## THE NATIONAL BUREAU OF STANDARDS

The scope of activities of the National Bureau of Standards is suggested in the following listing of the divisions and sections engaged in technical work. In general, each section is engaged in specialized research, development, and engineering in the field indicated by its title. A brief description of the activities, and of the resultant reports and publications, appears on the inside of the back cover of this report.
Electricity. Resistance Measurements. Inductance and Capacitance. Electrical Instruments. Magnetic Measurements. Applied Electricity. Electrochemistry.
Optics and Metrology. Photometry and Colorimetry. Optical Instruments. Photographic Technology. Length. Gage.
Heat and Power. Temperature Measurements. Thermodynamics. Cryogenics. Engines and Lubrication. Engine Fuels. Cryogenic Engineering.
Atomic and Radiation Physics. Spectroscopy. Radiometry. Mass Spectrometry. Solid State Physics. Electron Physics. Atomic Physics. Neutron Measurements. Infrared Spectroscopy. Nuclear Physics. Radioactivity. X-Rays. Betatron. Nucleonic Instrumentation. Radiological Equipment. Atomic Energy Commission Instruments Branch.

Chemistry. Organic Coatings. Surface Chemistry. Organic Chemistry. Analytical Chemistry. Inorganic Chemistry. Electrodeposition. Gas Chemistry. Physical Chemistry. Thermochemistry. Spectrochemistry. Pure Substances.
Mechanics. Sound. Mechanical Instruments. Aerodynamics. Engineering Mechanics. Hydraulics. Mass. Capacity, Density, and Fluid Meters.
Organic and Fibrous Materials. Rubber. Textiles. Paper. Leather. Testing and Specif. cations. Polymer Structure. Organic Plastics. Dental Research.
Metallurgy. Thermal Metallurgy. Chemical Metallurgy. Mechanical Metallurgy. Corrosion.
Mineral Products. Porcelain and Pottery. Glass. Refractories. Enameled Metals. Concreting Materials. Constitution and Micrsstructure. Chemistry of Mineral Products.
Building Technology. Structural Engineering. Fire Protection. Heating and Air Condition. ing. Floor, Roof, and Wall Coverings. Codes and Specifications.
Applied Mathematics. Numerical Analysis. Computation. Statistical Engineering. Machine Development.

Electronics. Engineering Electronics. Electron Tubes. Electronic Computers. Electronic Instrumentation.
Radio Propagation. Upper Atmosphere Research. Ionospheric Research. Regular Propagation Services. Frequency Utilization Research. Tropospheric Propagation Research. High Frequency Standards. Microwave Standards.

# EVALUATION OF FLOORING MATERIALS IN ARMY INSTALLATIONS 

## 1。 PURPOSE OF INVESTIGATION

To evaluate the performance of flooring materials in militaryotype structures within the continental United States and to secure data upon which to base recommendations for coordinating and standardizing the repair and rehabilitation of floors in such structures on an economical basis.

## 2. BACKGROUND

The maintenance and repair of floors in Army buildings throughout the country has become a difficult problem. Many of the buildings were closed in 1946 and reopened for active service in 1949. In numerous cases, replacement of the floor surface was necessary if the buildings were to be kept in a sanitary and livable condition.

The various Armies have proposed and, in some cases, used, radically different methods for covering these floors, involving a wide range of materials and costs. Since very large floor areas were involved, it seemed desirable that an impartial survey be made of the conditions of the floors in need of repairg and of coverings now in use, in order to insure satisfactory and economical service from all reconditioned floors.

The Repairs and Utilities Division, Office of the Chief of Engineers, Department of the Army, requested the Building Technology Division, National Bureau of Standards, Department of Commerce, to conduct such a survey and submit appropriate recommendations.
3. METHOD OF MAKING THE SURVEY

The Office of the Chief of Engineers arranged for all inspections in the various Armies. The representative or representatives of the National Bureau of Standards visited stations selected either by the Office of the Chief of Engio neers or by the Army headquarters in each area in company with an engineer from Army headquarters. Station engineers assisted in the actual inspections.

## 4. SCOPE OF THE INVESTIGATION

Fifty-six stations in the six Army areas and the Military District of Washington were visited。 Practically every type of floor, floor covering, and method of repair was observed in the course of the inspections.

While emphasis was placed on floors in mobilization-type buildings, inspections were not confined to buildings of this type, but rather, included every category from permanent to most temporary.

The tabulated lists of floors，Tables 1 to 9 inclusive， give the stations visited and the condition of floors in build－ ings of different occupancy．It should be understood that，in most cases，numerous buildings of each type of occupancy were inspected at every station。

## Stations Visited，Listed by Army Areas

Military District of Washington：
Walter Reed Army Hospital，District of Columbia。
Fort Belvoir，Virginia。 Fort Myer，Virginia。

## First Army Area：

Govenors Island，New York。
Fort Jay，New York．
New York Port of Embarkation，New York．
Belle Mead Quartermaster Depot，New Jersey．
Raritan Ordnance Arsenal，New Jersey．
Fort Monmouth，New Jersey。
Fort Dix，New Jersey．
Camp Edwards，Massachusetts．
Fort Devens，Massachusetts。
Murphy Army Hospital，Massachusetts．
Second Army Area：
Fort George Go Meade，Maryland．
Aberdeen Proving Grounds，Marylando
Valley Forge Army Hospital，Pennsylvania。
Richmond Quartermaster Depot，Virginia。
Fort Lee，Virginia。
Fort Eustis，Virginia。
Fort Monroe，Virginia。
Fort Campbeil，Kentucky。
Fort Knox，Kentucky。

## Third Army Area：

Fort McPherson，Georgia。 Atlanta General Depot，Georgia。 Fort Benning，Georgia。 Camp Gordon，Georgia． Lawson Air Force Base，Georgia． Fort McClellan，Alabama。 Fort Bragg，North Carolina。 Pope Air Force Base，North Carolina． Fort Jacksong South Carolina。

Fourth Army Area：
Fort Sam Houston，Texas．
San Antonio Quartermaster Depot，Texas． Brooke Army Hospital，Texas．
Camp Bullis，Texas。
Fort Hood，Texas．
Fort Bliss，Texas．
William Beaumont Army Hospital，Texas．
Camp Polk，Louisiana。
Camp LeRoy Johnson，Louisiana。
New Orleans Port of Embarkation，Louisiana．

## Fifth Army Area：

Fort Sheridan，Illinois。
Fort Custer，Michigan。
Percy Jones Army Hospital，Michigan．
Fort Leavenworth，Kansas。
Fort Riley，Kansas。
St．Louis Medical Depot，Missouri。
Camp Carson，Colorado。
Sixth Army Area：
Presidio of San Francisco，California。
Letterman Army Hospital，California。
Oakland Army Baseg California。
Camp Stoneman，California。
Fort Mason，California。
Fort Ord，California。
Presidio of Monterey，California．
Camp Roberts，California。

## 5．RESULTS OF INSPECTIONS

The various Armies have used practically every available material to repair and cover floors．In some cases，only small－scale experimental installations have been made；in others，millions of square feet of floors have been covered with the same material．

In this section，the condition of floors，as found during the survey period July 1952 to February 1953，in buildings of different occupancy，is discussed and the materials that are considered satisfactory for repairing them are listed。 Materials that are reported as satisfactory have been obs served to render satisfactory service for at least the periods of time indicated．Some materials that have not proved to be satisfactory are listed。（See Tables l to 9，inclusive。）

In cases where a material has not been in service long enough under a particular condition of exposure to state positively the minimum length of service it may be expected to render，an attempt has been made to predict，from informa－ tion available from other sources，the service it is reasonable to expect．An example is vinyl plastic flooring in barracks， etc．Some vinyl plastic floorings exposed to heavy foot traffic have been under observation for 4 years．

No attempt has been made to establish cost data for any of the materials or methods of repair．

## 5．1 Barracks（Mobilization－Type，Excluding Latrine Areas）

Most of these two－story buildings were floored originally with 25／32－inog tongued－and－grooved，flat－grained pine，having a $3-1 / 4-1 n$ face。 The flooring was laid over l－in．diagonallym placed boards．The average age of these floors was ll years． They had been exposed to 8 years of severe use by troops． The condition of these floors was poor，although they were still usable。 Splintered segments were torn out，wide cracks appeared between strips and at the end joints，and they have required between 10 and 15 percent replacement of the boards in each barracks approximately every four years．The poor condition of the floors was generally at．tributed to the unorthodox methods of maintenance used by the Army；largely excessive exposure to water（see Fig。 I）。

Qak and edgeagrained pine gave 15 or more years of satism factory service when properly maintained and not exposed to excessive water。

Magnesium oxychloride flooring，heavy duty type，at least $5 / 8$ in。 thick，using proper mixing and installation methods with proper maintenance，should give 12 years of satisfactory service（see Fig。6）。

Asphalt tile， $1 / 8$ or $3 / 16$ in。 thick，was not satisfactory when laid directly over strip－wood flooring，i。e。g without a hard underlayment board（see Fig。 7）。

Linoleum，burlap－backed， $1 / 8$ in。 thick，laid over sanded strip－wood and felt underlayment，gave approximately 8 years satisfactory service（see Fig。 II）。

Vinyl plastic flooring，feltmbacked，with a wearing surm face at least 0.03 in。 thick，should be equal in durability to l／8－in．burlap－backed linoleum。

Pitch composition flooring，feltobacked，laid over strip－ wood without underlayment board，gave satisfactory service for approximately 2 to 2－1／2 years before replacement was required（see Fig。 12）．With underlayment board，felt－backed pitch composition flooring provided satisfactory service for approximately 3 to $3-1 / 2$ years before localized replacement was required。

> 5.2 Mess Halls (Mobilization; Company \& Consolidated Types)
（a）Dining Areas
The dining areas of these buildings were floored origi－ nally with the same type of stripopine flooring used in the barracks．Most of these floors had been covered in each Army area and from these installations the following conclusions were drawn：

Wood floors were not satisfactory because of damage from the frequent wet mopping required to keep them in a sanitary condition。

Concrete slabs， 4 in．or more thick，either structural or on grade，should provide 15 or more years of satisfactory service。

Concrete flooring，l－l／2 to $2-1 / 2$ in．thick，over wood should provide 10 or more years of satisfactory service pro－ vided appreciable structural movement does not occur．

Magnesium oxychloride flooring，heavy duty type，at least $5 / 8$ in．thick，over strip－wood，using proper mix and installation methods，should give 10 or more years service in dining－table areas and 5 to 6 years in the heavy trafficked areas，such as along serving lanes and at street entrances． Asphalt tile， $1 / 8$ or $3 / 16$ in．thick，was not satisfac－ tory when laid directly over strip－wood flooring without a hard underlayment board．It was satisfactory when laid directly over a concrete slab or in conjunction with a hardboard underlayment over strip－wood floors．

Linoleum，burlap－backed，l／8 in．thick，was satisfac－ tory if a hard underlayment board was used over the strip－ wood。

Pitch composition flooring, felt-backed, with underm layment board, over stripowood, provided only l to 2 years service in the traffic areas and serving laneso
(b) Kitchen Areas

The company-type kitchens were floored originally with strip~pine flooring. Later most of these wood floors were covered with regular-mix concrete ranging from I-I/2 to 2-1/2 in thick and reinforced or anchored by various methods. (See Department of the Army Technical Manual TM5-615, Concrete and Masonry。)

The consolidated-type kitchens were floored originally with concrete slabs, four or more inches thick, over wood or on a fill.

From the service life of the concrete and the limited observations of experimentai installations of toppings over the concrete, the following conclusions were reached:

Concrete slabs, in thicknesses of four or more inches, over wood or on a filil, provided oniy 5 to 8 years of service before areas adjacent to ranges, sinks and drains were eroded severely and the aggregate exposed。

Concrete flooring， $1-1 / 2$ to $2-1 / 2$ in．thick，over wood， provided only 5 to 7 years of service before areas adjacent to ranges，sinks and drains were eroded severely and the aggregate exposed．Numerous structural cracks also caused damaging effects（see Fig。2）。

Concrete toppings，integrally－hardened，l／2 in．thick， over thoroughly scarified，old concrete floors，may prove to be very satisfactory if adequate bonding procedures are carried out carefully and the toppings are cured thoroughly．

Magnesium oxychloride floors over wood or as a topping over concrete were not satisfactory in kitchen areas since excessive amounts of water caused deterioration in less than 1 year（see Figs。 3 and 4 ）。

Asphalt tile floors，grease－resistant，over concrete were not satisfactory．They provided only 6 months of service before replacements were necessary．They are damaged readily by impact and contact with hot cooking utensils and they re－ quire a smooth，rigid subfloor．

Quarry tile floors，with acid－resistant mortar joints laid over a structural concrete slab，were the most satisfac－ tory of all the kitchen floors observed．They should give more than 1.5 years of excelIent service（see Fig。13）。 The floors were reported as being very slippery when wet。

## 5．3 Hospitals（Mobilization－Type）

Most hospitals of this type consist of numerous one－story， ward buildings connected by long，enclosed corridors．Special． buildings，such as operating suites，laboratories，mess halls， and administrative offices，are also interconnected in the hospital area．These buildings and corridors were floored originally with 25／32－in。flat－grained pine over l－in。 diagonally－placed boards．Some wards were floored with edge－ grained pine or oak．
（a）Corridors
The corridors have been subjected to constant foot and cart traffic．The floors were exposed occasionally to rain from open windows．Most corridors had connecting steam Iines， either suspended from the roof or running directly under the floor，which often caused damage to the floor from leaks or extreme heat．In 1944 and 1945，many corridors were covered with a thin，feltabacked floor covering laid over 1／4oin． plywood．Some were covered without underlayment。 Conclusions from the observations of these corridors were as follows：

Plywood underlayment，interior－type ${ }_{9}$ showed delaminations at places exposed to puddles of water or steam leaks，which resulted in premature damage to the floor coverings at such locations（see Fig。8）。

Wood floors were not satisfactory because of frequent exposure to water，unevenness of boards and sanitary re－ quirements（see Fig．I）．

Magnesium oxchloride floors were not satisfactory over wood floors in corridors（see Fig．5）。

## Asphalt tile and felt－backed floor coverings were not

 satisfactory without a hard underlayment board（see Fig．7）。Linoleum，burlap－backed， $1 / 8$ in．thick，laid over a hard underlayment board，should give 15 to 20 years service with normal hospital maintenance．

Pitch composition matting，slip－resistant type，provided a satisfactory and safe surface when used on corridor ramps． Occasional replacement was necessary．
（b）Wards
The wards，with few exceptions，have had excellent maintenance and in many cases the original wood floors were still in good condition，which leads to the following con－ clusions：

Strip－wood floors，especially oak，with proper mainten－ ance，were very satisfactory。

Asphalt tile， $1 / 8$ in．thick，felt－backed linoleum and l／8 in．burlap－backed linoleum over a hard underlayment board provided very satisfactory service when they were maintained properly。
（c）Kitchens and Dining Areas
Remarks concerning mess hall floors apply equally to filoors in the kitchen and dining areas of hospitals（see Mess Halls）。
（d）Administrative Offices
The condition of the floors in these buildings was found to be the same as those in General Administration Buildings（see Administration Buildings）。

5．4 Administration and Recreation Buildings
In Administration and Recreation buildings wear of floor－ ings has not been as serious a factor as damage caused by office furniture，game tables or rearrangement of space。 Based on this type of occupancy，the following observations were made：

## Linoleum，vinyl plastic，or asphalt tile floorings，

 directly over suspended concrete floors or over hardboard underlayment on existing wood floors，provided long service When reasonably protected against severe indenting loads or abuse．Asphalt tile indents readily at elevated temperatures such as $120^{\circ} \mathrm{F}$ 。 It，however，is one of the few floor coverings Which can be installed satisfactorily over concrete floors in direct contact with the ground without the slab being thoroughly waterproofed．Pitch composition type floorings were not satisfactory because of their relatively low resistance to indentation， puncturing and tearing。

5．5 Bakeries
These buildings were constructed originally with a con crete slab on grade。 Because of dusting of the concrete，the floors have been covered with various materials．From these installations，the following conclusions were reached：

Maple floorings， $25 / 32$ in．thick，tongued－and－grooved， laid over thoroughly waterproofed，existing concrete floors， were satisfactory。

Concrete toppings，integrally－hardened，not less than I／2 in．thick，thoroughly bonded to existing concrete floors， were satisfactory．

Magnesium oxychloride floors，heavy－duty type，not less than 5／8 in．thick，thoroughly bonded to adequately water－ proofed existing concrete floors，were satisfactory．

$$
5.6 \text { Warehouses }
$$

Most warehouse floors were found to be in a satisfactory condition．Heavy－duty mastic topping over existing concrete floors，as specified in War Department Technical Manual TM5－615，dated October 1946，rendered very satisfactory service。

6．RECOMMENDATIONS
Recommendations for floor coverings for cantonment－ type buildings：

$$
\text { 6.1 Barracks } \underset{\substack{\text { Mobilization Type } \\ \text { Latrine Areas) }}}{\text { Excluding }}
$$

（a）Resilient Type
Burlap－backed linoleum，l／8 in．thick；felt－backed vinyl plastic flooring with a wearing surface not less than 0.03 in。 thick；and 1／8 in。 asphalt tile。 The flooring materials，particularly asphalt tile，should be laid over a hardboard underlayment not less than $3 / 16$ in．thick．The hardboard should be nailed on 6 in．centers in each direc－ tion over the entire area with ringed or barbed nails at least l－3／4 in．long．Consideration should be given to linoleum and vinyl plastic floorings in tile form，particuo larly at entrances and heavy－trafficked areas，to permit economical and satisfactory replacement at damaged or worn areas．Means should be provided to protect resilient－type coverings against severe indenting loads such as from lockers and legs of cots（see Fig．I＇t）。
（b）Magnesium Oxychloride Cement
Heavy－duty type，at least 5／8 in。thick，as specified by the American Standards Association Specification ASA A88．3－1951，＂Heavy Duty Oxychloride Composition Flooring and Its Installation＂。 The flooring should be installed in the following manner：

After preparation of the subfioor，a layer of 15－1b， asphalt－saturated felt，conforming to Federal Specification HH $-F-191 a$, should be laid over all wood floor areas to be covered．All edges and joints of felt to be lapped not less than two inches and tacked in a manner sufficient to hold the felt in place until metal mesh is placed。 Right－angled divi－ ding strips of brass or suitable plastic，not less than l／l6 in。 thick，and of sufficient width to conform to the thickness of the flooring，should be nailed to the felt and wood flooring at least every three feet．The dividing strips should be placed at not more than 30－ft。 intervals and at inside entrances to hallways and rooms．Over the felt and butted tight to the dividing strips，an anchoring medium consisting of 2.5 Ib ，small，diamond－mesh，painted，expanded metal lath， conforming to Federal Specification QQ－B－1016，should be laid with joints lapped at least $1 / 2$ in．The lath should be nailed with l－I／2－inog large head，galvanized，roofing nails，except over joists，where nails should be of sufficient length to
extend not less than $1-1 / 2$ In。 into the floor joistso Lath should be nailed on boinch centers in two directions and driven tight enough to secure the lath to wood floorg but not hard enough to force the lath into or puncture the felt。 The magnesium oxychloride cement，as specified in the American Standards Association Specification should be worked into the lath and finished with experienced workmen． Consideration should be given to the feasibility of installing a high wear－resistant oxychloride composition in hallways leading to stairs，latrine and street entranceso （c）Wood Type

Replacement of the top tongued－and－grooved flat－grained pine with 25／32oin．tonguedoandogrooved oak or maple in heavilyotrafficked areasg or with edge॰grained pine or edge－ grained fir where less wear resistance is required．The existing l－in。 subfloor should be carefully examined for loose boards andfor defective places before placing of building paper and new top flooring．The finished flooring should be sanded and sealed with two coats of a penetrating sealer．Caution should be taken to prevent excessive water from coming in contact with wood flooring。

$$
6.2 \text { Mess Halls (Mobilization; Company \& }
$$

（a）Dining Areas
A concrete topping，not less than $1-1 / 2$ in．thick， over existing wood floors．The topping should be reinforced with $4-\mathrm{X} 4 \times i \mathrm{n}_{0}$ ．No． 10 gage，wire mesh suspended in the center of the slab and laid over 55－1b，asphalt－prepared roll roofing，lapped 4 inches，and sealed at all edges and joints with asphalt adhesive。 Additional reinforcement with 20－d nails driven along all joists on l2－in．centers is recommended．The nails should be allowed to protrude one inch above the surface of the wood floor．The following references are given as sources of information on materials， placing，finishing，and curing of concrete：Department of the Army Technical Manual TM5－615，＂Concrete and Masonry＂； and＂Concrete Floor Finishes＂，Portland Cement Association， 33 West Grand Avenue，Chicago，Illinoiso

Vinyl plastic tile，semi－flexible and flexible， $1 / 8$ in。 thick，as specified in Interim Federal Specification L－T－751， dated 18 March．1952．The tile should be placed over hard－ board underlayment not less than $3 / 16$ in。 thick，which should be securely nailed on 6－in．centers，in two directions，with
ringed or barbed nails at least l－3／4 in。 long to the existing strip－wood floor．A water－resistant adhesive， recommended by the manufacturer of the flooring materialg should be used in areas likely to be subjected to spillage of water 9 such as along serving lanes．

Feltobacked vinyl plastic flooring with a wearing suro face not less than 0.03 in．thick．The flooring should be placed over hardboard underlayment over existing wood floor．

Flexibleotype vinyl floorings are not recommended for concrete floors in direct contact with the ground。 Semi－ flexible vinyl or asphalt tiles are recommended for such locations．
（b）Kitchen Areas
Sliporesistant，abrasiveotype，quarey tile with acido resistant mortar joints．The tile should be applied only over a structurallyosound concrete siab and in continuouslyo used kitchens，such as in a permanent－type mess hall．

Integrally－hardened concrete toppings not Less than I／2 in．thick，or cementolatex toppings not less than I／4 in。 thick．The toppings should be placed over thoroughly scario fied and cleaned existing concrete floors．Both of these types of toppings show promise of being satisfactory．However．
due to lack of information their use on an extensive basis is not recommended at this time。 Additional studies being made of these materials will be covered in a supplemental report。

Existing magnesium oxychloride floors should be patched and a penetrating sealer applied over the entire floor to extend the service life as long as possible before removal．The sealer should be applied periodically depend－ ing upon the condition of the floors but in no case should the period between applications exceed 6 months．

> 6.3 Administration and Recreation Buildings (Including Offices, Day Rooms, and Club Rooms)

Suspended concrete floors and stripowood floors in unsatisfactory condition should be covered with one of the floorings recommended for barracks．Recommended installa－ tion methods also apply．Rough concrete surfaces should be made even with a troweled－on，latex－type underlayment before installing resilient－type floor coverings．

Concrete floors，on or belowograde，in need of repair， should be leveled with a troweled－on underlayment and covered with $1 / 8$ in．asphalt tile or semioflexible vinyl plastic tile using a cut－back type asphalt adhesive（see Fig。 9）。

Means should be provided to protect resilient－type coverings，especially asphalt tile，against severe indenting loads from legs of desks，tables，chairs，and filing cabi－ nets．Smallosized casters and glides on all movable furnio ture and equipment should be replaced with ampleosized fittings．Heavy equipment should be placed on protective blocks or cups．

In view of the likelihood of localized areas being damaged by severe indenting loads and the rearrangement of equipment and space，the use of resilient－type floor covero ings in tile foxm is particularly recommended for adminiso tration and recreational buildings，to accommodate economi－ cal and satisfactory replacement at damaged areas（see Fig． 10）。
6o4 Hospitals (Mobilization-Type)

## （a）Corridors

Burlap－backed Iinoleum，I／8 in．thick，or felt－backed vinyl plastic flooring with a wearing surface not less than 0.03 in．thick．These floorings should be laid over a hard－ board underlayment not less than 3／16 in。 thick．The hard－ board should be nailed on boin．centers in both directions over the entire area with ringed or barbed nails at least 1－3／4 in。long。
(b) Wards

In general, the floors in the wards were found to be in good condition and should render many more years of service under the present type of maintenance. In the few exceptions where the floors may be in a condition which warrants covering, the recommendations given for barracks should be followed. Recommendations for the dining areas in mess halls should serve as a guide for diet kitchens.
(c) Kitchen and Dining Areas

Recommendations for mess halls should be followed for both kitchen and dining areas of hospitals (see Mess Halls)。
(d) Administrative Offices

Recommendations as given for administration and recreation buildings should be followed.
7. COMMENTS ON THE CARE OF FLOORS

The importance of the proper care and adequate maintenance of floors, in order to prolong their life, render satisfactory service, and present a pleasing appearance, can hardly be overemphasized. In the course of the survey,
it was noted that training courses on floor maintenance were instituted in a few Army Areas．It was also observed that，in general the floors in these Army Areas were in relatively good condition。

Probably the most damaging treatment of floors is an excessive exposure to water。 Practically all floors are harmed by such treatment，particularly wood floors．Con－ tinued wetting of wood floors causes the grain of the wood to raise，the strips to expand and buckle，and eventually result in a splintered and split flooring with open seams and end joints．

Resilientotype floor coverings are doubly harmed by excessive exposure to water．Even though the floor covering itself may be fairly resistant to water，failure in bond to an underlayment or to the subfloor is most likely to result． Wi．th a wood subfloor，additional damage to the floor covering occurs due to expansion and buckling of the flooring，or if a plywood underlay is involved，to the delamination of the plywood。

When wood and resilientotype floors need to be mopped in order to cleanse the floor surface，the least amount of water necessary to do the job should be used．Excess water
should be wrung from the mop into a pail and not spilled onto the floor surface。 When detergent solutions are used， the floors should be rinsed with clear water．（See Depart－ ment of the Army Technical Manual TM5－609，Custodial Serm vices）。 Paste，spirit，and water emulsion waxes are suit－ able as a protective surface coating for wood，linoleum， and vinyl plastic floor coverings．Solvent－type or spirit waxes should never be used on asphalt tile as the turpentine or mineral spirits used in such waxes will soften or dissolve the tile，causing the colors to bleed。 Use only water emul－ sion wax．

In general，water emulsion waxes are less slippery than paste and spirit waxes．The addition of colloidal silica to water emulsion waxes improves their slip resistance．The colloidal silica should be added during the manufacturing process．

Magnesium oxychloride floors which are porous should be sealed with a penetrating sealer of low viscosity。 Spirit or water emulsion waxes are suitable as protective coatings．If colored waxes are desired，the coloring should be done only by experienced persons，or waxes already pigmented should be purchased。

While magnesium oxychloride floors are damaged to a considerable extent by continuous exposure to water，such as occurs around kitchen sinks，they will withstand intero mittent exposure to water，such as from occasional spillage and wet mopping。

Repeated exposure to strong alkaline solutions or caustic preparations is harmful to most floors and will result in early deterioration．The service life of linoleumg in particular，is materially reduced by the frequent use of alkaline cleaning solutions．

## 8。 ACKNOWLEDGMENT

The authors of this report wish to acknowledge and thank the many military and civilian members of the Engio neering Section of the Department of the Army for their splendid cooperation and valuable assistance in this inveso tigation and survey．Appreciation is also extended to the U．S．Army Signal Corps for photographs of flooring ino stallations。
TABLE 1. WOOD FLOORING (25/32 IN. NOMINAL THICKNESS)

| MILITARY STATION | TYPE OF STRUCTURE | SUBFLOOR | TYPE OF FLOORING | $\begin{aligned} & \text { APPROX. } \\ & \text { AGE, } \\ & \text { YRS. } \end{aligned}$ | OVERALL CONDITION | REMARKS |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| FORT BELVOIR ${ }^{\text {a }}$ | BARRACKS; ${ }^{\text {b }}$ 700 SERIES | 1-IN. BOARDS | $\begin{aligned} & \text { PINE, FLAT-GRAIN, } \\ & 3-1 / 4-I N . F A C E \end{aligned}$ | 10 | POOR | SPLINTERED. SEGMENTS TORN OUT. WIDE CRACKS BETWEEN STRIPS AND END JOINTS. |
| DO. | $\begin{aligned} & \text { MESS HALL; } \\ & \text { DINING AREA } \end{aligned}$ | DO. | DO. | 10 | POOR | DO. |
| DO. | BARRACKS; ${ }^{\text {b }}$ 700 SERIES | PINE FLOORING ON I-IN. BOARDS | $\begin{aligned} & \text { OAK EDGE-GRAIN, } \\ & 3-1 / 4-I N . F A C E \end{aligned}$ | 3 | GOOD | STRIP OAK LAID AT RIGHT ANGLES TO STRIP PINE ALONG AISLE. SOME CRACKS BETWEEN STRIPS. |
| FORT MONMOUTH ${ }^{1}$ | DO. | I-IN. BOARDS | $\begin{aligned} & \text { PINE, FLAT-GRAIN, } \\ & 3-1 / 4-\text { IN. FACE } \end{aligned}$ | 10 | POOR | REQUIRES FREQUENT REPLACEMENT OF DAMAGED AND WORN AREAS. |
| CAMP EDWARDS ${ }^{1}$ | DO. | PINE FLOORING ON I-IN. BOARDS | DO. | 1 | GOOD | LAID AT RIGHT ANGLES TO OLD PINE FLOOR. FEW SMALL CRACKS AND SPLINTERS. |
| FORT DEVENS ${ }^{1}$ | DO. | I-IN. BOARDS | DO. | 12 | POOR | SPLINTERED. SEGMENTS TORN OUT. WIDE CRACKS BETWEEN STRIPS AND END JOINTS. |
| MURPHY HOSPITAL ${ }^{1}$ | $\begin{aligned} & \text { HOSPITAL; } \\ & \text { CORRIDORS } \end{aligned}$ | DO. | $\begin{aligned} & \text { OAK, EDGE-GRAIN, } \\ & 2-1 / 4-I N \cdot F A C E \end{aligned}$ | 9 | GOOD | SOME LOOSE BOARDS. GOOD CARE. |
| FORT MEADE ${ }^{2}$ | BARRACKS; ${ }^{\text {b }}$ 700 SERIES | DO. | $\begin{aligned} & \text { PINE, FLAT-GRAIN, } \\ & 3-1 / 4-\text { IN. FACE } \end{aligned}$ | 12 | POOR | SPLINTERED. SEGMENTS TORN OUT. WIDE CRACKS BETWEEN STRIPS AND END JOINTS. |

[^6]

Figure I. Typical mobilization-type barracks floor with 25/32-in., tongued-and-grooved, flat-grained pine having a $31 / 4=i n$. face. The flooring was laid over l-in., diagonally-placed boards. Note splintered segments torn out, and wide cracks between strips and end joints.

Figure 2. Concrete floor, l-1/2 in. thick, eight years
old, over typical, original wood floor in company-type
kitchen. Note exposure of aggregate, structural cracks
and damage around drain.

Figure 4 . Magnesium oxychloride floor, one morth old,
in kitchen of company-type mess hall. Note eroded
channel caused by drain from refrigerator.

Figure 5. Magnesium oxychloride floor, one year old, in hospital corridor. Note numerous cracks running across corridor, apparently caused by structural movement of wood subfloor.

Figure 7. Asphalt tile, 1/8-in, thick, four years old, laid over a strip-pine floor with a 15-1b, asphaltsaturated felt underlayment in a mobilization-type barracks. Note deterioration of tiles and numerous cracks running parallel to tongued-and-grooved, strippine flooring.

Figure 8. Asphalt tile, five years old, laid over 1/4-in. plywood adjacent to drinking fountain. Spillage of water has caused delamination of plywood and subsequent failure of asphalt tile.

$\frac{\text { Figure 13. Quarry tile floor with acid-resistant mortar }}{\text { joints, thirteen years old, in permanent-type kitchen. }}$

Figure 14. Foot locker stands and bed post blocks used
to protect resilient-type coverings against-severe
indenting loads.

## THE NATIONAL BUREAU OF STANDARDS

## Functions and Activities

The functions of the National Bureau of Standards are set forth in the Act of Congress, March 3, 1901, as amended by Congress in Public Law 619, 1950. These include the development and maintenance of the national standards of measurement and the provision of means and methods for making measurements consistent with these standards; the determination of physical constants and properties of materials; the development of methods and instruments for testing materials, devices, and structures; advisory services to Government Agencies on scientific and technical problems; invention and development of devices to serve special needs of the Government; and the development of standard practices, codes, and specifications. The work includes basic and applied research, development, engineering, instrumentation, testing, evaluation, calibration services, and various consultation and information services. A major portion of the Bureau's work is performed for other Government Agencies, particularly the Department of Defense and the Atomic Energy Commission. The scope of activities is suggested by the listing of divisions and sections on the inside of the front cover.

## Reports and Publications

The results of the Bureau's work take the form of either actual equipment and devices or published papers and reports. Reports are issued to the sponsoring agency of a particular project or program. Published papers appear either in the Bureau's own series of publications or in the journals of professionsl. and scientific societies. The Bureau itself publishes three monthly periodicals, available from the Government Printing Office: The Journal of Research, which presents complete papers reporting technical investigations; the Technical News Bulletin, which presents summary and preliminary reports on work in progress; and Basic Radio Propagation Predictions, which provides data for determining the best frequencies to use for radio communications throughout the world. There are also five series of nonperiodical publications: The Applied Mathematics Series, Circulars, Handbooks, Building Materials and Structures Reports, and Miscellaneous Publications.

Information on the Bureau's publications can be found in NBS Circular 460, Publications of the National Bureau of Standards (\$1.00). Information on calibration services and fees can be found in NBS Circular 483, Testing by the National Bureau of Standards ( 25 cents). Both are available from the Government Printing Office. Inquiries regarding the Bureau's reports and publications should be addressed to the Office of Scientific Publications, National Bureau of Standards, Washington 25, D. C.

[^0]:    Ordnance Development.
    Electromechanical Ordnance. Ordnance Electronics.

    These three divisions are engaged in a broad program of research and development in advanced ordnance. Activities include basic and applied research, engineering, pilot production, field testing, and evaluation of a wide variety of ordnance matériel. Special skills and facilities of other NBS divisions also contribute to this program. The activity is sponsored by the Department of Defense.
    Missile Development. Missile research and development: engineering, dynamics, intelligence, instrumentation, evaluation. Combustion in jet engines. These activities are sponsored by the Department of Defense.

    - Office of Basic Instrumentation
    - Office of Weights and Measures.
