Interlaboratory Intercomparison

of

400-Watt Mercury-Vapor Lamps

Abstract

Two groups of 400-watt mercury-vapor lamps were measured by each of seven laboratories. One group is composed of four clear-bulb lamps; the other is composed of four coated bulb lamps. The lamps were measured twice in each laboratory, once while holding the line voltage at 240 volts and again while holding the lamp wattage at 400-watts. The following lamp parameters were measured: lumens, amperes, lamp volts, and watts. Lumens per watt were computed from the above measurements. The results of measurements and a graphical analysis of the results are given.

Introduction

This intercomparison was undertaken to determine the uniformity of measurements on 400-watt mercury-vapor lamps made at the participating laboratories. The laboratories which participated are listed in the order in which they made their measurements.

1. Electrical Testing Laboratories
2. Duro Test
3. Westinghouse
4. Sylvania (Salem)
5. Sylvania (Manchester)
6. General Electric
7. National Bureau of Standards

Each laboratory followed its own customary procedure in making the measurements. In each laboratory measurements were made while holding the lamp wattage at 400 watts and except at Duro Test, they were measured again while holding the line voltage at 240 volts. Each laboratory measured the following parameters: lumens, amperes, lamp volts, watts and each laboratory computed lumens per watt.

Results of Measurements

The results reported by each laboratory are tabulated in tables 1 through 9. Average values for each lamp and for each laboratory are also given. The difference Δ between the average for each laboratory and the average for all the laboratory for each group of lamps is given for each measured parameter.

Analysis of Results

An analysis of the results of the measurements has been made following a modification of the method described by W. J. Youden (1), (2), and (3). The modification is described in National Bureau of Standards Report No. 6605, Interlaboratory Intercomparison of 32-Watt T12 Cool White Circline Lamps, and Report No. 6698, Interlaboratory Intercomparison of 40-Watt T12 Cool White Fluorescent Lamps. The analysis is shown on the graphs, figures 1 through 18. The point representing the measurements of an individual laboratory is designated by the first letter in the name of the laboratory. Sylvania's Salem Massachusetts laboratory is designated by SS and their Manchester N. H. laboratory is designated by S. M. The point representing the average of all the laboratories is designated by the letter A.
