## **Foreword**

The National Standard Reference Data System is a Government-wide effort to provide for the technical community of the United States effective access to the quantitative data of physical science, critically evaluated and compiled for convenience, and readily accessible through a variety of distribution channels. The System was established in 1963 by action of the President's Office of Science and Technology and the Federal Council for Science and Technology.

The responsibility to administer the System was assigned to the National Bureau of Standards and an Office of Standard Reference Data was set up at the Bureau for this purpose. Since 1963, this Office has developed systematic plans for meeting high-priority needs for reliable reference data. It has undertaken to coordinate and integrate existing data evaluation and compilation activities (primarily those under sponsorship of Federal agencies) into a comprehensive program, supplementing and expanding technical coverage when necessary, establishing and maintaining standards for the output of the participating groups, and providing mechanisms for the dissemination of the output as required.

The System now comprises a complex of data centers and other activities, carried on in Government agencies, academic institutions, and nongovernmental laboratories. The independent operational status of existing critical data projects is maintained and encouraged. Data centers that are components of the NSRDS produce compilations of critically evaluated data, critical reviews of the state of quantitative knowledge in specialized areas, and computations of useful functions derived from standard reference data. In addition, the centers and projects establish criteria for evaluation and compilation of data and make recommendations on needed modifications or extensions of experimental techniques.

Data publications of the NSRDS take a variety of physical forms, including books, pamphlets, loose-leaf sheets and computer tapes. While most of the compilations have been issued by the Government Printing Office, several have appeared in scientific journals. Under some circumstances, private publishing houses are regarded as appropriate primary dissemination mechanisms.

The technical scope of the NSRDS is indicated by the principal categories of data compilation projects now active or being planned: nuclear properties, atomic and molecular properties, solid state properties, thermodynamic and transport properties, chemical kinetics, colloid and surface properties, and mechanical properties.

An important aspect of the NSRDS is the advice and planning assistance which the National Research Council of the National Academy of Sciences-National Academy of Engineering provides. These services are organized under an overall Review Committee which considers the program as a whole and makes recommendations on policy, long-term planning, and international collaboration. Advisory Panels, each concerned with a single technical area, meet regularly to examine major portions of the program, assign relative priorities, and identify specific key problems in need of further attention. For selected specific topics, the Advisory Panels sponsor sub-panels which make detailed studies of users' needs, the present state of knowledge, and existing data resources as a basis for recommending one or more data compilation activities. This assembly of advisory services contributes greatly to the guidance of NSRDS activities.

The NSRDS-NBS series of publications is intended primarily to include evaluated reference data and critical reviews of long-term interest to the scientific and technical community.

A. V. ASTIN, *Director.*

## Preface

The rigid asymmetric rotor provides the first approximation for treating the rotational energy of asymmetric molecules. It is thus of considerable importance in the interpretation of both pure-rotational spectra and the rotational fine structure in vibrational and electronic bands. The quantum mechanics of the rigid asymmetric rotor has been discussed in many places, and several tabulations of energy eigenvalues and direction-cosine matrix elements are available. For some purposes, however, it is necessary to have an explicit description of the asymmetric rotor eigenfunctions. This can be given most conveniently in terms of the transformation coefficients from a symmetric rotor basis to the asymmetric rotor basis. The first part of this volume is a tabulation of transformation coefficients for varying degrees of asymmetry.

The transformation coefficients may be used to derive expectation values and matrix elements for the asymmetric rotor from the well-known properties of the symmetric rotor. Three quantities which are of particular importance in spectral analysis are the angular-momentum expectation values  $\langle P_z^2 \rangle$ ,  $\langle P_z^4 \rangle$ , and  $\langle P_z^6 \rangle$ . Values of these quantities have been computed at the same asymmetry intervals used in the table of transformation coefficients. They are tabulated in Part II of the volume.

# Tables for the Rigid Asymmetric Rotor: Transformation Coefficients from Symmetric to Asymmetric Bases and Expectation Values of $P_z^2$ , $P_z^4$ , and $P_z^6$

R. H. Schwendeman

Department of Chemistry, Michigan State University, East Lansing, Michigan

Tables of computed quantities associated with the rigid asymmetric rotor are presented. The first group of tables gives transformation coefficients from symmetric to asymmetric rotor bases. These coefficients permit the eigenfunctions of the asymmetric rotor to be written in terms of symmetric-rotor eigenfunctions. In Part II the angular-momentum expectation values ( $P_z^2$ ), ( $P_z^4$ ), and ( $P_z^6$ ) are tabulated. In both sets of tables values are given at intervals of 0.1 in the asymmetry parameter  $\kappa$  and for  $J \leq 15$ . The tabulated quantities find use in the analysis of microwave rotational spectra and the rotational fine structure in vibrational and electronic band spectra.

**Key Words:** Angular momentum, asymmetric rotor, eigenfunction, microwave spectra, rotational spectrum, and transformation coefficients.

## Description of the Tables

### I. Transformation Coefficients from Wang Symmetric to Asymmetric Rotor Bases

The matrices reproduced on the following pages contain the coefficients of the transformation from the Wang symmetric rotator basis to asymmetric rotator bases of varying degrees of asymmetry. The coefficients were computed on the CDC 3600 computer at Michigan State University, stored on magnetic tape, and prepared for duplication.

The computed transformation coefficients are the elements of a matrix  $\mathbf{T}$  where

$$\mathbf{w} = \tilde{\mathbf{T}} \mathbf{H}_w \mathbf{T}.$$

Here  $\mathbf{H}_w$  is the Wang reduced energy matrix [1] for a rigid asymmetric rotator in the Wang symmetric rotator basis and  $\mathbf{w}$  is diagonal. The matrices  $\mathbf{T}$  were computed for  $2 \leq J \leq 15$  at intervals of 0.1 in the asymmetry parameter  $\kappa$ . The King, Hainer, Cross representation  $I'$  was used [2] and the calculations were performed for  $0 \geq \kappa \geq -0.9$  using a continued fraction expansion which has been described [3]. The matrices for positive  $\kappa$  may be obtained from those for negative  $\kappa$  by interchanging  $K_{-1}$  and  $K_{+1}$  in the labeling of the eigenvectors (the columns of the matrices). In this case the representation will be  $III'$ . To obtain the matrices for representations  $I'$  and  $III'$  from the corresponding matrices for  $I'$  and  $III'$ , the signs of the matrix elements in alternate rows must be changed.

The matrix  $\mathbf{T}$  is diagonal in  $J$  and in a symmetry symbol  $\sigma$  ( $\sigma = E^+, 0^+, 0^-,$  or  $E^-$ ) [2]. Consequently,

the table consists of a reproduction of the submatrices for each  $J$ ,  $\sigma$ , and  $\kappa$ . The eigenvalues of  $\mathbf{H}_w$  used to compute the entries were accurate to at least  $\pm 1 \times 10^{-7}$  and the uncertainty in the matrix elements of  $\mathbf{T}$  is believed to be no more than  $\pm 1 \times 10^{-8}$  (the elements are normalized and given to eight decimal places). For checking purposes the elements of the matrix  $\mathbf{T}\tilde{\mathbf{T}}$  were computed and found to differ in every case by less than  $\pm 1 \times 10^{-8}$  from the elements of the unit matrix.

The principal application of the  $\mathbf{T}$  matrices is to express the wave functions of the asymmetric rotator as a linear combination of Wang symmetric rotator functions or to transform the matrix of an observable from the symmetric to the asymmetric rotator basis. If  $\phi$  is a row matrix of the Wang functions and  $\psi$  is a row matrix of the asymmetric rotator functions, then  $\psi = \phi \mathbf{T}$ . If  $\mathbf{A}_\phi$  is the matrix of an observable in the  $\phi$  basis and  $\mathbf{A}_\psi$  is the matrix of the same observable in the  $\psi$  basis, then

$$\mathbf{A}_\psi = \tilde{\mathbf{T}} \mathbf{A}_\phi \mathbf{T}.$$

## II. Expectation values $w(b)$ , $\langle P_z^2 \rangle$ , $\langle P_z^4 \rangle$ , and $\langle P_z^6 \rangle$ , for the Rigid Asymmetric Rotator

The computer program which was used to generate the transformation coefficients in the previous table has also been used to compute a table of  $\langle P_z^2 \rangle$ ,  $\langle P_z^4 \rangle$ , and  $\langle P_z^6 \rangle$  for asymmetric rotator molecules. These quantities are the average values of the square, fourth power, and sixth power of the molecule-fixed  $z$ -axis component of the rotational angular momentum. The calculations were performed on the CDC 3600 computer at Michigan State University.

The values of  $\langle P_z^2 \rangle$ ,  $\langle P_z^4 \rangle$ , and  $\langle P_z^6 \rangle$  have been computed for  $J \leq 15$  at intervals of 0.1 in the asymmetry parameter  $\kappa$ . The calculations were performed for  $0 \geq \kappa \geq -0.9$  using coordinate identification  $I^r$  in which the  $a$  and  $z$  axes are identical [1]. The expectation values for  $0 \leq \kappa \leq 0.9$  are obtained by changing the sign of  $\kappa$  in the table, interchanging the  $K_{-1}$  and  $K_{+1}$  labels of the energy states, and identifying  $\langle P_z^n \rangle$  with  $\langle P_a^n \rangle$  (coordinate identification  $III^l$  or  $III^r$ ). Values of the Wang reduced energy,  $w$ , have also been computed.

The values of  $w$ ,  $\langle P_z^2 \rangle$ ,  $\langle P_z^4 \rangle$ , and  $\langle P_z^6 \rangle$  are given to eight significant figures in floating decimal format and should be accurate to within  $\pm 1$  in the last figure given. (The last three digits and associated sign for each number give the exponent of 10. Thus, for example,

$$4.5808604 - 004 = 4.5808604 \times 10^{-4}.$$

For checking purposes the expectation values were read back into the computer from the computer tape used for duplication. Sums of the values read in were then compared with theoretical values of the sums. In no case did the calculated and theoretical sums differ by more than  $\pm 1$  in the eighth significant figure. As an additional check the values of  $\langle P_z^4 \rangle$  were compared with values computed from  $\langle P_z^2 \rangle$  and  $w$  using eq (6) below and found to agree to within the significance of the comparison.

Making use of the familiar relations, [1, 2]

$$H_w = P_z^2 + b(P_y^2 - P_x^2), \quad (1)$$

$$b = (Y - X)/(2Z - X - Y), \quad (2)$$

Representation  $I^r$ :  $Z = A$ ,  $X = B$ ,  $Y = C$ ,  $b = b_P$

$$= (\kappa + 1)/(\kappa - 3)$$

Representation  $III^l$ :  $Z = C$ ,  $X = B$ ,  $Y = A$ ,  $b = b_0$

$$= (\kappa - 1)/(\kappa + 3)$$

$$P^2 = P_x^2 + P_y^2 + P_z^2, \quad (3)$$

$$\langle H_w \rangle = w, \quad (4)$$

$$\langle P^2 \rangle = J(J+1), \quad (5)$$

it may be shown that

$$2\langle P_x^2 \rangle = J(J+1) - \langle P_z^2 \rangle - (w - \langle P_z^2 \rangle)/b,$$

$$2\langle P_y^2 \rangle = J(J+1) - \langle P_z^2 \rangle + (w - \langle P_z^2 \rangle)/b,$$

$$4\langle P_x^4 \rangle = (J(J+1) - w/b)^2 - 2(1 - 1/b)(J(J+1) - w/b)\langle P_z^2 \rangle + (1 - 1/b)^2\langle P_z^4 \rangle$$

$$4\langle P_y^4 \rangle = (J(J+1) + w/b)^2 - 2(1 + 1/b)(J(J+1) + w/b)\langle P_z^2 \rangle + (1 + 1/b)^2\langle P_z^4 \rangle. \quad (6)$$

In addition, from an equation given by Watson [3], it may be shown that

$$\begin{aligned} \langle P_z^4 \rangle &= \langle P_z^2 \rangle^2 - (f+g)(\langle P_x^2 \rangle \langle P_y^2 \rangle + \langle P_z^2 \rangle^2) \\ &\quad + f(\langle P_y^2 \rangle \langle P_z^2 \rangle + \langle P_x^2 \rangle \langle P_z^2 \rangle) \\ &\quad + g(\langle P_z^2 \rangle \langle P_x^2 \rangle + \langle P_y^2 \rangle \langle P_z^2 \rangle) \end{aligned} \quad (6)$$

where

$$f = 2b/(3b+3),$$

$$g = 2b/(3b-3).$$

The principal application of the  $\langle P_z^n \rangle$  is for the evaluation of the effects of centrifugal distortion. The centrifugal distortion contribution,  $W_1$ , to the total rotational energy of an asymmetric rotator may be written to first order as follows [3]:

$$\begin{aligned} W_1 &= d'_J J^2 (J+1)^2 - d'_{JK} J(J+1) \langle P_z^2 \rangle - d'_K \langle P_z^4 \rangle \\ &\quad - d'_{wJ} w J(J+1) - d'_{wK} w \langle P_z^2 \rangle \end{aligned}$$

where

$$d'_J = d_J + (\bar{X} + \bar{Y}) d_{wJ}/2$$

$$d'_{JK} = d_{JK} + (\bar{X} + \bar{Y}) d_{wK}/2$$

$$d'_K = d_K$$

$$d'_{wJ} = (2\bar{Z} - \bar{X} - \bar{Y}) d_{wJ}/2$$

$$d'_{wK} = (2\bar{Z} - \bar{X} - \bar{Y}) d_{wK}/2.$$

Equations for the unprimed  $d$ 's and the effective rotational constants  $\bar{X}$ ,  $\bar{Y}$ ,  $\bar{Z}$  in terms of the  $\tau$ 's of Kivelson and Wilson may be found in the recent paper by Watson [3].

The values of  $\langle P_z^2 \rangle$  and  $\langle P_z^4 \rangle$  are also useful in evaluating higher order corrections for internal

rotation [4]. In addition, the squares find use in fitting spectra since [5]

$$\langle P_\alpha^2 \rangle = \frac{\partial W}{\partial \alpha}, \quad \alpha = A, B, C,$$

where  $W$  is the energy of a rigid rotator.

## **Announcement of New Publications on Standard Reference Data**

Superintendent of Documents,  
Government Printing Office,  
Washington, D.C. 20402

Dear Sir:

Please add my name to the announcement list of new publications to be issued in the series: National Standard Reference Data Series—National Bureau of Standards.

Name \_\_\_\_\_

Company \_\_\_\_\_

Address \_\_\_\_\_

City \_\_\_\_\_ State \_\_\_\_\_ Zip Code\_\_\_\_\_

(Notification Key N337)

## THE NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards<sup>1</sup> provides measurement and technical information services essential to the efficiency and effectiveness of the work of the Nation's scientists and engineers. The Bureau serves also as a focal point in the Federal Government for assuring maximum application of the physical and engineering sciences to the advancement of technology in industry and commerce. To accomplish this mission, the Bureau is organized into three institutes covering broad program areas of research and services:

**THE INSTITUTE FOR BASIC STANDARDS** . . . provides the central basis within the United States for a complete and consistent system of physical measurements, coordinates that system with the measurement systems of other nations, and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. This Institute comprises a series of divisions, each serving a classical subject matter area:

—Applied Mathematics—Electricity—Metrology—Mechanics—Heat—Atomic Physics—Physical Chemistry—Radiation Physics—Laboratory Astrophysics<sup>2</sup>—Radio Standards Laboratory,<sup>2</sup> which includes Radio Standards Physics and Radio Standards Engineering—Office of Standard Reference Data.

**THE INSTITUTE FOR MATERIALS RESEARCH** . . . conducts materials research and provides associated materials services including mainly reference materials and data on the properties of materials. Beyond its direct interest to the Nation's scientists and engineers, this Institute yields services which are essential to the advancement of technology in industry and commerce. This Institute is organized primarily by technical fields:

—Analytical Chemistry—Metallurgy—Reactor Radiations—Polymers—Inorganic Materials—Cryogenics<sup>2</sup>—Office of Standard Reference Materials.

**THE INSTITUTE FOR APPLIED TECHNOLOGY** . . . provides technical services to promote the use of available technology and to facilitate technological innovation in industry and government. The principal elements of this Institute are:

—Building Research—Electronic Instrumentation—Technical Analysis—Center for Computer Sciences and Technology—Textile and Apparel Technology Center—Office of Weights and Measures—Office of Engineering Standards Services—Office of Invention and Innovation—Office of Vehicle Systems Research—Clearinghouse for Federal Scientific and Technical Information<sup>3</sup>—Materials Evaluation Laboratory—NBS/GSA Testing Laboratory.
