NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards¹ was established by an act of Congress March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau consists of the Institute for Basic Standards, the Institute for Materials Research, the Institute for Applied Technology, the Institute for Computer Sciences and Technology, and the Office for Information Programs.

THE INSTITUTE FOR BASIC STANDARDS provides the central basis within the United States of a complete and consistent system of physical measurement; coordinates that system with measurement systems of other nations; and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. The Institute consists of a Center for Radiation Research, an Office of Measurement Services and the following divisions:

Applied Mathematics — Electricity — Mechanics — Heat — Optical Physics — Nuclear Sciences² — Applied Radiation² — Quantum Electronics³ — Electromagnetics³ — Time and Frequency³ — Laboratory Astrophysics³ — Cryogenics³.

THE INSTITUTE FOR MATERIALS RESEARCH conducts materials research leading to improved methods of measurement, standards, and data on the properties of well-characterized materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government agencies; and develops, produces, and distributes standard reference materials. The Institute consists of the Office of Standard Reference Materials and the following divisions:

Analytical Chemistry — Polymers — Metallurgy — Inorganic Materials — Reactor Radiation — Physical Chemistry.

THE INSTITUTE FOR APPLIED TECHNOLOGY provides technical services to promote the use of available technology and to facilitate technological innovation in industry and Government; cooperates with public and private organizations leading to the development of technological standards (including mandatory safety standards), codes and methods of test; and provides technical advice and services to Government agencies upon request. The Institute consists of a Center for Building Technology and the following divisions and offices:

Engineering and Product Standards — Weights and Measures — Invention and Innovation — Product Evaluation Technology — Electronic Technology — Technical Analysis — Measurement Engineering — Structures, Materials, and Life Safety⁴ — Building Environment⁴ — Technical Evaluation and Application⁴ — Fire Technology.

THE INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides technical services designed to aid Government agencies in improving cost effectiveness in the conduct of their programs through the selection, acquisition, and effective utilization of automatic data processing equipment; and serves as the principal focus within the executive branch for the development of Federal standards for automatic data processing equipment, techniques, and computer languages. The Institute consists of the following divisions:

Computer Services — Systems and Software — Computer Systems Engineering — Information Technology.

THE OFFICE FOR INFORMATION PROGRAMS promotes optimum dissemination and accessibility of scientific information generated within NBS and other agencies of the Federal Government; promotes the development of the National Standard Reference Data System and a system of information analysis centers dealing with the broader aspects of the National Measurement System; provides appropriate services to ensure that the NBS staff has optimum accessibility to the scientific information of the world. The Office consists of the following organizational units:

Office of Standard Reference Data — Office of Information Activities — Office of Technical Publications — Library — Office of International Relations.

¹ Headquarters and Laboratories at Gaithersburg, Maryland, unless otherwise noted; mailing address Washington, D.C. 20234.

² Part of the Center for Radiation Research.

³ Located at Boulder, Colorado 80302.

⁴ Part of the Center for Building Technology.

Foreword

The National Standard Reference Data System provides access to the quantitative data of physical science, critically evaluated and compiled for convenience and readily accessible through a variety of distribution channels. The System was established in 1963 by action of the President's Office of Science and Technology and the Federal Council for Science and Technology, and responsibility to administer it was assigned to the National Bureau of Standards.

NSRDS receives advice and planning assistance from a Review Committee of the National Research Council of the National Academy of Sciences-National Academy of Engineering. A number of Advisory Panels, each concerned with a single technical area, meet regularly to examine major portions of the program, assign relative priorities, and identify specific key problems in need of further attention. For selected specific topics, the Advisory Panels sponsor subpanels which make detailed studies of users' needs, the present state of knowledge, and existing data resources as a basis for recommending one or more data compilation activities. This assembly of advisory services contributes greatly to the guidance of NSRDS activities.

The System now includes a complex of data centers and other activities in academic institutions and other laboratories. Components of the NSRDS produce compilations of critically evaluated data, reviews of the state of quantitative knowledge in specialized areas, and computations of useful functions derived from standard reference data. The centers and projects also establish criteria for evaluation and compilation of data and recommend improvements in experimental techniques. They are normally associated with research in the relevant field.

The technical scope of NSRDS is indicated by the categories of projects active or being planned: nuclear properties, atomic and molecular properties, solid state properties, thermodynamic and transport properties, chemical kinetics, and colloid and surface properties.

Reliable data on the properties of matter and materials is a major foundation of scientific and technical progress. Such important activities as basic scientific research, industrial quality control, development of new materials for building and other technologies, measuring and correcting environmental pollution depend on quality reference data. In NSRDS, the Bureau's responsibility to support American science, industry, and commerce is vitally fulfilled.

RICHARD W. ROBERTS, *Director*

Preface

This report is one of a series of data publications on radiation chemistry; the aim of the series is to compile, evaluate, and present the numerical results on processes occurring in systems which have been subjected to ionizing radiation. Various kinds of data are important in radiation chemistry. The quantities which were measured first were the observed radiation yields or G values (molecules formed or destroyed per 100 eV). Various indirect methods based on G values have been used to determine yields of transient species and relative rates of reactions. The spectral properties (optical, electron spin resonance) of transients have provided a direct method for their identification, and rates of the very fast reactions of transients which occur in irradiated systems have been measured directly by spectroscopic methods. Conductivity and luminescence methods have also provided a means of measuring properties of transients and their kinetics. Some reactions which occur in irradiated systems have also been studied by other methods, such as photochemistry, electric discharge, ultrasonics, chemical initiation, electron impact, etc. The emphasis in these publications is on the data of radiation chemistry, but where other pertinent data exist, they are included.

The data of radiation chemistry are voluminous; thousands of systems have been investigated. As a result there are certain collections, *e.g.* rate constants of particular types of reactions or certain properties of transients, for which tabulations of the data are considered essential, but for which critical assessment of each value is impossible. On the other hand, certain systems and properties have been studied so extensively that critical examination of these data is desirable and timely. Authors of this series of data publications have been asked to evaluate the extent to which the data can be critically assessed, to describe their criteria for evaluation, and to designate preferred values whenever possible.

*Radiation Chemistry Data Center, Radiation Laboratory,**

University of Notre Dame, Notre Dame, Ind. 46556

Rates of reactions of hydrogen atoms (from radiolysis of water and other sources) with organic and inorganic molecules, ions, and transients in aqueous solution have been tabulated. Directly measured rates obtained by kinetic spectroscopy or conductimetric methods, and relative rates determined by competition kinetics are included.

Key words: Aqueous solution; chemical kinetics; data compilation; hydrogen atom; radiation chemistry; rates.

Introduction

The radiolysis of water yields three major intermediates: the hydrogen atom, the hydrated electron, and the hydroxyl radical. Tables of rates of hydrated electron reactions comprise part I of this series (73-0030). This compilation contains tables of rates of hydrogen atom reactions in aqueous solution and covers the literature through 1972. The rate data for the hydroxyl radical have been compiled and will be published in part III of this series.

The hydrogen atom is the simplest chemical species, carrying a single electron. Being such a fundamental entity, its reactivity with other chemical species is of special interest to theoretical chemists as well as to anyone involved in the research of mechanisms of chemical reactions. In addition, the hydrogen atom is one of the important products of the radiolysis of water and its reactivity determines, therefore, the behavior of radiolyzed systems. As such the hydrogen atom reactions are of great importance to radiation chemists and radiobiologists.

The chemical behavior of hydrogen atoms may be summarized in the following examples:

*The Radiation Laboratory is operated under contract with The Atomic Energy Commission. The work of the Center is supported jointly by The National Bureau of Standards, Office of Standard Reference Data and The Atomic Energy Commission. This is AEC Document COO-38-815.

These reactions include abstraction reactions, some of which—like hydrogen abstraction—may be defined as oxidation processes. Additions to double bonds or aromatic rings and to free radicals or biradicals may be considered as reducing processes. The third category of H atom reactions are reduction processes which proceed probably via electron transfer mechanisms. Finally there are the $\text{H} + \text{OH}^-$ and $\text{H} + \text{F}^-$ reactions which yield hydrated electrons and which have no simple analog in chemistry.

In acid solutions hydrated electrons are converted into hydrogen atoms,

with a specific rate of $2.3 \times 10^{10} \text{ dm}^3/\text{mol} \cdot \text{s}$. In alkaline solutions hydrogen atoms are converted into hydrated electrons (see 2.90);

thus, the amount of H present in strongly alkaline solutions is very small, but irradiated acidic and neutral aqueous solutions contain hydrogen atoms which react with each other, with other transients from water, and with organic and inorganic materials in the solution. A large number of such reactions have been studied, although the number of H atom reactions for which rates are available is less than the nearly 700 e_{aq}^- reactions listed in part I. One reason for the larger number of hydrated electron rates is the ease of their direct measurement by kinetic spectroscopy. Hydrogen atom reactions have been studied in a number of ways, but only a few of the data have been obtained by direct methods.

Methods for Specific Rate Determination

Generation of H by pulse radiolysis of aqueous solutions and direct observations of the hydrogen atom by esr or optical spectroscopy, by conductivity methods, as well as by measurements on transients produced by H addition or abstraction, can be used in some cases to determine rates.

The reaction $\text{H} + \text{H} \rightarrow \text{H}_2$ has been measured directly by following the decay of the optical absorption of the hydrogen atom at 200 nm. The rate law is $-\text{d}[\text{H}]/\text{dt} = 2k[\text{H}]^2$. In this compilation, values of k are reported. In other cases, absolute specific rates of reactions have been measured by following the growth of the optical absorption signal due to a product of the reaction. For reactions, where none of the products has optical absorption, the relative rates have been measured by competition with reactions which produce products with optical absorption. Interference by OH, or transients from OH reactions, must be avoided in all optical studies by removing the OH from the solution. Alcohols such as *tert*-butanol and CD_3OH , which react much more slowly with H than with OH, have been used as scavengers for OH: another method for removing OH is saturation with H_2 at high pressures which converts OH to H by the reaction $\text{OH} + \text{H}_2 \rightarrow \text{H} + \text{H}_2\text{O}$.

The esr signals of hydrogen atoms are observed in irradiated aqueous solutions as a result of their enhancement by spin polarization effects. These signals decrease with time because of relaxation processes. This relaxation has been used to measure relative and absolute rates of reactions of the hydrogen atom by steady state and pulse radiolysis, respectively.

There are about 60 reactions in these tables for which specific rates have been determined directly; the rates are listed in the column under k . More commonly, the kinetics of reactions of H are studied indirectly by steady state radiolysis, or in a few cases by atomized hydrogen gas flow techniques, by comparing measurements made on two reactants. The result is a ratio of rate constants obtained by analyzing the data assuming a kinetic mechanism. The majority of the nearly 400 reactions in these tables list relative rates which have been determined by competition kinetics, either by steady state or pulse techniques. The measured rate ratios are included in the column under *Ratio* and are given in the form

k/k_x , where k_x is $k(H + X)$ and X is the competing reactant. Certain values of k have been chosen for normalization of the relative data; those values are listed in table 1. Values of k are calculated from the ratios using those values and are designated as relative (rel.). The values listed in table 1 have been chosen either because they are *directly* measured values or because they give the best agreement among various values of relative rates. These values, some of which had to be chosen arbitrarily, are not presented as recommended values and are open for revision.

Abbreviations used for X, and other abbreviations and symbols used in the tables, are collected at the end of this section.

Arrangement of Tables

Arrangement of these tables is similar to the arrangement in part I; reactions of H with other transients from water are in table 2. Reactions of H with inorganic solutes are listed in table 3 in alphabetical order by main element. Reactions of H with organic solutes are listed in table 4 in alphabetical order by name. In most cases IUPAC nomenclature has been used. All reported values of specific rates have been included except when a measurement has been superseded by a more reliable measurement by the same author. In a few cases values were omitted because it was apparent that the reported value did not refer to the stated reaction or that the value was completely out of line with a number of well-established superseding measurements. Within the tables both solute and reaction have been included when product identification has been made; otherwise only the solute is listed.

Columns are included identifying the source of the radical and the method of measurement; other descriptive information is given under *Comments*. The serial number used in the Radiation Chemistry Data Center files has been used for citing references; the first two digits of the number specify year. All references are given following the tables. A formula index is also included, following the tables, as an aid in locating specific compounds.

Acknowledgements

The assistance of the staff of the Radiation Chemistry Data Center in preparation of these tables is gratefully acknowledged. Our thanks go especially to Mary Early for proofreading and indexing and to Joyce Ross for typing of the manuscript. We are grateful to those persons who have provided unpublished data for inclusion in these tables.

16. ABSTRACT (A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.) Rates of reactions of hydrogen atoms (from radiolysis of water and other sources) with organic and inorganic molecules, ions, and transients in aqueous solution have been tabulated. Directly measured rates obtained by kinetic spectroscopy or conductimetric methods, and relative rates determined by competition kinetics are included.				
17. KEY WORDS (Alphabetical order, separated by semicolons) Aqueous solution; chemical kinetics; data compilation; hydrogen atom; radiation chemistry; rates.

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH reports National Bureau of Standards research and development in physics, mathematics, and chemistry. It is published in two sections, available separately:

• Physics and Chemistry (Section A)

Papers of interest primarily to scientists working in these fields. This section covers a broad range of physical and chemical research, with major emphasis on standards of physical measurement, fundamental constants, and properties of matter. Issued six times a year. Annual subscription: Domestic, \$17.00; Foreign, \$21.25.

• Mathematical Sciences (Section B)

Studies and compilations designed mainly for the mathematician and theoretical physicist. Topics in mathematical statistics, theory of experiment design, numerical analysis, theoretical physics and chemistry, logical design and programming of computers and computer systems. Short numerical tables. Issued quarterly. Annual subscription: Domestic, \$9.00, Foreign, \$11.25

DIMENSIONS/NBS (formerly Technical News Bulletin)—This monthly magazine is published to inform scientists, engineers, businessmen, industry, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on the work at NBS. The magazine highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, it reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing.

Annual subscription: Domestic, \$4.45; Foreign, \$11.85.

NONPERIODICALS

Monographs—Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

Handbooks—Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications—Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Applied Mathematics Series—Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

National Standard Reference Data Series—Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a world-wide

program coordinated by NBS. Program under authority of National Standard Data Act (Public Law 90-306)

NOTE: At present the principal publication outlet for these data is the Journal of Physical and Chemical Reference Data (JPCRD) published quarterly for NBS by the American Chemical Society (ACS) and the American Institute of Physics (AIP). Subscriptions, reprints, and supplements available from ACS, 1155 Sixteenth St. N. W., Wash. D. C. 20056

Building Science Series—Disseminates technical information developed at the Bureau on building materials, components systems and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Technical Notes—Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

Voluntary Product Standards—Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The purpose of the standards is to establish nationally recognized requirements for products, and to provide all concerned interests with a basis for common understanding of the characteristics of the products. NBS administers this program as a supplement to the activities of the private sector standardizing organizations.

Federal Information Processing Standards Publications (FIPS PUBS)—Publications in this series collectively constitute the Federal Information Processing Standards Register. Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations).

Consumer Information Series—Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

NBS Interagency Reports (NBSIR)—A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Service (Springfield, Va. 22161) in paper copy or microfiche form.

Order NBS publications (except NBSIR's and Bibliographic Subscription Services) from: Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.

BIBLIOGRAPHIC SUBSCRIPTION SERVICES

The following current-awareness and literature-survey bibliographies are issued periodically by the Bureau:

Cryogenic Data Center Current Awareness Service

A literature survey issued biweekly. Annual subscription: Domestic, \$20.00; foreign, \$25.00.

Classified Natural Gas. A literature survey issued quarterly. Annual subscription: \$20.00.

Superconducting Devices and Materials. A literature

survey issued quarterly. Annual subscription: \$20.00. Send subscription orders and remittances for the preceding bibliographic services to National Technical Information Service, Springfield, Va. 22161.

Electromagnetic Metrology Current Awareness Service Issued monthly. Annual subscription: \$100.00 (Special rates for multi-subscriptions). Send subscription order and remittance to Electromagnetics Division, National Bureau of Standards, Boulder, Colo. 80302.
