## THE NATIONAL BUREAU OF STANDARDS

The scope of activities of the National Bureau of Standards is suggested in the following listing of the divisions and sections engage 1 in technical work. In general, each section is engaged in specialized research, development, and engineering in the field indicated by its title. A brief description of the activities, and of the resultant reports and publications, appears on the inside of the back cover of this report.
Electricity. Resistance Measurements. Inductance and Capacitance. Electrical Instruments. Magnetic Measurements. Applied Electricity. Electrochemistry.
Optics and Metrology. Photometry and Colorimetry. Optical Instruments. Photographic Technology. Length. Gage.
Heat and Power. Temperature Measurements. Thermodynamics. Cryogenics. Engines and Lubrication. Engine Fuels. Cryogenic Engineering.

Atomic and Radiation Physics. Spectroscopy. Radiometry. Mass Spectrometry. Solid State Physics. Electron Physics. Atomic Physics. Neutron Measurements. Infrared Spectroscopy. Nuclear Physics. Radioactivity. X-Rays. Betatron. Nucleonic Instrumentation. Radiological Equipment. Atomic Energy Commission Instruments Branch.
Chemistry. Organic Coatings. Surface Chemistry. Organic Chemistry. Analytical Chemistry. Inorganic Chemistry. Electrodeposition. Gas Chemistry. Physical Chemistry. Thermochemistry. Spectrochemistry. Pure Substances.
Mechanics. Sound. Mechanical Instruments. Aerodynamics. Engineering Mechanics. Hydraulics. Mass. Capacity, Density, and Fluid Meters.
Organic and Fibrous Materials. Rubber. Textiles. Paper. Leather. Testing and Specifcations. Polymer Structure. Organic Plastics. Dental Research.

Metallurgy. Thermal Metallurgy. Chemical Metallurgy. Mechanical Metallurgy. Corrosion. Mineral Products. Porcelain and Pottery. Glass. Refractories. Enameled Metals. Concreting Materials. Constitution and Microstructure. Chemistry of Mineral Products.
Building Technology. Structural Engineering. Fire Protection. Heating and Air Conditioning. Floor, Roof, and Wall Coverings. Codes and Specifications.
Applied Mathematics. Numerical Analysis. Computation. Statistical Engineering. Machine Development.
Electronics. Engineering Electronics. Electron Tubes. Electronic Computers. Electronic Instrumentation.
Radio Propagation. Upper Atmosphere Research. Ionospheric Research. Regular Propagation Services. Frequency Utilization Research. Tropospheric Propagation Research. High Frequency Standards. Microwave Standards.

Ordnance Development.
Electromechanical Ordnance.
Ordnance Eilectronics. Ordnance Electronics. basic and applied research, engineering, pilot production, field
testing, and evaluation of a wide variety of ordnance matériel. Special skills and facilities of other NBS divisions also contribute to this program. The activity is sponsored hy the Department of Defense.
Missile Development. . Missile research and development: engineering, dynamics, intelligence, instrumentation, evaluation. Combustion in jet engines. These activities are sponsored by the Department of Defense.

- Office of Basic Instrumentation

These three divisions are engaged in a broad program of research and development in advanced ordnance. Activities include research and developm
mbustion in jet engines

- Office of Weights and Measures.

STOCHASTIC SEARCH FOR THE MAXIMUM OF A FUNCTION ${ }^{1}$

by<br>E．W．Barankin ${ }^{2}$<br>I。 INTRODUCTION

Consider a real valued function $f$ on a domain $D$ 。 We assume that $D$ is a finite set of points，say $N$ in number．Let $M=\max f(x)$ ，and suppose $f$ takes on the value $M$ at exactly $v$ points；the set of these points will be denoted by K．

Far from looking upon our assumption of finiteness of $D$ as a specialization we consider that it reflects the real computing situa－ tion．Consequently，our results pertain also to situations in which D is taken to be a continuum and in which continuous distributions are employed；it is required only to＇recognize the discontinuous distribu－ tions to which the given continuous distributions are approximations．

It is our purpose here to study stochastic processes $\delta=\left\{X_{i}, i=1,2, \cdots\right\}$ ，where each $X_{i}$ is a random variable in $D$ ； more particularly，to study the implications of such a process for the determination of $M$ when the realized values $x_{i}$ of the random variables $X_{i}$ are submitted to computation of $f-$ values．To be precise， we suppose that after each stage of the process，say the ioth，if the point $x_{i} \varepsilon D$ is the realized value of $X_{i}$ ，we compute $f\left(x_{i}\right)$ ．Thus，
$1_{\text {The preparation of this paper was sponsored（in part）by ARDC。 }}$
${ }^{2}$ Universjity of California，Berkeley，National Bureau of Standards， Los Angeles，and Logistics Research Project，University of California， Los Angeles．
after the kith stage，if the realized values of $X_{1}, X_{2}, \cdots, X_{k}$ are $x_{1}, x_{2}, \ldots, x_{k}$ ，respectively，then we have before us the $f=$ values $f\left(x_{1}\right), f\left(x_{2}\right), \cdots, f\left(x_{k}\right)$ ．This represents a certain amount of inform mation about the function $f$ ；let us denote it by $d_{k}{ }^{o}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ 。

It may be that some general knowledge concerning $f$ can be coupled with the information $l_{k}{ }^{0}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ to give still a greater amount of specific useful information after the kith stage Accordingly， we shall take the $k$－th stage information scheme to be in general as follows，in addition to $\mathcal{l}_{\mathrm{k}}{ }^{\circ}$ ：

$$
\begin{aligned}
& l_{k}^{I}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text { : a known number } T_{k}\left(x_{1}, x_{2}, \ldots, x_{k}\right) \geqslant \\
& \max _{i=1,2, \cdots, k} f\left(x_{i}\right) \text { such that it is known } \\
& \text { that } M \geqslant T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text {; } \\
& d_{k}{ }^{2}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text { : a known subset of } D, A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \supseteq \\
& \left\{x_{1}, x_{2}, \cdots, x_{k}\right\} \text { such that for each } \\
& x \in A_{K+1}\left(x_{I}, x_{2,} \cdots, x_{K}\right) \text {, although the } \\
& \text { number } f(x) \text { may not be known exactly, it } \\
& \text { is known that } f(x) \leq T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text {; } \\
& \mathscr{S}_{k}{ }^{3}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text { : a known subset of } D, B_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text {, } \\
& \text { dis joint from } A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text {, such } \\
& \text { that for each } x \in B_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text { the } \\
& \text { number } f(x) \text { is not known exactly, but it is } \\
& \text { known that } f(x)>T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \text { 。 }
\end{aligned}
$$

The special case of this scheme, wherein

$$
\begin{aligned}
T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right) & =\max _{i=1,2, \cdots, k} f\left(x_{i}\right), \\
A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) & =\left\{x_{1}, x_{2}, \cdots, x_{k}\right\},
\end{aligned}
$$

and

$$
B_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)=\Lambda
$$

(where $\Lambda$ denotes the empty subset of $D$ ) is that in which $g_{k}{ }^{0}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ is actually the total information at hand. On the basis of the above information scheme, an immediately suggested estimated value for $M$ is $T_{k}\left(x_{1}, x_{2,}, \ldots, x_{k}\right)$. There are alternatives to this; for example, the maximum of the function on $D$ obtained by a specified extrapolation of the known values of $f$ on $A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$. However, in this article we shall fix our attention on the estimator $\left\{T_{i}, i=1,2, \cdots\right\}$. We are consequently committed to study the stochastic convergence of the sequence of random variables $J=\left\{T_{1}\left(X_{1}\right), T_{2}\left(X_{1}, X_{2}\right), \cdots\right\}$ 。

Of course, we have for all $k=1,2, \cdots$, and all
$x_{1}, x_{2}, \cdots, x_{k}, x_{k+1} 9$

$$
\begin{equation*}
T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \leq M \tag{III}
\end{equation*}
$$

and
(1.2) $T_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k+1}\right) \geqslant T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right) 。$

From (1.2) it follows that
(1.3) $A_{k+2}\left(x_{1}, x_{2}, \cdots, x_{k+1}\right) \supseteq A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \quad$.

The stochastic process $\&$ that will be at work producing points of $D$, will be conditioned by the computer's behavior. This conditioning is effected upon the conditional probabilities
(1.4) $P\left\{X_{k+1}=x \mid X_{i}=X_{i,}, i=1,2, \cdots, k\right\}, x \in D$.

The conditioning is realized through the choice, by the computer, of random devices which (he guesses) will secure desirable analytic conditions on the conditional probabilities (1.4). Just what such desirable analytic conditions are will be determined by studying the implications of various analytic conditions on (1.4) in the light of our designated criteria for the process $\&$. Our criteria in this article are the following: large values for the probabilities

$$
\begin{equation*}
P\left\{T_{k}\left(X_{1}, X_{2}, \cdots, X_{k}\right)=M\right\} \quad, k=1,2, \cdots, \tag{1.5}
\end{equation*}
$$

and weak and strong stochastic convergences of $J$ to $M$. Thus, the problem that will oceupy us is this: to find analytic conditions on (1.4) which will give large values to the numbers (1.5) and which will insure weak and strong stochastic corvergences of $\mathcal{J}$ to $M_{\text {。 }}$ Now, there is, of course, a limitation on the desirable analytic conditions for which we may seek, a limitation that must be observed if the computer is to be able to realize these conditions in the choices (of random devices) that are open to him; namely, the fulfillment of
the conditions must be feasible under the 'information at hand at each stage. To illustrate this, consider that after any stage, say the $k$-th, it would be highly desirable to select random devices to secure

$$
\begin{equation*}
P\left\{X_{k+1} \varepsilon K \mid X_{i}=x_{i}, \quad i=1,2, \cdots, k\right\}=1 \tag{1,6}
\end{equation*}
$$

whatever be $x_{1}, x_{2}, \cdots, x_{k}$. But unless
(1.7) $\left\{\begin{array}{l}A_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k}\right)=D \\ \text { or } \\ \left\{\begin{array}{l}B_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k}\right)=\bar{A}_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k}\right) \text { and it } \\ \text { is known that } f \text { is constant on } B_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k}\right),\end{array}\right.\end{array}\right.$ (where $\bar{A}_{\mathrm{K}+1}$ denotes the complement of $A_{\mathrm{K}+1}$ in D ) we do not have enough information to locate a subset of $K_{9}$ therefore not enough information to secure (1.6). It will be seen in our discussion that our conditions are feasible in the sense here indicated.

Our results are stated in Theorem 1 (end of section 2) and in The orem 2 (end of section 3). And in section 4 we discuss the matter of improving these results.
2. SUFFICIENT CONDITIONS FOR STRONG CONVERGENCE OF J TO M

As of each $k$-th stage, the computer is motivated in two ways toward putting feasible analytic conditions on the probabilities (1.4). First, if neither of the situations (1.7) holds, he wishes to insure a positive $(k+1)$-th stage probability to each point of
$\vec{A}_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$; this, by way of not ruling out the possibility of any such point being realized in the ( $k+1$ )-th stage, since (according to the information at hand) f may have the value $M$ only at one of these complementary points. Secondly, he wishes to assign high probabilities to sets concerning which he has been led to beineve that in them the values of $f$ are higher than the $f-$ values he has aiready discovered. The conditions we shall put on the probabilities (1.4) will embody these motivations.

But first, consider (1.7). If either of the se situations holds, and only if one of them holds, we know exactly which points corstitute K. And it is then feasible to make the probability of $K$ unity. Thus, we shall take

$$
\text { (2.1) } P\left\{X_{k+1} \varepsilon K \mid X_{i}=X_{i}, i=I_{,} 2, \cdots, k\right\}=1 \text { if }(1,7) \text { holds } .
$$

Now consider the first motivation. One feasible realization of this is in terms of a chosen positive number $c_{k+1}<1$, and is as follows: Whatever be $x_{1}, x_{2}, \cdots, x_{k}$, if ( 1.7 ) does not hold, we take

$$
\begin{equation*}
P\left\{X_{k+1}=x \mid X_{i}=x_{i}, i=1,2, \cdots, k\right\} \geqslant c_{k+1} \text { for each } \tag{2,2}
\end{equation*}
$$

$$
x \in \bar{A}_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)
$$

The nature of this condition is such as to imply a sharper restriction on $c_{k+1}$. Let $\rho\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ denote the number of points in $A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ (This number is known under the, information
at hand). Then, according to (2.2), the conditional probability of the set $\bar{A}_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ is greater than or equal to

$$
\left[N-\rho\left(x_{1}, x_{2}, \cdots, x_{k}\right)\right] c_{k+1},
$$

and therefore this number must be less than or, equal to unity, whence

$$
c_{k+1} \leqslant \frac{1}{N-\rho\left(x_{1}, x_{2}, \cdots, x_{k}\right)}
$$

Moreover, since $c_{k+1}$ is taken to be independent of $x_{1}, x_{2}, \cdots, x_{k} 9$ we must have

$$
\begin{equation*}
c_{k+1} \leqslant \frac{1}{\min _{x_{1}, x_{2}, 0 \circ x_{k}}^{\rho\left(x_{1}, x_{2}, \cdots o, x_{k}\right)}} \quad . \tag{2.3}
\end{equation*}
$$

We cannot say anything more explicit about the number $x_{1}, x_{2}, \cdots{ }^{\min } \quad \rho\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ without further assumptions concerning the sets $A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$. As an example, if

$$
A_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k}\right)=\left\{x_{1}, x_{2}, \cdots, x_{k}\right\}
$$

for all $x_{1}, x_{2,} \cdots, x_{k}$, then $\min _{x_{1} 9 x_{2} 9,00 x_{k}} \rho\left(x_{1}, x_{2}, \cdots, x_{k}\right)=1$, and we get

$$
\begin{equation*}
c_{k+1} \leqq \frac{1}{N-1} \tag{2.4}
\end{equation*}
$$

Of course, the right-hand side of (2,4) is not greater than the righthand side of $(2.3)$; consequently, if we required the fulfillment of $(2.4)$, then $(2,3)$ would be automatically satisfied.

We now go to the second motivation. And this leads us immediately to favor at least the set $B_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$. That is, if this set is not empty, then we know that the f-values at the points in it are greater than the largest value of $f$ so far discovered, and therefore we want to give the points of $\mathrm{B}_{\mathrm{k}+1}$ a "better than minimal chance" of being realized. If the second of the two situations ( 1.7 ) hoIds, then we know that $B_{k+1}\left(x_{1}, x_{2}\right.$, $\left.0, x_{k}\right)=K_{\text {, }}$ and we proceed according to (2.1) . But if (1.7) does not hold, we do not wish to throw ail the conditional probability into $\mathrm{B}_{\mathrm{k}+1}$, for, according to our incomplete information, the value $M$ may very well be taken on only in $\overline{A_{k+1} \cup B_{k+1}}$. Thus, we shall want only this much: to give each point of $B_{k+1}$ a probability $\geqslant$ a positive number, say $b_{k+1}$, this number being greater than $c_{k+1}$ :

$$
\begin{equation*}
b_{k+1}>e_{k+1} \quad, \quad k=1,2, \ldots 0 \tag{2.5}
\end{equation*}
$$

Thus do we favor the points of $B_{k+1}$ in particular, over the points of $\bar{A}_{k+1}$ in general.

But-we repeat-- K may not intersect $\mathrm{B}_{\mathrm{k}+1}$ at all. The computer may have some feeling about this, not at all based on the formal information at hand. This is to say that he may feel justified in making a guess over and above any logical justification by his infore mation. We want to allow for such guessing, and we do so as follows: there shall be designated a set $F_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$, disjoint from $B_{k+1}$, such that each of its points, as well as the points of $B_{k+1}$ 9 shall be given a conditional probability $\geqslant b_{k+1}$ 。

We have now carried out fully the second motivation, and it has led to the following formal prescription: whatever be $x_{1}, x_{2}, \cdots, x_{k}$, if (1.7) does not hold, we take

$$
P\left\{X_{k+1}=x \mid X_{i}=x_{i}, I, 2, \cdots, k\right\} \Rightarrow b_{k+1} \text { for each }
$$

$$
\begin{equation*}
x \in G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \tag{2.6}
\end{equation*}
$$

where

$$
\begin{gathered}
G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)= \\
B_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \cup F_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \quad
\end{gathered}
$$

If $\tau\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ denotes the number of points in the set $G_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k}\right)$ then we must have

$$
\begin{equation*}
b_{k+1} \leq \frac{1}{x_{1}, x_{2}, \cdots, x_{k}} \tau\left(x_{1}, x_{2}, \cdots, x_{k}\right) \quad . \tag{2.7}
\end{equation*}
$$

It is to be remarked that if $B_{k+1}$ is empty then $F_{k+1}$ might very well include the set

$$
\begin{equation*}
A_{k+1}^{*}\left(x_{1}, x_{2}, \cdots, x_{k}\right)= \tag{2,8}
\end{equation*}
$$

This would represent the guess that M may already have been achieved. We shall, in fact, make this inclusion assumption; that is, if $B_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ is empty, then we take

$$
\begin{equation*}
F_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \supseteq A_{k+1}^{*}\left(x_{1,} x_{2}, \cdots, x_{k}\right) \quad \tag{2.9}
\end{equation*}
$$

We have now finished our specification of a feasible set of analytic conditions on the conditional probabilities (I.4), and we are ready to study the implications of these conditions. We direct our attention to obtaining a lower bound, in terms of the constants $b_{k}$ and $c_{k}$, $k=2,3, \cdots, s$ for the comprehensive probability $P\left\{T_{S}\left(X_{1}, X_{2}, \cdots, X_{S}\right)=M\right\}$. Let us define another estimator $\left\{\mathrm{T}_{\mathrm{K}}{ }^{\circ}, \mathrm{K}=1,2, \ldots\right\}$ as follows:
(2.10)

$$
T_{k}^{0}\left(x_{1}, x_{2}, \cdots, x_{k}\right)=\max _{x=x_{1}, x_{2}, \cdots 0, x_{k}(x)}
$$

By virtue of the inclusion $\left\{x_{1}, x_{2}, \cdots, x_{k}\right\} \subseteq A_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k}\right)$, we have always

$$
\begin{equation*}
T_{k}^{0}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \leqslant T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \tag{2.11}
\end{equation*}
$$

And therefore,

$$
P\left\{T_{s}\left(X_{I}, X_{2}, \cdots, X_{k}\right)=M\right\} \geqslant
$$

$$
\begin{equation*}
P\left\{T_{s}^{0}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\}, s=1,2, \cdots \tag{2.12}
\end{equation*}
$$

Hence, we shall have a lower bound for the left-hand side of (2.12) when we have found a lower bound for the right -hand side.

Now, the right-hand side of (2.12) is equal to
$1-P\left\{T_{S}{ }^{0}\left(X_{1}, X_{2}, \cdots, X_{S}\right)<M\right\}(c f 。(1,1)$ and (2.11)), and there fore we may, and shall actually work first toward an upper bound for (2.13) $P\left\{T_{s}{ }^{0}\left(X_{1}, X_{2}, \cdots, X_{s}\right)<M\right\}=P\left\{f\left(X_{i}\right)<M, i=1,2, \cdots, s\right\}$

Toward this end we set down the following equalities and inequalities, derived from $(2.1),(2.2),(2.6)$, and (2.9).
(2.14) $P\left\{f\left(X_{k+1}\right)<M \mid X_{i}=X_{i 9} i=1,2, \cdots, k\right\}=0$ if (1.7) holds If (1.7) does not hold, and if $K \cap G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \neq \Lambda$, then
(2.15) $P\left\{f\left(X_{k+1}\right)<M \mid X_{i}=X_{i}, i=1,2, \cdots, k\right\} \leq 1-b_{k+1} \quad$.

If (1.7) does not hold, and if $K \cap G_{K+1}\left(x_{1}, x_{2}, \cdots, x_{K}\right)=\Lambda$, then,
(2.16) $P\left\{f\left(X_{k+1}\right)<M \mid X_{i}=x_{i}, i=1,2, \cdots, k\right\} \leqslant i-\nu c_{k+1}$.

These three assertions, for $k=2,3, \cdots, s \infty l_{\text {, }}$ together with

$$
P\left\{f\left(X_{1}\right)<M\right\} \leqq I
$$

are now applied to the relations

$$
P\left\{f\left(X_{i}\right)<M, i=1,2, \cdots, k+1\right\}=
$$

(2.17) $\sum_{f\left(x_{j}\right)<M} P\left\{f\left(X_{k+1}\right)<M \mid X_{i}=x_{i}, i=1,2, \cdots, k\right\}$

$$
j=1,2, \cdots \cdots, k
$$

$$
\times P\left\{X_{i}=x_{i}, i=1,2, \cdots, k\right\}, k=2,3, \cdots, s-1 .
$$

And the result in general is the following:

$$
P\left\{f\left(X_{i}\right)<M, i=1,2, \cdots, s\right\} \leq
$$

(2.18)

$$
\prod_{j=2}^{s}\left(\max \left[1-b_{j}, 1-\nu c_{j}\right]\right), s=2,3, \cdots
$$

whence

$$
P\left\{T_{s}^{0}\left(X_{1}, X_{2}, \ldots X_{s}\right)=M\right\} \geqslant
$$

(2.19)

$$
I-\prod_{j=2}^{s}\left(\max \left[1-b_{j}, I-v c_{j}\right]\right), s=2,3, \cdots .
$$

We have said that (2.18) is the consequence of our calculations in general. One finds, in carrying out those calculations, that the following hold:

If for all $k=2,3, \cdots$, and all $x_{1}, x_{2}, \cdots, x_{k}$,
$G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ contains a point of $K$, then

$$
P\left\{T_{s}{ }^{0}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\} \geqslant
$$

(2.20)

$$
1-\prod_{j=2}^{s}\left(1-b_{j}\right), s=2,3, \cdots
$$

$$
\text { If for all } k=2,3, \cdots, \text { and all } x_{1}, x_{2}, \cdots, x_{k},
$$

$G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ contains no point of $K$ ，then

$$
P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\} \equiv
$$

（2．21）

$$
I-\prod_{j=2}^{s}\left(I-\nu_{c_{j}}\right), s=2,3, \cdots
$$

The import of these special results is this．Suppose the computer has great confidence in his sets $G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ ，that is，confidence that they contain points of $K$ ．Then he wiil make the numbers $b_{j}$ big （i．eio，very close to 1）with the result that they will be much bigger than the corresponding numbers $\mathcal{V}_{j}$ 。 Then iff although this is not within his information，the sets $G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ do in fact all contain points of $K$（i。e．，his confidence in these sets is，unbeknown to him，actually verified），the probabilities $P\left\{T_{s}{ }^{0}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\}$ have the larger lower bounds $1-\prod_{j=2}^{s}\left(I-b_{j}\right)$ ．On the other hand，if， in fact，none of the sets $G_{k+1}$ contains a point of $K$（in spite of his confidence）then we can only assert（2．21），with the smaller lower bounds $I-\prod_{j=2}^{S}\left(I-\nu e_{j}\right)$ 。

Now，a necessary and sufficient condition that the products in $(2,18)$ and $(2.19)$ ，for $s=2,3, \cdots$ ，tend to 0 is that the series

$$
\sum_{j=2}^{\infty} \min \left[b_{j}, v c_{j}\right]
$$

be divergent．This condition，which，through（2．19）and（2．12）is seen to be a sufficient condition for weak convergence of $\mathcal{I}$ to $M$ ，is

$$
\theta
$$

however, not a feasible condition, for, we do not know the value of $\nu$ 。 However, by virtue of (2.5) we have

$$
\sum_{j=2}^{s} \min \left[b_{j g} \nu c_{j}\right]>\sum_{j=2}^{s} c_{j} s s=2,3, \cdots
$$

Hence, we can take the feasible condition that $\Sigma c_{j}$ be divergent. This has, in addition, the consequence (again through (2.5)) that also $\sum b_{j}$ is divergent. Thus, the convergence to 1 of the rightmhand sides of all three inequalities $(2.19),(2.21)$, and $(2.20)$ is assured.

Hence, the divergence of $\Sigma c_{j}$ insures the weak convergence of $J^{\prime}$ to $M$ in any case. But more than this, it insures the strong convergence of $J$ to $M$. This is a consequence of (1.2). That is, by virtue of (1.2) we have, for each $s=1,2, \ldots$,
(2.22)

$$
\left\{\left(x_{1}, x_{2}, \cdots 0\right) \in D \times D \times \ldots \mid T_{S}\left(x_{1}, x_{2}, \cdots, x_{S}\right)=M\right\}
$$

$$
\subseteq\left\{\left(x_{1}, x_{2}, \cdots\right) \varepsilon D \times D \times \cdots \mid \lim _{r \rightarrow \infty} T_{r}\left(x_{1}, x_{2}, \cdots, x_{r}\right)=M\right\}
$$

which implies that, for each $s=1,2, \ldots$,
(2.23)

$$
P\left\{\lim _{r \rightarrow \infty} T_{r}\left(X_{1}, X_{2,}, \cdots, X_{r}\right)=M\right\} \geqslant
$$

$$
P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\}
$$

so that weak convergence implies strong convergence.
If we combine (2.22) with the inequalities (2.19), (2.20), and (2.21) to write: in general

$$
P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\} \triangleq
$$

(2.24)

$$
I-\prod_{j=2}^{s}\left(\max \left[I-b_{j}, I-v_{c_{j}}\right]\right), s=2,3, \cdots ;
$$

if for all $k=2,3, \cdots$, and all $x_{1}, x_{2}, \cdots, x_{k}, G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ contains a point of $K$, then

$$
P\left\{T_{s}\left(X_{1}, X_{2}, \ldots, X_{s}\right)=M\right\} \geq
$$

$$
\begin{equation*}
1-\prod_{j=2}^{s}\left(1-b_{j}\right), s=2,3, \cdots ; \tag{2.25}
\end{equation*}
$$

if for all $k=2,3, \cdots$, and all $x_{1}, x_{2}, \cdots, x_{k}, G_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ contains no point of K , then

$$
\begin{align*}
& P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\} \geqslant  \tag{2.26}\\
I & -\prod_{j=2}^{S}\left(I-v c_{j}\right), s=2,3, \cdots ;
\end{align*}
$$

then we can state our result as follows:
THEOREM 1. If the stochastic process $\&$ satisfies the conditions (2.1), (2.2), (2.5), (2.6), and (2.9), then the inequalities (2.24), (2.25), and (2.26) hold in the respective cases described. And in any case a sufficient condition that $I=\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)\right.$, $s=1,2, \ldots\}$ converge almost surely to $M$ is that the series $\sum e_{j}$ be divergent.

This theorem actually states a weaker convergence result than we have established. That is, $(1,2)$ and consequently $(2.22)$ and $(2.23)$
hold also with $T^{\circ}$ in place of $T_{0}$. Therefore, through the inequalities $(2.19),(2.20)$, and $(2.21)$, the divergence of $\Sigma c_{j}$ implies almost sure convergence of $\mathcal{J}^{0}=\left\{T_{s}{ }^{0}\left(X_{I}, X_{2}, \cdots, X_{s}\right), s=1,2, \cdots\right\}$ to $M$. And this is the stronger result by virtue of (2.11) and (1.1). However, our attention is concentrated on the random variables $T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)$, and this being the case, our detailed results, namely the inequalities $(2.24),(2.25)$, and $(2.26)$ are in fact the weaker for having come about by our taking advantage of $(2,12)$. We shall say more about this ins section 4 。
3. NECESSARY CONDITIONS FOR STRONG CONVERGENCE OF J TO M

In this section we shall obtain upper bounds for the probabilities $P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{S}\right)=M\right\}, s=I_{2} 2, \cdots$, and from them obtain a necessary condition for strong convergence of $\mathcal{J}$ to $M$ 。

Let us define ne

$$
A_{k+1}^{0}\left(x_{1}, x_{2}, \cdots, x_{k}\right)=
$$

$$
\begin{equation*}
\left\{x \in A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right) \mid f(x) \text { is known }\right\} \tag{3.1}
\end{equation*}
$$

and
$\min _{x_{1}, x_{1}, \cdots, x_{1}} P\left\{X_{k+1} \in A_{k+1}^{0}\left(x_{1}, x_{2}, 0,0, x_{k}\right) \mid X_{i}=x_{i}, i=1,2, \cdots, k\right\}$ $x_{1}, x_{2}, \cdots, x_{k}$

$$
k=1,2, \cdots
$$

It is to be noted that the $a_{k}$ are feasible parameters；that is，the computer can control them（to within the requisite guessing）．

Now let us direct our attention to the following important subsets of $D:$
（3．3）$H_{k}\left(x_{1}, x_{2}, \cdots, x_{k=1}\right)=\left\{x_{k} \varepsilon D \mid T_{k}\left(x_{1}, x_{2}, \ldots, x_{k}\right)<M\right\} \quad$ 。 For $k=1$ we set also
（3．4）

$$
H_{1}=\left\{x \in D \mid T_{1}(x)<M\right\}
$$

By virtue of（1．2）we have

$$
\left\{\begin{array}{l}
\frac{\text { 'if } x_{k}}{} \in H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right) \text {, then }  \tag{3.5}\\
x_{k-1} \& H_{k-1}\left(x_{1}, x_{2}, \cdots, x_{k=2}\right) \text { 。 }
\end{array}\right.
$$

An equivalent statement is the following：
（3．6）$\left\{\begin{array}{l}\text { if } x_{k-1} \& \tilde{H}_{k=1}\left(x_{1}, x_{2}, \cdots, x_{k-2}\right), \text { then } \\ H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right)=\Lambda\end{array}\right.$
A consequence of this is that if $H_{k=1}\left(x_{1}, x_{2}, \cdots, x_{k-2}\right)=\Lambda$ ，then for each $x_{k-1} \in D$ also $H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right)=\Lambda$ 。

From（3．5）or（3．6）we get the following identity：

$$
\begin{equation*}
P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)<M\right\}= \tag{3.7}
\end{equation*}
$$

$$
\begin{aligned}
& P\left\{X_{S} \& H_{S}\left(x_{1}, x_{2}, \cdots, x_{s-1}\right) \mid X_{i}=x_{i}, i=1,2, \cdots, s=1\right\} \times \\
& x_{2} \& H_{2}\left(x_{1}\right) \ldots \\
& x_{S-1} \varepsilon H_{S-1}\left(x_{19} 9 x_{2}, \cdots, x_{s-2}\right) \\
& P\left\{X_{s=1}=x_{s-1} \mid X_{i}=x_{i}, i=1,2, \ldots, s-2\right\} \times \cdots 0 \\
& P\left\{x_{2}=x_{2} \mid X_{1}=x_{1}\right\} x \\
& P\left\{X_{1}=x_{1}\right\} \text { 。 }
\end{aligned}
$$

The importance of the sets $H_{k}$ is that they provide this exact expression for $P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)<M\right\}$ 。

If it were the case that $T_{s}\left(x_{1}, x_{2}, \cdots, x_{S}\right) \equiv M$ for ail $s$ and ail $x_{1}, x_{2}, \cdots, x_{s}$ ，then（3．7）wo uid vanish identically．However，we are excluding this extraordinary situation，and therefore we are assured that for each $k$ there is at least one set $H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right)$ which is not empty．

Now let us take note of our information scheme．If，at the $(k-1)$ th stage，the knowledge of the values of $f$ on $A_{k}{ }^{0}\left(x_{1}, x_{2}, \ldots, x_{k-1}\right)$ could in itself improve upon the number $T_{k-1}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right)$ ，then in the information at that stage we should have put，not $T_{k+1}\left(x_{1}, x_{2}, \ldots, x_{k-1}\right)$ ， but the improved number．In other words，it is implicit in the informa－ tion scheme that if the $k$－th realized point，$x_{k}$ ，is，as a point of $D, ~ a$ duplicate of one of the points in $A_{k}{ }^{\circ}\left(x_{1}, x_{2}, \cdots, x_{k=1}\right)$ then $T_{k}\left(x_{1}, x_{2}, \cdots, x_{k}\right)=T_{k=1}\left(x_{1}, x_{2}, \ldots, x_{k \infty 1}\right)$－－that is，the $T$－value
does not increase. In particular, therefore, if $T_{k \infty 1}\left(x_{1}, x_{2}, \cdots, x_{k \infty 1}\right)<M$, then for each $x \& A_{k}{ }^{0}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right)$ we have $T_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}, x\right)<M$. Otherwise expressed:
(3.8) $\left\{\begin{array}{l}\frac{i f}{0}, x_{k-1} \varepsilon H_{k-1}\left(x_{1}, x_{2}, \cdots, x_{k-2}\right) \text {, then } \\ A_{k}{ }^{\circ}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right) \subseteq H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right) \quad \text { 。 }\end{array}\right.$

Combining this with $(3.6)$ we get:
(3.9) $\left\{\begin{array}{l}\text { if } H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right) \neq \Lambda, \text { then } \\ A_{k}^{\circ}\left(x_{I}, x_{2}, \cdots, x_{k-1}\right) \subseteq H_{k}\left(x_{1}, x_{2}, \cdots, x_{k=1}\right) \quad .\end{array}\right.$

From (3.2) and (3.9) we get the following inequalities:

$$
\boldsymbol{P}\left\{X_{k} \in H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right) \mid X_{i}=x_{i}, i=1,2, \cdots, k-1\right\} \geq a_{k},
$$ (3.10)

$$
\mathrm{k}=2,3, \cdots \quad .
$$

If, now, we set

$$
P\left\{\begin{array}{lll}
X_{1} & \varepsilon & H_{1}
\end{array}\right\}=a_{1}
$$

and apply (3.10) to (3.7), we obtain the following result:

$$
\begin{equation*}
P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)<M\right\} \geqslant \prod_{j=1}^{S} a_{j} \tag{3.11}
\end{equation*}
$$

And therefore,

$$
\begin{equation*}
P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{s}\right)=M\right\} \leqslant 1-\prod_{j=1}^{s} a_{j} 。 \tag{3.12}
\end{equation*}
$$

If there is strong corvergence of $\mathcal{I}$ to $M_{9}$ then the leftohand side of（3．12）must tend to 1 as $s \Rightarrow \infty$ 。 Consequently we must have $\prod_{j=2}^{s} a_{j} \rightarrow 0$（by our assumption of a non $\rightarrow$ tri vial problem，$a_{1}>0$ ）．We state this result in

THEOREM 2．A necessary condition that the stochastic process give strong（or weak，since the two are equivalent by virtue of（1．2） convergence of $\mathcal{J}$ to $M$ is that（cf。（3．2））

$$
\begin{equation*}
\lim _{s \rightarrow \infty} \prod_{j=2}^{s} a_{j}=0 \tag{3,23}
\end{equation*}
$$

The inequalities（3．12）hold for $\$$ ．
It is readily seen that the relations
（3．14）

$$
a_{i} \leqslant 1-c_{i} \quad, \quad i=2,3, \ldots
$$

hold，so that the divergence of $\Sigma \mathfrak{c}_{i}$ implies（3．13）．
This theoren is in the nature of an exact verification of the first motivation discussed in section 2．It says，roughly，that we must not consisterity allot too much conditional probability to the points at which the value of $f$ is already known，if we are to have stochastic convergence of $\mathcal{J}$ to M 。

By virtue of（2．11），the inequalities（3．12）and the theorem hold a fortiori if $T$ is replaced by $T^{\circ}$ 。

## 4. CONCERNING SHARPENING OF THE RESULTS

The results we have obtained in section 2 are quite obviously obtained actually for the estimator $\left\{T_{S}{ }^{0}, S=I, 2, \ldots\right\}$, and come to bear upon $\left\{T_{S}, S=1,2, \ldots 0\right\}$ through (2.12). This means that those results couid have been obtained even if we had not introduced the hypothesis of additional $k$-th stage information embodied in the generally conceived sets $A_{K+1}\left(X_{1}, x_{2}, \ldots, x_{K}\right)$ and $B_{K+1}\left(x_{1}, x_{2}, \cdots, x_{K}\right)$; that is, if we had assumed $\ell_{k}{ }^{0}\left(x_{1}, x_{2}, \ldots, x_{k}\right)$ as the orly $k-$ th stage information. And the results in section 3 obtain by the grace of (3.9), which is a completely general relation, therefore holding also in the special case where $\hat{\partial}_{k}^{0}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ is the only information. One of the directions for investigation after bounds which will be improvements on $(2.24),(2.25),(2.26)$, and (3.12), is in making additional assumptions concerning the information scheme. For example, if ${ }^{\prime}$ we specialize to the situation that $D$ is a rectangular lattice in the plane,

$$
D=\{(m h, n h) \mid m, n=1,2, \ldots, r\},
$$

and that the computer knows $f$ to have the property

$$
\begin{aligned}
& \left|f(m h, n h)-f\left(m^{9} h, n^{\gamma} h\right)\right|<\alpha \\
& \quad \text { for } m^{8}=m \pm 1, n^{8}=n \pm 1,
\end{aligned}
$$

where $\alpha$ is a fixed number, then the following $c$ an be said: if $x_{j}(j=1,2, \cdots, k)$ is such that $f\left(x_{j}\right)+\alpha \leqslant \max _{i+1,2, \cdots 0 k} f\left(x_{i}\right)$,
then the four points $x_{j}+(h, h), x_{j}+(\infty h, h), x_{j}+(h,-h)$ ，and $x_{j}+(\infty h, \infty h)$ all belong to $A_{k+1}\left(x_{1}, x_{2}, \cdots, x_{k}\right)$ 。

Such additional facts concerning the sets $A_{k+1}, B_{k+1}$ ，and $\mathrm{F}_{\mathrm{k}+1}$ would enable us in general to improve the inclusion relation（3．9）； that is，enable us to assert a larger set than $A_{k}{ }^{\circ}$ included，in $H_{k}$ ． In this way we could obtain smaller upper bounds for $P\left\{T_{S}\left(X_{1}, X_{2}, \ldots 0, X_{S}\right)=M\right\}$ than given in（3．12）。

It is easy to see that we always have：

$$
\begin{equation*}
H_{k}\left(x_{1}, x_{2}, \cdots, x_{k-1}\right) \subseteq \bar{K} \tag{4.1}
\end{equation*}
$$

This relation can be used with $(3.7)$ to obtain lower bounds for the probabilities $P\left\{T_{s}\left(X_{1}, X_{2}, \cdots, X_{S}\right)=M\right\}$ ．And these lower bounds are precisely $(2.24),(2.25)$ ，and $(2.26)$ ．Now，additional facts concerning the sets $A_{K+1}, B_{K+1}$ and $F_{K+1}$ would in general enable us also to improve（ 4.1 ），and the reby，through（ 3.7 ）to obtain better bounds than given in $(2.24),(2.25)$ ，and $(2.6)$ 。

Of course，such improved bounds would in turn give us less stringent sufficient conditions for convergence of $\mathcal{J}$ to $M$ and more complete necessary conditions．

But even without making additional assumptions concerning the information scheme，there is a refinement that can be made to im prove our results．This is to introduce more control parameters than the $c_{k}, b_{k}$ ，and $a_{k}$ ；namely，different parameters for different
values of $\rho\left(x_{1}, x_{2}, \cdots, x_{k}\right), \tau\left(x_{1}, x_{2}, \cdots, x_{k}\right)$, and $\lambda\left(x_{k}, x_{2}, \cdots, x_{k}\right)$ (三 number of points in $\left.A_{k+1}^{0}\left(x_{1}, x_{2}, \cdots, x_{k}\right)\right)$ as well as for different stages $k$. This would call for more refined calcuiations with (2.17) and (3.7).

## THE NATIONAL BUREAU OF STANDARDS

## Functions and Activities

The functions of the National Bureau of Standards are set forth in the Act of Congress, March 3, 1901, as amended by Congress in Public Law 619, 1950. These include the development and maintenance of the national standards of measurement and the provision of means and methods for making measurements consistent with these standards; the determination of physical constants and propertics of materials; the development of methods and instruments for testing materials, devices, and structures; advisory services to Government Agencies on scientific and technical problems; invention and development of devices to serve special needs of the Government; and the development of standard practices, codes, and specifications. The work includes basic and applied research, development, engineering, instrumentation, testing, evaluation, calibration services and various consultation and information services. A major portion of the Bureau's work is performed for other Government Agencics, particularly the Department of Defense and the Atomic Energy Commission. The scope of activities is suggested by the listing of divisions and sections on the inside of the front cover.

## Reports and Publications

The results of the Bureau's work take the form of either actual equipment and devices or published papers and reports. Reports are issued to the sponsoring agency of a particular project or program. Published papers appear either in the Bureau's own series of publications or in the journals of professional and scientific societies. The Bureau itself publishes three monthly periodicals, available from the Government Printing Office: The Journal of Research, which presents complete papers reporting technical investigations; the Technical News Bulletin, which presents summary and preliminary reports on work in progress; and Basic Radio Propagation Predictions, which provides data for determining the best frequencies to use for radio communications throughout the world. There are also five series of nonperiodical publications: The Applied Mathematics Series, Circulars, Handbooks, Building Materials and Structures Reports, and Miscellaneous Publications.

Information on the Bureau's publications can be found in NBS Circular 460, Publications of the National Bureau of Standards (\$1.00). Information on calibration services and fees can be found in NBS Circular 483, Testing by the National Bureau of Standards ( 25 cents). Both are available from the Government Printing Office. Inquiries regarding the Bureau's reports and publications should be addressed to the Office of Scientific Publications, National Bureau of Standards, Washington 25, D. C.
