Photonuclear Data Index

January 1965 through April 1967

United States Department of Commerce

National Bureau of Standards

Miscellaneous Publication 277—Supplement 1

THE NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards[1] provides measurement and technical information services essential to the efficiency and effectiveness of the work of the Nation's scientists and engineers. The Bureau serves also as a focal point in the Federal Government for assuring maximum application of the physical and engineering sciences to the advancement of technology in industry and commerce. To accomplish this mission, the Bureau is organized into three institutes covering broad program areas of research and services:

THE INSTITUTE FOR BASIC STANDARDS . . . provides the central basis within the United States for a complete and consistent system of physical measurements, coordinates that system with the measurement systems of other nations, and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. This Institute comprises a series of divisions, each serving a classical subject matter area:

—Applied Mathematics—Electricity—Metrology—Mechanics—Heat—Atomic Physics—Physical Chemistry—Radiation Physics—Laboratory Astrophysics[2]—Radio Standards Laboratory,[2] which includes Radio Standards Physics and Radio Standards Engineering—Office of Standard Reference Data.

THE INSTITUTE FOR MATERIALS RESEARCH . . . conducts materials research and provides associated materials services including mainly reference materials and data on the properties of materials. Beyond its direct interest to the Nation's scientists and engineers, this Institute yields services which are essential to the advancement of technology in industry and commerce. This Institute is organized primarily by technical fields:

—Analytical Chemistry—Metallurgy—Reactor Radiations—Polymers—Inorganic Materials—Cryogenics[2]—Office of Standard Reference Materials.

THE INSTITUTE FOR APPLIED TECHNOLOGY . . . provides technical services to promote the use of available technology and to facilitate technological innovation in industry and government. The principal elements of this Institute are:

—Building Research—Electronic Instrumentation—Technical Analysis—Center for Computer Sciences and Technology—Textile and Apparel Technology Center—Office of Weights and Measures —Office of Engineering Standards Services—Office of Invention and Innovation—Office of Vehicle Systems Research—Clearinghouse for Federal Scientific and Technical Information[3]—Materials Evaluation Laboratory—NBS/GSA Testing Laboratory.

J. D. Murphy, and J. S. O'Connell

Foreword

A Photonuclear Data Center is being operated in the Radiation Physics Division of the NBS Institute for Basic Standards with the support of the NBS Office of Standard Reference Data. The objective of the Center project is the creation and maintenance of a current Photonuclear Data File which will be used as source material for a series of miscellaneous reports covering various aspects of the field.

This publication is the first in a series of supplements to the Photonuclear Data Index (NBS Miscellaneous Publication 277), which the Center issued in April 1966. It essentially covers data published in the field of photonuclear reactions in the period from January 1, 1965 through the middle of April 1967. It is expected that additional cumulative supplements will be issued approximately every one and a half to two years. Future publications of the Center will contain critically evaluated data and will be included in the National Standard Reference Data Series.

The NBS Office of Standard Reference Data was established to carry out the Bureau's assigned responsibility to administer the National Standard Reference Data System (NSRDS). This System is a Government-wide effort to give the American technical community optimum access to the quantitative data of physical science, critically evaluated and compiled for convenience. The NSRDS was established by the President's Office of Science and Technology, acting upon the recommendation of the Federal Council for Science and Technology. Its general objective is to coordinate and integrate existing data evaluation and compilation activities into a systematic, comprehensive program supplementing and expanding technical coverage when necessary, establishing and maintaining standards for the output of the participating groups, and providing mechanisms for the dissemination of the output as required.

A. V. Astin, Director.

PHOTONUCLEAR DATA INDEX
Supplement 1 (1967)

Photonuclear Data Project*

Radiation Physics Division
National Bureau of Standards, Washington, D. C.

This index, a supplement to NBS Miscellaneous Publication 277, primarily covers data published in the period dated January 1, 1965 through the middle of April 1967. Organized by element and isotope, each entry in the index supplies quantitative information for a specific reaction on the ranges of excitation energy, source energy, detected particle energy, and emission angles for reaction produced covered in each reference. Information is also given on the type of measurement and detector used.

Key Words: Bibliography, Data Index, Elements, Isotopes, Nuclear Physics, Photonuclear Reactions.

1. Introduction

The function of this data index is to furnish a means of readily locating experimental data in the field of photonuclear reactions. This index differs from a bibliography in that it supplies quantitative information about the content of a paper. Each entry in the index corresponds to the measurement of a specific photonuclear reaction for a specific nuclide or group of nuclides. An attempt is made to give as complete a description of each measurement as is possible in a single line. The type of measurement is indicated as well as the range of excitation energies covered, the type of detector used and its energy response, and the type of angular distribution data obtained. The object has been to give a description of each measurement that is complete enough to permit an individual looking for specific types of data in the field to locate the pertinent references without having to go through a large number of irrelevant papers as might be the case if only the title of the paper or the reaction studied were listed for each entry.

For the purposes of this index the general criterion as to what constitutes a measurement of photonuclear data is that the measurement must give information on the electromagnetic matrix element between the ground state and excited states of some nucleus. The most common type

*Participants in the photonuclear data project: T. M. Collins, E. G. Fuller, J. D. Murphy, and J. S. O'Connell.

of reactions are: (γ,γ), (γ,n), (γ,p), (p,γ_o), and (e,e'). Two reactions which fit the matrix element criterion, but which were not included in the compilation because of their rather special nature are heavy particle coulomb excitation and the thermal neutron capture reaction (n,γ_o). The energy region of interest is from 0 to about 150 MeV. Most of the experiments are concerned with the excitation energy range 8 to 30 MeV, the region of the giant dipole resonance.

2. Scope of the Data Index

This supplement covers experimental data published in the period from January 1, 1965 through April 1967. In addition, it contains the complete index entry for all the items marked with an asterisk in the original Photonuclear Data Index NBS Miscellaneous Publication 277. In the original index, these entries had been made on the basis of the abstracts of the papers only, not a complete reading of the paper. In preparing this supplement, nine journals were searched, issue by issue. These were: Journal of Experimental and Theoretical Physics (JETP), Journal of Experimental and Theoretical Physics (JETP Letters), Journal of Nuclear Physics-USSR (Sov. J. Nucl. Phys.), Physics Letters, Nuclear Physics, Il Nuovo Cimento, Physical Review, Physical Review Letters, and Zeitschrift für Physik (Z. Physik). Nuclear Science Abstracts was used to find papers in other journals.

Only articles published in journals were abstracted. In a few cases, conference reports were used if the article was fairly complete and it was likely that this was the final report of the experiment.

3. Description of the Index

The data index of each element begins with the isotopic abundances for that element and a list of particle thresholds for each isotope. The abundances were taken from a compilation by Gladys Fuller[1]. This reference should be consulted for remarks concerning the accuracy of these values and possible variations with the source of the sample. The reaction thresholds were taken from a list of Q-values computed by J. H. E. Mattauch, W. Thiele, and A. H. Wapstra[2]. The values given in reference 2 have been arbitrarily rounded off to the nearest 0.1 MeV except for those cases where the uncertainties quoted are of the order of 1 MeV. In these cases, thresholds are given to the nearest MeV.

In the index itself eight categories are used to describe a given paper. These are: Reference Number; Nucleus Excited; Reaction; Type of Information; Excitation Energy Range; Source Type and Energy Range; Detector Type; Energy and Angular Range; and Remarks.

For each element, entries are grouped under six reaction classes. These are: total absorption cross sections; elastic and inelastic photon scattering; inelastic electron scattering, including coincidence experi-

ments with outgoing reaction products; reactions where a neutron is detected, i.e. (γ,n), (γ,xn), (γ,np), etc.; reactions where protons are detected; reactions where particles of mass greater than one or multiple particles are emitted; inverse capture reactions; and photofission.

4. Description of Entries

4.1. Reference Number (REF)

The reference number is used to cite the full bibliographical reference which is given in the bibliography following the data index. This number is made up of the year and the first two letters of the first author's name, plus an additional serial number. For example, a paper published in 1963 by Galileo would have a reference number 63Gal.

4.2. Nucleus Excited (NUCLIDE)

The atomic number (Z), chemical symbol, and mass number (A) of the excited nucleus (not necessarily the target nucleus) is given. The mass number is listed only if the isotopic assignment is unambiguous. In general, it was assumed that the mass number was unambiguous if in the target the abundance of a single isotope was $\geq 97\%$.

4.3. Reaction

The following table defines the symbols used under IN,OUT:

$	polarization of the incident or outgoing particle or polarization or alignment of the target
A	alpha particle
D	deuteron
E	electron
E/	inelastically scattered electron
E+	positron
F	fission
G	photon
G/	inelastically scattered photon
He3	^{3}He
MU-T	total photon absorption
N	neutron

P	proton
T	triton
XN	all neutrons
XP	all protons

When two reaction products are listed under OUT they were detected in coincidence, e.g., the notation E,E/P means the inelastically scattered electron and proton were detected in coincidence in a reaction of the type: $A + e \rightarrow (A - 1) + e + p$, while E, P means that only the proton was detected.

4.4. Type of Information (RES)

The following catalog of abbreviations applies to the type of result obtained in an experiment:

ABI	absolute integrated cross section data $\int \sigma dE_\gamma$
ABX	absolute cross-section data
ABY	absolute yield data
FMF	form factor
LFT	excitated state lifetime
NOX	no cross-section data
RLI	relative integrated cross-section data
RLX	relative cross-section data
RLY	relative yield data
SPC	particle energy spectrum

4.5. Excitation Energy Range (EXCIT)

The excitation energy range of the nucleus involved in the gamma-ray transition is given in MeV. For reactions initiated by gamma rays, the excitation energy is taken as the gamma-ray energy; for reactions initiated by particles, the binding energy and kinematic corrections are made. The abbreviation THR stands for threshold.

4.6. Source Type and Energy Range (SOURCE)

The source of incident particles is characterized by the letter C or D indicating that the source was continuous or discrete in energy. The source energy is indicated under MIN-MAX. The usual source of photons is bremsstrahlung which would be marked C. The range of end point energies is given.

4.7. Detector Type, Energy, and Angular Range (DETECTOR)

The following abbreviations apply under detector TYPE:

ACT	measurement of radioactivity of the target
BBL	bubble chamber
BF3	BF_3 neutron counter with moderator, e.g., Halpern detector, long counter
CCH	cloud chamber
EMU	emulsions (photographic plates)
IØN	ionization chamber
MAG	magnetic spectrometer
MGC	magnetic Compton spectrometer
MGP	magnetic pair spectrometer
MØD	moderated neutron detector not employing a BF_3 counter, e.g., rhodium foil, Szilard-Chalmers reaction, ^3He, ^6Li reactions
NAI	NaI(Tl) spectrometer
SCD	semiconductor (solid state) detector
SCI	scintillator detector other than NaI; e.g., CsI, KI, organic (liquid or solid), stilbene, He
SPK	spark chamber
TEL	counter telescope
THR	threshold detector, e.g., $^{29}Si(n,p)\ ^{29}Al$
TØF	time-of-flight detector

The symbols D or I under TYPE mean that the reaction product was detected differentially or integrally in energy. For example, a scintillator (SCI) is usually used differentially (D) while a BF_3 detector used with a neutron moderator (BF3) integrates over neutron energy. The range of detected particle angular distribution is shown under ANG with the following designations:

0-180	one number in this column means the measurements were made at this angle only (angle in degrees)
4PI	a 4π geometry was used or a method like radioactivity or a total absorption measurement
DST	an angular distribution was measured

4.8. Remarks

This additional information was selected in a fairly unsystematic way and limited by the available space. It should therefore not be regarded as exhaustive or consistent.

Some of the abbreviations used in this column are:

BREAKS	levels located by "breaks" in the yield curve
CF	compared with
COINC	coincidence
DT BAL	detail balance
G-WIDTH	Γ_γ, gamma-ray transition width
J-PI	spin and parity assignments of levels are made
POL	polarization
Q-SQUARE	momentum transfer squared (q^2)
REL	relative
SEP ISOTPS	separated isotope used

Bibliography

In the following bibliography Conference Proceedings are indicated as follows:

PICNS-60 Proceedings of the International Conference on Nuclear Structure, Kingston, Ontario 1960 (Bromley, D. A. and Vogt, E. W., Eds., University of Toronto Press, 1960)

PICNS-61 Proceedings of the Rutherford Jubilee International Conference Manchester 1961 (Birks, J. B., Ed., Academic Press Inc., New York, 1961)

PICNS-62 Proceedings of the Conference on Direct Interactions and Nuclear Reaction Mechanisms, University of Padua 1962 (Clementel, E. and Villi, C., Eds., Gordon and Breach, New York-London, 1963)

PICNS-64 Congrès International de Physique Nucléaire, Paris 1964 (Gugenberger, P., Ed., Editions Centre Natl. Rech. Sci., Paris, 1964)

55Ba5 P. S. Baranov, V. I. Gol'danskii; Zhur. Eksp. i Teoret. Fiz. 28, 746, (1955); Soviet Phys. JETP 1, 613 (1955)

55Bu1 J. L. Burkhardt; Phys. Rev. 100, 192 (1955)

55Ca2 J. H. Carver, H. J. Hay, E. W. Titterton; Phil Mag. 46, 841 (1955)

55Er1 P. Erdos, P. Jordan, P. Stoll; Helv. Phys. Acta 28, 322 (1955)

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH reports National Bureau of Standards research and development in physics, mathematics, chemistry, and engineering. Comprehensive scientific papers give complete details of the work, including laboratory data, experimental procedures, and theoretical and mathematical analyses. Illustrated with photographs, drawings, and charts.

Published in three sections, available separately:

• Physics and Chemistry

Papers of interest primarily to scientists working in these fields. This section covers a broad range of physical and chemical research, with major emphasis on standards of physical measurement, fundamental constants, and properties of matter. Issued six times a year. Annual subscription: Domestic, $5.00; foreign, $6.00*.

• Mathematics and Mathematical Physics

Studies and compilations designed mainly for the mathematician and theoretical physicist. Topics in mathematical statistics, theory of experiment design, numerical analysis, theoretical physics and chemistry, logical design and programming of computers and computer systems. Short numerical tables. Issued quarterly. Annual subscription: Domestic, $2.25; foreign, $2.75*.

• Engineering and Instrumentation

Reporting results of interest chiefly to the engineer and the applied scientist. This section includes many of the new developments in instrumentation resulting from the Bureau's work in physical measurement, data processing, and development of test methods. It will also cover some of the work in acoustics, applied mechanics, building research, and cryogenic engineering. Issued quarterly. Annual subscription: Domestic, $2.75; foreign, $3.50*.

TECHNICAL NEWS BULLETIN

The best single source of information concerning the Bureau's research, developmental, cooperative and publication activities, this monthly publication is designed for the industry-oriented individual whose daily work involves intimate contact with science and technology—*for engineers, chemists, physicists, research managers, product-development managers, and company executives.* Annual subscription: Domestic, $1.50; foreign, $2.25*.

*Difference in price is due to extra cost of foreign mailing.

NONPERIODICALS

Applied Mathematics Series. Mathematical tables, manuals, and studies.

Building Science Series. Research results, test methods, and performance criteria of building materials, components, systems, and structures.

Handbooks. Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Miscellaneous Publications. Charts, administrative pamphlets, Annual reports of the Bureau, conference reports, bibliographies, etc.

Monographs. Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

National Standard Reference Data Series. NSRDS provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated.

Product Standards. Provide requirements for sizes, types, quality and methods for testing various industrial products. These standards are developed cooperatively with interested Government and industry groups and provide the basis for common understanding of product characteristics for both buyers and sellers. Their use is voluntary.

Technical Notes. This series consists of communications and reports (covering both other agency and NBS-sponsored work) of limited or transitory interest.

CLEARINGHOUSE

The Clearinghouse for Federal Scientific and Technical Information, operated by NBS, supplies unclassified information related to Government-generated science and technology in defense, space, atomic energy, and other national programs. For further information on Clearinghouse services, write:
