THE NATIONAL BUREAU OF STANDARDS

The scope of activities of the National Bureau of Standards is suggested in the following listing of the divisions and sections engaged in technical work. In general, each section is engaged in specialized research, development, and engineering in the field indicated by its title. A brief description of the activities, and of the resultant reports and publications, appears on the inside of the back cover of this report.

Electricity. Resistance Measurements. Inductance and Capacitance. Electrical Instruments. Magnetic Measurements. Applied Electricity. Electrochemistry.

Optics and Metrology. Photometry and Colorimetry. Optical Instruments. Photographic Technology. Length. Gage.

Heat and Power. Temperature Measurements. Thermodynamics. Cryogenics. Engines and Lubrication. Engine Fuels. Cryogenic Engineering.

Atomic and Radiation Physics. Spectroscopy. Radiometry. Mass Spectrometry. Solid State Physics. Electron Physics. Atomic Physics. Neutron Measurements. Infrared Spectroscopy. Nuclear Physics. Radioactivity. X-Rays. Betatron. Nucleonic Instrumentation. Radiological Equipment. Atomic Energy Commission Instruments Branch.

Chemistry. Organic Coatings. Surface Chemistry. Organic Chemistry. Analytical Chemistry. Inorganic Chemistry. Electrodeposition. Gas Chemistry. Physical Chemistry. Thermochemistry. Spectrochemistry. Pure Substances.

Mechanics. Sound. Mechanical Instruments. Aerodynamics. Engineering Mechanics. Hydraulics. Mass. Capacity, Density, and Fluid Meters.

Organic and Fibrous Materials. Rubber. Textiles. Paper. Leather. Testing and Specifications. Polymer Structure. Organic Plastics. Dental Research.

Metallurgy. Thermal Metallurgy. Chemical Metallurgy. Mechanical Metallurgy. Corrosion.

Mineral Products. Porcelain and Pottery. Glass. Refractories. Enameled Metals. Concreting Materials. Constitution and Microstructure. Chemistry of Mineral Products.

Building Technology. Structural Engineering. Fire Protection. Heating and Air Conditioning. Floor, Roof, and Wall Coverings. Codes and Specifications.

Applied Mathematics. Numerical Analysis. Computation. Statistical Engineering. Machine Development.

Electronics. Engineering Electronics. Electron Tubes. Electronic Computers. Electronic Instrumentation.

Radio Propagation. Upper Atmosphere Research. Ionospheric Research. Regular Propagation Services. Frequency Utilization Research. Tropospheric Propagation Research. High Frequency Standards. Microwave Standards.

Ordnance Development. These three divisions are engaged in a broad program of research

Electromechanical Ordnance. and development in advanced ordnance. Activities include Electronic Ordnance. basic and applied research, engineering, pilot production, field testing, and evaluation of a wide variety of ordnance matériel. Special skills and facilities of other NBS divisions also contribute to this program. The activity is sponsored by the Department of Defense.

Missile Development. Missile research and development: engineering, dynamics, intelligence, instrumentation, evaluation. Combustion in jet engines. These activities are sponsored by the Department of Defense.

● Office of Basic Instrumentation

● Office of Weights and Measures.

FOREWORD

This report was prepared as part of a continuing program of research on mathematical statistics and its applications carried out at the National Bureau of Standards under the general supervision of Dr. Churchill Eisenhart, Chief of the Statistical Engineering Laboratory. The Statistical Engineering Laboratory is Section 11.3 of the National Applied Mathematics Laboratories (Division 11, National Bureau of Standards), and is concerned with the development and application of modern statistical methods in the physical sciences and engineering.

J. H. Curtiss

INTRODUCTION

by

W. S. Connor

In the balanced incomplete block design v variaties or treatments are compared in such a manner that each treatment is assigned to r experimental units. The units themselves are arranged into b more or less homogeneous blocks, each containing k experimental units. Any two treatments occur together in the same block λ times, the treatments occurring in a given block being all different. Hence the design depends on the five parameters, v , b , r , k , and λ . From this definition it is easy to show that the following conditions are necessary:

$$bk = vr, r(k-1) = (v-1)\lambda.$$

Fisher [1] also showed that for the existence of an actual combinatorial solution it is necessary that

$$b \geq v, \text{ or } k \leq r.$$

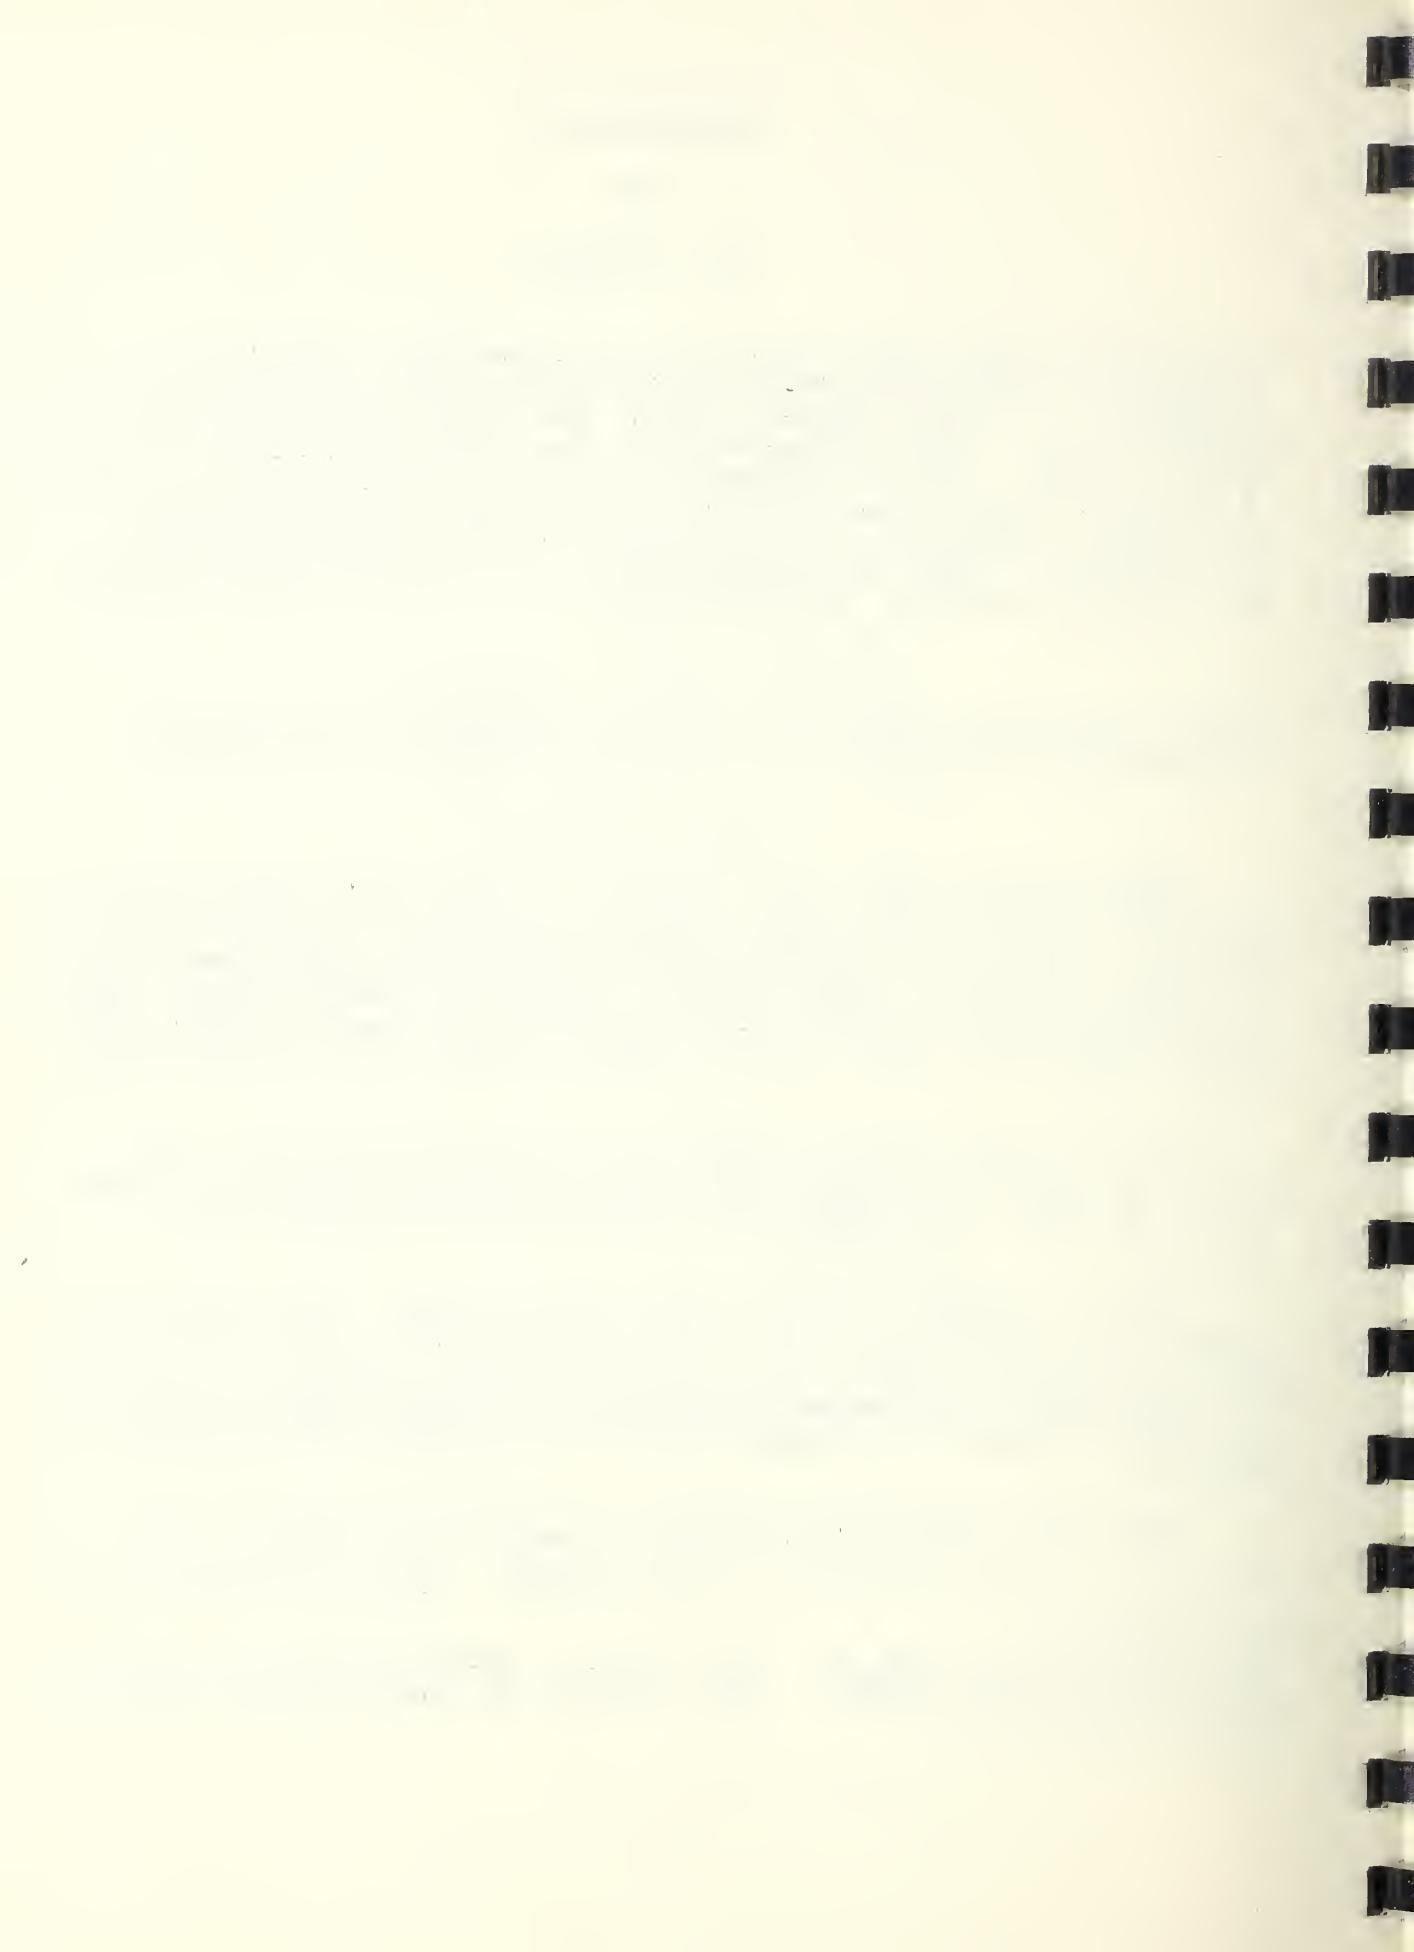

The work of Yates [2], Fisher and Yates [3], Bose [4], and Bhattacharya [5], [6], [7], provided solutions for many of these designs. Sets of parameters which satisfy the above conditions, together with brief explanations of how to construct the corresponding designs, are included in Fisher and Yates' tables [8]. All of these sets have $r \leq 10$, which is felt to be a practical upper limit.

The purpose of this report is to write out in full the solutions for the designs which are listed by Fisher and Yates. It is believed that making the designs more accessible will increase their usefulness.

Every solution occupies one or more pages. The reference number and parameters of the design are given at the top of the page, followed in some cases by descriptive remarks, and then by the solution. Treatments are denoted by Arabic numbers, blocks by Arabic numbers in parentheses, and replications by Roman numbers.

The index gives the reference number,* parameters, and important characteristics of each design. These characteristics

*No solution is known for those sets of parameters which do not carry a reference number. All but two of these designs have been proved impossible.

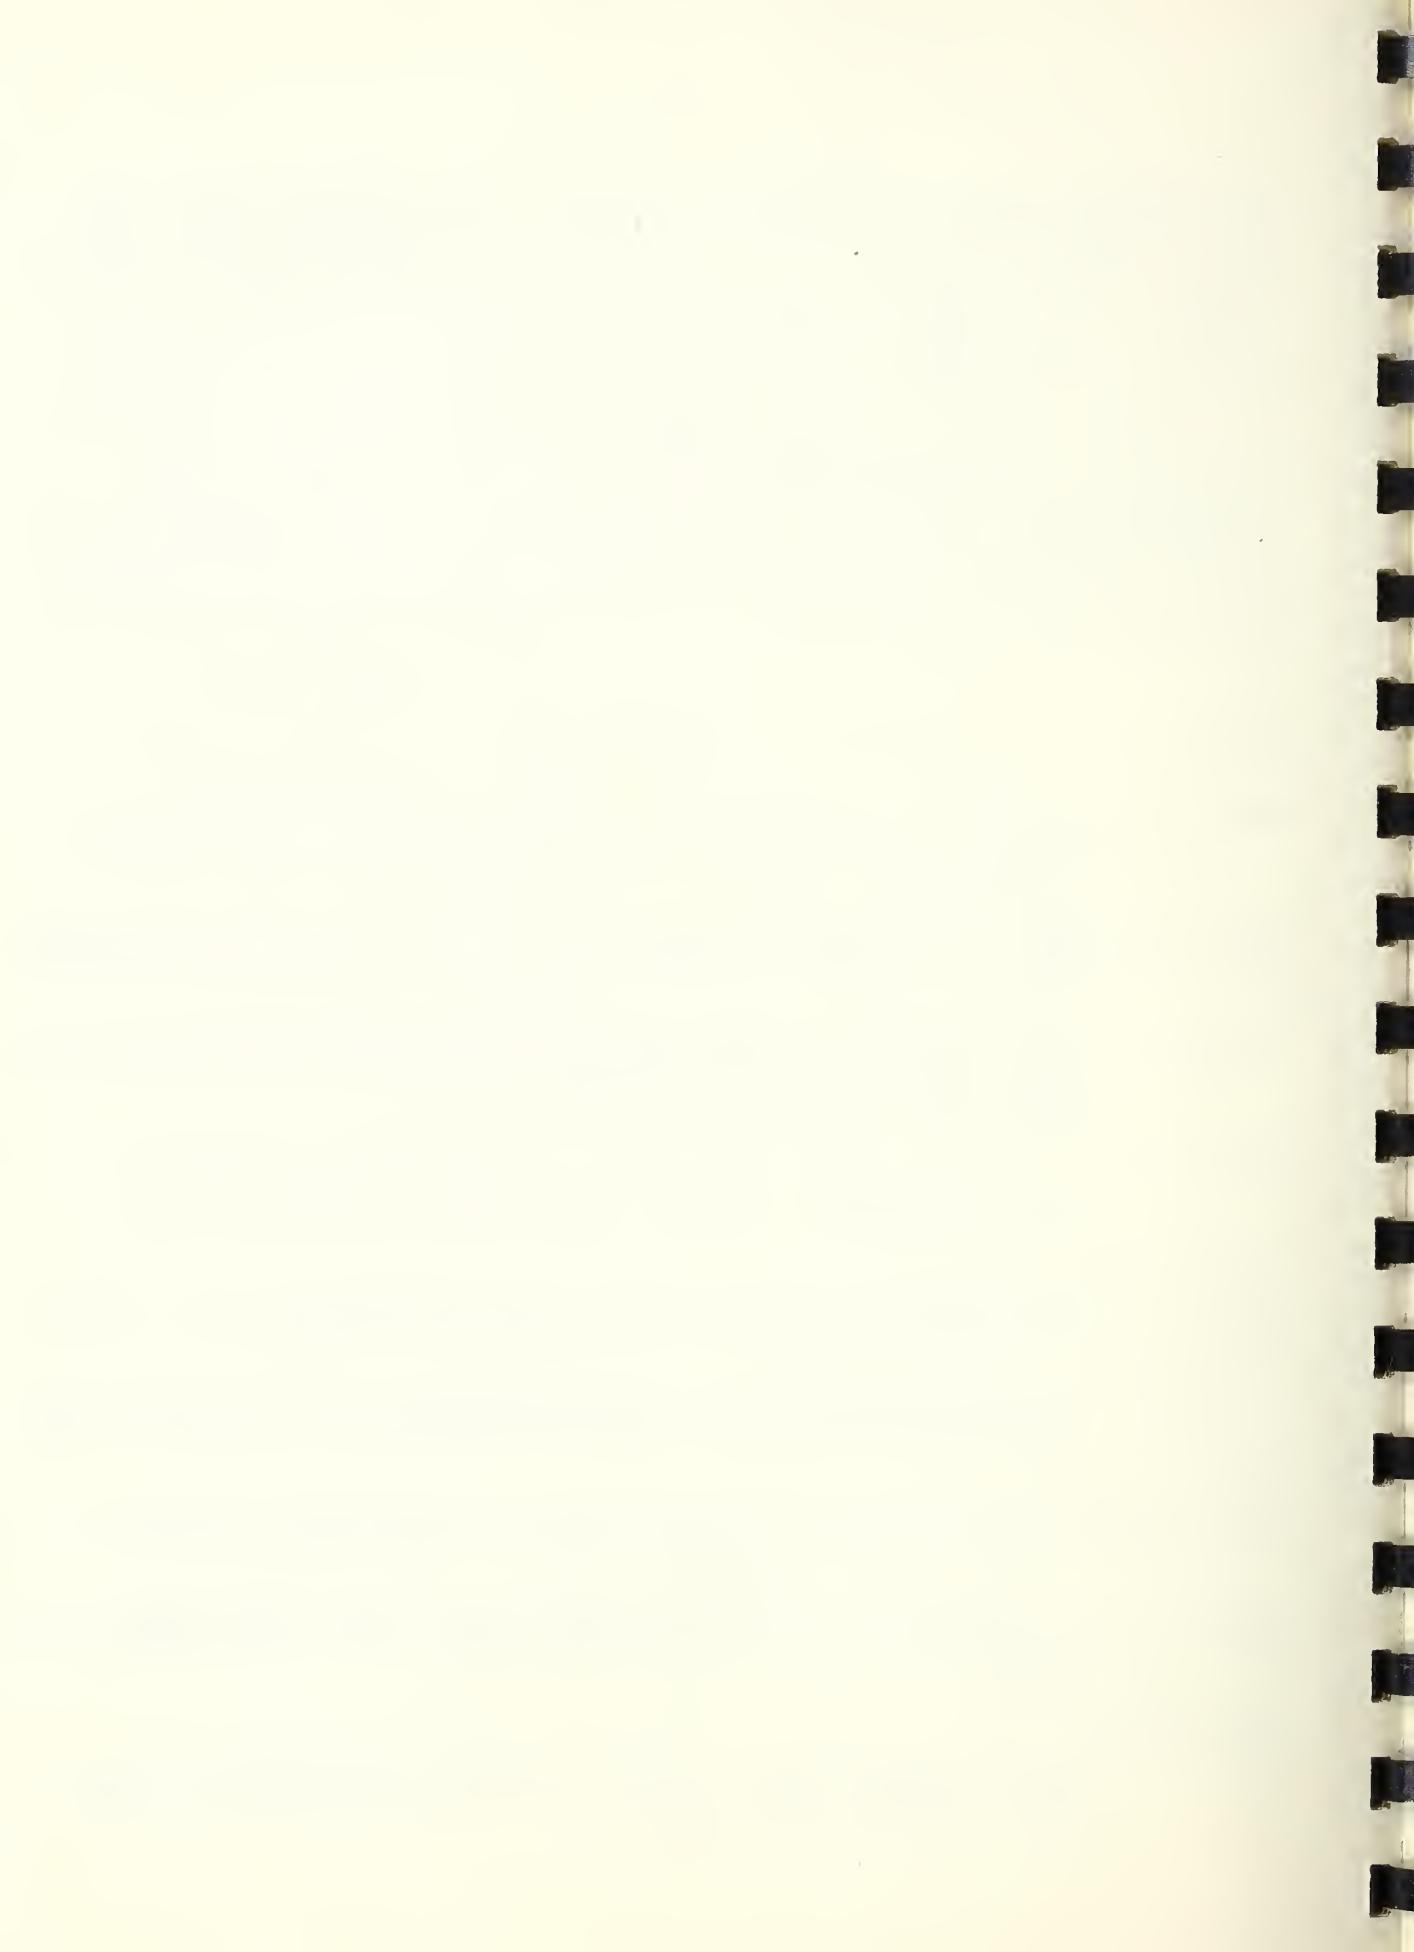

are abbreviated in a "Remarks" column. The abbreviations have the following meanings: "R" denotes "resolvable", which means that the blocks are divisible into groups, which have the property that every treatment occurs once in a group: " $i_1 G : i_2$ "; where i_1 and i_2 are positive integers, means that the blocks have been divided into i_1 groups, each of which contains every treatment i_2 times.

"Y.S." denotes "Youden Square", which means that the treatments have been arranged so that each column contains every treatment exactly once. This kind of arrangement is always possible when $b = v$. The first Youden Squares were given in [9]. "E.Y.S." denotes "extended Youden Square", and means that each column contains every treatment i_3 times, where i_3 is a positive integer, greater than one.

(7)	7	1	2	3	4

CORRECTION

In the designs which are divided into groups, Roman numbers have been used to indicate the groups. The caption of this column has been mislabelled "Rep.," instead of the correct "Group." For example, the design with reference number 2, which has two groups, should appear as follows:

<u>Group</u>	<u>Blk.</u>	<u>Tr.</u>
I	(1)	1 2
	(2)	2 5
	(3)	3 4
	(4)	4 1
	(5)	5 3
II	(6)	1 3
	(7)	2 4
	(8)	3 2
	(9)	4 5
	(10)	5 1

No confusion will arise by observing that such designs carry a brief description, in which the number of groups is specified.

Some other designs, such as the design with reference number 1, are divided into replications, and hence the caption "Rep." is correct for them.

THE NATIONAL BUREAU OF STANDARDS

Functions and Activities

The functions of the National Bureau of Standards are set forth in the Act of Congress, March 3, 1901, as amended by Congress in Public Law 619, 1950. These include the development and maintenance of the national standards of measurement and the provision of means and methods for making measurements consistent with these standards; the determination of physical constants and properties of materials; the development of methods and instruments for testing materials, devices, and structures; advisory services to Government Agencies on scientific and technical problems; invention and development of devices to serve special needs of the Government; and the development of standard practices, codes, and specifications. The work includes basic and applied research, development, engineering, instrumentation, testing, evaluation, calibration services, and various consultation and information services. A major portion of the Bureau's work is performed for other Government Agencies, particularly the Department of Defense and the Atomic Energy Commission. The scope of activities is suggested by the listing of divisions and sections on the inside of the front cover.

Reports and Publications

The results of the Bureau's work take the form of either actual equipment and devices or published papers and reports. Reports are issued to the sponsoring agency of a particular project or program. Published papers appear either in the Bureau's own series of publications or in the journals of professional and scientific societies. The Bureau itself publishes three monthly periodicals, available from the Government Printing Office: The Journal of Research, which presents complete papers reporting technical investigations; the Technical News Bulletin, which presents summary and preliminary reports on work in progress; and Basic Radio Propagation Predictions, which provides data for determining the best frequencies to use for radio communications throughout the world. There are also five series of nonperiodical publications: The Applied Mathematics Series, Circulars, Handbooks, Building Materials and Structures Reports, and Miscellaneous Publications.

Information on the Bureau's publications can be found in NBS Circular 460, Publications of the National Bureau of Standards (\$1.00). Information on calibration services and fees can be found in NBS Circular 483, Testing by the National Bureau of Standards (25 cents). Both are available from the Government Printing Office. Inquiries regarding the Bureau's reports and publications should be addressed to the Office of Scientific Publications, National Bureau of Standards, Washington 25, D. C.
