be accompanied by an affidavit

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHOD OF TEST FOR SIZE OF ANTHRACITE, DESIGNATION D310-31, 1931

TEST SCREENS

SCOPE

1. This method of test covers the screen tests of anthracite to determine the percentage of undersize or oversize in any given commercial size.

APPARATUS

2. The screens for testing the various sizes of anthracite shall consist of No. 16 U. S. gage metal plates with staggered round openings. Screens mounted in hardwood box frames 16 to 20 inches square are satisfactory for testing chestnut, pea, and buckwheat sizes of anthracite. For broken, egg, and stove sizes it is more convenient to use screens square or rectangular in shape having an area of 4 to 6 square feet. The screens may conveniently be mounted on a rack, so as to slide like a drawer, with a pan underneath to catch the undersize.

3. The screen openings for testing the different commercial sizes of anthracite⁹² shall be as follows:

Size	Size of round-hole openings in testing screens
Broken.....	Passing a 4 ¹ / ₁₆ -inch screen, retained on a 3 ¹ / ₁₆ -inch screen.
Egg.....	Passing a 3 ¹ / ₁₆ -inch screen, retained on a 2 ⁹ / ₁₆ -inch screen.
Stove.....	Passing a 2 ⁹ / ₁₆ -inch screen, retained on a 1 ⁹ / ₁₆ -inch screen.
Chestnut.....	Passing a 1 ⁹ / ₁₆ -inch screen, retained on a 1 ¹ / ₁₆ -inch screen.
Pea.....	Passing a 1 ¹ / ₁₆ -inch screen, retained on a 3 ¹ / ₁₆ -inch screen.
No. 1 Buckwheat.	Passing a 3 ¹ / ₁₆ -inch screen, retained on a 3 ¹ / ₁₆ -inch screen.
No. 2 Buckwheat (rice).	Passing a 3 ¹ / ₁₆ -inch screen, retained on a 3 ¹ / ₁₆ -inch screen.
No. 3 Buckwheat (barley).	Passing a 3 ¹ / ₁₆ -inch screen, retained on a 3 ¹ / ₁₆ -inch screen.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE DEFINITION OF THE TERM SCREEN (SIEVE), DESIGNATION E13-28T, 1928

DEFINITION OF SIEVE

(See 645.31, p. 1226.)

NOTE.—Tentative specifications, E17-31T, entitled "Round-Hole Screens for Testing Purposes" was issued in 1932.

NATIONAL ASSOCIATION OF SHEET METAL CONTRACTORS, STANDARD PRACTICE IN SHEET METAL WORK, 1929

SHEET METAL WORK

(See 605.22, p. 276.)

⁹² The names of anthracite sizes and the size of screen openings for broken, egg, stove, chestnut, and pea sizes are in conformity with those recommended by the Anthracite Operators' Conference of Aug. 8, 1929.

619.3 SCREW POSTS, METAL FENCE POSTS. AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR METAL FENCE POSTS, 1928

METAL FENCE POSTS

Classes.—Metal fence posts shall be divided into two classes: (1) Posts which support the straight-away body of the fence shall be designated as line posts. (2) Such other special posts as are needed at the end or corner of the fence and at gates, shall be designated as end, corner, or gate posts.

Material.—Metal fence posts may be made of steel or wrought iron, or alloys of iron of any kind which will pass strength tests as described below.

Strength.—Material used for fence posts shall have a minimum tensile strength of 40,000 pounds per square inch; and with a finished post, clamped rigidly, a load of 300 pounds applied at 3 feet from the face of the clamp, the deflection shall not exceed 6 inches, and the permanent set shall not exceed 2¹/₂ inches. The load for this test shall be applied to the face of the post against which the fence material bears.

Ductility.—A finished post resting upon supports 5 feet apart, and with a load applied at the center, must withstand bending 9 inches from a straight line, with no signs of failure.

Tubular posts.—The cold rolling of tubular posts is sufficient test for ductility; therefore, tubular posts are exempt from the ductility test.

Workmanship.—All posts shall be smoothly rolled or formed and shall be straight throughout the length. Each finished post shall be free from burrs or other deformation caused by fabrication. They shall also be free from slivers, depressions, seams, crop ends, and evidence of being burnt. (The above does not refer to rough places caused by zinc coating when galvanized.)

Variations in length shall not exceed one-half inch over or under the prescribed length. Variations in other dimensions shall not be more than one-sixteenth inch over or under the prescribed figures.

Coating—Zinc.—All galvanized posts shall be galvanized by the hot-dip process and shall possess a uniform coating of prime western spelter or better grade, with not less than 2 ounces per square foot of surface as determined by the spot test or by the Preece test with four dips.

Galvanized posts are to be desired. All posts not galvanized shall be painted or dipped in a protective coating of metallic paint.

Special fabrication for line posts.—Line posts shall be fabricated to the section agreed upon by the purchaser.

If the posts are not so designed as to make anchorage for alinement unnecessary, an anchorage device shall be rigidly fabricated to bottom portion of posts.

All posts shall be provided with some convenient means of fastening wire to same for at least 12 positions in a height of 5 feet, above the surface of the ground. All posts shall permit the refastening of the wire at least five times without damage to the connecting appliance, if an integral part of the post.

All posts shall be capable of being driven in ordinary earth without injury to the post.

All posts shall have sufficient length, so that when installed with the required height above the ground, one-third of the total length shall be underground, providing that the post shall extend into the ground not less than 2¹/₂ feet.

Special fabrication for end, corner, and gate posts.—All special posts shall be fabricated the same as line posts, except as follows:

All posts shall have sufficient length to permit installing 3 feet into the ground; and shall be equipped with some suitable form of bracing and anchorage which shall aid in keeping the post vertical.

Weight.—The main stem of all form sections, not including tubing, shall weigh at least 1.30 pounds per linear foot, and preferably should be 25 per cent heavier than that. Posts made of tubing shall be fabricated of at least 10-gage material and be not less than 1¼ inches in diameter.

Inspection.—Inspection and approval of the posts shall be made by the engineer or other authorized representative of the purchaser. Such inspection shall be made at the plant of the manufacturer, who will allow the inspector access to all operations involved and shall facilitate as much as possible the work of inspection and provide necessary facilities for inspection. Two posts out of each 200, selected by the inspector at random, shall be inspected and tested and if they meet the requirements, the lot shall be accepted. If either fails to meet requirements, three other posts shall be selected in like manner by the inspector, and if either one of these shall fail, the lot shall be rejected.

619.4 BUOYS OF IRON OR STEEL.

(No nationally recognized specifications available.)

619.5 WATER FILTERS.

AMERICAN WATER WORKS ASSOCIATION, WATER WORKS PRACTICE MANUAL, 1925

PRESSURE WATER FILTERS

(Permissible rates of filtration dependent on use of water; requirements concerning dimensions and

capacities for filters and pipe connections, and minimum wash water for various filtration rates. Required thickness of shell and head for various working pressures for vertical steel and cast-iron filters.)

619.9 MANUFACTURES OF IRON OR STEEL NOT COVERED IN ABOVE CLASSIFICATION.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, OVERHEAD LINE MATERIAL FOR DIRECT AND CATENARY SUSPENSION, RECOMMENDED SPECIFICATION, D102-30, 1930

OVERHEAD LINE MATERIAL

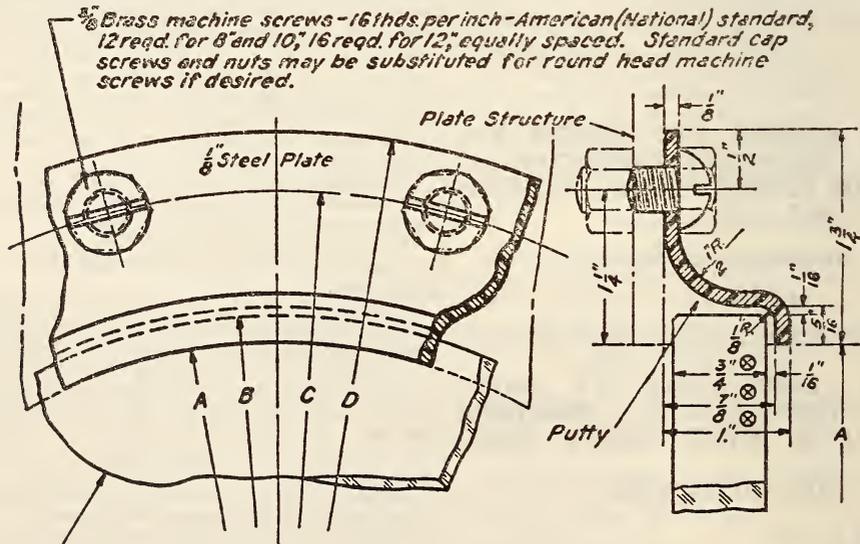

(D102-30, paragraphs 306, 307, 309, 310, etc., include requirements for various kinds of fittings. For specification, see 611.29, p. 682.)

AMERICAN MARINE STANDARDS COMMITTEE, FIXED LIGHTS FOR SHIPS, H NO. 3—1925

TYPE A PRESSED STEEL FRAME

The frames of types A and B are interchangeable; they are for use in places where the ship's structure holds the glass on one side and generally where no bright metal finish is required around the glass, although type B, if polished, is suitable for lights where bright metal finish is wanted on one side. Type C is designed for independent or shop assembly and is intended especially for places where bright metal finish is desired around the glass on both sides. (For types B and C, see 645.21, pp. 1207-1208.)

The glass used in these lights is separately covered by standard H No. 1-1925 as to dimensions and by

See standard H No. 1-1925 for recommended glass sizes.
 ⊗ For glass of a different thickness alter these dimensions to suit.
 All other dimensions (except as shown in table) apply to all standard sizes, 8", 10" and 12"

620-629 FERRO-ALLOYING ORES AND METALS, ALLOY STEELS, AND ALLOY-STEEL MANUFACTURES

621. FERRO-ALLOYING ORES AND METALS

621.1 FERRO-ALLOYING ORES.

621.11 CHROMIUM ORES.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF ULTIMATE CHEMICAL ANALYSIS OF REFRACTORY MATERIALS, INCLUDING CHROME ORES AND CHROME BRICK, DESIGNATION C18-21, 1921

REFRACTORY MATERIALS, CHEMICAL ANALYSIS

(As implied by the title, this specification also includes the chemical analysis of refractory non-metallic materials, such as lime and magnesia.)

PREFATORY NOTE.—It will be understood that the making of a complete silicate analysis is a difficult procedure requiring a wide knowledge of the chemistry involved in the operations, and a thorough training in carrying out the work. A skilled analyst of good training is therefore required to do the work. The descriptions here given cover the vital points of procedure, but frequent reference in regard to the details of the various manipulations must be made to Bulletin No. 422, United States Geological Survey on Analysis of Silicate and Carbonate Rocks, by W. F. Hillebrand; also, to Treatise on the Ceramic Industries, vol. I, 1913, by J. W. Mellor; and to similar publications.

GENERAL REFRACTORIES

General Considerations

1. The sample shall be crushed in a hardened tool-steel mortar, using a pestle of the same sort. Fine grinding shall be done in an agate mortar, either by hand, or by a mechanical sample grinder of the McKenna, Carling, or similar type, so constructed as to prevent the introduction of impurity.

2. Moisture shall be determined in the sample in its ordinary air-dried condition, and all other percentage composition shall be calculated to a moisture-free basis. Whenever a sample is weighed out for any determination, a moisture determination shall also be made. If preferred, the sample may be dried in a weighing bottle, from which the required samples shall be weighed out.

3. In all cases, check determinations shall be made, and the results shall be redetermined if satisfactory checks are not obtained. It shall be considered satisfactory if the differences between check determinations do not exceed the following limits:

	Per cent
For silica or other constituent amounting to 30 per cent or over	0.3
For alumina or other constituent amounting to 10-30 per cent	.2
For any other constituent amounting to under 10 per cent	.1

These figures are stated in terms of the whole sample as 100 per cent.

Solutions Required

4. The acids referred to as concentrated shall be of approximately the following specific gravities:

Hydrochloric Acid (HCl)	1.19
Sulphuric Acid (H ₂ SO ₄)	1.84
Nitric Acid (HNO ₃)	1.42

5. Dissolve 1.5 g of ammonium carbonate in 50 c c of cold water.

6. Dissolve 107 g of NH₄Cl in 1,000 c c of warm water.

7. Neutralize 20 c c of concentrated HNO₃ with NH₄OH and dilute to 1,000 c c. Test with litmus; the solution shall not be acid.

8. Dissolve 1 g of ammonium oxalate in 50 c c of water, heating gently.

9. The strength of the final standard titania solution shall be 1 c c=0.0001 g TiO₂. To prepare the solution weigh out in a platinum crucible an amount of potassium titanium fluoride (K₂TiF₆) sufficient to make from ½ to 1 liter of "stock solution" in which 1 c c=0.001 g TiO₂. Evaporate several times with H₂SO₄ without taking to dryness, thus driving out all fluorine. Take up the residue with water containing enough H₂SO₄ to make at least 5 per cent of the solution, when finally diluted to the standard solution strength. To standardize the stock solution take out two 50 c c portions, dilute, boil, and precipitate with ammonia. Filter, wash with hot water until free from alkali, ignite, blast, and weigh. The duplicate should check very closely. From the weight of titania thus determined calculate the strength of the stock solution. The standard solution to be used is obtained from the stock solution by diluting until 1 c c=0.0001 g (TiO₂).

10. Dissolve about 0.4 g (a little less) of KMnO₄ in 1 liter of water and check against an iron solution of known purity and strength. Dilute the solution until 1 c c=0.001 g Fe₂O₃.

The ordinary chemical iron wire is not sufficiently pure for this use. If preferred the solution may be standardized against sodium oxalate, a pure form of which is prepared especially for such work by the Bureau of Standards, Washington, D. C.

Methods

11. *Moisture.*—To determine moisture, heat approximately 1 g of the sample at a temperature not under 105° nor over 110° C., to constant weight.

12. *Loss on ignition.*—To determine loss on ignition, heat about 1 g of the sample over a blast lamp or in an electric furnace at 900° to 1,000° C., to constant weight. Ignition loss may be determined in the sample from which the moisture has been removed. The percentage of ignition loss is calculated to a moisture-free basis.

13. *Silica.*—To determine silica, weigh out approximately 0.5 g of the sample and mix with 5 g of Na₂CO₃. Put a little Na₂CO₃ in the bottom of the crucible before introducing the mixture, and then cover the mixture with a little more Na₂CO₃. Fuse over a Meker burner or blast lamp until complete solution is obtained. Cool the fusion and as it solidifies, rotate the crucible to spread the mass up the side walls. Dissolve the fusion in about 100 c c of water in a platinum or porcelain evaporating dish. Add about 20 c c of concentrated HCl, introducing it slowly by means of a pipette, keeping the dish covered with a watch glass. Evaporate to dryness and heat until the fumes of HCl are gone. Add about 5 c c of concentrated HCl and 30 to 40 c c of water. Warm on a water bath for 10 to 15 minutes and break up the lumps. Decant the clear liquid onto a filter paper and collect the filtrate in a 400 c c beaker. Add more HCl and

water to the evaporating dish, warm again and decant. Repeat this a third time.

Finally transfer the contents of the dish to the filter paper. Wash with cold water until silver nitrate shows no chlorides to be left. Transfer the filtrate to the original evaporating dish, evaporate again to dryness, take up with a little HCl and water, transfer to a new filter paper and wash as before. Transfer both silica precipitates to a platinum crucible. Ignite carefully over a Bunsen flame until the filter paper is burned off, then blast for about 30 minutes; cool and weigh. Repeat blasting for 5 minutes, weigh again and repeat until constant weight is obtained.

To the residue in the crucible add about 5 c c of water and 5 drops of H_2SO_4 . Add HF drop by drop at first, and then slowly until the crucible is almost one-half filled. Warm on a hot plate until almost dry, add 2 or 3 c c more of HF and evaporate to dryness. Heat the crucible to bright redness and then blast for 5 minutes. Cool and weigh and repeat blasting to constant weight. The loss in weight from the original silica residue represents the actual silica content (SiO_2), except for that part of silica which is later recovered from alumina, etc. The residue from the HCl evaporation is left in the crucible and the total precipitate of alumina, etc., is added to this same crucible in which it is ignited and weighed.

14. *Alumina*.—Regarding the determination of alumina, reference should be made to Scientific Paper No. 286 of the Bureau of Standards by Doctor Blum on Determination of Alumina as Oxide.

To determine alumina, to the filtrate from the silica determination, add about 10 c c of NH_4Cl solution and heat to boiling. Then add NH_4OH very slowly and with constant stirring until there is a slight excess. The NH_4OH must be free from CO_2 . Filter hot and rapidly, and wash four times by decantation with hot solution of ammonium nitrate. Carefully wash the precipitate from the filter paper into a beaker, using hot water. Dissolve the precipitate in hot dilute HCl. Repeat the precipitation with NH_4Cl and NH_4OH . Decant four times as before, using hot ammonium nitrate. Transfer to the filter paper and wash with hot ammonium nitrate until the washings are free from chlorides when tested by silver nitrate. Evaporate the filtrate nearly to dryness, add a little NH_4OH and continue the evaporation. Keep the solution alkaline to coagulate any iron and aluminum hydroxides. Transfer the precipitate to a filter paper and wash thoroughly. Transfer the moist filter paper to the platinum crucible containing the residue from the silica. Burn off the filter paper and blast the precipitate. Repeat blasting and weighing to a constant weight.

15. *Iron oxide*.—To determine iron oxide, fuse the ignited alumina precipitate with about six times its weight of potassium pyrosulfate or potassium bisulfate. Avoid sputtering. Heat carefully to redness and continue heating until the residue is all dissolved. Cool. Dissolve in warm water and add about 10 c c of dilute H_2SO_4 (1:5). Evaporate to a small volume. Then heat to a higher temperature until copious fumes of H_2SO_4 are evolved. Sufficient H_2SO_4 should be present to form a pasty mass when cooled. Take up with water, filter off, wash, ignite and weigh the silica as before and evaporate with HF as before. The loss in weight is extra silica to be added to the original silica determination and subtracted from the alumina. Fuse the residue with a little potassium pyrosulfate or potassium bisulfate, and add the solution of this cake to the main solution. Transfer the total filtrate to a 250-c c graduated flask and dilute to 250 c c, mixing

thoroughly. Draw off 50 c c of this solution and reserve for titania determination. Pass the remaining 200 c c through a Jones reductor, or otherwise reduce the solution with pure zinc and H_2SO_4 . To the solution add 3 c c of 10 per cent $CuSO_4$ solution and titrate with standard $KMnO_4$ solution (1 c c equivalent to 0.001 g Fe_2O_3), until a faint pink tinge is seen. If Jones reductor or similar apparatus is used, subtract the $KMnO_4$ equivalent, which has previously been determined on blank samples run through the apparatus. From the result, calculate the iron as Fe_2O_3 .

16. *Titania*.—To determine titania, place in a small Nessler tube the 50 c c of filtrate previously set aside for titania determination, and fill the tube up to the graduation mark. Add 1 c c of H_2O_2 (free from fluorine) and shake well. The color of this solution is now compared in any standard color comparator with the color of a known standard solution, preferably of such strength that 1 c c equals 0.0001 g of titanium dioxide (TiO_2). To make the comparison, put 10 c c of this standard solution into a second small Nessler tube and dilute with water from a burette until the color is matched. Note the amount of water added and calculate the percentage of TiO_2 in the sample.

17. *Lime*.—To determine lime, evaporate the filtrate from the alumina precipitation to about 250 c c. While still boiling add about 5 c c of acetic acid. Meanwhile, dissolve about 1 g of oxalic acid in a little hot water and add to the solution. In about five minutes add a slight excess of NH_4OH and boil until precipitation is complete. Cool thoroughly and filter. Wash three times by decantation with dilute NH_4OH (1:10) or a 1 per cent solution of ammonium oxalate. Dissolve the precipitate by adding about 50 c c of dilute HNO_3 (1:5). Again add a slight excess of NH_4OH and a few drops of oxalic-acid solution. Boil well and let stand a couple of hours to cool. Filter and wash as before. Transfer the precipitate to a platinum crucible, carefully burn off the paper and ignite over a blast lamp for about 10 minutes. Cool and weigh quickly. Repeat the blasting to constant weight. The increase in weight of crucible is calcium oxide.

18. *Magnesia*.—To determine magnesia, add to the filtrate from lime precipitation about 2 g of sodium-ammonium-phosphate dissolved in 15 c c of water. Stir vigorously and while stirring add drop by drop about one-third of the volume of the solution of NH_4OH . Let stand 12 to 24 hours. Filter and wash the precipitate with dilute NH_4OH (1:10). Discard the filtrate. Wash the precipitate until the washings show no discoloration when tested with silver nitrate. Redissolve the precipitate in warm dilute HNO_3 (1:5), using about 50 c c, and collect in a beaker. Precipitate and wash as before. Collect the precipitate on a Gooch asbestos crucible. Dry slowly and then heat over a Meker burner for about 10 minutes; cool and weigh. Re-ignite to constant weight.

The $Mg_2P_2O_7$ is never pure, being contaminated by small amounts of calcium, barium, aluminum, iron, manganese, etc., but in the analysis of refractories this error is negligible, and correction for these impurities is not required unless previously agreed upon.

19. *Alkalies*.—To determine alkalies, the J. Lawrence Smith method shall be used. Weigh out about 0.5 g of the sample and mix well with 0.5 g of NH_4Cl and 3 g of $CaCO_3$. Transfer to a platinum crucible, placing about 0.5 g of $CaCO_3$ in the bottom of the crucible and a similar amount over the top of the mixture. Heat gently over a low flame for about 15 minutes to volatilize NH_4Cl . Then raise the temperature until the lower three-quarters of the crucible is dull red. Hold this temperature for about one hour. Cool, take up with about 50 c c of water and heat over a water bath,

adding water to replace that lost by evaporation. Break up any lumps with a small pestle. Decant the clear liquid through a filter paper and wash four times by decantation. Then transfer the residue to the filter. Wash until silver nitrate shows only a very faint turbidity. To the filtrate add NH_4OH and ammonium carbonate and heat to boiling. Filter and again digest the precipitate with NH_4OH and ammonium carbonate. Filter and allow the filtrate to collect with the previous filtrate, then evaporate to dryness in a platinum or porcelain dish. Remove ammonium salts by gentle ignition in a moving flame. Treat with water and remove the last trace of lime by adding ammonium oxalate to the boiling solution and let stand over night. Filter, evaporate to dryness, ignite gently and allow to cool. Then moisten the residue with HCl , evaporate again to dryness, ignite gently and weigh. Dissolve in water. Ignite and weigh any insoluble residue, deducting this from the alkali chlorides.

Dilute the solution of the mixed chlorides and add hydrochloroplatinic acid in amount equal to 0.3 c c more than would be necessary if all chlorides were present as NaCl . Evaporate to a sirupy consistency. Cool and treat with a few cubic centimeters of 80 per cent ethyl alcohol. Stir and decant through a weighed Gooch crucible. Treat again with 80 per cent alcohol and decant. Repeat washing and decantation until the alcohol leaving the Gooch crucible is colorless and the precipitate appears golden yellow, not orange. Transfer the precipitate to the Gooch crucible, wash with 80 per cent alcohol about six times and dry at 130°C . to constant weight. This residue is potassium chloroplatinate.

The oxides are calculated as follows:

Weight of potassium chloroplatinate $\times 0.3068 = \text{KCl}$.
 Weight of potassium chloroplatinate $\times 0.1941 = \text{K}_2\text{O}$.
 Total chlorides $- \text{KCl} = \text{NaCl}$.
 $\text{NaCl} \times 0.5303 = \text{Na}_2\text{O}$.

CHROME ORES AND CHROME BRICK

20. The sample shall be secured after the manner of any of the approved methods of sampling. If from ores or chrome-bearing refractories, it shall not be less than 10 pounds, in small nut-size particles when sent to the laboratory. If from chrome brick, the sample shall consist of a small portion from the interior of from 15 to 25 bricks. This 10-pound sample shall be crushed to pass a No. 20 sieve⁹³ and quartered until a sample of 100 g is secured, which shall be ground to pass a No. 100 sieve.⁹³ From this portion, a smaller working sample shall be quartered and ground in an agate mortar to a very nearly gritless powder. In the case of hard burned brick or hard lump chrome ore the very fine grinding assists materially in solution of the sample.

21. Dry the fine, ground powder at 110°C . for not less than one hour. Cool in desiccator. Fuse 0.5 g of the thoroughly dried sample in approximately 10 g of fused potassium bisulphate in a platinum crucible. The usual cautions of a bisulphate fusion should be observed; that is, the flame turned very low so that the bisulphate just melts, increasing the flame so that the bisulphate remains in a liquid condition, very gradually increasing until the crucible reaches a dull red heat. The object of the slow heating is to retain the sulphuric acid, which is the effective part of the flux. The most refractory ores should be thoroughly fused in one and one-half to two hours. Remove the crucible from the burner and allow to cool in the air. The bisulphate melt will shrink from the crucible and may be removed

easily in one cake. Dissolve the fusion in 200 c c hot HCl (1:1), boiling until the solution acquires a clear, bright green color. Transfer the solution to a porcelain evaporating dish and evaporate to dryness on a water bath. Bake at exactly 120°C . until free from hydrochloric acid fumes. Moisten with hot HCl (1:1), evaporate on water bath and bake a second time at 120°C . Dissolve in 200 c c hot dilute HCl (1:1), and filter out the silica. Ignite and weigh the silica in a platinum crucible. Add two drops concentrated H_2SO_4 and sufficient HF to remove all silica. Evaporate, ignite and weigh. The difference gives the amount of silica present in the sample. Should there be any appreciable residue left in the crucible it should be fused with a small amount of fused KHSO_4 and added to the filtrate from the silica.

Dilute the filtrate from the silica to about 500 c c and precipitate iron, aluminum, chromium, and titanium, if present, with NH_4OH , using care to have not more than two drops of NH_4OH in excess in order to avoid solution of chromium and aluminum hydroxide in the alkaline solution. On account of the relatively large amount of magnesium that is usually present in chrome ores and chrome brick it is advisable to dissolve the precipitate in hot dilute HCl and precipitate a second time. Filter out the combined hydroxides and dissolve them on the filter paper with HNO_3 , catching the solution in a porcelain casserole. Add a few crystals of KClO_3 and evaporate the nitric solution, adding a crystal of KClO_3 from time to time until the chromium is completely oxidized, which is indicated by a change from a dull green to a brilliant orange color. Dilute this solution with hot water and again precipitate with NH_4OH , filtering as before. The filtrate contains a large percentage of the chromium, while the residue on the filter consists of iron and aluminum hydroxides and titanium, if present. Repeat the oxidation two or three times until the filtrate from the iron and aluminum hydroxide precipitation shows no further traces of chromium. Concentrate and combine the filtrates containing chromium to approximately 500 c c. Add H_2SO_4 until the liquid changes from a bright orange to a brilliant green color and heat to boiling. Add NH_4OH to precipitate chromium as hydroxide, having not more than two drops in excess, as stated above. Filter, wash well with hot water, ignite, and weigh as Cr_2O_3 . The iron and aluminum and titanium hydroxides are ignited and weighed in a platinum crucible. Fuse the combined oxides with a small amount of KHSO_4 , following the same precautions as mentioned above. Dissolve the fusion in dilute H_2SO_4 , reduce with H_2S and titrate the iron with standard permanganate solution. Determine the titanium present by the colorimetric method, as described in section 16. Subtract the combined amounts of Fe_2O_3 and TiO_2 from the total weight of the three oxides and thus determine Al_2O_3 . If titanium is absent, reduce the iron with metallic zinc and titrate with K_2MnO_4 , which is a little quicker method than the H_2S reduction.

To the combined filtrates from the precipitations of iron, aluminum, chromium, and titanium hydroxides add bromine, allow to stand for a few minutes and then add sufficient NH_4OH to precipitate the manganese hydroxide. Boil to concentrate the manganese hydroxide if any be present. Filter, ignite, and weigh as Mn_2O_3 . In the filtrate from the manganese add NH_4OH and $(\text{NH}_4)_2\text{C}_2\text{O}_4$. Heat to boiling and when the calcium oxide has settled, filter with the usual precautions. The calcium oxide may be determined by ignition or by the volumetric method. (Refer to the determination of calcium oxide as described in sec. 17.)

⁹³ For detailed specifications for these sieves, see the standard specifications for sieves for testing purposes, A. S. T. M. E11. (See 645.31, p. 1226.)

Evaporate the filtrate from the calcium oxalate to dryness with HNO_3 to remove the excess of ammonium salts. Dissolve the residue in hot water, filter, allow to cool and determine MgO as described in section 18.

Determine alkalis by the J. Lawrence Smith Method, as described in section 19.

RAPID ROUTINE METHOD FOR THE ANALYSIS OF CHROME BRICK AND CHROME ORE

22. The sample shall be secured after the manner of any of the approved methods of sampling. If from ores or chrome-bearing refractories it shall not be less than 10 pounds in small nut-sized particles when sent to the laboratory. If from chrome brick, the sample shall consist of a small portion from the interior of from 15 or 25 bricks. This 10-pound sample shall be crushed to pass a No. 20 sieve⁹⁴ and quartered, until a 4-ounce sample is secured, which shall be ground to pass a No. 100 sieve.⁹⁴ From this portion a smaller working sample shall be quartered and ground in an agate mortar to a very nearly gritless powder. In the case of hard burned brick or hard lump chrome ore the very fine grinding assists materially in solution of the sample. Dry the fine, ground powder at 110°C . for not less than 1 hour. Cool in desiccator.

23. *Chromium*.—Fuse 0.5 g of the sample in 8 to 10 g of sodium peroxide in a nickel or porcelain crucible over a Bunsen burner, being careful not to heat too strongly. When fused, leach out with cold water, boil 15 minutes to decompose any sodium peroxide. Cool and add 100 c c of H_2SO_4 (1:1). Cool to tap-water temperature and titrate with ferrous ammonium sulfate and potassium permanganate. Time 30 to 45 minutes.

24. *Silica and iron*.—Fuse 0.5 g of the sample in a nickel crucible over a Bunsen burner. Leach out with cold water, make acid with HCl and evaporate to dryness. Take up with 200 c c water and add 10 c c HCl . Filter off silica and wash well with hot water and hot dilute HCl . For high silica a second evaporation is necessary. The filtrate or combined filtrate is made alkaline with sodium hydroxide and about 5 c c of bromine added. The mass is allowed to digest for one-half hour on a steam bath. This oxidizes the iron and chromium, precipitates the iron, and dissolves the chromium and aluminum. After precipitating the iron twice it is filtered off on an asbestos plug and washed well with hot water. This precipitate of iron may be dissolved off the plug with hot HCl (1:1) and determined by the stannous chloride reduction, and permanganate method.

A blank should be run in conjunction with this method and deductions made when necessary to determine the purity of the chemicals used.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR GROUND CHROME ORE, NO. 125, APRIL 1, 1924. (CURRENT DESIGNATION: TT-C-251)

CHROME ORE

GRADE

1. This specification covers one grade of ground chrome ore.

⁹⁴ For detailed specifications for these sieves, see the standard specifications for sieves for testing purposes, A. S. T. M. E11. (See 645.31, p. 1226.)

MATERIAL

2. The material shall be as required in the following paragraphs.

GENERAL REQUIREMENTS

3. Chrome ore furnished under these specifications shall be ground sufficiently fine to insure its suitability for use as a refractory for open-hearth furnaces.

DETAIL REQUIREMENTS

4. (a) Ground chrome ore shall contain not less than 45.0 per cent chromic oxide (Cr_2O_3).

(b) An analysis of each shipment of ground chrome ore shall be furnished by the contractor showing the percentage of chromic oxide. The results of this analysis shall conform to the requirements specified in paragraph 4 (a).

(c) Ground chrome ore not complying with all the requirements of this specification and of the contract or purchase order shall be rejected and the contractor notified.

TESTS AND METHODS OF INSPECTION

5. (a) Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative and without cost to the contractor. The chemical composition thus determined shall conform to the requirements specified in paragraph 4 (a).

(b) Chrome ore shall be sampled at the contractor's plant, whenever practicable, otherwise at the point of delivery.

(c) Representative samples shall be obtained from at least 10 per cent of the containers in a lot or shipment, these individual samples crushed to $\frac{1}{2}$ -inch size or smaller, thoroughly mixed, and the resultant mixture, quartered down to a 5-pound sample, shall be sent to the designated laboratory in an air-tight and moisture-proof container for analysis.

621.12 MANGANESE ORES.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, C25 AND SUPPLEMENT, 1927

MANGANESE ORE, SAMPLE NO. 25b

(This standard sample is prepared and sold by the Bureau of Standards for use by industrial organizations and others for checking the accuracy of analyses of manganese ores, etc. It is accompanied by a certificate giving its analysis as regards manganese and available oxygen.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, ANALYZED IRON AND MANGANESE ORES, METHODS OF ANALYSIS, C26, 1921

METHODS OF ANALYSIS OF MANGANESE AND IRON ORES

(Circular 26 contains methods of analysis which have been found satisfactory at the Bureau of Standards and which may be used in the analysis of the standard sample No. 25b for manganese ore and standard samples No. 26, No. 27a, No. 28, and No. 29, for crescent, Sibley, Norrie, and magnetite iron ores.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR MANGANESE ORE, QQ-M-71, MAY 3, 1932.

MANGANESE ORE

GENERAL REQUIREMENTS

1. Federal specification QQ-M-151 (see 600.0, p. 3), general specifications for metals, forms a part of this specification.

2. Manganese ore furnished under these specifications shall consist of pyrolusite or psilomelane. It shall be supplied in lumps, crushed, or screened to size, as specified in the contract or purchase order.

DETAIL REQUIREMENTS

3. (a) Manganese ore shall contain not less than 40.0 per cent manganese.

(b) An analysis of each shipment of manganese ore shall be furnished by the contractor, showing the percentage of manganese. The results of this analysis shall conform to the requirements specified in paragraph 3 (a).

(c) Manganese ore not complying with all the requirements of this specification and of the contract or purchase order shall be rejected, and the contractor notified.

TESTS AND METHODS OF INSPECTION

4. (a) Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative, and without cost to the contractor. The chemical composition thus determined shall conform to the requirements specified in paragraph 3 (a).

(b) Manganese ore shall be sampled at the contractor's plant whenever possible, otherwise at the point of delivery.

(c) Representative samples shall be obtained from at least 10 per cent of the containers in a lot or shipment, consisting of at least 4 ounces for every 150 pounds, in the case of finely granulated or screened material. In the case of lump material, at least 5 pounds shall be taken for every 1,000 pounds or fraction thereof in the lot or shipment. These individual samples shall be crushed to one-half inch or smaller, thoroughly mixed, and the resultant mixture quartered down to a 5-pound sample, which shall be sent to the designated laboratory in an air-tight and moisture-proof container for analysis.

621.13 SILICON ORES.

(No nationally recognized specifications available.)

621.2 FERRO-ALLOYS.

621.20 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF SAMPLING FERRO-ALLOYS, DESIGNATION A103-27, 1927

SAMPLING FERRO-ALLOYS

The procedures recommended in these methods are considerably more elaborate than those in general use by the principal consumers of ferro-alloys in this country. However, the methods have been designed as standard procedure for use in important cases where large sums are often involved and they accordingly should represent the most approved modern practice.

FERROSILICON, HIGH-CARBON FERROMANGANESE, AND SILICOMANGANESE

These alloys are usually shipped in bulk in car-loads and should be sampled while being loaded or unloaded. At these times the sampler can make the fairest estimate of the ratio of lump to fine material and should secure proportionate amounts of each. Frequently the percentage of fines is negligible.

While the shipment is being loaded or unloaded, samples aggregating 150 pounds or more shall be gathered from all parts of the car with due regard to the estimated ratio of lump to fine material. In breaking lumps or pigs, fragments representing the full cross section should be secured, a heavy hammer or sledge being employed.

The gross sample thus obtained shall be crushed to pea size in a heavy crusher provided with smooth plates of manganese steel. The crushed product shall be repeatedly mixed and halved with a Jones divider until about 5 pounds remain. If a Jones divider is not available, the sampler may be reduced by quartering, but use of the divider is preferred. The sample shall be further reduced to approximately a size to pass a No. 10 sieve⁹⁵ in laboratory rolls and again cut down by a Jones divider or by quartering to about 300 g. This sample shall then be divided in the same way into four portions of approximately 75 g each and three of these shall be reserved. The fourth portion shall be pulverized until all has been passed through a No. 80 or No. 100 sieve.⁹⁵ A steel mortar with a close-fitting pestle, both of hardened alloy steel, shall be used for this reduction. Rejection of any part of the sample because of failure to pass the screen is almost sure to produce error. The sample shall be thoroughly mixed, and dried for one hour at 105° to 110° C. It is then ready for analysis. If necessary, one-half rather than one-fourth of the 10-mesh sample shall be pulverized to pass a No. 80 or No. 100 sieve and the resulting sample divided for distribution to the interested parties.

HIGH-CARBON FERROCHROMIUM, CHROMIUM METAL, LOW-CARBON FERROMANGANESE, AND MANGANESE METAL

These alloys are usually shipped in stout kegs or barrels. Most of these products are relatively costly, and accuracy in sampling is extremely important even when the tonnage involved is small.

If the shipment is believed to be fairly uniform in composition and contains only a small percentage of fines, a satisfactory sample can be obtained by removing the ends or cutting the sides of the packages and taking from each at least 0.5 per cent of the contents. Thus at least 2½ pounds would be taken from a package containing 500 pounds. If the product has been crushed to a small size, for example, ¼ to ¾ inch, the sample can be taken with a shovel or scoop. If the material is in larger pieces, as is usual with high-carbon ferrochromium, the sample shall be taken by breaking fragments from a number of lumps until the requisite weight has been obtained as already described for the sampling of lumps of ferrosilicon. The gross sample shall be obtained by combining the samples taken from the individual packages and crushed and worked down in the manner described for the preceding group of alloys.

The relatively simple procedure of the preceding paragraph is justified only when experience has shown that the product being sampled contains no more than a small percentage of fines and is relatively uniform in composition. The fines usually differ somewhat in composition from the lumps and always work toward the bottom of the container

⁹⁵ For detailed specifications for these sieves, see A. S. T. M. specification E 11 (645.31, p. 1226).

while in transit. Products like tungsten powder or pulverized ferrosilicon (80 to 85 per cent Si) are also liable to segregate while in transit and should be sampled in a manner to avoid error due to the accumulation of a heavy constituent in the bottom of the container. The term "relatively uniform in composition" applies to a shipment or a subplot of a shipment in which the composition of any package is approximately the same as that of any other. Frequently a shipment comprises two or more lots, each uniform in composition within itself, but differing in this respect from the other lots. In these cases, each lot shall be sampled separately. If the product is rather variable in composition or if it contains a considerable proportion of fines, all of the packages comprising the shipment or lot shall be emptied and from each shall be taken a sample amounting to at least 0.5 per cent of the contents. The percentage of fine and lump alloy in each barrel shall be estimated and the sampling conducted accordingly. In sampling a small lot which varies widely in composition within itself, it is good practice to empty all of the packages, combine the entire contents, and mix the lot thoroughly. The pile shall then be quartered repeatedly until a sample is obtained approximating 5 per cent of the weight of the entire lot. The gross sample obtained by combining samples from the individual barrels or by quartering the entire shipment shall be crushed and worked down in the manner described for the group containing ferrosilicon.

LOW-CARBON FERROCHROMIUM

Low-carbon ferrochromium is ordinarily shipped in stout kegs. The alloy usually contains about 70 per cent of chromium together with maximum contents of carbon ranging from 0.1 to 2 per cent. The combination of hardness and toughness characteristic of this product, particularly of the lower carbon grades, makes it the most difficult by far of any of the ferro-alloys to sample properly. In view of the great importance of the accurate determination of the carbon content—especially of the alloy containing a maximum of 0.1 per cent of carbon—the utmost care must be taken to avoid contamination of the sample with fragments of steel from the tools. Fortunately low-carbon ferrochromium is usually uniform in composition and free from fines.

If the alloy is known to be reasonably uniform in composition, 10 lumps shall be drawn from each package in the shipment or subplot. This can be accomplished by removing the head or cutting the side of the keg. If the composition is variable, each package of the shipment or subplot shall be emptied and about 20 lumps taken at random. The number of lumps should be varied according to the net weight of the package and the average size of the lumps found in it. One fragment about one-eighth inch in diameter shall be broken from each lump of the gross sample, using a heavy hammer and a plate of hardened alloy steel. As nearly as possible each fragment should offer a cross section of the lump from which it was taken. The resulting sample shall be crushed to approximately a size to pass a No. 10 sieve by means of a mortar and pestle of hardened alloy steel. This material shall be cut down with a Jones divider or quartered until 30 or 40 g remain. This quantity shall then be pulverized to pass a No. 40 sieve by means of the mortar and pestle. Especially in pulverizing the grades relatively low in carbon, an air hammer is almost indispensable. The material passing a No. 40 sieve shall be split into two or four parts according to the requirements, by means of a Jones divider or by quartering. The following procedure is recommended for those cases in which prolonged crushing has

resulted in a powder which passes entirely through a No. 20 sieve but which passes a No. 40 sieve in part only. The entire sample shall be passed through a No. 20 sieve and then divided into fractions finer and coarser than No. 40. The fractions shall be weighed and preserved in separate packages upon which are recorded the percentages by weight of the two sizes. The fractions may be analyzed separately or a composite sample may be prepared for the determination of each element, by weighing and subsequently combining the proper proportions of the coarse and fine material.

REQUIREMENTS FOR MORTAR AND PESTLE

In the analysis of ferro-alloys, errors arising from contamination of the sample by iron from the sampling appliances are both serious and common. A rapid and accurate method for the determination of unalloyed metallic iron in ferrochromium and in ferrosilicon is known, and by this means such contamination has been detected and measured. Contamination has often been due to iron from the mortar and pestle but can be avoided by the proper selection and treatment of the steel from which they are made. These tools are essential to the accurate sampling of ferro-alloys—especially low-carbon ferrochromium—and when made in accordance with the following requirements are suitable for this purpose.

Chromium-nickel steel containing approximately 1.5 per cent Cr, 3 per cent Ni, and 0.35 per cent C is recommended for both tools. For the mortar a cylinder 3 by 3 in. shall be drilled axially to a diameter of 1½ inches and a depth of 2½ inches. The bottom of the hole shall be made perfectly flat and the entire inner surface brought to a smooth finish. The pestle shall be made from a rod originally 1½ inches in diameter by 5 inches long, and shall be smoothly faced and turned to a final diameter slightly less than 1½ inches. The mortar and pestle shall be heated for several hours in a laboratory muffle furnace at 750° to 800° C. and hardened by quenching in oil. The upper part of the pestle shall be slightly softer than the remainder in order to decrease the tendency to shatter. Both tools shall be polished with abrasive paper for the removal of scale. Such a mortar and pestle, together with an air hammer will pulverize alloys which will resist other equipment.

Other approved methods for the preparation of the pulverized sample from the gross sample may be substituted for the above provided they do not lead to contamination or loss of any portion of it. For example, the gross sample may be crushed entirely by rolls or in the absence of power machinery may be broken by hand to the required size. In the entire absence of power equipment the gross sample should be sent to a point where suitable facilities are available.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF FERRO-ALLOYS, DESIGNATION A104-27, 1927

CHEMICAL ANALYSIS OF FERRO-ALLOYS

FERROSILICON

Determination of Silicon by Fusion with Sodium Peroxide and Dehydration with Hydrochloric Acid

Transfer 0.5000 g (use 0.4000 g for 90 per cent silicon) of the finely powdered sample (passing a No. 150 sieve⁶⁶) to a 50 c c pure iron crucible made from No. 20 gage (0.32 inch thickness) ingot iron and add approximately 13 g of sodium peroxide. Mix thoroughly with a platinum or iron rod and carefully clean the rod of adhering particles by scraping with another rod. Cover the mixture with a layer of about 2 g of additional peroxide. Heat the crucible and contents on a hot plate for 5 to 10 minutes to expel any water in the peroxide which would cause spattering in the subsequent fusion.

⁶⁶ For detailed specifications for this sieve see A. S. T. M. Specification E11 (645.31, p. 1226).

Carefully fuse over a low flame by holding the crucible with a pair of tongs and slowly revolving it around the outer edge of the flame until the contents have melted down quietly. When the fusion is molten rotate the crucible carefully to stir up any unattacked particles on the bottom or sides, the crucible and contents being maintained at a low red heat. Just before completion of the fusion, which requires only three or four minutes, increase the temperature to bright redness for a minute. If the reaction has proceeded too violently, due to too rapid heating, to the use of insufficient sodium peroxide, or to the lack of thorough mixing, appreciable loss will occur and the work should be repeated.

Cover the crucible and allow it to cool until the fusion has solidified, and tap the crucible, while still warm, several times on an iron plate, which will loosen the fused mass in a solid cake. When the crucible and cake have completely cooled, transfer the cake to a large (275 c c) gold or preferably platinum dish. Cover the dish with a clock glass and cautiously add 50 c c of cold water. When the reaction ceases, wash the small amount of adhering matter in the crucible into the dish with a little water. Cool the solution and carefully add an excess of hydrochloric acid. Evaporate to dryness, preferably on a steam bath, but do not bake at a temperature above 110° C. If platinum or gold dishes are not available for solution of the fused cake, the latter can be disintegrated with water in a pure nickel dish and the contents then transferred to a porcelain dish containing sufficient hydrochloric acid to provide an excess of acid. It is not desirable to dissolve the fusions directly in porcelain, because of the action of the alkaline solution.

When the residue is dry, allow the dish to cool. Add 10 c c of hydrochloric acid (specific gravity 1.13), cover the dish, and heat gently for a few minutes. Dilute with 100 c c of hot water, digest for a few minutes, and filter through an 11 cm paper. Wash about eight times with hot 5 per cent hydrochloric acid, three times with warm 5 per cent sulphuric acid, and a few times with hot water. Reserve this paper until the second evaporation has been completed.

Evaporate the filtrate to dryness and bake the covered casserole or dish at 110° C. for one hour. Heating at a higher temperature is unnecessary and also disadvantageous. Cool, add 10 c c of hydrochloric acid (1:1), digest on the steam bath for ten minutes, add 100 c c of warm water, filter immediately, and wash about eight times with cold 1 per cent hydrochloric acid, twice with cold 5 per cent sulphuric acid, and a few times with cold water.

Place the paper and silica from the second dehydration in a large partially covered platinum crucible and char the paper without inflaming. Add the paper containing the silica from the first dehydration, char as before and then ignite carefully until the carbon has been burned off. Great care should be exercised in igniting the papers as the current of air produced by a burning filter is sufficient to carry finely divided silica out of the crucible. When the carbon of the filter paper has been completely burned, gradually heat the tightly covered crucible to the full heat of a blast lamp and continue the heating at 1,050° to 1,100° C. for 25 minutes. Cool in a desiccator, weigh, and check for constant weight by ten minutes' additional heating at the above temperature. Add sufficient sulphuric acid (1:1) to moisten the silica and then 15 to 20 c c of pure hydrofluoric acid (48 per cent). Evaporate to dryness, ignite, and weigh. The loss represents silica which contains 46.72 per cent of silicon. A blank,

not omitting the same amount of hydrofluoric acid, should be carried through all stages of the operation.

NOTE.—The silica remaining in the filtrate after the second dehydration is practically negligible, averaging about 0.0096 to 0.0010 g in hydrochloric dehydration and 0.0010 to 0.0015 g in sulphuric dehydration.

FERROMANGANESE

Determination of Manganese by the Modified Bismuthate Method

REAGENTS REQUIRED

Dilute nitric acid (specific gravity 1.135).—Mix 300 c c of nitric acid (specific gravity 1.42) and 700 c c of distilled water. Test for proper specific gravity.

Dilute nitric acid (3 : 97).—Mix 30 c c of recently boiled nitric acid (specific gravity 1.42) and 970 c c of distilled water. Add a little sodium bismuthate and shake well.

Asbestos.—Asbestos for this work should be digested in hot nitric acid (specific gravity 1.42) and then washed free from acid with distilled water.

Sodium bismuthate.—This reagent should be of 80 per cent grade and its oxidizing power tested as follows: Shake 0.5 g of the reagent with 4 g of potassium iodide and a little water in a stoppered flask. Add 15 c c of hydrochloric acid and allow to stand in the dark, with occasional shaking until the bismuthate has entirely decomposed. Dilute to 300 c c and titrate with 0.1 N sodium thiosulphate, using starch as an indicator at the end. One cubic centimeter of 0.1 N $\text{Na}_2\text{S}_2\text{O}_3$ equals 0.0140 g of NaBiO_3 .

Standard potassium permanganate solution.—See the determination of chromium in ferrochromium, given below. One cubic centimeter of 0.1 N KMnO_4 equals 0.001099 g of manganese.

METHOD

(a) Solution of the sample

All samples should be crushed to approximately a size to pass a No. 100 sieve and dried at 105° to 110° C.

With high-carbon 80 per cent ferromanganese, dissolve 0.25 g of the prepared sample in 60 c c of nitric acid (specific gravity 1.42) in a 750 c c Erlenmeyer flask, provided with a clock-glass cover or trap to prevent loss by spraying.

Add 2 g of potassium nitrate and boil gently until the volume of the solution has been reduced to about 15 c c. Cool, add 10 c c of H_2SO_4 (1 : 1) and evaporate to strong fumes of sulphuric acid. Cool somewhat, dilute the solution with 200 c c of HNO_3 (specific gravity 1.135), heat to boiling, remove from the heat, and add sodium bismuthate a little at a time until a precipitate of manganese dioxide has formed. When this occurs, add sulphurous acid dropwise until the precipitate has dissolved and an excess of about 1 c c has been provided to reduce any chromium to the trivalent form. Boil the solution about five minutes to expel oxides of nitrogen completely, dilute to 250 c c with water, cool the flask and solution in crushed ice, and treat as described later. High-carbon ferromanganese containing 1 per cent or more of chromium may not dissolve completely in nitric acid. In this case, dilute the solution after treatment with nitric acid, filter, and fuse the washed residue with a little sodium carbonate. Dissolve the melt in a small volume of nitric acid (specific gravity 1.135), and add it to the main solution. Treat with potassium nitrate, etc., as previously described.

With low-carbon ferromanganese or manganese metal dissolve 0.2500 g of the sample in 250 c c of

nitric acid (specific gravity 1.135) in a covered 750 c c Erlenmeyer flask and boil the solution gently for a few minutes to expel oxides of nitrogen. Treat with bismuthate and sulphurous acid as described above.

With silico-manganese (60 to 70 per cent of manganese) and manganese-silicon (20 to 25 per cent of manganese) treat 0.3000 g of the former and 1.000 g of the latter with 5 c c of hydrofluoric acid in a large platinum dish equipped with a gold or platinum cover. (Some spiegeleisens are completely soluble in nitric acid, in which case the sample can be dissolved directly in 250 c c of nitric acid (specific gravity 1.135). When the reaction moderates, add nitric acid (specific gravity 1.42) a few drops at a time until the sample has completely dissolved. Add 10 c c of nitric acid (specific gravity 1.42) and evaporate to a sirupy consistency. Again add 10 c c of nitric acid (specific gravity 1.42) and evaporate as before to expel hydrofluoric acid. Dissolve the residue in nitric acid (specific gravity 1.135), transfer to a 750 c c Erlenmeyer flask, dilute with nitric acid (specific gravity 1.135) to 250 c c, and treat as described before with sodium bismuthate, etc.

(b) Oxidation of manganese

If the preceding directions have been followed, the manganese will be present in a concentration of approximately 0.001 g per 1 c c of nitric acid (specific gravity 1.135). This concentration of manganese and nitric acid, together with a temperature of 10° to 15° C. are the conditions which insure maximum stability of the permanganic acid, formed as further described. To insure complete oxidation of the manganese to permanganic acid, it is essential that the sodium bismuthate (80 per cent of NaBiO_3) be used in the ratio of at least 26 g to every gram of manganese in solution. Add approximately 7.0 g of sodium bismuthate (80 per cent) to the flask, agitate briskly for one minute, dilute with 250 c c of cold water, and filter immediately on a layer of acid-washed asbestos supported on a 2-inch aluminum or perforated porcelain plate resting in a large glass funnel. The filter can be washed free from manganese more readily if not allowed to run dry during the filtering and washing. Wash the filter and residue with cold 3 per cent nitric acid until the washings are entirely colorless and immediately treat the filtrate and washings as described in the following paragraph.

Weigh accurately 9.000 g of ferrous ammonium sulphate, taken from a bottle of the well-mixed salt, and add to the filtered solution of permanganic acid. Stir briskly and, as soon as the reduction is complete and the salt has dissolved, titrate the excess of ferrous salt with 0.1 N potassium permanganate. The manganese value of the ferrous salt is obtained in the following manner:

Two hundred and fifty cubic centimeters of nitric acid (specific gravity 1.135) contained in a 750 c c Erlenmeyer flask are treated with approximately 2.0 g of sodium bismuthate and the solution is vigorously agitated for one minute, diluted with 250 c c of cold water, and immediately filtered on a layer of acid-washed asbestos as previously described. Five (5.000) grams of the ferrous ammonium sulphate are added to the filtrate and the resulting solution is immediately titrated with 0.1 N KMnO_4 until a faint pink color appears. The excess of permanganate used to cause an end-point color must be determined by watching the color in another beaker containing the same amounts of acid and cold water.

NOTES.—1. Chromium when less than 2 per cent does not cause any interference if the reactions are rapidly done in cold solutions. Larger amounts interfere to some extent and should be separated prior to the final oxidation with bismuthate.

2. The gravimetric determination of manganese by the pyrophosphate method will give high values if the precipitate of manganese ammonium phosphate is allowed to stand more than 10 hours before filtration.

3. Volumetric methods such as Volhard's, Ford-Williams's, and Julian's do not permit the use of a theoretical titre. Each necessitates the use of an empirical titre obtained by titration of material of known manganese content which has been carried through all steps of the method.

Determination of Carbon by the Direct-Combustion Method

(For apparatus and reagents common to both the soda-asbestos and barium hydroxide methods of absorbing the carbon dioxide, also for factors influencing rapid combustion, as well as for the determination of carbon (carbon dioxide absorbed in soda-asbestos), and for diagram showing arrangement of apparatus, see A64 (601.20, p. 119). For the determination of carbon (carbon dioxide absorbed in barium hydroxide solution) and diagram showing apparatus for filtration, see A33 (600.1, p. 10).)

A furnace temperature of 1,050° to 1,075° C. suffices, and high-silicon material should be covered with 1 or 2 g of ingot iron.

Determination of Phosphorus by the Alkalimetric Method

SOLUTIONS REQUIRED

Dilute nitric acid (specific gravity 1.135).—Mix 300 c c of HNO_3 (specific gravity 1.42) and 700 c c of distilled water.

Standard sodium hydroxide.—Dissolve 6.5 g of purified NaOH in 1,000 c c of distilled water, add a slight excess of a 1 per cent solution of Ba(OH)_2 , let stand for 24 hours, decant the liquid, and standardize against Bureau of Standards standard benzoic acid as follows: Dissolve 0.6 g of benzoic acid in 15 c c of alcohol in a small Erlenmeyer flask and titrate in the cold with phenolphthalein indicator, taking precautions to prevent access of carbon dioxide from the air during titration. The ratio of phosphorus to sodium hydroxide is taken as 1 to 23 in calculating the value of the sodium hydroxide. Protect the solution from carbon dioxide with a soda-lime tube.

Dilute ammonium hydroxide (specific gravity 0.96).—Dilute 400 c c of NH_4OH (specific gravity 0.90) with 600 c c of water. The strength of this solution should be established by titration or test with a hydrometer.

(Standard nitric acid and ammonium molybdate are identical with like solutions in the determination of phosphorus by the alkalimetric method in B28. (See 646.0, p. 1243.)

METHOD

Dissolve 2.000 g of the sample in 70 c c of nitric acid (specific gravity 1.42), evaporate to dryness, and bake for two or three hours at 120° C. High-silicon alloys may require the addition of a little hydrofluoric acid for complete decomposition. In this case, several evaporations with 15 c c portions of nitric acid (specific gravity 1.42) should be made to remove hydrofluoric acid before the baking treatment. Moisten the residue with 25 c c of dilute hydrochloric acid (1:1), digest a few minutes,⁹⁷ add 75 c c of water, heat until the salts are dissolved, and then filter to remove silica. Evaporate the filtrate to a sirupy condition, add 15 c c of nitric acid (specific gravity 1.42), and again evaporate to a small volume. Again add 15 c c of nitric acid (specific gravity 1.42) and evaporate to a small volume. Add 100 c c of nitric acid (specific gravity 1.135), heat to boiling, and add a 1.5 per cent solution of potassium permanganate until oxides of

⁹⁷ Addition of a little sulphite or sulphurous acid facilitates solution after the baking treatment.

manganese are precipitated. Dissolve the oxides of manganese by addition of sulphurous acid and boil to expel the oxides of nitrogen. To the cold solution add 40 c c of NH_4OH (specific gravity 0.96) and 50 c c of ammonium molybdate solution and shake for 5 minutes. Allow to settle for 10 minutes; for material containing less than 0.02 per cent of phosphorus, allow to stand 30 minutes. Filter and wash ten times with a 1 per cent solution of KNO_3 . Return the precipitate and paper to the precipitating vessel, add 1 to 3 c c in excess of standard NaOH solution and 25 c c of water, both free from carbon dioxide, and shake or stir until the precipitate is dissolved. Dilute to 100 c c with water free from carbon dioxide, add 3 drops of a 0.2 per cent solution of phenolphthalein, and discharge the pink color with standard acid. Finish the titration by adding standard alkali until the reappearance of the pink color. With very low phosphorus material this titration should be corrected by a blank carried through all the steps of the method.

NOTE.—If vanadium is present in amounts over 0.08 per cent it should be reduced by ferrous sulphate and sulphurous acid before precipitation with molybdate.

Determination of Sulphur by the Oxidation Method

Proceed as in the determination of sulphur by the oxidation method in plain carbon steel in A33. (See 600.1 p. 10.)

NOTE.—Routine determinations of sulphur can be made by the evolution method, provided concentrated hydrochloric acid (specific gravity 1.19) is used, preferably in all-glass apparatus of the Fulsifer type.

Determination of Silicon by the Nitro-Sulphuric Acid Method

SOLUTIONS REQUIRED

(Nitro-sulphuric acid is the same as in A64. See 601.20, p. 119.)

METHOD

Dissolve 0.9344 g of the sample passing a No. 100 sieve⁹⁸ with 50 c c of the nitro-sulphuric acid in a 250 c c porcelain casserole and evaporate until copious fumes of sulphuric acid are evolved. (Then proceed as in A64 (see 601.20, p. 119), until weighing, when) the difference in weights divided by 2 and multiplied by 100 represents the percentage of silicon in the alloy.

NOTE.—For silico-manganese and manganese-silicon fuse 0.4672 g of the former or 0.2336 g of the latter with 8 g of sodium peroxide in a pure iron crucible. Dissolve the fusion and evaporate to fumes of sulphuric acid. When acidifying the solution of the fusion with sulphuric acid it is necessary to add some sulphurous acid to dissolve the manganese dioxide which separates out.

FERROCHROMIUM

Determination of Chromium by Fusion with Sodium Peroxide

SOLUTIONS REQUIRED

Potassium permanganate, 0.1 N.—Dissolve 3.2 g of potassium permanganate in 1,000 c c of distilled water, allow to age for at least 10 days, and filter through purified asbestos. Standardize the permanganate solution against Bureau of Standards standard sodium oxalate as follows:

In a 400 c c beaker dissolve 0.25 to 0.30 g of sodium oxalate in 200 to 250 c c of hot water (80 to 90° C.) and add 10 c c of dilute H_2SO_4 (1:1). Titrate at once with the permanganate solution, stirring the liquid vigorously and continuously. The permanganate must not be added more rapidly than 10 to 15 c c per minute, and the last 0.5 to 1 c c must be added drop wise, with particular care to allow each drop fully to decolorize before

the next is introduced. The excess of permanganate used to cause an end-point color must be estimated by matching the color in another beaker containing the same bulk of acid and hot water. The temperature of the solution should not be below 60° C. by the time the end point is reached. One cubic centimeter of 0.1 N KMnO_4 is equivalent to 0.001734 g of chromium.

Standard ferrous ammonium sulphate.—Dissolve 43 g of the salt in 250 c c of cold water, add 40 c c of sulphuric acid (1:3), dilute to one liter with distilled water, and mix thoroughly. Large amounts of the solution can be conveniently mixed by means of a stream of carbon dioxide from a cylinder. As the ferrous ammonium sulphate solution gradually weakens in reducing power it is necessary to standardize it daily or at the same time the ferrochromium is analyzed. The solution can be standardized against either potassium dichromate or sodium oxalate.

The first method is somewhat simpler and more satisfactory for routine work as the conditions prevailing in both the standardization and in the analysis are practically identical. No "blank" corrections are afterwards necessary where the amounts of dichromate, ferrous salt, and permanganate are approximately those prevailing in the analysis. The second method is employed chiefly for checking the accuracy of the results obtained with potassium dichromate and in cases where only occasional analyses are made and pure dichromate is not readily available.

To prepare pure potassium dichromate, recrystallize at least twice the purest grade of the salt obtainable, dry the crystals at 150° C., grind to a fine powder, and again dry at 150° C. to constant weight. Keep the prepared salt in a ground-glass-stoppered bottle. Transfer 1.0000 g of the pure dichromate, which contains approximately the same amount of chromium as an 0.5000 g sample of 70 per cent ferrochromium, to an 800 c c beaker. Dissolve in cold water, acidify with 40 c c of sulphuric acid (1:3), and dilute with cold water to 500 c c. Add a slight excess of the ferrous sulphate solution, approximately 190 c c, and titrate the excess ferrous salt with 0.1 N permanganate to the first faint permanent darkening of the clear green color.

Example.—The calculations involved are illustrated as follows: In a standardization, 190.0 c c of the ferrous solution was used and 5.06 c c of 0.1 N permanganate was required to titrate the excess.

1 c c of 0.1 N $\text{K}_2\text{Cr}_2\text{O}_7$ contains 0.004903 g of $\text{K}_2\text{Cr}_2\text{O}_7$
1 g of $\text{K}_2\text{Cr}_2\text{O}_7$ equals 203.94 c c of 0.1 N $\text{K}_2\text{Cr}_2\text{O}_7$

then:

$203.94 + 5.06 = 209.0$ c c of equivalent 0.1 N solution reduced by the ferrous solution.

$\frac{209.0}{190} = 1.100$, the 0.1 N normality factor.

In standardizing through sodium oxalate, it is necessary to add the ferrous ammonium sulphate solution by means of an accurately calibrated pipette or burette instead of an automatic pipette. Transfer 100 c c of the approximately 0.1 N ferrous solution to a 600 c c beaker, dilute to 300 c c with cold 5 per cent sulphuric acid, add 2 c c of phosphoric acid, and titrate immediately with 0.1 N KMnO_4 to a faint permanent pink color. Determine the "blank" on the same volume of water and acids and deduct. When this method is used it is necessary in the actual analysis to determine a "blank" to counteract the influence of the green color of the chromium sulphate upon the permanganate end point. This "blank" can be determined in the solution used in the analysis and is obtained as described later.

⁹⁸ For detailed specifications for this sieve see E11 (645.31, p. 1226).

METHOD

Transfer 0.5000 g of the sample of ferrochromium (dried at 105° to 110° C.) to a 30 c c heavy-walled porcelain crucible. Samples of low-carbon ferrochromium should be crushed to pass through a No. 40 screen, while high-carbon ferrochromium and chromium metal should be reduced to pass a No. 100 screen. Add approximately 8 g of sodium peroxide and thoroughly mix the contents of the crucible with a small rod, being careful to clean the rod, which can be done conveniently by scraping with another rod. Cover the mixture with 1 to 2 g of sodium peroxide. Carefully fuse the contents of the covered crucible, preferably in an electric muffle heated to 600° to 700° C. Fusion for five minutes at a low red heat after the mass has melted will insure complete decomposition. When the charge has melted, the crucible should be given a slight rotary motion to stir up any unattached particles.

Place the cooled crucible and cover in a 600 c c beaker and dissolve the contents in 200 c c of water. When the melt has dissolved, remove the crucible and cover, add 1 g of sodium peroxide and boil the solution 10 minutes to decompose the excess of peroxide completely.

Allow the precipitate to settle and filter through a pad of ignited asbestos, preferably in a Büchner funnel. An asbestos rather than a paper filter should be used, for the alkaline solution extracts reducing matter from paper which would cause low results for chromium. Thoroughly wash the precipitate with hot water, and at no time allow the precipitate to run dry during the filtering and washing. If desired, the precipitate can be subsequently dissolved in dilute sulphuric acid and tested for chromium by adding a slight excess of sodium peroxide; the amount of chromium retained is negligible if the precipitate is filtered and washed as directed.

Cool the filtrate, acidify with 50 c c of sulphuric acid (1:1), again cool to room temperature, transfer to an 800 c c beaker, dilute with cold water to 500 c c and add a measured excess of ferrous ammonium sulphate. The point at which reduction is complete can be told by changes in the deep green color which is developed. The ferrous salt can be added either as an approximately 0.12 *N* solution or in weighed portions from a bottle of the well-mixed salt. If the solution of ferrous salt is used, approximately 180 c c will be required for a 70 per cent alloy; if the salt is added, 8 g will usually be sufficient. Titrate the excess of ferrous salt with standard 0.10 *N* potassium permanganate. The first faint permanent darkening of the clear green color is taken as the end point, which is quite sharp and well defined to the practiced eye. If the ferrous salt has been standardized against dichromate, subtract the required number of cubic centimeters of 0.1 *N* permanganate from the number of cubic centimeters of 0.1 *N* ferrous solution (obtained by multiplying the number of cubic centimeters of the approximately 0.1 *N* ferrous solution by the 0.1 *N* normality factor). The difference represents the number of cubic centimeters of 0.1 *N* ferrous solution which multiplied by 0.001733 g gives the number of grams of chromium present.

Where the ferrous solution has been standardized against sodium oxalate, it is necessary to subtract a "blank" from the permanganate titration. This "blank" is obtained as follows: When the end point is reached and the readings have been noted, add about 5 c c in excess of the ferrous solution and oxidize the excess of ferrous iron by adding 8 c c of a 15 per cent solution of ammonium persulphate. Stir the liquid vigorously for one minute. Carefully

add 0.1 *N* permanganate to the solution with constant stirring until the same end point is obtained as before. The volume of permanganate required, usually 0.2 to 0.4 c c, constitutes the "blank" to be deducted from the volume of the permanganate titration. For example, in the determination of chromium in an 0.5000 g sample, 190.0 c c of a 0.11 *N* ferrous solution and 11.00 c c of an 0.1 *N* permanganate (11.40—0.4 c c blank) were employed.

The calculations are as follows:

$$\begin{aligned} 190.0 \times 1.100 &= 209.0 \text{ c c of } 0.1 \text{ } N \text{ ferrous solution} \\ 209.0 - 11.0 &= 198.00 \text{ c c} \\ 198.0 \times 0.001734 \times 2 \times 100 &= 68.65 \text{ per cent of chromium.} \end{aligned}$$

The above calculations are given for exactly 0.1 *N* permanganate; if the permanganate is not 0.1 *N*, the volume used must be converted to the equivalent of 0.1 *N* by multiplying by the proper factor.

Determination of Carbon by the Direct-Combustion Method

(For apparatus and reagents common to both the soda-asbestos and barium hydroxide methods of absorbing the carbon dioxide, also for factors influencing rapid combustion, as well as for the determination of carbon (carbon dioxide absorbed in soda-asbestos), and for diagram showing arrangement of apparatus, see A64 (601.20, p. 119). For the determination of carbon (carbon dioxide absorbed in barium hydroxide solution) and diagram showing apparatus for filtration, see A33 (600.1, p. 10).)

1. Ferrochromium alloys require a furnace temperature of 1,125 to 1,150° C. in order to yield all of the carbon in the material.

2. The determination is made as given in the reference except that the weighed sample of ferrochromium, 0.5000 g for 4 to 8 per cent carbon and 3 to 1 g for 0.10 to 2.00 per cent carbon, is mixed with 1 g of copper oxide and covered with 2 g of pure ingot-iron drillings in order to facilitate complete combustion.

3. On account of the small weight of sample used, the blanks are important and must be carefully determined.

Determination of Silicon

Low-carbon ferrochromium and chromium metal can be decomposed by means of dilute sulphuric acid, but the high-carbon alloy has to be fused with sodium peroxide. For low-carbon ferrochromium, transfer 0.9344 g (a double factor weight) to a 250 c c porcelain casserole, add 60 c c of sulphuric acid (1:4) and warm the covered casserole gently until the reaction is complete. For high-carbon ferrochromium, transfer 0.9344 g of the sample passing a No. 100 sieve to a 30 c c pure iron crucible made from No. 20 gage (0.032 inch thickness) ingot iron. Add approximately 8 g of sodium peroxide, mix thoroughly, and fuse as directed under the determination of chromium. When the fusion has solidified, tap the covered crucible, while still warm, on an iron plate to loosen its contents in a solid cake which is then transferred to a 250 c c casserole. Rinse the crucible with a little water, transfer the solution to the casserole, cover, and carefully add 60 c c of sulphuric acid (1:4) after which the cover glass is rinsed and removed.

Evaporate the solution obtained by either of the above procedures until fumes of sulphuric acid are given off. If chromium sulphate solutions are fumed at too high temperatures or for any great length of time or with too little free acid present, considerable difficulty will occur in dissolving the salts. The fuming should, therefore, be made at a temperature not much higher than that required for evolving the acid. Allow the casserole and contents partly to cool (if permitted to become entirely cold

difficulty may be experienced in getting chromium salts to dissolve), add 100 c c of warm water while stirring to prevent the residue from caking on the bottom, and boil the solution gently for several minutes to dissolve all salts. Filter, washing the paper several times with cold dilute hydrochloric acid (2 per cent), and then with warm water. Transfer the filter and contents to a platinum crucible, char the paper, carefully ignite to remove carbon, and then heat the covered crucible over a blast lamp or in a muffle furnace at 1,050° to 1,100° C. for at least 15 minutes. Cool in a desiccator and weigh. Add sufficient dilute sulphuric acid (1:1) to moisten the silica and then a small amount of hydrofluoric acid. Evaporate to dryness, ignite, and weigh. The difference in weights represents silica which contains 46.72 per cent of silicon.

NOTE.—Crucibles made from pure ingot iron contain only traces of silicon and the amount of silica present in the sodium peroxide used is usually negligible, but “blanks” should be run on new lots of crucibles and of peroxide. All nickel crucibles, even the German “Rein” nickel, contains appreciable amounts of silicon.

FERROVANADIUM

Determination of Vanadium by the Ammonium Persulphate Method

SOLUTIONS REQUIRED

Ammonium persulphate (15 per cent).—Make up as needed by dissolving 15 g of the salt in 100 c c of distilled water. This salt should be 95 per cent pure and its purity tested by adding 30 c c of a standard ferrous sulphate solution to 0.3 g of the persulphate, then 200 c c of hot water, and titrating the excess ferrous salt with potassium permanganate. One cubic centimeter of 0.1 *N* ferrous solution equals 0.01141 g of $(\text{NH}_4)_2\text{S}_2\text{O}_8$.

Potassium ferricyanide indicator.—Dissolve 0.1 g of the salt in 100 c c of water. This solution should be made up fresh daily.

Standard ferrous ammonium sulphate (approximately 0.1 N).—See the determination of chromium in ferrochromium, given above.

Potassium Permanganate (0.1 N).—See the determination of chromium in ferrochromium given above. One cubic centimeter of 0.1 *N* KMnO_4 is equivalent to 0.005096 g of vanadium in the following method.

METHOD

Treat 0.5000 g of the alloy, dried at 105° to 110° C., in a 250 c c covered beaker with a mixture of 60 c c of sulphuric acid (1:3) and 25 c c of nitric acid (1:1). If the alloy fails to decompose readily because the silicon content is high, it may be necessary to add a small amount of hydrofluoric acid. In this event, a 200 c c platinum dish should be substituted for the beaker. When the reaction has abated, rinse the cover glass and evaporate the solution until copious fumes of sulphuric acid are evolved. Cool, add 100 c c of water, and heat until the salts are dissolved. Transfer the solution to an 800 c c beaker, dilute to 400 c c and to the cooled solution add an approximately 0.1 *N* solution of potassium permanganate until a strong pink color has developed which remains permanent for 30 seconds. Next reduce the vanadium by the use of an approximately 0.1 *N* solution of ferrous ammonium sulphate added until a drop of the solution withdrawn from the beaker and placed on a drop of potassium ferricyanide indicator shows ferrous iron present—about 35 c c of 0.1 *N* ferrous solution. Add 5 c c of the ferrous ammonium sulphate in excess, stir the solution at least one minute, oxidize the excess of ferrous sulphate with 8 c c of 15 per cent ammonium persulphate and stir the solution vigorously for one minute. Titrate the solution with 0.1 *N* potassium permanganate solution,

added with constant stirring until a faint pink color appears which remains permanent for 30 seconds. Determine the “blank” by dissolving 0.4 g of “ingot iron” in 60 c c of H_2SO_4 (1:3) and 5 c c of nitric acid (specific gravity 1.42), and putting the solution through all of the operations of the analysis. If the alloy contains an appreciable amount of chromium, a weight of pure $\text{K}_2\text{Cr}_2\text{O}_7$ equivalent to the amount of chromium in the sample is dissolved in the acids with the ingot iron.

Determination of Carbon

(For apparatus and reagents common to both the soda-asbestos and barium hydroxide methods of absorbing the carbon dioxide, also for factors influencing rapid combustion, as well as for the determination of carbon (carbon dioxide absorbed in soda-asbestos) and for diagram showing arrangement of apparatus, see A64 (601.20, p. 119). For the determination of carbon (carbon dioxide absorbed in barium hydroxide solution) and for diagram showing apparatus for filtration, see A33 (600.1, p. 10).) A furnace temperature of 1,050° to 1,100° C. will suffice for ferrovanadium and complete combustion, except in very high silicon material, can be secured without the addition of ingot iron and copper oxide.

Determination of Phosphorus by the Molybdate Magnesia Method

SOLUTIONS REQUIRED

(Ammonium molybdate is the same as in the determination of phosphorus by the alkalimetric method in B28. See 646.0, p. 1243.)

Magnesia mixture.—Dissolve 50 g of $\text{MgCl}_2 \cdot 6\text{H}_2\text{O}$ and 200 g of NH_4Cl in 1,000 c c of distilled water containing a few cubic centimeters of hydrochloric acid.

METHOD

Transfer 4 g of the sample to a platinum dish of 150 to 200 c c capacity, add 70 c c of dilute HNO_3 (5:6), and heat the covered dish until vigorous action ceases. Add 1 or 2 c c of hydrofluoric acid, stir the solution, evaporate to dryness, moisten with 10 c c of nitric acid (specific gravity 1.42), and again evaporate to dryness. Moisten the cooled residue with 10 c c of HNO_3 (specific gravity 1.42), add 50 c c of water, and wash the contents of the dish into a 400 c c beaker, rubbing the dish well with a policeman. Remove the last traces of adhering salts with 5 c c of HCl (specific gravity 1.19) and hot water. Add 10 c c of HNO_3 (specific gravity 1.42) and evaporate to a sirupy consistency. Cool, add 25 c c of HNO_3 (specific gravity 1.42), 60 c c of water, 1 g of boric acid (to take care of any residual fluoride), and heat gently until solution occurs. Filter through a rapid paper into a 300 c c Erlenmeyer flask and wash with hot water. Heat the solution to boiling, add about 12 c c of potassium permanganate solution (1.5 per cent) and continue the boiling until manganese dioxide precipitates. Dissolve the precipitate by the addition of sufficient sulphurous acid added dropwise. About 1 c c usually suffices. Boil for a few minutes to expel completely oxides of nitrogen. Add to the cold solution 15 c c of ammonium hydroxide (specific gravity 0.90) and cool the solution to 15° C.

Next reduce the vanadium in the cold (15° C.) solution by ferrous sulphate added in approximately 1.5 g excess. The use of a 50 per cent solution of the salt furnishes a convenient way of adding the necessary amount. One gram of quinquevalent vanadium requires 5.5 g of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ for reduction to the quadrivalent state. A 4 g sample of 30 per cent vanadium alloy, including

an excess of 1.5 g would require 8.1 g of ferrous sulphate. Too large an excess of ferrous sulphate should be avoided. The addition of ferrous sulphate will change the color of the solution to a deep blue. Add 2 drops of a saturated solution of sulphurous acid, 100 c c of molybdate reagent, shake for 10 minutes, and allow to stand at 15° C. for four to six hours, or preferably overnight. It is well to let the solution stand in a refrigerator. Filter on a paper of close texture, keeping as much of the precipitate in the flask as possible, and wash the flask and the precipitate with not more than 50 c c of cold, dilute nitric acid (1:99). Set the filtrate and washings aside after thorough mixing and see whether further separation of phosphomolybdate occurs. Dissolve the precipitate on the filter in 20 c c of dilute ammonium hydroxide (1:1) to which have been added 2 g of citric acid, catch the solution in the original flask containing the bulk of the yellow precipitate, and finally wash the filter several times with dilute hydrochloric acid (5:95). If the ammoniacal solution of the phosphomolybdate is not clear at this point, heat it to boiling, filter through the same paper, and wash the paper with hot water. In this case, and whenever appreciable amounts of such elements as titanium or zirconium are known to be present in the original material, preserve the paper and ignite it in a small platinum crucible with the paper reserved below.

Render the ammoniacal solution acid with hydrochloric acid, add 20 c c of magnesia mixture and then ammonium hydroxide (specific gravity 0.90) slowly until a crystalline precipitate appears, and then finally an excess of 3 to 5 per cent by volume. The volume of the solution at this point should not exceed 100 c c. Allow the solutions to stand in a cool place for four to six hours, or preferably overnight.

Filter, keeping as much of the precipitate as possible in the flask, and wash the flask and the precipitate moderately with dilute ammonium hydroxide (1:20). Set the filtrate and washings aside after thorough mixing and see whether further precipitation occurs. Dissolve the precipitate on the filter in 25 c c of dilute hydrochloric acid (1:1), catching the solution in the original flask containing the bulk of the precipitate. Wash the filter thoroughly with dilute hydrochloric acid (5:95). In case the original material contains appreciable amounts of the elements mentioned above (titanium or zirconium), add the paper to the one reserved above, ignite, fuse any residue with as little carbonate as possible (not over 0.5 g), extract the cooled melt with hot water, filter, and add the water solution to the hydrochloric acid solution. Transfer the solution to a 200 c c beaker. In case the amount of arsenic is known to be very small, add 0.5 to 1 g of ammonium bromide and boil the hydrochloric acid solution to a volume of 5 to 10 c c. Where large amounts of arsenic were originally present, treat with hydrogen sulphide, digest, filter, and wash with acidulated hydrogen sulphide water. Boil to expel hydrogen sulphide and to reduce the volume to 50 to 75 c c. Add 0.1 to 0.2 g. of citric acid, 2 to 3 c c of magnesia mixture, make ammoniacal as above, and allow to stand in a cool place for 4 to 24 hours.

Filter, wash with dilute ammonium hydroxide (1:20), and ignite the precipitate carefully and at as low a temperature as possible until the carbon has been destroyed and the residue is white. Finally, ignite at approximately 1,000° C. to constant weight. Dissolve the ignited residue in 5 c c of dilute nitric acid (1:1) and 20 c c of water. Filter, wash the residue with hot water, ignite, and weigh. Treat with a few drops of hydrofluoric acid, evaporate to dryness, ignite, and reweigh. Subtract any loss of weight from the original weight of the pyrophosphate

and calculate on the basis of this purified magnesium pyrophosphate.

Determination of Sulphur by the Oxidation Method

Transfer 4.57 g of the sample to a 600 c c beaker and dissolve it in 75 c c of HNO₃ (specific gravity 1.42). The reaction is apt to be very rapid and the acid should be added in small portions to the covered beaker, which is preferably kept cooled by immersion in ice water. Effect complete solution by gentle warming if necessary.

Add 30 c c of HCl (specific gravity 1.19) and evaporate to dryness on the steam bath. Add 30 c c more of HCl (specific gravity 1.19), again evaporate to dryness, and bake for 30 minutes at 105° C. Moisten the residue with 30 c c of HCl (specific gravity 1.19) and evaporate on the steam bath to a volume of 5 c c. Add 5 c c of HCl (specific gravity 1.19), dilute to 150 c c, and filter. Wash with warm water.

Adjust the volume of the solution to 250 c c, which should now contain about 3 to 4 per cent by volume of HCl. Warm to 75° C., add 30 c c of BaCl₂ (10 per cent), and allow to stand for 24 to 40 hours.

Filter, with as little transfer of the precipitate as possible, through a paper of close texture. Wash the paper two or three times with cold 1 per cent HCl and seven times with warm water. Ignite the paper and contents in a platinum crucible. Treat the ignited residue with 5 c c of HCl (specific gravity 1.19) and transfer the resulting solution to the original beaker containing most of the precipitate of BaSO₄. Digest the combined portions of BaSO₄ so as to dissolve any barium vanadate. Adjust to 150 c c volume and 2 per cent acidity, add 8 c c of 10 per cent BaCl₂ solution, and allow to stand for 24 hours. Filter on a paper of close texture, wash three times with cold 1 per cent HCl and 10 times with warm water. Ignite the paper in platinum, cool in a desiccator, and weigh. A blank should be carried through all steps of the determination. The corrected weight of the ignited barium sulphate multiplied by 3 is equal to the percentage of sulphur.

NOTES.—If desired, the washings can be kept separate and examined for BaSO₄ as follows: Evaporate the washings to dryness. Dissolve the slight residue in 50 c c of hot dilute HCl (2:98), add 2 c c of BaCl₂ solution (10 per cent), digest at 70° to 80° C. for two hours, avoiding any undue evaporation. Filter on a small paper of close texture and wash as above. The recovery of BaSO₄ which is ordinarily obtained, represents approximately 0.001 to 0.002 per cent of sulphur.

In high-silicon alloys the residue from the initial acid digestion should be evaporated with hydrofluoric and nitric acids, fused with sodium carbonate, and the water extract of the melt added to the main solution.

Determination of Silicon by the Nitrosulphuric Method

SOLUTIONS REQUIRED

(Nitrosulphuric acid is the same as in the determination of silicon by the nitrosulphuric method in A64. See 601.20, p. 119.)

METHOD

Dissolve 0.9344 g of the sample passing a No. 100 sieve of low or medium silicon ferrovanadium in 40 c c of the nitrosulphuric acid in a 250 c c porcelain or platinum dish and evaporate the solution until copious fumes of sulphuric acid are evolved.

Ferrovanadium containing 4 per cent or more of silicon is not completely soluble in nitric acid and sulphuric acid. In this case, fuse 0.9344 g of the alloy, thoroughly mixed with 8 g of sodium peroxide, in a 30 c c crucible of pure iron. Five minutes heating at a dull red heat after the contents of the crucible have melted will insure complete decomposition of the sample. Allow the fusion to solidify, but before it has entirely cooled tap the covered crucible on an iron plate which will loosen the contents in a solid cake. Transfer the melt to a 250 c c porcelain casserole, rinse the crucible with warm water, and cautiously add the solution to the

covered casserole. Next add 150 c c of sulphuric acid (20 per cent by volume) and evaporate to copious fumes of sulphuric acid. Cool the sulphuric acid solution obtained in either procedure, add 125 c c of water, and heat for a few minutes with frequent stirring until all salts are dissolved. Immediately filter on a 9 cm paper. Wash the precipitate with cold dilute HCl (5:95) and cold water alternately to complete the removal of iron salts, and finally with hot water until free from acid. Transfer the filter to a platinum crucible, char the paper without inflaming, and finally ignite the covered crucible over a blast lamp or in a muffle furnace at 1,050° to 1,100° C. for at least 15 minutes. Cool in a desiccator and weigh. Add sufficient dilute H₂SO₄ (1:1) to moisten the silica and then a small amount of hydrofluoric acid. Evaporate to dryness, ignite, and weigh. The difference in weights divided by 2 and multiplied by 100 represents the percentage of silicon in the alloy.

Determination of Aluminum by the Ether-Hydrochloric Acid Method ⁶⁹

Dissolve 2 g of the sample in 25 to 30 c c of dilute nitric acid (specific gravity 1.135). (Note 1.) When action ceases, add 5 c c of hydrochloric acid and evaporate to dryness. Add 10 c c of hydrochloric acid, evaporate to dryness, and bake the residue at a moderate temperature. Dissolve the residue in 10 c c of hydrochloric acid, add 30 c c of water, boil, and filter. Wash the residue with hot dilute hydrochloric acid (1:9) followed by water. (Note 2.)

Evaporate the solution to dryness on a steam bath, add 20 c c of hydrochloric acid, and warm gently until complete solution is obtained. Cool the solution in ice water and pass hydrochloric acid gas into it to saturation. Add 20 c c of ether and continue passing the gas into the cold solution until it is again saturated. Allow the mixture to stand for several hours, keeping it cold by immersing the container in ice water. If the solution becomes warm or if it is not allowed to stand, the separation of hydrated aluminum chloride is not quite complete.

Filter through asbestos (small Bückner-asbestos pad washed once with cold ether-hydrochloric acid mixture immediately before use), wash, by decantation, with a cold mixture of equal parts of strong hydrochloric acid and ether which has been saturated with hydrochloric acid gas. The aluminum chloride retains a little vanadium.

Dissolve the precipitated aluminum chloride in the least possible amount of dilute hydrochloric acid (1:9) back into the original beaker, from which all of the precipitate need not have been removed. Evaporate the solution to near dryness on a steam bath, add 10 c c of strong hydrochloric acid and pass hydrochloric acid gas into the solution to saturation, add 15 c c of ether and continue passing hydrochloric acid gas to saturation, keeping the solution cold by means of ice water. Let stand several hours, filter on asbestos, and wash with the ether-hydrochloric acid mixture as before.

Dissolve the aluminum chloride in dilute hydrochloric acid (1:9) into a 250 c c beaker, add a few grams of ammonium chloride, make faintly alkaline with ammonia, boil, filter (using paper pulp), wash with hot water, dry, ignite, and weigh as Al₂O₃.

According to published data, this method gives a complete separation of aluminum from iron, beryllium, zinc, copper, mercury, and bismuth. A little vanadium is carried down in the first separation, but two chloride precipitations seem to give a practically complete separation. The proportion of vanadium retained in the final alumina is hardly appreciable when working on a 35 per cent vanadium alloy.

The effect of chromium is not known; presumably some of it would be included in the Al₂O₃. This could be corrected for by fusing the Al₂O₃ with sodium peroxide and estimating the Cr₂O₃ by color.

NOTES.—1. Dilute nitric acid (specific gravity 1.135) is recommended for solution. While this requires rather long digestion at steam-bath temperature, solution seems to be quite complete even when the alloy is high in silicon. In some cases where silicon is very high it is necessary to use a little hydrofluoric acid with the nitric acid. In this case solution should be effected in a platinum dish, the solution evaporated to dryness, and the dry residue transferred to a beaker before treatment with hydrochloric acid. A little dilute hydrochloric acid may be used to loosen any oxides that adhere to the dish.

2. The siliceous residue may retain alumina; it should be ignited in platinum. Silica should be expelled by HF+H₂SO₄ and the residue fused with KHSO₄. After dissolving the fusion in water plus a little HCl the liquid is made faintly alkaline with ammonia and boiled. Any iron and alumina precipitate is removed by filtration, washed with water, dissolved in a little hot dilute HCl and added to the solution of the alumina obtained after the first ether-hydrochloric acid separation.

FERROTUNGSTEN AND TUNGSTEN METAL

Determination of Tungsten

SOLUTIONS REQUIRED

(Cinchonine solution and cinchonine wash solution are the same as in the determination of tungsten in tungsten-steel by the acid digestion-cinchonine method in A55. (See 621.30, p 1107.)

Treat 1 g of the material passing a No. 100 sieve in a large (60 c c) platinum crucible with 5 c c of HF; add HNO₃ drop by drop until the metal dissolves. Add 3 to 4 c c of H₂SO₄ and evaporate on a steam bath until HNO₃+HF is expelled. Shake gently over a small Bunsen flame, or heat slowly in a sheet iron "radiator" (described by Hillebrand)¹ until H₂SO₄ fumes strongly. Cool, transfer to a 250 c c beaker with water, finally wiping the crucible with a little filter paper. A little WO₃ sticks to the crucible; it can not be removed by wiping. Reverse the crucible. Dilute the contents of the beaker to about 150 c c with water, add 10 c c of hydrochloric acid (specific gravity 1.19) and boil for a few minutes. Remove from the source of heat, add 10 c c of cinchonine solution and digest the solution at 80° to 90° C. with occasional stirring, for 30 to 45 minutes.

Add some paper pulp to the solution, stir the solution and when the tungsten precipitate has settled filter on a 9 cm paper containing a little "ashless" filter pulp. Wash thoroughly with hot cinchonine solution and finally several times with warm 1 per cent hydrochloric acid. Gently ignite the filter and residue of crude WO₃ in the crucible in which it was originally treated until the carbon is consumed. Add a few drops of nitric acid and dry in the radiator. Ignite the covered crucible for five minutes in the full heat of a Bunsen burner, cool, and weigh. Ignitions may be made at about 750° C. in an electric muffle. As WO₃ is slowly but steadily volatilized at temperatures above 750° C., serious error may result from continued ignition of the tungsten trioxide at the temperature that is specified. Add about 5 g of Na₂CO₃ and fuse, running the fusion around the side of the crucible to remove all WO₃. Dissolve the fusion in hot water, add alcohol, heat, filter, and wash with hot water. Place the filter in the crucible and ignite; add a little Na₂CO₃ and fuse again. Dissolve the fusion in water, filter, and wash very thoroughly with hot water to remove the last traces of Na₂CO₃; ignite in the same crucible as at first, cool, and weigh. The difference between the weight of crucible plus residue and the weight of crucible plus impure tungstic oxide is WO₃ × 0.7931 = W.

NOTES.—At the best, direct determination of tungsten in high-grade metal is subject to inherent errors. Accuracy within 0.2 per cent is all that can be expected by any method.

⁶⁹ Gooch-Havens, Am. J. Sci., vol. 4, pp. 11-416.

Determination of Carbon

(For apparatus and reagents common to both the soda-asbestos and barium hydroxide methods of absorbing the carbon dioxide, also for factors influencing rapid combustion, as well as for the determination of carbon (carbon dioxide absorbed in soda-asbestos) and for diagram showing arrangement of apparatus, see A64 (601.20, p. 119). For the determination of carbon (carbon dioxide absorbed in barium hydroxide solution) and diagram showing apparatus for filtration, see A33 (600.1, p. 10).) The alloy ground to pass a No. 100 sieve and mixed with 2 g of pure iron is burned in an electric furnace heated at 1,050° to 1,100° C. A "blank" on the ingot iron must be determined and deducted.

Determination of Phosphorus

Treat 1 g of the finely powdered sample in a platinum dish, fitted with a gold cover, with 15 c c of HNO₃ (specific gravity 1.42), add 3 c c of HF, and warm gently. When action subsides, add 3 c c more of HF. After action subsides, boil, remove cover, and if decomposition is not complete add more HF and boil again. When solution is complete, wash off the cover and evaporate at a low heat to a volume of about 10 c c, then add three or four drops of concentrated permanganate solution and continue evaporation until crusts of WO₃ begin to form at the edges, that is to a volume of about 6 c c. Add 5 c c of H₂SO₄ and evaporate on the stove at a low heat until HF and HNO₃ are expelled and H₂SO₄ fumes are given off. (Strong heat causes spattering and also causes hard overbaked crusts to form on the bottom of the dish which resist subsequent treatment.) Cool, add 25 c c of water, and boil (by agitating over a Bunsen flame) until all soluble salts are dissolved. Discharge pink color, due to excess permanganate, by adding sulphurous acid drop by drop. The pink color may not be very evident but the SO₂ is added even so to reduce higher oxides of manganese. Boil for a minute or two after adding the SO₂. Add 1.20 g of pure tartaric acid and, when this is dissolved and the solution is cooled to a temperature of about 50° C., add 20 c c of NH₄OH (specific gravity 0.90) diluted with an equal volume of water. The precipitated tungstic acid should dissolve completely, giving a clear solution. The solution becomes hot from the reaction between H₂SO₄ and NH₄OH. While it is still hot, add 10 c c of magnesia mixture and transfer it from the platinum dish to a 6-ounce glass-stoppered bottle. Set the bottle in ice water and when it is thoroughly cooled add four or five glass beads about 6 mm in diameter. Stopper it tightly and shake in an efficient shaking machine for at least 10 minutes. The agitation should be violent. The beads aid in starting the formation of the magnesium precipitate. After agitation add 15 c c of strong NH₄OH and return the bottle to the ice-water tank and put into a refrigerator to stand overnight. Phosphorus separates as magnesium ammonium phosphate free from tungsten but containing possibly basic magnesium compounds. After standing overnight filter the solution through a 9 cm paper containing a little paper pulp and wash the bottle and paper thoroughly by small additions of ammonia wash water (1 part NH₄OH to 3 parts H₂O). Do not attempt to remove all the precipitate from the bottle, but remove the beads to the filter. The precipitate consists of magnesium ammonium phosphate and arsenate together with silica and other impurities. Tin, tungsten, molybdenum, vanadium, and titanium are eliminated by precipitation with magnesia mixture in the presence of tartaric acid. Dissolve the magnesia precipitate in hot dilute HCl and evaporate to a small volume, say 7

or 8 c c. Add 10 c c of strong HCl and 0.5 g of KBr and evaporate to dryness. Take up with 5 c c of HNO₃ and evaporate to dryness again. The KBr serves to reduce As^v to Asⁱⁱⁱ. The addition of strong HCl and boiling followed by evaporation to dryness eliminates As. Dissolve residue in 60 c c of HNO₃ (specific gravity 1.135), filter into a 250 c c shaking bottle; add 40 c c of NH₄OH (specific gravity 0.96), cool to 33° C., add 30 c c of molydate solution (Blair), and finish the determination by the alkalimetric method (Handy) described in Blair's Chemical Analysis of Iron.

NOTES.—The usual proportions of HNO₃ and HF are reversed in order to provide a constant excess of HNO₃ to oxidize P. The procedure given takes a little longer than when the sample is treated with HF first and HNO₃ is added a little at a time, but the solution is finally complete. It is necessary to keep the platinum dish covered after action begins, as the reaction is somewhat violent.

The platinum dishes recommended are: 8 cm in diameter at top, 7.8 cm in diameter at bottom, and 4 cm high. They have flat bottoms and are wire rimmed at the top to give additional stiffness. They weigh 58 to 60 g each and hold about 175 c c. The covers are made of pure gold (for economy), and dished like a crucible cover to fit the top of the dishes closely. The dishes have small lips to aid pouring. The tongue of the cover overlaps the lip. Ordinary round-bottomed dishes may be used, but the manipulation is much more difficult; there is a greater tendency to spattering and danger of local baking or overheating in evaporating to fumes of H₂SO₄. If the separated WO₃ is overheated locally it does not dissolve readily in NH₄OH. In flat-bottomed dishes, the WO₃ is spread in a thin layer and heat is applied evenly all over the bottom.

A good shaking machine should be used. The magnesia precipitate may be started by shaking the bottles by hand, but it is a tiresome job. The solution must be cold, say 8° or 10° C., when shaking begins.

Permanganate solution is added to insure complete oxidation of phosphorous, as in steel analysis. The color of the permanganate gradually fades in the hydrofluoric nitric solution, but after evaporating to fumes and adding water the solution is usually slightly pink.

The amount of tartaric acid is limited to 1.20 g since ammonium tartrate retards the formation of the magnesia precipitate. Complete precipitation can only be obtained by brisk agitation and by keeping the solution very cold, followed by long standing in a cold place. By this method determinations started at 3 p. m. may be completed by noon the next day.

Determination of Sulphur and Silicon

SOLUTIONS REQUIRED

Cinchonine solution.—Thoroughly wash cinchonine reagent with hot water on a Büchner funnel, dry, and dissolve 125 g of the washed cinchonine in a mixture of 500 c c of HCl (specific gravity 1.19) and 500 c c of distilled water.

Cinchonine wash solution.—Dilute 30 c c of the above solution to one liter.

Barium chloride solution.—One hundred grams of BaCl₂·2H₂O to 1,000 c c.

SULPHUR

Fuse 2 g of the finely powdered metal, intimately mixed with 8 g of dry Na₂CO₃ and 2 g of powdered KNO₃, in a large platinum crucible (40 c c). The fusion is best done over an alcohol blast flame or in an electric muffle to avoid contamination with sulphur contained in illuminating gas. Leach the fusion with 100 c c of distilled water in a 250 c c beaker. Filter into a 12 cm porcelain casserole and wash the residue several times with hot distilled water. The solution contains practically all of the sulphur and most of the tungsten and silica. The residue contains some of each, but not more than traces of sulphur.

Render the liquid acid with 20 c c of HCl and evaporate to dryness on a steam bath, thus precipitating tungstic acid. After the residue is dry, heat it to 110° to 120° C. in an oven to dehydrate silica, take up with 5 c c of HCl and 50 c c of water, add 3 c c of a strong cinchonine solution, and boil, or heat just short of the boiling point, for 30 minutes. Let the solution stand for at least three hours and preferably overnight. By means of the cinchonine, all WO₃ is rendered insoluble. Filter through an 11 cm filter paper (free from ash) which has been liberally treated with an emulsion of filter paper

¹ U. S. Geological Survey Bull. No. 700, p. 33.

pulp and wash the residue with dilute cinchonine solution. Reserve the residue. The filtrate contains all the sulphur; heat it to boiling and add 10 c c of barium chloride solution, boil for 10 minutes, allow it to stand overnight, filter on a 9 cm filter paper (free from ash), wash repeatedly but not excessively with hot water, ignite in platinum, and weigh as BaSO₄. If the work is properly carried out every trace of WO₃ is removed from the solutions and there is no danger of including BaWO₄ with the BaSO₄. If one suspects that the BaSO₄ is not quite pure, it should be fused with a little Na₂CO₃, leached with water and filtered; the filtrate should be acidulated with HCl, a few drops of cinchonine solution added and the solution evaporated to dryness on a steam bath. The dry residue should be dissolved in a little water, a few drops of HCl added, and any residue filtered off. In the clear filtrate BaSO₄ should be again precipitated as before. The weight of BaSO₄ × 0.1374 = S.

"Blanks" on all reagents must be made parallel with the determination; this is important since all sodium carbonate obtainable contains sulphur and there is sometimes more or less of it in cinchonine. All evaporations should be made over steam and the operations conducted in a place free from sulphur gases.

NOTE.—Evolution of sulphur in a stream of hydrogen saturated with hydrochloric acid as in Johnson's method is optional.

SILICON

The residue of tungstic oxide from which the solution for the determination of sulphur was filtered contains most of the silica. The residue from leaching the original fusion contains the rest.

Wash the residue from Na₂CO₃ fusion from the filter paper with a fine jet of water into a small casserole, add an excess of HCl, and evaporate to dryness on a steam bath; heat the dry residue at 110° to 120° C. to dehydrate the silica, drench with hydrochloric acid, dilute to 100 c c with hot water, heat until salts are in solution, and filter on a small filter paper (free from ash). Wash thoroughly with hot dilute HCl (1 : 100) and finally with hot water. Reserve the filter.

Wash the residue of tungstic oxide, silica, and filter paper pulp from the filter into a small casserole, add 5 c c of HCl and heat for a few minutes, then filter again through the same paper and wash it thoroughly with hot water. This second washing is necessary to remove sodium salts completely. (The original washing sufficed to remove all of the small amount of sulphur present.) Transfer the well-washed filter and residue to a platinum crucible, add the small filter containing the little silica recovered from the Na₂CO₃ fusion residue, and ignite both to constant weight in a platinum crucible. On account of the presence of filter-paper pulp, the ignited residue is porous and friable; if paper pulp had not been used the WO₃ would be dense and not easily susceptible to the subsequent treatment. Cool the ignited residue of WO₃ and SiO₂ and weigh it. Add 2 or 3 drops of H₂SO₄ and 5 or 6 c c of pure HF. Digest at a gentle heat for some time, and then slowly evaporate off the HF. When H₂SO₄ fumes are evolved, cool and again add HF, digest as before, evaporate off the HF, ignite gently to expel H₂SO₄ and heat strongly for 10 or 15 minutes. Cool and weigh. The loss in weight after expulsion is SiO₂ which multiplied by 0.4672 equals silicon.

NOTE.—Tentative standard, A 104-32T, entitled "Tentative Methods of Chemical Analysis of Ferrotungsten and Ferromolybdenum" was issued in 1932.

621.21 FERROCHROMIUM.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR FERROCHROMIUM, DESIGNATION A101-27, 1927

FERROCHROMIUM

SCOPE

1. These specifications cover ferrochromium in four grades, as follows: High carbon, grade A; low carbon, grades B, C, and D.

BASIS OF PURCHASE

2. (a) *Ferrochromium, high carbon.*—This material shall be furnished to size as specified.

(b) *Ferrochromium, low carbon.*—This material shall be crushed to the specified size and mixed before packing, so that the quality in each package is uniform with the lot.

CHEMICAL REQUIREMENTS

3. The material shall conform to the following requirements as to chemical composition:

	High carbon	Low carbon		
	Grade A	Grade B	Grade C	Grade D
Chromium.....	<i>Per cent</i> 60.00 to 75.00.			
Carbon.....	4.00 to 8.00 as specified.	1.50 to 2.00..	1.00 to 1.50..	Under 1.00 as specified.
Silicon.....	As specified.	As specified.	As specified.	As specified

¹ Grade D material may be obtained with various maximum carbon contents down to 0.10 per cent of carbon.

SAMPLING

4. When agreed upon by the purchaser and seller, the sampling shall be carried out in accordance with the standard methods of sampling ferro-alloys. (See A. S. T. M., A103-27 (621.20, p. 1092).)

METHODS OF CHEMICAL ANALYSIS

5. When agreed upon by the purchaser and seller, the chemical analysis shall be carried out in accordance with the standard methods of chemical analysis of ferro-alloys. (See A. S. T. M., A104-27 (621.20, p. 1093).)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, C25 AND SUPPLEMENT, 1927

FERROCHROMIUM (HIGH CARBON), SAMPLE NO. 64

(This standard sample is prepared and sold by the Bureau of Standards for use by industrial organizations and others for checking the accuracy of analysis of ferrochromium, etc. It is accompanied by a certificate giving its complete analysis.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FERROCHROMIUM, QQ-F-151 MAY 3, 1932

FERROCHROMIUM

GRADES

1. Ferrochromium shall be of the following grades: Grade A, grade B, grade C, grade D, grade E, and grade F.

MATERIAL

2. The material shall be as required in the following paragraphs.

GENERAL REQUIREMENTS

3. Ferrochromium shall be furnished in lumps, crushed, or screened to size, as specified in the contract or purchase order.

DETAIL REQUIREMENTS

4. (a) Ferrochromium shall conform to the requirements as to chemical composition specified in the following table for the grade ordered:

Grades	Chromium, permissible range	Iron	Carbon, maximum	Aluminum, maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
A-----	1.96	Remainder-----	-----	1.00
B-----	67-72	Remainder-----	0.10	1.00
C-----	67-72	Remainder-----	.20	1.00
D-----	67-72	Remainder-----	.50	1.00
E-----	67-72	Remainder-----	1.00	1.00
F-----	67-72	Remainder-----	(²)	-----

¹ Minimum.

² Greater than 1 as specified.

(b) An analysis of each shipment of ferrochromium shall be furnished by the contractor, showing the percentage of the elements specified.

TESTS AND METHODS OF INSPECTION

5. (a) Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative, and without cost to the contractor.

(b) Representative samples shall be obtained from at least 10 per cent of the containers in a lot or shipment, consisting of at least 4 ounces for every 150 pounds, in the case of finely granulated or screened material. In the case of lump material at least 5 pounds shall be taken for every 1,000 pounds, or fraction thereof, in the lot or shipment. The samples so selected shall be crushed to at least 1/2-inch size, well mixed, and the resultant sample quartered down to 5 pounds, which shall be sent to the designated laboratory for analysis.

NOTES

Grade A ferrochromium covers what is known commercially as pure carbon-free chromium, or chromium metal, intended only for use in the manufacture of alloys where iron is considered an impurity.

Grades B, C, D, and E ferrochromium are suitable for use in the manufacture of special steels and alloys where high carbon content is objectionable. Grade B provides for ferrochromium of a quality known commercially as "carbon-free."

Grade F covers high-carbon ferrochromium suitable for use in the manufacture of alloy steels. The maximum carbon permitted should be stated in the proposal and contract or purchase order.

Federal Specification QQ-M-151, Metals; General Specifications for the inspection of, of the issue in effect on date of invitation for bids, forms a part of this specification. (See 600-0, p. 3.)

621.22 FERROMANGANESE, SPIEGELEISEN.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SPIEGELEISEN, DESIGNATION A93-27, 1927

SPIEGELEISEN

SCOPE

1. These specifications cover spiegeleisen in two grades as follows: Grade A and grade B.

BASIS OF PURCHASE

2. The spiegeleisen shall be furnished in pigs, or lumps, and each shipment shall be uniform as to the grade specified.

CHEMICAL REQUIREMENTS

3. The material shall conform to the following requirements as to chemical composition:

Grade	Manganese	Carbon, maximum	Phosphorus, maximum	Sulphur, maximum	Silicon, maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
A-----	19 to 21	6.50	0.15	0.04	As specified.
B-----	16 to 19	6.50	.25	.05	Do.

SAMPLING AND CHEMICAL ANALYSIS

4. (For sampling, see A. S. T. M., A103-27 (621.20, p. 1092). For methods of chemical analysis, see A. S. T. M., A104-27 (621.20, p. 1093).)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATION FOR FERROMANGANESE, DESIGNATION A99-27, 1927

FERROMANGANESE

SCOPE

1. These specifications cover ferromanganese in one grade only.

BASIS OF PURCHASE

2. Ferromanganese shall be furnished in pigs, lumps, crushed, or screened to size, as specified.

CHEMICAL REQUIREMENTS

3. The material shall conform to the following requirements as to chemical composition:

	<i>Per cent</i>
Manganese, minimum-----	78.00
Phosphorus, maximum-----	.35
Carbon, maximum-----	7.5
Silicon, maximum-----	1.00
Sulphur, maximum-----	.050

SAMPLING AND CHEMICAL ANALYSIS

4. (For sampling, see A. S. T. M., A103-27 (621.20, p. 1092). For methods of chemical analysis, see A. S. T. M., A104-27 (621.20, p. 1093).)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; STANDARD SAMPLES, C25 AND SUPPLEMENT, 1927

SPIEGELEISEN, SAMPLE NO. 66; MANGANESE METAL, SAMPLE NO. 67; FERROMANGANESE, SAMPLE NO. 68

(These standard samples are prepared and sold by the Bureau of Standards for use by industrial organizations and others for checking the accuracy of analysis of similar products. Each is accompanied by a certificate giving the complete analysis of the particular sample.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FERROMANGANESE, QQ-F-161, MAY 26, 1931

FERROMANGANESE

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. Federal specification QQ-M-151 (formerly No. 339), general specifications for metals, of the issue in effect on date of invitation for bids, shall form a part of this specification. (See 600.0, p. 3.)

B. GRADES

B-1. Ferromanganese shall be of the following grades: Grade A and grade B.

C. MATERIAL

C-1. The material shall be as required in the following paragraphs.

D. GENERAL REQUIREMENTS

D-1. Ferromanganese shall be furnished in pigs, lumps, or crushed in screened sizes, as specified in the contract or purchase order.

E. DETAIL REQUIREMENTS

E-1. Ferromanganese shall conform to the requirements as to chemical composition specified in the following table for the grade ordered:

Grade	Manganese, minimum	Carbon, maximum	Phosphorus, maximum	Sulphur, maximum	Silicon, maximum	Aluminum, maximum	Iron, maximum
A.....	Per cent 95.00	Per cent 0.25	Per cent 0.25	Per cent 0.10	Per cent 1.50	Per cent 1.25	Per cent 2.50
B.....	78.00	7.50	.35	.05	1.00	.20	Remainder.

E-2. An analysis of each shipment of ferromanganese shall be made by the contractor showing the percentages of the elements specified.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative and without cost to the contractor.

F-2. Representative samples shall be obtained from at least 10 per cent of the containers in a lot or shipment, consisting of at least 4 ounces for every 150 pounds, in the case of finely granulated or screened material. In the case of lump material

at least 5 pounds shall be taken for every 1,000 pounds, or fraction thereof, in the lot or shipment. The samples so selected shall be crushed to at least ½-inch size, well mixed, and the resultant sample quartered down to 5 pounds, which shall be sent to the designated laboratory for analysis.

NOTES

I-1. Grade A ferromanganese covers what is known as pure carbon-free manganese metal, intended only for use in the manufacture of high-grade aluminum and nonferrous castings, and of crucible steel.

I-2. Grade B covers a good grade of commercial ferromanganese.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SPIEGELEISEN, NO. 273, JANUARY 22, 1925 (CURRENT DESIGNATION: QQ-S-611)

SPIEGELEISEN

In respect to material, general requirements, analysis of shipments, tests, sampling, packing, and marking this specification is identical with F. S. B. QQ-F-151. (See 621.21, p. 1103.) Like A. S. T. M., A98, given above, it covers two grades, A and B, the chemical compositions of which, however, are as follows:

Grade	Manganese	Carbon, maximum	Phosphorus, maximum	Sulphur, maximum	Silicon, maximum
A.....	Per cent 19-22	Per cent 6.5	Per cent 0.10	Per cent 0.04	Per cent 1.50
B.....	16-19	6.0	.25	.05	2.0

621.23 FERROMOLYBDENUM.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FERROMOLYBDENUM, NO. 143, MAY 1, 1924 (CURRENT DESIGNATION: QQ-F-171)

FERROMOLYBDENUM

(In respect to material, general requirements, analysis of shipments, tests, sampling, packing, and marking this specification is identical with F. S. B. QQ-F-151.) (See 621.21, p. 1103.) It covers one grade of ferromolybdenum, the chemical composition of which is as follows:)

Molybdenum	Carbon, maximum	Phosphorus, maximum	Sulphur, maximum
Per cent 50.0-60.0	Per cent 2.00	Per cent 0.10	Per cent 0.25

(The following additional requirements appear in this specification:)

1. If the results of the check analysis show a molybdenum content of more than 1 per cent below the minimum specified, such material may be accepted, in the discretion of the contracting officer, but the molybdenum content obtained by such analysis shall constitute the basis of payment.

2. Except as provided for in the preceding paragraph, ferromolybdenum not complying with all the requirements of this specification and of the contract or purchase order shall be rejected.

3. If special packing be necessary to secure the acceptance of ferromolybdenum by common or other carriers for safe transportation at the lowest rate to the point of delivery, such packing shall be provided by the contractor without additional expense to the purchaser.

ADDITIONAL INFORMATION

4. The melting point of ferromolybdenum is about 2,700° F.

621.24 FERROSILICON.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR FERROSILICON, DESIGNATION, A100-27, 1927

FERROSILICON

SCOPE

1. These specifications cover ferrosilicon in three grades, as follows: Grade A, grade B, and grade C.

BASIS OF PURCHASE

2. (a) The ferrosilicon shall be furnished in lumps, or crushed or screened to size, as specified.

(b) When furnished in lump or granulated form, the ferrosilicon shall be free from excessive disintegration.

CHEMICAL REQUIREMENTS

3. The material shall conform to the following requirements as to chemical composition:

	Grade A	Grade B	Grade C
Silicon...	<i>Per cent</i> 47.00-53.00	<i>Per cent</i> 72.00-78.00	<i>Per cent</i> 85.00-95.00

4. An analysis of each shipment of ferrosilicon shall be furnished the purchaser, showing the percentage of silicon.

SAMPLING AND CHEMICAL ANALYSIS

5. (For sampling, see A. S. T. M., A103-27 (621.20, p. 1092). For methods of chemical analysis, see A. S. T. M., A104-27 (621.20, p. 1093).)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; STANDARD SAMPLES, C25 AND SUPPLEMENT, 1927

REFINED SILICON, SAMPLE NO. 57. FERROSILICON (75 PER CENT SILICON), SAMPLE NO. 58. FERROSILICON (50 PER CENT SILICON), SAMPLE NO. 59

(These standard samples are prepared and sold by the Bureau of Standards for use by industrial organizations and others for checking the accuracy of analysis of similar products, etc. Each is accompanied with a certificate giving the complete analysis of the particular sample.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS SPECIFICATION FOR FERROSILICON, NO. 145, MAY 1, 1924. (CURRENT DESIGNATION: QQ-F-181)

FERROSILICON

(In respect to material, general requirements, analysis of shipments, tests, sampling, packing, and marking this specification is identical with F. S. B. QQ-F-151. (See 621.21, p. 1103.) It covers three grades of ferrosilicon, A, B, and C, the chemical compositions of which are as follows:)

	Grade A	Grade B	Grade C
Silicon.....	<i>Per cent</i> 70.0-80.0	<i>Per cent</i> 45.0-55.0	<i>Per cent</i> 10.0-20.0

(The following additional requirements appear in this specification):

1. If the results of the check analysis show a silicon content of more than 1 per cent below the minimum specified for grades A and B, or more than 0.5 per cent below the minimum specified for grade C, such material may be accepted, in the discretion of the contracting officer, but the silicon content obtained by such check analysis shall constitute the basis of payment.

2. Except as provided for in the preceding paragraph, ferrosilicon not complying with all the requirements of this specification and of the contract or purchase order shall be rejected.

3. If special packing be necessary to secure the acceptance of ferrosilicon by common or other carriers for safe transportation at the lowest rate to the point of delivery, such packing shall be provided by the contractor without additional expense to the purchaser.

ADDITIONAL INFORMATION

4. Grade A ferrosilicon is suitable for use in the manufacture of steels with a relatively high silicon content, such as steels for springs, and for use on certain electrical equipment.

5. Grade B ferrosilicon is suitable for use as a deoxidizer in the manufacture of steels.

6. Grade C ferrosilicon is also known as siliconisen, high-silicon pig, or Bessemer ferrosilicon. It is used in the manufacture of high-silicon acid-resistant iron and in general cupola practice.

621.25 FERROTUNGSTEN.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; STANDARD SAMPLES, C25 AND SUPPLEMENT, 1927

FERROTUNGSTEN SAMPLE NO. 75

(This standard sample is prepared and sold by the Bureau of Standards for use by industrial organizations and others for checking the accuracy of analysis of ferrotungsten, etc. It is accompanied by a certificate giving its complete analysis.)

621.26 FERROTITANIUM, FERROURANIUM, FERROVANADIUM.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR FERROVANADIUM DESIGNATION A102-27, 1927

FERROVANADIUM
SCOPE

1. These specifications cover ferrovanadium in four grades, as follows: Grade A, grade B, grade C, and grade D.

	Grade A	Grade B	Grade C	Grade D
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Vanadium.....	30.00 to 40.00.....	30.00 to 40.00.....	35.00 to 45.00.....	35.00 to 45.00.
Carbon.....	3.00 to 6.00.....	1.50 to 3.00.....	Not over 1.5.....	Not over 0.75.
Silicon.....	8.00 to 15.00.....	5.00 to 8.00.....	Not over 2.00.....	Not over 2.00.
Phosphorus.....	Not over 0.250.....	Not over 0.250.....	Not over 0.150.....	Not over 0.100.
Sulphur.....	Not over 0.300.....	Not over 0.300.....	Not over 0.300.....	Not over 0.100.
Aluminum.....	Not over 2.00.....	Not over 2.00.....	Not over 2.00.....	Not over 1.00.

SAMPLING AND CHEMICAL ANALYSIS

4. (For sampling, see A. S. T. M., A103-27 (621.20 p. 1092). For methods of chemical analysis, see A. S. T. M., A104-27 (621.20, p. 1093).)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, C25 AND SUPPLEMENT, 1927

FERROVANADIUM, SAMPLE NO. 61

(This standard sample of high-carbon ferrovanadium is prepared and sold by the Bureau of Standards for use by industrial organizations and others for checking the accuracy of analysis of ferrovanadium, etc. It is accompanied by a certificate giving its complete analysis.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR FERROVANADIUM, QQ-F-201, MAY 31, 1932

FERROVANADIUM

(In respect to material, general requirements, analysis of shipments, tests, packing, and marking this specification is identical with F. S. B. QQ-F-151. (See 621.21 p. 1103.) It covers two grades of ferrovanadium, the chemical compositions of which are as follows:)

Grade	Vanadium	Aluminum, maximum	Silicon, maximum	Sulphur, maximum	Phosphorus, maximum	Carbon, maximum	Manganese, maximum
A.....	<i>Per ct.</i> 30.0-40.0	<i>Per ct.</i> 1.00	<i>Per ct.</i> 1.00	<i>Per ct.</i> 0.03	<i>Per ct.</i> 0.04	<i>Per ct.</i> 0.75	<i>Per ct.</i> 0.75
B.....	30.0-40.0	2.00	2.00	.35	.08	2.0	-----

(Method of sampling is the same as in Federal Specification QQ-F-191 below for sampling lump ferrotitanium.)

BASIS OF PURCHASE

2. The material furnished under this specification shall be crushed to the specified size and mixed before packing, so that the quality in each package is uniform with the lot. The material shall be packed in sound containers sufficiently strong to prevent loss in transportation.

CHEMICAL REQUIREMENTS

3. The material shall conform to the following requirements as to chemical composition:

1. Circular proposals and requests for bids on ferrovanadium should require that all bidders quote "per pound of contained vanadium." Payment should be made on the basis of vanadium content only.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR FERROTITANIUM, QQ-F-191, JANUARY 5, 1932

FERROTITANIUM

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. *Federal specification QQ-M-151 (old No. 339a).*—Metals; general specifications for—of the issue in effect on date of invitation for bids—forms a part of this specification. (See 600.0, p. 3.)

B. GRADES

B-1. Ferrotitanium shall be of the following grades: Grade A and grade B.

C. MATERIAL

C-1. The material shall be as required in the following paragraphs.

D. GENERAL REQUIREMENTS

D-1. Ferrotitanium shall be furnished in lumps, crushed or screened to size, as specified in the contract or purchase order.

E. DETAIL REQUIREMENTS

E-1. Ferrotitanium shall conform to the requirements as to chemical composition specified in the following table for the grade ordered.

Grade	Titanium	Carbon, maximum	Silicon, maximum	Aluminum, maximum	Copper phosphorus, sulfur, and manganese combined, maximum	Iron, per cent
A.....	<i>Per cent</i> 25-30	<i>Per cent</i> 0.25	<i>Per cent</i> 3.00	<i>Per cent</i> 6.00	<i>Per cent</i> 0.50	Remainder. Do.
B.....	15-18	7.50	3.00	1.50	.50	

E-2. Analysis of each shipment of ferrotitanium shall be made by the contractor showing the percentages of the elements specified.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative and without cost to the contractor.

F-2. Representative samples shall be obtained from at least 10 per cent of the containers in a lot or shipment, consisting of at least 4 ounces for every 150 pounds, in the case of finely granulated or screened material. In the case of lump material at least 5 pounds shall be taken for every 1,000 pounds, or fraction thereof, in the lot or shipment. The samples so selected shall be crushed to at least 1/2-inch size, well mixed, and the resultant sample quartered down to 5 pounds, which shall be sent to the designated laboratory for analysis.

I. NOTES

I-1. Grade A ferrotitanium covers what is known as commercially carbon-free alloy, intended for use in the manufacture of products wherein this grade is specifically required.

I-2. Grade B covers a good grade of commercial ferrotitanium.

621.27 FERROPHOSPHORUS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; STANDARD SAMPLES, C25 AND SUPPLEMENT, 1927

FERROPHOSPHORUS, SAMPLE NO. 90

(This standard sample is prepared and sold by the Bureau of Standards for use by industrial organizations and others for checking the accuracy of analysis of ferrophosphorus. It is accompanied by a certificate giving its analysis as regards phosphorus.)

621.3 FINISHED AND SEMIFINISHED ALLOY STEELS.

621.30 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF ALLOY STEELS, SERIAL DESIGNATION A55-24, 1924

CHEMICAL ANALYSIS OF ALLOY STEELS

SILICOMANGANESE STEELS

All determinations are carried out as in the standard methods of chemical analysis of plain carbon steel as specified in A33. (See 600.1, p. 10.)

(In some respects the specifications in A33 are either identical with or substantially the same as the specifications in A64 and B28. Direct reference to all such identities will be found at the proper place in A33.)

NICKEL STEEL

Determination of Carbon

See the determination of carbon in plain carbon steel by the direct-combustion method in A33 (600.1, p. 10) and also in sampling and chemical analysis of pig and cast iron in A64 (601.20, p. 119).

Determination of Manganese by the Bismuthate Method (Absence of Cobalt)

(Same as determination of manganese by the bismuthate method (absence of cobalt) in A33 (see 600.1, p. 10) except in the following particulars:)

SOLUTIONS REQUIRED

(Dilute nitric acid (1:3), dilute nitric acid (3:97), ferrous ammonium sulphate solution, standard potassium permanganate solution, and standard sodium arsenite solution, all of which are the same as like solutions in the determination of manganese by the bismuthate method in A64. See 601.20, p. 119.)

METHOD

(Ferrous sulphate-permanganate titration (less than 0.05 per cent chromium) same as in A64. See 601.20, p. 119.)

Determination of Manganese by the Persulphate Method (Routine, in the Presence of Cobalt)

SOLUTIONS REQUIRED

(Conform to like solutions in the determination of manganese by the persulphate method of A64. See 601.20, p. 119.)

METHOD

(Same as in the determination of manganese by the persulphate method in A33 (see 600.1, p. 10) until addition of AgNO₃ solution (0.133 per cent), then proceed as indicated in A64 (see 601.20, p. 119).)

Determination of Phosphorus by the Molybdate-Magnesia Method

(Same as A33 (see 600.1, p. 10), except in respect to ammonium molybdate solution, which conforms to B28 (see 646.0, p. 1243).)

Determination of Phosphorus by the Alkalimetric Method (Routine)

(In respect to solutions required, same as molybdate-magnesia method in A33 (see 600.1, p. 10), except for ammonium molybdate, potassium nitrate (1 per cent), phenolphthalein indicator, standard sodium hydroxide, and standard nitric acid, all of which conform to B28 (see 646.0, p. 1243).)

METHOD

(Same as A33. See 600.1, p. 10.)

NOTES.—(Same as A33. See 600.1, p. 10.)

Determination of Sulphur by the Oxidation Method

(Same as A33. See 600.1, p. 10.)

Determination of Sulphur by the Evolution-Titration Method (Routine)

(Same as A64 (see 601.20, p. 119) in respect to diagram illustrating apparatus, solutions required, and method, except that here the chemical reactions in the potassium iodide solution are omitted, and for the starch solution in A64 is substituted the starch indicator specified in A33 (see 600.1, p. 10). The notes are identical with those given in A33, with the addition of the following:)

NOTE.—The evolution-titration method should not be used with steels containing appreciable amounts of tungsten or molybdenum or more than 0.4 per cent of copper.

Determination of Silicon by the Nitrosulphuric Method

(In respect to solutions required, same as A33 (see 600.1, p. 10), except for dilute hydrochloric acid (5:95) which conforms to the determination of silicon by the nitrosulphuric acid method in A64 (see 601.20, p. 119).)

METHOD

(Identical with A64 (see 601.20, p. 119), except that 80 c c of the nitrosulphuric acid is added cautiously to 4.676 g of steel, and that the difference in weights in milligrams divided by 100 equals the percentage of silver, instead of being divided by 50, as in A64.

Allowable error.—(Same as in A33: (See 600.1, p. 10).)

NOTE.—(Same as in A33 (see 600.1, p. 10).)

Determination of Silicon by the Sulphuric Acid Method (Optional)

(Same as A64 (see 601.20, p. 119), except that here 2.338 g of steel is substituted for the 2.336 g of iron specified in A64.)

Determination of Nickel by the Gravimetric Dimethylglyoxime Method

SOLUTIONS REQUIRED

Dilute nitric acid (1:3).—Mix 250 c c of HNO₃ (specific gravity 1.42) with 750 c c of distilled water.

Dilute hydrochloric acid (1:1).—Mix 500 c c of HCl (specific gravity 1.19) and 500 c c of distilled water.

Dimethylglyoxime (1 per cent).—(Same as A64. (See 601.20, p. 119).)

METHOD

For ordinary nickel steel take a 1 g sample; with less than 0.10 or more than 5 per cent nickel, larger or smaller samples may be taken. In the presence of less than 0.5 per cent chromium dissolve the sample in 50 c c of hot dilute HNO₃ (1:3). When chromium is present in amounts greater than 0.5 per cent or under circumstances where chromium carbides are present, dissolve the sample in 60 c c of dilute HCl (1:1) with the aid of heat and then oxidize the iron and the carbides by adding HNO₃ (specific gravity 1.42) drop by drop, until effervescence ceases. Boil to remove the products resulting from the decomposition of the HNO₃ and then cool the solution. Add in succession, with stirring after each addition, 12 g of citric acid or equivalent solution, 20 c c of NH₄OH (specific gravity 0.90), sufficient solution of dimethylglyoxime to precipitate all nickel present, and finally enough more NH₄OH to make the solution distinctly ammoniacal. The solution will usually have a volume of 200 to 250 c c and precipitation is complete immediately if the amount of nickel is over 0.10 per cent. With less nickel or in umpire analyses, digestion for one hour is desirable. Stir the solution thoroughly and filter on an asbestos mat on a 2-inch perforated porcelain plate or a Büchner funnel, avoiding strong suction and taking care that the funnel always remains partly filled with liquid. Thoroughly wash the precipitate with water, discard the filtrate and washings, rinse the funnel stem and then with the mat still in place and with suction off, add 25 c c of a mixture of 20 c c of HCl (specific gravity 1.19) and 5 c c of HNO₃ (specific gravity 1.42). After one minute, apply suction till dry, repeat the treatment with 25 c c of the mixture, drain, and wash thoroughly with water. Transfer the solution to a 400 c c beaker and evaporate the solution to 100 c c. Filter if necessary and repeat the precipitation of the glyoxime by adding 5 g citric acid, nearly neutralizing the absolutely clear solution with NH₄OH (specific gravity 0.90) and then adding dimethylglyoxime and NH₄OH as before. Finally filter on a weighed Gooch crucible, thoroughly wash with hot water, dry at 110° to 120° C. and weigh. The precipitate contains 20.31 per cent of nickel.

Allowable error.—Percentages of nickel determined by the above method should be accurate to $\pm (0.005 + (0.01 \times \text{the percentage of nickel found}))$

NOTES.—Direct weighing of the precipitate is desirable when small amounts of nickel are concerned. Large precipitates are more conveniently ignited at red heat to NiO. In this case, care must be taken to prevent sublimation of the undecomposed salt. This may be accomplished by inclosing the wet paper and precipitate in one or two wet ashless papers and slowly igniting so that the papers char before taking fire. In this way the compound is decomposed and ignition may proceed at full red heat.

It is difficult to precipitate nickel and to obtain it free from cobalt when cobalt is preponderant. Complete precipitation may be obtained by adding sufficient dimethylglyoxime to react with both cobalt and nickel and digesting for a longer period, or by oxidizing the cobalt to the trivalent condition by means of NaClO₂ or (NH₄)₂S₂O₈ in ammoniacal solution before precipitating with dimethylglyoxime. In either case, the first precipitate should be filtered off, dissolved, and reprecipitated.

Determination of Nickel by the Cyanide-Titration Method (Routine)

PRELIMINARY TREATMENT

The cyanide titration may be performed in a solution prepared as in (a), (b), or (c) below:

(a) *Preliminary separation with dimethylglyoxime.*—(Presence of chromium, copper, cobalt and small amounts of tungsten.)

Proceed as in the gravimetric method until the dimethylglyoxime precipitate has been dissolved in aqua regia, and then evaporate the solution to 50 c c or until free from dimethylglyoxime and oxidizing gases. Cool the solution, with ice if desired, neutralize with NH₄OH (specific gravity 0.90) (rosolic acid is a convenient indicator), add 5 c c in excess, dilute to 250 c c and proceed as in the final titration below.

(b) *Preliminary ether extraction.*—(Absence of cobalt and more than 1 per cent tungsten.)

SOLUTIONS REQUIRED

Dilute hydrochloric acid (3:2).—Mix 600 c c of HCl (specific gravity 1.19) and 400 c c of distilled water.

Acidulated hydrogen sulphide water.—Add 25 c c of HCl (specific gravity 1.19) to 500 c c of distilled water and saturate with H₂S.

METHOD

In a 150 c c beaker dissolve 1 g of the steel in 20 c c of the dilute HCl (3:2), add about 2 c c of HNO₃ (specific gravity 1.42) to oxidize the iron, and boil to expel the oxides of nitrogen. Cool and transfer the solution into an 8-ounce separatory funnel, rinsing the beaker with small portions of the dilute HCl (3:2). Add 50 c c of ether, shake for five minutes, let settle for one minute, and then draw off the lower clear solution into another 8-ounce separatory funnel. Add 10 c c of dilute HCl (3:2) to the solution in the first separatory funnel, cool, shake thoroughly, allow to settle for one minute, and then draw off the lower clear solution into the second separatory funnel. To the combined solutions in the second separatory funnel add 50 c c of ether, shake for five minutes, let settle for 1 minute, and then draw off the clear layer into a 150 c c beaker. Heat the aqueous solution gently to expel the ether, add 0.2 g of potassium chlorate, boil until the chlorate is decomposed, dilute to 100 c c with hot water, make faintly ammoniacal, and boil for five minutes. Filter and wash with hot water. To the filtrate add 10 c c of HCl (specific gravity 1.19) heat just short of boiling and precipitate the copper with hydrogen sulphide. Filter and wash with acidulated hydrogen sulphide water. Boil the filtrate to expel hydrogen sulphide, neutralize with ammonia as in (a), add 5 c c in excess, dilute to 250 c c, and proceed as in the final titration below.

(c) *Direct titration.*—(Absence of copper, cobalt, and more than 1 per cent of tungsten.)

SOLUTIONS REQUIRED

Dilute nitric acid (specific gravity 1.20).—Mix 380 c c of HNO_3 (specific gravity 1.42) and 620 c c of distilled water.

Ammonium persulphate (15 per cent).—Make up as needed by dissolving 15 g of the salt in 100 c c of distilled water.

Dilute ammonia (1:1).—Mix equal volumes of NH_4OH (specific gravity 0.90) and distilled water.

Sulphuric-citric acids.—Dissolve 200 g of citric acid in a cooled mixture of 100 c c H_2SO_4 (specific gravity 1.84) and 900 c c of distilled water.

METHOD

Transfer 1 g of the sample to a 400 c c beaker, treat with 20 c c of dilute HNO_3 (specific gravity 1.20) and heat until the sample is dissolved. Add 8 to 10 c c of ammonium persulphate solution (15 per cent) and continue the boiling for five minutes. Cool the solution, add 50 c c of the sulphuric-citric acid mixture, and then dilute NH_4OH (1:1) until the solution is just alkaline to litmus, when an excess of 5 c c is added. In case a precipitate is formed, use more citric acid. The neutralization of the solution should be made as soon as possible after the addition of the citric acid, as otherwise this may reduce traces of iron. Cool to room temperature, dilute to 250 c c and proceed as in the final titration below.

NOTE.—If chromium is present in amounts over 1 per cent, dissolve the steel in 20 c c of dilute H_2SO_4 (1:4), oxidize with 5 c c of HNO_3 (specific gravity 1.42), boil five minutes, cool, add 50 c c of sulphuric-citric acid mixture, and proceed as above.

FINAL TITRATION

SOLUTIONS REQUIRED

Potassium iodide (10 per cent).—Dissolve 10 g of KI in 100 c c of distilled water.

Standard silver nitrate.—Dissolve 5.7903 g of AgNO_3 in distilled water and dilute to exactly 1,000 c c.

Standard potassium cyanide.—Dissolve 4.5 g of KCN in 1,000 c c of distilled water containing 1 g of KOH. Standardize this solution against the standard silver nitrate solution as follows: To a 400 c c beaker add 100 c c of water, 3 c c of NH_4OH , 2 c c of potassium iodide solution (10 per cent), and finally 30 c c of silver nitrate solution from a burette. Titrate with the cyanide solution until the solution is perfectly clear, and then add more silver nitrate solution until a faint cloudiness is obtained which can be dispelled by two drops of the cyanide solution. Adjust the cyanide solution so that it is equivalent to the silver nitrate solution and check the theoretical value (0.001 g nickel) by standardizing, by the procedure chosen, against a steel of known nickel content as determined by the gravimetric dimethylglyoxime method.

METHOD

Add 2 c c of potassium iodide solution (10 per cent) to the solution prepared as in (a), (b), or (c) and then from a burette add 3 c c of standard silver nitrate solution. Slowly add standard cyanide solution, with constant stirring, until the solution is perfectly clear. Continue the addition of the silver nitrate solution and titration with cyanide solution until the cloudiness of the solution, due to the addition of two drops of the standard silver nitrate, is just expelled by the final addition of two drops of the standard cyanide. Each cubic centimeter excess of standard cyanide solution required over standard silver nitrate solution used in the titration represents 0.1 per cent of nickel.

NOTE.—If cobalt is present, an unsatisfactory end point will be obtained if the titration is carried out as directed after a preliminary separation by methods (b) or (c). Cobalt may, however, be titrated satisfactorily provided it is first oxidized to the trivalent condition by boiling the ammoniacal solution with NaClO_2 prior to the titration with cyanide. In this case, the compound $\text{K}_2\text{Co}(\text{CN})_6$ is formed and the titration represents the combined effect of nickel and cobalt. (See the determination of cobalt in tungsten steel by the cyanide titration method (routine), given below.)

CHROME-NICKEL STEEL

Determination of Carbon

See the determination of carbon in plain carbon steel by the direct-combustion method in A33 (600.1, p. 10) and also in sampling and chemical analysis of pig and cast iron in A64 (601.20, p. 119).

NOTE.—Difficultly combustible high-chromium steel can usually be burned directly if the sample is heated for a few minutes before admitting oxygen. A high temperature (1,100° C.) is desirable, and in extreme cases complete combustion can be had by mixing the drillings with low-carbon iron or steel.

Determination of Manganese by the Hydrolysis-Bismuthate Method

(Absence of Cobalt)

SOLUTIONS REQUIRED

Dilute sulphuric acid (1:9).—Pour 100 c c of H_2SO_4 (specific gravity 1.84) slowly and with stirring into distilled water, cool, and dilute to 1,000 c c.

Sodium bicarbonate (8 per cent).—Dissolve 80 g of NaHCO_3 in 1,000 c c of distilled water.

Dilute nitric acid (3:97).—Mix 30 c c of HNO_3 (specific gravity 1.42) and 970 c c of distilled water.

(Ferrous sulphate and standard potassium permanganate are the same as in the determination of manganese in sampling and chemical analysis of pig and cast iron by the bismuthate method in A64. (See 601.20, p. 119).)

METHOD

Dissolve 1.000 g of the sample contained in a 200 c c covered Erlenmeyer flask in 20 c c of dilute H_2SO_4 (1:9). When action is complete, dilute to 100 c c with boiling water. Add from a burette sodium bicarbonate solution (8 per cent) until a permanent precipitate is formed (approximately 36 c c) and then 4 c c more. Boil one minute, allow to settle, and filter on a rapid filter, washing four to five times with boiling water. If the precipitation has been properly performed there will be no more precipitate than can be conveniently handled on a 9 cm paper. The filtrate will become cloudy in the funnel stem and in the receiving vessel, owing to oxidation and hydrolysis. Heat the filtrate to boiling and oxidize with small portions of HNO_3 (specific gravity 1.42), adding in all 12 c c. Evaporate to about 25 c c, cool to 15° C., and add an excess of sodium bismuthate. Let stand for a few minutes, add 50 c c of dilute HNO_3 (3:97), and filter through asbestos. Wash with the same acid until the washings run through colorless. Add 3 c c of H_3PO_4 (specific gravity 1.71) and titrate with ferrous sulphate and standard potassium permanganate, as in the determination of manganese in sampling and chemical analysis of pig and cast iron by the bismuthate method. (See A64 (601.20, p. 119).)

Allowable error.—Percentages of manganese determined by the above method should be accurate to $\pm(0.02 + (0.02 \times \text{the percentage of manganese found}))$.

NOTES.—The bicarbonate precipitate does not ordinarily contain more than small amounts (about 0.005 per cent) of manganese. In very accurate work this should be recovered by transferring the precipitate to a beaker, dissolving it in aqua regia, fuming with sulphuric acid, and then adding sodium hydroxide and sodium peroxide and boiling. Chromium and vanadium are thus separated from manganese and iron which should be filtered off, dissolved in 5 c c of HNO_3 (1:1) and added to the filtrate from the bicarbonate precipitation. A drop of sulphurous acid added to the nitric acid aids in the solution of the manganese dioxide.

The determination of manganese by the Ford or Ford-Williams method (preliminary separation of manganese as dioxide by boiling with concentrated nitric acid and potassium chlorate) is satisfactory for steels containing over 0.1 per cent of manganese. This method should not be used, however, except in laboratories which have excellent ventilation facilities.

Determination of Manganese by the Persulphate Method (Routine and in the Presence of Cobalt)

SOLUTIONS REQUIRED

(Conform to like solutions in the determination of manganese by the persulphate method in A64. (See 601.20, p. 119).)

METHOD

(Same as in A33 (see 600.1, p. 10) until addition of AgNO_3 solution (0.133 per cent), then proceed as indicated, in A64 (see 601.20, p. 119).)

NOTE.—In making the titration, special care should be given to standardizing the end-point reading and the reading should be corrected by a blank, which varies with the amount of chromium present.

Determination of Phosphorus

(Same as the determination of phosphorus in plain carbon steel by the molybdate magnesia method in A33 (see 600.1, p. 10) except for ammonium molybdate solution, for which see B28 (646.0 p. 1243).)

Determination of Phosphorus by the Alkalimetric Method (Routine)

SOLUTIONS REQUIRED

(Dilute nitric acid (specific gravity 1.20), dilute nitric acid (2:100), potassium permanganate, and ammonium bisulphite—all are identical with like solutions in the molybdate magnesia method in A33. (See 600.1, p. 10.) Ammonium molybdate, potassium nitrate (1 per cent), phenolphthalein indicator, standard sodium hydroxide, and standard nitric acid—all are identical with like solutions in B28. See 646.0, p. 1243.)

METHOD AND NOTES

(Same as in A33. (See 600.1, p. 10).)

DETERMINATION OF SULPHUR

See the determination of sulphur in plain carbon steel by the oxidation method in A33 (600.1, p. 10).

(In the determination of sulphur by the evolution-titration method, this specification conforms, in respect to diagram illustrating apparatus, solutions required, and method, to A64 (see 601.20, p. 119), except that in A64 the potassium iodate solution includes the chemical reactions, and for the starch solution and notes in A64, there should be substituted the starch indicator and notes in A33 (see 600.1, p. 10).)

NOTES.—The evolution-titration method should not be used with steels containing appreciable amounts of tungsten or molybdenum, or more than 0.4 per cent of copper.

The annealing of the steel drillings has been found by a number of investigators to increase the degree of refinement of the method.

Determination of Silicon

(A) LOW CHROMIUM

SOLUTIONS REQUIRED

Nitrosulphuric acid.—(Same as in A33. See 600.1, p. 10.)

Dilute hydrochloric acid (5:95).—(Same as in A64. See 601.20, p. 119.)

METHOD

(Identical with A64 (see 601.20, p. 119), except that 80 c c of the nitrosulphuric acid is added cau-

tiously to 4.676 g of steel, and that the difference in weights in milligrams divided by 100 equals the percentage of silicon, instead of being divided by 50 as in A64.)

Allowable error.—(Same as in the determination of silicon in plain carbon steel by the nitrosulphuric method in A33. (See 600.1, p. 10).)

NOTE.—(Same as in the determination of silicon in plain carbon steel by the nitrosulphuric method in A33. See 600.1, p. 10.)

(B) HIGH CHROMIUM

SOLUTIONS REQUIRED

Dilute sulphuric acid (1:9).—Pour 100 c c of H_2SO_4 (specific gravity 1.84) slowly and with stirring into 900 c c of distilled water.

Dilute hydrochloric acid (5:95).—(Same as in A64. See 601.20, p. 119.)

METHOD

Dissolve 2.338 g of the sample in a covered porcelain dish in 30 c c of HCl (specific gravity 1.19) or 100 c c of dilute sulphuric acid (1:9). If vanadium or molybdenum be present, add a few crystals of sodium chlorate when the action is complete, boil, and then evaporate to low bulk. If sulphuric acid has not been added, cautiously add 15 c c of H_2SO_4 (specific gravity 1.84) and continue the evaporation until fumes of H_2SO_4 begin to come off. Do not prolong this treatment or allow the solution to go to dryness lest insoluble chromium and nickel sulphates be formed. Cool, dilute with 125 c c of distilled water, add 5 c c of HCl (specific gravity 1.19), and warm gently with frequent stirring until the soluble salts have dissolved. Immediately, filter through an 11-cm filter paper, wash with dilute HCl (5:95) until free from iron and then with hot water until free from acid. Transfer the filter to a platinum crucible, burn off the paper carefully, and finally ignite, with the crucible covered, over a blast lamp or in a muffle furnace at $1,000^\circ\text{C}$. for at least 10 minutes. Cool in a desiccator and weigh. Add sufficient dilute H_2SO_4 (1:1) to moisten the silica, and then a small amount of HF. Evaporate to dryness, ignite, and weigh. The difference in weights represents the amount of silica.

NOTE.—(Same as in the determination of silicon in plain carbon steel by the nitrosulphuric method in A33. See 600.1, p. 10.)

Determination of Chromium by the Persulphate-Oxidation Method

SOLUTIONS REQUIRED

Sulphuric-phosphoric acid mixture.—Mix 320 c c of H_2SO_4 (1:1), 80 c c of H_3PO_4 (85 per cent), and 600 c c of distilled water.

Silver nitrate (2.5 per cent).—Dissolve 25 g of AgNO_3 in 1,000 c c of distilled water.

Ammonium persulphate (15 per cent).—Make up as needed by dissolving 15 g of the salt in 100 c c of distilled water.

Sodium chloride (5 per cent).—Dissolve 50 g of NaCl in 1,000 c c of distilled water.

Dilute nitric acid (specific gravity 1.20).—(Same as in determination of manganese by the persulphate method in A64. (See 601.20, p. 119).)

Standard ferrous sulphate.—(Same as in determination of manganese by the bismuthate method in A64. (See 601.20, p. 119).)

Standard permanganate solution.—(Same as in determination of manganese by the bismuthate method in A64. (See 601.20, p. 119).)

METHOD

Transfer 2 g of the sample to a 600 c c beaker and add 60 c c of sulphuric-phosphoric acid mixture. Heat until all action ceases, add 10 c c of HNO_3

(specific gravity 1.20), and boil until solution is complete and oxides of nitrogen are expelled. Add silver nitrate solution (2.5 per cent) in amount equal to 0.03 g of the salt for each 1.5 per cent of chromium present. Dilute to 300 c c with boiling water, heat to boiling, and add 8 c c of ammonium persulphate solution (15 per cent). When the permanganate color has developed, add 5 c c of sodium chloride solution (5 per cent) and boil until the pink color disappears and the persulphate is decomposed, which requires about 10 minutes. Cool the solution, dilute to approximately 400 c c, and titrate for chromium as follows: Add a measured excess of standard ferrous sulphate solution (50 c c for less than 1.5 per cent chromium, 100 c c for 1.5 to 3 per cent chromium) and then titrate with the standard potassium permanganate solution until an end point is obtained which is permanent upon continued stirring for at least one minute. The titration must be corrected for dilution and color effect. If no chromium or nickel were present the dilution effect alone would be involved and satisfactorily eliminated by titrating the same volume of ferrous sulphate solution in a solution of like volume and acidity. In colored solutions the correction can be made (1) empirically, as judged by experience; (2) by titration of the same volume of ferrous sulphate in a solution of like volume and acidity and containing the same amount of the coloring elements in their final valency; or (3) in the final titrated solution. The last is the most convenient and satisfactory and may be performed by destroying the slight excess of permanganate which is present in the titrated solution by a few drops of hydrogen peroxide, boiling until the excess of peroxide and the pervanadate are destroyed (10 minutes actual boiling), cooling to room temperature, and then titrating with the permanganate solution. The difference between the volumes of permanganate used is then a true oxidizing equivalent of the excess of ferrous sulphate employed and the percentage of chromium may be calculated in the usual manner. The final solution may be preserved for the determination of vanadium as described in the determination of vanadium in chrome-vanadium steel by reduction with ferrous sulphate and titration with permanganate method (routine), given below.

Allowable error.—Percentages of chromium determined by the above method should be accurate to $\pm (0.01 + (0.01 \times \text{the percentage of chromium found}))$.

Determination of Nickel

See the determination of nickel in nickel steel by the gravimetric dimethylglyoxime method, given above. (For dimethylglyoxime (1 per cent) solution, see A64 (601.20, p. 119).)

See the determination of nickel in nickel steel by the cyanide-titration method (routine), given above.

VANADIUM STEEL

All determinations carried out as in the methods of chemical analysis of chrome-vanadium steel, given below.

CHROME-VANADIUM STEEL

Determination of Carbon

See determination of carbon in plain carbon steel by the direct-combustion method in A33 (600.1, p. 10); and also in sampling and chemical analysis of pig and cast iron in A64 (601.20, p. 119).)

Determination of Manganese

(Conforms to the determination of manganese in chrome-nickel steel by the hydrolysis-bismuthate method, given above, except in solutions required, in

which standard potassium permanganate and ferrous ammonium sulphate are the same as in the determination of manganese by the bismuthate method in A64 (see 601.20, p. 119).)

(Conforms to the determination of manganese by the persulphate method in A64 (see 601.20, p. 119) in respect to like solutions. In respect to method, it conforms to the determination of manganese by the persulphate method in A33 (see 600.1, p. 10) until addition of AgNO_3 solution (0.133 per cent), then proceed as indicated, in A64 (see 601.20, p. 119). Note is the same as in the determination of manganese in chrome-nickel steel by the persulphate method, given above.)

Determination of Phosphorus by the Modified Molybdate Magnesia Method.

SOLUTIONS REQUIRED

(Same as in the determination of phosphorus by the molybdate magnesia method in A33 (see 600.1, p. 10) except ammonium molybdate, which is the same as in the determination of phosphorus by the alkalimetric method in B28 (see 646.0, p. 1243) and the following additional item:)

Ferrous sulphate.—Dissolve 40 g of ferrous sulphate in 100 c c of distilled water that has been acidified with 1 c c of H_2SO_4 (specific gravity 1.84).

METHOD AND NOTES

(Same as in A33 (see 600.1, p. 10) except that after boiling to free from oxides of nitrogen, the solution is cooled to 15° to 20° C. (instead of to 80° C. as in A33) and then there are added 5 c c of the ferrous sulphate solution and two or three drops of concentrated sulphurous acid.)

Allowable error.—Percentages of phosphorus determined by the above method should be accurate to $\pm (0.003 + (0.02 \times \text{the percentage of phosphorus found}))$.

Determination of Phosphorus by the Modified Alkalimetric Method (Routine)

SOLUTIONS REQUIRED

(Dilute nitric acid (specific gravity 1.20), dilute nitric acid for washing (2:100), potassium permanganate (2.5 per cent), ammonium bisulfite (3 per cent)—all are identical with the determination of phosphorus by the molybdate magnesia method in A33. (See 600.1, p. 10.) Ammonium molybdate, potassium nitrate (1 per cent), phenolphthalein indicator, standard sodium hydroxide, and standard nitric acid—all are identical with the determination of phosphorus by the alkalimetric method in B28. (See 646.0, p. 1243.) Ferrous sulphate solution is the same as given above in modified molybdate magnesia method.)

METHOD AND NOTES

(Same as in A33 (see 600.1, p. 10) except that after boiling to free from oxides of nitrogen, the solution is cooled to 15° to 20° C. (instead of to 80° C. as in A33) and then there are added 5 c c of the ferrous sulphate solution and two or three drops of concentrated sulphurous acid. Also omit here the notation reference to phosphomolybdate.)

Determination of Sulphur

See the determination of sulphur in plain carbon steel by the oxidation method in A33 (600.1, p. 10).

(In respect to the determination of sulphur by the evolution-titration method, this specification is identical to A64 (see 601.20, p. 119) as regards diagram of apparatus, solutions required, and method, except that the potassium iodate chemical reactions are not included here, and for the starch

solution in A64 should be substituted the starch indicator in A33 (see 600.1, p. 10). Notes are the same as in A33.)

NOTES.—(Same as for the determination of sulphur in chrome-nickel steel, given above.)

Determination of Silicon by the Nitrosulphuric Method

(In respect to solutions required, same as A33 (see 600.1, p. 10) except for dilute hydrochloric acid (5:95) which conforms to A64.) (See 601.20, p. 119.)

METHOD

(Identical with A64 (see 601.20, p. 119) except that 80 c c of the nitrosulphuric acid is added cautiously to 4.676 g of steel, and that the difference in weights in milligrams divided by 100 equals the percentage of silver, instead of being divided by 50, as in A64.)

Allowable error.—(Same as in A33. See 600.1, p. 10.)

NOTE.—(Same as in A33. See 600.1, p. 10.)

Determination of Silicon by the Sulphuric Acid Method (Optional)

(Same as A64 (see 601.20, p. 119) except that here 2.338 g of steel is substituted for the 2.336 g of iron specified in A64.)

Determination of Chromium

SOLUTIONS REQUIRED

(Sulphuric-phosphoric acid mixture, silver nitrate (2.5 per cent), ammonium persulphate (15 per cent), and sodium chloride (5 per cent)—all are identical with like solutions in the determination of chromium in chrome-nickel steel by the persulphate-oxidation method, given above. Dilute nitric acid (specific gravity 1.20) is identical with solution in determination of manganese by the persulphate method in A64. (See 601.20, p. 119.) Standard ferrous sulphate and standard permanganate solution are identical with like solutions in determination of manganese by the bismuthate method in A64.) (See 601.20, p. 119.)

METHOD

(Same as in determination of chromium in chrome-nickel steel by the persulphate-oxidation method, given above.)

NOTE.—Reserve the titrated solution for the determination of vanadium by reduction with ferrous sulphate and titration with permanganate (routine) given below.

Determination of Vanadium by the Electrolytic-Separation Method

SOLUTIONS REQUIRED

Dilute sulphuric acid (1:9).—Carefully mix 100 c c of H_2SO_4 (specific gravity 1.84) and 900 c c of distilled water.

Dilute sulphuric acid (1:1).—Add 500 c c of H_2SO_4 (specific gravity 1.84) slowly and with stirring to 500 c c of distilled water.

Sodium bicarbonate (8 per cent).—Dissolve 80 g of $NaHCO_3$ in 1,000 c c of distilled water.

Potassium ferricyanide.—Prepare a very dilute solution as needed, by dissolving a crystal the size of the head of a pin in 25 c c of distilled water.

Standard potassium permanganate.—See the determination of manganese by the bismuthate method in A64 (601.20, p. 119.)

METHOD

Dissolve 2 g of the sample, contained in a 200 c c covered Erlenmeyer flask, in 30 c c of dilute H_2SO_4 (1:9). When action is complete, dilute to 100 c c with boiling water, heat to boiling, and add sodium bicarbonate solution (8 per cent) from a burette until a permanent precipitate appears (approximately 36 c c) and then 4 c c more. Let settle,

filter on a rapid filter, and quickly wash the flask and precipitate with hot water. If the precipitation has been properly performed there will be no more precipitate than can be conveniently handled on a 9 cm paper. The filtrate will become cloudy in the funnel stem and in the receiving vessel, owing to oxidation and hydrolysis. (If the flask, paper, and precipitate have been well washed, the filtrate will contain all but traces of the manganese in the sample free from chromium and vanadium and therefore, it may be oxidized with nitric acid and the manganese determined by the bismuthate or persulphate methods.) Place the paper and precipitate in the original flask, add 20 c c of HNO_3 (specific gravity 1.42) shake until the paper is broken up, and then add 5 c c of H_2SO_4 (specific gravity 1.84). Heat over a free flame until fumes of sulphuric acid are given off, cool, and then add more HNO_3 and repeat the heating in case the organic matter has not been destroyed. Finally cool, wash down the sides of the flask, and evaporate again to the appearance of fumes of sulphuric acid and until all of the nitric acid has been expelled. Cool, dilute to 40 c c, and nearly neutralize the solution with NH_4OH (specific gravity 0.90). Transfer the weakly acid solution to the electrolyzing apparatus, rinsing the flask with small portions of water and keeping the total volume of the solution down to 70 c c. The electrolysis may be performed with a mercury cathode in (1) a special modified separatory funnel,² (2) in a small beaker with sealed-in platinum wire,³ or (3) in an ordinary beaker with the cathode wire enclosed in a glass tube extending into the mercury. In any case, the cathode wire should be embedded in about 200 g of mercury, and the solution electrolyzed (preferably with a stirring arrangement) using a current of 5 to 6 amperes at 15 to 20 volts. Continue the electrolysis (ordinarily 15 to 20 minutes if the solution is stirred) until iron is absent as indicated by a ferricyanide test on a small drop of the electrolyte. When iron is absent, remove the electrolyte and wash the mercury two or three times with 25 to 30 c c of water while the current is continued. The solution must now give no test for iron. Add 2 to 3 c c of dilute H_2SO_4 (1:1), heat to 70° to 80° C., and add permanganate solution to a strong pink color. Run sulphur dioxide into the boiling solution for a few minutes until the vanadium is reduced, and then a rapid stream of carbon dioxide until the escaping steam gives no test for SO_2 . Cool the solution to 70° to 80° C., and titrate with the standard permanganate solution. Repeat the reduction and titration until concordant results are obtained. The titration should be corrected by a blank determination on a solution of like volume and acidity.

Allowable error.—Percentages of vanadium determined by the above method should be accurate to $\pm(0.02 + 0.01 \times \text{the percentage of vanadium found})$.

Determination of Vanadium by Reduction with Ferrous Sulphate and Titration with Permanganate (Routine)

SOLUTIONS REQUIRED

(Sulphuric-phosphoric acid mixture, silver nitrate (2.5 per cent), ammonium persulphate (15 per cent), and sodium chloride (5 per cent)—all are identical with the determination of chromium in chrome-nickel steel by the persulphate-oxidation method, given above. Dilute nitric acid (1:1) is identical with the determination of manganese by the persulphate method in A64. (See 601.20, p. 119.) Standard ferrous sulphate and standard potassium permanganate are identical with the determination

² Reprint 161 from the Bulletin of the Bureau of Standards, vol. 74, No. 3; Journal Industrial and Engineering Chemistry, vol. 3, p. 76, 1911.

³ Smith, Electroanalysis, 5th ed., P. Blakiston's Sons & Co., p. 63.

of manganese by the bismuthate method in A64. (See 601.20, p. 119.)

Method

See the determination of chromium in chrome-nickel steel by the persulphate-oxidation method given above.

Use the solution employed for the determination of chromium and add 10 c c of ferrous sulphate solution if vanadium is under 0.80 per cent, and 20 c c if the vanadium content is higher. Stir the solution thoroughly, add 8 c c of ammonium persulphate solution (15 per cent) and stir for one minute. Titrate with the standard permanganate solution to a definite pink color which does not fade upon continued stirring for one minute. In this determination the ferrous sulphate reduces the vanadium, the persulphate oxidizes the excess of ferrous sulphate but does not oxidize the reduced vanadium and the reduced vanadium is oxidized by permanganate which does not react with the excess of persulphate. As in the determination of chromium, an excess of permanganate is used in order to overcome the dilution effect and the color interference, and the same blank correction should be subtracted as was there found.

TUNGSTEN STEEL

Determination of Carbon

See the determination of carbon in plain carbon steel by the direct-combustion method in A33 (600.1, p. 10) and also in sampling and chemical analysis of pig and cast iron in A64 (601.20, p. 119).

NOTE.—Difficultly combustible tungsten steel can often be burned directly if the sample is heated for a few minutes before admitting oxygen. A high temperature (1,100° C.) is desirable, and in extreme cases complete combustion can be had by mixing the sample with low-carbon iron or steel.

Determination of Manganese by the Hydrolysis-Bismuthate Method (Absence of Cobalt)

(Same as the determination of manganese in chrome-nickel steel by the hydrolysis-bismuthate method, given above, except for standard potassium permanganate and ferrous sulphate solutions, for which see determination of manganese by the bismuthate method in A64 (601.20, p. 119), and the addition of the following:

NOTES.—The retention of manganese by the bicarbonate precipitate is a little greater in steels containing tungsten than in steels containing no tungsten, but the retention is usually no more than from 0.01 to 0.02 per cent. In very accurate work this should be recovered as follows:

Place the paper and precipitate in the original flask, add 20 c c of HNO_3 (specific gravity 1.42) shake until the paper is broken up, and then add 5 c c of H_2SO_4 (specific gravity 1.84). Heat over a free flame until fumes of sulphuric acid are given off, cool, and then add more HNO_3 and repeat the heating in case the organic matter has not been destroyed. Finally cool, wash down the sides of the flask, and evaporate again to the appearance of fumes of sulphuric acid and until all of the nitric acid has been expelled. Cool, dilute, neutralize with sodium hydroxide, then add sodium peroxide and boil. Chromium, vanadium, and tungsten are thus separated from manganese and iron, which should be filtered off and washed with hot water containing a little sodium hydroxide. Dissolve the precipitate of iron and manganese in warm dilute 1:1 nitric acid with the aid of a few drops of sulphurous acid if necessary, and add the solution to the original filtrate.

Cobalt interferes in the above method. When this element is present the persulphate method must be used with a fresh sample as directed below, or in the filtrate obtained after the bicarbonate precipitation. In the latter event, acidify the filtrate with nitric acid, add 10 c c of dilute sulphuric acid (1:1) and evaporate to a volume of 20 c c. Add 10 c c of HNO_3 (specific gravity 1.20) and proceed as directed below. With material containing much cobalt use one-fourth of the solution, which will represent 0.5 g of steel.

Allowable error.—Percentages of manganese determined by the above method should be accurate to $\pm (0.02 + (0.02 \times \text{the percentage of manganese found}))$.

Determination of Manganese by the Persulphate-Arsenite Method (Routine and in the Presence of Cobalt)

SOLUTIONS REQUIRED

Dilute sulphuric acid (1 : 1).—(Same as in determination of vanadium in chrome-vanadium steel by the electrolytic separation method, given above.)

Dilute nitric acid (specific gravity: 1.20).—(Same as in determination of phosphorus by the molybdate-magnesia method in A33. See 600.1, p. 10.)

Silver nitrate (0.5 per cent).—Dissolve 5 g of AgNO_3 in a mixture of 750 c c of distilled water with 250 c c of H_2SO_4 (1:1).

Ammonium persulphate (15 per cent).—(Same as in determination of chromium in chrome-nickel steel by the persulphate-oxidation method, given above.)

Sodium chloride (0.5 per cent).—Dissolve 5 g of NaCl in 1,000 c c of distilled water.

Standard sodium arsenite solution.—Dissolve 2 g of sodium arsenite in 1,000 c c of distilled water and standardize against a standard steel or by withdrawing 10 c c of 0.03 N permanganate (or its equivalent) into a 250 c c beaker, reducing with a few drops of sulphurous acid, and then proceeding as described in the method below.

METHOD

Transfer 0.50 g of steel to a flask, add 25 c c of water, 5 c c of dilute H_2SO_4 (1:1), and 2 c c of phosphoric acid (85 per cent), and heat until all effervescence ceases. Add 10 c c of HNO_3 (specific gravity 1.20), and boil to dissolve the tungstic acid. Add 50 c c of silver nitrate solution (0.5 per cent) (sufficient for 5 per cent chromium steel), boil, and add 15 c c of ammonium persulphate solution (15 per cent). Remove the flask from the heat, allow to stand in a warm place until the color has developed, and then rapidly cool. Transfer the solution to a 250 c c beaker, dilute to a volume of 100 c c and add 30 c c of sodium chloride solution (0.5 per cent) to precipitate the silver. Titrate with the standard sodium arsenite solution to the disappearance of the pink tint of permanganic acid. The addition of sodium chloride is unnecessary if the solution of permanganic acid is quite cold and the titration is conducted rapidly.

Determination of Phosphorus by the Molybdate Magnesia Method

SOLUTIONS REQUIRED

Dilute hydrochloric acid (1 : 1).—Dilute 500 c c of HCl (specific gravity 1.19) with 500 c c of distilled water.

Dilute hydrochloric acid (1 : 10).—Dilute 100 c c of HCl (specific gravity 1.19) with 1,000 c c of distilled water.

Ferrous sulphate.—Dissolve 40 g of ferrous sulphate in 100 c c of water and acidify with 1 c c of H_2SO_4 (specific gravity 1.84).

Ammonium molybdate.—(Same as in B28. See 646.0, p. 1243.)

(Dilute nitric acid for washing (2:100), dilute ammonium hydroxide (1:2), and magnesia mixture—all are identical with like solutions in the determination of phosphorus in plain carbon steel by the molybdate-magnesia method in A33. See 600.1, p. 10.)

METHOD

Treat 2 g of the sample, in a porcelain dish provided with a cover glass, with 20 c c of HNO_3 (specific gravity 1.42) and 60 c c of HCl (specific gravity 1.19). Heat gently until the sample is completely decomposed and then evaporate to dryness. Remove the cover glass and bake until the acid is completely expelled. Cool, add 30 c c of HCl (specific gravity 1.19), warm until the soluble salts are dissolved, and then evaporate to dryness on the sand bath. Add 30 c c of dilute HCl (1:1) and boil the solution until the soluble salts are dissolved. Dilute to 60 c c with boiling water, filter from the silica and tungstic acid, and wash the residue with dilute HCl (1:10) until free from iron. (See note.) Evaporate the filtrate to approx-

imately 20 c c, cool, and make ammoniacal. Dissolve the precipitated hydroxides in the exact amount of HNO_3 (specific gravity 1.42) necessary to effect complete solution and add 5 c c in excess. The further treatment depends on whether vanadium is absent or present. If vanadium is absent, proceed as in the determination of phosphorus in plain carbon steel by the molybdate-magnesia method in A33. (See 600.1, p. 10.) If vanadium is present, proceed as in the determination of phosphorus in chrome-vanadium steel by the modified molybdate-magnesia method, given above, in which will be found certain references to A33 and B28.

Allowable error.—Percentages of phosphorus determined by the above method should be accurate to $\pm (0.004 + (0.02 \times \text{the percentage of phosphorus found}))$.

NOTE.—The residue of tungstic and silicic acids sometimes contains very small amounts of phosphorus and in accurate analyses it must be treated as follows: Ignite in a platinum crucible, fuse with a little Na_2CO_3 (free from phosphorus), and dissolve the cooled melt in hot water. Acidify the solution slightly with HCl , add a few crystals of FeCl_3 , and precipitate with NH_4OH in slight excess. Filter, wash with a hot wash solution containing a little NH_4OH and NH_4Cl , and discard the filtrate. Dissolve the precipitate of ferric hydroxide and ferric phosphate in a small amount of HCl and add to the main filtrate.

Determination of Phosphorus by the Alkalimetric Method (Routine)

SOLUTIONS REQUIRED

Dilute nitric acid (1:3).—Dilute 250 c c of HNO_3 (specific gravity 1.42) with 750 c c of distilled water.

(Dilute hydrochloric acid (1:1), dilute hydrochloric acid (1:10), and ferrous sulphate—all are identical with like solutions in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above. Ammonium molybdate is the same as in the determination of phosphorus by the alkalimetric method in B28 (see 646.0, p. 1243), as also are potassium nitrate (1 per cent), phenolphthalein indicator, standard sodium hydroxide, and standard nitric acid.)

METHOD

Treat 2 g of the sample, in a porcelain dish provided with a cover glass, with 50 c c of dilute HNO_3 (1:3), add 10 c c of HCl (specific gravity 1.19), and evaporate to dryness. Dissolve the soluble salts in 30 c c of dilute HCl (1:1) by boiling, dilute to 60 c c with water, filter, and wash the residue with dilute HCl (1:10). Evaporate the filtrate to approximately 100 c c, make the solution ammoniacal, add just enough HNO_3 (specific gravity 1.42) to effect complete solution and then add 5 c c in excess. The further treatment depends on whether vanadium is absent or present. If vanadium is absent, proceed as in the determination of phosphorus in plain carbon steel by the alkalimetric method (routine) in A33 (see 600.1, p. 10). If vanadium is present, proceed as in the determination of phosphorus in chrome-vanadium steel by the modified alkalimetric method (routine), given above.

Determination of Sulphur by the Gravimetric Method

SOLUTIONS REQUIRED

(Dilute hydrochloric acid (1:10) and dilute hydrochloric acid (1:1) are the same as in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above. Cinchonine and cinchonine wash solution are the same as in the determination of tungsten in tungsten steel by the acid digestion-cinchonine method, given below.)

METHOD

Treat 5 g of the sample, in a 600 c c beaker or Erlenmeyer flask, with 75 c c of HNO_3 (specific

gravity 1.42) and heat gently. Certain steels react violently. In this event, do not heat but cool the vessel in cold water in order to prevent loss of incompletely oxidized sulphur. Some steels dissolve very slowly. In this case add 5 c c of HCl (specific gravity 1.19) in successive portions as the solution is digested on a steam bath. When the steel is dissolved, digest until the residue is bright yellow with no dark material, adding fresh portions of acid if necessary. Evaporate the solution to small volume, cool, add 30 c c of HCl (specific gravity 1.19), again evaporate to small volume and dilute with boiling water. Boil until soluble salts are in solution, filter, and wash the precipitate with dilute HCl (1:10), catching the filtrate and washings in a 600 c c casserole. Evaporate the solution to dryness, add 40 c c of HCl (specific gravity 1.19), and again evaporate to dryness and heat for 10 minutes at a temperature not to exceed 130°C . Treat the residue with 60 c c of dilute HCl (1:1), warm until soluble salts are in solution, dilute with 50 c c of boiling water, and add 10 c c of cinchonine solution. After standing in a warm place for several hours, preferably overnight, filter, and wash with cinchonine wash solution. Evaporate the filtrate and washings until a slight film begins to form upon the surface of the solution and proceed as in the determination of sulphur in plain carbon steel by the oxidation method. The results should be corrected by blanks on reagents carried through all of the steps of the process, paying particular attention to sulphur derived from the cinchonine solution.

Allowable error.—Percentages of sulphur determined by the above method should be accurate to $\pm (0.004 + (0.02 \times \text{the percentage of sulphur found}))$.

Determination of Silicon by Acid Attack and Baking at 120°C .

SOLUTIONS REQUIRED

(Dilute hydrochloric acid (1:10) and dilute hydrochloric acid (1:1) are the same as in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above. Dilute hydrochloric acid (5:95) same as in the determination of silicon by the nitro-sulphuric acid method in A64. See 601.20, p. 119.)

Dilute sulphuric acid (1:1).—Cautiously pour, with constant stirring, 500 c. c. of H_2SO_4 (specific gravity 1.84) into 500 c c of distilled water.

Sodium hydroxide (2 N).—Dissolve 80 g of NaOH in 1,000 c c of distilled water.

METHOD

Treat 2 g of the sample in a covered beaker with 50 c c of HCl (specific gravity 1.19) heat to incipient boiling and then when solution is complete add HNO_3 (specific gravity 1.42) at intervals and a few drops at a time until the vigorous action which ensues ceases. Digest until the tungstic acid is bright yellow. Add 100 c c of boiling water, boil for one minute, cool somewhat, and filter. Wash the residue thoroughly with dilute HCl (1:10) and set the precipitate aside. Evaporate the filtrate to dryness and bake for one hour at a temperature of 120°C . Take up in 15 c c of HCl (specific gravity 1.19) and bake again. Take up in 10 c c of dilute HCl (1:1) and 50 c c of hot water. Filter and wash with dilute HCl (5:95). Reserve the filtrate. Ignite the two residues and filter papers in an open deep-form platinum crucible at a temperature high enough to dehydrate the silica and weigh. Treat the residue with a few drops of dilute H_2SO_4 (1:1), a few cubic centimeters of hydrofluoric acid, and carefully evaporate to dryness. Ignite very cautiously (to avoid spattering) at a temperature not above

800° C. and weigh. The loss in weight is the weight of silica which multiplied by 0.4676 gives the weight of silicon.

Dissolve the ignited tungstic oxide in a slight excess of NaOH solution (2 N), boil, and filter off any residue. Wash the residue with hot water, dissolve it in a few cubic centimeters of hot dilute HCl (1:1), add the solution to the reserved filtrate and preserve the combined solutions for the determination of cobalt.

Allowable error.—Percentages of silicon determined by the above method should be accurate to $\pm (0.02 + (0.02 \times \text{the percentage of silicon found}))$.

Determination of Tungsten by the Acid Digestion-Cinchonine Method

SOLUTIONS REQUIRED

Cinchonine.—Dissolve 125 g of cinchonine in a mixture of 500 c c of HCl (specific gravity 1.19) and 500 c c of distilled water.

Cinchonine wash solution.—Dilute 30 c c of the above solution to 1 liter.

Ammonia-ammonium chloride.—Pour 200 c c of NH_4OH (specific gravity 0.90) into 790 c c of water and add 10 c c of HCl (specific gravity 1.19).

(Dilute hydrochloric acid (1:1) is the same as in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above.)

METHOD

Treat 2 g of the sample in a covered beaker with 50 c c of HCl (specific gravity 1.19), heat to incipient boiling and then when solution is complete, add HNO_3 (specific gravity 1.42) at intervals and a few drops at a time until the vigorous action which ensues ceases. Digest until the tungstic acid is bright yellow. Dilute to 150 c c, add 10 c c of cinchonine solution, and digest at a temperature of about 90° to 95° C. for 30 minutes or longer, with occasional stirring. Decant the clear solution on a paper and wash the beaker and the precipitate by decantation four times with 30 to 40 cc portions of the hot cinchonine wash solution, keeping as much of the precipitate as possible in the beaker. Place the beaker and precipitate under the funnel and dissolve the precipitate on the paper on the least possible amount of the ammonia-ammonium chloride solution. Wash the paper several times with hot water, once with hot dilute HCl (1:1), several more times with hot water, and finally with small portions of the ammonia-ammonium chloride wash. Reserve the paper. Warm the filtrate and add just enough NH_4OH (specific gravity 0.90) to dissolve the tungstic acid. Evaporate the solution until most of the ammonia has been expelled and then filter through the reserved paper into a 400 c c beaker. Wash the original beaker and the paper with small portions of hot water. Reserve the filtrate. The residue may contain a little tungsten, therefore treat it with successive small portions of hot dilute HCl (1:1), hot water, and ammonia-ammonium chloride solution. Render this solution slightly alkaline, boil to expel most of the ammonia, filter through the original paper and wash with a little hot water. Combine the ammoniacal filtrates. (The above treatments serve to remove any tantalum or columbium as well as iron and chromium and render unnecessary any purification of the final hydrofluoric acid-treated tungstic oxide.) Dilute the faintly ammoniacal filtrates to 200 c c, add 10 c c of HCl (specific gravity 1.19), and boil for 10 minutes. Add 10 c c of cinchonine solution and digest in a warm place for 15 to 30 minutes with occasional stirring. Add a little paper pulp, filter, and wash the precipitate with hot cinchonine wash solution. Add 5 c c of cinchonine to the filtrate and washings, set aside in a warm place for several

hours, and, in case any tungstic acid settles out, filter it off, wash, and add to the main precipitate. Ignite the tungstic acid under oxidizing conditions in a deep-form platinum crucible until the carbon is destroyed and finally at 800° to 900° C. Cool the crucible and contents, moisten the oxide with hydrofluoric acid, carefully evaporate to dryness, and then cautiously (to avoid spattering) ignite as before and weigh as WO_3 . Multiply by 0.7931 to obtain the weight of tungsten.

Allowable error.—Percentages of tungsten determined by the above method should be accurate to $\pm (0.05 + (0.01 \times \text{the percentage of tungsten found}))$.

NOTES.—1. Tungstic acid is incompletely precipitated by acid digestion alone of solutions containing appreciable amounts of alkali or ammonium salts, phosphorus, or molybdenum, and only slowly by cinchonine in such solutions.

2. Tungstic acid carries down phosphorus pentoxide if it is present in appreciable amount. The small amount present in the solution of the steel is not carried down in sufficient amount to affect the determination of tungsten.

3. Molybdenum is carried down by tungstic acid and must be recovered from the final weighed oxide as specified under the determination of molybdenum in molybdenum steel by precipitation as sulphide and weighing as lead molybdate ((b) presence of tungsten) and deducted as MoO_3 , given below.

Determination of Tungsten and Silicon by Digestion with Acids (Routine)

METHOD

(a) *Determination of silicon.*—Proceed exactly as in the determination of silicon above until the ignition of the tungstic and silicic acids. Then ignite in a weighed deep-form platinum crucible at a temperature of from 800° to 900° C. and under oxidizing conditions. Weigh, treat the residue with a few drops of dilute H_2SO_4 (1:1), and a few cubic centimeters of hydrofluoric acid, and carefully evaporate to dryness. Ignite very cautiously (to avoid spattering) at a temperature not above 800° to 900° C. and again weigh. The loss of weight represents silica which, multiplied by 0.4676, gives silicon.

(b) *Determination of tungsten.*—The weight of the residue left after the above treatment represents impure tungstic oxide. To correct for the impurities, cover the residue with about its weight of pure dry sodium carbonate and heat until thoroughly fused. Extract the cooled melt with hot water, filter, and wash the residue thoroughly with hot water. Ignite the residue in the original crucible, weigh, subtract the weight from the weight of the crucible and impure tungstic oxide, and multiply the corrected weight of WO_3 by 0.7931 to obtain tungsten.

Determination of Chromium by the Persulphate-Oxidation Method

See the determination of chromium in chrome-nickel steel by the persulphate-oxidation method, given above, in which will be found, under solutions required, certain references to A64.

Allowable error.—Percentages of chromium determined by the above method should be accurate to $\pm (0.01 + (0.02 \times \text{the percentage of chromium found}))$.

Determination of Vanadium by the Electrolytic Separation Method

See the determination of vanadium in chrome-vanadium steel by the electrolytic-separation method, given above, except for standard potassium permanganate, for which see the determination of manganese by the bismuthate method in A64. (See 601.20, p. 119.) Proceed exactly as in that method until the bicarbonate precipitate and paper have been dissolved in sulphuric and nitric acids and all of the nitric acid has been expelled. Cool the solution, dilute with three times as much water as there is sulphuric acid present, warm to dissolve the soluble salts, and filter through a small filter to

remove the tungstic acid. Wash the paper and precipitate with small portions of dilute H_2SO_4 (1:3). Nearly neutralize the filtrate with NH_4OH (specific gravity 0.90), evaporate, if necessary, to a volume of approximately 70 c c and proceed with the electrolysis of the weakly acid solution and the determination of vanadium as in the determination of vanadium in chrome-vanadium steel by the electrolytic separation method, given above.

Allowable error.—Percentages of vanadium determined by the above method should be accurate to $\pm(0.03 + (0.01 \times \text{the percentage of vanadium found}))$.

Determination of Vanadium by Reduction with Ferrous Sulphate and Titration with Permanganate (Routine)

SOLUTIONS REQUIRED

Dilute hydrochloric acid (2:1).—Mix 2 parts of HCl (specific gravity 1.19) with 1 part of water.

Dilute hydrochloric acid (1:9).—Mix 100 c c of HCl (specific gravity 1.19) and 900 c c of distilled water.

(Dilute nitric acid (specific gravity 1.20) is the same as in the determination of phosphorus by the molybdate-magnesia method in A33. See 600.1, p. 10.)

METHOD

(a) (When cobalt does not exceed 1 per cent).—Treat 2 g of the steel in a porcelain dish with 70 c c of dilute HCl (2:1) and heat until all action ceases. Cautiously add 10 c c of dilute HNO_3 (specific gravity 1.20) and evaporate the solution to dryness or to low bulk. Treat the residue with 45 c c of dilute HCl (2:1) and heat until the soluble portion dissolves. Add an equal volume of water, boil for three minutes, filter, and wash the residue thoroughly with dilute HCl (1:9) until free from iron. Evaporate the solution to small volume and destroy hydrochloric acid by small additions of nitric acid (specific gravity 1.42) followed by boiling. If a residue appears, filter the solution. From this point proceed for chromium as in the determination of chromium in chrome-nickel steel by the persulphate-oxidation method, given above, in which will be found, under solutions required, certain references to A64 (see 601.20, p. 119); and for vanadium as in the determination of vanadium in chrome-vanadium steel by reduction with ferrous sulphate and titration with permanganate method (routine), given above, in which will be found certain references to A64.

(b) (When cobalt exceeds 1 per cent).—See the determination of vanadium in chrome-vanadium steel by the electrolytic-separation method, given above, except for standard potassium permanganate, for which see the determination of manganese by the bismuthate method in A64. (See 601.20, p. 119.)

Proceed as described in that method until the bicarbonate precipitate has been washed with hot water. Return the paper and precipitate to the flask and add 60 c c of dilute HCl (2:1). Heat the solution, add 10 c c of HNO_3 (specific gravity 1.20), and evaporate the solution to dryness or to a small volume. Treat the residue with 45 c c of dilute HCl (2:1) and proceed as described above.

NOTES.—Tungsten interferes with the determination of vanadium by the above method and must be removed. While chromium can be determined in the presence of tungsten, it is conveniently determined in the same sample as is vanadium and the end point is easier to get when tungsten has been removed.

In case hydrochloric acid is present when silver nitrate is added, enough of the latter must be added to take care of this before the regular addition is made.

The pink color of cobalt interferes with the end-point readings. If under 1 per cent, the color does not seriously affect the results, if over this, it should be removed.

Determination of Nickel by the Gravimetric Dimethylglyoxime Method

SOLUTIONS REQUIRED

(Dilute hydrochloric acid (1:10) and dilute hydrochloric acid (1:1) are the same as in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above. Sodium hydroxide (2 N) is the same as in the determination of silicon in tungsten steel by acid attack and baking at $120^\circ C$., given above. Dimethylglyoxime (1 per cent) is the same as in the determination of nickel by the dimethylglyoxime method in A64. (See 601.20, p. 119.)

METHOD

Treat 2 g of the sample in a covered beaker with 50 c c of HCl (specific gravity 1.19), heat to incipient boiling, and then when solution is complete add HNO_3 (specific gravity 1.42) at intervals and a few drops at a time until the vigorous action which ensues ceases. Digest until the tungstic acid is bright yellow. Add 100 c c of boiling water, boil for one minute, cool somewhat, and filter. Wash the residue thoroughly with dilute HCl (1:10) and reserve the filtrate. Dissolve the tungstic acid in a slight excess of sodium hydroxide solution (2 N), boil, and filter off any residue. Wash the residue with hot water, discard the filtrate, and dissolve the residue in a few cubic centimeters of hot dilute HCl (1:1), add the solution to the main reserved filtrate and proceed with the determination of nickel as in the determination of nickel in nickel steel by the gravimetric dimethylglyoxime method, given above.

Allowable error.—Percentages of nickel determined by the above method should be accurate to $\pm(0.02 + (0.01 \times \text{the percentage of nickel found}))$.

NOTE.—It is difficult to precipitate nickel and to obtain it free from cobalt when cobalt is preponderant. Complete precipitation may be obtained by adding sufficient dimethylglyoxime to react with both cobalt and nickel and digesting for a longer period or by oxidizing the cobalt to the trivalent condition by means of $NaClO_2$ or $(NH_4)_2S_2O_8$ in ammoniacal solution before precipitating with dimethylglyoxime. In either case, the first precipitate should be filtered off, dissolved, and reprecipitated.

Direct weighing of nickel dimethylglyoxime is desirable when small amounts of nickel are concerned. Large precipitates are more conveniently ignited to red heat to NiO . In this case, care must be taken to prevent sublimation of the undecomposed salt. This may be accomplished by enclosing the wet paper and precipitate in one or two wet ashless papers and slowly igniting so that the papers char before taking fire. In this way the compound is decomposed and ignition may proceed at full red heat.

Determination of Nickel by the Cyanide Titration Method (Routine)

(The only solution required is dilute hydrochloric acid (1:10) which is the same as in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above.)

METHOD

Treat 2 g of the sample in a covered beaker with 50 c c of HCl (specific gravity 1.19), heat to incipient boiling, and then when solution is complete add HNO_3 (specific gravity 1.42) at intervals and a few drops at a time until the vigorous action which ensues ceases. Digest until the tungstic acid is bright yellow. Add 100 c c of boiling water, boil for one minute, cool somewhat and filter. Wash the residue thoroughly with dilute HCl (1:10) and determine nickel in the filtrate as in the determination of nickel in nickel steel by the cyanide titration method, given above.

NOTE.—In case cobalt is present, the preliminary separation (a) as given in the cyanide titration method must be employed.

Determination of Cobalt

SOLUTIONS REQUIRED

Sodium carbonate (10 per cent).—Dissolve 100 g of Na_2CO_3 in 1,000 c c of distilled water.

Ammonium acetate (5 per cent).—Dissolve 50 g of $\text{NH}_4\text{C}_2\text{H}_3\text{O}_2$ in 1,000 c c of distilled water.

Dilute hydrochloric acid (1 : 1).—(Same as in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above.)

Acidulated hydrogen sulphide water.—Mix 20 c c of H_2SO_4 (specific gravity 1.84) and 1,000 c c of distilled water, cool, and saturate with H_2S .

Nitroso beta naphthol (7 per cent).—Prepare as needed by dissolving in the proportion of 7 g of the compound to 100 c c of glacial acetic acid.

METHOD

See the determination of silicon in tungsten steel by the acid attack and baking at 120°C . method, given above.

Employ the HCl solution reserved in this determination or prepare a similar solution by treatment of a new 1 g sample in the same fashion, with the difference, however, that the wet tungstic acid is not ignited but treated directly with NaOH solution (2N) for the recovery of its cobalt content.

Evaporate the HCl solution to a volume of approximately 100 c c and neutralize the acid solution by adding solid Na_2CO_3 until the acid is nearly destroyed and then continuing with care by adding sodium carbonate solution (10 per cent), drop by drop with vigorous stirring, until the solution has become amber colored and the precipitate dissolves with difficulty. Pour the feebly acid solution slowly and with constant stirring into 200 c c of boiling ammonium acetate solution (5 per cent). Boil for two to three minutes, allow to settle, filter without washing on a large rapid filter, and reserve the filtrate which must be absolutely clear. Dissolve the precipitate in as little hot dilute (HCl 1 : 1) as possible, catching the solution in the unwashed beaker and reprecipitate as before, taking the same precautions as to preliminary neutralization and the volumes employed. Again filter without washing, discard the precipitate, and combine the filtrate with that already reserved. The combined filtrates should now be free from iron, chromium, and vanadium but may contain such elements as molybdenum, copper, and small amounts of tungsten in addition to cobalt, nickel, and manganese. To eliminate molybdenum and tungsten and to concentrate the others, neutralize the combined solutions with NH_4OH (specific gravity 0.90) add 30 c c in excess, and saturate the solution with a rapid current of H_2S . Allow the precipitate to settle, filter without washing, discard the clear filtrate, and transfer the paper and precipitate to a 250 c c Erlenmeyer flask. Dissolve any precipitate adhering to the precipitation beaker in 20 c c of HNO_3 (specific gravity 1.42) and a little HCl (specific gravity 1.19), pour the solution on the paper and precipitate and shake until the paper has disintegrated. Add 5 c c of H_2SO_4 (specific gravity 1.84) and heat over a free flame until fumes of H_2SO_4 are evolved. In case the organic matter has not been destroyed add a little more HNO_3 and repeat the HNO_3 treatment and the evaporation until fumes of H_2SO_4 appear. Cool, dilute to 100 c c, add 2 cc of NH_4OH (specific gravity 0.90), and saturate the acid solution with a rapid current of H_2S . Filter, wash with acidulated H_2S water, and discard the precipitate. Boil the filtrate until H_2S has been expelled and the solution reduced to a volume of 100 c c and then proceed as in (a) or (b) below.

(a) *Determination of cobalt by the electrolytic method.*—Add 5 c c of H_2SO_4 (specific gravity 1.84), neutralize with NH_4OH (specific gravity 0.90), add 35 c c in excess and then 2 g of NaHSO_3 . Electrolyze in a volume of 150 c c for six hours or overnight, using gauze electrodes and a current density of 0.2 to 0.3 ampere per dm^2 . Wash the cathode with cold water, dry at 100°C ., and weigh the deposit. The electrolyte usually contains from 0.1 to 1 mg of nickel and cobalt (mainly cobalt) and should be tested as follows: Boil the electrolyte with an excess of ammonium persulphate, keeping the solution strongly ammoniacal, to precipitate manganese. Filter, wash, and discard the precipitate and saturate the clear ammoniacal filtrate with H_2S . Digest at the side of the steam bath for one hour, filter if a precipitate has appeared and wash with water containing a little NH_4Cl and $(\text{NH}_4)_2\text{S}$. Ignite, weigh the combined oxides of nickel and cobalt, multiply by the empirical factor 0.75, and add to the cathode weight. The weight of cobalt must then be found by deducting nickel as determined on a separate portion of the steel or by analysis of the deposit and the small recovery from the electrolyte. In either case, attention must be paid to the difficulty in precipitating small amounts of nickel as pure nickel dimethylglyoxime in the presence of large amounts of cobalt, as described under the determination of nickel in nickel steel by the gravimetric dimethylglyoxime method, given above.

NOTE.—Tungsten, molybdenum, and vanadium must be completely removed in order to obtain a satisfactory deposition of nickel and cobalt.

(b) *Determination of cobalt by the nitroso-beta-naphthol method.*—Transfer the solution to a 600 c c beaker, add NH_4OH (specific gravity 0.90) until the solution is slightly ammoniacal and then HCl (specific gravity 1.19) until in 5 c c excess. Dilute to 350 c c heat to boiling, and for each centigram of cobalt expected add, with constant stirring, 6 c c of nitroso-beta-naphthol solution (7 per cent). Set aside until the precipitate has settled, filter on paper, and wash the precipitate twice, alternately with dilute HCl (1 : 1) and water, and finally with hot water. Transfer to a porcelain crucible, heat gently until the carbonaceous matter has been destroyed, and then at a high temperature for 20 minutes. Cool in a desiccator and weigh as Co_3O_4 .

Allowable error.—Percentages of cobalt determined by the above method should be accurate to $\pm(0.04 + (0.01 \times \text{the percentage of cobalt found}))$.

NOTES.—The ignited oxide does not have the exact formula Co_3O_4 and therefore in case the weight is appreciable it is safer to change the oxide to metallic cobalt by repeated ignition in hydrogen in a rose-form crucible until the weight is constant.

The precipitate is apt to be contaminated by nickel in case nickel is preponderant in the original solution.

Determination of Cobalt by Cyanide Titration (Routine)

SOLUTIONS REQUIRED

Dilute nitric acid (1 : 3).—Mix 200 c c of HNO_3 (specific gravity 1.42) and 600 c c of distilled water.

(Sulphuric-citric acid, potassium iodide (10 per cent), standard silver nitrate, and standard potassium cyanide, all identical with like solutions in determination of nickel in nickel steel by the cyanide titration method (routine), given above.)

METHOD

See the determination of silicon in tungsten steel by the acid attack and baking at 120°C ., given above. Then proceed as follows:

To the reserved HCl solution or one prepared in the same way from a new portion of steel, add 50 c c of the sulphuric-citric acid solution and then NH_4OH (specific gravity 0.90) until in 10 to 15 c c excess.

Bring the solution to boiling, add 1 g of NaClO_3 and boil for five minutes. Cool, dilute to 200 c c, add dilute HNO_3 (1:3), carefully, until the solution is just neutral and then add 5 c c of NH_4OH (specific gravity 0.90). Again cool if necessary, add 2 c c of potassium iodide solution (10 per cent) and titrate as in the determination of nickel in nickel steel by the cyanide titration method, given above. The volume of standard cyanide solution which is actually consumed represents the sum of nickel and cobalt. The volume of standard cyanide solution consumed by the nickel may be found and deducted by a determination of nickel as in the determination of nickel in tungsten steel by the cyanide titration method (routine), given above, with preliminary separation (a) or by calculation based on a determination of nickel as in the determination of nickel in tungsten steel by the gravimetric dimethylglyoxime method, given above. In either case, the volume of standard cyanide solution consumed by cobalt represents that required to convert cobalt to the compound $\text{K}_2\text{Co}(\text{CN})_5$ and the cobalt titre of the cyanide solution is best found by titration of material of known cobalt content under the conditions that obtain in the method.

Determination of Copper

In steels containing little tungsten, proceed as in the determination of copper in A64 (see 601.20, p. 119), substituting 10 g of steel for 10 g of iron and dissolving the cooled melt in HCl instead of dilute H_2SO_4 .

In steels containing considerable tungsten, proceed as in the determination of copper in A64 (making the substitutions noted above) with the single exception that the first sulphide precipitate and paper is digested with HNO_3 and H_2SO_4 to complete destruction of organic matter instead of igniting the paper and residue. The H_2SO_4 solution is then cooled, diluted, boiled with an excess of NaOH solution (2 N) and treated as in the ordinary procedure.

MOLYBDENUM STEEL

Determination of Carbon

See the determination of carbon in plain carbon steel by the direct-combustion method in A33 (600.1, p. 10) and also in sampling and chemical analysis of pig and cast iron in A64 (601.20, p. 119).

Determination of Manganese

(a) *Determination of manganese (absence of chromium and cobalt).*—(Same as determination of manganese by the bismuthate method (absence of cobalt) in A33 (see 600.1, p. 10), except in the following particulars:)

SOLUTIONS REQUIRED

(Dilute nitric acid (1:3), dilute nitric acid (3:97), ferrous ammonium sulphate solution, standard potassium permanganate solution, and standard sodium arsenite solution, all of which are the same as like solutions in the determination of manganese by the bismuthate method in A64. See 601.20, p. 119.)

METHOD

(*Ferrous sulphate-permanganate titration (less than 0.05 per cent chromium)*) (Same as in A64 (see 601.20, p. 119).)

Determination of manganese (presence of chromium and absence of cobalt).—(Same as determination of manganese by the hydrolysis-bismuthate method (absence of cobalt) in chrome-nickel steel, given above, except for ferrous ammonium sulphate and

standard potassium permanganate solution, which conform to the determination of manganese by the bismuthate method in A64. See 601.20, p. 119.)

Determination of manganese.—(Routine and in the presence of cobalt.)

SOLUTIONS REQUIRED

(Conforms to like solutions in the determination of manganese by the persulphate method in A64. See 601.20, p. 119.)

METHOD

(Conforms to the determination of manganese by the persulphate method (routine and in the presence of cobalt) in A33 (see 600.1, p. 10) wherein will be found certain references to A64.)

Determination of Phosphorus

(a) *Determination of phosphorus (absence of vanadium).*—See the determination of phosphorus in plain carbon steel by the molybdate-magnesia method in A33 (600.1, p. 10), except ammonium-molybdate solution, for which see B28 (646.0, p. 1243).

(b) *Determination of phosphorus (presence of vanadium).*

SOLUTIONS REQUIRED

(Same as in the determination of phosphorus by the molybdate-magnesia method in A33 (see 600.1, p. 10) except ammonium molybdate, which is the same as in the determination of phosphorus by the alkalimetric method in B28 (see 646.0, p. 1243) and the following additional item:)

Ferrous sulphate.—Dissolve 40 g of ferrous sulphate in 100 c c of distilled water that has been acidified with 1 c c of H_2SO_4 (specific gravity 1.84).

METHOD AND NOTES

(Same as in A33 (see 600.1, p. 10), except that after boiling to free from oxides of nitrogen, the solution is cooled to 15° to 20° C. (instead of to 80° C. as in A33) and then there are added 5 c c of the ferrous-sulphate solution and two or three drops of concentrated sulphurous acid.)

Allowable error.—(Same as in the determination of phosphorus in chrome-vanadium steel by the modified molybdate-magnesia method, given above.)

(c) *Determination of phosphorus (routine and in presence of vanadium).*

SOLUTIONS REQUIRED

(Dilute nitric acid (specific gravity 1.20), dilute nitric acid for washing (2:100), potassium permanganate (2.5 per cent), ammonium bisulphite (3 per cent), all are identical with the determination of phosphorus by the molybdate-magnesia method in A33. See 600.1, p. 10. Ammonium molybdate, potassium nitrate (1 per cent), phenolphthalein indicator, standard sodium hydroxide, and standard nitric acid, all are identical with the determination of phosphorus by the alkalimetric method in B28. (See 646.0, p. 1243. Ferrous sulphate solution is the same as given above, in (b).)

METHOD AND NOTES

(Same as in A33 (see 600.1, p. 10), except that after boiling to free from oxides of nitrogen, the solution is cooled to 15° to 20° C. (instead of to 80° C. as in A33) and then there are added 5 c c of the ferrous sulphate solution and two or three drops of concentrated sulphurous acid. Also omit here the notation reference to phosphomolybdate.)

(d) *Determination of phosphorus (routine in absence of vanadium).*

SOLUTIONS REQUIRED

(Dilute nitric acid (specific gravity 1.20), dilute nitric acid (2:100), potassium permanganate, and ammonium bisulphite, all are identical with the determination of phosphorus by the molybdate-magnesia method in A33. (See 600.1, p. 10.) Ammonium molybdate, potassium nitrate (1 per cent), phenolphthalein indicator, standard sodium hydroxide, and standard nitric acid all are identical with the determination of phosphorus by the alkalimetric method in B28. See 646.0, p. 1243.)

METHOD AND NOTES

(Same as in A33. See 600.1, p. 10.)

Determination of Sulphur

See the determination of sulphur in plain carbon steel by the oxidation method in A33 (600.1, p. 10).

See the determination of sulphur in plain carbon steel by the evolution-titration method (routine) in A33, in which will be found certain references to A64.

NOTES.—The ordinary evolution method yields low values with molybdenum steel. Good results are obtained on annealed samples with HCl (specific gravity 1.19).

Determination of Silicon

Determination of silicon by the nitrosulphuric method.

SOLUTIONS REQUIRED

(Nitrosulphuric acid same as in A33. See 600.1' p. 10. Dilute hydrochloric acid (5:95) same as in A64. See 601.20, p. 119.)

METHOD

(Identical with A64 (see 601.20, p. 119), except that 80 c c of the nitrosulphuric acid is added cautiously to 4.676 g of steel, and that the difference in weights in milligrams divided by 100 equals the percentage of silicon, instead of being divided by 50 as in A64.)

(Allowable error and note are the same as in A33. See 600.1, p. 10.)

Determination of silicon by the sulphuric acid method (optional).—(Identical with A64 (see 601.20, p. 119) except that here 2.338 g of steel is substituted for the 2.336 g of iron specified in A64.)

Determination of Molybdenum by Precipitation as Sulphide and Weighing as Lead Molybdate

SOLUTIONS REQUIRED

Bromine water.—A saturated solution.

Ammonium persulphate (10 per cent).—Prepare as needed by dissolving 1 g of the persulphate in 10 c c of distilled water.

Acidulated hydrogen sulphide water.—Pour 10 c c of sulphuric acid (specific gravity 1.84) into 1,000 c c of distilled water. Add 10 g of tartaric acid and saturate the solution with H₂S.

Ammonium acetate (50 per cent).—Dissolve 100 g of ammonium acetate in 100 c c of distilled water.

Lead acetate (1 per cent).—Dissolve 10 g of lead acetate in a mixture of 990 c c of distilled water and 10 c c of acetic acid. Filter if necessary.

Ammonium nitrate (2.5 per cent).—Dissolve 25 g of NH₄NO₃ in 1,000 c c of distilled water, filter if necessary, and make sure that the solution is neutral.

(Dilute sulphuric acid (1:1) and sodium hydroxide (2 N) are the same as in the determination of silicon in tungsten steel by acid attack and baking at 120°, given above. Dilute hydrochloric acid

(1:1) is the same as in the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above. Dilute hydrochloric acid (1:9) is the same as in the determination of vanadium in chrome-vanadium steel by reduction with ferrous sulphate and titration with permanganate, given above.)

METHOD

(a) *Determination of molybdenum (absence of tungsten).*—In an 800 c c beaker, dissolve a sufficient amount of the sample to yield approximately 0.03 g of molybdenum in a mixture of 100 c c of water and 50 c c of H₂SO₄ (1:1). When effervescence ceases, add 10 c c of ammonium persulphate solution (10 per cent), boil to oxidize molybdenum and part of the iron and cool somewhat. (Note 1.) Add 5 g of tartaric acid (note 2) nearly neutralize with NH₄OH (specific gravity 0.90) heat nearly to boiling and pass in H₂S rapidly for 10 minutes or until the iron has been reduced and the molybdenum precipitated. Allow the solution to stand on the steam bath at 50° to 60° C. for three hours, filter and wash the sulphur and sulphides with acidulated hydrogen sulphide water. Treat the sulphides as below. Boil the filtrate to expel hydrogen sulphide, and until the volume is reduced to from 400 to 500 c c. Add 10 c c of ammonium persulphate solution (10 per cent), boil, and again precipitate with H₂S as above in order to recover any molybdenum which escaped the first precipitation. Wash the main precipitate and the recovered precipitate from the papers into a 400 c c beaker and dissolve the part remaining on the papers in 20 c c of hot dilute HCl (1:1) and bromine water, the solution being received in the 400 c c beaker. Finally wash the papers with a little water and ignite them with the paper reserved below. Dilute the solution to 100 c c, add 20 c c of HCl (specific gravity 1.19) and 3 g of sodium chlorate and boil until the molybdenum sulphide is dissolved. Filter, wash the paper and residue with water, and reserve the filtrate. Ignite the papers and residues at a very low temperature in a deep-form crucible (to avoid volatilization loss of any MoO₃), treat any residue with warm NaOH solution (2 N) and pour the solution into the main filtrate. Nearly neutralize the combined solutions with sodium hydroxide solution (2 N) and pour the clear yellow solution slowly and with stirring into 100 c c of boiling sodium hydroxide solution (2 N) contained in a 400 c c beaker. After the precipitate has settled, filter and wash thoroughly with hot water. Reserve the filtrate and dissolve the precipitate in hot dilute HCl (1:1) and re-precipitate with sodium hydroxide solution (2 N) as above. (Note 3.) Neutralize the combined filtrates with HCl (specific gravity 1.19), add 5 c c in excess and evaporate the solution to 250 c c. To the clear solution add 50 c c of ammonium acetate solution (50 per cent), heat to boiling and slowly add lead acetate solution (1 per cent) from a burette dropwise and with continual stirring, until in slight excess. This is usually shown by a clearing of the solution. At this point discontinue the addition of the acetate, boil the solution for two or three minutes while stirring, allow the precipitate to settle somewhat, and test the supernatant liquid with a few drops more of the acetate. When precipitation is complete, boil for 10 minutes, allow to settle and filter the supernatant liquid through an ashless filter. Wash three or four times by decantation with 75 c c portions of hot ammonium nitrate solution (2.5 per cent), and finally transfer and complete the washing of the precipitate on the paper. If the precipitate is large or much sulphate was present in the solution, it is advisable to dissolve the first precipitate in hot dilute HCl (1:1) and re-precipitate it as above in order to avoid undue contamination by

lead sulphate or sodium salts. The precipitate may be carefully ignited directly in a porcelain crucible under oxidizing conditions until the carbon is destroyed or else the paper and precipitate may be dried at 100° C., the precipitate removed from the paper, and the paper carefully ignited separately before the ignition of the main precipitate. In either case the final ignition to PbMoO_4 should be at a very dull red heat. (Note 4.)

(b) *Determination of molybdenum (presence of tungsten).*—Treat the sample, in a 400 c c beaker, with 50 c c of dilute HCl (1:1), and when solution is complete add 10 c c of HNO_3 (specific gravity 1.42) to oxidize the iron and the tungsten. Digest until the tungstic acid is bright yellow, filter and wash with dilute HCl (1:9). Reserve the precipitate. Add 30 c c of dilute H_2SO_4 (1:1) to the filtrate, evaporate until fumes of H_2SO_4 appear, cool, and add 40 c c of water. If a light residue of tungstic acid separates, filter it off on a small filter, wash with a little dilute sulphuric acid, and treat it together with the main tungstic acid precipitate. Add 3 g of tartaric acid to the clear solution, nearly neutralize with NH_4OH (specific gravity 0.90), precipitate the molybdenum as sulphide in slightly acid solution and proceed as above. In order to recover the molybdenum which is always carried down by tungstic acid, dissolve the tungstic acid residues by pouring hot sodium hydroxide solution (2 *N*) upon them and finally wash the papers with a little hot dilute sulphuric acid. To the filtrate add 5 g of tartaric acid, make slightly acid with sulphuric acid, and precipitate as above with hydrogen sulphide. Any molybdenum recovered here is apt to be contaminated by tungsten and therefore the precipitate must be dissolved in a little HCl and bromine water as above, treated with 2 c c of H_2SO_4 (specific gravity 1.84) evaporated until fumes of H_2SO_4 appear, cooled and diluted with 6 c c of water. After warm digestion, filter off the dissolved molybdenum, wash with water containing a little H_2SO_4 , add the solution to the reserved major portion, and proceed as in method (a).

Allowable error.—Percentages of molybdenum determined by the above method should be accurate to $\pm (0.02 + (0.02 \times \text{the percentage of molybdenum found}))$.

NOTES.—1. Molybdenum is very slowly and incompletely precipitated by H_2S when in a reduced state.

2. Tartaric acid is necessary to prevent the partial precipitation of vanadium and tungsten by H_2S . These are the main interfering elements in any method for the determination of molybdenum.

3. The two sodium hydroxide precipitations are necessary to completely separate molybdenum from iron which would otherwise be precipitated upon boiling in dilute acetic acid solution.

4. PbMoO_4 is somewhat soluble in ammonium acetate solution, but this reagent is necessary to prevent contamination by PbSO_4 . If the solution contained no sulphates a more desirable method would consist in precipitating the molybdate in a hot, very dilute HNO_3 solution by means of $\text{Pb}(\text{NO}_3)_2$, and then, when the precipitate became granular, making the solution faintly alkaline with ammonia and faintly acid with acetic acid.

5. Molybdenum may also be satisfactorily determined by carefully igniting the sulphide to the oxide MoO_3 , weighing, and then correcting for iron and copper oxides or, by dissolving the sulphide in acid, freeing the solution from copper, arsenic, and iron, reducing in a Jones reductor containing ferric alum and phosphoric acid in the receiver, and titrating the reduced oxide (Mo_2O_3) to MoO_3 by means of a standard permanganate solution.

Determination of Molybdenum by Sodium Hydroxide Separation, Lead Molybdate Precipitation (Routine)

SOLUTIONS REQUIRED

Dilute hydrochloric acid (1:4).—Pour 200 c c of HCl (specific gravity 1.19) into 800 c c of distilled water.

Dilute hydrochloric acid (5:100).—Pour 50 c c of HCl (specific gravity 1.19) into 1,000 c c of distilled water.

(Sodium hydroxide (2 *N*) same as in the determination of silicon in tungsten steel by acid attack

and baking at 120° C., given above. Ammonium acetate (50 per cent) and lead acetate (1 per cent) are the same as in the determination of molybdenum by precipitation as sulphide and weighing as lead molybdate, given above.)

METHOD

Determination of molybdenum by sodium hydroxide separation, lead molybdate precipitation (absence of tungsten and vanadium).—Dissolve 2 g of the sample in 20 c c of HCl (specific gravity 1.19), oxidize with 5 c c of HNO_3 (specific gravity 1.42) and expel oxides of nitrogen. Add sodium hydroxide solution (2 *N*) until the excess of free acid is neutralized, taking care not to produce a red solution (dissolved hydrate) or a precipitate (basic molybdate). Heat the solution to boiling, and run the solution of the steel in rapid drops from a tap funnel into 160 c c of sodium hydroxide solution (2 *N*) with constant stirring of the mixture. Dilute the alkaline solution to exactly 500 c c, filter through a dry filter, discard the first few cubic centimeters, and then take exactly 250 c c of the filtrate. Neutralize the solution with HCl (specific gravity 1.19) add 5 c c in excess, boil, add 20 c c of ammonium acetate solution (50 per cent), and proceed as in the determination of molybdenum by precipitation as sulphide and weighing as lead molybdate, given above, omitting, however, a second precipitation of the lead molybdate.

NOTES.—The above process is of fairly general application. Manganese, nickel, cobalt, aluminum, and the ordinary elements of steel are without influence in the method. Chromium may be partially oxidized to chromate in the alkali treatment but can be reduced to the harmless trivalent condition by adding a few drops of sulphurous acid to the acid solution, prior to the molybdate precipitation. Tungsten and vanadium interfere. Vanadium is not easily removed but the interference of tungsten can be largely overcome by the modification of the method indicated in method (b).

Determination of molybdenum by sodium hydroxide separation, lead molybdate precipitation (presence of tungsten and absence of vanadium).—Dissolve 2 g of the sample in a covered beaker in 50 c c of HCl (specific gravity 1.19), heat to incipient boiling and digest on a hot plate at moderate heat. Add a few drops of HNO_3 (specific gravity 1.42), wait until the vigorous action ceases, and continue the dropwise addition of the acid until the vigorous action ceases. If this is carefully done, no tungstic acid separates at this stage. Next evaporate the liquid as quickly as possible until tungstic acid begins to separate, and then more slowly until the solution is pasty. Now add 50 c c of dilute HCl (1:4), boil, and set aside for at least 15 minutes. Filter through paper pulp, wash with dilute HCl (5:100) and treat the hydrochloric acid solution for molybdenum as above.

Determination of Molybdenum by the Colorimetric Method (Optional Routine) (Absence of Tungsten and High Vanadium or Copper)

SOLUTIONS REQUIRED

Dilute sulphuric acid (1:7).—Carefully mix 100 c c of H_2SO_4 (specific gravity 1.84) and 700 c c of distilled water.

Dilute nitric-sulphuric acid mixture.—Mix 833 c c of HNO_3 (specific gravity 1.20) and 167 c c of H_2SO_4 (1:1).

Sulphuric-hydrochloric acid mixture.—Mix 450 c c of H_2SO_4 (1:1), 100 c c of HCl (1:1), and 450 c c of distilled water.

Ferric sulphate.—Dissolve 70 g of ferric sulphate in a mixture of 120 c c of HCl (1:1), 500 c c of H_2SO_4 (1:1), and 380 c c of distilled water. Filter if necessary.

Chromic sulphate.—Dissolve 50 g of chromic potassium sulphate in 100 c c of H_2SO_4 (1:1), and 200

c c of water and heat until the purple color changes to green. Dilute to 1,000 c c.

Stannous chloride.—Dissolve 250 g of stannous chloride in 200 c c of HCl (specific gravity 1.19), and dilute to 1,000 c c with distilled water.

Standard molybdenum solution.—Weigh accurately such an amount of a standard ferro-molybdenum (preferably over 50 per cent molybdenum) as will represent exactly 0.5 g of molybdenum, and transfer the sample to a platinum dish. Add 20 c c of dilute HNO₃ (1:1), and a few cubic centimeters of hydrofluoric acid, warm until the alloy is dissolved and then add 20 c c of H₂SO₄ (1:1) and evaporate until fumes of H₂SO₄ appear. Cool, add 50 c c of water, boil until all salts are dissolved and then cool and transfer to a liter flask. Add 100 c c of H₂SO₄ (1:1) and dilute the solution to the mark.

Potassium thiocyanate (5 per cent).—Dissolve 50 g of KCNS in 1,000 c c of distilled water.

METHOD

Transfer 0.5 g of the steel to a 200 c c casserole, dissolve in 10 c c of the nitric-sulphuric mixture, and then evaporate until fumes of H₂SO₄ are evolved. Cool, add 30 c c of sulphuric-hydrochloric mixture and heat until the salts are in solution. Cool the solution, transfer to a comparison bath and place in a bath for further cooling. To another comparison tube add 25 c c of the ferric sulphate solution (0.5 g Fe), 1 c c of the chromic sulphate solution for each per cent of chromium present, and then 1 c c of the standard molybdenum solution for each 0.1 per cent of molybdenum expected. Cool both tubes to the same temperature and add to each from a burette 5 c c of potassium thiocyanate solution (5 per cent). Mix the solution in each tube, add 10 c c of the stannous chloride solution to each from a burette and well mix each solution for 10 seconds. With dilute H₂SO₄ (1:7), dilute the standard to some multiple of its molybdenum content and dilute the test until the colors match. The amounts of molybdenum are then directly proportional to the heights of the columns of liquids.

NOTES.—The above method is applicable to steels containing up to 0.5 per cent of molybdenum. Above this percentage the solution of the steel must be divided into aliquot portions and the iron and the hydrochloric acid in the standard varied accordingly.

If the analyst is dealing with steels of approximately the same composition, the iron, chromium (nickel) and molybdenum may be combined so that a single 25 c c portion is used as the standard.

The amount of hydrochloric acid must be regulated and be the same in the tests as excessive hydrochloric acid causes a fading of the color.

If the steel contains chromium in excess of 1 per cent, difficulty may be encountered in obtaining complete solution after the evaporation to the appearance of fumes of H₂SO₄. In this event, dissolve 0.5 g of the steel, contained in a 200 c c flask, in 15 c c of dilute H₂SO₄ (1:1), and 30 c c of distilled water. When solution is complete, add 15 c c of (NH₄)₂S₂O₈ solution (15 per cent) and boil, add 3 c c of dilute HCl (1:1), boil 10 minutes to expel the excess persulphate, and to reduce the volume to 30 c c preliminary to comparison. If any residue remains, add paper pulp, filter, reserve the filtrate, and transfer the paper and pulp to a 150 c c breaker and add 10 c c of HNO₃ (specific gravity 1.42), 5 g of sodium chlorate and 5 c c of H₂SO₄ (specific gravity 1.84). Evaporate to the appearance of copious fumes and repeat the treatment if the solution is not free from color due to organic matter. Cool and add to the reserved filtrate.

Determination of Copper

(Substantially the same as the determination of copper in A64. See 601.20, p. 119.)

Determination of Nickel

See determination of nickel in nickel steel by the gravimetric dimethylglyoxime method, given above, except in solutions required, where dimethylglyoxime is the same as in A64. (See 601.20, p. 119.)

See the determination of nickel in nickel steel by the cyanide titration method (routine), given above.

Determination of Chromium

SOLUTIONS REQUIRED

(Sulphuric-phosphoric acid mixture, silver nitrate (2.5 per cent), ammonium persulphate (15 per cent), sodium chloride (5 per cent), all are the same as in the determination of chromium in chrome-nickel steel by the persulphate oxidation method, given above. Dilute nitric acid (specific gravity 1.20) is the same as in the determination of manganese by the persulphate method in A64. See 601.20, p. 119. Standard ferrous sulphate and standard permanganate solution are the same as in the determination of manganese by the bismuthate method in A64. See 601.20, p. 119.)

METHOD

(Same as in the determination of chromium in chrome-nickel steel by the persulphate oxidation method, given above.)

Determination of Vanadium

See the determination of vanadium in chrome-vanadium steel by the electrolytic-separation method, given above, except for standard potassium permanganate in solutions required, for which see the determination of manganese by the bismuthate method in A64. (See 601.20, p. 119.)

Determination of Vanadium by Reduction with Ferrous Sulphate and Titration with Permanganate (Routine)

SOLUTIONS REQUIRED

(Sulphuric-phosphoric acid mixture, silver nitrate (2.5 per cent), ammonium persulphate (15 per cent), and sodium chloride (5 per cent), all are identical with the determination of chromium in chrome-nickel steel by the persulphate method, given above. Dilute nitric acid (1:1) is identical with the determination of manganese by the persulphate method in A64. See 601.20, p. 119. Standard ferrous sulphate and standard potassium permanganate are identical with the determination of manganese by the bismuthate method in A64. See 601.20, p. 119.)

METHOD

See the determination of chromium in chrome-nickel steel by the persulphate oxidation method, given above. Then turn to the determination of vanadium by reduction with ferrous sulphate and titration with permanganate (routine) under chrome-vanadium steel, given above.

Determination of Tungsten

See the determination of tungsten in tungsten steel by the acid digestion-einchonine method, given above, except for dilute hydrochloric acid (1:1), for which see the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above.

See the determination of tungsten in tungsten steel by the digestion with acids method (routine), given above.

Determination of Cobalt

SOLUTIONS REQUIRED

See the determination of cobalt in tungsten steel by the sulphide method, given above, except for dilute hydrochloric acid (1:1), for which see the determination of phosphorus in tungsten steel by the molybdate-magnesia method, given above.

METHOD

See the determination of silicon in tungsten steel by the acid attack and baking at 120° C. given above. Then turn to the determination of cobalt in tungsten steel by the sulphide method, given above.

Determination of Cobalt by Cyanide Titration (Routine)

SOLUTIONS REQUIRED

Dilute nitric acid (1:3) is identical with the determination of cobalt in tungsten steel by the cyanide titration method, given above. Sulphuric acid, potassium iodide (10 per cent), standard silver nitrate, and standard potassium cyanide, all are identical with like solutions in the determination of nickel in nickel steel by the cyanide titration method (routine), given above.

METHOD

See the determination of silicon in tungsten steel by the acid attack and baking at 120° C. given above. Then turn to the determination of cobalt in tungsten steel by the cyanide titration method, given above.

621.31 ALLOY STEEL BILLETS, BARS, AND RODS.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, HIGH CHROME STEEL RIVET MATERIAL AND RIVETS FOR NITRIC ACID TANK CARS, RECOMMENDED PRACTICE, 1929

HIGH CHROME STEEL RIVET MATERIAL

(In respect to process, chemical properties, ladle and check analyses, and method of pickling, this specification is identical with the A. R. A. specification for high chrome steel tank plates for nitric acid tank cars (see 621.32, p. 1124). In respect to inspection, rejection, and reheating it conforms to A. S. T. M. standard specifications for steel (see 605.0, p. 247). Otherwise it provides for the following requirements:)

PHYSICAL PROPERTIES AND TESTS

1. *Tension tests.*—Bars to be used for manufacture of rivets shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	60,000
Yield point.....	do.....	40,000
Elongation in 2 inches.....	per cent ..	25
Reduction of area.....	do.....	50

2. *Bend tests.*—(a) The test specimen shall stand being bent cold through 180° flat on itself without cracking on the outside of the bent portion; subject to approval of the inspector.

(b) *Oil quench bend tests.*—The specimen shall be heated to 1,400° F. and quenched in oil. These specimens shall stand bending 120° around a pin equal to diameter of the bar without cracking on the outside of the bent portion. Oil quench bend tests may be omitted at the discretion of the inspector.

3. Test specimens in section 2 shall be of the full diameter of the bars as rolled.

4. *Test specimens.*—Two tension, two cold bend, and two oil quench bend test specimens shall be selected from each annealing charge and stamped with an identification mark. Each test shall conform to the requirements specified in sections 1 and 2.

5. If any specimen fails to meet the condition of the test, another specimen may be selected. If this also fails to meet the conditions of the test, the heat may be rejected at the discretion of the inspector.

PERMISSIBLE VARIATIONS IN DIAMETER

6. *Permissible variations.*—The diameter of the finished rivet bars shall not vary from that specified by more than the amount given in the following table:

Diameter	Variations in diameter		Out of round
	Under	Over	
Up to ½ inch, inclusive.....	Inch 0.010	Inch 0.010	Inch 0.010
Over ½ to 1 inch, inclusive.....	0.010	.015	.015

FINISH

7. *Finish.*—The finished bars shall be free from seams, laps, slivers, etc., and shall have a work-man like finish.

MARKING

8. Rivet bars shall, when loaded for shipment, be properly separated and marked with the name or brand of the manufacturer and heat numbers, as well as an identification mark corresponding with the test as specified in section 4.

REQUIREMENTS FOR RIVETS

9. Rivets may be fabricated by either of the following methods unless one of them is specifically designated. No manufacturer may start the fabrication of rivets without first notifying the purchaser in sufficient time to enable his representative to be present.

(a) *Hot fabrication.*—The fabrication of rivets by this method shall be conducted in an indirect fired furnace whose temperature is uniform throughout, at a temperature not exceeding 1,400° F. Furnaces for the fabrication of rivets shall be provided with a pyrometric apparatus which has recently been tested and is in good working condition, in order to ascertain that the temperature of 1,400° F. is not being exceeded.

(b) *Cold fabrication.*—The fabrication of rivets by this method shall be conducted at a temperature not exceeding 250° F.

10. The shape of the rivet head shall be in accordance with the purchaser's design.

11. All rivets shall carry a distinguishing mark or symbol on the head to indicate that the material of which they are made is chromium steel, in order to avoid the possibility of the accidental substitution of carbon-steel rivets in the operations of fabrication.

PHYSICAL PROPERTIES AND TESTS

12. *Bend tests.*—The rivet shank shall stand being bent cold through 180° flat on itself without cracking on the outside of the bent portion, subject to the approval of the inspector.

13. *Flattening test.*—The rivet head shall flatten axially while hot (at the fabrication temperature specified above in section 9 (a)), to a diameter two and one-half times the diameter of the shank without cracking at the edges.

14. *Number of tests.*—Three bend and three flattening tests shall be made from each size in each lot of 500 rivets of less offered for inspection, each of which shall conform to the requirements specified.

PERMISSIBLE VARIATIONS IN DIAMETER

15. *Permissible variations.*—The diameter of finished rivets measured cold shall not vary from that specified more than the amounts given in the following table:

Diameter	Variations in snap gage measurement	Diameter, ring gage measurement
Up to 1 inch, inclusive	0.0156 inch under.	0.0156 inch above.

Snap gage measurements shall be made at the point of minimum diameter, but it is not required that the rivet shall turn completely in the gage. Measurements of the maximum tolerance shall be made with the ring gage, all rivets to slip full to the head in the gage of the required size for the various diameters.

16. The dimensions of the rivet head shall not vary from that specified for standard boiler rivets more than the amount given in the following table:

Diameter of rivets as ordered	Head tolerances	
	Width	Height
<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
1/2	+1/16 -1/32	+1/32
3/8	+1/16 -1/32	+1/32
1/4	+1/16 -1/32	+1/32
7/8	+1/16 -1/32	+1/32

WORKMANSHIP AND FINISH

17. *Finish.*—All rivets shall be true to form and concentric, shall be made in a workmanlike manner and shall be free from injurious defects.

18. *Bars and rivets, pickling.*—All bars and rivets are to be thoroughly pickled by the method referred to above (see A. R. A., 621.32, p. 1124).

19. When required, the manufacturer shall furnish the purchaser with a statement as to the analysis of each lot of bars or rivets, including the number shipped, and that the bars or rivets on this lot have been tested and have met all the requirements of these specifications.

(See 621.33, p. 1127.)

621.32 ALLOY-STEEL PLATES, SHEETS, AND STRIPS.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, HIGH CHROME STEEL TANK PLATES FOR NITRIC ACID TANK CARS, RECOMMENDED PRACTICE, 1929

STEEL TANK PLATES

PROCESS

1. The steel shall be made by the electric furnace process.

CHEMICAL PROPERTIES AND TESTS

2. The steel shall conform to the following requirements as to chemical composition:

Carbon, maximum	0.12
Manganese, maximum	.50
Phosphorus, maximum	.025
Sulphur, maximum	.025
Nickel, maximum	.40
Silicon, maximum	1.10
Chromium, minimum, unless otherwise specified	16.0

Analysis of each heat shall be made by the manufacturer for the determination of the elements mentioned above. The analysis shall be made from a test ingot taken during the pouring of the heat. The chemical composition thus determined shall be

1 For chromium 16 to 19 per cent.

reported to the purchaser or his representative, and shall conform to the requirements specified in section 2.

CHECK ANALYSES

3. Check analyses may be made by the purchaser from finished material representing each heat. The chemical composition thus determined shall conform to the requirements specified in section 2.

PHYSICAL PROPERTIES AND TESTS

4. *Bend test.*—Test specimens shall withstand bending cold around a pin, the diameter of which is equal to the thickness of the plate, 180° for specimens taken longitudinally and 120° for transverse specimens, without cracking on the outside of the bent portion.

5. *Test specimens.*—(a) Bend-test specimens for longitudinal bend tests, section 4, shall be taken longitudinally (in direction of rolling) from the long edge of the rolled plate.

(b) Bend-test specimens for transverse bend test, section 4, shall be taken transversely (normal to the direction of rolling) from the middle of the ends of the rolled plates.

(c) Bend-test specimens shall be of the full thickness of the material and shall be about 18 inches long by not less than 2 inches wide, and shall have machined edges.

6. *Number of tests.*—Three longitudinal and three transverse bend-test specimens shall be made for each annealing charge, one of which must be from each heat.

7. *Retests.*—If the results of the bend tests do not conform to the requirements specified in section 4, a retest of one additional pair of bend-test specimens from the same lot may be made, at the discretion of the inspector.

8. As bend tests can not be made on a finished, flanged, and dished head because tests of the material made previous to heating and bending would give no indication of its condition after fabrication, the only means to determine the condition of the metal in flanged and dished heads will be by comparison of the hardness of the finished head with the hardness of the satisfactory annealed plate, which has passed inspection. No manufacturer may flange and dish a head or do any hot operation upon a finished plate without first notifying the purchaser in sufficient time to have a representative present. Hardness will be measured by either Scleroscope or Brinell test, in as many places as required by the inspector, in which case the reading on the finished head should be within 10 per cent of either the Scleroscope or Brinell reading on the annealed plate.

PERMISSIBLE VARIATIONS IN THICKNESS

9. *Permissible variations.*—The thickness of each plate shall not vary more than 0.01 inch under that ordered; for plates one-fourth-inch thick and under the thickness shall not be more than 0.02 inch over that ordered, and for plates over one-fourth-inch thick, not more than 0.03 inch over that ordered. The thickness is to be measured not over 3 inches from the edge along the long edge of the plate.

FINISH

10. *Finish.*—(a) The finished material shall be free from pits, seams, splits, slivers, and other injurious defects, and shall have a workmanlike finish. Unless otherwise specified, all pits, seams, and slivers, which can be removed by spot grinding to a depth such as will not go below the minimum thickness as specified under section 9, shall not be classified as defects.

(b) If plates are to be finished by sand blasting, all pits, seams, and slivers which show up after sand

blasting, may be removed by spot grinding if in so doing the thickness of plate is not reduced below the minimum thickness as specified under section 9, above.

(c) All spot grinding to remove such defects shall be done in the presence of the inspector and acceptance or rejection shall be at his discretion.

11. *Pickling.*—All plates are to be thoroughly pickled by the method described below, or other approved method.

Method of pickling.—For the pickling of all high chrome material, made by any method of manufacture, in order to produce surfaces free from scale and as corrosive resistant as possible, the following procedure shall be carried out:

(a) The material shall first be immersed in a solution containing a mixture of not less than 10 per cent sulphuric acid, by weight, and not less than 10 per cent hydrochloric acid, by weight, and held there for approximately 30 minutes, depending on the condition of the material; the temperature of this solution should be approximately 110° F.

(b) At the end of the above period of time the material shall be well rinsed in water and immersed in a 10 per cent solution of nitric acid at approximately 110° F. for a sufficient period of time to thoroughly loosen all the remaining scale.

(c) The material shall then be thoroughly washed off with water, using a hose stream and a suitable brush.

MARKING

12. The name or brand of the manufacturer and the manufacturer's test identification number (including the heat number) shall be legibly stamped on each finished plate in two places not less than 12 inches from the edges. The manufacturer's test identification number shall be legibly stamped on each of the test specimens.

INSPECTION AND REJECTION

(Requirements covering inspection, rejection, and reheating conform to those specified in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR STRUCTURAL NICKEL STEEL, DESIGNATION A8-29, 1929

STRUCTURAL NICKEL STEEL

(See 621.33, p. 1127.)

621.33 STRUCTURAL SHAPES OF ALLOY STEELS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR STRUCTURAL NICKEL STEEL, DESIGNATION A8-29, 1929

STRUCTURAL NICKEL STEEL

(With a few exceptions, this specification is identical with A. S. T. M. A7 (see 605.11, p. 249). The exceptions are:)

1. *Discard*.—A sufficient discard shall be made from each ingot intended for eyebars to secure freedom from injurious piping and undue segregation.

2. *Chemical composition*.—The steel shall conform to the following requirements as to chemical composition:

	Structural steel (per cent)	Rivet steel (per cent)
Carbon.....	Not over 0.45.....	Not over 0.30.
Manganese.....	Not over 0.70.....	Not over 0.60.
Phosphorus:		
Acid.....	Not over 0.05.....	Not over 0.04.
Basic.....	Not over 0.04.....	Not over 0.03.
Sulphur.....	Not over 0.05.....	Not over 0.045.
Nickel.....	Not under 3.25.....	Not under 3.25.

3. *Check analyses*.—Analyses may be made by the purchaser from finished material representing each melt. The chemical composition thus determined shall conform to the requirements specified in section 2.

4. *Tension tests*.—The material shall conform to the following requirements as to tensile properties:

Properties considered	Rivet steel	Plates, shapes, and bars	Eyebar flats and rollers unannealed ^a	Eyebar flats ^b and pins ^a unannealed
Tensile strength.....lbs./in. ²	70,000-80,000	85,000-100,000	95,000-110,000	90,000-105,000
Yield point, minimum.....do.....	45,000	50,000	55,000	52,000
Elongation in 8 inches, minimum.....per cent.....	1,500,000	^c 1,500,000	^c 1,500,000	20
	Tensile strength	Tensile strength	Tensile strength	
Elongation in 2 inches, minimum.....do.....		18	16	20
Reduction of area, minimum.....do.....	40	25	25	35

^a Elongation shall be measured in 2 inches.

^b Tests of annealed specimens of eyebar flats shall be made for information only.

^c See modification in elongation.

5. *Modification in elongation*.—For plates, shapes and unannealed bars over 1 inch in thickness, a deduction from the percentage of elongation in 8 inches specified in section 4 of 0.25 per cent shall be made for each increase of one thirty-second inch of the specified thickness above 1 inch to a minimum of 14 per cent.

6. *Character of fracture*.—All broken tension-test specimens shall show either a silky or a very fine granular fracture, of uniform color, and free from coarse crystals.

7. *Bend tests*.—Bend-test specimens shall stand being bent cold through 180° without cracking on the outside of the bent portion as follows: For material three-fourths inch or under in thickness, around a pin the diameter of which is equal to the thickness of the specimen; and for material over three-fourths inch in thickness, around a pin the diameter of which is equal to twice the thickness of the specimen.

8. *Drift tests*.—Punched rivet holes pitched two diameters from a planed edge shall stand drifting until the diameter is enlarged 50 per cent, without cracking the metal.

9. *Tests of eyebars*.—Full-size tests of annealed eyebars shall conform to the following requirements as to tensile properties:

Tensile strength.....lbs./in. ²	85,000-100,000
Yield point, minimum.....do.....	48,000
Elongation in 18 feet, minimum.....per cent.....	10
Reduction of area, minimum.....do.....	30

10. The yield point shall be determined by the halt of the gage of the testing machine.

(For general requirements relating to yield point, number of tests, permissible variations in weight and thickness of material, finish, marking, inspection, rejection, and reheating, also test specimens Figures 128 and 129, see A. S. T. M. specifications for steel, 605.0, p. 247.)

(For tables of permissible variations of rectangular plates ordered to weight, and permissible over-weights of rectangular plates ordered to thickness, see A. A. S. M. Tables 1 and 2, 605.0, p. 248.)

(Requirements relating to process, ladle analysis, bend test for rivet steel, and test specimens are identical with those in A. S. T. M. A7 (see 605.11, p. 249), par. 2, 4, 7 (c), and 8 (a), (b), (c), (d), (e), (f), (g), (h), (i), and (j).)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR STRUCTURAL SILICON STEEL, DESIGNATION A94-29, 1929

STRUCTURAL SILICON STEEL

1. *Scope*.—These specifications cover a special high-strength structural steel intended primarily for use as main stress-carrying material of structural members.

2. *Process*.—The steel shall be made by the open-hearth process.

3. A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

4. *Chemical composition*.—The steel shall conform to the following requirements as to chemical composition:

	Ladle analysis (per cent)	Check analysis (per cent)
Carbon.....	Not over 0.40.....	Not over 0.44.
Phosphorus:		
Acid.....	Not over 0.06.....	Not over 0.075.
Basic.....	Not over 0.04.....	Not over 0.05.
Sulphur.....	Not over 0.05.....	Not over 0.063.
Silicon.....	Not under 0.20.....	Not under 0.18.

5. *Ladle analysis.*—An analysis of each melt shall be made by the manufacturer to determine the percentages of carbon, manganese, phosphorus, sulphur, and silicon. This analysis shall be made from a test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and the percentages of carbon, phosphorus, sulphur, and silicon shall conform to the requirements for ladle analysis specified in section 4.

6. *Check analysis.*—(Same as A8, above.)

7. (a) *Tension tests.*—The material shall conform to the following requirements as to tensile properties:

Final strength	lbs./in. ² ..	80,000-95,000
Yield point, minimum	do.....	45,000
Elongation in 8 inches, minimum	per cent ^a ..	1,500,000
Reduction of area, minimum	do.....	Tensile strength 30

(b) The yield point shall be determined by the drop of the beam of the testing machine when operated at a crosshead speed not greater than one-half inch per minute. The testing machine shall not be stopped to obtain the drop of the beam.

8. (a) *Modifications in elongation.*—For material over three-fourths inch in thickness, a deduction from the percentage of elongation specified in section 7 (a) of 0.25 per cent shall be made for each increase of one-sixteenth inch of the specified thickness above three-fourths inch, to a minimum of 14 per cent.

9. *Modifications of reduction in area.*—For material over three-fourths inch in thickness, a deduction from the percentage of reduction of area specified in section 7 (a) of 0.50 per cent shall be made for each increase of one-sixteenth inch of the specified thickness above three-fourths inch, to a minimum of 24 per cent.

10. *Bend tests.*—The test specimen shall stand being bent cold through 180° without cracking on the outside of the bent portion around a pin the diameter of which shall have the following relation to the thickness of the specimen:

Specimen thickness	Pin diameter
Up to 3/4 inch, inclusive.....	1 times the thickness.
Over 3/4 inch to 1 inch, inclusive.....	1 1/2 times the thickness.
Over 1 inch to 1 1/4 inches, inclusive.....	2 times the thickness.
Over 1 1/4 inches.....	2 1/2 times the thickness.

11. *Test specimens.*—(Paragraphs (a), (b), (c), (d), and (g) are identical with paragraphs 8 (a), (b), (d), (e), and (j) of A. S. T. M. A7 (see 605.11, p. 249.) except that reference to eyebar flats is omitted from paragraph (d) in this specification. For test specimen diagram, see A. S. T. M. specifications (605.0, p. 247). The remaining paragraphs of this section are as follows:

(e) Tension-test specimens for material over 1 inch in thickness or diameter may be machined to a thickness or diameter of at least three-fourths inch for a length of at least 9 inches.

(f) Bend-test specimens for material over 1/4 inches in thickness or diameter may be machined to a thickness or diameter of at least three-fourths inch, or to 1 by 1/2 inch in section.

(For general requirements relating to number of tests, permissible variations in weight and thickness of material, finish, marking, inspection, rejection, and reheating, see A. S. T. M. specifications (605.0, p. 247), except that two tension and one bend test shall be made from each melt, and reference to 2-inch specimens is omitted from paragraph 12 (c).)

(For tables of permissible variations of rectangular plates ordered to weight, and permissible over-

weights of rectangular plates ordered to thickness, see A. S. T. M. Tables 1 and 2, 605.0, p. 248.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR STRUCTURAL STEEL FOR LOCOMOTIVES AND CARS, A. S. T. M. DESIGNATION A113-29, 1929

COPPER STEEL FOR LOCOMOTIVES AND CARS

(See 605.13, p. 266.)

SOCIETY OF AUTOMOTIVE ENGINEERS, IRON AND STEEL SPECIFICATIONS, CHEMICAL COMPOSITIONS, JUNE, 1929

NICKEL STEELS

SOCIETY OF AUTOMOTIVE ENGINEERS, IRON AND STEEL SPECIFICATIONS, CHEMICAL COMPOSITIONS, JUNE, 1929

NICKEL-CHROMIUM STEELS

(See 621.31, p. 1124.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NICKEL STEEL, STRUCTURAL, No. 372, JANUARY 25, 1926. (CURRENT DESIGNATION: QQ-N-341)

STRUCTURAL NICKEL STEEL

GENERAL SPECIFICATIONS

1. United States Government general specifications for metals, Federal Specifications Board specifications No. 339a (current designation: QQ-M-151), in effect on date of issuance of proposals, shall form part of this specification. (See 600.0, p. 3.)

GRADES

2. Structural nickel steel shall be of the following grades: A, plates, shapes, and bars; B, rivet steel; and C, eyebars and rollers (annealed and unannealed).

NUMBER OF TESTS

3. Two tension and two bend tests shall be made from each melt, unless the finished material from a melt is less than 25 short tons, when one tension and one bend test shall be sufficient. If, however, material from one melt differs three-eighths inch or more in thickness, the thickest and thinnest material rolled shall be represented by one tension and one bend test, regardless of the weight of the melt.

4. Plates three-sixteenths inch or under in thickness shall not be subject to tension tests.

5. On all bars the tension-test specimens shall be taken when size permits so that the axis shall be at a point one-half the distance between the center and the surface of the bar.

(In respect to process of manufacture, test specimens, and bend tests this specification conforms to A. S. T. M. A7-24 (see 605.11, p. 249); in respect to workmanship, permissible variations, yield point, defective machining, percentage of elongation, packing and marking, it conforms to A. S. T. M.

^a See sec. 8.

^b See sec. 9.

specifications for metals (see 605.0, p. 247); in respect to chemical composition, check analysis, tension requirements, modification of elongation, character of fracture, and drift tests it conforms to A. S. T. M. A8-24 (see 621.33, p. 1126); in respect to permissible variation of plates ordered to weight, permissible overweight of plates ordered to thickness, and allowable variation in size of rivet bars it conforms to the Association of American Steel Manufacturers' standard specifications for structural and boiler steel (see 605.0, p. 248.)

621.34 ALLOY STEEL FOR SPRINGS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SILICO-MANGANESE-STEEL BARS FOR RAILWAY SPRINGS, DESIGNATION A59-27, 1927

BARS FOR RAILWAY SPRINGS

SCOPE

1. These specifications cover silicomanganese-steel bars to be used for the manufacture of railway springs.

MANUFACTURE

2. The steel shall be made by one or more of the following processes: Open-hearth, crucible, or electric furnace.

CHEMICAL PROPERTIES AND TESTS

3. The steel shall conform to the following requirements as to chemical composition:

Carbon.....	Per cent
Manganese.....	0.55-0.65
Silicon.....	.60-.90
Phosphorus, not over.....	1.80-2.20
Sulphur, not over.....	.045
	.015

LADLE AND CHECK ANALYSES

(Same as in American Railway Association specification for steel-tank plates. See 621.32, p. 1124.)

PERMISSIBLE VARIATIONS IN DIMENSIONS

(Identical with A. S. T. M. A14. See 603.33, p. 152.)

(Workmanship and finish, marking, inspection and rejection, and reheating conform to paragraphs 5, 6, 7, 8, and 9 in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CHROME-VANADIUM-STEEL BARS FOR RAILWAY SPRINGS, DESIGNATION A60-27, 1927

BARS FOR RAILWAY SPRINGS

SCOPE

1. These specifications cover chrome-vanadium-steel bars to be used for the manufacture of railway springs.

MANUFACTURE

2. The steel shall be made by one or more of the following processes: Open-hearth, crucible, or electric-furnace.

CHEMICAL PROPERTIES AND TESTS

3. The steel shall conform to the following requirements as to chemical composition:

Carbon.....	Per cent
Manganese.....	0.50-0.60
Chromium.....	.60-.90
Phosphorus, not over.....	.90-1.10
Sulphur, not over.....	.045
Vanadium, not under.....	.045
	.15

LADLE AND CHECK ANALYSES

(Same as in American Railway Association specification for steel tank plates. See 621.32, p. 1124.)

PERMISSIBLE VARIATIONS IN DIMENSIONS

(Identical with A. S. T. M. A14. See 603.33, p. 152.)

(Workmanship and finish, marking, inspection and rejection, and reheating conform to paragraphs 5, 6, 7, 8, and 9 in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

SOCIETY OF AUTOMOTIVE ENGINEERS, IRON AND STEEL SPECIFICATIONS, CHEMICAL COMPOSITIONS, JUNE, 1929

SILICOMANGANESE STEELS

(For prefatory remarks, see 600.0, p. 2; for specification details, see 600.1, p. 49.)

CHEMICAL COMPOSITION

[For silicon range see footnote 1]

S. A. E. steel No.	Carbon range	Manganese range	Phosphorus, maximum	Sulphur, maximum	Silicon range ¹
9250	Per cent 0.45-0.55	Per cent 0.60-0.90	Per cent 0.045	Per cent 0.05	Per cent 1.80-2.20
9260	.55-.65	.60-.90	.045	.05	1.80-2.20

¹ Silicon range of all S. A. E. basic open-hearth alloy steels shall be 0.15-0.30 per cent. For the electric and acid open-hearth steels the silicon content shall be a minimum of 0.15 per cent.

621.35 ALLOY STEEL FOR TOOLS.

AMERICAN RAILWAY ASSOCIATION, PURCHASES AND STORES DIVISION, STANDARDIZATION AND SIMPLIFICATION OF STORES STOCKS, D V1-238, 1930

HIGH-SPEED TOOL STEEL

(Recommended practice in stocking certain specified sizes of flat, square, and round high-speed tool steel.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR HIGH-SPEED TOOL STEEL, DESIGNATION A92-26, 1926

HIGH-SPEED TOOL STEEL

(Identical with A. S. T. M. A71-26 (see 603.32, p. 151) except in the following particulars:)

MANUFACTURE

The steel shall be furnished annealed unless otherwise specified. The microstructure, Brinell hardness, and fracture tests shall be as agreed upon between the purchaser and the vendor.

CHEMICAL COMPOSITION

The composition of the tool steels shall be as agreed upon by the purchaser and the vendor with the following permissible variations in composition:

	Permissible variations	
	Over	Under
Carbon.....	<i>Per cent</i> 0.05	<i>Per cent</i> 0.05
Manganese.....	.15	.15
Phosphorus.....	.01	-----
Sulphur.....	.01	-----
Silicon.....	.15	.15
Chromium.....	.50	.50
Vanadium.....	.25	.25
Tungsten.....	.75	.75
Cobalt.....	.50	.50
Other elements as agreed.		

In case of dispute, the chemical analysis shall be made in accordance with the standard methods of chemical analysis of alloy steels. See A. S. T. M. A55 (621.30, p. 1107).

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALLOY TOOL STEEL, DESIGNATION A115-28, 1928

ALLOY TOOL STEEL

(Identical with A. S. T. M. A71-26 (see 603.32, p. 151) except in the following particulars:)

SCOPE

These specifications cover alloy tool steels, the composition of which shall be as agreed upon by the purchaser and the vendor, with the permissible variations in chemical composition specified below. These steels are suitable for the manufacture of special purpose tools.

MANUFACTURE

The steel shall be furnished annealed unless otherwise specified. The microstructure, Brinell hardness, and fracture tests shall be as agreed upon by the purchaser and the vendor.

CHEMICAL COMPOSITION

The composition of the tool steels shall be as agreed upon by the purchaser and the vendor with the following permissible variations in composition:

	Permissible variations	
	Over	Under
Carbon:	<i>Per cent</i>	<i>Per cent</i>
1.25 or under.....	0.05	0.05
Over 1.25.....	As agreed.	As agreed.
Manganese:		
1.00 or under.....	.10	.10
Over 1.00.....	As agreed.	As agreed.
Phosphorus.....	.005	-----
Sulphur.....	.005	-----
Silicon.....	.15	.15
Chromium:		
1.00 or under.....	.10	.10
Over 1.00 to 2.00, inclusive.....	.15	.15
Over 2.00.....	As agreed.	As agreed.
Vanadium:		
0.50 and under.....	.075	.075
Over 0.50 to 1.00, inclusive.....	.10	.10
Over 1.00.....	As agreed.	As agreed.
Tungsten:		
4.00 or under.....	.25	.25
Over 4.00.....	As agreed.	As agreed.
Other elements as agreed.		

In case of dispute, the chemical analysis shall be made in accordance with the standard methods of chemical analysis of alloy steels. See A. S. T. M. A55 (621.30, p. 1107).

SOCIETY OF AUTOMOTIVE ENGINEERS, IRON AND STEEL SPECIFICATIONS, CHEMICAL COMPOSITIONS, JUNE, 1929

CHROMIUM-VANADIUM STEELS

(See 621.31, p. 1124.)

SOCIETY OF AUTOMOTIVE ENGINEERS, IRON AND STEEL SPECIFICATIONS, CHEMICAL COMPOSITIONS, JUNE, 1929

TUNGSTEN STEELS

(For prefatory remarks, see 600.0, p. 2; for specification details, see 600.1, p. 49.)

CHEMICAL COMPOSITION

[For silicon range see footnote 1]

S. A. E. steel No.	Carbon range	Man-ganese, maximum	Phos-phorus, maximum	Sulphur maximum	Chro-mium range	Tungsten range
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
71360	0.50-0.70	0.30	0.035	0.04	3.00-4.00	12.00-15.00
71660	.50 .70	.30	.035	.04	3.00-4.00	15.00-18.00
7260	.50 .70	.30	.035	.04	0.50-1.00	1.50- 2.00

¹ Silicon range of all S. A. E. basic open-hearth alloy steels shall be 0.15-0.30 per cent. For the electric and acid open-hearth steels the silicon content shall be a minimum of 0.15 per cent.

621.36 ALLOY STEEL FOR MAGNETS.

(For methods of test for magnetic properties of iron and steel see A. S. T. M. specification A34-28, 600.1, p. 13. No nationally recognized specifications for alloy magnet steels themselves are available.)

622. MANUFACTURES OF ALLOY STEELS**622.1 BOLTS, ALLOY STEEL.**

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, RECOMMENDED SPECIFICATION FOR ALLOY-STEEL BOLTING MATERIAL FOR HIGH-TEMPERATURE SERVICE, SERIAL No. G101-25, 1925

STEEL PIPE FLANGES AND FLANGED FITTINGS

(See 607.4, p. 465.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR QUENCHED ALLOY-STEEL TRACK BOLTS, DESIGNATION A51-21, 1921

QUENCHED ALLOY-STEEL TRACK BOLTS

(See 606.4, p. 356.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALLOY-STEEL BOLTING MATERIAL FOR HIGH-TEMPERATURE SERVICE, DESIGNATION A96-31, 1931

ALLOY-STEEL BOLTING MATERIAL

1. (a) These specifications cover alloy-steel bolting material for pressure vessels, valves, flanges, and fittings for high-temperature service (see explanatory note in A. S. T. M. A95, 611.41, p. 709). The term "bolting material" as used in these specifications cover rolled, forged or cold-drawn bars, and bolts, screws, and studs.

(b) Three classes of material are covered, A, B, and C, classified in accordance with their physical properties as specified in section 10, choice depending upon design and upon the stresses and service for which the material is to be used.

(c) Nickel, chrome-nickel, chrome-vanadium, chrome-manganese or any other types of alloy steel approved by the purchaser may be submitted under these specifications.

(d) Carbon-steel nuts and washers for use with this bolting material are covered in section 16.

2. When agreed upon between the manufacturer and the purchaser, Brinell hardness tests may be made to determine the acceptance of bolting material in lieu of the tension tests herein specified; but shall not be used as a basis for rejection without confirming tension tests being made.

3. Unless otherwise specified on the order, a certification that bolts, screws, and studs for valves and other fittings intended for stock and other purposes requiring assembly in the manufacturer's plant conform to the requirements of these specifications, shall be accepted in lieu of the tests herein specified.

MANUFACTURE

4. The steel shall be made by one or more of the following processes: Open-hearth, electric furnace, or crucible.

5. A sufficient discard shall be made from each ingot to secure freedom from injurious piping and undue segregation.

6. (a) Heat treatment shall consist of quenching and tempering.

(b) Immediately after rolling or forging, the bolting material shall be allowed to cool to a temperature below the critical range under suitable conditions to prevent injury by too rapid cooling. For quenching and tempering, the material shall then be uniformly reheated to the proper temperature to refine the grain (a group thus reheated being known as a quenching charge) and quenched in some medium under substantially uniform conditions for each quenching charge. The material shall then be uniformly reheated to the proper temperature for tempering or "drawing back" (a group thus reheated being known as a tempering charge) and allowed to cool uniformly.

CHEMICAL PROPERTIES AND TESTS

7. (a) The steel shall conform to the following requirements as to chemical composition:

	Per cent
Phosphorus, not over.....	0.045
Sulphur, not over.....	.05

(b) The composition of the steel furnished under these specifications, other than phosphorus and sulphur, shall be agreed upon by the manufacturer and the purchaser.

NOTE.—It is recommended that the carbon content shall not be less than 0.20 nor more than 0.45 per cent, and that the carbon ranges shall be 0.10 per cent of carbon.

8. An analysis of each melt of steel shall be made by the steel manufacturer to determine the percentages of the elements present. This analysis shall be made from a test ingot taken during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in section 7.

9. Analyses may be made by the purchaser from samples representing the bolting material. The chemical composition thus determined shall conform to the requirements specified in section 7.

PHYSICAL PROPERTIES AND TESTS

10. (a) The bolting material, after final heat treatment, shall conform to the following requirements as to minimum tensile properties:

Diameter (inches)		Class A	Class B	Class C
2½ and under	Tensile strength.....lbs./in. ²	95,000	105,000	125,000
	Yield point.....do.....	70,000	80,000	105,000
	Elongation in 2 inches.....per cent.....	20	20	16
	Reduction of area.....do.....	50	50	50
Over 2½ to 4, inclusive	Tensile strength.....lbs./in. ²	90,000	100,000	115,000
	Yield point.....do.....	65,000	75,000	95,000
	Elongation in 2 inches.....per cent.....	20	20	16
	Reduction of area.....do.....	50	50	45
Over 4 to 7, inclusive	Tensile strength.....lbs./in. ²	90,000	100,000	110,000
	Yield point.....do.....	65,000	75,000	85,000
	Elongation in 2 inches.....per cent.....	20	20	16
	Reduction of area.....do.....	50	50	45

(b) The yield point shall be determined by the drop of the beam of the testing machine or by the use of dividers.

11. (a) When Brinell hardness tests are made, the bolting material, after final heat treatment, shall conform to the following requirements:

Class A.....	Brinell hardness No. 190-250
Class B.....	210-270
Class C.....	260-320

(b) The Brinell hardness test shall be made in accordance with the standard methods of Brinell hardness testing of metallic materials in A. S. T. M.: E 10 (See 600.1, p. 40).

12. (a) The tension-test specimens taken from the bolting material shall conform to the dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel (see 605.0, p. 247), except as specified in paragraph (b). The ends shall be of a form to fit the holders of the testing machine in such a way that the load shall be axial.

(b) In the case of small sections which will not permit of taking the standard tension-test specimen specified in paragraph (a), the tension-test specimen shall be as large as feasible and its dimensions shall be proportional to those shown in the standard-test specimen in Figure 129, 605.0, p. 247. The gage length for measuring elongation shall be four times the diameter of the specimen.

(c) Specimens for tension tests shall be taken longitudinally. For sizes under 1½ inches in diameter the full section shall be turned to conform to requirements specified in paragraph (a). For sizes 1½ inches and larger the specimens shall be taken halfway between the center and the surface.

13. (a) Except as specified in paragraph (b), one tension test shall be made for each lot of 100 pieces or less of bolting material from each tempering charge. If more than one quenching charge is represented in a tempering charge, one tension test shall be made from each lot of 100 pieces or less from each quenching charge. If more than one melt is represented in a quenching charge, one tension test shall be made from each lot of 100 pieces or less from each melt.

(b) Unless required on the order, tension tests shall not be made on an order of less than 100 bolts, screws, or studs; in which case acceptance shall be based upon the provisions in sections 2 or 3.

(c) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(d) If the percentage of elongation of any test specimen is less than that specified in section 10 (a) and any part of the fracture is outside of the middle three-fourths of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

14. If the results of the physical tests of any lot of bolting material do not conform to the requirements specified, the manufacturer may re-treat such lot one or more times and retests shall be made as specified in section 13 (a).

WORKMANSHIP AND FINISH

15. The bolting material shall be free from injurious defects and shall have a workmanlike finish.

16. Bolts and studs shall be equipped with semi-finished carbon-steel nuts of United States standard rough dimensions, chamfered and trimmed. If washers are used under nuts they shall be of forged or rolled steel. All nuts and washers shall be free from injurious defects and shall have a workmanlike finish. Nuts shall conform to the chemical requirements for phosphorus and sulphur as follows:

	Class A	Class B
Phosphorus, not over.....	Per cent 0.045	Per cent 0.05
Sulphur, not over.....	.05	.15

17. United States standard threads shall be used, except that no stud shall have less than eight threads per inch.

MARKING

18. Identification marks to be stamped on bolting material shall be agreed upon between the manufacturer and the purchaser.

INSPECTION AND REJECTION

(Conform to A. S. T. M. standard specifications for steel under 605.0, paragraphs 7 and 8, except that rejections based on tests shall be reported within 12 days instead of within 5 days, and that the following requirements are added:)

19. The purchaser may make the tests to govern the acceptance or rejection of the bolting material in his own laboratory or elsewhere. Such tests, however, shall be made at the expense of the purchaser.

20. Samples tested in accordance with section 19 which represent rejected bolting material, shall be preserved for two weeks from the date of the test report. In case of dissatisfaction with the results of the test, the manufacturer may make claim for a rehearing within that time.

TINGS, ALLOY STEEL.**

**AMERICAN RAILWAY ASSOCIATION, ME-
CHANICAL DIVISION, SEAMLESS HIGH
CHROME-STEEL TUBING FOR NITRIC-
ACID TANK CARS, RECOMMENDED
PRACTICE, 1929**

HIGH CHROME-STEEL TUBING

(In respect to process, chemical properties, ladle and check analyses, and method of pickling, this specification is identical with the A. R. A. specification for high chrome-steel tank plates for nitric-acid tank cars (see 621.32, p. 1124). The flaring tool and die block used in making flange tests is the same as that shown in A. S. T. M. B42-24 (see 642.23, p. 1182). In respect to inspection, rejection, and re-heating it conforms to A. S. T. M. standard speci-

fications for steel (see 605.0, p. 247). Otherwise it provides for the following requirements:)

PHYSICAL PROPERTIES AND TESTS

4. (a) For tubing to be used for heat exchanges and coolers, a test specimen not less than 4 inches in length shall have a flange turned over at right angles to the body of the tube without cracking or showing any flaws. This flange, measured from the outside of the tube, shall in no case be less than one-fourth inch nor more than one-half inch in width.

(b) For tubing which has been hot rolled, the inside may be reamed out, previous to testing, until the wall thickness is uniform.

(d) For all tubes, a test specimen 6 inches in length shall withstand flattening between parallel plates without cracking or showing any flaws until the distance between the plates is six times the wall thickness of the tube.

(e) For tubing 3 inches in diameter or under, a sufficient length of tubing shall stand being bent cold through 90° around a cylindrical mandrel, the diameter of which is five times the nominal diameter of the tube, without developing cracks or seams in any portion.

5. *Test specimens.*—(a) Test specimens shall be from the finished material. They shall be smooth on the ends and free from surface defects.

(b) All tests specified under section 4 for the several specimens shall be made cold; that is, at temperatures not exceeding 250° F.

6. *Number of tests.*—One of each of the physical tests specified in section 4 shall be made from each of two tubes in annealing charge, each lot of 250 tubes or less.

7. *Retests.*—If the results of the physical tests of only one tube from any lot do not conform to the requirements specified in section 6, retest of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified.

WORKMANSHIP AND FINISH

8. (a) Finished tubes 4 inches or under in outside diameter shall be circular within 0.02 inch and the mean outside diameter shall not vary more than 0.02 inch from the size ordered. For tubes over 4 inches in outside diameter these variations shall not exceed 0.5 per cent of the outside diameter.

(b) The thickness of the wall of the tubes shall not be less than the gage thickness specified by the purchaser, nor greater than that specified by more than three gages.

(c) The length shall not be less, but may be one-eighth inch more than that specified.

9. *Finish.*—Finished tubes shall be free from injurious or surface defects and distortion, shall have smooth ends, and shall have a workmanlike finish.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD DESIGN OF SOLID MANGANESE-STEEL CROSSINGS; STEAM RAILROAD OVER ELECTRIC RAILWAY FOR 7-INCH AND 9-INCH GIRDER RAILS, SERIAL NO. W29-27, 1927

MANGANESE-STEEL CROSSINGS

(Specifications for the general character and quality of the materials and workmanship entering into manganese-steel rail crossings are contained in

A. E. R. E. A. W32-30 (see 606.3, p. 335), including references in W32 to A. E. R. E. A. W33. The drawing accompanying W29 is identical with A. R. E. A. plan No. 780. An excerpt from this drawing is shown below as Figure 1065. Similar drawings covering rail braces, switches, switch stands, frogs, guard rails, crossings, gages and flangeways, double-slip switches, turnouts and crossovers, movable-point crossings, and track construction details will be found in a book of track-work plans published by the American Railway Engineering Association in collaboration with the Manganese Track Society.)

NOTES TO PLAN NO. 780

1. For external joints, bolts to be $1\frac{3}{8}$ inches diameter. For external arms on steam railroad, bolts to be $1\frac{1}{4}$ inches diameter for 9-inch rail, 1 inch diameter for 7-inch rail. For external arms on electric railway, bolts to be 1 inch diameter. All bolts to be high tensile steel.
2. Crossing may be furnished in four parts if so specified, with internal steam railroad joints as shown on plan No. 781.
3. For internal joints on electric railway, planed bar steel plates may be substituted for the splice bars shown in sections E-E. Bars to be $1\frac{1}{2}$ inches thick.
4. Mitered or lap joints may be used for internal joints on electric railway, similar to steam railroad joints on plan No. 781.
5. Portions of castings under intersections to be thoroughly and efficiently reinforced.
6. It is recommended that new rail be installed against all external arms of crossing.

MANGANESE-STEEL CROSSINGS

(Observations identical with those given above for A. E. R. E. A. No. W29-27, apply in this case, except that the drawing accompanying W30 is identical with A. R. E. A. plan No. 781. This plan No. 781 provides for crossings at angles below 60° to 40°.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD DESIGN OF SOLID MANGANESE-STEEL CROSSINGS; STEAM RAILROAD OVER ELECTRIC RAILWAY, W37-28, 1928

MANGANESE-STEEL CROSSINGS

(Observations identical with those given above for A. E. R. E. A. No. W29-27, apply in this case, except that the drawing accompanying W37 is identical with A. R. E. A. plan No. 776. This plan No. 776 provides for solid manganese-steel crossings at angles 90° to 60°, inclusive. No mention is made of girder rails as in A. E. R. E. A. W29.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, STANDARD DESIGN OF SOLID MANGANESE-STEEL CROSSINGS; STEAM RAILROAD OVER ELECTRIC RAILWAY, W38-28, 1928

MANGANESE-STEEL CROSSINGS

(Observations identical with those given above for A. E. R. E. A. No. W29-27, apply in this case, except that the drawing accompanying W38 is identical with A. R. E. A. plan No. 777. This plan No. 777 provides for solid manganese-steel crossings at angles below 60° to 40°, inclusive. No mention is made of girder rails as in A. E. R. E. A. W29.)

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, SPECIFICATION FOR MATERIALS FOR USE IN THE MANUFACTURE OF SPECIAL TRACK WORK, W104-28, 1928

[Approved as American tentative standard (E10-1929) by the American Standards Association, January 23, 1929]

SPECIAL TRACK-WORK MATERIALS

(See 606.3, p. 342.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, HIGH CHROME-STEEL CASTINGS FOR VALVES FOR NITRIC-ACID TANK CARS, RECOMMENDED PRACTICE, 1929

HIGH CHROME-STEEL CASTINGS

1. *Process*.—The steel shall be made by the electric furnace process.

CHEMICAL PROPERTIES AND TESTS

2. *Chemical properties*.—(a) The steel shall conform to the following requirements as to chemical composition:

	Per cent
Carbon, maximum	0.35
Manganese, maximum	.70
Phosphorus, maximum	.035
Sulphur, maximum	.035
Nickel, maximum	.40
Silicon, maximum	11.10
Chromium, minimum, unless otherwise specified	16.0

(b) Analysis of each heat shall be made by the manufacturer to determine the percentage of the elements specified in section 2 (a). This analysis shall be made from drillings taken at least one-quarter inch beneath the surface of a test ingot obtained during the pouring of the heat. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in section 2 (a).

3. *Check analyses*.—Check analysis may be made by the purchaser from broken test specimens or from a casting representing each heat. The chemical composition thus determined shall conform to the requirements specified in section 2. Drillings for analysis shall be taken not less than one-quarter inch beneath the surface, except in the case of cast-

¹ For chromium 16 to 19 per cent.

ings which are too thin and shall be taken in such manner as not to impair the usefulness of the casting.

HEAT TREATMENT

4. *Heat treatment.*—(a) All castings shall receive a heat treatment prior to shipment from the manufacturer's works. This heat treatment shall consist of a normalizing and drawing treatment according to the following:

(b) The procedure for normalizing shall consist in allowing the castings to cool, after pouring, to a temperature below the critical range. They shall then be heated to a proper temperature to refine the grain and allowed to cool freely in air.

(c) After normalizing, the castings shall receive a drawing treatment by heating to 1,450° to 1,500° F. and holding for a sufficient time for a thorough soaking, then cooling slowly in the furnace.

WORKMANSHIP AND FINISH

5. *Workmanship.*—(a) All castings shall be of good workmanship and of such dimensions as will comply with dimensions shown on blue prints after machining is finished.

(b) *Finish.*—The castings shall be free from injurious defects such as blowholes, scabs, and porosity. Castings which have been calked will be rejected. All castings shall be freed from scale by sand-blasting and acid pickle as required, and followed by nitric-acid dip.

6. *Porosity test.*—Unless otherwise specified on the drawings, all castings shall be subjected to a porosity test and each shall show no leakage or sweating under 150 pounds hydrostatic pressure.

INSPECTION AND REJECTION

(Inspection, rejection, and reheating conform to A. S. T. M. standard specifications for steel (see 605.0, p. 247) with the following additional provision:)

7. When required, the manufacturer shall furnish the purchaser with a statement as to the analysis of each lot of castings, including the number shipped, and that the castings on this lot have been tested and have met all the requirements of these specifications.

AMERICAN RAILWAY ENGINEERING ASSOCIATION AND MANGANESE TRACK SOCIETY, SPECIFICATIONS FOR SWITCHES, FROGS, CROSSINGS, AND GUARD RAILS, TRACK-WORK PLANS, 1929

TRACK WORK

(See A. R. E. A., 606.3, p. 349.)

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR AUSTENITIC MANGANESE-STEEL CASTINGS, DESIGNATION A128-30T, 1930

AUSTENITIC MANGANESE-STEEL CASTINGS

1. These specifications cover austenitic manganese-steel castings; this material is also often referred to as Hadfield's manganese steel.

MANUFACTURE

2. The steel shall be made by one or more of the following processes: Open-hearth, electric furnace, converter, or crucible.

3. The castings shall receive a suitable heat treatment to render them tough and ductile. This heat treatment shall consist of uniformly heating the castings to a temperature of at least 1,000° C. (1,832° F.), holding them at the maximum temperature until they are uniformly heated throughout, and quenching them in water.

CHEMICAL PROPERTIES AND TESTS

4. The steel shall conform to the following requirements as to chemical composition:

	Per cent
Carbon.....	1.00- 1.40
Manganese.....	10.00-14.00
Phosphorus, not over.....	0.10

5. An analysis of each melt of steel shall be made by the manufacturer to determine the percentages of the elements specified in section 4. This analysis shall be made from drillings taken at least one-quarter inch beneath the surface of a test ingot obtained during the pouring of the melt. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in section 4.

6. Analyses may be made by the purchaser on samples obtained from a casting. The samples for analyses shall be taken not less than one-quarter inch below the surface in the case of rough castings. In the case of castings finished by grinding or machining, the samples for analysis may be taken at the finished surface, provided at least one-quarter inch of metal has been removed from the casting at the point selected for sampling. The phosphorus content thus determined shall not exceed 0.11 per cent. The carbon content thus determined shall not be less than 0.90 per cent nor more than 1.50 per cent.

NOTE.—Contamination of the drillings by drill chips must be carefully guarded against. Flat drills of the best high-speed steels, or drills of some of the newer tool materials, will generally be satisfactory for drilling manganese steel. Manganese steel may be drilled best after it has been annealed for several hours at from 500° to 600° C.

PHYSICAL PROPERTIES AND TESTS

7. (a) Bend tests shall be required only when specified in the purchase order.

(b) When bend tests are specified, the test specimens shall stand being bent cold without breaking, around a pin 1 inch in diameter, to an angle of 150°. The bending may be by any method preferred by the manufacturer.

8. In the case of castings weighing not over 50 pounds, and if satisfactory to the manufacturer and inspector, a test to destruction may be made as an alternative to bend tests when the latter are specified. For this test the castings shall be grouped in lots, each lot containing castings from the same melt and from the same heat-treatment charge. From each such lot the inspector shall select one casting to represent the lot. The representative casting shall be tested to destruction by pressure or by blows. This test shall show the material to be tough and ductile, and suitable for the purpose intended. The cost of all such test castings shall be provided for in the purchase order.

9. (a) Bend-test specimens, when specified, shall not be cast attached to the castings, but shall be poured in separate molds, from the same heat or melt of steel as the castings they represent. They shall be ½ by ¾ inch in cross section and 12 inches in length, and shall be heat treated and tested without being machined or ground except when necessary to remove irregularities of surface, or to separate them from the runner or sprue through which they are poured.

(b) Bend-test specimens, when specified, shall be heat treated with the castings they represent. When

bend-test specimens are heat treated with castings of comparatively heavy section, the test bars should be protected from oxidation by inclosing them in pipes or containers containing a small amount of carbonaceous material, and suitably sealed or luted to prevent the furnace gases from coming in contact with the test bars. To permit the expansion of the gases within these containers, they should not be completely sealed.

10. (a) When bend tests are specified, one such test shall be made from each melt or heat of steel in each heat-treatment charge. When so specified by the purchaser, one bend test shall be made from the steel used for pouring each casting weighing 500 pounds or over.

(b) If any test specimen develops flaws and does not conform to the requirements specified, it shall be discarded, in which case another specimen from the same lot shall be substituted.

11. If the results of the bend tests for any lot do not conform to the requirements specified, such lot may be re-heat-treated, but not more than twice. Retests shall be made as specified in section 7 (b). In the case of re-heat-treatment and retest, when bend tests are specified in the order, two bend tests from a lot, or from each casting weighing 500 pounds or over, instead of one as specified in section 10 (a), shall be required, both of which shall conform to the requirements specified in section 7 (b).

WORKMANSHIP AND FINISH

12. The castings shall conform to the shapes and sizes indicated by the patterns and drawings submitted by the purchaser, with such tolerances as are customarily allowed in the case of parts not finished to exact dimensions by grinding or machining.

13. (a) The casting shall be free from injurious defects.

(b) Defects which do not impair the strength of the castings may be welded by an approved process. The defects shall be cleaned out to solid metal, before welding, and when so required by the inspector, shall be submitted to him in this condition for his approval. No welding shall be done except such as is approved by the inspector.

INSPECTION AND REJECTION

(Inspection, rejection, and reheating conform to the requirements in A. S. T. M. standard specifications for steel, paragraphs 7, 8, and 9. See 605.0, p. 247.)

622.6 ALLOY-STEEL FORGINGS.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, AXLES, SHAFTS, AND OTHER FORGINGS, ALLOY STEEL, QUENCHED AND TEMPERED, 1925

ALLOY-STEEL FORGINGS

SCOPE

These specifications cover the various classes of chrome-nickel and chrome-vanadium alloy steel forgings now commonly used in locomotive construction.

The purpose for which these classes are frequently used are as follows:

Class A.—Forgings for main and side rods, straps, and piston rods, and all other forgings which are to be machined with milling cutters or complicated forming tools, or where there is an abrupt change in section.

Class B.—Forgings for driving and trailer axles, crank pins, plain piston rods, crosshead pins, and other forgings not requiring the use of milling cutters or complicated forming tools.

MANUFACTURE

(Requirements covering manufacture are practically the same as for carbon-steel and alloy-steel forgings in A. S. T. M. A18-30 (see 611.51, p. 754), including the heat-treatment specified in paragraph 6 (b).)

CHEMICAL PROPERTIES AND TESTS

Chemical composition.—The steel shall conform to the following requirements as to chemical composition:

	Chromenickel	Chromevanadium
	<i>Per cent</i>	<i>Per cent</i>
Carbon.....	0.35-0.50	0.35-0.45
Manganese.....	.50-.80	.50-.80
Phosphorus, not over.....	.05	.05
Sulphur, not over.....	.05	.05
Chromium.....	.45-.75	.75-1.25
Nickel.....	1.00-1.50
Vanadium, not under.....15

(Ladle and check analyses are the same as in A. S. T. M. A18-30, with the addition of the following paragraph:)

In addition to the complete analysis a phosphorus determination may be made by the purchaser from each tension-test specimen, and this determination shall conform to the requirements for phosphorus specified in the table given above.

PHYSICAL PROPERTIES AND TESTS

Tension tests.—The forgings shall conform to the requirements as to tensile properties in Table 1.

TABLE 1.—For forgings whose maximum diameter or thickness is not over 10 inches when solid

CLASS A				
	Tensile strength	Elastic limit, minimum	Elongation in 2 inches, minimum	Reduction of area, minimum
Main and side rods, straps, piston rods.....	Lbs./in. ² 90,000 to 110,000	Lbs./in. ² 65,000	Per cent 20	Per cent 50
CLASS B				
Up to 7 inches diameter or thickness when solid, or 3½-inch maximum wall.....	100,000 to 120,000	75,000	20	50
7 to 10-inch diameter or thickness when solid, or 5-inch maximum wall.....	100,000 to 120,000	75,000	18	45

(Requirements covering classification of forgings by size, determination of elastic limit by means of the extensometer, time of testing forgings, tension and bend test specimens (including illustration), are practically the same as for carbon-steel and alloy steel forgings in A. S. T. M. A18-30. See 611.51, p. 754.)

Bend tests.—If specified by the purchaser, bend tests shall be made as follows:

(a) For forgings up to 7 inches in diameter or thickness when solid, 180° on a 1-inch flat mandrel having a rounded edge of ½-inch radius without cracking on the outside of the bent portion.

(b) For forgings 7 to 10 inches in diameter or thickness when solid or, 5-inch maximum wall, the

test specimen shall bend cold through 180° around a 1½-inch flat mandrel having a rounded edge of ¼-inch radius without cracking on the outside of the bent portion.

Proof test.—Unless otherwise specified by the purchaser, ail forgings shall be subjected to an impact proof test. The details of this test shall be agreed upon by the manufacturer and the purchaser.

Bend-test specimens shall be one-half inch square in section with corners rounded to a radius not over one-sixteenth inch and need not exceed 6 inches in length.

Number of tests.—(a) One tension, and if specified by the purchaser, one bend test shall be made from each tempering charge. If more than one quenching charge is represented in a tempering charge, one tension, and, if specified, one bend test shall be made from each quenching charge. If more than one melt is represented in a quenching charge, one tension and, if specified, one bend test shall be made from each melt.

(b) If more than one class of forgings by size is represented in any lot, one tension and, if specified, one bend test from a forging of each class by size shall be made as specified.

(c) If any test specimen shows defective machining or develops flaws, it may be discarded and another specimen substituted.

(d) If the percentage of elongation of any tension test specimen is less than that specified above and any part of the fracture is more than three-fourths inch from the center of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

Retests.—(a) If the fracture of any tension-test specimen shows over 15 per cent crystalline, a second test shall be made. If the fracture of the second specimen shows over 15 per cent crystalline, the forgings represented by such specimen shall be retempered or requenched and retempered.

(b) If the results of the physical tests of any lot do not conform to the requirements specified, the manufacturer may retemper or requench and retemper such lot, but not more than three additional times, unless authorized by the purchaser, and retests shall be made as specified above.

(Requirements covering workmanship and finish, marking, inspection and rejection, and reheating conform with those specified in A. S. T. M. standard specifications for steel, paragraphs 5, 6, 7, 8, and 9. See 605.0, p. 247).

Freight charges.—All rejected forgings will be returned to the manufacturer, who shall pay freight charge both ways.

ALLOY-STEEL FORGINGS

(Practically the same as the specification for alloy-steel forgings, quenched and tempered, of the American Railway Association, given above, in-

cluding references therein to A. S. T. M. A18-30, and standard specifications for steel in 605.0, pars. 5, 6, 7, 8, and 9, except that the percentage of phosphorus in basic steel should be not over 0.04. Also the requirements as to boring are the same as in A. S. T. M. A19-27. (See 611.52, p. 771.)

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR NORMALIZED AND TEMPERED ALLOY-STEEL FORGINGS FOR LOCOMOTIVES, DESIGNATION A133-31T, 1931

ALLOY-STEEL FORGINGS FOR LOCOMOTIVES

SCOPE

These specifications cover two classes of normalized and tempered alloy-steel forgings for use in locomotive construction. The characteristics of the two classes are as follows:

Class A.—Medium tensile strength with high yield point and high ductility.

Class B.—High tensile strength with considerable ductility.

MANUFACTURE

(Requirements covering process, discard, prolongation for tests, and boring are the same as for carbon-steel and alloy-steel forgings in A. S. T. M. A18-30. See 611.51, p. 754.)

HEAT TREATMENT

Cooling.—After forging, the objects shall be allowed to cool to a temperature below the critical range, under suitable conditions to prevent injury by too rapid cooling.

Normalizing.—For normalizing, the forgings shall be uniformly reheated to a proper temperature to refine the grain, and after being held a sufficient length of time at this temperature, shall be withdrawn from the furnace and allowed to cool uniformly in still air, protected from rain or snow, to a temperature below the critical range. A group of forgings thus heated shall be known as a normalizing charge.

Tempering.—For tempering, after normalizing as described in the preceding paragraph, the forgings shall be uniformly reheated to a temperature below the critical range, and after being held a proper time at this temperature shall be allowed to cool uniformly either in the furnace or in the atmosphere protected from rain or snow. A group of forgings thus treated shall be known as a tempering charge.

CHEMICAL PROPERTIES AND TESTS

The steel shall conform to the following requirements as to chemical composition:

Phosphorus, maximum.....	Per cent
Sulphur, maximum.....	0.045
	.050

The composition other than phosphorus and sulphur shall be agreed upon by the manufacturer and the purchaser.

NOTE.—Compositions which have been used successfully to give the physical properties specified below are as follows:

	Class A	Class B
	<i>Per cent</i>	
Carbon.....	0.20 to 0.30.....	0.42 to 0.57.
Manganese.....	0.80 to 1.00.....	0.70 to 0.95.
Silicon.....	Not less than 0.15.....	Not less than 0.15.
Nickel.....	2.50 to 3.00.....	Not over 0.25.
Chromium.....	Not over 0.40.....	Not over 0.40.
Vanadium.....	Not over 0.05.....	Not less than 0.15.

(Ladle and check analyses are the same as in A. S. T. M. A18-30, referred to above.)

PHYSICAL PROPERTIES AND TESTS

The forgings shall conform to the following minimum requirements as to tensile properties:

	Class A, not over 14 inches in diameter or thickness, 7-inch maximum wall	Class B, not over 14 inches in diameter or thickness, 7-inch maximum wall
Tensile strength.....Lbs./in. ²	80,000	90,000
Yield point.....do.....	¹ 0.67	¹ 0.62
Elongation in 2 inches.....per cent.....	28	22
Reduction of area.....do.....	56	42

¹ Of tensile strength.

The yield point shall be determined by the drop of the beam or halt in the gage of the testing machine. The speed of the testing machine shall be such that when running light the crosshead speed shall be not less than one-sixteenth inch nor more than one-eighth inch per minute.

Tests of forgings shall be made only after final treatment. If specified by the purchaser, bend tests shall be made as follows: The test specimen shall stand being bent cold through 180° around a pin one-half inch in diameter without cracking on the outside of the bent portion.

(Requirements covering test specimens, including illustration, are the same as in A. S. T. M. A18, referred to above. Requirements covering bend test specimens, number of tests, and retests are the same as in the American Railway Association specification for axles, shafts, and other forgings, alloy steel, quenched and tempered, given above, except that in this specification normalizing is substituted for quenching and tempering in the A. R. A. specification.) (Requirements covering workmanship and finish, marking, inspection and rejection, and re-heating conform to those specified in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, COMMERCIAL STANDARD FOR STEEL BONE PLATES AND SCREWS, CS37-31, NOVEMBER 16, 1931

STEEL BONE PLATES

(This commercial standard has been selected and accepted by industry and is promulgated by the Department of Commerce through the Bureau of Standards.)

SCOPE

1. This commercial standard covers the physical and metallurgical requirements, design, dimensions, workmanship, and finish of steel bone plates and screws available for use in the reduction of bone fractures, together with the packaging, identification, and certification of quality to buyers.

TYPE AND GRADE

2. Steel bone plates and screws shall be of the form known as the Sherman type. They shall be made in one grade only.

GENERAL REQUIREMENTS

3. *Workmanship and finish.*—Steel bone plates and screws shall be of good workmanship without apparent flaws or defects. They shall be thoroughly cleaned and polished smooth after tempering and then given a blued steel finish.

4. *Metallurgical requirements.*⁴—(a) The steel for both plates and screws shall be chromium-vanadium steel conforming to the following requirements as to chemical composition:

Carbon.....per cent.....	0.45-0.55
Manganese.....do.....	.50-.80
Chromium.....do.....	.80-1.10
Phosphorus.....not over, per cent.....	.040
Sulphur.....do.....	.045
Vanadium.....(not under, per cent.....	.18-.15
.....(desired, per cent.....	

(b) The plates and screws, after forming, shall be heat treated to a hardness of not less than 43 or more than 53, as determined by the Rockwell hardness tester using the C scale and the 150 kg load on the diamond cone penetrator.

DETAIL REQUIREMENTS

(a) Bone Plates

5. *Design.*—Bone plates shall conform to the Sherman design as shown in Figures 1066 and 1067,

⁴ These requirements are the same as for Society of Automotive Engineers steel 6150, according to 1931 S. A. E. handbook.

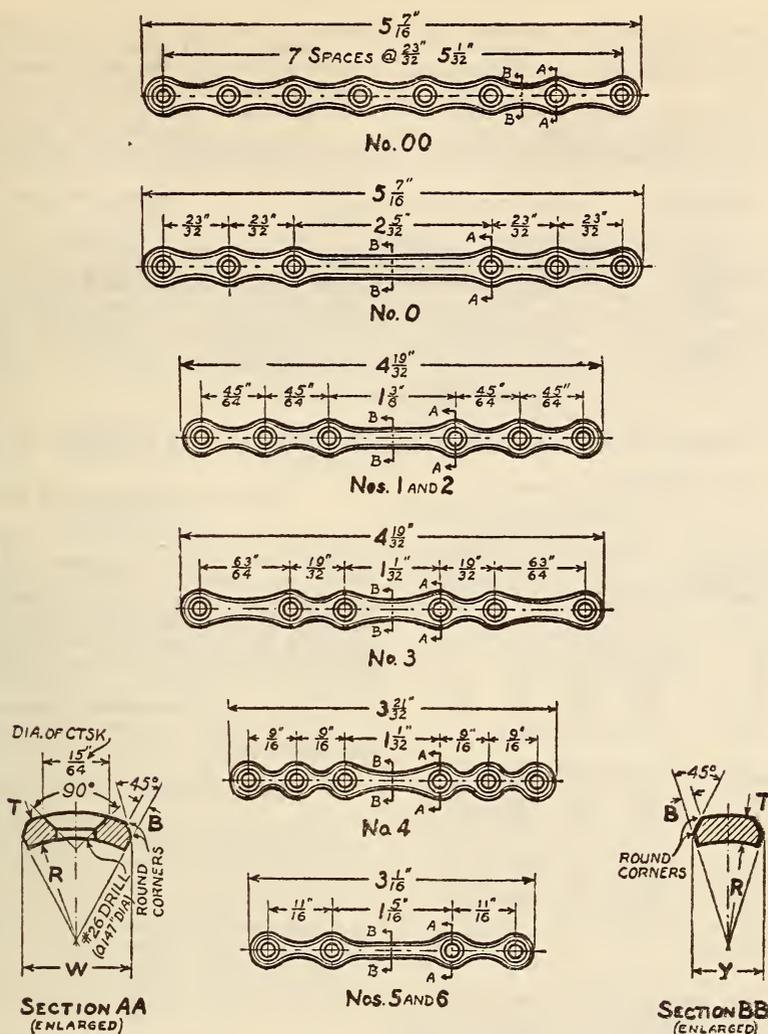

FIGURE 1066.—Curved bone plates

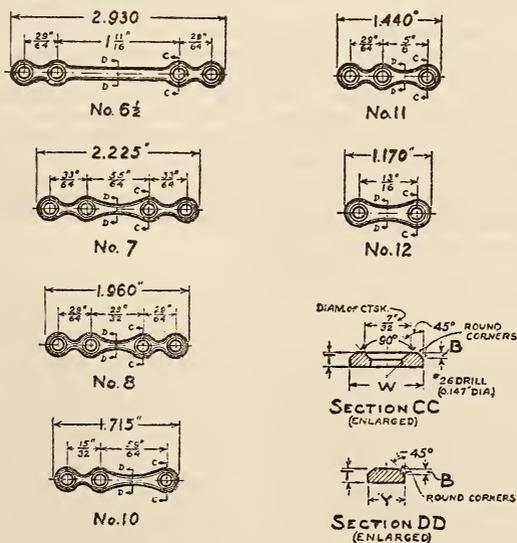

FIGURE 1067.—Flat bone plates

and shall be of good workmanship, provided with accurately drilled and countersunk screw holes. Screw holes in curved plates shall be countersunk after plate is curved.

6. *Sizes and dimensions.*—Bone plates shall be made in 14 sizes with dimensions and contour to conform with Table 1 and Figures 1066 and 1067.

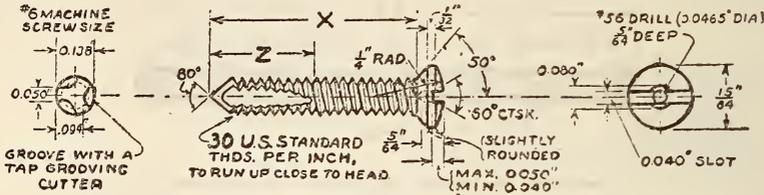

FIGURE 1068.—Self-tapping screw

7. *Tolerances.*—Tolerances are as given in Table 1.

TABLE 1.—Plates, sizes, and dimensions

No.	Total length ±1/16	Thick- ness (T) 1 ±0.015	Num- ber of holes	Width		Bevel (B) 1	Radius of cur- vature (R) 1
				W 1 ±0.015	Y 1 ±0.015		
00	Inches 5 7/16	Inch 0.085	8	Inch 0.406	Inch 0.260	Inch 3/64	3/8
0	5 7/16	.085	6	.406	.260	3/64	3/8
1	4 1/2	.085	6	.406	.215	3/64	3/8
2	4 1/2	.083	6	.406	.215	.041	3/8
3	4 1/2	.083	6	.406	.228	.041	3/8
4	3 1/2	.065	6	.375	.146	.025	3/8
5	3 1/6	.083	4	.375	.156	.041	3/8
6	3 1/6	.065	4	.375	.156	.025	3/8
6 1/2	2.930	.055	4	.336	.165	.025	Flat.
7	2.227	.065	4	.336	.125	.025	Flat.
8	1.960	.065	4	.336	.125	.025	Flat.
10	1.715	.065	3	.325	.112	.025	Flat.
11	1.440	.065	3	.360	.186	.025	Flat.
12	1.170	.065	2	.360	.186	.025	Flat.

1 See Figs. 1066 and 1067.

8. *Inspection and tests.*—Each plate shall be tested for hardness before sale or offering for sale as conforming to this specification. Hardness impressions shall be made as near the ends of the plate as practicable, and not in the mid section of any plate which is to be put into service

9. *Stamping.*—Each bone plate shall be stamped near an end with the name or trade-mark of the manufacturer and with the designation CS37-31, indicating conformity to this specification. No stamping shall be allowed on the mid section. Stamping shall not be so deep as to appreciably weaken the plate, and shall be done before hardening.

10. *Packaging.*—Each individual plate shall be sealed in a transparent envelope so that the seal or

envelope must be broken to remove the plate. The envelope shall bear a mark showing the size number of the plate contained therein.

11. *Guarantee label.*—Each envelope containing a plate shall bear a label worded as follows: "The ----- Co. certifies this steel bone plate to conform to all requirements of Commercial Stand-

ard CS37-31 issued by the U. S. Department of Commerce."

(b) Screws for Attaching Steel Bone Plates

12. *Material.*—The steel for screws shall be as specified in paragraph 4 (a), and shall be heat treated as specified in paragraph 4 (b).

13. *Design.*—Screws for attaching steel bone plates shall be of the Sherman self-tapping design, provided with accurately cut self-tapping flutes and center hole for use with special self-centering screw driver.

14. *Sizes and dimensions.*—Screws shall be made in 11 sizes with dimensions as shown in Table 2 and Figure 1068.

TABLE 2.—Screws, sizes, and dimensions

Size	Dimen- sion X	Dimen- sion Z	Size	Dimen- sion X	Dimen- sion Z
A	Inch 3/8	Inch 3/16	G	Inches 1 1/8	Inch 3/8
B	1/2	5/32	H	1 1/4	3/8
C	5/8	1 1/32	I	1 3/8	3/8
D	3/4	3/8	J	1 1/2	3/8
E	7/8	3/8	K	1 3/4	3/8
F	1	3/8			

15.—*Packaging.*—Screws shall be packaged in lots of 3 or 6 of one size, in transparent envelopes so sealed that the seal or envelope must be broken to remove screws. Each envelope containing screws shall bear a label stating the size and number of screws contained therein.

16. *Guarantee label.*—Each envelope containing screws shall bear a guarantee label worded as follows: "The ----- Co. certifies these screws to conform to all requirements of Commercial Standard CS37-31 issued by the U. S. Department of Commerce."

METALLOGRAPHIC TESTING OF NONFERROUS METALS

(See 600.1, p. 28.)

631. ALUMINUM

631.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE METHODS OF CHEMICAL ANALYSIS OF ALUMINUM AND LIGHT ALUMINUM ALLOYS, DESIGNATION B40-28T, 1928

CHEMICAL ANALYSIS OF ALUMINUM AND LIGHT ALUMINUM ALLOYS

The methods of analysis listed under "analysis of aluminum" contemplate the analysis of aluminum containing more than 98 per cent aluminum and containing only silicon, titanium, iron, copper, carbon, and traces of manganese as impurities.

Unless it is positively known that such elements as tin, antimony, zinc, lead, nickel, magnesium, sodium, nitrogen or oxygen (as aluminum oxide) are absent, the methods listed under the Analysis of Light Aluminum Alloys should be employed.

ANALYSIS OF ALUMINUM

(Not less than 98 per cent aluminum)

Determination of Silicon and Titanium

Determination of Total Silicon

SOLUTIONS REQUIRED

Acid mixture.—1,200 c c of H_2SO_4 (25 per cent by volume), 600 c c HCl (specific gravity 1.20) and 200 c c HNO_3 (specific gravity 1.42).

25 per cent sulphuric acid.—Pour 250 c c of H_2SO_4 (specific gravity 1.84) into distilled water, and dilute to 1,000 c c.

METHOD

Dissolve 1 g of the well-mixed sample in 35 c c of the acid mixture in a covered flat-bottomed porcelain dish or casserole. When the drillings are completely dissolved, boil the solution to complete expulsion of HNO_3 and HCl and heat until copious fumes of H_2SO_4 have been given off for five minutes. Cool and take up the residue with 10 c c of 25 per cent H_2SO_4 and 100 c c of water. Warm to complete solution of the sulphates and filter on an ashless filter paper. Wash the residue with hot water until free from sulphates and ignite in a platinum crucible. Fuse the residue with eight to ten times its weight of Na_2CO_3 and treat the fused mass in a casserole or beaker with 20 c c of H_2SO_4 (1:3), washing out the crucible. Evap-

orate the solution until it fumes strongly to separate the SiO_2 . Cool, dilute to about 100 c c, boil till the salts are dissolved, filter, wash well, ignite in a platinum crucible and weigh. Treat the ash with HF and a few drops of H_2SO_4 (1:3), carefully evaporate till dry, ignite and again weigh.

From the difference between the two weights deduct a blank obtained from the reagents and filter. The rest of the loss in weight represents SiO_2 corresponding to the Si in the metal.

$$SiO_2 \times 0.4672 = Si$$

NOTES.—Blanks should be carried along with all reagents and the proper corrections made.

In routine analysis, fusion of the first H_2SO_4 residue with sodium carbonate and subsequent treatment to the point of treating the ash with HF may be omitted. The first residue may be weighed and treated with HF , etc., as directed for the second H_2SO_4 residue. This, however, should not be done if the material contains much graphitic silicon or if the residue after ignition is dark colored.

Since there may be a slight loss of silicon in the filtrates from the silica filtrations, this amount should be recovered by repeated evaporations of the filtrates, for accurate work.

Determination of Titanium

APPARATUS AND SOLUTIONS REQUIRED

Nessler tubes or some form of colorimeter.

Hydrogen peroxide U. S. P.—This reagent must be free from HF .

Standard titanium solution.—This solution is best prepared and standardized as follows:⁵

"Potassium titanium fluoride, K_2TiF_6 , best serves as the starting point for the preparation of the standard solution. A quantity of this is recrystallized from boiling water one or more times, dried, and preserved in a glass-stoppered bottle. Enough of it to make 0.5 to 1 liter of the standard sulphate solution is put into a platinum dish and evaporated several times with strong sulphuric acid without bringing to dryness, till the fluorine is completely expelled. The residue is then taken up with water containing enough sulphuric acid to make at least 5 per cent of the latter when fully diluted. Two 50 to 100 c c portions of the prepared solution are then further diluted, boiled, and precipitated with ammonia. The precipitates are collected on paper, washed with hot water till free from alkali, ignited moist in the filter, blasted, and weighed. Duplicates should agree almost exactly. From the weights found, the strength of the standard is calculated and the result affixed to the bottle containing it. The stopper of the bottle should be coated with vaseline and the needed quantities of solution should be withdrawn by a pipette, never poured. In a solution so prepared there is not enough alkali sulphate to weaken the color when peroxidized."

METHOD

See determination of total silicon.

Fuse the nonvolatile residue remaining after the silicon determination in a small amount of $K_2S_2O_7$, take up in a little 5 per cent H_2SO_4 and add to the filtrates and washings from the silicon determination. Evaporate the solution to approximately 100 c c, and treat with 5 c c H_2SO_4 (specific gravity 1.84) and 3 g of iron-free zinc. Heat until the zinc

⁵ W. F. Hillebrand, The Analysis of Silicate and Carbonate Rocks. Bulletin No. 700, U. S. Geological Survey, p. 157.

is nearly dissolved and the reduction of copper is complete. Decant the solution into another beaker, wash the zinc and copper with hot water and continue the evaporation of the solution to approximately 75 c c. Cool and transfer to a 100 c c Nessler's comparison tube, add 5 c c of 3 per cent H_2O_2 and dilute to the 100 c c mark. In another tube, place 88 c H_2O , 5 c c of H_2SO_4 (specific gravity 1.84) and cool. Add 5 c c of 3 per cent H_2O_2 and then from a burette add the standard titanium solution until the colors match. The volume of the standard solution required multiplied by one hundred times its titer represents the percentage of titanium in the sample.

NOTES.—The filtrate and washings from the silicon determination should ordinarily be colorless. If light yellow owing to iron, the standard comparison solution should be brought to the same tint with ferric sulphate solution before adding the hydrogen peroxide.

In case the amount of titanium is high the solution may be diluted to a definite volume and aliquot portions taken for the colorimetric test.

Determination of Iron

SOLUTIONS REQUIRED

Acid mixture.—1,200 c c of H_2SO_4 (25 per cent by volume), 600 c c of HCl (specific gravity 1.20) and 200 c c of HNO_3 (specific gravity 1.42).

Tartaric acid solution.—Dissolve 20 g of tartaric acid crystals in 100 c c of distilled water.

Dilute ammonium sulphide solution.—Add 15 c c of NH_4OH (specific gravity 0.90) to 15 c c of distilled water and saturate with H_2S ; then dilute to 200 c c with distilled water. Use freshly made.

Dilute sulphuric acid solution for reductor (5 per cent).—Mix 50 c c of H_2SO_4 (specific gravity 1.84) and 1,000 c c of distilled water.

Standard potassium permanganate solution.—Dissolve 1 g $KMnO_4$ in 1,000 c c of H_2O , and allow to stand for several days in a glass-stoppered bottle in a dark closet. Filter the solution through prepared asbestos and standardize against 0.1000 g portions of pure sodium oxalate. Each cubic centimeter is equivalent to approximately 0.00177 g of iron.

METHOD

Dissolve 1 g of the well-mixed sample in 35 c c of the acid mixture and proceed as in determination of total silicon, until the first insoluble residue is ignited. Treat this with a little concentrated HNO_3 and HF to remove the silicon, then evaporate to dryness. Fuse the unvolatilized part with $K_2S_2O_7$, dissolve in a little H_2SO_4 (5 per cent) and add to the main solution. Saturate this solution with H_2S and filter. To the filtrate add 25 c c of the tartaric acid solution, and then with constant stirring, add NH_4OH (specific gravity 0.90), finally drop by drop, until it is in slight excess. Pass in H_2S for a few moments, warm somewhat and allow the solution to stand. Filter and wash the sulphide precipitate thoroughly with a freshly made dilute ammonium sulphide solution, until all tartaric acid is washed out.

Dissolve the sulphide precipitate through the filter paper with warm dilute H_2SO_4 (1:10), washing the paper thoroughly, alternately with hot distilled water and with 5 per cent H_2SO_4 , using in all about 100 c c. Boil until H_2S is expelled and add, while hot, a few drops of concentrated solution of $KMnO_4$ until a distinct pink color persists. Boil again, cool and pass the solution through the reductor. Wash the beaker and reductor with 150 c c of dilute H_2SO_4 for reductor and then with 100 c c of distilled water. Titrate with standard $KMnO_4$ solution.

NOTES.—Results of titration should be checked with a blank determination made on corresponding amounts of solutions used.

A small quantity of liquid should always be left in the reductor funnel and air should never be allowed to enter the body of the reductor.

For further details of the use of reductor see The Chemical Analysis of Iron, by A. S. Blair, or Quantitative Chemical Analysis, by H. P. Talbot.

The effect of tartaric acid is to form complexes with aluminum, vanadium, chromium, titanium, etc., preventing their precipitation as hydroxides.

Where the iron exists in very small quantities, a gravimetric method is preferable. In this case, double precipitation of iron sulphide is necessary to eliminate all aluminum. Dissolve the second sulphide precipitate in warm dilute H_2SO_4 (1:10), boil, and oxidize the iron with H_2O_2 . Add 3 to 4 g of NH_4Cl and then NH_4OH (specific gravity 0.90) in considerable excess, with stirring. Filter quickly, dry and ignite the precipitate, weighing as ferric oxide. If an accurate determination of iron is desired, it is necessary to correct for the small accumulation of silica by treatment of the ignited precipitate with H_2SO_4 (—) HF.

In adding the few drops of concentrated solution of $KMnO_4$ for oxidation, only a very slight excess is used. There may be precipitated a very slight amount of manganese oxide but this can be disregarded in passing the solution through the reductor.

Determination of Copper by Electrolytic Method

APPARATUS FOR ELECTROLYSIS

See the determination of copper by the electrolytic method in B27 (647.20, p. 1261).

SOLUTIONS REQUIRED

Sodium hydroxide solution.—Dissolve 250 g of NaOH in distilled water and dilute to 1,000 c c.

Nitric acid (1:1).—Pour 500 c c of HNO_3 (specific gravity 1.42) into distilled water and dilute to 1,000 c c.

METHOD

Dissolve 10 g of the sample in a large casserole or beaker with 150 c c of the NaOH solution.

This should be added in small portions as the action is vigorous for a time. After the action slackens, complete solution may be hastened by warming. When no evidence of further reaction can be seen, dilute to about 700 c c with water at the boiling temperature. Filter through a strong paper and wash.

Dissolve the residue from the paper with 25 c c of hot HNO_3 (1:1) into a beaker for electrolyzing, and wash the filter thoroughly with hot water. Boil to expel oxides of nitrogen, add 6 to 8 c c of H_2SO_4 (1:1), dilute to about 150 c c and electrolyze. Use a weighed sand-blasted cathode and a current of from 3 to 5 amperes at approximately 10 volts. When the solution is colorless and 1 c c of the solution gives no copper test with H_2S water on a porcelain plate, remove the solution from the electrodes quickly without interrupting the current. Quickly rinse the cathode in distilled water and then dip it in two successive baths of alcohol. Shake off the excess alcohol and ignite the remainder by bringing it to the flame of an alcohol lamp. Keep the cathode moving continually while the alcohol burns. Weigh as metallic copper.

NOTES.—The electrolytic method is preferred for the determination of copper no matter what the percentage.

It is not anticipated that the aluminum will contain tin. In case tin has been found it will be preferable to precipitate with hydrogen sulphide. The sulphides are then to be dissolved, digested in HNO_3 (1:1), the metastannic acid filtered off and the electrolysis then carried out.

A staining of the anode indicates the presence of lead or manganese. Copper, when present in small amounts, may also be determined by potassium cyanide titration. See standard methods of chemical analysis of alloys of lead, tin, antimony and copper B18(692.0, p. 1317).

If the electrolytically deposited copper is not bright in appearance, it should be dissolved from the cathode and redeposited from a sulphuric-nitric acid solution, the operation being carried through in the same way as in the first electrolysis.

Determination of Manganese

(a) *Persulphate method.*—(For samples containing under 1.5 per cent of manganese.)

SOLUTIONS REQUIRED

Acid mixture.—Pour 400 c c of H_2SO_4 (specific gravity 1.84) into distilled water, cool and add 400 c c of HNO_3 (specific gravity 1.42). Then dilute the mixture with distilled water to a total volume of 2,000 c c.

Silver nitrate.—Dissolve 1.33 g of $AgNO_3$ in 1,000 c c of distilled water.

Stock sodium arsenite solution.—To 15 g of arsenious oxide (As_2O_3) in 300 c c Erlenmeyer flask, add 45 g of Na_2CO_3 and 150 c c of distilled water. Heat the flask and contents on the steam bath until the As_2O_3 is dissolved. Cool the solution, filter and make up to 1,000 c c with distilled water.

Standard sodium arsenite solution.—Mix 200 c c of the stock sodium arsenite solution with 2,500 c c of distilled water, and standardize against a measured volume of a standard $KMnO_4$ solution that has been reduced and treated as in the method, or against a suitable standard metal or alloy of the United States Bureau of Standards. One cubic centimeter of this solution should be equivalent to approximately 0.00035 g of manganese.

Ammonium persulphate.—Dissolve 6 g of ammonium persulphate in 100 c c of distilled water. (This solution should be made up as needed as it deteriorates rapidly.)

METHOD

Use 1 g of the sample if the manganese is not over 0.2 per cent. For a higher manganese content adjust the size of sample so that it will not contain more than 0.002 g of manganese. Place it in a 250 c c Erlenmeyer flask with 30 c c of the acid mixture and heat until solution is complete. Boil until oxides of nitrogen are expelled. Dilute to 100 c c with boiling-hot water, add 20 c c of $AgNO_3$ solution and 30 c c of the persulphate solution, then remove to a moderately warm place to stand for a few minutes for complete development of the permanganic acid. Cool to below 25° C. and titrate with the standard sodium arsenite solution to the disappearance of the pink color.

NOTES.—Large amounts of permanganic acid are unstable; on that account samples which contain large amounts of manganese should have correspondingly small samples weighed out.

The ammonium persulphate must be tested for its strength. A good grade should contain about 95 per cent of $(NH_4)_2S_2O_8$; some lots contain no more than 25 per cent of the salt.

If it is desired, larger amounts of the sample can be used and correspondingly greater amounts of $AgNO_3$ and $(NH_4)_2S_2O_8$ (preferably in the form of stronger solutions).

(b) *Bismuthate method.*—(For samples containing less than 1.50 per cent manganese.) (Optional.)

SOLUTIONS REQUIRED

Acid mixture.—(Same as in (a), above.)

Nitric acid (1:3).—Pour 250 c c of HNO_3 (specific gravity 1.42) into distilled water and dilute to 1,000 c c.

Dilute nitric acid (3 per cent).—Pour 30 c c of HNO_3 (specific gravity 1.42) into distilled water and dilute to 1,000 c c.

Standard permanganate solution.—Dissolve 1 g of $KMnO_4$ in 1,000 c c of distilled water. Allow it to stand for at least one week and then filter through purified asbestos. Standardize against 0.1 g portions of pure sodium oxalate. One cubic centimeter of this solution should be equal to approximately 0.00035 g of manganese.

Standard ferrous ammonium sulphate solution.—Dissolve 12.4 g of ferrous ammonium sulphate crystals in 950 c c distilled water, and add 50 c c of H_2SO_4 (specific gravity 1.84).

METHOD

In a 250 c c Erlenmeyer flask, dissolve 1 g of the sample in 30 c c of acid mixture by warming on a water bath until solution is complete.

When solution is complete heat to expel all oxides of nitrogen and cool. Dilute with 50 c c of HNO_3 (1:3) and add 0.5 g sodium bismuthate. Heat for a few minutes until the purple color has disappeared with or without the precipitation of manganese dioxide. Add a little ferrous ammonium sulphate solution until the solution becomes clear and boil until the oxides of nitrogen are expelled. Cool, add an excess of sodium bismuthate and agitate for a few minutes. Add 50 c c of 3 per cent HNO_3 and filter through an aluminum crucible or an asbestos pad. Wash with 50 c c of 3 per cent HNO_3 . Add from a pipette or a burette 10 to 50 c c (depending on the amount of permanganic acid) of ferrous ammonium sulphate solution and titrate with the $KMnO_4$ solution.

In exactly the same manner carry through a blank determination using the same amounts of acid mixture, HNO_3 (1:3), and sodium bismuthate as was done with the regular sample. Finally, add the exact volume of ferrous ammonium sulphate solution employed and titrate with the $KMnO_4$ solution.

The difference between the volumes required in the two titrations represents the manganese in the sample, and the percentage is found by multiplying this volume by two hundred times the manganese titre of the permanganate solution.

NOTES.—Large amounts (above 0.01 g of manganese per 100 c c of solution) of permanganic acid are unstable; the method can be used with satisfaction for alloys containing high percentages of manganese by decreasing the size of the sample.

The filtrate from the bismuthate must be perfectly clear, as the least particle of bismuthate carried into the filtrate will vitiate the results.

The solution must be cold at time of filtration and titration. Instead of employing the method of reducing permanganic acid by means of standardized ferrous ammonium sulphate solution and titrating the excess of the reagent, it is possible to reduce the permanganic acid by standard sodium-arsenite solution. See determination of manganese by the persulphate method.

The sodium bismuthate reagent should be tested for manganese and used only if its absence is shown.

ANALYSIS OF LIGHT ALUMINUM ALLOYS

(a) ALLOYS CONTAINING 1 PER CENT OR LESS OF SILICON

Determination of Total Silicon

Proceed as described under determination of total silicon under analysis of aluminum.

NOTES.—In case $PbSO_4$ is present (as evidenced by a white crystalline precipitate quickly settling after stirring) the filtered residue must be washed free from the sulphate with hot dilute HCl (1:3). The final washing must be made with hot water.

If the alloy contains much tin an insoluble compound is apt to form on redissolving the sulphates after the first fuming for SiO_2 . To avoid this, thoroughly wet all the salts with H_2SO_4 (specific gravity 1.84) or HCl instead of dilute acid, before adding water.

Determination of Iron

Proceed as described under determination of iron under analysis of aluminum.

Determination of Copper by Electrolytic Method

APPARATUS AND SOLUTIONS REQUIRED

See the determination of copper by electrolytic method under analysis of aluminum.

METHOD

For copper contents up to 1 per cent proceed as described under determination of copper by electrolytic method under analysis of aluminum.

If the copper content is more than 1 per cent, dissolve a 1 g sample in a medium size beaker with 20 c c of the NaOH solution, warming after the reaction slakens. When no further action can be seen, dilute to 200 c c with hot water, filter and wash with hot water.

Dissolve the metallic residue from the paper into an electrolytic beaker with 10 c c of hot HNO₃ (1:1) followed by thorough washing. Add dilute H₂SO₄ equivalent to 2 c c of concentrated acid. Dilute to 150 c c. Electrolyze and finish as described under determination of copper by electrolytic method under analysis of aluminum.

Determination of Manganese

Proceed as described under determination of manganese under analysis of aluminum.

NOTE.—If the manganese content is over 2 per cent there is danger of precipitation at the peroxidizing stage. In that case a suitable aliquot of a new solution should be taken for developing the permanganate form.

Determination of Calcium and Magnesium

SOLUTIONS REQUIRED

Sodium hydroxide solution.—Same as in the determination of copper by electrolytic method under analysis of aluminum.

Sodium carbonate wash.—Dissolve 1 g of Na₂CO₃ in 100 c c of distilled water.

Hydrochloric acid (1:1).—Mix equal volumes of HCl (specific gravity 1.19) and distilled water.

Ammonium sulphide wash.—Take 10 c c of NH₄OH (specific gravity 0.90) dilute to 500 c c, add 10 g of NH₄Cl and saturate with H₂S.

Bromine water.—Place 20 to 30 c c of liquid bromine in a 500 c c bottle, fill with cold distilled water, and shake thoroughly. Be very careful to avoid contact of the bromine with the skin.

Ammonium oxalate solution.—Make a saturated solution by adding (NH₄)₂C₂O₄ in excess to distilled water.

Sulphuric acid (25 per cent).—See the determination of total silicon in analysis of aluminum.

Standard potassium permanganate.—See the determination of iron in analysis of aluminum.

Microcosmic salt solution.—Prepare a clear saturated solution as required.

Ammonium nitrate wash.—Mix 80 c c of HNO₃ (1:1) with 100 c c of NH₄OH and dilute to 1 liter.

METHOD

Dissolve 2 g of the sample in 35 c c of the NaOH solution, add about 0.5 g of Na₂CO₃. When dissolved, dilute to 250 c c with hot water filter, and wash five times with hot sodium carbonate wash. Dissolve the residue from the filter with 40 c c of hot HCl (1:1) and a few drops of HNO₃, receiving it in a beaker, and wash the filter. Neutralize this solution with NH₄OH and add from 2 to 5 c c in excess. Pass in H₂S for two or three minutes. Filter, and wash a few times with an ammonium sulphide wash.

Boil the filtrate vigorously to drive off (NH₄)₂S. When sulphur precipitates add a little bromine water and continue boiling until clear and the odor and color of bromine are gone. Add a drop or two of methyl red as indicator to the solution, then NH₄OH carefully till the yellow color appears. Boil for a minute, filter and wash. Add a few drops of NH₄OH, 10 c c of (NH₄)₂C₂O₄ solution and heat near boiling for 30 minutes, keeping ammoniacal. If a precipitate forms, filter through a small, close-textured paper, and wash eight times with small portions of hot water, reserving the filtrate for determining magnesium.

Return the filter to the precipitation beaker, add 130 c c of hot water and 20 c c of H₂SO₄ (25

per cent), then titrate with standard KMnO₄ solution. Deduct a determined blank.

The Na₂C₂O₄ value of the KMnO₄ multiplied by 0.2990 equals the calcium value.

The filtrate from the calcium determination, or the unfiltered solution if clear, is made just acid with HCl, and 20 to 30 c c of microcosmic salt solution added. Cool, and add NH₄OH drop by drop, stirring vigorously until a crystallin precipitate begins to form. Continue the very slow addition of NH₄OH with stirring until the precipitate no longer forms, and then add one-tenth the volume of NH₄OH (specific gravity 0.90) and let stand for at least three hours. Filter, and wash with a cold ammonium nitrate wash solution. Place in a weighed porcelain or vitreosil crucible and ignite at about 1,000° C. until completely white. Weigh as Mg₂P₂O₇ and deduct a blank.

NOTES.—If much Mg is present (over 1 per cent) some of it may be carried down with the sulphides. In that case, dissolve the precipitate with 10 c c of HCl (1:1), neutralize and add 2 c c in excess of NH₄OH, precipitate, and filter off the sulphides as before, then combine the filtrates.

If the alloy contains manganese the ignited phosphate should be dissolved and tested for manganese by the (a) persulphate method as described in the determination of manganese in the analysis of aluminum, deduction being made for pyrophosphate corresponding to the manganese found.

Determination of Zinc

(a) *Zinc oxide method.*—(For samples containing 1 per cent of zinc or less.)

SOLUTIONS REQUIRED

Hydrochloric acid (1:1).—Mix equal volumes of HCl (specific gravity 1.19) and distilled water.

Acid wash water.—Slowly stir 10 c c of H₂SO₄ (specific gravity 1.84) into 1,000 c c of distilled water, and saturate with H₂S.

Formic acid mixture.—Treat 200 c c of formic acid with 30 c c of NH₄OH (specific gravity 0.90) and dilute to 1,000 c c.

Formic acid wash water.—Mix 25 c c of formic acid mixture and 1,000 c c of distilled water and saturate with H₂S.

Hydrochloric acid (1:10).—Mix 100 c c of concentrated HCl and 1,000 c c of distilled water.

METHOD

Dissolve 2 g of the sample in a covered 400 c c beaker in 45 c c of HCl (1:1) added cautiously, followed by 1 c c of HNO₃ (specific gravity 1.42) toward the end of the reaction. Boil to complete the solution and to expel oxides of nitrogen. Dilute to 200 c c, precipitate with H₂S, filter, and wash with acid wash water. Boil thoroughly to expel H₂S.

Cool somewhat, add 10 g of citric acid, dilute to 300 c c, neutralize with NH₄OH using methyl red as indicator, then add 25 c c of the formic acid mixture. Heat nearly to boiling, and pass in a rapid stream of H₂S for 15 minutes. Filter through a close-textured paper set with a little of the liquid to be filtered. Refilter the first part if cloudy. Wash five times with the formic acid wash water. Dissolve the ZnS from the filter into the original beaker with hot HCl (1:10), washing thoroughly with hot water. Boil the solution to expel H₂S. Cool, add 1 g of citric acid and make just alkaline to methyl red with NH₄OH, dilute to 100 c c, heat, and pass in H₂S for three minutes. Add 10 c c of the formic acid mixture and continue the H₂S for five minutes more. Filter through a close-textured, ashless paper set with a little of the liquid to be filtered, and wash five times with the formic acid wash water. To avoid creeping of the precipitate

do not fill the paper too near to its top, and do not wet the funnel above the paper.

Ignite the paper and precipitate in a weighed porcelain or vitreous crucible, starting at a dull red heat and finishing at a moderate red. Cool, and weigh as ZnO. Deduct a determined blank.

NOTE.—By starting the second sulphide precipitation in the alkaline condition adherence of sulphide to the container is avoided.

(b) *Ferrocyanide method.*—(For samples containing over 1 per cent of zinc.)

SOLUTIONS REQUIRED

Ferrous sulphate indicator.—Dissolve 0.2 g of $\text{FeSO}_4 \cdot (\text{NH}_4)_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$ in 50 c c of distilled water. Prepare fresh, as required.

Standard potassium ferrocyanide solution.—Dissolve approximately 22 g of $\text{K}_4\text{Fe}(\text{CN})_6 \cdot 3\text{H}_2\text{O}$ per liter of distilled water. It is necessary for this solution to contain a small amount of ferricyanide for indicator purposes. If the solution can be allowed to stand for several weeks enough ferricyanide will be formed by oxidation. For immediate use add 0.15 g of $\text{K}_3\text{Fe}(\text{CN})_6$ per liter. The ferrocyanide known solution is standardized by titrating solutions containing known amounts of pure zinc, in accordance with the directions for titration given in this method.

METHOD

If the zinc content is between 1 and 3 per cent dissolve 2 g of the sample in 45 c c of the HCl. (1:1). If over 3 per cent dissolve 1 g of the sample in 25 c c of the HCl. Proceed as in (a) zinc oxide method until the first ZnS precipitate has been washed. Return this precipitate on its paper to the original beaker and add 20 c c of HCl (1:1). When the sulphide has dissolved, filter, and wash with hot water. Boil the solution containing the zinc to expel H_2S , cool, and wash down. Add two drops of methyl red solution (0.1 per cent), then neutralize with NH_4OH . Make the solution just acid again with HCl and add 3 c c of concentrated HCl in excess. Dilute to 200 c c and heat almost to boiling for titration.

Add five drops of the ferrous sulphate indicator then titrate with the standard potassium ferrocyanide solution. Shortly after starting, a blue color appears and obscures the methyl red. When the ferrocyanide has acted on all the zinc, the red tint reappears since the red is stronger than the light green which would otherwise show. Toward the end the standard solution should be added slowly, stirring vigorously after each addition. The end point is reached when an additional drop causes no visible change from blue to red.

Determination of Nickel by the Dimethylglyoxime Method

SOLUTIONS REQUIRED

Sulphuric acid (1:1).—Slowly stir 500 c c of H_2SO_4 (specific gravity 1.84) into distilled water, cool, and dilute to 1,000 c c.

Hydrogen sulphide wash water.—Slowly stir 10 c c of H_2SO_4 (specific gravity 1.84) into 1,000 c c of distilled water and saturate with H_2S .

Tartaric acid solution (20 per cent).—Dissolve 20 g of tartaric acid in distilled water, dilute to 100 c c and filter if necessary.

Dimethylglyoxime solution (1 per cent).—Dissolve 10 g of dimethylglyoxime in 1,000 c c of alcohol (95 per cent).

METHOD

Dissolve 1 g of the sample in 25 c c of H_2SO_4 (1:1) by warming and adding a drop or two of HNO_3 (specific gravity 1.42) occasionally until solution is complete. After oxides of nitrogen have been expelled by boiling, add 14 c c of NH_4OH (specific gravity 0.90) in order to bring down the acidity to approximately 5 c c of H_2SO_4 (specific gravity 1.84) per 100 c c of solution. Treat with H_2S . Filter off the sulphides, wash with hydrogen sulphide wash water and boil the filtrate until H_2S is expelled. Add a few crystals of $(\text{NH}_4)_2\text{S}_2\text{O}_8$ and boil thoroughly to destroy sulphur and oxidize iron. Add 20 c c of tartaric acid solution and make slightly ammoniacal. If no precipitate appears add HCl (specific gravity 1.19) to slight acidity. If a precipitate appears, dissolve in HCl, add 10 c c of tartaric acid and again make ammoniacal, repeating the operation, if necessary, to get a clear solution. To the weakly acid solution add dimethylglyoxime solution in such an amount that the ratio of the reagent to nickel is at least four to one. Heat the solution to boiling and make slightly ammoniacal. Allow to digest, while cooling, for two hours. Collect on a weighed Gooch crucible and wash thoroughly with hot water. Dry for 45 minutes at from 110° to 120° C. and weigh. The nickel dimethylglyoxime contains 20.32 per cent of nickel.

(b) ALLOYS CONTAINING OVER 1 PER CENT OF SILICON

Determination of Silicon

SOLUTIONS REQUIRED

See the determination of total silicon under the analysis of aluminum.

METHOD

If the silicon content is under 10 per cent use a 1 g sample and if a content of higher percentage is expected use an 0.5 g sample. Place the sample in a 350-c c casserole. Keeping covered as much as possible, cautiously add 35 c c of the acid mixture. When no further action can be seen evaporate to dryness, taking care to prevent spattering. Heat to strong fuming of SO_3 . Cool, moisten with 10 c c of H_2SO_4 (25 per cent), add 100 c c of hot water, and boil to dissolve the salts. Stir in some ashless paper pulp, then filter through a close-textured paper. Wash three or four times with hot water. Evaporate the filtrate to fumes, cool, dissolve with water, add paper pulp, filter, and wash as before.

Ignite the residues in a large platinum crucible. After cooling, add from 5 to 8 g (depending on the amount of residue) of Na_2CO_3 . Stir well and cover with a layer of Na_2CO_3 . Fuse cautiously till nearly quiet, then finish with a full Meker flame or its equivalent. Run the melt up the sides of the crucible, cool, and place in a casserole with 60 to 80 c c of H_2SO_4 (25 per cent). When the melt has dissolved remove the crucible, washing it into the casserole. Evaporate, and finally heat till heavy fumes are given off, then remove from the heat. When still moderately warm add a little cold water followed by 100 c c of hot water. Heat to complete solution of soluble salts, but avoid too long a treatment as the SiO_2 tends to redissolve. Filter the liquid, preferably after stirring in some paper pulp, and wash thoroughly with hot water.

Evaporate the filtrate and heat to fuming again to separate any silica which may have escaped the

first treatment. This is collected in the same manner as the main portion.

Dry the filters with contents, then ignite in a platinum crucible, cool, and weigh. Moisten with a few drops of H_2SO_4 (1:3) and add several cubic centimeters of HF. Evaporate until dry, ignite, cool, and weigh again. The loss in weight represents SiO_2 . After correcting for a determined blank multiply by 0.4672 to find the amount of Si in the sample taken.

NOTE.—In diluting the solution after the fuming which succeeds the fusion, adding a little cold water to the warm solution throws out the silica in a more granular form which is less soluble and more convenient to filter.

Determination of Iron

METHOD

Dissolve 1 g of the sample in the acid mixture and proceed as under determination of total silicon under analysis of aluminum till the first insoluble residue is ignited. Treat this with a little concentrated HNO_3 and HF to remove the silicon, then evaporate to dryness. Fuse the unvolatilized part with $K_2S_2O_7$, dissolve, and add to the main solution. From this point continue by the sulphide separation method as described under determination of iron under analysis of aluminum.

Determination of Copper

METHOD

Dissolve 5 g of the sample in a large casserole or beaker by adding, in small portions, 150 c c of the acid mixture used for starting the silicon determination. When the aluminum is dissolved, evaporate to dryness and heat until copious fumes of H_2SO_4 are given off, cool, dissolve by heating with 300 c c of water, filter, and wash a few times.

Ignite the dark residue in a platinum dish, add 10 c c of HNO_3 (specific gravity 1.42), 2 c c of H_2SO_4 (1:1), and then add HF drop by drop until the silicon has dissolved. Evaporate to fumes to remove the HF. Take up with water and add to the main filtrate.

Pass H_2S into this liquid for several minutes, and filter off the precipitated CuS , washing with 1 per cent H_2SO_4 saturated with H_2S . Ignite the precipitate in a porcelain crucible, cool, dissolve by heating with some HNO_3 (1:1), transfer to a suitable beaker and finish electrolytically as under determination of copper by electrolytic method under the analysis of aluminum.

Determination of Manganese

METHOD

Proceed as under determination of manganese, (a) persulphate method, under the analysis of aluminum, except that a few drops of HF should be added to remove the silicon when dissolving the sample. After the solution is complete boil a short time to remove most of the HF, then proceed as usual.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

ALUMINUM SAMPLE

(Sample No. 44b is a standard sample of aluminum metal prepared and sold by the Bureau of Standards for use by industrial organizations and others as a standard for calibrating pyrometers, etc. Each sample is accompanied by a certificate giving the melting point of that particular sample.)

(Circular No. 66 of the Bureau of Standards gives information on the preparation of these samples and the method of use.)

631.1 ALUMINUM AND ALUMINUM ALLOY INGOTS AND BARS.

631.11 ALLOYS, ALUMINUM.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS: ALLOYS NOS. 26, 27, 28, AND 29; SPECIFICATIONS NOS. 30, 31, 31A, 32, 33, 34, 35, 36, 37, 38, AND 39, ALUMINUM ALLOYS, JULY, 1930

ALUMINUM ALLOYS

ALLOY NO. 28

1. Composition in percentage—		Per cent
Copper.....		3.5-4.5
Magnesium.....		2-.75
Manganese.....		.4-1.0
Aluminum, not less than.....		92.0

2. General information.—This alloy is the alloy commonly designated "duralumin," "dural," or "17S." It is used in the wrought condition either rolled, drawn-forged, or extruded. In the form of sheet this alloy is supplied to the following mechanical property requirements:

3. Duralumin or 17S sheet, heat-treated

Thickness	Minimum tensile strength	Minimum yield point	Minimum elongation in 2 inches
<i>Inches</i>	<i>Lbs./in.²</i>	<i>Lbs./in.²</i>	<i>Per cent</i>
0.010-0.020	55,000	30,000	15
.021-.128	55,000	30,000	18
.129-.258	55,000	30,000	15
.259-.500	55,000	30,000	12
.501-1.75	55,000	30,000	9

¹ Sheets 30 inches or more in width in thickness of 0.021 to 0.041 inch may show a minimum elongation of 17 per cent.

4. In the annealed temper, the tensile strength shall not exceed 35,000 pounds per square inch.

5. The following thickness tolerances are commercial for this product:

Thickness tolerances for duralumin or 17S sheet

Thickness (inch)	Plus or minus tolerances, widths		
	18 inches and less	Over 18 inches to 36 inches	Over 36 inches
0.013-0.036	Inch 0.0015	Inch 0.002	Inch 0.0025
0.037-0.050	.002	.0025	.003
0.051-0.070	.0025	.003	.004
0.071-0.090	.003	.003	.004
0.092 and heavier	5% T	5% T	-----

(T=nominal thickness of sheet.)

6. In the form of tubing and extruded shapes, the same tensile strength and yield point are obtained, the elongation varying with the cross-sectional area of the test section. Rod and bar will also show these same properties, except in certain of the larger sizes, where manufacturing limitations may result in slightly lower values.

7. This alloy is extensively used in the construction of motor coaches and trucks, and aircraft (both heavier and lighter than air). It is available in all the forms in which metals are commonly used—sheet, plate, strip, tubing (including streamline and other special shapes), bar, rod, wire, rivets, bolts, nuts, screws and other screw-machine products, structural shapes, and extruded sections specially designed for aircraft construction.

ALLOY NO. 27

1. *Composition in percentage.*—

	Per cent
Copper.....	3.9-5.0
Manganese.....	.5-1.1
Silicon.....	.5-1.1
Aluminum, not less than.....	92.0

2. *General information.*—This alloy is known as 25S and, like duralumin, is used in the wrought condition. In the fully heat-treated temper, the tensile strength is from 55,000 to 63,000 pounds per square inch. The elongation, except for very thin or very heavy sections, is between 16 and 22 per cent in 2 inches. If the alloy be given the solution heat treatment, but not the precipitation heat treatment, it is in a more workable condition and has the following properties:

Tensile strength.....	lbs./in. ²	45,000-53,000
Yield-point.....	do	15,000-30,000
Elongation in 2 inches.....	per cent	15-22

3. In the annealed temper the tensile strength varies from 25,000 to 35,000 pounds per square inch.

4. This alloy is commonly available in a variety of forms, including sheet, plate, bar, and structural shapes. It is especially adapted for the manufacture of forgings, because of its excellent hot-working properties. Forgings of this alloy in common use include connecting rods for automobile engines, propellers for aircraft, automobile hardware, and fittings of various types.

ALLOY NO. 28

1. *Composition in percentage.*—

	Per cent
Magnesium.....	0.45-0.9
Silicon.....	.6-1.2
Aluminum, not less than.....	96.3

2. *General information.*—This alloy is designated in the trade as 51S. It is used in the wrought form and is one of the alloys susceptible to heat treatment. In the fully heat-treated temper (designated as T), the tensile strength is from 45,000 to 50,000 pounds per square inch; the elongation varies from 10 to 18 per cent in 2 inches, except in very thin or very heavy sections. The yield-point is from 30,000 to 40,000 pounds per square inch, substantially the same as duralumin or 25S, although the ultimate strength is about 10,000 pounds lower than that of these alloys. If the alloy is not subjected to the precipitation heat treatment after it has been heated and quenched, it has a tensile strength in the range 30,000 to 40,000 pounds per square inch, and an elongation of 20 to 30 per cent in 2 inches. In this temper (designated W) the alloy can be formed with considerable ease. In the annealed temper the tensile strength varies from 14,000 to 19,000 pounds per square inch, and the elongation from 22 to 32 per cent in 2 inches.

3. This alloy is available in practically all the wrought forms in which aluminum and other metals are produced; these include sheet, plate, tubing, rod, bar, wire, shapes, moldings, both rolled and extruded, forgings, etc.

4. Because of the readiness with which this alloy can be worked hot, it is used for the manufacture of complicated forgings, such as radial aircraft-engine crank cases. It is also used for less highly stressed parts, such as automobile hardware.

ALLOY NO. 29

1. *Composition in percentage.*—

	Per cent
Manganese.....	1.0-1.5
Copper, not over.....	.2
Aluminum, minimum.....	97.0

2. *General information.*—This alloy is used to replace pure aluminum where somewhat higher tensile strength and hardness are desired. It is not quite so easily formed as is commercial aluminum in the corresponding tempers. This alloy shows substantially the same resistance to atmospheric corrosion and to most forms of chemical attack as does aluminum of commercial purity.

3. As is the case with commercial aluminum, the various tempers are obtained by varying the amount of cold work done on the alloy after its final annealing. It is regularly manufactured in the form of sheet, plate, tubing, rod, bar, and wire, extruded shapes, moldings, etc.

4. The alloy in the various standard tempers has the tensile strengths shown in the following table. The elongation values for flat sheet are also shown. In the case of strip sheet in the half-hard temper, the elongation may be slightly lower than the values shown for flat sheet.

Temper	Tensile strength, minimum	Thickness (inch)							
		0.013 to 0.019	0.020 to 0.031	0.032 to 0.050	0.051 to 0.113	0.114 to 0.162	0.163 to 0.258	0.259 to 0.375	
		Elongation in 2 inches							
Soft.....	Lbs./in. ² 14,000	P. ct. 20	P. ct. 20	P. ct. 23	P. ct. 25	P. ct. 25	P. ct. 25	P. ct. 28	
One-half hard.....	19,500	3	4	5	6	7	8	8	
Three-fourths hard.....	24,000	1	2	3	4	-----	-----	-----	
Hard.....	27,000	1	2	3	4	-----	-----	-----	

(Thickness tolerances for flat sheet and for strip sheet are identical with those tabulated in S. A. E. specification No. 78. See 631.23, p. 1156.)

SPECIFICATION NO. 30

1. Composition in percentage.—

	Per cent
Copper.....	7.00-8.50
Zinc, maximum.....	.20
Silicon, iron, zinc, manganese, and tin, maximum.....	1.70
Other impurities.....	None.
Aluminum.....	Remainder.

2. *General information.*—The tensile strength of test specimens about one-half inch in diameter of this alloy cast in sand and tested without machining off the skin should be about 18,000 to 20,000 pounds per square inch, and the elongation 1 to 2 per cent in 2 inches.

3. This is a light alloy, having a specific gravity of about 2.83, and is used more extensively in the automotive industry than all other light casting alloys combined. A shrinkage of 0.156 ($\frac{1}{32}$) inch per foot should be allowed in pattern designs. This alloy is used for crank cases, oil pans, steering-wheel spiders, differential carriers, transmission cases, cam-shaft housings, hub caps, and similar parts.

4. For more difficult castings, alloy No. 36, which has similar mechanical properties and superior casting characteristics, is now commonly specified.

SPECIFICATION NO. 31

1. Composition in percentage.—

	Per cent
Copper.....	2.25-3.25
Zinc.....	12.50-14.50
Silicon, iron, manganese, and tin, maximum.....	1.70
Other impurities.....	None.
Aluminum.....	Remainder.

2. *General information.*—The tensile strength of test specimens about one-half inch in diameter of this alloy cast in sand and tested without machining off the skin should be about 25,000 to 30,000 pounds per square inch, with an elongation of more than 1 per cent in 2 inches.

3. The specific gravity is about 3.0, and a shrinkage of 0.156 ($\frac{1}{32}$) inch per foot should be allowed in pattern designs.

4. This alloy is used extensively in England for such parts as crank cases, oil pans, steering-wheel spiders, and transmission cases.

SPECIFICATION NO. 31A

1. Composition in percentage.—

	Per cent
Copper.....	2.0-3.5
Zinc.....	9.0-11.5
Iron.....	1.25-1.75
Total other impurities, not over.....	1.0
Aluminum.....	Remainder.

2. *General information.*—Test specimens cast in sand and tested without machining give tensile strengths in the range 25,000 to 36,000 pounds per square inch and elongations from 3 to 7 per cent in 2 inches.

3. The specific gravity is about 3.0. A shrinkage of 0.156 ($\frac{1}{32}$) inch per foot should be allowed in pattern designs.

4. This alloy is used where somewhat higher mechanical properties are desired than are obtained with alloys Nos. 30, 33, and 36. In common with other alloys containing considerable percentages of zinc, this alloy loses its strength more rapidly as the temperature is raised than do some of the other alloys, hence it is not recommended for use at elevated temperatures.

SPECIFICATION NO. 32

1. Composition in percentage.—

	Per cent
Copper.....	11.00-13.50
Zinc, maximum.....	.20
Silicon, iron, zinc, manganese, and tin, maximum.....	1.70
Other impurities.....	None.
Aluminum.....	Remainder.

2. *General information.*—The tensile strength of test specimens about one half inch in diameter of this alloy cast in sand and tested without machining off the skin should be about 19,000 to 23,000 pounds per square inch, and the elongation will be practically nothing.

SPECIFICATION NO. 33

1. Composition in percentage.—

	Per cent
Copper.....	6.0-8.0
Zinc, not over.....	2.5
Iron, not over.....	1.5
Silicon, not over.....	1.0
Total other impurities, not over.....	1.0
Aluminum.....	Remainder.

2. *General information.*—This is a light alloy, having a specific gravity of 2.83 to 2.86, and has been the most extensively used alloy in the automotive industry. It is similar to specifications Nos. 30 and 36, and is used for crank cases, oil pans, steering-wheel spiders, differential carriers, transmission cases, cam-shaft housings, hub caps, and similar parts. A shrinkage of 0.156 ($\frac{1}{32}$) inch per foot should be allowed in pattern designs.

3. Test specimens cast in sand and tested without machining show tensile strengths in the range 19,000 to 24,000 pounds per square inch and elongation from 1.0 to 2.5 per cent in 2 inches. It is customary to omit elongation requirements from specifications for this alloy.

SPECIFICATION NO. 34

1. Composition in percentage.—

	Per cent
Copper.....	9.25-10.75
Iron.....	.90-1.50
Magnesium.....	.15-.35
All other elements, not over.....	0.75
Aluminum.....	Remainder.

2. *General information.*—Test-bars cast in a chill mold show a tensile strength of 24,000 to 30,000 pounds per square inch, and the elongation in 2 inches is usually less than 1 per cent. The specific gravity should not exceed 2.95. The Brinell hardness number, using a 500 or 1,000 kg load with a ball 10 mm in diameter, should not be less than 85, and should average about 105.

3. This alloy cast in permanent molds is used principally for pistons, cam-shaft bearings, valve tappet guides, and other parts where high hardness and good bearing qualities are essential.

SPECIFICATION NO. 35

1. Composition in percentage.—

	Per cent
Silicon.....	4.5-6.0
Copper, not over.....	0.6
Iron, not over.....	1.0
Zinc, not over.....	.2
Manganese, not over.....	.3
Magnesium, not over.....	Trace.
Other impurities, not over.....	0.3
Aluminum.....	Remainder.

2. *General information.*—The minimum tensile strength of test specimens about one-half inch in diameter of this alloy cast in sand and tested without machining off the skin should be about 16,000 pounds per square inch, with a minimum elongation of 3.5 per cent in 2 inches.

3. This alloy is intended for automobile body parts and other parts that must be cast in thin sections. The alloy withstands salt-water corrosion very well and is therefore suitable for aircraft-engine parts or other parts that may be subjected to severe corroding influences. The alloy has a relatively low yield point and therefore can not be used where great strength or stiffness is required.

SPECIFICATION NO. 38

1. Composition in percentage.—		Per cent
Copper.....		7.0-8.5
Silicon.....		1.0-1.5
Iron.....		.8-1.4
Zinc.....		.2
Manganese.....		.3
Magnesium, not over.....		Trace.
Other impurities, not over.....		0.3
Aluminum.....		Remainder.

2. *General information.*—Standard tensile test specimens cast in sand and tested without machining give tensile strengths in the range 19,000 to 24,000 pounds per square inch. The elongation is usually from 1 to 3 per cent in 2 inches, but because of the difficulty of measuring elongations in this range with accuracy it is customary to omit elongation requirements from specifications for this alloy.

3. This alloy was developed from alloy No. 30, and differs from it only in that iron and silicon are added in carefully controlled amounts instead of being allowed to vary at random in the range permitted by the limit on impurities. In this alloy iron and silicon are definite alloying constituents, and are added to improve the casting characteristics of the old aluminum-copper casting alloy. With this alloy the tendency for cracks and shrinks is very greatly decreased. It has largely superseded No. 30, particularly for more difficult castings that require pouring temperatures higher than are usually used.

4. This is a light alloy, having a specific gravity of about 2.83, and is commonly used where alloy No. 30 has previously been specified. A shrinkage of 0.156 ($\frac{5}{32}$) inch per foot should be allowed in pattern design. This alloy and No. 33 are most commonly used for casting crank cases, oil pans, differential carriers, transmission cases, and other such castings.

SPECIFICATION NO. 37

1. Composition in percentage.—		Per cent
Silicon.....		12.0-13.0
Iron, not over.....		.8
Copper, not over.....		.3
Zinc, not over.....		.2
Manganese, not over.....		.5
Magnesium, not over.....		Trace.
Total other impurities, not over.....		0.3
Aluminum.....		Remainder.

2. *General information.*—Standard test bars cast to size in sand show tensile strengths from 24,000 to 31,000 pounds per square inch, and elongations from 5.0 to 15.0 per cent. These properties are obtained only if the molten alloy is subjected to a special process, known as "modification," immediately before it is poured. The specific gravity is 2.68.

3. Like alloy No. 35, this alloy is especially resistant to salt-water corrosion. Because of its good foundry characteristics it can be used for complicated castings consisting of both thin and heavy sections. The ratio of yield point to ultimate tensile strength is somewhat lower than is the case with

some of the other aluminum casting alloys, which fact should be considered in connection with the properties shown in the preceding paragraph.

SPECIFICATION NO. 38 (HEAT-TREATED CASTINGS)

1. Composition in percentage—		Per cent
Copper.....		4.0-5.0
Silicon, not over.....		1.20
Iron, not over.....		1.20
Zinc, not over.....		.25
Total of all constituents except aluminum and copper, not over.....		2.5

2. *General information.*—Castings from this alloy can be heat treated to produce mechanical properties distinctly higher than those of the ordinary aluminum casting alloys. The heat treatment may be varied, depending upon the service requirements.

3. Where maximum toughness and resistance to shock are desired, a solution heat-treatment alone is used which produces in sand-cast test specimens tensile strengths from 28,000 to 38,000 pounds per square inch, and elongations from 6 to 12 per cent in 2 inches. On standing at room temperatures there is an aging effect which is practically complete in a few months. The tensile strength increases by a few thousand pounds per square inch, and the elongation decreases by a few per cent in 2 inches. The greatest change occurs in the yield point, which increases to a value usually well in excess of 20,000 pounds per square inch.

4. If somewhat greater initial strength, hardness, and yield point are desired, the solution heat treatment may be followed by a precipitation heat treatment in which tensile strength from 30,000 to 40,000 pounds per square inch, and elongations from 3 to 8 per cent in 2 inches are developed.

5. If still greater strength and hardness are desired, the heat treatment may be varied to produce tensile strengths from 36,000 to 50,000 pounds per square inch, and elongations from 0 to 5 per cent in 2 inches.

6. Since the introduction of this alloy its use has developed into very substantial tonnages. It is used in windshield frames, fire engine, motor coach engine, and aircraft engine crank cases, and for a variety of parts in both motor vehicle and aircraft assemblies, where a high-strength light-weight casting is desired. It is very much more resistant to corrosion than the ordinary alloys containing copper, and is extensively used in the manufacture of outboard motors and for castings to be used on board ships.

SPECIFICATION NO. 39

1. Composition in percentage—		Per cent
Copper.....		3.75-4.25
Nickel.....		1.8-2.3
Magnesium.....		1.2-1.7
Iron, not over.....		1.0
Silicon, not over.....		.7
Total other impurities, not over.....		.2
Aluminum.....		Remainder.

2. *General information.*—Standard test specimens cast to size in sand, after proper heat treatment, show tensile strengths from 30,000 to 42,000 pounds per square inch, and elongations from 0 to 2 per cent. If the alloy is not heat treated, the tensile strength is about one-third less than these values. Because of its property of retaining its strength better at elevated temperatures than do many of the other aluminum alloys, it is used for pistons, and cylinder-heads of aircraft engines and for other parts where this property is an advantage.

631.12 INGOTS, ALUMINUM.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALUMINUM INGOTS FOR REMELTING, DESIGNATION B24-29, 1929

ALUMINUM INGOTS

SCOPE

1. These specifications cover three grades of virgin aluminum, as follows:

Grade	Aluminum minimum
	<i>Per cent</i>
99.5	99.5
99.0	99.0
98.5	98.5

2. The presence in any of the above grades of more than a trace of manganese, magnesium, zinc, calcium, or similar metals commonly used in the light alloys, is not admissible, and such ingot can not be classed as virgin aluminum under these specifications. Copper is an allowable impurity up to a maximum of 0.1 per cent in the 99.5 grade; 0.25 per cent in the 99.0 grade; and 0.45 per cent in the 98.5 grade. Iron and silicon are also allowable impurities. The sum total of the impurities, however, shall not exceed 0.5 per cent in the 99.5 grade, 1.0 per cent in the 99.0 grade, nor 1.5 per cent in the 98.5 grade.

MANUFACTURE

3. No scrap shall be used other than that resulting in the manufacturer's own plant from the production of material of composition similar to that specified.

PHYSICAL DEFECTS

4. Aluminum ingots shall have a clean surface and shall be free from dirt, slag, and foreign material.

SAMPLING

5. If the aluminum is shipped in carload lots, then random samples shall be taken, but not less than five ingots for each car. If the shipment is in less than carload lots, one ingot shall be taken for each 10,000 pounds (4,536 kg) or fractional part thereof. When it is deemed necessary, a sample may be taken from each heat of 500 pounds (226.8 kg) or more of metal.

6. The ingots selected shall be drilled without lubricant completely through, or halfway through from top and bottom. The drillings shall be fine, thin chips. They shall be thoroughly mixed and the sample for analysis shall not be less than 60 g.

ANALYSES

7. The chemical analysis shall be made in accordance with the tentative methods of chemical analysis of aluminum and light aluminum alloys in A. S. T. M. B40. (See 631.0, p. 1141.)

MARKING

8. The maker's brand and the grade of aluminum shall be cast on each ingot. When this is not practicable, the grade shall be indicated by spotting each large ingot, or one ingot in each bundle of small ingots, with a designating color of painting—white indicating the 99.5 grade; blue, the 99.0 grade; and red the 98.5 grade.

CLAIMS

(Same as B30. See 644.11, p. 1196.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALUMINUM FOR USE IN THE MANUFACTURE OF IRON AND STEEL, DESIGNATION B37-26, 1926

ALUMINUM FOR STEEL MANUFACTURE

SCOPE

1. These specifications cover two grades of virgin and four grades of secondary aluminum, as follows:

(a) *Virgin aluminum*.—(1) 98.0 grade, containing not less than 98 per cent aluminum.

(2) 94.0 grade, containing not less than 94 per cent aluminum. The remainder may be chiefly iron and silicon.

(b) *Secondary aluminum*.—(1) 98.0 grade, containing not less than 98 per cent aluminum. This grade is generally made from sheet clippings. The remainder may be chiefly copper, iron, and silicon.

(2) 94.0 grade, containing not less than 94 per cent aluminum. A maximum of 0.5 per cent of zinc will be allowed in this grade. The remainder may be chiefly copper.

(3) 90.0-A grade, containing not less than 90 per cent aluminum. A maximum of 0.5 per cent of zinc will be allowed in this grade. The remainder may be chiefly copper.

(4) 90.0-B grade, containing not less than 90 per cent aluminum. A maximum of 4 per cent of zinc will be allowed in this grade. The remainder may be chiefly copper.

MANUFACTURE

2. The manufacturer shall use care to have each lot of metal as uniform as possible.

3. The aluminum may be in the form of ingots, rods, or shot.

Ingots should be of convenient size for use. Ingots with a minimum of five notches, weighing approximately 3 pounds, will meet the requirements of these specifications.

Rods may be either rolled or cast and three-eighth to one-half inch in diameter.

Shot should be of convenient size. That produced by running the molten metal through one-eighth inch diameter holes is satisfactory.

SAMPLING

(Requirements covering sampling are the same as in A. S. T. M. B24, given above, except for the omission from B37 of taking samples from each heat of 500 pounds or more of metal, and the addition of the following two items:)

5. Rods shall be sampled in a similar manner, except that the drilling shall be radial.

An equivalent amount of shot shall be taken as a sample and reduced by quartering to a sample of convenient size.

ANALYSES

(Same as in A. S. T. M. B40-28T. See 631.0, p. 1141.)

MARKING

7. The maker's brand and the grade of aluminum shall be cast or rolled on each ingot or rod and marked plainly on each container of shot metal. When marking the grade by casting or rolling is not practicable, the grade shall be indicated by spotting each large ingot or one ingot or rod from each bundle with a designating color of paint, red indicating the 98.0 virgin grade, yellow the 94.0 virgin grade, red and white the secondary 98.0 grade, red and yellow the secondary 94.0 grade,

red and blue the secondary 90.0-A grade, and red and black the secondary 90.0-B grade.

CLAIMS

(Same as in A. S. T. M. B51-27. See 682, p. 1307.)

AMERICAN SOCIETY FOR TESTING MATERIALS, SPECIFICATIONS FOR ALUMINUM-BASE SAND-CASTING ALLOYS IN INGOT FORM, DESIGNATION B58-31, 1931

ALUMINUM-ALLOY INGOTS

1. These specifications cover commercial aluminum-base sand-casting alloys in ingot form for remelting. The specific gravity of these alloys does not exceed 3. Ten alloys are specified and are designated alloys A to H, inclusive, and J and K. (See explanatory note.)

MANUFACTURE

2. The alloys may be made by any approved process.

3. The material covered by these specifications shall be of uniform quality, and shall be free from dross, slag, and other harmful contamination.

CHEMICAL COMPOSITION AND TESTS

4. (The alloys shall conform to the requirements as to chemical composition specified in Table 1 in A. S. T. M. B26-31 (see 631.41, p. 1160) except for percentage of iron, which is 0.2 per cent lower in B58.)

(Sampling requirements are identical with those in A. S. T. M. B10. See 643.4, p. 1192. Inspection and rejection requirements are identical with those in A. S. T. M. B59. See 647.15, p. 1259.)

NOTE.—Explanatory notes pertaining to these alloys when used in the form of sand castings are given in connection with the tentative specifications for aluminum-base alloy sand castings in A. S. T. M. B26-31. (See 631.41, p. 1160.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ALUMINUM INGOTS, NO. 134, MAY 1, 1924. (CURRENT DESIGNATION: QQ-A-451)

ALUMINUM INGOTS

(This specification is the same as A. S. T. M. serial designation B24-29, given above, with the exception that only two grades of aluminum ingots are specified herein while B24-29 covers three grades. The chemical composition of like grades in both specifications is practically identical. In this speci-

fication grade A corresponds to the 99.0 grade, and grade B to the 98.0 grade in B24-29.)

631.23 SHEETS, ALUMINUM.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALUMINUM SHEET, DESIGNATION B25-29, 1929

ALUMINUM SHEET

SCOPE

1. These specifications cover flat aluminum sheet. Strip or coil sheet may show somewhat lower elongations than those specified but is required to conform to the requirements of the same bend test as the flat sheet.

MANUFACTURE

2. No scrap shall be used in the manufacture of aluminum sheet except such as shall accumulate at the manufacturer's own plants from material of similar composition and of his own manufacture.

CHEMICAL PROPERTIES AND TESTS

3. The sheet shall contain a minimum of 99 per cent aluminum as determined by chemical analysis.

4. Samples for analysis shall be obtained from a random sheet, representing each 500 pounds (226.8 kg) of aluminum or any lot weighing less than 500 pounds (226.8 kg), as agreed upon between the seller and the purchaser. Samples so prepared shall be divided into three equal parts, each of which shall be placed in a sealed package, one for each party and one for an umpire if necessary. The sample for analysis may be prepared by shearing or by drilling or machining without the use of any lubricant in such a manner as to give a sample representative of the entire cross section of the sheet.

PHYSICAL PROPERTIES AND TESTS

5. (a) The sheet shall be supplied in the temper specified in the contract or purchase order and shall conform to the following minimum requirements as to tensile properties for the specified temper:

Thickness	Temper No. 1, soft	Temper No. 2, half hard		Temper No. 3, hard			
		Minimum tensile strength	Minimum elongation in 2 inches	Minimum tensile strength	Minimum elongation in 2 inches	Minimum tensile strength	Minimum elongation in 2 inches
B. & S. gage	Inches	Lbs./in. ²	Per cent	Lbs./in. ²	Per cent	Lbs./in. ²	Per cent
2 to 16	0.258-0.051	12,000	30	16,000	7		
Thinner than 10 to 16	.102-.051					22,000	4
Thinner than 16 to 20	.050-.032	12,000	25	16,000	5	24,000	3
Thinner than 20 to 24	.031-.020	12,000	20	16,000	4	26,000	2
Thinner than 24 to 28	.019-.013	12,000	15	16,000	3	30,000	1

(b) Tension-test specimens for sheet in temper No. 2, half hard, shall be cut from the sheet parallel to the direction of final rolling. From sheet in temper No. 1, soft, or temper No. 3, hard, the tension-test specimens may be cut in any direction.

6. Bend-test specimens cut in any direction from sheet in temper No. 1, soft, or No. 2, half hard, shall stand being bent cold through 180° flat upon themselves without cracking.

7. One tension and one bend test specimen shall be cut from a random sheet representing each 500 pounds (226.8 kg) or fraction thereof of aluminum, as mutually agreed upon between the manufacturer and purchaser.

PERMISSIBLE VARIATIONS IN DIMENSIONS

8. The thickness of sheets shall not vary from that specified by more than the following tolerances:

Thickness	Inches	Tolerance in thickness		
		20 inches in width and under	Over 20 to 36 inches, inclusive, in width	Over 36 to 60 inches, inclusive, in width
		<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
2 to 3	0.258-0.220	±0.007	±0.008	±0.009
Thinner than 3 to 9	.219-.115	±.005	±.006	±.007
Thinner than 9 to 13	.114-.073	±.003	±.0035	±.004
Thinner than 13 to 21	.072-.030	±.0025	±.0025	±.003
Thinner than 21 to 24	.029-.019	±.002	±.002	±.003
Thinner than 24 to 27	.018-.014	±.002	±.002	±.002
Thinner than 27	.013 and less.	±.0015	±.0015	±.0015

WORKMANSHIP AND FINISH

9. All sheets shall be commercially flat and free from buckles; they shall be free from injurious surface defects and shall have a workmanlike finish.

INSPECTION AND REJECTION

10. The manufacturer shall afford the inspector representing the purchaser, without charge, all reasonable facilities to satisfy him that the material is being furnished in accordance with these specifications.

11. Materials which fail to conform to these specifications will be rejected and the manufacturer shall be notified.

NOTES.—In the case of sheet in the half-hard temper, there is an appreciable difference in the elongation depending upon the direction in which the test specimen is taken from the sheet. This measurement made parallel to the direction of final rolling is distinctly higher than if the specimen were cut perpendicular to this direction. This difference is not observed in hard or soft sheet. The inspection of half-hard sheet calls for the use of specimens parallel to the direction of final rolling because of the greater contrast with the values obtained from hard sheet. The fact that the bend-test specimens may be taken without regard to the direction of rolling is evidence that the lower elongation across the grain does not indicate a lack of workability.

The use of grips which insure a uniform axial loading of the test specimen is essential, if satisfactory results are to be obtained.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALUMINUM-ALLOY (DURALUMIN) SHEET, DESIGNATION B78-31, 1931

DURALUMIN

(In respect to manufacture, chemical analysis, workmanship and finish, inspection and rejection, this specification conforms with A. S. T. M. B25, given above.)

CHEMICAL COMPOSITION

2. The sheet shall conform to the following requirements as to chemical composition:

	Per cent
Copper	3.5-4.5
Magnesium	.2-.75
Manganese	.4-1.0
Aluminum, minimum	92

PHYSICAL PROPERTIES AND TESTS

4. (a) The sheet shall be supplied in the temper specified in the contract or purchase order and shall conform to the following requirements as to tensile properties for the specified temper:

Thickness		Temper No. 1, quenched and aged			Temper No. 2, annealed	
B. & S. gage	Inch	Tensile strength, minimum	Yield point, minimum	Elongation in 2 inches, minimum	Tensile strength, maximum	Elongation in 2 inches, minimum
2 to 10.....	0.258-0.102	Lbs./in. ² 55,000	Lbs./in. ² 30,000	Per cent 15	Lbs./in. ² 35,000	Per cent 12
Thinner than 10 to 16.....	.101- .051	55,000	30,000	18	35,000	12
Thinner than 16 to 20.....	.050- .032	55,000	30,000	18	35,000	12
Thinner than 20 to 24.....	.031- .020	55,000	30,000	15	35,000	10
Thinner than 24 to 28.....	.020- .013	55,000	30,000	15	35,000	8

(b) Tension-test specimens for sheet in either of the tempers may be cut in any direction, irrespective of the direction of rolling.

5. Bend-test specimens cut in any direction from aluminum-alloy (duralumin) sheet shall stand being bent cold through an angle of 180°, around a pin the diameter of which is equal to *n* times the thickness of the sheet without cracking; the values of *n* for tempers Nos. 1 and 2 being as follows:

Thickness		Value of <i>n</i>	
B. & S. gage	Inch	Temper No. 1, quenched and aged	Temper No. 2, annealed
2 to 10.....	0.258-0.102	6	4
Thinner than 10 to 16.....	.101- .051	4	2
Thinner than 16 to 20.....	.050- .032	4	1
Thinner than 20 to 24.....	.031- .020	4	0
Thinner than 24 to 28.....	.020- .013	4	0

6. One tension and one bend-test specimen shall be cut from a random sheet representing each 500 pounds (226.8 kg) or fraction thereof of aluminum alloy (duralumin), as mutually agreed upon between the manufacturer and purchaser.

PERMISSIBLE VARIATIONS IN DIMENSIONS

7. The thickness of sheets shall not vary from that specified by more than the following tolerances:

Thickness		Tolerances in thickness		
B. & S. gage	Inch	18 inches in width and wider	Over 18 to 36 inches inclusive, in width	Over 36 inches in width
Thicker than 11.....	0.092 and thicker.	Inch (1)	Inch (1)	Inch (1)
11 to 13.....	0.091-0.072	±0.003	±0.003	±0.004
14 to 15.....	.064- .057	±.0025	±.003	±.004
16 to 18.....	.051- .040	±.002	±.0025	±.004
19 to 28.....	.036- .013	±.0015	±.002	±.0025

¹ ± 5 per cent of sheet thickness.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALUMINUM-MANGANESE ALLOY SHEET, DESIGNATION B79-31, 1931

ALUMINUM-MANGANESE ALLOY SHEET

(In respect to manufacture, chemical analysis, workmanship and finish, inspection and rejection, and explanatory notes, this specification conforms with A. S. T. M. B25, given above.)

SCOPE

1. These specifications cover flat aluminum-alloy (duralumin) sheet. Strip or coil sheet may show somewhat lower elongations that those specified, but it is required to conform to the requirements of the same bend test as the flat sheet.

CHEMICAL COMPOSITION

3. The sheet shall conform to the following requirements as to chemical composition:

	Per cent
Manganese.....	1.0- 1.5
Copper, maximum.....	.2
Aluminum, minimum.....	97.0

PHYSICAL PROPERTIES AND TESTS

5. (a) The sheet shall be supplied in the temper specified in the contract or purchase order and shall conform to the following requirements as to tensile properties for the specified temper:

Thickness		Temper No. 1, soft		Temper No. 2, half hard		Temper No. 3, hard	
B. & S. gage	Inch	Tensile strength, minimum	Elongation in 2 inches, minimum	Tensile strength, minimum	Elongation in 2 inches, minimum	Tensile strength, minimum	Elongation in 2 inches, minimum
2 to 16.....	0.258-0.051	Lbs./in. ² 14,500	Per cent 25	Lbs./in. ² 19,500	Per cent 6	Lbs./in. ² 27,000	Per cent 4
Thinner than 10 to 16.....	.102- .051	14,500	25	19,500	5	27,000	3
Thinner than 16 to 20.....	.050- .032	14,500	20	19,500	4	20,000	2
Thinner than 20 to 24.....	.031- .020	14,500	20	19,500	3	33,000	1
Thinner than 24 to 28.....	.019- .013	14,500	20	19,500	3	33,000	1

(b) Tension-test specimens for sheet in Temper No. 2, half hard, shall be cut from the sheet parallel to the direction of final rolling. From sheet in temper No. 1, soft, or temper No. 3, hard, the tension-test specimens may be cut in any direction.

6. (a) Bend-test specimens cut in any direction from sheet in temper No. 1, soft, shall stand being bent cold through 180° flat upon themselves without cracking.

(b) Bend-test specimens cut in any direction from sheet in temper No. 2, half hard, shall stand being bent cold through 180° around a pin the diameter of which is equal to twice the thickness of the sheet.

(c) The bend test shall not be required on sheet in temper No. 3, hard.

7. One tension and one bend-test specimen shall be cut from a random sheet representing each 500 pounds (226.8 kg) or fraction thereof of aluminum-manganese alloy as mutually agreed upon between the manufacturer and purchaser.

PERMISSIBLE VARIATIONS IN DIMENSIONS

8. The thickness of sheets shall not vary from that specified by more than the following tolerances:

Thickness		Tolerances in thickness		
B. & S. gage	Inch	20 inches in width and under	Over 20 to 36 inches, inclusive, in width	Over 36 to 60 inches, inclusive, in width
		Inch ±0.007 ±.005 ±.003 ±.0025 ±.002 ±.002 ±.0015	Inch ±0.003 ±.006 ±.0035 ±.0025 ±.002 ±.002 ±.0015	Inch ±0.009 ±.007 ±.004 ±.003 ±.003 ±.002 ±.002

SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
ALUMINUM ALLOYS, ALLOYS NOS. 26,
27, 28, AND 29, JULY, 1930

ALUMINUM-ALLOY SHEETS

(See 631.11, p. 1146.)

SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 78, ALUMINUM
SHEET AND STRIP, JULY, 1930

ALUMINUM SHEET AND STRIP

1. Composition in percentage.—

	Per cent
Aluminum, minimum.....	99

2. Physical properties.—Aluminum sheet or strip is furnished in several tempers or degrees of hardness. These tempers or degrees of hardness are indicated by the reduction in thickness produced by cold-rolling after annealing and are expressed in terms of the number of American wire (Brown & Sharpe) gage sizes included between the final annealing thickness and the finish thickness. Thus temper No. 4 indicates that the sheet was given its final annealing at a thickness four gage numbers thicker than the finish gage, to which it was subsequently reduced by cold-rolling. Temper No. 0 indicates that the sheet or strip is in the soft annealed state. Hard temper indicates that the sheet or strip has been reduced in thickness after its final annealing by 12 or more gage numbers by cold-rolling. The mechanical properties of aluminum sheet or strip of tempers 0, 4, and 6 and hard temper are given in the accompanying table.

3. Physical properties of aluminum flat sheet.—

Temper	Thickness				Minimum tensile strength	Minimum elongation in 2 inches
	A. w. g.		Inch			
	From—	To—(including)	From—	To—(including)		
0 (soft).....	2	9	0.258	0.114	Lbs./in. ² 12,000	Per cent 30
	9	16	.114	.051	12,000	30
	16	20	.051	.032	12,000	25
	20	24	.032	.020	12,000	20
4.....	24	28	.020	.013	12,000	15
	6	9	.162	.114	16,000	7
	9	16	.114	.051	16,000	7
	16	20	.051	.032	16,000	5
6.....	20	24	.032	.020	16,000	4
	24	28	.020	.013	16,000	3
	10	16	.102	.051	18,000	5
	16	20	.051	.032	18,000	3
Hard.....	20	24	.032	.020	18,000	2
	24	28	.020	.013	18,000	2
	10	16	.102	.051	22,000	4
	16	20	.051	.032	24,000	3
	20	24	.032	.020	26,000	2
	24	28	.020	.013	30,000	1

4. Aluminum strip sheet shows the same physical properties as flat sheet, with the exception that in tempers Nos. 4 and 6 the elongations may be slightly lower than those shown for flat sheet.

5. The tensile-test specimen shall be cut from the sheet or strip parallel to the direction of rolling. The bend-test specimen may be cut without regard to the direction of rolling. Sheet or strip of tempers Nos. 0 and 4 shall withstand being bent cold flat upon itself, without cracking. Although tensile tests of sheet strip of temper No. 6 indicate an elongation only slightly greater than that of the hard-temper sheet, it is considerably more ductile, as is evidenced by the fact that it will withstand cold bending through an angle of 180° around a diameter equal to twice the thickness of the sheet, without cracking. Hard aluminum sheet or strip will not endure any considerable amount of bending without cracking, especially in the thicker gages.

6. Thickness tolerances for flat sheet.—

B. & S. gage	Thickness ¹	Width		
		20 inches and under	Over 20 inches to 30 inches, inclusive	Over 36 inches to 60 inches, inclusive
2 and 3.....	0.250-0.220	±0.007	±0.003	±0.009
4 to 9.....	.219-.115	±.035	±.066	±.007
10 to 13.....	.114-.073	±.003	±.0035	±.004
14 to 21.....	.072-.050	±.0025	±.0025	±.003
22 to 24.....	.049-.019	±.002	±.002	±.003
25 to 27.....	.018-.014	±.002	±.002	±.002
28 to 36.....	.013-.005	±.0015	±.0015	±.0015

¹ Material having thickness greater than 0.250 inch is considered plate and is covered by plate tolerances.

7. Thickness tolerances for strip sheet.—

B. & S. gage	Thickness	Width	
		14 inch to 12 inches inclusive	Over 12 inches to 24 inches, inclusive
10 to 18.....	0.102-0.041	±0.003	±0.003
19 and 20.....	.040-.030	±.002	±.0025
21 to 25.....	.029-.017	±.002	±.0025
26 to 29.....	.016-.011	±.0015	±.0015
30 to 36.....	.010-.005	±.001	±.001

8. Aluminum body sheets.—

ALUMINUM-ALLOY RODS

(See 631.11, p. 1146.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR RODS, WELDING, NONFERROUS, FOR GAS WELDING, QQ-R-571, MAY 3, 1932

ALUMINUM AND ALUMINUM-ALLOY RODS

(For general specifications, types, material, general requirements, detail requirements, methods of inspection, tests, and chemical analysis, packing and marking of shipments, and notes see F. S. B. QQ-R-571, 600.0, p. 3.)

1. Aluminum rods may be used for general welding of aluminum.

2. Aluminum-alloy rods may be used for general welding of aluminum-copper alloys.

3. Welding rods shall conform to the following chemical requirements:

	Per cent
Type D, aluminum:	
Aluminum, minimum.....	99.0
Type E, aluminum alloy:	
Aluminum, minimum.....	92.5
Silicon, minimum.....	4.5-6.0
Iron, maximum.....	1.0
Copper, maximum.....	.6
Zinc, maximum.....	.2
Manganese, maximum.....	.2
Magnesium, maximum.....	Trace.

4. Standard sizes for both aluminum and aluminum-alloy rods for gas welding are:

Diameter (inch)..... $\frac{1}{16}$, $\frac{3}{16}$, $\frac{1}{4}$, $\frac{5}{16}$, and $\frac{3}{8}$

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS, HARD-DRAWN ALUMINUM CONDUCTORS, DECEMBER 10, 1926

Approved as American Standard (C11-1927) by the American Standards Association, May 2, 1927]

HARD-DRAWN ALUMINUM CONDUCTORS

SCOPE

The standards of this section cover the electrical and related properties of standard hard-drawn aluminum conductors. The following shall be taken as normal values for standard hard-drawn aluminum conductors:

Resistivity.—At a temperature of 20° C. the electrical resistivity is 2.828 microhm-cm. (See note 1.)

Resistance-temperature coefficient.—The 20° C. resistance-temperature coefficient is 0.00403 per degree centigrade. (See note 2.)

Density.—At a temperature of 20° C. the density is 2.703 g per cm³. (See note 3.)

Length-temperature coefficient.—The 20° C. length-temperature coefficient is 0.000023 per degree centigrade. (See note 4.)

Change in resistivity with change in temperature.—The change in resistivity with change in temperature is 0.0115 microhm-cm per degree centigrade. (See note 5.)

Temperature.—In determining the resistivity of commercial aluminum conductors, measurements shall be made at a temperature (*t*) not less than 10° C. nor more than 30° C., and the values obtained corrected to 20° C. (See note 6.)

EXPLANATORY NOTES

1. The values given above are consistent with resistivities at 20° C. of 17.01 ohm circular mil per foot and 0.07644 ohm gram/meter², and a conductivity at 20° C., as compared with the annealed copper standard at 20° C. of 60.97 per cent.

2. The value taken for the resistance-temperature coefficient is the amount by which the resistance of a conductor of standard hard-drawn aluminum

changes when the temperature is changed, divided by the change in temperature expressed in degrees centigrade, and divided by the resistance of the same conductor when at a temperature of 20° C.

3. The value taken for the density may be considered to be the same as the ratio of the mass of a quantity of standard hard-drawn aluminum to the mass of a quantity of pure water when the volume of the aluminum at a temperature of 20° C. is equal to the volume of the water at a temperature of 4° C.; or the specific gravity at 20° C. as compared with pure water at 4° C.

4. The value taken for the length-temperature coefficient (linear expansion coefficient) is the amount by which the length of a conductor of standard hard-drawn aluminum changes when the temperature is changed, divided by the change in temperature expressed in degrees centigrade, and divided by the length when at a temperature of 20° C.

5. The value taken for the change in resistivity with change in temperature, as given above, is the sum of the resistance-temperature coefficient and the length-temperature coefficient, multiplied by the resistivity at 20° C., as given above.

6. A temperature correction of 0.0115 ($t-20$) microhm-cm corresponds to 0.069 ($t-20$) ohm circular mil per foot and 0.000305 ($t-20$) ohm gram/meter².

AMERICAN RAILWAY ASSOCIATION, SIGNAL SECTION, AERIAL ALUMINUM CABLE, STEEL REINFORCED, SPECIFICATION NO. 5416, 1916

ALUMINUM CABLE

GENERAL

(a) The intent of this specification is to provide for the furnishing of aerial aluminum cable, steel reinforced.

(b) The cable shall be composed of one extra high strength galvanized steel wire for a core and six aluminum wires concentrically laid around the steel core.

(c) The wires composing the cable shall be cylindrical in form, free from scales, flaws, irregularities, splits, and all imperfections. Each length shall contain no weld, joint, or splice.

(d) The galvanizing for the steel core shall consist of a continuous coating of pure zinc of uniform thickness so applied that it adheres firmly to the wire and presents a smooth surface.

PROPERTIES

(a) The mechanical properties of the separate wires and of the finished cable shall conform to the following requirements:

COMPLETE CABLE

Nominal size	Diameter	Circular mils	Elastic limit	Breaking strength	Approximate weight per 1,000 feet
<i>A. w. g.</i>	<i>Inch</i>		<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>
0000	0.564	247,275	5,950	8,452	290
000	.502	195,766	4,692	6,666	231

0	.398	123,118	2,964	4,215	145
1	.355	97,580	2,354	3,344	116
2	.316	77,432	1,864	2,646	91.9
3	.281	61,402	1,482	2,104	72.6
4	.250	48,697	1,153	1,646	57.5
6	.198	30,625	732	1,040	35.1

STEEL WIRE

Gage of complete cable	Diameter	Circular mils	Minimum elongation in 18 inches	Elastic limit	Breaking strength
	<i>Inch</i>		<i>Per cent</i>	<i>Pounds</i>	<i>Pounds</i>
0000	0.1880	35,325	4	3,600	4,450
000	.1670	27,966	4	2,850	3,500
00	.1491	22,203	4	2,280	2,800
0	.1327	17,588	4	1,800	2,240
1	.1182	13,940	4	1,440	1,760
2	.1052	11,062	4	1,140	1,380
3	.0933	8,772	4	895	1,110
4	.0834	6,957	4	720	880
6	.0661	4,375	4	450	555

ALUMINUM WIRE

(Gage of complete cable, diameter in inches, and circular mils are the same for aluminum wire as for steel wire, given above. The minimum elongation in 18 inches, per cent, is 1. The elastic limit and breaking strength are as follows:)

	Gage								
	0000	000	00	0	1	2	3	4	6
Elastic limit.....pounds..	391	307	243	194	152	121	98	73	47
Breaking strength...do....	667	527	419	329	264	211	165	127	81

(b) The aluminum wire shall be smooth and true and shall not vary in diameter more than 1 per cent from the specified diameter.

(c) The conductivity of aluminum wire shall not be less than 60 per cent of Matthiessen's annealed copper standard at zero degrees centigrade.

GALVANIZING TEST

(a) Galvanizing shall be in accordance with A. R. A. specification No. 2912. (See 600.3, p. 61.)

INSPECTION AND TESTS

(a) The purchaser is to have the right to make such inspection and tests of the completed products as are necessary to assure him that the requirements of this specification have been met, except that samples for test if taken from the finished cable shall not exceed 4 feet in length, and from not more than 5 per cent of the reels.

(b) The manufacturer must provide, at the mill, all apparatus and labor for making the required tests under the supervision of the purchaser.

(c) Tests shall be made at the mill or on samples submitted by the manufacturer, and may also be made on the cable upon its arrival at destination.

(d) If, upon arrival at destination, the cable does not meet the requirements of this specification, it will be rejected and returned to the manufacturer, who shall pay all freight charges.

PACKING FOR SHIPMENT

(a) The cable shall be furnished in coils or on reels as specified, and of not less than the following lengths unless otherwise specified:

Gage of cable	Preferred arrangement	Minimum length
0000	Reel.....	<i>Feet</i> 3,500
	do.....	4,400
	do.....	5,600
	do.....	4,500
	do.....	3,550
	do.....	4,500
	do.....	5,600
	do.....	3,550
	do.....	4,500
	do.....	4,100

(b) When furnished on reels, each reel shall have the weight, length of cable, with arrow indicating direction of unreeling, the name of the manufacturer, and purchaser's order and inspection number plainly and indelibly marked on a strong tag securely fastened to the cable and also stenciled on the outside of the reel.

(c) When furnished in coils, each coil shall be thoroughly wrapped with burlap and shall have the weight, length, and size of cable, the name of the maker, the purchaser's order, and inspection number, and the proper shipping address plainly and indelibly marked on a strong tag, securely fastened to the coil.

631.4 ALUMINUM AND ALUMINUM ALLOY CASTINGS AND TUBES.

**631.41 CASTINGS, ALUMINUM.
AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALUMINUM-BASE ALLOY SAND CASTINGS, DESIGNATION B26-31, 1931**

ALUMINUM ALLOY CASTINGS

1. These specifications cover commercial aluminum-base alloy sand-castings having a specific grav-

ity of 3 and less. Ten alloys are specified and are designated alloys A to H, inclusive, and J and K. (See explanatory notes.)

MANUFACTURE

2. The alloy may be made by any approved method.

CHEMICAL COMPOSITION AND TESTS

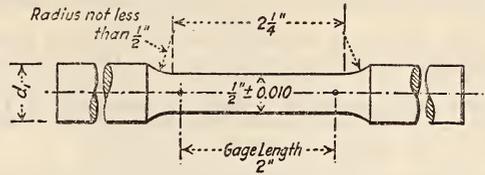

3. The alloys shall conform to the requirements as to chemical composition specified in Table 1. (See explanatory notes.)

(Sampling requirements are identical with those in A. S. T. M. B10 (see 643.4, p. 1192). Inspection and rejection requirements are identical with those in A. S. T. M. B59 (see 647.15, p. 1259).)

PHYSICAL PROPERTIES AND TESTS

5. The alloys shall conform to the minimum requirements as to tensile properties specified in Table 2.

6. The test bars shall be separately cast in green sand and shall be "cast to size" according to the dimensions shown in Figure 1072. If the castings are heat treated, the test bars representing such castings shall be similarly heat treated. They shall not be machined prior to test except to adapt the grip

NOTE:

The Gauge Length, Parallel Section and Fillets shall be as shown, but the Ends may be of any Shape to fit the Holders of the Testing Machine in such a way, that the Load shall be Axial.

In Order to promote the Breaking of the Specimen in the Center it is permissible to use a Taper in the Reduced Section from the Fillets to the Center of not to exceed 0.010 in.

It is recommended, that Diameter d, be from 3/8" to 1".

FIGURE 1072.—Tension test specimen

to the holders of the testing machine in such a manner as to insure an axial load.

7. (a) The tests shall so far as possible be made by heats or melts, but unless otherwise agreed upon two tension tests shall be made for each unit of 500 pounds or fraction thereof.

(b) If any test specimen shows defective machining or develops flaws, it may be discarded; in which case the manufacturer and the purchaser or his representative shall agree upon the selection of another specimen in its stead.

EXPLANATORY NOTES

Alloy A.—Alloy A has a specific gravity of about 2.83. In pattern design a shrinkage of about 0.156 (5/32) inch per foot should be allowed. This alloy was for years the standard and is still somewhat used, but is being superseded by alloy B.

Alloy B.—This alloy has a specific gravity of about 2.83. The pattern shrinkage is about 0.156 (5/32) inch per foot. It is superseding alloy A as it possesses better casting characteristics, especially in the more difficult work where higher pouring temperatures than those usually employed are found necessary. The tendency toward cracks and shrinks is considerably overcome by the careful control of the iron and silicon contents. This alloy is used for general casting purposes.

Alloy C.—The specific gravity of alloy C is about 2.83 to 2.86. The pattern shrinkage is about 0.156 (5/32) inch per foot. It has somewhat better machining qualities than alloys A and B. It is used for about the same purposes as alloy B, particularly for automotive work, such as crank and transmission cases and similar parts.

Alloy D.—This alloy has a specific gravity of about 2.83. Due to its higher silicon content it has greater fluidity and is less subject to cracking.

It is used for the more intricate general casting work.

Alloy E.—Alloy E has a specific gravity of about 2.95 and the pattern shrinkage is 0.156 (5/32) inch per foot. It is used for pumps, manifolds, and general castings which should be leak proof. The high copper content makes the alloy more brittle and lowers its shock resistance.

Alloy F.—The specific gravity of this alloy is about 2.90 and the pattern shrinkage about 0.156 (5/32) inch per foot. The alloy is used for pistons, cylinder heads, valve guides, and bearings or other parts where hardness and good bearing qualities are essential. Together with alloy H it possesses the property of retaining at higher temperatures a greater percentage of its room-temperature strength than any other alloy in this group. This alloy may be heat-treated, in which case substantially higher strength and hardness or other desirable characteristics are obtained.

Alloy G.—This alloy has a specific gravity of about 2.78. It is for general casting purposes where a combination of lightness, higher strength, and ductility is desired. The various strengths are obtained through different heat treatments. Heat treatment No. 1 gives maximum elongation and resistance to shock. It is a solution heat treatment and may be specified where the most rugged service is required. An aging effect takes place on standing which increases the strength and slightly decreases the elongation. Heat treatment No. 2 is a solution and precipitation heat treatment, and should be specified where a higher initial strength, yield point, and hardness are desired. Heat treatment No. 3 should be specified where the highest strength and hardness are desired, and lower ductility is not objectionable. This alloy with the various heat treatments is used in general for high strength parts in street cars and buses, parts for internal combustion engines, outboard motor parts, and other marine castings.

Alloy H.—The specific gravity of this alloy is about 2.80. It is usually employed in the heat-treated condition. The alloy is used for pistons, cylinder heads, valve guides, and bearings or other parts where hardness or good bearing qualities are essential. Together with alloy F it possesses the property of retaining at higher temperatures a greater percentage of its room-temperature strength than any other alloy in this group.

Alloy J.—This alloy is somewhat lighter than aluminum, having a specific gravity of about 2.69. It withstands corrosion better than the copper alloys. The free-flowing property of the alloy when molten makes it easier to pour castings of thin sections or intricate design. Its leak-proof properties are valuable where pressure tightness is essential. It has a lower strength and yield point than the copper alloys and poorer machining qualities. It is especially suitable for automobile body parts, cooking utensils, architectural and marine castings.

Alloy K.—The specific gravity of this alloy is about 2.68. Immediately before pouring, the alloy is treated by a process called "modification." Its corrosion resistance is good, especially to salt water. It has good foundry characteristics and can be used for castings having both thin and heavy sections. It is not so readily machined and has a lower yield point in proportion to tensile strength than most of the copper alloys. It is used for marine castings, bus, street car, and engine parts, and for thin castings such as radiators, small motor housings, and meter cases.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR ALUMINUM-BASE ALLOY DIE CASTINGS, DESIGNATION B85-31T, 1931

ALUMINUM-BASE ALLOY DIE CASTINGS

SCOPE

1. These specifications cover die castings die cast from aluminum-base alloys. Seven alloy compositions are specified, designated alloys Nos. IV to IX, inclusive, and XII.

CHEMICAL COMPOSITION AND TESTS

2. The alloys shall conform to the requirements as to chemical composition given in Table I within the limits specified therein.

3. (a) It is understood that iron contributes to the hardness in all these alloys. While the use of steel or iron containers for the commercial manufacture of die castings unavoidably introduces some of this element into the alloy, it shall not exceed the percentages specified in Table I.

(b) Manganese and nickel are not regarded as harmful elements in these alloys up to the limits specified in Table I.

4. Samples for chemical analysis may be taken either by sawing, drilling, or milling a representative group of castings, and shall represent the average cross section of the material. The castings and cutter shall be thoroughly cleaned and no lubricant shall be used during the operations.

5. Chemical analysis shall be made in accordance with the tentative methods of chemical analysis of aluminum and light aluminum alloys in A. S. T. M. B40-28T. (See 631.0, p. 1141.)

SOUNDNESS

6. No casting shall be acceptable which weighs less than a minimum agreed upon by the manufacturer and purchaser for the individual order.

WORKMANSHIP AND FINISH

7. Castings shall be produced with smooth surfaces, free from cracks and disfiguring blemishes.

TABLE 1.—Chemical compositions of aluminum-base die-casting alloys

Alloy No.	Desired composition				Permissible variations in alloying elements, per cent				Other elements, maximum

¹ The alloy designations correspond to numbers used in the investigation on aluminum-base die-casting alloys carried out under the jurisdiction of committee B-6 on die-cast metals and alloys (formerly subcommittee XV on die-cast metals and alloys of committee B-2 on nonferrous metals and alloys), the alloy numbers omitted correspond to alloy compositions which were investigated by the committee, but which were not considered desirable of inclusion in these specifications. See Proc. A. S. T. M., vol. 29, p. 192, 1929.

8. Dimensional tolerances shall be within the limits specified on the drawings describing the casting or castings on order or shall be within the limits specified in the order.

REJECTION

9. Castings which show injurious defects subsequent to acceptance may be rejected. The manufacturer's liability shall be confined to replacing rejected castings without charge to the purchaser.

APPENDIX

The data in the following table do not constitute a part of these specifications. They will indicate to the purchaser the physical properties that may be expected of tension and impact test specimens when made in a die, the test specimens being cast in regular production routine and conforming to the chemical composition specified. It should be thoroughly understood that the following figures represent die-cast test specimens and not specimens cut from commercial die-cast parts. Rockwell hardness values have not been shown because they are considered too unreliable on die castings.

Alloy No.	Tension tests on round specimens		Charpy impact on square specimens
	Tensile (strength)	Elongation in 2 inches	
IV	Lbs./in. ²	Per cent	Ft.-lbs.
V	29,000	3.5	4.5
VI	33,000	1.5	2.0
VII	30,000	3.5	5.0
VIII	32,000	2.0	2.5
IX	29,000	4.0	4.5
X	31,000	1.5	2.0
XII	33,000	1.0	1.5

NONFERROUS PLATE, SHEET, AND STRIP

1. AMERICAN WIRE GAGE (FOR COPPER, ALUMINUM AND NONFERROUS ALLOYS)

The American wire gage, also commonly known as the Brown & Sharpe gage, is extensively used in the United States for nearly all nonferrous sheets, particularly copper, aluminum, and nonferrous alloy sheets, as well as for wire of the same materials. It was devised by J. R. Brown and Lucian Sharpe, founders of the Brown & Sharpe Manufacturing Co., in 1856, and was adopted by the Association of Brass Manufacturers in February, 1857, eight of the leading brass manufacturers signing the resolutions. Its gage numbers, like those of the U. S. standard gage and many other gages, are retrogressive, a larger number denoting a smaller size. The gage is based on a simple mathematical law of geometrical progression, which may be expressed in either of three following manners: (a) The ratio of any size to the next smaller is a constant number, namely

$\sqrt[39]{\frac{0.460}{0.005}}$, which is 1.1229322; (b) the difference

between any two successive sizes is a constant percentage of the smaller of the two sizes, namely, 0.1229322; and (c) the difference between any two successive sizes is a constant ratio times the next smaller difference between two successive sizes, namely, 1.1229322.

When the gage was developed, the size No. 0000 was defined as 0.4600 and No. 36 as 0.005 inch, and it was specified that there should be 38 sizes between the two which should advance by geometrical progression. The sixth power of the ratio 1.229322 is 2.0050, so that the thickness and, consequently, the weight per unit area of a sheet six sizes heavier than a given size, is approximately twice as great as for the given size.

(a) Approximate Weights per Square Foot

In Table 13 the gage numbers and thicknesses of the American wire gage are given, together with the approximate weights per square foot of rolled copper and aluminum sheets.

Copper.—The weights of copper sheets given in Table 13 are based on the density of 8.89 grams per cubic centimeter, which is the value adopted by the International Electrotechnical Commission and the American Institute of Electrical Engineers in their "definition of the annealed copper standard"; and is used in some specifications of the American Society for Testing Materials. This value for density is equivalent to 0.321 pounds per cubic inch, or 46.25

pounds per square foot per inch thick. The weights given in the table are, therefore, for cold-rolled and annealed copper sheets. Hot-rolled copper plates having a thickness of five-sixteenths inch and over are about one-half per cent heavier, the density being 8.94 grams per cubic centimeter, 0.323 pound per cubic inch, or 46.51 pounds per square foot per inch thick, according to A. S. T. M. standard specifications for copper plates for locomotive fireboxes, B11-18 (see 641.21, p. 1176). The International Critical Tables give 8.94 grams per cubic centimeter as also the value for pure copper.

Aluminum.—The weights of aluminum sheets, given in Table 13, are based on the density 2.71 grams per cubic centimeter, 169.2 pounds per cubic foot, or 14.10 pounds per square foot per inch thick, this value being commonly accepted as the average density of commercially pure (99.0 to 99.4 per cent) aluminum (2S) rolled commercial sheets. The National Metals Handbook gives the value 2.706 grams per cubic centimeter for 99.4 per cent aluminum.

Copper alloys.—The weights of brass and some other copper-alloy sheets and plates rolled to the American wire gage are given in Table 14. These are alloys covered by certain United States Government or United States Army specifications. The weights of gilding metal and cupro-nickel are based on determinations of density of samples of sheet made to such specifications, whereas those for commercial brass, naval brass, and nickel silver are those generally accepted as representative of rolled sheets of these materials. The densities are as follows:

Alloy	Grams per cubic centimeter	Pounds per cubic inch	Pounds per square foot per inch thick
Commercial brass.....	8.47	0.306	44.06
Naval brass.....	8.41	.304	43.75
Gilding metal.....	8.79	.318	45.73
Cupro-nickel (Benedict nickel).....	8.92	.322	46.41
Nickel silver.....	8.75	.316	45.52

Tests of samples showed that, in general, the density of nonferrous sheets is somewhat higher than that of bars. Also a variation averaging about one-half per cent among different thicknesses of sheet samples of brass of the same nominal composition was noted, but a sufficient number of samples was not tested and chemically analyzed to determine a consistent relationship.

Aluminum alloys.—The weights of certain aluminum-alloy sheets and plates rolled to the American wire gage are given in Table 15. These weights are based on densities obtained from Aluminum Co. of America data sheet No. 389, November 15, 1929, as follows:

Alloy	Grams per cubic centimeter	Pounds per cubic inch	Pounds per square foot per inch thick
Aluminum manganese alloy (3S).....	2.74	0.099	14.25
Aluminum alloy 17S and duralumin.....	2.79	.101	14.51
Aluminum alloy 25S.....	2.79	.101	14.51
Aluminum alloy 51S.....	2.68	.097	13.94

¹The equivalent weights correspond to the gage thickness as rounded off in column 2, and are carried out further than they should be used practically.

(b) Permissible Variations in Thickness and Weight

(The available data as to tolerances applied to thicknesses of copper, aluminum, brass, and other nonferrous-alloy plates, sheets, and strips are contained in tabulations in this circular. One tabulation gives the permissible variations in thickness of wrought nonferrous sheets and strips of naval brass, wrought aluminum bronze, phosphor bronze, cupronickel, nickel silver, and manganese bronze. This is identical with the table of permissible variations in thickness of German silver sheets and strips in F. S. B. specification QQ-N-321. (See 655.2, p. 1287.) The other tabulation gives the permissible variations in thickness of wrought nonferrous sheets and strips of copper, low and rich low brass, commercial brass, and gilding metal. This is identical with the table of permissible variations in thickness of copper sheets and strips in F. S. B. specification QQ-C-501. (See 641.21, p. 1177.)

NOTE.—The above tolerances are taken from Aluminum Co. of America data sheet No. 669.742, June 1, 1929.

2. OTHER GAGES FOR COPPER SHEETS

Copper sheets are frequently made in definite weights per square foot. This practice is customary in the heavier flat sheets. Table 20 shows the corresponding approximate thicknesses, which are based on a density of 8.89 grams per cubic centimeter, 555 pounds per cubic foot, or 46.25 pounds per square foot per inch thick.

Copper sheets can also be obtained in fractional-inch thicknesses varying by sixteenths of an inch from one-sixteenth to 2 inches. Also the Birmingham wire gage has been used in designating thicknesses of copper sheets. Permissible variations in weight and thickness of certain fractional-inch sizes will be found in A. S. T. M., B11-18 (see 641.21, p. 1176).

3. MONEL METAL (NICKEL-COPPER ALLOY)

Monel-metal sheets (approximately 67 per cent nickel, 28 per cent copper, and 5 per cent of other elements) are rolled in thicknesses corresponding to the wrought-iron thicknesses of the U. S. standard gage for sheet and plate iron and steel. The corresponding weights per unit area are given in Table 22. The weights per square foot are based on a density of 8.850 grams per cubic centimeter, 552.5 pounds per

cubic foot, or 46.04 pounds per square foot per inch thick.

Inasmuch as the U. S. standard gage is strictly a weight gage, this practice with regard to thicknesses of Monel-metal sheets represents a deviation from the standard practice. Monel-metal sheets are usually used to replace sheet steel, or steel sheets coated with zinc, both of which come in U. S. standard gage weights. If Monel-metal sheets were rolled to the same weight per unit area as steel sheets, according to the U. S. standard gage, the resulting thicknesses would be quite different from those of standard steel sheets of corresponding gage number, because of the large difference in density of the two metals.

The tolerances on thickness of Monel metal, as given in Table 22, are the practice of the International Nickel Co. When rolled to weight, the tolerances correspond to sheet-steel practice. Permissible variations in thickness given in F. S. B. No. QQ-C-541, will be found in 654.52, p. 1285.

¹ To the nearest 1/4 ounce.

4. AMERICAN ZINC GAGE

The American zinc gage, commonly used by manufacturers of zinc sheet in the United States, is given in Table 24. The weights per square foot for the thickness given are based on a density of 0.2596 pounds per cubic inch, 37.38 pounds per square foot per inch thick, or 7.186 grams per cubic centimeter, the value given in the specifications cited below.

Permissible variations in thicknesses of sheet zinc are presented in United States Government, Federal

specification QQ-Z-301, and in the American Society for Testing Materials standard specifications for rolled zinc, B69-29 (see 683.2, p. 1311.), wherein rolled zinc is classified as follows:

Type A, ribbon zinc and sheets or strips cut from ribbon zinc.—Type A rolled zinc shall be rolled from a single bar in one continuous direction. The permissible variations in thickness of Type A rolled zinc shall be as given in B69-29. Thicknesses of metal falling between the gages shown shall take the tolerances of the nearest gage.

Type B, sheet zinc or strips cut from sheet zinc.—Type B rolled zinc shall be rolled by the pack-rolling method. The permissible variations in thickness of type B rolled zinc shall be as given in B 69-29, wherein such tolerances are expressed as percentages, plus or minus, of the equivalent weights as given in Table 24, and apply only to units or lots of 500 pounds or more.

No individual sheet shall weigh more than the theoretical weight of a sheet of the gage next above, nor less than a sheet of the next gage below.

Type C, boiler plate, name plates, tags, etc.—Type C rolled zinc may be rolled either from a single bar or by the pack-rolling method. The permissible variations in thickness of type C rolled zinc shall be the same as those for either type A or type B rolled zinc, depending upon whether the material is cut from a ribbon or a sheet.

TABLE 24.—American zinc gage

9	.018	.673	19	.060	2.24			
10	.020	.748	20	.070	2.62			

NOTE.—Manufacturers' catalogues usually omit Nos. 1 and 2.

5. SHEET LEAD

Sheet lead is commonly ordered on the basis of weight per square foot in units as given in column 1 of Table 27. The average weight per cubic foot of sheet lead is about 707.6 pounds, which corresponds to 59.0 pounds per square foot per inch thick. (The value 59.5 is commonly used.) The decimal thicknesses given in column 2, Table 27, are computed on the basis 59.0. The fractional thicknesses in column 3 are those commonly listed in catalogues and handbooks.

United States Government, Federal specification QQ-L-201 specifies the permissible variation in weight of any sheet as ±5 per cent (see 651.5, p. 1277). Grade A lead sheet contains no reclaimed lead, and the thickness of any sheet of grade A sheet lead, corresponding to the weight per square-foot specified, may vary within ±0.003 inch.

641. COPPER

641.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF BATTERY ASSAY OF COPPER, SERIAL DESIGNATION B34-20, 1920

[Approved as American tentative standard by the American Standards Association, June 15, 1921]

BATTERY ASSAY OF COPPER

[Approved by the supervisory committee on standard methods of analysis, American Chemical Society]

The methods that follow are those originally proposed by Heath,⁶ whose work has been checked and elaborated by Keller, Ferguson, and others.

The methods are those generally accepted in the United States for standard analysis in all the larger laboratories of both producers and consumers of copper and copper products.

GENERAL INSTRUCTIONS

Sampling ingots.—Select 6 ingots at random from the lot. Considering 3 ingots as a rectangular unit, drill 1 hole in each ingot, 1 at the center and 1 at each end of a diagonal of the rectangle. Drill each hole entirely through the ingot, starting from the bottom. Start the drill on the surface sufficiently to remove the oxide before commencing to collect the drillings for the sample. Run the drill so as to prevent oxidation of the chips. Discard all drillings carrying oxide from the "set," or burned by the drill. Use no lubricant on the drill, and if the sample shows oil or grease, remove this with ether. Sift all drillings on a screen with 250 meshes per square centimeter in order to remove material which is ground between the drill and sides of the hole. Extract with a strong magnet any iron which may have come from the drill. Keep the drillings in air-tight bottles.

Weights.—Weights shall be calibrated and frequently rechecked. It is recommended⁷ to use a special 5 g brass weight in weighing the samples and to have the weight of the sample always within 5 mg of 5 g. When the cathode with its deposit is finally weighed the identical weights are to be used with which the cylinder was tared, plus the special 5 g brass weight. This brings all the change

or deficiency in the final weight on a small fractional weight and the beam and rider.

ASSAY OF ELECTROLYTIC AND LOW-RESISTANCE LAKE COPPER

The method described below is applicable to such grades of electrolytic and low-resistance lake copper as are covered by the standard specifications for lake copper wire bars, cakes, slabs, billets, ingots and ingot bars, serial designation: B 4, (see 641.11, p. 1173.) and for electrolytic copper wire bars, cakes, slabs, billets, ingots and ingot bars, serial designation: B 5, (see 641.11, p. 1174.) of the American Society for Testing Materials. The silver is deposited with the copper and is included as such; when it is desired to correct for the silver this is determined in a larger separate sample and the amount found is deducted from the deposit of copper plus silver.

APPARATUS FOR ELECTROLYSIS

(Specifications for electrodes and cathodes are identical with those in B27. (See 647.20, p. 1261.)

Anodes.—Spiral platinum anodes should be used, made from 1.02 mm or 1.14 mm wire formed into a spiral of seven turns having a height of approximately 51 mm and a diameter of 16 mm, the length over all being approximately 145 mm.

SOLUTION REQUIRED

"Assay solution" for dissolving.—Mix 300 c c of H₂SO₄ (specific gravity 1.84), 210 c c of HNO₃ (specific gravity 1.42) and 750 c c of distilled water.

METHOD

Place 5 g of the drillings in a tall lipless beaker which is provided with a well-fitting cover glass, and add 42 c c of "assay solution." The electrolysis beakers are from 100 to 125 mm tall and 55 mm in diameter across the bottom, with a total capacity of 225 to 300 c c. After the assays have stood for a few minutes and the action has nearly ceased, place them on a steam bath having a temperature of 80° to 90° C. and allow them to remain there until solution is completed and the red fumes have disappeared. Wash the cover and the sides of the beaker and dilute the solution to 150 c c and electrolyze, keeping the top of the cathode 5 or 6 mm below the surface of the solution.

During electrolysis, cover the beakers with two pairs of split watch glasses placed at right angles to each other. For each solution use a current of 1 ampere at approximately 10 volts, or else use a current of 4 amperes at approximately 10 volts continued for about 4 hours. The latter case requires the use of gauze cathodes. In the former case, it is convenient to start the assays at night; after about 15 hours wash the cover glasses, electrodes and beakers and reduce the current to 0.6 ampere per solution. As soon as the cathodes begin to evolve gas reduce the current to 0.4 ampere per solution. When this occurs take out about 1 c c of liquid, place it in a depression in a porcelain test plate and add two or three drops of fresh H₂S water. If the slightest discoloration occurs continue the electrolysis, repeating the test until there is no discoloration whatever.⁸ If possible the assay should finish without decided evolution of gas.

⁸ It has been shown by Heath, J. Ind. Eng. Chem., vol. 4, p. 404, 1912, that a few thousandths of a per cent of copper may remain in the solution without being detected by the test on the spot plate. This amount of copper is negligible in many instances, but when necessary to make exact determinations, as in the complete analysis of copper, make the solution, after electrolysis, slightly alkaline, neutralize with HCl (specific gravity 1.19), adding 3 c c excess, evaporate to 50 c c and precipitate with H₂S. Filter off the copper sulphide, treat with HNO₃ and H₂SO₄, deposit the small amount of copper from the solution by electrolysis and add it to that obtained in the original determination.

⁶ Heath, Transactions, Am. Inst. Min. Engrs., vol. 27, pp. 390-400, 1897.

⁷ Greenwood, U. S. Metals Refining Co., Personal Communication.

Without interrupting the current, siphon off the acid solution, at the same time filling the beakers with distilled water. Remove the cathodes quickly and rinse them in distilled water and two successive baths of alcohol. An experienced operator can quickly remove a cathode and immerse it in water without loss. Throw off the excess alcohol by a quick motion of the hand and ignite the remainder by bringing the cathode quickly to the flame of an alcohol lamp; then keep the cathode moving continually while the alcohol burns. Weigh as metallic copper.

Accuracy.—All assays shall be made in duplicate and shall check within an outside limit of 0.015 per cent of copper.

NOTES.—Use of the "Assay Solution" prevents a violent reaction and a consequent loss of copper with the vapors. The solution should not be boiled, since this likewise may cause a loss of copper.

By the use of rotating anodes, gauze or perforated electrodes or the Frary solenoid, it is possible to use a high current density and to reduce the time required for depositing the copper to about four hours. Good results can be obtained by experienced workers, but there is much more chance for error. The slow or overnight method, which is more certain and which requires less of the operator's time, is therefore recommended.

The deposition of the silver with the copper is said to work well up to the limit of 0.3 per cent silver, that is, 100 ounces per ton.

The method of burning off the alcohol in the flame of an alcohol lamp dries the cathode without causing oxidation, whereas drying in an oven to 100° C. generally causes increase in weight.

ASSAY OF LOW-GRADE OR CASTING COPPER

For all grades of copper which are not included in the specifications of the American Society for Testing Materials, previously referred to, as electrolytic and low-resistance lake copper, the procedures given below are recommended. These brands may contain a considerable amount of arsenic and some antimony, tellurium, bismuth, and nickel. (See notes.)

Solution Required

"Assay solution" for dissolving.—Mix 300 c c of H₂SO₄ (specific gravity 1.84), 210 c c of HNO₃ (specific gravity 1.42) and 750 c c of distilled water.

METHOD I

Carry out the assay exactly as given for electrolytic and low-resistance lake copper. Place the cathode in a clean beaker, cover with a watch glass perforated with a small hole just large enough to accommodate the stem of the electrode, add 42 c c of "assay solution" and water enough to cover the sheet. Let it stand upon the steam bath until the coating is dissolved. Reelectrolyze in the regular manner.

METHOD II⁹

Dissolve a 5 g sample in 42 c c of the "assay solution" and evaporate until all the HNO₃ is expelled. Redissolve in 70 c c of water and add 3 c c of ferric nitrate solution (1 c c=0.01 g of iron). Transfer the solution to a lipped beaker and place the original beaker under a funnel fitted with a small filter paper. Precipitate the iron from the hot liquid by ammonia, filter and wash out salts. Place the solution on a hot plate to concentrate, reprecipitate the hydroxide from dilute H₂SO₄ in a very small volume of solution and add the filtrate to the main solution. Reprecipitate the hydroxide once more from dilute H₂SO₄, filter wash thoroughly and add the filtrate to the main solution. Make acid with dilute H₂SO₄ and add 2 c c of HNO₃ (specific gravity 1.42). Deposit the copper as in the method for electrolytic and low-resistance lake copper.

⁹ Heath (Senter modified), J., Am. Chem. Soc. vol. 26, p. 1123, 1904.

METHOD III¹⁰

[For copper containing only traces of antimony or bismuth but sufficient selenium or tellurium to interfere]

Dissolve the 5 g sample in 42 c c of "assay solution" and evaporate until fumes appear, or until the residue is white. Redissolve in 60 c c of water and saturate the boiling hot solution for 10 minutes with SO₂ gas, removing the solution from the lamp when the gas is started. The gas may be generated by dropping cold saturated sodium sulphite solution into strong H₂SO₄. It is also conveniently obtainable in cylinders which are fitted with a valve. Let the precipitate settle for a few hours, filter and wash with a little hot water. Boil the filtrate gently to remove most of the SO₂ gas. Ignite the filter in a porcelain crucible to volatilize the selenium and tellurium, redissolve the oxidized residue in 1.5 to 2 c c of HNO₃ and add to the main solution. Deposit the copper as in the method for electrolytic and low-resistance lake copper.

NOTE.—The selenium is said to be carried down by SO₂ as a selenide of silver, but the roasting sufficiently removes the elements selenium and tellurium. When the silver is to be removed, the selenium, etc., are thrown down with the silver by the SO₂ gas and the precipitation of silver is then completed by the addition of chlorides or HCl.

METHOD IV¹¹

[For copper high in arsenic only]

Modification A.—Dissolve the sample in 42 c c of the "assay solution" in the regular way and add 5 g of ammonium nitrate. Electrolyze as usual.

Modification B.—Dissolve the sample in 60 c c of the "assay solution" instead of 42 c c. Electrolyze as usual.

Accuracy.—All assays shall be made in duplicate and shall check with an outside limit of 0.015 per cent of copper.

NOTES.—It has been recommended¹² to use with solutions of the low-grade or casting copper about 2 c c of an addition agent prepared by boiling "lard oil" with strong HNO₃, cooling and removing the grease. This, it is said, will permit the use of high current densities and yet allow the copper to be deposited pure and bright. Moreover, it is said that arsenic and antimony, when present, do not contaminate the copper. It seems probable,¹³ however, that copper deposited from such solutions is not quite pure and that it is more accurate to purify the cathode deposit (Method I) or to give a preliminary treatment to the solution (Method II).

Method II is recommended in preference to Method I, which should be used only in the presence of small amounts of impurities.

In Method IV for copper high in arsenic, Modification B is to be preferred.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

COPPER SAMPLE

(Sample No. 45a is a standard sample of copper metal prepared and sold by the Bureau of Standards for use by industrial organizations and others as a temperature standard for calibrating pyrometers, etc. Each sample is accompanied by a certificate giving the melting point of that particular sample.)

(Circular No. 66 of the Bureau of Standards gives information on the preparation of these samples and the method of use.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR COPPER RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, QQ-C-501, FEBRUARY 2, 1932

COPPER RODS, BARS, SHAPES, PLATES, SHEETS, STRIPS

GENERAL SPECIFICATIONS

1. United States Government General Specification for Metals, Federal Specifications Board specification No. 339a (current designation: QQ-M-151), in effect on date of issuance of proposals, shall form part of this specification. (See 600.0, p. 3.)

GRADE, FORMS, AND TEMPER

2. This specification covers one grade of copper in the following forms and tempers:

- Rods, soft and hard. (See also 642.11, p. 1180.)
 Bars, soft and hard. (See also 642.11, p. 1180.)
 Shapes, soft and hard. (See also 641.22, p. 1179.)
 Plates, soft and hard. (See also 641.21, p. 1177.)
 Sheets, soft and hard. (See also 641.21, p. 1177.)
 Strips, soft and hard. (See also 641.21, p. 1177.)

MATERIAL AND WORKMANSHIP

3. Material shall be made from only the best grades of virgin metals, or from virgin metals and scrap of known and approved composition.

4. The material shall be uniform in quality and temper, clean, sound, smooth, commercially straight or flat, and free from foreign material, pipes, slivers, laps, cracks, twists, seams, scale, damaged ends or edges, buckles, and other injurious defects.

DETAIL REQUIREMENTS

5. The material shall contain not less than 99.90 per cent copper, silver being counted as copper.

TENSILE STRENGTH

6. The requirements as to tensile strength are as shown in Table 1.

TABLE 1.—Physical properties

Diameter or thickness (in inches)	Tensile properties		Bend test
	Tensile strength, mini- mum	Elonga- tion in 2 inches, mini- mum	
Rods and bars, soft:	<i>Lbs./in.²</i>	<i>Per cent</i>	<i>Degrees</i>
0.500 and less.....	° 37,000	25	120
Over 0.500.....	° 33,000	25	120
Rods, hard:			
0.250 or less.....	50,000	-----	120
0.251 to 0.375.....	50,000	10	120
0.376 to 1.....	45,000	12	120
1.001 to 2.....	40,000	15	120
Over 2.....	35,000	20	120
Bars, hard:			
0.250 or less.....	45,000	-----	120
0.251 to 0.375.....	45,000	10	120
0.376 to 1.....	40,000	12	120
1.001 to 2.....	35,000	15	120
Over 2.....	32,000	20	120
Shapes, soft, all sizes.....	° 35,000	25	120
Shapes, hard, all sizes.....	(^b)	(^b)	(^b)

° Maximum.

^b As specified.

TABLE 1.—Physical properties—Continued

Diameter or thickness (in inches)	Tensile properties		Bend test
	Tensile strength, mini- mum	Elonga- tion in 2 inches, mini- mum	
Plates, sheets, and strips, soft:	<i>Lbs./in.²</i>	<i>Per cent</i>	<i>Degrees</i>
0.005 to 0.010.....	° None.	15	° 180

0.072 to 0.375.....	40,000	5	120
Over 0.375.....	35,000	15	120

° Tensile strength to be recorded, but not to be a basis for acceptance.

^d Flat.

7. Special tempers not covered by Table 1 may be agreed upon between the contractor and purchaser, in which case they will be specifically defined and designated in the contract or purchase order.

Material shall withstand bending cold, without fracture on the outside of the bent portion, through the angle specified in Table 1, on a radius equal to the diameter or thickness of the material, except where the angle is noted as "180° flat" the material shall be bent flat back upon itself.

TESTS AND METHODS OF INSPECTION

8. When check analyses are required, the samples shall be obtained from each lot of 1,000 pounds or fraction thereof, of each size in the shipment. In the case of thin sheets and strips, at least 10 representative pieces shall be taken. In all other cases at least four representative pieces shall be taken. From the pieces so selected equal amounts of clean chips shall be obtained and the chips combined and thoroughly mixed. The inspector shall forward for analysis not less than 2 ounces of the resultant mixture.

9. Unless otherwise specified in the contract or purchase order, 1 tension, 1 bend, and 1 hammer test shall be made of every lot of 5,000 pounds or fraction thereof of each size in the shipment. The tension test specimen and the bend test specimen to represent a given lot shall not be selected from the same piece.

TENSION TESTS

10. All rods, bars, and shapes may be pulled in full size when practicable. When a machined specimen becomes necessary, enough metal may be removed from the gage section to meet the limitations of the testing machine, or the specimen may be machined to the form and dimensions of type 1, general specifications for metals. (See 600.0, p. 3.)

11. For rods, bars, and shapes up to 1½ inches in diameter or thickness, the axis of the test specimen shall coincide with the central axis of the piece. Over 1½ inches, the axis shall be located midway between the center and surface of the piece.

12. The test specimen for plates, sheets, and strips shall be machined to the form and dimensions

of type 2, general specification for metals. (See, 600.0 p. 3.)

13. The axis of tension test specimens for rods, bars, and shapes shall be parallel to the direction of rolling or drawing.

BENDING TESTS

14. Bending test specimens from rods, bars, and shapes may be the full size of the section or may be machined to the form indicated in paragraph 27 of general specification for metals. (See 600.0, p. 3.) When polygonal sections are bent in full size the edges may be rounded to $\frac{1}{16}$ -inch radius.

15. Bending test specimens from plates, sheets, and strips may consist of a strip from 1 to 2 inches wide by 6 to 12 inches long, with edges rounded to $\frac{1}{16}$ -inch radius, or may be machined to the form indicated in paragraph 19 of general specification for metals. (See 600.0, p. 3.) Material less than 1 inch wide shall be bent in full section.

16. The axis of all bending test specimens shall be parallel to the direction of rolling or drawing.

17. Specimens shall be bent cold, by either pressure or blows.

PACKING AND MARKING OF SHIPMENTS

18. All material shall be properly separated by size when loaded for shipment.

19. Each bundle, box, or crate shall be legibly and indelibly marked with the dimensions, weight, and temper of contents; name, brand, or trade-mark of contractor, and the contract or purchase order number.

NOTES.—Round, square, hexagonal, etc., sections are classed as rods. Rectangular sections with the ratio of the two dimensions of the section relatively small, are classed as bars. Rectangular sections with the ratio of the two dimensions relatively large, are classed as plates, sheets, or strips. All other sections are classed as shapes.

The material covered herein is suitable for the manufacture of copper pipes, tubing, shapes, receptacles, and for general copper-smith work. For purposes of calculation the weight per cubic inch of soft or hard copper may be taken as 0.321 pound.

641.1 COPPER INGOTS AND BARS.

641.11 INGOTS AND CAST BARS, COPPER.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR LAKE COPPER WIRE BARS, CAKES, SLABS, BILLETS, INGOTS, AND INGOT BARS, SERIAL DESIGNATION B4-27, 1927

[Approved as American Standard, No. H 17.1, 1932, by the American Standards Association]

LAKE COPPER WIRE BARS, CAKES, SLABS, BILLETS, INGOTS AND INGOT BARS

1. In order to be classed as lake, copper must originate on the northern peninsula of Michigan, U. S. A.

2. All wire bars, cakes, slabs, and billets shall be stamped with the maker's brand and furnace charge mark. Ingots and ingot bars shall have a brand stamped or cast in, but need have no furnace charge mark.

3. The refiner shall arrange carloads or lots so that as far as possible each shall contain pieces from but one furnace charge, in order to facilitate testing by the user.

4. (a) *Low resistance lake.*—Lake copper offered for electrical purposes, whether fire or electrolytically refined, shall be known as "low resistance lake."

Low resistance lake wire bars shall have a resistivity not to exceed 0.15436 international ohms per meter-gram at 20° C. (annealed). All ingots and ingot bars shall have a resistivity not to exceed 0.15694 international ohms per meter-gram at 20° C. (annealed).

Cakes, slabs, and billets shall come under the ingot classification, except when specified for electrical use at time of purchase; in which case wire-bar classification shall apply.

(b) *High resistance lake.*—Lake copper having a resistivity greater than 0.15694 international ohms per meter-gram at 20° C. shall be known as "high resistance lake."

5. (a) Low resistance lake copper shall have a purity of at least 99.900 per cent as determined by electrolytic assay, silver being counted as copper.

(b) High resistance lake copper shall have a purity of at least 99.900 per cent, copper, silver, and arsenic being counted together. The arsenic content of high resistance lake copper, when required for special purposes, shall be the subject of agreement at time of purchase.

6. Wire bars, cakes, slabs, and billets shall be substantially free from shrink holes, cold sets, pits,

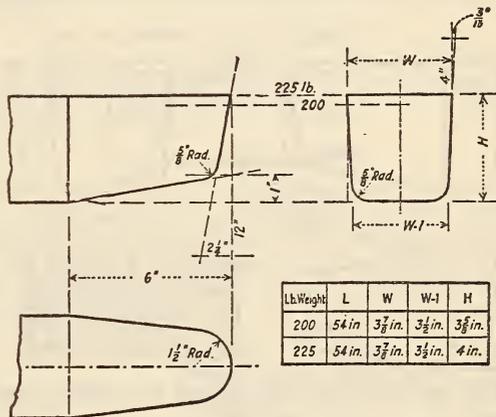

FIGURE 1076.—Mold for casting 200 to 230 pound wire bars

sloppy edges, concave tops and similar defects in set or casting. This clause shall not apply to ingots or ingot bars, in which case physical defects are of no consequence.

7. (a) One mold shall be used for casting 200 to 230 pound wire bars, the bottom width of this bar to be $3\frac{1}{2}$ inches, the listed weights being 200 and 225 pounds. (See fig. 1076.)

(b) One mold shall be used for casting 240 to 300 pound wire bars, the bottom width of this bar to be 4 inches, the listed weights being 250, 275, and 300 pounds. (See fig. 1077.)

(c) The length dimension of all bars shall be 54 inches. The side draft or taper shall be $\frac{3}{8}$ inch in 4 inches ($\frac{3}{16}$ inch in 4 inches on each side of the bar). The radius of the corners at the bottom of the bars shall be $\frac{3}{8}$ inch. The end taper at the bottom shall be 6 inches long over all and approximately 2 inches per foot.

The end taper of the side shall be approximately $2\frac{3}{8}$ inches per foot and the end of the bar shall be approximately $3\frac{3}{8}$ inches deep at the point.

8. Five per cent variation in weight or $\frac{1}{4}$ inch variation in any dimension from the refiner's published list or purchaser's specified size shall be considered good delivery; provided, however, that wire bars may vary in length 1 per cent from the listed

or specified length, and cakes 3 per cent from the listed or specified size in any dimension greater than 8 inches. The weight of ingot and ingot-bar copper shall not exceed that specified by more than 10 per cent, but otherwise its variation is not important.

9. Claims shall be made in writing within 30 days of receipt of copper at the customer's mill, and the results of the customer's test shall accompany such claims. The refiner shall be given one week from date of receipt of complaint to investigate his records, and shall then either agree to replace the defective copper or send a representative to the mill. No claims will be considered unless made as above stated, and if the copper in question, unused, can not be shown to the refiner's representative.

Claims against quality will be considered as follows:

(a) Resistivity by furnace charges, ingot lots, or ingot-bar lots.

(b) Metal contents by furnace charges, ingot lots, or ingot-bar lots.

(c) Physical defects by individual pieces.

(d) Variation in weights or dimensions by individual pieces.

10. (a) The refiners representative shall inspect all pieces where physical defects or variation in

Each party shall make an analysis in accordance with the standard methods of battery assay of copper (see A. S. T. M. B34, 641.0, p. 1170), and if the results do not establish or dismiss the claim to the satisfaction of both parties concerned, the third sample shall be submitted to a mutually agreeable umpire, who shall determine the question of fact and whose determination shall be final.

(c) In a question of resistivity each party shall select two samples, and in the presence of both parties these shall be rolled hot and drawn cold into wire of 0.080 inch in diameter, approximately, which shall be annealed at approximately 500° C. Three samples shall be cut from each coil and the same procedure followed as described in the previous paragraph.

11. The expenses of the shipper's representative and of the umpire shall be paid by the loser, or divided in proportion to the concession made in case of compromise. In case of rejection being established, the damage shall be limited to payment of freight both ways by the refiner for substitution of an equivalent weight of copper meeting these specifications.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ELECTROLYTIC COPPER WIRE BARS, CAKES, SLABS, BILLETS, INGOTS, AND INGOT BARS, SERIAL DESIGNATION B5-27, 1927

[Approved as American Standard, No. H 17.2, 1932, by the American Standards Association]

ELECTROLYTIC-COPPER WIRE BARS, CAKES, SLABS, BILLETS, INGOTS, AND INGOT BARS

(This specification is identical with A. S. T. M., B4, given above, with the exception that the copper does not have to originate on the northern peninsula of Michigan; that definitions and character of low-resistance and high-resistance lake copper are omitted; and that the following two paragraphs are included:)

1. *Metal content.*—The copper in all shapes shall have a purity of at least 99.900 per cent, as determined in accordance with the standard methods of battery assay of copper (see A. S. T. M., B34, 641.0, p. 1170), silver being counted as copper.

2. *Resistivity.*—All wire bars shall have a resistivity not to exceed 0.15436 international ohms per meter-gram at 20° C. (annealed); all ingots and ingot bars shall have a resistivity not to exceed 0.15694 international ohms per meter-gram at 20° C. (annealed).

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR FIRE-REFINED COPPER OTHER THAN LAKE, SERIAL DESIGNATION B72-28T, 1928

FIRE-REFINED COPPER OTHER THAN LAKE

1. (a) These specifications cover fire-refined copper, other than lake, and not usually electrolytically refined.

(b) Fire-refined copper, other than lake, is intended for use in rolling into sheets and shapes for mechanical purposes, and for certain grades of wrought-copper alloys, and is not intended for electrical purposes.

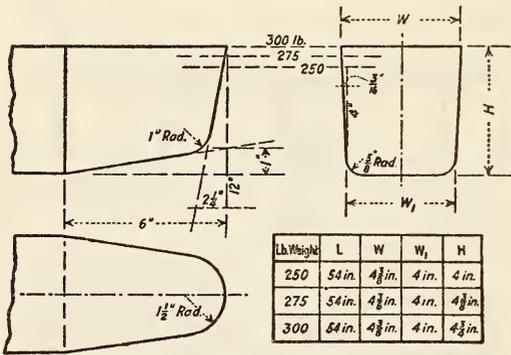

FIGURE 1077.—Mold for casting 240 to 300 pound wire bars

weight or dimension are claimed. If agreement is not reached, the question of fact shall be submitted to a mutually agreeable umpire, whose decision shall be final.

(b) In a question of metal contents, each party shall select a sample of three pieces from the consignment or lot to be investigated. These shall be sampled in the presence of both parties by drilling five holes, approximately one-half inch in diameter, at points equally spaced between the ends of the pieces. With bars, billets, ingots, and ingot bars, these holes should be along a middle line and with slabs and cakes on a diagonal line projected between opposite corners. The drilling shall be from top to bottom and completely through each piece. Scale from set and any surface dirt shall be rejected. No lubricant shall be used and drilling shall not be forced sufficiently to cause oxidation of the chips. In the case of sections having a depth greater than 5 inches, drillings may be made from both top and bottom for a depth of not less than 2 inches in each direction instead of completely through, but the drilling shall be otherwise conducted as before described.

The resulting sample shall be cut up, mixed and separated into three equal portions, each of which shall be placed in a sealed package, one for each party and the third for the umpire, if necessary.

CHEMICAL COMPOSITION

2. The copper in all shapes shall conform to the following requirements as to chemical composition:

	Per cent
Copper plus silver, minimum	99.7500
Arsenic, maximum	.1000
Antimony, maximum	.0060
Bismuth, maximum	.0022
Iron, maximum	.0050
Lead, maximum	.0075
Nickel, maximum	.1000
Oxygen, maximum	.0750
Selenium, maximum	.0100
Tellurium, maximum	.0010
Tin, maximum	.0500

(In respect to physical defects, permissible variations in weight and dimensions, marking, lots, claims, and chemical analysis, this specification is identical with A. S. T. M., B4, given above.)

NATIONAL METAL EXCHANGE (INC.) AND NATIONAL METAL CLEARING ASSOCIATION (INC.), BY-LAWS AND RULES, 1931

BY-LAWS CONCERNING COPPER

TENDERABLE GRADES OF COPPER FOR OLD STANDARD CONTRACT

Section 40-A.—The following grades of copper may be delivered against the National Metal Exchange (Inc.), old standard contract:

- Contract grades—*
 - Prime electrolytic copper.
 - Prime lake copper, assaying 99.90 per cent.
 - In ingots and/or ingot bars and/or wire bars of standard weights and sizes.
- Discount grades—*
 - Best selected copper, assaying 99.50 per cent.
 - Casting copper, assaying 99.50 per cent.
 - Casting copper, assaying 99.00 per cent.
 - In ingots and/or ingot bars of the usual weights and sizes.
- Discount grades—*
 - (Covers 5 grades of rough or blister copper, in 1 per cent assay steps, for copper assaying 98.00 to 94.00 per cent.)
 - In slabs and/or pigs weighing not more than 500 pounds.

Prime electrolytic copper to be deliverable as herein provided shall conform to the specifications and conditions given in American Society for Testing Materials specification B5-27.

(These by-laws also include discounts allowed from the contract price when any of the various discount grades above are delivered by the seller.)

TENDERABLE GRADES OF COPPER FOR "A" CONTRACT

Section 40-B.—The contract (basis) grade for the "A" contract shall be rough or blister copper assaying 99 per cent or better, deliverable at the contract price. (This by-law also includes the premiums and discounts applicable on any of 11 other grades which may be tendered against the "A" contract at the option of the seller.)

No copper assaying less than 94 per cent shall be a good delivery.

TENDERABLE GRADES OF COPPER FOR NEW STANDARD CONTRACT

Section 40-C.—The contract (basis) grade for the new standard contract shall be rough or blister copper assaying 99 per cent or better, deliverable at the contract price. (This by-law also includes 6 premium grades and 32 discount grades, with the premiums and discounts from the contract price specified, which may be tendered against the new standard contract.)

OFFICIAL LIST OF BRANDS OF COPPER

Section 42-A.—There shall be on file in the office of the secretary of the exchange descriptions and/or replicas of the brands of copper which may be

delivered against National Metal Exchange copper contracts, which shall be official when approved by the board of governors of the exchange.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR INGOT COPPER, QQ-C-521, MAY 13, 1932

INGOT COPPER

(This specification is basically similar to A. S. T. M., B4, given above. It provides for two grades of copper ingots, A and B, as shown below. Grade A corresponds to low-resistance lake in B4.)

GRADES

1. Ingot copper shall be furnished in two grades as required: Grade A, and grade B.

MATERIAL

2. Electrolytic copper or lake copper shall be furnished except as modified in paragraph 4 (b) below:

GENERAL REQUIREMENTS

3. Ingot copper shall be furnished in standard commercial-shaped ingots, between 9 and 12 inches in length, unless otherwise specified.

DETAIL REQUIREMENTS

4. (a) Grade A ingot copper shall be that known in the trade as "prime electrolytic" or "lake copper" and shall conform to the following table:

(b) Grade B ingot copper may be refined from ore or reclaimed from scrap and shall conform to the following table:

Grade	Copper, minimum ¹	Bismuth, maximum	Antimony, maximum	Arsenic, maximum	Sulphur, maximum
A-----	Per cent 99.90	Per cent (?)	Per cent 0.0025	Per cent 0.0025	Per cent 0.0035
B-----	99.50	0.01	.05	.0300	.006

Grade	Iron, maximum	Lead, maximum	Nickel, maximum	Tin, maximum
A-----	Per cent 0.004	Per cent 0.005	Per cent 0.20	Per cent 0.20
B-----	.10	.05		

¹ Silver to be computed as copper.
² None as determined from a 50 g sample.

TESTS AND METHOD OF INSPECTION

5. (a) Samples shall be taken as follows: One representative ingot shall be taken from each lot of 8,000 pounds or fraction thereof of an order. Two one-half inch holes shall be drilled from the top of ingot as cast to one-fourth inch from the bottom of each ingot selected for test. No lubricant shall be used and drilling shall not be forced sufficiently to cause oxidation of the chips. The drillings from the first one-eighth inch shall be discarded, and the inspector shall forward for analysis not less than 5 ounces of the remaining drillings, from each sample ingot, in a separate package for analysis. Drillings from all the samples of approximately equal weight for each full lot and not less

than 5 ounces from an order shall be thoroughly mixed and a portion taken therefrom for analysis unless a question of homogeneity of the metal arises, in which case separate analysis shall be made as may be deemed expedient. Copper shall be determined by electrolytic assay. Silver shall be counted as copper.

(b) Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative, and without cost to the contractor. The chemical composition thus determined shall conform to the requirements specified.

641.12 ROLLED BARS, COPPER.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR COPPER BARS FOR LOCOMOTIVE STAY BOLTS, SERIAL DESIGNATION B12-21, 1921

COPPER BARS FOR LOCOMOTIVE STAY BOLTS

SCOPE

1. These specifications cover two grades of copper for locomotive stay bolts; namely, arsenical and nonarsenical.

MANUFACTURE

2. The copper shall be fire-refined or electrolytic, and shall be finished to dimensions by hot-rolling from suitable bars.

CHEMICAL PROPERTIES AND TESTS

(Identical with A. S. T. M., B11 (see 641.21, p. 1176.), except that:)

3. An analysis may be made from one sample for each 5,000 pounds or fraction thereof of finished bars.

PHYSICAL PROPERTIES AND TESTS

(In respect to tensile strength, elongation, and retests, this specification is identical with B11, referred to above. In the matter of tests it varies from B11 in the following particulars:)

4. The test specimen shall bend cold through 180° flat on itself without cracking on the outside of the bent portion.

5. Tension and bend test specimens shall be of the full-size section of the bars as rolled.

6. One tension and one bend test shall be made from each 5,000 pounds or fraction thereof.

PERMISSIBLE VARIATIONS IN DIAMETER

7. The bars shall be truly round within 0.01 inch, and shall not vary more than 0.01 inch over nor more than 0.005 inch under the specified size.

(In respect to workmanship and finish, and marking, this specification is identical with A. S. T. M., B11, referred to above. In respect to inspection and rejection, and reheating, it conforms to A. S. T. M. standard specifications for steel. (See 605.0, p. 247).)

641.2 COPPER PLATES, SHEETS, SHAPES, AND STRIPS.

641.21. PLATES AND SHEETS. COPPER.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

COPPER PLATES AND SHAPES

(For general information and requirements see 600.0, p. 1. For test requirements see 600.1, p. 7.)

The material must be clean, smooth, of uniform color and quality, and free from defects. At least one tension test and one cold and one hot bend test should be made from each heat of the finished material. The material is to have a tensile strength of not less than 28,000 pounds per square inch, with an elongation of at least 25 per cent on a gage length of 8 inches. A test specimen must stand being bent cold through 180° flat on itself without fracture, and this specimen is to be subsequently drawn out cold by hammering to a fine point; a test specimen when heated to a dull red must stand being bent through 180° flat on itself in both directions without fracture. Sheets less than 0.072 inches in thickness will be subjected to bend tests only.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR COPPER PLATES FOR LOCOMOTIVE FIRE BOXES, SERIAL DESIGNATION B11-18, 1918

COPPER PLATES FOR LOCOMOTIVE FIRE BOXES

SCOPE

1. These specifications cover two grades of copper for locomotive fire boxes, namely, arsenical and nonarsenical.

MANUFACTURE

2. The copper shall be fire-refined or electrolytic, and hot-rolled from suitable cakes.

CHEMICAL PROPERTIES AND TESTS

3. The copper shall conform to the following requirements as to chemical composition:

(a) *Arsenical copper.*—Arsenical copper shall contain 0.25 to 0.50 per cent of arsenic, and shall not contain more than 0.120 per cent of impurities, exclusive of arsenic and silver.

(b) *Nonarsenical copper.*—Nonarsenical copper shall have a purity of at least 99.880 per cent as determined by electrolytic assay, silver being counted as copper. The total of impurities other than silver shall not exceed 0.120 per cent.

4. An analysis may be made by the purchaser from a broken tension-test specimen representing each plate as rolled. The chemical composition thus determined shall conform to the requirements specified in section 3.

PHYSICAL PROPERTIES AND TESTS

5. The material shall conform to the following minimum requirements as to tensile properties:

	Arsenical	Nonarsenical
Tensile strength.....lbs./in. ² ..	31,000	30,000
Elongation in 8 inches.....per cent..	35	30

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR COPPER RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, QQ-C-501, February 2, 1932

COPPER BARS

(See 642.11, p. 1180.)

6. The specimen shall bend both hot (500° to 700° C.) and cold through 180° without cracking on the outside of the bent portion as follows: For material 1 inch or under in thickness, flat on itself; and for material over 1 inch in thickness, around a pin, the diameter of which is equal to the thickness of the specimen.

7. Tension and bend test specimens shall be taken from the finished rolled material. They shall be of the full thickness of material as rolled, and shall be machined to the form and dimensions shown in Figure 128 in A. S. T. M. standard specifications for steel (see 605.0, p. 247.) except that bend-test specimens may be machined with both edges parallel.

8. (a) One tension, one cold-bend, and one hot-bend test shall be made from each plate as rolled.

(b) If any test specimen develops flaws it may be discarded and two other specimens substituted, each of which shall be free from flaws. If flaws appear in either or both of the substituted specimens, the lot shall be rejected.

(c) If the percentage of elongation of any tension-test specimen is less than that specified in section 5, and any part of the fracture is outside the middle third of the gage length, as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

(d) If any test specimen shows defective machining it may be discarded and another specimen substituted.

PERMISSIBLE VARIATIONS IN WEIGHT AND THICKNESS

9. The thickness of each plate shall not vary more than 0.04 inch under that ordered. An excess over the nominal weight corresponding to the dimensions on the order shall be allowed for each plate if not more than that shown in Table 1. One cubic inch of rolled copper is assumed to weigh 0.323 pound.

FINISH

10. The finished plates shall be free from injurious defects and shall have a workmanlike finish.

MARKING

11. The name or brand of the manufacturer, plate number, and grade shall be stamped on each plate. The plate number shall be legibly stamped on each test specimen.

TABLE 1.—Permissible overweights of plates ordered to thickness

Ordered thickness (in inches)	Weight per square foot	Permissible excess in average weights per square foot of plates for widths given (expressed in percentages of nominal weights)			
		Under 75 inches	75 to 100 inches exclusive	100 to 115 inches exclusive	115 inches or over
	<i>Pounds</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
5/16	14.53	8	12	16	17
3/8	17.44	7	10	13	13
7/16	20.34	6	8	10	12
1/2	23.25	5	7	9	11
5/8	26.16	5	6.5	8.5	10
3/4	29.06	5	6	8	9
Over 3/4		5	5	6.5	

INSPECTION AND REJECTION

(Inspection, rejection, and rehearing conform to the requirements specified in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 71, COPPER SHEET, FEBRUARY, 1929

COPPER SHEET

1. Composition in percentage:

	Per cent
Copper, minimum.....	99.50

2. Tensile strength and elongation.—

Copper	Thickness	Tensile strength per square inch	Elongation in 2 inches (minimum)
	<i>Inch</i>	<i>Pounds</i>	<i>Per cent</i>
Soft.....	0.005-0.031	(Max.) 37,000	20.0
	.032-.375	(Max.) 36,000	25.0
Hard 1.....	.072-.375	(Min.) 40,000	8.0
	Over .375	(Min.) 35,000	15.0

1 Hard copper less than 0.072 inch thick should be made as hard as possible and still stand cold bending through an angle of 180° flat back without fracture on the outside of the bent portion.

3. The thickness tolerances of sheet or strip made of this alloy shall be within the tolerances specified in S. A. E. Table 2. (See Table 5, F. S. B. QQ-C-501, given below.)

4. These should be considered as general specifications. Since copper is used for many purposes where the requirements of the operations used are too particular to be specified by any of the ordinary physical tests, it is frequently advisable to submit samples or drawings to the manufacturer and secure an adjustment of anneal or temper to suit the actual operations to which the material is to be submitted.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS; STANDARD THICKNESSES, WEIGHTS, AND TOLERANCES OF SHEET METAL (CUSTOMARY PRACTICE), CIRCULAR NO. 391, MARCH 24, 1931

AMERICAN WIRE GAGE COPPER PLATES AND SHEETS

(See 640.1, p. 1165.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR COPPER RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, QQ-C-501, FEBRUARY 2, 1932

COPPER PLATES, SHEETS, STRIPS

(For general specifications; grade, forms, and tempers; material and workmanship; detail requirements; physical properties; tests and methods of inspection; packing and marking; and notes, see 641.0, p. 1172.)

1. Plates, sheets, and strips, soft, shall be furnished hot-rolled, or cold-rolled and annealed, unless the particular process is specified in the contract or purchase order.

2. Sheets and strips, when ordered for spinning or drawing, shall be of such quality that after spin-

ning or drawing the material may be finished and present a good smooth surface which will not be spotted or open grained.

3. When specified in the contract or purchase order, plates, sheets, and strips shall be supplied with finished edges, as detailed hereinafter.

PERMISSIBLE VARIATIONS; PLATES, SHEETS, AND STRIPS

4. The permissible variations in thickness for sheets and strips 0.460 inch or less thick and 20 inches or less wide shall be as shown in Table 5.

TABLE 5.—Permissible variations in thickness of sheets and strips (plus or minus)

Thickness	Up to 6 inches wide, inclusive	Over 6 to 9 inches wide, inclusive	Over 9 to 14 inches wide, inclusive	Over 14 to 20 inches wide, inclusive
<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
0.460	0.0043	0.0045	0.0047	0.0049
.4096	.0042	.0044	.0046	.0048

.0050	.0008	.0009	.0010	.0011

5. The permissible variations in thickness for plates, sheets, and strips of all thicknesses and widths not covered in Table 5, shall be as shown in Table 6, except in no case shall the tolerance be less than that permitted by Table 5 for the same thickness.

TABLE 6.—Permissible variations in thickness of plates, sheets, and strips

Width (in inches)	Permissible variations	
	Plus	Minus
Up to 48, inclusive.....	Per cent 5	5
Over 48 to 60, inclusive.....	5	7
Over 60.....	5	8

6. The permissible variations in width for plates, sheets, and strips shall be as shown in Table 7:

TABLE 7.—Permissible variations in width of plates, sheets, and strips

Width (in inches)	Permissible variations	
	Plus	Minus
2 and less.....	<i>Inch</i> 0.010	<i>Inch</i> 0
Over 2 to 5, inclusive.....	.025	0
Over 5 to 14, inclusive.....	.050	0
Over 14.....	.125	0

7. Plates, sheets, and strips of all sizes may be ordered to exact lengths, in which case a variation of plus one-eighth inch on length shall be permitted.

8. When plates, sheets, and strips up to 14 inches wide are ordered in stock lengths, the pieces shipped shall be cut to the nominal or stock length as a maximum. The shortest acceptable lengths; the maximum permissible percentage by weight of short lengths; and the required percentage by weight of stock lengths in any one shipment shall be as shown in Table 8.

TABLE 8.—Permissible variations in length of plates, sheets, and strips up to 12 inches wide

Nominal or stock length (in feet)	Required per cent by weight of stock lengths	Maximum permissible percentage by weight of short lengths				
		8 to 10 feet	6 to 8 feet	4 to 6 feet	2 to 4 feet	Under 2 feet
10.....	60	40	30	20	10	0
8.....	70	30	20	10	0	0
6.....	80	20	10	0	0	0

For copper strips and sheets, tinned one side, ordered under this specification in weights per square foot as listed below, the permissible variations in thickness shall be as shown in Table 6 and 9.

TABLE 9

Weight per square foot	Thickness	Permissible variations (plus or minus) in thickness for widths			
		Up to 6 inches, inclusive	Over 6 to 9 inches, inclusive	Over 9 to 14 inches, inclusive	Over 14 to 20 inches, inclusive
<i>Ounces</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
12	0.0162	0.0014	0.0015	0.0016	0.0017
14	.0189	.0015	.0016	.0017	.0018
16	.0216	.0016	.0017	.0018	.0019
18	.0243	.0017	.0018	.0019	.0020
20	.0270	.0018	.0019	.0020	.0021

When specified, sheets and strips shall be suitable for either shallow cupping or deep cupping as required without the formation of symmetrically located ears resulting from directional properties in the strip or sheet.

By "shallow cupping" is meant the forming of any cup where the inside depth is less than the inside diameter.

By "deep cupping" is meant the forming of any cup where the inside depth is equal to or greater than the inside diameter.

9. When finished edges of plates and sheets are specified in the contract or purchase order, the following descriptions shall apply:

10. "Square edge" material shall be supplied with finishing edge, with sharp, square corners, without bevel or rounding of any sort.

11. "Round edge" material shall be supplied with finished edge, semicircular in form, the diameter of the circle forming the edge being equal to the thickness of the material.

12. "Round corners" material shall be supplied with square-finished edge, and corners rounded to a definite radius which, unless otherwise specified in the contract or purchase order, may be any radius less than one-half the thickness of the material.

13. When no description of any required form of edge is given, it shall be understood that edges such as would result from slitting, sawing, or shearing will be acceptable.

14. Plates, sheets, and strips shall be packed in boxes or crates sufficiently strong to protect them from injury and loss during shipment.

15. When material is ordered in the form of plates, sheets, or strips, it will be understood that these terms refer merely to the general form and dimensions of the material and do not have any technical significance as to the method of manufacture.

16. Contracts or purchase orders for sheets and strips should state the purpose for which the material is to be used, as, "for cupping," "for deep cupping," "for spinning," "for edgewise winding," "for bending at sharp right angles," etc.

17. The thickness of plates, sheets, and strips should be stated in decimals of an inch.

18. Plates, sheets, and strips should be ordered in as narrow widths as can be used.

641.22 SHAPES, COPPER.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

COPPER SHAPES

(See 641.21, p. 1176.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR COPPER RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, QQ-C-501, FEBRUARY 2, 1932

COPPER SHAPES

(This specification is identical with that for copper rods and bars (see 642.11, p. 1180) except in the following particulars:

1. For shapes, the permissible variation shall be as specified in the contract or purchase order.

2. Since the physical properties obtainable in shapes, hard temper, are dependent on the size and intricacy of the shape, the requirements for each particular order should be agreed upon between the contractor and purchaser.

641.23 STRIPS, COPPER.

642. MANUFACTURES OF COPPER

642.1 COPPER RODS, WIRES, AND SLEEVES.

642.11 RODS, COPPER.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR HOT-ROLLED COPPER RODS FOR WIRE DRAWING, DESIGNATION B49-26, 1926

COPPER RODS FOR WIRE DRAWING

SCOPE

1. These specifications cover black hot-rolled copper rods for wire-drawing purposes.

MANUFACTURE

2. The copper shall conform in quality and purity to the requirements of either A. S. T. M. B4 or B5. (See 641.11, p. 1173.)

3. (a) The rod shall be hot-rolled from standard wire bars.

(b) The rods shall be furnished in one continuous length without joints.

PHYSICAL PROPERTIES AND TESTS

4. (a) The rods shall conform to the following requirements as to tensile properties:

The elongation in 10 inches shall not be less than 25 per cent. The elongation shall be measured between bench marks placed upon the wire originally 10 inches apart and the fracture shall be between the bench marks and not closer than 1 inch to either bench mark. If, upon testing a sample from any coil or reel, the results do not conform to the specified requirements, two additional samples shall be tested and the average of the three tests shall determine acceptance or rejection of the coil or reel.

(b) Two tests shall be made from each carload of 50,000 pounds or less.

5. Electric resistivity shall be determined upon far samples by resistance measurements at a temperature of 20° C. (68° F.) and shall not exceed 891.58 pounds per mile-ohm.

DIMENSIONS AND PERMISSIBLE VARIATIONS

6. (a) The size shall be expressed as the diameter of the rod in decimal fractions of an inch.

(b) The rods shall be hot rolled to nominal size within the following permissible variations:

Diameter (inch)	Permissible variations	Diameter (inches)	Permissible variations
	<i>Inch</i>		<i>Inch</i>
0.250.....	+0.020	0.875.....	±0.020
.3125.....	±.010	1.00.....	±.020
.375.....	±.010	1.125.....	±.020
.500.....	±.015	1.250.....	±.020
.625.....	±.015	1.375.....	±.020
.750.....	±.015		

Sizes between those listed shall take the variation for the next larger size in the table.

7. For the purpose of calculating weights, cross sections, etc., the density of copper shall be taken as 8.89 g per cu cm at 20° C. (68° F.).

FINISH

8. The rod shall be free from all imperfections not consistent with the best commercial practice.

PACKING

9. Unless otherwise agreed upon, the rods shall be shipped in coils approximately 24 inches in inside diameter and each coil shall be bound tightly together with copper wire at two points approximately opposite to each other.

INSPECTION

10. The tests and inspection shall be made at the place of manufacture. The manufacturer shall afford the inspector representing the purchaser all reasonable facilities to assure him that the material conforms to all the requirements of the specifications.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR RODS, WELDING, NONFERROUS, FOR GAS WELDING, QQ-R-571, MAY 3, 1932

COPPER RODS

(For general specifications; types; material; general requirements; detail requirements; methods of inspection, tests, and chemical analysis; packing and marking of shipments; and notes see 600.0, P. 3.)

- 1. Copper rods may be used for general welding of copper sheets and rods.
- 2. Welding rods shall conform to the following chemical requirements:

TYPE C

	Per cent
Copper, minimum.....	99.75
Balance shall contain at least:	
Phosphorus.....	0.05
Or silicon.....	0.10

3. Standard sizes of copper rods for gas welding are:

Diameter (inch) $\frac{3}{8}$, $\frac{3}{16}$, $\frac{1}{4}$, $\frac{5}{16}$, and $\frac{3}{8}$

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR COPPER RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, QQ-C-501, FEBRUARY 2, 1932

COPPER RODS, BARS, SHAPES

(For general specifications; grade, forms, and tempers; material and workmanship; detail requirements; physical properties; tests and methods of inspection; packing and marking; and notes, see 641.0, p. 1172.)

MANUFACTURE

- 1. Rods, bars, and shapes may be manufactured by hot-rolling or extrusion, finished by such cold-rolling or cold-drawing as may be required, and straightened.
- 2. All rods and bars shall withstand being hammered hot to a fine point.

Permissible Variations; Rods, Bars, and Shapes

3. Rods and bars, except forging stock, measured on their diameters, or between parallel faces, shall not vary from the specified dimensions by more than the amounts shown in Table 2.

TABLE 2.—Permissible variations in diameter or thickness, rods and bars, except forging stock

Diameter or thickness (in inches)	Permissible variations	
	Rounds	Rectangular, square, hexagonal, etc.
0.50 and less.....	Inch ±0.0015	Inch ±0.0030
Over 0.50 to 1, inclusive.....	±.0020	±.0040
Over 1 to 2.5, inclusive.....	±.0025	±.0050
Over 2.5.....	±.0030	±.0060

4. Rods and bars for forging, measured on their diameters or between parallel faces, shall not vary from the specified dimensions by more than the amounts shown in Table 3.

TABLE 3.—Permissible variations in diameter or thickness, rods and bars for forging

Diameter or thickness (in inches)	Permissible variations for all sections
0.50 and less.....	Inch ±0.005
Over 0.50 to 1, inclusive.....	±.008
Over 1 to 2.5, inclusive.....	±.010
Over 2.5.....	±.015

5. Unless the contract or purchase order expressly stipulates that rods and bars are intended for forging, it shall be understood that the permissible variations specified in Table 2 shall apply.

6. For shapes, the permissible variation shall be as specified in the contract or purchase order.

7. Round rods, except forging stock, shall not be out of round more than one-half the permissible variation in diameter stated in Table 2.

8. Square, rectangular, and hexagonal rods, bars, and shapes shall have practically exact angles and shall have sharp corners unless otherwise specified.

9. Rods, bars, and shapes of all sizes may be ordered to exact lengths, in which case a variation of plus one-eighth inch on length shall be permitted.

10. When rods and bars one inch or less in diameter or thickness are ordered in stock lengths, the pieces shipped shall be cut to the nominal or stock length as a maximum. The shortest acceptable lengths and the maximum permissible percentage by weight of short lengths in any one shipment shall be as shown in Table 4.

TABLE 4.—Permissible variations in length of rods and bars

Nominal or stock length	Shortest acceptable length	Maximum permissible percentage, by weight, of short lengths
<i>Feet</i>	<i>Feet</i>	
20	12	80
18	10	80
16	10	80
14	8	80
12	8	40
10	6	40
8	6	40
6	4	40

11. Unless exact lengths are specified, rods and bars over 1 to and including 2 inches in diameter or thickness will be acceptable in random lengths of 4 to 10 feet, but in no case shall more than 40 per cent of lengths shorter than 10 feet be accepted.

12. Rods and bars over 2 inches in diameter or thickness will be ordered in special lengths.

13. Rods, bars, and shapes may be bundled for shipment.

642.12 WIRES, COPPER.

(Specifications and standards for electrical supplies are not included in this publication since, in the general classification of commodities in the "Encyclopedia series," electrical supplies are being placed with the classification division "machinery and vehicles." It is anticipated that standards and specifications for machinery and vehicles, including electrical supplies, will be the subject of a separate volume in the Encyclopedia series to be issued at a later date.

However, a list of the current nationally recognized standards and specifications for electrical copper wire, insulated electrical cord, and electrical cables, is given herein along with the names of the organizations sponsoring them.

These standards include standard sizes; construction of cables; dimensions of wire and cable; thicknesses of insulating coverings and metallic sheaths; requirements on materials entering into conductor, insulating covering, and sheaths; dielectric and insulation resistance requirements; flexibility requirements, etc.; and methods of test.)

American Bureau of Shipping, rules for building and classing steel vessels, 1930. Conductors and cables.

American Electric Railway Engineering Association; standard copper-wire tables, D1-16; round and grooved hard-drawn copper trolley wire, D2-30; high-voltage three-conductor paper-insulated lead-covered cable, D3-14; single-conductor paper-insulated lead-covered cable for 1,200 volts, D4-12; rubber-insulated wire and cable for power-distribution purposes, D10-30; motor leads, E216-27.

American Institute of Electrical Engineers; wires and cables, standard No. 30; recommended practice for electrical installations on shipboard, standard No. 45, includes cables and wires; tinned soft or annealed copper wire, standard No. 60; soft or annealed copper wire, standard No. 61; cotton-covered round copper magnet wire, standard No. 69; silk-covered round copper magnet wire, standard No. 70; enameled round copper magnet wire, standard No. 71.

American Railway Association, Electrical Section; electric wires and cables, XIX-a-21.

American Railway Association, Signal Section; enameled copper magnet wire, specification No. 4113; double-braided, weatherproof hard-drawn copper line wire, No. 7218; aerial braided cable for 660 volts or less, No. 8930; armored submarine cable for 660 volts or less and for 2,300 volts or less; lead-covered cable for 660 volts or less and for 2,300 volts or less, No. 9131; underground braided cable for 660 volts or less, No. 9420; copper bond wire, No. 10820; mineral-matter rubber-compound insulated signal wire, No. 11129; parkway cable, No. 14529.

American Railway Association, Telegraph and Telephone Section; paper-insulated lead-covered telegraph and telephone cable with high insulation, specification 1-A-9; hard-drawn bare copper wire, specification 1-A-13; annealed copper tie wires, specification 1-A-15; lead sheath office cable, specification 2-G-1; braided office cable, specification 2-G-2; single conductor cord, specification 2-G-11; twisted pair inside wire, specification 2-G-15;

single-conductor inside wire, 2-G-16; lead-sheath office cable quadded, 2-G-19; braided office cable of quadded rubber insulated No. 16 A. W. G. conductors, 2-G-22; double-conductor patching cord, 2-G-28; double-conductor switchboard cord, 2-G-29; reverse double-conductor cord, 2-G-32; single-conductor cord, 2-G-33.

American Society for Testing Materials; hard-drawn copper wire, B1-27; medium-drawn copper wire, B2-27; bare concentric-lay copper cable—hard, medium hard, or soft—B8-27; tinned soft or annealed copper wire for rubber insulation, B33-21; round and grooved hard-drawn copper trolley wire, B47-32; soft rectangular copper wire, B48-27; insulated wire and cable, D-27-31T.

Association of Electragists, International; electragist standards for wiring installations.

Association of Railway Electrical Engineers; tinned soft or annealed copper wire for rubber insulation, G-1-1; soft or annealed copper wire, G-1-2; 30 per cent rubber insulation for wire and cable for general purposes, G-1-3; cotton-covered round copper magnet wire, G-1-4; silk-covered round copper magnet wire, G-1-5; enameled round copper magnet wire, G-1-6.

Insulated Power Cable Engineers Association; impregnated paper-insulated lead-covered cable; recommended walls of insulation and of lead sheaths for paper-lead power cables; varnished cambric insulated cables.

International Association of Municipal Electricians; underground and aerial cable for fire-alarm, police, telegraph, traffic-signal, and street-lighting service.

National Board of Fire Underwriters; national electrical code, includes requirements for conductors.

National Electrical Manufacturers Association; handbook of supply standards, includes standards for intercommunicating telephone cable; handbook of radio standards, includes standards for connection cords.

Radio Manufacturers Association (Inc.); power cable, M4-505 and M4-506.

Society of Automotive Engineers; 1931 handbook, includes specifications for insulated cables, lighting and starting motor cable, magnet wire, soft or annealed copper wire.

Underwriters' Laboratories; armored cable and armored cord; flexible cord; heat-resisting fixture wire and flexible cord; heater cord; motion-picture cable and stove wire; nonmetallic sheathed cables; rubber-covered fixture wires; rubber-covered wire; rubber-sheathed cords; slow-burning and slow-burning weatherproof wires; varnished cloth wires and cables.

United States Government, Department of Commerce, Bureau of Mines; schedule 2C, explosion-proof mine equipment, includes requirements for trailing cables.

United States Government, Federal Specifications Board; rubber-covered wire and cables, specification No. 65.

642.13 SLEEVES, COPPER.

(No nationally recognized specifications available.)

642.2 COPPER CASTINGS, FERRULES, PIPES, AND TUBES.

642.21 CASTINGS, COPPER.

(No nationally recognized specifications available.)

642.22 FERRULES, COPPER.

(No nationally recognized specifications available.)

642.23 PIPES, COPPER.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

COPPER PIPES AND TUBES

(For general information and requirements see 600.0, p. 1. For test requirements see 600.1, p. 7.)

1. Seamless-drawn copper pipes and tubes subject to a working pressure of over 150 pounds are to be tested and inspected by the surveyor in accordance with the following requirements: The material used must be of the best quality, and the tubes must be true to form, of uniform thickness throughout, clean and smooth, and free from defects.

2. The test specimens are to be selected by the surveyor, and at least one set of tests is to be made for each lot of 2,000 pounds or less. The test specimens are to be annealed.

TENSILE TEST

3. A standard test piece must show the material to have a minimum tensile strength of 28,000 pounds per square inch, and a minimum elongation of 25 per cent.

FLATTENING TEST

4. A pipe 4 inches long must stand being flattened until the sides meet without showing signs of cracks or flaws. For brazed pipes the bending tests for plates may be applied. (See 641.21, p. 1176.)

FLANGING TEST

5. The end of the pipe must stand flanging cold without signs of cracks or flaws, the flange to be at an angle of 90° with the center of the pipe, and the width of the flange to be not less than one-fourth of the inside diameter of the pipe.

HYDROSTATIC TEST

6. All pipes are to be subjected to a hydrostatic test of not less than twice the working pressure for working pressures up to 1,000 pounds per square inch. For working pressures above 1,000 pounds per square inch the test pressure is to be equal to the working pressure plus 1,000 pounds per square inch.

GAGING AND MARKING

7. The minimum thickness shall not be less than specified by the purchaser and required by the rules.

8. Upon satisfactory compliance with the requirements, all pipes are to be legibly stenciled with the identification mark of the manufacturer, the test pressure, and A.B., showing that they have been satisfactorily tested and inspected by a surveyor to the bureau. Pipes developing defects previous to or during their installation shall be rejected, notwithstanding any previous acceptance.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

COPPER AND BRASS PIPES

(For general requirements see 607.4, p. 435.)

1. Copper pipes for pressures over 100 pounds per square inch should be seamless drawn. Copper pipes

should not be used to carry superheated steam. Copper pipes for steam, feed, and blow-off must be properly annealed before installation.

2. The minimum thickness of pipes shall be determined by the following formulas:

$$\text{Brazed copper and brass pipe } t = \frac{DW}{6000} + C$$

$$\text{Seamless copper and brass pipe } t = \frac{DW}{7000} + C$$

3. For special seamless brass pipe made of composition having a minimum tensile strength of 55,000 pounds per square inch and elongation of at least 30 per cent

$$t = \frac{DW}{8000} + C$$

Where

t = Thickness in inches.

D = Internal diameter in inches.

W = Working pressure in pounds per square inch. For feed pipes this should be 1.2 times the boiler pressure.

C = 0.06 inch for steam and water; 0.03 inch for air.

4. The reduction in thickness at the outer radius of bent pipes is to be considered in determining the required thickness.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR COPPER PIPE, STANDARD SIZES, DESIGNATION B42-24, 1924

COPPER PIPE**SCOPE**

1. These specifications cover seamless copper tubes and seamless copper pipe suitable for use in plumbing, boiler-feed lines, etc.

MANUFACTURE

2. (a) The pipe shall be cold-drawn to size.

(b) When pipe is required for bending, the purchaser shall so specify, in which case the pipe shall be furnished with a proper bending temper.

CHEMICAL PROPERTIES AND TESTS

3. The copper shall have a purity of at least 99.880 per cent as determined by electrolytic assay, silver being counted as copper.

4. The sample for chemical analysis shall consist of drillings, millings, or clippings, taken from the test specimens specified in section 9, equal quantities being taken from each specimen and thoroughly mixed. Samples so prepared shall be divided into three equal parts, each of which shall be placed in a sealed package—one for the seller, one for the purchaser, and one for an umpire if necessary.

PHYSICAL PROPERTIES AND TESTS

5. The material shall conform to the following minimum requirements as to tensile properties:

	Tensile strength	Elongation in 4 inches
Pipe less than 2 inches outside diameter.....	Lbs./in. ² 40,000	Per cent 10
Pipe 2 inches or over outside diameter (after annealing).....	30,000	25

6. (a) The test specimen, after being annealed, shall withstand being bent cold through 180° without cracking on the outside of the bent portion as follows: For material less than one-half inch in thickness, flat on itself; and for material one-half inch or over in thickness, around a pin the diameter of which is twice the thickness of the specimen. (Note that in F. S. B. No. WW-P-378 (see 642.24, p. 1187) this test says "around a diameter equal to its thickness.")

(b) In the case of pipe for bending, annealed full sections of the pipe shall withstand being bent cold through 180° without cracking on the outside of the bent portion, around a pin the diameter of which is one and one-half times the inside diameter of the pipe. This test shall be in addition to the test specified in paragraph (a).

7. (a) An annealed test specimen not more than 4 inches in length shall have a flange turned over at right angles to the body of the pipe without showing cracks or flaws. The width of this flange, as measured from the outside of the pipe, shall be one-fourth of the inside diameter of the pipe.

(b) In making the flange test it is recommended that the flaring tool and die block shown in Figure 1078 be used.

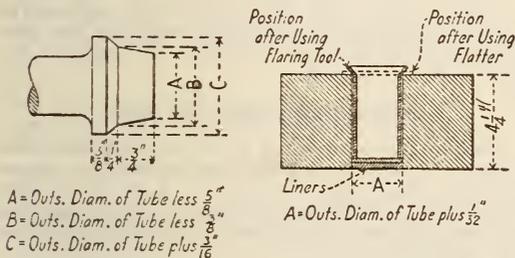

FIGURE 1078.—Flaring tool and die block

8. Each pipe shall withstand, without showing weakness or defects, an internal hydrostatic pressure sufficient to subject the material to a fiber stress of 6,000 pounds per square inch, determined by the formula for thin hollow cylinders under tension:

$$P = \frac{2tS}{D}$$

in which *P* equals the pressure in pounds per square inch, *t* equals the thickness of wall in inches, *D* equals the outside diameter of the pipe in inches, and *S* equals the allowable unit stress of the material or 6,000 pounds per square inch. No pipe shall be tested beyond a pressure of 1,000 pounds per square inch unless so specified.

9. (a) Tension-test specimens for pipe less than 2 inches in outside diameter shall consist of a full section of the unannealed pipe; the ends shall be plugged with metal plugs which shall not extend within the gage marks.

(b) In the case of pipe 2 inches or over in outside diameter and not exceeding 6 inches in outside diameter, the test specimen shall be cut longitudinally. In the case of pipe exceeding 6 inches in outside diameter, the test specimen shall be cut circumferentially. (Note that, in F. S. B. No. WW-P-378 (see 642.24, p. 1187), the corresponding specification calls for "six inches inside diameter.")

(c) The test specimen taken as specified in paragraph (b) shall be heated to a cherry red and straightened while hot. It shall then be machined to conform to Figure 1079. The width of the specimen shown in Figure 1079 shall be governed by the thickness of the material. For material one-fourth

inch or less in thickness, the width of the narrow portion of the test specimen shall be approximately one inch; for material over one-fourth inch in thickness, the width shall be such as to give a cross section of approximately one-fourth square inch in area, but in no case shall the width be less than the thickness of the material. The drawn surfaces shall not be machined, but be left in their original condition.

(d) The bend-test specimen shall consist of a strip, not over 1½ inches in width, cut longitudinally from the pipe.

10. One bend test shall be made for each 2,000 pounds or less of the finished product. For the remaining tests a sufficient number of pipe shall be taken at random to constitute 0.5 per cent of the shipment.

DIMENSIONS AND PERMISSIBLE VARIATIONS

11. The standard weights and dimensions for pipe of various outside diameters are given in Table 1.

12. (a) No single piece of pipe that exceeds the calculated weight by more than 5 per cent will be accepted. One cubic inch of the material is assumed to weigh 0.323 pound.

(b) The weight of the pipe shall vary not more than the following percentages from the weight specified in section 11; pipe 6 inches or less in diameter, 5 per cent; pipe from 6 to 8 inches in diameter, 7 per cent; pipe over 8 inches in diameter, 8 per cent.

TABLE 1.—Standard weights and dimensions for copper pipe

Size of pipe	Outside diameter	Standard pipe		Extra-strong pipe	
		Thick-ness	Nominal weight per foot of length	Thick-ness	Nominal weight per foot of length
<i>Inches</i>	<i>Inches</i>	<i>Inch</i>	<i>Pounds</i>	<i>Inch</i>	<i>Pounds</i>
⅞	0.405	0.0620	0.259	0.100	0.371
¾	.540	.0825	.460	.123	.624
⅝	.675	.0905	.643	.127	.847
½	.840	.1075	.957	.149	1.25
⅜	1.050	.1140	1.30	.157	1.71
1	1.315	.1265	1.83	.182	2.51
1¼	1.660	.1460	2.69	.194	3.46
1½	1.900	.1500	3.20	.203	4.19
2	2.375	.1565	4.23	.221	5.79
2½	2.875	.1875	6.14	.280	8.84
3	3.500	.2190	8.75	.304	11.82
3½	4.000	.2500	11.41	.321	14.37
4	4.500	.2500	12.94	.341	17.25
4½	5.000	.2500	14.46	.375	21.10
5	5.563	.2505	16.21	.375	23.67
6	6.625	.2500	19.41	.437	32.93
7	7.625	.2815	25.17	.500	43.34
8	8.625	.3125	31.63	.500	49.42
9	9.625	.3440	38.83	.500	55.56
10	10.750	.3655	46.22	.500	62.40

WORKMANSHIP AND FINISH

13. (a) The pipe shall be round and of uniform thickness throughout. It shall be free from cracks, slivers, seams, scale, and other surface defects.

(b) The thickness at any point shall not be less than that specified in section 11 by more than the following percentages: Pipe 6 inches or less in diameter, 5 per cent; pipe from 6 to 8 inches in diameter, 7 per cent; pipe over 8 inches in diameter, 8 per cent.

INSPECTION AND REJECTION

14. When the pipe is finished and ready for shipment the inspector shall make the tests to govern

the acceptance of the pipe. If any specimen fails to meet the requirements of sections 5 to 8, inclusive, two additional specimens may be taken, each of which shall conform to the requirements specified.

(The inspection requirements are identical with those for seamless admiralty condenser tubes and ferrule stock in B44. (See 645.24, p. 1220.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, STEAMBOAT INSPECTION SERVICE; GENERAL RULES AND REGULATIONS, MAY 4, 1929

COPPER PIPE

No copper pipe constructed after June 30, 1905, shall have any bend whose radius is less than one and one-half times the diameter of the pipe, and such pipe shall be so led and flanges so placed that they may be readily taken down if required. Such pipes shall be protected by iron casings when run through coal bunkers, and shall be clear of the coal chutes. The thickness of material, according to the working pressure, shall be determined by the following formula:

$$T = \frac{P \times D}{8000} + 0.0625$$

Where

T = thickness in inches.

P = working pressure.

D = inside diameter of pipe in inches.

Example.—Required, the thickness of material of a 5-inch copper pipe for a working pressure of 175 pounds per square inch.

Substituting values, we have

$$T = \frac{175 \times 5}{8000} + 0.0625 = 0.171 \text{ inch}$$

Provided, however, that all copper pipe subject to pressure and installed for use on steam vessels after July 1, 1911, shall have a thickness of material according to the working pressure, to be determined by the following formula:

$$T = \frac{P \times D}{6000} + 0.0625$$

Where

T = thickness in inches.

P = working pressure.

D = inside diameter of pipe in inches.

Example.—Required, the thickness of material of a 5-inch copper pipe for a working pressure of 175 pounds per square inch.

Substituting and solving, we have

$$T = \frac{175 \times 5}{6000} + 0.0625 = 0.208.$$

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR PIPE AND TUBING; COPPER, SEAMLESS: PIPE (STANDARD IRON-PIPE SIZE); TUBING (FOR PRESSURES UP TO 450 POUNDS PER SQUARE INCH), WW-P-378, MAY 27, 1930

SEAMLESS COPPER PIPE

(See 642.24, p. 1187.)

642.24 TUBES, COPPER.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

COPPER PIPES AND TUBES

(See 642.23, p. 1182.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SEAMLESS COPPER BOILER TUBES, DESIGNATION B13-18, 1918

SEAMLESS COPPER BOILER TUBES

SCOPE

1. These specifications cover two grades of copper tubes for locomotive boilers; namely, arsenical and nonarsenical.

MANUFACTURE

2. The copper shall be fire refined or electrolytic and shall be made into tubes either by the hot-rolling or cold-drawing process. It shall be finished by cold drawing.

CHEMICAL PROPERTIES AND TESTS

(Requirements covering both arsenical and nonarsenical copper are identical with those for copper plates for locomotive fireboxes in A. S. T. M. B11 (see 641.21, p. 1176) except that in this case the arsenical copper shall contain from 0.15 to 0.35 per cent of arsenic.)

3. Analyses of two tubes in each lot of 250 or less may be made by the purchaser. The chemical composition thus determined shall conform to the requirements specified above. Drillings for analyses shall be taken from several points around each tube, or turnings may be taken from the end of the tube.

4. If the analysis of any one tube does not conform to the requirements specified, analyses of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified.

PHYSICAL PROPERTIES AND TESTS

5. Tubes will be furnished hard or annealed, as specified. Test specimens taken from hard tubes shall be annealed before testing.

6. A test specimen not more than 4 inches in length shall have a flange turned over at right angles to the body of the tube, without showing cracks or flaws. This flange, as measured from the outside of the tube, shall be three-eighths inch wide for tubes $2\frac{1}{2}$ inches or under in outside diameter, and one-half inch wide for tubes over $2\frac{1}{2}$ inches in outside diameter.

(For illustration of flaring tool and die block used in making the flange test, see A. S. T. M. B42 (642.23, p. 1182).)

7. A test specimen $2\frac{1}{2}$ inches in length shall withstand crushing longitudinally until the outside folds are in contact, without showing cracks or flaws.

8. All tubes shall withstand an internal hydrostatic pressure of 750 pounds per square inch. The hydrostatic-pressure test shall be applied to the finished tubes before annealing.

9. (a) Test specimens shall consist of sections cut from tubes selected by the inspector representing

the purchaser from the lot offered for shipment. They shall be smooth on the ends and free from burrs.

(b) All specimens shall be tested cold.

10. One flange and one crush test shall be made from each of two tubes in each lot of 250 or less. Each tube shall be subjected to the hydrostatic test.

11. If the results of the physical tests of only one tube from any lot do not conform to the requirements specified, retests of two additional tubes from the same lot shall be made, each of which shall conform to the requirements specified.

STANDARD WEIGHTS

12. The standard weights for tubes of various outside diameters and thicknesses are as follows:

Thickness		Outside diameter (inches)				
B. w. g.	Inch	1½	1¾	2	2¼	2½
		Weight per foot				
		Pounds	Pounds	Pounds	Pounds	Pounds
13	0.095	1.624	1.913	2.202	2.491	2.779
12	.109	1.844	2.176	2.507	2.839	3.170
11	.120	2.015	2.380	2.744	3.109	3.474
10	.134	2.227	2.634	3.042	3.449	3.857
9	.148	2.434	2.884	3.334	3.785	4.235

13. The weight of the tubes shall not vary more than 5 per cent from that specified in section 12.

WORKMANSHIP AND FINISH

14. (a) The finished tubes shall be circular within 0.02 inch, and the mean outside diameter shall not vary more than 0.015 inch from the size ordered.

(b) The thickness at any point shall not vary more than 10 per cent from that specified.

(c) The length shall not be less, but may be 0.125 inch more than that ordered.

15. The finished tubes shall be free from injurious defects and distortion and shall have a workman-like finish.

MARKING

16. The name or brand of the manufacturer and "tested at 750 pounds" shall be legibly stenciled on each tube.

INSPECTION AND REJECTION

(Requirements covering inspection and rejection are identical with those for copper plates for locomotive fire boxes in A. S. T. M. B11 (see 641.21, p. 1176), except that tubes are substituted for plates, and the addition of the following paragraph:)

17. Tubes when inserted in the boiler shall withstand expanding and bending without showing cracks or flaws. Tubes which fail in this manner will be rejected, and the manufacturer shall be notified.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR BRIGHT ANNEALED SEAMLESS COPPER TUBING, B68-30T, 1930

ANNEALED SEAMLESS COPPER TUBING

1. These specifications cover annealed copper tubing suitable for use in refrigerators, oil lines, gasoline lines, etc., where tubing absolutely free from scale and dirt is required.

MANUFACTURE

2. The tubing shall be made from copper that has been deoxidized by means of phosphorus.

3. The tubing shall be bright annealed after the last drawing operation or after the coiling, if coiling is required.

4. The tubing shall be thoroughly recrystallized and have an average grain size not exceeding 0.040 mm in diameter.

CHEMICAL PROPERTIES AND TESTS

5. The material shall conform to the following requirements as to chemical composition:

Copper, minimum.....	Per cent	99.90
Phosphorus, maximum.....		.10

6. (Sampling is the same as for copper pipe in A. S. T. M. B42 (see 642.23, p. 1182), except that the sample shall be taken from each lot of 5,000 pounds or fraction thereof.)

PHYSICAL PROPERTIES AND TESTS

7. (a) The material shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	30,000
Elongation in 2 inches.....	per cent..	40

(b) Five test specimens shall be selected for physical test from each lot of 5,000 pounds or fraction thereof.

PERMISSIBLE VARIATIONS IN DIMENSIONS

8. The mean inside and outside diameters and the wall thickness of the tubing shall not vary more than the following amounts from that specified:

Mean inside and outside diameters (in inches)	Permissible variations
Up to 1, inclusive.....	Inch ±0.0025
Over 1 to 2, inclusive.....	±.003

Wall thickness

Stubbs gage No.	Inches	Permissible variations
Under 14 to 17, inclusive.....	0.082 to 0.058, inclusive....	Inch ±0.004
Under 17 to 20, inclusive.....	0.057 to 0.035, inclusive....	±.003
Under 20 to 23, inclusive.....	0.034 to 0.025, inclusive....	±.0025
Under 23.....	Under 0.025.....	±.0025

No combination of variations on the same tube shall make the thickness of the wall vary from the nominal thickness by more than these amounts.

9. The lengths of the tubing, when measured at a temperature of 68° F. (20° C.) shall not vary from that specified on the purchase order by more than the following amounts:

For straight lengths

Ordered length (in feet)	Permissible variations	
	Minus	Plus
Up to 8, inclusive.....	Inch 0	Inch 1/10
Over 8 to 15, inclusive.....	0	1/8
Over 15 to 20, inclusive.....	0	3/10

For coils

Ordered length (in feet)	Permissible variations	
	Minus	Plus
	Inch	Inches
Up to 10.....	0	2
Over 10 to 20, inclusive.....	0	3
Over 20 to 40, inclusive.....	0	6
Over 40 to 80, inclusive.....	0	12
Over 80.....	0	24

WORKMANSHIP AND FINISH

10. The finished tubing shall be smooth, free from interior and exterior mechanical imperfections, and shall have a clean, bright appearance.

PACKING AND MARKING

11. The tubing shall be packed in such a manner as to prevent damage in ordinary handling and transportation.

12. All boxes, bundles, or barrels shall bear the following information: Purchase order number, manufacturer's name, size and kind of material, and part number, if any.

REJECTION

13. Material failing to comply with the above specifications may be rejected and returned for replacement or full credit at the option of the purchaser.

AMERICAN SOCIETY FOR TESTING MATERIALS, SPECIFICATIONS FOR SEAMLESS COPPER TUBES, DESIGNATION B75-30, 1930

SEAMLESS COPPER TUBES

SCOPE

1. These specifications cover seamless copper tubes suitable for general engineering uses.

MANUFACTURE

2. The tubes shall be cold drawn to size.

3. (a) Unless otherwise specified, the tubes shall be furnished hard drawn.

(b) When tubes are ordered "hard," test specimens shall be annealed before testing.

CHEMICAL PROPERTIES AND TESTS

(Requirements covering chemical properties and tests are the same as those for copper pipe in A. S. T. M. B42 (see 642.23, p. 1182), except that in this case the copper shall have a purity of at least 99.90 per cent.)

PHYSICAL PROPERTIES AND TESTS

4. The tubes selected for test shall be capable of standing the following test without showing cracks or flaws: Pieces 4 inches in length cut from the ends of the test tubes shall be hammered flat so that a gage set at three times the thickness of the metal shall pass over the tube freely throughout the flattened part.

5. Pieces 3 inches in length cut from each tube selected for test shall, when split, stand opening out flat without showing cracks or flaws.

6. (a) A strip not over 1½ inches in width shall be taken from each test tube which, after annealing, shall stand being bent flat on itself without showing signs of fracture on the outside bent surface, and the ends of the bend-test specimen shall stand hammering down hot or cold to a knife-edge without showing signs of cracks.

(b) When tubes 2 inches in diameter or under are ordered fully annealed, full sections of the tubes shall stand being bent 180° around a diameter one and one-half times the inside diameter of the tube without cracking on the outside bent surface.

(Requirements covering flange test, including flaring tool and die block, and hydrostatic test are identical with those for copper pipe in A. S. T. M. B42 (see 642.23, p. 1182), substituting the word tube for pipe.)

7. A number of tubes equivalent to 0.5 per cent of the shipment shall be selected at random for purpose of tests. One hammering, one opening, one bend, and one flange test shall be made on each tube so selected.

DIMENSIONS AND PERMISSIBLE VARIATIONS

8. The standard weight of any tube shall be based upon the assumption that one cubic inch of the material weighs 0.323 pound.

9. (a) The mean inside or outside diameters of the tubing shall not vary from that specified by more than the following amounts:

Mean diameter (in inches)	Permissible variation
Up to 1, inclusive.....	Inch ±0.0025
Over 1 to 2, inclusive.....	±.003
Over 2 to 3, inclusive.....	±.004
Over 3 to 4, inclusive.....	±.005
Over 4 to 5, inclusive.....	±.006
Over 5 to 6, inclusive.....	±.007
Over 6 to 8, inclusive.....	±.008
Over 8 to 10, inclusive.....	±.010

(b) No combination of variations on the same tube shall make the thickness of the wall vary from the nominal thickness by more than the amount specified in Table 1.

TABLE 1.—Permissible variations from the standard tube thickness

Stubbs gage No.	Standard tube thickness Inch	Diameter (inches)			
		Up to 2, inclusive	Over 2 to 4, inclusive	Over 4 to 7, inclusive	Over 7 to 10, inclusive
Over 2-0.....	Over 0.380.....	Per cent ±5	Per cent ±5	Per cent ±6	Per cent ±6
Under 2-0 to 2, inclusive.....	0.379 to 0.284, inclusive.....	Inch ±0.012	Inch ±0.014	Inch ±0.016	Inch ±0.018
Under 2 to 5, inclusive.....	0.283 to 0.220, inclusive.....	±.010	±.012	±.014	±.016
Under 5 to 8, inclusive.....	0.219 to 0.165, inclusive.....	±.008	±.010	±.012	±.014
Under 8 to 11, inclusive.....	0.164 to 0.120, inclusive.....	±.006	±.008	±.010	±.012
Under 11 to 14, inclusive.....	0.119 to 0.083, inclusive.....	±.005	±.007	±.009	±.011
Under 14 to 17, inclusive.....	0.082 to 0.053, inclusive.....	±.004	±.006	±.008	±.010
Under 17 to 20, inclusive.....	0.057 to 0.035, inclusive.....	±.003	±.005	±.007	-----
Under 20 to 23, inclusive.....	0.034 to 0.025, inclusive.....	±.0025	±.004	-----	-----
Under 23.....	Under 0.025.....	±.0025	-----	-----	-----

(In workmanship and finish, and in rejection, this specification conforms to A. S. T. M. B42 (see 642.23, p. 1182), while inspection is identical with B44 (see 645.24, p. 1220).)

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS;
SPECIFICATION NO. 75, COPPER TUB-
ING, MARCH, 1922**

COPPER TUBING

Composition in percentage.

Copper, minimum.....	Per cent 99.50
----------------------	-------------------

1. *Hard-drawn tubes; bend test.*—One test specimen cut longitudinally and one cut transversely from the tube shall be tested. Test specimens must withstand cold-bending through an angle of 180° on a radius equal to the thickness of the wall of the tube without cracking.

2. *Annealed tubes; bend test.*—One test specimen cut longitudinally and one cut transversely from the tube shall be tested. Test specimens must withstand bending through an angle of 180°; that is, flat on itself, without cracking. The metal must not crack when hammered to a fine edge.

(In respect to dimensional tolerances, expanding test, appearance, special limits, and footnotes, this specification is identical with S. A. E. specification No. 74, see 645.24, p. 1221.)

**UNITED STATES GOVERNMENT, FEDERAL
SPECIFICATIONS BOARD, FEDERAL
SPECIFICATION FOR PIPE AND TUBING;
COPPER, SEAMLESS; PIPE (STANDARD
IRON-PIPE SIZE); TUBING (FOR PRES-
SURES UP TO 450 POUNDS PER SQUARE
INCH) WW-P-377 AND WW-P-378, MAY
27, 1930**

SEAMLESS COPPER TUBING AND PIPE

APPLICABLE FEDERAL SPECIFICATIONS

The following Federal specifications, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification	Former No.	Title	See—
GGG-P-351	238	Pipe threads.....	607.0, p. 365.
QQ-M-151	339	General specifications for metals.	600.0, p. 3.

B. GRADE AND TYPES

B-1. Seamless copper tubing and pipe shall each be of but one grade.

B-2. Seamless copper tubing shall be furnished in the following types:

Type	Maximum nominal working pressure
	<i>Lbs./in.²</i>
A	100
B	200
C	300
D	450

B-2a. These types are selected to give a stress not greater than 4,000 pounds per square inch in

the formula $t = \frac{P \times D}{2S}$ under hydrostatic pressures as

indicated opposite each type.

t = thickness in inches.

P = pressure, pounds per square inch.

D = inside diameter in inches.

S = stress in pounds per square inch.

B-3. For test pressures, see Table 3.

C. MATERIAL AND WORKMANSHIP

C-1. The pipe or tubing shall be made of copper, tubing having a purity of at least 99.88 per cent and pipe having a purity of 99.90 per cent, as determined by electrolytic assay, silver being counted as copper.

C-2. The pipe or tubing shall be clean, smooth, and free from grooving and indentations, cracks, flaws, or other defects; round, straight, of the proper dimensions, and with ends cut square.

D. GENERAL REQUIREMENTS

(Requirements for assumed weight of a cubic inch of the material, and tolerances for underweight and gage are the same as those for copper pipe in A. S. T. M. B42.) (See 642.23, p. 1182.)

D-2. The ends of the pipe or tubing shall not be threaded unless so ordered. Pipe threads shall be in accordance with the dimensions given in the table of standard taper pipe threads as contained in the Federal specification GGG-P-351 for standard pipe threads for pipe and pipe fittings (F. S. B. No. 238), in effect on date of invitation for bids. (See 607.0, p. 365.) Tubing-thread details shall be furnished by the purchaser.

D-3. When tubes or pipes are ordered to exact length, a variation of plus one-eighth inch on the length shall be permitted. No minus tolerance shall be permitted.

D-4. The permissible variations in average outside diameter of copper pipe and tubing shall be as given in Table 1 and Table 1A.

TABLE 1.—Permissible variations in average outside diameter of seamless tubes

Outside diameter	Permissible variation in average outside diameter
0.50 and less.....	<i>Inch</i> ±0.0020
Over 0.50 to 0.75, inclusive.....	±.0025
Over 0.75 to 1.00, inclusive.....	±.0030
Over 1.00 to 1.25, inclusive.....	±.0035
Over 1.25 to 1.50, inclusive.....	±.0040
Over 1.50 to 1.75, inclusive.....	±.0045
Over 1.75 to 2.00, inclusive.....	±.0050
Over 2.00.....	(1)

1 ±0.25 per cent of outside diameter.

1 1/4	±.0045	8	±.0215
1 1/2	±.0050	10	±.0270
2	±.0060		

E. DETAIL REQUIREMENTS

(In respect to pipe size, outside diameter, thickness, and weight per foot in pounds, this specification is identical with A. S. T. M. B42 (see 642.23, p. 1182), except that B42 includes data on 4½, 7, and 9 inch pipes. Additional data on copper pipe, iron pipe size, are as follows:)

TABLE 2.—Additional data on copper pipe, iron-pipe size

Iron-pipe size	Diameter, inside	Minimum test pressure
<i>Inches</i>	<i>Inches</i>	<i>Lbs./in.²</i>
1½	0.281	1,000
1¼	.375	1,000
¾	.494	1,000
1½	.625	1,000
¾	.822	1,000
1	1.062	1,000
1¼	1.368	1,000
1½	1.600	1,000
2	2.062	900
2½	2.500	900
3	3.062	900
3½	3.500	900
4	4.000	800
5	5.062	600
6	6.125	500
8	8.000	500
10	10.019	400

E-2. *Copper tubing.*—The dimensions and weights of the various sizes of copper tubing shall be as given in Table 3. Other diameters and thicknesses may be specified when required.

TABLE 3.—Standard weights and dimensions of seamless copper tubes¹

TYPE A				
Outside diameter	Thick-ness	Inside diameter	Weight per foot of length	Mini-mum test pressure
<i>Inches</i>	<i>Inch</i>	<i>Inches</i>	<i>Pounds</i>	<i>Lbs./in.²</i>

8.625	.436	7.753	43.476	650
10.750	.544	9.662	67.607	650

E-3. When copper pipe (I. P. S.) is ordered in random stock lengths, it shall be furnished in any lengths from 12 to 16 feet, inclusive.

E-4. When tubes are ordered in nominal stock lengths, the pieces shipped shall be cut to the nominal length as a maximum. The shortest acceptable lengths and the maximum permissible percentage by weight of short lengths shall be the same as for copper rods and bars in F. S. B. QQ-C-501. (See 642.11, p. 1180.)

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. Every pipe or tube shall withstand an internal hydrostatic pressure in accordance with Tables 2 and 3 and shall be perfectly tight under pressure and show no signs of bulging, cracks, flaws, porous places, or other defects.

F-2. All pipe shall be surface inspected for defects by rolling on a set of wooden horses or other suitable supports so that the entire surface of each pipe may be properly examined. In the event of failure of 10 per cent of any lot presented for inspection to pass the surface inspection and gaging tests, that lot shall be rejected.

F-3. A strip not over 1½ inches wide shall be taken from each lot of 2,000 pounds or less of pipe or tubing and shall stand the following tests:

F-3a. If less than half an inch thick, it shall stand after annealing bending flat on itself without signs of fracture on the outer surface.

F-3b. If one-half inch thick or over, it shall stand after annealing, a 180° bend around a diameter equal to its thickness without showing signs of fracture on the outer surface.

F-3c. The ends of all specimens used for the bending tests shall stand hammering down hot and cold to a knife edge without showing signs of cracks.

F-4. Each lot of pipe or tubing of the same diameter, 2½ inches outside diameter or less, shall be subjected to a hot bend test. One piece of full section in sufficient length shall be selected from each lot of 1,000 pounds or less, to represent the lot. The sample shall withstand bending while hot (low red heat, about 1,300° to 1,400° F.) 180° around a mandrel of one and one-half times the inside diameter of the tubing or pipe without sign of cracks or draws on the outside of the bent portion.

F-5. Additional test specimens from pipes or tubes from which tension, bend, and hammer test specimens have been taken shall stand flanging cold

after annealing; the width of the flange measured from the outside of the pipe or tube shall be one-fourth of the inside diameter of the pipe or tube.

F-6. Each lot of pipe or tubing of the same diameter, 2 inches inside diameter and over, shall be subjected to tension tests. One piece from each lot of 1,000 pounds or less shall be selected to represent the lot. If from 2 to 6 inches inside diameter for tubes and 2 to 5 inches I. P. S. for pipe, the test specimens shall be cut longitudinally; if over 6 inches inside diameter for tubes and 5 inches I. P. S. for pipe, they shall be cut circumferentially. All the test specimens shall be heated to a cherry red and straightened when hot, then annealed and machined to the shape of the standard type 8-inch test specimen. (See Figure No. 1079.)

F-7. For thicknesses up to and including one-half inch the width of the narrow part of the test specimen shall be about 1½ inches. For the thicker pieces the width shall be such as to give a cross section of about half a square inch, but the breadth shall not in any case be less than the thickness.

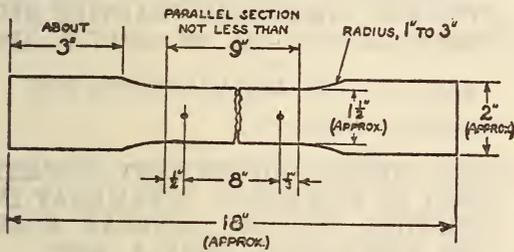

FIGURE 1079.—Standard type 8-inch test specimen

The surfaces shall not be machined but shall be left in their original condition.

F-8. Each test specimen shall show an ultimate tensile strength (after being annealed) of at least 30,000 pounds per square inch and an elongation of at least 25 per cent in 8 inches.

F-9. One piece of pipe selected from the completed lot (ready for shipment) shall stand threading in a satisfactory manner with the standard pipe threads for pipe and pipe fittings for that size of pipe.

F-10. Drillings, millings, or clippings for chemical analysis shall be taken from several points around each piece selected for physical tests and the chips from each lot combined and thoroughly mixed. The resultant sample shall be free from dirt, grit, and other foreign matter and shall consist of at least 2 ounces.

G. PACKAGING, PACKING, AND MARKING OF SHIPMENTS

G-2. *Packaging.*—Unless otherwise specified, commercial packages are acceptable under this specification.

G-3. *Packing.*—For domestic shipment, current commercial packing which will insure delivery in good order; for export, respective specifications of individual departments shall govern.

G-4. *Marking.*—Unless otherwise specified, shipments of the purchases of departments and establishments of the United States Government shall be marked with the name of the material, the size, type, and the quantity contained therein, as defined by the contract or order under which the shipment is made, the name of the contractor, and the number of the contract or order.

I. NOTES

- I-1. Pipe is regularly designated by iron-pipe size.
- I-2. Tubing is regularly designated by outside diameter and thickness.

I-3. When tubes or pipes are required to exact length it should be so stated on the requisition.

I-4. Tubing shall be furnished annealed or dead soft annealed when so specified by the order.

I-5. It is believed that this specification is adequate and that normally no samples will be necessary to determine compliance with the requirements, prior to award. If, for a particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids.

642.3 GRAVITY BATTERY COPPERS.

AMERICAN RAILWAY ASSOCIATION, SIGNAL SECTION, SPECIFICATION FOR GRAVITY BATTERY COPPERS, NO. 3328, JULY, 1928

GRAVITY BATTERY COPPERS

PURPOSE

The purpose of this specification is to provide coppers to be used as the cathodes of gravity battery cells.

DRAWINGS

Figure 1080 forms an essential part hereof.

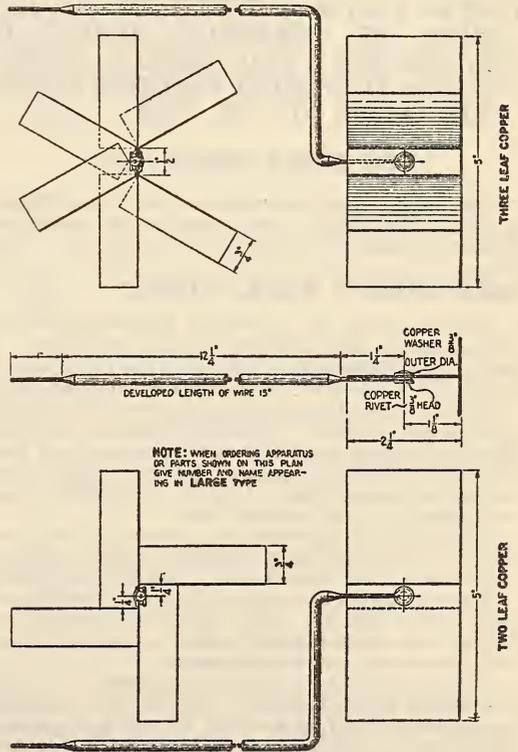

FIGURE 1080.—Coppers

MATERIAL AND WORKMANSHIP

Material and workmanship shall be first class in every respect.

Coppers shall be of 2-leaf. As an alternate 3-leaf may be specified. Leaves shall be of No. 30 A. W. G. hard-rolled bright copper not less than 98 per cent pure. The lead wire shall be No. 14 A. W. G. solid soft-drawn copper, insulated throughout the entire length, except 1 inch at each end. The insulation shall consist of ¼-inch wall of rubber, of a character

suitable to withstand the action of the battery solution, and must adhere tightly to the wire.

Rivets and washers shall be of copper not less than 98 per cent pure. Insulation of the wire shall be trimmed either tapered or square at the ends and in the operation the wire must not be scored. The end of the wire attached to the copper must be thoroughly cleaned and tightly riveted to the copper. Leaves, rivets, and wire shall be properly assembled.

PACKING

Coppers shall be carefully and securely packed in lots of 50. As an alternate, packing in lots of 100 may be specified.

642.4 COPPER WIRE CLOTH.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR NONFERROUS INSECT SCREEN CLOTH, DESIGNATION B50-29, 1929

INSECT SCREEN CLOTH

(See 645.39, p. 1228.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, WIRE INSECT SCREEN CLOTH, SIMPLIFIED PRACTICE RECOMMENDATION NO. 122, 1931

WIRE INSECT SCREEN CLOTH

(For steel wire insect screen cloth, see 603.43, p. 195. For copper wire insect screen cloth, see 646.52, p. 1256.)

642.5 HOLLOW WARE, COPPER.

(Specifications for containers frequently include requirements applicable to copper containers. A list of specifications in which there are requirements applicable to copper containers is given herewith:

Underwriters' Laboratories, standards for electric lighting plants, 1921. Includes fuel tanks for installation at engine, made of copper, brass, or cast iron. Requirements on capacity, general design, wall thickness, construction of joints, connections, and vent openings, and pressure test.

Underwriters' Laboratories, standards for gas-line stoves for cooking and heating, 1928. Includes requirements for lift-out tanks and pressure tanks.

Underwriters' Laboratories, standards for internal-combustion engines, 1920. Includes requirements for fuel tanks installed at the engine, made of copper, cast iron, or protected sheet steel.

Underwriters' Laboratories, standards for kerosene stoves for cooking and heating, 1927. Includes requirements for fuel tanks of lift-out and pressure types, made of glass, copper, brass, or steel sheets.

United States Government, Federal Specifications Board, Federal specification for sterilizers, dressing containers, etc., No. 68a, 1925. (Current designation GG-S-751.) Includes requirements on construction, dimensions, thickness of metal, burner or electric heater requirements, for 6 sizes of sheet

copper sterilizers for instruments and for sheet copper sterilizer for utensils, with requirements for pressure test.)

642.6 BRUSH COPPER AND MATS.

642.61 BRUSH COPPER.

(No nationally recognized specifications available.)

642.62 MATS, COPPER.

(No nationally recognized specifications available.)

642.9 MISCELLANEOUS MANUFACTURES OF COPPER.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, EAVES TROUGH, CONDUCTOR PIPE, CONDUCTOR ELBOWS, AND FITTINGS, SIMPLIFIED PRACTICE RECOMMENDATION NO. 29, JULY 1, 1925

EAVES TROUGH AND CONDUCTOR PIPE

(See 607.5, p. 491.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, STEAMBOAT INSPECTION SERVICE, GENERAL RULES AND REGULATIONS, MAY 4, 1929

SLIP JOINTS

The wearing surface of the male pipe in all slip joints made after June 30, 1908, for use in steam pipes shall be made of copper or composition, and shall be of sufficient length and so adjusted as to prevent accidental withdrawal from the packing box. When made of composition, same shall be of not less than 95 per cent copper, tin, and zinc, possessing a tensile strength of not less than 30,000 pounds to the square inch. It may be used for sizes up to and including 12 inches in diameter, and for all pressures not exceeding 300 pounds per square inch.

The minimum thickness of such fittings shall be determined by the following formula:

$$T = \frac{P \times D}{4,000} + 0.22$$

Where

P = working pressure in pounds.

D = diameter in inches.

T = thickness in inches.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NAILS, SPIKES, TACKS, AND STAPLES, FF-N-101, MAY 3, 1932

NAILS, SPIKES, TACKS, AND STAPLES

(See 608.11, p. 560.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR STANDARD MISCELLANEOUS CHAIN AND ATTACHMENTS, RR-C-271, DECEMBER 8, 1931

PLUMBER'S CHAIN, WELDLESS

FIGURE 1081.—Plumbers' chain, weldless

(For general specifications, material and workmanship, detail requirements, and methods of inspection and tests, see F. S. B. RR-C-271, (603.50, p. 199.) For other kinds of chain and chain attachments, specified in F. S. B. RR-C-271 see 603.51, 603.52 603.54, 603.56, 603.57, and 617.5. See also 631.9, 645.9, and 646.59.

1. Weldless chain shall be automatic machine-made chain. It will be paid for by the foot.

TABLE 51.—Plumber's chain (dimensions, strength, weights)

Material	Metal gage	Approximate number of links per foot	Minimum tensile strength	Approximate weight per 100 feet
Copper.....	Inch 0.032	21	Pounds 150	Pounds 3½

643. COPPER ALLOYS

643.1 MANGANESE COPPER.

(No nationally recognized specifications available.)

643.2 PHOSPHOR COPPER.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR PHOSPHOR COPPER, SERIAL DESIGNATION B52-27, 1927

PHOSPHOR COPPER

(In respect to quality of material, sampling marking, claims, and umpire analysis, these specifications are identical with A. S. T. M. B51. See 682, p. 1307.)

SCOPE

1. These specifications cover phosphor copper in two grades, as follows: Grade A and grade B.

MANUFACTURE

2. The manufacturer shall use new metal, or new metal and scrap resulting from the manufacture of ingots of similar composition, in the manufacture of this material.

3. The manufacturer or vendor shall furnish phosphor copper as ingots in the form of notched slabs weighing from 15 to 20 pounds, unless otherwise specified in the contract.

CHEMICAL PROPERTIES

4. The material shall conform to the following requirements as to chemical composition:

Grade	Phosphorus, minimum	Phosphorus plus copper, minimum	Iron, maximum
A	Per cent 14.0	Per cent 99.75	Per cent 0.15
B	10.0	99.75	.15

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PHOSPHOR COPPER, QQ-C-571, MAY 31, 1932

PHOSPHOR COPPER

(Except for the omission of claims and umpire chemical analysis, this specification is similar to A. S. T. M. B52-27, given above. In respect to sampling and marking it is similar to A. S. T. M. B51-27. (See 682, p. 1307.))

643.3 SILICON COPPER.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SILICON COPPER, DESIGNATION B53-27, 1927

SILICON COPPER

(In respect to manufacture, these specifications are identical with A. S. T. M. B52. (See 643.2, p. 1191.) In respect to quality of material, sampling, marking, claims, and umpire analysis, these specifications are identical with A. S. T. M. B51. See 682, p. 1307.)

SCOPE

1. These specifications cover silicon copper in one grade.

CHEMICAL PROPERTIES

2. The material shall conform to the following requirements as to chemical composition:

Silicon.....	Per cent 10-12
Tin, maximum.....	.25
Zinc, maximum.....	.25
Iron, maximum.....	.75
Aluminum, maximum.....	.25
Copper.....	Remainder.

3. The sum of the copper, silicon, and iron content shall be not less than 99.4 per cent.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SILICON COPPER, QQ-C-581, MAY 31, 1932

SILICON COPPER

(Except for the omission of claims and umpire chemical analysis, this specification is similar to A. S. T. M. B53-27, given above. In respect to sampling and marking it is similar to A. S. T. M. B51-27. See 682, p. 1307.)

643.4 COPPER-TIN-ZINC ALLOY.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR THE ALLOY: COPPER, 88 PER CENT; TIN, 10 PER CENT; ZINC, 2 PER CENT—DESIGNATION B10-18, 1918

ALLOY 88-10-2

SCOPE

1. (a) These specifications cover the alloy known commercially as government bronze, admiralty gun metal, gun metal, or 88-10-2 mixture, when used in castings.

(b) It is recommended that this alloy shall not be used where castings are subjected to a temperature exceeding 260° C. (500° F.).

MANUFACTURE

2. The alloy may be made by any approved method.

CHEMICAL PROPERTIES AND TESTS

3. The alloy shall conform to the following requirements as to chemical composition:

	Per cent
Copper.....	86-89
Tin.....	8-11
Zinc.....	1-3

CHEMICAL ANALYSIS

4. An analysis of each melt shall be made by the manufacturer. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in section 3.

SAMPLING

5. (a) The sample for chemical analysis may be taken either by sawing, drilling, or milling the casting or tension-test specimen, and shall represent the average cross section of the piece.

(b) The saw, drill, cutter, or other tool used shall be thoroughly cleaned. No lubricant shall be used in the operation, and the sawings or metal chips shall be carefully treated with a magnet to remove any particles of iron derived from the tools.

PHYSICAL PROPERTIES AND TESTS

6. The alloy shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	30,000
Elongation in 2 inches.....	per cent..	14

TEST SPECIMENS

7. (a) Two test bars (suitable for turning down to standard tension test specimens), shall be an integral part of large castings, or cast separately in the case of small castings, to represent a lot or melt, and shall be molded in a manner similar to the castings which they represent. If the castings are heat treated, the test bars representing such castings shall be similarly heat treated.

(b) The manufacturer and purchaser shall agree whether test bars can be attached to castings, on the location of bars on the castings, on the castings to which bars are to be attached, and on the method of casting unattached bars. Unless otherwise agreed upon, the minimum lot shall be considered as 500 pounds.

(c) (Tension-test specimen requirements conform with Figure 129 in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

NUMBER OF TESTS

8. (a) Two tension tests shall be made from each lot or melt.

(Requirements with respect to defective test specimens, and inspection and rejection are identical with those in B59. See 647.15, p. 1259.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SAND CASTINGS OF THE ALLOY: COPPER, 88 PER CENT; TIN, 8 PER CENT; ZINC, 4 PER CENT—DESIGNATION B60-28, 1928

ALLOY 88-8-4

SCOPE

1. (a) These specifications cover alloy castings, the alloy being a composition of copper, tin, and zinc, known commercially as 88-8-4.

(b) The castings are intended for use where an excellent steam metal (withstanding in the cast state hydrostatic pressures satisfactorily) is required, such as expansion joints, pipe fittings, valves, pump pistons—in general where good strength and resistance to salt water are required.

MANUFACTURE

2. (a) The alloy may be made by any approved method.

(b) The castings shall be of uniform quality.

CHEMICAL PROPERTIES AND TESTS

3. (a) The alloy shall conform to the following requirements as to chemical composition:

	Desired	Minimum	Maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Copper.....	88.00	88.00	89.00
Tin.....	8.00	7.50	11.00
Lead.....	None.	-----	.30
Zinc.....	4.00	1.50	4.50
Iron.....	None.	-----	.10
Nickel.....	None.	-----	.50
Phosphorus.....	None.	-----	.05
Aluminum.....	None.	-----	None.
Sulphur.....	None.	-----	.05
Antimony.....	None.	-----	.25
Total other impurities.....	None.	-----	.15

(b) Where "none" is specified it shall be construed to refer to none as determined on a 10 g sample.

PHYSICAL PROPERTIES AND TESTS

4. (a) The alloy shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	35,000
Yield point.....	do.....	15,000
Elongation in 2 inches.....	per cent..	15

(b) Castings made from this alloy shall conform to such requirements as to pressure tests as may be mutually agreed upon between the purchaser and the manufacturer, and as specified in the contract or purchase order.

5. The coupon attached to the casting shall be in accordance with the dimensions shown in Figure 1082. The fin gate along the side shall not be less than five-sixteenths inch in thickness at any point along its length.

(Specifications covering tension-test specimen requirements are identical with those in paragraph 11 (c), A18. See 611.51, p. 754. In respect to chemi-

cal analyses, determination of yield point, workmanship and finish, marking, inspection and rejection, this specification is identical with B59. See 647.15, p. 1259. In respect to number of tests, paragraphs 7 (a), (b), (c), and (d) in this specification are identical

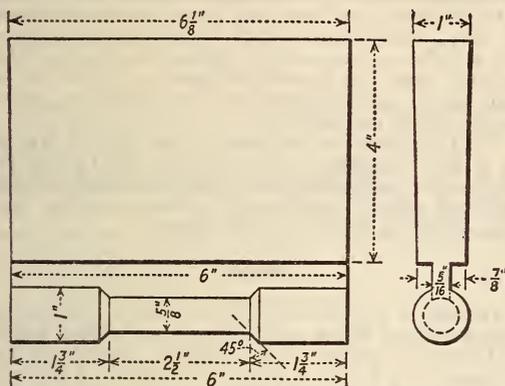

FIGURE 1082.—Test specimen coupon

with Paragraphs VI 2, 3, 4, and 13 in F. S. B. 172a. See 646.41, p. 1252.)

(For other copper-tin-zinc alloys see 646.41.)

644. BRASS

644.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF BRASS INGOTS AND SAND CASTINGS, DESIGNATION B45-27, 1927

CHEMICAL ANALYSIS OF BRASS INGOTS AND SAND CASTINGS

1. In the alloys containing the higher amounts of zinc this element is taken by difference. For determination of smaller amounts of zinc, see B28 (646.0, p. 1243).

DETERMINATION OF COPPER BY THE ELECTROLYTIC METHOD

(Same as B27 (see 647.20, p. 1261) except that height of anode is 130 mm instead of 137 mm and notes omit reference to zinc determination.)

DETERMINATION OF LEAD BY THE ELECTROLYTIC METHOD

(Same as B27 (see 647.20, p. 1261) except that notes omit reference to manganese.)

DETERMINATION OF LEAD AS SULPHATE

(Same as B27 (see 647.20, p. 1261) except in the following particulars:)

Method

In a 150 c c beaker, dissolve 1 g of brass in 10 c c of HNO_3 (specific gravity 1.42). Allow the solution to bake dry on the edge of a hot plate, or by standing over night on the steam bath. Add 10 c c of HNO_3 (specific gravity 1.42), and after digesting for a short time, add 50 c c of hot water and heat to boiling for a few minutes. Allow the solution to stand for several hours at a temperature just below the boiling point. Filter off the precipitated H_2SnO_3 on double closely woven filter papers, being careful to keep the solution hot throughout the process of filtration. Wash with boiling hot water. To the combined filtrate and washings, add 40 c c of lead acid, and evaporate until copious fumes of H_2SO_4 are evolved. Cool, add 35 c c of distilled water to dissolve (continue as in B 27 (see 647.20, p. 1261) from the point where 105 c c of distilled water is added).

NOTES.—Copper and lead may be determined on the same samples if so desired. In such a case, after filtering off the lead sulphate and washing with lead-acid, and before washing with dilute alcohol, remove the filtrate, add 3 c c of HNO_3 (specific gravity 1.42), dilute to 120 c c and determine copper by electrolysis. See the determination of copper by the electrolytic method B27 (647.20, p. 1261).

DETERMINATION OF COPPER AND LEAD SIMULTANEOUSLY BY THE ELECTROLYTIC METHOD

(Same as B27. See 647.20, p. 1261.)

DETERMINATION OF TIN

(Same as B27 (see 647.20, p. 1261) except that in solutions required the HCl has a specific gravity of 1.19 instead of 1.20, and in method 1 g of brass is substituted for 2 g of bronze.)

NOTE.—In alloys containing an appreciable amount of antimony and in presence of a large excess of tin, the antimony, as determined by titration according to the method given below, should be calculated to Sb^2O^3 , and a corresponding amount deducted from the weight of the ignited SnO^2 before calculating to tin.

DETERMINATION OF IRON

(Same as B27. See 647.20, p. 1261.)

DETERMINATION OF ANTIMONY BY THE VOLUMETRIC METHOD

Solutions Required

Potassium permanganate.—Dissolve 0.3 g of potassium permanganate in 1,000 c c of distilled water. Standardize by dissolving 25 mg of pure antimony in 15 c c of boiling sulphuric acid and proceed according to the method from this point.

Method

In a 250 c c beaker dissolve 5 g of brass in 25 c c of HNO_3 (specific gravity 1.42). When the action has ceased, boil until the oxides of nitrogen are expelled, add 125 c c of boiling water and allow to stand and settle for one hour or longer, keeping the temperature just below the boiling point. Filter on double 9 cm closely woven papers, keeping the solution hot. Wash with boiling water. Discard the filtrate.

Transfer the papers containing the tin and antimony to a 350 c c Erlenmeyer flask and add 25

c c of HNO_3 (specific gravity 1.42), 5 g of ammonium persulphate, and 15 c c of H_2SO_4 (specific gravity 1.84). Boil to strong fumes of SO_3 . If the solution is brown, cool and add 5 c c of HNO_3 (specific gravity 1.42) and a little more (1 g or less) persulphate, if necessary, and boil again to strong fumes of SO_3 . When the solution is colorless, cool, add 20 c c of distilled water 20 c c of HCl (specific gravity 1.19) and 1 g of sodium sulphite. Boil gently for 10 minutes to expel SO_2 completely. Dilute with 200 c c of distilled water and cool to 10° to 12° C. in ice or under running water.

Titrate with standard permanganate solution until the appearance of a decided pink color.

NOTES.—1. In alloys containing a large excess of tin, the antimony is precipitated quantitatively with the meta-stannic acid.

2. Ammonium persulphate and nitric acid are used to destroy the filter paper, and subsequent boiling with sulphuric acid effects the solution of the tin and antimony. A mixture of fuming nitric and sulphuric acids might be used to accomplish the same results, but the persulphate mixture is much more efficient.

3. If the solution becomes cool during the first filtration some of the meta-stannic acid may dissolve.

4. If arsenic is present, correction should be made for it.

DETERMINATION OF SULPHUR

Method

Weigh out four 5 g samples of brass into 250 c c beakers. Dissolve each in 25 c c of HNO_3 (specific gravity 1.42) and boil until the disappearance of red fumes. Add 125 c c of boiling water and settle for one hour or longer, keeping the temperature just below the boiling point. Filter on double 12.5 cm closely woven papers, keeping the solutions hot. Wash with boiling water. Discard the meta-stannic acid precipitates, combine the four filtrates in a tall 700 c c beaker, and add 0.5 g of Na_2CO_3 , and evaporate the solution until sirupy. Cool somewhat, then dilute to the lip with warm water. There should be present a layer about one-quarter inch (6 mm) in thickness, composed of basic salts of copper. Electrolyze, using stationary electrodes, at a current of 4 amperes, or using the Frary solenoid at a current of about 10 amperes. The lead must be removed at the anode as the copper is taken out at the cathode. When copper and lead are out, evaporate the electrolyte to small volume, cover the beaker, add 75 c c of HCl (specific gravity 1.19), and boil down to small volume. Add 75 c c more HCl and evaporate to dryness to dehydrate any silica present. Moisten with about 0.5 c c of HCl and take up with 20 c c of hot water. Filter into a small beaker. Heat the filtrate to boiling and add 10 c c of 5 per cent BaCl_2 solution, drop by drop, with stirring. Allow to settle at least five hours, filter on a small ashless paper, and wash with hot water. Ignite cautiously in a small porcelain or platinum crucible, and then heat to bright redness for 20 minutes. Cool and weigh the BaSO_4 and calculate to sulphur.

NOTES.—1. Throughout the entire analysis, the utmost precautions must be taken to prevent contamination by sulphur in any form, H_2SO_4 fumes, H_2S , and SO_2 gases especially. All heating with gas burners must be avoided. Run a blank with each analysis, adding all the reagents and subjecting it to the same operations as the beakers containing the drillings. Subtract the amount of BaSO_4 found in the blank from that in the determinations. If this blank amounts to 0.002 g, it is a sign of poor work or impure reagents, and the analysis should be repeated. Wash out all beakers, funnels, etc., with distilled water before using.

2. It is necessary to keep the solution containing the meta-stannic acid hot during filtration. If the solution becomes cool, some of the meta-stannic acid may dissolve.

Determination of Aluminum in Small Quantities

(a) General method for accurate work—

Solutions Required

Electrolytic solution.—Mix 300 c c of HNO_3 (specific gravity 1.42), 1,700 c c of distilled water, and 500 c c of H_2SO_4 (specific gravity 1.84).

Acidified H_2S water for washing.—Dilute 10 c c of HCl (specific gravity 1.19) with 1,000 c c of distilled water and saturate with H_2S .

Phenylhydrazine solution for washing.—Add saturated SO_2 water to a few cubic centimeters of phenylhydrazine until the crystallin sulphite first formed is redissolved, and then add phenylhydrazine, drop by drop, with vigorous agitation, until the odor of SO_2 is no longer perceptible; dilute 5 to 10 c c of this solution with 100 c c of hot water and allow to remain at the boiling point for a few minutes so as to get rid of the excess SO_2 .

NH_4Cl solution for washing (2 per cent).—Mix 30 c c of HCl (specific gravity 1.19) with 200 c c of distilled water, add methyl red, neutralize with NH_4OH until the solution changes to a distinct yellow, and then dilute to 1,000 c c with water.

Method

Dissolve 1 g of brass or bronze in 35 c c of electrolytic solution, dilute with 100 c c of distilled water, and remove copper by electrolysis. Evaporate the electrolyte to fumes of SO_3 . (If much tin is present, boil the sulphuric acid solution vigorously for a few minutes.) Cool, and dilute with 100 c c of water. Filter off PbSO_4 and any tin which may be precipitated at this point, washing with hot water. Dilute the filtrate to at least 200 c c.

Pass H_2S into the filtrate for 30 minutes. This will precipitate any copper, lead, tin, arsenic, or antimony which may be present. Allow the sulphides to settle, and filter, washing with acidified H_2S water. Boil the filtrate to one-half volume to expel H_2S , add 3 c c HNO_3 (specific gravity 1.42) and boil for a few minutes to oxidize iron.

Precipitate iron and aluminum according to the following¹⁴: Add 10 c c of HCl (specific gravity 1.19) and just neutralize with NH_4OH , using methyl red as an indicator. Boil for two minutes and filter, washing with hot NH_4Cl (2 per cent). Dissolve the precipitate from the paper with boiling hot HCl (1:1) and wash alternately with hot water and HCl (1:1) into the beaker in which the precipitation was made. Reprecipitate the iron and aluminum, following the same procedure as before.

Dissolve the precipitate again with hot HCl (1:1), dilute to 100 c c with water, make just ammoniacal, then only acid enough to hold iron in solution. Add sufficient saturated solution of ammonium bisulphite to reduce the iron (5 to 20 drops). Add a few drops of methyl orange, quickly bring to neutrality with NH_4OH , and then add 6 to 7 drops of HCl (1:1) in excess. Finally, add from 1 to 3 c c of phenylhydrazine and stir until the precipitate becomes flaky. The supernatant liquid should be plainly acid to litmus and the precipitate may be colored owing to organic matter. Filter and wash with phenylhydrazine wash solution. Ignite in a weighed platinum crucible, finishing with the blast for five minutes. Weigh as Al_2O_3 . The weighing should be made rapidly and with the crucible covered, as Al_2O_3 is somewhat hygroscopic.

NOTES.—1. For small amounts of aluminum, a 5 g sample should be used. In this case dissolve in 60 c c of "assay solution" of the following proportions:

- 7 volumes HNO_3 (specific gravity 1.42).
- 10 volumes H_2SO_4 (specific gravity 1.84).
- 25 volumes H_2O .

2. When phosphorus is present the final precipitate will be $\text{Al}_2\text{O}_3 + \text{P}_2\text{O}_5$. In this case it is necessary to fuse the residue with Na_2CO_3 , dissolve with hot water, acidify with HNO_3 , and determine phosphorus in accordance with the determination of phosphorus by the alkalimetric method of the standard methods of chemical analysis of bronze bearing metal; B46 (see 646.0, p. 1246). The phosphorus is calculated to P_2O_5 and subtracted.

¹⁴ Blum: B. S. Sci. Paper, No. 286, 1916; J. Am. Chem. Soc., vol. 38, p. 1282, 1916.

3. For accurate work the Al_2O_3 residue is treated with HF and H_2SO_4 for the removal of possible SiO_2 .

4. Ammonium bisulphite solution may be prepared by saturating cold NH_4OH (1:1) with SO_2 until yellow.

5. This method is especially satisfactory for small amounts of aluminum in brass or bronze since no reagents are used which may contaminate the precipitate with aluminum, iron, or silica. A precipitate with phenylhydrazine gives positive indication of the presence of aluminum.

(b) *Rapid method for control work*—

Solutions Required

Sodium hydroxide solution (2.5 per cent).—Dissolve 25 g of NaOH (free from aluminum) in water and dilute to 1,000 c c.

Sodium sulphide solution.—Dissolve 150 g of NaOH (free from aluminum) in 1,000 c c of water, saturate 500 c c of this solution with hydrogen sulphide, and mix with the remaining 500 c c of solution.

Dilute hydrochloric acid (1:3).—Mix 200 c c of HCl (specific gravity 1.19) with 600 c c of water.

Acidified hydrogen sulphide water.—(Same as in (a) above.)

Ammonium chloride solution (2 per cent).—(Same as in (a) above.)

Method

Dissolve 2 g of the sample in 20 c c of HCl (specific gravity 1.19) and 5 c c of HNO_3 (specific gravity 1.42). Boil the solution to expel chlorine and dilute with 50 c c of water. Nearly neutralize the cold solution with NaOH solution (2.5 per cent, or stronger if much free acid is present), and pour it slowly and with constant shaking into a 500 c c volumetric flask containing 100 c c of sodium sulphide solution. Dilute to the mark with NaOH solution (2.5 per cent) and mix thoroughly. Filter on a large, dry, No. 42 Whatman filter paper (or its equivalent) and keep the paper well filled with the solution lest iron be oxidized and dissolved. Reject the first 20 to 25 c c and catch exactly 250 c c which will represent 1 g of sample. In routine analyses of material containing not more than 1 per cent of aluminum, the aliquot portion can be gathered in a 250 c c graduate.

Transfer the aliquot portion to a 600 c c beaker, neutralize the solution with dilute HCl (1:3), and finally add 25 c c in excess. Digest at 40° to 60° C. for one hour, filter, and wash the paper and precipitate with acidified H_2S water.

Boil the filtrate and washings to expel H_2S , add a few drops of methyl red indicator, and then dilute ammonia (1:2) until the solution is just distinctly yellow. Boil for one to two minutes and filter at once through a small filter. Wash the beaker, paper, and precipitate two or three times with hot NH_4Cl solution (2 per cent) and discard the filtrate. Dissolve the precipitate in 200 c c of hot dilute HCl (1:3), wash the filter thoroughly with small portions of hot water, and reserve it for the second filtration. Dilute the filtrate to 50 c c, add methyl red, and precipitate with dilute ammonia (1:2) as before. Filter, wash with hot NH_4Cl solution (2 per cent), ignite, and weigh.

The ignited residue is prone to carry silica and must be purified before weighing as follows: Add 1 or 2 drops of water, 1 drop of diluted H_2SO_4 , and 1 to 5 c c of HF. Evaporate to dryness, increase the heat slowly, and finally heat with a blast lamp or its equivalent. Weigh as Al_2O_3 . The weight of Al_2O_3 corrected for the blank and multiplied by 52.94 gives the percentage of aluminum.

NOTES.—The first aluminum hydroxide precipitate will carry down some NaCl and much of any silica that was dissolved in the NaOH solution; hence, it is not safe to omit the second precipitation and the HF treatment. There is no attack on the glassware during the short contact with the weak, cool, alkaline solution. It is, of course, preferable that the NaOH be free from aluminum. The most satisfactory test for it lies in running an analysis with nonferrous alloys containing no aluminum. Direct test, by acidification followed by precipitation with ammonia, is sufficient if no precipitate is obtained, but is of doubtful value in case one appears, for it may contain other elements, such as iron, which do not affect the results.

If phosphorus is known to be present, the method should be followed through the first addition of ammonia. If aluminum is indicated, reacidify the solution with HCl, add macerated paper, two drops of methyl orange, and 10 c c of a solution of diammonium phosphate (10 per cent). Render the solution just ammoniacal, then just restore the pink color with dilute HCl (1:3), heat to boiling, and add 30 c c of a solution of ammonium acetate (25 per cent). Boil for five minutes, filter on an 11 cm No. 42 Whatman or similar filter paper, and wash with hot NH_4NO_3 solution (5 per cent) until 5 c c of the washings no longer give a test for chlorides with acidified $AgNO_3$. Ignite in platinum or porcelain, heat at approximately 1,100° C. for 10 minutes, and weigh as AlP_4 . This method is not strictly accurate on account of the uncertain composition of the phosphate, but is sufficiently accurate for all but the most painstaking analyses.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRASS RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, COMMERCIAL, QQ-B-611, MARCH 1, 1932

BRASS RODS, BARS, SHAPES, PLATES, SHEETS, STRIPS

(In respect to general specifications, material and workmanship, tests and methods of inspection, packing and marking, this specification is substantially the same as F. S. B. QQ-C-501 and notes (see 641.0, p. 1172). It differs from the latter in requiring check analyses samples to be obtained from each lot of 5,000 pounds or fraction thereof and that resultant samples be not less than 5 ounces, the replacing of a hammer test by a flattening test, and in the following additional particulars:)

TYPES AND GRADES

1. This specification covers three grades of commercial brass in the following forms and tempers:

- Grade A, rods for forging. See also 645.11, p. 1205.
- Grade B, rods, soft and half hard, free cutting. See also 645.11.
- Grade A, bars for forging. See also 645.11.
- Grade B, bars, soft and half hard, free cutting. See also 645.11.
- Grade A, shapes for forging. See also 645.11.
- Grade B, shapes, soft and half hard, free cutting. See also 645.11.
- Grade C, shapes, various tempers. See also 645.11.
- Grade C, plates, various tempers. See also 644.21, p. 1202.
- Grade C, sheets, various tempers. See also 644.21, p. 1202.
- Grade C, strips, various tempers. See also 644.21, p. 1202.

2. Grades B and C brass may be ordered as type 1 or type 2.

DETAIL REQUIREMENTS

3. The chemical requirements are as shown in Table 1.

TABLE 1.—Chemical composition

Grade	Composition	Copper	Zinc (per cent)	Lead	Iron, maximum	Other impurities, maximum
		Per cent	Per cent	Per cent	Per cent	Per cent
A	Desired	60.0	Remainder	2.00	0.00	0.00
	Permissible	58.5-61.5	do	1.50-2.50	.15	.35
B	Desired	61.5	do	3.00	.00	.00
	Permissible	60.0-63.0	do	2.25-3.75	.15	.50
C	Desired	65.0	do	0.00	.00	.00
	Permissible	64.5-67.5	do	0-0.30	.05	.10

When grades B and C are ordered as type 2, they shall be in accordance with the following chemical composition: Copper, 59 to 68 per cent; tin, maximum, 1.5 per cent; zinc, remainder; lead, maximum, 3.5 per cent; iron, maximum, 0.2 per cent.

4. Grade A brass shall be malleable, as determined by the flattening test defined hereinafter.

5. Commercial brass shall conform to the physical requirements as shown in Table 2. Special tempers not covered herein may be agreed upon between the contractor and purchaser, in which case they will be specifically defined and designated in the contract or purchase order.

TABLE 2.—Physical properties

Grade	Diameter or thickness, inches, and temper	Tensile strength			Bend test
		Tensile strength	Yield point	Elongation in 2 inches, minimum	
		Lbs./in. ²	Lbs./in. ²	Per cent	Degrees
A.....	Rods, bars, and shapes, all sizes ¹				
B, type 1.....	Rods, bars, and shapes, soft: 1 and less.....	48,000	20,000	20.0	} (1)
	Over 1 to 2, inclusive.....	44,000	18,000	25.0	
	Over 2.....	40,000	15,000	30.0	
B, type 1.....	Rods, bars, and shapes, half hard: 0.50 and less.....	57,000	25,000	10.0	120
	Over 0.50 to 1, inclusive.....	55,000	25,000	15.0	120
	Over 1 to 2, inclusive.....	50,000	20,000	20.0	120
	Over 2.....	45,000	15,000	25.0	120
C, type 1.....	Plates, shapes, sheets, and strips 0.079 and less: Soft drawing anneal.....	40,000		42.0	} (1)
	Drawing anneal.....	42,000		38.0	
	Light anneal.....	45,000		32.0	
	Quarter hard.....	45,000		27.5	
	Half hard.....	52,500		15.0	
	Hard.....	67,500		5.0	
	Extra hard.....	80,000		2.0	
	Spring temper.....	87,500		1.0	
B and C, type 2 ¹	Plates, sheets, and strips 0.080 and over ¹				

¹ No requirements.

6. Grade B, type 1, brass rods, bars, and snapes, half hard, shall withstand bending cold, without fracture on the outside of the bent portion, through the angle specified in Table 2, on a radius equal to the diameter or thickness of the material. At the option of the purchaser, any or all of the physical tests may be waived.

7. Grade C, brass plates, sheets, and strips 0.080 inch and over in thickness shall conform to the Brinell hardness requirements shown in Table 3:

TABLE 3.—Brinell hardness, grade C plates, sheets, and strips, 0.080 inch and over

Temper	Brinell hardness
Soft drawing anneal.....	47- 55
Drawing anneal.....	55- 65
Light anneal.....	65- 75
Quarter hard.....	75- 95
Half hard.....	95-115
Hard.....	130-150
Extra hard.....	150-170
Spring.....	160-180

TESTS

(Rockwell hardness requirements are also included in the full text of this specification.)

8. For grade A brass (forging brass), specimens cut from the rods or bars, and having a length equal to the diameter or thickness of the specimen, shall stand flattening in an axial direction while hot until reduced to 20 per cent of their original length without cracking.

9. For sheets and strips 0.080 inch or over in thickness, at least 10 pieces shall be selected from every 5,000 pounds of metal, or fraction thereof, of each size, and subjected to the Brinell test, using a 10 mm ball, 500 kg pressure held for 30 seconds. The average hardness of the 10 sheets shall conform to the requirements specified.

NOTES

10. Round, square, hexagonal, etc., sections are classed as rods. Rectangular sections having

greater width than thickness are classed as bars, plates, sheets, or strips. All other sections are classed as shapes.

11. These alloys are susceptible to season cracking, and are intended for structural uses in locations not exposed to weather or corrosive influences. When exposure to corrosive influences is unavoidable, naval brass should be used in the form of rods, bars, or shapes, or low brass in the form of plates, sheets, and strips.

644.1 BRASS INGOTS AND BARS.

644.11 INGOTS, BRASS.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR COPPER-BASE ALLOYS IN INGOT FORM FOR SAND CASTINGS, DESIGNATION B30-31T, 1931

COPPER-BASE ALLOYS IN INGOT FORM

1. These specifications cover copper-base alloys in ingot form for sand castings in 20 different compositions, regularly sold by the trade and arbitrarily herein given numbers 1 to 20, inclusive, to differentiate them from one another. These numbers have no other significance.

MANUFACTURE

2. The manufacturer shall use care to have each lot of ingot metal as uniform in quality as possible. This metal may be manufactured by any refining process which will yield a satisfactory quality of product.

CHEMICAL PROPERTIES AND TESTS

3. The alloys shall conform to the requirements as to chemical composition given in Table 1, within the limits specified therein.

NOTE.—The limits specified in Table 1 indicate the maximum and minimum percentages within which variations of different elements shall be permitted, with the understanding that every precaution shall be taken both in the selection of raw materials as well as methods of manufacture to insure that the resulting ingot metal will come within these specified limits.

SAMPLES FOR CHEMICAL ANALYSIS

4. (a) Ten ingots shall be selected by the inspector to represent each 40,000 pounds, and five ingots shall be selected for less than carload lots.

(b) The samples for chemical analysis may be taken by drilling the ingots, and shall represent the average cross section of all the ingots selected for sampling.

(c) The drill used shall be thoroughly cleaned. No lubricant shall be used in the operation, and the drillings shall be carefully treated with a magnet to remove any particles of steel introduced in taking the sample.

METHODS OF CHEMICAL ANALYSIS

5. The chemical analysis shall be made in accordance with the standard methods of chemical analysis of brass ingots and sand castings in A. S. T. M. B45. (See 644.0, p. 1193, including references in B45 to A. S. T. M. B27.)

MARKING

6. The designating mark of the manufacturer, the proper lot number, and the numerical designation of the alloy shall be marked on each ingot for identification.

INSPECTION AND REJECTION

(Identical with B59 (see 647.15, p. 1259) with the addition of the following item:)

7. If the test ingots selected to represent a lot fail to conform to the requirements specified in section 3, all ingots in such lot shall be rejected.

CLAIMS

8. Claims, to be considered, shall be made in writing within 30 days of receipt of material at the purchaser's plant, and the results of the purchaser's tests shall be given. The manufacturer shall, within one week of receipt of such claim, either agree to satisfy the claim, or send a representative to the purchaser's plant to resample the shipment in accordance with section 4. Samples so taken shall be sealed and submitted to a mutually agreeable umpire, whose determinations shall be final.

9. The expense of umpire analysis shall be paid by the loser, or divided in proportion to the concession made in case of a compromise. In case of rejection being established, the damages shall be limited to the payment of freight both ways by the manufacturer for the substitution of an equivalent weight of ingot metal conforming to these specifications.

¹ The term "none" as applied to aluminum allowance is defined as a maximum of 0.005 per cent when determined in accordance with section 5.
² Minimum.

(An appendix to this specification gives information on the tensile strength, uses, machining qualities, and other properties of these alloys.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF BRASS INGOTS AND SAND CASTINGS, DESIGNATION B45-27, 1927

(See 644.0, p. 1193.)

644.12 BARS, BRASS.

FEDERAL SPECIFICATIONS BOARD, SPECIFICATION, FOR BRASS RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, COMMERCIAL, QQ-B-611, MARCH 1, 1932

BRASS BARS

(See 645.11, p. 1205.)

644.2 BRASS PLATES, SHEETS, SHAPES, AND STRIPS.

644.21 PLATES AND SHEETS, BRASS.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

BRASS PLATES AND SHAPES

(For general information and requirements see 600.0, p. 1.)

(For test requirements see 600.1, p. 7.)

1. The material is to have a tensile strength of not less than 40,000 pounds per square inch, with an elongation of at least 15 per cent on a gage length of 8 inches. Otherwise the test and requirements are to be as specified for copper plates and shapes (See 641.21, p. 1176.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARTRIDGE BRASS, DESIGNATION B19-29, 1929

CARTRIDGE BRASS

SCOPE

1. These specifications cover sheet brass for making rifle and other small arms cartridge cases.

MANUFACTURE

2. The brass shall be made from lake or electrolytic copper, meeting the requirements of the standard specifications for lake copper wire bars, cakes, slabs, billets, ingots, and ingot bars in A. S. T. M. B4 (see 641.11, p. 1173), or the standard specifications for electrolytic copper wire bars, cakes, slabs, billets, ingots, and ingot bars in A. S. T. M. B5 (see 641.11, p. 1174), and zinc of grades Nos. 1 or 2 of the standard specifications for slab zinc (spelter) in A. S. T. M. B6 (see 683.1, p. 1310).

3. No scrap shall be used except that arising from the manufacture of brass or cases made from materials complying with the requirements of section 2.

CHEMICAL PROPERTIES AND TESTS

4. The brass shall conform to the following requirements as to chemical composition:

	Per cent
Copper.....	68.00-71.00
Lead, maximum.....	.07
Iron, maximum.....	.05
Other materials, maximum.....	.15
Zinc.....	Remainder.

5. Analyses may be made on each lot of 50,000 pounds or fraction thereof. Drillings or millings shall be made from at least 10 separate pieces, equal quantities being taken from each and thoroughly mixed. Samples so prepared shall be divided into three equal parts, each of which shall be placed in a sealed package, one for the manufacturer, one for the purchaser, and one for an umpire, if necessary.

6. In case of dissatisfaction, resampling shall be done in the presence of representatives of both parties. The thoroughly mixed sample shall be divided into three equal parts, each of which shall be placed in a sealed package, one for the manufacturer, one for the purchaser, and one for an umpire, if necessary.

PHYSICAL PROPERTIES AND TESTS

7. The brass shall be so annealed that the average of 10 Brinell hardness readings from a lot will be within the limits of 49 to 65, using a 10 mm ball and a pressure of 500 kg. (See notes 1 and 2.)

PERMISSIBLE VARIATIONS IN DIMENSIONS

8. A permissible variation of ± 0.002 inch from the specified thickness when measured one-half inch from the edge of the strip will be allowed. The width of the strip may vary ± 0.010 inch.

9. Cartridge metal may be furnished in coils or flat strips as required. When furnished in flat strips, no strip shall be of less length than 60 per cent of that specified. No lot shall contain more than 40 per cent of such short lengths.

WORKMANSHIP AND FINISH

10. The metal shall be free from injurious external and internal defects of a nature which will interfere with the purpose for which it is intended. It shall be well pickled and free from dirt. Strips shall be substantially straight and flat. (See note 3.)

INSPECTION AND REJECTION

11. The manufacturer shall afford the inspector representing the purchaser, without charge, all reasonable facilities to satisfy him that the material is being furnished in accordance with these specifications.

12. Material which fails to conform to these specifications will be rejected and the manufacturer shall be notified.

EXPLANATORY NOTES

NOTE 1.—A comparative study of Brinell hardness and grain size indicates the following relations:

Grain size (mm)	Equivalent Brinell hardness number	Grain size (mm)	Equivalent Brinell hardness number
0.150	47	0.058	55
.111	49	.050	57½
.100	49.7	.044	60
.098	50	.040	62½
.087	51	.034	65
.075	52½	.030	68
.060	54½	.029	69

As it is easier and quicker to take the Brinell hardness than to polish and etch samples for study with the microscope, the Brinell hardness is much to be preferred. Furthermore, through straightening or flattening operations, cartridge metal may be hardened to an appreciable extent without affecting the grain size or producing any noticeable distortion.

Many operations in making rapid determinations of grain size slight the polishing and etch in strong acids, so that it is frequently impossible to distinguish between twinned crystals and separate crystals and a false grain count is obtained.

NOTE 2.—These specifications are intended to cover the requirements of commercial practice which do not in all cases agree with those of the Ordnance Department, U. S. Army. These departures involve only the degree of final annealing.

NOTE 3.—The differentiation between immaterial and injurious defects is a matter which requires a considerable degree of knowledge as to the causes of the various kinds of imperfections which are encountered in material of this character, as well as a thorough understanding of the effects thereof upon its further fabrication and use. In general, two classes may be readily distinguished, namely, those which are imposed and those which are inherent. In the former class are dents and scratches caused by blows or abrasion, and foreign matter which, adhering to the surface of the material, may have been rolled into it. Dents and scratches may be of considerable magnitude and still disappear completely in subsequent operations of fabrication. Similarly the presence of imposed foreign matter may be relatively unimportant. The point to be observed in this connection is that the presence of this class of defects is indicative of nothing beyond their presence.

Inherent defects are those which occur as a result of the presence either of gas or foreign matter included in the material during the process of casting. Metal is seldom entirely free from such defects and visual evidence of these argues the presence of others not visible. Experience is needed to determine whether any such encountered are of a magnitude and character sufficient to establish a departure from correct casting practice sufficient to disqualify the material.

A third character of defect, and one of a grave nature, is caused by failure to completely remove any piping which may have occurred in casting. The indications of this defect are, however, well pronounced and characteristic.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CARTRIDGE BRASS DISKS, DESIGNATION B20-29, 1929

CARTRIDGE BRASS DISKS

SCOPE

1. These specifications cover brass disks for making artillery cartridge cases.

2. The disks shall be made of cartridge brass conforming to the requirements of the A. S. T. M. standard specifications for cartridge brass, B19-29 (see above), except as to dimensions and permissible variations thereof, which shall conform to the requirements specified in section 4.

3. The brass shall be so annealed that the average of 10 Brinell hardness readings from a lot will be within the limits of 49 to 65, using a 10-mm ball and a pressure of 500 kg.

NOTE.—These specifications are intended to cover the requirements of commercial practice which do not in all cases agree with those of the Ordnance Department, U. S. Army. These departures involve only the degree of final annealing.

4. (a) Variations in dimensions shall conform to the following limits:

	Permissible variation	
	Under	Over
Gage:	Inch	Inch
Up to 0.150 inch, inclusive.....	0	0.0050
Over 0.150 to 0.300 inch, inclusive.....	0	.006
Over 0.300 to 0.400 inch, inclusive.....	0	.008
Over 0.400 inch.....	0	.010
Diameter:		
Up to 1 inch, inclusive.....	0.0025	0.0025
Over 1 to 3 inches, inclusive.....	.003	.003
Over 3 to 6 inches, inclusive.....	.004	.004
Over 6 to 8 inches, inclusive.....	.005	.005
Over 8 inches.....	.0075	.0075

(b) The thickness of disks shall be measured not less than one-half inch from the edge and on the diameter at right angles to the direction in which the bar was rolled.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SHEET HIGH BRASS, DESIGNATION B36-27, 1927

SHEET HIGH BRASS

SCOPE

1. These specifications cover commercial sheet brass commonly used for drawing, forming, stamping, and bending. It should be understood that they are general. Since high brass is used for many purposes where the requirements of the operations used are too particular to be specified by any of the ordinary physical tests, it is frequently advisable to submit samples or drawings to the manufacturer and secure an adjustment of anneal or temper to suit the actual operations to which the material is to be submitted.

MANUFACTURE

2. (a) (Same as A. S. T. M. specification for cartridge brass (see above), except that for sheet high brass grade 3 zinc is used instead of grade 1 or 2.)

(b) The brass shall be manufactured by the cold-rolling and annealing process and may be furnished in either the cold-rolled or annealed condition, as required.

CHEMICAL PROPERTIES

3. The brass shall conform to the following requirements as to chemical composition:

	Per cent
Copper.....	64.50-67.50
Lead, not over.....	.30
Iron, not over.....	.05
Zinc.....	Remainder.
Other impurities, not over.....	.10

4. Analysis shall be made on each lot of 10,000 pounds or less. Drilling, millings, or clippings shall be taken from at least 10 separate coils or pieces. Drillings or millings shall be taken on material thicker than 0.040 inch. Clippings may be taken with shears from metal thinner than 0.040 inch. Equal quantities shall be taken from each piece and thoroughly mixed together. Samples so prepared shall be divided into three equal parts, each of which shall be placed in a sealed package, one for each party and one for an umpire, if necessary.

5. (a) Analyses of separate pieces may be made by the purchaser. The copper, lead, and iron determined shall be within the following limits:

	Per cent
Copper.....	64.00-68.00
Lead, not over.....	.35
Iron, not over.....	.07

(b) In case of dissatisfaction the metal shall be resampled in the presence of representatives of both parties. The thoroughly mixed sample shall be divided into three equal parts, each one of which shall be placed in a sealed package, one for each party and one for an umpire, if necessary.

TEMPER AND ANNEAL

6. The temper of sheet brass shall be designated as follows:

	Reduction, B. & S. gage No.
Quarter hard.....	1
Half hard.....	2
Hard.....	4
Extra hard.....	6
Spring.....	8

7. Annealed sheet brass shall be designated as follows:

- Light anneal.
- Drawing anneal.
- Soft drawing anneal.

PHYSICAL PROPERTIES AND TESTS

(a) Hard brass

8. The average Brinell hardness of 10 samples of cold-rolled brass 0.080 inch or over in thickness shall be within the following limits:

	Brinell hard- ness No.
Quarter hard.....	75-95
Half hard.....	95-115
Hard.....	130-150
Extra hard.....	150-170
Spring.....	160-180

9. The average of tension tests of two samples of cold-rolled brass thinner than 0.080 inch shall conform to the following minimum requirements:

	Tensile strength	Elongation in 2 inches
	<i>Lbs./in.²</i>	<i>Per cent</i>
Quarter hard.....	45,000	27.5
Half hard.....	52,500	15.0
Hard.....	67,500	5.0
Extra hard.....	80,000	2.0
Spring.....	87,500	1.0

(b) Soft brass

10. The average Brinell hardness of 10 samples of annealed brass 0.080 inch or over in thickness shall be as follows:

	Brinell hard- ness No.
Light anneal.....	65-75
Drawing anneal.....	55-65
Soft drawing anneal.....	47-55

11. The average of tension tests of two samples of annealed brass thinner than 0.080 inch shall conform to the following minimum requirements:

	Tensile strength	Elongation in 2 inches
	<i>Lbs./in.²</i>	<i>Per cent</i>
Light anneal.....	45,000	32
Drawing anneal.....	42,000	38
Soft drawing anneal.....	40,000	42

PERMISSIBLE VARIATION IN DIMENSIONS

12. The width of sheared metal shall not vary more than 0.010 inch.

13. The standard method of specifying thickness shall be in terms of Brown & Sharpe gage. When the thickness is specified in either common or decimal fractions of an inch, the tolerances shall be those of the corresponding group of Brown & Sharpe sizes in the following table:

TABLE 1.—Permissible variations in thickness, plus or minus

Thickness		Width			
B. & S. gage No.	Inch	Up to 6 inches, inclusive	Over 6 to 9 inches, inclusive	Over 9 to 14 inches, inclusive	Over 14 to 20 inches, inclusive
		<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
0000	0.460	0.0043	0.0045	0.0047	0.0049
000	.4096	.0042	.0044	.0046	.0048
00	.3648	.0041	.0043	.0045	.0047
0	.3249	.0040	.0042	.0044	.0046
1	.2893	.0039	.0041	.0043	.0045
2	.2576	.0038	.0040	.0042	.0044
3	.2294	.0037	.0039	.0041	.0043
4	.2043	.0036	.0038	.0040	.0042
5	.1819	.0035	.0037	.0039	.0041
6	.1620	.0034	.0036	.0038	.0040
7	.1443	.0033	.0035	.0037	.0039
8	.1285	.0032	.0034	.0036	.0038

35	.0056	.0008	.0009	.0010	.0011
36	.0050	.0008	.0009	.0010	.0011

14. Metal may be furnished in coils or flat strips as required. Coils shall consist of not more than three lengths, no one of which shall be less than 10 feet long. When furnished in flat strips a variation of one-sixteenth inch over the specified length will be permitted on full-length sheets.

15. (a) When ordered in lengths over 10 to 12 feet:

- 40 per cent may be 10 feet and over.
- 30 per cent may be 8 to 10 feet.
- 20 per cent may be 6 to 8 feet.
- 10 per cent may be 4 to 6 feet.

Not more than 40 per cent of any one shipment may be less than the length ordered.

(b) When ordered in 10-foot lengths:

- 40 per cent may be 8 feet and over.
- 30 per cent may be 6 to 8 feet.
- 20 per cent may be 4 to 6 feet.
- 10 per cent may be 2 to 4 feet.

Not more than 40 per cent of any one shipment may be less than 10 feet.

(c) When ordered in 8-foot lengths:

- 30 per cent may be 6 feet and over.
- 20 per cent may be 4 to 6 feet.
- 10 per cent may be 2 to 4 feet.

Not more than 30 per cent of any one shipment may be less than 8 feet.

(d) When ordered in 6-foot lengths:

- 20 per cent may be 4 feet and over.
- 10 per cent may be 2 to 4 feet.

Not more than 20 per cent of any one shipment may be less than 6 feet.

(e) When special lengths are required, they shall be specified in the order.

WORKMANSHIP AND FINISH

16. The brass shall be free from injurious external and internal defects of a nature which would interfere with the purpose for which it is intended. It shall be well cleaned and free from dirt.

INSPECTION AND REJECTION

(Same as A. S. T. M. B19-29, given above.)

NOTE 1.—In the making of brass the best results are obtained if a minimum of one-third of previously alloyed material is used. It is also frequently desirable to employ previously alloyed material composed of copper and zinc in proportions other than provided for in these specifications, sufficient copper and zinc being added as may be required to properly correct the composition.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR MUNTZ METAL CONDENSER TUBE PLATES, DESIGNATION B57-27, 1927

MUNTZ METAL CONDENSER TUBE PLATES

SCOPE

1. These specifications cover rolled Muntz metal plates for surface condenser tube sheets.

MANUFACTURE

2. The plates shall be made by hot rolling from castings of suitable dimensions.

CHEMICAL PROPERTIES AND TESTS

3. The plates shall conform to the following requirements as to chemical composition:

	Per cent
Copper.....	58.00-61.00
Lead.....	.35- .90
Iron, not over.....	.15
Tin, not over.....	.25
Other impurities, not over.....	.10
Zinc.....	Remainder.

4. Analysis may be made on each lot of 5,000 pounds or less.

5. The sample shall be taken by drilling or milling representative plates in such a way that a sample of the entire thickness shall be obtained. Equal quantities from each plate shall be thoroughly mixed. Samples so prepared shall be divided into

three equal parts, one for the seller, one for the purchaser, and one for an umpire, if necessary.

PHYSICAL PROPERTIES AND TESTS

6. The material shall conform to the following minimum requirements:

Tensile strength.....	lbs./in. ² ..	50,000
Yield point.....	do.....	20,000
Elongation in 2 inches.....	per cent.....	35.0

7. The bend-test specimen shall stand being bent cold through 120° around a pin, the diameter of which is equal to twice the thickness of the specimen, without cracking on the outside of the bent portion.

8. Tension-test specimens may be 1 inch in width and of the full thickness of the plate as rolled, or may be machined to conform to the dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel (see 605.0, p. 247), in which case the ends shall be of a form to fit the holders of the testing machine in such a way that the load shall be axial.

9. Bend test specimens shall be 0.5 by 1 inch in section with corners rounded to a radius not over one-sixteenth inch. In the case of thin plates, the specimen may have the same thickness as the plate, with corners rounded to a radius equal to one-fourth of the thickness of the plate.

PERMISSIBLE VARIATIONS IN DIMENSIONS

10. The thickness shall not vary from that specified by more than plus 3 per cent or minus 2 per cent.

WORKMANSHIP AND FINISH

11. The plates shall be free from injurious defects and shall have a smooth clean surface. The fracture shall be uniform in color and grain throughout.

INSPECTION AND REJECTION

(Same as A. S. T. M. B19-29, given above.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 70, COMMERCIAL BRASS SHEET, FEBRUARY, 1929

COMMERCIAL BRASS SHEET

1. *Composition in percentage—*

	Per cent
Copper.....	64.50-67.50
Lead, maximum.....	.30
Iron, maximum.....	.05
Other impurities, maximum.....	.10
Zinc.....	Remainder.

MECHANICAL REQUIREMENTS

2. *Temper and anneal.*—The temper of sheet brass shall be designated as follows:

	Reduction B. & S. gage No.
Quarter hard.....	1
Half hard.....	2
Hard.....	4
Extra hard.....	6
Spring.....	8

3. The annealed sheet shall be designated as follows:

- Light anneal
- Drawing anneal
- Soft drawing anneal

4. The average Brinell hardness of 10 samples of sheet 0.080 inch or over in thickness shall be within the following limits:

	Brinell hardness No.
Quarter hard.....	75-95
Half hard.....	95-115
Hard.....	130-150
Extra hard.....	150-170
Spring.....	160-180
Light anneal.....	65-75
Drawing anneal.....	55-65
Soft drawing anneal.....	47-55

5. The average of tension tests of two samples of sheet thinner than 0.080 inch shall conform to the following minimum requirements:

Temper	Minimum ultimate strength	Minimum elongation in 2 inches
	<i>Lbs./in.²</i>	<i>Per cent</i>
Quarter hard.....	45,000	27.5
Half hard.....	52,500	15.0
Hard.....	67,500	5.0
Extra hard.....	80,000	2.0
Spring.....	87,500	1.0
Light anneal.....	45,000	32.0
Drawing anneal.....	42,000	38.0
Soft drawing anneal.....	40,000	42.0

In very thin strips, on account of the difficulties in testing, the elongation may be considerably less than the figures given above.

6. These should be considered as general specifications. Since high brass is used for many purposes where the requirements of the operations used are too particular to be specified by any of the ordinary physical tests, it is frequently advisable to submit samples or drawings to the manufacturer and secure an adjustment of anneal or temper to suit the actual operations to which the material is to be submitted.

7. The thickness tolerances of sheet or strip made of this alloy shall be within the tolerances specified in Table 5 under United States Government, F. S. B. QQ-C-501. (See 641.21, p. 1177.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

SHEET BRASS SAMPLE

(Sample No. 37b is a standard sample of sheet brass prepared and sold by the Bureau of Standards for use by industrial organizations and others as a comparison standard for checking the accuracy of analysis of sheet brass. Each sample is accompanied by a certificate giving the complete analysis of that particular sample.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD THICKNESSES, WEIGHTS, AND TOLERANCES OF SHEET METAL (CUSTOMARY PRACTICE), CIRCULAR NO. 391, MARCH 24, 1931

AMERICAN WIRE GAGE BRASS PLATES AND SHEETS

(See 640.1, p. 1165.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION, FOR BRASS RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, COMMERCIAL, QQ-B-611, MARCH 1, 1932

BRASS PLATES, SHEETS, STRIPS

(For general specifications, types and grades, material and workmanship, detail requirements, physical properties, tests and methods of inspection, packing and marking, and notes, see 644.0, p. 1195. Otherwise the specifications for brass plates, sheets, and strips are identical with those for copper plates, sheets, and strips in F. S. B. QQ-C-501 (see 641.21, p. 1177) with the following exceptions:)

1. The permissible variations in thickness of sheets and strips (grade C, type 1) 0.460 inch or less thick and 20 inches or less wide shall be the same as for copper sheets and strips in Table 5. (See 641.21, p. 1178.)

2. The permissible variations in thickness of plates, sheets, and strips (grade C, type 1) of all thicknesses and widths not covered in Table 5 (see 641.21, p. 1178) and of plates, sheets, and strips (grade C, type 2) of all thicknesses and widths shall be as shown in Table 6 (see 641.21, p. 1178), except that in no case shall the tolerances be less than that permitted for the same thickness given in Table 5.

3. Sheets and strips in long lengths shall not exhibit sidewise bend or curvature in excess of 0.25 inch per foot.

4. Grade C, type 1, brass (plates, sheets, and strips) is a common high brass. It is malleable and suitable for a variety of drawing, forming, stamping, and bending operations. Grade C, type 2, is an ordinary sheet brass suitable for name plates, brass tags, and similar applications.

644.22 SHAPES, BRASS.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

645. MANUFACTURES OF BRASS

645.1 BRASS RODS AND WIRES.

645.11 RODS, BRASS.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, SPECIFICATIONS FOR WELDING WIRE AND RODS, 1924

WELDING WIRE AND RODS

1. Brass welding rods for gas welding of miscellaneous brass and grey cast-iron parts.
2. *Chemical composition.*—Welding wire and rods shall conform to the following chemical composition:

	Per cent
Copper.....	60-70
Zinc.....	30-40
Lead, maximum.....	0.06
Total other elements and impurities, maximum.....	.50

(For specification details, see 603.41, p. 156.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR BRASS FORGING ROD, DESIGNATION B15-18, 1918

[Approved as American tentative standard (H7-1925) by the American Standards Association, June 8, 1925]

BRASS FORGING ROD

SCOPE

1. These specifications cover brass rods of any specified cross section capable of being readily forged hot, and easily machined.

MANUFACTURE

2. The rods may be manufactured either by hot rolling or extrusion, and may be finished by cold drawing if necessary to meet the requirement for size.

CHEMICAL ANALYSES

3. Analyses may be made on each lot of 5,000 pounds or less. Drillings or millings shall be made from at least four separate rods, equal quantities being taken from each rod and thoroughly mixed. Samples so prepared shall be divided into three equal parts, each of which shall be placed in a sealed package, one for each party and one for an umpire, if necessary.

CHECK ANALYSES

4. (a) Analyses of separate rods may be made by the purchaser. The copper and lead contents thus determined shall be within the following limits:

	Per cent
Copper.....	57.9-62.1
Lead.....	1.2- 3.0

- (b) In case of dissatisfaction the rod or rods shall be sampled in the presence of representatives of both parties. The thoroughly mixed sample shall be divided into three equal parts, each of which shall be placed in a sealed package, one for each party and one for an umpire, if necessary.

PHYSICAL PROPERTIES AND TESTS

5. (a) One flattening test shall be made from each lot of 2,000 pounds or fraction thereof.

- (b) In case of failure of any test specimen representing a lot, two additional specimens shall be chosen each of which shall conform to the requirements as specified in paragraph 8 of F. S. B. QQ-B-611. (See 644.0, p. 1195.)

(With respect to chemical composition and flattening tests, this specification is identical with F. S. B. QQ-B-611. (See 644.0, p. 1195.) Permissible variations in dimensions and requirements as to stock lengths from 12 to 6 feet are the same as for copper rods, bars, and shapes in F. S. B. QQ-C-501. (See 642.11, p. 1180.) Workmanship and finish, inspection and rejection are identical with B57. (See 644.21, p. 1201.)

NOTE.—The material intended to be covered by these specifications exhibits a very considerable variation in properties with slight changes in composition. Its strength, stiffness, and ability to stand forging operations are in inverse proportion to the copper content; so also is the amount of lead which the alloy can contain without producing hot shortness. Toughness, on the other hand, is directly proportional to the copper content.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR FREE-CUTTING BRASS ROD FOR USE IN SCREW MACHINES, DESIGNATION B16-29, 1929

FREE-CUTTING BRASS ROD

SCOPE

1. These specifications cover free-cutting brass rods of any specified cross section, suitable for high-speed screw machine work. (See note 1.)

MANUFACTURE

2. The rods shall be finished by cold drawing and straightening, unless otherwise specified.

CHEMICAL PROPERTIES AND TESTS

3. The brass shall conform to the following requirements as to chemical composition. (See note 2.)

	Per cent
Copper.....	60.0-63.0
Lead.....	2.50-3.75
Iron, maximum.....	.15
Materials other than copper, lead, and zinc, maximum.....	.50
Zinc.....	Remainder.

CHECK ANALYSES

4. In case of dissatisfaction, the rod or rods shall be sampled in the presence of representatives of both parties. The thoroughly mixed sample shall be divided into three equal parts, each of which shall be placed in a sealed package, one for the manufacturer, one for the purchaser, and one for an umpire, if necessary.

PHYSICAL PROPERTIES AND TESTS

5. Rods or bars shall stand being bent cold through an angle of 120° around a pin, the diameter of which is equal to twice the diameter of the round rods or four times the thickness of other shapes, without fracturing. (See note 3.)

6. (a) One bend test shall be made from each lot of 5,000 pounds or fraction thereof.

(b) In case of failure of any test specimen representing a lot, two additional specimens shall be chosen, each of which shall conform to the requirements specified in section 5.

(With respect to chemical analyses, this specification is identical with B15, given above. Permissible variations and requirements as to stock lengths from 12 to 6 feet are the same as in F. S. B. QQ-C-501 (see 642.11, p. 1180) except that in this case for diameters over 2½ inches the permissible variation in diameter for rounds is ±0.15, and for other shapes ±0.30 per cent. Workmanship and finish, inspection and rejection are identical with requirements in B57. (See 644.21, p. 1201.))

NOTES.—1. The material intended to be covered by these specifications is suitable for ordinary manufacturing purposes. In order to machine freely it must contain lead, and possess a considerable degree of temper which is obtained by cold working. The former requirement reduces strength and ductility while the latter adds firmness and stiffness.

2. There are four major constituents encountered in all brass alloys, the control and determination of which present very perplexing problems. They are copper, zinc, lead, and iron. The high volatility of zinc, the variations in temperature which occur in the alloying operation and the variation in the proportion in which it is added to the crucible charge in unalloyed form, causes its proportion in the casting to occasionally fluctuate over wide limits. Except when certain expensive grades of zinc are employed, substantially free from lead, the latter element will also show very considerable variation. Iron is subject to accidental introduction.

On account of the fact that the ordinary crucible charge is only about 200 pounds, it is not commercially practicable to determine the four main elements in each cast. On the other hand, the determination by chemical analysis of the constituents of an individual sample from a lot of a given size tells little about the mean values of the proportions, or the extreme variations which exist in the lot. It is proposed, though not as a very satisfactory solution of this problem, to require that a sample composed of four equal portions from four individual pieces be taken to represent the mean composition of a lot, and that individual samples be permitted to vary between wider limits. It is appreciated that this is not a satisfactory solution of the problem, but no better one has been offered.

There are many uses for which alloys outside of the specified limits are perfectly suitable. The limits given, however, represent standard practice. On the other hand, there are special requirements which can not be most advantageously satisfied by alloys meeting these specifications.

3. It is desirable that a limit be imposed on the hardness due to cold drawing. It is felt that the bend test proposed accomplishes the purpose as satisfactorily as any other test.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR NAVAL BRASS RODS FOR STRUCTURAL PURPOSES, DESIGNATION B21-29, 1929

NAVAL BRASS RODS

SCOPE

1. These specifications cover naval brass rods of any uniform cross section, such as round, hexagonal, square, etc. (Note 1.)

MANUFACTURE

2. The rods shall be manufactured either by hot rolling or extrusion, finished by such cold drawing as may be required, and straightened.

CHEMICAL PROPERTIES AND TESTS

3. The brass shall conform to the following requirements as to chemical composition:

	Per cent
Copper.....	59.0-61.0
Tin.....	.5- 1.0
Iron, not over.....	.10
Lead, not over.....	.30
Materials other than copper, tin, iron, and lead, not over.....	.10
Zinc.....	Remainder.

PHYSICAL PROPERTIES AND TESTS

4. (a) The rods shall conform to the following minimum requirements as to tensile properties:

Diameter, or distance between parallel faces (in inches)	Yield point	Tensile strength	Elongation in 2 inches
	Lbs./in. ²	Lbs./in. ²	Per cent
Up to 1, inclusive.....	31,000	62,000	25.0
Over 1 to 2½, inclusive.....	30,000	60,000	30.0
Over 2½ to 3½, inclusive.....	25,000	56,000	35.0
Over 3½.....	22,000	54,000	40.0

(b) Yield point in tension shall be determined as the stress producing an elongation under load of 0.5 per cent; that is, 0.01 inch in a gage length of 2 inches.

5. The test specimen shall stand being bent cold through 120° to a radius equal to its diameter, without fracturing.

6. A 9-inch length of the test specimen shall stand without cracking an immersion for 15 minutes in an aqueous mercurous-nitrate solution containing 100 g of mercurous nitrate and 13 cc of HNO₃ (specific gravity 1.42) per liter of solution. (Note 2.)

7. (a) Tension test specimens shall be as nearly as possible of the same diameter, or distance between parallel faces, as the rods.

(b) Bend test specimens may be a piece of the full size rod, or a piece 1 inch in width by one-half inch in thickness. In the case of bend test specimens of rectangular section, the edges may be rounded off to a radius equal to one-fourth of the thickness.

(c) Strain test specimens shall be of the full size of the rod, at least 12 inches in length, and without bending, springing, polishing, or any other preparation.

8. (a) Rods shall be grouped into lots of not more than 5,000 pounds.

(b) One tension, one bend, and one strain test specimen shall be cut from one rod for each lot or fraction thereof.

(c) If any tension test specimen breaks outside the middle third of the gage length, a retest shall be allowed.

(With respect to chemical analyses, this specification is identical with B15, given above. Permissible variations and requirements as to stock lengths from 12 to 6 feet are the same as in F. S. B. QQ-C-501 (see 642.11, p. 1180) except that in this case for diameters over 2½ inches the permissible variation in diameter for rounds is ±0.15, and for other shapes ±0.30 per cent. Workmanship and finish, inspection and rejection are identical with requirements in B57 (see 644.21, p. 1201.))

NOTES.—1. Material intended to be covered by these specifications is suitable for structural purposes, and may be used as rods, bolts, etc. It is capable of being forged hot, but is not free cutting.

2. Bars which have been properly straightened or sprung will have internal stresses so broken up as not to be in danger of splitting or cracking. The mercurous-nitrate test is designed to determine whether the internal stresses have been properly broken up and rendered safe.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 88, BRASS ROD, JULY 1924

BRASS ROD

(In respect to scope, manufacture, and analysis of separate rods this specification is identical with A. S. T. M. B15, given above. The flattening test is identical with paragraph 8, and the chemical

composition with grade A, in F. S. B. QQ-B-611 (see 644.0, p. 1195).

Dimensions and tolerances are identical with Table 3 in F. S. B. QQ-C-501 (see 642.11, p. 1180.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 72, FREE-CUTTING BRASS ROD, FEBRUARY 1929

FREE-CUTTING BRASS ROD

1. *Composition in percentage.*—

	Per cent
Copper.....	60.00-63.00
Lead.....	2.25- 3.25
Iron, maximum.....	.15
Other impurities, maximum.....	.25
Zinc.....	Remainder.

2. When several bars or rods are analyzed they should meet this specification. If only one rod or bar is sampled, the following limits will be acceptable:

	Per cent
Copper.....	59.40-63.60
Lead.....	1.80- 3.90

MECHANICAL REQUIREMENTS

3. *Bend test.*—Rods or bars shall bend cold without fracture through an angle of 120° around a pin the radius of which is equal to the diameter or thickness of the rod or bar.

(Dimensions and tolerances are identical with those given in Table 2, F. S. B. QQ-C-501. See 642.11, p. 1180.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 73, NAVAL BRASS (TOBIN BRONZE) ROD, JULY 1924

NAVAL BRASS RODS

1. *Composition in percentage.*—

	Per cent
Copper.....	59.00-62.00
Tin.....	.50- 1.50
Iron, maximum.....	.10
Lead, maximum.....	.30
Other impurities, maximum.....	.10
Zinc.....	Remainder.

MECHANICAL REQUIREMENTS

2. *Tensile test data.*—

Diameter or thickness		Minimum tensile strength	Minimum yield point	Minimum elongation in 2 inches
Over	To and including			
Inches	Inches	Lbs./in. ²	Lbs./in. ²	Per cent
0	1	62,000	31,000	25.0
1	2½	60,000	30,000	30.0
2½	3½	56,000	25,000	35.0
3½	-----	54,000	22,000	40.0

3. *General information.*—This material is intended for use wherever brass rod that is stronger, tougher, and less corrodible than commercial brass rod is required.

(Strain test requirements are the same as those for admiralty condenser tubes and ferrule stock in A. B. S. (See 645.24, p. 1219.) Bend test requirements are identical with those given above in specification No. 72. Dimensions and tolerances are identical with those given in Table 2, F. S. B. QQ-C-501. See 642.11, p. 1180.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR RODS, WELDING, NONFERROUS, FOR GAS WELDING QQ-R-571, MAY 3, 1932

NAVAL BRASS RODS

(For general specifications, types, material, general requirements, detail requirements, methods of inspection, tests, and chemical analysis, packing and marking of shipments, and notes, see 600.0, p. 3.)

1. Naval brass rods may be used for general welding of brass.

2. Welding rods shall conform to the following chemical requirements:

Type B

	Per cent
Copper.....	59.0-62.0
Zinc.....	Remainder.
Tin.....	0.5-1.5
Lead, maximum.....	.2
Iron, maximum.....	.05
Aluminum, maximum.....	1.02

3. Standard sizes of naval brass rods for gas welding are:

Diameter (inch)..... ¼, ½, ¾, and 1

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRASS RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, COMMERCIAL, QQ-B-611, MARCH 1, 1932

BRASS RODS, BARS, SHAPES

(For general specifications, types and grades, material and workmanship, detail requirements, physical properties, tests and methods of inspection, packing and marking, and notes, see 644.0, p. 1195. Otherwise the specifications for brass rods, bars, and shapes are identical with those for copper rods, bars, and shapes in F. S. B. QQ-C-501 (see 642.11, p. 1180) with the following exceptions:)

1. Free-cutting brass rods and bars (grade B, type 1), measured on their diameters or between parallel faces, shall not vary from the specified dimensions by more than the amounts shown for copper rods and bars in Table 2. (See 642.11, p. 1180.) Shapes (grade C, type 1) shall be measured on any cross-sectional dimension.

2. Forging brass rods and bars (grade A), free-cutting brass rods and bars (grade B, type 2), and shapes (grade C, type 2), measured on their diameters or between parallel faces, shall not vary from the specified dimensions by more than the amounts shown for copper rods and bars for forging in Table 3. (See 642.11, p. 1180.)

3. Grade A brass (rods, bars, and shapes) is easily forged hot, and machines well.

4. Grade B brass (rods, bars, and shapes) is suitable for use as trim and in machined parts where strength and incorrodibility are not required. It takes a good finish, especially the half hard, which is to be preferred where accuracy is essential. Type 1 should be ordered where physical requirements are important or close tolerances desired, but type 2 will be satisfactory for less exacting needs. Grade B, type 1, half hard, is also known as drill rod.

¹ As determined on a 20-gram sample.

645.12 WIRES, BRASS.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 80, BRASS WIRE,
AUGUST, 1922**

BRASS WIRE

1. *Composition in percentage.*—

	Grade A	Grade B
Cooper.....	70.00-74.00	64.00-68.00
Lead, maximum.....	.10	.10
Iron, maximum.....	.06	.07
Zinc.....	Remainder.	Remainder.

2. *Physical properties.*—This wire shall have a tensile strength of at least 100,000 pounds per square inch, but should be capable of being bent through an angle of 180° around a wire of the same diameter without breaking.

3. *Appearance.*—The wire shall be uniform in quality and temper, cylindrical in shape and smooth and free from injurious defects.

4. *Dimensional tolerances.*—The wire shall not vary from the specified diameter by more than plus or minus 1 per cent for sizes larger than 0.050 inch. From 0.050 to 0.025 inch the variation in size shall not be more than plus or minus 0.0005 inch. For sizes smaller than 0.025 inch the variation shall not be more than plus or minus 0.00025 inch.

5. *General information.*—Brass wire made to this specification is used for springs. Grade A is for use where the requirements are especially severe. Grade B is for use under ordinary conditions, and will be furnished unless otherwise specified.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 82, BRASS WIRE,
JULY, 1924**

BRASS WIRE

(See 693.2, p. 1334.)

**UNITED STATES GOVERNMENT, FEDERAL
SPECIFICATIONS BOARD, FEDERAL
SPECIFICATION FOR WIRE, BRASS, QQ-
W-321, JUNE 24, 1930**

BRASS WIRE

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, or parts thereof that are below indicated, of the issue in effect on date of invitation for bids, shall form a part of this specification. Federal specification QQ-M-151. (F. S. B. No. 339a); general specifications for metals. (See 600.0, p. 3.)

B. GRADES

B-1. Brass wire shall be furnished in the following three grades, as specified: Grade A, annealed, soft; grade B, as drawn; and grade C, spring temper.

C. MATERIAL AND WORKMANSHIP

C-1. Brass wire shall be made from virgin metals, except scrap as may accumulate in the manufac-

turer's plant from materials of the same composition, and of the manufacturer's own make, may be used.

D. GENERAL REQUIREMENTS

D-1. The wire shall be uniform in composition and quality, free from all injurious internal and surface defects, cracks, seams, laps, slivers, kinks, and scale. It shall be new, bright, smooth, and of uniform size.

D-2. Wire shall not vary from the specified diameter by more than the amounts shown in Table 1.

TABLE 1

Diameter of wire	Permissible variation
<i>Inch</i>	<i>Inch</i>
0.0250-0.0375	±0.00040
.0376-.050	±.00050
.0510-.080	±.00080
.0810-.10	±.0010
.0110-.150	±.0015
.1510-.18750	±.0020
.1880-.250	±.0025

E. DETAIL REQUIREMENTS

E-1. The chemical composition of the wire shall be as covered by Table 2.

TABLE 2

Grades	Copper	Lead, maximum	Iron, maximum	Zinc, per cent
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	Remainder.
A and B.....	64-69	0.150	0.06	Do.
C.....	69-74	.075	.06	

E-2. The wire shall meet the physical requirements of Table 3.

TABLE 3

Grade	Tensile strength per square inch in pounds			Ductility tests
	Under 0.080 inch diameter	0.080 inch to 0.150 inch diameter	Over 0.150 inch diameter	
A.....	{ 140,000 2 56,000	{ 138,000 2 54,000	{ 136,000 2 52,000	See sec. F-3.
B.....	{ 156,000 2 70,000	{ 154,000 2 70,000	{ 152,000 2 68,000	
C.....	1 120,000	1 118,000	1 116,000	See sec. F-4.

¹ Minimum.² Maximum.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. One tension and one ductility test specimen shall be selected from each 500 pounds or fraction thereof.

F-2. One chemical analysis sample shall be taken to represent each 1,000 pounds or fraction thereof.

F-3. When required by the contract, the following test shall be included: Grades A and B wire shall be capable of being wrapped eight times around a rod having a diameter not more than five times the diameter of the wire. Upon release of the free end, the spring shall not be greater than that given in the following table:

Diameter (inch)	Degree unwind of free end	
	Grade A	Grade B
Under 0.080.....	30	35
Wire over 0.080.....	25	40

F-4. Grades A, B, and C wire shall withstand being bent cold 360° around a wire of the same diameter without showing cracks or fracture.

G. PACKAGING, PACKING, AND MARKING

G-1. *Packaging.*—Unless otherwise specified, the outside and inside diameters of the coils shall be optional with the manufacturer, and the brass wire shall be furnished in 1-pound spools, 5-pound coils, or 10-pound coils, as called for.

I. NOTES

I-1. The brass wire covered by this specification is intended for use only where commercial brass wire is applicable.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

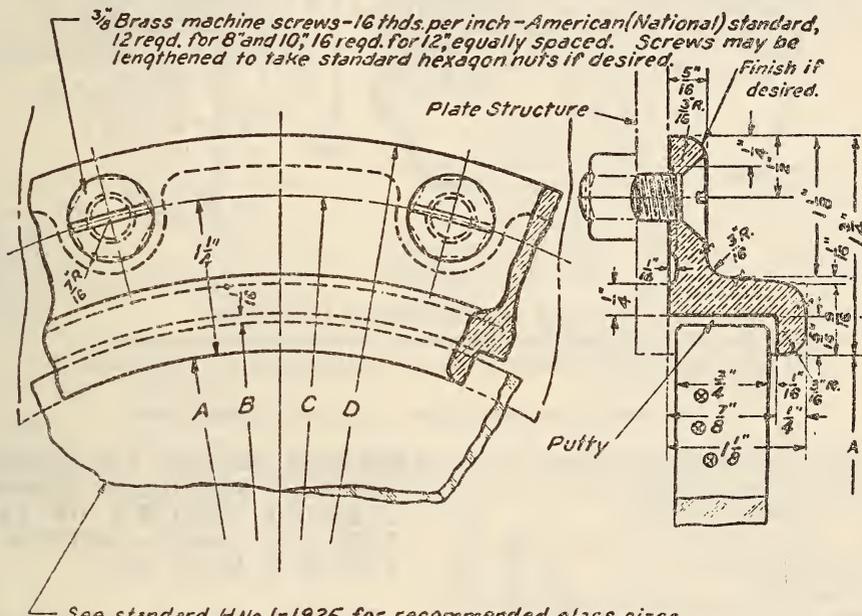

BRASS CASTINGS

(See 646.41, p. 1250.)

AMERICAN MARINE STANDARDS COMMITTEE, FIXED LIGHTS FOR SHIPS, H NO. 4-1925

TYPE B. CAST BRASS FRAME

The frames of types A and B are interchangeable (for type A, see 619.9, p. 1086); they are for use in

See standard HNo. 1-1925 for recommended glass sizes.
 * For glass of a different thickness alter these dimensions to suit.
 All other dimensions (except as shown in table) apply to all standard sizes, 8", 10" and 12".

FIGURE 1083.—Fixed lights, type B, cast-brass frame

I-2. Grade A brass wire is used for beading, seizing, etc.

I-3. Grade B brass wire is used for hinge-pins, rivets, lamp guards, etc.

I-4. Grade C brass wire is used for springs, locking rings, etc.

(See 644.0, p. 1193.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR COMPOSITION BRASS OR OUNCE-METAL SAND CASTINGS, DESIGNATION B62-28, 1928

OUNCE METAL

SCOPE

1. These specifications cover alloy castings, the alloy being a composition of copper, tin, lead, and zinc, known commercially as composition metal, 85-5-5-5, or ounce metal. Castings of this alloy are commonly used in hydrostatic pressures up to 350 pounds per square inch.

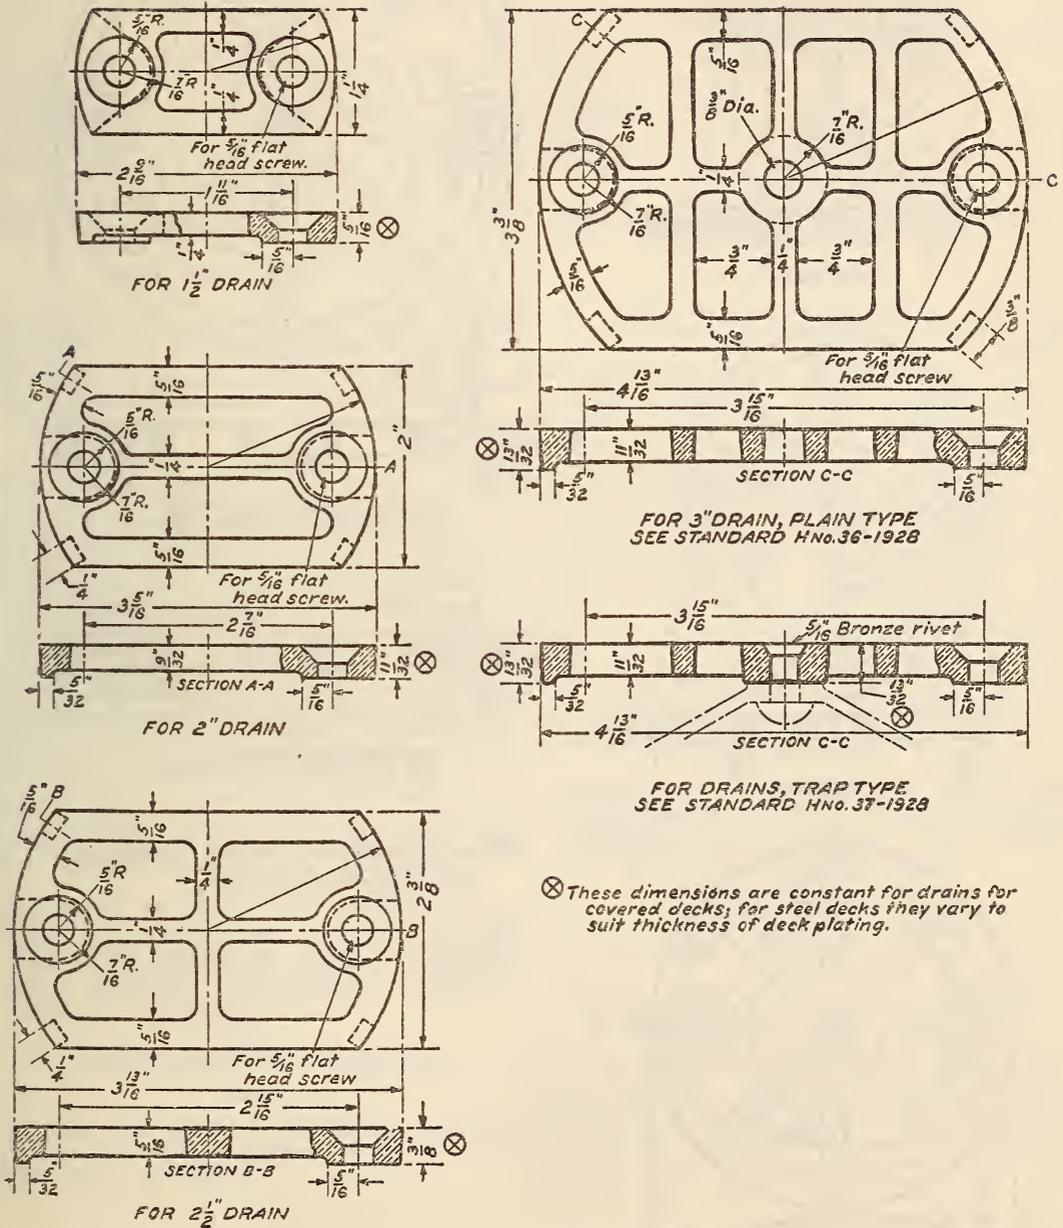

FIGURE 1085.—Deck drain strainers, type A

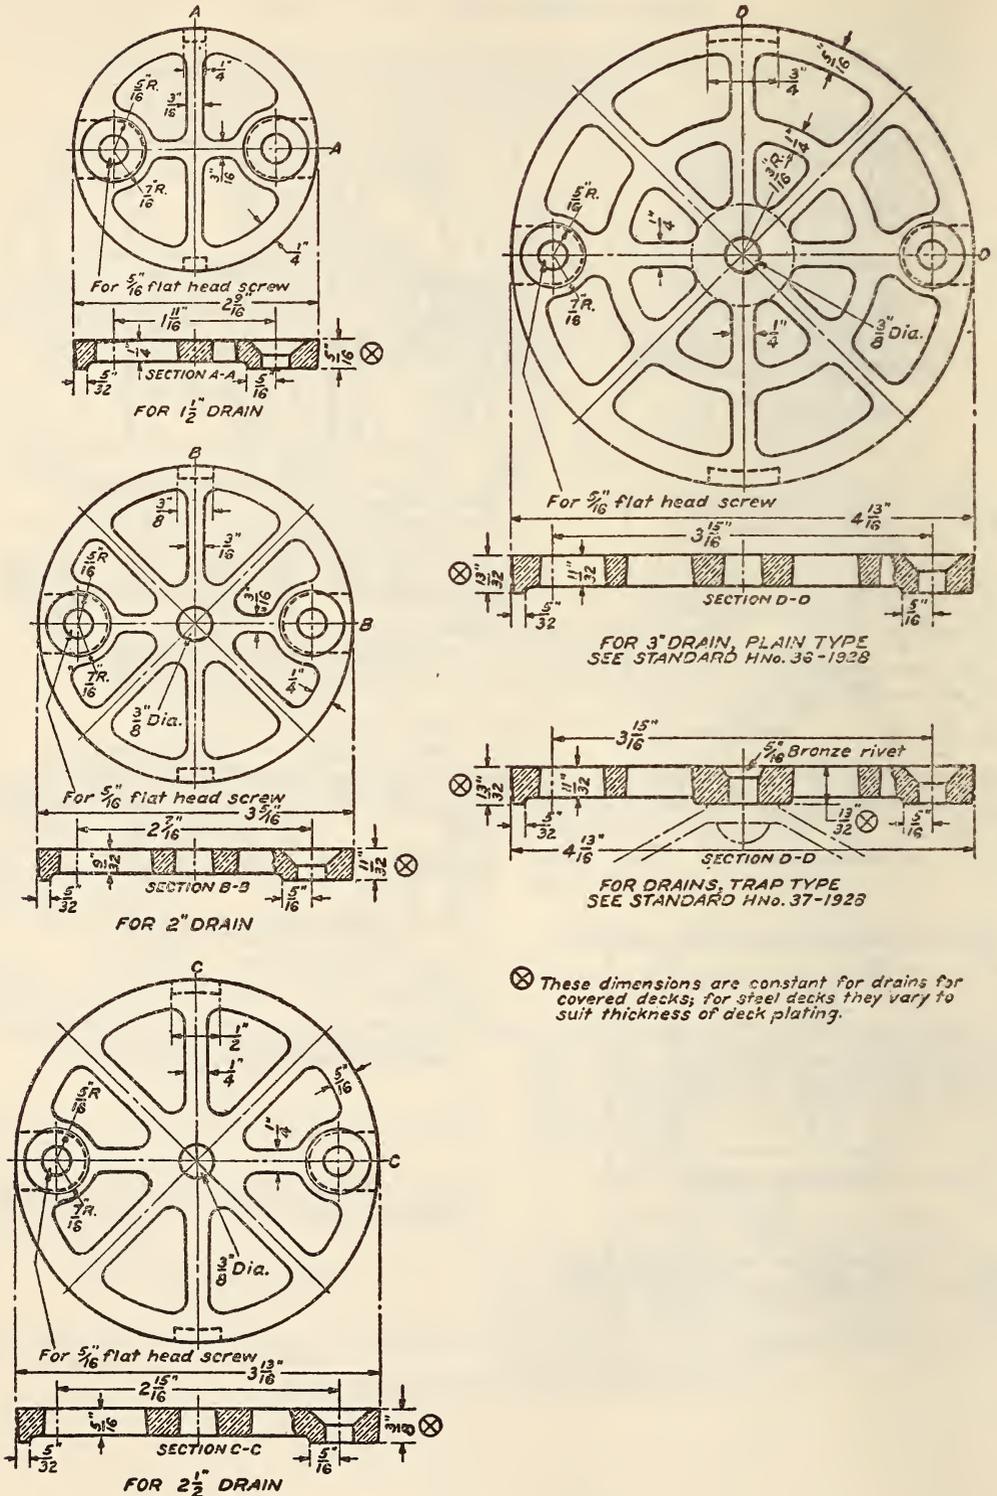

FIGURE 1086.—Deck drain strainers, type B

CHEMICAL PROPERTIES AND TESTS

2. The alloy shall conform to the following requirements as to chemical composition:

	Desired	Minimum	Maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Copper.....	85.00	84.00	86.00
Tin.....	5.00	4.00	6.00
Lead.....	5.00	4.00	6.00
Zinc.....	5.00	4.00	6.00
Iron.....	None.		25
Nickel.....			75
Phosphorus.....	None.		.05
Aluminum.....	None.		None.
Sulphur.....			.05
Antimony.....			25
Total other impurities.....			.15

Where "none" is specified it shall be construed to refer to none as determined on a 10 g sample.

PHYSICAL PROPERTIES AND TESTS

3. (a) Where desired by the purchaser and so specified in the contract or purchase order, the alloy shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	26,000
Yield point.....	do.....	12,000
Elongation in 2 inches.....	per cent..	15

(b) Where physical requirements are not specified in the contract or purchase order, a fracture of the test specimens shall be made and the fractured surface shall indicate the soundness and uniformity of the metal upon examination with the naked eye. If the test bars do not indicate a uniform soundness and quality of metal, the castings may be rejected.

(Specifications covering tension-test-specimen requirements are identical with those in paragraph 11 (c), A18. (See 611.51, p. 754.) In respect to chemical analyses, determination of yield point, workmanship and finish, marking, and inspection and rejection, this specification is identical with B59. (See 647.15, p. 1259.) In respect to manufacture, pressure-test requirements, and dimensions of test-specimen coupon, it is identical with B60. (See 643.4, p. 1192.) Paragraphs 7 (a), (b), (c), and (d) in this specification, covering number of tests, are identical with Paragraphs VI 2, 3, 4, and 13 in F. S. B. QQ-B-691. See 646.41, p. 1252.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR YELLOW-BRASS SAND CASTINGS FOR GENERAL PURPOSES, DESIGNATION B65-28, 1928

YELLOW-BRASS SAND CASTINGS

SCOPE

1. These specifications cover castings made from one of the many yellow brasses commonly used for a wide variety of castings.

CHEMICAL PROPERTIES AND TESTS

2. The alloy shall conform to the following requirements as to chemical composition:

	Desired	Minimum	Maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Copper.....	63.5	62.0	67.0
Tin.....	None.	None.	1.0
Lead.....	2.5	1.5	3.5
Zinc.....	34.0	Remainder.	Remainder.
Iron.....	None.		0.75
Nickel.....	None.		.25
Phosphorus.....	None.		.03
Aluminum.....	None.		.3
Sulphur.....	None.		.05
Antimony.....	None.		.15
Total other impurities.....	None.		.15

Where "none" is specified it shall be construed to refer to none as determined on a 10 g sample.

PHYSICAL PROPERTIES AND TESTS

3. Where desired by the purchaser and so specified in the contract or purchase order, the alloy shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	20,000
Elongation in 2 inches.....	per cent..	15

(Specifications covering tension-test-specimen requirements are identical with those in paragraph 11 (c), A18. (See 611.51, p. 754.) In respect to chemical analyses, workmanship and finish, marking, and inspection and rejection, this specification is identical with B59. (See 647.15, p. 1259.) In respect to manufacture and dimensions of test-specimen coupon, it is identical with B60. (See 643.4, p. 1192.) In respect to fracture of test specimens when physical requirements are not specified it is identical with B62. (See 645.21, p. 1208.) Paragraphs 7 (a), (b), (c), and (d) in this specification, covering number of tests, are identical with Paragraphs VI 2, 3, 4, and 13 in F. S. B. QQ-B-691. (See 646.41, p. 1252.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 44, CAST BRASS TO BE BRAZED, MARCH, 1922

CAST BRASS TO BE BRAZED

1. Composition in percentage.—

	Per cent
Copper.....	83.00-86.00
Zinc.....	14.00-17.00
Lead, maximum.....	.50
Iron, maximum.....	.15

2. General information.—This brass starts to melt at approximately 1,830° F., and is entirely melted at approximately 1,870° F. As a brazing material on this brass to be brazed, either silver solder or a brazing brass melting at a temperature lower than that the brass to be brazed should be used.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 40, RED BRASS,
AUGUST, 1922**

RED BRASS

1. *Composition in percentage.*—

	Per cent
Copper.....	83.00-86.00
Tin.....	4.50- 5.50
Lead.....	4.50- 5.50
Zinc.....	4.50- 5.50
Iron, maximum.....	.35
Antimony, maximum.....	.25
Aluminum.....	None.

2. *General information.*—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	27,000
Yield point.....	do.....	12,000
Elongation in 2 inches, or proportionate gage length.....	per cent..	16

3. This is a free-cutting brass with good casting and finishing properties.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 41, YELLOW BRASS,
AUGUST, 1922**

YELLOW BRASS

1. *Composition in percentage.*—

	Per cent
Copper.....	62.00-65.00
Lead.....	2.00- 4.00
Zinc.....	31.00-36.00
Tin, maximum.....	1.00
Iron, maximum.....	.50
Aluminum.....	None.
Other impurities.....	.25

2. *General information.*—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	25,000
Yield point.....	do.....	12,000
Elongation in 2 inches, or proportionate gage length.....	per cent..	20

3. This alloy is intended for use in commercial castings where cheapness and good machining properties are the main considerations.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

BUILDERS' HARDWARE (NONTEMPLATE)

(See 617.0, p. 977.)

BUILDERS' HARDWARE (NONTEMPLATE)

(See 617.0, p. 978.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION: FF-P-451)

PLUMBING FIXTURES (FOR LAND USE)

(See 617.73, p. 1062.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR NAVAL AND COMMERCIAL BRASS CASTINGS, QQ-B-621, MAY 31, 1932.

BRASS CASTINGS

In respect to general requirements, tests and methods of inspection, and packing and marking, this specification is identical with F. S. B. QQ-B-691 (see 646.41, p. 1252) except as noted below. Otherwise its provisions are as follows:)

GRADES

1. This specification covers two grades of brass in the form of castings, as follows: A, naval brass castings; and B, commercial brass castings.

MATERIAL

2. The castings shall be made only from the best grades of virgin metals, or from virgin metals and scrap of known and approved composition.

GENERAL REQUIREMENTS

3. The color of the fracture and the grain of the metal shall be uniform throughout.

DETAIL REQUIREMENTS

4. Castings shall conform to the chemical requirements shown below:

Grade	Composition	Copper	Zinc	Tin	Lead	Iron (maximum)	Aluminum (maximum)
		<i>Per cent</i>					
Naval brass.....	(Desired.....)	62.5	36.3	1.0	0	0	0.2
	(Permissible.....)	60.0-65.0	Remainder.	.5-1.5	0-1.0	0.5	.5
Commercial brass.....	(Desired.....)	63.5	34.0	0	2.5	0	0
	(Permissible.....)	62.0-67.0	Remainder.	0-1.0	1.5-3.0	.75	.3

5. An analysis of each melt of castings shall be furnished by the contractor, showing the percentages of the elements designated.

6. The physical requirements for naval brass castings are:

Tensile strength minimum	Elongation in 2 inches minimum
Lbs./in. ² 30,000	Per cent 15.0

7. No physical requirements are specified for commercial brass castings, and no test coupons need be provided.

TESTS AND METHODS OF INSPECTION

8. Check chemical analyses may be made by the inspector, or through him by any Government laboratory or other designed representative, and without cost to the contractor.

9. Samples for check analyses shall be taken from tensile-test specimens or from a representative casting or gate selected by the inspector from each melt or lot. The drillings shall be taken from sound metal below the surface. The inspector shall forward for analysis not less than 5 ounces of drillings.

10. (The Brinell tests called for in QQ-B-691 are omitted from this specification.)

PACKING AND MARKING

NOTES.—Naval brass may be used for corrosion-resisting castings, where strength or bearing requirements are unimportant, such as valves, handwheels, handrail fittings, chest hinges, etc.

Commercial brass may be used for castings that are not to be subjected to water or air pressure, and where iron or steel is unsuitable because of corrodibility, such as name and number plates, instrument cases, oil cups, distribution boxes, trimmings, etc. Commercial brass will machine with greater facility than naval brass because of its higher lead content, but its physical properties are much lower.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR BRASS CASTINGS TO BE BRAZED, QQ-B-601, MAY 31, 1932.

BRASS CASTINGS TO BE BRAZED

(In respect to general requirements, and packing and marking of shipments, this specification is identical with F. S. B. QQ-B-691. (See 646.41, p. 1252.) Otherwise its provisions are as follows:)

GRADES

1. Brass castings to be brazed shall be furnished in two grades: Grade A and grade B.

MATERIAL

2. The castings shall be made only from the best grades of virgin metals, or from virgin metals and scrap of known and approved composition.

DETAIL REQUIREMENTS

3. Castings shall conform to the chemical requirements shown below:

Composition	Copper	Zinc	Lead (maximum)	Iron (maximum)	Other impurities (maximum)
	Per cent	Per cent	Per cent	Per cent	Per cent
Desired.....	85.0	15.0	0	0	0
Permissible:					
Grade A.....	83.0-86.0	Remainder.	0.3	0.06	0.04
Grade B.....	83.0-86.0	Remainder.	.5	.15	.10

4. An analysis of each melt of castings shall be furnished by the contractor, showing the percentages of the elements designated.

5. Castings shall conform to such physical requirements as may be specified in the contract or purchase order.

6. Fracture tests may be prescribed by the department or bureau concerned.

METHODS OF INSPECTION AND TESTS

7. Check chemical analysis may be made by the inspector, or through him by any Government laboratory or other designated representative, and without cost to the contractor.

8. Samples for check analyses shall be taken from a representative casting selected by the inspector from each melt or lot. The drillings shall be taken from sound metal below the surface. The inspector shall forward for analysis not less than 5 ounces of drillings.

9. Where castings are of such form and dimensions as to make calipering of their walls impracticable, and the inspector so requests, one-quarter inch holes shall be drilled through at doubtful places to establish the exact thickness. Before loading for shipment, these holes shall be tapped out and filled by screwing in suitable brass plugs, or by welding, wherever such method is approved by the inspector. Such plugs shall carry the inspector's stamp.

NOTES.—This brass starts to melt at approximately 1,830° F. and is entirely melted at 1,870° F.

As brazing material on this brass, either silver solder or a lower melting higher-zinc brass should be used.

645.22 FERRULES, BRASS.

AMERICAN MARINE STANDARDS COMMITTEE, E NO. 1-1931

CONDENSER-TUBE FERRULES

GENERAL NOTES

1. *Scope.*—The ferrules and tube sheet stuffing boxes shown by this standard apply especially to condensers in which soft fibrous packing is used. They are usable with hard fiber and metallic packings also, but as these packings require but little compression in setting them and none after they are set, no reserve thread is, therefore, needed, and the length of ferrules for permanent use with such packings may be shortened by one-eighth inch in the thread, or from three-fourths inch to five-eighths inch over all. All of the other features of the shortened ferrules and the tube lengths would be in accordance with the standard. The length of thread in the stuffing box would be correspondingly shortened. Hard fiber or metallic packings should be ordered to suit the stuffing box and the length of ferrule to be used.

2. *Types.*—The standard comprises three types of ferrules, the details of which are shown in Figure 1087.

Type 1 is for application especially at the inlet end of tubes packed at both ends. It may also be used in lieu of type 2 at the outlet end of such tubes, but it is not advocated for that purpose except in an emergency.

Type 2 is companion to type 1 and is for application exclusively at the outlet end of the same tubes.

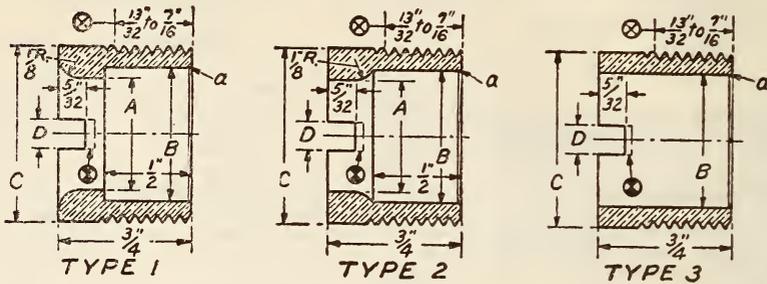

Type 3 is for application at the outlet end of tubes which are rigidly secured to the tube sheet at the inlet end by expansion or rolling.

Typical applications of all three types with soft packings appear herewith, which shows the approximate positions of the ferrules when the tubes are newly packed and when the packing is compressed to the limit and the ferrules are fully engaged.

3. *Materials.*—High character of material for condenser-tube ferrules is of the utmost importance for reliable service and economical results. The American Marine Standards Committee contemplates the issuance of standard specifications for condenser tubes and ferrule stock, in which present

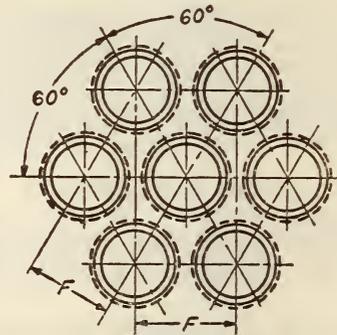

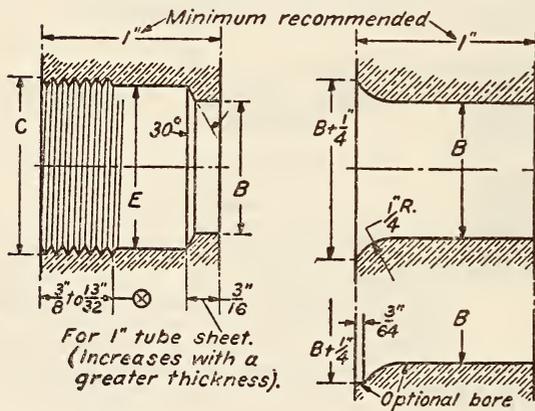

Tubes; condenser and ferrule admiralty [stock metal specification No. 374 (WW-T-781), issued by the Federal Specifications Board. (See 645.24, p. 1222.)

4. *Packings.*—The packings for condenser tubes must be of such character as to be unaffected by any

a-Slight chamfer.
 • Slots may be cut with a flat or concave bottom provided that the latter leaves a thickness of at least $\frac{1}{32}$ between the slot and the shoulder of types 1 and 2.

FERRULE DETAILS

TYPICAL ARRANGEMENT OF TUBES WITH A MINIMUM SPACING

TUBE SHEET DETAILS

FIGURE 1087

divergent requirements are to be reconciled. Pending issuance of such specifications, the use of either of the following is recommended as basis for purchasing these materials:

Seamless admiralty condenser tubes and ferrule stock, specifications B 44, promulgated by the American Society for Testing Materials. (See 645.22, given below.)

extremes or changes of temperature in the condenser. Soft packing may be of any suitable fibrous material, such as corset lacing, susceptible to moderate compression. Hard fiber packing may be of any appropriate composition, molded or cut to the requisite form and size. For metallic packing and its application, see American Marine Standard E No. 20-1928, published in A. M. S. C. 41.

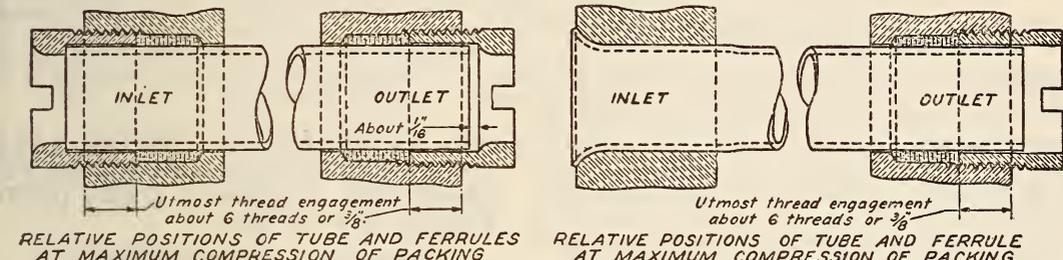

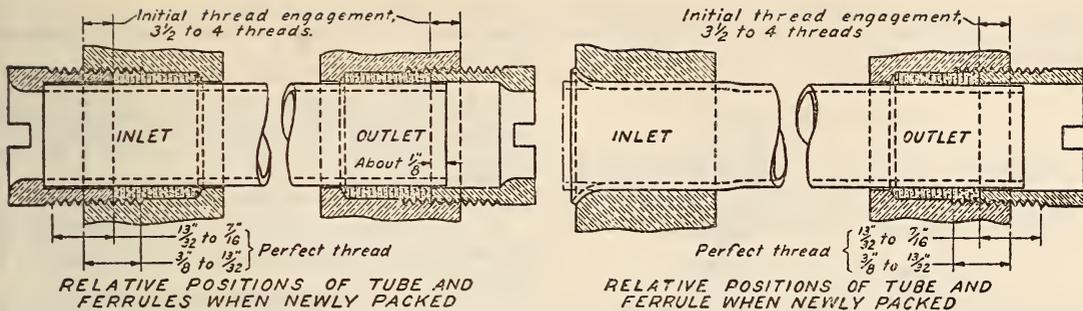

FIGURE 1088.—Types 1 and 2, tube packed at both ends; type 3, tube expanded at one end. Typical applications of ferrules

[Dimensions given in inches]

	Inside diameter	0.527	0.509	0.495	0.652	0.634	0.620	0.777	0.759	0.745	0.902	0.884	0.870
Ferrules and tube sheets	A	0.509			0.634			0.759			0.884		
	B	.635			.762			.889			1.016		
	C	0.875 (7/8)			1.000			1.125 (1 1/8)			1.250 (1 1/4)		
	D	5/8			3/4			7/8			1		
	E	.796			.921			1.046			1.171		
	F	1			1 1/8			1 1/4			1 1/2		

Pitch diameter of thread:

Ferrules shall be gaged at a distance 3/8-inch from end.

Tolerance: Undersize 0.002 inch; no oversize.

Tube sheet shall be gaged at the face.

Tolerance: Oversize 0.002 inch; no undersize.

Subject to these requirements, the threads may taper up to 0.004 inch per inch.

⊗ Length of perfect thread: 16 per inch, American (national) standard form.

Diameters A, B, C, and E may be plus 0.005 inch, no undersize; eccentricity shall not exceed 0.002 inch.

Tube length for all types equals distance from face to face of tube sheet plus 3/16 inch, subject only to a tolerance of 1/32 inch, plus or minus.

(An appendix to this specification covers general requirements for effective condenser-tube packing, and the details of an experiment conducted by the United States Shipping Board with an installation of condenser tubes without ferrules on the steamship *Bakersfield*. The results of this experiment will be found in Vol. XLII, No. 4, November, 1930, of the American Society of Naval Engineers.)

645.23 PIPES, BRASS.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

BRASS PIPES

(See 642.23, p. 1182.)

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

BRASS PIPES AND TUBES

(For general information and requirements see 600.0, p. 1. For test requirements see 600.1, p. 7.)

1. Seamless-drawn brass pipes and tubes subject to a working pressure of over 150 pounds are to be tested and inspected by the surveyor in accordance with the following requirements: The material used must be of the best quality; the tubes must be true to form, of uniform thickness throughout, clean and smooth, and free from defects.

2. Test specimens are to be selected by the surveyor, and at least one set of tests is to be made for each lot of 2,000 pounds or less. The test specimens are to be annealed. All tubes are to be at least semiannealed if full annealing is not required by the purchaser.

TENSILE TEST

3. A standard tension-test piece must show the material to have a minimum tensile strength of 40,000 pounds per square inch, and a minimum elongation of 15 per cent.

FLATTENING TEST

4. A section of pipe 4 inches long must stand flattening until the sides are brought parallel to a

distance between the parallel sides of twice the thickness of the metal without showing cracks or flaws.

BENDING TEST

5. For fully annealed pipes a test tube shall stand bending through 180° around a diameter of one and one-half times the inside diameter of the pipe or tube.

EXPANDING TEST

6. A test specimen 6 inches long must stand an expansion of three-eighths inch without cracking or splitting.

HYDROSTATIC TEST

7. All tubes are to be subjected to a hydrostatic pressure of not less than twice the working pressure for working pressures up to 1,000 pounds per square inch. For working pressures above 1,000 pounds per square inch the test pressure is to be equal to the working pressure plus 1,000 pounds per square inch. (The gaging and marking are the same as for copper pipes and tubes. See 642.23, p. 1182.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR BRASS PIPE, STANDARD SIZES, DESIGNATION B43-24, 1924

BRASS PIPE, STANDARD SIZES

SCOPE

1. These specifications cover seamless brass pipe suitable for use in plumbing, boiler-feed lines, etc.

MANUFACTURE

2. The pipe shall be cold-drawn to size.

3. (a) The pipe shall be annealed sufficiently to enable it to pass the physical tests herein specified.

(b) All pipe shall be annealed sufficiently to prevent cracking. Semiannealed pipe, which is suitable for ordinary uses, shall be furnished unless otherwise specified.

(c) When pipe is required for bending, the purchaser shall so specify, in which case the pipe shall be furnished fully annealed.

CHEMICAL PROPERTIES AND TESTS

4. The brass shall conform to the following requirements as to chemical composition:

	Hot pierced process	Cold process
Copper.....	Per cent 59.00-63.00	Per cent 65.00-68.00
Lead, maximum.....	0.50	0.80
Iron, maximum.....	.07	.07
Zinc.....	Remainder.	Remainder.

(Sampling for chemical analysis is identical with that for copper pipe in A. S. T. M., B42. See 642.23, p. 1182.)

PHYSICAL PROPERTIES AND TESTS

(The hammering test is the same as that for condenser tubes and ferrule stock in A. B. S. (see 645.24, p. 1219); also the strain test in an aqueous mercurous nitrate solution, except that in this specification the strain-test specimen is only 3 inches long.)

5. A test specimen 3 inches in length, when split, shall withstand opening out flat without showing cracks or flaws.

6. The pipe shall withstand threading in a satisfactory manner.

7. A sufficient number of pipes shall be taken at random to constitute 0.5 per cent of the shipment. One flattening, one strain, and one threading test shall be made on each pipe so selected.

(Requirements covering bend test and hydrostatic test are the same as those for copper pipe in A. S. T. M., B42 (see 642.23, p. 1182), except that in this case the fiber stress is 7,000 pounds per square inch instead of 6,000 as in B42.

DIMENSIONS AND PERMISSIBLE VARIATIONS

(The dimensions for brass pipe are the same as for copper pipe, as are the variations in both weight and thickness, as given in B42, referred to above. The standard weights for brass pipe of various outside diameters are shown in the accompanying table:)

TABLE 1.—Standard weights for brass pipe

Size of pipe Inches	Standard pipe, nominal weight per foot of length Pounds	Extra-strong pipe, nominal weight per foot of length Pounds
1/4	0.246	0.353
3/8	.437	.593
1/2	.612	.805
5/8	.911	1.19
3/4	1.24	1.62
1	1.74	2.39
1 1/4	2.56	3.30
1 1/2	3.04	3.99
2	4.02	5.51
2 1/2	5.83	8.41
3	8.31	11.24
3 1/2	10.85	13.67
4	12.29	16.41
4 1/2	13.74	20.07
5	15.40	22.52
6	18.44	31.32
7	23.92	41.23
8	30.05	47.02
9	36.94	52.81
10	43.91	59.32

8. No single piece of pipe that exceeds the calculated weight by more than 5 per cent will be accepted. One cubic inch of the material is assumed to weigh 0.307 pound.

9. All pipes shall be acid cleaned after the final annealing.

(Requirements covering workmanship and inspection and rejection are identical with those for copper pipe in B42, with the exception that:)

10. Pipes that show nonuniform annealing under handling shall be rejected from the lot.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIPE; BRASS, SEAMLESS, IRON-PIPE SIZE, STANDARD AND EXTRA STRONG, WW-P-351, JULY 22, 1930

BRASS PIPE

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification GGG-P-351, pipe threads. (See 607.0, p. 365.)

Federal specification QQ-M-151. General specification for metals. (See 600.0 p. 3.)

B. GRADES AND WEIGHTS

B-1. Seamless brass pipe shall be furnished in three grades, A, B, C, and as required.

B-2. Each grade shall be furnished in two weights, standard and extra strong, as required.

C. MATERIAL AND WORKMANSHIP

C-1. The pipe shall be clean, smooth, round, straight, of the proper dimensions, and with ends cut square. It shall be free from grooving, indentations, cracks, flaws, or other defects.

D. GENERAL REQUIREMENTS

D-2. One cubic inch of grade A material is assumed to weigh 0.316 pound. One cubic inch of grades B or C material is assumed to weigh 0.307 pound. No single piece that exceeds the calculated weight by more than 5 per cent shall be accepted. The tolerance for underweight and gage shall be 5 per cent for pipe up to and including 6 inches; 7 per cent from 6 inches to and including 8 inches; and 8 per cent above 8 inches, respectively.

D-3. The ends of the pipe shall not be threaded unless so ordered. Pipe threads when ordered shall be standard taper pipe threads conforming to Federal specification GGG-P-351, as referred to in paragraph A-1.

D-4. Random stock lengths of from 12 feet to 16 feet, inclusive, will be accepted, except when exact lengths are ordered.

D-4a. When exact lengths are ordered, a variation of plus one-eighth inch in the length will be permitted.

D-5. All pipe shall be furnished semi-annealed, unless otherwise specified.

D-6. All fully annealed pipe shall be acid cleaned.

D-7. The name or trade-mark of the manufacturer and the grade letter shall be permanently marked on each pipe.

E. DETAIL REQUIREMENTS

E-1. Seamless brass pipe shall be made of material conforming in composition to the requirements in Table 1.

TABLE 1.—Chemical composition of brass pipe

Grade	Copper	Zinc	Lead	Iron
	<i>Per cent</i>		<i>Per cent maximum</i>	<i>Per cent maximum</i>
A.....	83 to 68	Remainder.....	0.06	0.05
B.....	65 to 68do.....	.80	.07
C.....	59 to 68do.....	.80	.07

E-2. The dimensions, weights, and number of threads per inch of the various sizes of pipe when ordered as standard iron-pipe size, regular, shall be as shown in Table 2.

TABLE 2.—Standard weights and dimensions of brass pipe, iron-pipe size

Iron-pipe size	Weight per foot		Minimum internal hydrostatic test pressure per square inch	Threads per inch
	Grade A	Grades B and C		
<i>Inches</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>

$\frac{1}{4}$.450	.437	1,000	18
$\frac{3}{8}$.630	.612	1,000	18
$\frac{1}{2}$.938	.911	1,000	14
$\frac{3}{4}$	1.27	1.24	1,000	14
1	1.79	1.74	1,000	11½
1¼	2.63	2.56	1,000	11½
1½	3.13	3.04	1,000	11½
2	4.14	4.02	1,000	11½
2½	6.00	5.83	1,000	8
3	8.56	8.31	1,000	8
3½	11.17	10.85	1,000	8
4	12.66	12.29	900	8
5	15.85	15.40	700	8
6	18.99	18.44	600	8
8	30.95	30.05	500	8
10	45.20	43.91	500	8

(Outside diameter and wall thickness for the various sizes are the same as for standard-weight copper pipe given in A. S. T. M. specification B42. (See 642.23, p. 1182.)

E-3. The dimensions, weights, and number of threads per inch of the various sizes of pipe when ordered as extra strong shall be as shown in Table 3.

TABLE 3.—Weights and dimensions of brass pipe, iron-pipe size, extra strong

Iron-pipe size	Weight per foot		Minimum internal hydrostatic test pressure per square inch	Number of threads per inch
	Grade A (plain ends)	Grades B and C (plain ends)		
<i>Inches</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>	
$\frac{1}{8}$	0.363	0.353	1,000	27
$\frac{1}{4}$.611	.593	1,000	18
$\frac{3}{8}$.829	.805	1,000	18
$\frac{1}{2}$	1.23	1.19	1,000	14
$\frac{3}{4}$	1.67	1.62	1,000	14
1	2.46	2.39	1,000	11½
1¼	3.39	3.30	1,000	11½
1½	4.10	3.99	1,000	11½
2	5.67	5.51	1,000	11½
2½	8.66	8.41	1,000	8
3	11.57	11.24	1,000	8
3½	14.07	13.67	1,000	8
4	16.89	16.41	1,000	8
5	23.18	22.52	1,000	8
6	32.21	31.32	1,000	8
8	48.39	47.02	900	8
10	61.05	59.32	700	8

(Outside diameter and wall thickness for the various sizes are the same as for extra-strong copper pipe given in A. S. T. M. specification B42. See 642.23, p. 1182.)

F. METHOD OF SAMPLING INSPECTION AND TESTS

F-1. Each pipe shall be subjected to a minimum internal hydrostatic pressure in accordance with the

fourth column of Tables 2 and 3, without showing signs of bulging, cracks, flaws, porous places, or other defects.

F-2. All pipe shall be surface inspected for defects by rolling on a set of wooden horses or other suitable supports, so that the entire surface of each pipe may be properly examined. In the event of failure of 10 per cent of any lot presented for inspection to pass the surface inspection and gaging tests, that lot shall be rejected.

F-3. For purposes of inspection, 1,000 pounds or fraction thereof of the same size of pipe shall be considered a "lot."

F-3a. The inspector shall select and subject 1 per cent of the lengths of each lot of pipe of the same size submitted for inspection to the following tests:

F-3b. Each test pipe shall have a piece 3 inches long cut from it, which piece when slit on one side shall stand bending out flat without showing cracks or flaws.

F-3c. A full-section test specimen 6 inches in length shall withstand total immersion for 15 minutes without cracking in an aqueous mercurous nitrate solution containing 100 g of mercurous nitrate and 13 c c of nitric acid (specific gravity 1.42) per liter of solution.

F-3d. For pipe under 2 inches in diameter, the length of test pipe remaining after tests F-3b, and F-3c shall be flattened on different elements throughout its length so that a gage set at three times the thickness of the metal shall pass over the pipe freely throughout the flattened part, except at such points where changes in the elements of flattening take place. The pipe shall be rotated approximately 90° between each successive flattened element. For pipe 2 inches and over in diameter a section 4 inches long shall be flattened so that a gage set at three times the wall thickness shall pass over the pipe freely throughout the flattened part. Pipe shall develop no cracks or flaws as a result of these tests.

F-4. One piece of pipe selected by the inspector from each size submitted for inspection shall stand threading satisfactorily with a hand die, with the standard pipe thread for pipe and pipe fittings for that size of pipe.

F-5. If any specimen fails to meet the requirements of subparagraphs F-3b, F-3d, F-4, two additional specimens may be taken, each of which shall conform to the requirements specified.

F-6. When 2-inch pipe and under is ordered fully annealed, full sections of pipe shall withstand bending 180° around a diameter of one and one-half times the inside diameter of the pipe without cracking on the outside bent portion. Flattening of pipe due to bending is permitted.

F-7. Chemical analysis may be made by the inspector or through him by any Government laboratory or other designated representative without cost to the contractor.

F-7a. Drillings, millings, or clippings for chemical analysis shall be taken from several points around each piece selected for physical tests and the chips from each lot combined and thoroughly mixed. The resultant sample shall be free from dirt, grit, and other foreign matter and shall consist of at least 2 ounces.

I. NOTES

I-1. Pipe is regularly designated by iron-pipe size, grades A, B, or C, standard or extra strong.

I-2. When pipe is required for severe bending, the requisition or purchase order should specifically require "fully annealed pipe."

I-3. When pipes are required to exact length, it shall be so stated on the requisition.

I-4. As regards corrosion resistance, it is considered that the grades may be rated in the following order: A, B, and C, grade A being the most resistant

645.24 TUBES, BRASS.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

BRASS PIPE AND TUBES

(See 645.23, p. 1216.)

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

CONDENSER TUBES AND FERRULE STOCK

(For general information and requirements, see 600.0, p. 1. For test requirements, see 600.1, p. 7.)

1. The tube shall be cold-drawn to a size, of a standard alloy in which scrap shall not be used except such as may result from the manufacture of articles of the same composition.

2. Condenser tubes shall be annealed sufficiently to enable the tubes to pass the physical and metallographic tests specified. Tubes for ferrule stock shall be sufficiently annealed to prevent cracking, but need not be held within the close limits specified for condenser tubes.

3. The material shall conform to the following requirements as to chemical composition:

	Per cent
Copper (lake or electrolytic), not less than.....	70.0
Tin (straits).....	0.90-1.2
Lead, not over.....	0.075
Iron, not over.....	.06
Zinc.....	Remainder.

4. The sample for chemical analysis shall consist of drillings, millings, or clippings taken from the last three separate tubes from each lot of 600 tubes or less.

5. A microscopic examination of the tubes shall show sufficient annealing for complete recrystallization with a uniform grain size not in excess of 0.045 mm in average diameter, the grain size approaching as closely as possible a mean diameter of not over 0.035 mm. The determination of the grain size shall be made by comparison of micrographs of the samples to those of standard specimens for which the grain size has been accurately determined, the standard magnification to be used being 75 diameters.

HAMMERING TEST

6. The tubes shall be capable of withstanding the following test without showing cracks or flaws: Pieces cut from the ends of the tubes shall be hammered flat on different elements throughout their length, so that a gage set at three times the thickness of the metal shall pass freely over the tube throughout the flattened part, except at such points where changes in the elements of flattening take place.

EXPANDING TEST

7. The tubes shall be capable of withstanding the following test without showing signs of cracking or rupture: A pin having a taper of 1½ inches per foot shall be driven into the tube until the diameter has been increased 20 per cent.

STRAIN TEST

8. A test specimen 6 inches long shall withstand an immersion in an aqueous mercurous nitrate solution containing 100 g of mercurous nitrate and 13 c c of nitric acid (specific gravity 1.42) per liter of solution for 15 minutes without cracking.

NUMBER OF TESTS

9. The foregoing physical tests should be made on two tubes from each lot of 600 tubes or less.

HYDROSTATIC TEST

10. All tubes shall withstand an internal hydrostatic pressure of 1,000 pounds per square inch without leakage, and shall show no sign of strain or cracking.

TOLERANCES

11. No tube at its thinnest point shall be less than the thickness specified. The lengths shall not be less but may be one-sixteenth inch more than that specified when measured at a temperature of 68° F. (20° C). No single tube shall exceed the calculated weight by more than 5 per cent. One cubic inch of the material is assumed to weigh 0.308 pound.

WORKMANSHIP AND FINISH

12. The tubes shall be round, straight, and of uniform thickness throughout. They shall be free from cracks, seams, slivers, scale, and other surface defects, both inside and outside. All tubes shall be acid cleaned after the final annealing.

13. If any test specimen representing a lot fails to meet the requirements, two additional specimens, at the option of the manufacturer, may be taken as before and submitted for check analysis or subjected to any tests in which the original failed, but each of these specimens shall conform to the requirements specified.

AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS, RECOMMENDED PRACTICE FOR ELECTRICAL INSTALLATIONS ON SHIPBOARD, NO. 45, OCTOBER, 1930

CONDUIT TERMINAL AND BULKHEAD STUFFING TUBES

1. Conduit terminal tubes should consist of bronze, brass, or galvanized malleable iron. They should be machined with a standard pipe thread, and be designed so as to receive a flanged nut or gland nut of composition or brass, which when screwed into the body, should force a loose collar or gland ring against a soft rubber gasket or other suitable water-tight packing, thereby obtaining a water-tight joint.

2. The bulkhead or deck stuffing tubes should conform to the recommendations listed above, and in addition the body or tubes should have a nipple of sufficient length to pass through the bulkhead or deck with room for a gasket and lock nut on each side, thereby securing a water-tight joint through the deck or bulkhead. Deck stuffing tubes should be provided with a nut on each side.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SEAMLESS BRASS BOILER TUBES, DESIGNATION B14-18, 1918

SEAMLESS BRASS BOILER TUBES

SCOPE

1. These specifications cover brass tubes for locomotive boilers.

MANUFACTURE

2. The tubes shall be cold-drawn to size and semi-annealed. They shall be fully annealed at both ends, if so ordered.

CHEMICAL PROPERTIES AND TESTS

3. The material shall conform to the following requirements as to chemical composition:

70-30 alloy

Copper, not under.....	Per cent
Lead, not over.....	69.00
Iron, not over.....	.50
Materials other than copper and zinc, not over.....	.10
Zinc.....	.50
	Remainder.

4. Drillings or turnings for analyses may be taken from the end of the tube.

PHYSICAL PROPERTIES AND TESTS

5. Test specimens taken from semiannealed tubes shall be fully annealed before testing.

6. A test specimen not more than 4 inches in length shall have a flange turned over at right angles to the body of the tube without showing cracks or flaws. The outside diameter of this flange shall measure not less than one and one-fourth times the original outside diameter of the tube.

7. The tubes shall be capable of standing the following test, when cold, without showing cracks or flaws: A piece of the tube shall be flattened down until the interior surfaces of the tube meet, and then doubled over on itself; that is, bent through an angle of 180, the bend being at right angles to the length of the tube.

8. One flange and one flattening test shall be made from each of two tubes in each lot of 250 or less. Each tube shall be subjected to the hydrostatic test.

STANDARD WEIGHTS

9. The standard weight for tubes of various outside diameters and thicknesses are as follows:

Weight in pounds, per foot of length

Thickness		Outside diameter (in inches)				
B. w. g.	Inch	1½	1¾	2	2¼	2½
		<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>	<i>Pounds</i>
13	0.095	1.551	1.827	2.102	2.378	2.654
12	.109	1.761	2.078	2.395	2.711	3.028

(In respect to other physical properties and tests, permissible variations in weights, workmanship, and finish, marking, and inspection and rejection, this specification is identical with A. S. T. M., B13-18. See 642.24, p. 1184.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SEAMLESS ADMIRALTY CONDENSER TUBES AND FERRULE STOCK, DESIGNATION B44-29, 1929

SEAMLESS ADMIRALTY CONDENSER TUBES AND FERRULE STOCK

(These specifications are identical with those of the American Bureau of Shipping, given above, except that, instead of specifying the use of a standard alloy, B44 states specifically the use of lake or electrolytic copper conforming to the requirements of either the standard specifications for lake-copper wire bars, cakes, slabs, billets, ingots, and ingot

bars in A. S. T. M., B4 (see 641.11, p. 1173), or the standard specifications for electrolytic-copper wire bars, cakes, slabs, billets, ingots, and ingot bars in A. S. T. M., B5 (see 641.11, p. 1174); zinc of grade No. 1 in the standard specifications for slab zinc (spelter) in A. S. T. M., B6 (see 683.1, p. 1310); and straits tin or its equivalent. The following additional matter is contained in these specifications).

PHYSICAL PROPERTIES AND TESTS

1. The standard micrographs shall be taken from specimens the grain size of which has been determined by Jeffries's method for grain-size measurements as described in the standard rules governing the preparation of micrographs of metals and alloys in A. S. T. M., E2 (see 600.1, p. 20), at a magnification of 250 diameters. Reproductions of micrographs so prepared will be found under that commodity designation.

PERMISSIBLE VARIATIONS IN DIMENSIONS

2. The outside diameter of the tubes shall not vary from that specified by more than the following amounts, as measured by "go" and "no go" ring gages:

Nominal diameter (in inches)	Permissible variation
Up to 0.500, inclusive.....	<i>Inch</i> ±0.002
Over 0.500 to 0.740, inclusive.....	±.0025
Over 0.740 to 1.000, inclusive.....	±.003
Over 1.000 to 1.250, inclusive.....	±.0035
Over 1.250 to 1.500, inclusive.....	±.004

3. No tube at its thinnest point shall be less than the thickness specified.

4. The length shall not be less but may be one-sixteenth inch more than that ordered when measured at a temperature of 68° F. (20° C.).

5. No single tube that exceeds the calculated weight by more than 5 per cent will be accepted. One cubic inch of the material is assumed to weigh 0.308 pound.

INSPECTION

(Conforms with standard specifications for steel, A. S. T. M. (See 605.0, p. 247).)

EXPLANATORY NOTES

NOTE 1.—The ideal composition for admiralty metal is 70 per cent of copper, 29 per cent of zinc, and 1 per cent of tin. Better tubes will be obtained by adhering as closely as possible to this composition, particularly as to tin. It does not, therefore, seem wise to make 1 per cent of tin the minimum, but rather in order to obtain as nearly 1 per cent as possible to allow some variation under 1 per cent and make the minimum limit for tin 0.90 per cent. Owing to the fact that a minimum of 1 per cent tin has heretofore existed, cases will occur, until the present specifications become universal, where the tin may exceed the 1.20 per cent maximum. It is not considered that this would be harmful or should be made a cause for rejection.

NOTE 2.—The so-called compression test requiring that tubes of varying sizes and thicknesses should be subjected to certain arbitrary pressures without more than 0.005 inch permanent deformation, has not been included because the physical properties of the tube under compression are functions of the temperature at which it receives its final heat treatment, and the metallographic examination sufficiently indicates the temper of the tube to decide whether it may be properly packed in the condenser head.

Until concrete information is available relative to the effect of grain sizes on corrosion, the committee points out that section 6 (a) (see par. 5 in A. B. S. above) has been prepared solely for the purpose of getting a measurement of the compressibility and freedom from stress.

NOTE 3.—Since the specifications require that the tubes shall be annealed sufficiently to establish crystalline equilibrium and show a grain size within certain definite limits, it would seem that a test for internal strains might be unnecessary. The mercurous nitrate test has been included, however, to guard against the hardening of tubes by light drawing operations which would not deform the crystals to an extent recognizable by microscopic examination.

NOTE 4.—Provision is made for the testing of each tube separately to 1,000 pounds per square inch hydrostatic pressure in order

to develop and make evident fractures or punctures which may have occurred in the process of manufacture. This is a 100 per cent test and it is not necessary to test all the tubes again by subjecting them to 80 pounds per square inch pneumatic pressure while immersed in water. Both of these tests are made to detect the same kind of faults, and either, if carried out to the intent of the specifications, should be sufficient. The 1,000-pound hydrostatic pressure test is the more searching and has been specified. The multiplication of tests to determine the same facts under the plea that there may be carelessness in applying one or another should not be encouraged.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SEAMLESS 70-30 BRASS CONDENSER TUBES AND FERRULE STOCK, DESIGNATION B55-25, 1925

SEAMLESS 70-30 BRASS CONDENSER TUBES AND FERRULE STOCK

SCOPE

1. These specifications cover seamless tubes and ferrule stock made from 70-30 brass for condenser use.

(In all other respects these specifications are identical with B44-29, given above, except of course that B55 contains no reference to tin as a component.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SEAMLESS MUNTZ METAL CONDENSER TUBES AND FERRULE STOCK, DESIGNATION B56-25, 1925

SEAMLESS MUNTZ METAL CONDENSER TUBES AND FERRULE STOCK

SCOPE

1. These specifications cover seamless tubes and ferrule stock made from Muntz metal for condenser use.

CHEMICAL PROPERTIES

2. The material shall conform to the following requirements as to chemical composition:

	Per cent
Copper.....	59.00-63.00
Lead, not over.....	.30
Iron, not over.....	.07
Zinc.....	Remainder.

(Otherwise these specifications are identical with B44-29, given above, except that the tubes shall be made by any approved process and finished by cold-drawing; zinc of grades 1, 2, or 3 may be used; no reference is made to tin as a component; scrap of equivalent grades may be used; and the tubes and ferrule stock shall be suitable for packing in tube plates. The microscopic examination is similar, but there is no reference to determining the grain size by Jeffries's method, nor reproductions of micrographs, with accompanying notes. In the expanding test the diameter of the tube is increased only 15 per cent, instead of 20 per cent as in B44; and 1 cubic inch of the material is assumed to weigh 0.306 pound instead of 0.308 pound as in B44.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 74, ANNEALED SEAMLESS BRASS TUBING, MARCH, 1922

ANNEALED SEAMLESS BRASS TUBING

Composition in percentage.—

	Per cent
Copper, minimum.....	60.00
Lead, maximum.....	1.00
Iron, maximum.....	.10
Zinc.....	Remainder.

MECHANICAL REQUIREMENTS

1. *Tensile test.*—Ultimate strength, minimum pounds per square inch, 40,000. Elongation in 2 inches, or proportionate gage length, minimum, per cent, 25.

2. *Expanding test.*—A pin having a taper of 1 to 8 shall be driven into one end of a tube until the diameter is increased 15 per cent. The tube shall withstand this test without showing cracks, splits, or other defects.

3. *Appearance.*—These tubes shall be clean, smooth, and free from injurious defects, both inside and outside.

Dimensional tolerances

Outside diameter		Tolerances, ¹ plus or minus	Wall thickness		Tolerances, ¹ plus or minus
Over—	To—		Over—	To—	
<i>Inches</i>	<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
0	½	0.002	0	⅜	0.001
½	¾	.0025	⅜	½	.002
¾	1	.003	½	⅝	.003
1	1¼	.0035	⅝	¾	.005
1¼	1½	.004	¾	⅞	.008

(In respect to dimensional tolerances, expanding test, appearance, special limits, and footnotes, this specification is identical with S. A. E. specification No. 74, given above.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR CONDENSER TUBES AND TUBES FOR FERRULE STOCK (ADMIRALTY METAL), NO. 374, JANUARY 25, 1926 (CURRENT DESIGNATION: WW-T-781)

CONDENSER TUBES AND TUBES FOR FERRULE STOCK

TYPES

1. Tubes in accordance with this specification shall be furnished in two types as required: Type A, condenser tubes, suitable for packing or expanding into tube sheets; type B, tubes for ferrule stock. (In respect to material, general requirements, and detail requirements, this specification is substantially the same as A. S. T. M., B44-29, given above, (including references in B44 to other specifications) with the following exceptions:)

2. Each lot of tubes shall, in the presence of the inspector, be immediately boxed for shipment unless waived by the purchaser.

3. A tolerance of 0.0025 inch over the specified outside diameter of condenser tubes, and a minus tolerance of 0.0025 inch will be permitted.

4. For ferrule stock the stock length specified in the purchase order shall be the maximum. The

8. The tubes of each lot shall be assembled for inspection in a well-lighted place and so arranged as to simplify the inspection as much as practicable. The tubes that do not show uniform annealing under handling shall be rejected from the lot.

9. All tubes shall be surface inspected and shall be of workmanlike finish; straight, true to form, and of an equal thickness throughout; free from cracks, seams, and other defects. All burrs resulting from cutting tubes to length shall be removed from the ends.

10. Each tube showing slivers or "spilly" metal either during the process of manufacture or upon final inspection shall be rejected. If 10 per cent of the tubes on final inspection of any lot show slivers on the inside, the lot shall be rejected.

11. To insure that the tubes conform to weight requirements, each lot of tubes shall be weighed, or the weight of any lot may at the discretion of the inspector be determined by weighing the test tubes representing that lot.

12. Samples for chemical analysis shall be taken by a milling machine or such other method as will insure clean chips the size of a medium pinhead, and they shall be from the entire cross section of each of the six test tubes representing a test lot. The whole amount taken from the six tubes shall be not less than 8 ounces.

13. These samples thus obtained shall be thoroughly blended one half given to the manufacturer and the other half retained by the inspector, the amount in each case being enough for three analyses.

14. In case the material is rejected on account of failure of the first check analysis to meet the requirements, a second check analysis by umpire methods may be made if requested by the contractors.

15. The inspector shall select two specimens 1 inch in length from each test tube. These specimens shall be subjected to a compression test in a testing machine approved by the purchaser. Each specimen shall be held between two parallel blocks, giving contact on opposite sides of the specimen over its entire length. The pressure shall be applied gradually until a total pressure of 300 pounds is reached. The pressure shall then be released, and the resulting deformation between the points of contact along the specimen shall not exceed 0.005 inch. An approved type of testing machine is shown in Figure 1090.

16. A specimen cut from each end of each test tube shall be subjected to an expanding test. This shall be performed by driving a pin having a taper in its diameter of 1½ inches per foot, into the tube until the internal diameter has been increased 20 per cent.

17. One 6-inch test specimen shall be taken from each test tube and submitted to the aqueous mercurous nitrate strain-test specified in the A. B. S. specification above. The failure of one or more specimens to stand this test shall cause the rejection of the lot represented.

18. One specimen at least one-half inch long for metallographic examination shall be taken from each of the six test tubes, and the six specimens thus obtained shall be marked with the lot number. The location from which each specimen is taken shall be selected by the inspector. The specimens shall be split longitudinally. One half of each specimen shall be prepared by the manufacturer for metallographic examination by the inspector. The other half of each specimen properly marked with the lot number for easy identification shall be sent to the laboratory designated by the purchaser, for use in case of dispute arising from the action of the inspector.

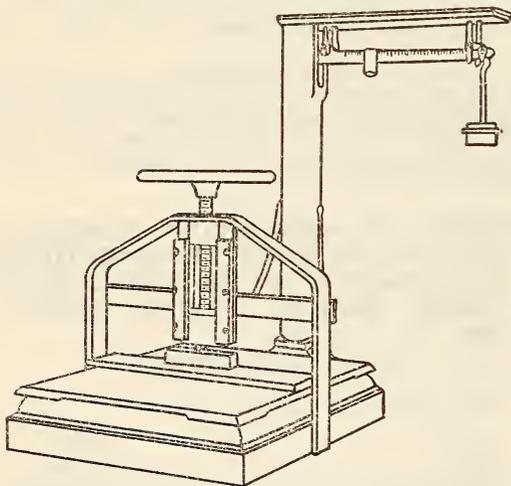

FIGURE 1090.—Sketch of approved testing machine

shortest acceptable lengths and the maximum permissible percentage by weight of short lengths shall be the same as for copper rods, bars, and shapes in Federal Specification QQ-C-501. (See 642.11, p. 1180.)

METHOD OF INSPECTION AND TESTS

5. All condenser tubes shall be inspected and tested as follows:

6. The tubes shall be divided into lots of 606 tubes. Six tubes for test to destruction shall be selected by the inspector to represent each lot of 600 or less tubes. These test tubes, and additional tubes if required, shall be exclusive of the number required on the order and furnished at the contractor's expense.

7. All tubes shall be subjected to a hydrostatic pressure of 1,000 pounds per square inch. All tubes found defective shall be rejected.

19. In preparing the specimens for examination, the longitudinal surfaces of the two walls shall be polished and etched. For etching, any reagent may be used that will develop the structure so as to show clearly the grain boundaries and surface details. In case any specimen does not show complete recrystallization the lot shall be rejected.

20. All test tubes shall be flattened without cracks on different elements throughout the lengths remaining after specimens for the expanding, compression, and metallographic tests have been taken. Each element shall be slowly flattened by one stroke of a press. The term "flattened" shall be interpreted as follows: A micrometer caliper set at three times the wall thickness shall pass over the tube freely throughout the flattened part except at the points where the change in element of flattening takes place.

21. The failure of more than one test tube to stand all the tests required in paragraphs 15, 16, and 20, or the same tube failing in more than one of these tests, shall cause the rejection of the lot represented. In the case of the failure of one test tube under a single one of these tests, six additional tubes shall be selected and subjected to all the required tests except check analysis. The failure of any one of the additional tubes to stand any one of the tests shall cause the rejection of the lot represented.

TUBES FOR FERRULE STOCK

22. The tubes shall be divided into lots of 600 lengths or less. (In respect to hydrostatic tests, assembly for inspection, finish and freedom from defects, weighing of tubes, samples for chemical analysis, and strain test by aqueous mercurous nitrate solution, the specifications for tubes for ferrule stock conform to those for condenser tubes given above. The following additional items cover both kinds of tubes:)

PACKING AND MARKING

23. Unless otherwise ordered, all tubes shall be packed in substantial boxes. The net weight of contents of each box shall not exceed 600 pounds.

24. Each box shall be marked with contract or order number; the lot number; the type, number, and dimensions of tubes contained; name of contractor; and manufacturer.

NOTES

25. The condenser tubes supplied in accordance with this specification are suitable for installation by packing or expanding and do not require further annealing at the place of delivery.

26. The properties of the material covered by this specification are based on the assumption that all $\frac{3}{8}$ -inch diameter condenser tubes will be ordered 0.065 inch thick; all $\frac{1}{2}$ -inch diameter condenser tubes will be ordered 0.072 inch thick; all $\frac{3}{4}$ and 1 inch diameter condenser tubes will be ordered 0.083 inch thick.

27. It is assumed that the lateral compression strength of condenser tubes varies directly as the square of the wall thickness and inversely as the tube diameter. In event that it becomes necessary to purchase condenser tubes with dimensions other than given, the compression-test pressure should be calculated on the above assumption, using the dimensions of the $\frac{3}{8}$ -inch tube as a basis of calculation.

28. Ferrule stock should be ordered in stock lengths, giving the maximum length desired. The order should also state the outside and inside diameter desired.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR TUBING, BRASS, SEAMLESS, WW-T-791, JULY 21, 1931

BRASS TUBING

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, or parts thereof that are below indicated, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal specification QQ-M-151 (F. S. No. 339), general specifications for metals. (See 600.0, p. 3.)

B. GRADES AND TYPES

B-1. Seamless brass tubing shall be furnished in three grades—1, 2, and 3—according to chemical composition as specified in Table 4.

B-2. Seamless brass tubing shall be furnished in four types, as follows:

Type A, maximum nominal working pressure, 100 pounds per square inch.

Type B, maximum nominal working pressure, 200 pounds per square inch.

Type C, maximum nominal working pressure, 300 pounds per square inch.

Type D, maximum nominal working pressure, 450 pounds per square inch.

B-2a. The thicknesses for the various types are designed to give a stress not greater than 4,000 pounds per square inch in the formula

$$t = \frac{P \times D}{2S} \text{ under hydrostatic pressures as in-}$$

dicated opposite each type.

t = thickness, in inches.

P = pressure, pounds per square inch.

D = inside diameter, in inches.

S = stress in pounds per square inch.

B-3. For test pressures, see Table 5.

C. MATERIAL AND WORKMANSHIP

C-1. The tubing shall be clean, smooth, round, straight, of the proper dimensions and with ends cut square. It shall be free from grooving, indentations, cracks, flaws, or other defects.

D. GENERAL REQUIREMENTS

D-1. The ends of the tubing shall not be threaded unless so ordered. (See par. 1-4.)

D-1a. Tubes may be ordered with special threads, the details of which shall be furnished by the purchaser.

D-2. One cubic inch of grade 1 material is assumed to weigh 0.316 pound. One cubic inch of grades 2 and 3 material is assumed to weigh 0.307 pound. The weight of any lot of tubes shall be not less than the calculated weight of the size specified.

D-2a. The maximum tolerance permitted for overweight of any lot shall be as given in Table 1.

TABLE 1.—Overweight tolerances for seamless brass tubing

Wall thickness	Up to 2 inches diameter		Over 2 inches to 4 inches diameter		Over 4 inches to 7 inches diameter		Over 7 inches to 10 inches diameter	
	1-10 pieces	lots over 10 pieces	1-10 pieces	lots over 10 pieces	1-10 pieces	lots over 10 pieces	1-10 pieces	lots over 10 pieces
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
Over 0.380 inch.....	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)
0.379 inch to 0.284 inch, inclusive	(1)	(1)	(1)	(1)	8	4	10	5
0.283 inch to 0.220 inch, inclusive	(1)	(1)	7	4	10	5	12	5
0.219 inch to 0.165 inch, inclusive	7	4	8	4	12	5	14	6
0.164 inch to 0.120 inch, inclusive	8	4	10	5	14	6	16	6
0.119 inch to 0.083 inch, inclusive	10	5	12	5	16	6	18	7
0.082 inch to 0.058 inch, inclusive	12	5	14	6	18	7	-----	-----

¹ These sizes are not covered by this specification. When required, the proper tolerances should be specified.

D-3. The walls of the tubes at any point shall be not less than the thickness specified.

D-4. The permissible variations in average outside diameter of brass tubing shall be as given in Table 2.

TABLE 2.—Permissible variations in average outside diameter

(Tolerances on outside diameter are the same as given in Table 1 of F. S. B. specification WW-P-378 for copper tubing. See 642.24, p. 1187.)

D-5. When tubes are ordered to exact length, a variation of plus 0.125 inch on the length shall be permitted. No minus tolerance shall be permitted.

D-6. When tubes are ordered in nominal stock lengths the pieces shipped shall be cut to the nominal length as a maximum. The shortest acceptable lengths and the maximum permissible percentage by weight of short lengths shall be as given in Table 3.

TABLE 3.—Permissible variations in length

Nominal stock length (feet)	Shortest acceptable length (feet)	Maximum permissible percentage, by weight of lengths shorter than nominal
20	12	80
18	10	80
16	10	80
14	8	80
12	8	40
10	6	40
8	6	40
6	4	40

D-7. All tubing shall be furnished semiannealed, unless otherwise specified.

D-7a. Fully annealed tubing shall be acid cleaned.

D-8. The name or trade-mark of the manufacturer and the type number shall be permanently marked on each tube.

E. DETAIL REQUIREMENTS

E-1. Seamless brass tubing shall be made of material conforming in composition to the requirements in Table 4.

TABLE 4.—Chemical composition of brass tubing

Grade	Copper (per cent)	Zinc (per cent)	Lead (per cent, maximum)	Iron (per cent, maximum)
1	83-86	Remainder....	0.06	0.05
2	65-68	-----do-----	.80	.07
3	59-68	-----do-----	.80	.07

E-2. The dimensions and weights of the various sizes of brass tubing shall be as given in Table 5. Other diameters and thicknesses may be specified when required.

E-3. All tubing shall pass the tests prescribed in section F for the material ordered.

TABLE 5.—Standard weights and dimensions of seamless brass tubing

5.563	8.540	8.297	17.681	17.178	700
6.625	12.172	11.826	25.102	24.387	700
8.625	20.563	19.977	42.534	41.323	700
10.750	32.004	31.093	66.142	64.259	700

It will be noted that actual outside diameters correspond to iron-pipe sizes; however, all tubing should be designated by actual outside diameter and wall thickness.

(Dimensions of the tubing for all four types are the same as for copper tubing given in Table 3 of F. S. B. specification WW-P-378. Test pressures for type A and type B tubing are the same as given in the above table. See 642.24, p. 1187.)

F. METHODS OF SAMPLING INSPECTION AND TESTS

F-2. *Hydrostatic test.*—Each tube shall withstand an internal, hydrostatic pressure which will subject

the metal to a fiber stress of 7,000 pounds per square inch, the test pressure being calculated by the following formula for thin, hollow cylinders, but in no case will a test pressure of over 1,000 pounds per square inch be required.

$$P = \frac{2tS}{D}$$

in which

P = safe internal pressure.

D = inside diameter, in inches.

S = allowable unit stress of the material, 7,000 pounds per square inch.

t = wall thickness, in inches.

Every tube shall be perfectly tight under pressure and show no signs of bulging, cracks, flaws, porous places, or other defects. The test pressures for specified sizes of tubing are listed in Table V.

F-3. *Surface inspection.*—All tubing shall be surface inspected for defects by rolling on a set of wooden horses or other suitable supports, so that the entire surface of each tube may be properly inspected. In the event of failure of 10 per cent of any lot presented for inspection to pass the surface inspection and gaging tests, that lot shall be rejected.

F-4. *Lot.*—For the purpose of inspection, 1,000 pounds or fraction thereof of the same size of tubes shall be considered a "lot."

F-5. The inspector shall select and subject 1 per cent by weight of each lot of tubes of the same size submitted for inspection to the following tests.

F-6. *Mercurous nitrate test.*—A full section test specimen 6 inches in length shall be taken from each tube selected for test and shall withstand total immersion, for 15 minutes without cracking, in an aqueous mercurous nitrate solution containing 100 g of mercurous nitrate and 13 ml of nitric acid (specific gravity 1.42) per liter of solution.

F-7. *Flattening test.*—For all tubing under 2 inches in outside diameter of grades 1, 2, and 3 the length of tube selected for test remaining after test F-6 shall be flattened on different elements throughout its length so that a gage set at three times the thickness of the metal shall pass over the tube freely throughout the flattened part, except at such points where changes in the elements of flattening take place. The tube shall be rotated approximately 90° between each successive flattening element. For tubing 2 inches and over in outside diameter, a section 4 inches long shall be flattened so that a gage set at three times the wall thickness shall pass over the tube freely throughout the flattened part. Tubing shall develop no cracks or flaws as a result of the tests.

F-8. *Bending test.*—When tubing 2 inches and under in diameter, of grades 1, 2, and 3, is ordered fully annealed, full sections of tubing shall withstand bending 180° around a diameter of one and one-half times the inside diameter of the tubing without cracking on the outside bent portion. Flattening of pipe due to bending is permitted.

F-8a. *Bending test.*—A strip not over 1½ inches wide shall be taken from each tube selected for test of grade 1 tubing, and after annealing shall stand bending flat on itself without showing signs of fracture on the outer surface. The ends of the specimens used in this test shall stand hammering down hot and cold to a knife-edge without showing signs of cracks.

F-9. *Flanging test.*—A specimen shall be taken from each tube selected for test of grade 1 tubing and shall stand flanging cold, after annealing. The width of the flange, measured from the outside of the tube, shall be one-fourth of the inside diameter of the tube.

F-10. *Tension test.*—Each lot of grade 1 tubing 2 inches inside diameter and over shall be subjected to tension tests. One piece from each tube selected for test shall be tested to represent the lot. If from 2 to 6 inches inside diameter, the test specimens shall be cut longitudinally; if over 6 inches inside diameter, they shall be cut circumferentially. All the test specimens shall be heated to a cherry red and straightened when hot, then annealed and machined to the dimensions of Type II standard-test specimen with 8-inch gage length, as required in Specification QQ-M-151 referred to in paragraph A-1. For thicknesses up to and including one-fourth inch, the width of the narrow part of the test specimen shall be about 1½ inches. For the thicker pieces the width shall be such as to give a cross section of about half a square inch, but the breadth shall not in any case be less than the thickness. The surfaces shall not be machined but shall be left in their original condition.

F-11. The test specimens of grade 1 tubing, as described in section F-10, shall show an ultimate tensile strength of at least 35,000 pounds per square inch and an elongation of at least 30 per cent in 8 inches.

F-12. *Chemical analysis.*—Chemical analysis may be made by the inspector or through him by any Government laboratory or other designated representative without cost to the contractor.

F-12a. Drillings, millings, or clippings for chemical analysis shall be taken from several points around each piece selected for physical tests and the chips from each lot combined and thoroughly mixed. The resultant sample shall be free from dirt, grit, and other foreign matter and shall consist of at least 2 ounces.

I. NOTES

I-1. It is suggested that tubing be purchased on a footage basis (per foot of length) in preference to weight.

I-2. Tubing is regularly designated by actual outside diameter and thickness and should be so specified on all orders.

I-3. When tubes are required to be exact lengths it should be so stated in the requisition. When tubing is ordered in stock lengths the nominal stock lengths desired should be stated in the invitation for bids. (See Table 3.)

I-4. Tubing covered by Table 5 is suitable for the respective pressures given in that table only when straight and not threaded. If bending or threading is required, tubing with adequate wall thickness should be specified.

I-5. When tubing is required for severe bending, the requisition or purchase order should specifically require "fully annealed tubing."

I-6. Grade 1 is intended for use where a material with special resistance to corrosion by salt water, salt air, or gases is required.

I-7. Grade 2 is intended for fresh-water service where corrosive conditions are more severe than ordinary.

I-8. Grade 3 is intended for ordinary fresh-water service.

I-9. When tubing is required for instrument making and similar uses and the dimensions and/or tolerances in this specification are not suitable, the dimensions and/or tolerance desired should be stated in the invitation for bids.

645.31 SIEVES, BRASS.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE DEFINITION OF THE TERM "SCREEN" (SIEVE), DESIGNATION E13-28T, 1928

SCREEN (SIEVE)

A plate or sheet or a woven cloth, or other device, with regularly spaced apertures of uniform size, mounted in a suitable frame or holder, for use in separating material according to size.

NOTE 1.—The shape and spacing of apertures, size of wires or threads, thickness of plate or sheet, allowable variations and similar properties should be taken care of in specifications.

NOTE 2.—In mechanical analysis testing work, when not otherwise specified, the term "sieve" shall apply to an apparatus in which the apertures are rectangular, and the term "screen" shall apply to an apparatus in which the apertures are circular.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SIEVES FOR TESTING PURPOSES, DESIGNATION E11-26, 1926

SIEVES FOR TESTING

1. These specifications cover sieves for use in the usual cases of precision testing for the fineness of materials (classification of materials according to size). The sieves have been designated according to the size of openings in terms of microns, the corresponding United States standard sieve series designation in arbitrary numbers being given for the convenience of those familiar with the latter scheme of designation.

PHYSICAL REQUIREMENTS

2. Wire cloth for standard sieves shall be woven (not twilled, except that the cloth of 44, 53, and 62 micron sieves may be twilled until further notice) from brass, bronze, or other suitable wire and mounted on the frames without distortion. To prevent the material being sieved from catching in the joint between the cloth and the frame, the joint shall be smoothly filled with solder, or so made that the material will not catch. The sieve frames should be circular, about 20 cm (8 inches) in diameter and about 5 cm (2 inches) or 2.5 cm (1 inch) between the top of the frame and the cloth.

NOTE.—The size specified above is for the regular standard testing sieve, but for special purposes other sizes may be used, as, for example, the 3-inch sieve, which is designed especially for use on laboratory balances as in the testing of pigments.

Requirements for sieve openings and wire diameter with permissible variations

Designation (in microns)	Corresponding U. S. standard sieve series No.	Sieve opening		Wire diameter		Tolerance in average opening		Tolerance on wire diameter		Tolerance in maximum opening
		3	4	5	6	Under	Over	Under	Over	
1	2	3	4	5	6	7	8	9	10	
		<i>mm</i>	<i>Inch</i>	<i>mm</i>	<i>Inch</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	
4,700-----	4	4.76	0.187	1.27	0.050	±3	15	30	10	
4,000-----	5	4.00	.157	1.12	.044	±3	15	30	10	
3,360-----	6	3.36	.132	1.02	.040	±3	15	30	10

177-----	80	.177	.0070	.119	.0047	±6	15	35	40	
149-----	100	.149	.0059	.102	.0040	±6	15	35	40	
125-----	120	.125	.0049	.086	.0034	±6	15	35	40	
105-----	140	.105	.0041	.074	.0029	±8	15	35	60	
88-----	170	.088	.0035	.063	.0025	±8	15	35	60	
74-----	200	.074	.0029	.053	.0021	±8	15	35	60	
62-----	230	.062	.0024	.046	.0018	±8	15	35	90	
53-----	270	.053	.0021	.041	.0016	±8	15	35	90	
44-----	325	.044	.0017	.036	.0014	±8	15	35	90	

NOTE.—Screens having larger openings than those included in the table may be specified, but in specifying screens of larger openings the actual size of the opening (in millimeters or in inches) shall be stated. A tolerance of ±3 per cent on average openings and of 10 per cent in maximum openings shall be permitted.

3. The average opening between the adjacent warp and the adjacent shoot wires, taken separately, shall be that given in column 3 (or 4) of the table, within the "tolerance in average opening" given in column 7. The average diameter of the warp and of the shoot wires, taken separately, of the cloth of any given sieve shall be that given in column 5 (or 6) of the table, within the "tolerance on wire diameter" given in columns 8 and 9. The maximum opening between adjacent parallel wires shall not exceed the nominal width of opening for that sieve by more than the "tolerance in maximum opening" given in column 10 of the table.

WORKMANSHIP

4. The sieves shall be free from imperfections in the sieve cloth or its mounting, as, for example, punctured, loose or wavy cloth, imperfections in soldering, etc.

MARKING

5. The sieves shall bear a label upon which the manufacturer's nominal opening in metric units (preferably in microns) with the equivalent in inches, together with the size of wire should be given.

NOTE.—It is recommended that, until the new micron designation shall have been thoroughly established, in addition the corresponding United States standard sieve series number be given.

METHODS OF TESTING SIEVES

6. (a) To determine whether the cloth conforms to the requirements of these specifications, the wire diameter shall be measured in each direction by means of a micrometer-microscope or projection apparatus or other suitable apparatus of requisite precision, care being taken in all cases to avoid diffraction effects in measuring to the edge of a wire. Micrometer calipers and steel scales should not be used for this purpose. The mesh shall be determined by counting the number of openings for a distance of at least 6 inches in both directions of the sieve, using a scale, either glass or steel, and a microscope. The use of scales with special ruling for obtaining mesh by counting "interference bands" is recommended in cases where large numbers of any of the sieves with the smaller openings are to be measured. From the wire diameter and the mesh the average opening shall be computed.

NOTE.—No general rule can be given for the number of observations to be taken, except that they be sufficient to cause no change in the result if, say, three or four additional measurements are made.

(b) Measurements of large openings shall be made by means of the micrometer-microscope or the projection lantern or other suitable apparatus in the same way as wire diameters are measured.

NOTE.—In order to insure the securing of standard sieves it is possible to obtain from the manufacturer or dealer sieves which have been certified by the Bureau of Standards.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, 3-INCH SIEVES, LETTER CIRCULAR, LC58, MARCH 1, 1925

3-INCH SIEVES (FOR PAINT PIGMENTS)

Wire cloth for 3-inch sieves shall conform to the specifications for cloth of sieves of the United States standard sieve series. (See A. S. T. M. specification E11-26 above.) The cloth shall be woven (not twilled, except that the cloth of No. 230, No. 270, and the No. 325 sieve, may be twilled until further notice), from brass, bronze, or other suitable wire and mounted on the frames without distortion.

To prevent the material being sieved from catching in the joint between the cloth and the frame, the joint shall be smoothly filled with solder, or so made that the material will not catch. The sieve frames shall be circular, about 7.6 cm (3 inches) inside diameter and shall not vary from this by more than 0.4 cm (0.16 inch). The depth of the sieve from the top of the frame to the cloth shall not be less than 1.9 cm (0.75 inch). It is recommended that the frames be constructed of first-quality sheet brass in such a manner as to be permanently rigid. The weight of the completed sieve must not exceed 49 grams.

The Bureau of Standards also reserves the right to reject sieves for obvious imperfections in the sieve cloth or its mounting, as for example, punctured, loose, or wavy cloth, imperfections in soldering, etc.

(The Bureau of Standards issues reports on each 3-inch sieve submitted to it for test and stamps those which conform to this specification with the letters "B. S." and year of test.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SIEVE-TESTING APPARATUS, LETTER CIRCULAR, LC72, JULY 26, 1922

SIEVE TESTING APPARATUS

(This circular describes apparatus developed at the Bureau of Standards for measuring openings and wire diameters in sieves by projecting an enlarged image of the sieve on a ground-glass screen, measuring the image of the wires and measuring the magnification.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, SPECIFICATIONS FOR SIEVES, UNITED STATES STANDARD SIEVE SERIES, LC74, 1926, OCTOBER 1, 1926

SIEVES

(These specifications are identical in respect to nominal dimensions and tolerances with A. S. T. M. E11-26, given above. Section 3 of E11 gives specific requirements as to the sieve label. The Bureau of Standards at present has no requirements as to sieve label, except that it shall adequately describe the sieve and not be deceptive.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARDIZATION OF NO. 200 CEMENT SIEVES, TECHNOLOGIC PAPER NO. 42, JULY 30, 1914

NO. 200 SIEVES

(This paper describes the investigation and discusses the results of a number of observations made to determine methods of standardizing the 200-mesh sieve of the United States standard sieve series. Specifications for these sieves will be found in A. S. T. M. specification E11-26 above. This paper also treats of the establishment of a standard for the No. 200 sieve and the keeping of primary standards at the Bureau of Standards.)

ADOPTION AND MAINTENANCE OF A STANDARD VALUE OF FINENESS

In order to insure a greater uniformity in fineness determinations, and to enable other investigators to make comparative tests, the Bureau of Standards will henceforth maintain a standard of fineness. The real test of the preservation of fineness standards will consist in retests from time to time of a number of sieves which are in substantial agreement with the adopted standard and are set aside as fundamental standards. Three of the standard sieves now owned by the Bureau of Standards have been set aside as temporary fundamental standards.

In the future the bureau will be prepared to furnish standard samples of cement at a nominal price, for tests of sieves in other laboratories. The fineness of these samples will be guaranteed to within 0.2 per cent on the fundamental standard.

The sieving values of all new sieves with one sample of cement will in the future be given with the certificates of the standardized sieves, but while these values will, in general, be correct within 0.2 or 0.3 per cent they will probably be guaranteed within 0.5 per cent. This standardization test will ordinarily be made with a cement having a fineness between 75 and 80 per cent passing the No. 200 sieve, and will furnish a correction factor which will only be directly applicable to cements of similar fineness. (This paper also includes methods for the construction of simple calibration curves which may be used for determining the proper correction to sieves.)

(The Bureau of Standards, as referred to in above paragraph, issues certificates with sieves submitted to it for test.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

HOOKS AND EYES

(See 617.63, p. 1061.)

645.39 MISCELLANEOUS BRASS-WIRE MANUFACTURES.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR NONFERROUS INSECT SCREEN CLOTH DESIGNATION B50-29, 1929

INSECT SCREEN CLOTH

SCOPE

1. These specifications cover insect screen cloth woven from nonferrous wire and intended to be used as a protection against insects or small animals.

MANUFACTURE

2. There shall be two classes of standard insect screen cloth depending upon the material used as follows: Class A, comprising cloth made from copper wire. Class B, comprising cloth made from a 90 copper-10 zinc alloy wire.

3. Insect screen cloth shall be manufactured in five weights or sizes of mesh as follows:

14-mesh regular	18-mesh regular.
16-mesh regular.	22-mesh heavy.
16-mesh heavy.	

4. The same quality and size of wire shall be used for both the warp and filling.

CHEMICAL PROPERTIES

5. The composition of the wire used for class A insect screen cloth is the same as specified under manufacture in A. S. T. M. B49; that is, it conforms to the requirements of either A. S. T. M. B4 or B5. (See 641.11, p. 1173.)

6. The wire for class B insect screen cloth shall conform to the following chemical requirements:

	Per cent
Copper.....	90.00-92.00
Lead, maximum.....	.03
Iron, maximum.....	.06
Zinc.....	Remainder.

PHYSICAL PROPERTIES OF WIRE

7. The physical properties for all classes of screen wire shall be subject to agreement between the producer of the wire and the purchaser.

NOTE.—Wire for weaving insect screen cloth is usually furnished with a drawn temper. The needs of different weavers of wire cloth apparently call for difference in drawn temper and it is consequently at present impossible to give definite physical properties which would be satisfactory to the entire trade. It has, therefore, seemed better to leave this matter to specific agreement between the producers of wire and the manufacturers of wire cloth.

STANDARD SIZES, WEIGHTS, DIMENSIONS, ETC.

8. (a) The nominal diameter of wires to be used for the various weights of standard insect screen cloth shall be in accordance with the following:

Mesh	Diameter	Mesh	Diameter
	<i>Inch</i>		<i>Inch</i>
14 regular.....	0.0119	18 regular.....	0.0100
16 regular.....	.0113	22 heavy.....	.0150
16 heavy.....	.0150		

(b) The permissible variation from the nominal diameter of any of the wires specified above shall be ± 0.00025 inch.

9. The mesh as determined by counting the openings per linear inch for a length of one foot on any samples selected at random shall not vary from the nominal value in the warp, but an average variation of not more than one-half mesh per linear inch shall be permissible in the filling.

10. Insect screen cloth shall be furnished in rolls of approximately 100 linear feet. At least 87.5 per cent of the rolls ordered shall be in one continuous length; the remaining rolls may be in two lengths.

11. The widths of standard insect screen cloth shall be from 18 to 48 inches in multiples of 2 inches. The permissible variation in over all width as measured from outside wire to outside wire shall be $\pm \frac{1}{2}$ inch.

WORKMANSHIP AND FINISH

12. (a) The insect screen cloth shall be free from all imperfections and blemishes not consistent with best commercial practice.

(b) Well-made splices in individual wires are permitted at any point in the screen cloth.

INSPECTION

13. (a) All testing and inspection, both of individual wires and completed cloth, shall be made at the place of manufacture. Tests on individual wires shall be made on samples taken before weaving and not on wires removed from finished cloth.

(b) The manufacturer shall afford the inspector representing the purchaser all reasonable facilities to satisfy him that the material conforms to these specifications.

APPENDIX

The following table giving the weights of various mesh of insect screen cloth is not a part of these specifications, but is appended as a source of information for the purchaser:

Mesh	Approximate weight per 100 square feet of insect screen cloth wrapped and labeled ready for shipment
	<i>Pounds</i>
14 regular.....	14½
16 regular.....	15
16 heavy.....	27¾
18 regular.....	14
22 heavy.....	36

**SOCIETY OF AUTOMOTIVE ENGINEERS,
PARTS AND FITTINGS, WIRE CLOTH,
S. A. E. STANDARD, JULY, 1924**

WIRE CLOTH

(See 646.52, p. 1256.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, COMMERCIAL STANDARD FOR FOURDRINIER WIRE CLOTH, CS36-31, NOVEMBER 1, 1931

FOURDRINIER WIRE CLOTH

(This commercial standard has been selected and accepted by industry and is promulgated by the Bureau of Standards.)

GENERAL

It is the desire of manufacturers of Fourdrinier wire cloth for paper-making machines that their product shall be of high-grade workmanship and material and thereby provide maximum service and satisfaction in use. Adherence to this policy requires but one high-grade product described below that shall be known as the commercial standard grade. Other grades and meshes are to be considered as special.

PURPOSE

This commercial standard is a basis for clearer understanding between the manufacturers and users of Fourdrinier wire cloth. Its adoption and general use should result in a closer understanding between manufacturer and user through the establishment of standard mesh classifications, nomenclature, wire sizes, methods of inspection, labeling, handling, storage, and installation.

SCOPE

The standard applies to one grade only of Fourdrinier wire cloth—a flexible endless woven wire cloth used on paper-making machines. It establishes the number of wires in both directions for the several mesh classifications and the thickness of the wire. It further provides for inspection, labeling, and method of handling. An appendix includes recommendations of the manufacturers on the installation and use of the product.

GENERAL REQUIREMENTS

Commercial standard Fourdrinier wire cloth shall contain no imperfections that will shorten its period of usefulness or cause a mark or defect in the finished paper.

DETAIL REQUIREMENTS

1. *Kinds of wire.*—Wire used in the manufacture of Fourdrinier wire cloth may be of any metal or alloy with the necessary tensile strength, toughness, and elasticity to stand the physical strain and of sufficient resistance to the action of chemicals used in the preparation of pulp. Brass, bronze, phosphor bronze, Monel, nickel, and stainless steel are in common usage. One or more kinds of material may be used for the warp and shoot wires.

2. *Mesh of wire cloth and size of wire.*—The number of warp wires per inch (number of dents per inch in the reed) and the number of shoot wires (number of beats per inch) determines the mesh of the cloth.

The diameter of the single wire is varied according to the mesh of the wire cloth. The mesh, the corresponding number of warp and shoot wires per inch, and the corresponding diameter of wire listed in Table 1 are standard.

3. *Seam.*—The seam, which is one of the most important features of this commodity, shall suit the machine on which it is to be used and shall be flat and straight.

TABLE 1.—Details of standard mesh Fourdrinier wire cloth

Standard mesh designation	Warp wires per inch		Shoot wires per inch		Diameter of wire before weaving				
	Dents	Tolerance	Beats	Tolerance	Warp wire		Shoot wire		
					Minimum	Maximum	Minimum	Maximum	
	<i>Number</i>	<i>Number</i>	<i>Number</i>	<i>Number</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	
	40	40	—2	34	±2	0.0105	0.0115	0.0105	0.0115
	50	50	—2	36	±2	.0095	.0105	.0095	.0105
	60	60	—2	40	±2	.0090	.0095	.0090	.0105
	65	65	(±1)	46	±2	.0080	.0085	.0080	.0090
	70	70	—2	52	±2	.0075	.0080	.0075	.0085
	75	75	(±1)	56	±2	.0070	.0075	.0070	.0080
	80	80	—2	60	±2	.0065	.0070	.0065	.0075
	85	85	(±1)	64	±2	.0057	.0063	.0057	.0065
	90	90	—2	74	±2	.0055	.0060	.0055	.0060
	100	100	—2	86	±4	.0045	.0050	.0045	.0055

METHOD OF INSPECTION

The wire cloth shall be given a very rigid inspection while on the stretching table. It shall run true on the rolls. Particular attention shall be given to the seam. The entire area shall be examined for defects.

In measuring the diameter of a strand of wire a micrometer caliper, or V gage, shall be used and the diameters recorded to the nearest ten-thousandth of an inch.

PACKING

The wire cloth shall be wound on three spars, each not less than 2½ inches in diameter, two at the center of the roll and the third inside the loose end. In order to prevent damage to the wire cloth all three spars shall be firmly bound in position at the ends. The wire cloth shall be securely wrapped in heavy moisture-resistant paper, tied, and carefully supported in the packing case by jamming both ends of the spars with pieces of wood securely fastened to them. Each Fourdrinier wire shall be packed in a case made for that particular wire and every precaution shall be taken to guard against the possibility of damage in transit.

LABELING

The wrapper on all commercial standard Fourdrinier wire cloth shall be labeled according to mesh classification, kind of wire (both warp and shoot), and width and length of the cloth, and, in addition, shall contain the following statement:

"The ----- certifies that this Fourdrinier (Name of company) wire cloth conforms to the requirements of the U. S. Commercial Standard CS36-31 as issued by the United States Department of Commerce."

The shipping case shall also be stenciled on side and end according to mesh classification, kind, size, and date of shipment.

STORAGE, UNPACKING, AND INSTALLATION

1. *Storage.*—The Fourdrinier wires shall be stored in a clean, dry place in their original packing cases until required, and shall be used in the order received at the paper mill. No complaints will be recognized by wire-cloth manufacturers unless made within six months of delivery date.

2. *Unpacking.*—The packing case shall be opened with care. The covering of the wire cloth shall be carefully removed with the fingers only, never with a knife or other sharp instrument. The wire cloth shall then be placed on a clean, flat surface covered with heavy wrapping paper, the first turn unwound and the spar under the loose end slowly and evenly withdrawn, carefully followed by insertion of the porter bar.

3. *Installation.*—(The full text of this standard includes requirements on the installation of the wire cloth at the paper machine and recommendations on the proper care of wire cloth.)

¹ "Maximum carbonator rating" in United States gallons per hour based on a maximum allowable carbonated water velocity at the outlet of 2.25 feet per second. Example: To find the maximum capacity of a carbonator having an outlet of A equals 1 1/16 inches clear opening or a equals 1.353 square inches outlet area. Answer: Formula: Rating equals 186.9 a V, equals 186.9 by 1.353 by 2.25, equals 570 United States gallons per hour.

Threads.—American standard straight pipe threads. (See U. S. Government National Screw Thread Commission, 607.0, p. 365.)

The bottling equipment section of the B. A. I. C. also recommends the use of a compression coupling adapted to the use of light-gage metal tubing illustrated above. This coupling is so constructed that the possibility of bacterial contamination in the joint itself is reduced to a minimum. It is not

necessary to thread the tubing, the tubing being cut off square and the joint made by compressing a rubber ring around it. It will be very easy to take this line apart whenever it may be necessary to take it down for cleansing. The method of joining this pipe line to tanks or valves is also shown.

ASSOCIATED FACTORY MUTUAL FIRE INSURANCE COMPANIES, SPECIFICATIONS FOR FIRE HOSE, COUPLINGS, AND PLAY PIPES, 1930

(See also 607.0, p. 363.)

HOSE COUPLINGS

Workmanship.—Couplings must be made, finished, and fitted in a workmanlike manner throughout.

Pattern.—Couplings must be of the expanding-ring pattern, of ample strength, and of the best form to resist the strain of expanding the binding ring in the coupling, and must have a tail part sufficiently long to extend it one-eighth inch beyond the end of the expansion ring. The female portion of the coupling shall have a swivel either of the tongue-and-groove type, the wire-and-groove type, or a still thread.

Expansion rings.—Expansion rings must be made of well-annealed brass or other noncorrodible alloy of equally suitable properties. For 2½-inch couplings the ring must be at least 1¼ inches long and three sixty-fourths inch thick. For 1¼-inch couplings the ring must be at least three-fourths inch long and one thirty-second inch thick.

Washer.—Each coupling must be fitted with a rubber washer at least three-sixteenths inch thick for 2½-inch couplings, and at least one-eighth inch thick for 1½-inch couplings.

Composition.—Couplings must be made of an alloy of copper, tin, and zinc (and lead if desired) of the following proportions:

	Per cent
Copper, not less than.....	83
Tin, not less than.....	5
Zinc, not more than.....	7
Lead, not more than.....	3

Weight.—Couplings, including both male and female expansion rings, must weigh not less than:

	Pounds
2½-inch for cotton rubber-lined hose.....	5
2½-inch for linen hose.....	4
1¼-inch for linen hose.....	1¼

Marking.—Both male and female couplings must be stamped with the name or registered trade-mark of the maker, the date of manufacture, and the **FM** identification mark, the marking to consist of letters and figures not less than one-eighth inch high.

Gasket.—Couplings for cotton rubber-lined hose must be provided with rubber gaskets of best quality, accurately fitted and not extending into the waterway.

Thread.—(See 607.0, p. 633.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BRASS PIPE NIPPLES, COMMERCIAL STANDARDS CS10-29, JULY 1, 1929

BRASS PIPE NIPPLES

(In respect to dimensions, this specification is identical with Federal Specifications Board specification WW-N-351, given below. In respect to material, this specification is identical with Federal Specifications Board specification WW-P-351 (see 645.23, p. 1217), except for slight tolerance differences in the copper and lead components of grade A (red brass).) (Taper pipe-thread dimensions are identical with those of the National Screw Thread Commission under commodity designation 607.0, p. 365. Stock sizes of standard weight contained in carton are as follows:)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, BRASS LAVATORY AND SINK TRAPS, SIMPLIFIED PRACTICE RECOMMENDATION R21, 1925

BRASS LAVATORY AND SINK TRAPS

In accordance with the unanimous action of the general conference of representatives of manufac-

turers, distributors, and users of brass lavatory and sink traps, the United States Department of Commerce, through the Bureau of Standards, recommends that the recognized sizes, styles, and gages of brass lavatory and sink traps be reduced to the following list:

WROUGHT TRAPS

Size	Gage	Style	Inlet	Clean out	Remarks
<i>Inches</i>			<i>Inches</i>		
1 1/4	20	P	1 1/4	No....	26 inches over all.
1 1/4	20	P	1 1/4	With...	
1 1/4	20	S	1 1/4	No....	
1 1/4	20	S	1 1/4	With...	
1 1/4	20	S	1 1/4	With...	
1 1/4	20	S	1 1/4	With...	
1 1/4	20	S	1 1/4	No....	Do.

NEW YORK AND BOSTON REGULATION TRAPS

Size	Gage	Style	Inlet
<i>Inches</i>			
1 1/4	-----	P	1 1/4 inches external. ¹
1 1/2	-----	P	1 1/2 or 1 1/4 inches external. ¹
2	-----	P	2, 1 1/2, or 1 1/4 inches external. ¹
1 1/2	-----	P	1 1/2 or 1 1/4 inches internal.
1 1/4	Bag offset.-----		1 1/4 inches tubing outlet.
1 1/2	do-----		1 1/2 or 1 1/4 inches tubing outlet.
1 1/4	do-----		1 1/4 inches I P outlet.
1 1/2	do-----		1 1/2 or 1 1/4 inches I P outlet.

¹ Antisiphon traps (S) to be furnished with either straight or offset outlet tube as required.

It is further recommended that—

1. All traps be listed and supplied less connections.
2. All traps be stamped with the name of the manufacturer and with gage.
3. Elimination of all gages except No. 20 B. & S. and No. 17 B. & S. gage. (Every effort to be made to bring practice to use No. 17 B. & S. gage minimum, thus reducing the present variety and adopting one standard gage for all types of traps.)
4. All crown-vented traps to be eliminated.
5. All traps made in accordance with special city codes, such as Kansas City, Los Angeles, and Cleveland, to be eliminated. (The eliminations under items 4 and 5 were intended as a step forward, as sufficient combinations and types were included in the recognized varieties to meet all local conditions. Local health authorities and engineers are urged to revise codes and specifications in order to keep abreast of the advance in practice as recommended by the industry.)

These recommendations became effective January 1, 1925, subject to regular annual revision by a similar conference of the industry.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION: FF-P-451)

PLUMBING FIXTURES (FOR LAND USE)

(See 617.73, p. 1062.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR NIPPLES, PIPE—BRASS, STEEL, AND WROUGHT IRON, WW-N-351, JUNE 24, 1930

BRASS NIPPLES

(See 607.4, p. 485.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR PIPE FITTINGS—BRASS OR BRONZE (THREADED), 125 POUND, WW-P-448, MAY 26, 1931

BRASS OR BRONZE PIPE FITTINGS

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. The following Federal specifications, of the issue in effect on date of invitation for bids, shall form a part of this specification:

Federal Specification	Former No.	Title	See
GGG-P-351...	238	Pipe threads.....	607.0, p. 365.
QQ-M-151....	339	General specifications for metals.	600.0, p. 3.

B. CLASS AND COMPOSITION

B-1. Fittings shall be threaded and of the 125-pound class.

B-2. Fittings shall be of the following chemical compositions as specified in paragraph E-1: Composition A and composition B.

C. MATERIAL AND WORKMANSHIP

C-1. All cast fittings shall be sound, smoothly cored, true to form, uniform in texture and free from cold shuts, porosity, or any other defect which might affect their serviceability. They shall be thoroughly cleaned both inside and outside, and all fins and roughness shall be removed.

C-2. All wrought fittings shall be free from defects and shall be machined to dimensions required.

D. GENERAL REQUIREMENTS

D-1. The name or trade-mark of the manufacturer or his initial shall be cast upon the outside of the body of each rough cast fitting or stamped upon the outside of each wrought fitting.

D-2. All fittings shall be threaded in accordance with Federal specification GGG-P-351, pipe threads, referred to in paragraph A-1.

D-2a. The threads of all fittings shall be sharp and clean and shall not cut the walls of the fittings. Threading shall be concentric with the axis of the fitting.

D-2b. All fittings with external threads shall be chamfered at the end at an angle of about 45° with the axis of the thread.

D-2c. All fittings with internal threads shall be countersunk at the end a distance of not less than one-half the pitch of one thread and at an angle of about 45° with the axis of the thread.

D-3. In measuring the length of threads specified in all tables of dimensions, the countersink or chamfer shall be included.

D-4. The band on all fittings shall be rectangular in section with or without rounded corners.

D-5. A bevel on the face of the fittings not exceeding 5° will be permitted.

D-6. Fitting dimensions shall be in accordance with the sketches and tables incorporated herein with the option permitted in paragraph D-5 as to bevel.

D-7. The following tolerances shall be permitted in center to end dimensions for all fittings:

Iron pipe size	Tolerance (plus or minus)	Iron pipe size	Tolerance (plus or minus)
<i>Inches</i>	<i>Inch</i>	<i>Inches</i>	<i>Inch</i>
1/8	0.03	1 1/2	0.08
3/8	.04	2	.08

1	.06	3 1/2	.10
1 1/4	.07	4	.12

E. DETAIL REQUIREMENTS

E-1. The chemical composition of 125-pound cast-bronze fittings shall be as follows:

Composition	Copper	Tin	Zinc	Lead	Iron (maximum)	Other elements (maximum)
	<i>Per cent</i>					
A.....	78-82	4-6	10-16	2-3	0.35	1.00
B.....	84-86	4-6	4-6	4-6	.25	1.00

E-2. The chemical composition of 125-pound wrought-bronze fittings shall be as follows (see notes, Tables 4, 7, and 10):

	Per cent
Copper.....	83-86
Lead, maximum.....	.06
Iron, maximum.....	.05
Zinc.....	Remainder.

E-3. Fittings shall conform to dimensions specified in Tables 1 to 11, inclusive.

E-4. Wall thickness of reducing fittings shall be that required for the iron pipe sizes involved.

E-5. All fittings shall pass the tests prescribed in section F.

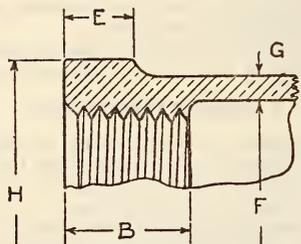

FIGURE 1098.—Detail dimensions, end of fittings

TABLE 1.—Detail dimensions

Iron pipe size (inches)	B		E		F		G	H
	Length of thread, minimum	Width of band, minimum	Inside diameter of fittings		Metal thickness, minimum	Band diameter, minimum		
			Minimum	Maximum				
1/8	.25	.14	.41	.44	.08	.67		
1/4	.32	.16	.54	.58	.08	.81		
3/8	.36	.17	.68	.72	.09	1.00		
1/2	.43	.19	.84	.90	.09	1.17		
3/4	.50	.23	1.05	1.11	.10	1.42		
1	.58	.27	1.32	1.39	.11	1.72		
1 1/4	.67	.31	1.66	1.73	.12	2.10		
1 1/2	.70	.34	1.90	1.97	.13	2.38		
2	.75	.41	2.38	2.45	.15	2.92		
2 1/2	.92	.48	2.88	2.98	.17	3.49		
3	.98	.55	3.50	3.60	.19	4.20		
3 1/2	1.03	.60	4.00	4.10	.20	4.75		
4	1.08	.66	4.50	4.60	.22	5.31		

TABLE 2.—Center to end dimensions of 90° elbows, tees, crosses, and 45° elbows, straight

[Detail dimensions shall be as given in Table 1]

Iron pipe size (inches)	A		C	
	Center to end 90° elbows, tees, crosses		Center to end 45° elbows	
	Inches	Inches	Inches	Inches
1/8	.54	.42		
1/4	.71	.56		
3/8	.82	.63		
1/2	1.01	.78		
3/4	1.18	.89		
1	1.43	1.06		
1 1/4	1.69	1.22		
1 1/2	1.84	1.30		
2	2.12	1.45		
2 1/2	2.70	1.95		
3	3.08	2.17		
3 1/2	3.42	2.39		
4	3.79	2.61		

NOTE.—Sizes 2 1/2 to 4 inches, inclusive, have the same center to end dimensions "A" and "C" as adopted for malleable iron screwed fittings conforming to specification B16c of A. S. M. E. (See 607.2, p. 422.)

(For illustrations of above fittings, see Figure 258 under American Society of Mechanical Engineers, specification B16c for malleable-iron screwed fittings 607.2, p. 422.)

TABLE 3.—Dimensions of street tees and 90° and 45° elbows, straight

[Detail dimensions other than those given shall be as in Table 1]

Iron pipe size (in inches)	A	C	G	J	K	L	N
	Center to end	Center to end 45° ell	Metal thickness, minimum	Center to end	Center to end 45° ell	Length of external thread minimum	Port diameter, maximum
1/8	.54	.42	.08	.92	.78	.27	.18
1/4	.71	.56	.08	1.11	.88	.41	.28
3/8	.82	.63	.09	1.24	.92	.41	.40
1/2	1.01	.78	.09	1.48	1.06	.54	.53
3/4	1.18	.89	.10	1.65	1.23	.55	.72
1	1.43	1.06	.11	1.98	1.40	.69	.93
1 1/4	1.69	1.22	.12	2.24	1.64	.71	1.25
1 1/2	1.84	1.30	.13	2.46	1.80	.73	1.47
2	2.12	1.45	.15	2.88	2.14	.76	1.91

NOTE.—Both thread designs shown in Figure 262 are acceptable.

(For illustrations of above fittings, see Figure 262 under American Society of Mechanical Engineers, specification B16c for malleable-iron screwed fittings (607.2, p. 422).)

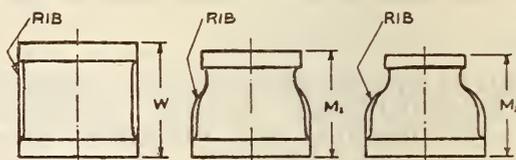

FIGURE 1099.—Straight coupling
Reducer (reducing one size)
Reducer (reducing two sizes).

TABLE 4.—End to end dimensions of cast couplings and reducers

[Detail dimensions shall be as given in Table 1]

Iron pipe size (inches)	W	M ₁	M ₂
	End to end (straight)	End to end (reducing one size)	End to end (reducing two sizes)
1/8	.80		
1/4	.97	0.88	
3/8	1.05	1.01	0.92
1/2	1.29	1.17	1.13
3/4	1.43	1.36	1.24
1	1.68	1.56	1.49
1 1/4	1.86	1.77	1.65
1 1/2	1.92	1.89	1.80
2	2.20	2.06	2.03
2 1/2	2.88	3.25	3.25
3	3.18	3.69	3.69
3 1/2	3.43	4.00	4.00
4	3.69	4.38	4.38

NOTE.—Couplings may be cast or wrought in sizes 1/4 to 3/4 inch, inclusive. Dimensions of wrought couplings are given in Table 10.
2. Right-hand cast couplings have 2 ribs. Right and left cast couplings have 4 ribs on sizes smaller than 1 inch and 6 ribs on sizes 1 inch and larger.
3. End to end dimensions on sizes 2 1/2 inches and larger are same as adopted for malleable-iron screwed fittings conforming to specification B16c of A. S. M. E. (See 607.2, p. 422.)

TABLE 5.—Center to end dimensions of 45° Y branch, straight

[Detail dimensions shall be as given in Table 1]

Iron pipe size (in inches)	T	U	V
	Center to end, inlet	Center to end, outlet	End to end
	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
1/8	0.34	0.81	1.15
1/4	.43	1.07	1.50
3/8	.50	1.23	1.78
1/2	.61	1.58	2.19
3/4	.72	1.90	2.62
1	.85	2.33	3.18
1 1/4	1.02	2.83	3.85
1 1/2	1.10	3.14	4.24
2	1.24	3.76	5.00
2 1/2	1.52	4.73	6.25
3	1.71	5.55	7.26
3 1/2	1.85	6.25	8.10
4	2.01	6.97	8.98

NOTE.—End to end dimensions on sizes 2 1/2 inches and larger are same as adopted for malleable-iron screwed fittings conforming to specification B16c of A. S. M. E. (See 607.2, p. 422.)

(For illustration of above fittings, see Figure 261 under American Society of Mechanical Engineers, specification B16c for malleable-iron screwed fittings (607.2, p. 422).)

TABLE 6.—Center to center dimensions of close, medium, and open pattern return bends

[Detail dimensions shall be as given in Table 1]

Iron pipe size (in inches)	R ₁	R ₂	R ₃
	Center to center, close pattern	Center to center, medium pattern	Center to center, open pattern
	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
1/2	1.00	1.25	1.50
3/4	1.25	1.50	2.00
1	1.50	1.88	2.50
1 1/4	1.75	2.25	3.00
1 1/2	2.19	2.50	3.50
2	2.63	3.00	4.00
2 1/2	3.25	3.75	4.50
3	4.00	4.50	5.00

NOTE.—Center to center dimension R₁, R₂, and R₃ are the same as adopted for malleable-iron screwed fittings conforming to specification B16c of A. S. M. E. (See 607.2, p. 422.)

(For illustrations of above fittings, see Figure 265 under American Society of Mechanical Engineers, specification B16c for malleable-iron screwed fittings (607.2, p. 422).)

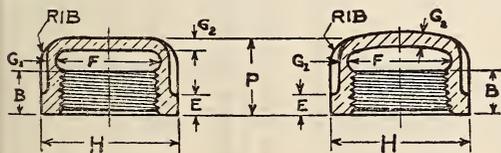

FIGURE 1100.—Flat top cap; crowned top cap

TABLE 7.—Detail dimensions of cast caps

Iron pipe size (in inches)	B	E	F		G ₁	G ₂	H	P	Thickness of ribs, minimum

2	.75	.41	2.38	2.45	.15	.22	2.92	1.32	
2 1/2	.92	.48	2.88	2.98	.17	.25	3.49	1.70	
3	.98	.55	3.50	3.60	.19	.29	4.20	1.80	
3 1/2	1.03	.60	4.00	4.10	.20	.32	4.75	1.90	
4	1.08	.66	4.50	4.60	.22	.36	5.31	2.08	

NOTE 1.—Size 1/8 to 3/4 inch, inclusive, may be cast or wrought. Dimensions of wrought caps made from rod are given in Table 10.

2. Both flat-top and crowned-top designs are acceptable.

3. Height dimensions of sizes 1/8 to 2 inches, inclusive, do not include allowance for draft or crown of top.

4. Height dimensions of size 2 1/2 inches and larger, are same as adopted for malleable-iron screwed fittings, conforming to specification B16c of A. S. M. E. (See 607.2, p. 422.)

TABLE 8.—Center to end dimensions of elbows and crosses, reducing

[Detailed dimensions shall be as given in Table 1]

Iron pipe size (in inches)	Elbows		Crosses	
	Center to end		Center to end	
	X	Z	X	Z

4 by 3 by 4	3.79	3.60	3.79
4 by 3 by 3	3.30	3.08	3.60

(For illustration of above fitting, see Figure 260 under American Society of Mechanical Engineers, specification B16c for malleable-iron screwed fittings (607.2, p. 422).)

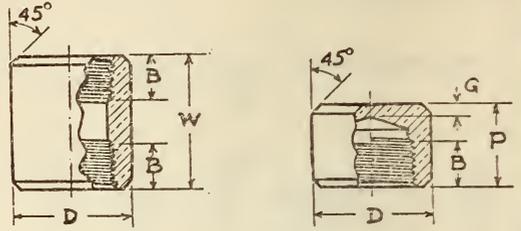

FIGURE 1101.—Wrought coupling; wrought cap

TABLE 10.—Dimensions of wrought couplings and caps

Iron pipe size (inch)	B	D	G	P	W
	Length perfect thread, minimum	Outside diameter, minimum	Metal thickness, minimum	Height of cap	Length of coupling
	<i>Inch</i>	<i>Inches</i>	<i>Inch</i>	<i>Inch</i>	<i>Inches</i>
1/8	0.25	0.56	0.11	0.49	0.83
1/4	.32	.69	.13	.59	1.03
3/8	.36	.84	.13	.68	1.11
1/2	.43	1.05	.14	.84	1.36
3/4	.50	1.31	.15	.94	1.50

NOTES.—These fittings will be accepted in lieu of cast fittings, Figures 1099 and 1100, when purchased on a per piece basis. For dimensions of cast couplings, see Table 4. For dimensions of cast caps, see Table 7.

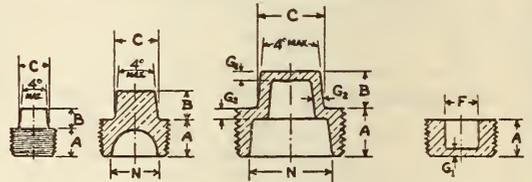

FIGURE 1102.—Pipe plugs, square head, and countersunk patterns

TABLE 11.—Dimensions of pipe plugs

Iron pipe size (in inches)	A	B	C ¹	F ²	G ₁	G ₂	1/2
	Thread length, minimum	Height of square, minimum	Wrench opening, minimum	Standard square bar	Metal thickness of top, minimum	Metal thickness, sides of face, minimum	Inside diameter, maximum
	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>	<i>Inch</i>
1/8	0.27	0.24	3/32	0.24	0.09	0.12	0.53
1/4	.41	.28	0.377	.28	.10	.13	.72
3/8	.41	.31	.440	.31	.11	.14	.93
1/2	.54	.38	.566	.38	.12	.15	1.25
3/4	.55	.44	.629	.44	.13	.16	1.47
1	.69	.50	.818	.50	.15	.17	1.91
1 1/4	.71	.56	.943	.56	.17	.19	2.32
1 1/2	.73	.62	1.132	.62	.18	.20	2.80
2	.76	.68	1.320	.68	.19	.22	3.36
2 1/2	1.07	.74	1.509	.74	.20	.22	3.83
3	1.13	.80	1.697	.80	.21	.22	4.30
3 1/2	1.18	.86	1.885	.86	.22	.22	4.77
4	1.22	.92	2.262	.92	.22	.22	5.24

¹ Square head of plug shall fit these minimum wrench openings. Maximum total taper of opposite sides head shall be 4°. ² Square socket of countersunk patterns shall fit standard square bars of these sizes.

NOTE.—Fittings having one or more ports 2 1/2-inch size or larger, have same center to end dimensions as adopted for malleable-iron screwed fittings conforming to specification B16c of A. S. M. E. (See 607.2, p. 422.)

F. METHOD OF INSPECTION AND TEST

F-1. One or more fittings shall be selected by the inspector from each lot of the same size for chemical analysis to determine conformity with the composition required.

F-2. Representative samples shall be selected by the inspector from every lot of 20 or less of the same kind or size submitted for inspection and shall be subjected to an air pressure of not less than 60 pounds per square inch while under water. As an alternative, the test may be made under hydrostatic pressure of 250 pounds per square inch for one minute. Under the hydrostatic pressure the fittings shall not leak water or sweat at any part of the surface. Under the air pressure the fittings shall not leak air at any part of the surface.

F-3. Representative samples shall be surface inspected and checked for conformity with the dimensions as given in the tables.

G. PACKAGING, PACKING, AND MARKING OF SHIPMENTS

G-1. *Packaging.*—Ten fittings of the same kind and size up to and including 1 inch shall be securely tied together, or a like number may be packed in a commercial container.

G-1a. Five fittings of the same kind and size above 1 inch shall be securely tied together, or a like number may be packed in a commercial container.

I. NOTES

I-1. This specification contemplates the purchase of fittings by the piece, and it is recommended that bids be requested on that basis.

I-2. In ordering reducing fittings, the kind of fitting and the sizes of connecting ends shall be specified as shown in the following paragraphs.

I-3. In specifying tees (T) and wyes (Y), the run should be given first, then the outlet, thus:

(The order in which opening sizes are stated is the same as given and illustrated in specification B16c of A. S. M. E. See 607.2, p. 422.)

I-4. Pipe nipples are covered by Federal specification No. WW-N-351. (See 607.4, p. 485.)

I-5. Compositions A or B may be furnished at the option of the bidder, unless one of these compositions is specified in the invitation for bids.

I-6. Rough fittings will regularly be furnished under this specification unless otherwise specified. When polished or plated fittings are required, it should be so specified in the invitation for bids.

I-7. It is the standard practice in some Government departments to use 250-pound fittings with standard weight pipe.

I-8. It is believed that this specification is adequate and that normally no samples will be necessary prior to award to determine compliance with this specification. If for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids and the particular purpose to be served by the bid sample should be definitely stated, the specification to apply in all other respects.

645.5 BRASS OILERS.

(No nationally recognized specifications available.)

645.6 BUILDERS' HARDWARE, BRASS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUILDERS' HARDWARE (NONTEMPLATE), COMMERCIAL STANDARD CS22-30, DECEMBER 11, 1930

BUILDERS' HARDWARE (NONTEMPLATE)

(See 617.0, p. 977.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATIONS FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

BUILDERS' HARDWARE (NONTEMPLATE)

(For applicable Federal specifications; types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings, and methods of inspection and tests, see 600.3, p. 70.)

(Specific commodities, such as locks, latches, hinges, bolts, etc., will be found under their respective commodity designations. For a list of these commodities, see under detail requirements in 617.0, p. 979.)

645.9 MISCELLANEOUS MANUFACTURES OF BRASS.

AMERICAN GAS ASSOCIATION, STANDARD GAS FIXTURES SPECIFICATIONS, 1920

BRASS PIPE OR TUBING

Brass pipe or tubing should be either seamless drawn or brazed; in either case of best quality to allow bending and threading without splitting.

The thickness of walls of brass pipe or tubing should not be less than No. 18 B. & S. gage (0.04030 inch), except when it is used as casing or covering for iron or steel pipe, in which case it should be not less than No. 22 B. & S. gage (0.02534 inch). Both of these gages are subject to the usual gage tolerance of plus or minus 0.002 inch. Particular attention should be paid to having tubing which runs the full gage.

(While No. 18 gage is very generally in use, it is believed that it is very much better to use No. 17 gage. This is not because the 18-gage tubing is not strong or rigid enough but because, when threads are cut on it, there is not sufficient metal to be sure that a good joint is made. If the 18 gage always ran full size, or a little oversize, there would be no objection to it being used, but as it is necessary to allow some variation in the gaging of tubing, it is thought that the No. 17 gage should be specified.)

All threads on brass tubing should be straight threads to conform to the standard specification of the American Society of Mechanical Engineers for such threads.

When brass tube, steel or iron are connected, the thread should be gas-fixture size brass-tubing thread on both the brass and steel or iron; but is recom-

mended that where possible, instead of connecting the parts in this manner, a brass bushing be used, threaded on the outside with standard I. P. S. thread to screw into the iron body, the bushing being tapped on the inside with a straight gas-fixture size brass-tubing tap, for the connection of the brass tube.

(This specification also provides for assembling requirements, for gas-fixture fittings, including fixture cocks, chain pulls, and for sizes of pipe or tubing used in fixture stems and arms. These sizes are as follows:)

SIZES OF PIPE OR TUBING USED IN FIXTURE STEMS

[All dimensions in inches]

	Maximum No. of lights		When made of iron or steel pipe	When made of brass tubing	When made of brass chain		Size of gas way through cock
	Cased	Uncased			When made of both sides	Down center or one side	
23 inches and under.....	1	1/8	1/4	3/8	1/4	1/4	1/8
33 inches and under.....	2	1/4	1/4	3/8	1/4	3/8	3/16
Over 33 inches and under 42 inches.....	2	1/4	3/8	1/2	3/8	3/8	3/16
Over 42 inches and under 72 inches.....	2	3/8	3/8	1/2	3/8	3/8	3/16
Any length to 42 inches.....	4	3/8	3/8	1/2	3/8	3/8	3/16
Any length, 42-72 inches.....	4	3/8	3/8	1/2	3/8	3/8	3/8
Do.....	7	3/8	3/8	3/4	3/4	1/2	1/4
Do.....	12	1/2	3/4	3/4	3/4	1/2	3/16
Do.....	20	3/4	1	1	1/2	3/8	3/8

Size of pipe or tubing to be used in 1-piece or harp pendants:

[All dimensions in inches]

Number of lights not exceeding	Harp (maximum size 18 by 12 inches)		Stem (maximum length 36 inches)	
	Steel or iron pipe	Brass tubing	Iron or steel pipe	Brass tubing
1.....	1/8	3/8	1/4	1/2
3.....	1/4	1/2	3/8	1/2
5.....	3/8	1/2	3/8	3/4

SIZES OF PIPING OR TUBING FOR ARMS

Arms of pendants, or of wall brackets; that is those parts which carry gas for only one burner, should be made not smaller than the following sizes:

[All dimensions in inches]

Length of arm	When made of iron or steel pipe		When made of brass pipe
	Cased	Uncased	
12 inches and under.....	1/8	1/4	5/16
Over 12 inches to and including 18 inches.....	1/4	1/4	3/8
Over 18 inches to and including 24 inches.....	3/8	3/8	1/2
Over 24 inches.....	3/8	3/8	5/8

NOTE.—When over 24 inches in length, the arms should be properly supported by some means other than their attachment to the wall outlet in case of a bracket, or the body in case of an arm.

BRASS WOOD SCREWS

(See 608.2, p. 584.)

646. BRONZE

646.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF GUN METAL, DESIGNATION B28-19, 1919

[Approved as American tentative standard (K4-1921) by the American Standards Association, December 28, 1921]

CHEMICAL ANALYSIS OF GUN METAL

GENERAL CONSIDERATIONS

Phosphorus should not be present in this alloy except in very small amounts. A rapid qualitative test for it is given, whereby it is easily seen whether or not it is necessary to make a correction for its presence in the determination of tin.

A special method is also given for the determination of tin in alloys such as phosphor bronze which contain considerable phosphorus.

DETERMINATION OF COPPER BY THE ELECTROLYTIC METHOD

APPARATUS FOR ELECTROLYSIS

(Electrodes, cathodes, and anodes are identical with those in B27. See 647.20, p. 1261.)

METHOD

In a 150 c c beaker dissolve 1 g of gun metal in 10 c c of HNO_3 , specific gravity 1.42. When the action has ceased, boil until the oxides of nitrogen are expelled, add 50 c c of hot distilled water, and allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm ashless papers, being careful to keep the solution hot throughout the process of filtration, and receiving the filtrate in a 200 c c beaker of the tall type used in electrolysis. Wash with boiling not water. Retain the papers containing the precipitate for subsequent use in the tin determination.

Add to the filtrate 5 c c of H_2SO_4 , specific gravity 1.84, and determine copper by electrolysis, retaining the electrolyte, after the removal of the copper, for the subsequent determination of zinc. See the determination of copper by the electrolytic method, standard methods of chemical analysis of manganese bronze in B27. (See 647.20, p. 1261.)

Accuracy.—Duplicate determinations should check within 0.10 per cent of copper.

NOTES.—Copper, zinc, and tin are conveniently determined on the same sample, tin being first removed, and any zinc tested for after copper has been deposited by electrolysis.

If the solution becomes cool during the first filtration some of the meta-stannic acid (H_2SnO_3) may dissolve.

DETERMINATION OF TIN

[For samples free from phosphorus]

METHOD

See the determination of copper by the electrolytic method, given above.

Use the papers containing the H_2SnO_3 which was filtered off in the determination of copper by the electrolytic method. Ignite the papers with the precipitate, while moist, in a porcelain or platinum crucible, slowly at first, and finally at the full heat of the burner. If the precipitate weighs more than 20 mg heat to constant weight, using a blast lamp. Weigh as SnO_2 , which contains 78.81 per cent of tin.

Accuracy.—Duplicate determinations should check within 0.04 per cent of tin.

NOTES.—This method is not accurate for alloys which contain arsenic, antimony, or phosphorus, or which contain over 0.25 per cent of iron. The SnO_2 may be contaminated with a slight amount of copper and purification is required in very accurate work, but is generally neglected in routine analysis.

The ignited tin oxide contains any phosphorus which may be present in the alloy. The following test is here made use of to detect phosphorus, and to estimate its amount if any is found.

Qualitative Test for Phosphorus

SOLUTIONS REQUIRED

Ferric chloride.—Dissolve 25 g of ferric chloride in 100 c c of distilled water, and add 25 c c of HCl , specific gravity 1.20.

METHOD

Dip a small piece of the alloy into a few cubic centimeters of ferric chloride for about 10 seconds, and then rinse it in running water. Alloys containing phosphorus are darkened noticeably where they have been dipped; alloys containing over 0.25 per cent of phosphorus are rendered almost black by this test. Arsenic and antimony act in a manner similar to phosphorus, but should not be present in this alloy.

Correction for Phosphorus

In alloys containing up to 0.20 per cent of phosphorus a correction for its presence in the ignited tin oxide may be made according to the following empirical method: From the phosphorus content of the alloy, which must be determined on a separate sample, compute the weight of P_2O_5 and subtract two-thirds of this weight from the weight of the ignited tin oxide containing phosphorus. The remainder is considered as pure SnO_2 , which contains 78.81 per cent of tin. The factor for converting phosphorus to $\frac{3}{4} \times \text{P}_2\text{O}_5$ is 152.6 per cent, or approximately one and one-half times the phosphorus content of the sample.

If the alloy contains over 0.20 per cent of phosphorus a special method for the determination of tin should be used.

Arsenic and antimony should not be present in weighable amounts in the tin oxide resulting from a sample of gun metal.

Iron may be present in the H_2SnO_3 in very small amounts, but its weight is negligible in this determination.

In alloys which contain over 0.25 per cent of iron, use the method for the determination of tin in manganese bronze, standard methods of chemical analysis of manganese bronze, B27. (See 647.20, p. 1261.)

DETERMINATION OF TIN

[For samples containing phosphorus]

SOLUTIONS REQUIRED

Yellow ammonium sulphide.—Saturate 150 c c of NH_4OH , specific gravity 0.90, with H_2S gas and then add 50 c c more NH_4OH . Dissolve in this solution 3 or 4 g of sulphur flour and about 1 g of NH_4Cl . Make up this solution freshly and filter immediately before using.

Dilute yellow ammonium sulphide for washing.—Mix 20 c c of yellow ammonium sulphide, prepared as above, and 400 c c of distilled water.

Ammonium acetate for washing.—Dissolve 10 g of ammonium acetate in 300 c c of distilled water, made slightly acid with acetic acid, and saturate with H_2S gas.

METHOD

See the determination of copper by the electrolytic method, given above.

Use the papers containing the freshly filtered H_2SnO_3 which was filtered off in the determination of copper by the electrolytic method. Transfer the papers with the precipitate to a 150 c c beaker, and cover them with 40 to 50 c c of yellow ammonium sulphide. Warm for about 15 minutes, or until the H_2SnO_3 has dissolved. Filter and wash thoroughly with dilute yellow ammonium sulphide. Acidify the combined filtrate and washings cautiously with 50 per cent acetic acid. Warm, and allow the precipitated tin sulphide and sulphur to settle. Filter on double papers and wash with ammonium acetate solution. Dry the precipitate and place it with the papers in a porcelain crucible which projects part way through a hole in a piece of asbestos board. Heat slowly until the free sulphur has been driven off, but without allowing the sulphur to burn. When the sulphur has been expelled, place the crucible on a triangle and ignite slowly at first, and finally at the full heat of the burner. If the precipitate weighs more than 20 mg, heat to constant weight, using a blast lamp. Weigh as SnO_2 , which contains 78.81 per cent of tin.

Accuracy.—Duplicate determinations should check within 0.06 per cent of tin.

NOTES.—If during the first filtration the solution becomes cool, some of the H_2SnO_3 may dissolve.

During ignition, if the sulphur is allowed to burn, some tin sulphate may be formed, causing high results. On the other hand, low results may be caused by too high heat, which causes spattering, and volatilizes some tin sulphide.

DETERMINATION OF LEAD

(Specifications covering the determination of lead, both by the electrolytic method and as a sulphate, for samples containing up to 2 per cent of lead, are identical with those specified in B27. See 647.20, p. 1261.)

DETERMINATION OF ZINC

SOLUTIONS REQUIRED

Dilute hydrochloric acid.—Mix 500 c c of HCl, specific gravity 1.20, and 500 c c of distilled water.

METHOD

See the determination of copper by the electrolytic method, given above.

After the copper has been completely deposited by electrolysis, quickly remove the cathode and wash it thoroughly in distilled water, catching the washings in the beaker containing the electrolyte. Heat the solution and saturate with H_2S gas. Filter off any precipitate and boil the solution to expel H_2S . Make the solution barely alkaline with NH_4OH , and add 25 c c of 85 per cent formic acid. Dilute the solution with distilled water to 300 c c, heat to boiling, and saturate with H_2S gas. Filter and wash with hot water. Dissolve the precipitate with hot dilute HCl, and transfer the solution to a weighed platinum or porcelain dish or crucible. Add a few drops of H_2SO_4 , specific gravity 1.84, and evaporate the solution until copious fumes escape. If the solution is not clear and colorless, cool, add a few cubic centimeters of HNO_3 , specific gravity 1.42, and again evaporate the solution until fumes of H_2SO_4 come off freely. Repeat the treatment with HNO_3 , if necessary, until the organic matter is destroyed, and the solution is colorless. Remove the excess of H_2SO_4 by heating the dish cautiously, and finally heat to dull redness. Weigh as zinc sulphate, which contains 40.49 per cent of zinc.

Accuracy.—Duplicate determinations should check within 0.05 per cent of zinc.

DETERMINATION OF PHOSPHORUS BY THE ALKALIMETRIC METHOD

SOLUTIONS REQUIRED

Nitric acid for dissolving.—Mix 1,000 c c of HNO_3 , specific gravity 1.42, and 1,200 c c of distilled water.

Nitric acid for washing.—Mix 20 c c of HNO_3 , specific gravity 1.42, and 1,000 c c of distilled water.

Ammonium molybdate—Solution No. 1.—Place in a beaker 100 g of 85 per cent molybdic acid, mix it thoroughly with 240 c c of distilled water, add 140 c c of NH_4OH , specific gravity 0.90, filter, and add 60 c c of HNO_3 , specific gravity 1.42.

Solution No. 2.—Mix 400 c c of HNO_3 , specific gravity 1.42, and 960 c c of distilled water.

When the solutions are cold, add solution No. 1 to solution No. 2, stirring constantly; then add 0.1 g of ammonium phosphate dissolved in 10 c c of distilled water and let stand at least 24 hours before using.

Potassium nitrate, 1 per cent.—Dissolve 10 g of KNO_3 in 1,000 c c of distilled water.

Phenolphthalein indicator.—Dissolve 0.2 g of phenolphthalein in 50 c c of 95 per cent ethyl alcohol and 50 c c of distilled water.

Standard sodium hydroxide.—Dissolve 6.5 g of purified NaOH in 1,000 c c of distilled water, add a slight excess of 1 per cent solution of barium hydroxide, let stand for 24 hours, decant the liquid, and standardize it against a steel of known phosphorus content as determined by the molybdate-magnesia method, so that 1 c c will be equivalent to 0.01 per cent of phosphorus on the basis of a 2 g sample (see notes). Protect the solution from carbon dioxide with a soda-lime tube.

Ferric chloride.—Dissolve 100 g of ferric chloride (phosphorus free), in 100 c c of distilled water.

Standard nitric acid.—Mix 10 c c of HNO_3 , specific gravity 1.42, and 1,000 c c of distilled water. Titrate the solution against standardized NaOH, using phenolphthalein as indicator, and make it equivalent to the NaOH by adding distilled water.

METHOD

In a 400 c c casserole dissolve 1 g of gun metal in 10 c c of HNO_3 , specific gravity 1.42. Add 20 c c of HCl, specific gravity 1.20, and evaporate to dryness. Moisten with HCl, evaporate to dryness again, and bake to dull redness. Moisten with HCl again, add 3 c c of ferric chloride solution, and dilute to about 200 c c with distilled water. Add NH_4OH , specific gravity 0.90, until the basic salts of copper have dissolved and the solution has become a deep blue. Boil, allow to settle, and filter on a loosely woven filter paper. Wash with dilute ammonia and with hot water. Dissolve the precipitate on the filter with hot dilute HCl, dilute the solution to about 200 c c, add NH_4OH , specific gravity 0.90, until the precipitate which forms at first dissolves rather slowly, and saturate with H_2S gas. Filter off and reject the precipitate. Boil the filtrate to expel H_2S and add HNO_3 , specific gravity 1.42, until the iron is oxidized. Add NH_4OH , specific gravity 0.90, until the solution is alkaline. Boil and filter on a loosely woven filter paper. Wash with dilute ammonia and with hot water. Dissolve the precipitate on the filter with HNO_3 for dissolving, receiving the solution in a 350 c c Erlenmeyer flask. Add NH_4OH , specific gravity 0.90, until the iron is entirely precipitated, and then add HNO_3 , specific gravity 1.42 cautiously until the solution just becomes clear. Bring the solution to a temperature of about 80° C., and add 40 c c of ammonium molybdate at room temperature. Allow to stand for one minute, shake or agitate for three minutes, and filter on a 9 cm paper. Wash the precipitate three times with the 2 per cent HNO_3 solution to free it from iron, and continue the washing with the 1 per cent KNO_3 solution until the precipitate and flask are free from acid.

Transfer the paper and precipitate to a solution flask, add 20 c c of distilled water, five drops of phenolphthalein solution as indicator, and an excess of standard NaOH solution. Insert a rubber stopper and shake vigorously until solution of the precipitate is complete. Wash off the stopper with distilled water and determine the excess of NaOH solution by titrating with standard HNO_3 solution. Each cubic centimeter of standard NaOH solution represents 0.02 per cent of phosphorus.

Accuracy.—Duplicate determinations should check within 0.01 per cent of phosphorus.

NOTES.—The ammonium molybdate solution should be kept in a cool place and should always be filtered before using.

All distilled water used in titration should be freed from carbon dioxide by boiling or otherwise.

Bureau of Standards standard steel No. 19 (a) is recommended as a suitable steel for standardization of the NaOH solution.

DETERMINATION OF PHOSPHORUS BY THE FERRIC ALUM METHOD

[Optional]

SOLUTIONS REQUIRED

Ferric chloride.—Dissolve 100 g of ferric chloride (phosphorus free) in 100 c c of distilled water.

Dilute ammonia.—Mix 100 c c of NH_4OH , specific gravity 0.90, and 900 c c of distilled water.

Dilute hydrochloric acid.—Mix 500 c c of HCl , specific gravity 1.20, and 500 c c of distilled water.

Dilute sulphuric acid for dissolving.—Mix 200 c c of H_2SO_4 , specific gravity 1.84, and 800 c c of distilled water.

Dilute sulphuric acid for reductor.—Mix 50 c c of H_2SO_4 , specific gravity 1.84, and 1,000 c c of distilled water. This solution is used boiling hot.

Ammonium molybdate.—(Same as in alkalimetric method, given above.)

Acid ammonium sulphate.—Mix 25 c c of H_2SO_4 , specific gravity 1.84, and 1,000 c c of distilled water, and then add 15 c c of NH_4OH , specific gravity 0.90.

Ferric alum.—Dissolve 200 g of ferric ammonium sulphate crystals in 1,950 c c of distilled water. Add 50 c c of H_2SO_4 , specific gravity 1.84, and 80 c c of phosphoric acid, 85 per cent.

Potassium permanganate.—Dissolve from 3.0 to 3.2 g of KMnO_4 in 1,000 c c of distilled water. Allow the solution to stand for about one week, and then filter it through an asbestos filter. Standardize by using about 0.200 g portions of pure sodium oxalate.

METHOD

(Method is identical with the alkalimetric method given above until after boiling and filtering on a loosely woven filter paper, and washing with dilute ammonia and with hot water. Then proceed as follows:)

Dissolve the precipitate on the filter with hot dilute H_2SO_4 , receiving the solution in a 350 c c Erlenmeyer flask. Add NH_4OH , specific gravity 0.90, until the iron is entirely precipitated, and then add HNO_3 , specific gravity 1.42, cautiously until the solution just becomes clear. Bring the solution to a temperature of about 80°C ., and add 40 c c of ammonium molybdate at room temperature. Allow to stand for one minute, shake or agitate for three minutes, filter on a 9 cm paper, and wash very thoroughly (about 25 times) with acid ammonium sulphate. Dissolve the precipitate on the paper using 50 c c of dilute ammonia. Add sufficient H_2SO_4 to adjust the acidity to 2.5 per cent by volume, and immediately pass the solution through a Jones reductor, which has the reductor tube prolonged and reaching nearly to the bottom of the flask, dipping into 50 c c of ferric alum solution. Wash through the reductor with 150 c c of the H_2SO_4 for reductor and follow with 100 c c of distilled water. Titrate with the standard KMnO_4 solution.

By this method the molybdenum which in passing through the reductor has been reduced entirely to the form corresponding to the oxide Mo_2O_3 , is partially oxidized by the ferric alum, an equivalent amount of iron being reduced to the ferrous condition. The resultant solution is not rapidly oxidized through contact with air during the titration, and the calculations can therefore be made on the Mo_2O_3 — 2MoO_3 basis.

Accuracy.—Duplicate determinations should check within 0.01 per cent of phosphorus.

NOTES.—The ammonium molybdate solution should be kept in a cool place and should always be filtered before using.

A blank determination should be made on corresponding amounts of acid and water, passing through the reductor into the usual amount of ferric alum solution in the flask.

A small quantity of liquid should always be left in the reductor funnel, and air should never be allowed to enter the reductor.

For description and further details of the use of reductor see "Chemical Analysis of Iron" by A. A. Blair, or "Quantitative Chemical Analysis" by H. P. Talbot.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF BRONZE BEARING METAL, DESIGNATION, B46-27, 1927

CHEMICAL ANALYSIS OF BRONZE BEARING METAL

DETERMINATION OF COPPER BY THE ELECTROLYTIC METHOD

APPARATUS FOR ELECTROLYSIS

(Identical with B27. See 647.20, p. 1261.)

METHOD

In a 150 c c beaker, dissolve 1 g of the bronze in 10 c c of HNO_3 (specific gravity 1.42). When the action has ceased, boil until the oxides of nitrogen are expelled; add 50 c c of hot distilled water; and allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm ashless papers, being careful to keep the solution hot throughout the process of filtration, and receive the filtrate in a 200 c c beaker of the tall type used in electrolysis. Wash with boiling hot water. Retain the papers containing the precipitate for subsequent use in the tin determination.

Add to the filtrate 5 c c of H_2SO_4 (specific gravity 1.84), and determine copper by electrolysis, retaining the electrolyte, after the removal of the copper, for the subsequent determination of zinc. See the determination of copper by the electrolytic method, B27 (647.20, p. 1261).

NOTES.—Copper, zinc, and tin are conveniently determined on the same sample, tin being first removed, and any zinc tested for after copper has been deposited by electrolysis.

If the solution becomes cool during the first filtration, some of the meta-stannic acid (H_2SnO_3) may dissolve.

DETERMINATION OF TIN

[For samples free from phosphorus]

(Same as B28, above.)

Qualitative Test for Phosphorus

(Same as B28, above, except that the specific gravity of the HCl is 1.19 instead of 1.20 and no reference is made to arsenic and antimony.)

DETERMINATION OF TIN

[For samples containing phosphorus]

(Same as B28, above, except for note 1, which says: "The ignited tin oxide will contain any arsenic or antimony that was present in the sample.")

DETERMINATION OF LEAD BY THE ELECTROLYTIC METHOD

APPARATUS

Electrodes and other apparatus used in electrolysis; see the determination of copper by the electrolytic method, B27 (647.20, p. 1261).

METHOD

In a 150 c c beaker, dissolve 1 g of the bronze in 10 c c of HNO_3 (specific gravity 1.42). When the action has ceased, boil until the oxides of nitrogen are expelled, add 50 c c of boiling hot distilled water, and allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm ashless papers, being careful to keep the solution hot throughout the process of filtration. Wash with boiling hot water. Add to the filtrate 9 c c of HNO_3 (specific gravity 1.42) and dilute to about 150 c c with distilled

water. Insert a sand-blasted platinum gauze electrode in the anode terminal; this electrode may be one of the type used as cathode in the determination of copper by the electrolytic method, or it may be one of the sand-blasted gauze anodes therein described. Insert in the cathode terminal one of the electrodes used as anode in the determination of copper by the electrolytic method. (See B27, 647.20, p. 1261.) Cover with a pair of split watch glasses and electrolyze. For each solution use a current of 2 amperes at 10 volts continued for about two hours. Wash down the cover glasses, electrodes, and sides of the beakers, raising the level of the liquid 5 or 6 mm, and continue the electrolysis for 15 minutes. If no darkening of the newly exposed surface of the platinum can be detected, the lead has been entirely deposited. If the newly exposed surface of the platinum is darkened, continue the electrolysis until no such darkening can be detected when the current has been continued for 15 minutes after the level of the liquid has been raised.

When the lead has been entirely deposited, remove the anode quickly and rinse it in distilled water and then in alcohol, and dry in an oven at 210° C. for 30 minutes. Weigh as PbO₂ using the factor for lead 0.8643 instead of the theoretical value.

NOTES.—1. It is impossible to remove the tin quantitatively as H₂SnO₃ in the case of alloys containing over 0.25 per cent of iron, and traces of tin are sometimes found in the PbO₂ deposit.

2. In this and in the following method, a slight amount of lead may be retained by the H₂SnO₃. This should be recovered in very accurate work, but is neglected in a routine analysis.

3. *Samples for analysis.*—When lead is less than 0.10 per cent, a 5 or 10 g sample is taken. The 5 g sample should be dissolved in 25 c c of HNO₃. The 10 g sample should be dissolved in 45 c c of HNO₃. When the lead content is greater than 15 per cent, dissolve the sample in HNO₃ as described under "Method," transfer the solution to a graduated flask, and choose aliquot portions for analysis in order not to exceed the above-mentioned limit of lead to be deposited on the anode as PbO₂. The lead peroxide will tend to flake off the electrode when the amount deposited becomes excessive.

DETERMINATION OF LEAD AS SULPHATE

SOLUTIONS REQUIRED

(Same as B27. See 647.20, p. 1261.)

METHOD

In a 150 c c beaker, dissolve 1 g of the bronze in 10 c c of HNO₃ (specific gravity 1.42). When the action has ceased, boil until the oxides of nitrogen are expelled, add 50 c c of boiling hot distilled water, and allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm ashless papers, being careful to keep the solution hot throughout the process of filtration. Wash with boiling hot water. Add 40 c c of lead acid and evaporate until copious fumes of H₂SO₄ are evolved. Cool; add 35 c c of distilled water to dissolve the salts. Heat to boiling and allow to cool and settle for five hours, or overnight if convenient. Filter on a weighed Gooch crucible and wash with lead acid. Wash out the lead acid with dilute alcohol, set the Gooch crucible inside a porcelain crucible, ignite for five minutes at the full heat of a Tirrell burner, cool, and weigh as PbSO₄, and calculate to Pb.

NOTES.—1. Copper and lead may be determined on the same samples if so desired. In such a case, after filtering off the lead sulphate and washing with lead acid, and before washing with dilute alcohol, remove the filtrate, add 3 c c of NH₄OH (specific gravity 1.42), dilute to 120 c c and determine copper by electrolysis. See the determination of copper by the electrolytic method.

2. Copper and lead may also be determined simultaneously by the electrolytic method. See the standard methods of chemical analysis of manganese bronze B27 (647.20, p. 1261).

DETERMINATION OF IRON

SOLUTIONS REQUIRED

Yellow ammonium sulphide.—Saturate 150 c c of NH₄OH (specific gravity 0.90) with hydrogen

sulphide gas, and then add 50 c c more of NH₄OH. Dissolve in this solution 3 or 4 g of sulphur flour, and about 1 g of NH₄Cl. Make up this solution fresh, and filter it immediately before use.

Dilute yellow ammonium sulphide for washing.—Mix 20 c c of yellow ammonium sulphide, prepared as above, and 400 c c of distilled water.

Other solutions.—See the determination of iron in the standard methods of chemical analysis of brass ingots and sand castings B45 (644.0, p. 1193).

METHOD

In a 150 c c beaker, dissolve 1 g of bronze in 10 c c of HNO₃ (specific gravity 1.42). When the action has ceased, boil until the oxides of nitrogen are expelled, add 50 c c of boiling water, and allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm papers, keeping the solution hot, and wash with boiling hot water. Retain both the filtrate and the precipitate. Transfer the papers with the precipitate to a 150 c c beaker, and cover them with 40 to 50 c c of yellow ammonium sulphide. Warm about 15 minutes, or until the meta-stannic acid is dissolved. Filter and wash thoroughly with hot, dilute, yellow ammonium sulphide.

Dissolve the small black residue on the filter with hot dilute HCl, receiving the solution in a small beaker. Add 5 c c of HNO₃ (specific gravity 1.42) and boil to oxidize sulphur and iron. Add this small solution to the original filtrate from the meta-stannic acid. Add about 5 g of NH₄Cl, then NH₄OH, (specific gravity 0.90) and proceed as in the determination of iron in the standard methods of chemical analysis of manganese bronze in B27. (See 647.20, p. 1261.)

DETERMINATION OF NICKEL BY THE DIMETHYLGLYOXIME METHOD

SOLUTIONS REQUIRED

Dimethylglyoxime solution.—Dissolve 5 g of dimethylglyoxime in 500 c c of grain alcohol, and filter before using.

Sodium potassium tartrate solution.—Dissolve 200 g of the salt in 1 liter of distilled water.

Dilute ammonia for washing.—Solution containing 10 c c of NH₄OH (specific gravity 0.90) per liter of water.

METHOD

In a 200 c c electrolytic beaker, dissolve a 1 g sample exactly as in the determination of copper by the electrolytic method, B27 (see 647.20, p. 1261), and remove the copper by electrolysis. Evaporate the solution to about 100 c c, filter, add about 1 g of NH₄Cl, then 10 c c of sodium potassium tartrate solution, and nearly neutralize with NH₄OH (specific gravity 0.90). Heat nearly to boiling, add 5 c c of dimethylglyoxime solution for each 0.01 g or fraction of nickel present and then NH₄OH in slight excess. Let stand at least 30 minutes on the steam bath, filter, and wash with dilute ammonia solution. For accurate work, the precipitate should be dissolved in hot HCl (1:1) and reprecipitated as before. Filter on a weighed Gooch crucible, wash with dilute ammonia solution and then with hot water, dry at 110° to 120° C. for about two hours, and weigh as the glyoxime salt which contains 20.31 per cent of nickel. If it is preferred, instead of by weighing the glyoxime salt, the nickel can be determined electrolytically as follows: Dissolve the red precipitate of nickel glyoxime in hot HCl (1:1), add 10 c c of H₂SO₄ (1:1) and evaporate to strong fumes. Dilute, neutralize with NH₄OH (specific gravity 0.90), and add 20 c c in excess. The final volume should be about 150 c c

Electrolyze with a current of 0.3 ampere per solution. Test the solution for completion of deposition with fresh H_2S water as is done in the determination of copper by the electrolytic method. Remove the cathode, wash with water, and dry with alcohol as in the determination of copper by the electrolytic method. Weigh the deposit as metallic nickel.

DETERMINATION OF ZINC

(Same as B28, above, except that "solutions required" item is omitted and the hot HCl is proportioned 1:1.)

DETERMINATION OF PHOSPHORUS BY THE ALKALIMETRIC METHOD

SOLUTIONS REQUIRED

(Same as B28 above.)

METHOD

In a 400 c c beaker, dissolve a 1 g sample in 10 c c of HNO_3 (specific gravity 1.42) and heat until brown fumes are driven off; then add 15 c c of HCl (specific gravity 1.19) and evaporate to dryness. Add 10 c c of HCl (specific gravity 1.19) and again evaporate to dryness, but do not bake.

Add 15 c c of HCl (specific gravity 1.19) and heat to solution, dilute with 50 c c of distilled water, and bring to a boil. Take off the hot plate and wash down the cover glass and sides of the beaker; add 20-mesh c. p. zinc, 2 or 3 g at a time, until the solution becomes colorless, that is until all the copper, tin, and lead are precipitated. Filter, receiving the filtrate in a 400 c c beaker and wash well with hot water.

Add 3 c c of the ferric chloride solution to this filtrate and make faintly ammoniacal; bring to a boil, let settle and filter. Dissolve this precipitate in hot dilute HCl and again make ammoniacal; heat to boiling, let settle, and filter, washing well with hot water.

Dissolve this precipitate in as small a quantity of hot dilute HNO_3 as possible, receiving the solution in a 300 c c Erlenmeyer flask, wash filter free of iron with hot dilute HNO_3 and hot distilled water. Evaporate to about 15 c c, cool, make ammoniacal, then neutralize with HNO_3 (specific gravity 1.42) and add 5 c c in excess. Cool to 80° C. and add 60 c c of the ammonium molybdate solution. Let stand one minute, then shake three minutes and let settle. Filter on an 11 cm filter (using a small quantity of paper pulp on the filter) and wash free of iron with 2 per cent nitric acid wash, then free of acid with the 1 per cent potassium nitrate solution.

Place the paper in the thoroughly washed acid-free flask in which the original precipitation was made, add 25 c c of distilled water and an excess of the standard sodium hydroxide solution. By using a long glass rod, the paper can be pulped and the yellow precipitate dissolved in a very few seconds. Wash off the rod and the sides of the flask and add a few drops of the phenolphthalein solution and titrate the excess of standard NaOH with the standard HNO_3 . The strength of the standard NaOH and the standard HNO_3 in terms of phosphorus can be determined by using a standard steel or preferably a standard phosphor bronze in which the phosphorus has been determined by the molybdate-magnesia method.

Accuracy.—Duplicate determinations should check within 0.01 per cent of phosphorus.

Notes.—1. The ammonium molybdate solution should be kept in a cool place and should always be filtered before using.

2. All distilled water used in titration should be freed from carbon dioxide by boiling or otherwise.

3. Bureau of Standards standard steel No. 19 (a) or a bronze of known phosphorus content are recommended as suitable materials for standardization of the sodium hydroxide solution.

4. (Gravimetric method, optional.) It is considered by some that more accurate results can be obtained by a gravimetric determination of phosphorus as $Mg_2P_2O_7$. This can be carried out by dissolving the yellow molybdate precipitate in 20 c c of NH_4OH (1:1) to which has been added 2 g of citric acid, precipitating with magnesia mixture, and proceeding as usual, finally weighing as $Mg_2P_2O_7$.

5. Determination of phosphorus by the ferric alum method is optional. See the standard methods of chemical analysis of gun metal B25 above.

DETERMINATION OF ANTIMONY BY THE VOLUMETRIC METHOD

(Same as B45. See 644.0, p. 1193.)

DETERMINATION OF SULPHUR

(Same as B45. See 644.0, p. 1193.)

DETERMINATION OF ARSENIC

(Same as B45. See 644.0, p. 1193.)

DETERMINATION OF ALUMINUM IN SMALL QUANTITIES

(Same as B45. See 644.0, p. 1193.)

646.1 BRONZE INGOTS AND BARS.

646.11 INGOTS, BRONZE.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR COPPER-BASE ALLOYS IN INGOT FORM FOR SAND CASTINGS, DESIGNATION B30-31T, 1932

COPPER-BASE ALLOYS—INGOT FORM

(See 644.11, p. 1196.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR BRONZE INGOTS (FOR REMELTING), QQ-B-701, MAY 31, 1932

BRONZE INGOTS

I. GENERAL SPECIFICATIONS

Federal specification for metals, Federal Specifications Board specification No. 339 (Current designation: QQ-M-151.), in effect on date of invitation for bids, shall form part of this specification.

II. GRADES

This specification covers 10 grades of bronze in the form of ingots for remelting, as shown in Table 1.

III. MATERIAL

Bronze ingots shall be made of the best grades of virgin metals or from scrap of known and approved composition.

IV. GENERAL REQUIREMENTS

Ingots for remelting shall be furnished in commercial standard forms or shapes with brand name cast in unless otherwise specified in the contract or purchase order, and shall be of uniform quality, clean, and free from burned metal or foreign materials.

V. DETAIL REQUIREMENTS

Bronze ingots shall conform to the chemical requirements shown in Table 1.

VI. METHODS OF INSPECTION AND TESTS

1. An analysis of each melt of ingots shall be furnished by the contractor, showing the percentage of the elements designated.
2. Check analysis of the ingots may be made by the inspector, or through him by any Government laboratory or other designated representative and without cost to the contractor.
3. The drillings for check analysis of ingots shall be taken from one ingot selected by the inspector from each melt. The drillings shall be taken from metal below the surface of the ingot, and shall consist of not less than 5 ounces.

VII. PACKING AND MARKING OF SHIPMENTS

Each ingot shall bear its proper heat or melt number, either stamped or cast in, and shall be packed in such manner as to facilitate identification and handling at the point of delivery.

VIII. NOTE

The various grades of ingots mentioned herein are suitable for stock for castings of the corresponding grade prescribed in Federal specification for bronze castings, Federal Specifications Board, specification QQ-B-691.

TABLE 1.—Chemical composition

Grade	Copper	Tin	Zinc	Lead	Iron, maximum	Nickel, maximum	Phosphorus, maximum	Sulphur, maximum	Antimony, maximum	Other elements, maximum	
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>

646.32 WIRES, BRONZE.

- (Phosphor bronze wire, see 647.38, p. 1270.)
- (Specifications for bronze trolley wire are not included in this publication. See reference to electrical materials and supplies under 642.12, p. 1181. Specifications for bronze trolley wire have been prepared jointly by the American Electric Railway Engineering Association and the American Society for Testing Materials. These specifications cover round and grooved trolley wire of two strength grades with copper according to A. S. T. M. specifications, and include requirements on tensile strength, elongation, resistivity and dimensions, twist test for round wire, and standard sections for grooved wire. These specifications are designated as follows: A. E. R. E. A. bronze trolley wire, designation D12-30; A. S. T. M. bronze trolley wire, designation B9-30.)

646.4 BRONZE CASTINGS AND TUBES.**646.41 CASTINGS, BRONZE.**

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; MATERIALS FOR MACHINERY, BOILERS, AND PIPING, 1930

BRONZE CASTINGS

(For general information and requirements see 600.0, p. 1. For test requirements see 600.1, p. 7.)

1. Brass and bronze castings subject to test and inspection shall be free from blowholes, porous spots, cracks, and other defects. The material must satisfactorily comply with the following physical characteristics:

Grade	Minimum tensile strength	Minimum elongation in 2 inches	Purpose	Stamp
1	Lbs./in. ² 30,000	Per cent 15	For general purposes	A, B.
2	60,000	20	For propeller blades and similar high-grade castings.	A, B. 1

2. The number of tests for brass and bronze castings is to be in accordance with the requirements for steel castings (see 611.41, p. 706, par. 2), but no bend tests are required.

AMERICAN BUREAU OF SHIPPING, RULES FOR BUILDING AND CLASSING STEEL VESSELS; PUMPS AND PIPING SYSTEMS, 1930

MATERIAL OF VALVES AND FITTINGS

(For general requirements see 607.4, p. 435.)

1. Composition having the physical characteristics for grade 1 material (bronze castings) specified above under materials for machinery, boilers, and piping may be used in the construction of valves and fittings for temperatures up to 470° F. For temperatures greater than 470° F. the chemical and physical characteristics of the composition are to be specially submitted for approval. The minimum thickness in inches for material of composition grade 1 quality shall be determined by the formula:

$$t = \frac{\text{Working pressure} \times \text{internal diameter}}{5,000} + 0.125$$

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, OVERHEAD LINE MATERIAL FOR DIRECT AND CATENARY SUSPENSION, RECOMMENDED SPECIFICATION, D102-30, 1930

OVERHEAD LINE MATERIAL

(D102-30, paragraphs 330, 332, 333, etc., include requirements for bronze castings. For specification see 611.29, p. 682.)

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR RAILWAY BUILDINGS, MISCELLANEOUS METAL WORK, 1929

BRONZE CASTINGS

Bronze castings shall be made from electroplated metal patterns in molds with special facings and shall be hand filed, chased, and carefully finished.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR THE ALLOY; COPPER, 88 PER CENT; TIN, 10 PER CENT; ZINC, 2 PER CENT—DESIGNATION B10-18, 1918

ALLOY 88-10-2

(See 643.4, p. 1192.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SAND CASTINGS OF THE ALLOY; COPPER, 88 PER CENT; TIN, 8 PER CENT; ZINC, 4 PER CENT—DESIGNATION B60-28, 1928

ALLOY 88-8-4

(See 643.4, p. 1192.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR STEAM OR VALVE BRONZE SAND CASTINGS, DESIGNATION B61-28, 1928

BRONZE SAND CASTINGS**SCOPE**

1. These specifications cover alloy castings, the alloy being a composition of copper, tin, lead, and

zinc, commonly used as a high-grade steam metal or valve bronze.

CHEMICAL PROPERTIES AND TESTS

2. The alloy shall conform to the following requirements as to chemical composition:

	Desired	Minimum	Maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Copper.....	88.00	86.00	91.00
Tin.....	6.50	6.00	7.00
Lead.....	1.50	1.00	2.00
Zinc.....	4.00	Remainder.	Remainder.
Iron.....			.15
Nickel.....			.50
Phosphorus.....			.05
Aluminum.....	None.		None.
Antimony.....			.25
Sulphur.....			.05
Total other impurities in addition to those specified above.....			.15

Where "none" is specified it shall be construed to refer to none as determined on a 10-gram sample.

PHYSICAL PROPERTIES AND TESTS

The alloy shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	32,000
Yield point.....	do.....	16,000
Elongation in 2 inches.....	per cent..	17

(Specifications covering tension-test specimen test requirements are identical with those in paragraph 11 (c), A18. See 611.51, p. 754. In respect to chemical analyses, determination of yield point, workmanship and finish, marking, and inspection and rejection, this specification is identical with B59. See 647.15, p. 1259. In respect to manufacture, pressure-test requirements, and dimensions of test-specimen coupon, it is identical with B60. See 643.4, p. 1192. In respect to number of tests, paragraphs 7 (a), (b), (c), and (d) in this specification are identical with Pars. VI 2, 3, 4, and 13 in F. S. B. QQ-B-691. See 646.41, p. 1252.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR BRONZE CASTINGS IN THE ROUGH FOR LOCOMOTIVE WEARING PARTS, DESIGNATION B66-28, 1928

BRONZE CASTINGS

SCOPE

1. These specifications cover bronze castings in the rough for locomotive wearing parts.

BASIS OF PURCHASE

2. Unless otherwise specified on the purchase order or in the contractual arrangement, the manufacturer shall furnish hard bronze for connecting-rod bearings, valve-motion bushings, crosshead gibs, and miscellaneous bearings subject to hard wear. Hard bronze shall also be furnished for pedestal wedges and eccentric straps should these appear on the purchase order or contract.

Medium bronze shall be furnished for driving-box brasses, engine-truck brasses, hub liners, and bearings which require lining metal for facing or lining.

Phosphor bronze and soft bronze will be furnished only when specified.

CHEMICAL PROPERTIES AND TESTS

3. (a) The material shall conform to the following requirements as to chemical composition:

Alloy	Lead	Tin	Tin and lead, maximum	Zinc, maximum	Phosphorus	Sum of tin, lead, copper, and phosphorus, minimum	Sum of tin, lead, copper, and zinc, minimum	Remainder, maximum
	<i>P. ct.</i>	<i>P. ct.</i>	<i>P. ct.</i>	<i>P. ct.</i>	<i>P. ct.</i>	<i>P. ct.</i>	<i>P. ct.</i>	<i>Per cent</i>
Phosphor bronze.....	8-11	9-11	-----	0.5	0.4-0.8	99	-----	1.00
Hard bronze.....	10-15	7-10	22	1.25	-----	-----	-----	99.25
Medium bronze.....	14-22	6-8	28	1.25	-----	-----	-----	99.25
Soft bronze.....	23-27	4-6	31	.75	-----	-----	-----	99.25

1 This grade is usually used for chilled castings.

(b) Where no figures are given for impurity maximum, these elements may be present up to any amount to come within the total impurity specified, provided the material otherwise meets the chemical and physical tests. Where maximum percentages are specified, the elements referred to are considered as impurities and shall not be intentionally added.

CHEMICAL ANALYSIS

4. An analysis shall be made by the purchaser or his representative from one casting representing each lot of 100 castings or fraction thereof. The chemical composition thus determined shall conform to the requirements as specified in section 3 (a) for the particular alloy.

SAMPLE FOR CHEMICAL ANALYSIS

5. (a) The sample for chemical analysis shall be taken from the casting at three points along the fractured surface, as described in section 6 (a). Drillings through the skin shall be rejected. Equal quantity of drillings from each hole thoroughly mixed shall constitute the sample for chemical analysis.

(b) All samples shall be kept free of oil and shall be carefully treated with a magnet to remove any iron introduced in taking the sample.

PHYSICAL PROPERTIES AND TESTS

6. (a) The casting representing a lot for acceptance, shall be broken through the center and parallel with the longitudinal axis of the bearing in order to ascertain the uniformity of the grain of the metal. When this fracture shows separation or imperfect mixing of the component parts, or dross or dirt spots, the lot shall be rejected.

(b) One casting may be taken for fracture test from each lot of 100 castings or fraction thereof.

PERMISSIBLE VARIATIONS IN DIMENSIONS

7. The purchaser will furnish drawings showing the dimensions of the castings ordered and permissible variations therefrom, and all castings shall conform to the gages and dimensions shown on the drawings.

WORKMANSHIP AND FINISH

8. The castings shall be sound, free from blow-holes, flaws, and shrinkage cracks, and shall show good foundry practice and workmanship.

MARKING

9. Each lot of 100 castings or fraction thereof shall bear a serial number, commencing with the numeral one at the beginning of the year and continuing consecutively until the end of the year. All castings shall also have cast on them the manufacturer's initials or trade-mark, the pattern number, and such other marks as are shown on the drawings.

INSPECTION, REJECTION, AND REHEARING

(Conform to A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 62, HARD CAST
BRONZE, MARCH, 1922**

HARD CAST BRONZE

1. Composition in percentage.—	Per cent
Copper.....	86.00-89.00
Tin.....	9.00-11.00
Lead, maximum.....	.20
Iron, maximum.....	.06
Zinc.....	1.00-3.00

2. General information.—Good castings made of this bronze should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	30,000
Yield point.....	do.....	15,000
Elongation in 2 inches or proportionate gage length.....	per cent..	14

3. This alloy is suitable wherever a strong general utility bronze is required. It may be used for severe working conditions where heavy pressures obtain, as in gears and bearings.

4. Bearings or gears made of bronze alloys should be used only against hardened steel.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 63, LEADED GUN
METAL, MARCH, 1922**

LEADED GUN METAL

1. Composition in percentage.—	Per cent
Copper.....	86.00-89.00
Tin.....	9.00-11.00
Phosphorus, maximum.....	.25
Zinc and other impurities, maximum.....	.50
Lead.....	1.00-2.00

2. General information.—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	30,000
Yield point.....	do.....	12,000
Elongation in 2 inches, or proportionate gage length.....	per cent..	10

3. Combining strength with fair machining qualities, this general-utility bronze is especially good for bushings subjected to heavy loads and severe working conditions.

(See 617.0, p. 977.)

**UNITED STATES GOVERNMENT, FEDERAL
SPECIFICATIONS BOARD, FEDERAL
SPECIFICATION FOR BUILDERS' HARD-
WARE (NONTEMPLATE), FF-H-101, AU-
GUST 19, 1930**

BUILDERS' HARDWARE (NONTEMPLATE.)

(For applicable Federal specifications; types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes, see 617.0, p. 978. For chromium plating, nickel plating, and zinc coatings; and methods of inspection and tests, see 600.3, p. 70.)

(Specific commodities, such as locks, latches, hinges, bolts, etc., will be found under their respective commodity designations. For a list of these commodities, see under detail requirements in 617.0, p. 979.)

**UNITED STATES GOVERNMENT, FEDERAL
SPECIFICATIONS BOARD, FEDERAL
SPECIFICATION FOR BRONZE CASTINGS,
QQ-B-691, MAY 31, 1932**

BRONZE CASTINGS

(In respect to general specifications, this specification conforms to F. S. B. 339 under commodity des-

ignation 600.0, p. 3 (current designation: QQ-M-151). In other respects it is as follows:)

II. GRADES

This specification covers 10 grades of bronze in the form of castings.

III. MATERIAL

The castings shall be made only from ingots of the corresponding grade of Federal Specifications Board specification QQ-B-701 of latest revision, from the best grades of virgin metals, or from the best grades of virgin metals and scrap of known and approved composition and cleanliness, with the exception of grades 4 and 6X, which may be made from scrap only, if desired.

IV. GENERAL REQUIREMENTS

1. The castings shall be of uniform quality, free from blowholes, porosity, hard spots, shrinkage defects, cracks, or other injurious defects, and shall be smooth and well cleaned before inspection by

sandblasting, tumbling, chipping, or other process approved by the inspector.

2. Castings shall not be repaired, plugged, or welded without permission from the inspector. Such permission will be given only when the defects are small and do not adversely affect the strength, use, or machineability of the castings.

3. Each repair shall be encircled with a ring of white paint prior to shipment.

4. The responsibility for furnishing castings that can be laid out and machined to the finished dimensions, within the specified tolerances, as shown on the blueprints or drawings, and that will conform to such gages as may be specified in individual cases, shall rest with the contractor. Sufficient stock shall be allowed for shrinkage, and, where required, for finishing, but castings or excessive size or weight shall not be furnished.

V. DETAIL REQUIREMENTS

1. Castings shall conform to the chemical requirements shown in Table 1, except that grade 4 shall show upon analysis a copper-tin-lead-zinc alloy of the minimum copper content shown in Table 1.

TABLE 1.—Chemical composition

Grade	Copper	Tin	Zinc	Lead	Iron, maximum	Nickel, maximum	Phosphorus, maximum	Sulphur, maximum	Antimony, maximum	Other elements, maximum

¹ Minimum.

² See Sec. VIII for details of application.

³ Minimum and maximum limits.

Grade 6X, which may be made of scrap only, has the same chemical composition requirements as grade 6 given in the above Table 1.

2. An analysis of each melt of castings shall be furnished by the contractor, showing the percentage of the elements designated.

3. Castings shall conform to the physical requirements shown in Table 2.

4. The physical properties of castings of bronze No. 3 need not be determined unless specified in the contract or purchase order.

TABLE 2.—Physical properties

Grade	Tensile strength, minimum	Elongation in 2 inches, minimum	Brinell hardness No., minimum
	<i>Lbs./in.²</i>	<i>Per cent</i>	
1.....	32,000	17.0	
2.....	27,000	15.0	
3 ^a	28,000	15.0	
4.....	25,000	12.0	
5 ^b	40,000	20.0	
6 ^b	35,000	18.0	
7.....			
8.....	25,000	8.0	
9.....	30,000	1.0	
10.....	45,000		160

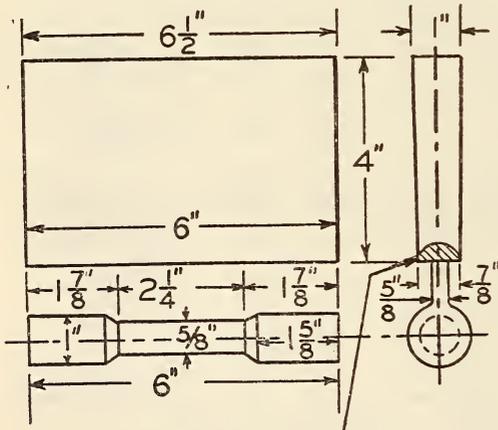

^a See Sec. V, 4.
^b See Sec. VIII for details of application.
^c Not required, but may be obtained in sound castings.

Grade 6X shall have a tensile strength of 30,000 pounds per square inch and an elongation of 12 per cent.

5. Castings made of bronzes Nos. 1, 2, or 3 shall conform to such requirements as to pressure as may be specified in the contract or purchase order.

VI. METHODS OF INSPECTION AND TESTS

1. Samples for check analyses shall be taken from tensile-test specimens or from a representative

GATED HERE AND TWO BARS PER MOLD Poured FROM COMMON RUNNER

FIGURE 1117

casting selected by the inspector from each melt. The drillings shall be taken from sound metal below the surface. The inspector shall forward for analysis not less than five ounces of drillings.

2. Each casting weighing 250 pounds or more shall have at least one test coupon attached thereto. The responsibility of furnishing sufficient test specimens shall rest with the contractor.

3. In the case of castings weighing less than 250 pounds each, at least one test coupon shall be attached to one or more castings from each melt or heat, or from such groups of melts or heats as the purchaser may specify, but in no case shall a lot consist of more than 1,000 pounds of castings.

4. In the case of castings where, in the opinion of the inspector, it is impracticable to attach a test coupon to the casting, bars shall be cast separately

in sand, at least one test bar being poured from each melt or heat of metal, or such groups of melts or heats as the purchaser may specify, but in no case shall a lot consist of more than 1,000 pounds of castings. The bars shall be cast from the first metal poured from the heat, and the inspector shall witness the pouring of the test mold.

5. Test specimens may be of two types, namely, machined or cast to size.

6. Unless otherwise specified in the contract or purchase order, machined test specimens will be

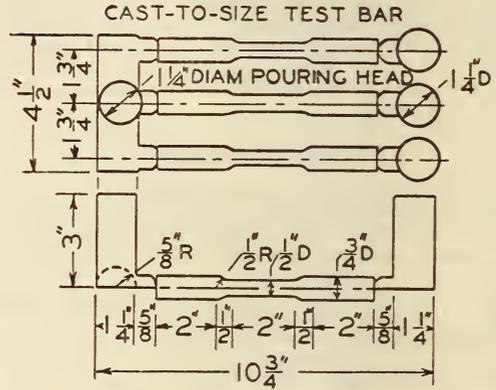

FIGURE 1118

used. In this case the test coupon or separately cast bar shall be of the dimensions shown in Figure 1117, and the test specimen machined therefrom shall conform to the dimensions shown in Figure 129 under 605.0, p. 247. The fin connecting the test coupon with the casting or sink head shall be not less than five-eighths inch thick.

7. When required by the contract or purchase order, test bars cast in green sand in accordance with the method and to the dimensions shown in Figure 1118 shall be furnished by the contractor. These bars shall not be machined prior to testing, except to adapt the grips to the holders of the testing machine in such manner as to insure an axial load.

8. Separately cast test coupons shall be drawn from the sand in the presence of the inspector, who will mark the coupons or bars for future identification. Test coupons shall not be removed from castings except in the presence of the inspector, or until he has stamped them for future identification.

9. When the manufacturer so desires, extra castings may be made in order to provide for test specimens in lieu of the test bars or coupons attached.

10. The chilling of test coupons or bars shall cause the rejection of the material represented, unless otherwise specified in the contract or purchase order.

11. Brinell hardness determinations shall be made one-sixteenth inch below the surface with a 10-mm ball and a pressure of 3,000 kg (6,615 pounds) sustained for 30 seconds.

12. Where castings are of such form and dimensions as to make calipering of their walls impracticable, and the inspector so requests, 1/4-inch holes shall be drilled through at doubtful places to establish the exact thickness. Before loading for shipment, these holes shall be tapped out and filled by screwing in suitable bronze plugs, or by welding, wherever such method is approved by the inspector. Such plugs shall carry the inspector's stamp.

13. If any test specimens contain flaws which result in the failure of the specimens, at the discretion of the inspector, additional specimens from the same melt or heat may be selected to replace them. If additional test coupons are not available, the

replacement specimens, at the discretion of the inspector, may be taken from the body of a casting selected by the inspector.

14. Castings in which injurious defects are revealed by manufacturing operations subsequent to delivery shall be rejected.

VII. MARKING AND PACKING OF SHIPMENTS

1. Castings shall be marked with the pattern or mark number, and when practicable with the melt or lot number, in a position on the casting where they will not be machined off in manufacturing to finished dimensions.

2. Castings which are impracticable to so mark shall be properly separated by melts or lots when presented for inspection, and shall be so marked that their identity will be clear at the point of delivery.

3. A lot shall consist of castings from the same melt unless otherwise specified in the contract or purchase order or mutually agreed upon by the contractor and the inspector.

4. Large castings having projections that may be damaged in handling shall be crated. Small, rough castings may be packed rigidly in boxes or crates, or may be bundled. Small polished castings shall be well wrapped in paper and rigidly packed in boxes.

5. If special packing be necessary to secure the acceptance of castings by common or other carriers for safe transportation at the lowest rate to the point of delivery, such packing shall be provided by the contractor without additional expense to the purchaser.

VIII. NOTES

1. The material covered by this specification is not intended for use in the manufacture of mail locks for the Post Office Department and this specification is not mandatory when purchasing castings therefor.

2. Grade No. 1 bronze is a high grade steam or valve bronze.

3. Grade No. 2 bronze is a standard composition for general service, also known as ounce metal, red brass, and hydraulic bronze.

4. Grade No. 3 bronze is a medium grade bronze which may be used for standard and extra heavy water, air, or gas fittings. Ordinarily it may be purchased without physical test.

5. Grade No. 4 bronze is a cheap bronze which may be used for ornamental or electrical fittings, instruction and marker plates, handwheels, brackets, and in general where the characteristics of a bronze are essential, but composition and physical properties are relatively unimportant.

6. Grade No. 5 bronze is an excellent steam metal and structural bronze which may be used for expansion joints, special pipe fittings, gears, bolts and nuts, valves, pump pistons and casings, bushings, bearings, and similar applications where strength requirements combined with the necessity for casting properties and corrosion resistance of tin-bronze and weight limitations make this high tensile bronze necessary.

7. Grade No. 6 bronze is a leaded phosphor bronze or leaded gun metal which serves in the same way as grade No. 5 as a steam metal and general structural bronze. It machines more easily than grade No. 5 bronze, but may, in general, be used for expansion joints, special pipe fittings, gears, valves, pump pistons and casings, bushings, bearings, and similar applications requiring good strength and resistance to sea-water corrosion.

Grade No. 6X is a leaded phosphor bronze or leaded gun metal which may be made from scrap or like composition, and is intended for use where the stresses are low or where structural strength is not required.

8. Grade No. 7 bronze is a good bearing bronze for machinery carrying heavy loads and running at very low speeds.

9. Grade No. 8 bronze is a good bearing bronze for general service.

10. Grade No. 9 bronze is a hard bearing bronze, also known as hard gear bronze.

11. Grade No. 10 bronze is an extra hard bearing bronze or gear bronze, intended only for special applications.

SIEVES FOR TESTING

(See 645.31, p. 1226.)

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE DEFINITION OF THE TERM SCREEN, DESIGNATION E13-28T, 1928

DEFINITION OF SCREEN

(See 645.31, p. 1226.)

SOCIETY OF AUTOMOTIVE ENGINEERS, PARTS AND FITTINGS, WIRE CLOTH, S. A. E. STANDARD, JULY, 1924

WIRE CLOTH

1. Mesh denotes the number of openings per inch.
2. The weave shall be what is known as "plain," except that in meshes 80 and finer, "twilled" weave may be used.
3. Double-crimped wire shall be used and woven so as to give square openings.

4. Wire cloth dimensions

Mesh	Diameter of wire	Size of opening	Proportion of openings to total area ¹	Mesh	Diameter of wire	Size of opening	Proportion of openings to total area ¹
	Inch	Inch	Per cent		Inch	Inch	Per cent
8-----	0.028	0.097	60	45	0.0095	0.0130	34
10-----	.025	.075	56	50	.009	.0110	30
12-----	.023	.060	52	60	.008	.0090	29
14-----	.020	.051	51	70	.007	.0073	26
16-----	.018	.044	51	80	.006	.0068	29
20-----	.016	.034	46	90	.005	.0059	28
24-----	.015	.027	42	100	.0045	.0055	30
30-----	.013	.021	40	120	.004	.0043	26
35-----	.011	.018	40	150	.003	.0037	31
40-----	.010	.015	36	200	.0021	.0029	33

¹ This column is given for general information only. The areas are based on the nominal wire sizes.

5. The accuracy of spacing wires shall be such as to give openings within 10 per cent, plus or minus, of the openings specified.
6. The variation in the diameter of the wire shall not exceed the following plus and minus tolerances:

Up to and including 16 mesh.....	Inch	0.003
From 20 to 50 mesh.....002
From 60 to 100 mesh.....0015
Above 100 mesh.....001

7. The material shall be specified by the purchaser, taking account of the fact that at present manufacturers of wirecloth stock these meshes in steel and brass up to about 80 mesh; above this it is common practice to supply phosphor-bronze and monel metal.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, WIRE INSECT SCREEN CLOTH, SIMPLIFIED PRACTICE RECOMMENDATION R122-31, 1931

WIRE INSECT SCREEN CLOTH

(For steel wire insect screen cloth, see 603.43, p. 195.)

In accordance with the unanimous action of a general conference of the industry held on June 18, 1931, the United States Department of Commerce submits for the acceptance of the industry the following recommendation for the stock varieties of wire insect screen cloth:

TABLE 2.—Copper and commercial bronze wire insect screen cloth

[Hard-drawn copper and commercial bronze, selvaged both edges]

Description	Finish	Mesh openings per linear inch ¹	Wire size before weaving ²		Width of roll (inches) ³	Length of roll (approximate)	Packing
			Warp	Filling			
Commercial bronze 90 to 92 per cent copper; balance zinc.	Bright.....	14	.0113	.0113	{ 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 48. }	100	Heavy wrapping paper.
		16					
Hard-drawn copper (at least 99.8 per cent copper).do.....	14	.0113	.0113	{ 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40, 42, 48. }	100	Do.
		16					
		18					

¹ Commercially exact for warp wires; one-half mesh variation plus or minus in filler wires in any 1 inch.

² Permissible variation from nominal diameter plus or minus 0.00025 inch.

³ Permissible variation in width plus or minus 1/8 inch.

⁴ The process of manufacture requires the inclusion of an occasional 2-piece roll; all 2-piece rolls have an extra footage of 1 to 2 linear feet.

NOTE.—The approximate weight of 100 square feet of copper and commercial bronze screen cloth, exclusive of wrapping, is as follows. 14 mesh, 13 to 13 1/4 pounds; 16 mesh, 14 1/4 to 15 pounds; 18 mesh, 16 1/2 to 16 3/4 pounds.

This recommendation, if accepted by the industry, is effective 1 month after the date of the department's general letter announcing the necessary degree of support has been recorded through the medium of signed acceptance.

646.59 MISCELLANEOUS MANUFACTURES OF BRONZE.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, RECOMMENDED SPECIFICATION FOR TROLLEY POLES, WHEELS, HARPS, AND BASES; MANUAL SECTION E124-29, 1929

TROLLEY WHEEL

Wheels shall be made of highest grade electrolytic ingot copper, Strait's tin, and highest grade zinc in the following proportions: Copper, 92 per cent; tin, 8 per cent; zinc, approximately 0.5 per cent. Brinell hardness of finished wheels shall be between 60 and 71.

Finished wheel shall be made accurately to the dimensions shown in Figure 1121. The outer surface of the wheel flange shall be turned accurately to the dimensions. The wheel shall be perfectly balanced.

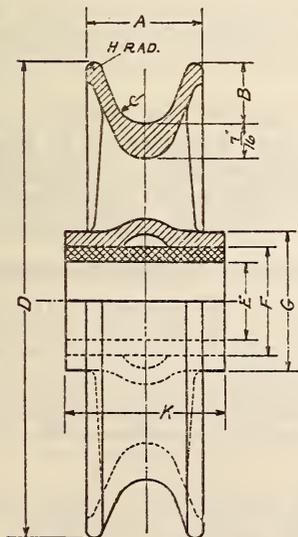

FIGURE 1121.—Recommended designs of trolley wheels of 4 1/4, 5, and 6 inch diameter

647. SPECIAL BRONZES (BRONZE ALLOYS)

647.1 ALUMINUM BRONZE.

647.11 INGOTS, ALUMINUM BRONZE.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ALUMINUM BRONZE INGOTS (FOR REMELTING), NO. 173A, OCTOBER 28, 1926. (CURRENT DESIGNATION: QQ-B-681)

(In respect to general specifications, material and workmanship, general requirements, methods of inspection and tests, and packing and marking, this specification conforms to F. S. B. No. 290a (current designation: QQ-B-701) (see 646.11, p. 1248). Otherwise its requirements are as follows:)

GRADE

This specification covers one grade of aluminum bronze in the form of ingots for remelting.

DETAIL REQUIREMENTS

The chemical requirements for aluminum bronze ingots are as follows:

Copper	Aluminum	Iron	Tin (maximum)	Total other impurities (maximum)
<i>Per cent</i> 85-89	<i>Per cent</i> 7.0-9.0	<i>Per cent</i> 2.5-4.5	<i>Per cent</i> 0.5	<i>Per cent</i> 0.25

Aluminum bronze differing in composition from that specified may be supplied, provided such differences are clearly noted in the bids, and are acceptable to the purchaser.

The physical properties of the material shall be as follows:

Tensile strength, (minimum)	Yield point, (minimum)	Elongation in 2 inches (minimum)
<i>Lbs./in.²</i> 75,000.....	<i>Lbs./in.²</i> 30,000	<i>Per cent</i> 30

The yield point is obtained by the drop of the beam of the testing machine.

METHOD OF INSPECTION AND TESTS

One test ingot shall be selected by the inspector from each melt. The tension-test specimen shall be cut from one corner near the bottom of the ingot, and shall be machined to the standard form and dimensions shown in the general specification for metals. (See 600.0, p. 3.)

PACKING AND MARKING

All shipments shall be marked with the contract or purchase order number, name of manufacturer, and contents.

NOTE.—Attention of the Federal Specifications Board has been called to the fact that the formula covered by this specification is alleged to be covered by letters patent.

647.12 BARS, ALUMINUM BRONZE.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 69, WROUGHT ALUMINUM BRONZE, FEBRUARY, 1929

WROUGHT ALUMINUM BRONZE

1. *Composition in percentage.*—(Identical with specification No. 68 for cast aluminum bronze, except that copper component is 2 per cent larger. (See 647.15, p. 1260.)

2. The thickness tolerances of sheet or strip made of this alloy shall be within the tolerances specified in Table 4 in Federal specification No. 46S (QQ-N-321) for nickel silver sheets and strips. (See 655.2, p. 1287.)

3. *General information.*—Wrought shapes, rods, and bars of this alloy, the composition of which is identical with specification No. 68 (see 647.15, p. 1260) combine unusual strength with good bearing and anticorrosive qualities.

4. Wrought bars made of this alloy, when annealed or hot-rolled, should give the following minima in physical characteristics:

Diameter or thickness		Ultimate strength	Yield point	Elongation in 2 inches or proportionate gage length
Over	To and including			
<i>Inch</i>	<i>Inch</i>	<i>Lbs./in.²</i>	<i>Lbs./in.²</i>	<i>Per cent</i>
0	½	80,000	40,000	20
½	1	75,000	37,500	25
1	-----	72,000	35,000	30

647.13 RODS, ALUMINUM BRONZE.

AMERICAN WIRE GAGE—ALUMINUM BRONZE PLATES AND SHEETS

(See 640.1, p. 1165.)

647.15 CASTINGS, ALUMINUM BRONZE.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ALUMINUM BRONZE CASTINGS, DESIGNATION B59-28, 1928

ALUMINUM BRONZE CASTINGS

SCOPE

1. These specifications cover alloy castings, the alloy being a composition known commercially as aluminum bronze. Two grades are specified: Namely, grade A, not responding to heat treatment, and grade B, capable of heat treatment.

MANUFACTURE

2. (a) The bronze may be made by any approved method.
 (b) No scrap shall be used in the manufacture of the bronze, excepting that of known composition and origin.

(c) The copper used in these castings shall conform to the requirements of the standard specifications for lake copper wire bars, cakes, slabs, billets, ingots, and ingot bars in B4 (see 641.11, p. 1173) or of the standard specifications for electrolytic copper wire bars, cakes, slabs, billets, ingots, and ingot bars in B5 (see 641.11, p. 1174), or copper of equal purity.

(d) The aluminum shall be that commercially known as grade No. 1, or that carrying less than 0.30 per cent of silicon. The iron shall be a pure grade of iron free from dirt or other detrimental foreign material.

CHEMICAL PROPERTIES AND TESTS

3. The bronze shall conform to the following requirements as to chemical composition:

	Grade A	Grade B
	<i>Per cent</i>	<i>Per cent</i>
Copper.....	87-89	89.5-90.5
Aluminum.....	7-9.6	9.5-10.5
Iron.....	2.5-4	1.0
Tin, maximum.....	.5	.2
Total other impurities, maximum.....	1.0	.5

¹ Maximum.

CHEMICAL ANALYSES

4. (a) An analysis of each melt may be made at the option of the purchaser and at his own expense.

(b) The sample for chemical analysis shall be taken from cuttings from the test bars.

PHYSICAL PROPERTIES AND TESTS

5. (a) The bronze shall conform to the following minimum requirements as to physical properties:

	Grade A	Grade B
Tensile strength (as cast).....lbs./in. ²	65,000	65,000
Tensile strength (as heat treated, quenched, and drawn).....lbs./in. ²		80,000
Yield point (as cast).....do.....	25,000	25,000
Yield point (as heat treated).....do.....		50,000
Elongation in 2 inches (as cast).....per cent.....	20	15
Elongation in 2 inches (as heat treated).....per cent.....		4

(b) The yield point in tension shall be determined as the stress producing an elongation under load of 0.5 per cent; that is, 0.01 inch in a gage length of 2 inches.

6. (a) The tension-test specimen shall be machined from coupons to the dimensions shown in Figure 550, A. S. T. M. A. 18. (See 611.51, p. 754.) The ends shall be of a form to fit the holders of the testing machine in such a way that the load shall be axial.

(b) The coupon attached to the casting, or cast separately in the case of small castings, shall conform to the form and dimensions shown in Figure 1123. In the case of coupons cast separately, they shall be molded in a manner similar to the castings which they represent. If the castings are heat treated, the coupons representing such castings shall be similarly heat treated.

7. (a) Two coupons or test bars shall be cast as an integral part of large castings, or cast separately in the case of small castings, to represent each lot or melt of 500 pounds or less. Additional coupons may be provided at the option of the manufacturer.

(b) The manufacturer and purchaser shall agree whether coupons can be attached to the castings, on the location of coupons on the castings, on the castings to which the coupons are to be attached and on the method of casting unattached bars

Unless otherwise agreed upon, the minimum lot shall be considered as 500 pounds.

(c) If any test specimen shows defective machining or develops flaws, it may be discarded; in which case the manufacturer and purchaser, or his representative, shall agree upon the selection of another specimen in its stead.

WORKMANSHIP AND FINISH

8. (a) The castings shall be free from blowholes, porosity, hard spots, shrinkage defects or cracks, or other injurious defects; and shall be smooth and well cleaned before inspection by sand blasting, tumbling, chipping, or other process approved by the inspector.

(b) The castings shall not be repaired, plugged, welded, or "burned in" unless permission from the inspector has been previously secured. This permission will be given only when the defects are such that after the approved repair the usefulness and strength of the casting has not been impaired. Each such repair shall be encircled by a ring of white paint at the time of shipment.

(c) All castings shall be true to pattern, free from swells, etc. Wall thickness shall be uniform throughout the lot of castings, and all cores shall be accurately set.

(d) Where thick and thin sections join, the manufacturer shall be permitted to add (where not previously provided) fillets of proper size to avoid cracking upon cooling, subject to the approval of the inspector.

MARKING

9. The castings shall be marked with pattern or mark number, and when practicable with the melt or lot number, at a position on the castings where they will not be machined off in manufacture to finished dimensions.

INSPECTION AND REJECTION

10. (a) Inspection may be made at the manufacturer's works, or at the point of delivery. Inspection shall be made at the option of the purchaser.

(b) If the purchaser elects to have the inspection made at the manufacturer's works, the inspector representing the purchaser shall have free entry, at all times while work on the contract is being performed, to all parts of the manufacturer's works which concern the manufacture of the material ordered. The manufacturer shall afford the inspector, without charge, all reasonable facilities to satisfy him that the material is being furnished in accordance with these specifications. All tests and inspection shall be so conducted as not to interfere unnecessarily with the operation of the works.

11. Castings which show injurious defects revealed by machining operations subsequent to acceptance may be rejected; and if rejected, shall be replaced by the manufacturer without charge to the purchaser. The full weight of the original material rejected shall be returned to the manufacturer.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 68, CAST ALUMI- NUM BRONZE, MARCH, 1922

CAST ALUMINUM BRONZE

1. Composition in percentage.—

	Per cent
Copper.....	85.00-87.00
Aluminum.....	7.00-9.00
Iron.....	2.50-4.50
Tin (none desired), maximum.....	.50
Other impurities, maximum.....	.25

2. *General information.*—Good castings made of this alloy should give the following minima in mechanical properties:

Ultimate strength.....	lbs./in. ²	65,000
Yield point.....	do.	20,000
Elongation in 2 inches, or proportionate gage length.....	per cent.	20

3. This is a noncorrodible alloy of great strength, with a hardness equal to that of manganese bronze, and good bearing qualities. It is suitable for use in worm wheels, gears, and similar parts.

4. Bearings or gears made of bronze alloys should be used only against hardened steel.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ALUMINUM BRONZE CASTINGS, NO. 369a, OCTO- BER 28, 1926. (CURRENT DESIGNA- TION: QQ-B-671)

ALUMINUM BRONZE CASTINGS

(In respect to general specifications, this specification conforms to Federal specification 339a (current designation QQ-M-151) (see 600.0, p. 3); in respect to general requirements and methods of inspection and tests it is substantially the same as Federal specification QQ-B-691. See 646.41, p. 1252. It differs from the latter, however, in that it does not include requirements relative to samples for check analysis, Brinell tests, caliper or drilling tests, encircling repairs with a ring of white paint, and in the following additional particulars:)

GRADE

1. This specification covers one grade of aluminum bronze in the form of castings.

MATERIAL

2. Aluminum bronze castings shall be made only from the best grade of virgin metals, or from virgin metals and scrap of known and approved composition.

DETAIL REQUIREMENTS

3. The chemical requirements are as shown in the table below:

	Composition				
	Copper	Alumi- num	Iron	Tin	Total other ele- ments maxi- mum
Desired.....	Per cent 83.0	Per cent 9.0	Per cent 3.0	Per cent 0	Per cent 0
Permissible.....	85.0-89.0	7.0-9.0	2.5-4.5	.5	.40

4. Aluminum bronze differing in composition from that specified above may be supplied, provided that such differences are clearly noted in the bids, and are acceptable to the purchaser.

5. The physical requirements are as shown below:

Tensile strength, mini- mum	Elonga- tion in 2 inches, mini- mum
Lbs./in. ² 70,000	Per cent 25.0

METHODS OF INSPECTION AND TESTS

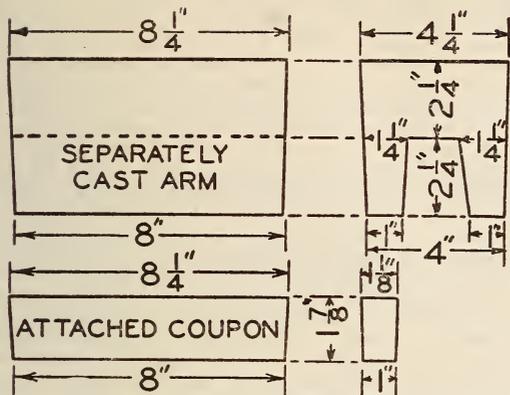

FIGURE 1123.—Test coupon

6. One tension test is required for each lot of 1,000 pounds of castings.

7. The test coupons or separately cast bars shall conform to the dimensions of Figure 1123, and the test specimen machined therefrom shall conform to the dimensions of Figure 129, under 605.0, page 247.

PACKING AND MARKING

8. Large castings shall be stamped with the melt or lot number, and when practicable, with the pattern or mark number.

9. Small castings shall be properly separated by melts or lots when presented for inspection, and when shipped shall be so marked that their identity will be clear at the point of delivery.

10. All shipments shall be marked with the contract or order number, name of manufacturer, and contents.

NOTES.—Aluminum bronze is an alloy of great strength, with a hardness equal to that of manganese bronze, and greater resistance to corrosion, shock, and fatigue. It may be used in gun slides, gears, and similar parts.

647.2 MANGANESE BRONZE.

647.20 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF MANGANESE BRONZE, DESIGNATION B27-19, 1919

[Approved as American tentative standard (K3-1921) by the American Standards Association, December 28, 1921]

CHEMICAL ANALYSIS OF MANGANESE BRONZE

GENERAL CONSIDERATIONS

Methods are given for the determination of lead, using a large sample when lead is present up to about 0.2 per cent. A method is also given for the electrolytic determination of lead and copper in the same small sample when lead is present in amounts over 0.2 per cent.

In this alloy zinc is taken by difference. For a method of determining small amounts of zinc, see standard methods of chemical analysis of gun metal, in B28 (646.0, p. 1243).

DETERMINATION OF COPPER BY THE ELECTROLYTIC METHOD

APPARATUS FOR ELECTROLYSIS

Electrodes.—The electrodes recommended are of the stationary and not of the rotating type, as the stationary require less operator's time and there is less chance for erroneous results to be obtained than with the other kind. Rapid and accurate results are obtained with stationary electrodes made from platinum gauze.

Cathodes.—Platinum cathodes may be formed either from plain or perforated sheets, or from wire gauze, and may be either open or closed cylinders. They should give a depositing surface, counting both sides, of approximately 100 square centimeters. Gauze cathodes are recommended and are best made from gauze containing approximately 400 meshes per square centimeter (50 meshes per linear inch). The cathode should be stiffened by doubling the gauze for about 3 mm at the top and at the bottom of the cylinder. The cylinder should be approximately 30 mm in diameter and 30 mm in height. The stem should be made from 1.14 mm or 1.29 mm wire, flattened and welded the entire width of the gauze; the height over all should be approximately 130 mm, and the gauze should be sand blasted.

Anodes.—Platinum anodes may be of the spiral type when used in the determination of copper by electrolysis, or in the electrolytic determination of lead when it is present in amounts not over 0.2 per cent. When used in electrolytic determination of copper and lead together in samples containing 0.2 per cent lead or over, the anodes should be of wire gauze. Spiral anodes should be made from 1.02 mm or 1.14 mm wire formed into a spiral of seven turns having a height of approximately 51 mm and a diameter of 16 mm, the length over all being approximately 145 mm. Platinum gauze used in making anodes should contain approximately 400 meshes per square centimeter (50 meshes per linear inch). The gauze should be formed into closed cylinders approximately 12 mm in diameter and 30

mm in height. The cylinders should be stiffened by doubling the gauze for about 3 mm at the top and at the bottom. The stem should be made from 1.02 mm or 1.29 mm wire, flattened and welded the entire width of the gauze; the height over all should be approximately 137 mm, and the gauze should be sand blasted.

METHOD

In a 150 c c beaker dissolve 1 g of bronze in 10 c c of HNO_3 , specific gravity 1.42. When the action has ceased, evaporate the solution to dryness, and bake thoroughly on the edge of a hot plate. Moisten thoroughly with HNO_3 , specific gravity 1.42, and after digesting for a short time dilute to 50 c c with hot distilled water, heat to boiling, and allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm papers, keeping the solution hot, and receive the filtrate in a 200 c c electrolysis beaker. Wash with boiling hot water. Add to the filtrate 5 c c of H_2SO_4 , specific gravity 1.84, and evaporate until copious fumes of H_2SO_4 are evolved. Dilute to about 100 c c with distilled water, add 1.5 c c of HNO_3 , specific gravity 1.42, insert electrodes, cover with a pair of split watch glasses and electrolyze. For each solution use a current overnight of 0.5 ampere at approximately 10 volts, or else use a current of 4 amperes at approximately 10 volts continued for about 2½ hours. The latter case requires the use of gauze cathodes. When the solution is colorless, wash down cover glasses, electrodes, and sides of beaker, raising the level of the liquid slightly and continue the electrolysis about 15 minutes, noting whether or not copper is deposited on the newly exposed surface of the platinum. If no copper appears, transfer about 1 c c of the colorless solution to the cavity of a porcelain test plate, and add a few drops of fresh H_2S water. If the slightest discoloration occurs continue the electrolysis, repeating the test. Remove the cathode quickly, rinse it in distilled water, and then dip it in two successive baths of alcohol. Shake off the excess alcohol and ignite the remainder by bringing it to the flame of an alcohol lamp. Keep the cathode moving continually as the alcohol burns. Weigh as metallic copper.

Accuracy.—Duplicate determinations should check within 0.10 per cent of copper.

NOTES.—In alloys of the type of manganese bronze, which carry considerable iron, it is impossible to remove the tin quantitatively as metastannic acid (H_2SnO_3), notwithstanding the preliminary baking. Upon testing (by the addition of H_2S water), the liquid in the pits of the test plate may be colored yellow, due to the tin present, but there should be no darkening due to the presence of copper. If the cathode appears dark, as though tin had been deposited on it, dissolve the coating in 10 c c of HNO_3 , specific gravity 1.42, filter off the tin as before, add to the filtrate 5 c c of H_2SO_4 , specific gravity 1.84, and redeposit copper by electrolysis. It is rarely necessary thus to purify the deposited copper.

If zinc is to be determined in the alloy be careful to keep the solution quantitative when the electrodes are removed, catching all washings in the beaker containing the electrolyte.

A slight amount of copper is retained by the metastannic acid (H_2SnO_3), which should be recovered in very accurate work but is generally neglected in routine analysis.

DETERMINATION OF LEAD BY THE ELECTROLYTIC METHOD

(For samples containing up to 0.2 per cent of lead)

METHOD

In a 250 c c beaker dissolve 5 g of bronze in 25 c c of HNO_3 , specific gravity 1.42. Allow the solution to bake dry on the edge of a hot plate or by standing over night on the steam bath. Add 17 c c of HNO_3 , specific gravity 1.42, and after digesting for a short time, add 85 c c of hot water and heat to boiling for a few minutes. Allow the solution to stand for several hours at a temperature just below the boiling point. Filter off the precipitated H_2SnO_3 on double closely woven filter papers, being careful to keep

the solution hot throughout the process of filtration. Wash with boiling hot water. Receive the combined filtrate and washings in a 250 c c beaker. Dilute to about 150 c c with distilled water and insert electrodes. In the positive terminal use a sand-blasted platinum gauze electrode such as is used for the cathode in the determination of copper; in the negative terminal insert an electrode such as is used for the anode in the determination of copper. Cover with a pair of split watch glasses and electrolyze. For each solution use a current of 1.25 to 1.5 amperes at 10 volts continued for about one hour. Wash down the cover glasses, electrodes, and sides of beaker, raising the level of the liquid slightly, and continue the electrolysis for 15 minutes. If no darkening of the newly exposed surface of the platinum can be detected the lead has been entirely deposited. Continue the electrolysis until no darkening of the platinum can be detected when the current has been passed for 15 minutes after the level of the liquid has been raised.

When the lead has been entirely deposited, remove the anode quickly, rinse it in distilled water and then in alcohol, and dry it at 210° C. for one-half hour. Weigh as PbO_2 , using the factor for lead 0.8643 instead of the theoretical value.

Accuracy.—Duplicate determinations should check within 0.01 per cent of lead. Results obtained by this method are likely to be about 0.01 per cent too high. For exceptionally accurate or investigation work redissolve the coating from the electrode and determine the lead as sulphate. See the determination of lead as sulphate.

NOTES.—It is impossible to remove the tin quantitatively as H_2SnO_3 in the case of alloys containing over 0.25 per cent of iron, and traces of tin are sometimes found in the PbO_2 deposit. Small amounts of manganese also are occasionally deposited with the PbO_2 . Tin and manganese are rarely present in the PbO_2 in amounts which necessitate a purification of the deposit.

In this and the following method a slight amount of lead may be retained by the H_2SnO_3 . This should be recovered in very accurate work, but is neglected in routine analysis.

DETERMINATION OF LEAD AS SULPHATE

(For samples containing up to 0.2 per cent of lead, optional)

SOLUTIONS REQUIRED

Lead acid.—Mix 300 c c of H_2SO_4 , specific gravity 1.84, and 1,800 c c of distilled water. Dissolve 1 g of lead acetate, c. p., in 300 c c of distilled water and add this to the hot solution, stirring meanwhile. Let stand at least 24 hours and syphon through a thick asbestos filter.

Dilute alcohol for washing.—Mix equal parts of denatured alcohol and distilled water.

METHOD

In a 250 c c beaker dissolve 5 g of bronze in 25 c c of HNO_3 , specific gravity 1.42. Allow the solution to bake dry on the edge of a hot plate, or by standing over night on the steam bath. Add 17 c c of HNO_3 , specific gravity 1.42, and after digesting for a short time, add 85 c c of hot water and heat to boiling for a few minutes. Allow the solution to stand for several hours at a temperature just below the boiling point. Filter off the precipitated H_2SnO_3 on double closely woven filter papers, being careful to keep the solution hot throughout the process of filtration. Wash with boiling hot water. To the combined filtrate and washings add 120 c c of lead acid, and evaporate until copious fumes of H_2SO_4 are evolved. Cool, add 105 c c of distilled water to dissolve the salts and to make the acid concentration the same as in lead acid, heat to boiling, and allow to cool and settle for five hours, or over night if convenient. Filter on a weighed porcelain Gooch crucible and wash with lead acid.

Wash out the lead acid with dilute alcohol, set the Gooch crucible inside a porcelain crucible, dry and ignite for five minutes at the full heat of a Tirrill burner, cool and weigh as $PbSO_4$ which contains 68.29 per cent lead.

Accuracy.—Duplicate determinations should check within 0.01 per cent of lead. Results obtained by this method are likely to be about 0.01 per cent too low.

NOTE.—It is impossible to remove the tin quantitatively as H_2SnO_3 in the case of alloys containing over 0.25 per cent of iron, but by the preliminary baking and long standing, most of the H_2SnO_3 is precipitated.

DETERMINATION OF COPPER AND LEAD SIMULTANEOUSLY BY THE ELECTROLYTIC METHOD

(For samples containing over 0.2 per cent of lead)

METHOD

In a 150 c c beaker dissolve 1 g of bronze in 10 c c of HNO_3 , specific gravity 1.42. When the action has ceased, evaporate the solution to dryness, and bake thoroughly on the edge of a hot plate. Add 10 c c of HNO_3 , specific gravity 1.42, and after digesting for a short time add 50 c c of hot distilled water, heat to boiling, and allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm filter papers, keeping the solution hot, and receive the filtrate in a 200 c c electrolysis beaker. Wash with boiling hot water, dilute to about 100 c c and insert electrodes. In the positive terminal insert one of the platinum gauze anodes previously described, and in the negative terminal insert a platinum gauze cathode. Cover with a pair of split watch glasses and electrolyze, using a current of from 3 to 5 amperes at approximately 10 volts for each solution. After about 45 minutes the lead will have been entirely deposited on the anode as PbO_2 ; without interrupting the current add to the electrolyte 3 to 4 c c of H_2SO_4 , specific gravity 1.84, and continue the electrolysis. When the solution is colorless, wash down cover glasses, electrodes, and sides of beaker, raising the level of the liquid slightly, and continue the passage of the current about 15 minutes, noting whether or not copper is deposited on the newly exposed surface of the platinum. If no copper appears, transfer about 1 c c of the colorless solution to the cavity of a porcelain test plate, and add a few drops of fresh H_2S water. If the slightest discoloration occurs continue the electrolysis until there is no discoloration whatever upon repeating the test. Remove the solution from the electrodes quickly without interrupting the current. Rinse the electrodes in distilled water and then dip them in two successive baths of alcohol. Dry the anode at $210^\circ C$. for one-half hour. Weigh as PbO_2 using the factor for lead 0.8643 instead of the theoretical value. Shake off the excess alcohol from the cathode and ignite the remainder by bringing it to the flame of an alcohol lamp. Keep the cathode moving continually while the alcohol burns. Weigh as metallic copper.

Accuracy.—Duplicate copper determinations should check within 0.10 per cent of copper. Duplicate lead determinations should check within 0.02 per cent of lead. Lead results obtained by this method are likely to be about 0.01 per cent too high. See notes under the determination of lead by the electrolytic method.

DETERMINATION OF TIN

SOLUTIONS REQUIRED

Dilute hydrochloric acid.—Mix 500 c c of HCl , specific gravity 1.20, and 500 c c of distilled water.

Dilute sulphuric acid.—Mix 300 c c of H_2SO_4 , specific gravity, 1.84, and 600 c c of distilled water.

Dilute ammonia.—Mix 100 c c of NH_4OH , specific gravity 0.90, and 900 c c of distilled water.

Ammonium-acetate solution for washing.—Dissolve 10 g of ammonium acetate in 300 c c of distilled water. Make slightly acid with acetic acid and saturate with H_2S gas.

METHOD

In a 150 c c beaker dissolve 2 g of bronze in a mixture of 10 c c of HCl , specific gravity 1.20, and 5 c c of HNO_3 , specific gravity 1.42. Dilute to about 75 c c with distilled water. Add NH_4OH , specific gravity 0.90, until the basic salts of copper dissolve and the solution has become a deep blue. Boil and allow to settle, and filter on a closely woven filter paper. Wash with dilute ammonia and with hot water. Dissolve the precipitate on the filter with hot dilute HCl . Dilute the solution to about 100 c c. Add NH_4OH , specific gravity 0.90, until a permanent precipitate forms. Heat the solution to boiling, allow to settle, filter and wash as before. Dissolve the precipitate on the filter with boiling hot dilute H_2SO_4 , washing the paper very thoroughly with this acid. Add NH_4OH , specific gravity 0.90, cautiously until the precipitate which forms at first dissolves rather slowly. Allow the solution to stand for some hours and if any lead sulphate forms filter it off. Dilute the solution to about 200 c c and saturate it with H_2S gas. Filter the precipitated tin sulphide off on double papers and wash with ammonium-acetate solution, retaining the filtrate and washings for the iron determination. Dry the precipitate and place it with the papers in a porcelain crucible which projects part way through a hole in a piece of asbestos board. Heat slowly until any free sulphur has been driven off, but without allowing the sulphur to burn. When the sulphur has been expelled, place the crucible on a triangle and ignite slowly at first and finally at the full heat of the burner. If the precipitate weighs more than 20 mg heat to constant weight, using a blast lamp. Weigh as SnO_2 , which contains 78.81 per cent of tin.

Accuracy.—Duplicate determinations should check within 0.06 per cent of tin.

NOTES.—If, during ignition, the sulphur is allowed to burn, some tin sulphate may be formed, causing high results. On the other hand, low results may be caused by too high heat, which causes spattering and volatilizes some tin sulphide.

Tin and iron are best determined on the same sample, retaining the filtrate from the tin sulphide precipitate to use for the iron determination.

DETERMINATION OF IRON

SOLUTIONS REQUIRED

See determination of tin, given above, and the following:

Dilute sulphuric acid for reductor.—Mix 50 c c of H_2SO_4 specific gravity 1.84, and 1,000 c c of distilled water. This solution is used boiling hot.

Potassium permanganate.—Dissolve 0.2 g of $KMnO_4$ in water, filter through asbestos, and dilute to 1,000 c c with distilled water. Standardize against 0.020 g portions of pure sodium oxalate. Each cubic centimeter is equivalent to approximately 0.00033 g of iron.

METHOD

Proceed exactly as in the determination of tin through the filtration and washing of the precipitated tin sulphide. Combine the filtrate and washings from the tin sulphide precipitate and boil until all H_2S is expelled. Add HNO_3 , specific gravity 1.42, until the iron is oxidized, which is shown by the solution becoming clear and of a

yellowish color. Add about 5 g of NH_4Cl , then NH_4OH , specific gravity 0.90, until a permanent precipitate forms. Boil, allow to settle, filter on a loosely woven filter paper and wash with dilute ammonia and with hot water. Dissolve the precipitate on the paper with hot dilute HCl and add NH_4OH , specific gravity 0.90, to the solution again until a permanent precipitate forms. Boil, allow to settle, filter on a loosely woven filter paper, and wash with dilute ammonia and with hot water until all NH_4Cl is removed. Dissolve the precipitate and wash the filter paper with 100 c c of dilute H_2SO_4 for reductor. Pass the solution through a Jones reductor, wash first with 150 c c of the H_2SO_4 for reductor and then with 100 c c of distilled water. Titrate with the standard KMnO_4 solution.

Accuracy.—Duplicate determinations should check within 0.03 per cent of iron.

NOTES.—A blank determination should be made on corresponding amounts of acid and water passed through the reductor and the results should be corrected accordingly. About 0.5 c c of the permanganate will be required to give a permanent coloration to the solution.

A small quantity of liquid should always be left in the reductor funnel, and air should never be allowed to enter the body of the reductor.

For description and further details of use of reductor see The Chemical Analysis of Iron, by A. A. Blair, or Quantitative Chemical Analysis, by H. P. Talbot.

DETERMINATION OF MANGANESE BY THE PERSULPHATE METHOD

SOLUTIONS REQUIRED

Solution for dissolving.—Mix 500 c c of H_2SO_4 specific gravity 1.84, 200 c c of HNO_3 specific gravity 1.42, and 1,700 c c of distilled water.

Silver nitrate.—Dissolve 1.33 g of AgNO_3 in 1,000 c c of distilled water.

Stock sodium arsenite.—To 15 g of arsenious oxide (As_2O_3) in a 300 c c Erlenmeyer flask, add 45 g of Na_2CO_3 and 150 c c of distilled water. Heat the flask and contents on the steam bath until the As_2O_3 is dissolved. Cool the solution, filter and make up to 1,000 c c with distilled water.

Standard sodium arsenite.—Mix 200 c c of stock sodium-arsenite solution with 2,500 c c of distilled water, and standardize against a steel or iron of known manganese content as determined by the bismuthate method, or standardize against one of the Bureau of Standards' standard irons or steels. One c c of this solution should be equivalent to approximately 0.00050 g of manganese.

Ammonium persulphate.—Dissolve 60 g of ammonium persulphate in 1,000 c c of distilled water.

METHODS

Adjust the size of sample to the expected percentage so that the portion taken does not contain more than 0.002 g manganese. Place it in a 250 c c Erlenmeyer flask with 24 c c of the "solution for dissolving" and heat until solution is complete. Boil until oxides of nitrogen are expelled. Dilute to 100 c c with boiling-hot water, add 20 c c of AgNO_3 solution and 30 c c of the persulphate solution, then remove to a moderately warm place to stand for a few minutes for complete development of the permanganic acid. Cool to below 25°C ., and titrate with the standard arsenite solution to the disappearance of the pink color.

(The method given above differs from that in the 1919 specification; it will be found in the A. S. T. M. tentative standards for 1930.)

Accuracy.—Duplicate determinations should check within 0.02 per cent of manganese.

NOTES.—Large amounts of permanganic acid are unstable; on that account, samples which contain large amounts of manganese should have correspondingly small samples weighed out. For instance,

with metal containing 1.5 per cent of manganese use a 0.10 g sample, while if metal contains 0.75 per cent manganese use a 0.20 g sample.

The solution must be cold when it is titrated, for high temperatures cause low results to be obtained.

DETERMINATION OF MANGANESE BY THE BISMUTHATE METHOD

(Optional)

SOLUTIONS REQUIRED

Nitric acid (1:3).—Mix 250 c c of HNO_3 specific gravity 1.42, and 750 c c of distilled water.

Nitric acid for washing.—Mix 30 c c of HNO_3 specific gravity 1.42, and 970 c c of distilled water.

Ferrous ammonium sulphate.—Dissolve 12.4 g of ferrous ammonium sulphate crystals in 950 c c of distilled water, and add 50 c c of H_2SO_4 specific gravity 1.84.

Potassium permanganate.—Dissolve 1 g of KMnO_4 in 1,000 c c of distilled water. Allow it to stand for about one week and then filter it through asbestos. Standardize against 0.10 g portions of pure sodium oxalate.

METHOD

In a 250 c c Erlenmeyer flask dissolve 1 g of bronze in 50 c c of HNO_3 (1:3). Without filtering off the H_2SnO_3 , cool and add 0.5 g of sodium bismuthate. Heat for a few minutes until the purple color has disappeared, with or without the precipitation of manganese dioxide. Add a little ferrous ammonium sulphate solution until the solution becomes clear, and boil until the oxides of nitrogen are expelled. Cool, add an excess of sodium bismuthate and agitate for a few minutes. Add 50 c c of HNO_3 for washing and filter through an aluminum crucible or an asbestos pad. Wash with 50 c c of the HNO_3 for washing. Add from a pipette or a burette 10 c c of ferrous ammonium sulphate solution and titrate with KMnO_4 . Owing to the presence of considerable copper, the end point is somewhat different from the normal pink color.

In exactly the same manner carry through a blank determination, using the same amounts of HNO_3 and sodium bismuthate as was done with the regular sample. Finally add exactly 10 c c of ferrous ammonium sulphate solution and titrate with KMnO_4 . The difference between the two titrations is due to the manganese. Since one manganese as permanganate oxidized five irons, the iron value of the permanganate multiplied by the factor $\frac{Mn}{5Fe}$ (or 0.1967) gives the value in terms of manganese.

Accuracy.—Duplicate determinations should check within 0.02 per cent of manganese.

NOTES.—Instead of employing the method of reducing the permanganic acid by means of standardized ferrous ammonium sulphate solution and titrating the excess of this reagent, it is possible to reduce the permanganic acid by standard sodium-arsenite solution. See determination of manganese by the persulphate method.

The filtrate from the bismuthate must be perfectly clear, as the least particle of bismuthate carried into the filtrate will vitiate the results.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

MANGANESE BRONZE SAMPLE

(Sample No. 62 is a standard sample of manganese bronze prepared and sold by the Bureau of Standards for use by industrial organizations and others as a comparison standard for checking the accuracy of analysis of manganese bronze. Each sample is accompanied by a certificate giving a complete analysis of that particular sample.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRONZE, MANGANESE, RODS, SHAPES, AND PLATES, NO. 552, APRIL 30, 1928. (CURRENT DESIGNATION: QQ-B-721)

MANGANESE BRONZE RODS, BARS, SHAPES, PLATES

(In respect to general specifications, material and workmanship, tests and methods of inspection, packing and marking, this specification is substantially the same as F. S. B. QQ-C-501. (See 641.0, p. 1172.) It differs from the latter in requiring the material to be free from "season cracking"; check analyses samples are to be taken from 5,000-pound lots, or fraction there of; reference is made to a hammer test; the bending in full section of material less than 1 inch wide is omitted; and in the following additional respects:)

GRADES, FORMS, AND TEMPER

1. This specification covers one grade of manganese bronze in the following forms and tempers:

- Rods, soft, half-hard, and hard. (See also 647.23.)
- Bars, soft, half-hard, and hard. (See also 647.22.)
- Shapes, soft. (See also 647.25.)
- Plates, soft, half-hard. (See also 647.24.)

DETAIL REQUIREMENTS

2. The chemical requirements are as shown in Table 1.

TABLE 1.—Chemical composition

Copper	Zinc	Tin	Iron	Manganese, maximum	Aluminum, maximum	Lead, maximum	Other impurities, maximum
<i>Per cent</i> 57-60	<i>Per cent</i> Remainder.	<i>Per cent</i> 0.5-1	<i>Per cent</i> 0.8-2	<i>Per cent</i> 0.50	<i>Per cent</i> 0.25	<i>Per cent</i> 0.20	<i>Per cent</i> 0.10

TENSILE STRENGTH

3. The requirements as to tensile strength are as shown in Table 2.

4. Special tempers not covered in Table 2 may be agreed upon between the contractor and purchaser, in which case they will be specifically defined and designated in the contract or purchase order.

TABLE 2.—Physical properties

Diameter or thickness (in inches)	Tensile strength,	Yield point,	Elongation in	Bend test
	minimum	minimum	2 inches, minimum	
	<i>Lbs./in.²</i>	<i>Lbs./in.²</i>	<i>Per cent</i>	<i>Degrees</i>
Rods and bars, soft all sizes				180
Rods and bars, half hard:				
1 and less	72,000	36,000	20	120
1.001 to 2.50	70,000	35,000	25	120
2.501 and over	65,000	32,000	30	120
Rods and bars, hard:				
1 and less	85,000	60,000	8	90
1.001 to 2.50	83,000	57,000	13	90
2.501 and over	80,000	54,000	18	90
Shapes, soft, all sizes	55,000	22,000	25	180
Plates, soft:				
0.50 and less, up to 30 inches wide	57,000	22,000	20	180
0.50 and less, over 30 inches wide	56,000	22,000	25	180
0.501 and over, all widths	56,000	22,000	25	180
Plates, half-hard:				
0.50 and less, up to 30 inches wide	60,000	24,000	18	120
0.50 and less, over 30 inches wide	58,000	23,000	22	120
0.501 and over, all widths	58,000	23,000	22	120

NOTE.—Soft rods and bars are intended for reworking.

5. Material shall withstand bending cold, without check or fracture on the outside of the bent portion, through the angle specified in Table 2, on a radius equal to the diameter or thickness of the material.

6. Specimens of material shall withstand immersion for 15 minutes without cracking in an aqueous solution containing 100 g of mercurous nitrate and 13 c c of nitric acid (specific gravity 1.42) per liter.

STRAIN TESTS

7. Strain test specimens shall be the full cross section size of the material. At least 6 inches of the specimen shall be immersed in the solution.

8. The specimen shall receive no annealing, bending, springing, polishing, or other preparation preliminary to this test.

NOTES.—Round, square, hexagonal, etc., sections are classed as rods. Rectangular sections having greater width than thickness are classed as bars. All other sections are classed as shapes.

The material covered hereby is suitable for purposes requiring great strength and incorrodibility, such as valve stems, propeller-blade bolts, air pump and condenser bolts, etc., and may be used in lieu of Tobin bronze and naval brass where higher strength is required.

The grade of manganese bronze covered herein is not commercially available in sheet and strip form, nor in any thickness less than one-eighth inch. Plates are generally furnished hot rolled. For purposes of calculation the weight per cubic inch may be taken as 0.304 pound.

647.21 INGOTS, MANGANESE BRONZE.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR MANGANESE-BRONZE INGOTS FOR SAND CASTING, DESIGNATION B7-27, 1927

MANGANESE-BRONZE INGOTS FOR SAND CASTING

SCOPE

1. These specifications cover the copper-zinc alloy known commercially as manganese bronze.

MANUFACTURE

2. The bronze shall be cast in the form of ingots having notched flat bottoms, approximately 3 by 2.75 inches wide by 12 inches long, properly tapered to strip easily from an iron mold.

CHEMICAL PROPERTIES

3. The bronze shall conform to the following requirements as to chemical composition:

	Maximum	Minimum
	<i>Per cent</i>	<i>Per cent</i>
Copper	60	55
Zinc	42	38
Tin	1.5	0
Manganese	3.5	0
Aluminum	1.5	0
Iron	2	0
Lead	.2	0

PHYSICAL PROPERTIES AND TESTS

4. The bronze shall conform to the following minimum requirements as to tensile properties:

Tensile strengthlbs./in. ²	70,000
Elongation in 2 inchesper cent.....	30

5. (a) The tension-test specimen shall be cut from one corner near the bottom of the test ingot.

(b) (Tension-test specimen requirements conform to fig. 129 in A. S. T. M. standard specifications for steel. See 605.0, p. 247.)

6. (a) One test ingot shall be selected by the inspector to represent 10,000 pounds of ingots or fraction thereof.

(b) If any test specimen shows defective machining or develops flaws, it may be discarded, in which case two additional test specimens may be selected by the inspector from the same lot, and tested to represent the lot.

7. Each ingot shall be stamped with its proper heat or charge number.

INSPECTION AND REJECTION

(Requirements covering inspection and rejection are identical with those for brass ingot metal for sand castings in A. S. T. M. B30-31T. See 644.11, p. 1196.)

SOCIETY OF AUTOMOTIVE ENGINEERS, SPECIFICATION NO. 43, MANGANESE BRONZE, MARCH, 1922

MANGANESE BRONZE

(This specification is substantially the same as A. S. T. M. B7-27, given above.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATION BOARD, FEDERAL SPECIFICATION FOR MANGANESE BRONZE INGOTS (FOR REMELTING), QQ-B-731, MAY 31, 1932

MANGANESE BRONZE INGOTS

(This specification conforms with A. S. T. M. B7-27, given above, except as to iron content. The minimum iron content here is 0.40 per cent as against zero content in B7.)

647.22 BARS, MANGANESE BRONZE.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRONZE, MANGANESE, RODS, BARS, SHAPES, AND PLATES, NO. 552, APRIL 30, 1928. (CURRENT DESIGNATION: QQ-B-721)

MANGANESE BRONZE BARS

(This specification is identical with that given for manganese bronze rods (see 647.23, p. 1266) with the following exception:)

1. Round bars, except forging stock, shall not be out of round more than one-half the permissible variation in diameter shown in the accompanying table.

TABLE 3.—Permissible variations in diameter or thickness of rods and bars, except forging stock

Diameter or thickness (in inches)	Permissible variations	
	Rounds	Rectangular, square, hexagonal, etc.
0.50 and less.....	Inch ±0.0015	Inch ±0.0030
Over 0.50 to 1, inclusive.....	±.0020	±.0040
Over 1 to 2.5, inclusive.....	±.0025	±.0050
Over 2.5.....	±.0030	±.0060

647.23 RODS, MANGANESE BRONZE.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR RODS, WELDING, NONFERROUS, FOR GAS WELDING, QQ-B-571, MAY 3, 1932

MANGANESE BRONZE RODS

(For general specifications, types, material, general requirements, detail requirements, methods of inspection, tests, and chemical analysis, packing, and marking of shipments, and notes see 600.0, p. 3.)

1. Manganese bronze rods may be used for general welding of brass and bronze sheets, plates, shapes, and castings.

2. Welding rods shall conform to the following chemical requirements:

Type A

	Per cent
Copper.....	57.0-60.0
Zinc.....	Remainder
Tin, maximum.....	1.0
Lead, maximum.....	.15
Manganese.....	0.3-1.0
Iron.....	.3-1.0
Aluminum.....	.15

3. Standard sizes of manganese bronze rods for gas welding are:

Diameter (inch)..... 3/8, 1/2, 5/8, and 3/4

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRONZE, MANGANESE, RODS, BARS, SHAPES, AND PLATES, NO. 552, APRIL 30, 1928. (CURRENT DESIGNATION: QQ-B-721)

MANGANESE BRONZE RODS, BARS, SHAPES

(For general specifications; grades, forms, and tempers; material and workmanship; detail requirements; physical properties; tests and methods of inspection; packing and marking; and notes, see 647.20, p. 1265. Otherwise the specification for manganese bronze rods, bars, and shapes is identical with that for copper rods, bars, and shapes in F. S. B. QQ-C-501 (see 642.11, p. 1180), with the following exception:)

TABLE 4.—Permissible variations in diameter or thickness of rods and bars for forging stock

Diameter or thickness (in inches)	Permissible variations for all sections
0.50 and less.....	Inch ±0.007
Over 0.50 to 1, inclusive.....	±.010
Over 1 to 2.5, inclusive.....	±.015
Over 2.5.....	±.022

647.24 PLATES AND SHEETS, MANGANESE BRONZE.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD THICKNESSES, WEIGHTS, AND TOLERANCES OF SHEET METAL (CUSTOMARY PRACTICE), CIRCULAR NO. 391, MARCH 24, 1931

AMERICAN WIRE GAGE—MANGANESE BRONZE PLATES AND SHEETS

(See 640.1, p. 1165.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRONZE, MANGANESE, RODS, BARS, SHAPES, AND PLATES, No. 552, APRIL 30, 1928. (CURRENT DESIGNATION: QQ-B-721)

MANGANESE BRONZE PLATES

(For general specifications; grades, forms, and tempers; material and workmanship; detail requirements; physical properties; tests and methods of inspection; packing and marking; and notes. see 647.20, p. 1266. Otherwise the specification for manganese bronze plates is identical with the specification for copper plates in F. S. B. QQ-C-501 (see 641.21, p. 1177), with the following exceptions:)

TABLE 8.—Permissible variations in width of plates

Width (in inches)	Permissible variation	
	Plus	Minus
14 and less.....	<i>Inch</i> 0.050	<i>Inch</i> 0
Over 14.....	.125	0

1. Plates of all sizes may be ordered to exact lengths, in which case a variation of one-half inch in length shall be permitted.

(In this specification the table of permissible variations in thickness of sheets and strips shows the B. & S. gage number of each thickness; but the range of thickness is only from 0.460 inch downward to 0.0808 inch, while in F. S. B. QQ-C-501 the range is from 0.460 inch downward to 0.0050 inch.)

647.25 SHAPES, MANGANESE BRONZE.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRONZE, MANGANESE, RODS, BARS, SHAPES, AND PLATES, NO. 552, APRIL 30, 1928. (CURRENT DESIGNATION: QQ-B-721)

MANGANESE BRONZE SHAPES

(See 647.23, p. 1266.)

647.26 CASTINGS, MANGANESE BRONZE.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR MANGANESE BRONZE SAND CASTINGS, DESIGNATION B54-27, 1927

MANGANESE BRONZE SAND CASTINGS

SCOPE

1. These specifications cover castings made from the copper-zinc alloy known commercially as manganese bronze.

MANUFACTURE

2. Material used in these castings shall conform to the requirements of the standard specifications for manganese bronze ingots for sand castings as given in A. S. T. M. B7 (see 647.21, p. 1265). At

least 35 per cent of the mixture shall consist of ingots manufactured in accordance with the standard specifications for manganese bronze ingots and the remainder shall consist of risers, sprues, and defective castings, accruing from the manufacture of castings in accordance with these specifications. Zinc additions shall be of zinc conforming to the requirements of Grade 2 or better of the standard specifications for spelter as given in A. S. T. M. B6 (see 683.1, p. 1310).

CHEMICAL COMPOSITION

(Same as A. S. T. M. B7 (see 647.21, p. 1265) except that the maximum percentage of lead in B54 is 0.4 instead of 0.2.)

PHYSICAL PROPERTIES AND TESTS

4. The bronze should conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	65,000
Elongation in 2 inches.....	per cent..	25

5. (a) The tension-test specimen shall be machined from coupons to the dimensions as shown in Figure 129 in A. S. T. M. standard specifications for steel (see 605.0, p. 247).

(b) The coupon attached to the castings shall be in accordance with Figure 1123 in F. S. B. QQ-B-671 (see 647.15, p. 1261), unless special authority to use coupons of other forms and dimensions is obtained from the purchaser.

(c) Each casting weighing 250 pounds or more as delivered from the foundry shall have at least two test coupons cast attached.

(d) When the castings constituting a heat weigh less than 250 pounds each, one coupon shall be cast attached to the first and one to the last casting poured in each heat.

(e) Castings which are too small to permit the casting of a coupon attached shall, when possible, be represented by coupons cast in the same flask and gated to the castings or runners. One coupon shall be cast gated to the first and one to the last casting poured in the heat.

(f) Only in cases when it is impossible to cast coupons in the same flask with small castings shall such coupons be cast separately. In case it is necessary to cast coupons separately, one coupon shall be cast to the first of the heats and one to the last.

(g) At least two ounces of drillings from each coupon tested shall be forwarded for chemical analysis.

MARKING

6. Each casting shall be clearly stamped with the heat number, and the heat number shall also be stamped on the test coupon representing that heat.

INSPECTION AND REJECTION

(Inspection conforms to A. S. T. M. B59 (see 647.15, p. 1259). Rejection is as follows:)

8. (a) Any casting may be rejected upon the failure of the test coupon to meet the physical requirements specified or for the noncompliance with the chemical composition. If the physical or chemical tests indicate that the heat of castings represented by its test coupon does not conform to the physical or chemical requirements, or both, the entire heat shall be rejected.

(b) In case tests on the first test piece do not conform to these specifications, a second test piece shall be tested. If such a test on the second piece is thoroughly satisfactory the castings or heat shall be accepted; if unsatisfactory, the castings or heat shall be rejected.

UNITED STATES GOVERNMENT, FEDLERA SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR MANGANESE BRONZE CASTINGS, QQ-B-726, MAY 31, 1932

BRONZE CASTINGS

(This specification is identical with Federal specification 369a (current designation: QQ-B-671) (see 647.15, p. 1260), except in the following particulars:)

GRADE

1. This specification covers one grade of manganese bronze in the form of castings.

MATERIAL

2. Manganese bronze castings shall be made only from the best grades of virgin metals, or from virgin metals and scrap of known and approved composition.

DETAIL REQUIREMENTS

3. The chemical requirements are as shown in the table below:

Copper	Zinc	Lead, maximum	Aluminum, maximum	Manganese maximum	Iron	Tin	Other elements, maximum
Per cent 55-60	Per cent 38-42	Per cent 0.20	Per cent 1.50	Per cent 3.50	Per cent 0.40-2.0	Per cent 1.50	Per cent 0.20

4. The physical requirements are as shown below:

Tensile strength, minimum	Elongation in 2 inches, minimum
Lbs./in. ² 65,000	Per cent 20.0

NOTE.—Manganese bronze may be used for castings such as propeller hubs, propeller blades, engine framing, gears, worm wheels, torpedo spoons, torpedo-tube castings, gun-mount castings, etc., where strength, toughness, or resistance to corrosion of sea water are required.

647.27 WIRES, MANGANESE BRONZE.

(No nationally recognized specifications available.)

647.3 PHOSPHOR BRONZE.

647.31 INGOTS AND BEARING METALS, PHOSPHOR BRONZE.

AMERICAN RAILWAY ENGINEERING ASSOCIATION, SPECIFICATIONS FOR MOVABLE BRIDGES, BRONZES, 1922

(See also 603.32, p. 151; 611.41, p. 707; 611.51, p. 753; 692.1, p. 1320.)

BRONZES

710. Phosphor bronze shall be a homogeneous alloy, of crystalline structure. It shall be made from new metals, except that scrap of known composition produced by the foundry at which the bronze is cast may be used. It shall not contain sulphur. The phosphorus shall be introduced in

the form of phosphor-tin or phosphor-copper. Castings shall be sound, clean, and free from blow-holes, porous places, cracks, and other defects.

711. The hardness of the finished castings shall be tested by the Brinell ball method and a record of the test furnished. The ball shall be of hardened steel 10 mm in diameter. The load shall be 500 kg and shall be applied for 30 seconds to a finished plane surface. No fewer than two hardness tests shall be made on each heat. A test shall be made on each trunnion bearing and on each disk.

712. The alloy shall be cast into ingots and allowed to cool, and the castings shall be poured from the remelted ingots. Care shall be exercised that the metal is not overheated and that the temperature at pouring and the conditions of cooling are such as will be most likely to secure dense castings.

713. There shall be four grades.

Grade A is to be used for contact with hardened steel disks under pressures exceeding 1,500 pounds per square inch, such as are used in turntables and center-bearing swing bridges.

Grade B is to be used for contact with soft steel at low speeds under pressures not exceeding 1,500 pounds per square inch, such as trunnions and journals of bascule and lift bridges.

Grade C is to be used for ordinary machinery bearings.

Grade D is to be used for gears, worm wheels, nuts, and similar parts which are subjected to other than compressive stresses.

714. The chemical and physical properties shall conform to the requirements in the following table:

Alloy of—	Grade			
	A	B	C	D
Copper.....per cent			° 82	° 89
Tin.....do	° 20	° 17	° 11	° 11
Lead.....do			° 11	
Zinc.....do				° 2.25
Phosphorus.....do	° 1.0	° 1.0	{ ° 1.0 ° 0.7 }	° 0.25
Other elements.....do	° 0.5	° 0.5	° 0.5	° 0.5
Elastic limit in compression.....lbs./in. ²	° 24,000	° 18,000		
Permanent set in inches under 100,000.....lbs./in. ²	{ ° 0.06 ° 0.10 }	° 0.10		
Permanent set in inches under 50,000.....lbs./in. ²	(°)	(°)	(°)	(°)
Yield point in tension.....do				(°)
Ultimate strength in tension.....lbs./in. ²				° 33,000
Elongation in 2 inches.....per cent				° 14

° Maximum. ° Minimum. ° To be recorded.

Cracks and other evidences of excessive brittleness in compression-test specimens may be cause for rejection.

The chemical analysis of each heat shall be furnished.

715. Test specimens shall be made from coupons which are a part of the castings and which have been fed and cooled under the same conditions as the casting.

Compression-test specimens shall be cylinders 1 inch high and of 1 square inch area. The elastic limit in compression shall be the load which gives a permanent set of 0.001 inch.

Tension-test specimens shall be turned from a coupon not less than 1 inch in diameter to the form

shown in A. S. T. M. standard specifications for steel. (See 605.0, p. 247.) The diameter of the turned specimen shall be one-half inch.

716. One or more compression tests shall be made from each melt for grades A, B, and C; and one compression and one tension test for grade D. For castings weighing over 100 pounds finished, the prescribed tests shall be made for each casting.

647.32 BARS, PHOSPHOR BRONZE.

(No nationally recognized specifications available.)

647.33 PLATES AND SHEETS, PHOSPHOR BRONZE.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD THICKNESSES, WEIGHTS, AND TOLERANCES OF SHEET METAL (CUSTOMARY PRACTICE), CIRCULAR NO. 391, MARCH 24, 1931

(See 640.1, p. 1165.)

647.34 CASTINGS, PHOSPHOR BRONZE.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 64, PHOSPHOR BRONZE, MARCH, 1922

PHOSPHOR BRONZE

1. Composition in percentage.—

	Per cent
Copper.....	78.50-81.50
Tin.....	9.00-11.00
Lead.....	9.00-11.00
Phosphorus.....	.05- .25
Zinc, maximum.....	.75
Other impurities, maximum.....	.25

2. General information.—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	25,000
Yield point.....	do.....	12,000
Elongation in 2 inches, or proportionate gage length.....	per cent..	8

3. This metal is an excellent composition for use where antifriction qualities are desired, standing up exceedingly well under heavy loads and severe usage.

4. Bearings or gears made of bronze alloys should be used only against hardened steel.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 65, PHOSPHOR GEAR BRONZE, MARCH, 1922

PHOSPHOR GEAR BRONZE

1. Composition in percentage.—

	Per cent
Copper.....	88.00-90.00
Tin.....	10.00-12.00
Phosphorus.....	.10- .30
Lead, zinc, and other impurities, maximum.....	.50

2. General information.—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	35,000
Yield point.....	do.....	20,000
Elongation in 2 inches, or proportionate gage length.....	per cent..	10

3. This is a very hard bronze and may be used for gears and worm wheels where the requirements are severe.

4. Bearings or gears made of bronze alloys should be used only against hardened steel.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BRONZE CASTINGS, QQ-B-691 MAY 31, 1932

BRONZE CASTINGS

(See 646.41, p. 1252.)

647.35 SHAPES, PHOSPHOR BRONZE.

(No nationally recognized specifications available.)

647.36 STRIPS, PHOSPHOR BRONZE.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS SPECIFICATION NO. 77, PHOSPHOR-BRONZE STRIP, AUGUST, 1922

PHOSPHOR-BRONZE STRIP

1. This specification covers bronze strips up to 0.080-inch gage, and includes a variety of tempers in two alloys, from which a suitable quality can be chosen for any ordinary purpose.

2. Composition in percentage.—

	Grade A	Grade B
	<i>Per cent</i>	<i>Per cent</i>
Tin.....	4.00-6.00	7.00-9.00
Phosphorus.....	.03- .40	.03- .20
Zinc, maximum.....	.20	.20
Iron, maximum.....	.10	.10
Lead, maximum.....	.10	.10
Copper.....	Remainder.	Remainder.

3. Temper designation.—The temper of strip phosphor bronze shall be designated as follows:

Temper	Reduction B. & S.No.
Half hard.....	2
Hard.....	4
Extra hard.....	6
Spring.....	8

4. Minimum physical properties.—

Temper	Grade A		Grade B	
	Mini- mum tensile strength	Mini- mum elonga- tion in 2 inches	Mini- mum tensile strength	Mini- mum elonga- tion in 2 inches
	<i>Lbs./in.²</i>	<i>Per cent</i>	<i>Lbs./in.²</i>	<i>Per cent</i>
Half hard.....	55,000	15.0	65,000	20.0
Hard.....	75,000	5.0	85,000	7.5
Extra hard.....	85,000	2.0	100,000	1.0
Spring.....	90,000	1.0	-----	-----

5. Physical properties.—The average tension test of two samples of sheet thinner than 0.080 inch should conform to the minimum requirements specified in the accompanying table.

In very thin strips, on account of difficulties in testing, the elongation may be considerably less than the values given.

6. *Dimensional tolerances.*—The width of the strip shall not vary more than 0.01 inch from the size specified in the order.

The thickness tolerances of sheet or strip made of this alloy shall be within the tolerances specified in Table 4. (See 655.2, p. 1287.)

7. *General information.*—These should be considered as general specifications. Phosphor-bronze strip is used for various kinds of springs where the manufacturing requirements and the uses to which the springs are put are too particular to be specified by ordinary physical tests. It is advisable to submit samples or drawings to the manufacturer and secure an adjustment of temper to suit the manufacturing and service requirements of the article.

8. Flat springs formed with easy bands across the grain are usually made of the grade A alloy, "spring" temper.

9. Flat springs with easy bends either across or with the grain are usually made of the grade B alloy, "extra hard" temper.

10. Clips or contact springs with most difficult bends are usually made of the grade B alloy, "hard" temper.

647.37 TUBING, PHOSPHOR BRONZE.

(No nationally recognized specifications available.)

647.38 WIRES AND RODS, PHOSPHOR BRONZE.

AMERICAN MARINE STANDARDS COMMITTEE, STANDARD WIRE ROPES FOR MARINE USES, 0 NO. 25-1930

WIRE ROPES FOR MARINE USES

(See 603.42, p. 163.)

AMERICAN MARINE STANDARDS COMMITTEE, LOCKS AND ACCESSORIES FOR SHIP DOORS, H NO. 61-1930

PHOSPHOR-BRONZE SPRINGS

(See 617.21, p. 1004.)

AMERICAN MARINE STANDARDS COMMITTEE, BOLTS AND CATCHES FOR SHIP DOORS, H NO. 62-1930

PHOSPHOR-BRONZE SPRINGS

(See 617.61, p. 1052.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 81, PHOSPHOR-BRONZE WIRE, AUGUST, 1922

PHOSPHOR-BRONZE WIRE

1. *Composition in percentage.*—

	Per cent
Tin	4.00-6.00
Phosphorus03- .40
Zinc, maximum20
Iron, maximum10
Lead, maximum10
Copper	Remainder.

2. *Bend test.*—The wire shall be capable of being bent through an angle of 180° flat back on itself without fracture on the outside of the bent portion.

3. *Appearance.*—The wire shall be uniform in quality and temper, cylindrical in shape, and smooth and free from all injurious defects.

4. *Dimensional tolerances.*—The wire shall not vary from the specified diameter by more than plus or minus 1 per cent for larger sizes than 0.050 inch.

5. *Mechanical requirements.*—

Wire diameter		Minimum tensile strength
Over	To and including	
<i>Inch</i> 0.0000	<i>Inch</i> 0.0625	<i>Lbs./in.²</i> 130,000
.0625	.1250	120,000
.1250	.2500	110,000
.2500	.3750	100,000

From 0.050 to 0.025 inch the variation in size shall not be more than plus or minus 0.0005 inch.

For sizes smaller than 0.025 inch the variation shall not be more than plus or minus 0.00025 inch.

6. *General information.*—Phosphor-bronze wire made to this specification is intended primarily for use in springs.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ROPE, WIRE, NO. 297, 1925. (CURRENT DESIGNATION: RR-R-571)

WIRE ROPE

(See 603.42, p. 183.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR PHOSPHOR-BRONZE SPRING WIRE, QQ-W-401, MAY 31, 1932

PHOSPHOR-BRONZE SPRING WIRE

I. GENERAL SPECIFICATIONS

United States Government general specification for metals, Federal Specification Board No. 339 (current designation: QQ-M-151) in effect on date of invitation for bids, shall form part of this specification.

II. GRADE

This specification covers one grade of phosphor-bronze spring wire as shown in Table 1.

III. MATERIAL

1. Phosphor-bronze spring wire furnished under this specification may be either hard drawn or hard rolled and shall be in accordance with the requirements of Section V.

2. Scrap shall not be used in the manufacture, except as it may accumulate in the manufacturer's plant from material of the same composition, and of the manufacturer's own make.

IV. GENERAL REQUIREMENTS

The material shall be free from all injurious internal and surface defects, clean, smooth, and of uniform color, quality and size. It shall be capable of being formed into helical springs without surface cracking.

V. DETAIL REQUIREMENTS

1. The wire shall be truly circular in cross section within 0.0005 inch; permissible variation from nominal diameter shall be: For wire 0.100 inch in diameter and larger, 1 per cent over or under. For wire less than 0.100 inch diameter, 0.001 inch over or under.

2. The chemical composition shall conform to the requirements shown in Table 1.

TABLE 1

Copper, minimum	Tin, minimum	Zinc, maximum	Iron, maximum	Lead, maximum	Phosphorus
Per cent 94	Per cent 3.50	Per cent 0.02	Per cent 0.10	Per cent 0.20	Per cent 0.05-0.50

3. The physical properties shall be in accordance with the requirements shown in Table 2.

TABLE 2

Diameter or thickness of material (inch)	Tensile strength, minimum	Elongation in 2 inches, minimum
	Lbs./in. ²	Per cent
Up to and including 0.025.....	150,000	-----
Above 0.025 and including 0.0625.....	135,000	1.5
Above 0.0625 and including 0.125.....	130,000	2.0
Above 0.125 and including 0.250.....	125,000	3.5
Above 0.250 and including 0.375.....	120,000	5.0
Above 0.375 and including 0.500.....	105,000	9.0

4. Test pieces shall withstand being bent cold through an angle of 120° to a radius equal to the diameter of thickness of the material.

5. The color of the fractured section of test pieces and the grain of the material shall be uniform throughout.

VI. METHODS OF INSPECTION AND TESTS

1. Each coil or when furnished in straight lengths, each length, shall be gaged at three places, one near each end, and one approximately at the middle to determine compliance with the detail requirements given above.

2. When furnished in coils, one tension and one bend test specimen shall be taken from each alternate coil. When furnished in straight lengths, one tension and one bend test specimen shall be taken to represent each 500 pounds or less.

3. Tension tests shall be made on the full cross section of the wire.

4. One chemical analysis sample shall be taken to represent each four coils or each 1,000 pounds of straight lengths. If machined from the tension test specimen, equal parts of each of the two specimens shall constitute the sample; otherwise equal amounts shall be obtained from each of the coils or lengths. Sample shall consist of not less than 5 ounces of millings or drillings.

VII. PACKING AND MARKING OF SHIPMENTS

1. Packages shall be legibly and indelibly marked with the name and size of material; the quantity contained; name, brand, or trade-mark of manufacturer or contractor; and the contract or purchase order number.

2. When furnishing in coils, each coil shall weigh not more than 200 pounds.

VIII. NOTES

1. The material covered by this specification is intended for use in the manufacture of phosphor-bronze helical springs. It is not intended for use in the manufacture of mail-bag locks.

651. LEAD

651.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF PIG LEAD, SERIAL DESIGNATION B35-24, 1924

CHEMICAL ANALYSIS OF PIG LEAD

A. DETERMINATION OF SILVER

Weigh 100 g of the sample into a 3-inch scorifier and heat in a muffle furnace until the assay "covers." Pour into an iron mold and allow to cool. Free the resulting lead button from PbO, scorify again, and pour as before. The button last obtained should not weigh over 20 g and can be cupelled directly. Weigh the silver button obtained upon an assay balance.

NOTE.—If the amount of silver is large, the button should be examined for gold, in the usual manner.

B. DETERMINATION OF BISMUTH

SOLUTIONS REQUIRED

Sodium carbonate.—Dissolve 100 g Na_2CO_3 in a liter of distilled water.

Ammonium carbonate.—Make a half-saturated solution.

Alkaline sulphide wash solution.—Dissolve 200 g of KOH in a liter of distilled water and mix one part of this solution with 4 parts of H_2S water.

METHOD

(a) *Determination for ordinary amounts of bismuth.*—Dissolve 20 g of the sample in a 400 c c beaker with 100 c c of HNO_3 (1:4), with the aid of heat. When solution is complete, add dilute ammonia (1:2), with constant stirring, drop by drop from a burette, until a faint opalescence appears. If an actual precipitate is formed, redissolve by the addition of a small amount of HNO_3 (1:4) and repeat the addition of ammonia. Now add 5 c c of HCl (1:9), fill the beaker with hot water, bring to boiling, and allow to stand on a steam bath for two hours. The assay, while standing, must not reach the boiling temperature. Filter through a 7 cm paper. Transfer the precipitate completely to the paper by means of a "policeman" and wash twice with hot water. Carefully examine the filtrate, washings, and any decanted liquid and reject if clear. Dissolve the precipitate by dropping around the edges, from a 5 c c pipette, 5 c c of boiling HCl (1:9), receiving the solution in the original beaker. Wash the paper thoroughly with hot water, fill the beaker with water, bring to boiling, and allow to stand as before. Filter the bismuth oxychloride upon a weighed Gooch crucible, wash thoroughly with water, once with alcohol, once with ether, and dry upon the hot plate. Cool and weigh.

NOTE.—If time permits it is convenient to allow the assay to stand overnight. In that case, the precipitate of bismuth oxychloride generally settles so completely that the clear supernatant solution can be decanted.

(b) *Determination for amounts of bismuth smaller than can be determined by (a).*—Dissolve 100 g of the sample in 500 c c of dilute HNO_3 (1:4). When solution is complete, allow to cool and add Na_2CO_3 solution little by little until a slight permanent precipitate has formed. Then add 50 c c of the Na_2CO_3 solution, bring to boiling, allow to stand warm until the supernatant liquor is clear again, filter, and reject the filtrate. Dissolve the precipitate without washing by slowly pouring hot HNO_3 (1:4) around the edges of the filter paper, using no more acid than necessary. Wash the paper once with hot water and determine bismuth in the filtrate as described in (a).

NOTE.—When the sample contains a small amount of bismuth, it is often difficult to ascertain when the correct amount of ammonia has been added to the nitrate solution. In this case, place a small piece of litmus paper in the solution, and add the ammonia very gradually until the litmus paper indicates a neutral reaction.

(c) *Determination of bismuth in samples containing appreciable amounts of tin and antimony.*—Use a piece of litmus paper as in note under (b), and after the first precipitation of bismuth oxychloride has been filtered off and washed (see (a)) proceed as follows: Dissolve the bismuth by dropping around the edges of the paper 10 c c of boiling HCl (1:2), receiving the solution in the original beaker. Discard the paper after washing. Dilute the solution to about 200 c c with fresh H_2S water and then pass H_2S gas through the hot solution for 15 minutes. Filter and wash with hot water. Remove any tin or antimony present by washing three times with alkaline sulphide wash solution. Wash the precipitate again with hot water, place it, together with the filter paper, in a 100 c c beaker, add 20 c c of HNO_3 (1:4), boil until sulphides are completely

dissolved and the paper well pulped. Filter the solution, receiving the filtrate in the original beaker, and wash well. Determine bismuth in the filtrate as in (a).

NOTE.—When the sample contains comparatively large amounts of tin or antimony, the residue left after the solution of the lead in the nitric acid obscures the opalescence found upon the addition of ammonia.

If the original sample contains more than 0.25 per cent of bismuth it is preferable to use only a 10 g charge.

C. DETERMINATION OF ARSENIC

METHOD

Dissolve 111.11 g of the sample in 550 c c of HNO_3 (1:4). When solution is complete wash into a graduated liter flask, add 75 c c of H_2SO_4 (1:1), cool, and make up to the mark with water. Transfer to a large beaker, rinsing out the flask with 25 c c of water. Mix thoroughly, allow to settle and filter off 900 c c, equivalent to a 100 g charge. Evaporate in a large porcelain dish until only enough H_2SO_4 is left to moisten the residue. When cool, wash into a small distilling flask with 60 c c of HCl (specific gravity 1.19) and 20 c c of water, cleaning the dish carefully. Add 10 g of ferrous sulphate and distill, boiling to as small a volume as possible. When cool add 50 c c more of HCl (specific gravity 1.19) and redistill. Pass H_2S gas through the cold distillate for 45 minutes. Filter, and weigh the As_2S_3 on a Gooch crucible, washing with cold water, alcohol, and CS_2 . After drying and weighing, redissolve with $(\text{NH}_4)_2\text{CO}_3$ solution and reweigh the Gooch crucible, calculating the loss in weight to arsenic.

NOTE.—The 25 c c of water added is equivalent to the volume of precipitated lead sulphate.

D. DETERMINATION OF REMAINING METALS

SOLUTIONS REQUIRED

Tartaric acid.—Dissolve 50 g of tartaric acid in 250 c c of distilled water to which has been added 250 c c HCl (specific gravity 1.20).

METHOD

Dissolve 222.23 g of the sample in 1,100 c c of HNO_3 (1:4), using a 1,300 c c beaker. When solution is complete examine for color and turbidity. If clear, wash the solution at once into a 2,000 c c graduated flask. In case of a residue (note 1), however, dilute to about 1,100 c c and allow to stand until the supernatant liquor is clear. Decant as much as possible into a 2,000 c c flask, filter the remainder, and receive the filtrate in the same flask. Wash the precipitate well and then place it, together with the filter paper, in a 100 c c beaker and add 20 c c of the tartaric acid mixture. Heat to boiling and when the paper is well pulped allow to digest warm for 30 minutes. Now add 50 c c of hot water, filter, and wash. (Note 2.) Carefully dry the residue and ignite. If any appreciable residue remains, brush it into a small silver dish containing 1 g of molten KOH . Fuse for five minutes, and after cooling dissolve in as little hot water as possible and add to the above-mentioned tartaric acid filtrate. Render this solution just alkaline with ammonia and then just acid with HCl , and saturate hot with H_2S gas. After digesting for 30 minutes on the steam bath, pass H_2S through the solution again for 15 minutes. Filter and wash with slightly acidified H_2S water. Reject the filtrate. Wash the sulphides from the paper into the original beaker and add 5 c c of KOH solution (1:5) for every 25 c c volume present. Digest hot for five minutes and filter through the original paper into a small flask graduated to 110 c c. After washing with H_2S water containing a little of the KOH solution, cool the filtrate and make up to the mark. Mix and reserve 100 c c as alkaline

sulphide solution No. 1. The precipitate may be discarded.

Add slowly to the main solution in the 2,000 c c flask 150 c c of H_2SO_4 (1:1). After cooling and filling up to the mark, pour into a clean 3-liter flask provided with a rubber stopper. Rinse the flask out with 50 c c of water, which is equivalent to the volume of lead sulphate present, and is added to the portion. After mixing thoroughly by shaking, allow the precipitate to settle and filter off 1,800 c c of the liquid. This is equivalent to a 200 g charge. Place this in a No. 9 porcelain evaporating dish and evaporate, first over a free flame and later on the hot plate, until only enough H_2SO_4 is left to moisten the residue remaining. Add 50 c c of water and, after digesting warm for a short time, wash the solution into a 250 c c beaker, cleaning the dish carefully. Allow the solution to digest on the steam bath for four or five hours. (Note 3.) Then filter, wash, and evaporate the filtrate to 200 to 250 c c. Place any residue (note 4), together with the filter paper, in a 100 c c beaker and treat with 20 c c of the tartaric acid mixture. Boil for five minutes, dilute with 50 c c of hot water, and filter. Make the filtrate alkaline with ammonia and just acid with HCl , and obtain the tin, antimony, and arsenic as previously described, reserving the whole of the alkaline sulphide solution as solution No. 2. Reject the sulphide residue.

To filtrate from the lead sulphate, add ammonia until the neutral point is reached, and then for every 50 c c of the solution present add 2 c c of HCl (specific gravity 1.19). Pass H_2S gas into the hot solution until saturated, digest for 30 minutes on the steam bath, and again pass H_2S into the solution. Filter and wash with H_2S water slightly acidified. (Note 5.) Separate tin, antimony, and arsenic in the precipitate with KOH solution as usual, obtaining an alkaline sulphide solution No. 3. (Note 6.)

To sum up, three alkaline sulphide solutions have been obtained containing tin, antimony, and arsenic; a precipitate of metallic sulphides containing copper, lead, etc.; and a solution containing iron, zinc, nickel, etc.

NOTES.—1. A residue indicates the presence of antimony, tin, possibly arsenic, or sulphur as lead sulphate.

2. It has been found that even this treatment occasionally fails to dissolve stannic acid completely.

3. If it is preferred, allow the solution to stand overnight to insure the complete solution of all soluble salts.

4. Any residue of lead sulphate may contain some tin, antimony, or possibly arsenic.

5. The filtrate will contain any iron, zinc, nickel, cobalt, and manganese; while in the precipitate will be found any copper, cadmium, lead, silver, bismuth, tin, antimony, and arsenic.

6. When separating the sulphides of arsenic, antimony, and tin from sulphides of copper, lead, etc., it is necessary to wash all the sulphides back into the beaker in which they were precipitated. These sulphides sometimes cling so tenaciously to the paper that in dislodging them more water than the 25 c c specified is required. In this case allow the sulphides to settle and then decant the clear supernatant liquor through the filter until the volume is reduced to 25 c c. Before rejecting the decanted fluid always test with H_2S water.

In washing sulphide precipitates with water, much trouble is experienced from the tendency of the precipitate to pass through the filter in the colloidal form. This is particularly true in washing sulphides that have been digested with KOH . Time and trouble will be saved by washing all the sulphides precipitated from mineral-acid solutions with H_2S water containing a little of the acid in which they were precipitated. The same is true of sulphides precipitated in or filtered from an alkaline solution.

When working with alkaline solutions in which tin is to be determined, avoid the use of Jena or other glass that contains zinc. The zinc content of the glass may influence the result.

DETERMINATION OF ANTIMONY AND TIN

SOLUTIONS REQUIRED

Potassium iodide.—Dissolve 100 g in a liter of distilled water.

Standard sodium thiosulphate.—Dissolve 24.8 g of $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ in 1,000 c c of distilled water and allow to stand for 24 hours. Standardize against antimony metal chemically pure, using the same

quantity of reagents and same procedure as under method. Each cubic centimeter is equivalent to approximately 0.006 g of antimony.

METHOD

Wash the alkaline sulphide solutions Nos. 1, 2, and 3 into a 600 c c beaker, and acidify with 5 c c of HNO_3 (specific gravity 1.42) and 20 c c of HCl (specific gravity 1.19). Evaporate the solution to dryness on the steam bath. Dissolve the residue in 200 c c of water, add 10 g of oxalic acid and 10 g of ammonium oxalate, and heat the solution until it is clear. Then pass H_2S gas through the boiling solution for 45 minutes. Filter off the precipitate, consisting of arsenic and antimony sulphides, and wash with hot water. Determine tin electrolytically in the filtrate, continuing the electrolysis until all the oxalic acid is decomposed and the solution becomes alkaline. Dissolve the deposit on the cathode with a small amount of HCl and examine qualitatively for tin.

Dissolve the sulphides of arsenic and antimony in KOH as usual, collecting the filtrate in a 500 c c Erlenmeyer flask. Add 50 c c of HCl (specific gravity 1.19) and boil the solution until about 30 c c are left. Expel the arsenic as chloride. Now oxidize the solution with a pinch of KClO_3 and boil until no more chlorine remains. Cool and add 5 c c of potassium iodide solution. Titrate the liberated iodine with 0.1 N sodium thiosulphate solution, using carbon disulphide as an indicator.

DETERMINATION OF COPPER AND CADMIUM

SOLUTIONS REQUIRED

Sodium chloride (solution No. 1).—Dissolve 1 g of NaCl in 100 g of distilled water.

Sodium chloride (solution No. 2).—Dissolve 10 g of NaCl in 100 g of distilled water.

Standard potassium cyanide.—Dissolve 2 g of KCN in a liter of distilled water and standardize against a known amount of copper as treated in the analysis.

Sodium carbonate (solution No. 1).—Dissolve 50 g of Na_2CO_3 in 1 liter of distilled water.

Sodium carbonate (solution No. 2).—Dissolve Na_2CO_3 in distilled water to saturation.

METHOD

(a) *Determination where copper exceeds 0.0025 per cent.*—Place the filter containing the sulphides in a 100 c c beaker and add 20 c c of HNO_3 (1:4). Heat with occasional stirring until the paper is thoroughly pulped and the sulphides are completely dissolved. Filter into a 250 c c beaker. Dry the residue, which generally contains a small amount of copper, ignite in a porcelain crucible, boil with 5 c c of HNO_3 (1:1), and wash into the main portion, keeping the volume below 100 c c. Render it strongly alkaline with ammonia, and add 5 g of potassium cyanide, then saturate it in the cold with H_2S gas. (Note 1.) Filter the solution and evaporate the filtrate to a volume of 20 to 30 c c in a 4-inch porcelain casserole. Boil until solution is complete. Add 20 c c of H_2SO_4 (1:1) and evaporate the solution under a hood until dense fumes of H_2SO_4 escape. Cool, dilute, and warm until copper sulphate is all dissolved. Now filter, if necessary, into a 200 c c beaker, render just alkaline with ammonia, make acid by the addition of 3 c c of HNO_3 per 100 c c solution, and electrolyze for copper.

Dissolve the precipitate of sulphides in the usual manner with 20 c c of HNO_3 (1:4). Add 1 c c NaCl solution No. 1 to the solution, still containing the pulped filter, and digest for one-half hour. Filter off the AgCl , wash, and reject. Make the filtrate, not

exceeding 100 c c, alkaline with a slight excess of Na_2CO_3 and add 5 g of KCN . Digest for one hour. Filter and wash with Na_2CO_3 solution No. 1. Reject the precipitate of bismuth. Now add a few cubic centimeters of ammonium sulphide solution to the filtrate to precipitate any cadmium as yellow cadmium sulphide. Filter upon a weighed Gooch crucible and weigh as cadmium sulphide. (Note 2.)

NOTES.—1. Copper remains in the solution while lead, silver, bismuth, and cadmium are precipitated.

2. If an appreciable amount of cadmium sulphide is found, it should be converted to and weighed as cadmium sulphate, according to method for cadmium under standard methods of chemical analysis of spelter, in B38 (see 683.0, p. 1308).

(b) *Determination where copper is less than 0.0025 per cent.*—Place the paper containing the sulphides in a porcelain crucible, dry carefully, and ignite. When the carbon has been all burned off, cool and dissolve the residue in 5 to 10 of HNO_3 (1:1). After evaporating to a volume of 1 to 2 c c, add 1 c c of H_2SO_4 (1:1). Then evaporate the solution until fumes appear, cool, dilute, add a few drops of NaCl solution No. 2, and filter off the lead sulphate and silver chloride. Again evaporate the filtrate until fumes of H_2SO_4 appear, and when cold dilute and neutralize with Na_2CO_3 solution No. 2. Then add about 6 drops of concentrated ammonia and titrate the solution with standard KCN solution until the blue color is discharged.

The cadmium can be obtained by making this solution, titrated for copper, strongly alkaline, diluting a little, and adding 5 g of KCN . Saturate the solution cold with H_2S gas, filter, discard the filtrate, and treat the precipitate for cadmium as described in method (a).

DETERMINATION OF IRON

METHOD

Evaporate the filtrate containing iron, zinc, etc., to 100 c c and oxidize with a few drops of HNO_3 . Separate the iron with ammonia as usual, making two separations, and receive the filtrate in a 500 c c Erlenmeyer flask. Redissolve the iron hydroxide with hot HCl (1:1) or dilute H_2SO_4 , and determine the iron volumetrically by any of the standard methods.

DETERMINATION OF ZINC

SOLUTIONS REQUIRED

Nitric acid (1:4).—Mix 200 c c of HNO_3 (specific gravity 1.42) with 800 c c of distilled water.

Sulphuric acid (1:1).—Carefully pour, with stirring, 500 c c of H_2SO_4 (specific gravity 1.84) into 500 c c of distilled water.

Acidulated hydrogen sulphide water.—Add 20 c c of HCl (specific gravity 1.19) to 1,000 c c of distilled water and saturate with hydrogen sulphide.

Ammonium thiocyanate solution (2 per cent).—Dissolve 20 g of NH_4CNS in 1,000 c c of distilled water.

Hydrochloric acid (1:3).—Mix 100 c c of HCl (specific gravity 1.19) and 300 c c of distilled water.

Standard zinc solution (0.1 mg of zinc per c c).—Dissolve exactly 0.1 g of Bureau of Standards pure zinc in 5 c c of HCl (specific gravity 1.19) and dilute to exactly 1,000 c c with distilled water.

Potassium ferrocyanide solution.—Dissolve 34.8 g of $\text{K}_4\text{Fe}(\text{Cn})_6 \cdot 3\text{H}_2\text{O}$ in 1,000 c c of distilled water.

METHOD

Dissolve 222.23 g of the sample in 1,100 cc of HNO_3 (1:4), using a 1,300 c c beaker. When the lead is dissolved, transfer the solution to a 2,000 c c graduated flask and add slowly 150 c c of H_2SO_4 (1:1). Cool, fill the flask to the mark, and then pour the solution into a clean 3,000 c c flask pro-

vided with a rubber stopper. Rinse the measuring flask with exactly 50 c c of water, which is equivalent to the volume of lead sulphate which is present. Mix the solution thoroughly by shaking, allow the precipitate to settle and filter through a dry filter until 1,800 c c of filtrate has been obtained.

Place exactly 1,800 c c of filtrate (equivalent to a 200 g charge) in a No. 9 porcelain evaporating dish and evaporate the solution to approximately 100 c c. Transfer the solution to a 600 c c beaker, neutralize with ammonia, and then add 5 c c of HCl (specific gravity 1.19) for every 100 c c of solution. Warm the solution and pass in a rapid current of hydrogen sulphide until it is saturated. Digest for 30 minutes on the steam bath, add an equal volume of water, and again saturate with hydrogen sulphide. Filter and wash with acidulated H₂S water.

Discard the precipitate and evaporate the filtrate in glassware containing no zinc (such as Pyrex) until the volume of the solution is approximately 100 c c.

Neutralize the solution with ammonium hydroxide, add 5 g of citric acid, and warm until the acid is dissolved. Add small portions of calcium carbonate to the hot citric acid solution until about 1 g of calcium citrate has separated and then pass in a rapid current of H₂S as the solution is allowed to cool. Allow the solution to stand for from two to four hours, part of the time on a water bath, until the supernatant liquid is clear.

Collect the precipitate on a filter, wash with a 2 per cent solution of ammonium thiocyanate, and then dissolve the precipitate in hot dilute hydrochloric acid (1:3). If the solution has a reddish color (due to iron) the zinc must be reprecipitated as above. If the solution is clear, evaporate it to dryness on the steam bath, take up the residue in 3 c c of HCl (specific gravity 1.19), add 20 c c of water, and filter if not perfectly clear.

Transfer the solution (note 2) to a 50 c c Nessler jar and dilute to 45 c c. Prepare other Nessler jars containing 3 c c of HCl (specific gravity 1.19), definite volumes of standard zinc solution, and diluted to 45 c c. Add 5 c c of potassium ferrocyanide solution to each jar, mix quickly, and compare the turbidities by viewing longitudinally as the jars are held over a sheet of fine print. Add more of the standard zinc solution from a burette to the jar which approximates the turbidity of the unknown most closely, until the turbidities match each other, and calculate the percentage of zinc on the basis of a 200 g sample or the aliquot portion taken.

NOTES.—1. All glassware that contains zinc must be avoided and in umpire work a blank test should be carried along with the test.

2. The whole solution can be used if the lead contains no more than 0.002 per cent of zinc. If more zinc is present it is best to take such an aliquot portion of the solution as will give approximately 4 mg of zinc and then to add enough HCl to provide 3 c c.

3. For further details concerning the turbidimetric test, consult the "Determination of Small Quantities of Zinc" by Mr. Bodansky, in J. Ind. Eng. Chem., vol. 13, pp. 696-697, 1921.

4. The addition of calcium carbonate with the formation of a precipitate of calcium citrate serves the purpose of giving a clear filtrate, and prevents the loss of colloidal sulphide.

DETERMINATION OF NICKEL AND COBALT

SOLUTIONS REQUIRED

Hydrogen sulphide wash water.—To each 100 c c of hydrogen sulphide water add 20 c c neutral ammonium acetate.

METHOD

Render the filtrate just alkaline with ammonia and saturate with H₂S. Heat to boiling and then make just acid with acetic acid, add 20 c c of neutral ammonium acetate solution, and boil until the sulphides of nickel and cobalt separate out. Filter and wash with warm H₂S wash water. Dry the precipitate and paper in a porcelain crucible and

carefully ignite. If there is an appreciable amount of residue after ignition, dissolve by boiling with 10 c c of aqua regia, wash into a 250 c c beaker, add 10 c c of H₂SO₄ (1:1), evaporate until fumes appear, cool, dilute to 200 c c, make alkaline with ammonia, and add 15 c c of concentrated ammonia. Then electrolyze the solution and weigh the nickel and cobalt as such.

NOTES.—If the amount of nickel and cobalt is small it can be weighed as oxide.

If the filtrate from the nickel and cobalt sulphides shows a brown color, it indicates that the precipitation has not been complete. In this case render the solution ammoniacal and repeat the above process.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

LEAD SAMPLE

(Sample No. 49 is a standard sample of lead prepared and sold by the Bureau of Standards for use by industrial organizations and others as a standard for calibrating pyrometers and temperature-measuring instruments. Each sample is accompanied with a certificate giving the melting point of that particular sample.)

651.1 Lead Ingots.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR PIG LEAD, DESIGNATION B29-23, 1923

PIG LEAD

SCOPE

1. These specifications are intended to cover lead in pig form, made from ore or similar raw materials, by processes of reduction and refining, and not produced from reworked material.

2. Under these specifications pig lead is considered in three grades, as follows: Grade I, corroding lead; Grade II, chemical lead; and Grade III, common lead.

MANUFACTURE

3. The maker shall use care to have each carload of as uniform quality as possible.

CHEMICAL PROPERTIES AND TESTS

(A) Chemical Composition

4. Corroding lead (Grade I) shall conform to the following requirements as to chemical composition:

	Per cent
Silver, not over.....	0.0015
Copper, not over.....	.0015
Copper and silver together, not over.....	.0025
Arsenic, not over.....	.0015
Antimony and tin together, not over.....	.0095
Zinc, not over.....	.0015
Iron, not over.....	.002
Bismuth, not over.....	.05
Lead (by difference).....	99.9330

NOTE.—The maximum limits for bismuth, copper, and silver have been given, but it is not expected that any delivery will contain the maximum of all three.

5. Chemical lead (Grade II) is a designation that has been used for many years in the trade to describe the undesilverized lead produced from southeastern Missouri ores. This lead contains from 0.04 to 0.08 per cent of copper, from 0.005 to 0.015 per cent (1½ to 4½ ounces per ton) of silver and carries less than 0.005 per cent of bismuth.

6. Common lead (Grade III) shall conform to the following requirements as to chemical composition:

(a) Desilverized lead.—	Per cent
Silver, not over.....	0.002
Copper, not over.....	.0025
Arsenic, antimony and tin together, not over.....	.015
Bismuth, not over.....	.25
Iron, not over.....	.002
Zinc, not over.....	.002
Lead (by difference).....	99.7265

(b) Soft Missouri lead.—	Per cent
Silver, not over.....	0.002
Copper, not over.....	.04
Arsenic, antimony and tin together, not over.....	.015
Bismuth, not over.....	.005
Iron, not over.....	.005
Zinc, not over.....	.002
Lead (by difference).....	99.931

(B) Sampling and Analysis

7. (a) In sampling, a carload or less shall be considered a lot or unit. One pig shall be taken to represent each ton of lead in the lot. The pigs

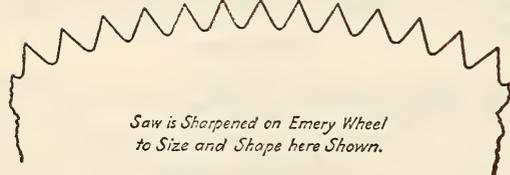

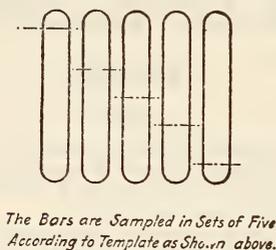

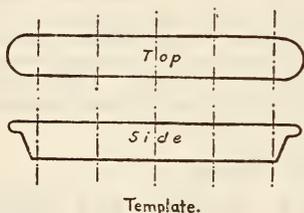

FIGURE 1124.—Saw method of sampling lead

thus taken shall be sampled by one of the following methods:

- (1) By sawing completely through, as illustrated in Figure 1124.
- (2) By punching completely through (if equipment permits) or punching halfway through from two opposite sides, as illustrated in Figures 1125 and 1126.
- (3) By drilling at least halfway through.

(b) Whenever the surface of the pigs to be sampled is dirty, care shall be taken to see that none of the dirt or foreign material gets into the sample.

8. If the sample is taken by sawing, the sawings from all the pigs shall be thoroughly mixed and quartered and the sample for analysis drawn from the mixed material. Care shall be taken that the sawings are free from all extraneous material.

9. If the sample is taken by punching or drilling, the holes shall be spaced along a diagonal line from one corner of the pig to the other. Sampling in this

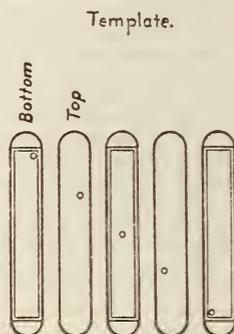

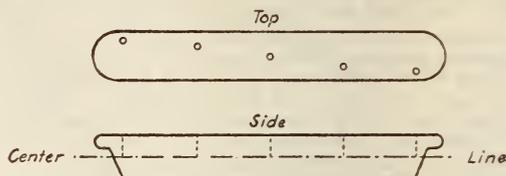

FIGURE 1125.—Punch method of sampling lead

The bars selected as samples are placed in a line with every other bar, bottom side up. The sampling is done according to template in sets of five bars each, as indicated above. The punch must be driven halfway through the bar. In case a larger sample is desired, the bars are turned over and sampled on the other diagonal.

manner may be so arranged that one or more holes are made in each of several pigs of a group in such positions that they represent consecutive positions on the diagonal of a single pig. (See illustration in fig. 1125.)

(a) If punchings are taken, they may be carefully melted in a clean graphite crucible, and either granulated by carefully pouring into distilled water and thoroughly drying, or casting into thin slabs which shall be sawed completely through in several places and the sawdust treated as described in section 8.

(b) If drillings are taken, they may be clipped and mixed, and the sample for analysis drawn from the mixed material; or they may be melted as in the case of punchings.

10. The chemical analysis shall be made in accordance with the standard methods of chemical analysis of pig lead in A. S. T. M. B35 (see 651.0, p. 1272).

MARKING

11. A brand shall be cast or otherwise plainly marked upon each pig by which the maker and grade may be identified.

CLAIMS

(Conform to A. S. T. M. B6-18. See 683.1, p. 1310.)

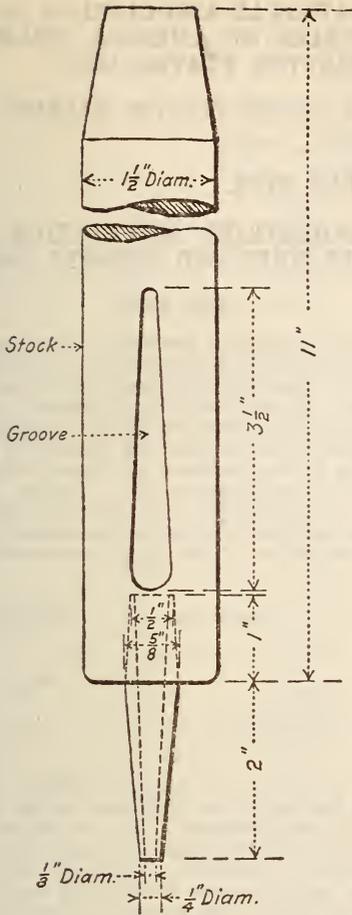

FIGURE 1126.—Sample punch for lead

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR LEAD; PIG, QQ-L-171, JUNE 23, 1931

PIG LEAD

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. Federal specification QQ-M-151, general specifications for metals, of the issue in effect on date of invitation for bids, shall form a part of this specification. (See 600.0, p. 3.)

B. GRADES

B-1. Pig lead shall be of the following grades, as specified: Grade A and grade B.

C. MATERIAL AND WORKMANSHIP

C-1. The material shall be as required in sections D and E.

D. GENERAL REQUIREMENTS

D-1. Pig lead shall be clean and reasonably free from adhering foreign matter.

D-2. Pigs shall weigh from 80 to 110 pounds each, unless otherwise specified.

D-3. Each pig shall be legibly and indelibly marked with a brand, by which the maker may be identified.

E. DETAIL REQUIREMENTS

E-1. The chemical composition of the pig lead shall be respectively as follows:

	Lead (minimum)
Grade A	per cent. 99.9
Grade B	do. 95.0

NOTE.—An analysis of each heat in a delivery shall be furnished by the contractor, showing the percentage of lead present.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. Check analyses shall be made by the inspector, or through him by any Government laboratory or other designated representative, without cost to the contractor.

F-2. From each 2 tons of grade A and from each 10 tons of grade B pig lead presented for inspection, one pig shall be selected by the inspector, and an equal amount of clean, fine drillings or sawdust shall be taken from each pig representing a particular grade. The samples obtained shall be thoroughly mixed. The saw or drill shall penetrate the entire cross section, only the surface material being discarded. The sample representing a delivery shall weigh not less than 15 ounces.

I. NOTES

I-1. Grade A pig lead is intended for foundry use.

I-2. Grade B pig lead is intended for weights, ballasts, etc.

651.2 BAR LEAD.

(See lead ingots above.)

651.3 CASTINGS, LEAD.

651.4 STRIPS AND SLEEVES, LEAD.

(No nationally recognized specifications available.)

651.5 SHEET LEAD.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD THICKNESSES, WEIGHTS, AND TOLERANCES OF SHEET METAL (CUSTOMARY PRACTICE), CIRCULAR NO. 391, MARCH 24, 1931

AMERICAN WIRE GAGE—SHEET LEAD

(See 640.1, p. 1165.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SHEET LEAD, NO. 308, JULY 6, 1925. (CURRENT DESIGNATION: QQ-L-201)

I. GRADES

There shall be two grades of sheet lead, as follows: Grade A and grade B.

II. MATERIAL AND WORKMANSHIP

All sheet lead shall be flat and free from pits, dents, buckles, waves, scratches, grit, foreign matter and porosity. No reclaimed lead shall be used in the manufacture of grade A sheet lead.

III. GENERAL REQUIREMENTS

1. The tolerance for uniformity of thickness of any sheet of grade A sheet lead shall be not greater than 0.003 inch over or under the thickness corresponding to the weight per square foot specified in the contract or order.
2. No sheets will be accepted which show a variation of more than 5 per cent over or under the estimated weight, assuming 1 square foot of lead 1 inch thick to weight 59.5 pounds.
3. The tolerance for widths and lengths shall be one-eighth inch over or under that specified in contract or order.

IV. DETAIL REQUIREMENTS

Chemical properties shall be as shown in the accompanying table.

	Lead, minimum	Anti-tin, and arsenic, maximum	Iron, maximum	Nickel and cobalt, maximum	Bismuth, maximum	Zinc, maximum	Copper, maximum	Silver, maximum
	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
Grade A	99.90	0.015	0.005	0.008	0.005	0.002	0.060	0.005
Grade B	99.50							

V. METHOD OF INSPECTION AND TESTS

From each shipment of 500 pounds or less one chemical analysis consisting of at least 2 ounces shall be taken. The chemical results obtained from this sample shall be in accordance with the grade ordered under Section IV.

VI. PACKING AND MARKING

1. Sheet lead shall be shipped in rolls properly slotted or boxed.
2. Shipments shall be marked with the name of the material, grade, name of contractor or manufacturer, quantity, and contract or order number under which delivery is made.

VII. ADDITIONAL INFORMATION

Sheet lead will ordinarily be ordered on the weight-per-square-foot basis.

651.6 LEAD ALLOYS.

651.8 LEAD PIPE.

LEAD INDUSTRIES ASSOCIATION, LEAD PIPE SIZES AND WEIGHTS, 1932

LEAD PIPE

The Lead Industries Association has approved a new standard of lead pipe sizes which is being adopted by the principal manufacturers as an aid to consumers. In addition to eliminating numerous variations in pipe sizes now found among lead pipe manufacturers, an outstanding feature of the new standard is that all sizes of lead pipe in the A, AA and AAA classifications (or "strong," "extra strong," and "double extra strong") will safely withstand constant cold-water pressures of 50, 75, and 100 pounds per square inch, respectively.

Classification	Safe pressures
	Lbs./in. ²
A or S	50
AA or XS	75
AAA or XXS	100

Heretofore the safe working pressure of these classes of lead pipe has decreased as the diameter of the pipe has increased. The principal changes occur in the wall thicknesses of the sizes from 1 1/4 to 2 inches. Alterations made in sizes below 1 1/4 inches are of minor importance and small in number but have been made to introduce a uniformity which does not now exist among the lead pipe sizes of various manufacturers. The new standard is as follows:

Lead Industries Association standard

Size	Classification		Outside diameter	Weight per foot					
	East	West		Pounds	Ounces				
Inches	E	AQ	Inches 0.520	-----	8				
	D	XL				.549	10

Lead pipe in sizes and weights per running foot other than indicated made to specification.

651.9 MISCELLANEOUS MANUFACTURES OF LEAD.

INTERNATIONAL ASSOCIATION OF ELECTROTYPERS OF AMERICA, STANDARDS IN PRINTING PLATES, 1930

PRINTING PLATES

THICKNESS OF UNMOUNTED ELECTROTYPES

(a) When made for use as "ad plates," 0.105 inches in thickness. Tolerance, plus or minus, 0.002 inch.

(b) When made for "patent bases," and recognizing as a standard base height 0.759 of an inch, plates are to be 0.154 inch thick, with 0.002 plus or minus tolerance.

For regular book printing this will allow an underlay of 0.005 of an inch, and in case the pressman does not wish to place underlays between plate and base (many do insist on this procedure), he can slip a sheet of 0.005-inch tympan paper under the entire form.

Because there are "patent bases" in use that vary quite materially from the suggested standard, plates of special thickness must of necessity be manufactured, but it is the thought to build for the future in the manner suggested.

THICKNESS OF CURVED ELECTROTYPES

Naturally, with rotary presses of many differing cylinder diameters in use, the electrotyper must continue manufacturing curved plates to the specifications of his customers, but it seemed desirable to set up a standard of thickness to enable the press designers to intelligently cooperate with the electrotypers in the future.

Variations in cylinder diameters there will always be, of necessity, but the suggested standard of plate thickness is 0.187 of an inch, with a plus or minus tolerance of 0.002 of an inch, for cylinders of usual diameter; and a thickness of 0.250 of an inch for very large cylinders—also carrying the same tolerance.

BEVEL OF EDGES OF "PATENT BASE" PLATES

The makers of patent bases have apparently pretty well standardized the "hook" angles, so patent base plates should be so beveled that the "hook" will engage exactly with the edge of the plate.

A bevel of 20° (which is 70° from the horizontal) is recommended as standard.

FORMULA OF ELECTROTYPE BACKING METAL

Having in mind that deterioration through "drossing" begins as soon as backing metal is melted, and that what is termed as standard metal shall have certain well-defined characteristics, the recommendation for backing metal is 4 per cent tin, 3 1/2 per cent antimony, 92 1/2 per cent lead.

652. MERCURY

(No nationally recognized specifications available.)

653. NICKEL

653.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF NICKEL, DESIGNATION B41-23, 1923

CHEMICAL ANALYSIS OF NICKEL

DETERMINATION OF IRON

(a) By the cuprous chloride method.—

SOLUTIONS REQUIRED

Cuprous chloride solution.—Place into a 2-liter heavy glass bottle 400 g NaCl, 100 c c HCl and 20 g Cu₂Cl₂. Add 2 liters of warm water; shake well; place into the solution a few copper rods and let stand overnight in a cool place. After shaking, the solution is ready for use.

One cubic centimeter of Cu₂Cl₂ should reduce 0.003 to 0.005 g of iron.

METHOD

Dissolve 10 g of nickel drillings in 100 c c dilute HNO_3 (1:2) in a 600 c c covered beaker, add 1 or 2 g KClO_3 , boil for 30 minutes, add about 100 c c cold water, make alkaline with NH_4OH , and add about 50 c c in excess. Boil a few minutes, filter, wash the precipitate with hot water two or three times.

Redissolve the precipitate in hot HCl (1:3). After the precipitate is dissolved make the solution alkaline with NH_3OH , boil a few minutes, filter, and wash with hot water. Dissolve the $\text{Fe}(\text{OH})_3$ in 30 c c hot HCl (1:3) in a 24-ounce flask, cool, add about 300 c c cold water, and titrate with a standard Cu_2Cl_2 solution using two drops of a saturated solution of KCNS as an inside indicator. Titrate to faint opalescence.

NOTES.—The Cu_2Cl_2 solution should be standardized each time, before using, with 10 c c of standard ferric chloride, to which 5 c c of HCl is added, diluted to 300 c c with cold water, and titrated to faint opalescence. The ferric chloride is made by dissolving 5 g of standard iron wire in 150 c c of HCl (1:1); then 5 g KClO_3 is added to oxidize the iron. Add 1 liter of water and boil until all the free chlorine is driven off. Boil about eight hours, keeping the volume of the solution about 1 liter, then cool and make the solution up to 2 liters.

The above method is used for determining iron in material with less than 5 per cent iron, using a 1 g sample, and when less than 0.5 per cent using a 10 g sample.

The solution gains in Cu_2Cl_2 , and should now and then be diluted with a solution containing 20 per cent of NaCl and 5 per cent of HCl . If the solution should fall off in Cu_2Cl_2 , add about 5 g Cu_2Cl_2 .

(b) *By potassium permanganate method.*—

SOLUTIONS REQUIRED

Standard potassium permanganate solution.—Standardized by means of sodium oxalate (as furnished by the Bureau of Standards).

METHOD

Dissolve the $\text{Fe}(\text{OH})_3$ in dilute H_2SO_4 and reduce the iron with Zn , and then titrate with KMnO_4 .

NOTE.—This method is just as accurate as the cuprous chloride method providing 5 g of the drillings are taken.

DETERMINATION OF CARBON BY THE DIRECT-COMBUSTION METHOD

APPARATUS

Purifying train.—The purifying train should consist of a 5-inch U tube filled with glass beads and moistened with H_2CrO_4 solution, with a loose plug of glass wool in the forward end. This serves to oxidize any SO_2 and to absorb the SO_3 formed from the sulphur in the nickel drillings during combustion. This tube should be washed out daily and fresh glass wool inserted.

Material for lining boats.—The boat may be filled with ignited alumina. Alundum, "RR Alundum, alkali-free, specially prepared for carbon determination," is also recommended.

Catalyzers.—The forward end of the platinum combustion tube should contain a plug of loosely wound platinum gauze, $5\frac{1}{2}$ inches long, completely filling the bore of the tube and a similar roll 2 inches long, fitted with a loop, pushed in after the boat.

Combustion apparatus.—The apparatus may be heated by gas or electricity and combustion tubes may be of platinum, quartz, or porcelain glazed on one or both sides.

Boats or other containers of samples being burned.—These may be of alundum, but porcelain, quartz, clay, and platinum are also recommended.

Absorption train.—It is recommended that the absorption train consist of a Geissler potash bulb with a calcium chloride tube attached.

REAGENTS

Oxygen.—Oxygen of not less than 97 per cent purity is recommended. Endeavor should be made

to obtain oxygen which gives no blank since the correction for or elimination of this is troublesome and uncertain. For the most accurate work the blank should be completely eliminated by the use of a catalyzer before the furnace with a CO_2 absorbent interposed between the furnace and the catalyzer.

Potassium hydroxide solution.—A KOH solution (specific gravity 1.27) should be used as the absorbent for CO_2 but the use of "Ascarite" is also recommended.

FACTORS INFLUENCING RAPID COMBUSTION

Size of particles of sample.—The finer the chips the better, except with samples which burn too vigorously. Particles too coarse to pass a 20-mesh sieve are not recommended, nor long, curly drillings which will not pack closely. Oil, dust, and other foreign matter should be carefully excluded.

Manner of distributing sample in boat.—This is of considerable importance. With all samples, close packing in a small space is conducive to rapid combustion. In the case of samples which burn too vigorously, a satisfactory regulation may sometimes be attained by spreading the sample loosely over the lining in the boat.

Rate of admitting oxygen.—The valve controlling the supply of oxygen must be regulated so as to keep a slow current of gas passing through the absorption apparatus at all times and not to exceed three bubbles in a second.

METHOD

After having properly set up and tested the apparatus, fill the alundum boat with ignited alumina and make a V-shaped depression in the middle with a spatula, pressing the material against the sides of the boat. Ignite the boat and its contents strongly to expel any CO_2 present and burn off any carbonaceous matter that the alumina may contain. Weigh out 3 g of nickel drillings which have been broken down so as to pass through a No. 20 sieve and transfer it to the boat. Introduce the boat into the combustion apparatus. Burn the carbon by starting a slow current of oxygen and lighting one of the burners at the forward end of the tube, and as soon as the tube is red hot increase the heat slowly by lighting the other burners. Nickel is burned at a temperature of $1,200^\circ\text{C}$. for 20 minutes.

DETERMINATION OF SULPHUR

SOLUTIONS REQUIRED

Barium chloride.—A 20 per cent solution should be used.

METHOD

Weigh duplicate 10 g samples of drillings, place each into an 800 c c casserole, and treat as follows:

Add 3 g of KClO_3 , cover, and then add 200 c c strong HNO_3 . Place on steam bath until action has ceased and then evaporate to dryness on the hot plate. Cool and then add 50 c c HCl , and again evaporate to dryness. Repeat this operation. Take up with 150 c c water, add 8 c c HCl , heat to boiling, filter, and wash, taking care that the filtrate and washings do not exceed 300 c c in volume. Heat the filtrate to boiling, add 25 c c of 20 per cent BaCl_2 solution and allow it to stand in a warm place overnight. Filter through a small double ashless filter paper and wash with very dilute HCl , and finally with hot water. Ignite in a small platinum crucible and then heat to bright redness for 20 minutes. Cool and weigh the BaSO_4 .

NOTES.— $\text{BaSO}_4 \times 0.1373 = \text{sulphur}$.

Run a blank analysis, that is, take an 800 c c casserole, add to it all the reagents and subject the contents to the same operations as the samples of drillings at the same time. Deduct any BaSO_4 obtained from the result of the actual assay. If this blank amounts to 0.0040 g, the reagents are unfit for the above analysis and the determinations should be repeated with other reagents.

DETERMINATION OF NICKEL AND COBALT

(a) *By electrolysis.*—

APPARATUS

Electrodes.—It is recommended that the cathode consist of a platinum cylinder 50 by 38 mm in diameter; with stem diameter $1\frac{1}{2}$ mm and height 127 mm.

The anode should consist of a spiral of iron wire $1\frac{1}{2}$ mm in diameter.

METHOD

Dissolve 2 g of nickel drillings in 30 c c of HNO_3 (1 : 1) in a 400 c c covered beaker, add 30 c c HSO_4 (1 : 1), and evaporate until fumes of H_2SO_4 are given off copiously. Dilute with 250 c c of water. Boil, cool, and precipitate the copper with H_2S . Filter into a 600 c c plain beaker, wash the precipitate with hot water, boil the filtrate gently until about one-third of the volume is evaporated to remove the H_2S . Add 10 c c H_2O_2 to oxidize the iron, cool, add 100 c c NH_4OH water, then plate out the nickel and cobalt on a weighed platinum cylinder using a current of 0.6 ampere. It takes about 14 hours to plate out the nickel.

Make a replate on solution to recover the small amount of nickel which is left.

To make the replate, remove the beaker, add H_2SO_4 to the solution until acid, then add about 5 c c in excess, cool, add 60 c c NH_4OH water, then plate out nickel with a current of 1 ampere for two hours. Wash the cathode with water and alcohol, heat over an alcohol lamp, and when cool weigh. Increased weight equals nickel and cobalt.

The cathode on which the nickel and cobalt have been plated is placed in a 125 c c plain beaker. Dissolve the nickel and cobalt in dilute HNO_3 and remove the cathode. Evaporate the solution to a syrupy consistency, cool, add 25 c c water, boil, neutralize with K_2CO_3 solution, make slightly acid with 50 per cent acetic acid, then add 10 c c of 50 per cent acetic acid and make the volume up to 50 c c. In another beaker, dissolve 25 g KNO_2 in 50 c c water and make acid with acetic acid. Add the nitrite solution to the solution containing the nickel and cobalt, while boiling. Let stand in a warm place overnight. Filter and wash the precipitate with a 5 per cent KNO_2 solution made acid with acetic acid. The precipitate is transferred to a 300 c c beaker by washing with hot water and dilute H_2SO_4 , add 20 c c H_2SO_4 (1 : 1) and evaporate until fumes of sulphuric acid are given off copiously. Dilute with 150 c c water. Boil, cool, and add 100 c c NH_4OH water. Plate overnight, using a current of 0.5 ampere. Weigh as cobalt.

Subtract the percentage of cobalt found from the percentage of cobalt and nickel. The difference is nickel.

NOTE.—When manganese is present, a solution containing 30 c c of water and 2 g of Na_2O_2 is added to the alkaline solution just before plating out the nickel and cobalt and also just before making the replate on the solution.

653.1 NICKEL METAL, INGOTS, AND SHOT.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR NICKEL, DESIGNATION B39-22, 1922

NICKEL

SCOPE

1. (a) These specifications cover four grades of virgin nickel; that is, nickel made from ore or matte or similar raw material by refining processes, and not produced from melted metal, as follows: Electrolytic; X shot; A shot; ingot.

(b) The uses for which these four grades of virgin nickel are intended to be especially suitable are as follows:

Electrolytic, suitable for the manufacture of the highest grades of malleable alloys.

X shot, suitable for the manufacture of nonferrous alloys and nickel steel.

A shot, suitable for the manufacture of anodes.

Ingot, suitable for the manufacture of open-hearth and electric-furnace nickel steel.

MANUFACTURE

2. The maker shall use care to have each carload of as uniform quality as possible.

CHEMICAL REQUIREMENTS AND TESTS

3. The nickel shall conform to the following chemical requirements:

(a) *Electrolytic.*—

	Per cent
Nickel (including cobalt), not less than.....	99.50
Sulphur, not over.....	.02
Carbon, not over.....	.10
Iron, not over.....	.25

(b) *X shot.*—

	Per cent
Nickel (including cobalt, (not less than.....	98.90
Sulphur, not over.....	.05
Carbon, not over.....	.25
Iron, not over.....	.60

(c) *A shot.*—

	Per cent
Nickel (including cobalt), not less than.....	97.75
Sulphur, not over.....	.070
Carbon, not over.....	.75
Iron, not over.....	.90

(d) *Ingot.*—

	Per cent
Nickel (including cobalt), not less than.....	98.50
It shall be reasonably free from surface corrosion and adhering foreign matter.	

4. (a) *Electrolytic.*¹⁵—In all shipments cathodes shall be taken representing 5 per cent of the total weight shipped, but in no case shall the number of cathodes taken as samples be less than three.

The cathodes taken as samples shall be drilled by templet. In the case of a shipment represented by a sufficient number of cathodes, one line of holes on the templet shall be used for each cathode; that is, cathode No. 1 shall be drilled at the base; cathode No. 2 shall be drilled with one line of hole farther up, etc., the resultant sample being a representation of the total sample of one whole cathode. In cases where the cathodes in the sample are less than the number of lines of holes in the templet, the sample shall be drilled, using sufficient, lines and fractions thereof to insure at all times a sample representative of one whole cathode. In all cases the drilling shall be done through the cathodes. The drillings obtained in the above manner shall be thoroughly mixed and divided by split sampler until the sample is about 100 g.

(b) *X shot.*—In receiving shipments of shot, the following method of sampling shall govern: All barrels from the same melt shall be opened and a sample taken from each barrel—top, center, and bottom. These barrel samples shall be mixed, quartered down to 8 ounces, and broken into small pieces. This broken sample shall then be quartered down to 100 g, only material passing through a No. 20 sieve being used.

(c) *A shot.*—The sample shall be taken as described in paragraph (b).

¹⁵ The requirement for carbon in electrolytic nickel covers both contained and mechanically attached carbon from the starting sheet; and it should be recognized that while lower values can be obtained by separating the cathode sheets from the starting sheet and pickling before drilling, this method of taking the sample is outside of these specifications.

(d) *Ingot*.—Ingot nickel shall be sampled according to carloads whenever possible. From each carload 50 ingots shall be taken at random. In case of less than carload shipments, 5 per cent of the ingots shall be taken as a sample, but in no case shall the number of ingots taken as a sample be less than 10. (The drilling of the ingots is identical with that for electrolytic cathodes, specified above.)

METHODS OF ANALYSIS

5. The chemical analysis shall be made in accordance with the standard methods of chemical analysis of nickel. (See A. S. T. M. B41 (653.0, p. 1279).)

PACKAGES

6. All packages and barrels shall be marked with a brand by which the maker and grade can be identified.

CLAIMS

(Conform with specifications for spelter in A. S. T. M. B6. See 633.1, p. 1310.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR NICKEL FOR REMELTING, NO. 371, JANUARY 25, 1926. (CURRENT DESIGNATION: QQ-N-301)

NICKEL FOR REMELTING

GENERAL SPECIFICATIONS

1. General specifications for metals, Federal Specifications Board specification No. 339a, (current designation: QQ-M-151), in effect on date of proposal, shall form part of this specifications. (See 600.0, p. 3.)

GRADES

2. This specification covers three grades of nickel as follows: Grade A, grade B, and grade C.

MATERIAL

3. The material shall be made by refining processes, or may be produced from remelted metal.

GENERAL REQUIREMENTS

4. Nickel shall be furnished in cathodes, plates, pigs, ingots, cubes, or shot form, as specified in the contract or purchase order, except grade A, which shall be furnished in cathodes only.

5. Nickel shall be reasonably free from surface oxidation and adhering foreign matter.

DETAIL REQUIREMENTS

(The chemical requirements in respect to percentages of nickel, iron, carbon, and sulphur for grades A, B, C, and are the same as for electrolytic, X shot, and A shot, respectively, in A. S. T. M. B39, except for slight difference in content of sulphur in B and iron in A given above. This specification also provides for the following additional components:)

Grade	Copper, maximum	Silicon, maximum	Cobalt, maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
A	0.10	0.00	0.60
B	.25	.15	1.00
C	.25	.25	1.00

METHOD OF INSPECTION AND TEST

6. An analysis of each shipment of nickel shall be furnished by the contractor, showing the percentages of the elements specified.

7. In the case of shot or cubes, representative samples shall be taken from at least 10 per cent of the containers in a lot or shipment, consisting of at least 4 ounces for every 150 pounds. In the case of cathodes, plates, pigs, or ingots, a sample shall be obtained from one piece for every 5,000 pounds or fraction thereof of metal, although not more than 10 pieces need be taken from a carload.

PACKING AND MARKING

8. Nickel cathodes, plates, pigs, or ingots may be shipped in bulk, in sealed box cars unless otherwise specified.

9. Nickel cathodes, plates, pigs, or ingots shall be legibly and indelibly marked with the maker's trade-mark or brand, and the grade number.

10. Nickel shot and cubes when loaded for shipment shall be packed in bags, boxes, barrels, or other suitable containers unless otherwise specified.

11. Containers shall be legibly and indelibly marked with the manufacturer's name, trade-mark, or brand; the weight, grade number, and contract or purchase order number.

NOTES.—Grade A nickel is furnished in the form of the original cathode, and consists of thin plates with a peculiar warty surface on one side.

Grades B and C, while usually furnished in the form of the original cathode, may be procured in the form of cubes or ingots.

654.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD RULES GOVERNING THE PREPARATION OF MICROGRAPHS OF METALS AND ALLOYS, DESIGNATION E2-30, 1930

MICROGRAPHS

(See 600.1, p. 20.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR COPPER-NICKEL ALLOY RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, No. 585, DECEMBER 8, 1928. (CURRENT DESIGNATION: QQ-C-541)

COPPER-NICKEL ALLOY RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS

GENERAL SPECIFICATIONS

1. United States Government general specification for metals, Federal Specifications Board speci-

fication No. 339a (current designation: QQ-M-151), in effect on date of issuance of proposals, shall form part of this specification. (See 600.1 p. 3.)

GRADE

2. This specification covers one grade of copper-nickel alloy in the form of:

- Rods. (See also 654.53.)
- Bars. (See also 654.53.)
- Shapes. (See also 654.53.)
- Plates. (See also 654.52.)
- Sheets. (See also 654.52.)
- Strips. (See also 654.52.)

MATERIAL

3. The material shall be copper-nickel alloy containing approximately 65 per cent nickel and 28 per cent copper, and shall be manufactured from raw material of good quality. Scrap of known and approved composition may be used.

4. The material shall be uniform in quality, clean, sound, smooth, commercially straight or flat, and free from pipes, slivers, laps, cracks, twists, seams, scale, damaged ends or edges, buckles, or other injurious defects.

5. The material may be furnished in the hot finished or cold finished annealed condition, unless otherwise specified.

DETAIL REQUIREMENTS

6. The chemical properties shall be as specified in Table 1.

TABLE 1.—Chemical properties

Copper, minimum	Nickel, minimum	Iron, maximum	Aluminum, maximum	Manganese, maximum	Carbon, maximum	Silicon, maximum
Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent
23.0	60.0	3.5	0.5	3.5	0.3	0.5

7. The physical properties shall be as specified in Table 2.

TABLE 2.—Physical properties

Diameter or thickness (in inches)	Tensile strength, minimum	Yield point, minimum	Elongation in 2 inches, minimum	Cold bend °
Rods and bars:				
Rounds or squares—	<i>Lbs./in.²</i>	<i>Lbs./in.²</i>	<i>Per cent</i>	<i>Degrees</i>
¼ and under.....	75,000	30,000	30.0	180
Over ¼ to 1, inclusive.....	80,000	40,000	30.0	180
Over 1 to 2, inclusive.....	85,000	48,000	30.0	180
Over 2 to 3.5, inclusive.....	80,000	35,000	35.0	180
Over 3.5.....	80,000	40,000	32.0	180
Hexagons or rectangles, all sizes.....	80,000	40,000	30.0	180
Shapes, plates, sheets, and strips:				
Under 0.25.....	(b)	(b)	(b)	(b)
0.25 and over.....	60,000	25,000	25.0	120

^a Radius equal to diameter or thickness of test bar.
^b No requirements.

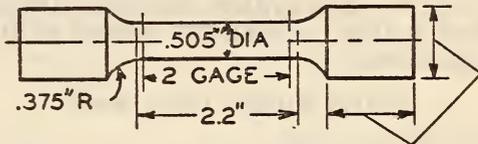

8. Material in which injurious defects are revealed by manufacturing operations subsequent to acceptance shall be rejected. It shall be replaced by the contractor without cost to the purchaser.

METHODS OF INSPECTION AND TESTS

9. An analysis of each melt or lot of material shall be furnished by the contractor, showing the percentages of the elements designated.

10. Check analysis may be made by the inspector, or through him by any Government laboratory or other designated representative, and without cost to the contractor.

11. Samples for check analyses shall be obtained from each lot of 5,000 pounds or fraction thereof of each size in the shipment. In the case of thin sheets and strips, at least 10 representative pieces shall be taken. In all other cases at least four representative pieces shall be taken. From the pieces so taken, equal amounts of clean chips shall be

THESE DIMENSIONS TO SUIT FIXTURE IN TESTING MACHINE IN SUCH A WAY THAT THE LOAD SHALL BE AXIAL.

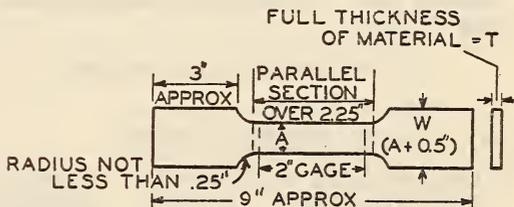

FIGURE 1127.—Standard tension test specimen

obtained. These chips shall be combined and thoroughly mixed. The inspector shall forward for analysis not less than 2 ounces of the resultant mixture.

12. Unless otherwise specified in the contract or purchase order, one tension and one hammer test shall be made for every lot of 5,000 pounds or fraction thereof of each size in the shipment.

13. All rods and bars shall withstand being hammered hot to a fine point. Such test shall be made when deemed advisable by the inspector.

14. All rods, bars, and shapes may be pulled in full size when practicable. When a machined specimen becomes necessary, enough metal may be removed from the pull section to meet the limitations of the testing machine, or the specimen may be machined to the form and dimensions of Figure 1127.

FOR MATERIAL UP TO 0.5" THICK, A = 0.5
 FOR MATERIAL OVER 0.5" THICK, A = T

FIGURE 1128.—Standard flat tension test specimen

15. For rods, bars, and shapes, up to 1½ inches in diameter or thickness, the axis of the test specimen shall coincide with the central axis of the piece; over 1½ inches, the axis shall be located midway between the center and surface of the piece.

16. The test specimen for plates, sheets, and strips shall be machined to the form and dimensions of Figure 1128, and may be taken either with or across the grain.

(Packing and marking of shipments are identical with that for copper rods, bars, shapes, plates, sheets, and strips given under 641.0, p. 1172.)

NOTES.—Round, square, hexagonal, etc., sections are classed as rods. Rectangular sections having greater width than thickness are classed as bars. All other sections are classed as shapes.

Copper-nickel alloy, rolled or shaped, is suitable for parts requiring great strength or incorrodibility, such as propeller blade bolts, air pump and condenser bolts, pump rods, and sheathing for airplane propellers. For purposes of calculation, the weight per cubic inch of this material may be taken as 0.323 pound.

654.1 INGOTS AND SHOT, NICKEL-COPPER METAL.

(No nationally recognized specifications available.)

654.2 BARS, NICKEL-COPPER.

654.5 MANUFACTURES OF NICKEL-COPPER.**654.51 CASTINGS AND FORGINGS, NICKEL-COPPER.**

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 42, WHITE NICKEL BRASS, MARCH, 1922

WHITE NICKEL BRASS

(See 655.9, p. 1288.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR COPPER-NICKEL ALLOY CASTINGS NO. 578, JUNE 28, 1928. (CURRENT DESIGNATION: QQ-C-551)

COPPER-NICKEL ALLOY CASTINGS

(In respect to general specifications, general requirements, methods of inspection and tests, and special packing provisions, this specification is substantially the same as F. S. B. QQ-B-691. (See 646.41, p. 1252.) It differs from QQ-B-691 in making no reference to encircling each repair with a ring of white paint, and in the following additional particulars:)

GRADE

1. This specification covers one grade of copper-nickel alloy in the form of castings.

GENERAL REQUIREMENTS

2. The castings shall be a copper-nickel alloy, containing approximately 65 per cent nickel and 28 per cent copper.

DETAIL REQUIREMENTS

3. The chemical properties shall be as follows:

Copper, minimum	Nickel, minimum	Iron, maximum	Aluminum, maximum	Manganese, maximum	Carbon plus silicon, maximum
Per cent 23.0	Per cent 60.0	Per cent 3.5	Per cent 0.5	Per cent 3.5	Per cent 2.0

4. The physical requirements are as follows:

Tensile strength, minimum	Yield point, minimum	Elongation in 2 inches, minimum
Lbs./in. ² 65,000	Lbs./in. ² 32,500	Per cent 25.0

METHODS OF INSPECTION AND TESTS

5. Check analyses of the castings may be made by the inspector, or through him by any Government laboratory or other designated representative, without cost to the contractor.

6. The drillings for check analyses of castings shall be taken from the test coupons or from representative castings selected by the inspector. The drillings shall be taken from sound metal below the surface.

7. The test coupon or separately cast bar shall be of the dimensions shown in Figure 1123. The test specimen machined therefrom shall conform to the dimensions shown in Figure 129 (p. 247) except that the length of the shank shall be 2.25 inches instead of 2.2 inches.

PACKING AND MARKING

8. All patterns furnished by the purchaser shall be properly cared for, and when being returned to the purchaser shall be suitably boxed or crated by the contractor to prevent damage or breakage. Before a shipment from the foundry, the patterns shall be inspected by a representative of the purchaser, and report shall be made by him if they are found to be in an unsatisfactory condition.

654.52 SHEETS AND PLATES, NICKEL-COPPER.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, NATIONAL BUREAU OF STANDARDS, STANDARD THICKNESSES, WEIGHTS, AND TOLERANCES OF SHEET METAL (CUSTOMARY PRACTICE), CIRCULAR NO. 391, MARCH 24, 1931

(See 640.1, p. 1165.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR COPPER-NICKEL ALLOY RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, NO. 585, DECEMBER 8, 1928. (CURRENT DESIGNATION: QQ-C-541)

COPPER-NICKEL ALLOY PLATES, SHEETS, STRIPS

(For general specifications, grade, material, detail requirements, physical properties, methods of inspection and tests, packing and marking, and notes, see 654.0, p. 1282. Otherwise the specifications for copper-nickel alloy plates, sheets, and strips are identical with those for copper plates, sheets, and strips in F. S. B. QQ-C-501 (see 641.21, p. 1177), with the following exceptions:

1. Sheets and strips in long length shall not exhibit sidewise bend or curvature in excess of 0.25 inch per foot.

2. The permissible variations in thickness for plates, sheets, and strips shall be as shown in Table 1.

TABLE 1.—Permissible variations in thickness of plates, sheets, and strips

Thickness (in inches)	Widths	Permissible variations
0.02 and less	Inches All widths	Inch ±0.002
Over 0.02 to 0.04, inclusive	do.	± .003
Over 0.04 to 0.065, inclusive	do.	± .004
Over 0.065 to 0.08, inclusive	do.	± .005
Over 0.08 to 0.1, inclusive	do.	± .006

Over 0.12 to 0.25, inclusive	do.	± .008
		Per cent
Over 0.25	{ 48 and less Over 48 to 60, inclusive. Over 60.	{ ±5 +5 -7 +5 -8

654.53 RODS, NICKEL-COPPER.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION NO. 269A, FOR RODS, WELDING, NONFERROUS, FOR GAS WELDING, QQ-R-571, MAY 3, 1932

COPPER-NICKEL ALLOY RODS

(For general specifications, types, material, general requirements, detail requirements, methods of inspection, tests, and chemical analysis; packing and marking of shipments; and notes see 600.0, p. 3.)

1. Copper-nickel alloy rods may be used for general welding of copper-nickel alloy castings and gray-iron castings.

2. Welding rods shall conform to the following chemical requirements:

Type F

	Per cent
Copper, minimum	23.0
Nickel, minimum	60.0
Iron, maximum	3.5
Aluminum, maximum	.5
Manganese, maximum	3.5
Carbon, maximum	.3
Silicon, maximum	.5

3. Standard sizes of copper-nickel alloy rods for gas welding are:

Diameter (inch)..... $\frac{1}{8}$, $\frac{3}{16}$, and $\frac{1}{4}$

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR COPPER-NICKEL ALLOY RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS, NO. 585, DECEMBER 8, 1928. (CURRENT DESIGNATION: QQ-C-541)

COPPER-NICKEL ALLOY RODS, BARS, SHAPES

(For general specifications, grade, material, detail requirements, physical properties, methods of inspection and tests, packing and marking, and notes, see 654.0, p. 1282. Otherwise the specifications for copper-nickel-alloy rods, bars, and shapes are identical with those for copper rods, bars, and shapes in F. S. B. QQ-C-501 (see 642.11, p. 1180) with the following exceptions:)

PERMISSIBLE VARIATIONS IN DIAMETER OR THICKNESS OF RODS AND BARS

1. Unless otherwise specified, rods and bars, measured on their diameters or between parallel faces, shall not vary from the specified dimensions by more than the amount shown in Table 1.

TABLE 1.—Permissible variations in diameter or thickness of rods and bars

Diameter or thickness (in inches)	Permissible variations	
	Plus	Minus
Rounds and rectangles:	Inch	Inch
1 and less	0.016	0.016
Over 1 to 2, inclusive	.031	.016
Over 2 to 4, inclusive	.047	.031
Over 4	.125	.063
Hexagons and squares, hot-rolled:		
1.2 and less	.016	.016
Over 1.2	.031	.031
Hexagons and squares, forged:		
1.5 and less	.031	.016
Over 1.5	.031	.031

2. Unless exact lengths are specified, rods and bars over 1 inch in diameter or thickness shall be furnished in stock lengths as follows (but in no case shall more than 80 per cent of lengths shorter than the maximum specified below be accepted):

Over 1 to 2 inches, inclusive, diameter or thickness, 8 to 20 feet.

Over 2 to 3 inches, inclusive, diameter or thickness, 6 to 15 feet.

Over 3 inches diameter or thickness, as specified in the contract or purchase order.

3. For shapes, the permissible variation shall be as specified in the contract or purchase order.

654.54 WIRES AND CABLES, NICKEL-COPPER.

(No nationally recognized specifications available.)

654.59 MISCELLANEOUS MANUFACTURES OF NICKEL-COPPER.

UNDERWRITERS' LABORATORIES, STANDARD FOR WINDOW CLEANERS' BELTS AND ANCHORS, MARCH 30, 1930

DESIGN AND CONSTRUCTION

BELTS

Window cleaners' belts shall be so designed and constructed that they may be readily put on by the wearer and will allow the wearer the requisite degree of freedom in use.

Belt hardware or fittings shall be forgings made of brass, Monel metal, or a copper-nickel alloy equivalent to Monel metal in physical properties. Belt terminal fittings shall be provided with a locking device to prevent accidental removal from anchors in service.

NOTE.—Brass forgings shall contain not less than 53 per cent nor more than 62 per cent copper with not less than 36 per cent zinc. Material used for such forgings shall be extruded brass.

Copper-nickel alloys shall show the following chemical analysis:

	Per cent
Copper, not less than.....	23
Nickel, not less than.....	60
Iron, not more than.....	3.5
Aluminum, not more than.....	.5
Manganese, not more than.....	3.5
Carbon, not more than.....	.3
Silicon, not more than.....	.5

Ropes or straps secured to eyes or rings shall be provided with metal thimbles to prevent wear. Rope, if used, shall be not smaller than ½-inch yacht manila or its equivalent.

Belts shall be made with a sufficient degree of uniformity so that parts will be interchangeable. Each belt shall be marked so as to identify the manufacturer and the model or type.

ANCHORS

Anchors shall be forgings made of brass, Monel metal, or copper-nickel alloy as specified in "NOTE" above, under belts.

Anchors shall be of the twin or double-head type designed for attachment to window frames or mullions. Anchors for wood frames or mullions shall be designed for attachment by bolts not less than three-eighths inch diameter made of the same material as the anchor and provided with washers and lock nuts or equivalent. Anchors for metal frames shall be designed for attachment by at least two machine screws not less than five-sixteenths inch in diameter and of the same material as the anchor. Each anchor shall be marked so as to identify the manufacturer and his type or model. The identification marking shall be visible after installation.

PERFORMANCE TESTS

The waist band, ropes of the belt, and all inter-connecting parts shall be separately subjected to tension tests and shall show a strength of at least 1,000 pounds.

Anchors shall withstand a load of at least 1,500 pounds applied by a special test terminal loaded in a direction 30° from the face and 30° to the side of the vertical center line of the anchor.

(The full text of this standard includes requirements on the installation of anchors on metal window frames and on wooden window frames.)

655. NICKEL - COPPER - ZINC ALLOYS (NICKEL SILVER AND GERMAN SILVER)

655.0 GENERAL ITEMS.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SILVER, NICKEL, RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS (GERMAN SILVER), NO. 468, JANUARY 25, 1927. (CURRENT DESIGNATION: QQ-N-321)

GERMAN SILVER RODS, BARS, SHAPES, PLATES, SHEETS AND STRIPS

(Requirements covering general specifications conform to F. S. B. QQ-M-151 (see 600.0, p. 3). Material and workmanship, packing and marking, and notes conform to F. S. B. QQ-C-501 (see 641.0, p. 1172). It differs from the latter in that no tests are required—only the usual optional check analyses—and in the following respects:)

GRADE

1. This specification covers two grades of nickel-silver, grades A and B, in the following forms:

- Rods. (See also 655.5.)
- Bars. (See also 655.5.)
- Shapes. (See also 655.5.)
- Plates. (See also 655.2.)
- Sheets. (See also 655.2.)
- Strips. (See also 655.2.)

DETAIL REQUIREMENTS

2. The chemical requirements are as shown in Table 1.)

TABLE 1.—Chemical composition

Grade	Cop- per	Zinc	Nick- el	Iron, maxi- mum	Sul- phur, maxi- mum	Lead	Man- ga- nese, maxi- mum	Other impur- ities, includ- ing alu- minum
A	Per cent 60-67	Per cent Remain- der.	Per cent 15-19	Per cent 0.35	Per cent 0.03	Per cent 0.20 (max.)	Per cent 0.50	Per cent 0.25
B	Per cent 60-67	Per cent Remain- der.	Per cent 15-19	Per cent .50	Per cent .03	Per cent 0.80-1.20	Per cent .50	Per cent .25

¹ Grade B shall contain from 0.80 to 1.20 per cent lead.

PHYSICAL PROPERTIES

3. Nickel silver shall conform to such requirements as to physical properties as may be specified in the contract or purchase order.

NOTES.—Nickel silver, or German silver, is suitable for trimmings and other parts requiring a metallic white finish and resistance to atmospheric corrosion. It is very ductile, can be rolled, hammered, stamped, or drawn, and at the same time is hard, tough, and not easily corroded. For purposes of calculation, the weight per cubic inch may be taken as 0.316 pound.

Grade A nickel silver machines readily with a fine finish, but will yield curly chips, as does naval brass. Grade B nickel silver is free-cutting, similar to commercial or leaded brass, and is particularly suited to screw-machine work.

The material covered by this specification is not intended for electrical resistance work.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR BUILDERS' HARDWARE (NONTEMPLATE), FF-H-101, AUGUST 19, 1930

BUILDERS' HARDWARE (NONTEMPLATE)

(For applicable Federal specifications; types, grades, and classes; material and workmanship; general requirements; detail requirements; packaging, packing, and marking; notes; and table of standard finishes. See 617.0, p. 978. For chromium plating nickel plating, and zinc coatings; and methods of inspection and tests. See 600.3, p. 70.)

(Specific commodities, such as locks, latches, hinges, bolts, etc., will be found under their respective commodity designations. For a list of these commodities see under detail requirements in 617.0, p. 979.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SILVER, NICKEL, RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS (GERMAN SILVER), NO. 468, JANUARY 25, 1927. (CURRENT DESIGNATION: QQ-N-321)

GERMAN SILVER SHAPES

(See 655.5, p. 1288, including references therein to various Federal specifications.)

655.4 STRIPS, NICKEL-COPPER-ZINC ALLOY.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SILVER, NICKEL, RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS (GERMAN SILVER), NO. 468, JANUARY 25, 1927. (CURRENT DESIGNATION: QQ-N-321)

GERMAN SILVER STRIPS

(See 655.2, p. 1287, including references therein to various Federal specifications.)

655.5 WIRES AND RODS, NICKEL-COPPER-ZINC ALLOY.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR SILVER, NICKEL, RODS, BARS, SHAPES, PLATES, SHEETS, AND STRIPS (GERMAN SILVER), NO. 468, JANUARY 25, 1927. (CURRENT DESIGNATION: QQ-N-321)

GERMAN SILVER RODS, BARS, SHAPES

(Requirements covering general specifications conform to F. S. B. QQ-M-151. See 600.0, p. 3.

For grade, chemical composition, physical properties, and notes on German silver, see F. S. B. QQ-N-321 under 655.0, p. 1286. Material and workmanship, packing and marking, and notes conform to F. S. B. QQ-C-501 (see 641.0, p. 1172), except that in QQ-N-321 there is no reference to manufacture, hammering hot to a fine point, and forging stock.)

655.6 HOLLOW AND STAMPED WARE, NICKEL-COPPER-ZINC ALLOY.

AMERICAN RAILWAY ASSOCIATION, TELEGRAPH AND TELEPHONE SECTION, SPECIFICATIONS FOR FUSE BLOCK ARA-1-A AND FUSE BLOCK ARA-2-A, JANUARY, 1924

FUSE BLOCKS

(Fuse blocks are classifiable under electrical supplies and as such are not included in this publication. See remarks under 642.12, p. 1181. However the metal requirements specified in the A. R. A. specification are as given herewith.)

CLIPS

The clips shall be made of No. 21 A. W. G. spring German silver which shall show a hardness of from 70 to 82 points when measured by the Shore scleroscope (magnifier hammer). They shall be made exactly according to the dimensions shown on the drawing with the grain of the metal running in the direction of the longest dimension. An analysis of the composition of the German silver used shall show the following.

	Minimum	Maximum
	<i>Per cent</i>	<i>Per cent</i>
Copper.....	53.50	56.50
Nickel.....	16.50	19.50
Zinc.....	25.50	28.50
Iron.....35

655.9 MISCELLANEOUS SPECIFICATIONS FOR NICKEL-COPPER-ZINC ALLOY.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 42, WHITE NICKEL BRASS, MARCH, 1922

WHITE NICKEL BRASS

1. Composition in percentage.—

	Per cent
Copper.....	55.00-64.00
Nickel, minimum.....	18.00
Iron, maximum.....	.35
Aluminum.....	None.
Other impurities.....	.25
Zinc.....	Remainder.

2. General information.—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ²	30,000
Elongation in 2 inches, or proportionate gage length.....	per cent.....	20

3. This brass is intended for use for trimmings or other parts requiring a metallic-white finish. The higher the nickel content, the more permanent will be the color.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, SPECIFICATION FOR PLUMBING FIXTURES (FOR LAND USE), NO. 448, NOVEMBER 22, 1926. (CURRENT DESIGNATION: FF-P-451.)

(See 617.73, p. 1062.)

PLUMBING FIXTURES (FOR LAND USE)

656. NICKEL-CHROMIUM ALLOY

656.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE METHODS OF CHEMICAL ANALYSIS OF METALLIC MATERIALS FOR ELECTRIC HEATING, DESIGNATION B71-29T, 1929

CHEMICAL ANALYSIS OF METALLIC MATERIALS FOR ELECTRIC HEATING

DETERMINATION OF NICKEL

SOLUTIONS REQUIRED

Concentrated sulphuric acid (specific gravity 1.84).—

Concentrated nitric acid (specific gravity 1.42).—

Concentrated hydrochloric acid (specific gravity 1.19).—

*Dilute sulphuric acid (1:1).—*Slowly stir 100 c c of H₂SO₄ (specific gravity 1.84) into 100 c c of water.

*Dilute sulphuric acid (1:99).—*Slowly stir 10 c c of H₂SO₄ (specific gravity 1.84) into 990 c c of water.

Tartaric acid (20 per cent).—

Ammonium hydroxide (specific gravity 0.90).—

*Dilute acetic acid (1:3).—*Mix 1 c c of acetic acid (specific gravity 1.04) and 3 c c of water.

*Nitrohydrochloric acid. —*Mix 10 c c of concentrated HNO₃ (specific gravity 1.42), 30 c c of concentrated HCl (specific gravity 1.19), and 40 c c of water.

*Ammonium bisulphite. —*Dissolve 1 g of ammonium bisulphite in 5 c c of hot water.

*Sodium dimethylglyoxime. —*Dissolve 3 g of dimethylglyoxime in 100 c c of NaOH (3 per cent), made fresh each time used.

METHOD

Dissolve exactly 1 g of the alloy sample in 20 c c of nitrohydrochloric acid in a covered 600 c c beaker. Add 20 c c of dilute H₂SO₄ (1:1) and evaporate the liquid carefully to fumes of sulphur trioxide. When the beaker and its contents have cooled, add 100 c c of water and allow the solution to digest at a low heat until all salts have dissolved. Filter the solution on a 9 cm paper to remove any silica, and wash the paper and residue thoroughly with hot water or, if an insoluble residue is present, wash with dilute H₂SO₄ (1:99). Ignite the precipitate at a low heat, and treat with 2 c c of HF, and several drops of concentrated H₂SO₄ in a platinum crucible, and evaporate to dryness. Fuse the residue with a little sodium carbonate, dissolve in HCl and add to the main nickel solution.

Transfer the nickel solution to a 250 c c graduated flask and dilute to the mark with cold water. Mix and draw off exactly 50 c c by means of an accurately calibrated pipette, and transfer this aliquot portion to a 600 c c beaker. This aliquot portion represents 0.2 g of the original sample. Add 25 c c of a 20 per cent solution of tartaric acid (enough to hold all the iron and chromium in solution), make the solution alkaline with NH₄OH, and then make it acid with an excess of 15 c c of concen-

trated HCl (specific gravity 1.19). Add 35 c c of a freshly prepared solution of sodium dimethylglyoxime, and make the solution ammoniacal, and then make it just acid with dilute acetic acid (1:3). Stir the solution vigorously and allow it to stand at a temperature of from 75° to 90° C., with occasional stirring, for one hour. If an alcoholic solution of dimethylglyoxime was used to precipitate the nickel, the contents of the beaker should be digested at a temperature just short of the boiling point until the odor of alcohol can no longer be detected.

Filter the scarlet precipitate of nickel dimethylglyoxime on a tared Gooch crucible. Wash thoroughly with hot water and dry at 110° C. to constant weight. Cool in a desiccator and weigh. The weight of nickel dimethylglyoxime multiplied by 20.32 and again by 5 gives the percentage of nickel in the sample. This method yields results that are correct within ± 0.35 per cent.

If greater accuracy is desired, use a larger aliquot portion with proportionally larger amounts of reagents, and filter the nickel dimethylglyoxime precipitate on an 11 cm paper and wash thoroughly 18 or 20 times with hot water. Return the paper and precipitate to the 600 c c beaker, treat with 5 c c of concentrated H₂SO₄ (specific gravity 1.84) and 25 c c of concentrated HNO₃ (specific gravity 1.42) and boil the liquid gently until strong fumes of sulphur trioxide are evolved.

Having allowed the beaker and its contents to cool somewhat, add 10 c c of concentrated HNO₃ (specific gravity 1.42) and repeat the evaporation. Rinse the cover and sides of the beaker with a fine jet of water and fume the solution again to insure the expulsion of every trace of the HNO₃. When cool add approximately 50 c c of cold water and boil the contents of the beaker for several minutes, which should result in a perfectly clear solution.

Neutralize with NH₄OH and add an excess of 20 c c NH₄OH (specific gravity 0.90). Add 1 g of ammonium bisulphide dissolved in 5 c c of hot water. Now electrolyze the nickel sulphate solution with a current of from 1 to 2 amperes, using a platinum-gauze weighed cathode and a spiral platinum anode. Continue the electrolysis until the solution has become colorless, and then continue for at least 15 minutes longer. Now test the solution by adding one or two drops of it to a solution of potassium sulphocarbonate. Pink color indicates the presence of nickel. The amount of the solution withdrawn for this test will not affect the results and may be neglected. This test will show whether or not the electrolysis has been completed. Wash the metal deposited on the cathode with water. Remove the cathode and dip it first into a beaker of distilled water and then into absolute alcohol, dry for a few minutes at a temperature of 80° to 100° C., and weigh. The increase in weight of the cathode multiplied by 100 and divided by the weight of the sample taken gives the percentage of nickel in the sample.

*Accuracy. —*In the case of a nickel content of 60 to 80 per cent, duplicate determinations should check within ± 0.35 per cent nickel by the gravimetric method and ± 0.15 per cent nickel by the electrolytic method.

DETERMINATION OF CHROMIUM BY THE PERSULPHATE METHOD

SOLUTIONS REQUIRED

*Silver nitrate solution (0.5 per cent). —*Dissolve 5 g of AgNO₃ in 1,000 c c of water.

*Ammonium persulphate (15 per cent). —*Dissolve 15 g of the salt in 100 c c of water. (The solution should be kept in a cool place and should not be used if over three days old. A fresh solution is preferable.)

Sodium chloride (10 per cent).—Dissolve 100 g of NaCl in 1,000 c c of water.

Nitro-hydrochloric acid.—Mix 30 c c of concentrated HCl (specific gravity 1.19), 10 c c of concentrated HNO₃ (specific gravity 1.42), and 40 c c of water.

Sulphuric acid (1:1).—Slowly stir 500 c c of concentrated H₂SO₄ (specific gravity 1.84) into 500 c c of water.

Standardized ferrous ammonium sulphate solution.—Dissolve 39.25 g of ferrous ammonium sulphate in distilled water, add 20 c c of dilute H₂SO₄ (1:1), dilute to 1 liter, mix thoroughly, and standardize against 0.1 N potassium permanganate, which has in turn been standardized against the Bureau of Standards sodium oxalate. This solution should be standardized just before using, as its value may change from day to day. One cubic centimeter of 0.1 N solution equals 0.001733 g of chromium.

Standard potassium permanganate solution (0.1 N).—Dissolve approximately 3.18 g of pure potassium permanganate in 300 c c of hot distilled water, boil for 10 to 15 minutes, cool to room temperature, and filter on asbestos. Transfer the solution to a glass-stoppered bottle and allow it to stand for two weeks, at the end of which time filter again on asbestos and transfer to a liter flask and dilute to the mark. This solution should be kept in a dark bottle. After a preliminary standardization against the Bureau of Standards sodium oxalate, dilute so as to be exactly 0.1 N, and verify this strength by a second comparison with sodium oxalate.

METHOD

Treat approximately 0.2000 g of the sample in a 500 c c flask with 20 c c of nitro-hydrochloric acid and 0.5 c c of HF (48 per cent), warm at a moderate temperature (about 60° C.) until the reaction is complete. Add 20 c c of dilute H₂SO₄ (1:1), 50 c c of water, and evaporate just to fumes of sulphuric acid. If any salts separate out, redissolve by adding 250 c c of water and digest on a hot plate until an entirely clear solution results. Remove from the plate and add 1 c c of AgNO₃ solution (0.5 per cent) and sufficient ammonium persulphate (approximately 15 c c for 10 to 12 per cent chromium alloys and 25 c c for 20 per cent chromium alloy) thoroughly to oxidize the manganese, and boil for three minutes. Add 20 c c of NaCl solution (10 per cent), heat on a plate until the manganese dioxide has dissolved completely, and boil for five minutes. Cool to room temperature, and add from a burette standardized ferrous ammonium sulphate until the solution turns green, and then add 5 c c in excess. Titrate this excess back with 0.1 N potassium permanganate.

Calculate the percentage of chromium from the following formula

$$\text{Percentage of chromium} = \frac{[(A \times B) - C] \times 0.001733}{0.2, \text{ or weight of sample}} \times 100$$

where

A = volume in cubic centimeters of ferrous ammonium sulphate used.

B = normality factor of ferrous ammonium sulphate, determined daily.

C = volume in cubic centimeters of 0.1 N potassium permanganate used.

Accuracy.—In the case of a chromium content of 10 to 20 per cent, duplicate determinations should check within ± 0.15 per cent chromium.

DETERMINATION OF IRON BY THE CUPFERRON METHOD

SOLUTIONS REQUIRED

Dilute hydrochloric acid (1:1).—Mix equal parts of concentrated HCl (specific gravity 1.19) and water.

Dilute hydrochloric acid (1:19).—Mix 5 c c of concentrated HCl (specific gravity 1.19) and 95 c c of water.

Dilute ammonium hydroxide (1:19).—Mix 1 c c of NH₄OH (specific gravity 0.90) and 19 c c of water.

Dilute sulphuric acid (1:4).—Slowly stir 1 c c of concentrated H₂SO₄ (specific gravity 1.84) into 4 c c of water.

Dilute sulphuric acid (1:9).—Slowly stir 1 c c of concentrated H₂SO₄ (specific gravity 1.84) into 9 c c of water.

Stannous chloride solution.—Dissolve 50 g of stannous chloride in 100 c c of concentrated HCl (specific gravity 1.19) and dilute to 1,000 c c.

Cupferron (6 per cent).—Freshly prepared filtered cupferron (C₆H₅(NO)ONH₂).

METHOD

For alloys containing 10 per cent or more of iron, use a 1-g sample, and for alloys containing 2 per cent or less of iron use a 5-g sample. Dissolve the sample in a 400-c c covered beaker in 25 to 75 c c of concentrated HCl (specific gravity 1.19) at a temperature of about 65° C. Add 2 c c of concentrated HNO₃ (specific gravity 1.42) and from 20 to 25 c c of concentrated H₂SO₄ (specific gravity 1.84), and evaporate the solution until fumes of sulphur trioxide are given off. After having allowed the beaker and its contents partly to cool, add 50 c c of warm water and boil the solution for several minutes to dissolve all salts. Filter the liquid on an 11-cm paper containing some paper pulp, and wash the residue and filter thoroughly with warm water. Reserve the filtrate. Ignite any residue in a platinum crucible until the carbon of the filter paper has burned off. After allowing the crucible to cool, add one or two drops of concentrated H₂SO₄ (specific gravity 1.84) and several cubic centimeters of HF and evaporate the solution to dryness. Any remaining residue is fused with a few grams of sodium carbonate. Dissolve the fusion in dilute HCl (1:1) and boil to expel carbon dioxide. Add a slight excess of dilute NH₄OH (1:19) and boil the solution for several minutes. Filter, and wash well with hot water. Dissolve the precipitate off of the filter in 20 c c of hot dilute H₂SO₄ (1:4) and add it to the main filtrate which should have a total volume of not more than 150 c c. Cool the solution to about 15° C., treat with a slight excess of cold, freshly prepared solution of cupferron (6 per cent), which should cause the complete precipitation of the iron while all the nickel and chromium should remain in solution. A brownish-red, partly amorphous, partly crystalline precipitate should separate out.

As soon as a drop of the reagent causes the formation of a transient snow-white crystalline precipitate, all of the iron is down. Add some ashless paper pulp, and filter the contents of the beaker on an 11-cm paper, wash the precipitate eighteen to twenty times with cold dilute H₂SO₄ (1:9), and finally wash five or six times with cold dilute NH₄OH (1:19). Discard the filtrate. This ammonia wash dissolves out the excess of cupferron, and will also dissolve any vanadium that might be present.

Ignite the cupferron precipitate, first at a low-red heat and finally at 900° to 1,000° C. Transfer the iron oxide to a 150-c c covered beaker and wash the crucible with 20 c c of hot HCl (1:1). Add 10 c c of concentrated HCl (specific gravity 1.19) and digest the solution at a temperature somewhat short of boiling. Add stannous chloride solution from time to time in amounts sufficient to discharge the yellow color of the ferric chloride, and to provide a few drops in excess. Finish the determination by the Reinhardt-Zimmerman method.

Accuracy.—In the case of an iron content of 0.5 per cent, duplicate determinations should check within ± 0.05 per cent iron. In the case of an iron content of 25 per cent, duplicate determinations should check within ± 0.2 per cent iron.

DETERMINATION OF MANGANESE

SOLUTIONS REQUIRED

Nitrohydrochloric acid.—Mix 10 c c of concentrated HNO_3 (specific gravity 1.42), 30 c c concentrated HCl (specific gravity 1.19) and 40 c c of water.

Concentrated nitric acid (specific gravity 1.42).—*Dilute nitric acid (1:200).*—Mix 1 c c of concentrated HNO_3 (specific gravity 1.42) and 200 c c of water.

Dilute sulphuric acid (1:3).—Slowly stir 1 c c of concentrated H_2SO_4 (specific gravity 1.84) into 3 c c of water.

Standardized ferrous ammonium sulphate solution.—See the determination of chromium by the persulphate method, given above.

NOTE.—One cubic centimeter of exactly 0.1 *N* solution equals 0.002769 g of manganese.

Standard potassium permanganate solution (0.1 N).—See the determination of chromium by the persulphate method, given above.

METHOD

Dissolve exactly 2.000 g of drillings in a 400 c c beaker with 40 c c of nitrohydrochloric acid, and when in solution evaporate to a sirupy consistency and take up with 50 c c of concentrated HNO_3 (specific gravity 1.42). Evaporate this again and add 100 c c of concentrated HNO_3 and boil down to 80 c c. Add slowly, 0.5 g at a time, about 3 g of potassium chlorate. Boil for at least five minutes after the last addition of potassium chlorate to insure complete oxidation of the chromium. Add 100 c c of water and filter through a thin asbestos pad with suction, washing the beaker and pad thoroughly with dilute HNO_3 (1:200), leaving no trace of oxidized chromium. Transfer the pad and the precipitate into the original beaker, being sure to wash out all precipitate adhering to the sides of the funnel with cold water.

Now add 100 c c of distilled water, 50 c c of dilute H_2SO_4 (1:3), and 5 c c in excess of enough ferrous ammonium sulphate to dissolve all of the manganese dioxide. (About 20 c c should be required for the weight of alloy taken). The normality factor of the ferrous ammonium sulphate must be determined just before using. Stir until all the manganese dioxide is dissolved, and titrate the excess of ferrous ammonium sulphate with 0.1 *N* potassium permanganate. Occluded oxidized chromium is usually the cause for high manganese results.

Calculate the percentage of manganese from the following formula:

$$\text{Percentage of manganese} = \frac{[(A \times B) - C] \times 0.002769}{2, \text{ or weight of sample}} \times 100$$

where

A = volume in cubic centimeters of ferrous ammonium sulphate used

B = normality factor of ferrous ammonium sulphate, determined daily

C = volume in cubic centimeters of exactly 0.1 *N* potassium permanganate used.

Accuracy.—In the case of a manganese content of 2 to 3 per cent, duplicate determinations should check within ± 0.1 per cent manganese.

DETERMINATION OF CARBON BY THE VOLUMETRIC METHOD

This method for the determination of carbon is the method for determining carbon by absorption of the

carbon dioxide in barium hydroxide solution. Reference should be made to the determination of carbon by the direct-combustion method as described in the standard methods of chemical analysis of plain carbon steel in A33. (See 600.1, p. 10.)

In a laboratory where accurate results are being obtained by the gravimetric method, or where a large number of samples are to be analyzed, and good weighing methods are in use, the gravimetric method may be used as described in method (a) of the determination of carbon by the direct-combustion method described in A64. (See 601.20, p. 119.) Where only occasional samples are to be run, it is probable that the volumetric method will give more satisfactory results.

SAMPLE

The sample should weigh at least 4 g and should be rather finely divided in order that such a large sample may be placed in the combustion boat. Ordinary turnings are satisfactory, except that they are bulky. Usual precautions should be used in obtaining a perfectly clean sample.

APPARATUS

Boats and lining material.—Zirkite boats 100 mm long, 13 mm wide, and 8 mm deep (inside dimensions) are most satisfactory, although alundum or porcelain boats may be used. The boats should be ignited in a muffle furnace before using. The bottom of the boat should be lined with a trench of 40 mesh high-grade chrome ore, ignited at 1,000° C. and preserved in a glass-stoppered bottle. The sample should be covered with a very thin layer of alundum. Some alundum powder should be sprinkled inside the combustion tube to prevent the boat from sticking.

Flux.—Exactly 2 g of fine drillings of ingot iron of known carbon content should be sprinkled over the sample before the alundum is placed over the top of the whole charge. The purpose of the ingot iron is not to flux the sample, but is a source of additional heat due to its rapid combustion when the oxygen is turned on. The results must be corrected for the amount of carbon added through the use of ingot iron.

Furnace and combustion tube.—The standard electric combustion furnace in common use may be used, but as the temperatures are considerably higher the life of the heating element will be shorter than usual. A pyrometer should always be used. A fused-silica tube 24 inches in length and 1 inch in diameter gives the best results. The ends of the tubes should be encased in water-cooled jackets, or strips of blotting paper partly immersed in water should be placed over the ends of the tubes. At least 8 inches of the tube next to the absorption apparatus is filled with asbestos fiber which has been saturated with a solution of ferric nitrate and heated overnight at 1,000° C. Ferric oxide will serve to oxidize any carbon monoxide formed, and will convert any sulphur dioxide to ferric sulphate. In case a combustion tube 30 inches in length is used, the dead space in the end next to the absorption apparatus should be filled with a glass plunger, which will decrease the amount of gas that has to be flushed out at each determination. The glass plunger may consist of a glass cylinder with the ends closed.

Detailed description of apparatus.—Figure 1129 illustrates the details of the apparatus. Oxygen from the 100 cubic feet cylinder *A*, passes through the reducing valve *B*, to the lower 8-liter-capacity bottle *C*, from which it forces distilled water to the upper bottle *D*, which is 2.5 feet higher than *C*. When the lower bottle is nearly full of oxygen, the valve *B* is closed and the gas, now under reduced pressure, can be supplied to the apparatus at the desired rate by means of the petcock *H*. One of the

essential parts of the apparatus is the mercury pressure gage *E*, which has a 6-inch scale with $\frac{1}{8}$ -inch subdivisions, for indicating the pressure, and, when calibrated, the rate of flow of the oxygen.

To calibrate the gage, the Meyer tube *O*, is filled to the usual point and the oxygen is regulated until the mercury stands at the desired mark, say $1\frac{1}{8}$ inches. The volume of oxygen passing through the apparatus per minute is then determined by collecting it over water in a graduated cylinder, the connection being made to the exit end of the Meyer tube by means of a rubber tube. The rate of flow at 1-inch pressure should be about 100 c c per minute, although, of course, this varies with the resistance offered to the flow of the oxygen by the reagents and materials in the train.

The capillary tube *N*, in the stopper at the exit of the combustion tube *J*, is an essential part of the

rubber stoppers and with water jackets, *K* and *L*, at the ends. The clear solution of barium hydroxide (20 g per liter) in the bottle *S*, is arranged so that it can be conveniently siphoned into the 8-bulb Meyer tube, *O*. The barium carbonate is filtered on the Büchner funnel *X*, shown fitted to the filter flask *P*, and the precipitate is washed with carbon-dioxide-free distilled water (prepared by bubbling through the water compressed air previously freed from carbon dioxide by passage through the soda-lime bottle *T*, delivered by gravity from the bottle *U*). The standard 0.1 *N* solutions of NaOH and HCl are delivered by gravity to the burettes, *R*, from the bottles *V* and *W*. The small hot plate *Q* is used for warming the flask containing the barium carbonate and the measured amount of 0.1 *N* HCl, in order to cause rapid and complete solution of the precipitate.

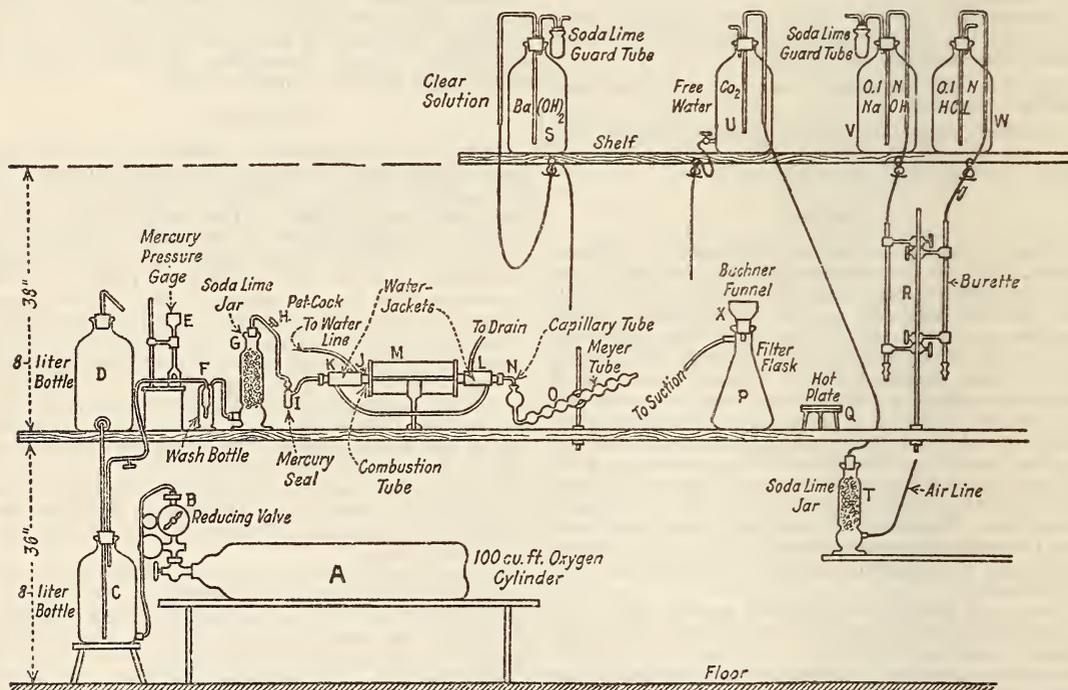

FIGURE 1129.—Apparatus for the determination of carbon by the volumetric method

apparatus. The size of the capillary opening is adjusted by heating in a flame so that when the mercury gage indicates a certain definite pressure (about 1 inch), the rate of flow through the capillary—the Meyer tube, *O*, being filled and connected—closely approximates but does not exceed 100 c c per minute. If the rate of flow much exceeds 100 c c per minute some carbon dioxide will be swept through the barium hydroxide without being absorbed, while if it is much less than 100 c c all of the carbon dioxide will not be flushed out of the combustion tube in the specified time. Removal of any carbon dioxide in the oxygen is effected by passage through NaOH solution (specific gravity 1.27) contained in the wash bottle *F*, and the 12-mesh soda lime in the jar *G*, although the principal function of the liquid in *F* is to serve as an indicator of the rate of flow of the gas. The mercury seal *I* prevents any possibility of back flow of the gases in the combustion tube. After passing through the mercury seal the oxygen enters the combustion tube *J*, which is provided with tightly fitting 1-hole

METHOD

The furnace having been previously heated to approximately $1,100^{\circ}$ C., all air having been displaced from the apparatus by passage of a stream of pure oxygen, and the Meyer tube having been filled with sufficient barium hydroxide solution (20 g per liter) to fill seven of the eight bulbs when the oxygen is passing at the maximum rate, the boat is quickly inserted, by means of a stout copper rod, into the hottest part of the furnace and the stopper immediately replaced. Allow the boat and its contents to heat for about one minute with no oxygen passing, this will result in some oxygen being absorbed by the iron, and the barium hydroxide being drawn back into the large bulb as a consequence of the partial vacuum resulting therefrom.

At the expiration of about one minute, admit oxygen to the tube at a rate of approximately 340 c c per minute (as indicated by the gage, which should read about $1\frac{1}{2}$ inches). Complete combustion of the ingot iron, and the alloy sample,

with vivid incandescence, should result in $1\frac{1}{2}$ to 2 minutes. Preliminary heating followed by the rapid admission of oxygen are absolutely essential to securing complete combustion in the short time allowed. Only in case the oxides are so thoroughly fused as to show no trace of the shape of the original drillings when the boat is removed from the furnace should the combustion be considered to have been successful. Upon the appearance of the faintest cloudiness in the first bulb of the Meyer tube, decrease the rate of flow immediately to 100 c c per minute (about 1 inch on the gage), and maintain it so to the end of the operation. If the rate of flow after the first noticeable formation of barium carbonate is much less or much greater than 100 c c per minute, low carbon results will be obtained, due either to some carbon dioxide not having been swept out of the apparatus in the time specified, or to some having escaped absorption in the barium hydroxide. Passage of oxygen for a total of five minutes is sufficient to sweep all carbon dioxide from the combustion tube.

At the conclusion of the above-described operations (six minutes after the boat was inserted into the furnace) remove the boat, and filter the contents of the Meyer tube on two superimposed, open-grain, 11 cm filter papers supported on a Büchner funnel fitted to a suction flask. Wash the Meyer tube three times with water free from carbon dioxide (prepared by passing compressed air through soda lime and then bubbling it through the distilled water), taking care to reach all points of the tube; then give the precipitate and paper four additional washings. Delivery of the water from an overhead bottle rather than from a wash flask avoids danger of contamination from the carbon dioxide of the breath, besides being more convenient and sanitary. Transfer the paper and precipitate to a 500 c c Erlenmeyer flask and add from a burette enough standard 0.1 *N* HCl solution to dissolve the barium carbonate and add 5 c c in excess, a portion of the acid being used to rinse the Meyer tube, which is then further rinsed with water. Place the flask containing the precipitate on a hot plate until the carbonate has dissolved; long heating should be avoided as it apparently causes some action on the filter paper involving a slight error in the determination. Introduce five or six drops methyl orange into the solution and determine the excess of HCl by titration with a standard 0.1 *N* solution of NaOH, the end point being marked by the color change from red to yellow. One cubic centimeter of standard 0.1 *N* HCl equals 0.000600 g of carbon.

A blank should be run on the ingot iron, boat, filter paper, etc., and any carbon found should be deducted from that obtained in the analysis. A 2 g sample of ingot iron should be used, and the determination made by the method as just described.

Accuracy.—In the case of a carbon content of 0.05 per cent, duplicate determinations should check within ± 0.01 per cent carbon.

DETERMINATION OF INSOLUBLE RESIDUE

METHOD

The sample should weigh at least 5 g and if the alloy is known to be low in insoluble residue a 10 g sample should be used. Treat the sample with from 200 to 400 c c of HCl (specific gravity 1.19) at a temperature of from 60° to 70° C. until the reaction appears to be complete, then add 1 to 2 c c of HNO₃ (specific gravity 1.42). Boil the solution for about two minutes, dilute with an equal volume of hot water, filter, and wash the filter thoroughly with hot dilute HCl (5:95).

Ignite the residue at a low heat in a platinum crucible, treat with HF and several drops of dilute

H₂SO₄ (1:1), and evaporate the solution just to fumes of sulphur trioxide. If any residue remains, add 10 c c of water to the crucible, filter on a 9 cm paper and wash the residue with hot water. Ignite any residue remaining on the paper and weigh. The increase in weight multiplied by 100 and divided by the weight of sample taken gives the percentage of insoluble residue.

Accuracy.—In the case of an insoluble residue of 0.05 per cent, duplicate determinations should check within ± 0.02 per cent insoluble residue.

DETERMINATION OF SILICON

METHOD

Treat a 2 g factor-weight sample (0.9344 g) 3 to a 5 g factor-weight sample (2.3360 g) in a 300 c c porcelain casserole with 30 to 50 c c of HCl (specific gravity 1.19), the casserole being covered with a watch glass, and warm until the reaction is complete. Add 30 to 50 c c of dilute H₂SO₄ (1:1), and evaporate just to fumes of sulphur trioxide. Allow the casserole partly to cool, add 200 c c of warm water, and boil briskly for several minutes to dissolve all salts. Filter the silica on a 11 cm paper containing some ashless paper pulp, wash five or six times with dilute HCl (1:100), and finally with hot water until free from acid.

Ignite the paper and the precipitate in a small platinum crucible, first at a dull-red heat until the carbon of the filter paper has been oxidized, and finally at 1,050° to 1,100° C. Allow the crucible to cool in a desiccator and weigh. Add one or two drops of H₂SO₄ (specific gravity 1.84), several cubic centimeters of HF, and evaporate the solution until all the H₂SO₄ has been expelled. Ignite the crucible again, cool, and weigh. The difference between the first and the second weights, multiplied by 100 and divided by the weight of sample taken, gives the percentage of silicon in the sample. In case the silica precipitate contains any undissolved material, ignite the paper and the precipitate at a dull-red heat until the carbon of the filter paper has been oxidized, transfer to a 30 c c pure-iron crucible, and fuse with approximately 5 g of sodium peroxide. When cool, transfer the melt to a 300 c c porcelain casserole and dissolve in 50 c c of water. Add 50 c c of dilute H₂SO₄ (1:1), and evaporate the solution just to fumes of sulphur trioxide. From this point proceed as described above.

Accuracy.—In the case of a silicon content of 0.2 per cent, duplicate determinations should check within ± 0.03 per cent silicon.

DETERMINATION OF SULPHUR BY THE EVOLUTION-TITRATION METHOD

This method is based on (1) the evolution of practically all the sulphur in the alloy as hydrogen sulphide when the alloy is dissolved in HCl (specific gravity 1.19) (see note); (2) absorption of the evolved gas by means of an ammoniacal solution of cadmium chloride; and (3) determination of the sulphur by titration with a standard solution of potassium iodate (0.0312 *N*).

SOLUTIONS REQUIRED

Potassium permanganate solution (2.5 per cent).—Dissolve 2.5 g of KMnO₄ in 100 c c of water.

Sodium hydroxide (30 per cent).—Dissolve 30 g of NaOH in 100 c c of water.

Cadmium chloride solution.—Dissolve 10 g of CdCl₂·2H₂O in 400 c c of water and 600 c c of NH₄OH (specific gravity 0.90).

Starch solution.—Dissolve 1.2 g of soluble starch in 100 c c of boiling water, cool to room temperature, and add a solution of 0.5 g of KI dissolved in 10 c c of

cold, freshly distilled water. The starch solution shall not be used if it is over one day old.

Standard potassium permanganate (0.03 N).—Dissolve 0.99 g of pure KMnO_4 in 1,000 c c of hot distilled water, boil for 10 minutes, cool to room temperature, and filter through asbestos. Standardize against the Bureau of Standards standard sodium oxalate as follows: In a 200 c c beaker, dissolve 0.1 g of sodium oxalate in 75 to 100 c c of hot water (80° to 90° C.) and add 4 c c of H_2SO_4 (1:1). Titrate at once with the permanganate solution, stirring the liquid vigorously and continuously. The permanganate must not be added more rapidly than 10 to 15 c c per minute, and the last 0.5 to 1 c c must be added dropwise, with particular care to allow each drop to be fully decolorized before the next is introduced. The excess of permanganate used to cause an end-point color must be estimated by matching

distilled water. To 250 c c of cold distilled water in a 500 c c flask, add 10 c c of HCl (1:1) and then as the flask is gently swirled, add 35 c c of the iodate solution from a burette. Titrate the liberated iodine with the standard sodium thiosulphate solution (0.03 N) to a light straw color, add several cubic centimeters of the freshly prepared starch solution and continue titration to the disappearance of the blue color. Calculate the normality of the iodate solution and adjust the solution so that 1 c c is equivalent to 0.0005 g of sulphur.

APPARATUS

Figure 1130 illustrates the details of the apparatus employed. Hydrogen supplied from the Kipp generator, A, is freed from any sulphur by passage through a solution of potassium permanganate (2.5

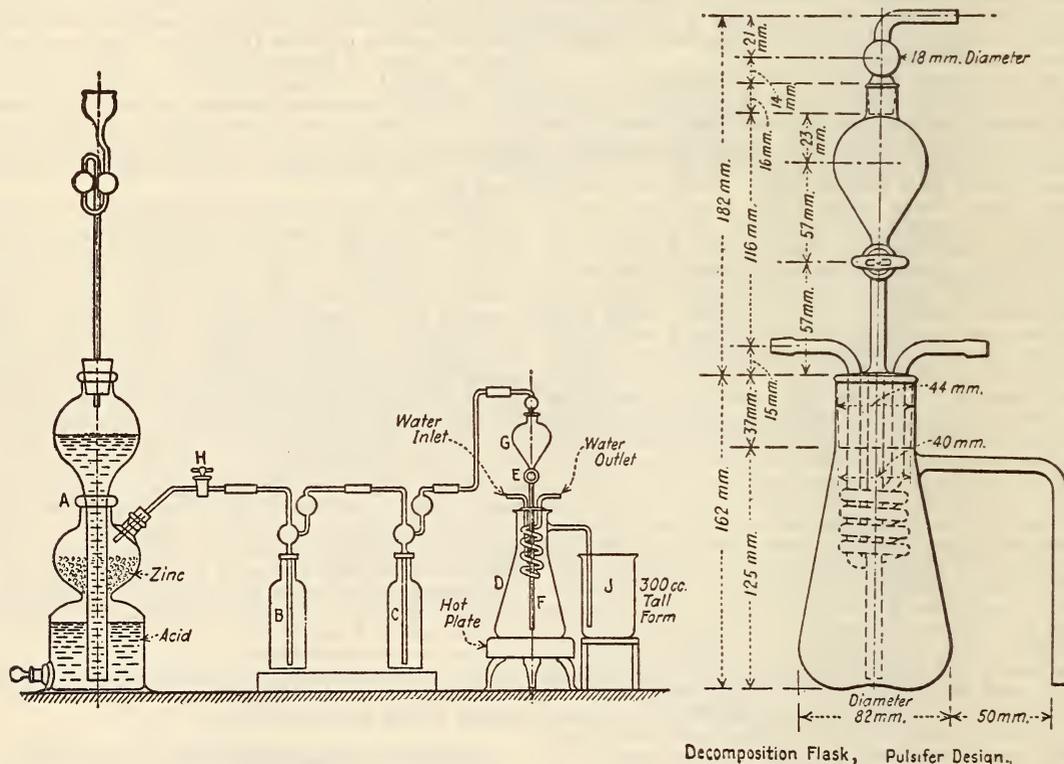

FIGURE 1130.—Apparatus for determination of sulphur by the evolution-titration method

the color in another beaker containing the same bulk of acid and hot water. The temperature of the solution should not be below 60° C. by the time the end point is reached. Calculate the exact normality of potassium permanganate from the sodium oxalate.

Standard sodium thiosulphate (0.3 N).—Dissolve 7.5 g of $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ in 1,000 c c of freshly boiled distilled water at room temperature. To 250 c c of distilled water in a 500 c c flask add 1 g of KI and 10 c c of HCl (1:1). Cool and add 35 c c of the standard potassium permanganate solution (0.03 N) from a burette. Swirl gently and titrate the liberated iodine with the thiosulphate solution to a light straw color. Add several cubic centimeters of the freshly prepared starch solution and continue the titration to the disappearance of the blue color. Calculate the normality of the thiosulphate solution from the standard permanganate solution.

Standard potassium iodate (0.0312 N).—Dissolve 1.12 g of pure KIO_3 , and 12 g of KI in 1,000 c c of

per cent) contained in a Drechsel bottle, B, and sodium hydroxide (30 per cent) held in the Drechsel bottle, C. Hydrogen is admitted through a glass stopcock, E, to the decomposition flask, D. The decomposition flask (Pulsifer's design) is provided with a ground-glass stopper, E, a funnel, G, and a cooling coil, F, with inlet and outlet tubes. An ammoniacal solution of cadmium chloride or some other suitable absorbent is held in a 300 c c beaker, J. The absorption should not be carried on in direct sunlight.

NOTE.—It is advisable to use an all-glass apparatus because the length of time (30 minutes) required for the solution of the alloy gives opportunity for fumes of hydrochloric acid to attack rubber stoppers and rubber hose connections, which always contain sulphur, and thus cause erroneous results.

METHOD

Transfer to the decomposition flask 5.00 g of the alloy ribbon which has been cut into very small pieces or of the wire sample which has been flat-

tened by means of a hammer and cut into small pieces. Pass a stream of hydrogen from the Kipp generator through the apparatus to displace the air. Pour 25 c c of cadmium chloride solution into the beaker, *J*, and add sufficient water to give a depth of 3 inches of the solution. Stop the hydrogen by closing the control stopcock, *H*, on the Kipp generator. Close the stopcock *E*. Remove the ground-glass tube leading into the funnel, *G*, and introduce 100 c c of HCl (specific gravity 1.19) (see note) into the decomposition flask through the funnel. As soon as the acid has been added, replace the ground-glass inlet tube, open the stopcock, *E*, and pass a steady stream of hydrogen through the apparatus during the remainder of the determination. Apply sufficient heat to the decomposition flask to maintain a steady decomposition of the sample. Passage of a stream of cold water through the cooling coil, *F*, of the decomposition flask serves to cool the stopper and to aid in maintaining the strength of the acid in the flask. Thirty minutes of this treatment is ordinarily sufficient to cause complete decomposition. When there is no further action, boil the solution in the decomposition flask for several minutes and continue the stream of hydrogen for five minutes longer.

At the end of this time remove the absorption beaker, *J*, close stopcock, *E*, and the control stopcock, *H*, and discontinue heating the decomposition flask. Filter the cadmium chloride solution through an 11 cm filter paper and wash the precipitate several times with water. Return the paper and precipitate to a 600 c c beaker, add 300 c c of cold water and 40 c c of dilute HCl (1:1) and titrate the liberated hydrogen sulphide with the standard solution of potassium iodate, starch solution being used as an indicator.

Carry a blank through all steps of the process and deduct any sulphur that is found.

If the potassium iodate solution has been adjusted to 0.0312 *N* and 5 g of the alloy has been dissolved, then the percentage of sulphur is 0.01 times the number of cubic centimeters of the iodate solution used.

NOTE.—There is a question whether concentrated HCl or dilute HCl should be used. This method calls for concentrated HCl. See article by Pulsifer, A Standard Apparatus for the Determination of Sulphur in Iron and Steel by the Evolution Method in *Ind. Eng. Chem.*, p. 545, 1918.

OPTIONAL METHOD

For an optional method see the determination of sulphur by the evolution-titration method (routine) in the standard methods of chemical analysis of plain carbon steel A33 (see 600.1, p. 10). This optional method may be used for nickel-chromium and for nickel-iron-chromium alloys with the following precautions:

1. Due to the length of time (30 minutes) required for solution of the alloy, closer observation is necessary than in the analysis of steel.

2. During the solution of the sample care must be exercised in order that the absorbing solution is not drawn back into the flask.

3. There is danger of contamination from rubber hose connections and rubber stoppers.

4. The use of a gas flame is a possible source of sulphur contamination and an electric heater is recommended.

Accuracy.—In the case of a sulphur content of 0.05 per cent, duplicate determinations should check within ± 0.003 per cent sulphur.

DETERMINATION OF COPPER

A. Nickel-Copper Alloys Containing 10 to 90 per cent Copper

SOLUTIONS REQUIRED

Dilute nitric acid (1:3).—Slowly stir 50 c c of HNO₃ (specific gravity 1.42) into 150 c c of distilled water.

Dilute sulphuric acid (1:1).—Slowly stir 10 c c of concentrated H₂SO₄ (specific gravity 1.84) into 10 c c of water.

METHOD

Dissolve exactly 2.000 g of the alloy in 25 c c of the dilute HNO₃ (specific gravity 1.135) and, when solution is complete, boil to expel nitrous fumes and dilute with about 175 c c of cold water. Add 5 c c of the dilute sulphuric acid (1:1).

Determine the copper by electrolysis. Use a current of 0.5 ampere unless the solution is agitated, in which case a larger current up to 4 amperes may be used.

Accuracy.—Duplicate determinations should check within ± 0.10 per cent of copper.

NOTE.—A little copper may be retained by the iron precipitate. The presence of molybdenum or silver will cause high results for copper.

B. Copper up to 5 per cent in Alloys of Chromium with Iron or Nickel or Both

SOLUTIONS REQUIRED

Ferric sulphate.—Dissolve 0.8 g of ferric sulphate (Fe₂(SO₄)₃·9H₂O) in 100 c c of distilled water.

Dilute sulphuric acid (1:4).—Slowly stir 50 c c of H₂SO₄ (specific gravity 1.84) into 200 c c of distilled water.

Dilute sulphuric acid (1:1).—Slowly stir 100 c c of H₂SO₄ (specific gravity 1.84) into 100 c c of distilled water.

Acidified hydrogen sulphide water.—Mix 10 c c of HCl (specific gravity 1.19) and 1,000 c c of distilled water and saturate with H₂S.

Ammonium hydroxide (specific gravity 0.90).—

METHOD

Dissolve exactly 5.000 g of the alloy in a 400 c c covered beaker in 100 c c of HCl (specific gravity 1.19) at about 65° C. When the reaction is complete, dilute to approximately 300 c c with warm water. Introduce ammonium hydroxide (specific gravity 0.90) until the solution is practically neutral and then add sufficient HCl (specific gravity 1.19) to give an acidity of 3 c c of HCl (specific gravity 1.19) per 100 c c of solution. Treat the solution with a brisk stream of hydrogen sulphide for at least 30 minutes.

Filter the precipitate of sulphide on a 9 cm paper containing a small amount of paper pulp and wash thoroughly with the acidified hydrogen sulphide water. Discard the filtrate.

Return the paper and the precipitate to a 250 c c covered beaker and treat with 3 c c of H₂SO₄ (specific gravity 1.84) and 25 c c of HNO₃ (specific gravity 1.42) and evaporate slowly to fumes of sulphur trioxide. Add sufficient HNO₃ (specific gravity 1.42) in small quantities to oxidize completely the filter paper and subsequently heat the solution until strong fumes of sulphur trioxide are evolved and all HNO₃ has been expelled.

Add 25 c c of the ferric sulphate solution to the cooled sulphuric acid solution and add ammonium hydroxide (specific gravity 0.90) in small excess. Heat the solution to boiling and after the precipitated ferric hydroxide has settled, filter on a 9 cm paper and wash with hot water.

Dissolve the precipitate in a small amount of hot dilute H₂SO₄ (1:4) and wash the filter with water. Repeat the ammonia precipitation and the filtration and combine the filtrates. Acidify with an excess of 5 c c of H₂SO₄ (1:1), add 1 c c of HNO₃ (specific gravity 1.42) and evaporate to approximately 100 c c.

Determine the percentage of copper by electrolysis, using a perforated platinum cathode and a spiral anode.

In case a trace of copper is to be determined, start with four 5 g portions of sample and combine them after the hydrogen sulphide precipitates have been filtered.

Accuracy.—Duplicate determinations should check within ± 0.02 per cent copper.

NOTE.—A little copper may be retained by the iron precipitate. The presence of molybdenum or silver will cause high results for copper.

656.1 NICKEL-CHROMIUM HEATING ELEMENTS.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR DRAWN OR ROLLED ALLOY, 80 PER CENT NICKEL, 20 PER CENT CHROMIUM, FOR ELECTRICAL HEATING ELEMENTS, DESIGNATION B82-31T, 1931

NICKEL-CHROMIUM HEATING ELEMENTS

1. These specifications cover annealed, drawn, or rolled shapes for electrical heating element purposes having a nominal chemical composition of 80 per cent nickel and 20 per cent chromium.

2. Wire and ribbon shall be thoroughly and uniformly annealed.

CHEMICAL PROPERTIES AND TESTS

3. The material shall conform to the following requirements as to chemical composition:

	Per cent
Nickel ¹⁶	77-79
Chromium.....	19-20
Iron, maximum.....	1.5
Manganese, maximum.....	2.5
Carbon, maximum.....	.25
Silicon, maximum.....	.40
Sulphur, maximum.....	.03

4. Samples for chemical analysis shall consist of clean drillings, millings, or clippings taken from the wire or ribbon selected for purposes of test. The sample shall be taken from a spool or coil representative of the lot in question. The sample so prepared shall be divided into three equal parts, each of which shall be placed in a sealed package, one for the manufacturer, one for the purchaser, and one for an umpire, if necessary.

5. Chemical analyses shall be determined in accordance with the tentative methods of chemical analysis of metallic materials for electrical heating in B71. (See 656.0, p. 1289.)

PHYSICAL PROPERTIES AND TESTS

6. Wire of No. 39 A. w. g. (0.0035 inch) and larger shall have a minimum elongation of 20 per cent in 10 inches, and from Nos. 40 to 44 A. w. g. (0.0031 to 0.002 inch), a minimum elongation of 10 per cent.

7. (a) The nominal specific resistance of the round wire shall be taken as 650 ohms per circular mil foot (108 microhms per centimeter cube) at 77° F. (25° C.).

(b) The nominal specific resistance of the ribbon shall be taken as 510 ohms per square mil foot (108 microhms per centimeter cube) at 77° F. (25° C.).

8. The specific resistance shall be determined in accordance with the standard method of test for resistivity of metallic materials for resistors in A. S. T. M. B63.

9. (a) **Round wire.**—The resistance per foot of round wire shall be calculated from the nominal

specific resistance and the cross section of the material. The limits on resistance per foot shall be as follows:

	Per cent
No. 30 A. w. g. (0.0100 inch) and larger.....	± 5
No. 31 to 40 A. w. g. (0.0089 to 0.0031 inch).....	± 8
No. 40 A. w. g. (0.0031 inch) and smaller.....	± 10

(b) **Strip material.**—The resistance per foot of strip material shall be calculated from the nominal specific resistance and the cross section of the material. In order to compensate for error in the calculated cross section on ribbon with rounded edges, the calculated values arrived at by multiplying the nominal width by nominal thickness shall be corrected by multiplying by the factor indicated in the following table:

Ratio of width to thickness	Factor
15 and under.....	0.94
Over 15.....	.83

10. Temperature coefficient of resistance shall, after the wire has been slowly cooled from an annealing temperature, be measured in accordance with the standard method of test for change of resistance with temperature of metallic materials for electrical heating in A. S. T. M. B70. The temperature coefficient of resistance shall be such as will bring the resistance within ± 20 per cent of the following:

Temperature	Resistance
	<i>Per cent</i>
77° F. (25° C.).....	100.0
900° F. (427° C.).....	103.7
1,000° F. (539° C.).....	104.0
1,200° F. (649° C.).....	103.3
1,400° F. (760° C.).....	103.2
1,600° F. (871° C.).....	103.6
1,800° F. (980° C.).....	104.1
2,000° F. (1094° C.).....	104.8

11. (a) When it is desired to determine the durability of the material at high temperatures, life tests shall be made in accordance with the tentative accelerated life test for metallic materials for electrical heating in A. S. T. M. B76. Test results shall be reported as a percentage of a standard of comparison.

(b) The life or durability value shall be the average of at least three simultaneous determinations each, on the wire in question and on the standard. If any test result varies more than 10 per cent from the average of the three determinations, that group shall be discarded.

FINISH

12. The material shall be as uniform and free from surface defects such as splits, kinks, laminations, scale, and other irregularities as the best commercial practice will permit. Finish shall be either bright annealed or oxidized, as specified.

PACKING AND MARKING

13. (a) **Round wire or rod.**—Round wire or rod in sizes No. 16 A. w. g. or larger shall be supplied in coils consisting of not more than two pieces per 40-pound coil. Round wire sizes smaller than No. 16 gauge shall be supplied in spools containing not

¹⁶ Small quantities of cobalt included shall be reported as nickel.

more than two pieces and shall be spooled in accordance with the following requirements:

Weight of wire	Diameter		Spool dimensions	
	Flange	Traverse	Diameter of hole	Diameter or barrel
<i>Pounds</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>	<i>Inches</i>
1	2	3	$\frac{5}{8}$	$1\frac{1}{4}$
2	$2\frac{3}{4}$	3	$\frac{5}{8}$	$1\frac{1}{2}$
5	4	3	$\frac{5}{8}$	$1\frac{1}{2}$
10	6	3	$\frac{5}{8}$	$1\frac{1}{2}$
25	9	4	1	$3\frac{3}{4}$

(b) *Ribbon*.—Ribbon over one-fourth inch in width shall be supplied in coils containing not more than one piece, and shall be securely wrapped so as to avoid injuring the edges of the strips. Ribbon of one-fourth inch in width or narrower, shall be supplied on suitable spools containing not more than two pieces per spool.

MARKING

14. Coils or spools shall be marked with the size and resistance per foot and a yellow tag or label shall be used to indicate this alloy.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR DRAWN OR ROLLED ALLOY, 60 PER CENT NICKEL, 15 PER CENT CHROMIUM, AND BALANCE IRON FOR ELECTRICAL HEATING ELEMENTS, DESIGNATION B83-31T, 1931

NICKEL-CHROMIUM HEATING ELEMENTS

(This specification is identical with A. S. T. M. B82-31T, given above, except that the ratio of nickel to chromium is 60 to 15 per cent instead of 80 to 20 per cent, with the following differences in

respect to chemical composition, physical properties, and temperature coefficient of resistance:)

CHEMICAL COMPOSITION

3. The material shall conform to the following requirements as to chemical composition:

	Per cent
Nickel, ¹⁷ minimum.....	57
Chromium.....	14-18
Iron.....	Balance.
Manganese, maximum.....	3
Silicon, maximum.....	.40
Carbon, maximum.....	.25
Sulphur, maximum.....	.03

PHYSICAL PROPERTIES

6. Wire of No. 39 A. w. g. (0.0035 inch) and larger shall have a minimum elongation of 20 per cent in 10 inches and from Nos. 40 to 44 A. w. g. (0.0031 to 0.002 inch) a minimum elongation of 10 per cent.

7. (a) The nominal specific resistance of round wire shall be taken as 675 ohms per circular mil foot (112.22 microhms per centimeter cube) at 77° F. (25° C.).

(b) The nominal specific resistance of the ribbon shall be taken as 530 ohms per square mil foot (112.22 microhms per centimeter cube) at 77° F. (25° C.).

Resistance increase with temperature

Temperature	Resistance
	<i>Per cent</i>
77° F. (25° C.).....	100
500° F. (260° C.).....	104.0
600° F. (315° C.).....	104.8
800° F. (427° C.).....	106.3
1,000° F. (537° C.).....	107.4
1,200° F. (649° C.).....	108.0
1,400° F. (760° C.).....	108.6
1,600° F. (871° C.).....	109.7

¹⁷ Small quantities of cobalt included shall be reported as nickel.

660-669 PRECIOUS METALS, METAL JEWELRY, AND PLATED WARE

661. PLATINUM AND PLATINUM JEWELRY

(No nationally recognized specifications available.)

662. GOLD AND DENTAL GOLD ALLOYS

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, C43, 1921

GOLD CARATS

The carat weights in use previous to July 1, 1913, in different countries had differed greatly, scarcely any two of the important countries having the same standard. Even within the United States there was not agreement in the standard used, the various makers of weights using slightly different standards. This led to considerable confusion in the weighing of gems, and was the more serious because of the great value of the article.

Beginning July 1, 1913, the international metric carat of 200 mg as the unit of weight for diamonds and other precious stones was put into commercial use in the United States by practically all the dealers in gems and precious stones through the efforts of a committee representing all the principal firms handling gems. On the same date the Treasury Department of the United States Government also began the use of this unit in the customs service for the levying of import duties on precious stones, and the Bureau of Standards recognized this unit for purposes of certification of all carat weights submitted to the bureau for test.

The movement for the adoption of a uniform, decimally divided standard was a decided step forward and therefore has met with success. The new metric carat of 200 mg is universally used in the United States and has been officially adopted by Belgium, Bulgaria, Denmark, England, France, Germany, Holland, Italy, Japan, Norway, Portugal, Rumania, Spain, Sweden, and Switzerland. The Bureau of Standards in 1913 prepared tables for converting "old" carats to new metric carats, and vice versa, and published them as Circular No. 43. These tables were of great aid at the time to the

transition from the old unit of about 205.3 mg and binary fractions to the new unit and decimal fractions.

The inconvenience and inefficient use of the present system of pennyweights and grains as opposed to the benefits derived from the use of the new metric decimally divided carat has become so pronounced that the bureau was invited to prepare a practical working outline of the metric system that would suit the needs of the jewelry trade and allied industries. The purpose of this is to make it easily possible for jewelers and silversmiths to substitute the gram for the dual unit of pennyweights and grains¹⁸ and also to use the metric system in all of their work.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, ANALYSIS OF DENTAL GOLD ALLOYS, S532, 1926

DENTAL GOLD ALLOYS

Dental gold alloys are, in general, composed chiefly of gold, silver, copper, and platinum. The proportionate amounts of these metals are usually of the order of 60 per cent of gold, 10 to 15 per cent of silver, 10 to 15 per cent of copper, and 10 per cent of platinum. Palladium is often substituted for part or all of the platinum. Many alloys contain small amounts of iridium and occasionally one is found to contain rhodium. Of the base metals besides copper, small amounts of nickel, manganese, zinc, and tin are found in many of the alloys and occasionally iron and magnesium occur. As many as nine of the above-named metals have been found in a single alloy. A number of these were undoubtedly present as impurities in the major constituents.

(The various steps for determining the composition of dental gold alloys are discussed in the order in which they would generally be carried out in making a complete analysis. The steps include sampling, assembling reagents, and a qualitative examination for the detection of minor constituents, such as palladium, iridium, rhodium, tin, nickel, manganese, zinc, iron, and magnesium. Gold, silver, platinum, and copper are the major constituents. The accompanying table shows analyses of typical dental gold alloys:)

Alloy No.	Sample	Argen- tum	Irid- ium	Stan- ium	Aurum	Pallad- ium	Copper	Plati- num	Rhodi- um	Zinc	Nickel	Fer- rum	Total
		Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent	Per cent

¹⁸ It is desirable to note in this connection that all medical prescriptions of the U. S. Army must be expressed in metric units, not in grains.

663. SILVER

663.0 GENERAL ITEMS.

UNITED STATES GOVERNMENT, CONGRESS, 34 STATUTES AT LARGE, 260, JUNE 13, 1906

NATIONAL STAMPING ACT

An act forbidding the importation, exportation or carriage in interstate commerce of falsely or spuriously stamped articles of merchandise made of gold or silver or their alloys, and for other purposes.

(For gold or part gold articles this act requires that the actual fineness of such gold or alloy shall not be less by more than one-half of 1 carat than the fineness indicated by the mark or word stamped or marked thereon; except for watchcases and flat ware the actual fineness shall be not less by more than 0.003 parts than the fineness indicated.)

(For silver or part silver articles the act requires that the actual fineness of the silver or alloy shall not be less by more than 0.004 parts than the actual fineness indicated by any mark or word, other than the word "sterling" or "coin"; no article shall be marked with the word "sterling" unless such article contains 0.925 parts pure silver; and no article shall be marked with the word "coin" or "coin silver" unless such article contains 0.900 parts pure silver: Provided, that in the case of all such articles, whose fineness is indicated by the word "sterling" or the word "coin" there shall be allowed a divergence in the fineness of 0.004 parts from the foregoing standards.)

663.1 SILVER METAL AND ALLOYS.

AMERICAN DENTAL ASSOCIATION, TENTATIVE SPECIFICATION FOR DENTAL AMALGAM ALLOYS, OCTOBER 10, 1929

DENTAL AMALGAM ALLOYS

(In regard to types, material, general requirements, and detail requirements, this specification is identical with specification U-A-451 of the U. S. Government Federal Specifications Board, given below. Methods of sampling and tests, and packing requirements are as given herewith.)

METHOD OF SAMPLING AND TESTS

The manufacturer shall specify the conditions under which test specimens are to be made, including alloy to mercury ratio, method and time of trituration and method of packing. These directions must fall within the limits of his published directions for the use of the product. The following details relative to test methods will be observed:

Ultimate compressive strength.—Specimens shall be cylinders 6 mm in diameter and 12 mm long. These shall be prepared by condensing the amalgam into a cavity of these dimensions in a rigid block, using a reasonable technic (that given in the sheet of instructions accompanying the alloy.)

The ends of the cylinder shall be surfaced plane at right angles to the axis. Strength tests shall be made five days after condensing, and the actual time consumed in applying the load, starting from the instant that the specimen is subjected to a load of 100 pounds, shall not be over three minutes nor under one minute. Tests shall be made at temperatures between 20° and 25° C.

(Test methods for flow test and setting changes are the same as given in Federal specification U-A-451 below.)

PACKING

Alloy shall be packed in moisture-resisting containers and in quantities of 1, 2, or 5 troy ounces. Accurate and adequate instructions for proportioning and manipulation shall accompany each package.

Each package of alloy shall be marked with a serial number or a combination of letters and numbers which shall refer to the manufacturer's records for the particular lot or batch or alloy. The date of manufacture (year and month) shall be indicated on the package as a separate item or as a part of the serial number.

Containers shall not be made, in whole or in part, of materials which will amalgamate readily with mercury.

NATIONAL METAL EXCHANGE (INC.) AND NATIONAL METAL CLEARING ASSOCIATION (INC.), BY-LAWS AND RULES, 1931

BY-LAWS CONCERNING SILVER

TENDERABLE SILVER

Section 40-D.—In fulfillment of every contract of silver, the seller must deliver 25,000 ounces (2 per cent more or less) of bar silver in usual commercial large bars only, assaying not less than 99.9 fineness and made up of one or more of the officially listed brands or markings as provided in section 42-B of these by-laws, current at the date of delivery of such silver.

OFFICIAL LIST OF BRANDS OR MARKINGS OF SILVER BARS

Section 42-B.—There shall be on file in the office of the secretary of the exchange descriptions and/or replicas of the brands or markings of silver bars which may be delivered against National Metal Exchange silver contract, and said official list shall at all times be available to members for inspection.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ALLOY; DENTAL, AMALGAM, U-A-451, MARCH 31, 1931

ALLOY: DENTAL, AMALGAM

A. APPLICABLE FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. TYPES

B-1. Dental amalgam alloy shall be of the following types as specified: Type A, shavings, and type B, filings.

C. MATERIAL AND WORKMANSHIP

C-1. *Material.*—The comminuted alloy shall be free of foreign materials and shall be uniform.

D. GENERAL REQUIREMENTS

D-1. Amalgams shall possess the following features, known as satisfactory working qualities:

D-1a. Thorough amalgamation in three minutes.

D-1b. Absence of granular or sandy consistency when amalgamated.

D-1c. Susceptibility to carving for at least 15 minutes after amalgamation.

D-1d. Susceptibility to receiving and retaining a polish 24 hours after amalgamation.

E. DETAIL REQUIREMENTS

E-1. *Chemical composition.*—The chemical composition shall be within the following limits:

	Per cent
Silver.....	65-70
Tin.....	26-29
Copper.....	3-6
Zinc.....	0-2

E-2. *Ultimate compressive strength.*—The average ultimate compressive strength values of three or more tests shall not fall below 2,500 kg per square centimeter (approximately 35,500 pounds per square inch).

E-3. *Flow.*—Specimens subjected to a constant pressure of 250 kg per square centimeter (approximately 3,550 pounds per square inch) shall not show more than 5 per cent flow (that is, more than 5 per cent shortening in length of specimen) in a period of 24 hours.

E-4. *Setting changes.*—Twenty-four hours after amalgamation the length shall have increased between 1μ and 10μ per centimeter. If at any time during the test a contraction of more than 4μ per centimeter is detected, the alloy shall be rejected.

F. METHODS OF SAMPLING, INSPECTION, AND TESTS

F-1. *Sampling.*—At least 1 ounce shall be taken at random from every 500 ounces or fraction thereof for test at time of delivery.

F-2. *Inspection and tests.*—

F-2a. *Ultimate compressive strength.*—Specimens shall be cylinders 6 mm in diameter and 12 mm long. These shall be prepared by condensing the amalgam into a cavity of these dimensions in a rigid block, using a reasonable technique (approximately that given in the sheet of instructions accompanying the alloy). The ends of the cylinder shall be surfaced plane at right angles to the axis. Strength tests shall be made five days after condensing and the actual time consumed in applying the load shall not be over five minutes nor under two minutes. Tests shall be made at temperatures between 20° and 25° C.

F-2b. *Flow.*—Specimens shall be cylinders 4 mm in diameter and 8 mm long and shall be prepared in the same manner as those for crushing. Three hours after condensing the specimen shall be subjected to a constant pressure of 250 kg per square centimeter (approximately 3,550 pounds per square inch). During this test the specimen shall be maintained at a temperature between 20° and 25° C.

F-2c. *Setting changes.*—Specimens shall be prepared by condensing into a cavity or matrix. These shall be removed as soon as condensation is completed and shall not be subject to restraint during the test. Measurements shall begin 15 minutes after amalgamation. (Time spent in mulling and condensing to be included as a part of the 15 minutes.)

G. PACKAGING, PACKING, AND MARKING

G-1. *Packaging.*—Dental amalgam alloy shall be furnished in moisture-resisting containers having either 1 or 5 ounce capacity, as specified.

(Packing and marking conform to the requirements specified in WW-N-351. See 607.4, p. 485.)

I. NOTES

I-1. It is believed that this specification adequately describes the characteristics necessary to secure the desired material, and that normally no samples will be necessary prior to award to determine compliance with this specification. If, for any particular purpose, samples with bids are necessary, they should be specifically asked for in the invitation for bids, and the particular purpose to be served should be definitely stated, the specification to apply in all other respects.

663.2 SILVERWARE.

AMERICAN MARINE STANDARDS COMMITTEE, O NO. 9-1926

SHIP SILVERWARE

This is a maximum list of kinds and sizes, from which can be selected articles required for any ship service. It is to be supplemented by standard specifications to define the characteristics of articles listed, the whole to constitute a simplified but adequate basis for manufacture and distribution, as well as a convenient and reliable one for purchasing, with resultant economy to all concerned.

(Under hollow ware are included casters, shakers, chafing dishes, dishes, covers, and accessories, pots, trays and waiters, tureens, and miscellaneous items. Under flatware will be found spoons, forks, knives, and miscellaneous items. Eighteen per cent alloy metal unplated (known to the trade as Lasherware) is specified for the crew and steerage.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STERLING SILVER FLATWARE, SIMPLIFIED PRACTICE RECOMMENDATION R54, 1926

STERLING SILVER FLATWARE

In accordance with the unanimous action, on March 2, 1926, of the general conference of representatives of manufacturers, distributors, and users of sterling silver flatware, the United States Department of Commerce, through the Bureau of Standards, recommends that the following schedule constitute the accepted list of stock items in sterling silver flatware patterns:

STAPLES

Item No.	Description
1.	Teaspoons, trade (to be stamped with letter "T"), 8 ounces (tolerance, $\frac{1}{2}$ ounce over or under).
2.	Teaspoons, regular (to be stamped with letter "R"), 10 ounces (tolerance, $\frac{1}{2}$ ounce over or under).
3.	Teaspoons, heavy (to be stamped with letter "H"), 12 ounces (tolerance, $\frac{1}{2}$ ounce over or under).
4.	Desert spoons. ¹⁹
5.	Tablespoons. ¹⁹
6.	Soup spoons.
7.	Desert forks. ¹⁹
8.	Desert knives (hollow handle).
9.	Dinner forks. ¹⁹
10.	Dinner knives (hollow handle).

FANCY DOZENS

11.	Bouillon spoons.
12.	Butter spreaders.
13.	Coffee spoons.
14.	Fish forks (individual).
15.	Fruit knives (hollow handle) (one style of blade only).
16.	Ice cream forks.
17.	Iced tea spoons.
18.	Orange or grapefruit spoons (one size only).
19.	Oyster forks.
20.	Salad forks (individual).

¹⁹ This item will be made in one or two weights at the manufacturer's option. If made and listed in one weight only, it shall in no case carry any designating mark referring to weight.

CARVING SETS

- 21. Meat carving knife.
- 22. Meat carving fork.
- 23. Meat carving steel.
- 24. Game carving knife.
- 25. Game carving fork.
- 26. Steak carving knife.
- 27. Steak carving fork.

BABY SET

- 28. Baby fork.
- 29. Baby knife (hollow handle).
- 30. Baby spoon, short.
- 31. Baby spoon, bent.

CHILD'S SET

- 32. Child's knife (hollow handle; may be listed also as "tea knife").
- 33. Child's fork.
Child's spoon (same as item No. 1).

FANCY SINGLE PIECES

- 34. Bonbon or almond spoon.
- 35. Butter knife.
- 36. Butter pick.
- 37. Cake server (hollow handle).
- 38. Cheese server (hollow handle, one size only).
- 39. Cream ladle.
- 40. Cucumber server.
- 41. Duck, "poultry or game" shears (hollow handle)
- 42. Egg server (hollow handle).
- 43. Gravy ladle.
- 44. Jelly server.
- 45. Lemon fork.
- 46. Mayonnaise or sauce ladle.
- 47. Olive fork.
- 48. Olive spoon.
- 49. Pie server (hollow handle).
- 50. Salad fork, serving.
- 51. Cold meat fork.
- 52. Salad or berry spoon.
- 53. Preserve of salad spoon.
- 54. Serving spoon.
- 55. Sugar spoon.
- 56. Sugar tongs, one size only.
- 57. Tomato server.

WEIGHTS

Teaspoons have not infrequently been listed in four weights, and then under no definitely established terminology indicating those weights. The recommended standard list eliminates one of these weights entirely and establishes standard terminology for the three weights retained.

Dessert spoons, tablespoons, dessert forks, and dinner forks have not infrequently been made in three weights. The recommended standard list eliminates one of these weights for each of the four items, and it is believed will tend more and more to the manufacturing of but one weight in the items noted.

Standardization of the terminology applied to weights will of itself be recognized as a forward step. The recommendations here made are equivalent to dropping out of the list at least five items.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR TABLEWARE; SILVER-PLATED, RR-T-51, JULY 21, 1931

SILVER-PLATED TABLEWARE

A. FEDERAL SPECIFICATIONS

A-1. There are no other Federal specifications applicable to this specification.

B. GRADE AND CLASSES

B-1. Silver-plated tableware covered by this specification shall be of a grade equal to that required for high-class hotel and restaurant service.

B-2. Silverware of this grade shall be divided into the following classes: Class Ia, flatware for frequent use; class Ib, flatware for occasional use; class IIa, hollow ware for frequent use and class IIb, hollow ware for occasional use.

C. MATERIAL AND WORKMANSHIP

C-1. Base metal composition.

C-1a. Unless white metal is specified, the base metal of bodies, spouts, and handles shall consist of "18 per cent" nickel brass (also known as nickel silver or German silver), except that the base metal of articles manufactured by spinning shall be of "15 per cent" nickel brass. Tips and other small parts shall consist of "12 per cent" nickel brass. For each of these alloys a minus tolerance of 1 per cent of nickel will be permitted.

C-1b. When "White metal" (Britannia) is specified, it shall be a tin-base alloy with not less than 80 per cent of tin by weight.

C-1c. Unless silver-plated blades are specified, the blades of the knives shall be of high-grade corrosion resisting cutlery steel properly heat treated and shall conform to the following chemical composition, and shall meet the corrosion test specified in paragraph F-4.

	Per cent
Carbon.....	0.30- 0.40
Manganese.....	.20- .60
Phosphorus, maximum.....	.03
Sulphur, maximum.....	.04
Silicon.....	.10- .50
Nickel, maximum.....	.50
Chromium.....	13.5 -14.5
Copper, maximum.....	1.30

C-1d. On hollow-handle knives the handles shall be of 18 per cent nickel brass. On solid-handle knives, the handle shall be of steel.

C-1e. All soldering on hollow ware shall be with hard or silver solder, except when in contact with "white metal" or insulators, in which case soft solder may be used.

C-1f. Shells of hollow-handle cutlery shall be silver soldered. Blades and tines may be soldered into the handles with soft solder.

C-1g. Where nonconducting handles are specified, they shall consist of or be provided with insulators consisting of wood, fiber, or other approved composition.

C-2. *Base metal thickness.*—

C-2a. Flatware: The blanks for flatware shall weigh not less than the following amounts:

	Avor. oz./doz.
Demitasse spoons.....	3
Teaspoons.....	11
Dessert spoons.....	18
Soup spoons.....	18
Tablespoons.....	24
Dinner forks.....	24
Dessert forks.....	18

Bidders shall state in their bids the weight of blanks for other pieces of flatware.

C-2b. Hollow ware: Unless specifically stated in drawings, the thickness of the metal used for each piece of hollow ware shall be such as will provide the strength and durability required for the service for which the particular piece is intended.

C-3. *Finish.*—

C-3a. *Flatware.*—Unless otherwise specified, flatware shall have the "Butler" (dull) finish except for the bowls, tines, and plated blades, which shall be burnished, and left bright.

C-3b. *Hollow ware.*—Unless otherwise specified, hollow ware shall have the "Butler" (dull) finish.

D. GENERAL REQUIREMENTS

D-1. The size, shape, design, and insignia of each article will be shown by appropriate drawings or samples, to be furnished by the purchasing officer.

D-2. The amount of silver to be applied to each article will be specified by weight. In general, this weight will represent approximately for each class, the average thickness corresponding to Table 1. Except for those articles listed in paragraph E-2 of this specification, the purchaser will indicate on each drawing the required weight of silver.

TABLE 1.—Approximate average thickness and weight of silver

Class	Average thickness	Weight of silver
Ia and IIa (flatware and hollow ware).....	Inch 0.0008	Dwt./ft. ² 12.8
Ib and IIb (flatware and hollow ware).....	0.0006	9.6

D-3. The back of the bowls of spoons and tines of forks in Class Ia shall have on the middle line of the bearing surface a coating of silver not less than 0.0012 inch thick at the thickest point.

D-4. On flatware and hollow ware, a minus tolerance of 15 per cent of the specified weight of silver shall be permitted on individual samples, and of 5 per cent on the average of three or more samples of the same lot of shipment.

E. DETAIL REQUIREMENTS

E-1. The four classes of tableware included in this specification cover the following articles:

Class Ia—Flatware for frequent use—

Forks, dessert, dinner.
Spoons, dessert, soup, tea, table.
Knives, tea, dessert, dinner.

Class Ib—Flatware for occasional use—

All articles of flatware not listed in Class Ia.

Class IIa—Hollow ware for frequent use—

Boats, gravy.
Bowls, ice, salad, sugar.
Dishes and covers, chafing, butter, fish, fruit, meat, vegetable.
Pitchers, cream, ice, water.
Pots, chocolate, coffee, tea.
Scrapers, crumb.
Shakers, salt, pepper.
Trays.
Tureens, soup.
Walters.

Class IIb—Hollow ware for occasional use—

All articles of hollow ware not listed in Class IIa.

E-2. The actual weight of silver required for flatware of Class Ia, shall be as shown in Table 2.

TABLE 2

Article	Approximate area	Required weight of silver
	Square inches	Tr. oz./gross
Forks:		
Dessert.....	9	8
Dinner.....	11	10
Knives:		
Tea hollow handle.....	10	6
Dessert hollow handle.....	15	10
Dinner hollow handle.....	19	12
Dinner hollow handle (handle only).....	9	6
Dinner solid handle.....	17	10
Dinner solid handle (handle only).....	7	5
Spoons:		
Dessert.....	13	9
Soup.....	14	9
Tea.....	9	6
Table.....	17	12

F. METHOD OF SAMPLING, INSPECTION, AND TESTS

F-1. Sampling for weight of silver plating.—

F-1a. On flatware or hollow ware, one piece shall be tested for each gross or less of that article or class purchased. If this sample fails to have within 15 per cent of the specified weight of silver, two more samples shall be selected at random. Unless the average of the three samples tested shall have within 5 per cent of the specified weight of silver the shipment will be rejected.

F-1b. The purchaser will pay for all samples tested upon accepted deliveries, but not for any samples tested on rejected deliveries. All rejected samples of hollow ware shall be returned to the contractor.

F-2. Determination of the weight of silver.—

F-2a. On nickel brass.—The articles are thoroughly cleaned from grease by washing with alcohol or an alkaline solution, and are then dried and weighed. They are then introduced into a suitable vessel containing a mixture of 19 parts by volume of C. P. concentrated sulphuric acid (specific gravity 1.84) and 1 part by volume of C. P. concentrated nitric acid (specific gravity 1.42) which mixture has been heated (for example on a sand bath) to 80° C. (176° F.). (The stripping bath should be kept covered when not in use, to prevent absorption of water.) The articles are kept in the solution until all the silver is dissolved as indicated by the production of a dark color over the entire surface. They are then thoroughly rinsed, dried, and reweighed, and the loss in weight is calculated as silver.

grams \times 0.0322 = troy oz.
grams \times 0.6440 = dwt.

F-2b. On steel and white metal.—The articles are cleaned, dried, and weighed as before, and are then hung as anodes in a solution containing 30 g/L (4 oz./gal.) of sodium cyanide, in which an iron or silver cathode is suspended. A potential of 3 to 4 volts is applied and the articles are shaken or the solution is agitated until all the silver has dissolved. The articles are then rinsed, dried, and weighed, and the loss in weight is considered as silver.

F-2c. Alternate method.—The purchaser may require the contractor to give notice as to when the material is to be plated so that the purchaser may send an inspector to the factory at that time. The inspector shall then weigh one or more pieces from each gross or one hundred pieces before plating and after plating and finishing, to determine whether the specified amount of silver is present.

F-2d. Umpire method.—In case of disagreement upon the results by the methods in (a), (b), or (c), three additional samples shall be tested by the following method. The article is treated with nitric acid (specific gravity 1.2, prepared by mixing equal volumes of water and concentrated nitric acid) until all the silver is dissolved. The solution is evaporated to dryness on a steam bath, treated with a few drops of nitric acid, taken up in water, filtered if necessary, and diluted to a definite volume. An aliquot portion containing about 0.5 gram of silver is then precipitated with hydrochloric acid and the silver chloride is filtered on a Gooch crucible, washed with dilute nitric acid, dried, and weighed. Weight of silver chloride \times 0.753 = silver.

F-3. Determination of the thickness of silver on spoons and forks.—One piece representing each gross or less shall be subjected to the following test. On the back of the bowls of spoons and tines of forks of Class Ia, the maximum thickness of silver will be determined by microscopic examination of the cross section. This is conducted by first plating that portion of the spoon or fork with copper from an acid copper sulphate solution, to a thickness of at least 0.01 inch. The bowl of the spoon, or the body of the fork is then cut with a fine saw

along the center axis; and the surface is carefully polished on a plane perpendicular to the surface of the spoon or fork at the point of contact until all saw marks and polishing scratches are obliterated. The thickness of the silver coating on the back of the spoon or fork, at the point where it would normally rest on a plane surface, is then measured with a suitable microscope and scale. The thickness of silver on that part at the thickest point shall be not less than 0.0012 inch.

F-4. *Corrosion test of steel knife blades.*—From each gross or less of knives submitted for inspection, the inspector shall select not less than one knife for the following test to determine the resistance to corrosion. Upon the clean surface of the blade three drops of copper sulphate solution shall be placed at intervals. After remaining on the blade for six minutes, the solution shall be washed off with fresh water. If the blade is stained by the solution, the material represented by that particular lot shall be considered unsatisfactory and shall be rejected. The copper sulphate solution shall be made up as follows:

Copper sulphate (CuSO ₄ ·5H ₂ O).....g.....	4
Sulphuric acid (H ₂ SO ₄).....ml.....	10
Water (H ₂ O).....ml.....	90

G. PACKING AND MARKING

G-1. *Packing.*—Unless otherwise specified, the subject commodity shall be delivered in standard commercial containers, so constructed as to insure acceptance by common or other carriers, for safe transportation, at the lowest rate, to the point of delivery. All articles of flatware in Class Ia shall be securely wrapped in packages of 12 each.

G-2. *Marking.*—All articles shall bear the manufacturers' name or trade-mark. Unless otherwise specified, shipping containers shall be marked with the name of the material, the size, type, and quantity contained therein as defined by the contract or order under which the shipment is made, the name of the contractor and the number of the contract or order.

I. NOTES

I-1. *Method of measuring areas and specifying weights of silver.*—

I-1a. For all articles for which the required amount of silver has not been previously specified, the purchaser will estimate the total area of the particular piece, and compute the amount of silver to be applied to produce the average thickness indicated in Table 1, and state on the drawing the required weight of silver.

I-1b. *Measurement of areas:* It is not possible by any simple methods to measure the area of irregularly shaped articles with high precision. By making a few measurements and the following arbitrary assumptions, however, the area can usually be estimated with a probable accuracy within 10 per cent.

I-1b (1). Flat or nearly flat surfaces such as the handles of spoons and forks, blades of knives, etc., may be considered as rectangles, with a length equal to the maximum length (measured with a flexible scale) and a width equal to the average of the maxi-

mum and minimum widths. The area on the two sides is therefore equal to the length multiplied by the sum of the minimum and maximum widths. Thus if the length of the handle of a teaspoon is 4 inches, the maximum width 0.75 inch and the minimum width 0.20 inch, the total area of the handle may be considered as $4(0.75+0.20)=3.80$ square inches. (In this calculation it is assumed that the error involved in omitting the thickness of the handle usually about balances the error involved by the assumption that the average width is the mean of the minimum and maximum widths.)

I-1b (2). For surfaces which approach a cylinder or cone (e. g. a knife handle or the body of a pitcher), the area may be estimated by multiplying the length by the average circumference, i. e., the mean of the minimum and maximum circumferences, as measured with a string or flexible scale. Thus if a knife handle is 4.5 inches long, the maximum circumference 2.75 inches and the minimum 1.55 inches,

the area is assumed to be $4.5\left(\frac{1.55+2.75}{2}\right)=9.7$ square inches.

I-1b (3). For ovoid or elliptical surfaces, such as the bowls of spoons, dishes, etc., it has been found by a series of measurements and approximations, that the area on each side is approximately equal to that of an ellipse, the two axes of which are equal respectively to the extreme length and width of the bowl. (These measurements may be made on the outside of the bowl with a flexible scale.) Thus if the extreme length of the bowl of a teaspoon is equal to 2.20 inches, and the extreme width 1.44 inches, the area on each side is equal to 3.14 (that is π) \times

$$\left(\frac{2.20 \times 1.44}{4}\right) = 2.49 \text{ inches.}$$

A simple formula for the area on the two sides of the bowl is therefore

$$a = \frac{\pi l w}{2}$$

where

- a = total area of bowl.
- $\pi = 3.14.$
- l = extreme length.
- w = extreme width.

The total area of the teaspoon considered in this paragraph is 4.98 (bowl) + 3.80 handle = 8.8 square inches or for practical purposes 9 square inches.

I-1c. *Relation between the area and the weight and average thickness of the deposit.*—For such computations the following factors may be employed:

1. Specific gravity of silver = 10.5.
2. A silver coating 0.001 inch in thickness, weighs 0.80 troy oz./ft.², or 16 dwt./ft.², or 0.11 dwt./in.².
3. Dwt./doz. $\times 0.6 =$ troy oz./gross.
4. Average thickness in inches $\times 800 =$ troy oz./ft.²
5. Average thickness in inches $\times 16000 =$ dwt./ft.²
6. Area of a piece in square inches = number of square feet per gross.

(An extended table contains the stock numbers, plan numbers, classes of silverware, and minimum deposit in pennyweights for each item of silverware for naval use. The items range from admiral's smoking sets to officers' mess finger bowl trays.)

671. CLOCKS

(No nationally recognized specifications available.)

672. WATCHES

NATIONAL WATCH CASE MANUFACTURERS ASSOCIATION, RULING OF THE FEDERAL TRADE COMMISSION INDORSED BY THE N. W. C. M. A. AND BY MANUFACTURERS OF GOLD-FILLED AND GOLD-PLATED WATCHCASES, JULY 25, 1931

WATCHCASES

Rule A.—The industry recommends that in every instance the manufacturer and the dealer place the maker's trade-mark conspicuously and indelibly on the inner surface of the lid or cap of any watches disposed of, and in the case of wrist watches, on the inner surface of the back.

Rule B.—The industry recommends that the line of time guarantee cases be definitely restricted in number to three: (a) 25-year cases, (b) 20-year cases, and (c) 10-year cases.

Rule C.—The industry recommends that the official standard for cases entitled to bear a 25-year guarantee stamp be as follows:

The sheet of gold or of its alloy affixed to the outer surface of the backs, center, open-faced bezel, pendant, crown and bow, shall not be less than four one-thousandths of 1 inch in thickness; the sheet of gold or its alloy affixed to the inner surfaces of the backs, to the inner and outer surfaces of the caps, and to the outer surface of the hunting bezel, shall not be less than one one-thousandth of an inch in thickness.

That whenever the thickness of the sheets of gold or its alloy in gold-filled watchcases is indicated, the mark indicating such thickness shall only refer to the thickness of the sheets of gold or its alloy so affixed to the outer surfaces of the backs, center, open face, bezel, pendant, crown and bow, the mark accurately indicating such thickness which shall be expressed in decimals indicating thousandths of an inch, in tests to ascertain the thickness, measurements being taken at a point where no gold has been added or taken away from decoration or ornament.

Rule D.—The industry recommends that the official standard for cases entitled to bear a 20-year guarantee stamp be as follows:

(This rule is similar to rule C for 25-year cases except that the thickness of plate for outer surfaces shall be not less than three one-thousandths of an inch and for inner surfaces not less than one one-thousandth of an inch.)

Rule E.—The industry recommends that the official standard for cases entitled to bear a 10-year guarantee stamp be that such cases shall have to contain as a minimum, a layer of gold of a thickness of one and one-half thousandths of an inch on the outer surface. The recognized marking for cases of this standard shall be "(blank) carat rolled gold plate, guaranteed (or warranted) 10 years."

(Rule F forbids the use of the word gold where the gold content is less than prescribed in above rules. Rule G limits the use of the time guarantee clause to the description of the wearing quality of the precious metal content of the watchcase.)

Rule H.—The industry recommends that all nickel or base metal cases be stamped with the word "nickel" or with the words "base metal" and condemns the manufacture and sale of such cases unless so stamped.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, JEWELERS' AND SILVERSMITHS' WEIGHTS AND MEASURES, CIRCULAR NO. 43, JANUARY 24, 1921

SIZES OF WATCHES

Watch sizes are based upon the diameter of the pillar plate. Watch movements made on the continent of Europe have their diameters expressed either in millimeters or in lignes, the former method being somewhat uncommon. A watch movement made in the United States has its diameter expressed in terms of a certain "Size No." The diameter of the 0-size watch is thirty-five thirtieths of an inch; the size number increases for each thirtieth of an inch. The diameter of a 12-size watch movement is therefore forty-seven thirtieths of an inch (1.567 inches, or 39.79 millimeters).

From the third column of Table 1 it is seen that an 18-ligne watch equals almost exactly a 13-size and that a 15-ligne equals very closely a 5-size. In connection with the most common sizes it is well to note that the diameter of a 16-size watch is nearest to 19 lignes, 12-size to 18 lignes, and 0-size to 13 lignes.

TABLE 1.—Watch sizes

[Based upon the diameter of pillar plate. 1 ligne=2.2559 millimeters; 1 inch=25.40005 millimeters, Size No.=Number of thirtieths (30th's) of an inch in excess of 35 thirtieths (35/30) of an inch]

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, TESTING OF TIMEPIECES, CIRCULAR NO. 392, JUNE 18, 1931

TESTING OF TIMEPIECES

(This circular describes in detail six standard tests for watches and chronometers adopted by the Bureau of Standards. These tests consist of four tests for pocket watches—namely, "class A," "class B," "railroad precision," and "business precision"—a short test for stop watches, and a short test for chronometers. Directions for the submittal of timepieces for test and other items of general information are also given.)

681. TIN

681.0 GENERAL ITEMS.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

TIN SAMPLE

(Sample No. 42b is a standard sample of tin prepared and sold by the Bureau of Standards for use by industrial organizations and others as a standard for calibrating pyrometers, etc. Each sample is accompanied with a certificate giving the melting point of that particular sample.)

(Circular No. 66 of the Bureau of Standards entitled "Standard Samples for Thermometric Fixed Points" gives a description of the preparation of pure samples of tin and other metals, their chemical analyses, determination of freezing points, and methods of using these standard-temperature samples.)

681.1 INGOTS AND PIG METAL, TIN.

NATIONAL METAL EXCHANGE (INC.) AND NATIONAL METAL CLEARING ASSOCIATION (INC.), BY-LAWS AND RULES, 1931

BY-LAWS CONCERNING TIN
TENDERABLE GRADES OF TIN

Section 40.—Tin bearing the following brands and/or descriptions may be delivered against the National Metal Exchange (Inc.), standard tin contract.

Class A.—Banka tin, Straits tin (4 brands listed in full text of this by-law), English refined tin (4 brands listed), German refined tin (3 brands listed), Belgian refined (1 brand listed), Australian refined (3 brands listed).

Class B.—English common (4 brands listed), German common (3 brands listed), Chinese (1 brand listed).

(This by-law specifies the discount applicable to contract price when any one of the brands in class B is tendered.)

UNMERCHANTABLE TIN

Section 43.—If a majority of the board of governors shall at any time determine that any one brand tenderable against exchange contracts has depreciated in its metallurgical assay to a percentage below that represented by the producers of said tin and/or as generally recognized by the trade, thereupon the board of governors may exclude said brand from tenderability on exchange contracts unless deliveries of said brand are accompanied by certificates of analysis of one of the official assayers of the exchange showing a minimum tin content as follows:

	Per cent
Straits, Banka, Australian, and/or English, Belgian and German refined brands.....	99.75
English, German, or Chinese common brands.....	99.00

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR PIG TIN, QQ-T-371. MAY 31, 1932

PIG TIN

GRADES

1. There shall be two grades of pig tin conforming to the requirements as stated below.

MATERIAL

2. (a) Grade A tin shall be new metal, free from scrap or remelted metal.

(b) Grade B tin may be Chinese tin, or may contain remelted metal.

GENERAL REQUIREMENTS

3. The general requirements shall be as stated in the following paragraph.

DETAIL REQUIREMENTS

4. The chemical properties of pig tin shall be as follows:

[Per cent]

Grade	Tin, minimum	Lead, maximum	Antimony, maximum	Zinc	Cadmium	Arsenic, maximum	Copper, maximum	Sulphur, maximum	Iron, maximum	Bismuth, maximum
A	99.75	0.10	0.10	x	x	0.10	0.10	0.01	0.01	0.01
B	98.00	1.50	1.50	x	x	.10	.10	.01	.10	.10

x=none as determined from a 20-gram sample.

The material shall be clean and of uniform quality.

TEST AND INSPECTION

5 (a) Sample shall be taken as follows: Four representative pigs shall be taken from each lot of 5,000 pounds or fraction thereof of an order. A half-inch hole shall be drilled from the top (as cast) of each pig, to one-quarter inch from the bottom, the drillings from the first one-eighth of an inch being discarded in each instance. No lubricant shall be used and drilling shall be under uniform pressure and not forced sufficiently to cause oxidation of the chips.

(b) Approximately equal weights of drillings from each pig shall be thoroughly mixed unless the question of homogeneity of the metal arises (when drillings shall remain unmixed and analyzed separately). The composite sample thus formed shall weigh not less than 15 ounces, and analysis shall be made of this mixture.

(c) Check analyses may be made by the inspector, or through him by any Government laboratory or other designated representative, and without cost to the contractor. The chemical composition thus determined shall conform to the requirements specified.

MARKING

6. All ingots both when presented for inspection and when loaded for shipment shall be legibly and indelibly marked with the brand name.

681.2 SHEETS, TIN.

681.49 MISCELLANEOUS MANUFACTURES OF TIN.

AMERICAN BOTTLERS OF CARBONATED BEVERAGES, STANDARDS FOR BEVERAGE MANUFACTURING EQUIPMENT AND RECOMMENDED PRACTICES, EDUCATIONAL BULLETIN NO. 4, 1930

RUBBER HOSE AND BLOCK TIN TUBING

RECOMMENDED PRACTICE

While all commercial piping and fittings threaded according to the National or American Briggs

standard pipe thread system may be used with the A. B. C. B. connection standards, it will be particularly necessary that the inside diameters of rubber hose and block tin tubing as well as the outside diameters of light gage sirup line (metal) be selected to conform to those thread standards if their use is to be completely successful.

The following inside diameters for rubber hose and block tin tubing are recommended as satisfactory and every effort should be made to promote such sizes as standard: $\frac{3}{4}$, 1, $1\frac{1}{4}$, $1\frac{1}{2}$, and 2 inch sizes.

The following outside diameters for light-gage metal sirup line tubing are also recommended as most satisfactory and as standard: $\frac{5}{8}$, $\frac{7}{8}$, $1\frac{1}{8}$, $1\frac{3}{8}$, and $1\frac{3}{4}$ inch sizes.

AMERICAN BOTTLERS OF CARBONATED BEVERAGES, STANDARDS FOR BEVERAGE MANUFACTURING EQUIPMENT AND RECOMMENDED PRACTICES, EDUCATIONAL BULLETIN NO. 4, 1930

FITTINGS

(For fittings for tin and other metal tubing see 645.4, p. 1230.)

682. PHOSPHOR TIN

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR PHOSPHOR TIN, SERIAL DESIGNATION B51-27, 1927

PHOSPHOR TIN

SCOPE

1. These specifications cover phosphor tin in one grade.

MANUFACTURE

2. The manufacturer shall use new tin of uniform quality throughout in the manufacture of phosphor tin.

3. The manufacturer or vendor shall furnish phosphor tin ingots in the form of notched slabs of a size that can be handled conveniently.

4. Phosphor tin shall be clean, free from defects, and uniform in quality.

CHEMICAL PROPERTIES AND TESTS

5. The material shall conform to the following requirements as to chemical composition:

	Per cent
Phosphorus, minimum.....	3.50
Phosphorus, plus tin, minimum.....	99.50

6. One ingot from each melt or portion of melt shall be selected, and not less than 140 g of clean fine drillings or sawdust shall be taken from the ingot and mixed thoroughly. The ingots selected shall be drilled completely through, or one-half through, from top to bottom, the surface material being rejected.

MARKING

7. A brand and melt number shall be cast or otherwise plainly marked upon each slab or ingot by which the manufacturer and heat may be identified. Marking may be done by either stamping or painting.

CLAIMS

(Claims are the same as in A. S. T. M. B30-31T (see 644.11, p. 1196) except that they must be made in writing within 10 days instead of the 30 days specified in B30-31T.)

UNITED STATES GOVERNMENT, FEDERAL
SPECIFICATIONS BOARD, FEDERAL
SPECIFICATION FOR PHOSPHOR TIN,
QQ-T-351 MAY 3, 1932

PHOSPHOR TIN

(Except for the omission of claims and umpire chemical analysis, this specification is identical with A. S. T. M. B51-27, given above except that a sample of 150 g is required.)

683. ZINC

683.0 GENERAL ITEMS.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF SPELTER, SERIAL DESIGNATION B38-31, 1921

CHEMICAL ANALYSIS OF SPELTER

DETERMINATION OF LEAD BY THE ELECTROLYTIC METHOD

APPARATUS

Platinum cylindrical gauze electrodes containing approximately 400 meshes per square centimeter (50 meshes per linear inch) are recommended for anode and cathode. They should be stiffened by doubling the gauze for about 3 mm at the top and at the bottom of the cylinders. The anode should be approximately 30 mm in diameter and 30 mm in height. The stem should be made from 1.14 mm or 1.29 mm wire, flattened and electrically welded the entire width of the gauze; the height over all should be approximately 130 mm, and the gauze should be sand-blasted. The cathode should be approximately 12 mm in diameter by 30 mm in height, the stem being of the same dimensions and welded in the same way as the anode.

METHOD

Place 8.643 g (note 1) of the sample in a 400 c c beaker, add sufficient water to cover, and then add 30 c c HNO_3 (specific gravity 1.42) gradually. When action is complete, boil the solution for 10 minutes, wash off the watch glass, and transfer the solution to a 200 c c electrolytic beaker, washing out the original 400 c c beaker. Dilute to 125 c c and electrolyze (note 2) with a current of 5 amperes for 45 minutes. (Note 3.) Test the solution for complete precipitation of lead by washing the watch glasses and sides of the beaker, increasing the depth of the solution about 12 mm. Continue the current for 15 minutes and, if the newly exposed surface is still bright, wash the anode (note 4) three or four times with distilled water, once with alcohol, and then dry in an oven (note 5) at 210° C. for 30 minutes, cool in a desiccator, and weigh.

The weight of the deposited PbO_2 , in milligrams, divided by 100, gives the percentage of lead. (Note 6.)

NOTES.—1. The empirical factor weight, 8.643 g, is used instead of the theoretical one (8.660 g) as dried dioxide contains some adherent and included water, not entirely expelled.

2. Before electrolyzing, the beaker should be covered with split watch glasses to prevent loss by spraying.

3. The time required for complete deposition is usually 30 to 45 minutes. For small amounts of lead 30 minutes will be found sufficient.

4. The washing should be done immediately, as the deposit of PbO_2 tends to dissolve.

5. The anode may also be dried on a hot plate, although a drying oven is to be preferred.

6. The PbO_2 deposit can be readily removed by immersing the anode in hot dilute solution of HNO_3 to which oxalic acid has been added, or by covering with dilute HNO_3 and inserting a rod of copper.

DETERMINATION OF LEAD BY THE LEAD ACID METHOD

SOLUTIONS REQUIRED

Lead acid.—Pour 300 c c of H_2SO_4 (specific gravity 1.84) into 1,800 c c of distilled water; dissolve 1 g of lead acetate in 300 c c of distilled water, and add to the acid solution with stirring. Allow to settle for several days and siphon off the clear solution through a thick asbestos pad. (Note 1.)

Nitric acid.—Mix 1,000 c c of HNO_3 (specific gravity 1.42) with 1,000 c c of distilled water.

Alcohol.—Mix 1,000 c c of ethyl alcohol (95 per cent) with 1,000 c c of distilled water.

METHOD

Place sample (note 2) of 25, 15, 10, or 5 g in a 350 c c beaker and add 300, 180, 120, or 60 c c, respectively, of lead acid. After all but about 1 g is dissolved, filter on a close filter and wash out the beaker twice with lead acid from a wash bottle. Wash the undissolved matter from the filter into the original beaker with water and dissolve with 10 c c of HNO_3 . Add 40 c c of lead acid and evaporate until copious fumes of H_2SO_4 are evolved. When cool, add 35 c c (Note 3) of water, heat to boiling and add the first filtrate (note 4), stir well and allow to stand overnight (note 5). Filter on a Gooch crucible, wash with lead acid, then with alcohol-water mixture, and finally with alcohol alone. Set the Gooch crucible inside of a larger porcelain crucible (note 6) and heat for five minutes at the full heat of a Tirrill burner. Cool and weigh as PbSO_4 .

NOTES.—1. When lead acid is used, it is unnecessary to consider the solubility of PbSO_4 , since the solution is always brought back to the same volume as the lead acid used originally, consequently it will retain no PbSO_4 from the sample.

2. The amount of sample taken is governed by the grade of spelter:

Grade No. 1, 25 g.	Grade No. 3, 10 g.
Grade No. 2, 15 g.	Grade No. 4, 5 g.
Grade No. 5, 5 g.	

3. The 35 c c of water added is the quantity of water evaporated from the lead acid.

4. The first filtrate, which contains the greater part of the zinc, may also contain a small amount of PbSO_4 .

5. It is preferable to allow the solution and precipitate of PbSO_4 to stand overnight, although this time may be shortened to not less than five hours.

6. The Gooch crucible is heated inside of a porcelain crucible to avoid reduction of the PbSO_4 by flame gases and mechanical disintegration of the asbestos mat.

DETERMINATION OF IRON

SOLUTIONS REQUIRED

Dilute ammonia water.—Mix 100 c c of NH_4OH (specific gravity 0.90) with 1,000 c c of distilled water.

Sulphuric acid (1:4).—Mix 250 c c of H_2SO_4 (specific gravity 1.84) with 1,000 c c of distilled water.

Sulphuric acid (1:1).—Mix 500 c c of H_2SO_4 (specific gravity 1.84) with 500 c c of distilled water.

Dilute sulphuric acid for reductor.—Mix 50 c c of H_2SO_4 (specific gravity 1.84) with 1,000 c c of distilled water. This solution is used boiling hot.

Potassium permanganate.—Dissolve 0.2 g of KMnO_4 , chemically pure, in 1,000 c c of distilled water. Allow to stand for several days in a glass-stoppered bottle in a dark closet, and then filter through prepared asbestos. Standardize against 0.020 g portions of pure sodium oxalate, dissolved in 200 c c of the dilute H_2SO_4 for reductor. Each cubic centimeter of KMnO_4 is equivalent to approximately 0.00033 g of iron.

METHOD

Place 25 g of the sample in a tall 700 c c beaker and dissolve cautiously with 125 c c of HNO_3 (spe-

cific gravity 1.42). Boil, dilute to about 300 c c, add 10 g of NH_4Cl and then ammonia water (specific gravity 0.90) until the precipitated $\text{Zn}(\text{OH})_2$ has redissolved. Boil, let settle, and filter on an 11 cm filter paper. (Note 1.) Wash with dilute ammonia water and then with hot water until free from chlorides. Dissolve precipitate from the paper with hot H_2SO_4 (1:4), add 40 c c of H_2SO_4 (1:1), cool, and pass through a Jones reductor. (Note 2.) Wash out the reductor first with 150 c c of dilute H_2SO_4 for reductor and then with 100 c c of distilled water and titrate with standard KMnO_4 solution. (Note 3.)

NOTES.—1. A filter paper which will retain $\text{Fe}(\text{OH})_3$ and filter rapidly should be used. Whenever the amount of iron is at all large or when great accuracy is demanded, a second precipitation of $\text{Fe}(\text{OH})_3$ should be made by dissolving the precipitate on the paper in hot dilute HCl , adding ammonia water and filtering, in order to remove all traces of nitrates.

2. The reductor should be clean, preferably washed out with 150 c c of dilute H_2SO_4 and 100 c c of water first. If, before passing through the reductor, a large amount of PbSO_4 is present, it is well to filter it off so as to prevent it from clogging the reductor. A small quantity of liquid should always be left in the reductor funnel, and air should never be allowed to enter the body of the reductor. For description and further details of use of reductor, see "The Chemical Analysis of Iron," by A. A. Blair, or "Quantitative Chemical Analysis," by H. P. Talbot.

3. A blank determination should be made on corresponding amounts of acid and water passed through the reductor and the results should be corrected accordingly. About 0.5 c c of the KMnO_4 solution will be required to give a permanent coloration to the solution.

DETERMINATION OF CADMIUM GRAVIMETRICALLY

SOLUTIONS REQUIRED

Sulphuric acid (1:1).—Mix 500 c c of H_2SO_4 (specific gravity 1.84) with 500 c c of distilled water.

Sulphuric acid (1:5).—Mix 200 c c of H_2SO_4 (specific gravity 1.84) with 1,000 c c of distilled water.

Hydrochloric acid (1:3).—Mix 250 c c of HCl (specific gravity 1.20) with 750 c c of distilled water.

METHOD

Place 25 g of drillings in a tall 500 c c beaker; add 250 c c of water and 55 c c of HCl (specific gravity 1.20) and stir. When the action has almost ceased add more acid with stirring, using about 2 c c at a time and allowing to stand after each addition, until finally all but about 2 g of the zinc has been dissolved. (Note 1.) Filter, first transferring one of the undissolved pieces of zinc to the filter, and wash twice with water. Discard the filtrate. Wash the undissolved matter on the filter paper into the 500 c c beaker, cover, and dissolve in 10 c c of water and 10 c c of HNO_3 (specific gravity 1.42). Transfer to a casserole, add 20 c c of H_2SO_4 (1:1), and evaporate until fumes appear. Take up with 100 c c of water, boil, cool, and let settle over night. (Note 2.) Filter off the PbSO_4 on paper, wash twice with water, retain the filtrate but discard the paper and precipitate. Dilute the filtrate to 400 c c, add about 10 g of NH_4Cl , and pass H_2S gas through for one hour. (Note 3.) Allow to stand until the precipitate has settled, and filter off the impure CdS (note 4) on a loose-bottom Gooch crucible. Remove the precipitate by punching out the bottom into a tall 200 c c beaker, wiping off the sides of the crucible with a little asbestos pulp. Add 60 c c of H_2SO_4 (1:5) and boil for 30 minutes. (Note 5.) Filter, wash, and dilute to 300 c c, add about 5 g of NH_4Cl ; and precipitate with H_2S gas as before. (Note 6.) Repeat, making a third precipitation if the amount of cadmium present is large. (Note 7.) After the final precipitation, let settle, filter, and transfer to a weighed platinum dish, cover, and dissolve in HCl (1:3). Dissolve the precipitate remaining on the paper in hot HCl (1:3) and add also to the solution in the platinum dish. (Note 8.) Add 10 c c of H_2SO_4 (1:1) and evaporate the solution until copious fumes are evolved. (Note 9.) Remove the excess of H_2SO_4 by heating the dish cautiously, and finally

heat to between 500° and 600° C. Cool and weigh as CdSO_4 .

NOTES.—1. The addition of HCl will dissolve the zinc and a small amount of the cadmium. By adding the acid in small quantities, that is, keeping the acidity low, and also keeping the solution cold, the amount of cadmium dissolved will be small. Since it requires some time to reprecipitate completely any cadmium dissolved, it is desirable for the solution to stand overnight following the addition of the 55 c c of HCl at the start. For the same reason the solution should be allowed to stand after the last addition of acid, and care be taken that the stated amount of spelter remain in the undissolved residue. If the solution is heated, or if time is not allowed for the action of the acid to cease completely, small amounts of cadmium may pass into the solution and be lost.

Equally satisfactory or, in some cases, more satisfactory results are obtained by using H_2SO_4 to dissolve the major portion of the zinc. The rate of solution is slower and the tendency for cadmium to pass into solution less. The quantity of acid required can be calculated, measured out at the beginning and small quantities added from time to time as the action becomes slow.

2. It is desirable to allow it to settle overnight to precipitate all the PbSO_4 from the solution and to give good conditions for filtering.

3. It is occasionally necessary to add a drop or two of ammonia water to the solution to start the precipitation of CdS .

4. All the cadmium will be precipitated as sulfide together with some ZnS . The major portion of the zinc will remain in solution.

5. In case of high cadmium content, more acid may be required.

6. The second precipitation should give practically pure CdS .

7. A third precipitation will remove any uncertainty as to the completeness of the separation of cadmium from zinc.

8. A crucible may also be used if the volumes are kept small or evaporated before transferring to the crucible.

9. On evaporating to fumes, darkening of the solution may occur from filter paper shreds. This may be destroyed by diluting slightly with water and adding 5 c c HNO_3 (specific gravity 1.42) and again evaporating to fumes.

DETERMINATION OF CADMIUM BY THE ELECTROLYTIC METHOD

SOLUTIONS REQUIRED

Potassium hydroxide (note 1).—Dissolve 20 g of KOH , chemically pure, in 200 c c of distilled water.

Potassium cyanide (note 2).—Dissolve 20 g of KCN , chemically pure, in 200 c c of distilled water.

APPARATUS

See determination of lead by the electrolytic method, given above. The anode, as used in the lead determination, is here used as the cathode, and vice versa.

METHOD

See determination of cadmium gravimetrically, given above.

Dissolve the final precipitate of CdS in hot HCl (1:3), boil to remove H_2S , adding a few drops of HNO_3 (specific gravity 1.42) near the end, and filter off the separated sulphur. Transfer the solution to a 200 c c electrolytic beaker, add a drop or two of phenolphthalein and then KOH solution until a permanent red color is obtained. Add KCN solution with constant stirring until the precipitate

of Cd (OH)₂ is completely dissolved. (Note 3.) Dilute to 150 c c and electrolyze with a current of 5 amperes for two hours. (Note 4.) Test for completeness of deposition by washing the watch glasses and sides of the beaker to increase the depth of the solution. Continue electrolysis for 20 minutes and if the newly exposed surface of the cathode is still bright, remove the beaker with electrolyte and wash the electrodes three times with distilled water and twice with ethyl alcohol (95 per cent). Dry the cathode at 100° C., cool, and weigh. The increase is metallic cadmium.

NOTES.—1. Pure NaOH may be used in place of KOH.
2. Pure NaCN may be used in place of KCN.
3. Avoid using an excess of KCN.
4. The test for completeness of deposition may be made after one hour when the quantity present is not large.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

ZINC ORE AND ZINC SAMPLES

(Sample No. 2 is a standard sample of zinc ore D prepared and sold by the Bureau of Standards for use by industrial organizations and others as a comparison standard for checking the accuracy of analysis of zinc ores. Each sample is accompanied by a certificate giving the content of zinc in the particular sample.)

(Sample No. 43b is a standard sample of the metal zinc for use in calibrating pyrometers, etc. Each sample is accompanied with a certificate giving the melting point of that particular sample.)

(Circular No. 66 of the Bureau of Standards entitled "Standard Samples for Thermometric Fixed Points" gives information on the preparation of these standard samples, their chemical analyses, determination of freezing points, and methods of use.)

683.1 INGOT METALS, ZINC OR SPELTER.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SPELTER, SERIAL DESIGNATION B6-18, 1918

SPELTER

SCOPE

1. Under these specifications virgin spelter; that is, spelter made from ore or similar raw material by a process of reduction and distillation, or by electrolysis, and not produced from reworked metal, is considered in five grades, as follows: 1, high grade; 2, intermediate; 3, brass special; 4, selected; and 5, prime western.

2. A brand shall be cast in each slab by which the maker and grade can be identified.

QUALITY

3. The maker shall use care to have each carload of as uniform quality as possible.

COMPOSITION

4. (1) *High grade*.²⁰—The spelter shall not contain over—

	Per cent
Lead.....	0.07
Iron.....	.03
Cadmium.....	.07

²⁰ For slush castings and certain zinc-aluminum alloys, a special grade of spelter may be required, as noted in "Spelter, Its Grades and Uses," published as Appendix 1 to the report of Committee B-2 on nonferrous metals and alloys, Proc., Am. Soc. Testing Mats., vol. 16, pt. 1, p. 183, 1916.

It shall be free from aluminum.

The sum of lead, iron, and cadmium shall not exceed 0.10 per cent.

(2) *Intermediate*.—The spelter shall not contain over—

	Per cent
Lead.....	0.20
Iron.....	.03
Cadmium.....	.50

It shall be free from aluminum.

The sum total of lead, iron, and cadmium shall not exceed 0.50 per cent.

(3) *Brass special*.—The spelter shall not contain over—

	Per cent
Lead.....	0.60
Iron.....	.03
Cadmium.....	.50

It shall be free from aluminum.

The sum total of lead, iron, and cadmium shall not exceed 1.0 per cent.

(4) *Selected*.—The spelter shall not contain over—

	Per cent
Lead.....	0.80
Iron.....	.04
Cadmium.....	.75

It shall be free from aluminum.

The sum total of lead, iron, and cadmium shall not exceed 1.25 per cent.

(5) *Prime western*.—The spelter shall not contain over—

	Per cent
Lead.....	1.60
Iron.....	.08

PHYSICAL

5. The slabs shall be reasonably free from surface corrosion or adhering foreign matter.

SAMPLING

6. Take 10 slabs²¹ at random from a carload and saw each slab completely across from the middle of one long side to the middle of the other, and use the sawdust as the sample; or, drill three 9-mm holes along one diagonal of each slab, boring completely through and taking care to make fine drillings; the holes should be drilled as nearly as possible at the middle and halfway between either end and the middle of such diagonals. Go over the drillings or sawings with a powerful magnet to take out any iron which may have come from the drill or saw, and mix the sample thoroughly. The drill or saw shall be thoroughly cleaned before use, and no lubricant shall be used in either drilling or sawing.

CLAIMS

Claims to be considered shall be in writing within 30 days of receipt of material at customer's plant, and the results of customer's test shall be given. The shipper shall be given one week from date of receipt of such claim to investigate his records, and then shall either agree to satisfy the claim or send a representative to the plant.

(a) *Analysis by car lots*.—No claims shall be considered unless the minimum samples as specified for the grade in question can be shown to such representative.

(b) *Physical defects of individual pieces*.—No claims shall be considered unless the spelter in question, unused, can be shown to such representative.

²¹ Sec. 6 on sampling is based on the report of the subcommittee on methods of analysis of nonferrous alloys of the Division of Industrial Chemists and Chemical Engineers of the American Chemical Society, approved by the supervisory committee on standard methods of analysis of that society: J. Ind. Eng. Chem., vol. 7, p. 547, 1915.

PLANT TREATMENT

8. Where the spelter satisfies the chemical and physical requirements of these specifications, it shall not be condemned for defects of alloys in which it is used, or for defects in the coating of galvanized products.

INVESTIGATION OF CLAIMS

9. The maker's representative shall inspect all pieces where physical defects are claimed. If agreement is not reached the question of fact shall be submitted to a mutually agreeable umpire, whose decision shall be final.

On a question of metal contents a sample shall be drawn by representatives of both parties as described under "Sampling," section 6. The properly mixed and quartered sample shall be separated into three parts, each of which shall be placed in a sealed package, one for each party and one for the umpire if necessary. Each party shall make an analysis, and if the results do not establish or dismiss the claim to the satisfaction of both parties, the third sample shall be submitted to a mutually agreeable umpire, who shall determine the question of quality, and whose determination shall be final.

SETTLEMENT OF CLAIMS

10. The expenses of the seller's representative and of the umpire shall be paid by the loser, or divided in proportion to concession made in case of compromise.

In case of rejection being established, damages shall be limited to the payment of freight both ways by the seller for the substitution of an equivalent weight of spelter meeting these specifications.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR ZINC SLAB (SPELTER) QQ-Z-351, MAY 31, 1932

ZINC SLAB

(In common with other Government specifications for metals, this specification includes F. B. S. No. 339a (QQ-M-151). (See 600.1, p. 3.) In respect of grades, material, general requirements, chemical composition (except that tin is specifically disallowed), and methods of inspection and tests, it is identical with A. S. T. M. B6, given above. It differs from B6 in that, instead of extended specifications on claims and settlement thereof, it states briefly:)

1. Sample slabs for analysis shall be selected, one for each 4,000 pounds or fraction thereof, so as to represent as nearly as possible the average quality of the metal. The sample from each slab shall weigh not less than 5 ounces and shall be kept separate.

2. Check analysis may be made by the inspector, or through him by any Government laboratory or other designated representative and without cost to the contractor. The chemical composition thus determined shall conform to the requirements specified.

683.2 SHEETS AND PLATES, ZINC.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR ROLLED ZINC, DESIGNATION B-69-29, 1929

ROLLED ZINC

SCOPE

1. These specifications cover three types of commercial rolled zinc, as described in section 2. It

should be understood that the specifications are general. Any closer limitations on permissible variations shall be a matter of agreement between the buyer and seller at the time of purchase.

SPECIFICATIONS

2. The rolled zinc shall be divided into the following types: Type A, ribbon zinc and sheets or strips cut from ribbon zinc; type B, sheet zinc or strips cut from sheet zinc; and type C, boiler plate, name plates, tags, etc.

Manufacture

3. (a) Type A rolled zinc shall be rolled from a single bar in one continuous direction.

(b) Type B rolled zinc shall be rolled by the pack rolling method.

(c) Type C rolled zinc may be rolled either from a single bar or by the pack rolling method.

CLASSIFICATION ACCORDING TO TEMPER

4. Rolled zinc of the three types shall be classified according to temper as follows:

Type A.....	} Dead soft Soft Half hard Hard
Type B.....	
Type C.....	Commercial No classification

5. The classification of rolled zinc according to temper shall be determined by means of the dynamic ductility test and the temper test described in sections 18 to 23, inclusive. The requirements for the several types shall be as specified in sections 6 and 7.

6. Type A.—The requirements for temper for the several grades of type A rolled zinc shall be as given in Table 1.

TABLE 1.—Requirements for temper, type A rolled zinc

Amer- ican zinc gage	Thick- ness	Dead soft		Soft		Half hard		Hard

7. Type B.—The requirements for temper for type B rolled zinc shall be as given in Table 2.

PERMISSIBLE VARIATIONS IN DIMENSIONS

(a) THICKNESS

8. The thickness of rolled-zinc plates, sheets, and ribbons of types A, B and C, shall be stated in decimals of an inch.

9. *Type A.*—The permissible variations in thickness of type A rolled zinc shall be as given in Table 3. Thicknesses of metals falling between the gages shown shall take the tolerances of the nearest gage.

TABLE 2.—Requirements for temper, type B rolled zinc

12	.028	±6	23	.100	±6
13	.032	±6			

unit of 500 pounds. One cubic inch of the material is assumed to weigh 0.2596 pound. No individual sheet shall weigh more than the theoretical weight of a sheet of the gage next above, nor less than a sheet of the gage next below.

11. *Type C.*—The permissible variations in thickness of type C rolled zinc shall be the same as those for either type A or type B rolled zinc, depending upon whether the material is cut from a ribbon or a sheet.

(b) WIDTH

12. (a) The permissible variations in width for all types of rolled zinc up to 0.100 inch in thickness shall be as follows:

Width (in inches)	Permissible variation	
	Plus	Minus
2 and under	<i>Inch</i> 0.010	0
Over 2 to 5, inclusive	.025	0
Over 5 to 14, inclusive	.050	0
Over 14	.125	0

(b) The permissible variations in width for all types of rolled zinc from 0.100 inch to 0.250 inch in thickness shall be plus or minus one-sixteenth inch, and from 0.250 inch to 0.500 inch in thickness plus or minus one-eighth inch, and for material over 0.500 inch in thickness plus one-fourth inch.

(c) LENGTH

13. (a) Sheets, strips, and plates may be ordered to exact length up to 12 feet, in which case a variation in length of plus one-fourth inch shall be permitted.

(b) When sheets, strips, and plates are ordered in stock lengths the pieces shall be cut to the nominal or stock length as a maximum. The shortest acceptable lengths, the maximum permissible percentage by weight of short lengths, and the required percentage by weight of stock lengths in any one shipment shall be as follows:

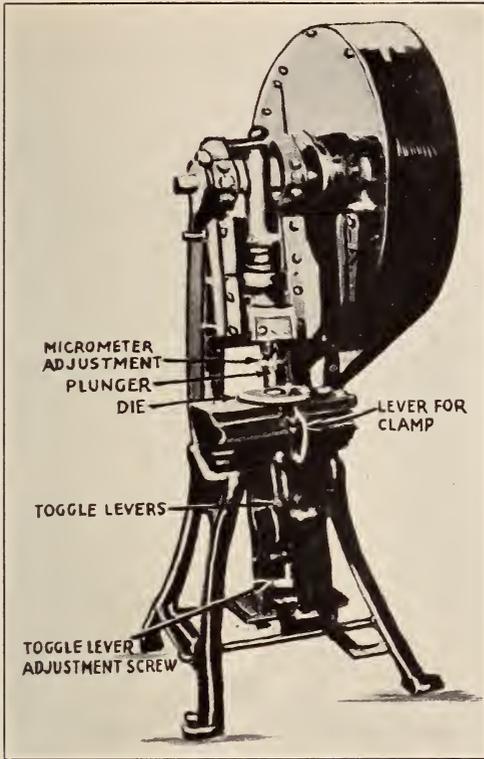

FIGURE 1131.—*Dynamic ductility test machine*
(For specification see p. 1313.)

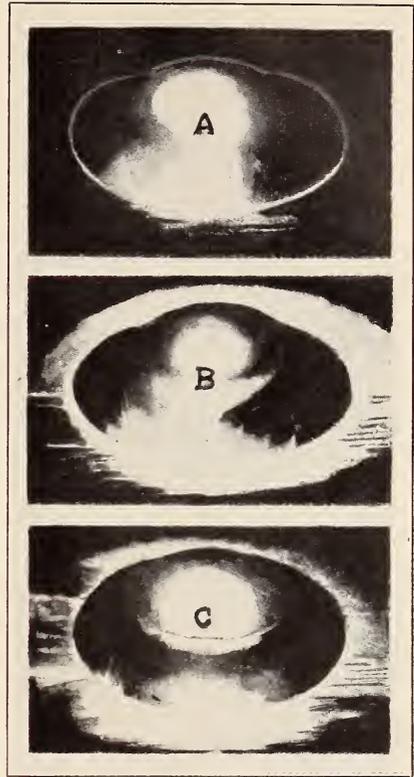

FIGURE 1132.—*Showing typical cups formed in ductility test*
A, Before rupture; B, at rupture; C, past rupture.
(For specification see p. 1313.)

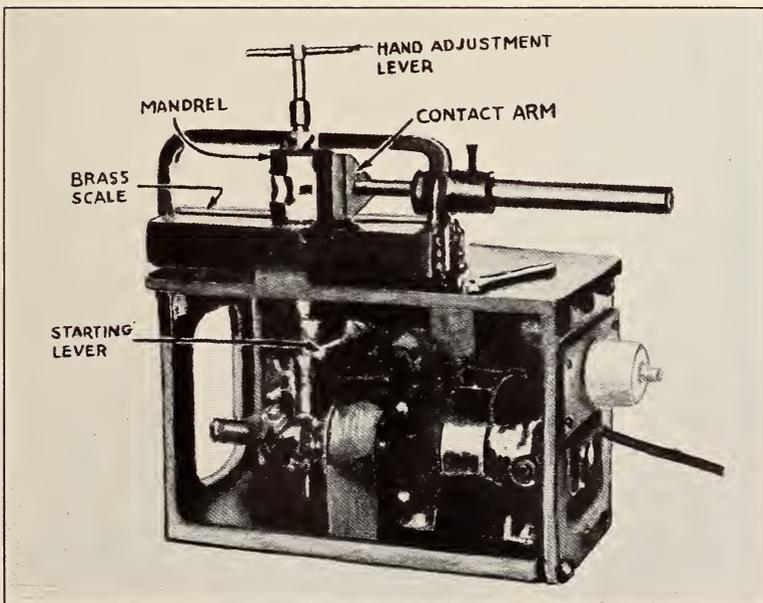

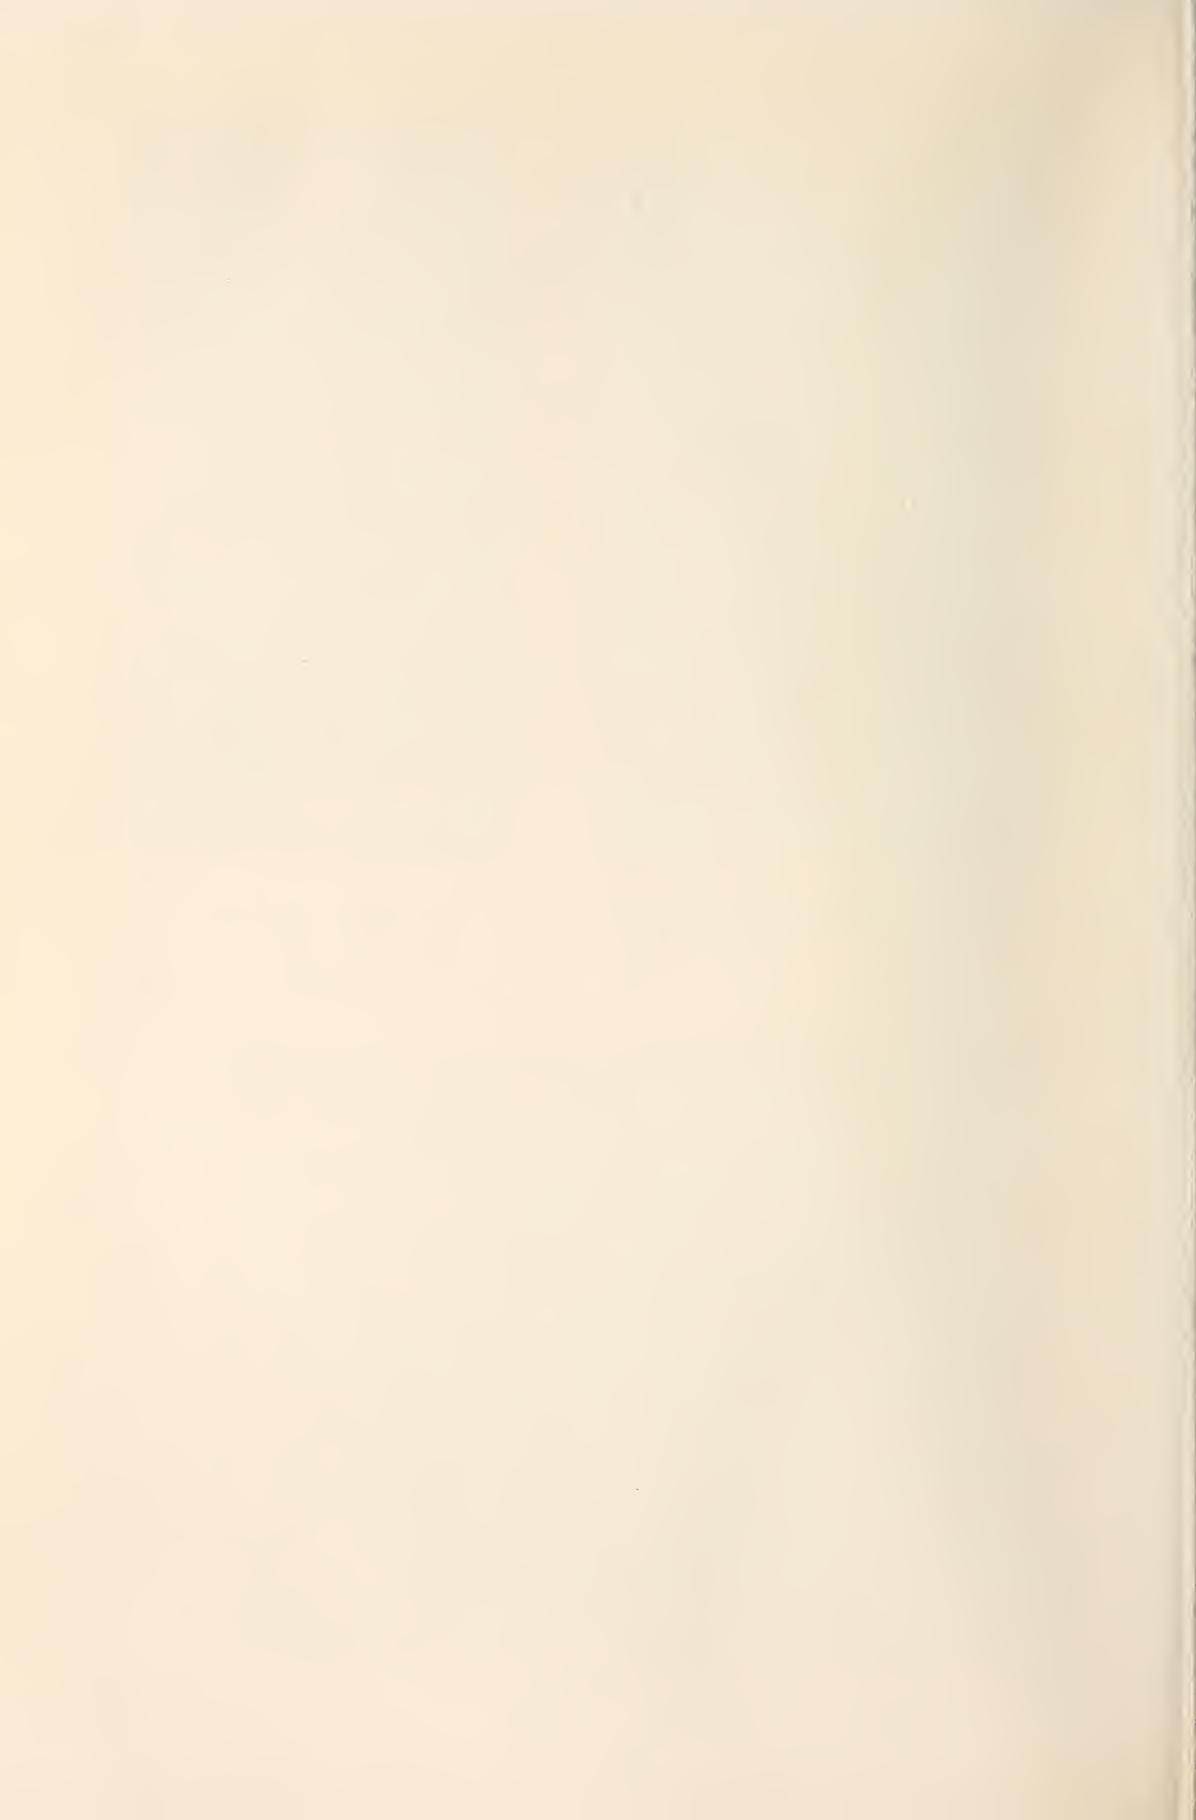

FIGURE 1133.—*Temper test machine*
(For specification see p. 1313.)

Permissible variations in length of plates, sheets, and strips up to 20 inches in width

Nominal or stock length, (feet)	Required percentage by weight of stock, lengths	Maximum permissible percentage by weight of short lengths				
		8 to 10 feet	6 to 8 feet	4 to 6 feet	2 to 4 feet	Under 2 feet
10	60	40	30	20	10	0
8	70	-----	30	20	10	0
6	80	-----	-----	20	10	0

14. When type A rolled zinc is supplied in coils it shall be consistent with good commercial practice and in no case shall a coil consist of more than 4 pieces. No piece shall be less than 10 feet long.

15. Type A rolled zinc in lengths over 10 feet shall not exhibit sidewise bend or curvature in excess of 1 inch in any length of 10 feet.

Packing and Marking

16. (a) All material shall be properly separated according to size when loaded for shipment. In the case of shipments of plates, sheets, and ribbons packed in boxes or crates, the containers shall be sufficiently strong to protect them from injury and loss during shipment.

(b) Bulk shipments shall be properly braced in the car.

17. Each bundle, box or crate shall be legibly marked with the type letter, dimensions, and gross, tare, and net weight.

METHODS OF TEST

Sampling

18. For purposes of test in shipments of type A or B rolled zinc, 10 samples shall be taken for every 5,000 pounds. These samples shall be taken from representative coils or sheets throughout the shipment, and not more than one sample shall be taken from the same coil or sheet. Test specimens shall be cut from the samples as described in the various test methods.

Dynamic Ductility Test

19. The dynamic ductility machine for conducting the dynamic ductility test is a modified inclinable power press fitted with an adjustable die as shown in Figure 1131. The speed of the machine shall be 85 to 90 oscillations of the plunger per minute.

20. (a) The test specimen shall consist of a strip cut across the full width of a ribbon or sheet, the width of the strip being approximately 3½ inches. When this results in a specimen of less than 12 inches in length, as from narrow unslit ribbon zinc, two specimens 3½ inches in width shall be cut.

(b) Test specimens from narrow strips such as ribbon or sheet zinc after slitting shall be cut to 20-inch lengths.

NOTE.—The construction of the machine will not permit test specimens of greater thickness than 0.060 inch.

21. (a) The temperature of the test specimens, testing machine and room throughout the test shall be kept within 70° and 90° F. The specimen shall be inserted in the machine and firmly clamped. The testing shall be started at one end and the strip moved with each successive cup. The series of cups shall be along the middle line of a 3½-inch strip so that clamping will be uniform around the cup as it is formed. With the motor running the clutch shall be thrown in, lowering the plunger, which, with the die in the clamp base, presses the cup in the

test strip. If the cup does not show rupture, the plunger is advanced by increments of 0.005 inch and the cupping repeated with each increased depth until rupture occurs. Having determined the rupturing point additional cups shall be formed as a check. The rupturing point shall not be considered to be that point where an open crack is formed, but where the drawing of the bottom of the cup has just caused "necking" of the surface prior to rupture (see fig. 1132).

NOTE.—An experienced operator should catch the rupture point after two or three trial cups.

(b) The depth of the cup at which rupture just occurs is read from the micrometer attachment on the plunger and is reported as the dynamic ductility of the specimen. The average ductility of the test specimens shall be considered the dynamic ductility of the shipment.

NOTE.—The micrometer attachment on the plunger mechanism measures the distance that the plunger extends beyond the zero point. The zero point is where no impression would be made on the test strip. The clamp base is adjusted for the varying thicknesses. The micrometer attachment also serves to advance and withdraw the plunger.

Temper Test

22. The apparatus consists of a temper-test machine as shown in Figure 1133.

23. Duplicate test specimens shall be cut from each sample and shall be rectangular in shape and cut accurately to 1½ inches in width and 4¾ inches in length, with the length taken in the direction of rolling. With ribbon zinc the duplicate test specimens shall be cut from adjacent places across the width of a sample.

NOTE.—The construction of the machine does not permit test specimens of greater thickness than 0.035 inch.

24. (a) The temperature of test specimens, testing machine, and room throughout the test shall be kept within 70° and 90° F. The test specimens shall be inserted to the full depth of the vise of the mandrel and securely held by tightening the vise. The diameter of the mandrel is 2½ inches. Inserting the test specimen as specified to the full depth of the vise leaves extended a length exactly one-half the circumference of the mandrel. In the rotation of the mandrel the test specimen is pressed by the contact arm against the mandrel. When the outer or free end passes the contact arm it springs out according to its temper. The speed of rotation of the mandrel shall be between 50 and 55 r. p. m. With the motor running, the clutch shall be thrown in, rotating the mandrel counterclockwise. When the outer end of the specimen has passed the contact arm the rotation of the mandrel shall be stopped by throwing out the clutch. The mandrel shall be turned to the 100 per cent position which is indicated by a mark on the mandrel and the fixed pointer, and the percentage of temper shall be read from the position of the outer end of the specimen on the underlying graduated scale, consisting of a half circle graduated counterclockwise from 0 to 100 per cent.

(b) The duplicate specimen shall be similarly tested and, in order to eliminate the effect of the curvature of the specimens due to coiling, shall be inserted in the vise in the reverse position to that of the first specimen.

That is, if one specimen is inserted and pressed with its curvature toward the mandrel, the duplicate specimen should be inserted with its curvature away from the mandrel.

(c) The average of the readings on two test specimens shall be reported as the temper of the material.

Test for sidewise bend or curvature

25. The coil shall be supported on a reel at one end of the table and the ribbon drawn along a 10-

foot straight edge, keeping both ends of the straight edge touching the edge of the ribbon. No point on the straight edge shall then be more than 1 inch from the edge of the ribbon.

Gaging

26. Type A rolled zinc shall be gaged with a micrometer caliper which has previously been checked with precision blocks. No two measurements along the length of the coil shall be made within 12 inches of each other, nor shall measurements in any one line across the width of the coil be used as a basis of rejection.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD THICKNESSES, WEIGHTS, AND TOLERANCES OF SHEET METAL (CUSTOMARY PRACTICE), CIRCULAR NO. 391, MARCH 24, 1931

AMERICAN WIRE GAGE—ZINC SHEETS

(See 640.1, p. 1165.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION, FOR ZINC PLATES, SHEETS, AND STRIPS, NO. 531, NOVEMBER 23, 1927. (CURRENT DESIGNATION: QQ-Z-301)

ZINC PLATES, SHEETS, AND STRIPS

(In respect to grade and types; material and workmanship; permissible variations in thickness, width, and length; maximum permissible percentage by weight of short lengths; and method of inspection and tests, this specification is in conformity with A. S. T. M. B69-29, given above. In respect to quality of material, bending tests, general specifications, and packing and marking of shipments, it is in conformity with F. S. B. QQ-C-501. (See 641.0, p. 1172. Otherwise it provides that:)

The chemical requirements are as shown in Table 1.

TABLE 1.—Chemical composition

Lead, maximum	Iron, maximum	Cadmium, maximum	Aluminum, maximum	Total, of lead, iron, and cadmium, maximum	Zinc
Per cent 0.80	Per cent 0.04	Per cent 0.75	Per cent None ¹	Per cent 1.25	Per cent Remainder.

¹ As determined on a 25 g. sample.

Material shall withstand transverse bending at a temperature of 65° to 100° F. through the angle noted in Table 2 without fracture on the outside of the bent portion, on a radius equal to the multiple of the thickness of the material indicated in Table 2.

TABLE 2.—Bending test requirements

Thickness		Bending test	
From—	To—	Degree	Radius of pin equal to—
<i>Inch</i> 0.002	<i>Inch</i> .0.036	180	1/2 T
.040	.090	120	1/3 T
.100 and over	-----	45	0.5 inch

¹ T=Thickness of material.

Unless otherwise specified in the contract or purchase order, two bend tests shall be made for every lot of 5,000 pounds or fraction thereof, of each size in the shipment.

NOTES.—Contracts or purchase orders for sheets and strips should state the purpose for which the material is to be used; as "for cupping," "for deep cupping," "for spinning," for edgewise winding," "for bending at sharp right angles," etc.

² Zinc plates, sheets, and strips are commercially obtainable in the following thicknesses:

Inch	Inch	Inch	Inch
0.006	0.020	0.050	0.125
.008	.024	.055	.250
.010	.028	.060	.375
.012	.032	.070	.500
.014	.036	.080	1.000
.016	.040	.090	
.018	.045	.100	

Plates, sheets, and strips should be ordered in as narrow widths as can be used.

For purposes of calculations, the weight of rolled zinc per cubic inch may be taken as 0.2596 pound.

When finished edges of plates, sheets, and strips are specified in the contract or purchase order, the following descriptions should apply:

(a) "Square edge" material shall be supplied with finished edge, with sharp, square corners, without bevel or rounding of any sort.

(b) "Round edge" material shall be supplied with finished edge, semicircular in form, the diameter of the circle forming the edge being equal to the thickness of the material.

(c) "Round corners" material shall be supplied with square finished edges, and the corners rounded to a definite radius which, unless otherwise specified in the contract or purchase order, may be any radius less than one-half the thickness of the material.

(d) When no description of a required form of edge is given, it shall be understood that edges such as would be left after slitting, sawing, or shearing will be acceptable.

683.4 MANUFACTURES OF ZINC.

683.41 DIE CASTINGS, ZINC-BASE.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR ZINC-BASE ALLOY DIE CASTINGS, DESIGNATION B86-31T, 1931

ZINC-BASE ALLOY DIE CASTINGS

SCOPE

1. These specifications cover commercial zinc-base alloy die castings.

MANUFACTURE

2. (a) The alloy may be made by any approved method.

(b) The casting shall be of uniform quality and no scrap shall be used other than the sprues, gates, rejected castings, etc., of this alloy which are produced in the manufacturer's own plant. The rejected castings used shall be free from finishes, solder, or inserts which may contaminate the alloy.

3. The base metal for all alloys shall be slab zinc conforming to the requirements of the standard specifications for slab zinc (spelter) A. S. T. M., B6 (see 683.1, p. 1310), except that the total impurities including lead, iron, tin, and cadmium shall not exceed 0.02 per cent.

CHEMICAL COMPOSITION AND TESTS

4. The alloy shall conform to the following requirements as to chemical composition:

	Per cent
Copper.....	2.5 - 3.5
Aluminum.....	3.5 - 4.5
Magnesium.....	0.02-0.10
Iron, maximum.....	.1
Lead, maximum.....	.010
Cadmium, maximum.....	.005
Tin, maximum.....	.005
Total other impurities.....	.02
Zinc.....	Remainder.

5. (a) The sample for chemical analysis may be taken either by sawing, drilling, or milling the casting or tension-test specimen, and shall represent the average cross section of the piece.

(b) The saw, drill, cutter, or other tool used shall be thoroughly cleaned. No lubricant shall be used in the operation, and the sawings or metal chips shall be carefully treated with a magnet to remove any particles of iron introduced in taking the sample.

PHYSICAL PROPERTIES AND TESTS

6. The average expansion of any five or more castings when aged as described in section 8 shall not exceed 0.0025 inch per inch. An expansion of 0.0025 inch will be allowable in any dimension less than 1 inch.

7. (a) Unless specified in the order, acceptance of castings under these specifications shall not depend upon the physical properties as determined by tension or impact test specimens.

(b) When specified, the alloy shall conform to the following requirements as to physical properties:

	Minimum average of 5 specimens	Minimum of individual specimens
Tensile strength.....lbs./in. ² ..	44,000	35,000
Elongation in 2 inches.....per cent..	2.0	0.5
Charpy impact value.....feet-pounds..	6.0	4.0

8. (a) The alloy shall conform to the following requirements as to physical properties after being exposed to water vapor at 95° C. for 10 days.

	Average of 5 specimens
Tensile strength, minimum.....lbs./in. ² ..	30,000
Elongation in 2 in., minimum.....per cent..	0.5
Impact Charpy, minimum.....feet-pounds..	0.75
Expansion per inch, maximum.....inch..	0.0025

(b) The humidity cabinet shall contain no wood or organic matter and the specimens shall be supported only by glass, procelain, zinc, or zinc-coated metal.

9. (a) The test specimens shall be die cast according to the dimensions shown in Figures 1134

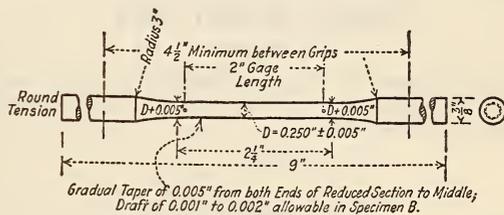

FIGURE 1134.—Tension test specimen

and 1135 and shall be tested without machining. No ejector pins shall be used on reduced sections. Specimens shall be removed from dies as soon as cast and cooled in still air with gates attached.

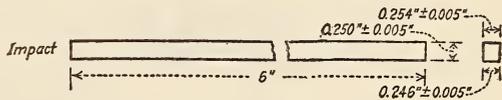

FIGURE 1135.—Charpy impact test specimen

(b) Impact-test specimens shall be made by cutting the 6-inch bar into two pieces 3 inches in length. The anvil of the testing machine shall have a 40 mm span. The parting line of the test specimen shall be placed against the anvil.

(c) In case any of the test specimens contains a flaw or flaws which results in failure of the alloy to meet the specifications, the manufacturer and purchaser shall agree upon the selection of specimens for retests, or the defective bars shall be disregarded.

10. Five of each type of test specimen shall be tested.

11. Heavy section die castings are subject to spongy centers. The extent of this sponginess if objectionable shall be mutually agreed upon by the manufacturer and purchaser for each individual casting.

WORKMANSHIP AND FINISH

12. The die casting shall be produced free from cracks and other disfiguring blemishes.

REJECTION

13. Die castings which show injurious defects revealed by machining operations subsequent to

acceptance may be rejected, and if rejected the manufacturer's responsibility shall be limited to replacing rejected parts free of charge to the purchaser.

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

ZINC-BASE DIE-CASTING ALLOY SAMPLES

(Samples No. 94, No. 95, and No. 96 are standard samples of zinc-base die-casting alloy prepared and sold by the Bureau of Standards for use by industrial organizations and others as comparison standards for checking the accuracy of analysis of similar alloys. Each sample is accompanied by a certificate giving a complete analysis of that particular sample.)

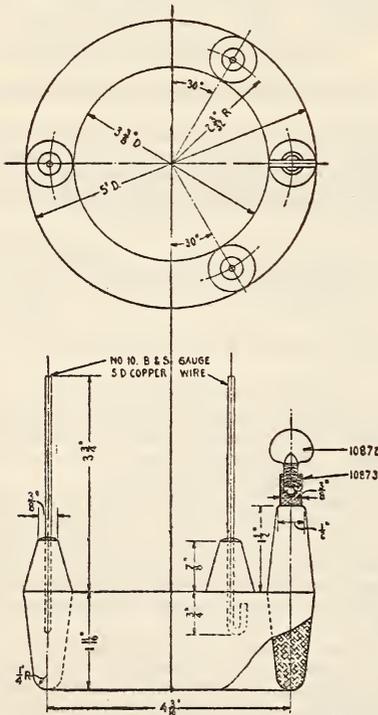

683.42 GRAVITY-BATTERY ZINCS.

AMERICAN RAILWAY ASSOCIATION, SIGNAL SECTION, SPECIFICATION FOR GRAVITY-BATTERY ZINCS, NO. 3428, JULY, 1928

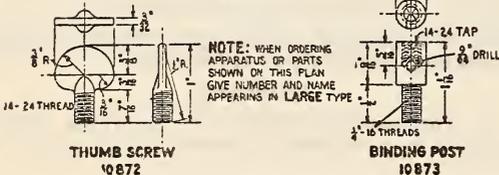

GRAVITY-BATTERY ZINCS

1. PURPOSE

The purpose of this specification is to provide gravity-battery zincs to be used as the anodes of gravity-battery cells.

ZINC 10671

THUMB SCREW 10872

BINDING POST 10873

FIGURE 1136.—Zinc

2. DRAWINGS

Figure 1136 forms an essential part hereof.

3. MATERIAL AND WORKMANSHIP

Material and workmanship shall be first class in every respect.

Zincs shall weigh 4 pounds each and shall be made of virgin spelter cast at a low temperature and thoroughly amalgamated with mercury. The chemical composition of the finished zincs shall be as follows:

	Per cent
Mercury, not less than.....	2.00
Iron, not less than.....	.10
Lead, not more than.....	.50
Other impurities, not more than.....	.40
Zinc, not less than.....	97.00

Binding post and screw shall be made of brass.

Zincs shall be uniform in size and weight, free from flaws and mechanical defects, and shall have a smooth outer surface and a firm close grain.

Binding post must be firmly connected both mechanically and electrically to the zinc. The binding screw must be perfectly threaded and fit closely in the binding post.

Manufacturer's name shall be cast on the upper flat surface of the zinc in letters raised to not less than three-thirty-seconds inch and as large as the surface will permit. In addition the manufacturer's name or trade-mark shall be stamped on some other part in such a position as not to be effaced by the action of the electrolyte or by the process of cleaning.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF ALLOYS OF LEAD, TIN, ANTIMONY, AND COPPER, SERIAL DESIGNATION B18-21, 1921

(Approved as American tentative standard (K5-1922) by the American Standards Association, November 13, 1922)

CHEMICAL ANALYSIS OF ALLOYS OF LEAD, TIN, ANTIMONY, AND COPPER

These methods apply particularly to white-metal bearing alloys (known commercially as Babbitt metal) and to similar lead and tin base alloys.

Two sets of methods are here given. The first method is somewhat slow but is recommended as giving the more accurate results where the analysis of these alloys is of comparatively infrequent occurrence. The second method is rapid and is suitable for control work, giving good results after the analyst has become familiar with it.

I. GENERAL METHOD²²

A. Determination of Lead, Copper, Antimony, and Tin.

DETERMINATION OF LEAD

SOLUTIONS REQUIRED

Mixed acid.—Dissolve 20 g of KCl in 500 c c of water, add 400 c c of HCl (specific gravity 1.20), mix and add 100 c c of HNO₃ (specific gravity 1.42).

Alcohol-hydrochloric acid mixture.—Mix 400 c c of 95 per cent ethyl alcohol and 100 c c of HCl (specific gravity 1.20).

Acid ammonium acetate.—To 500 c c of NH₄OH (specific gravity 0.90), add 500 c c of water and then acetic acid (80 per cent), until slightly acid to litmus.

²² G. W. Thompson's method. See J., Soc. Chem. Ind. vol. 15, p. 179.

METHOD

Dissolve 1 g of the finely divided alloy by boiling in 70 to 100 c c of "mixed acid" solution in a covered beaker. Add more mixed acid if a complete solution of the alloy is difficult to obtain, and continue boiling until evaporated to about 50 c c. Add 5 c c of HCl (specific gravity 1.20), cool in ice water until the bulk of PbCl₂ has crystallized out, then add slowly, with constant stirring, 50 c c of alcohol (95 per cent), continue stirring for a few minutes, and cool in ice water for 10 minutes. Add 50 c c more alcohol from a pipette, allow to stand in ice water for 20 minutes, and filter through 9 cm paper into an 800 c c beaker. Wash by decantation three times with alcohol-hydrochloric acid mixture and finally wash the paper twice with the same mixture. Wash the PbCl₂ from the paper back into the beaker; wash paper several times with hot water, catching washings in beaker with the bulk of the chloride. Finally, wash paper with hot acid ammonium acetate solution. Heat until all PbCl₂ is dissolved. Add 15 c c of saturated solution of K₂Cr₂O₇; heat until precipitate is of good orange color; filter on weighed Gooch crucible; wash with water, alcohol, and ether; dry at 110° C.; and weigh. Calculate percentage of lead by the empirical factor 63.75.

NOTES—1. With proper manipulation, the PbCl₂ precipitate should contain consistently all but 0.003 g of lead.

2. During the heating of the acid ammonium acetate to dissolve the PbCl₂, the solution should remain perfectly clear, any turbidity indicating the presence of tin or antimony, as even 1 mg of tin or antimony will cause a slight but distinct turbidity.

DETERMINATION OF COPPER AND ANTIMONY

SOLUTIONS REQUIRED

Potassium hydroxide.—Dissolve 100 g of KOH in 500 c c of water.

Potassium cyanide.—Dissolve 3.5 g of KCN in 1,800 c c of water and standardize against copper of known purity.

Sodium thiosulphate.—Dissolve 24.8 g of Na₂S₂O₃·5H₂O in 1,000 c c of water, and allow to stand for 24 hours. Standardize against antimony metal chemically pure, using same quantity of reagents and same procedure as under (c) determination of antimony, given below.

METHOD

See determination of lead, given above.

Evaporate the filtrate from PbCl₂ filtration by boiling in the loosely covered 800 c c beaker, and finally take to dryness on a water bath. Add 10 c c of KOH solution and after a few minutes add 20 c c of 3 per cent H₂O₂. Add more KOH, if solution is acid, until an alkaline reaction is shown by litmus paper. Heat on the water bath for 20 minutes, add 10 g of ammonium oxalate, 10 g of oxalic acid, and 200 c c of water, and heat to boiling. Pass in H₂S for 45 minutes with solution near boiling, filter at once, and wash precipitate with hot dilute solution of oxalic acid saturated with H₂S, catching washings with filtrate.

Wash the precipitate of copper and antimony sulphides from the filter paper back into the beaker with the least amount of water possible, treat with 10 c c of KOH solution, heat on water bath until the undissolved matter is distinctly black, and filter through same paper into a 300 c c Erlenmeyer flask. Wash the precipitate with hot water containing a small amount of K₂S.

(a) *Determination of copper by potassium cyanide titration.*—Dry and ignite the precipitate with paper in a small casserole, dissolve in nitric acid (specific gravity 1.42), boil to expel nitrous fumes, neutralize with Na_2CO_3 , add a few drops of NH_4OH , and titrate with standard KCN solution.

(b) *Determination of copper by electrolytic method.*—See Determination of copper by potassium cyanide titration, given above.

Dry and ignite the sulphide precipitate in a small casserole, dissolve in 10 c c of HNO_3 (specific gravity 1.42), boil until oxides of nitrogen are expelled and add 50 c c of distilled water. Transfer to a tall 200 c c beaker, wash out casserole, add 5 c c of H_2SO_4 (specific gravity 1.84) and determine copper by the electrolytic method. See the determination of copper by the electrolytic method in B27. (See 647.20, p. 1261).

NOTES.—1. On filter after heating with KOH solution, the copper remains as sulphide with a small amount of lead sulphide which failed to be precipitated as chloride. If it is desired to determine this lead, it can be done by separation from the copper by ordinary methods.

2. If the amount of antimony and copper is small (less than 10 mg) the lead which failed to be precipitated as chloride may also fail to come down as sulphide on passing H_2S through the oxalic solution. It will remain in the filtrate from the sulphides and be deposited electrolytically with the tin on the cathode. This can be prevented by adding an oxalic acid solution of a pure antimony salt containing about 100 mg of antimony just before passing H_2S . In this case antimony must be determined on a separate portion.

3. If the amount of copper present is from 8 to 10 mg or more, it should be determined by the electrolytic method. In this case, the small amount of lead precipitated as sulphide with the copper is deposited on the anode as PbO_2 and may be weighed, calculated to lead by factor 86.43, and added to that obtained under determination of lead.

(c) *Determination of antimony.*—See determination of copper by potassium cyanide titration, given above.

Add 50 c c of HCl (specific gravity 1.20) to the KOH solution of antimony sulphide, and boil down to small volume until all arsenic has been expelled as arsenious chloride.

Add 25 c c of HCl (specific gravity 1.20) and 1 g of KClO_3 and boil until colorless. Filter into a 300 c c Erlenmeyer flask, through glass wool if sulphur has separated, wash out original flask with HCl (specific gravity 1.20), cool, add 1 g of KI, 1 cc of CS_2 , and titrate with standard thiosulphate solution.

DETERMINATION OF TIN

APPARATUS FOR ELECTROLYSIS

Electrodes.—Cylindrical cathodes of platinum wire gauze—2 by $1\frac{1}{2}$ inches in diameter.

Platinum-wire spiral anodes.

METHOD

See determination of copper and antimony, given above.

Concentrate the filtrate and washings from the precipitated sulphides, if necessary, to a volume of 200 c c and add 5 g more of oxalic acid in case the amount of tin is over 0.5 g. Electrolyze until the solution reacts alkaline, using a current of about 0.5 ampere. Remove the cylinder; wash twice with distilled water and once with 95 per cent ethyl alcohol; dry at 110°C ., and weigh.

NOTE.—If the electrolysis is carried out over night it will usually be found by morning that the solution has become alkaline and it may be taken for granted that the tin has all been precipitated on the cathode. The best results are obtained by regulating the current, or the time, so as to render the solution alkaline only a very short time before the cathode is to be removed. The cathode should be placed close to the bottom of the beaker to insure proper agitation of the electrolyte.

B. Determination of Arsenic

SOLUTIONS REQUIRED

Ferric chloride.—Solution of specific gravity 1.43.
Ammonium carbonate.—Dissolve 75 g in 500 c c of water.

METHOD

Weigh 1 g of sample into a 250 c c distillation flask and add 10 c c of FeCl_3 solution, 60 c c of HCl (specific gravity 1.20) 20 c c of water and 5 g of KCl. Connect the flask with a condenser, heat slowly until solution is complete and boil down to as small a volume as possible, catching distillate in a tall 400 c c beaker. Cool flask, add 50 c c HCl (specific gravity 1.20) and redistill as before, catching distillate in same beaker. Cool distillate and pass H_2S through for one hour, allow to settle, and filter the arsenious sulphide on a Gooch crucible. Wash twice with HCl (1:4), four times with cold water, three times with alcohol, and four times with CS_2 . Dry at 110°C . for 10 minutes and weigh after cooling. Dissolve the arsenious sulphide with $(\text{NH}_4)_2\text{CO}_3$ solution wash thoroughly with water, dry for 30 minutes at 110°C ., and reweigh after cooling. The difference in weights multiplied by 0.60911 gives the percentage of arsenic.

II. RAPID METHOD FOR CONTROL WORK²³

A. Determination of Lead and Copper

SOLUTIONS REQUIRED

Lead acid.—Mix 300 c c of H_2SO_4 (specific gravity 1.84) and 1,800 c c of distilled water. Dissolve 1 g of lead acetate chemically pure in 300 c c of distilled water and add this to the hot solution, stirring meanwhile. Let stand at least 24 hours and siphon through a thick asbestos filter.

Dilute alcohol for washing.—Mix equal parts of denatured alcohol and distilled water.

METHOD

(a) *Determination of lead.*—In a covered 300 c c Erlenmeyer flask dissolve 1 g of the alloy in 20 c c of H_2SO_4 (specific gravity 1.84); heat the solution nearly to boiling until the metal is completely decomposed and the PbSO_4 is white (this may take 30 minutes or more), and finally boil for several minutes. Allow to cool, but not below 60°C ., and then add slowly 50 c c of water while the solution is agitated. Heat to boiling for several minutes in order to insure complete solution of antimony sulphate. Allow the PbSO_4 to settle out until the solution is clear, not letting the temperature fall below 60°C . If the liquid does not clear quickly it must be heated longer. When clear, pour the solution through a weighed porcelain Gooch crucible with asbestos mat, decanting the solution as completely as possible without allowing more than a very small amount of PbSO_4 to go over into the crucible. Now add 10 c c more of H_2SO_4 (specific gravity 1.84) to the PbSO_4 in the original flask, and boil for several minutes. Cool, add slowly 30 cc of water, and again heat to boiling for a few minutes; allow the solution to cool to about 60°C . and completely transfer the PbSO_4 to the Gooch crucible. Wash with lead acid, retaining the filtrate and these washings for the copper determination. Remove the beaker containing these solutions and wash out the lead acid with dilute alcohol; set the Gooch crucible inside a porcelain crucible; dry and ignite for five minutes at the full heat of a Tirrill burner; cool and weigh as PbSO_4 , which contains 68.29 per cent lead.

(b) *Determination of copper.*—To the filtrate from the PbSO_4 , which contains the copper and which has been transferred to an Erlenmeyer flask, add NH_4OH (specific gravity 0.90) until the solution is slightly alkaline; then add 2 c c of H_2SO_4 (specific gravity 1.84); heat nearly to boiling; add 2 g of

²³ See The Analysis of Alloys of Lead, Tin, Antimony, and Copper, by D. J. Demorest, J. Ind. Eng. Chem., vol. 5, p. 842; Rapid Analysis of Alloys for Tin, Antimony, and Arsenic, by F. A. Stief, J. Ind. Eng. Chem., vol. 7, p. 211; and Technical Analysis of Brass, 1917. Price and Meade, p. 182.

Na_2SO_3 and when this is entirely dissolved add 1 g of KCNS dissolved in 10 c c of water. Shake well and allow the precipitated CuCNS to settle for one hour while the solution is kept hot. Filter on a close filter paper, wash with cold water and ignite paper and precipitate in a porcelain crucible. Proceed by one of the two following methods:

(1). Dissolve in HNO_3 (specific gravity 1.42), add 5 c c H_2SO_4 (specific gravity 1.84); evaporate until fumes of H_2SO_4 are evolved. Dilute to about 100 c c with distilled water. Add 1.5 c c of HNO_3 (specific gravity 1.42) and determine copper by electrolysis. See the determination of copper by the electrolytic method in B27 (647.20, p. 1261).

(2). Dissolving the ignited precipitate in HNO_3 (specific gravity 1.42), as in (1); boil to expel nitrous fumes, neutralize with Na_2CO_3 and determine volumetrically with cyanide as in A of general method.

NOTE.—If the amount of copper is very small it may escape detection by this method, in which case it should be determined as in A of "general method."

B. DETERMINATION OF ARSENIC, ANTIMONY, AND TIN APPARATUS

Arsenic still.—A condenser is made from glass tubing in the form of a letter S, about 18 inches long and one-half inch in inside diameter, tapering to about one-fourth inch at the upper end and to about one-eighth inch at the lower end. One curve is nearly filled with water and is submerged in cold water in a 500 c c beaker. The lower end dips into about 75 c c of water in a 300 c c beaker and the upper end is connected by a delivery tube with a 300 c c Florence flask, closed with a rubber stopper which is fitted with a delivery tube and with a thermometer reaching to about 1 inch above the surface of the liquid in the flask.

SOLUTIONS REQUIRED

Iodine.—Dissolve 10.7 g of iodine in 50 c c of distilled water which contains 20 g of KI in solution and dilute to 1,000 c c with distilled water. Standardize against pure tin having exactly the same conditions for titration as are specified for the analysis of the alloy. Each cubic centimeter is equivalent to approximately 0.00500 g of tin or 0.00315 g of arsenic.

Potassium permanganate.—Dissolve 2.7 g of KMnO_4 in distilled water, filter through asbestos, and dilute to 1,000 c c with distilled water. Standardize against pure antimony having exactly the same conditions for titration as are specified for the analysis of the alloy. Each cubic centimeter is equivalent to approximately 0.00500 g of antimony or 0.00465 g of iron.

Ferrous ammonium sulphate.—Dissolve 12.4 g of ferrous ammonium sulphate crystals in 950 c c of distilled water and add 50 c c of H_2SO_4 (specific gravity 1.84).

Starch.—To 1,000 c c of boiling water, add a cold suspension of 6 g of starch in 100 c c of distilled water; cool, add a few drops of chloroform, and mix thoroughly.

METHOD

(a) *Determination of arsenic.*—In a 300 c c Florence flask, dissolve 0.5 g of the alloy in exactly 8 c c of H_2SO_4 (specific gravity 1.84). The metal must be finely divided, preferably in the form of thin foillike shavings, although sawings or very fine drillings may be used. Heat the solution to boiling; cool, add about 5 c c of water and a bulk of about 0.5 c c of clean granulated pumice stone, and boil the covered solution very gently for about

five minutes, or until the strong odor of SO_2 can no longer be detected. Finally, being careful to have 5 c c of water present, cool the solution to about 18° C. and cautiously add 20 c c of HCl (specific gravity 1.20). Insert in the flask a rubber stopper fitted with a thermometer and delivery tube and connect the delivery tube with the S condenser. Heat the solution to gentle boiling for from 10 to 15 minutes, keeping the vapor temperature at 107° C. for at least 5 minutes. Wash out the condenser into a 300 c c beaker and add an excess of about 2 g of NaHCO_3 . Bring the volume of the solution to about 200 c c; warm to about 27° C. and titrate with standard iodine solution and starch to the appearance of a deep blue color.

NOTE.—A blank determination should be made on corresponding amounts of reagents treated as above, and the results should be corrected accordingly.

(b) *Determination of antimony.*—Cool the solution which remains in the flask after the arsenic distillation; add about 130 c c of cold, recently boiled distilled water to which has been added about 3 c c of HCl (specific gravity 1.20), and titrate with standard KMnO_4 solution to the appearance of a decided permanent pink color. From a burette add an excess of standard ferrous ammonium sulfate solution until the pink color is discharged and then titrate with standard KMnO_4 solution to the reappearance of a pink color.

(c) *Determination of tin.*—If the sample does not contain 14 per cent (or 0.07 g) of antimony, add enough dissolved SbCl_3 to the solution to bring the contents of antimony up to about 0.07 g for the purpose of insuring perfect reduction of the tin and uniform conditions for the titration. Then add exactly 6 c c of H_2SO_4 (specific gravity 1.84) and 60 c c of HCl (specific gravity 1.20) and add about 6 inches of clean, soft No. 14 pure iron wire cut into 2-inch lengths and cleaned with dilute HCl just before using. Boil gently for 30 minutes, add about 6 inches more wire, and boil 30 minutes longer. Remove from heat, close flask loosely with a rubber stopper, and allow about two minutes for all air to be expelled by hydrogen and acid vapors. Close flask tightly and quickly place it in cold water, cooling the solution to about 20° C. Transfer the solution quickly to a 500 c c beaker (leaving the iron wires in the flask) and rinse flask and contents with 150 c c of cold, recently boiled distilled water. Add rinsings to main solution in the beaker, bring final volume to about 300 to 350 c c and titrate quickly with standard iodine solution and starch to the appearance of a strong blue color.

NOTES.—A blank determination should be made on corresponding amounts of reagents treated as above, and the results should be corrected accordingly.

If the copper content of the alloy is as high as about 3 per cent or over, it prevents a good end point in the tin titration when the tin percentage is low. Under such conditions, just before titrating, add about 1 g. of KI crystals, stir until nearly dissolved, and titrate immediately. If allowed to stand too long at this point, trouble may be encountered due to the precipitation of some of the other constituents.

Other forms of pure iron may be employed, but the wire as above specified has been found convenient.

For accurate work it is desirable to reduce and titrate the solution of tin in an atmosphere of CO_2 .

692.1 BABBITT METALS.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, ARMATURE AND AXLE LINERS, E212-25, 1925

ARMATURE AND AXLE LINERS

(See 692.2, p. 1324.)

BABBITT METAL

Babbitt metal shall be approximately of the following composition:

	Per cent
Copper.....	3.6
Tin.....	89.3
Antimony.....	7.1

Babbitt metal shall be poured in the bearings in such a way that the thickness of the lining after boring will be uniform.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR WHITE METAL BEARING ALLOYS (BABBITT METAL), DESIGNATION B23-26, 1926

BABBITT METAL

SCOPE

1. These specifications cover white metal bearing alloys, known commercially as "babbitt metal." Twelve typical babbitt metals are specified, covering the range of alloys commercially used and are designated as grades Nos. 1 to 12, in accordance with their decreasing tin content as specified in section 4.

MANUFACTURE

2. The manufacturer shall use care to have each lot of babbitt metal as uniform in quality as possible.

3. The standard bar, unless otherwise specified, shall have the following approximate dimensions:

Top face.....	1¼ inches wide, 8½ inches long.
Thickness.....	Not over 1¼ inches.

CHEMICAL PROPERTIES AND TESTS

4. The alloys shall conform to the following requirements as to chemical composition, within the limits specified in section 5:

Alloy grade No.	Tin	Anti-mony	Lead	Cop-per	Iron, maxi-mum	Arsenic, maxi-mum	Zinc	Alumi-num
1	Per cent 4½	Per cent 1.35	Per cent 1.35	Per cent 4½	Per cent 0.08	Per cent 0.10	None.	None.
2	89	7½	1.35	3½	.08	.10	None.	None.
3	83½	8½	1.35	8½	.08	.10	None.	None.
4	75	12	10	3	.08	.15	None.	None.
5	65	15	18	2	.08	.15	None.	None.
6	20	15	63½	1 1½	.08	.15	None.	None.
7	10	15	75	1 0.50	-----	.20	None.	None.
8	5	15	80	1.50	-----	.20	None.	None.
9	5	10	85	1.50	-----	.20	None.	None.
10	2	15	83	1.50	-----	.20	None.	None.
11	-----	15	85	1.50	-----	.25	None.	None.
12	-----	10	90	1.50	-----	.25	None.	None.

¹ Maximum.

5. The following permissible variations in the percentages of the desired elements specified in section 4 will be allowed, but shall not apply to the maximum percentages of impurities specified:

Percentage of element specified	Permissible variations over or under the specified value, units of per cent
Not over 2 per cent.....	0.25
Over 2 to 5 per cent, inclusive.....	.50
Over 5 to 10 per cent, inclusive.....	.75
Over 10 per cent.....	1.00

6. (a) Three bars shall be selected to represent a shipment of less than 1,000 pounds, five bars to represent a shipment of over 1,000 pounds to 10,000 pounds, inclusive, and 10 bars to represent a shipment of over 10,000 pounds to one carload.

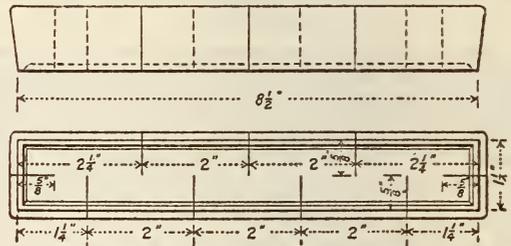

FIGURE 1137.—Method of sampling

(b) Saw cuts shall be made at points in the bars indicated in Figure 1137. No lubricants shall be used for sawing. The sawings shall be carefully treated with a magnet to remove any particles of steel introduced in taking the sample.

(c) Sawings thoroughly mixed shall constitute the sample for chemical analysis.

7. The chemical analysis shall be made in accordance with the A. S. T. M. standard methods of chemical analysis of alloys of lead, tin, antimony and copper (see 692.0, p. 1317).

MARKING

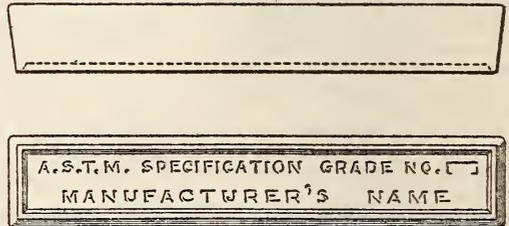

FIGURE 1138.—Preferred arrangement of marking

8. The name of the manufacturer shall be cast on each bar. The numerical designation of the grade supplied shall be stamped or cast on each bar for identification.

NOTE.—A preferred arrangement of marking is shown in Figure 1138.

CLAIMS

(Conforms to A. S. T. M. B30-31T. See 644.11, p. 1196.)

APPENDIX

The data in the following table do not constitute a part of these specifications. They are given

merely to indicate to the purchaser the physical properties of the various alloys specified which can be expected of carefully manufactured alloys of the formulas indicated, and to constitute a guide to the purchaser in selecting the grade best suited for meeting the service condition for which the babbitt

metal is to be used. The alloys were prepared at the Bureau of Standards from pure Banka tin, high grade "Star" antimony and a commercially pure lead (99.94 per cent Pb), and the values given are the results of tests made in the bureau laboratories. These figures are subject to revision.

Composition and physical properties¹ of white metal bearing alloys

11	2,750	1,100	12,800	5,100	15.0	7.0	471	244	504	262	630	332
12	2,250	950	12,900	5,100	14.5	6.5	473	245	498	259	625	329

¹ The compression test specimens were cylinders 1½ inches in length and ½ inch diameter, machined from chill castings 2 inches in length and ¼ inch in diameter. The Brinell tests were made on the bottom face of parallel machined specimens cast in a 2-inch diameter by ¾-inch deep steel mold at room temperature.

² The values for yield point were taken from stress-strain curves at a deformation of 0.125 per cent reduction of gage length.

³ Johnson's apparent elastic limit is taken as the unit stress at the point where the slope of the tangent to the curve is one and one-half times its slope at the origin.

⁴ The ultimate strength values were taken as the unit load necessary to produce a deformation of 25 per cent of the length of the specimen.

⁵ These values are the average Brinell number of 3 impressions on each alloy using a 10 mm ball and a 500 kg load applied for 30 seconds.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CAR AND TENDER JOURNAL BEARINGS, LINED, DESIGNATION B67-28, 1928

JOURNAL BEARINGS, LINED

(See 692.3, p. 1329.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, WHITE BEARING METALS, SPECIFICATIONS NOS. 10, 11, 12, 13, 14, BABBITT, AUGUST, 1922

WHITE BEARING METALS

The limits for the chemical compositions specified for metal in ingot form are closer than the limits specified for cast products, as allowances have been made for variations in the chemical content due to casting.

SPECIFICATION NO. 10, BABBITT

1. Composition in percentage.—

	Cast products	Ingot
	Per cent	Per cent
Tin, minimum	90	90.75
Copper	4-5	4.25-4.75
Antimony	4-5	4.25-4.75
Lead, maximum	.35	.35
Iron, maximum	.08	.08
Arsenic, maximum	.10	.10
Bismuth, maximum	.08	.08
Zinc and aluminum	None.	None.

2. When finished bronze-backed bearings are purchased a maximum of 0.6 per cent lead is permissible in scraped samples, provided a lead-tin solder has been used in bonding the bronze and the Babbitt.

3. General information.—This Babbitt is very fluid and may be used for bronze-backed bearings, particularly for thin linings such as are used in aircraft engines. It is also suitable for die castings.

SPECIFICATION NO. 11, BABBITT

1. Composition in percentage.—

	Cast products	Ingots
	Per cent	Per cent
Tin, minimum.....	86.00	87.25
Copper.....	5.00-6.50	5.50-6.00
Antimony.....	6.00-7.50	6.50-7.00
Lead, maximum.....	.35	.35
Iron, maximum.....	.08	.08
Arsenic, maximum.....	.10	.10
Bismuth, maximum.....	.08	.08
Zinc and aluminum.....	None.	None.

2. (Same as par. 2 in specification No. 10, given above.)

3. *General information.*—This is a rather hard Babbitt which may be used for lining connecting-rod and shaft bearings which are subjected to heavy pressures. Its "wiping" tendency is very slight. It is also suitable for die castings.

SPECIFICATION NO. 12, BABBITT

1. Composition in percentage.—

	Cast products	Ingots
	Per cent	Per cent
Tin, minimum.....	59.50	60.00
Lead, maximum.....	26.00	25.25
Antimony.....	9.50-11.50	10.25-10.75
Copper.....	2.25-3.75	2.75-3.25
Iron, maximum.....	.08	.08
Bismuth, maximum.....	.08	.08
Zinc and aluminum.....	None.	None.

2. *General information.*—This is a relatively cheap Babbitt and is intended for bearings subjected to moderate pressures. It is also suitable for die castings.

SPECIFICATION NO. 13, BABBITT

1. Composition in percentage.—

	Cast products	Ingots
	Per cent	Per cent
Lead, maximum.....	86.00	85.50
Antimony.....	9.25-10.75	9.75-10.25
Tin.....	4.50-5.50	4.75-5.25
Copper, maximum.....	.50	.50
Arsenic, maximum.....	.20	.20
Zinc and aluminum.....	None.	None.

2. *General information.*—This is a cheap Babbitt and serves successfully where the bearings are large and the service light. It should not be used as a substitute for a Babbitt with a high tin content. It is also suitable for die castings.

SPECIFICATION NO. 14, BABBITT

1. Composition in percentage.—

	Cast products	Ingots
	Per cent	Per cent
Lead, maximum.....	76.00	75.25
Antimony.....	14.00-16.00	14.75-15.25
Tin.....	9.25-10.75	9.75-10.25
Copper.....	.50	.50
Arsenic, maximum.....	.20	.20
Zinc and aluminum.....	None.	None.

2. (Same as par. 2 in specification No. 13, given above.)

UNITED STATES GOVERNMENT, DEPARTMENT OF COMMERCE, BUREAU OF STANDARDS, STANDARD SAMPLES, CIRCULAR NO. 25 AND SUPPLEMENT, 1927

LEAD-BASE AND TIN-BASE BEARING METAL SAMPLES

(Standard sample No. 53 for lead-base bearing metal and standard sample No. 54a for tin-base bearing metal are prepared and sold by the Bureau of Standards for use by industrial organizations and others as comparison standards for checking the accuracy of analysis of similar bearing metals. Each sample is accompanied by a certificate giving the complete analysis of that particular sample.)

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD, FEDERAL SPECIFICATION FOR METAL, ANTI-FRICTION, INGOTS AND CASTINGS, QQ-M-161, FEBRUARY 2, 1932

ANTI-FRICTION METAL

I. GENERAL SPECIFICATIONS

United States Government general specification for metals, Federal Specifications Board specification No. 339 (current designation, QQ-M-151) in effect on date of invitation for bids, shall form part of this specification. (See 600.0, p. 3.)

II. GRADE

This specification covers seven grades of anti-friction metal in the form of ingots for remelting or castings as shown in Table 1.

III. MATERIAL

The ingots or castings shall be made only from the best grades of virgin metals, or from virgin metals and scrap of known and approved composition.

IV. GENERAL REQUIREMENTS

The metal, on both surface and fracture, shall be free from abnormal amounts of dross, thoroughly homogeneous, and white in color.

V. DETAIL REQUIREMENTS

1. The chemical composition shall conform to the requirements shown in Table 1.

2. Unless otherwise specified in the contract or purchase order, anti-friction metal ingots shall be provided with a central V notch and shall have a maximum cross section of 2½ inches and a maximum weight of 10 pounds.

3. Ingots shall be made in a manner consistent with the best practice, particularly in respect to the temperature of the metal and that of the mold parts at time of pouring. They shall be of uniform quality, clean, and free from excessive dross and foreign material.

4. Castings shall be made in a manner consistent with the best practice, particularly in respect to the temperature of the metal and that of the mold parts at time of pouring, and shall be sound, clean, free from segregation, excessive grain size, blowholes, porous places, cracks, or any other defects which may materially affect their strength or appearance or which indicate an inferior quality of metal.

Castings shall be in accordance with the form and dimensions shown on plans accompanying the contract or purchase order.

5. Each ingot shall have cast or stamped thereon, the name, brand, or trade-mark of the manufacturer and the grade number.

6. Large castings shall be marked with the pattern or mark number, and when practicable, with the lot number, in a position on the casting where they will not be machined off in manufacturing to finished dimensions.

7. Small castings shall be properly separated by melts or lots and shall be so marked that their identity will be clear at the point of delivery.

VI. METHODS OF INSPECTION AND TEST

1. A lot shall consist of ingots or castings from the same melt, unless otherwise specified in the contract or purchase order or mutually agreed upon by the contractor and the inspector.

2. Chemical analysis of the ingots or castings may be made by the inspector or through him by any Government laboratory or other designated representative and without cost to the contractor.

3. The sample for analysis of ingots shall be obtained by selecting 3 ingots to represent a ship-

6. Samples for fracture test of castings shall be taken from 10 representative castings selected by the inspector from each lot of 1,000 pounds or fraction thereof. The inspector shall designate the points in the castings where fracture tests are to be made and may use heads or gates if satisfied that they are fully representative.

VII. PACKING AND MARKING OF SHIPMENTS

1. Ingots may be shipped in bulk in sealed cars, or in suitable containers.

2. Castings shall be so boxed or crated as to insure safe transportation to the point of delivery.

3. Each container shall be legibly and indelibly marked with the grade number; weight of contents; melt or lot number (in the case of castings); name, brand, or trade-mark of contractor; and the contract or purchase order number.

VIII. NOTES

1. Contracts and purchase orders should state the grade of metal required.

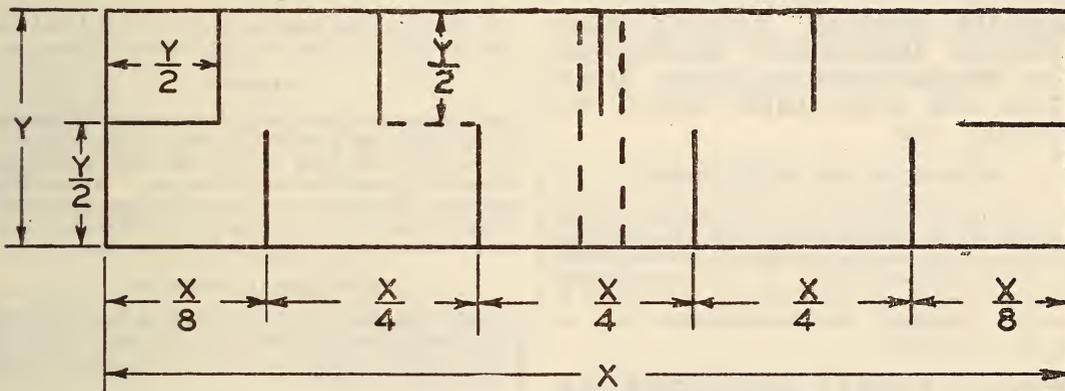

FIGURE 1139.—Locations in ingots from which samples shall be taken

ment of less than 1,000 pounds, 5 ingots to represent a shipment of from 1,000 to 10,000 pounds, and 10 ingots to represent a shipment of from 10,000 pounds to one carload. The samples for analysis shall be taken by saw cuts made in the ingots at the locations and of the depth shown in Figure 1139. No lubricant shall be used for sawing. The sawings shall be carefully treated with a magnet to remove any particles of steel introduced in taking the sample. The sawings thus obtained, thoroughly mixed, shall constitute the sample for analysis.

4. The samples for analysis of castings shall be taken from two representative castings selected by the inspector from each melt or lot of 250 pounds or fraction thereof. If a melt or lot consists of more than 250 pounds, two castings shall be selected from each 500 pounds or fraction thereof. Saw cuts shall be made at such points in the castings or heads or gates as the inspector may designate, the sawings cleaned with a magnet and thoroughly mixed before analysis. Where sawing is inadvisable, the sample may be obtained by scraping or other approved method.

5. To determine compliance with the fracture-test requirements of Section IV, 6 ingots shall be selected to represent a shipment of less than 1,000 pounds, 10 ingots to represent a shipment of from 1,000 to 10,000 pounds, and 20 ingots to represent a shipment of from 10,000 pounds to one carload.

2. Grade No. 1 antifriction metal is a medium hard Babbitt metal and may be used for aircraft engine bearings.

3. Grade No. 2 antifriction metal is genuine Babbitt metal and may be used for all bearing surfaces requiring a hard white metal alloy and where conditions are moderately severe such as general automotive engine use.

4. Grade No. 3 antifriction metal is a rather hard Babbitt metal which may be used for bearings subject to moderately heavy pressures.

5. Grade No. 4 antifriction metal is a hard bearing metal which may be used for service involving very heavy pressure and high speed.

6. Grade No. 5 antifriction metal is one of intermediate cost and may be used for electric motor and other bearings subject to rather low pressures at high speed.

7. Grade No. 6 antifriction metal is a clean Babbitt and may be used where the bearings are large and the service light.

8. Grade No. 7 antifriction metal is somewhat similar to grade No. 6, but may be used for slightly more severe service than No. 6.

9. Alternate bids based on furnishing antifriction metal with a range of composition differing from the above will be considered, provided the range of composition of the metal that the bidder proposes to furnish is clearly noted and is approved by the department concerned.

TABLE 1.—Percentage composition

Grade	Tin	Antimony	Lead ¹	Copper
1.....	90 -93	3.5- 5	0.50	3.5-5
2.....	87.5-89.5	7 - 8	.35	3.5-4.5

692.2 BEARING METALS, OTHER THAN BABBITT.

AMERICAN ELECTRIC RAILWAY ENGINEERING ASSOCIATION, MISCELLANEOUS METHODS AND PRACTICES, ARMATURE AND AXLE LINERS, SERIAL NO. E212-25, 1925

ARMATURE AND AXLE LINERS

(Contains information concerning present-day methods of treating armature and axle bearings, including bronze bearing shells, both hard and soft, with thin Babbitt linings. It also covers clearances; percentages of tin, antimony, and copper in "genuine Babbitt"; and recommendations for babbitting bearings.)

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, SPECIFICATIONS FOR BEARINGS, BRONZE, FOR LOCOMOTIVES, 1928

BRONZE BEARINGS FOR LOCOMOTIVES

SCOPE

1. These specifications cover rough bronze castings for locomotive wearing parts.

CHEMICAL PROPERTIES AND TESTS

2. *Chemical composition.*—The material shall conform to the following requirements as to chemical composition:

	Bronze			
	Phos- phor	Hard	Me- dium ¹	Soft
Tin.....	<i>Per cent</i> 9-11	<i>Per cent</i> 7-10	<i>Per cent</i> 6-8	<i>Per cent</i> 4-6
Lead.....	8-11	10-15	14-22	23-27
Tin and lead, not over.....		22.0	28.0	31.0
Phosphorus.....	0.4-0.8			
Zinc, not over.....	0.5	1.25	1.25	.75
Sum of tin, lead, copper, and phosphorus in phosphor bronze, minimum.....	99.0			
Sum of tin, lead, copper, and zinc in hard, medium, and soft bronze, minimum.....		99.25	99.25	99.25
Remainder, maximum.....	1.0	.75	.75	.75

¹ This grade is frequently used for chilled castings.

3. *Analysis.*—The sample for chemical analysis shall be taken from the bearing at three points along the fractured surface, as described in section 4, either by drilling or by using cuttings thus obtained, well mixed.

PHYSICAL PROPERTIES AND TESTS

4. *Tests.*—The casting representing a lot for acceptance shall be broken through the center and parallel with the longitudinal axis of the bearing in order to ascertain the uniformity of the grain of the metal. When this fracture shows separation or imperfect mixing of component parts, or dross or dirt spots, the lot shall be rejected.

5. *Number of tests.*—One sample may be taken for chemical analyses from each lot of 5,000 pounds or less. One casting may be taken for fracture test from each lot of 100 castings or less.

PERMISSIBLE VARIATIONS

6. *Gaging.*—All bearings shall conform to gages and dimensions shown on drawings.

FINISH

7. *Finish.*—The castings shall be sound and free from blowholes, dross, or mechanical defects.

MARKING

8. *Marking.*—Each lot of 100 castings or fraction thereof shall bear a serial number, commencing with one at the beginning of the year and continuing consecutively until the end of the year. All bearings shall also have cast on them the manufacturer's initials or trade-mark, the pattern number, and such other marks as are shown on the drawings.

INSPECTION AND REJECTION

(Requirements covering inspection and rejection, and rehearing conform with those specified in A. S. T. M. standard specifications for steel, pars. 7, 8, and 9 (see 605.0 p. 247).)

AMERICAN RAILWAY ENGINEERING ASSOCIATION, MOVABLE RAILWAY BRIDGES, MANUAL, 1929

BRONZES

(See also 647.31, p. 1268, and 692.1, p. 1320.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR BRONZE BEARING METALS FOR TURN-TABLES AND MOVABLE RAILROAD BRIDGES, SERIAL DESIGNATION B22-21, 1921

BRONZE BEARING METALS

SCOPE

1. (a) These specifications cover four classes of bronze bearing metals for turntables and movable railroad bridges.

(b) The purposes for which these classes are frequently used are as follows:

Class A, for contact with hardened steel disks under pressures over 1,500 pounds per square inch; for example, bearing metals used in turntables and center-bearing swing bridges.

Class B, for contact with soft steel at low speeds under pressures not over 1,500 pounds per square inch; for example, trunnions and journals of bascule and lift bridges.

Class C, for ordinary machine bearings.

Class D, for gears, worm wheels, nuts, and similar parts which are subjected to other than compressive stresses.

MANUFACTURE

2. (a) The bronze shall be a homogeneous alloy of copper and tin. The bronze shall be made from new metal, except that scrap of known composition produced by the foundry at which the bronze is cast may be used.

(b) Care shall be exercised that the metal is not overheated and that the temperature at pouring and the conditions of cooling are such as will be most likely to secure dense castings.

CHEMICAL PROPERTIES AND TESTS

3. The bronze shall conform to the following requirements as to chemical composition:

Elements considered	Class			
	A	B	C	D
	<i>Per cent</i> (¹)	<i>Per cent</i> (¹)	<i>Per cent</i> ¹ 82	<i>Per cent</i> ¹ 89
Copper.....	20	17	11	11
Tin, maximum.....			11	
Lead, maximum.....				2.25
Zinc, maximum.....				0.2
Iron, maximum.....				¹ 0.25
Phosphorus.....	¹ 1.0	¹ 1.0	0.7-1.0	
Other elements, maximum.....	0.5	0.5	0.5	0.5

¹ Remainder. ² Not over.

CHEMICAL ANALYSES

4. (a) An analysis of each melt may be made at the option of the purchaser and at the purchaser's expense. The chemical composition thus determined shall be reported to the purchaser or his representative, and shall conform to the requirements specified in section 3.²⁴

(b) The compression-test coupon shall be used for analysis.

PHYSICAL PROPERTIES AND TESTS

5. (a) The bronze shall conform to the following requirements as to compressive and tensile properties:

Properties considered	Class			
	A	B	C	D
COMPRESSION				
Deformation limit, min.....	<i>Lbs./in.²</i> 24,000	<i>Lbs./in.²</i> 18,000	<i>Lbs./in.</i>	<i>Lbs./in.²</i>
Permanent set in 1 in. under 100,000 lb.....	0.06-0.12	0.10-0.20		
TENSION				
Yield point, min.....				(¹)
Tensile strength, min.....				33,000
Elongation in 2 inches, minimum per cent.....				14

¹ To be recorded.

(b) The deformation limit in compression shall be determined as that load which produces a permanent set of 0.001 inch in the compression-test specimen described in section 6 (b).

²⁴ Material with a range of composition differing from that specified in section 3, or containing elements not specified, may be used, provided the manufacturer shall submit in writing previous to the execution of the contract the range of composition of the material he proposes to use, and provided this range of composition shall be accepted by the purchaser.

TEST SPECIMENS

6. (a) A test bar of the form and dimensions shown in Figure 129 in A. S. T. M. standard specifications for steel. (See 605.0, p. 247), to be used for the tension-test specimen, and a suitable test bar for the compression-test specimen, shall be an integral part of the casting, and shall be fed and cooled under the same conditions as the castings.

(b) Compression-test specimens shall be cylinders 1 square inch in cross-sectional area and 1 inch high.

7. (a) One compression test shall be made from each melt for class A and class B castings; and one tension test from each melt for class D castings. For castings of any grade weighing over 100 pounds finished, the specified tests shall be made for each casting. (Tension-test specimen requirements conform with Figure 129, (page 247). With respect to copper used in manufacture, yield point in tension, finish, and inspection and rejection, requirements are identical with those in B59 (see 647.15, p. 1259).)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR BRONZE BEARING METAL IN INGOT FORM, SERIAL DESIGNATION B31-21, 1921

BRONZE BEARING METAL

SCOPE

1. These specifications cover copper-tin-lead alloys in ingot form, known commercially as "bronze bearing metal," made wholly or partly from scrap materials. Six typical alloys are specified and are designated as grades Nos. 1 to 6, in accordance with their decreasing copper content as specified in section 2.

CHEMICAL PROPERTIES AND TESTS

2. The alloy shall conform to the following requirements as to chemical composition, within the limits specified in section 3:

Alloy, grade No.	Copper	Tin	Lead	Zinc ¹	Phosphorus	Sulphur ²	Iron	Antimony ²	Aluminum	Total im-purities ²
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
1.....	85	10	5	0.25	¹ 0.70	0.05	0.25	0.50	None.	0.50
2.....	80	10	10	.50	1.70	.05	.25	.50	None.	.75
3.....	80	10	10	2.00	² 0.05	.05	.25	.50	None.	2.50
4.....	77	8	15	.50	² 0.25	.05	.25	.50	None.	.75
5.....	73	7	20	.50	² 0.05	.05	.25	.50	None.	1.00
6.....	70	5	25	.50	None.	.05	.25	.50	None.	1.00

¹ Minimum.

² Maximum.

PERMISSIBLE VARIATIONS

3. The following permissible variations in the percentages of the desired elements specified in section 2 will be allowed, but shall not apply to the maximum percentages of impurities specified:

Percentage of element specified	Permissible variations over and under the specified value
Not over 5 per cent.....	<i>Units of per cent</i> 0.50
Over 5 to 10 per cent, inclusive.....	.75
Over 10 per cent.....	2.00

SAMPLES FOR CHEMICAL ANALYSIS

4. Three ingots shall be selected by the inspector to represent 10,000 pounds of ingot or fraction thereof. (Requirements with respect to sampling are identical with those in B10. See 643.4, p. 1192. With respect to manufacture, marking, rejection, and claims, they are identical with those in B30. See 644.11, p. 1196. With respect to inspection, they are identical with those in B59. See 647.15, p. 1259.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF BRONZE BEARING METAL, DESIGNATION B46-27, 1927

CHEMICAL ANALYSIS OF BRONZE BEARING METAL

(See 646.0, p. 1246.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR BRONZE CASTINGS IN THE ROUGH FOR LOCOMOTIVE WEARING PARTS, DESIGNATION B66-28, 1928

BRONZE CASTINGS

(See 646.41, p. 1251.)

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR SAND CASTINGS OF THE ALLOY: COPPER, 80 PER CENT; TIN, 10 PER CENT; LEAD, 10 PER CENT, DESIGNATION B74-28T, 1928

ALLOY 80-10-10

SCOPE

1. (a) These specifications cover alloy castings, the alloy being a composition of copper, tin, and lead, known commercially as 80-10-10, deoxidized with phosphorus.

(b) The castings are intended for use for bearings and bushings in the cast state. This alloy is frequently used also for castings which are called upon to resist some of the mild acids such as are found in mine waters.

CHEMICAL PROPERTIES AND TESTS

2. The alloy shall conform to the following requirements as to chemical composition:

	Desired	Minimum	Maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
Copper.....	80	79	81
Tin.....	10	9	11
Lead.....	10	9	11
Zinc.....	None.	0.25
Iron.....	None.	None.	.10
Nickel.....50
Phosphorus.....	Trace.	Trace.	.25
Aluminum.....	None.	None.
Sulphur.....	None.05
Antimony.....	None.	None.	.25
Total other impurities.....	None.15

Where "none" is specified it shall be construed to refer to none determined on a 10 g sample.

PHYSICAL PROPERTIES AND TESTS

3. The alloy shall conform to the following minimum requirements as to tensile properties:

Tensile strength.....	lbs./in. ² ..	25,000
Yield point.....	do.....	12,000
Elongation in 2 inches.....	per cent..	6

(Specifications covering tension-test specimen requirements are identical with those in paragraph 11 (c), A18. (See 611.51, p. 754.) In respect to chemical analyses, determination of yield point, workmanship and finish, marking, inspection, and rejection, this specification is identical with B59. (See 647.15, p. 1259.) In respect to manufacture, pressure-test requirements, and dimensions of test-specimen coupon, it is identical with B60. (See 643.4, p. 1192.) In respect to number of tests, paragraphs 7 (a), (b), (c), and (d) in this specification are identical with paragraphs VI 2, 3, 4 and 13 in F. S. B. 172a (QQ-B-691). (See 646.41, p. 1252.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 64, PHOSPHOR BRONZE, MARCH, 1922

PHOSPHOR BRONZE

(See 647.34, p. 1269.)

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 66, BRONZE BACKING FOR LINED BEARINGS, MARCH, 1922

BRONZE BACKING FOR LINED BEARINGS

1. *Composition in percentage.*—

	Per cent
Copper.....	83.00-86.00
Tin.....	4.50-6.00
Lead.....	8.00-10.00
Zinc, maximum.....	2.00
Impurities, maximum.....	.25

2. *General information.*—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	25,000
Yield point.....	do.....	12,000
Elongation in 2 inches, or proportionate gage length.....	per cent..	8

3. This composition is recommended as an inexpensive but suitable alloy for bronze-backed bearings.

4. Bearings or gears made of bronze alloys should be used only against hardened steel.

SOCIETY OF AUTOMOTIVE ENGINEERS, NONFERROUS METAL SPECIFICATIONS, SPECIFICATION NO. 67, SEMIPLASTIC BRONZE, MARCH, 1922

SEMIPLASTIC BRONZE

1. *Composition in percentage.*—

	Per cent
Copper.....	75.50-78.50
Tin.....	7.25-8.75
Lead.....	13.50-16.50
Zinc, maximum.....	.50
Phosphorus, maximum.....	.25
Iron, maximum.....	.25
Antimony, maximum.....	.50
Aluminum.....	None.
Impurities, maximum.....	.75

2. *General information.*—Good castings made of this alloy should give the following minima in physical characteristics:

Ultimate strength.....	lbs./in. ² ..	20,000
Elongation in 2 inches, or proportionate gage length.....	per cent..	10

3. This metal is intended for use where a soft bronze with good antifriiction qualities is desired.

I. CHEMICAL PROPERTIES AND TESTS

3. Composition of back.—

	Per cent
Lead	15-22
Tin	5-7
Total of tin, lead, and copper minimum	97
Remainder, including zinc, maximum	3
Remainder, excluding zinc, maximum	1

Within the ranges permitted, the tin and lead shall vary, if at all, in opposite directions, the tin being increased for the lower percentages of lead.

4. Composition of lining.—

	Per cent
Tin	As specified.
Antimony, not less than	8.0
Tin and antimony	10-14
Arsenic, maximum	.2
Copper, maximum	.5
Sum of tin, antimony, lead, and arsenic, minimum	99.25
Remainder, maximum	.75

5. Analysis.—The sample for chemical analysis of the back shall consist of a thorough mixture of equal quantities of fine drillings taken at three points on the bearing, surface metal being discarded. The sample for analysis of the lining shall be taken by scraping the lining, after removing surface metal.

AMERICAN RAILWAY ASSOCIATION, MECHANICAL DIVISION, BEARINGS, JOURNAL, LINED, RECOMMENDED PRACTICE, 1926

JOURNAL BEARINGS, LINED

1. Scope.—These specifications cover journal bearings for use on locomotive tenders and passenger and freight equipment cars.

2. Manufacture.—Before lining, the brass backs shall be bored and thoroughly tinned in accordance with the best standard practice. The thickness of linings which is desired shall be specified in the order. If it is not specified, linings one-quarter inch thick shall be furnished. After lining, the ends of the bearings shall be made smooth by scraping, filing, or machining. They must not be ground or rubbed with abrasive materials.

II. PHYSICAL PROPERTIES AND TESTS

6. Tests.—The finished casting representing a lot for acceptance shall be broken, either longitudinally or transversely, or both, in order to ascertain the uniformity of the grain of the metal. When this fracture shows separation or imperfect mixing of component parts or cross or dirt spots, the lot shall be rejected.

7. Number of tests.—Bearings shall be divided into lots of 300 or less, and one bearing shall be taken for test and chemical analysis from each lot.

III. PERMISSIBLE VARIATIONS

8. Gaging.—All bearings shall conform to the latest standards of the mechanical section of the American Railway Association, with respect to form and dimensions and variations therefrom.

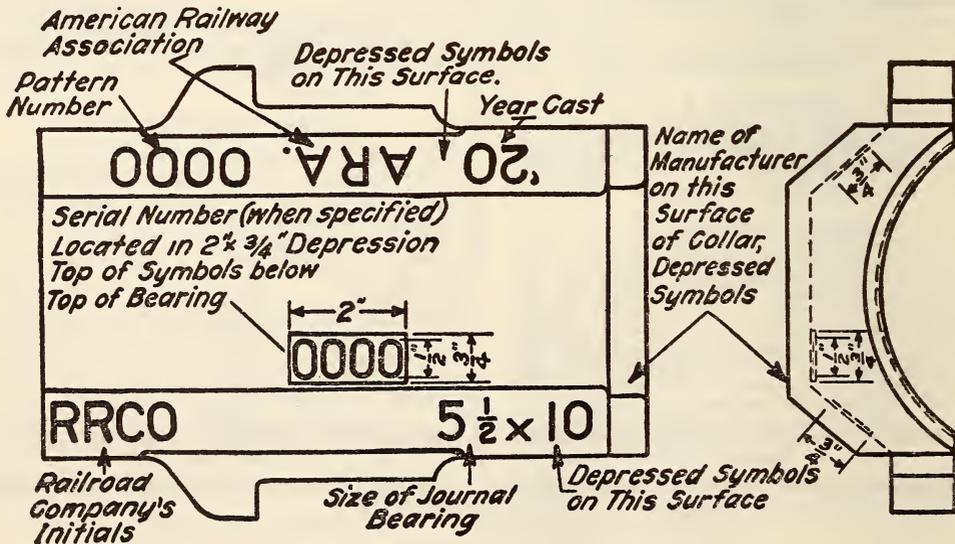

FIGURE 1142.—Journal bearings

IV. FINISH

9. *Finish.*—The castings shall be sound and free from blowholes, dross, and mechanical defects. All bearing surfaces, including ends, before and after lining, shall be smooth finished and free from sand.

V. MARKING

10. *Marking.*—The bearings shall be cast with the marks as shown on Figure 1142. When a serial number is specified it shall be located as shown on Figure 1142. Each lot of 300 or less shall bear the same serial number, which shall commence with 1 with the opening of the year and continue consecutively until the end of the year, at each manufacturer's plant.

(Requirements covering inspection, rejection, and reheating conform to those specified for A. R. A. M. galvanized sheets (see 604.32, p. 243).)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR CAR AND TENDER JOURNAL BEARINGS, LINED, DESIGNATION B67-28, 1928

JOURNAL BEARINGS, LINED

(Identical with specification of American Railway Association, given above, with the following additions:)

All samples shall be kept free of oil and shall be carefully treated with a magnet to remove any iron introduced in taking the sample.

A second test shall be made after application of the lining, as follows:

The suspended brass when tapped with a hammer shall give a distinct ring.

The lining when chipped with a cold chisel shall tear from the soldered surface as distinguished from clean shearing.

SOCIETY OF AUTOMOTIVE ENGINEERS, BALL AND ROLLER BEARINGS, S. A. E. STANDARD, JANUARY, 1930

BALL AND ROLLER BEARINGS

(In these specifications essential dimensions of the several kinds of ball bearings and of roller bearings are contained in 28 tables, as indicated in the accompanying summary of tabular contents. As shown in the fifth column, in some cases the unit of measurement is in inches, in others it is in millimeters, and in still others it is in both inches and millimeters. The fourth column gives the range in the size of bore for each type of bearing.)

Kind of bearing	Type	Series	Range in bore size	Unit of measure
Annular ball.....	Single row.....	Light, medium, heavy.....	4-110 millimeters.....	Inch and millimeter.
Annular ball and roller.....	{Wide..... Separable (open).....	{do..... do.....	{10-110 millimeters..... 5-19 millimeters.....	{Do..... Do.....
Angular contact ball.....	Steering knuckle.....	Light, medium, heavy.....	10-110 millimeters.....	Do.....
	Single direction flat face.....	Light, medium.....	8-30 millimeters.....	Do.....
	do.....	Light, medium, heavy.....	½-4 inches.....	Inch.
	do.....	Light, medium, heavy.....	10-110 millimeters.....	Millimeter.
Thrust ball.....	Single direction self-aligning.....	Light, medium.....	½-4 inches.....	Inch.
	do.....	Light, medium, heavy.....	10-110 millimeters.....	Millimeter.
	Double direction flat face.....	do.....	10-110 millimeters.....	Do.....
	Double direction self-aligning.....	do.....	10-110 millimeters.....	Do.....

(S. A. E. standard roller bearings, arranged according to bore, are dimensioned in both inches and millimeters in tabular form, the diameter of the bore ranging from $\frac{1}{8}$ inch to 8 inches.)

AMERICAN RAILWAY ASSOCIATION, TELEGRAPH AND TELEPHONE SECTION, SPECIFICATION 2-G-20, ROSIN CORE SOLDER, 1926

ROSIN CORE SOLDER

1. The purpose of this specification is to guide the seller/contractor in the manufacture of rosin core solder.

GENERAL

2. The rosin core solder shall consist of a seamless tube of solder in the form of a cylindrical wire, filled with a core of rosin flux.

3. The quality of the material used and the methods of manufacture shall be such as to insure for the completed solder the properties called for in this specification.

4. The seller/contractor must make sure that all material and work is in accordance with the specification before the solder is offered.

MATERIAL

5. The solder employed in the wire shall consist of an alloy of lead and tin containing by weight approximately 38 per cent of tin and 62 per cent of lead.

6. The proportion of tin contained in the alloy shall in no case be less than 37.75 per cent of the total weight. The remainder of the alloy shall consist of lead, except that antimony, bismuth, copper, and iron, in quantities not greater than hereinafter permitted, may also be present.

7. The proportion of copper or iron present shall not be more than 0.05 per cent by weight for each metal.

8. The proportion by weight of bismuth present shall not be greater than 0.10 per cent, and the total proportion by weight of antimony, bismuth, copper, and iron present in the solder shall not be greater than 0.5 per cent by weight.

9. Other metallic impurities, if present, shall amount to not more than a trace of each metal, the maximum limit for a trace being 0.005 per cent by weight.

10. The solder shall be uniform in composition throughout.

11. The rosin core shall consist of a good grade of commercial rosin, equivalent to grade F or better.

12. The per cent by weight of rosin in the finished solder shall be nominal, 3 per cent; minimum, $2\frac{1}{2}$ per cent; maximum, 4 per cent.

MANUFACTURE

13. The diameter of the finished rosin core solder measured between the outside surfaces, shall not be greater than 0.102 inch nor less than 0.086 inch.

14. The core of rosin shall be well centered in the finished solder.

INSPECTION

15. The purchaser shall have the right to make such inspection and tests as he may desire of the

rosin core solder at any stage of its manufacture. Such inspection is not to include the process of manufacture. The inspector of the purchaser shall have the right to reject any material or finished solder which is defective in any respect. Inspection, however, shall not relieve the seller/contractor, from obligation of furnishing first-class material and sound, reliable work.

16. Any improper material or unfaithful work that may be discovered before the final acceptance of the completed solder shall be corrected immediately, upon the requirement of the purchaser, notwithstanding that it may have been overlooked by the inspector. If the requirements of this specification are not fulfilled when the solder is offered for final acceptance, the purchaser shall have the right to reject the solder.

17. The seller/contractor shall provide at his factory apparatus and other facilities needed for making the required tests, and shall notify the purchaser when the solder is ready for test.

PACKING

18. The rosin core solder shall be furnished on spools. The weight of the finished solder on each spool shall be either 1 or 5 pounds, as specified on the order.

17. The length of spools containing 5 pounds of solder shall not be greater than $4\frac{1}{4}$ inches, and the diameter of the ends of the spools not greater than $4\frac{1}{8}$ inches. Each spool shall have a hole nine-sixteenths inch in diameter, extending throughout its length symmetrical to its longitudinal axis.

18. The length of spools containing 1 pound of solder shall not be greater than $4\frac{1}{4}$ inches, and the diameter of the ends of the spools not greater than 2 inches. Each spool shall have a hole three-eighths inch in diameter, extending throughout its length symmetrical to its longitudinal axis.

19. Each spool shall bear on one end an inscription in bold type specifying the name of material, its size, weight, and name of seller/contractor.

20. The spools of solder shall be packed in strong packing cases to prevent their being damaged in transit.

MARKING

21. The number of spools of solder, total net weight, purchaser's order and requisition numbers, name of consignor, name and address of consignee, and such other information as may be specified on the order shall be plainly marked on the outside of each case.

22. Detailed list of containers and their contents shall be furnished for each shipment.

WARRANTY

23. The seller/contractor hereby expressly warrants that the material furnished under this specification shall be free from defects in design, material, and workmanship. The seller's/contractor's obligation under this warranty shall not apply to any material which has been subject to misuse, negligence, or accident after acceptance.

24. The seller/contractor hereby covenants and agrees to save harmless and indemnify the purchaser against all claims, suits, actions, or proceedings, damages, costs, fees, and expenses by reason of alleged infringement of patents, or for patent royalties involved, in consequence of the purchase or the use of the material covered hereby.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD METHODS OF CHEMICAL ANALYSIS OF ALLOYS OF LEAD, TIN, ANTIMONY, AND COPPER, DESIGNATION B18-21, 1921

DETERMINATION OF LEAD, COPPER, ANTIMONY, AND TIN

(See 692.0, p. 1317.)

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SOLDER METAL, DESIGNATION B32-21, 1921

SOLDER METAL

SCOPE

1. (a) These specifications cover lead-tin alloys used for solder metal and commonly known as soft solder.

(b) Two classes, A and B, are given, in each of which several compositions are specified covering the range of alloys commercially used and designated as grades Nos. 0 to 5, in accordance with their decreasing tin content as specified in section 4.

The choice of the class and grade of solder for any specified purpose depends on the material in connection with which it is to be used and the method of applying. For galvanized iron and zinc, only class A should be used. Recommended practice is given in an appendix to these specifications, together with a table showing melting points, to constitute a guide to the purchaser in selecting the grade best suited for meeting the conditions required.

MANUFACTURE

2. The manufacturer shall use care to have each lot of solder metal as uniform in quantity as possible. Each bar, ingot, or other form in which the solder is sold shall be uniform in composition with the entire lot. All grades in class A shall be made from new or virgin metals. All grades in class B shall be made from at least one-half new or virgin metals, the balance being recovered or secondary metals.

3. When specified in bar or ingot form, the sizes or shapes, unless otherwise specified, shall be approximately as follows:

	Length	Width	Thickness
A. Bar:			
Top-----	<i>Inches</i> 13½	<i>Inches</i> ¾	} ¾
Bottom-----	13½	¾	
B. Ingot:			
Top-----	5½	2½	} 1½
Bottom-----	4½	1½	

CHEMICAL PROPERTIES AND TESTS

4. The alloys shall conform to the following requirements as to chemical composition, within the limits specified in section 5:

CLASS A

Grade No.	Tin	Lead, approximate	Antimony, maximum	Copper, maximum	Zinc and aluminum	Other impurities, maximum ¹
0	<i>Per cent</i> 63.00	<i>Per cent</i> 37.00	<i>Per cent</i> 0.12	<i>Per cent</i> 0.08	<i>Per cent</i> None.	<i>Per cent</i> 0.10
1	50.00	50.00	.12	.08	None.	.10
2	45.00	55.00	.12	.08	None.	.10
3	40.00	60.00	.12	.08	None.	.10
4	37.50	62.50	.12	.08	None.	.10
5	33.00	67.00	.12	.08	None.	.10

CLASS B

1	49.25	50.00	0.75	0.15	None.	0.10
2	43.50	55.00	1.50	.15	None.	.10
3	38.00	60.00	2.00	.15	None.	.10
4	35.50	62.50	2.00	.15	None.	.10
5	31.00	67.00	2.00	.15	None.	.10

¹ Exclusive of bismuth.

PERMISSIBLE VARIATIONS

5. The permissible variation plus or minus in the percentage of tin shall not be over 1 per cent of the tin contents specified in section 4.

SAMPLE FOR CHEMICAL ANALYSIS

6. (a) Three bars or ingots shall be selected to represent a shipment of less than 1,000 pounds; 5 bars or ingots to represent a shipment of over 1,000 to 10,000 pounds, inclusive; and 10 bars or ingots to represent a shipment of over 10,000 pounds to one carload. In case the shipment is in other form, such as wire, wire segments, drops, pigs, or slabs, an equivalent amount of metal representative of the lot shall be taken, but in no case shall less than one whole piece (except wire) represent a shipment.

(b) The preferable method of preparing the sample for chemical analysis is to cut exactly in half the bars selected, marking each half and retaining one of each of the half bars to preserve their identity and for check analysis. The remaining half of each bar shall then be remelted in a perfectly clean utensil at a temperature a little above the complete liquation point of the alloy, mixed thoroughly, and poured into a cold mold, forming a thin bar approximately one-fourth inch thick. Saw cuts shall then be made entirely across this bar not more than 1 inch apart and evenly distributed throughout its length.

If it is impracticable to remelt the sample as above, saw cuts shall be made entirely across each piece at several points not more than 1 inch apart and evenly distributed throughout their length. No lubricants shall be used for sawing.

(c) Sawings thoroughly mixed shall constitute the sample for chemical analysis.

METHODS OF CHEMICAL ANALYSIS

7. The chemical analysis shall be made in accordance with the standard methods of chemical analysis of alloys of lead, tin, antimony, and copper of the American Society for Testing Materials. See A. S. T. M. B18-21 (692.0, p. 1317).

MARKING

8. The name of the manufacturer may be cast, at the option of the purchaser, on each bar or ingot. The numerical designation of the grade supplied

shall be stamped or cast on each bar or ingot for identification.

(Requirements covering inspection and rejection and claims are identical with those for brass ingot metal for sand castings in A. S. T. M. B30-31T. See 644.11, p. 1196).

APPENDIX

9. It is recommended that the grade of solder metal be selected which contains the least amount of tin required to give suitable flowing and adhesive qualities for the work in hand.

10. A table is given showing the melting points of the different grades of solder metal and of tin and lead for comparison. It is to be noted that the alloys are completely solid below the lower point given, designated "melting point," and completely liquid only above the higher point given, designated "complete liquation point." In the range of temperature between these two points the alloys are partly solid and partly liquid. In grade No. 1 the amount of solid portion is so small in the range that it is practically unnoticeable. In grade No. 4 the proportion of solid and fluid metal in the range given makes this alloy suitable for use as wiping solder.

Table showing melting points of solder metal

Grade	Formula			Melting point		Complete liquation point	
	Tin	Lead	Anti-mony	°C.	°F.	°C.	°F.
	Per cent	Per cent	Per cent				
Tin.....	100.00			232	449.6	232	449.6
0A.....	63.00	37.00	0.12	181	357.8	181	357.8
1A.....	50.00	50.00	.12	181	357.8	213	415.4
1B.....	49.25	50.00	.75	185	365.0	208	397.4
2A.....	45.00	55.00	.12	181	357.8	225	437.0
2B.....	43.50	55.00	1.50	188	370.4	220	428.0
3A.....	40.00	60.00	.12	181	357.8	237	458.6
3B.....	38.00	60.00	2.00	188	370.4	228	442.4
4A.....	37.50	62.50	.12	181	357.8	241	467.6
4B.....	35.50	62.50	2.00	188	370.4	231	441.8
5A.....	33.00	67.00	.12	181	357.8	252	485.6
5B.....	31.00	67.00	2.00	188	370.4	235	455.0
Lead.....		100.00		327	620.6	327	620.6

11. The data in this appendix do not constitute a part of these specifications. They are given merely to indicate to the purchaser the physical properties of the various alloys specified which can be expected of carefully manufactured alloys of the formulas indicated, and to constitute a guide to the purchaser in selecting the grade best suited for meeting the service condition for which the solder metal is to be used.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATIONS NOS. 1, 2, AND 3,
SOLDER, MARCH, 1922**

SOLDER

(These three specifications practically conform with A. S. T. M. B32-21, given above. The conformings are as follows:

S. A. E. Handbook	A. S. T. M. B32-21
Specification No. 1:	
Class A.....	Grade No. 1, Class A.
Class B.....	Grade No. 1, Class B.
Specification No. 2:	
Class A.....	Grade No. 2, Class A.
Class B.....	Grade No. 2, Class B.
Specification No. 3:	
Class A.....	Grade No. 3, Class A.
Class B.....	Grade No. 3, Class B.

There are, however, in the S. A. E. specifications no classes that correspond to the other grades specified in B32, given above.)

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 4, FOR SOLDER,
AUGUST, 1922**

SOLDER

1. Composition in percentage.—

	Class A	Class B
Tin.....	Per cent 24.50-25.50	Per cent 22.50-23.50
Lead, approximate.....	75.00	75.00
Antimony, maximum.....	.12	2.00
Copper, maximum.....	.08	.15
Zinc and aluminum.....	None.	None.
Other impurities, maximum.....	.10	.10

2. General information.—This solder is recommended for use on work that is to be coated with enamel and then baked, as it will withstand higher baking temperatures than solders containing larger amounts of tin.

3. The choice of the class and grade of solder for any specified purpose depends on the material in connection with which it is to be used and the method of applying. For galvanized iron and zinc, only Class A should be used. Class A solder should be furnished under this specification unless otherwise specified.

4. It is recommended that the grade of solder metal be selected that contains the least amount of tin required to give suitable flowing and adhesive qualities for the work in hand.

Class	Melting point		Complete liquation point

**UNITED STATES GOVERNMENT, FEDERAL
SPECIFICATIONS BOARD, FEDERAL
SPECIFICATION FOR TIN-LEAD SOLDER,
QQ-S-571, MAY 31, 1932**

TIN-LEAD SOLDER

(In scope, manufacture, inspection and tests, marking, and melting points, this specification practically conforms with A. S. T. M. B32-31, given above. Otherwise it provides for the following:)

GENERAL SPECIFICATIONS

1. General specifications for metals, Federal Specifications Board specification No. 339a, (QQ-M-151) in effect on date of issuance of proposals, shall form part of this specification. (See 600.0, p. 3.)

GRADES

2. This specification covers five grades of tin-lead solder, as follows: Grade A, grade B, grade C, grade D, and grade E.

Grades A, B, C, and F solder shall be manufactured from new metals. Grades D and E solder may contain reworked metals.

DETAIL REQUIREMENTS

3. The chemical requirements are as given in the table below:

Grade	Tin plus lead, minimum	Tin, minimum	Antimony, maximum	Copper, maximum	Sum of zinc, aluminum, and cadmium, maximum
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
A	99.65	49.0	0.12	0.08	¹ None.
B	99.65	44.0	.12	.08	¹ None.
C	99.65	38.0	.12	.08	¹ None.
D	97.50	35.0	1.25-1.50	.15	² 0.50
E	97.50	30.0	.50-.75	.15	² .50
F	99.65	70.0	.12	.08	¹ None.

¹ As determined on a 5 g sample.

² Not more than 0.30 per cent of zinc, aluminum, or cadmium individually will be permitted.

4. The inspector shall forward for analysis not less than 5 ounces of mixed sawings.

ADDITIONAL INFORMATION

5. Grade A solder is suitable for use with galvanized iron and zinc, and in general for all purposes for which "half-and-half" solder is customarily employed. It starts to melt at about 360° F, and is completely liquid at about 415° F.

6. Grade B solder is suitable for use with galvanized iron and zinc, but is not so adaptable for sweating as grade A. It starts to melt at about 360° F., but is not completely liquid until about 430° to 450° F.

7. Grade C solder is suitable for use with galvanized iron and zinc and, in general, for all purposes for which 40-60 solder is customarily employed. It starts to melt at about 360° F., but is not completely liquid until about 460° to 470° F.

8. Grade D solder is suitable for ordinary plumbing and wiping purposes where fine finish and strength of joint are not required. It starts to melt at about 370° F., but is not completely liquid until about 415° to 440° F.

9. Grade E solder is suitable for such work as dip work on auto radiators. It starts to melt at about 370° F., but is not completely liquid until about 460° F.

10. Grade F solder is intended for making and sealing liners for small-arms ammunition packing cases and soldering zinc. It starts to melt at about 330° F. but is not completely liquid until about 355° F.

11. Only Grades A, B, and C, should be used for galvanized iron or zinc. It is recommended that the grade of solder be selected which contains the least amount of tin required to give suitable flowing and adhesive qualities for the work in hand.

693.2 SOLDERS, COPPER-ZINC BASE.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR BRAZING SOLDER, DESIGNATION B64-28, 1928

BRAZING SOLDER

SCOPE

1. These specifications cover two grades of granular brazing solder, in three classifications: Round grain, long grain, and lump, as described in sections 6, 7, and 8, respectively.

MANUFACTURE

2. These solders shall be produced by grinding or other process of granulation.

CHEMICAL PROPERTIES AND TESTS

3. The material shall conform to the following requirements as to chemical composition:

	50-50 grade	52-48 grade
	<i>Per cent</i>	<i>Per cent</i>
Copper.....	50.00-53.00	52.00-55.00
Lead, maximum.....	.50	.50
Iron, maximum.....	.10	.10
Zinc.....	Remainder.	Remainder.

4. A composite sample of not less than 2 ounces shall be taken from each 2,000 pounds or fraction thereof in the shipment by taking, as nearly as possible, equal parts from each package or container. Samples shall consist of the grains as prepared for round grain and long grain solder or, in the case of lump solder, of material obtained by drilling, milling, or sawing the lumps. The samples shall be clean and free from oil, dirt, oxide, or other foreign material.

5. In the case of dissatisfaction the solder shall be sampled in the presence of representatives of both the seller and the purchaser. The thoroughly mixed sample shall be divided into three equal parts, each of which shall be placed in a sealed package—one for the seller, one for the purchaser, and one for an umpire, if necessary.

CLASSIFICATION AND SIZES

Round Grain Solder

6. (a) Round grain solder shall be furnished according to the following classification and sizes:

Fine grain

Retained on No. 8 standard screen (2.38 mm opening), none.
Retained on No. 40 standard screen (0.42 mm opening), not more than 5 per cent.

Retained on No. 100 standard screen (0.149 mm opening), not less than 90 per cent.

Passing No. 100 standard screen (0.149 mm opening), not more than 5 per cent.

Coarse grain

Retained on No. 8 standard screen (2.38 mm opening), not more than 8 per cent.

Retained on No. 40 standard screen (0.42 mm opening), not less than 90 per cent.

Passing No. 40 standard screen (0.42 mm opening), not more than 2 per cent.

(b) Mixed round grain solder shall be a mixture of all grains from fine to coarse.

Long Grain Solder

7. Long grain solder shall be furnished in the following sizes:

(a) Fine long grain solder shall consist of fairly uniform grains about one-half inch in length and about one-sixteenth inch in maximum diameter.

(b) Coarse long grain solder shall consist of irregular aggregates of long grains about one-quarter inch to 1 inch in length and about one-quarter inch in maximum diameter.

(c) Mixed long grain solder shall be a mixture of all grains from fine to coarse.

Lump Solder

8. Lump solder shall consist of irregular lumps of long grain solder, about 2 to 4 inches in dimensions.

PACKING AND MARKING

9. Round and long grain solder shall be packed in strong wooden boxes, not to exceed 200 pounds per box. The fine grain solders shall be packed in paper-lined wooden boxes. Lots weighing less than 100 pounds shall be packed in tin containers inclosed in wooden boxes unless otherwise specified.

10. Lump solder shall be packed in strong barrels, not to exceed 500 pounds per barrel.

11. The coarse grain or mixed solders may be packed in strong barrels when so specified.

12. Each package shall be legibly marked with the grade and size, the weight of the material, brand or trade-mark of the manufacturer, and the contract or purchase order number.

IMPURITIES

13. The brazing solder shall be free from oxide, dirt, or any foreign material which will impair its working qualities.

INSPECTION AND REJECTION

14. The manufacturer shall afford the inspector representing the purchaser, without charge, all reasonable facilities to satisfy himself that the solder is being furnished in accordance with these specifications. All tests and inspections shall be so conducted as not to interfere unnecessarily with the operation of the works.

15. Solder which fails to conform to these specifications will be rejected and the manufacturer shall be notified.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
NONFERROUS METAL SPECIFICATIONS,
SPECIFICATION NO. 82, BRASS WIRE,
JULY, 1924**

BRASS WIRE

1. *Composition in percentage.*—

	Per cent
Copper.....	59.00-62.00
Lead, maximum.....	.30
Iron, maximum.....	.06
Aluminum.....	None.
Zinc.....	Remainder.

2. This wire should be finished soft annealed. The surface should be clean and free from scale or other foreign materials.

3. Wire in accordance with this specification is suitable for brazing and torch welding.

**SOCIETY OF AUTOMOTIVE ENGINEERS,
SPECIFICATION NO. 45, BRAZING SOLDER,
MARCH, 1922**

BRAZING SOLDER

1. *Composition in percentage.*—

	Per cent
Copper.....	48.00-52.00
Lead, maximum.....	.50
Iron, maximum.....	.10
Zinc.....	Remainder.

2. *General information.*—This solder starts to melt at approximately 1,560° F., and is entirely melted at 1,600° F. It may be used by melting it in a crucible under a flux of borax, with or without the addition of boric acid, and dipping the material to be brazed in the melted brazing solder; or this brazing solder, in powdered form, may be mixed with the flux applied to the material to be brazed and melted either in a furnace or by the use of a brazing torch.

**UNITED STATES GOVERNMENT, FEDERAL
SPECIFICATIONS BOARD; FEDERAL
SPECIFICATION FOR SPELTER SOLDER
(FOR BRAZING), NO. 306, JULY 6, 1925.
CURRENT DESIGNATION: QQ-S-566)**

SPELTER SOLDER

General specifications for metals, Federal specifications board specification No. 339a (QQ-M-151) (see 600.0, p. 3), in effect on date of issuance of proposals, shall form part of this specification.

GRADES

I. This specification covers four grades of spelter solder, as follows: Grade A, grade B, grade C, and grade D.

MATERIAL AND WORKMANSHIP

II. Spelter solder furnished under this specification shall be of the best commercial quality.

III. Grades A and B spelter solder shall be furnished in granulated form. Grades C and D spelter solder shall be furnished in the form of ingots, bars, or wire, as may be specified.

IV. *Chemical requirements.*—The chemical requirements are as given in the following table:

Grade	Copper	Tin	Lead, maximum	Iron, maximum	Aluminum, maximum	Zinc (per cent)
A.....	<i>Per cent</i> 49.0-52.0	<i>Per cent</i> None.	<i>Per cent</i> 0.50	<i>Per cent</i> 0.10	<i>Per cent</i> 0.10	Remainder.
B.....	49.0-52.0	3.0-4.0	.50	.10	-----	Do.
C.....	68.0-72.0	1 None.	.30	.10	-----	Do.
D.....	78.0-82.0	1 None.	.20	.10	-----	Do.

¹ As determined on a 1 g sample.

METHOD OF INSPECTION AND TESTS

V. Samples for check analysis, when made, shall be taken from at least five pieces or packages in each lot of 500 pounds, or fraction thereof, and shall be free from oil, dirt, or foreign material. The individual samples shall be thoroughly mixed and not less than 5 ounces forwarded for analysis.

PACKING AND MARKING

VI. 1. Grade A spelter solder shall be packed in substantial wooden boxes, each containing 100 pounds net weight.

2. Grade B spelter solder shall be packed in 1-pound packages. These packages shall be shipped in suitable containers.

3. Grades C and D spelter solder may be packed in accordance with the contractor's usual practice.

4. Containers shall be legibly and indelibly marked with the grade of material, weight of contents, name, brand, or trade-mark of contractor, and the contract or purchase order number.

ADDITIONAL INFORMATION

VII. 1. The grain size desired should be specified by the department concerned. Long-grain solder is suitable for brazing steel; fine-grain for brazing non-ferrous material.

2. The melting point of grades A and B is about 1,600° F. Grades C and D are suitable for brazing steel parts that are to be subjected to heat treatment after brazing. The melting point of grade C varies

from 1,650° F. to 1,760° F., and that of grade D from 1,725° F. to 1,825° F. On account of its higher melting point, grade D is more difficult of application than grade C, but it is preferable with chrome-vanadium and chrome-molybdenum steel.

693.3 SILVER SOLDER.

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR SILVER SOLDERS, DESIGNATION B73-29, 1929

SILVER SOLDERS

SCOPE

1. (a) These specifications cover eight grades of silver-copper-zinc alloys in wire, strip, sheet, or granular form, used for brazing purposes and commercially known as silver solders.

(b) The eight grades of silver solders covered by these specifications shall be designated as grades Nos. 1 to 8 in accordance with their chemical composition as specified in section 6.

(c) The choice of the grade of solder for any specified purpose depends on the material in connection with which it is to be used. Recommendations regarding applications and data regarding colors and melting ranges are given in the Appendix to these specifications.

MANUFACTURE

2. The alloys shall be made from virgin metals or such clean scrap as may result from the manufacture of articles of the same or similar composition.

3. Strip or sheet solder shall be cold-rolled to size and, unless otherwise specified, shall be furnished in the hard condition.

4. Wire shall be cold-drawn to size and, unless otherwise specified, shall be annealed after cold-drawing and pickled bright.

5. Granular solder shall be produced by filing, grinding, or other process of granulation. The material shall be supplied in sizes specified in accordance with the requirements for the size of sieve opening of the standard specifications for sieves for testing purposes, in A. S. T. M., E11-26. (See 645.31, p. 1226.) The material shall contain not more than 10 per cent over the specified size.

CHEMICAL PROPERTIES AND TESTS

6. The alloys shall conform to the following requirements as to chemical composition, within the permissible variations specified in section 7:

Grade No.	Silver	Copper	Zinc	Cadmium	Impurities, maximum
	<i>Per cent</i>				
1	10	52	38	(1)	0.15
2	20	45	35	(1)	.15
3	20	45	30	5	.15
4	45	30	25	nil.	.15
5	50	34	16	nil.	.15
6	65	20	15	nil.	.15
7	70	20	10	nil.	.15
8	80	16	4	nil.	.15

¹ The addition not to exceed 0.50 per cent of cadmium to assist in fabricating grades Nos. 1 and 2 shall not be considered as a harmful impurity.

7. The permissible variation from the percentages, specified in section 6, of silver, copper, and zinc, for all grades, shall be plus or minus 1 per cent in the case of silver and copper, and 2 per cent in the case of zinc. The permissible variation in the percentage of cadmium for grade No. 3 shall be plus or minus 1 per cent.

8. A composite sample of not less than 1 ounce shall be taken from each lot of 50 pounds or fraction thereof of grades Nos. 1, 2, and 3; and from each lot of 20 pounds or fraction thereof of grades Nos. 4, 5, 6, 7, and 8. Samples of granulated solder shall consist of the grains as prepared. Samples from wire, sheet, or strip shall be taken by shearing or clipping pieces from the entire cross section of the same, remelting in a clean container at a temperature slightly above the melting range, mixing thoroughly and pouring into a cold mold of convenient size for milling, drilling, or sawing. The samples so prepared shall be milled, drilled, or sawed in such a manner as to represent the entire cross section. The saw, drill, cutter, or other tool used shall be thoroughly cleaned. No lubricant shall be used in the operation, and the sawings of metal chips shall be carefully treated with a magnet to remove any particles of steel introduced in taking the sample.

9. In the case of disagreement, the solder shall be re-sampled in the presence of the manufacturer and purchaser. The sample shall consist of not less than 3 ounces of solder prepared as described in section 8. The thoroughly mixed sample shall be divided into three equal parts, each of which shall be placed in a sealed package—one for the manufacturer; one for the purchaser; and one for an umpire, if necessary.

PACKING AND MARKING

10. The silver solder shall be packed in such a manner as to prevent injury during shipment.

11. Each package shall be legibly marked with the grade and size, the weight of the material, brand or trade-mark of the manufacturer, and the contract or purchase order number.

WORKMANSHIP AND FINISH

12. All wire, sheet, and strip shall be reasonably smooth and bright, and substantially free from slivers, splitting, or other injurious or objectionable defects.

13. Granular solder shall be substantially free from oxide, dirt, or any foreign material which will impair its working qualities.

REJECTION

14. Solder which fails to conform to these specifications will be rejected, and the manufacturer shall be notified.

APPENDIX

15. The approximate melting points, flow points, and colors of the grades are as follows:

Grade No.	Melting point		Flow point		Color
	°F.	°C.	°F.	°C.	
1	1,510	820	1,600	870	Yellow.
2	1,430	775	1,500	815	Do.
3	1,430	775	1,500	815	Do.
4	1,250	675	1,370	745	Nearly white.
5	1,280	695	1,425	775	Do.
6	1,280	695	1,325	720	White.
7	1,335	725	1,390	755	Do.
8	1,360	740	1,460	795	Do.

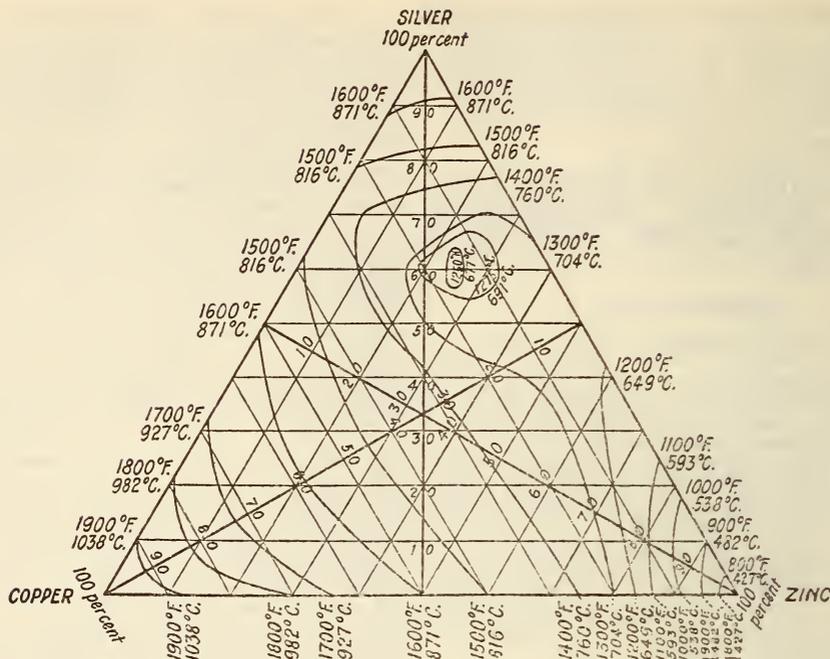

FIGURE 1144.—Liquidus diagram of silver-copper-zinc alloys

16. Solders of grades Nos. 1, 2, and 3 are suitable for brazing purposes which require a solder that flows more readily than the ordinary copper-zinc brazing solders. Grades Nos. 3 and 4 flow freely at a still lower temperature and are recommended for use where strong joints are required, and in such cases where heating to a sufficiently high temperature to flow grades Nos. 1, 2, or 3, would be injurious to the article being soldered. Grades Nos. 6, 7, and 8, are higher-grade silver solders and are recommended for special cases where a high degree of malleability and ductility is required.

NOTE.—The liquidus diagram of silver-copper-zinc alloys shown in Figure 1144 is based upon a large number of cooling curves made in the research laboratory of Handy & Harman, Bridgeport, Conn.

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE METHODS OF CHEMICAL ANALYSIS OF SILVER SOLDERS, DESIGNATION B81-31T, 1931

CHEMICAL ANALYSIS OF SILVER SOLDERS

General Considerations

In the analysis of silver solder the usual determinations are silver, copper, cadmium, and zinc. In routine analysis, however, it is customary to take zinc by difference.

Methods are provided for the determination of lead, tin, iron, and nickel as impurities, starting with a separate 5 g sample. The methods for determination of impurities are based on the consideration that any of these will not exceed a few tenths of a per cent in amount; in case it is necessary to determine larger quantities, the size of the sample may be reduced accordingly.

In the scheme as outlined below, the procedure for the determination of main constituents is kept separate from the determination of impurities, in the belief that such an arrangement will provide continuous procedures convenient for general use.

DETERMINATION OF SILVER

METHOD

Weigh 1 g of the sample into a 250 c c beaker, add 20 c c of HNO_3 (1:4), cover, gently warm until solution is complete, and boil to expel NO_2 fumes; dilute to a volume of 175 c c with distilled water, and heat to boiling. Add, drop by drop, from a pipette, a dilute solution of HCl (3:100) (1 c c of this solution should precipitate about 0.038 g of silver) until precipitation is complete. It is important to avoid a large excess of the precipitant. When the solution has become cold and the precipitate has settled, test the clear solution with a few drops of the dilute HCl to determine whether or not precipitation is complete. Filter on a weighed porcelain Gooch crucible, washing the precipitate several times with a cold dilute solution of HNO_3 (1:200) and once with cold distilled water. Save the filtrate for the determination of copper. Place the Gooch crucible inside a porcelain crucible, dry and heat the latter to dull red in the oxidizing flame of a Tirrill burner, cool, and weigh as AgCl . Calculate to Ag .

NOTES.—1. If tin is present, as shown by a precipitate of meta-stannic acid when dissolving in nitric acid, it should be filtered off as directed under determination of tin before proceeding with the determination of silver. It is particularly important to observe the precautions regarding contamination by chlorides, noted under determination of tin.

2. AgCl melts at 451°C . and, if heated too long at too high a temperature, low results are obtained. The final ignition of this precipitate should not be carried beyond the point of incipient fusion.

DETERMINATION OF SILVER BY THE COMBINATION ASSAY METHOD

SOLUTIONS REQUIRED

Sodium chloride solution.—Dissolve 107 g of NaCl in 2,000 c c of distilled water. One cubic centimeter of this solution will precipitate 100 mg of Ag .

METHOD

Weigh out an amount of sample which will be equivalent to 300 to 500 mg of silver. Dissolve in

dilute HNO_3 (1:4), allowing 20 c c of dilute acid for each gram of sample, in a 400 c c beaker. Cover and then boil to remove NO_2 fumes and dilute to 350 c c with hot H_2O . Precipitate AgCl in the hot solution with NaCl solution. Avoid an excess. As long as some Ag remains unprecipitated, the solution will clear rapidly on stirring; towards the end the cloudiness will persist for some time. Allow to settle (overnight for best results).

Test with a drop of sodium chloride solution. If clear, filter through a double 11 cm closely woven paper. Wash well with hot water to aid in removing copper. Add 5 g of test lead to precipitate in the paper. Place in a 2½-inch scorifier which has been lined with a sheet of lead weighing approximately 10 g. Incinerate in an oven or muffle. Cover ash with 20 g of test lead, add 1 g of a mixture composed of equal parts of silica and borax glass. Scorify to about a 14 to 16 g button, pour in mold, clean off slag, hammer into a cube, and cupel in a moderately hot muffle, no attempt being made to feather. When cupellation is finished, set a hot cupel inverter over the one holding the head and withdraw both cupels from the furnace. Clean and weigh button as Ag . Corrections are made as determined by running proofs of approximately the same composition as the solder being analyzed.

NOTE.—All lead should be bismuth and silver free.

DETERMINATION OF COPPER BY THE ELECTROLYTIC METHOD

APPARATUS FOR ELECTROLYSIS

See the determination of copper by electrolytic method in B27 (647.20, p. 1261).

METHOD

Transfer the filtrate from AgCl (determination of silver) to a 400 c c beaker, add 5 c c of H_2SO_4 (specific gravity 1.84) and evaporate to fumes, cool, dilute to a volume of 50 c c with distilled water, and boil. Add 2 c c of HNO_3 (specific gravity 1.42), transfer to a 200 c c lipless beaker, dilute to a volume of 100 c c with cold distilled water and electrolyze for copper, using stationary electrodes and a current of 1.0 ampere. When the solution is colorless, wash down cover glasses, electrodes, and sides of beaker, raising the level of the liquid slightly, and continue the electrolysis about 15 minutes, noting whether or not copper is deposited on the newly exposed surface of the platinum. If no copper appears, remove the cathode quickly, washing it with distilled water, and catching all washings in the beaker containing the electrolyte. Save the electrolyte for the determination of cadmium and zinc. Dip the cathode in two successive baths of alcohol, shake off the excess alcohol, and ignite the remainder by bringing it to the flame of an alcohol lamp. Keep the cathode moving continually as the alcohol burns. Weigh metallic copper.

NOTE.—If denatured alcohol is used for drying cathode with copper deposits, it should not show any weighable residue on evaporation to dryness. Alcohol denatured only by the addition of methyl alcohol is suitable for this purpose.

DETERMINATION OF CADMIUM BY THE ELECTROLYTIC METHOD

SOLUTIONS REQUIRED

Potassium hydroxide (note 1).—Dissolve 20 g of KOH , c. p., in 200 c c of distilled water.

Potassium cyanide (note 2).—Dissolve 20 g of KCN , c. p., in 200 c c of distilled water.

METHOD

Transfer the electrolyte from the determination of copper to a 600 c c beaker and boil to expel dis-

solved gases. Make slightly alkaline with NH_4OH (1:1), and then just neutral with H_2SO_4 (1:4); finally add 25 c c of H_2SO_4 (1:4) in excess, dilute to a volume of 300 c c with distilled water, bring to a boil, and pass H_2S for one hour. (Note 3.) Allow to stand until the precipitate has settled and filter off impure CdS (note 4) on a loose-bottom Gooch crucible. Remove the precipitate by punching out the bottom into a tall 200 c c beaker, washing and wiping off the sides of the crucible with a little asbestos pulp. Add 60 c c of H_2SO_4 (1:5) and boil for 30 minutes. (Note 5.) Filter, wash, and dilute to 300 c c add about 5 g of NH_4Cl , and precipitate with H_2S gas as before. (Note 6.) Repeat, making a third precipitation if the amount of cadmium present is large. (Note 5.) Save combined filtrates from CdS for the determination of zinc. Dissolve the final precipitate of CdS in 25 c c hot HCl (1:3), boil to remove H_2S , add a few drops of HNO_3 (specific gravity 1.42) near the end, and filter off the separated sulphur. Transfer the solution to a 200 c c tall form lipless beaker, add a drop or two of phenolphthalein, and then KOH solution until a permanent red color is obtained. Add KCN solution with constant stirring until the precipitate $\text{Cd}(\text{OH})_2$ is completely dissolved. (Note 8.) Dilute to 150 c c and electrolyze with a current of 5 amperes for two hours. (Note 9.) Test for completeness of deposition by washing the watch glasses and sides of the beaker to increase the depth of the solution. Continue the electrolysis for 20 minutes and, if the newly exposed portion of the cathode is still bright, remove the beaker with the electrolyte and wash the electrode three times with distilled water and twice with ethyl alcohol (95 per cent). Dry the cathode at 100°C ., cool, and weigh. The increase is metallic cadmium.

NOTES.—1. Pure NaOH may be used in place of KOH .

2. Pure NaCN may be used in place of KCN .

3. It is occasionally necessary to add a drop or two of ammonia water to the solution to start the precipitation of CdS .

4. All the cadmium will be precipitated as sulphide together with some ZnS . The major portion of the zinc will remain in solution.

5. In case of high cadmium content, more acid may be required. The final acidity should not exceed 10 c c of H_2SO_4 (specific gravity 1.84) in a volume of 300 c c.

6. The second precipitation should give practically pure CdS .

7. A third precipitation will remove any uncertainty as to the completeness of the separation of cadmium from zinc.

8. Avoid using an excess of KCN .

9. The test for completeness of deposition may be made after one hour when the quantity present is not large.

DETERMINATION OF CADMIUM BY THE GRAVIMETRIC METHOD

[See determination of cadmium by the electrolytic method]

METHOD

Dissolve the final precipitate of CdS with 25 c c of hot HCl (1:3) into a weighed platinum dish (note 1), add 10 c c of H_2SO_4 (1:1), and evaporate the solution until copious fumes are evolved. (Note 2.) Remove the excess of H_2SO_4 by heating the dish cautiously, and finally heat to between 500° and 600°C . Cool and weigh as CdSO_4 .

NOTES.—1. A crucible may also be used if the volumes are kept small or evaporated before transferring to the crucible.

2. On evaporating to fumes, darkening of the solution may occur from filter-paper shreds. This may be destroyed by diluting slightly with water and adding 5 c c of HNO_3 (specific gravity 1.42) and again evaporating to fumes. It is not advisable to add HNO_3 unless it is certain that all HCl has been expelled.

DETERMINATION OF ZINC BY THE VOLUMETRIC METHOD

SOLUTIONS REQUIRED

Potassium ferrocyanide.—Dissolve 34.8 g of $\text{K}_4\text{Fe}(\text{CN})_6$ in 1,000 c c of distilled water and age this solution for at least 90 days. If necessary, add 0.3 g of $\text{K}_3\text{Fe}(\text{CN})_6$ to the solution. (Note 1.) Standardize against c. p. zinc as follows:

Weigh 0.3 to 0.35 g of c. p. zinc into a tall 400 c c beaker, add about 75 c c of water and 13 c c of HCl (specific gravity 1.20). Cover and when in complete solution boil for about five minutes. Cool, add 13 c c of NH_4OH (specific gravity, 0.90), neutralize with HCl (specific gravity 1.20), and add an excess of 2.5 c c. Dilute to 250 c c, heat to boiling, and titrate immediately with the potassium ferrocyanide solution as described under the method below. Calculate the factor of the $\text{K}_4\text{Fe}(\text{CN})_6$ solution as follows:

$$\text{Factor of } \text{K}_4\text{Fe}(\text{CN})_6 \text{ solution} = \frac{B}{A}$$

where

A = the cubic centimeters of $\text{K}_4\text{Fe}(\text{CN})_6$ solution for the c. p. zinc; and

B = the weight of the c. p. zinc

Ferrous sulphate.—Weigh 1.25 g of $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$ into a tall 150 c c beaker and add about 3 g of granular aluminum. Fill the beaker about half full with water and add about 0.15 c c of HCl (specific gravity 1.20). Heat to boiling and boil until the solution clears. Cool, transfer to a 250 c c measuring flask, and dilute to the mark. Mix well before using.

Sulphuric acid (1 : 1).—Mix cautiously 100 c c of H_2SO_4 (specific gravity 1.84) with 100 c c of cold distilled water.

METHOD

(Refer to determination of cadmium)

Add 10 c c of H_2SO_4 (1 : 1) to the combined filtrates from the cadmium determination and evaporate to dryness. Take up with 100 c c of water and 10 c c of HCl (specific gravity 1.20) and heat until all is in solution. Transfer the solution to a 400 c c beaker, neutralize (note 2) with NH_4OH (specific gravity 0.90), and add exactly 2.5 c c of HCl (specific gravity 1.20). Dilute to 250 c c, heat to boiling, and titrate immediately with the potassium ferrocyanide solution as follows:

Transfer about one-half of the solution to be titrated into a 150 c c beaker. Add 0.5 c c of the ferrous sulphate solution to the portion remaining in the original beaker and run the $\text{K}_4\text{Fe}(\text{CN})_6$ solution into this portion with constant stirring until the blue color changes to pea green, then add an excess of 3 c c of $\text{K}_4\text{Fe}(\text{CN})_6$. (Note 3.) Pour the solution from the 150 c c beaker into the solution in the 400 c c beaker, retaining from 2 to 3 c c, and titrate until the end point is passed by two to three drops. Wash the remaining solution from the side beaker into the main portion. Add 0.05 c c of $\text{K}_4\text{Fe}(\text{CN})_6$ solution at a time until the end point is reached. The end point is a change from blue to pea green. (Note 4.)

Calculate the percentage of zinc as follows:

$$\text{Zinc, per cent} = \frac{A \times C \times 100}{\text{Weight of sample}}$$

where

A = the cubic centimeters of $\text{K}_4\text{Fe}(\text{CN})_6$ solution required for the sample; and

C = the factor of the $\text{K}_4\text{Fe}(\text{CN})_6$ solution (grams of zinc per cubic centimeter).

NOTES.—1. The purpose of aging is to remove any oxidizing agents by the reducing action of the $\text{K}_4\text{Fe}(\text{CN})_6$. A small amount of $\text{K}_3\text{Fe}(\text{CN})_6$ is formed. If this is sufficient to give the proper blue color with the ferrous iron in the standardization, no more need be added.

2. Use litmus paper as the indicator.

3. The titration is carried out in this manner in order to insure proper composition of the precipitate.

4. The end point is best observed by looking down through the solution. The blue color in the solution is due to Turnbull's blue formed by the interaction of ferrous iron with $\text{K}_3\text{Fe}(\text{CN})_6$. This ferrous ferrocyanide is stable until the $\text{K}_4\text{Fe}(\text{CN})_6$ is present in excess when it forms the ferrous ferrocyanide which is colorless.

DETERMINATION OF ZINC BY THE ZINC OXIDE METHOD

METHOD

Evaporate the combined filtrates from CdS to a volume of about 100 c c. Make the solution just alkaline with NH_4OH and add 30 c c of formic acid (specific gravity 1.2) for every 200 c c of final volume. Heat nearly to boiling, and pass in a rapid stream of H_2S for 15 minutes. Filter and wash with hot 2 per cent formic acid solution saturated with H_2S . Dissolve the ZnS from the filter into the original beaker with 50 c c of hot HCl (1:10) washing thoroughly with hot water. Boil to expel H_2S . Make just alkaline with ammonia, then add 20 c c of formic acid (specific gravity 1.2) and dilute to 200 c c with distilled water. Heat to boiling and pass H_2S for 15 minutes. Filter and wash with formic acid wash water. To avoid creeping of the precipitate do not fill the paper too near to its top and do not wet the funnel above the paper. Ignite the paper and precipitate under good oxidizing conditions in a weighed porcelain or vitreous crucible, raising the temperature gradually to a dull red heat and finishing with a moderate red. Cool and weigh as ZnO.

DETERMINATION OF TIN

METHOD

Dissolve a separate 5 g sample with 100 c c of HNO_3 (1:4) in a 400 c c beaker. Boil to expel NO_2 fumes, and dilute to a volume of 250 c c with boiling distilled water. Allow to stand and settle for about one hour, keeping the temperature just below the boiling point. Filter on double 7 cm ashless papers, being careful to keep the solution hot throughout the process of filtration, washing with boiling hot water. Save the filtrate for the determination of lead. Ignite the paper and precipitate under good oxidizing conditions in a weighed porcelain crucible, and weigh as SnO_2 .

NOTE.—Every precaution must be taken to avoid contamination by chlorides from any source, in order to prevent the precipitation of AgCl during the determination of tin. All distilled water must be free from chlorides, beakers and apparatus must be carefully rinsed before using, and all chloride fumes must be avoided.

DETERMINATION OF LEAD

SOLUTIONS REQUIRED

Lead acid.—Mix 300 c c of H_2SO_4 (specific gravity 1.84) and 1,800 c c of distilled water. Dissolve 1 g of lead acetate, c. p., in 300 c c of distilled water and add this to the hot solution, stirring meanwhile. Let stand for at least 24 hours and siphon through a thick asbestos filter.

Dilute alcohol for washing.—Mix equal parts of denatured alcohol and distilled water.

METHOD

Heat the filtrate from the meta-stannic acid to boiling, and precipitate silver with dilute HCl as in the determination of silver, avoiding a large excess of the precipitant. When the solution has become cold and the precipitate has settled, test the clear solution with a few drops of the dilute HCl to determine whether or not precipitation is complete. Filter on a closely woven paper, washing with cold dilute HNO_3 (1:200). Add 80 c c of "lead acid" and evaporate to fumes. To insure complete removal of chlorides, cool, add a few cubic centimeters of H_2O and fume again. Cool, add 70 c c of distilled water to dissolve the salts and to make the acid concentration the same as in "lead acid." Heat to boiling, and allow to cool and settle for 5

hours, or overnight if convenient. Filter on a weighed porcelain Gooch crucible and wash with "lead acid." Remove the filtrate and save for the determination of iron. Continue washing the precipitate with dilute alcohol, set the Gooch crucible inside a porcelain crucible, dry and ignite for five minutes at the full heat of a Tirrill burner, cool and weigh as PbSO₄.

NOTE.—In order to avoid "spitting" during evaporation with "lead acid" it is suggested to heat over a burner, holding the beaker with a pair of tongs and twirling as the evaporation is carried on.

DETERMINATION OF IRON

SOLUTIONS REQUIRED

Dilute sulphuric acid solution for reductor.—Mix 50 c c of H₂SO₄ (specific gravity 1.84) and 1,000 c c of distilled water.

Standard potassium permanganate solution.—Dissolve 1 g of KMnO₄ in 1,000 c c of H₂O and allow to stand for several days in a glass-stoppered bottle in a dark closet. Filter the solution through prepared asbestos and standardize against 0.1000 g portions of pure sodium oxalate. Each cubic centimeter is equivalent to approximately 0.00177 g of iron.

METHOD

To the filtrate from the PbSO₄ add 5 c c of HNO₃ (specific gravity 1.42) and remove copper by electrolysis. To the electrolyte add 5 g of NH₄Cl, and 2 to 3 c c of H₂O₂ or HNO₃ (specific gravity 1.42), and boil to oxidize iron. Make ammoniacal, adding sufficient NH₄OH to dissolve any basic salts, and boil. Filter and wash with hot water. Dissolve the precipitate through the filter paper with hot dilute HCl and reprecipitate iron with ammonia. Filter and wash with hot water. Combine and save filtrates for the determination of nickel. Dissolve the precipitate through the filter with 100 c c of hot dilute H₂SO₄ for reductor. Add a few drops of concentrated solution of KMnO₄ until a distinct pink color persists, boil, cool, and pass the solution through the reductor. Wash the beaker and reductor with 150 c c of dilute H₂SO₄ solution for reductor and then with 100 c c of distilled water. Titrate with standard KMnO₄ solution.

NOTES.—1. Results of titration should be checked with a blank determination made on corresponding amounts of solutions used.

2. A small quantity of liquid should always be left in the reductor funnel and air should never be allowed to enter the reductor.

3. For further details of the use of reductor see "Chemical Analysis of Iron" by A. A. Blair, "Quantitative Chemical Analysis" by H. P. Talbot, or "Applied Inorganic Analysis" by Hillebrand and Lundell.

DETERMINATION OF NICKEL

SOLUTIONS REQUIRED

Dimethylglyoxime solution.—Dissolve 5 g of dimethylglyoxime in 500 c c of ethyl alcohol and filter before using.

METHOD

Evaporate the combined filtrates from the precipitation of iron to a convenient volume and make barely acid with HCl (specific gravity 1.20). Heat nearly to boiling and add 5 c c of dimethylglyoxime solution for each 0.1 g or fraction of nickel present and then HN₄OH in slight excess. Let stand at least 30 minutes on the steam bath. Filter and wash with dilute ammonia solution (1:100). For accurate work, the precipitate should be dissolved in hot HCl (1:1) and reprecipitated as before. Filter on a weighed Gooch crucible, wash with hot water, dry at 110° to 120° C. for about two hours and weigh as the glyoxime salt which contains 20.31 per cent nickel. If it is preferred, instead of weighing the glyoxime salt, the nickel can be determined electrolytically as follows: Dissolve the red precipitate

of nickel glyoxime in hot HCl (1:1), add 10 c c of H₂SO₄ (1:1) and evaporate to strong fumes. Dilute, neutralize with NH₄OH (specific gravity 0.90), and add 20 c c in excess. The final volume should be about 150 c c. Electrolyze with a current density overnight of 0.3 amperes per square decimeter (2.7 amperes per square foot.) Test the solution for completeness of deposition by removing 1 c c to a porcelain test plate and adding fresh H₂S water. Remove the cathode, wash with water, and dry with alcohol as in the determination of copper by the electrolytic method. Weigh the deposit as metallic nickel.

UNITED STATES GOVERNMENT, FEDERAL SPECIFICATIONS BOARD; FEDERAL SPECIFICATION FOR SILVER SOLDERS, JULY 6, 1925, NO. 307. (CURRENT DESIGNATION: QQ-S-561)

SILVER SOLDERS

GENERAL SPECIFICATIONS

General specifications for metals, Federal Specifications Board No. 339a, (QQ-M-151) shall form part of this specification. (See 600.0, p. 3.)

I. This specification covers three grades of silver solder, as follows: Grade 0, grade 1, and grade 2.

MATERIAL AND WORKMANSHIP

II. Silver solder shall be made only from the best grades of virgin metals or from scrap of known and approved composition.

GENERAL REQUIREMENTS

III. 1. Silver solder shall be supplied in strips in form X, A, or B, or wire, as specified.

2. Form X solder shall be not over 0.02 inch thick and not over 3 inches wide.

3. Form A solder shall be not over 0.003 inch thick and not over three-quarters inch wide.

4. Form B solder shall be not over 0.03 inch thick and not over one-quarter inch wide, and not less than 12 inches long.

5. Silver solder shall be uniform in color, quality, and size; clean, bright, sound, and smooth; and free from ragged edges, damaged ends, or other injurious defects.

DETAIL REQUIREMENTS

IV. *Chemical requirements.*—The chemical requirements are as given in the accompanying table.

Chemical composition

Grade	Permissible range, maximum values					
	Silver	Copper	Zinc	Tin	Lead	Other impurities
	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>	<i>Per cent</i>
0	20.0-25.0	45.0-50.0	Remainder.	0.50	0.05	0.15
1	44.0-50.0	35.0-45.0	Remainder.	.50	.05	.15
2	64.0-70.0	18.0-23.0	Remainder.	.50	.05	.15

METHODS OF INSPECTION AND TESTS

V. Samples for check analysis, when made, shall be taken from each lot of 50 pounds, or fraction thereof, of grade 0 solder, and from each lot of 20 pounds, or fraction thereof, of grades 1 and 2 solder, and shall be free from oil, dirt, or foreign material.

PACKING AND MARKING

VI. Solder ordered in form A shall be packed in metal containers containing not more than 2 ounces each, unless otherwise specified.

ADDITIONAL INFORMATION

VII. 1. Grade 0 solder is suitable for ordinary brazing purposes where a solder is required that possesses higher physical properties than provided by spelter solders, and where the service or appearance does not require a high silver content.

2. Grade 1 solder is a high-grade silver solder suitable for the general range of silver-soldering requirements. It may be used for soldering turbine blades.

3. Grade 2 solder provides a very high silver content and should be used only where the application requires high strength, resistance to corrosion, and appearance.

4. Form A should be specified on grades 1 and 2 solder for very light work, such as the soldering of parts of delicate instruments, etc. Form B should be specified on Grades 1 and 2 when intended for soldering light and medium weight parts.

5. This specification does not include silver solder for dental purposes.

693.4 SOLDERS FOR ALUMINUM.

(No nationally recognized specifications available.)

695. MAGNESIUM AND MAGNESIUM ALLOYS

AMERICAN SOCIETY FOR TESTING MATERIALS, TENTATIVE SPECIFICATIONS FOR MAGNESIUM-BASE ALLOY CASTINGS, DESIGNATION B80-31T, 1931

MAGNESIUM-BASE ALLOY CASTINGS

SCOPE

1. These specifications cover commercial magnesium-base alloy sand castings having a specific gravity of 1.9 or less. Three typical alloys are specified and are designated alloys Nos. 1, 2, and 3.

MANUFACTURE

2. The alloy may be made from virgin metal or from purified scrap metal of known composition.

3. Castings from alloy No. 2 may be subjected to such heat treatment as the manufacturer desires to produce material that will conform to the requirements specified. Heat treatment shall be performed on the whole of a casting, never on a part only, and shall be applied in a manner that will produce the utmost uniformity.

CHEMICAL COMPOSITION

4. The alloys shall conform to the following requirements as to chemical composition:

Alloy No.	Magnesium (per cent)	Aluminum	Manganese, minimum	Copper	Cadmium	Other impurities maximum
		Per cent	Per cent	Per cent	Per cent	Per cent
1....	Remainder.....	5.5-7.0	0.2	10.1	-----	0.3
2....do.....	6.5-8.5	.2	1.1	-----	.3

¹ Maximum.

PHYSICAL PROPERTIES AND TESTS

5. The castings shall conform to the following requirements as to tensile properties:

Alloy No.	Condition	Tensile strength, minimum	Elongation in 2 inches, minimum
		Lbs./in. ²	Per cent
1....	Sand cast.....	24,000	4
2....do.....	24,000	4
	(Sand cast, heat treated)	29,000	6
3....	Sand cast.....	21,000	2

(Sampling requirements are identical with those in A. S. T. M. B10. See 643.4, p. 1192. Test specimens and number of tests are identical with those in A. S. T. M. B26-31. See 631.41, p. 1160. Inspection and rejection requirements are identical with those in A. S. T. M. B59. See 647.15, p. 1259.)

WORKMANSHIP AND FINISH

6. The castings shall be of uniform quality and condition, free from cracks or other injurious defects, and shall be well cleaned before inspection by sand-blasting, tumbling, chipping, pickling in sulphuric acid, or other approved process.

NOTE.—Alloy No. 1.—Alloy No. 1 has a specific gravity of about 1.78. It is used only in the as-cast condition. The copper content should be kept as low as possible in order to minimize corrosion.

Alloy No. 2.—Alloy No. 2 has a specific gravity of about 1.80. It is susceptible to heat treatment and is used both in the as-cast and heat-treated conditions. The most beneficial effects of heat-treatment are reflected in the increase in tensile strength percentage of elongation, and notched-bar impact toughness. The copper content should be kept as low as possible in order to minimize corrosion.

Alloy No. 3.—Alloy No. 3 has a specific gravity of about 1.82. Its thermal conductivity is 50 to 75 per cent greater than that of alloys 5 Nos. 1 and 2, and is recommended where this property is of great importance.

696. ORES, METALS, AND ALLOYS NOT ELSEWHERE CLASSIFIED

AMERICAN SOCIETY FOR TESTING MATERIALS, STANDARD SPECIFICATIONS FOR TUNGSTEN POWDER, SERIAL DESIGNATION A97-27, 1927

TUNGSTEN POWDER

1. These specifications cover tungsten powder in one grade only.

BASIS OF PURCHASE

2. The tungsten powder shall be thoroughly mixed and packed in sound containers, preferably metallic or metallic lined, and sufficiently strong to prevent loss in transportation.

CHEMICAL REQUIREMENTS

3. The material shall conform to the following requirements as to chemical composition:

	Per cent
Metallic tungsten, minimum.....	95.00
Carbon, maximum.....	.50
Sulphur, maximum.....	.05
Phosphorus, maximum.....	.05
Oxygen, maximum.....	1.00
Silicon, maximum.....	.75
Tin, maximum.....	.03
Copper, maximum.....	.03
Arsenic, maximum.....	.03
Bismuth, maximum.....	.03
Antimony, maximum.....	.03

SAMPLING AND CHEMICAL ANALYSIS

4. (For sampling, see A. S. T. M. A103 (621.20, p. 1092.) For methods of chemical analysis, see A. S. T. M. A104 (621.20, p. 1093).)

TECHNICAL SOCIETIES, TRADE ASSOCIATIONS, AND OTHER ORGANIZATIONS ISSUING STANDARDS AND SPECIFICATIONS DEALING WITH METALS AND METAL PRODUCTS

There are given below the names and addresses of organizations the standards and specifications of which are reproduced herein either in full or in substance by means of abstracts and cross references. Under the procedure of many of these organizations provision is made for periodic revision of standards on an annual, biannual, or similar basis. Persons interested in obtaining information concerning the status or revisions of standards should communicate with the organizations at the offices as listed below:

- American Association of State Highway Officials.
W. C. Markham, secretary, National Press Building, Washington, D. C.
- American Automobile Association, Ernest N. Smith, executive vice president, Pennsylvania Avenue at Seventeenth Street NW., Washington, D. C.
- American Bottlers of Carbonated Beverages, Junior Owens, secretary, 726 Bond Building, Washington, D. C.
- American Bureau of Shipping, J. W. Cantillon, secretary, Stevenson Taylor Memorial Building, 24 Old Slip, New York, N. Y.
- American Electric Railway Association, G. C. Hecker, general secretary, 292 Madison Avenue, New York, N. Y. (Name changed to American Transit Association.)
- American Gas Association (Inc.), Alexander Forward, managing director, 420 Lexington Avenue, New York, N. Y.
- American Gear Manufacturers Association, J. C. McQuiston, secretary, First National Bank Building, Wilkensburg, Pa.
- American Institute of Architects, F. Leo Smith, technical secretary, structural service department, 1741 New York Avenue NW., Washington, D. C.
- American Institute of Electrical Engineers, H. H. Henline, acting national secretary, 33 West Thirty-ninth Street, New York, N. Y.
- American Institute of Steel Construction (Inc.), Charles F. Abbott, executive director, 200 Madison Avenue, New York, N. Y.
- American Marine Standards Committee, A. V. Bouillon, secretary, U. S. Department of Commerce Building, Washington, D. C.
- American Mining Congress, J. F. Callbreath, secretary, Munsey Building, Washington, D. C.
- American Oil Chemists' Society, J. O. P. Helm, secretary, 705 Tchoupitoulas Street, New Orleans, La.
- American Petroleum Institute, E. R. Boyd, jr., executive vice president, 250 Park Avenue, New York, N. Y.
- American Railway Association, Electrical Section, E. H. Fritch, secretary, 59 East Van Buren Street, Chicago, Ill.
- American Railway Association, Mechanical Division, V. R. Hawthorne, secretary, 59 East Van Buren Street, Chicago, Ill.
- American Railway Association, Purchases and Stores Division, W. J. Farrell, secretary, 30 Vesey Street, New York, N. Y.
- American Railway Association, Signal Section, R. H. C. Balliet, secretary, 30 Vesey Street, New York, N. Y.
- American Railway Association, Telegraph and Telephone Section, W. A. Fairbanks, secretary, 30 Vesey Street, New York, N. Y.
- American Railway Engineering Association, E. H. Fritch, secretary, 59 East Van Buren Street, Chicago, Ill.
- American Society of Civil Engineers, George T. Seabury, secretary, 33 West Thirty-ninth Street, New York, N. Y.
- American Society of Heating and Ventilating Engineers, A. V. Hutchinson, secretary, 51 Madison Avenue, New York, N. Y.
- American Society of Mechanical Engineers, Calvin W. Rice, secretary, 29 West Thirty-ninth Street, New York, N. Y.
- American Society of Municipal Engineers, C. W. S. Sammelmann, executive director, 4359 Lindell Boulevard, St. Louis, Mo.
- American Society for Steel Treating, W. H. Eisenman, secretary, 7016 Euclid Avenue, Cleveland, Ohio.
- American Society for Testing Materials, C. L. Warwick, secretary-treasurer, 1315 Spruce Street, Philadelphia, Pa.
- American Standards Association, P. G. Agnew, secretary, 29 West Thirty-ninth Street, New York, N. Y.
- American Transit Association, G. C. Hecker, general secretary, 292 Madison Avenue, New York, N. Y. (Formerly known as the American Electric Railway Association.)
- American Water Works Association, Malcolm Pirnie, chairman, committee on water works practice, 25 West Forty-third Street, New York, N. Y.
- Asphalt Shingle and Roofing Institute, J. S. Bryant, manager, 2 West Forty-fifth Street, New York, N. Y.
- Associated Cooperage Industries of America, Louis F. Horn, secretary, 411 Olive Street, St. Louis, Mo.
- Associated Factory Mutual Fire Insurance Companies, C. W. Mowry, manager, Inspection Department, 184 High Street, Boston, Mass.
- Associated Manufacturers of Water Purifying Equipment, Arthur M. Crane, secretary, P. O. Box 307, Gary, Ind.
- Association of American Steel Manufacturers, J. O. Leech, secretary, 616 Investment Building, Pittsburgh, Pa.
- Association of Edison Illuminating Companies, Preston S. Millar, secretary, Eightieth Street and East End Avenue, New York, N. Y.
- Association of Iron and Steel Electrical Engineers, John F. Kelly, managing director, 1010 Empire Building, Pittsburgh, Pa.
- Association of Manufacturers of Chilled Car Wheels, G. E. Doke, president and secretary, McCormick Building, Chicago, Ill.
- Association of Railway Electrical Engineers, J. A. Andreucetti, secretary, Chicago & Northwestern Terminal Station, Chicago, Ill.
- Chlorine Institute, Robert T. Baldwin, secretary, 30 East Forty-second Street, New York, N. Y.

- Compressed Air Society, C. H. Rohrbach, secretary, 90 West Street, New York, N. Y.
- Concrete Reinforcing Steel Institute, R. W. Johnson, engineer, 333 North Michigan Blvd., Chicago, Ill.
- Contracting Plasterers' International Association, Edward McDonnell, secretary-treasurer, 4755 Commonwealth Avenue, Detroit, Mich.
- Glass Container Association of America, Victor L. Hall, secretary of the standardization committee, 19 West Forty-fourth Street, New York, N. Y.
- Heating and Piping Contractors National Association, Joseph C. Fitts, secretary, 50 Union Square, East, New York, N. Y.
- Institute of Boiler and Radiator Manufacturers, F. W. Herendeen, secretary, Geneva, N. Y.
- International Association of Electrotypers, Neal Gross, field secretary, 949 Leader Building, Cleveland, Ohio.
- International Association of Milk Dealers, R. E. Little, executive secretary, 228 North La Salle Street, Chicago, Ill.
- Malleable Iron Research Institute, Robert E. Belt, secretary, Union Trust Building, Cleveland, Ohio.
- Manganese Track Society, W. Homer Hartz, chairman standardization committee, care of Morden Frog and Crossing Works, Chicago, Ill.
- Manufacturers Standardization Society of the Valve and Fittings Industry, John J. Harman, general secretary, 103 Park Avenue, New York, N. Y.
- National Association of Master Plumbers of the United States, Jere L. Murphy, chairman, standardization committee, 340 East Forty-fourth Street, New York, N. Y.
- National Association of Sheet Metal Contractors of the United States, W. C. Markle, secretary, 429 Fourth Avenue, Pittsburgh, Pa.
- National Association of Waste Material Dealers, Charles M. Haskins, secretary, Times Building, New York, N. Y.
- National Board of Fire Underwriters, W. E. Mal-lalieu, general manager, 85 John Street, New York, N. Y.
- National District Heating Association, D. L. Gaskill, executive secretary, 603 Broadway, Greenville, Ohio.
- National Electrical Manufacturers' Association, A. W. Berresford, managing director, 570 Lexington Avenue, New York, N. Y.
- National Engineering Inspection Association, Bur-ton H. Witherspoon, secretary, Pittsburgh Testing Laboratory, Pittsburgh, Pa.
- National Fire Protection Association, Franklin H. Wentworth, managing director, 60 Batterymarch Street, Boston, Mass.
- National Machine Tool Builders' Association, Frida F. Selbert, secretary, 617 Vine Street, Cincinnati, Ohio.
- National Metal Exchange (Inc.), J. J. Murphy, secretary, 27 William Street, New York, N. Y.
- National Safety Council, W. H. Cameron, managing director, 20 North Wacker Drive, Chicago, Ill.
- National Warm Air Heating Association, Allen W. Williams, managing director, 3440 A. I. U. Build-ing, Columbus, Ohio.
- National Watch Case Manufacturers Association, Alexander Vincent, secretary, 20 West Forty-seventh Street, New York, N. Y.
- Power Piping Society, Stuart J. Swenson, secretary, 1714 Clark Building, Pittsburgh, Pa.
- Railway Fire Protection Association, R. R. Hackett, secretary, Baltimore and Ohio Building, Balti-more, Md.
- Refrigerating Machinery Association, Fred Nolde, secretary, 23 South Fifty-second Street, Phila-delphia, Pa.
- Society of Automotive Engineers (Inc.), John A. C. Warner, secretary and general manager, 29 West Thirty-ninth Street, New York, N. Y.
- Steel Joist Institute, Frank Burton, Dime Bank Building, Detroit, Mich.
- Underwriters' Laboratories, Dana Pierce, president, 207 East Ohio Street, Chicago, Ill.
- United States Government, Washington, D. C.:

Boilers, coffee.....	817, 818	Brazing solder.....	1333, 1334, 1336, 1339
gas, house heating.....	860	chemical analysis of (silver solder).....	1336
hot water supply.....	862	Bread boxes, metal.....	818
house heating.....	860, 862, 866	Bread plates, metal.....	817
coal burning.....	862, 866	Breast drills.....	869
oil burning.....	862	Brick, chromium, chemical analysis of.....	1088
range.....	853	Bridges, highway, steel.....	273
wash.....	817, 818	railway.....	274
Bollards, ship.....	664	movable.....	249, 250, 251, 273
Bolsters, truck, railway car.....	255, 253	structural steel for.....	
gages for.....	259	Bronze, aluminum (bars, castings, etc.). (See Bars, aluminum bronze; Castings, aluminum bronze; etc.)	
Bolt locks.....	1052, 1054, 1055, 1056, 1057, 1058, 1059, 1060	chemical analysis. (See also Manganese bronze, chemical analysis of.)	
cremone, for doors.....	1056	chemical analysis of.....	1243, 1246
espagnolette, for doors.....	1057	chromium plating on (specification).....	70
exit, for doors.....	1059		
flush, for doors.....	1054, 1057		
ship door.....	1054		
foot, for doors.....	1058		

INDEX

	Page		Page
Bronze, manganese, chemical analysis of.....	1261	Casement adjusters.....	1051
standard sample.....	1264	Casement fasteners.....	1043
methods of test of, metallographic.....	28	Cases, comb, sheet-metal.....	818
nickel (castings).....	978	file, steel.....	836, 850
nickel plating on (specification).....	71	transfer. (See Cases, file.)	
phosphor (bars, castings, etc.). (See Bars, phosphor bronze; castings, phosphor bronze; etc.)	52	watch.....	1304
scrap, classification of.....		Casing, metal. (See Trim, door.)	
white. (See also Nickel silver.)		oil well.....	444
Bronze bars, castings, etc. (See Bars, bronze; Castings, bronze; etc.)		oil well, screw-thread gages for.....	895
ingots, etc. (See Bars, bronze; Ingots, bronze, etc.)		screw threads for.....	450
Bronze bearing metal, chemical analysis of.....	1246	Casing nails.....	563
Bronze castings, Government. (See Castings, bronze.)		Cast iron. (See Castings, iron, gray, and Castings, iron, malleable.)	
Broom nails.....	563	Casters, bed.....	828
Brush copper.....	1190	Castings, admiralty metal. (See Castings, bronze.)	
Bucket wheels, turbine.....	814	alloy-steel.....	344, 350, 1133-1136
Buckets, chamber.....	818, 819	heat treatment of.....	87
covered.....	817	aluminum alloy.....	1146, 1160, 1162
dinner.....	817	standard sample.....	1163
metal.....	818	aluminum bronze.....	1259, 1260
Builders' hardware (nontemplate) (template).....	977, 982	Babbitt metal.....	1320, 1321, 1322
Buildings, fireproofing, safety factor for.....	275	bearing metal, bronze.....	1324, 1325
industrial.....	277	brass.....	1208, 1211, 1212, 1213
sheet-metal work for.....	275, 276	chemical analysis of.....	1193
structural steel for.....	250, 252, 254	trolley suspension.....	682
Bull points (sizes).....	964	bronze. (See also Castings, aluminum-bronze; Castings, manganese-bronze; Castings, phosphor-bronze.)	
Buoy chain.....	201	bronze.....	1192, 1250, 1251, 1252, 1324, 1325, 1326
Burners, oil, domestic.....	868	bearing.....	1324, 1325, 1326
Butcher saws.....	952	standard sample.....	1252
Butt hinges.....	982, 994, 995, 997, 998, 999, 1000, 1001	chromium-steel, for valves for acid-tank cars.....	1134
bronze.....	995	copper.....	1181
cast-iron.....	997	chemical analysis of.....	1171
cupboard.....	998	copper-nickel.....	1284, 1288
folding door.....	999	copper-tin-zinc. (See Castings, bronze.)	
half surface.....	1001	die, aluminum-alloy.....	1162
hospital type.....	1000	dies for, heat treatment of.....	78
narrow.....	998	zinc-base.....	1315
steel.....	997	gear, phosphor-bronze.....	1269
transom.....	999	Government bronze. (See Castings, bronze.)	
Buttons, door.....	1081	gun-metal. (See Castings, bronze.)	
		iron. (See also Pig iron.)	
		chemical analysis of.....	119
		gray.....	345, 635, 636, 637, 638, 640
		method of test.....	636, 637, 640
		malleable.....	345, 665, 666
		ornamental, for buildings.....	664
		magnesium-base alloy.....	1340
		manganese-bronze.....	1267, 1268
		manganese-steel, austenitic.....	1135
		metal, radiographic testing of.....	45
		nickel-brass. (See Castings, copper-nickel.)	
		nickel-bronze.....	978
		nickel-silver.....	978
		ounce-metal. (See Castings, brass.)	
		phosphor-bronze.....	1269
		radiographic testing of.....	45
		steel.....	344, 706, 707, 708, 709, 711
		heat treatment of.....	85, 108
		radiographic testing of.....	45
		valve and high-temperature fitting.....	709
		track, iron.....	345
		steel.....	344, 350
		valve, bronze.....	1250, 1252
		gray-iron.....	637
		zinc.....	1316
		zinc nuts.....	588, 608
		Castle nuts.....	607
		Castle-nut slots, gaging of.....	1043, 1055
		Catches, door.....	1043, 1055
		ship.....	1043, 1055
		elbow.....	1043, 1044
		sash.....	1044
		transom.....	1044
		turn, for cupboard and locker doors.....	1055
		Cathodes, copper (battery).....	1189
		nickel.....	1281, 1282
		Ceiling hooks for clothing.....	1061
		Cement nails.....	564
		Center plates for railway cars.....	259
		Center sill for railway cars, section of.....	261
		Cesspool, plumbing.....	1065
		Chain, anchor.....	200, 206
		buoy.....	201
		cast-steel.....	200, 204, 206
		commercial grade.....	198, 200
		conveyor.....	201
		crane.....	198, 199, 200, 203, 204
		heat treatment of.....	89
		double-jack.....	213
		double-loop, weldless.....	212
		dredge (sizes).....	198
		flat-link. (See Chain, weldless.)	
		harness (sizes).....	198
		ladder.....	213, 1243
		brass.....	1243
		long link coil.....	201
		marine.....	201, 203, 204, 206, 208
		mechanical communication, brass.....	1242
		plumber's.....	213, 1191
		copper.....	1191
		proof-coil.....	198-200, 203, 204
		register.....	213, 1243
		brass.....	1243

C

SPECIFICATIONS FOR METALS AND METAL PRODUCTS

	Page		Page
Chain, safety, aluminum.....	1164	Chromium steel castings for valves for acid tank cars.....	1134
brass.....	1243	Chromium steel rivet bars.....	1122
sash.....	212, 1258	Chromium steel tank plates.....	1124
bronze.....	1258	Chromium steel tubing for acid tank cars.....	1132
sash attachments for.....	1049	Chromium-molybdenum steel, standard sample.....	1122
ship. (See Chain, marine.)		Chromium-nickel steel, chemical analysis of.....	1109
silent.....	223	standard sample.....	1122
single-jack, brass.....	1243	Chromium-tungsten-vanadium steel, standard sample.....	1122
weldless.....	213, 1243	Chromium-vanadium steel, chemical analysis of.....	1111
single-loop, weldless.....	212	standard sample.....	1122
sling.....	203	Chromium-vanadium steel bars, sheets, plates.....	1124
heat treatment of.....	89	Chromium-vanadium steel bars for railway springs.....	1128
sprocket-wheel.....	201	Circular saws.....	953
stud-link.....	204, 206	Clamps, guy.....	685
methods of test.....	205	messenger dead end.....	700
submarine-net.....	201	trolley feed wire.....	700
testing of.....	200, 202, 205, 209	vise.....	884
transom.....	1050	Classification of iron and steel scrap.....	51, 53, 56
twist link coil.....	211	Classification of materials and supplies for electric railways.....	52
welded (sizes and varieties).....	198	Classification of metals.....	51-60
weldless.....	212, 213, 1242	Classification of railway metallic supplies.....	52, 53
brass.....	1242	Classification of scrap iron and steel.....	51, 53, 56
double-jack.....	213	Classification of scrap metals (nonferrous).....	51, 55
double-loop pattern.....	212	Claw bars.....	962, 964, 970
flat-link.....	212	Cleats, ship.....	664
single-jack.....	213	Clinch nails.....	564
single-loop pattern.....	212	Clips, cable (electrical).....	482
wire-link. (See Chain, weldless.)		conduit (electrical).....	482
Chain dogs.....	198, 217	fuse.....	1288
Chain fittings.....	198, 213, 215, 216, 217	spring rebound, automobile.....	810
Chain links, repair.....	198, 220	tubing (electrical).....	482
Chain plates, cast steel.....	743	Clocks.....	1304
Chain rings.....	222	testing of.....	1305
Chain shackles.....	216, 221, 222	Closers, door.....	1042
method of test.....	215	Cloth, Fourdrinier wire.....	1229
Chain shackles and shackle pins.....	213, 215	wire, insect screen.....	195, 1228, 1256
Chain swivels.....	216, 223	Clout nails.....	559, 564
Chain toggles.....	223	Coal hods.....	818
Chairs, metal.....	833	toy.....	818
Channel nails (sizes).....	560	Coat and hat hooks.....	1061
Channels, structural. (See Shapes, structural.)		Coating of metals.....	60-71
Chasers, die-head (sizes).....	871	Coating on tin, terne, and lead-coated sheets, methods of test- ing.....	64
Check valves.....	503, 1064	Coatings, zinc. (See Galvanizing.)	
rubber facings for.....	498	Cobalt.....	1164
Chemical analysis of alloy steels.....	1107	Cobbler's nails.....	569
Chemical analysis of aluminum and aluminum alloys.....	1141	Cobbler's tacks (sizes).....	560
Chemical analysis of bearing metal (Babbitt).....	1317	Cocks, ball, for flushing tanks.....	1062
Chemical analysis of brass castings.....	1193	drain, automobile.....	1232
Chemical analysis of brass ingots.....	1193	Code, safety, gas.....	361
Chemical analysis of bronze.....	1243, 1246	Coffee biggins.....	817
Chemical analysis of bronze bearing metal.....	1246	Coffee boilers.....	817, 818
Chemical analysis of chromium brick.....	1088	Coffee pots.....	818
Chemical analysis of chromium-nickel steel.....	1109	Coin silver.....	1299
Chemical analysis of chromium ores.....	1088	Colanders, kitchen.....	817, 818
Chemical analysis of chromium-vanadium steel.....	1111	Collars, cylinder, door lock.....	1036
Chemical analysis of copper castings.....	1171	stovepipe.....	817
Chemical analysis of copper nickel alloys.....	1289	Colors for sanitary ware.....	816
Chemical analysis of copper wire bars, billets, slabs, ingots, and ingot bars.....	1170	Comb cases, sheet metal.....	818
Chemical analysis of ferro-alloys.....	1093	Compass saws.....	953
Chemical analysis of ferrochromium.....	1096	Compression stops.....	1062
Chemical analysis of ferromanganese.....	1094	Condenser tube ferrules, brass.....	1213
Chemical analysis of ferrosilicon.....	1093	Condenser tube plates, Muntz metal.....	1201
Chemical analysis of ferrotungsten.....	1100	Condenser tubes, admiralty metal. (See Condenser tubes, brass.).....	1219, 1220, 1221, 1222
Chemical analysis of ferrovanadium.....	1098	Muntz metal. (See Condenser tubes, brass.)	
Chemical analysis of gun metal.....	1243	Conductors, electrical. (See Wire.)	
Chemical analysis of iron (pig and cast iron).....	119	Conduit, flexible, ferrules for.....	1215
Chemical analysis of lead in pig form.....	1272	steel, galvanizing of.....	69
Chemical analysis of manganese bronze.....	1201	Conduit clips (electrical).....	482
Chemical analysis of metallic materials for electric heating.....	1289	Conduit terminal tubes.....	1219
Chemical analysis of molybdenum steel.....	1118	Connecting links for chains.....	220
Chemical analysis of nickel.....	1279	Connecting-rod bolts, automobile.....	601
Chemical analysis of nickel-chromium alloy.....	1289	Containers, glass, gages for.....	906
Chemical analysis of nickel steel.....	1107	Conveyor chain.....	201
Chemical analysis of refractory materials.....	1088	Coolers, water, sheet metal.....	818
Chemical analysis of silicomanganese steels.....	1107	Coopers' rivets, steel.....	614
Chemical analysis of silver solders.....	1336	Copper, battery, gravity.....	1189
Chemical analysis of solder (tin-lead).....	1317	battery assay of.....	1170
Chemical analysis of spelter.....	1308	lead, tin, and antimony alloys, chemical analysis of.....	1317
Chemical analysis of steel, carbon.....	40	manganese.....	1191
Chemical analysis of steel products, rolled and forged.....	47	methods of test of, metallographic.....	28
Chemical analysis of tungsten metal.....	1100	phosphor.....	1191
Chemical analysis of tungsten steel.....	1111	scrap, classification of.....	52, 55
Chemical analysis of vanadium steel.....	1308	silicon.....	1191
Chemical analysis of zinc.....	1308	tack and nail.....	561
Chest locks.....	1028	Copper bars, plates, etc. (See Bars, copper; Plates, copper; etc.).....	561
Chisel bar.....	970	Copper bearing steel, for tacks and nails.....	1171
Chisels:		Copper metal, standard sample.....	569
backsmiths, (sizes).....	964	Copper slating nails.....	559
heat treatment of.....	83	Copper tacks (sizes).....	564
pneumatic hammer.....	939	Copper wire nails.....	564
track.....	964, 969	Copper-clad nails, common.....	564
woodworkers'.....	945	Copper-nickel alloys, chemical analysis of.....	1289
Chlorine valves.....	507	Copper-nickel-zinc rods, bars, etc. (See Rods, nickel silver; Bars, nickel silver; etc.).....	
Chrome. (See Chromium.)		Copper-tin-zinc castings. (See Castings, bronze.)	891
Chromium metal, methods of sampling.....	1092	Coppers, soldering.....	646
Chromium ores.....	1091	Cordage grooves in pulleys.....	
chemical analysis of.....	1088		
Chromium plating, testing of.....	71		
Chromium plating on nonferrous metals (specification).....	70		
Chromium steel bars.....	1122		
sheets, plates.....	1124		

INDEX

	Page		Page
Cords, bell, wire	167	Disks, cartridge, brass	1199
sash (sash, attachments for)	1049	Dividers (tool)	891
wire	167	Dogs, chain	198, 217
wire, sash and bell	167	ring	218
Corers, apple	817, 818	Door buttons	1081
Cot, hospital	830	Door catches	1055
metal	830, 832	Door closers	1042
Cotter-pin holes in bolt ends	588	Door fasteners, with chain	1044
Cotter pins	588, 616	Door frames, metal (sizes)	280, 282
Coupler gages, railway (type D coupler)	737	Door handles, entrance	1038
Coupler knuckle pivot pins, railway	742	Door holders	1045
Coupler yokes for railway cars	259	Door hooks	1061
Couplers, drop-test machine for	750, 751	Door knobs, metal	1037
railway (electric railway)	728	Door latches	1034
type D	728	tubular	1025
type E	738	Door locks	1004, 1020, 1021, 1022, 1023, 1025, 1052, 1056
Coupling, fire hose, screw thread gages for	929	bathroom	1021
Couplings, hose (fire hose)	1232	bolt	1052
screw threads for	363	communicating door	1022
pipe. (See Fittings, pipe.)		cylinder collar for	1036
Covers, ash can	818	elevator	1022
garbage can	818	entrance, cylinder	1025
manhole, sewer	1065	escutcheons and rosette for	1017
Crane chain	199, 200, 203, 204	escutcheons for	1036
heat treatment of	89	french door	1021
Crane track wheels, steel	793	front door	1022
Crank pins, locomotive, steel forgings for	752, 757, 771	cylinder	1023
Cranks, oil well rig	769	inside	1021
Cremona bolt locks for doors	1056	key plates for	1036
Cross arm braces	689	knobs, handles, and spindles, for	1018
Crosscut saws	954	office, cylinder	1023
Crosses, pipe. (See Fittings, pipe.)		roses for	1036
Crossings, railroad	336, 339, 341, 348, 349, 1133	ship	1004
manganese-steel	1133	tubular	1025
trolley	692	vestibule, cylinder	1023
Crow bars	962, 970	Door pulls	1039
Cubes, nickel	1281, 1282	Door shock absorber	1045
Culvert pipe, cast-iron	370	Door stops	1045, 1046
method of test of	369	Doors, bolt locks for	1056
Culverts, metal, corrugated	488, 490	catches for	1043
method of test of corrugated metal culverts	488	cremona bolt locks for	1056
Cupboard locks	1029	espagnolette bolt locks for	1057
Cupboard turns	1055, 1081	exit bolt locks for	1059
Cups, metal	817	fire	275, 276, 277
Curtain, shower bath	1066	flush bolt locks for	1057
Cuspidors. (See also Spittoons.)		foot bolt locks for	1058
sheet metal	818	Kalamein (sizes)	282
Cutlery, kitchen	816	kick plates for	1040
Cut nails, copper	565	lavatory, bolt locks for	1053
slating	569	metal	275, 280, 282
iron, common	564	metal-clad	275, 276, 277
finishing	566	push bars for	1040
flooring	566	push plates for	1040
shingle	568	ship, bolt locks for	1052
slating	569	catches for	1055
Muntz metal	565	flush bolt locks for	1054
slating	569	spring bolt locks for	1055
steel, common	564	tin-clad. (See Doors, metal-clad.)	
finishing	566	Double jack chain	213
flooring	566	Double loop weldless chain	212
shingle	568	Double-pointed tacks	570
slating	569	Dowel pins, metal	565
zinc	565	Down spout nozzles for roof drains	1065
slating	569	Drain and trap combined, plumbing	1065
Cutters, glass	955	Drain cocks, automobile	1232
keyway, Woodruff	620	Drain pipe, cast-iron.	
milling, heat treatment of	77	(See also Soil pipe, cast-iron.)	
pastry	817, 818	Drain plugs, crank case	483
pipe	882	Drain strainer, deck (brass)	1208-1210
Cylinder collar, door lock	1036	Drain traps	1234
		Drains, deck, brass	645
D		cast-iron	644, 645
Dating nails	557	plumbing	1065
Decimal gage, solid notch	901	roof	1063
Deck drain strainer (brass)	1208-1210	down spout nozzles for	1065
Deck drains, brass	645	draw knives	948
cast-iron	644, 645	Drawer locks	1029
Deck scupper	745	Drawer pulls	1039
Definitions of terms relating to heat-treatment operations	112	Dressing room inclosures	1078
Definitions of terms relating to magnetic testing	13, 18	Drift pins (sizes)	964
Definitions of terms relating to metallographic testing	34	Drill pipe, oil well	444
Definitions of terms relating to methods of testing	31, 32	threads for	454
Definitions of terms relating to specific gravity	43	Drill pipe thread gages	895
Definitions of terms relating to wrought iron	71	Drill sizes for various tap sizes	519
Dental amalgam alloy	1299	Drill tool screw thread gages	896
Dental amalgam alloys	1299	Drill tools (oil well), thread form for	362
Dental gold alloys	1298	Drills, breast	869
Dental silver alloys	1299	hand	870
Derricks, oil-well, steel	283	Drivers, screw	956
Desk locks	1029	Drop-test machine for railroad materials	317
Desks, steel	833	Drum forgings, steel	754
Dials	1305	Dry pipe valves, rubber facings for	498
Die blocks, plain carbon and alloy-steel, heat treatment of	79	Duralumin sheets, plates, etc. (See Sheets, aluminum alloy; plates, aluminum alloy; etc.)	
Die castings, aluminum alloy	1162	Dust guards for journal boxes	673
dies for, heat treatment of	78	Dust pans	818, 820
zinc-base	1315		
Die-head chasers (sizes)	871	E	
Dies, blanking, heat treatment of	81	Ears, trolley	693
Dies for die castings, heat treatment of	78	Eaves trough and conductor pipe (sizes)	491
Dinner buckets	817	Egg poacher	818
Dippers, metal	817, 818	Elbow catches	1043, 1055
Dishes. (See also Silverware.)			

SPECIFICATIONS FOR METALS AND METAL PRODUCTS

	Page
Elbows. (See Fittings, pipe.)	
Electric heating, chemical analysis of materials for	1289
Electrician's staples	570
Electrodes, welding, iron	155, 156, 157
steel	155, 156, 157
Electrolytic nickel. (See Cathodes, nickel.)	
Electrotypes	1279
Elements, heating, electrical	1296, 1297
chemical analysis of	1289
nickel chromium	1296, 1297
Elevator door lock	1022
Enameled ironware	1062
Enamelling ovens	868
Engine bolts, iron bars for	139
Escutcheon pins	565
Escutcheons, doorlock	1017, 1036
Espagnolette bolt locks for doors	1057
Exit bolt locks for doors	1059
Expansion tanks	853
Eyebars, bridge, steel	273
Eyebolts	683
aeronautic	602
wire rope	158
Eyes, pad, ship	743
padlock	1037
transom	1050

F

Fabric, fence. (See Fencing.)	
Facings, rubber, for dry pipe valves and check valves	498
Fasteners, blind	1044
casement	1043
door, with chain	1044
sash	1044, 1046
scuttle	1044
window	1043
window screen	1044
Fence. (See also Fencing.)	
Fence fabric, woven wire. (See Fencing, woven wire.)	
Fence nails	565
Fence posts, metal	1085
Fence staples, wire	571
Fencing, barbed wire	192, 194, 196
chain-link	193
field	191, 192, 195, 196
hog and cattle (types and sizes)	195
poultry	195, 196
railway	191, 192
wire	191, 192, 193, 194, 195, 196
wolf-proof, (types and sizes)	195
woven wire	191, 192, 193, 195, 196
Ferro-alloys, chemical analysis of	1093
methods of sampling	1092
Ferrochromium	1102, 1103
chemical analysis of	1096
methods of sampling	1092, 1093, 1103
standard sample	1102
Ferromanganese	1103
chemical analysis of	1094
methods of sampling	1092, 1104
standard sample	1104
Ferromolybdenum	1104
Ferrophosphorus, standard sample	1107
Ferrosilicon	1105
chemical analysis of	1093
methods of sampling	1092
standard sample	1105
Ferrotitanium	1106
methods of sampling	1107
Ferrotungsten, chemical analysis of	1100
standard sample	1105
Ferrovandium	1106
chemical analysis of	1098
standard sample	1106
Ferrule stock, brass	1219, 1220, 1221, 1222
Ferrules, condenser-tube, brass	1213
copper	1182
flexible-conduit	1215
wire, aeronautic	194
Fetter drive screws	574
File cases, steel	836, 850
Files (hand tool)	884
Filters, water, pressure	1086
Finishing nails	565, 566
Fire doors. (See Doors, fire.)	
Fire hose coupling screw thread gages	929
Firebox steel. (See Plates, firebox, steel.)	
Fireproofing buildings, safety factor in	275
Fittings, boom cargo	441
carbonated water bottling equipment	1230
chain	198, 213, 215, 216, 217
fuel tubing, automobile	1232
lubrication, automobile	1232
pipe. (See also Nipples, pipe.)	
(See also Unions, pipe.)	
ammonia	413
brass	435, 1234, 1235
bronze	435, 1235, 1255
bronze castings for	1250, 1252
carbonated water	1230
cast-iron	371,
372, 374, 376, 379, 381, 385, 395, 401, 402, 404, 407, 413, 414,	
415, 435	

	Page
Fittings, pipe, gas, cast-iron	374
high temperature, steel	478
iron. (See also Fittings, pipe, cast iron.)	
(See also Fittings, pipe, malleable iron.)	
iron	414, 460, 464
malleable iron	416, 422, 423, 429, 430
oil	490
sanitary	1255
sewer, cast-iron	371
sizes	365
soil, cast-iron	371, 372
steel	414, 422, 428, 429, 435, 460, 464, 465, 478
steel castings for	709
union, combination	416
water, cast-iron	376, 379, 381
welding neck	412
plumbing	1062
rope, wire	158, 161, 162, 181, 183
sprinkler pipe, cast-iron	407
tube	1232
brass and copper	1232
Fixtures, gas, tubing for	1239
shower bath	1065
Flanges, floor, water-closet	1065
pipe, automobile	414
cast-iron	385, 395, 401, 402, 413, 414
iron	414
steel	414, 465, 478
high temperature	478
welding neck	412
water-pipe, automobile	414
Flatters, blacksmiths, sizes	964
Floor flanges, water-closet	1065
Floor hinges, checking	1003
Floor surface spring hinges	1002
Flooring brads	566
Flooring nails	566
Floor boxes, metal	818
Flour sieves	818
Flue stoppers	817
Flushing tank mechanism	1062
Flushing valves	1063
Forged steel. (See Forgings, steel.)	
Forged steel products, methods of sampling	20
methods of sampling and chemical analysis	47
Forges	884
Forgings, alloy steel	754, 1136, 1137
blooms, billets, slabs, and bars for	131, 133
axle, alloy-steel	1136
drum, steel	754
iron	704, 705
locomotive, alloy steel	1136, 1137
heat treatment of	93
shaft, alloy steel	1136
steel	346, 750, 752, 753, 754, 757, 759, 765, 771
annealing of	106
bars, for	149
blooms, billets, and slabs for	131, 133
proof testing of	8
track	346
Forks. (See Tableware.)	
rail	964, 969
Foundry nails	569
Fourdrinier wire cloth	1229
Frames, back-saw	887
Frogs, railroad	310, 335, 336, 338, 341, 345, 349
trolley	693
Fullers, blacksmiths (sizes)	964
Funnels, metal	818, 820
Furnaces, hot air. (See Furnaces, warm air.)	
house heating. (See also Boilers, house heating.)	
warm air, for house heating	861, 866
gas, for house heating	861
Fuse clips	1288

G

Gage, thickness, aluminum alloy sheet and plate	1167
aluminum sheet and plate	1165
brass sheet and plate	1165
copper sheet and plate	1165
iron sheet and plate	224
nickel-copper alloy sheet and plate	1165, 1169
nickel silver sheet and plate	1165
nonferrous plate, sheet, and strip	1165
steel sheet and plate	224
zinc sheet, strip, and plate	1169

Locomotive wheels. (See Car wheels, railway.)		storm (rivets).....	569
Loops, wire, aeronautic.....	194	wire.....	564
Lunch boxes, metal.....	818	copper-clad, common.....	565, 569
M		cut, copper.....	565, 569
Machine bolts. (See Bolts.)		slating.....	564
Machine screw threads.....	515, 516	iron, common.....	566
Machine screws.....	527, 551, 575, 579	finishing.....	566
Machinery, structural steel for.....	267	flooring.....	568
Magnesium-base alloy castings.....	1340	shingle.....	569
Magnetic testing (definitions of terms).....	18	slating.....	569
Magnetic testing of iron and steel.....	13	Muntz metal.....	565, 569
Magnets, alloy steel bars for.....	1129	slating.....	569
Malleable iron. (See Castings, iron, malleable.)		small (sizes).....	558
Mallets.....	975	steel, common.....	564
Manganese bronze, chemical analysis of.....	1261	finishing.....	566
standard sample.....	1264	flooring.....	566
Manganese bronze bars, rods, etc. (See Rods, manganese bronze; Bars, manganese bronze; etc.)		shingle.....	568
Manganese copper.....	1191	slating.....	569
Manganese metal, methods of sampling.....	1092	zinc.....	565, 569
standard sample.....	1104	slating.....	569
Manganese ore.....	1092	iron, common.....	567
standard sample.....	1091	double-head wire.....	565
Manganese-steel castings, austenitic.....	1135	dowel pins.....	565
Manganese-steel railway crossings.....	1133	fence.....	565
Manganese steel, standard sample.....	1122	finishing.....	565, 566
Manhole covers, sewer.....	641, 1065	flooring.....	566
Manhole frames and covers, cast-iron.....	641	foundry.....	566
Manholes, sewer.....	1065	galvanizing on, testing of.....	67, 68
Marking pots.....	818, 819	heel.....	560, 566
Match safes, metal.....	818	hinge.....	567
Mates, railroad.....	334, 337, 339, 341, 348	hob. (See also Nails, Hungarian.)	
Mats, copper.....	1190	hob.....	567
Mattocks (sizes).....	961	horseshoe.....	
Mattresses (sizes).....	826	Hungarian. (See also Nails, hob.)	
Mauls.....	962, 963, 968	sizes.....	560
		lath.....	567

SPECIFICATIONS FOR METALS AND METAL PRODUCTS

	Page		Page
Nails, molding	567	Pans, cooking and kitchen, metal	817, 818
Muntz metal	565	dust	818, 820
plaster-board	567	refrigerator	819
purlin	567	Partitions, toilet and shower	1078
roofing	558, 567, 568	Pastry cutters	817, 818
saddle	568	Pedestals, railway car truck	261
saddlery	568	Pestle and mortar, for analysis of ferro-alloys	1093
sheathing	568	Phosphor bronze bars, castings, etc. (See Bars, phosphor bronze; Castings, phosphor bronze; etc.)	
shingle	568	Phosphor bronze bearing metal, standard sample	1327
shoe (cobblers)	569	Phosphor bronze wire rope. (See Rope, wire, phosphor bronze.)	
siding	569	Phosphor copper	1191
slating	569	Phosphor tin ingots. (See Ingots, phosphor tin.)	
stem	569	Picks	961, 963, 968
storm, copper (rivets)	569	Pie plates, metal	817
testing of	67, 68, 571	Pig iron, charcoal. (See Pig iron, foundry.)	
trunk (sizes)	559	chemical analysis of	119
upholsterer's	569	coke. (See Pig iron, foundry.)	
zinc	565	foundry	130
Name plates, zinc	1311	malleable	131
Net, submarine, chain for	201	Pig lead	1275, 1277
Netting, fence. (See Fencing, poultry.)		chemical analysis of	1272
Nickel, chemical analysis of	1279	Pig nickel	1281, 1282
Nickel bars, ingots, etc. (See Bars, nickel; Ingots, nickel; etc.)		Pig tin	1306
Nickel brass. (See also Copper-nickel alloy.)		Pincers	881
Nickel bronze castings	978	Pinch bars	962, 970
Nickel chromium alloy, chemical analysis of	1289	Pinions, electric railway	812
Nickel chromium shapes, ribbon, etc. (See Shapes, nickel chromium; Ribbon, nickel chromium; etc.)		Pins, cotter	588, 616
Nickel plating	70, 71	holes for, in bolt ends	588
Nickel silver castings	978	coupler knuckle pivot, railway	742
Nickel silver rods, bars, etc. (See Rods, nickel silver; bars, nickel silver; etc.)		crank, locomotive, steel forgings for	752, 757, 771
Nickel steel. (See also Chromium-nickel steel.)		dowel, metal	565
Nickel steel, chemical analysis of	1107	drift (sizes)	964
standard sample	1122	escutcheon	565
Nickel steel bars, sheets, plates	1124, 1126, 1127	flat-head, aeronautic	616
Nickel chromium steel, bars, sheets, plates	1124	insulator	689, 702
Nickel copper bars, rods, etc. (See Bars, copper nickel; Rods, copper nickel; etc.)		piston, carburizing and heat treatment of	101
Nickel copper-zinc rods, bars, etc. (See Rods, nickel silver; Bars, nickel silver; etc.)		shackle, chain. (See also Shackles and shackle pins.)	
Nipples, pipe, brass	486, 1234	taper	588
iron	432, 485	castle nut	588
steel	483, 485	Pipe, brass	1182, 1216, 1217, 1239
Nonferrous metals and alloys, metallographic testing of	28	cast-iron	370, 371, 372, 374, 376, 379, 381
Nonferrous scrap, classification of	51, 55	testing of	369, 383
Normalizing steels. (See Heat treatment of steel.)		copper	1182, 1184, 1187
Nozzles, down spout, roof drain	1065	testing of	1188
Nut slots, castle, gaging of	607	culvert, cast-iron	370
Nuts. (See also Nuts, track.)		testing of	369
Nuts	522, 586, 588, 603, 606-609, 611, 683	metal, corrugated	488, 490
aeronautic	603, 608	drain, cast-iron. (See also Pipe, soil, cast-iron.)	
castle	588, 607, 608	drill, oil well	444
high	607	screw thread gages for	895
jam	611	threads for	454
propeller, aeronautic	603	eave conductor (sizes)	491
screw-thread gages for	927	gas, cast-iron	374
screw threads for	515, 516, 529, 543	high temperature, steel	479
track	350, 352, 353, 356, 357	iron. (See also Pipe, cast-iron.)	
tube fitting	1232	(See also Pipe, culvert, metal, corrugated.)	
		(See also Pipe, sheet iron and steel.)	
O			
Oil burners, domestic	868	Pipe, iron	365, 431, 433, 444, 457, 483
oil-burning furnaces, house heating	862	oil country	444, 457
Oil cans	817, 818, 1239	(sizes)	365
hand	1239	testing of	434, 444, 457
Oil heaters, incubator	868	lead	1278
portable	859	oil, iron	444, 457
Oil pumps, Baltimore	818	steel	444, 457
Oil stoves	858	sewer, cast-iron	371
Oil-well casing thread gages	895	sheet iron and steel	488-491
Oil-well drill tool thread and thread gages	362, 896	signal, iron	431
Oil-well pipe. (See Pipe, drill; pipe, oil.)		steel	463
Oil-well pumps. (See Pumps, oil-well.)		soil, cast-iron	371, 372
Oil-well sucker-rod gages	898	steel. (See also Pipe, culvert, metal, corrugated.)	
Oil-well tubing. (See Tubing, oil-well.)		(See also Pipe, sheet iron and steel.)	
Oilers, brass	1239	Pipe, steel	363, 436, 444, 457, 463, 476, 479, 482, 483, 487
Operators, sash	1049	oil country	444, 457
scuttle	1080	(sizes)	365
skylight	1080	testing of	444, 457, 480
transom	1050	water, cast-iron	376, 379, 381
Ores, chromium	1091	Pipe cutters	882
chemical analysis of	1088	Pipe fittings. (See also Fittings, pipe.)	
iron, standard samples	119	Pipe flanges, steel, high temperature	478
manganese	1092	Pipe flanges and flanged fittings, cast-iron	385, 395, 401, 402, 413, 414
standard sample	1091	iron	414
zinc, standard sample	1310	steel	414, 465, 478
Ornamental iron castings for building	664	Pipe markings	361
Ounce metal castings, etc. (See Castings, brass, etc.)		Pipe nipples, brass	486, 1234
Outdoor substations, electrical	276	iron	432, 485
Ovens, constant temperature, laboratory	867	steel	483, 485
enamelling and japanning	868	Pipe slip joints, brass	1190
Over-support rods, trolley	693, 699	copper	1190
		Pipe thread gage blanks	915
P			
Packing tools for journal boxes	977	Pipe thread gages	892, 894, 895, 930
Pad eyes and links, ship	743	Pipe threads. (See Threads, screw, pipe.)	
Padlock eyes	1037	Pipe unions	416, 428, 429
Padlocks	1031	Pipe unions and combination union fittings	416
Pails. (See Buckets.)		Pipe valves. (See Valves, pipe.)	
		Piping, gas	361, 364
		identification of	361, 363
		power	364
		Pistol cartridges	1083
		Piston pins, carburizing and heat treatment of	101

INDEX

	Page		Page
Piston rods, locomotive, steel forgings for.....	752, 757, 771	Plumbing drains.....	1065
Pitchers. (See also Silverware.)		Plumbing fixtures, nickel plating of.....	70
Pivots, sash.....	1048, 1052	Plumbing symbols.....	113-115
transom.....	1052	Plumbing traps.....	1065, 1075, 1234
Plaster-board nails.....	567	Pneumatic tools.....	1062
Plates, alloy steel.....	1138	Poacher, egg.....	939
aluminum, thickness gage for.....	1165	Pocketknives.....	818
weights of.....	1166	Pole bands.....	814
aluminum alloy.....	1146	Pole hangers, sash.....	690
thickness gage for.....	1167	Pole hooks, sash.....	981
weights of.....	1167	Pole steps.....	981
bench.....	891	Poles, steel.....	687
boiler, steel.....	227, 230-233	Poles, fence, metal.....	436
zinc.....	1811	indicator, for concealed valves.....	1085
bone, alloy steel.....	1138	Pots, coffee.....	504
screws for.....	1140	marking.....	818, 819
brass.....	1195, 1198, 1201, 1202	soldering.....	891
thickness gage for.....	1165	tea.....	818
weights of.....	1166	water.....	818
brazing quality, steel.....	235	watering.....	817
bread, metal.....	817	Powder cans.....	512
bronze. (See also Plates, manganese Bronze; plates, non-ferrous.)		Pressure regulators for gas cylinders.....	1279
center, railway car.....	259	Printing plates.....	1084
chain, cast steel.....	743	Projectiles for line-carrying guns.....	199, 200, 203, 204
chromium steel.....	1124	Proof coil chain.....	616
chromium-vanadium steel.....	1124	Propeller keys, marine.....	661
condenser tube, Muntz metal.....	1201	Propellers, marine, bronze blades for.....	661
copper.....	1172, 1176, 1177	built-up.....	661
method of test.....	1172	cast-bronze.....	663
thickness gage for.....	1165	cast-iron.....	663
weights of.....	1166	cast-steel.....	661, 663
copper-nickel alloy.....	1282, 1285	Pull plates, sash.....	981
firebox, copper.....	1176	Pullers, nail.....	959
steel.....	227, 230, 233	spike.....	964, 969
flange quality, iron.....	232	Pulleys. (See also Sheaves.)	
steel.....	229, 230, 233, 254	machine.....	649
(forge welding), steel.....	229, 230, 272	manila rope grooves in.....	646
German silver. (See Plates, nickel silver.)		railway car lighting generator.....	647
guy.....	686	sash.....	1050
hot, gas stove.....	855	Pullover, trolley.....	702
iron.....	232, 234, 235	Pulls, door.....	1039
thickness gage for.....	224	drawer.....	1039
tolerances on dimensions and weight of.....	117	knob.....	1039
joint, railroad.....	317, 318, 326, 328-333	Pumps, oil, Baltimore.....	818
key, door lock.....	1036	oil well, gages for barrel of.....	898
kick, door.....	1040	working barrels for.....	463
manganese bronze.....	1265, 1267	Punches, backing out, (sizes).....	964
molybdenum steel.....	1124	blacksmiths, (sizes).....	964
Monel metal. (See Plates, copper-nickel.)		blanking die, heat treatment of.....	81
name, zinc.....	1311	tie plug.....	964, 969
nickel.....	1281, 1282	track.....	964, 969
nickel silver.....	1286, 1287	Purlin nails.....	567
thickness gage for.....	1165	Push bars, door.....	1040
weights of.....	1166	Push plates, door.....	1040
nickel steel.....	1124, 1126, 1127	Putty knives.....	949
nickel-chromium steel.....	1124		
nickel-copper alloy, thickness gage for.....	1165, 1169	R	
weights of.....	1166, 1169	Radiator requirements for buildings.....	866
nonferrous, thickness gage for.....	1165	Radiator requirements for houses.....	865
weights of.....	1165	Radiator valves.....	509
pie, metal.....	817	Radiators, house heating.....	857, 862, 865
printing.....	1279	steam and hot water, gas-fired.....	857
push, door.....	1040	Radiographic testing of metal castings.....	45
sash pull.....	981	Rail forks.....	964, 969
silicon steel.....	1126	Rail joint plates. (See Plates, joint, railroad.)	
steel. 227, 229-233, 235, 239, 249-252, 254, 266-270, 272, 1124, 1126, 1127		Rail splice bars. (See Bars, splice, railroad.)	
gage for.....	224	Railroad tie plates. (See Tie plates, railroad.)	
galvanizing of.....	66	Railroad track tools.....	963, 966, 968
tolerances on dimensions and weight of.....	117, 248	Rails, girder, railroad.....	311, 314-316
structural, nickel steel.....	1126, 1127	railroad.....	310, 311, 313-316, 320, 321, 343
silicon steel.....	1126	Railway axles. (See Axles, railway.)	
steel.....	249-252, 254, 266-270, 272, 1126, 1127	Railway bridges.....	274
tank, chromium steel.....	1124	Railway car wheels. (See Wheels, railway car.)	
terne, gage for.....	226	Railway cars, structural steel for.....	254
method of testing coating.....	64	Railway crossings. (See Crossings, railway.)	
(sizes).....	241	Railway metallic supplies, classification of.....	52, 53
tie, railroad.....	328-330, 333, 334	Railway springs. (See Springs, railway.)	
zinc.....	1311, 1314	Railway track material.....	310-361
thickness gage for.....	1169	Range boilers.....	853
weights of.....	1169	Ranges, gas.....	853, 857
Plating, chromium, on nonferrous metals (specification).....	70	Rasps (sizes).....	890
testing of.....	71	Razor blades, packaging of.....	815
nickel, for plumbing fixtures.....	70	Reamers.....	871
on brass, methods of test of.....	70	Reducers, pipe. (See Fittings, pipe.)	
on nonferrous metals (specification).....	71	Refractory materials, chemical analysis of.....	1088
zinc. (See Galvanizing.)		Refrigerator pans.....	819
Plating on metals. (See also Coating on metals.)		Refrigerators, sheet metal.....	818
Pliers and plier cutters.....	881	Register chain.....	213, 1243
Plow bolts.....	596	brass.....	1243
Plugs, drain, crank-case.....	483	Regulators, pressure, gas cylinder.....	512
laundry tray.....	1075	Reinforcement bars, steel.....	304-309
lavatory.....	1075	Reinforcement wire, steel.....	304, 305
pipe. (See Fittings, pipe.)		Release valves, air brake.....	496
sink.....	1075	Repair shops, rail motor car.....	277
Plumb bobs.....	957	Rests, shelf.....	1060
Plumber's chain.....	213, 1191	Return bends, pipe. (See Fittings, pipe.)	1296, 1297
copper.....	1191	Ribbon, nickel-chromium.....	1311
Plumbers' ladders.....	940	zinc.....	1082
Plumbing, recommended minimum requirements for.....	113	Rifle cartridges.....	
Plumbing cesspool.....	1065		
Plumbing drain and trap combined.....	1065		

SPECIFICATIONS FOR METALS AND METAL PRODUCTS

	Page		Page
Rig irons, oil well.....	769	Rope thimbles. (See Thimbles, rope; Thimbles, manila rope.)	
Rigging screws for ships.....	626	Roses, door lock.....	1036
Ring dogs.....	218	Rosette, doorlock.....	1017
Rings, chain.....	222	Rules, caliper.....	957
Rivet bars, chromium steel.....	1122	carpenter's.....	957
steel. (See Bars, rivet, steel.)		steel.....	957
Rivet header (sizes).....	964		S
Rivet sets, heat treatment of.....	98	Saddle nails.....	568
riveting hammer.....	939	Saddle tacks.....	571
(sizes).....	964	Saddlery nails.....	568
Rivet steel. (See Bars, rivet.)		Safes, burglar-resisting.....	842
Riveted joints, bibliography on.....	246	insulated.....	835, 837
Riveters, pneumatic.....	939	key-locked.....	834
Rivets, aluminum alloy.....	1160	match, metal.....	818
aluminum type.....	1160	Safety chain, aluminum.....	1164
belt, steel.....	614	brass.....	1243
boiler.....	142, 612	Safety code, gas.....	361
chromium steel, for nitric acid tank cars.....	1123	Safety valves, boiler.....	492, 513
coopers', steel.....	614	locomotive.....	492
(copper storm nails).....	569	tank car.....	493
iron.....	612	Samples, standard. (See Steel, standard sample; Brass, standard sample; etc.)	
railway car, steel.....	141	Sampling chromium metal, methods of.....	1092
ship construction.....	612	Sampling ferro-alloys, methods of.....	1092
small, steel.....	612	Sampling ferrochromium, methods of.....	1092, 1093, 1103
split.....	1240	Sampling ferromanganese, methods of.....	1092, 1104
steel.....	141, 612, 614, 615	Sampling ferrosilicon, methods of.....	1092
steel bars for.....	144, 249	Sampling ferrotitanium, methods of.....	1107
storm, copper (nails).....	569	Sampling iron (pig and cast iron).....	119
tap.....	522, 615	Sampling manganese metal, methods of.....	1092
tanners, steel.....	614	Sampling silicomanganese, methods of.....	1092
tubular.....	1240	Sampling steel products.....	20, 47
Rods, aluminum. (See also Rods, welding, aluminum.)		Sanitary ware, colors for.....	816
for remelting.....	1150	Sash, metal.....	275, 280
aluminum alloy. (See also Rods, welding, aluminum alloy.)		Sash antirattler.....	1046, 1048
aluminum alloy.....	1146	Sash attachments (for cord or chain).....	1049
aluminum bronze.....	1258	Sash catch.....	1046
anchor.....	589, 686	Sash chain.....	212, 1258
brass. (See also Rods, welding, brass.)		bronze.....	1258
brass.....	1195, 1203-1205	Sash cord irons.....	1049
bronze. (See also Rods, aluminum bronze; rods, manganese bronze.)		Sash cord, wire.....	167
cast iron. (See also Rods, welding, iron.)		Sash fasteners.....	1044, 1046
copper.....	1172, 1179, 1180	Sash lifts.....	1041, 1048
method of test.....	1172	Sash lock.....	1046
copper-nickel alloy.....	1282, 1285	Sash operators.....	1049
German silver. (See Rods, nickel silver.)		Sash pivots.....	1048, 1052
iron. (See also Rods, welding, iron.)		Sash pole hangers.....	951
gages for.....	900	Sash pole hooks.....	981
locomotive, steel forgings for.....	752, 757, 771	Sash pull plates.....	981
manganese bronze. (See also Rods, welding, manganese bronze.)		Sash pulleys.....	1050
manganese bronze.....	1265, 1266	Sash weights.....	1049
Monel metal. (See Rods, copper-nickel.)		Saw blades, hack.....	885
naval brass. (See Rods, brass.)		Saw frames, hack.....	885, 887
nickel silver.....	1286, 1288	Saw sets, hand saw.....	940
oversupport, trolley.....	693, 699	Saws.....	951-955
piston, locomotive, steel forgings for.....	752, 757, 771	band.....	952
reinforcement. (See Bars, reinforcement.)		butcher.....	952
steel. (See also Bars, steel.)		circular.....	953
(See also Rods, welding, steel.)		compass.....	953
sucker, oil well, gages for.....	898	crosscut.....	954
tie, track.....	360	hack.....	885, 887, 954
trolley oversupport.....	693, 699	hand.....	954
welding. (See also Wire, welding.)		keyhole.....	954
aluminum.....	1157	web.....	955
aluminum alloy.....	1157	Scissors, office.....	815
brass.....	1203	Scoops.....	817, 818, 966
copper.....	1180	grocers, spice and thumb.....	817
copper-nickel.....	1285	ring handle, metal.....	818
gas, iron.....	156, 157	Scrap iron and steel, classification of.....	51, 53, 56
steel.....	156, 157	Scrap metals, nonferrous, classification of.....	51, 55
iron.....	156, 157	Scraping knives.....	949
manganese bronze.....	1266	Screen fasteners, window screen.....	1044
steel.....	149, 156, 157	Screen lifts, window screen.....	1042
Roller bearings.....	1329	Screen wire cloth.....	195, 1228, 1229, 1256
Roof drains.....	1063	Screens, grading.....	1085, 1226, 1227
down spout nozzles for.....	1065	brass.....	1226, 1227
Roofing. (See also Sheets, galvanized.)		testing, brass.....	1226, 1227
galvanized (sizes).....	246	Screw jacks.....	970, 972
tin (sizes).....	241	Screw stock, steel bars for.....	145, 147
terneplate (sizes).....	241	Screw thread gage blanks.....	906
Roofing nails.....	558, 567, 568	pipe.....	915
Roofing sheets, iron and steel.....	246	Screw thread gages.....	920, 921
Roofing tin.....	241	acme.....	924
gage for.....	226	hose, welding and cutting torch.....	926
Rope, wire, eyebolts for.....	158	hose couplings (fire hose).....	929
fittings for. (See Fittings, rope, wire.)		pipe.....	892, 894, 895, 930
galvanizing of, method of test.....	168	12-pitch thread series.....	938
guy.....	180, 181	Screw threads. (See also Threads, screw.)	
highway.....	158	acme.....	552
marine.....	159, 163	bolt.....	515, 516, 529, 543
messenger.....	179-181	machine screw.....	515, 516, 529, 543
mine.....	172	nut.....	515, 516, 529, 543
oil country.....	174	pipe.....	365, 450, 454, 456, 461
phosphor bronze.....	167, 186, 188	gages for.....	892, 894, 895, 930
steel.....	158, 159, 163, 172, 174, 179, 180, 181, 183	Screw drivers.....	956
testing of.....	159, 167, 175, 180	Screws, alloy-steel, high temperature.....	1130
Rope grooves in pulleys (manila rope).....	646	bone plate, alloy steel.....	1140
Rope grooves in sheaves (wire rope).....	647	cap.....	576-579, 583
Rope socket. (See Sockets, ropes)		Fetter drive.....	574
		lag.....	657
		packing of.....	604

INDEX

Screws, machine.....	527, 551, 575, 579	Sheets, German silver. (See Sheets, nickel silver.)	
method of test.....	527	iron.....	241, 243, 244
screw threads for.....	529, 543	gage for.....	224
rigging, ship.....	626	sizes.....	246
set.....	530	testing of.....	242, 244
wood.....	579, 584	tolerances on dimensions and weight of.....	117
brass.....	584	lead.....	1277
iron.....	890	thickness gage for.....	1169
Scribers.....	1071	weights of.....	1170
Scullery sink, steel.....	745	molybdenum steel.....	1124
Scupper, deck.....	1044	Monel metal. (See sheets, copper-nickel.)	
Scuttle fasteners.....	1002	nickel.....	1282
Scuttle hinges.....	1080	nickel-chromium steel.....	1124
Scuttle operators.....	968	nickel-copper alloy, thickness gage for.....	1165, 1169
Scythes.....	1035	weights of.....	1166, 1169
Secret gate latches.....	580	nickel silver.....	1286, 1287
Servers. (See also Tableware.)	98	thickness gage for.....	1165
Set screws.....	964	weights of.....	1166
Sets, rivet, heat treatment of.....	940	nickel steel.....	1124
sizes.....	1065	nonferrous, thickness gage for.....	1165
saw, hand saw.....	371	weights of.....	1165
Sewer manholes and covers.....	213, 215	roofing. (See also Sheets, galvanized.)	
Sewer pipe, cast-iron.....	183	iron (sizes).....	246
Shackle pins, chain.....	220, 221, 222	steel (sizes).....	246
Shackles, aeronautic.....	213, 215, 216, 221, 222	roofing tin.....	241
anchor.....	215	solder, silver.....	1335
chain.....	183	steel.....	236, 239, 241, 243, 244, 246
method of test.....	818	gage for.....	224
wire rope.....	1136	sizes.....	236, 246
Shades, electric light, metal.....	99	testing of.....	242, 244
Shaft keys. (See Keys, shaft; Woodruff keys; pins; etc.)	761, 771, 772	tolerances on dimensions and weight.....	117
Shafts, alloy steel forgings for.....	769	terneplate.....	241
cam, heat treatment and carburizing of.....	95	method of test for.....	242
line.....	147	tin coated.....	241
oil-well rig.....	752, 759, 765, 771, 1136	method of test for.....	64, 242
spline, heat treatment of.....	1172, 1173, 772	tin plate, gage for.....	226
steel bars for.....	1136	zinc.....	1311, 1314
steel forgings for.....	1146, 1152	thickness gage for.....	1169
transmission. (See Shafts, line.)	1258	weights of.....	1169
Shapes, aluminum alloy.....	1172, 1173, 772	zinc-coated. (See Sheets, galvanized.)	
aluminum bronze.....	1172, 1173, 772	Shelf brackets.....	1060
bronze. (See also Shapes, aluminum bronze; Shapes, manganese bronze; Shapes, phosphor bronze.)	1172, 1173, 772	Shelf rests.....	1060
copper.....	1172, 1173, 772	Shelf supports.....	1060
method of test.....	1172, 1173, 772	Shells, shot, paper, loaded.....	1081
copper-nickel alloy.....	1282, 1285	shotgun.....	1031
German silver. (See Shapes, nickel silver.)	234	Sherardizing. (See Galvanizing.)	
iron.....	1265, 1266	Shingle nails.....	568
manganese bronze.....	1296, 1297	Ship chain. (See Chain, marine.)	
Monel metal. (See Shapes, copper-nickel.)	1286, 1288	Ships, structural steel for.....	250, 268, 269, 270
nickel chromium.....	1126, 1127	Shock absorber, door.....	1045
nickel silver.....	253	Shoe knives.....	947
nickel steel.....	1269	Shoe nails (cobblers).....	569
open-web joists, steel.....	234	Shoe tacks.....	560, 571
phosphor bronze.....	1126	Shoes, bed, wooden.....	720, 726, 727
ship, iron.....	249-254, 266-270, 346, 1126, 1127	brake, railway.....	277
silicon steel.....	66	Shops, repair, rail motor cars.....	1150
steel.....	249	Shot, aluminum.....	1150
galvanizing of.....	1152	for steel manufacture.....	1284
tolerances on dimensions and weights of.....	1179, 1180	copper-nickel alloy.....	1284
structural, aluminum alloy.....	1126, 1127	nickel.....	1281, 1282
copper.....	1126	Shot shells, paper, loaded.....	1081
nickel steel.....	249-252, 254, 266-270, 346, 1126, 1127	Shotgun shells.....	1081
silicon steel.....	950	Shovels.....	966
steel.....	82	Shower bath curtains.....	1066
Shaves, spoke.....	968	Shower bath fixtures.....	1065
Shear blades, heat treatment of.....	815	Shower bath inclosures.....	1078
Shears, grass and hedge cutting.....	881	Shower baths, mixing valves for.....	1066
office.....	568	Shutters, fire.....	276, 277
tinnern.....	646	metal clad.....	276, 277
Sheathing nails.....	647	Sickles.....	968
Sheaves. (See also Pulleys.)	488-491	Siding nails.....	569
Sheaves and hoisting blocks.....	275, 276	Sieve testing apparatus.....	1227
Sheaves, wire rope grooves in.....	1154, 1156	Sieves, brass.....	1226, 1227
Sheet iron and steel pipe.....	1165	champion.....	818
Sheet-metal work for buildings.....	1166	flour.....	818
Sheets. (See also Strips.)	1166	testing.....	1226, 1227
aluminum.....	1154, 1156	Signal pipe, iron.....	431
thickness gage for.....	1165	Signals, railway, steel pipe fittings for.....	464
weights of.....	1166	steel pipe for.....	463
aluminum alloy.....	1146, 1154, 1155	Silent chains.....	223
thickness gage for.....	1167	Silicomanganese steel bars for springs.....	1128
weights of.....	1167	Silicomanganese steels, chemical analysis of.....	1107
aluminum bronze.....	1258	methods of sampling.....	1092
aluminum-manganese alloy.....	1195, 1199, 1201, 1202	Silicon, refined, standard sample.....	1105
brass.....	1202	Silicon copper.....	1191
standard sample.....	1165	Silicon steel bars, shapes, plates.....	1126
thickness gage for.....	1165	Silicomanganese. (See Silicomanganese.)	
weights of.....	1166	Sill, center, railway car.....	261
bronze. (See also Sheets, aluminum bronze.)	1124	Silver, coin.....	1299
chromium steel.....	1124	German (bars, rods, etc.) (See Bars, nickel-silver; Rods, nickel-silver; etc.)	
chromium-vanadium steel.....	1172, 1177	nickel (castings).....	978
copper.....	1172	sterling.....	1299
method of test.....	1165	Silver alloys, dental.....	1335, 1339
thickness gage for.....	1166, 1168	Silver solders.....	1336
weights of.....	1282, 1285	chemical analysis of.....	1301
copper-nickel alloy.....	225	Silverware.....	1300
duralumin. (See Sheets, aluminum alloy.)	243, 244, 246	ship.....	213
galvanized, gage for.....	246	Single jack chain.....	212
iron.....	243, 244, 246	Single loop chain.....	1075
roofing (sizes).....	244	Sink plug.....	1234
steel.....	244	Sink traps, brass.....	
testing of.....	244		

SPECIFICATIONS FOR METALS AND METAL PRODUCTS

	Page		Page
Sinks, kitchen, cast-iron.....	1067	Staples, poultry-netting.....	571
scullery, steel.....	1071	wire-fence.....	571, 573
slop, cast-iron.....	1068	Stay bolts, copper bars for.....	1176
Skimmers, flat and milk.....	817	flexible (sizes).....	588
Skylight operators.....	1080	iron bars for.....	136, 137, 139
Slabs. (See also Blooms and billets.)		sizes.....	588
alloy steel.....	131, 133	steel bars for.....	143, 145
copper.....	1173, 1174	steel tubing for.....	143
chemical analysis of.....	1170	Steady, trolley cross span.....	703
phosphor copper.....	1191	trolley-pole bracket.....	703
phosphor tin.....	1307	Steamers, sheet metal (tinware).....	818
silicon copper.....	1191	Steel, alloy, chemical analysis of.....	1107
spelter.....	1310, 1311	tool, heat treatment of.....	75
steel.....	131, 133	automotive, carburizing and heat treatment of.....	83, 109
zinc.....	1310, 1311	inspection and sampling.....	49
Slating nails.....	569	bar steel. (See Bars, steel.)	
copper-wire.....	569	boiler. (See Plates, boiler, steel.)	
Sledge hammers.....	881, 962, 964	carbon, chemical analysis of.....	10
Sleeves, lead.....	1277	SAE series, heat treatment of.....	53
Slicks, woodworkers'.....	945	chromium plating on.....	71
Sling chain.....	203	chromium-molybdenum, standard sample.....	1122
heat treatment of.....	89	chromium-nickel, chemical analysis of.....	1109
Sling hooks.....	219	chromium-nickel, standard sample.....	1122
Slip joints, pipe, brass.....	1190	chromium-tungsten-vanadium, standard sample.....	1122
copper.....	1190	chromium-vanadium, chemical analysis of.....	1111
Slop sink, cast-iron.....	1068	chromium-vanadium, standard sample.....	1122
Sockets, rope, wire.....	161, 181	copper bearing, tack and nail.....	561
sash (for chain).....	1049	finishing, heat treatment of.....	76
Soil pipe, cast-iron.....	371, 372	firebox. (See Plates, firebox, steel.)	
Solder, brazing.....	1333-1335, 1339	galvanizing on.....	60-62, 71
chemical analysis of (silver solder).....	1336	magnetic testing of.....	13
chemical analysis of (tin-lead).....	1317	manganese, standard sample.....	1122
copper zinc.....	1333, 1334	metallographic testing of.....	22
rosin core.....	1330	molybdenum, chemical analysis of.....	1118
silver.....	1335, 1339	nickel, chemical analysis of.....	1107
chemical analysis of.....	1336	standard sample.....	1122
soft. (See Solder, tin-lead.)		nickel plating on (specification).....	71
spelter. (See Solder, copper-zinc.)		rivet. (See Bars, rivet, steel.)	
tin lead.....	1330-1332	sampling of.....	20
chemical analysis of.....	1317	scrap, classification of.....	53, 56
wire.....	1330	screw stock. (See Bars, screw stock, steel.)	
Solder for aluminum.....	1340	sheradizing of.....	60
Soldering coppers.....	891	silicomanganese, chemical analysis of.....	1107
Soldering irons.....	891	spring. (See also Bars, spring, steel.)	
Soldering pots.....	891	heat treatment of.....	92
Soup strainers.....	818	stainless, standard sample.....	1122
Spacer links, trolley.....	702	standard samples of.....	50
Spades.....	966	stay bolt. (See Bars, stay bolt.)	
Specific gravity, definitions of terms relating to.....	43	structural, bridge.....	249-251, 273
Spelter, chemical analysis of.....	1308	building.....	250, 252, 254
Spelter solder. (See Solder, copper-zinc.)		galvanizing of.....	66
Spiegeleisen.....	1103, 1104	machinery.....	267
standard sample.....	1104	railway car.....	250, 254, 260, 267
Spike maul, track.....	968	ship.....	250, 268-270
Spike pullers.....	964, 969	thermal analysis of.....	44
Spikes, barge.....	570	tool. (See Bars, tool, steel.)	
boat.....	570	tool, finishing, heat treatment of.....	76
cut iron or steel, common.....	570	heat treatment of.....	72, 74, 75, 78
gutter.....	570	high-speed, heat treatment of.....	75
track.....	357-360, 570	nonshrinking, nondeforming, oil hardening, heat treatment of.....	76
wire, round.....	570	plain carbon, heat treatment of.....	74
Spindles, door-lock.....	1018	tungsten, chemical analysis of.....	1111
Spittoons. (See also Cuspидors.)		high-speed, heat treatment of.....	75
Spittoons, sheet metal.....	810	vanadium, chemical analysis of.....	1111
Splice bars, railroad.....	317, 318, 326, 328-333	Steel blooms, billets, and slabs, etc. (See Blooms, steel; Billets, steel; Slabs, steel; etc.)	
Splicers, trolley-wire.....	694	Steel castings. (See Castings, steel.)	
Spline shafts, heat treatment of.....	95	Steel products, annealing of.....	106
Spoke shaves.....	950	chemical analysis of.....	47
Spoons. (See Tableware.)		sampling of.....	47
Spout nozzles for roof drains.....	1065	test specimens for.....	48
Spouting, eave (sizes).....	491	Steel scrap, classification of.....	51
Spring caps, railway-car.....	794	Steel wire. (See Wire, steel.)	
Spring center bolts for automobile springs.....	603	Stem nails.....	569
Spring hinges, butt type.....	1002	Step bolt.....	594
Floor surface.....	1002	Steps, pole.....	887
lavatory door.....	1003	Sterling silver.....	1299
Spring rebound clips, spacers, and bolts, automobiles.....	810	Stone-hoist hooks.....	219
Spring steel, alloy and carbon, heat treatment of.....	92	Stools, metal.....	833
Springs, automobile.....	806	Stoppers, fire.....	817
bed.....	826, 828-831, 833	Stops, compression.....	1062
general purpose, steel bars for.....	153	door.....	1045, 1046
heat treatment of.....	92	Storage cabinets. (See Cabinets.)	
helical, for railroad frogs and switches.....	347, 351	Storn nails, copper (rivets).....	569
phosphor-bronze wire for.....	1270	Stove bolts.....	527, 579, 604
railway.....	347, 351, 794, 801, 803, 805	Stovepipe collars.....	857
carbon-steel bars for.....	152	Stoves, gas.....	853, 855-857
chromium-vanadium steel bars for.....	1128	method of test.....	
silicon-manganese steel bars for.....	1128	gasoline.....	858
silicomanganese steel bars for.....	1128	kerosene.....	858
track.....	347	laundry.....	855
vehicle, steel bars for.....	153	oil.....	858
Sprinkler pipe fittings, cast-iron.....	407	Strainers, deck drain (brass).....	1208-1210
Sprocket wheel chain.....	201	gravy.....	817
Squares.....	957	milk.....	817, 818
Stainless steel, standard sample.....	1122	soup.....	818
Stakes, bench.....	891	tea.....	818
Stamping act, national.....	1299	Strand. (See Rope, wire.)	
Stands, toilet, sheet metal.....	818	Strap hinges.....	1001
umbrella, sheet metal.....	818	Street washer valves.....	1064
Staples.....	560, 570, 571, 573		
electricians'.....	570		
metal-lath.....	571		

INDEX

	Page		Page
Strips. (See also Sheets.)		Tape, railway car wheel	785, 791, 958, 959
aluminum	1156	Taper pins for castle nuts	588
aluminum alloy	1146	Taps, screw thread	872
aluminum bronze	1258	heat treatment of	77
automotive, steel	238	Tea pots	818
brass	1195, 1198, 1202	Tea strainers	818
bronze. (See also Strips, aluminum bronze; Strips, phosphor bronze.)		Tea trays, sheet metal	818
cartridge, brass	1198	Tees, pipe. (See Fittings, pipe.)	
copper	1172, 1177	structural. (See Shapes, structural.)	
method of test	1172	Tempering of steels. (See Heat treatment of steel.)	
copper-nickel alloy	1282, 1285	Tension test specimen, cast iron	18
German silver. (See Strips, nickel silver.)		Terminal tubes, conduit	1219
lead	1277	Terms used in specifications. (See Definitions of terms.)	
Monel metal. (See Strips, copper-nickel.)		Terneplates, gage for	226
nickel-silver	1286, 1287	method of test	64, 242
nonferrous, thickness gage for	1165	roofing	241
weights of	1165	Ternes. (See Terneplate.)	
phosphor bronze	1269	Test, method of (air brake valves)	493
solder, silver	1335, 1339	(boiler material)	9
steel	237, 238	(castings, gray-iron)	636, 637, 640
zinc	1311, 1314	(chain)	200, 202, 205, 209
thickness gage for	1169	(chain, stud link)	205
weights of	1169	(chain shackles)	215
Structural nickel steel bars, shapes, plates	1126, 1127	(chromium plating)	71
Structural silicon steel bars, shapes, plates	1126	(compression and tension)	5
Structural steel. (See also Bars, structural; Plates, structural; Shapes, structural; etc.)		(copper rods, bars, shapes, plates, sheets, strips)	1172
Structural steel for bridges	249, 250, 251, 273	(galvanizing)	60, 61, 66, 69, 71
Structural steel for buildings	250, 252, 254	(galvanizing of nails)	67, 68, 571
Structural steel for machinery	1, 267	(galvanizing of sheets)	244
Structural steel for railway cars and locomotives	250, 254, 266, 267	(galvanizing of wire rope)	168
Structural steel for ships	250, 268-270	(hardness)	49, 50
Structural steel shapes, plates, and bars, galvanizing of	66	(lead coating on sheets and plates)	64
Stud bolts	552, 554	(magnetic properties of iron and steel)	13
Stuffing tubes, bulkhead	1181	(micrographs, preparation of)	20
Submarine net chain	201	(nails)	571
Substations, electrical, outdoor	276	(nickel plating on brass)	70
Substructures, steel, for tanks. (See Towers, tank.)		(pipe, cast-iron)	383
Sucker-rod gages, oil well	898	(pipe, copper)	1188
Sugar boxes, metal	818	(pipe, culvert, cast-iron)	369
Supports, shelf	1060	(pipe, culvert, corrugated-metal)	488
Surgical beds	828	(pipe, iron)	434, 444, 457
Suspensions, trolley	694	(pipe, steel)	444, 457, 476, 480
Swages, blacksmiths' (sizes)	964	(radiographic testing of metal castings)	45
Switches, railroad	310, 334, 335, 337, 339, 340, 348, 349	(screws)	527
Swivels, chain	216, 223	(sherardizing of iron and steel)	60
Symbols, engineering	9	(ship materials)	7
magnetic testing	18	(stoves and appliances, gas)	858
plumbing	113	(tacks)	571
		(tension and compression)	5
T		terneplates and tin-coated sheets)	242
T Hinges	1002	(test specimens)	4, 48
T slots, their bolts, nuts, tongues, and cutters	589	(testing of metals)	7-51
Tables, dispatchers'	848	(testing machines)	25
laundry	850	(thermal analysis of steel)	44
telegraph	848	(tin coating on sheets and plates)	64
Tableware, silver	1300	(valves, air brake)	493
silver-plated	1301	(wheels, railway car, cast-iron)	654, 655, 658, 660
Tacks, basket (sizes)	559	(wire rope)	159, 167, 175, 180
bill posters'	559, 570	Test bar, arbitration, cast-iron	18
brass	570	Test specimen, iron and steel	48
carpet	559, 570	tension, cast-iron	18
cobblers' (sizes)	560	Testing, definitions of terms relating to magnetic testing	13, 18
copper	559, 570	definitions of terms relating to methods of testing	31, 32
cut (sizes)	558	metallic materials (Brinell hardness testing)	40
double-pointed	570	(compression testing)	38
galvanized	560, 570	(tension testing)	34
gimp	559, 571	metallographic, (definitions of terms)	34
hide (sizes)	559	iron and steel	20, 22
lace (sizes)	559	nonferrous metals and alloys	28
lining (sizes)	559	Testing apparatus, sieve	1227
saddle	571	Testing machine, coupler and axle	750, 751
shoe	560, 571	drop, railroad materials	317
testing of	571	Testing machines, method of verification of	25
thumb	573	Testing screens	1085, 1226, 1227
trimmers' (sizes)	559	brass	1226, 1227
trunk (sizes)	559	Testing sieves	1226, 1227
upholsterer's	559, 571	Thermal analysis of steel	44
Tags, zinc	1311	Thimbles, cables, aeronautic	183
Tamping bars	964, 966	manila rope	1087
Tank heating equipments	867	rope, wire	161, 162, 183, 687
Tank hoops, metal	236	Thread gage blanks	906
Tank plates. (See also Plates, iron; Plates, steel.)		pipe	915
chromium steel	1124	Thread gages	920, 921
Tanks, expansion	853	A cme	934
flammable liquid. (See Tanks, oil.)		drill tool	896
flushing, flushing mechanism for	1062	fire-hose coupling	929
gasoline. (See Tanks, oil.)		hose, welding and cutting torch	836
hot water	853, 866, 1072, 1073	nut	895
iron	292, 293, 298, 299	oil-well casing	895
oil, iron	292, 293, 298, 299	oil-well drill pipe	896
steel	284, 286, 287, 292, 293, 298, 299	oil-well tubing	895
pressure, steel	288, 296	pipe	892, 894, 895, 930
steel	284, 286-288, 292-294, 296, 298, 299, 853, 866, 1072, 1073	12-pitch-thread series	938
substructures for. (See Towers, tank.)		Threads, casing, oil-well	450
water. (See also Tanks, hot water.)		drill pipe, oil-well	454
steel	287, 292, 294	machine screw. (See Threads, screw, machine screw.)	
Tap bolts	604	pipe. (See Threads, screw, pipe.)	
Tap drill sizes	519	screw, A cme	552
Tap rivets	522, 615	bolt	515, 516, 529, 543
		drill-tool	362
		hose coupling	363

SPECIFICATIONS FOR METALS AND METAL PRODUCTS

	Page		Page
Threads, screw, machine screw	515, 516, 529, 543	Trolley suspensions	694
screw, nut	515, 516, 529, 543	bracket arms for	690
pipe	365, 450, 454, 456, 461	Trolley wheels	1257
gages for	892, 894, 930	Trolley wire splicers	694
Thumb latches	1035	Trowels	975
Thumb tacks	573	Truck bolsters, railway car	255, 258
Tie plates, railroad	328, 330, 333, 334	gages for	259
Tie plug punch	964, 969	Truck side frames, railway car	266, 748
Tie-rods, track	360	Trucks, railway car, arch bars for	255
Tie tongs	964, 969	(gages for truck sides)	261
Timber tongs	969	pedestals for	261
Tin, antimony, copper, and lead alloys, chemical analysis of	1317	Trunk nails (sizes)	559
roofing	241	Trunk tacks (sizes)	559
standard sample	1306	Tube fittings for brass and copper tubes	1232
Tin ingots, tubes, etc. (See Ingots, tin; Tubes, tin; etc.)		Tubes, alloy steel	1132
Tin-clad doors. (See Doors, metal clad.)		aluminum alloy	1146
Tin-coated sheets. (See Sheets, tin-coated.)		boiler, brass	1219
Tinners' rivets, steel	614	boiler, copper	1184
Tinners' shears	881	brass	1216, 1219-1223, 1239
Tin-plate gage	226	bulkhead stuffing	1219
Tinware (sizes)	817	chromium steel, for acid tank cars	1132
Tires, railway car wheel, steel	780-782, 788	condenser, admiralty metal. (See Tubes, condenser, brass.)	1219-1222
gages for	780	brass	1219-1222
Toggles, chain	223	ferules for (brass)	1213
Toilet and dressing room inclosures	1078	Muntz metal. (See Tubes, condenser, brass.)	
Toilet stands, sheet metal	818	conduit terminal	1219
Tolerances on dimensions and weights of iron and steel bars	116	copper	1182, 1184-1187
Tolerances on dimensions and weights of iron and steel sheets and plates	117	method of test	1188
Tolerances on dimensions and weights of sheets, plates, bars, etc. (See also Sheets, steel; Plates, steel, etc.)		gas fixture	1239
Tolerances on dimensions and weights of steel plates, shapes, and bars	248	iron	444
Tongs, hand tool (sizes)	964	naval brass. (See Tubes, brass.)	
rail	964, 968	phosphor bronze	1270
tie	964, 969	steel	444, 482, 1132
timber	969	tin	1307
Tool steel, heat treatment of	72, 74, 75, 76	Tubing. (See also Tubes.)	
Tool steel bars. (See Bars, tool, steel.)		oil well	444
Tools, blacksmith (sizes)	964	screw-thread gages for	896
drill (oil well), thread form for	362	stay bolt, steel	143
hand	869-892	Tubing clips (electrical)	482
packing, journal box	977	Tubs, bath. (See also Baths.)	
pneumatic	939	cast-iron	1069
track	963, 966, 968	colors for	816
Tooth form, spur-gear	812, 813	toy, wash	818
Torches, blow	891	wash	819
welding and cutting, thread gages for hose connections	936	Tungsten metal, chemical analysis of	1100
Towers, tank, steel	287, 292, 296	Tungsten powder	1340
Towlines, wire ropes for	159	Tungsten steel, chemical analysis of	1111
Toy coal hod	818	Tungsten steel bars. (See Bars, tungsten steel.)	
Toy washtubs	818	Turbine bucket wheels	814
Track adzes	941, 964	Turn, cupboard	1055, 1081
Track bolts	350, 352, 353, 356, 357	locker	1055
Track castings, iron. (See Castings, track, iron.)		Turnbuckles. (See also Rigging screws for ships.)	
steel. (See Castings, track, steel.)		aeronautic	630
Track chisels	964, 969	Turnbuckles for blinds	1044
Track forgings. (See Forgings, track.)		Turnbuckles (sizes)	634
Track gage	310, 901, 964	Turners, cake	817
Track maul	968	Twist link chain	211
Track nuts	350, 352, 353, 356, 357		
Track punches	964, 969	U	
Track spikes	357-360, 570	Umbrella stands, sheet metal	818
Track tie rods	360	Union pipe fittings	416
Track tools	963, 966, 968	Unions, pipe	416, 428, 429
Track work, special	334-352	Upholsterer's nails	569
bolted	336	Upholsterer's tacks	559, 571
cast	335	Urinals, flushing mechanism for	1062
cast steel hard center construction	348		
iron-bound hard center	348	V	
materials for	342	Vacuum oven, constant temperature	867
rail-bound insert type	340	Valves. (See also Cocks.)	
Transfer cases. (See Cases, file.)		acid tank car, chromium steel castings for	1134
Transmission shafts. (See Shafts, line.)		air brake, method of test	493
Transom butt hinges	999	angle. (See Valves, pipe.)	
Transom catches	1043	bronze castings for	1250, 1252
Transom chains	1050	carbonated water and sirup	491
Transom eyes	1050	check	503, 1064
Transom lifters	1051	rubber facings for	498
Transom operators	1050	chlorine container	507
Transom pivots	1052	compression stop	1062
Transoms, metal (sizes)	1051	flammable liquid	509
Traps, drain	1234	flushing	1063
plumbing	1065, 1075, 1234	flushing tank	1062
Tray plug, laundry tray	1075	gas cylinder	507, 512
Trays, tea, sheet metal	818	gas shut-off	509
Trim, door, metal (sizes and types)	280, 282	gasoline hose	509
Trimmers' tacks (sizes)	559	gate. (See Valves, pipe.)	
Trimnings, plumbing	1062	globe. (See Valves, pipe.)	
water-closet and bath inclosure	1074	gray-iron castings for	637
Triple-valve for air brakes, test of	493	hose	502, 509
Trolley bracket arms	699	mixing, shower bath	1066
Trolley cross span steady	703	pipe. (See also Hydrants.)	
Trolley crossings	692	pipe	365, 491, 492, 497, 499, 501, 505, 509, 1062, 1063, 1064, 1066
Trolley ears	693	dry, rubber facings for	498
Trolley feed wire clamp	700	(sizes)	365
Trolley frogs	693	radiator	509
Trolley hangers	694, 701	reducing, gas cylinder	512
Trolley oversupport rods	693, 699	release air brake	496
Trolley pole bracket steady	703	safety, boiler	492, 513
Trolley pullover	702	locomotive	492
Trolley spacer links	702	tank car	493
		(sizes)	365

INDEX

	Page		Page
Valves, steel castings for.....	709	Window cleaners belts and anchors.....	1286
street washer.....	1064	Window fasteners.....	1043
sirup (carbonated beverages).....	491	Window lifts.....	1041
triple, air brake, test of.....	493	Window screen fasteners.....	1044
Vanadium steel. (See also chromium-vanadium steel.)		Window screen lifts.....	1042
chemical analysis of.....	1111	Window screen wire cloth.....	195, 1228, 1256
Variations in dimensions, weight, etc. (See also Tolerances on dimensions, weight, etc.)		Window spring bolt locks.....	1060
Vehicle and harness hooks.....	218	Window stop adjuster.....	1050
Vessels, unfired pressure. (See Tanks, pressure.)		Windows. (See also Casements.)	
Vise clamps.....	884	Windows. (See also Sash.)	
Vises.....	882	Windows, steel.....	280
W			
Wardrobe locks.....	1030	Wire, aluminum. (See also Wire, welding, aluminum.)	
Warm-air furnaces, gas, house heating.....	861	Wire, aluminum.....	1158, 1159
house heating.....	861, 866	aluminum alloy.....	1146
Warm-air heating systems for house heating.....	866	barbed.....	194, 196
Warps, wire ropes for.....	159	bonding, galvanizing of.....	60
Washboards.....	818	brass. (See also Wire, solder, copper zinc.)	
Wash boilers.....	817, 818	(See also Wire, welding, brass.)	
Washtubs.....	819	brass.....	1206
Washers.....	624, 626, 688	bronze. (See also Wire, phosphor bronze.)	
flat, aeronautic.....	624	bronze.....	1249
lock.....	624	copper.....	1181
plain.....	626	(rods for drawing into wire).....	1179
street.....	1064	copper-nickel.....	1286
Watchcases.....	1304	fence.....	192, 196
Watches, sizes of.....	1304	iron. (See also Wire, welding, iron.)	
testing of.....	1305	iron.....	153, 192, 194
Water, carbonated, pipe fittings for.....	1230	testing of galvanizing.....	66
Water-closet floor flanges.....	1065	manganese bronze.....	1268
Water-closet inclosures, trimmings for.....	1074	messenger. (See Rope, wire, messenger.)	
Water-closet seats, hinges for.....	993	nickel.....	1282
Water closets, colors for.....	816	nickel-chromium.....	1296, 1297
flushing mechanism for.....	1062	phosphor-bronze, for springs.....	1270
Water coolers, sheet metal.....	818	reinforcement, steel.....	304, 305
Water filters, pressure.....	1086	sash and bell cord.....	167
Water heaters, coal burning.....	1071, 1072	solder, brazing.....	1334
gas.....	855	solder, copper-zinc.....	1334
Water pipe, cast-iron.....	376, 379, 381	silver.....	1335, 1339
Water pipe flanges, automobile.....	414	tin-lead.....	1330
Water pots.....	818	spring, phosphor-bronze.....	1270
Water tanks, hot water.....	1072, 1073	steel. (See also Wire, welding, steel.)	
Watering pots.....	818	steel.....	153, 192, 194, 196, 304, 305
Web saws.....	955	testing of galvanizing.....	66
Wedges, journal bearing.....	681	welding. (See also Rods, welding.)	
gages for.....	1327	aluminum.....	1157
(sizes).....	962	brass.....	1203, 1334
Weights, carat.....	1298	(electric, iron and steel.....	155-157
sash.....	1049	(gas). (See also Rods, welding, (gas).)	
Welding electrodes, iron.....	155	iron and steel.....	156
steel.....	155	Wire cloth.....	195, 1228, 1229, 1256
Welding neck pipe flanges.....	412	Fourdrinier.....	1229
Welding rods, aluminum.....	1157	Wire gages.....	153
aluminum alloy.....	1157	Wire lath.....	301
brass.....	1203	Wire loops and ferrules, aeronautic.....	194
copper.....	1180	Wire rope. (See Rope, wire.)	
copper-nickel.....	1285	Wood screws.....	579, 584
gas, iron.....	156, 157	brass.....	584
steel.....	156, 157	Woodruff key way cutters.....	620
manganese bronze.....	1266	Woodruff key ways for shafts.....	623
steel.....	149	Woodruff keys.....	622
Welding torches, screw thread gages for hose connections.....	936	Woodworkers' chisels, gouges, and slicks.....	945
Welding wire, aluminum.....	1157	Wrecking bar.....	971
brass.....	1203, 1334	Wrench openings.....	884
iron and steel.....	155-157	Wrenches.....	883, 963
Well drilling equipment. (See Oil well.)		Wrought-iron, definitions of terms relating to.....	71
Wheel contour measuring tape.....	958, 959	Wrought-iron sheets, plates, etc. (See Sheets, iron; Plates, iron; etc.)	
Wheels, crane track, steel.....	793	Y	
locomotive. (See Wheels, railway car.)		Y branch, pipe.* (See Fittings, pipe.)	
railway car, cast-iron.....	649, 653, 654, 656, 661, 775	Yokes, coupler, railway car.....	259
gage for.....	652	Ys, pipe.† (See Fittings, pipe.)	
method of test.....	654, 655, 658, 660	Z	
cast steel.....	745	Zinc, battery, gravity.....	1316
electric, steel.....	787	chemical analysis of.....	1308
gages for.....	310, 652, 773-775, 777, 779, 780, 785-787, 791, 792	standard sample.....	1310
mounting of.....	780	Zinc coatings. (See Galvanizing.)	
steel.....	775, 776, 780, 781, 783, 787, 789	Zinc ore, standard sample.....	1310
gages for.....	785-787, 791, 792	Zinc plates, strips, etc. (See Plates, zinc; Strips, zinc; etc.)	
steel tire for.....	780, 782, 788	Zinc plating. (See Galvanizing.)	
trolley.....	1257	Zinc-coated (galvanized) steel sheets. (See Sheets, galvanized.)	
turbine bucket.....	814
