OF THE NATIONAL BUREAU OF STANDARDS
NBS SPECIAL PUBLICATION 305
SUPPLEMENT NO. 7

1975 Catalog
U.S. Department
of Commerce

75 YEARS
NBS
1901-1976
The National Bureau of Standards\(^1\) was established by an act of Congress March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau consists of the Institute for Basic Standards, the Institute for Materials Research, the Institute for Applied Technology, the Institute for Computer Sciences and Technology, and the Office for Information Programs.

**THE INSTITUTE FOR BASIC STANDARDS** provides the central basis within the United States of a complete and consistent system of physical measurement; coordinates that system with measurement systems of other nations; and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. The Institute consists of the Office of Measurement Services, the Office of Radiation Measurement and the following Center and divisions:

Applied Mathematics — Electricity — Mechanics — Heat — Optical Physics — Center for Radiation Research: Nuclear Sciences; Applied Radiation — Laboratory Astrophysics\(^2\) — Cryogenics\(^3\) — Electromagnetics\(^2\) — Time and Frequency\(^5\).

**THE INSTITUTE FOR MATERIALS RESEARCH** conducts materials research leading to improved methods of measurement, standards, and data on the properties of well-characterized materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government agencies; and develops, produces, and distributes standard reference materials. The Institute consists of the Office of Standard Reference Materials, the Office of Air and Water Measurement, and the following divisions:

**THE INSTITUTE FOR APPLIED TECHNOLOGY** provides technical services to promote the use of available technology and to facilitate technological innovation in industry and Government; cooperates with public and private organizations leading to the development of technological standards (including mandatory safety standards), codes and methods of test; and provides technical advice and services to Government agencies upon request. The Institute consists of the following divisions and Centers:

**THE INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY** conducts research and provides technical services designed to aid Government agencies in improving cost effectiveness in the conduct of their programs through the selection, acquisition, and effective utilization of automatic data processing equipment; and serves as the principal focus within the executive branch for the development of Federal standards for automatic data processing equipment, techniques, and computer languages. The Institute consists of the following divisions:

Computer Services — Systems and Software — Computer Systems Engineering — Information Technology.

**THE OFFICE FOR INFORMATION PROGRAMS** promotes optimum dissemination and accessibility of scientific information generated within NBS and other agencies of the Federal Government; promotes the development of the National Standard Reference Data System and a system of information analysis centers dealing with the broader aspects of the National Measurement System; provides appropriate services to ensure that the NBS staff has optimum accessibility to the scientific information of the world. The Office consists of the following organizational units:

---

\(^1\) Headquarters and Laboratories at Gaithersburg, Maryland, unless otherwise noted; mailing address Washington, D.C. 20234.

\(^2\) Located at Boulder, Colorado 80302.
Publications of the National Bureau of Standards
1975 Catalog
A Compilation of Abstracts and Key Word and Author Indexes

Betty L. Hurdle, Editor
Office of Technical Publications
National Bureau of Standards
Washington, D.C. 20234
National Bureau of Standards Special Publication 305 Supplement 7
To Accompany National Bureau of Standards Special Publication 305; and its Supplements 1, 2, 3, 4, 5, and 6
CODEN: XNBSAV
Issued June 1976
PREFACE

As the National Bureau of Standards celebrates the Bicentennial of the United States as well as its own 75th Anniversary (1901-1976), it is interesting to take note of the Bureau's total published output over the years—papers which have played a significant role in the growth of science and technology in this country and indeed throughout the World. Since the turn of the century, some 32,363 NBS papers have been published in the open literature, a grand total of 606,854 printed pages. Many of the Bureau’s early publications were classic contributions that still stand as scientific and scholarly references.

Included in the 75 year total is the published 1975 output cited in this annual catalog—1948 papers and 41,183 printed pages. About one-half of these papers were issued in the Bureau's own publication series; the other half in non-NBS journals, books, and proceedings.

The citations for all NBS papers, whatever the publication medium, include the full title, author(s), place of publication, abstract, and key words. Permutted author and key word indexes facilitate use of this catalog as a reference source. In addition, all NBS publications are categorized by major primary subject area for convenient browsing by specialists.

Included is information on previous NBS catalogs, availability information for NBS papers published in past years, and Tables of Contents for the twelve 1975 issues of the Bureau’s monthly newsmagazine, DIMENSIONS/NBS.

NBS papers published by the Government Printing Office are sold by the Superintendent of Documents and also, in microfilm form, by the National Technical Information Service. The complete citations for these publications are organized in this catalog by the respective NBS publications series. NBS-authored papers published in non-NBS media are cited separately in numerical sequence. For completeness, papers published but not reported in previous years have been included in this supplement.

Included also among the NBS publications series are citations for the papers which have appeared in the Journal of Physical and Chemical Reference Data, published for NBS by the American Institute of Physics and the American Chemical Society.

This 1975 catalog was produced utilizing computer-assisted photocomposition techniques, as were past supplements to NBS Special Publication 305.

W. R. Tilley, Chief
Office of Technical Publications

1. NBS PUBLICATION PROGRAM

1.1. INTRODUCTION

The formal publication of the National Bureau of Standards—some 1948 papers in 1975—provide the primary means of communicating the results of NBS programs to its varied technical audiences, as well as to the general public. Publications thus constitute a major end product of the Bureau’s efforts. These take the form of the Bureau’s three periodicals, its ten nonperiodical series, interagency reports, and articles in the journals of professional organizations and technological associations.

This annual catalog, Publications of the National Bureau of Standards, cites the 1975 output of papers that document the results of the Bureau’s current programs. The various media in which these papers appeared are as follows:

1.2. PERIODICALS

1.2.1. JOURNAL OF RESEARCH

JOURNAL OF RESEARCH reports National Bureau of Standards research and development in physics, mathematics, and chemistry. It is published in two sections, available separately:

- Physics and Chemistry (Section A)
  Papers of interest primarily to scientists working in these fields. This section covers a broad range of physical and chemical research, with major emphasis on standards of physical measurement, fundamental constants, and properties of matter. Issued six times a year.

  Editor: C. W. Beckett
  Associate Editor: D. D. Wagman

- Mathematical Sciences (Section B)
  Studies and compilations designed mainly for the mathematician and theoretical physicist. Topics in mathematical statistics, theory of experiment design, numerical analysis, theoretical physics and chemistry, logical design and programming of computers and computer systems. Short numerical tables. Issued quarterly.

  Editor: M. Newman
  Associate Editor: F. W. Olver

1.2.2. DIMENSIONS/NBS

This monthly magazine is published to inform scientists, engineers, businessmen, industry, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on the work at NBS. The magazine highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, it reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing.

The table of contents for each issue in 1975 are listed in Section 3.3, pages 37–39. Issued monthly.

Managing Editor: S. A. Washburn

1.2.3. JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA (JPCRD)

This Journal is published quarterly by the American Chemical Society and the American Institute of Physics for the National Bureau of Standards. The objective of the Journal is to provide critically evaluated physical and chemical property data, fully documented as to the original sources and the criteria used for evaluation. Critical reviews of measurement techniques, whose aim is to assess the accuracy of available data in a given technical area, are also included. The principal source for the Journal is the National Standard Reference Data System (NSRDS). The Journal is not intended as a publication outlet for original experimental measurements such as are normally reported in the primary research literature, nor for review articles of a descriptive or primarily theoretical nature. (See also Section 1.3, National Standard Reference Data Series.)

1.3. NONPERIODICALS

Ten categories of nonperiodical publications, described as follows, are listed in this catalog:

MONOGRAPHS—major contributions to the technical literature on various subjects
related to the Bureau’s scientific and technical activities.

HANDBOOKS—recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

SPECIAL PUBLICATIONS—include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

APPLIED MATHEMATICS SERIES—mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

NATIONAL STANDARD REFERENCE DATA SERIES—provides quantitative data on the physical and chemical properties of materials, compiled from the world’s literature and critically evaluated. Developed under a worldwide program coordinated by NBS. Program under authority of National Standard Data Act (Public Law 90-396). See also Section 1.2.3.

BUILDING SCIENCE SERIES—distributes technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

TECHNICAL NOTES—studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other government agencies.

VOLUNTARY PRODUCT STANDARDS—developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The purpose of the standards is to establish nationally recognized requirements for products, and to provide all concerned interests with a basis for common understanding of the characteristics of the products. The National Bureau of Standards administers the Voluntary Product Standards program as a supplement to the activities of the private sector standardizing organizations.

CONSUMER INFORMATION SERIES—practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today’s technological marketplace.

1.4. NBS INTERAGENCY REPORTS

A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution is by the National Technical Information Service (Springfield, VA. 22161) in paper copy or microfiche form. (See pages 21 to 25 for price lists.)

1.5. NBS BIBLIOGRAPHIC SUBSCRIPTION SERVICES

The Cryogenic Data Center and the Electromagnetics Division of the National Bureau of Standards, Boulder, CO. have developed specialized bibliographic issuances designed to provide interested audiences with information on latest developments in certain specialized fields. These issuances, together with subscription information, are listed below:

CRYOGENIC DATA CENTER CURRENT AWARENESS SERVICE (Publications and Reports of Interest in Cryogenics). A literature survey issued weekly. Annual subscription: Domestic, $20.00; Foreign, $25.00.
LIQUEFIED NATURAL GAS. A literature survey issued quarterly. Annual subscription: $20.00.

Send subscription orders and remittances for the preceding bibliographic services to the National Bureau of Standards, Cryogenic Data Center (275.02), Boulder, CO. 80302.

ELECTROMAGNETIC METROLOGY CURRENT AWARENESS SERVICE (Selected electro-optic subjects). Issued monthly. Annual subscription: $24.00.

Send subscription order and remittance made payable to the Dept. Comm./NBS to the Electromagnetic Metrology Information Center, Electromagnetics Division, National Bureau of Standards, Boulder, CO. 80302.

1.6. PAPERS PUBLISHED BY OTHERS

Many significant contributions by NBS authors are published in other journals. Up-to-date listings of these articles are carried regularly in each section of the Journal of Research, along with selected abstracts. A complete listing is published annually in NBS SP305, along with abstracts, key words, and author/subject indexes.

2. PURCHASE PROCEDURES AND DOCUMENT AVAILABILITY

2.1. PURCHASE PROCEDURES

The publications of the Bureau are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, at the prices listed in this publication. However, prices are subject to change without notice. You may also order through the U.S. Department of Commerce Field Office nearest you (see Appendix C for list of Field Offices of the U.S. Department of Commerce). Microfiche copies of all recent NBS publications, and paper copies and many non-periodicals, may be ordered through the National Technical Information Service, U.S. Department of Commerce, Springfield, VA. 22161.

This section includes prices lists of available publications, plus instruction on how to acquire reprints of articles by NBS authors, and how to get out-of-print material.

How To Make Remittances. Remittances for publications for which individual sales or subscription prices are shown should be mailed to Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, by coupon, postal money order, express money order, or check. Postage stamps will not be accepted. Publications cannot be mailed before remittances are received. Foreign remittances should be made either by international money order or draft on an American bank.

The letter symbol, publication number, full title of the publication, SD catalog number, and SD stock number MUST be given when ordering. The Superintendent of Documents allows a discount of 25 percent on orders of 100 or more copies of one publication. For the convenience of the general public, coupons in the denomination of five cents may be purchased from the Superintendent of Documents. These may be exchanged for Government publications sold by the Superintendent's office. Address order to Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Persons who make frequent purchases from the Superintendent of Documents may find a deposit account convenient. Deposits of $25 or more are accepted against which orders may be placed without making individual remittances or first obtaining quotations. Order blanks are furnished for this purpose. After the order has been processed, the order itself is returned, showing the publications supplied, explanations regarding those not sent, the amount of charge, and the balance on deposit.

No charge is made for postage on documents sent to points in the United States and its possessions. In computing foreign postage, add one-fourth of the price of the publication to cover the cost of shipping and handling charges.

Orders for publications purchased from the National Technical Information Service (NTIS) must be accompanied by postal money order, express money order, or check made out to the NTIS and covering total cost of the publications order. Information concerning NTIS coupons can be obtained directly from NTIS. All inquiries or orders should be addressed to: National Technical Information Service, Springfield, VA. 22161.

SD and NTIS order forms are included at the end of this publication for your convenience in ordering.
2.2. ANNOUNCEMENTS OF NBS PUBLICATIONS

The National Bureau of Standards and the agencies mentioned below regularly issue the following official announcements dealing with NBS publications.

NBS JOURNAL OF RESEARCH. Both Sections A and B carry a listing of all NBS publications as issued. See 2.6 for subscription information.

Selected List of U.S. Government Publications. Issued monthly by the Superintendent of Documents. Each list is arranged by subject, with annotations, prices, and order form. May be obtained free from the Superintendent of Documents, Attn: Selected List, P.O. Box 1821, Washington, D.C. 20013.

2.3. CATALOGS OF NBS PUBLICATIONS

Previous catalogs, plus this publication, constitute a complete list of the titles of the Bureau's publications through December 31, 1975. The catalogs are available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, or may be consulted in a library which maintains sets of National Bureau of Standards publications.

Circular 460: Publications of the National Bureau of Standards 1901 to June 30, 1947. 375 pages, including subject and author indexes. Brief abstracts are included for the period January 1, 1941 to June 30, 1947............................... $1.25

Supplement to Circular 460: Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957. 373 pages, including subject and author indexes....................... $1.50

Miscellaneous Publication 240: Publications of the National Bureau of Standards, July 1, 1957 to June 30, 1960. First NBS catalog to include Titles of Papers Published in Outside Journals 1950 to 1959. 391 pages, including subject and author indexes....................... $3.50

Supplement to Miscellaneous Publication 240: Publications of the National Bureau of Standards published by NBS, July 1960 through June 1966; published by others, 1966 through 1965. 740 pages, including subject and author indexes............................... $4.00

Special Publication 305: Publications of the National Bureau of Standards, published by NBS, July 1966 through December 1967; published by others, 1966–1967. 223 pages, a citation of titles and abstracts, with key words and author indexes............. $2.00

Supplement 1 to Special Publication 305: Publications of the National Bureau of Standards, 1968 through 1969. 497 pages, a citation of titles and abstracts, with key words and author indexes....................... $5.55

Supplement 2 to Special Publication 305: Publications of the National Bureau of Standards, 1970. 378 pages, a citation of titles and abstracts, with key words and author indexes....................... $4.30

Supplement 3 to Special Publication 305: Publications of the National Bureau of Standards, 1971. 342 pages, a citation of titles and abstracts, with key words and author indexes....................... $3.95

Supplement 4 to Special Publication 305: Publications of the National Bureau of Standards, 1972. 449 pages, a citation of titles and abstracts, with key words and author indexes....................... $4.20

Supplement 5 to Special Publication 305: Publications of the National Bureau of Standards, 1973. 349 pages, a citation of titles and abstracts, with key words and author indexes....................... $4.15

Supplement 6 to Special Publication 305: Publications of the National Bureau of Standards, 1974. 523 pages, a citation of titles and abstracts, with key words and author indexes....................... $6.80

Supplement 7 to Special Publication 305: Publications of the National Bureau of Standards, 1975. 595 pages, a citation of titles and abstracts, with key words and author indexes....................... $7.55

2.4. FUNCTIONS OF DEPOSITORY LIBRARIES IN THE UNITED STATES

The Superintendent of Documents, United States Government Printing Office, is authorized by law to furnish Government publications to designated depository libraries.

Under provisions of Title 44 of the United States Code, certain libraries are designated
depositories for Government publications. Through them Federal Government documents are made available to residents of every State, District of Columbia, Guam, Puerto Rico, and the Virgin Islands. Distribution to the libraries is made by the Office of the Superintendent of Documents. It is sometimes impossible to obtain desired publications by purchase from the Superintendent of Documents. Stocks may have been exhausted or the document may be permanently out of print. In these instances the depositories render an invaluable service by keeping such publications permanently available. Every Government publication cannot be consulted at all depository libraries. Designated Regional Depositories are required to receive and retain one copy of all Government publications made available to depository libraries either in printed or microfacsimile form. All other libraries are allowed to select the classes of publications best suited to the interest of their particular clientele.

The libraries listed in Appendix A are now receiving selected publication series of the National Bureau of Standards for general reference use. Whether a given library has a copy of a particular publication can be determined by inquiring at the library.

2.5. FUNCTIONS OF U.S. DEPARTMENT OF COMMERCE DISTRICT OFFICES

Department of Commerce District Offices are maintained in the cities listed in Appendix B. Their purpose is to provide ready access, at the local level, to the services of the Department of Commerce as well as to its reports, publications, statistical statements, and surveys. Each District Office serves as an official sales agent of the Superintendent of Documents, U.S. Government Printing Office, making available for purchase locally a wide range of Government publications. The reference library maintained by each District Office contains many Government and private publications, periodicals, directories, reports, and other reference materials.

2 Foreign price includes the cost of the publication and postage.
3 Prices of the bound volumes vary. The Superintendent of Documents will furnish prices on request.

B. PRICE LISTS FOR NONPERIODICALS

The following lists give the numbers and prices of all NBS publications issued from 1901 through 1975 which are still in print. Those items in boldface denote the 1975 publications cited in this supplement. The prices shown herein supersede prices quoted in previous catalogs of NBS publications. The prices shown are those in effect as of the date this publication went to press. Prices are subject to change without notice, and the prices that will be charged on your order will be those in effect as of the date your order is processed. Publications may be ordered from the Superintendent of Documents, U.S. Government Printing Office or from the U.S. Department of Commerce District Office nearest you. SD order forms are included at the end of this publication. Some NBS publications may be purchased from the National Technical Information Service. (See Section 2.1.)

Publications not listed are out of print. In such cases, your nearest depository library may still have a copy of that item. (See Section 2.4 and Appendix A.)

C. SUPERSEDED NBS REFERENCE PUBLICATIONS

Those NBS publications not listed in the Price Lists are out of print and are not available from the Superintendent of Documents. Many can be consulted at libraries. Also, in many cases, photoduplicated copies can be purchased from the Library of Congress. For full information concerning this service, write to the Photoduplication Service, Library of Congress, Washington, DC 20540.

Certain NBS publications are out of print because they have been replaced, or partially replaced, by material issued by other organizations. In this connection NBS is able to offer the following information:

Circular 410, National Standard Petroleum Oil Tables. Information in this Circular has been incorporated in the ASTM-IP Petroleum Measurement Tables issued by the American Society for Testing and Materials, 1916 Race Street, Philadelphia PA 19103. Available at $12.75, 20% off to ASTM members. Tables 5 and 7 of the ASTM-IP Tables may also be purchased from the ASTM in separate reprint form at $1.75 and $1.50 per copy respectively.

Circular 438, Static Electricity. The National Fire Protection Association, 60 Batterymarch Street, Boston, MA 02110, has issued a publication by the same title, available from them as NFPA Publication 77, at $2.00.

Circular 564, Tables of Thermal Properties of Gases. A reprinted edition is available from University, Microfilms, Inc., Ann Arbor, MI. 48106. Order as OP 12,192 for $25.00. Microfiche of this Circular is available from Cryogenic Data Center, National Bureau of Standards, Boulder, CO 80302 for $4.50

Circular 576, Automotive Antifreezes. For information on this subject consult American National Standards Institute, 1430 Broadway, New York, NY 10018.

Circular 577 and Supplement, Energy Loss and Range of Electrons and Positrons. These have been superseded by NASA Special Publication 3012, available from the National Technical Information Service, Springfield, VA 22161, at $5.75 hardcopy and $2.25 microfiche number N65-12506.

Handbook 48, Control and Removal of Radioactive Contamination in Laboratories. Reprints of this Handbook can be purchased as NCRP Report 8 at $2.00 from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 49, Recommendations for Waste Disposal of Phosphorus-32 and Iodine-131 for Medical Users. Reprints of this Handbook can be purchased as NCRP Report 9 at $2.00 from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 58, Radioactive Waste Disposal in the Ocean. Reprints of this Handbook can be purchased as NCRP Report 16 at $2.00 from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 59, Permissible Dose from External Sources of Ionizing Radiations. Reprints of this Handbook can be purchased as NCRP Report 39 at $4.00 per copy from NCRP Pub-
Handbook 63, Protection Against Neutron Radiation up to 30 MeV. Reprints of this Handbook can be purchased as NCRP Report 38 at $5.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 65, Safe Handling of Bodies Containing Radioactive Isotopes. Reprints of this Handbook can be purchased as NCRP Report 37 at $4.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 69, Maximum Permissible Body Burdens and Maximum Permissible Concentrations of Radionuclides in Air and in Water for Occupational Exposure. Reprints of this Handbook can be purchased at $3.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 73, Protection Against Radiations from Sealed Gamma Sources (Supersedes H54). Reprints of this Handbook can be purchased as NCRP Report 40 at $4.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 74, Building Code Requirements for Reinforced Masonry. The American National Standards Institute, 1430 Broadway, New York, NY 10018 has issued a publication on this subject. Available from them as A41.2-1960 (R1970), at $3.25.

Handbook 75, Measurement of Absorbed Dose of Neutrons and of Mixtures of Neutrons and Gamma Rays. Reprints of this Handbook can be purchased as NCRP Report 25 at $2.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 76, Medical X-ray Protection Up to Three Million Volts. Now NCRP 33 and 34 respectively. Purchase from NCRP Publications, Post Office Box 30175, Washington, DC 20014, at $3.00 and $4.00 respectively.

Handbook 80, A Manual of Radioactivity Procedures. Reprints of this Handbook can be purchased as NCRP Report 28 at $3.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

Handbook 81 and its Supplements, Safety Rules for the Installation and Maintenance of Electric Supply and Communication Lines (also H30 and H110-1). The American National Standards Institute, 1430 Broadway, New York, NY 10018 has issued a publication on this subject. Available from them as ANSI C2, at $6.40.

Handbook 84, Radiation Quantities and Units. Reprints of this Handbook can be purchased as Report 19 at $2.50 per copy from ICRU Publications, Post Office Box 30165, Washington, DC 20014.

Handbook 89, Methods of Evaluating Radiological Equipment and Materials. Reprints of this Handbook can be purchased as ICRU Report 10F at $2.50 per copy from ICRU Publications, Post Office Box 30165, Washington, DC 20014.

Handbook 96, Inspection of Processed Photographic Record Films for Aging Blemishes. Reprints of this Handbook can be purchased as PH 1.28-1973 at $4.00 per copy from The American National Standards Institute, 1430 Broadway, New York, NY 10018.

Handbook 97, Shielding for High-Energy Electron Accelerator Installations. Reprints of this Handbook can be purchased as NCRP Report 31 at $2.00 per copy from NCRP Publications, Post Office Box 30175, Washington, DC 20014.

3. TITLES AND ABSTRACTS OF NBS PUBLICATIONS, 1975

January-February 1975

Key words: emission anisotropy; fluorescence; fluorescence quantum yield; fluorescence standards; fluorimetry; polarization; spectrofluorimetry; viewing angle.

Polarization effects on fluorescence measurements are a function of four independent variables. The first is \( F \), the polarization ratio of the exciting light which reaches the sample. The second is \( r \), the emission anisotropy of the sample, which is the polarization “response” of the sample to plane polarized exciting light. The third is \( G \), the polarization ratio of the emission detection system, which is the ratio of the sensitivities of the detection system to vertically and horizontally polarized light. The fourth is \( \alpha \), the viewing angle, which is the angle between the direction of the propagation of the exciting light and the direction from which the emission is being detected.

The intensity and the degree of polarization of the fluorescence emission that the sample exhibits are functions of \( F, r, \alpha \), and \( G \), while the actual readings obtained with a typical spectrofluorimeter are functions of all four variables, \( F, r, \alpha, \) and \( G \). A theoretical analysis is made taking all these factors into account, and proper mathematical models are developed for the different modes of operation in which a fluorimeter can be used. These are verified experimentally with data obtained for a sample which has a high degree of emission anisotropy (Nile Blue A Perchlorate in glycerol). A recently designed goniospectrophotometer was used. Calibration procedures are developed and recommendations are made for modes of operation and fluorescence standards.

Key words: hollow cathode; iron; neon; wavelength standards.

Over 4000 wavelengths are listed between 1900 and 9000 Å for Fe I, Fe II, Ne I and Ne II lines measured in a hollow cathode discharge tube with iron electrodes and a neon gas filling. Photoelectric traces between 2400 and 5700 Å on a semiquantitative intensity scale are also included. For Fe I, energy values for 124 even and 240 odd levels have been computed. These have been used to calculate Ritz standards for most of the Fe I lines.

Key words: coexistence boundary; critical point; ethane; equation of state; fluids; methane; orthobaric densities; specific heats; vapor pressures.

This equation of state was developed from PVT compressibility data on methane and ethane. The highly-constrained form originates on a given liquid-vapor coexistence boundary (described by equations for the vapor pressures and the orthobaric densities). It then requires only five least-squares coefficients, and ensures a qualitatively correct behavior of the \( P (p, T) \) surface and of its derivatives, especially about the critical point. This nonlinear equation yields a maximum in the specific heats \( C_p (p, T) \) at the critical point.

Key words: electrical resistivity; high-speed measurements; high temperature; solid-solid phase transformation; thermodynamics; zirconium.

Measurements of the temperature and energy of the \( \alpha \rightarrow \beta \) phase transformation, and the electrical resistivity near and at the transformation point of zirconium using a subsecond duration pulse heating technique are described. The results yield 1147 K for the transformation temperature and 3980 J • mol\(^{-1}\) for the transformation energy. Electrical resistivity is found to decrease by 17 percent during the transformation. Estimated inaccuracies of the measured properties are: 10 K for the transformation temperature, 5 percent for the transformation energy, and 2 percent for the electrical resistivity.

March-April 1975

Thermal conductivity of gases. III. Some values of the thermal conductivities of argon, helium, and nitrogen from 0 °C to 75 °C at pressures of \( 1 \times 10^2 \) to \( 2.5 \times 10^5 \) pascals, I. A. Guildner, J. Res. Nat. Bur. Stand. (U.S.), 79A (Phys. and Chem.), No. 2, 407-413 (Mar.-Apr. 1975).

Key words: excess thermal conductivity of \( N_2 \); thermal conductivity of \( Ar \); thermal conductivity of \( He \); thermal conductivity of \( N_2 \).

Accurate measurements of the thermal conductivities of \( Ar \) and \( He \) agree with the theoretical value of 2.5 \( \phi \nu T \eta / c_v \) (\( \eta = \) viscosity, \( c_v = \) specific heat capacity at constant volume, \( \phi \) is a number slightly greater than 1 depending upon the intermolecular potential). Measurements of the thermal conductivities of \( N_2 \) at 9.6 and 75 °C as a function of pressure up to \( 2.53 \times 10^5 \) Pa help to appraise the validity of other measurements of the thermal conductivities of dense gases. The excess conductivity of...
nitrogen (the additional conductivity resulting from pressure) is shown to be a function of only the density of the nitrogen from 0 to 700 °C and pressures up to $1.3 \times 10^5$ Pa.

Key words: differential cross section; real metals; theory; x-ray inelastic scattering.

A formal formulation of the differential cross section for x-ray inelastic scattering is given for a real solid, in particular, in terms of the polarization propagator and the inverse dielectric function. The differential cross section is related to the causal functions of electron properties rather than those retarded functions.

Key words: composite materials; elastic constants; filled polymers; mechanical properties; particulate composites; shear modulus; theory of elasticity.

The coefficients in van der Poel's equation for calculating the shear modulus of a particulate composite have been greatly simplified, making the calculation much less unwieldy. Approximate solutions of van der Poel's equation are also derived, and it is shown that one of the lower order approximations is Kerner's equation, or Hashin and Shtrikman's equation for the highest lower bound. The Kerner approximation is often too low in value when the volume fraction of filler exceeds 0.2, but it can be used to provide further simplification in van der Poel's equation, or it can be used as a first approximation in a Newton's method of solution.

Key words: calorimetry; combustion; creatinine; enthalpy; formation; heat; nicotinic acid.

The enthalpies of combustion of nicotinic acid and creatinine have been determined in an adiabatic rotating-bomb calorimeter. The enthalpies of formation have been obtained by combination of the experimental data with the accepted values for the enthalpies of formation of carbon dioxide and water. The results of other investigations on creatinine are discussed briefly. The resulting values and their estimated uncertainties are as follows:

<table>
<thead>
<tr>
<th>Nicotinic acid</th>
<th>Creatinine</th>
</tr>
</thead>
<tbody>
<tr>

<td>-344.97±0.62 kJ/mol</td>
</tr>
</tbody>
</table>

Key words: electrical resistivity; emittance; hafnium; high-speed measurements; high temperatures; specific heat; thermodynamics.

Simultaneous measurements of specific heat, electrical resistivity and hemispherical total emittance of hafnium containing 3.12 weight percent zirconium in the temperature range 1500 to 2400 K by a subsecond duration, pulse heating technique are described. The measurements indicate decreases in specific heat (by about 13%) and in electrical resistivity (by about 8%) as the result of the $\alpha \rightarrow \beta$ transformation. Estimated inaccuracies of the measured properties are: 3 percent for specific heat, 1 percent for electrical resistivity and 5 percent for hemispherical total emittance.

Key words: adiabatic calorimetry; branched polyethylene; calorimetry; cryogenic temperature; heat capacity; linear polyethylene; polyethylene; thermodynamic properties.

Heat capacities of two polyethylene samples, one linear with a density of 0.973 g cm$^{-3}$ and one branched with a density of 0.91 g cm$^{-3}$, have been determined by adiabatic calorimetry from 5 to 360 K in a different experimental arrangement than employed for studies of other polyethylene samples in this series. The heat capacity behavior of these two samples confirms expectations for samples with corresponding densities.

May-June 1975

Key words: combustion; enthalpy; formation; heat; isomerization; secondary standard.

The enthalpies of combustion and formation of one sample of ortho- and two samples of parafluorobenzoic acids have been determined by combustion in an oxygen-bomb calorimeter. The data obtained by other investigators are discussed briefly. The values obtained and their estimated uncertainties are as follows:

<table>
<thead>
<tr>
<th></th>
<th>o-Fluorobenzoic acid</th>
<th>p-Fluorobenzoic acid I</th>
<th>p-Fluorobenzoic acid II</th>
</tr>
</thead>
<tbody>
<tr>

A comparison with previously reported data is given.

Key words: cholesterol; clinical standard; combustion, heat of; enthalpy; formation, heat of; reference material.

The enthalpy of combustion of cholesterol was measured in an adiabatic, rotating-bomb calorimeter capable of high precision with relatively small samples. The random error for the experimental measurements was 0.006 percent which may be compared with approximately 0.3 percent for prior investigations on this substance. The results obtained for the enthalpy of combustion and the derived enthalpy of formation together with the estimated overall uncertainties are:

\[ \Delta H^\circ(25 ^\circ C) = -16524.0 \pm 3.9 \text{ kJ/mol} \]
\[ \Delta Hf^\circ(25 ^\circ C) = -674.8 \pm 4.1 \text{ kJ/mol} \]

The results of prior investigations are discussed briefly.

Key words: atomic energy levels; atomic spectrum; copper; doubly ionized copper; electron configuration; ionization potential; wavelengths.

An analysis of Cu III based on observations from 500 to 6900 Å is presented. The low structures 3d\(^4\) and 3d\(^4\)s are complete, including the rarely, if ever before, found 3d\(^4\)(S)3s\(^4\)S. The 3d\(^4\)F\(^6\)s includes 3F\(^2\), 3F\(^4\), 3G, and 3H but the 3P\(^2\), 3P\(^4\), 3D, 3D\(^4\) have eluded all attempts to find them. The ionization potential calculated from 4s, 3s, 2s\(^4\)F\(^2\)),1/2 is 296 980 cm\(^{-1}\) but by a comparison with Ni the series an approximate value of 297 140 can be estimated. The 3d\(^4\)A\(^2\) group is complete, except for one level, as is 5d based on 3F and 3G, the other 5d groups being incomplete. 3d\(^4\)F\(^4\)F\(^4\) is complete and 26 levels based on 3D, 3P, 3G are known. 3d\(^4\)F\(^5\)F\(^5\) is incomplete and a few levels based on 4D and 4G have been found. A discussion of the validity of the analysis of Cu I by J. F. Schröder and Th. A. M. Van Kleef is given.

July-August 1975

Key words: high-speed measurements; high temperature; iron; melting; normal spectral emissance; radiance temperature.

Radiance temperature (at 653 nm) of iron at its melting point was measured using a subsecond-duration pulse heating technique. Specimens in the form of strips with initially different surface roughnesses were used. The results do not indicate any dependence of radiance temperature (at the melting point) on initial surface or system operational conditions. The average radiance temperature (at 653 nm) at the melting point for 13 specimens is 1670 K on 1PTS-68, with a standard deviation of 0.8 K and a maximum absolute deviation of 1.7 K. The total error in the radiance temperature is estimated to be not more than ±6 K.

Key words: dimensional stability; glass; glass-ceramic; interferometry.

There are several glasses and glass-ceramics available today which have low coefficients of thermal expansion—some near zero. For this reason they often serve as substrates for massive mirrors in orbit. In order for such a mirror to enjoy a lifetime of 5 years or more of diffraction-limited service, the substrate must be dimensionally stable and thereby preserve the original figure.

Early in 1967, it was decided that the National Bureau of Standards and Corning Glass Works would undertake a joint effort to measure the lengths of small samples of such materials over a period of years. These measurements were completed in 1971.

The average length changes in parts per million of the four materials selected are as follows:

- Corning Code 9623 a glass ceramic — 0.30
- Corning Code 7971 a titanium silicate — 0.37
- Corning Code 7940 a vitreous silica — 0.47
- Corning Code 9622 a glass-ceramic — 1.03

Key words: enhancement factor; equation of state; interaction virial coefficients; moist air; saturated air; second virial coefficients; virial coefficients.

Experimental measurements of the enhancement factors for mixtures of water vapor and CO\(_2\)-free air have been made at −20, −10, and +70 °C. The results, coupled with previous experimental enhancement data, have been used to calculate the second interaction virial coefficients, B\(_{nn}\), for water vapor air mixtures from −50 to +90 °C. Within this temperature range, an error analysis shows that the uncertainties in B\(_{nn}\) are between 6 and 10 percent. The calculated B\(_{nn}\) values are used in deriving enhancement factors at 10 °C intervals for −50 < t < 90 °C., at varying pressure intervals from 0.25 to 100 bar. The associated uncertainties are shown as a function of pressure and temperature. The enhancement factors are extrapolated to −80 °C.

Key words: combustion; enthalpy; formation; heat; secondary standard; sulfur compound; thianthrene.

The enthalpy of combustion of thianthrene (diphenylene disulfide) has been determined in an oxygen-bomb calorimeter. The enthalpy of formation has been derived using data from the available literature. The results obtained are as follows:

\[ \text{C}_9\text{H}_6\text{S}_2\text{(g)} + 17\text{O}_2\text{(g)} + 228\text{H}_2\text{O}\text{(l)} = 12\text{CO}_2\text{(g)} + 2\text{H}_2\text{SO}_4\text{(aq)} + 115\text{H}_2\text{O}\text{(l)} \]
\[ \Delta H_f^\circ(25 ^\circ C) = -7253.27 \pm 1.40 \text{ kJ/mol} \]
\[ (-1733.65 \pm 0.33 \text{ kcal/mol}) \]
\[ \Delta H_f^\circ(25 ^\circ C) = 184.23 \pm 1.50 \text{ kJ/mol} (44.03 \pm 0.36 \text{ kcal/mol}) \]

A comparison is given of the results of this investigation with those of previous investigators.

Key words: adsorption; computer application; desorption.
dry weight determination; moisture content; surface area; water content; water vapor adsorption.

It is standard procedure to fit an applicable isotherm equation to water vapor adsorption data using the method of least squares in arriving at a value for the surface area accessible to the water molecule. The least squares technique has been extended in the present investigation to determine, in addition and simultaneously, a "best" value for the zero-humidity sample weight of the material. The application is equally valid for desorption isotherm as the zero-humidity weight is concerned, although the derived value for "surface area" from desorption data will be overestimated in the general case because of hysteresis. There is no limitation on the range of humidities since the method is not restricted to the BET equation (i.e., between 0.1 and 0.3 r.h.). In fact, good agreement with the zero-humidity points measured experimentally has been obtained even from drying curves in which the relative humidity has been confined to the region above 50 percent. An iterative method is employed in the calculations for which computer assistance is especially adaptable. Fortran IV programs are included in the appendix whose use requires no extensive computer experience. A fraction of a second in computer processing time is all that is required for each determination.

September-October 1975

Key words: adsorbed polymer; deformation; fold surface; gold decoration; polymer crystals; poly(oxymethylene); surface layer.

The deformation of single crystals of poly(oxymethylene) grown from 0.01 percent bromobenzene solution has been studied by deposition on a deformable substrate. Slight decoration of the crystal surfaces with gold prior to mechanical deformation of the composite reveals breaks in the gold which are displaced with respect to cracks in the underlying polymer crystals. These observations are interpreted to imply the existence of a very thin discrete film on the surface of the polymer crystals which can slip during deformation. Such a film might arise from polymer molecules adsorbed on the crystal surface.

Key words: adsorbed layer; amorphous component; fold surface; polymer crystals; regular folds.

A model for the surface of folded-chain polymer single crystals is presented in which the "amorphous" phase is composed of polymer molecules physically adsorbed on surface sites of a fairly regularly folded surface. The evidence for the presence of an amorphous phase in polymer single crystals is reviewed briefly as well as the evidence for regular folding and adjacent reentry. The proposed model would allow simultaneous acceptance of the evidence for both an amorphous layer and a surface composed of regularly folded molecules; such evidence was heretofore contradictory. Experimental evidence for such a model is discussed and some predictions are made concerning the properties of such an adsorbed layer.

Key words: bromobenzene; calorimetry; enthalpy; entropy; Gibbs energy; heat capacity; heat of fusion; heat of vaporization; thermodynamic properties, triple point.

Measurements were made of the heat capacity of crystalline and liquid bromobenzene from 11 to 300 K, of the triple point and heat of fusion at the triple point and of the heat of vaporization at one atmosphere. The adiabatic calorimeter used was precise over most of its range to ±0.1 percent; the purity of the sample was 99.996 mol percent. The triple point of pure bromobenzene is 242.401 K (± 0.016°C). The entropy and enthalpy of fusion are, respectively, 10702 ± 5.11 J K⁻¹ mol⁻¹ and 44.150 ± 0.022 K J K⁻¹ mol⁻¹. The heat and entropy of vaporization at 293.00 K are, respectively, 43.963 ± 0.01 J mol⁻¹ and 150.0 ± 0.2 J K⁻¹ mol⁻¹. Tables are given for the thermodynamic functions of the condensed phases from 0 to 300 K; the functions for the ideal gas from 100 to 1500 K; calculated from spectroscopic and molecular data using statistical mechanical methods; are also tabulated. The entropy of the ideal gas at 293.00 K and one atmosphere, from statistical mechanics, is 323.63 J K⁻¹ mol⁻¹; the same quantity from the experimental measurements (third law) is 323.73 J K⁻¹ mol⁻¹. No anomalies or additional transitions were observed.

Key words: Dirac theory; hydrogen; line strength; oscillator strength; relativistic corrections; spectroscopy.

Relativistic line strengths have been computed for a large number of transitions using Dirac wave functions for the one-electron, hydrogen-like ions. As expected, the results indicate that relativistic effects are quite small for low stages of ionization. However, in general, they also remain small throughout a large portion of the isoelectronic sequence, becoming typically of the order of 10 percent in the vicinity of Z = 50, after which they grow quite rapidly. This suggests that for multielectron ions a basically nonrelativistic theory might well be adequate for light atom isoelectronic ions through as much as 30 or 40 stages of ionization.

Key words: combustion; dichloroethyl sulfide; enthalpy; formation; heat; mustard gas.

The enthalpies of combustion and formation of 2,2'-dichloroethyl sulfide (mustard gas) have been determined by combustion in an adiabatic rotating-bomb calorimeter. The bomb process has been corrected to: C₂H₅Cl₂S(110) + 70₄ = C₂H₅Cl₂S(110) + 98 H₂O(110)

        4 CO₂(110) + 2 HCl + H₂SO₄ + 100 H₂O (110)

for which the following values were obtained:

\[ \Delta H^\circ(25°C) = -3163.49 ± 1.26 \text{ kJ mol}^{-1} \]
\[ \Delta H^\circ(25°C) = -200.57 ± 1.58 \text{ kJ mol}^{-1} \]

Key words: absorption coefficients; barothermal behavior; Green's function; heat diffusion; weakly absorbing materials.

Two devices are proposed for measuring absorption coefficients in weakly absorbing materials. The first device measures cylindrical samples and the second device measures flat plate or disk samples. This paper reports on the derivations for the
steady-state and transient solutions to the heat diffusion equations which describe the barothermal behavior of the two proposed devices. In addition, Green’s function techniques were used to describe the cyclic heating and cooling of the cylinders and plates.

November-December 1975

Key words: axialite; chain folds; crystallization rate; molecular weight; nucleation theory; polyethylene; regime I; regime II; spherulite.

The growth rate G of the crystalline bodies appearing in each of a set of 35 characterized polyethylene fractions ranging from 3600 to 807,000 in molecular weight has been measured as a function of the undercooling ΔT. In isothermal crystallization, only axialites were found from M_w = 3600 to 18,000. For these runs, ΔT < 17.5 °C. From M_w = 18,000 to M_w = 115,000, coarse-grained noncrystalline spherulites were found for ΔT > 17.5 °C, and axialites for ΔT < 17.5 °C: a rather sharp break occurred in the log_10 G versus T data at ΔT = 17.5 °C. Above M_w = 115,000, only nearly structureless “irregular” spherulites were found at all undercoolings corresponding to isothermal growth. Typical branching spherulites were obtained only on quenching.

Wide-angle x-ray data showed that the usual orthorhombic subcell predominated in all the morphologies encountered. Low-angle x-ray data showed that the specimens exhibited lamellar crystallization irrespective of the particular glass morphology involved. The growth rate data on each fraction were analyzed using \( G = G_0 \exp \left( -\frac{U_0}{R(T - T_m)} \right) \exp \left( -\frac{K}{T \Delta T} \right) \) where \( f = 1 \) to obtain values of \( K_w \) and \( G_0 \). The value of \( Y \) in \( K_w = \frac{Y}{2} \) was obtained for each morphology by applying the "Z" test of Lauritzen, Y = 4 for regime I crystallization (single interface nucleus leads to completion of substrate) and Y = 2 for regime II crystallization (numerous surface nuclei involved in substrate completion). It was found that the axialites obeyed regime I kinetics (Y = 4), the coarse-grained spherulites regime II kinetics (Y = 3), and the irregular spherulites "mixed" kinetics (Y < 3). The assumption that the substrate length L in Lauritzen’s regime theory was ~ 5 µm led to the prediction of a rather sharp regime I→regime II transition (corresponding to a break in the log_10 G versus T data at ΔT = 17.5 °C, in accord with experiment. The \( \sigma \sigma \) value calculated from \( K_w \) and Y for \( M_w > 20,000 \) was approximately constant with molecular weight and independent of morphology; the limiting value of \( \sigma \sigma \) from kinetic measurements was about 1285 erg/cm^2, corresponding to \( \sigma = 90.5 \) erg/cm^2 and \( \sigma = 14.2 \) erg/cm^2. (This value of \( \sigma \) compares favorably with \( \sigma = 93 \pm 8 \) erg/cm^2 from melting point experiments.) The increase of \( \sigma \sigma \) and \( \tau \) that took place at low molecular weights on up to ~ 20,000 was treated using an expression given by Hoffman, viz \( \sigma = \sigma_{0} \\rho (\rho + 1) \) where \( \rho = \text{number of folds per molecule} \) and \( \sigma = \sigma_{0} (\rho + 1) \). Inherent high and low values of \( \sigma \) were found experimentally in this region, showing that \( \beta \) varied intermittently with increasing molecular weight between 0.15 and ~ 0.7. Theoretical estimates of these upper and lower bounds for \( \beta \) are given. The variation of \( \sigma \) between its upper and lower bounds was tentatively explained in terms of the alternate appearance of short and long terminal cilia, few if any of the latter exceeding \( L_{m} \) in length, as the molecular weight increased. Estimates of the initial lamellar thickness \( L_{m} \) were made from \( \sigma \sigma \) and compared with the appropriate low-angle x-ray spacings. A theoretical estimate of the ratio of the preexponential factors \( G_{0(I)} \) and \( G_{0(I)} \) for regimes I and II was compared with experiment with satisfactory results. The value of \( G_{0(I)} \) is not strongly dependent upon the viscosity of the melt. The work of chain folding deduced from the growth rate data is close to 4.1 kcal/mol, which is in good agreement with other estimates.

Key words: chain folds; fractions; homogeneous nucleation; molecular weight; nucleation theory; polyethylene; surface free energies.

The droplet technique was used to obtain estimates of the isothermal rate of homogeneous crystal nucleation in highly supercooled melts of 8 characterized fractions of linear polyethylene (weight average molecular weights from 3,100 to 249,000). Data obtained from these experiments were analyzed in accord with current theories of homogeneous nucleation of chain folded crystals. Values for the quantity \( \sigma \sigma \), where \( \sigma \) and \( \sigma \) are the lateral and end-surface free energies of the crystal, were estimated as a function of molecular weight.

Sample 3.2 K was found to be anomalous in its nucleation behavior. When we assume that this sample crystallizes in the extended chain form and calculate \( \sigma \sigma \) instead of \( \sigma \sigma \), the value for \( \sigma \sigma \) is found to be 10.57 erg/cm^2 which is in reasonable agreement with the value 9.6 erg/cm^2 found by other investigators for linear hydrocarbons. However, there remains the question as to whether sample 3.2 K ever underwent homogeneous nucleation.

For samples 9.70 K, 11.74 K and 23.0 K, \( \sigma \sigma \), was found to increase rapidly due to a decrease in the number of cilia per fold chain as the molecular weight increases. For higher molecular weights the value for \( \sigma \sigma \), levels off and the average value of \( \sigma \sigma \), for samples 23.0 K to 249 K was found to be 19,000 ergs/cm^2.

The experimental value of the absolute nucleation frequency \( \lambda \) was found to differ from the theoretical value by approximately \( 1 \times 10^{14} \). If one assumes that the surface free energies are temperature dependent [i.e., \( \sigma \sigma = \sigma \sigma (1 + \chi \Delta T) \) and \( \sigma = \sigma \sigma (1 + \chi \Delta T) \)] the average value of \( \sigma \sigma \), changes only slightly (to 19,800 ergs/cm^2) due to the compensating effects in the signs of the temperature corrections and \( \lambda \) is close to the theoretical value, \( 1 \times 10^{14} \) nuclei/cm^2/s.

Key words: absolute ratios; atomic weight; isotopic abundance; potassium; reference standard.

Solid sample, thermal ionization, mass spectrometry has been used to obtain absolute values for the isotopic abundance ratios of a reference sample of potassium. Standards of known isotopic composition, prepared by gravimetrically mixing nearly isotopically and chemically pure separated isotopes of \(^{39}\)K and \(^{40}\)K, were used for calibration. The absolute isotopic abundance ratios are \(^{39}\)K/\(^{40}\)K = 13.8566 ± 0.0063 and \(^{39}\)K/\(^{40}\)K = 0.0017343 ± 0.000061 which yield atom percent compositions of \(^{39}\)K = 93.2581 ± 0.0029, \(^{40}\)K = 0.01167 ± 0.00004, and \(^{40}\)K = 6.7302 ± 0.0029. The calculated atomic weight for potassium is 39.098304 ± 0.000058. The indicated uncertainties are overall limits of error which are the sum of the uncertainty components for ratio determinations and the components covering the effects of known sources of possible systematic error.

Key words: absolute ratios; atomic weight; isotopic abundance; silicon.

Absolute values have been obtained for the isotopic abundance ratios of a reference sample of silicon using electron impact mass spectrometry. Samples of known isotopic composition prepared from nearly isotopically pure separated silicon isotopes were used to calibrate the mass spectrometers. The resulting absolute $^{28}\text{Si}/^{30}\text{Si}$ ratio = 29.74320 ± 0.00747 and the $^{28}\text{Si}/^{29}\text{Si}$ ratio = 1.50598 ± 0.00086 which yield atom percents of $^{28}\text{Si} = 92.22933 ± 0.00155$, $^{29}\text{Si} = 4.66987 ± 0.00124$ and $^{30}\text{Si} = 3.10085 ± 0.00074$. The atomic weight calculated from this isotopic composition is 28.085526 ± 0.000056. The indicated uncertainties are overall limits of error based on 95 percent confidence limits for the means and allowances for the effects of known sources of possible systematic error. A study of natural $^{28}\text{Si}/^{30}\text{Si}$ ratio variations reported in the literature extends the estimated uncertainty in the atomic weight of natural silicon to ±0.00039.

Key words: atomic weight; coulometry; electrochemical equivalent; zinc atomic weight.

The use of a specially designed coulometer and a high accuracy coulometric circuit resulted in the accurate measurement of the electrochemical equivalent and atomic weight of zinc. The experimental conditions to make possible the final precise and accurate measurements were established. These include a study of mechanical losses from the anode during the electrolysis and the corrosion of zinc in various media used in the determination. The effects of both of these sources of error may be controlled. Mechanical losses are minimized when an amalgamated electrode is used; corrosion when an amalgamated electrode is used in an air free system. An electrolyte, 25 wt. percent NH₄Cl and 3 molal ZnCl₂, was used in these determinations. This report presents the account of research which was prerequisite for subsequent accurate determination of the electrochemical equivalent and the atomic weight of zinc.

Key words: atomic weight; coulometry; electrochemical equivalent; zinc atomic weight.

A new, successful approach to the determination of atomic weights of suitable elements has been demonstrated in this research. An absolute constant-current coulometric method was employed for the determination of the electrochemical equivalent and the atomic weight of zinc. The effects of possible sources of systematic error were investigated and appropriate corrections applied. The newly determined values of the two constants are 0.3387958 mg C⁻¹ and 65.3771 respectively. The uncertainty in the atomic weight of zinc was reduced by more than an order of magnitude. The publication of partial data resulted in the revision of the value of the atomic weight of zinc by the International Union of Pure and Applied Chemistry.

Key words: irradiance; radiometry; spectrometer calibration; standard source; synchrotron radiation; vacuum ultraviolet.

Synchrotron radiation has been used as a standard source to calibrate spectrographic instruments at the National Bureau of Standards (NBS). Conceptually it is straightforward to apply the calculable continuum distribution of synchrotron radiation to problems requiring a source of known irradiance if the electron energy, the radius of the electron orbit, and the beam current are known. In practice many factors affect the accuracy of such a calibration, such as temporal and spatial variations in electron beam, uncertainties in the orbital radius and maximum energy of the orbiting electron beam. These sources of error are discussed and the method of calibration on SURF-I is specified. A storage ring synchrotron radiation facility (SURF-II) is now operational at NBS. The calibration techniques developed for SURF-I are applied to SURF-II with anticipated improvements in calibration accuracy. For SURF-I the incident flux was determined with an accuracy of 15 percent while for SURF-II we anticipate accuracies of about 7 percent.

Key words: chemical association; Lennard-Jones potential parameters; third interaction virial coefficients; virial coefficients; water vapor-air mixtures.

This note points out errors in the values of the third virial coefficients for pure water vapor which appeared in a 1967 paper by Hyland and Mason. The errors arose while converting from the units of Goff and of Keyes to the desired units of (l/mol). The consequences of the errors are outlined, and it is shown that there is no effect on the primary results of the paper, namely, in the preferred values of the third interaction virial coefficient for air-water vapor mixtures, C₃₉₉."
3.2. PAPERS FROM THE JOURNAL OF RESEARCH OF THE NATIONAL BUREAU OF STANDARDS, SECTION B. MATHEMATICAL SCIENCES, VOLUME 79B, JANUARY-DECEMBER 1975

January-June 1975

Key words: celestial mechanics; orbit perturbation; satellite ephemeris; variation of parameters.

A new set of elements is proposed to describe Keplerian motions subject to perturbing forces. The resulting equations do not break down for small eccentricities, small inclinations and rotations of the ideal frame reference that are half turns. The parameters are selected with a view of simplifying the programming of the right-hand members.

Key words: linear differential operators; reciprocity relations; scattering matrix; transducers.

The "equations of motion" of a linear electroacoustic transducer are written in the alternative forms

\[ L \cdot X = 0, \quad L' \cdot X = 0, \]

where the matrices \( L \) are linear differential expressions. \( X = (E, H) \) represents electroacoustic fields, and the superscripts distinguish selected normalizations of the equations of motion. To each operator \( L \) corresponds a mathematically defined adjoint operator \( (L')^* \) and an associated adjoint transducer, whose material tensor parameters are given by certain transpositions and interchanges of the parameters of the given transducer. Dissipative characteristics (lossiness, losslessness, or "gaininess") of the material of the given transducer are preserved pointwise in the adjoint transducers. A generalized reciprocity lemma leads to relations of reciprocal type between external properties of the given and the adjoint transducers. In the self-adjoint cases, the conventional electroacoustic reciprocity and antireciprocity relations are obtained and the derivation of those relations is critically confirmed. The generalized or adjoint reciprocity relations have been applied in the plane-wave scattering-matrix formalism developed for electroacoustic transducers by D. M. Kerns.

Corollaries of the adjoint reciprocity relations, analogous to conventional reciprocity theorems, but involving properties of adjoint pairs of transducers, are derived. Examples are discussed of transducers for which it is feasible to form the adjoint transducers.

The diophantine equation

\[ p^2 x^4 + 3px^2 y^2 + y^4 = z^2, \quad p \text{ an odd prime} \]

Key words: diophantine equation; infinite descent; quadratic residues.

The object of this paper is to prove:

**Theorem 1.** The equation

\[ p^2 x^4 + 3px^2 y^2 + y^4 = z^2 \]

where \( p \) is an odd prime, has no solutions in integers with \( xy \neq 0 \) if \( p = 5 \) or \( p = 13 \) (mod 20) or \( p = 13 \) (mod 40).

Key words: diagonalizable matrix; partitioned matrix.

When \( U \) and \( V \) are diagonalizable matrices the diagonalizability of

\[ \begin{bmatrix} U & 0 \\ 0 & V \end{bmatrix} \]

is equivalent to the solvability in \( X \)

\[ UX = XV = N. \]

A corollary and a simple generalization are given.

Key words: algebra; alternating tensor; Capelli's identity; Cartesian tensor; group representation; invariant; isotropic tensor; Kronecker delta; orthogonal group; tensor.

This paper contains a complete listing of isotropic Cartesian tensors of ranks up to eight with their associated reduction equations for obtaining linearly independent sets whenever the reduction is called for. In particular, the listing is compiled only for isotropic tensors associated with the rotation group \( O^+(3) \) of the three-dimensional underlying vector space. Based on an identity originally due to Capelli (1887), reduction equations for tensors of odd ranks beginning at rank five and even ranks beginning at rank eight are shown to be nontrivial. Significance of the computational result in both pure and applied mathematics is discussed.

Key words: independence properties; matroids; maximal flows; network flows.

This paper represents new proofs for some known network flow results. First, maximal network flows are expressed as matroids, and then Gale's characterization of matroids is used to prove the existence of various lexicographic network flows. Second, an independence property of maximum flows is proved and this property is related to an independence property of Brualdi and Scrimger.

Key words: co-convergent; contra-convergent; Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences.

The main result of this note is a generalization of an earlier theorem on the metrizability of spaces with countably based
closed sets. Use is made of some results related to co-convergent spaces which are spaces having countably bounded compact sets.

Key words: charge profiles; ionization chambers; numerical integration.

Numerical integration of the differential equations describing charge transport in plane-parallel ionization chambers allows to obtain charge profiles in addition to current-voltage curves. It is found that charge densities may exhibit maxima within a certain range of saturation. The effect is interpreted in terms of field modulation of carrier velocities.

**July-December 1975**

Key words: consistency; matrix norm; monotonicity; principal submatrix; spectral radius; vector norm.

Induced matrix norms \( N \) are defined consistently for all orders up to a given order, which have the property:

\[ N(\tilde{A}) \leq N(A) \]

for all principal submatrices \( \tilde{A} \) of an arbitrary \( m \times m \) complex matrix \( A \) are characterized. Conditions are also given which insure that

\[ N(A \oplus B) = \max\{N(A), N(B)\} \]

Key words: co-convergent; contra-convergent; Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences.

In \( T \)-spaces metrizability can be characterized in terms of mutual convergence of “neighboring sequences.” In this paper Nagata spaces are characterized in terms of a convergence property of neighboring sequences and more generally it is shown that in all stratifiable spaces, neighboring sequences satisfy a similar convergence property.

Key words: center; centroid; facility location; graph; tree.

Using the criterion that vertex \( u \) of a graph \( G \) is “more central” than vertex \( v \) if there are more vertices closer to \( u \) than to \( v \), the security center and security centroid of a graph are defined.

Several results, including the fact that the security center of a tree is the centroid, are presented. A simple algorithm to find the security center (centroid) of a tree is presented. The problem of finding the security center of \( G \) is shown reducible to a search over a single block of \( G \).

Key words: matrix equation; partitioned matrix; rational canonical form; similarity.

Suppose that \( A, B, T \) are matrices of order \( r \times r, s \times s \), and \( r \times s \) respectively over a field \( F \). We prove that

\[
\begin{bmatrix}
A & T \\
0 & B
\end{bmatrix}
\]

is similar to

\[
\begin{bmatrix}
A & 0 \\
0 & B
\end{bmatrix}
\]

if \( AXB = T \), for some matrix \( X \). We also give some corollaries and a simple generalization.

Key words: angle; dimension; logarithm; neper; radian.

The basic principles of the group properties of physical quantities are reviewed. The problems associated with the dimensions of angle and logarithm are solved by using functional equations, instead of analytic expressions, for defining functions of non-numerical quantities. It is concluded that the neper and radian are related by \( Np = -j \pi \), so that when the radian is considered as a base unit, the neper becomes a derived unit, and is the SI unit for logarithmic quantities.

Key words: Bessel functions; complete elliptic integrals; hyperbolic function; infinite integrals; modified Bessel functions; noise theory; signal statistics; trigonometric functions.

Infinite integrals involving products of Bessel and trigonometric or hyperbolic functions reducible to complete elliptic integrals are compiled. The table also contains certain types of infinite double integrals of modified Bessel functions. All results are expressed in conveniently compact form suited for practical applications.
3.3. DIMENSIONS/NBS (Formerly Technical News Bulletin), ARTICLE TITLES ONLY

This monthly magazine is published to inform scientists, engineers, businessmen, industry, teachers, students, and consumers of the latest advances in science and technology, with primary emphasis on the work at NBS.

DIMENSIONS/NBS highlights and reviews such issues as energy research, fire protection, building technology, metric conversion, pollution abatement, health and safety, and consumer product performance. In addition, DIMENSIONS/NBS reports the results of Bureau programs in measurement standards and techniques, properties of matter and materials, engineering standards and services, instrumentation, and automatic data processing. Issued monthly.

3.4. PAPERS FROM THE JOURNAL OF PHYSICAL AND CHEMICAL REFERENCE DATA, VOLUME 4, JANUARY-DECEMBER 1975

This journal is published quarterly by the American Chemical Society and the American Institute of Physics for the National Bureau of Standards. The objective of the Journal is to provide critically evaluated physical and chemical property data, fully documented as to the original sources and the criteria used for evaluation. Critical reviews of measurement techniques, whose aim is to assess the accuracy of available data in a given technical area, are also included. The principal source for the Journal is the National Standard Reference Data System (NSRDS). The Journal is not intended as a publication outlet for original experimental measurements such as are normally reported in the primary research literature, nor for review articles of a descriptive or primarily theoretical nature.

Volume 4, No. 1

Key words: critically evaluated data; enthalpy; entropy; equilibrium constant of formation; free energy of formation; Gibbs energy function; heat capacity; heat of formation; thermochemical tables.

The thermodynamic tabulations previously published in NSRDS-NBS-37 and the 1974 Supplement (J. Phys. Chem. Ref. Data 3, 311 [1974]) are extended by 158 new and revised tables. The JANAF Thermochemical Tables cover the thermodynamic properties over a wide temperature range with single phase tables for the crystal, liquid, and ideal gas state. The properties given are heat capacity, entropy, Gibbs energy function, enthalpy, entropy of formation, Gibbs energy of formation, and the logarithm of the equilibrium constant for formation of each compound from the elements in their standard reference states. Each tabulation lists all pertinent input data and contains a critical evaluation of the literature upon which these values are based. Literature references are given.

Key words: alloy diffusion; beryllium; cerium; cesium; chlorine; copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; molybdenum; niobium; plutonium; potassium; praseodymium; promethium; rhenium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium.

A survey, comparison, and critical analysis is presented of data compiled from the scientific literature concerning diffusion in copper alloy systems involving elements in Groups IA, IIA, III B, IVB, VB, VIB, and VIIB. Here the term "copper alloy system" is interpreted in the broadest sense. For example, the review of diffusion in the Cu-M system reports all diffusion situations which involve both copper and element M, including diffusion of Cu in M or in any binary, ternary or multicomponent alloy containing M; diffusion of M in Cu or in any alloy containing Cu; and diffusion of any element in any alloy containing both Cu and M. Topics include volume diffusion, surface diffusion, grain boundary diffusion, tracer diffusion, alloy interdiffusion, electromigration, thermomigration, dislocation-pipe diffusion, and diffusion in molten metals. An extensive bibliography is presented along with figures, tabular presentation of data and discussion of results.

Key words: critically evaluated data; enthalpy; enthalpy function; entropy; equilibrium constant of formation; energy; Gibbs energy function; Gibbs energy of formation; heat capacity; ideal gas thermodynamic properties; internal rotation; internal rotation barrier height; propylene; torsional frequency.

The ideal gas thermodynamic properties \( \{H^\circ - H^\circ \text{a}(G^\circ - H^\circ \text{a})/T, (H^\circ - H^\circ \text{a})/T, S^\circ, C_p^\circ, \Delta H^\circ, \Delta G^\circ, \text{and } \log K_f \} \) for ethylene and propylene in the temperature range 0 to 1500 K and at 1 atm have been calculated by the statistical thermodynamic method employing the most recent fundamental and molecular spectroscopic constants. The internal rotational contributions to thermodynamic properties for propylene were generated based on an internal rotation partition function formed by summation of internal rotation energy levels. The energy levels were derived from the potential function \( V (cm^{-1}) = 349.2 (1 - \cos 3 \theta) - 6.5 (1 - \cos 6 \theta) \). The calculated heat capacities and entropies were compared with the available experimental values.

Volume 4, No. 2

Key words: allowed transitions; line strengths; oscillator strengths; scandium; titanium; transition probabilities.

Atomic transition probabilities for about 1500 allowed spectral lines of the elements scandium and titanium through all stages of ionization have been critically evaluated and compiled. All available literature sources have been utilized. The data are presented in separate tables for each element and stage of ionization and are arranged according to multiplets and, when appropriate, also to transition arrays and increasing quantum numbers. For each line the transition probability for spontaneous emission, the absorption oscillator strength, and the line strength are given along with the spectroscopic designation, the wavelength, the statistical weights, and the energy levels (when available) of the upper and lower atomic states. In addition the estimated accuracy and the literature reference is indicated. In short introductions, which precede the tables for each spectrum, the main justifications for the choice of the adopted data and for the accuracy rating are discussed. A general introduction contains some more details on our evaluation procedure.

The energy levels of the iron atom in all of its stages of ionization, as derived from the analyses of atomic spectra, have been compiled. In cases where only line classifications are given in the literature, level values have been derived. The percentages for the two leading components of the calculated eigenvectors of the levels are given where available. Ionization energies are also given.

Key words: barrier height to internal rotation; fluoroethanes with a symmetric top; ideal gas thermodynamic functions; reduced and principal moments of inertia; standard heat of formation; structural parameters; torsional mode; vibrational fundamentals.

The molecular structural parameters, the vibrational fundamentals, the potential barrier height to internal rotation, and the standard enthalpy of formation for each of the six fluoroethanes in which at least one of the internally rotating groups is a symmetric top have been extensively studied and recommended values selected. Chemical thermodynamic properties of molecules in the ideal gas state at temperatures from 0 to 1500 K have been calculated with the rigid-rotor-harmonic-oscillator approximation. The calculated values are in a very good agreement with the existing third-law entropies.

Key words: bromomethanes; critically evaluated data; ideal gas thermodynamic properties; iodomethanes.

The available molecular parameters, fundamental frequencies, and enthalpy of formation for eight bromo- and iodomethanes have been critically evaluated and recommended values selected. This information has been utilized to calculate the ideal gas thermodynamic properties, \(C_p^0, S^0, H_0 - H_\infty, (G_0 - H_0)/T, \Delta H^0, \Delta G^0\), and log \(K_f\) from 0 to 1500 K using the rigid-rotor-harmonic-oscillator approximation.

Volume 4, No. 3

Key words: atomic form factor; Compton scattering; cross sections; gamma rays; incoherent scattering function; photons; Rayleigh scattering; tabulations; x rays.

Tabulations are presented of the atomic form factor, \(F(x,Z)\), and the incoherent scattering function, \(S(x,Z)\), for values of \(x = \sin(\theta/2)/A\) from 0.005 Å\(^{-1}\) to 10 Å\(^{-1}\), for all elements \(A = 1\) to 100. These tables are constructed from available state-of-the-art theoretical data, including the Pirene formulas for \(Z = 1\). Configuration-interaction results by Brown using Brown-Fontana and Weiss-Fock results by Cromer for \(Z = 7\) to 100, and a relativistic K-shell analytic expression for \(F(x,Z)\) by Bethe and Levinger for \(x > 10\) Å\(^{-1}\) for all elements \(Z = 2\) to 100. These tabulated values are graphically compared with available photon scattering angular distribution measurements. Tables of coherent (Rayleigh) and incoherent (Compton) total scattering cross sections, obtained by numerical integration over combinations of \(P^2(x,Z)\) with the Thomson formula and \(S(x,Z)\) with the Klein-Nishina formula, respectively, are presented for all elements \(Z = 1\) to 100, for photon energies 100 eV (\(\lambda = 124\) Å) to 100 MeV (0.000124 Å). The incoherent scattering cross sections also include the radiative and double-Compton corrections as given by Mork. Similar tables are presented for the special cases of terminal-bonded hydrogen and for the \(H_2\) molecule, interpolated and extrapolated from values calculated by Stewart et al., and by Bentley and Stewart using Kolos-Roothaan wavefunctions.

Key words: ab initio calculations; atomic negative ions; binding energy; electron affinity; excited states; experimental methods; fine structure splitting; recommended values; semiempirical calculations.

A survey of the electron affinity determinations for the elements up to \(Z = 85\) is presented, and based upon these data, a set of recommended electron affinities is established. Recent calculations of atomic electron affinities and the major semiempirical methods are discussed and compared with experiment. The experimental methods which yield quantitative electron binding energy data are described and intercompared. Based primarily upon extrapolation techniques, fine structure splittings for these ions and excited state term energies are given.

Key words: electrical breakdown of gases; electrical discharges; electron attachment coefficient; electron detachment coefficient; electron diffusion coefficient; electron drift velocity; electron excitation coefficient; electron ionization coefficient; electron-ion recombination coefficient; electron swarm; electron transport coefficients; ionized gases.

An electron swarm consists of a small number density \(n\) of electrons in a gas of much higher number density \(N\). The mean energy and energy distribution of such a swarm are determined by the value of \(E/N\), where \(E\) is the electric field. At any given value of \(E/N\) the swarm may be characterized by the values of eight parameters, viz: drift velocity, diffusion coefficient, (diffusion coefficient)/mobility, excitation coefficient, electron attachment coefficient, electron detachment coefficient, ionization coefficient, recombination coefficient. In this survey, data on these parameters obtained by a variety of experimental techniques are collected, discussed, and compared graphically. Also included on the graphs are computed values of the parameters obtained in many cases from cross sections and energy distributions chosen to give the best fit with the swarm data. Selected tabulations of the data are also given except in cases for which the accuracy of the data is not sufficient to warrant numerical presentation. The mean energy of the electron swarms ranges from thermal to several electron volts and the gases for which data are given are the rare gases, the common molecular gases (\(H_2, N_2, O_2, CO, NO, CO_2, NO_2\)) and air. The survey also contains an extensive bibliography which includes references (i) to publications on electron swarms in a much wider range of gases than those for which data are given and (ii) to papers concerned with energy distributions, conductivity, and ionization coefficients in crossed electric and magnetic fields in addition to those relating to the eight parameters listed above.

Volume 4, No. 4

Key words: equilibrium compositions; heat of isomerization; ideal gas thermodynamic properties; isobutane; n-butane; potential barrier to internal rotation.

Reported values of structural parameters, vibrational fundamentals, and potential energy functions for internal rotation of n-butane and isobutane are reviewed. The selected values were used to calculate the thermodynamic properties $(C_p^0, S^0, (H^0 - H_n^0)/T, (G^0 - H_n^0)/T)$ in the temperature range of 0 to 1500 K by the usual statistical thermodynamic methods using the rigid-rotor and harmonic-oscillator model. Contributions of internal rotation were evaluated by the direct sum of terms containing energy levels which were calculated with a one-dimensional potential model. For internal rotation about the central C–C bond in n-butane, energy levels were approximated by two procedures. A unique potential function was assumed for each methyl rotor of n-butane or of isobutane. Top-top interactions in isobutane were approximated by the potential parameter $V_n$ which was determined empirically by comparison with thermodynamic data. The calculated and observed values of heat capacities and entropies agree well within experimental uncertainties. Standard enthalpies of formation at 298.15 K for the ideal gaseous state were selected from measured values of heats of combustion and third-law enthalpies for isomerization. Corresponding values of $\Delta H_f^0$, $\Delta G_f^0$ and log $K_f$ are tabulated over the same temperature range.

Key words: chlorides; data compilation; density; electrical conductance; molten salt mixtures; standard reference data; surface tension; viscosity.

Data on the electrical conductance, density, viscosity, and surface tension of chloride mixtures have been systematically collected and evaluated. Results are given for 124 binary mixtures over a range of compositions and temperatures. Values of the above properties for the single salts have been updated in accord with previously advanced recommendations.
3.5. MONOGRAPHS

Major contributions to the technical literature on various subjects related to the Bureau’s scientific and technical activities.

Key words: crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction.

Standard x-ray diffraction patterns are presented for 57 substances. Twenty-five of these patterns represent experimental data and 32 are calculated. The experimental x-ray powder diffraction patterns were obtained with an x-ray diffractometer. All d-values were assigned Miller indices determined by comparison with computed interplanar spacings consistent with space group extinctions. The densities and lattice constants were calculated, and the refractive indices were measured whenever possible. The calculated x-ray powder diffraction patterns were computed from published crystal structure data. Both peak height and integrated intensities are reported for the calculated patterns.

Key words: base metals alloys; noble metal alloys; temperature scale; temperature standards; thermoelements; thermometry.

Reference tables for several thermoelements versus platinum (Pt-67) are given with values of the thermoelectric voltage as a function of temperature in degrees Fahrenheit. Only tables for standard letter-designated thermoelements are included. Types BP, BN, JP, JN, KP (same as EP), KN, TP, and TN (same as EN). These tables supplement those given in NBS Monograph 125 and were calculated from the power series expansions presented in that Monograph. They are based upon the absolute electrical units and the International Practical Temperature Scale of 1968 (IPTS-68).

Key words: diffractive production; diffractive scattering; Glauber model; hadronic components of photons; high energy scattering; multiple scattering; neutrino-nucleus interactions; shadowing effects.

Elastic scattering and diffractive production processes induced in nuclear targets by high energy projectiles are discussed in this article. Special attention is paid to the interaction of high energy hadrons and photons. Interactions of high energy electrons and neutrinos are briefly mentioned. The common features of all these processes are emphasized throughout the article: The multiple scattering and shadowing processes inside of the target nuclei. An effort is made to develop a unified way of treating nuclear interactions of particles which are either hadrons or exhibit some hadronic components in such interactions.

This article is divided into five sections: 1) Introduction, 2) Description of multiple scattering, 3) Elastic scattering of hadrons from nuclei, 4) Diffractive dissociation and diffractive excitation, 5) Diffractive production of hadrons in hadron-nucleon collisions.

Key words: dissociation laser; excimers; excited state kinetics; f-values; mercury molecules; new spectroscopic techniques; optical excitation; potential curves.

The Hg₂ molecule is representative of a class of molecules which have dissociative ground states and bound excited states. It can therefore be used as a prototype of this class of molecules which are of interest as potential new laser candidates. Because of the non-bound ground state, standard absorption spectroscopic techniques cannot be used to obtain the necessary information about the excited states. We have therefore developed new measurement techniques to obtain potential curves, f-values, and kinetic behavior for Hg₂. These techniques are applicable to this whole class of dissociation molecular systems.

Key words: attenuation; interlaboratory standard; measurement; rotary-vane attenuator.

This paper presents a comprehensive report on the measurement and the use of the rotary-vane attenuator as an interlaboratory standard.

Methods of attenuation measurement developed at NBS are used to supply data for the evaluation of the deviations from theoretical cos²θ law due to rotor misalignment, gear eccentricity, resettability, resolution, and insufficient maximum attenuation.

A precision rotary-vane attenuator with an optical readout capable of 1 second of arc angular resolution has an effective attenuation resolution of 0.00005 dB at a 3 dB dial setting, and 0.0005 dB at a 30 dB dial setting. This type of precision attenuator is an effective standard for use in the dual detection microwave bridge measurement system.

Key words: classification of spectral lines; intensities of spectral lines; spectral-line intensities; tables of spectral-line intensities; wavelengths of spectral lines.

The relative intensities, or radiant powers, of 39,000 spectral lines with wavelengths between 2000 and 9000 Å are given. It has been determined on a uniform energy scale for seventy chemical elements. This was done by mixing 0.1 atomic percent of each element in powdered copper, pressing the powder-mixture to form solid electrodes which were burned in a 10 amper, 220 volt direct-current arc, and photographing the spectra with a stigmatic concave grating while a step sector was rotating in front of the slit. The sectorc spectrograms facilitated the estimation of
intensities of all element lines relative to copper lines which were then calibrated on an energy scale provided by standardized lamps, and all estimated line intensities were finally adjusted to fit this calibration. Comparisons with other intensity measurements in individual spectra indicate that the National Bureau of Standards spectral-line intensities may have average errors of 20 percent, but first of all they provide uniform quantitative values for the seventy chemical elements commonly determined by spectrochemists. These data are presented by element in part I, and all 39,000 observed lines are given in order of wavelength in part II. Supersedes Monograph 32, Parts I and II and its supplement.

Key words: classification of spectral lines; intensities of spectral lines; spectral-line intensities; tables of spectral-line intensities; wavelengths of spectral lines.

The relative intensities, or radiant powers, of 39,000 spectral lines with wavelengths between 2000 and 9000 Ångstroms have been determined on a uniform energy scale for seventy chemical elements. This was done by mixing 0.1 atomic percent of each element in powdered copper, pressing the powder-mixture to form solid electrodes which were burned in a 10 amperere, 220 volt direct-current arc, and photographing the spectra with a stigmatic concave grating while a step server was rotating in front of the slit. The sectorized spectrograms facilitated the estimation of intensities of all element lines relative to copper lines which were then calibrated on an energy scale provided by standardized lamps, and all estimated line intensities were finally adjusted to fit this calibration. Comparisons with other intensity measurements in individual spectra indicate that the National Bureau of Standards spectral-line intensities may have average errors of 20 percent, but first of all they provide uniform quantitative values for the seventy chemical elements commonly determined by spectrochemists. These data are presented by element in part I, and all 39,000 observed lines are given in order of wavelength in part II. Supersedes NBS Monograph 32, Parts I and II.

Key words: composite particles; interacting quantum fields; nuclear structure; particle structure; relativistic bound systems; relativistic nuclear physics.

The principles and the mathematical details of a fully relativistic nuclear theory are given. Since the concept of nuclear forces is a strictly non-relativistic construct, it must be abandoned and the forces must be replaced explicitly by their physical origin, i.e., by the interaction between nucleons and mesons. Thus, in this monograph the description of a nucleus has been formulated as a problem of relativistic quantum field theory which is solved by nuclear physics methods. To wit: The physics is described by specifying a Lagrangian which is a functional of the constituent fields (= of the parton fields). The solutions for the physical systems then are obtained in a time-independent treatment as expansions in the parton fields; both particles and nuclei are composite systems, made up of parton configurations, which define a representation of the Hamiltonian (associated with the specified Lagrangian). The Hamiltonian is truncated by omitting all configurations having a diagonal element exceeding that of the lowest configuration by a pre-determined value, $E_{max}$, and is diagonalized. All formulae needed to carry out this program are derived and given in full detail for spin 0, 1/2, and 1 parton fields for PS, PV, and $\varphi$ interactions. Particular attention is devoted to the center-of-mass position coordinate which in relativistic kinematics is a non-separable many-body operator. Finally, the configurations up to $E_{max}$ = 1 GeV are listed for the nucleon, the deuteron, and the pion.

Key words: certification: meaningful measurement; measurement; measurement system; precision; reference method; specificity; SRM; standard reference material; systematic error.

This publication is a guide to the use of Standard Reference Materials (SRM's) and should be useful to all users of SRM's, particularly those in countries developing national measurement systems. It is not intended to be an exhaustive description of the NBS-SRM program, but rather a review of the role SRM's play in the measurement system, how SRM's are certified, and what the certification means. To illustrate the use of SRM's several selected industries are described in which SRM's have made significant contributions.

Key words: measurement algorithm; measurement assurance; measurement process; measurement unit; process variability; uncertainty.

The differences between the methods of traditional metrology and the measurement assurance programs are briefly discussed. The historical data relative to long gage blocks (5 in to 20 in) are analyzed to provide a basis for comparison with results from new measurement processes formulated in accordance with the philosophies of the measurement assurance programs. The results from the new processes are in agreement with the work of the past. The current length values assigned and associated uncertainties are shown for selected long gage blocks used in the dissemination of length by the National Bureau of Standards. These long gage blocks are a part of a growing collection of similar well characterized artifact standards for use in comparative measurement processes. The methods and techniques used in developing the new measurement process are discussed in some detail. It is the author's intent that, in addition to the technical content, this paper be largely tutorial in the area of measurement process analysis. This paper is, in essence, a report on the extension of the techniques first suggested in NBS Monograph 103 “Relativistic Uncertainties and the Mass Measurement Process” to the area of length measurement.

Key words: calibration; gage blocks; interferometry; laser; length; measurement process; uncertainty.

The interferometric transfer of the length unit from its defined wavelength to NBS reference standard gage blocks is basic to the gage block calibration program at NBS. The interferometric measurement process using a laser light source and a Kusters type gage block interferometer is described here. Continuous evaluation and refinement of the process is aided by statistical treatment and control chart techniques. All error sources, both random and systematic, are evaluated and the process is maintained in a state of statistical control.
3.6. HANDBOOKS

Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Key words: gamma-ray equipment; radiation installations; radiation safety; x-ray equipment.

This standard establishes requirements for the design and operation of common types of installations which use gamma and x radiation for non-medical purposes. Its objective is to protect persons who work with or are near such installations, as well as the general public, against excessive exposure to radiation. Maximum permissible dose limits established by the National Council on Radiation Protection and Measurements are cited. Methods for achieving adequate radiation protection are described, including structural details, surveys and inspections, and operating procedures. Appendixes contain technical information useful for design of radiation shielding barriers. (Revision of ANSI Z54.1-1963, published as NBS Handbook 93).

Key words: energy conservation; energy conservation guide; energy conservation opportunities; energy conservation program; industrial energy conservation.

The Energy Conservation Program Guide for Industry and Commerce (EPIC) is a handbook to assist business firms to establish an on-going conservation program. Supplement contains simplified management program, additional conservation opportunities, case studies, and sources of information.

Key words: bell prover; calibration; inspection; liquefied petroleum gas; pressure; report form; temperature; temperature compensator; test; vapor meter; volume.

A manual for State and local weights and measures officials for the examination and test of liquefied petroleum gas vapor measuring devices. Definitions, test methods, and testing apparatus (including description and calibration procedures) are given. Inspection and test procedures are reviewed. A proposed test report form along with suggestions on reporting the results of a test are included. Provision is made for accommodating a changeover to metric units of registration in the definitions, correction tables, procedures, and in reporting a test. Supersedes NBS Handbook 45.

Key words: data handling language; interactive computing; interpretive computer programming language and operating system; medical automation; minicomputer-based systems; MUMPS; MUMPS Development Committee; MUMPS Language Standard.

This NBS Handbook contains a three-part description of various aspects of the MUMPS computer programming language. Part I, the MUMPS Language Specication, consists of a stylized English narrative definition of the MUMPS language which was adopted and approved for publication as a Type A release of the MUMPS Development Committee on March 12, 1975. Part II, the MUMPS Transition Diagrams, represents a formal definition of the language described in Part I, employing a form of line drawings to illustrate syntactic and semantic rules governing each of the language elements; it was adopted and approved for publication as a Type A release of the MUMPS Development Committee on September 17, 1975. Part III, the MUMPS Portability Requirements, identifies constraints on the implementation and use of the language for the benefit of parties interested in achieving MUMPS application code portability; it was adopted and approved for publication as a Type A release of the MUMPS Development Committee on September 17, 1975.

A bibliography of other MUMPS Development Committee documents is included.
3.7. SPECIAL PUBLICATIONS

Include proceedings of conferences sponsored by NBS, NBS annual reports, and other special publications appropriate to this grouping such as wall charts, pocket cards, and bibliographies.

Key words: analysis; characterization; composition; General Materials; properties: Research Materials; Standard Reference Materials.

This Catalog lists and describes the Standard Reference Materials (SRM's), Research Materials (RM's), and General Materials (GM's) currently distributed by the National Bureau of Standards, as well as many of the materials currently in preparation. SRM's are used to calibrate measurement systems and to provide a central basis for uniformity and accuracy of measurement. The unit and quantity, the type, and the certified characterization are listed for each SRM, as well as directions for ordering. The RM's are not certified, but are issued to meet the needs of scientists engaged in materials research. RM's are issued with a "Report of Investigation," the sole authority of which is the author of the report. The GM's are standardized by some agency other than NBS. NBS acts only as a distribution point and does not participate in the standardization of these materials. Announcements of new and renewal SRM's, RM's, and GM's are made in the semi-annual supplements of this Catalog, SRM Price List, and in scientific and trade journals.

Key words: austenitic stainless steel; electrical resistivity; high temperature; low temperature; standard reference materials; thermal conductivity.

A historical review of the development of selected thermophysical standard reference materials, SRM's, is given and selection criteria for those SRM's are listed. Thermal conductivity and electrical resistivity data for austenitic stainless steel, SRM's 735 and 798, are critically evaluated. Recommended values are presented for the temperature range 4 to 1200 K. Material variability studies, including the effects of heat treatment, have been performed at low temperatures. No irreversible transformations are observed up to temperatures of 1200 K. Based on the results of several types of characterization measurements, effects of material variability are believed to be less than 1 percent in electrical resistivity and not significantly more in thermal conductivity. The uncertainty of the recommended electrical resistivity data is estimated at 1 percent at low temperatures and 2 percent at higher temperatures. The corresponding uncertainty for thermal conductivity is 2 percent below 100 K, increasing to 3 percent at 300 K, and 5 percent at higher temperatures.

Key words: electrical resistivity; electrolytic iron; high temperature; iron; Lorenz ratio; low temperature; standard reference material; thermal conductivity; thermopower.

A historical review of the development of Standard Reference Materials, SRM's, is given and selection criteria of SRM's are listed. Thermal conductivity and electrical resistivity data for electrolytic iron and similar irons are compiled, analyzed, and correlated. Recommended values of thermal conductivity and electrical resistivity for electrolytic iron, SRM's 734 and 797, are presented for the range 4 to 1000 K. These values are based on NBS measurements up to 280 K and on measurements by Oak Ridge National Laboratory on a similar iron above 280 K. The average uncertainty of the thermal conductivity values below ambient is 1.5 percent and 3 percent above ambient. The corresponding uncertainties in electrical resistivity are 1 percent and 2 percent.

Key words: accuracy in spectrophotometry; glass filters; spectral bandpass; spectrophotometer; standard reference materials; stray radiation; testing of spectrophotometers; transmittance (absorbance) accuracy; wavelength accuracy.

This publication describes various factors which can affect the proper functioning of a spectrophotometer and suggests means and procedures to assess and control these factors. Particular consideration is given to the long and short term stability of a spectrophotometer, the wavelength accuracy, the spectral bandpass, the stray radiation, and the accuracy of the transmittance or absorbance scale. A description is given of the means and Standard Reference Materials (SRM's) which can be used to control these factors, together with the methods for the preparation, certification, and use of such materials (SRM 930). The results obtained in actual use of SRM 930 are examined in some detail. An appendix contains the reproduction of several publications relevant to the subject discussed in this work.

Key words: electrical resistivity; high temperature; Lorenz ratio; low temperature; standard reference materials; thermal conductivity; thermopower; tungsten.

A historical review of the development of thermophysical Standard Reference Materials, SRM's, is given and selection criteria of SRM's are listed. Thermal conductivity and electrical resistivity data for arc cast and sintered tungsten are compiled, analyzed, and correlated. Recommended values of thermal conductivity (SRM 730) and electrical resistivity (SRM 799) for these lots of tungsten are presented for the range 4 to 3000 K. These values are based on low temperature NBS measurements and higher temperature measurements by participants of the AFML-AGARD project. The uncertainty of the thermal conductivity values below ambient is 2 percent and rises to 5 percent between ambient and 2000 K. Above 2000 K the uncertainty rises to a maximum of about 8 percent. The uncertainty of the
electrical resistivity values is 2 percent over the entire temperature range.

Key words: buffers; buffer solutions; glass electrode; pH; pH buffers; pH electrode; pH measurement; pH standards.

One of the most widely performed analytical measurements in chemical laboratories is that of pH using the glass electrode. In order to insure the consistency of these measurements, the National Bureau of Standards has adopted an operational scale of pH defined in terms of the pH(S) of a series of standard buffer solutions. Certified samples of buffer materials, from which the standard reference solutions of reproducible pH can be prepared, are issued by the NBS. At present, the operational scale is defined by the pH of seven primary and three secondary standard solutions.

This report is concerned primarily with a discussion of the method used at the NBS for the assignment of pH values to the standard buffer solutions, a description of the NBS measurement facilities, and a summary of the characteristics of these standards. A brief discussion of the types of electrodes used and the calibration of pH instrumentation is also presented.

Key words: International system of units; measurement systems; metric system; modernized metric system; SI; weights and measures.

The Modernized Metric System (also called the International System of Units) is made up of seven base units, two supplementary units, and many derived units. The chart describes this entire system, including details about the standards for each base unit and information on how the system is used.

The reverse side of the chart contains a brief history of measurement systems. The need for measurement began with primitive man, who used parts of his body and his natural surroundings for measurement standards and measuring instruments. As societies evolved, weights and measures became more complex. Two systems became predominant: the English system, rooted in the history and tradition of England; and the metric system, a scientifically based system using decimal notation. The metric system, with its inherent decimal advantages, gained widespread acceptance and is now the official measurement system in nearly all countries of the world.

Key words: abstracts, NBS publications; key words; publications.

This supplement to Special Publication 305 Supplements 1 through 5 of the National Bureau of Standards lists the publications of the Bureau issued between January 1, 1974 and December 31, 1974. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 4), key-word and author indexes; and general information and instructions about NBS publications.

Miscellaneous Publication 240 (covering the period July 1, 1957 through June 30, 1960) and its supplement (covering the period July 1, 1960 through June 30, 1966), Special Publication 305 (covering the period July 1966 through December 1967) and Special Publication 305 Supplement 1 (covering the period 1968-1969), Special Publication 305 Supplement 2 (covering the period 1970), Special Publication 305 Supplement 3 (covering the period 1971), Special Publication 305 Supplement 4 (covering the period 1972), Special Publication 305 Supplement 5 (covering the period 1973) remain in effect. Two earlier lists, Circular 460 (Publications of the National Bureau of Standards, 1901 to June 1947) and its supplement (Supplementary List of Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957) are also still in effect.

Key words: engineering standards, index of; index of standards, recommended practices, specifications, test methods; Key-Word-in-Context index of voluntary standards; KWIC index of standards; standards, voluntary, index of.

This supplement contains the permuted titles of more than 5,700 voluntary engineering standards, specifications, test methods, codes and recommended practices published by 164 U.S. technical societies, professional organizations and trade associations. Each title can be found under all the significant key words which it contains. These key words are arranged alphabetically down the center of each page together with their surrounding context. The date of publication or last revision, the standard number and an acronym designating the standards-issuing organization appear as part of each entry.

Key words: atomic; instrumental broadening; line shapes; line shifts; pressure broadening; resonance broadening; Stark broadening; van der Waals broadening.

This is the second supplement to the NBS Special Publication 366, "Bibliography on Atomic Line Shapes and Shifts (1889 through March 1972)." It contains about 400 references and covers the literature from July 1973 through May 1975. As before, the bibliography contains five major parts: (1) All general interest papers are catalogued according to the broadening mechanisms (and, further, according to special topics under several of the mechanisms) and as to whether the work is a general theory, a general review, a table of profiles or parameters, a comment on existing work, a study of general experimental measurement techniques, or an experimental effort of general importance. Also included are selected papers on important applications of line broadening and on miscellaneous topics relating to atomic spectral line shapes and shifts. (2) In Part 2, all papers containing numerical data are ordered as to element, ionization stage, and broadening mechanism (in the case of foreign gas broadening the perturbing species are listed), and it is indicated whether the data are experimentally or theoretically derived. (3) While in the two preceding parts of the bibliography the references are listed for brevity by identification numbers only, in Part 3 all references are listed completely by journal, authors, and title and are generally arranged chronologically and alphabetically each year according to the principal author. (4) This section contains a list of all authors and their papers. (5) A final section provides corrections or additions to the first bibliography and supplement.

Key words: bibliography; chemical kinetics; excited state; gas phase; nitrogen atom; nitrogen molecule; nitrogen oxides; oxygen atom; oxygen molecule; ozone.

A reaction-oriented list of references is provided for papers and reports published in 1972 and 1973, containing rate data for reactions of N, N₂, N₂O, N₂O₃, N₂O₄, NO, NO₂, NO₃, NO₄, NO₅, O₂, and O₃ with each other. Some reactions of species in excited states are included. This bibliography, covering about 500 papers, extends the coverage of two previous bibliographies on the same subject, COM-71-00941, NBS-OSRDB-71-2, August 1971 and NBS Special Publication 371, February 1973. Some work published prior to 1972 omitted in the previous publications has been included here.

Key words: carbon (graphite); ceramics; composites; data sources; glasses; properties.

A directory was compiled for selected sources of property data of ceramics, glasses, carbon/graphite and composite materials containing a ceramic component. Included is an assessment of the scope, assets and deficiencies of the most prominent sources. These include handbooks, technical compilations, information/data centers, technical societies, and trade associations or institutes. The directory is indexed by materials and properties.

Key words: electronics; high-frequency probes; interlaboratory comparison; scattering parameters; S parameters; transistors.

Results of an interlaboratory comparison of transistor scattering-parameter measurements are reported for transistor types 2N709, 2N918 and 2N3960. From these results it is estimated that, for such devices, between-laboratory variability of transistor S-parameter measurements in the frequency range between 200 and 2000 MHz could be held to a maximum relative standard deviation of 7.5 percent in the measurement of magnitude and a maximum sample standard deviation of 8 degrees in the measurement of phase of S₁₁, and 3.5 degrees in the measurement of phase of other S parameters. This could be done if all participants were required to use the same calibration procedure and to limit their test signal to a level that would assure small-signal operation. In a separate study, the equivalent circuit of high-frequency probes used in characterizing the parameters of integrated circuits was evaluated by measuring S parameters at the input connectors with the probe tips in contact with known loads. These measurements revealed a resonance which would limit the usefulness of the probes for measurements in the vicinity of 1.2 GHz. Work is underway to determine design changes needed to eliminate this resonance.

Key words: Boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; photomasks; photoresist; resistivity; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; test patterns; thermal resistance; thermal response; thermally stimulated capacitance; thermally stimulated current; ultrasonic bonding; voltage contrast mode; wire bonds.

This quarterly progress report describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period include (1) identification of surface preparation procedures which improve the quality of spreading resistance measurements, (2) preparation of a videotaped tutorial discussion of thermally stimulated current and capacitance measurements. (3) completion of an analysis of the apparent position of an opaque edge when viewed with incoherent and coherent illumination, and (4) completion of the construction of a flying-spot scanner. Results are also reported on capacitance-voltage and two-probe resistivity measurements; analyses of thermally stimulated current and capacitance measurements on metal-oxide-semiconductor (MOS) capacitors; a review of methods for characterizing interface states associated with thin oxide films on silicon; fabrication of a test pattern based on the charge-coupled device; a preliminary comparison of flicker and image shearing eyepieces for line-width measurement; a review of technologies in use for photomask inspection and measurements; procedures for determination of correct photoresist exposure; epitaxial layer thickness; stimulated atom; stimulated molecule; stimulated states; stimulated vapor; scanning micrometrology; stimulated emission; stimulated resonant scattering; thermal capacitance; thermal conductance; thermal conduction; thermal diffusivity; thermal energy; thermal mass; thermal resistance; thermal response; thermal stimulated capacitance; thermally stimulated current; ultrasonic bonding; voltage contrast mode; wire bonds.

Key words: BASIC; capacitance-voltage measurements; computer programs; dopant profiles; error function; Gaussian diffusion; plotting, computer; semiconductor; silicon.

A computer program is presented which is suitable for calculating dopant density vs. depth profiles from capacitance-voltage data for the case of a Gaussian-diffused p-n junction diode. The program includes corrections for peripheral capacitance of round or rectangular diodes and back depletion of the space charge region into the diffused layer. Inputs to the program consist of the surface dopant density, the junction depth, the background dopant density in the diffused layer, the junction diameter, three scaling parameters, and the capacitance-voltage data pairs. Output from the program is in the form of a plot and an optional listing of dopant density as a function of depth. The equations underlying the program are given and are related to the program whose operation is described in detail. A second program, for generating idealized capacitance-voltage data for a Gaussian-diffused diode on material with a constant dopant density is also included.

Key words: acoustic emission; beam-lead bonds; boron redistribution; Darlington pairs; dopant profiles; electrical
properties: electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; incremental sheet resistance; measurement methods: microelectronics; micrometry; MOS devices: oxide films; resistivity; scanning low energy electron probe: semiconductor devices; semiconductor materials: semiconductor process control: silicon; test patterns; thermally stimulated current: thermal resistance; thermal response: ultrasonic bonding: wire bonds; x-ray photoelectron spectroscopy.

This quarterly progress report describes NBS activities directed toward the development of methods for measurement of semiconductor materials, process control, and devices. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period include: (1) completion of Hall effect measurements to determine activation energies of the gold donor and acceptor levels in silicon; (2) successful direct measurement of fast interface state density with the circular CCD test structure; and (3) demonstration of the feasibility of the use of acoustic emission as a non-destructive means for testing individual beam-lead bonds. Results are also reported on a holder for semi-automated sheet resistance measurements, progress on development of mathematical models of dopant profiles, analysis of thermally stimulated current and capacitance measurements on junction diodes, x-ray photoelectron spectroscopy, a comparative study of surface analysis techniques, design and fabrication of a test pattern for resitivity-dopant density evaluation, epitaxial layer thickness measurements, use of the flying-spot scanner, initial work on the scanning low energy electron probe, mathematical modeling of ultrasonic bonding, an improved method for force adjustment and measurement on beam lead bonders, helium mass spectrometry for leak testing, thermal resistance measurements on Darlington pairs, and transistor thermal response measurements. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices.

Key words: boron nitride; boron redistribution; capacitance-voltage methods; Darlington pairs; deep depletion; dopant profiles; electrical properties; electron beam evaporator; electron beam induced damage: electronics; epitaxial layer thickness; flier eyepiece: flying-spot scanner; hermeticity: hydrogen chloride gas; image shearing eyepiece: laser interferometry; measurement methods: microelectronics: micrometry: MOS devices: oxide films; photomask inspection: resistivity; scanning electron microscope: scanning low energy electron probe: semiconductor devices: semiconductor materials: semiconductor process control: silicon; test patterns; thermally stimulated current: thermal resistance; thermal response: ultrasonic bonding: wire bonds; x-ray photoelectron spectroscopy.

This progress report describes NBS activities directed toward the development of methods for measurement of semiconductor materials, process control, and devices. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period include: (1) initiation of development of measurement technology for characterizing boron nitride diffusion sources and hydrogen chloride purging gas; (2) application of de electrical methods with a sensitivity of about 0.1 µm to the measurement of critical dimensions such as the width of diffusion windows; (3) completion of an initial comparison of line-width measurements made with an image shearing eyepiece and a flier eyepiece, and (4) development of procedures for measuring electrically the thermal resistance of the output transistor of integrated Darlington pairs. Also reported are the intermediate results of an interlaboratory evaluation of standard reference wafers for resistivity, evaluation of the deep-depletion method for measuring dopant density with an MOS capacitor, progress on development of mathematical models of dopant profiles, initial results of the reevaluation of Irvin’s curve for n-type silicon, analysis of thermally stimulated current and capacitance measurements on MOS capacitors, study of surface carbon contamination which occurs during measurement of silicon by x-ray photoelectron spectroscopy, preliminary measurements of absorbed dose from electron-beam evaporation of aluminum films, initial evaluation of the CCD test structure operating as an MOS capacitor and an MOS transistor, analysis of a TV-microscope system for photomask inspection, initial study of calibration procedures and artifacts for photomask metrology, analysis of the range of applicability of MOS C-V methods for epitaxial layer thickness measurement, use of an optical flying-spot scanner, assessment of damage to selected integrated circuits caused by inspection with a scanning electron microscope, mathematical modeling of ultrasonic bonding, a dry gas method for gross leak testing, and measurements of transistor thermal response. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices.

Key words: carrier trapping; gamma-ray detector; germanium; Ge(Li) detector; infrared response silicon.

An infrared response (IRR) technique was evaluated for its utility in qualifying germanium for radiation detector use. Because of several improvements in the sensitivity and interpretation of the technique made during the evaluation, it was possible to observe a number of discrete energy levels lying within the forbidden energy gap of germanium which had passed unobserved in previous studies. These levels correlate with the type of defects and vacancies introduced by radiation damage into germanium as measured using such techniques as photoconductivity and Hall effect measurements after irradiation. Furthermore, the improved infrared response measurement method was used to identify impurities, such as copper, gold, and iron, and dislocations resulting from heat treatments in germanium. A major advance was made when it was determined that the IRR spectra could be grouped into five distinct types on the basis of spectral features observed in the energy range from 0.6 to 0.7 eV. One of the spectrum types represented crystals from which good quality detectors could be fabricated; the other four represented crystals that yielded poorer quality detectors due to carrier trapping, or crystals that presented problems such as low lithium drift mobility in detector fabrication. Three of the four spectrum types representative of poor crystal quality could be duplicated by suitably degrading specimens of a good quality crystal. The material and detector characteristics of crystals within each spectrum type were found to be similar.

Key words: integrated circuits; microelectronics; micrometry; photolithography; photomask; semiconductor technology.

49
Photomasks are the basic artifacts for transferring design geometry to the semiconductor wafer in integrated circuit (IC) production. Currently, photolithographic techniques using optical equipment are the primary means for both fabricating masks and using masks to print patterns on wafers. The present study was to identify the major optical and dimensional-measurement problems related to the fabrication and use of masks.

The results show that the primary optical problems are those related directly to the use of optical instruments for dimensional measurements of IC pattern geometry. Furthermore, most suppliers and users of optical equipment for mask fabrication do not conduct sufficient optical testing to determine imaging performance. The basic limitations derived from light diffraction and coherence continue to limit the quality of masks and IC devices with sub-micrometre geometry, and acceptable units are produced generally on a best-effort basis. The primary dimensional-measurement problems are (1) accurate measurements below about 10 μm, (2) edge definition or location of a physical edge for a line, and (3) mask registration. Recommendations to improve the accuracy of dimensional measurements are given.

A bibliography of publications related to the optical and micrometrical aspects of photomasking is included.

An ACM/NBS Workshop on Computer Performance Evaluation (CPE) was held in San Diego, Calif., in March 1973. The papers, workshop discussions, conclusions, and recommendations presented in this volume address specific problems in making computer performance evaluation a commonplace and productive practice.

While several of the conclusions indicate that improvements are needed in performance analysis tools, another suggests that improved application of CPE could be achieved by better documentation of analysis field to develop its full potential. Participants noted that the common emphasis on data collection or modeling, to the exclusion of considering objectives, often seriously degrades the value of performance analysis. These proceedings include the following papers (indented):

Key words: reduction of measurement data; software measurement tools; total computing capacity; user satisfaction measurement.

Mellon Bank has acquired or developed a series of software measurement tools which gather statistics related to job production and system utilization. No one software tool meets all the bank's needs and, on occasion, resort is made to a hardware probe. Of particular benefit have been data reduction schemes, file managers, and query languages that facilitate rapid reduction, summarization, search, and calculation of the raw measurement data. A continuing aim has been to use the same body of base measurement data for job production statistics, system tuning data, and user costing schemes. In spite of the use of benchmarks, etc., there is concern about a basic inability to access accurately total third generation computing capacity in a rapidly changing hardware and software environment. The increasing need and the capability to make more accurate, timely, usable, and meaningful data immediately available to the final user requires use of teleprocessing, file management, and query systems that in a narrow and traditional sense are "wasteful" of system resources on a massive scale.

Key words: Computer Performance Evaluation (CPE); CPE education; CPE imagination; CPE instrumentation; CPE policy; EDP productivity.

The computer has grown in its ability to provide information processing support to the automobile industry. The budget for computers and related items has also grown, both in magnitude and as a percentage of the expense of sales. Computer Performance Evaluation (CPE) has begun to offer help in increasing the productivity of EDP equipment. The auto industry has recognized the need for CPE and engages in CPE programs with vigor. The general CPE consciousness taking hold within the EDP community promises benefits to the auto industry, which currently is involved with generating its own CPE talent and techniques.

This paper discusses the CPE needs of the automobile industry with specific references to General Motors where the author was previously involved in CPE activities.

Key words: end-user satisfaction; performance evaluation; performance factors; resource utilization; user competence.

The unique problems of performance evaluation in a university computer facility arise because of the diversity of usage patterns and resource demand patterns with which a single facility must cope. In such an environment, one key element of performance evaluation is the characterization of the workload; another is that a high premium must be placed upon adaptability and flexibility of the management algorithm. Subsystem performance can normally be subdivided into the service given the different classes of users. It is a balanced and adequate performance in these subsystems which is basically the most important criterion in universities.

Certain performance factors are discussed, such as end-user satisfaction, resource utilization, and usage of system subcomponents. The skewed competence of users, peculiar to a university environment, is also discussed as a factor affecting performance.

Key words: distribution; low utilization; overhead; suboptimization; subsystem measurement; variability.

The goal of performance measurement is to improve the performance of the system and reduce the cost. The present measurement tools start at the computer subsystem level. A thorough understanding of these tools seems to be necessary before we can move beyond the subsystem level into the overall system, then the computer operations, then the computer management, and hopefully beyond. Subsystem measurements have a direct impact on equipment configurations, in terms of reduction of presently installed equipment, postponement of planned equipment, selection of new equipment, and comparison between different vendors. How to detect and interpret low and high device utilization and uneven distributions of activities is covered.

Overhead is explored in several contexts and an attempt to generalize the concept of overhead is made. Performance comparisons are made between theoretical and practical maximums. Suboptimization is discussed, pointing out that
some suboptimization can have no bad side effects and should be achieved.

Variability in present measurement techniques is bothersome and is discussed briefly. A need for better reporting techniques is indicated.

Key words: computer system; factors; measurement; parameters; performance; performance terminology; predictability; requirements; variables; workload.

Advances in programming and computer system architecture are causing additional performance factors to be identified faster than the relationships among them are being understood. This must necessitate changes in the technology, terminology, and methodology, used to measure and describe computer system performance in the future. Problems and limitations resulting from using several measures of performance popular today, and suggestions for meeting tomorrow's needs, are noted in this paper. Insights gained from evaluating IBM's recently delivered storage systems during their development and early release stages provide the basis for discussing these changing requirements.

Key words: computer performance evaluation; efficiency; measurement data; measures of computer performance; system effectiveness.

Subsystem end-users should be concerned primarily with measures of system effectiveness that are cost or value based. Only through these measures can they relate the operations of their subsystem to the goals of the larger system. Individual subsystem effectiveness measures should be related through a total systems effectiveness model to permit tradeoff and marginal allocation decisions to be made.

Subsystem end-users are usually not concerned with measures of system efficiency, which are the traditional computer performance measurements, but they are responsible for seeing that their effectiveness is achieved at minimum cost, which is determined and achieved by analysis of computer performance measurement data. Subsystem end-users therefore should see that their operating units receive system efficiency measurement data and that they understand how resource efficiency is related to system effectiveness.

Key words: computer performance evaluation; computer resource allocation; computer service parameters; component system performance; cost/effectiveness; cost/performance; performance evaluation; user control of computing; user performance evaluation; users' performance measures.

The end-user's view of a computer system's performance is generally quite different from that of the computer professional or of the service provider. He is unconcerned about such traditional system performance measures as CPU utilization, channel balance, memory fragmentation, and I/O queues. He is concerned only with the indirect effects of these measures as manifested in the cost he incurs or in the performance he receives. Factors reflected in these measures encompass items in the areas of accounting cost, control, system service, reliability, user interface, output, programming, and user (rather than system) performance.

In addition to the usual perceptual differences that exist between server and user, there are also significant disparities in the items taken to define performance, in the measures used to reflect that performance, and in the criteria employed to evaluate the measured performance. The paper explores some of these differences as well as discussing certain aspects of computer performance which are of particular concern to the end-users of computer systems.

Key words: computer architecture; functional evaluation; hardware monitor; measurement tools; performance measurement.

The relationship between computer design and computer performance analysis is argumentatively claimed to be an information-producing symbiosis. Performance analysis can add precision to the conceptual models which designers use to generate new systems. Most of the major aspects of good models, however, are unquantifiable. Computer design can help or hinder performance analysis, mainly by adding or omitting those few components which allow hardware monitors to recognize significant system events.

Key words: actual system performance; computer performance evaluation; performance prediction; simulation; software validation; tools.

This paper describes the relationship between software validation and computer performance evaluation. A brief review of validation objectives and methods is presented. With this background, three principal aspects of the relationship between validation and evaluation are explored.

The first aspect to be explored is the activity undertaken during validation to compare the actual system performance with performance predicted earlier. The second aspect, with which the paper is concerned, is the difficulty of validation. This should be an important consideration in the evaluation of a particular software or hardware system. The third aspect of the relationship is the similarity of the tools used in validation and performance evaluation.

Key words: computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; security, file access; security, identification (password); security, input and output processing; security software; software monitors.

The necessity for security often overrides the concern for optimum performance of a computer system. However, it is important that the relationships between security and performance be recognized. In this paper three major areas concerning these relationships are discussed.

The first concern is with some of the types of hardware and software that are required in order to maintain security internally in an ADP system, and the effect of this hardware and software on the performance of the system.

The second area discusses some of the complex problems of evaluating the impact of security software on the performance of computer systems.

The final area discusses a number of other technical and human problems often associated with evaluating performance in a secure environment.

Key words: hardware monitoring; monitoring register; software monitoring; system reliability.

A literature search discloses very few papers devoted to the improvement of system reliability through the use of performance evaluation techniques. A brief description is provided of an existing hardware monitor of advanced design which is capable of discerning both software and hardware events. In terms of such a tool, methods are discussed by which an attack may be launched on a number of the root causes of system unreliability. In order that new forms of packaging technology may not jeopardize the continuing use of such techniques, a proposal is made for the inclusion of a monitoring register in future computer systems.

Key words: computer; evaluation; hardware monitors; measurement; performance; software monitors; throughput.

First generation computers were designed to operate in a serial fashion—performing one operation at a time (e.g., input, output, process). Performance evaluation was simply a matter of determining, with a watch or calendar, the time from the start of a job to the end. After several generations of computers, we now have systems with an enormous degree of complexity and parallelism.

In an effort to keep pace in the performance evaluation area, several computer manufacturers, as well as companies not directly involved in the manufacture of computers, have built a number of performance measurement tools. These tools cover the whole spectrum, from a simple device using electromechanical counters, to a system larger than most computers it would measure.

Future measurement systems will involve both hardware and software. Special software sometimes will communicate with the hardware monitor over a special I/O interface. These new measurement systems will not only provide information about system performance, but will provide much more accurate job accounting information than is currently available, as well as doing a better job of scheduling.

Key words: computer system performance evaluation; experimental assessment of system behavior; performance in data analysis; performance data presentation; performance monitoring.

Experimental observations form an important part of computer system performance evaluation. It is through experimentation that models are validated, simulations parameterized and systems tuned. This paper surveys several approaches to designing experiments to aid in the assessment of systems behavior. Data gathering tools and techniques are discussed, as are the important topics of data presentation and data analysis. The paper concludes with a critical examination of the state of the art of experimentation. The key problems are found to include: (1) a lack of generally applicable guidelines, (2) a missing link between low-level data and high-level questions, and (3) a lack of means for dealing with variations in behavior attributable to variations in the workload.

Key words: computer performance analysis; measurement; performance monitoring; performance variability.

The performance of a computer varies significantly, even when it is subjected to the same load. Analysts who are forming between-machine comparisons, predicting performance, or merely trying to understand performance can be led to incorrect decisions if random variability is interpreted as representing real differences. Tightly controlled tests employing a flexible synthetic job indicated that elapsed time, processor time, and response time vary enough to deceive analysts. Several trends seem to indicate that variability will increase with time, so the effect will increase in importance. Both computer manufacturers and performance analysts should take specific actions to preclude problems due to computer performance variability.

Key words: accounting systems; hardware monitors; performance evaluation; performance measurement; software monitors.

In lieu of an integrated approach to performance, it may be helpful to propose a structure for consideration of the entities of Performance Measurement: systems, applications, and measurement techniques. It is proposed that these entities can be compartmentalized into "domains." For the categorization of performance measurement. It is likely that definite domains will be uncovered indicating the use of performance measurement, or more important and less widely recognized, where it is not cost-effective to perform system measurement.

The tools for measuring performance—hardware monitors, software monitors, and accounting systems—are discussed in terms of system level or application level management programs.

Several tasks are suggested that need to be addressed; (1) the gathering of currently available information on the use of accounting systems, and the development and publication of guidelines for the employment of accounting data; (2) the development and postulation of a set of Computer Performance Evaluation domains; (3) a Performance Measurement Handbook comprising guidelines for utilization of computer performance evaluation over all domains.

Key words: analytical models; evaluation; measurement; networks; performance; queues.

Tradeoffs between methods of solving analytical queueing models are discussed. It is suggested that representing the multiple (simply defined) resources of a computer system and the sequencing of tasks among these resources gives models which are simple enough to yield to analysis and yet are applicable to systems of interest. Theoretical results from the study of such networks are summarized and directions of future research are briefly discussed.

Key words: analytical; computer systems modeling; end users; performance.

Performance analysis, as practiced by end users, appears to be dominated by the trial and error approach. Computer systems modeling techniques have received relatively little usage by such users except for the sporadic application of commercially available computer system simulators. Vendors, by contrast (cf. the various ACM and IEEE publications) have been extensive users of both analytical and simulation based techniques for performance analysis. This paper discusses some of the reasons underlying the lack of extensive usage of such techniques by end users, identifies...
ann area of performance analysis appropriate to the usage of modeling techniques and discusses an approach to its investigation through their usage.

Key words: evaluation; graphs; measurement; networks; performance; Petri Nets; probability.

Program behavior is discussed in terms of Petri Nets. Using probabilistic information, an experimental method is given to determine the time spent in each state. To illustrate the method, two examples are given for program graphs.

Key words: computer efficiency; evaluation; measurement; performance; power; work.

The concept of power is defined and proposed as a new performance measurement tool for computer systems. Several examples are given that illustrate the calculation of power for small devices. The efficiency of a system is then discussed in terms of power. Finally, the new methods are compared with other methods of system evaluation.

Key words: computer performance measurement; software physics; software units; software work.

This paper is a brief exposition of the idea that a "software physics" exists, and furthermore that it is based on the same concepts as used in the natural sciences. The idea of a software unit is introduced to name the entities embodying the basic observable properties of software physics. These properties are identified as work and time. (Another property, existence, is not referenced in this paper.) The relation of these properties, in a general sense, to the variables of performance monitors and modeling is commented on.

Key words: accuracy; audit; certification; code-independent; documentation; optimization; precision; run statistics; security; terminology; validation; warranty.

Giving "evaluation" equal billing with "measurement" opens the door to discussion of performance that is good or bad, as opposed to fast or slow. Through this opening come considerations of security and confidentiality, validation of software and hardware means for performing arithmetic operations and evaluating mathematical functions (to varying degrees of precision and accuracy), code independence, auditing and warranty, optional optimization in compilation of running programs in high-level languages, and retention of statistics of every aspect of operation—for later analysis and reduction of duplicate work.

The role of the technical societies in the field of computer measurement, R. W. Hamming, SP406, pp. 151-153 (Aug. 1975).

Key words: computer measurement; technical societies.

It is comparatively easy to make measurements of computer performance, but this does not mean that there is, or can be, any single set of "right" measurements of performance—much as we may wish otherwise! This being the situation, the technical societies should not get themselves involved in trying to set standards of measurement (in the sense of what to measure), though they should encourage high quality measurement and subsequent data processing, publication, and oral presentation of results.

Key words: accounting; computer performance evaluation; efficiency; measurement; research and development.

Computer performance evaluation has moved to the forefront of a long list of tools to help the field practitioner. However, as long as R&D is applied only to large installations pushing the margin of feasibility (a noble and rewarding effort) that R&D will not contribute to the majority of data processing installations. Something useful is needed for the more normal installation.

In addition, it is becoming increasingly clear that CPE leads one to discuss and evaluate procedures and goals set for and acting upon the whole "user" community and not just the hardware monitor. More needs to be done in the external environment.

University education in computer measurement and evaluation, J. D. Noe, SP406, pp. 159-163 (Aug. 1975).

Key words: computer measurement and evaluation; computer science curriculum; hardware monitors; modeling.

The paper presents the view that computer measurement and evaluation should be taught in universities to stimulate research activity and to establish in the minds of students the importance of the measurement and evaluation viewpoint. It is recommended that measurement and evaluation initially be taught as a separate course, but the ultimate aim should be for the viewpoint to pervade all course work on hardware and software systems, at which time the need for the specific course should vanish. A list of suggested concepts is included.

Key words: digital indicators; drained weight; laws and regulations; metrication; metric conversion; net weight; package control; petroleum products; scales; survey; temperature compensation; uniformity; weights and measures.

This is a report of the proceedings (edited) of the Fifty-Ninth National Conference on Weights and Measures, sponsored by the National Bureau of Standards, held in Washington, D.C., July 7-12, 1974, and attended by state, county, and city weights and measures officials, the Federal Government, business, industry, and consumer organizations. These proceedings include the following papers (indented):

Advancing measurement assurance in the marketplace, J. H. Lewis, SP407, pp. 1-6 (June 1975).

Address, Betsy Ancker-Johnson, SP407, pp. 6-11 (June 1975).

Expanding the Nation's measurement system, A. O. McCoubrey, SP407, pp. 11-23 (June 1975).

Metric conversion:

Metric plans, programs, problems:

The metric conversion of scales as viewed by the scale industry, W. N. Shannon, SP407, pp. 87-92 (June 1975).

Petroleum industry, K. E. Bailey, SP407, pp. 93-96 (June 1975).

Metric conversion for gasoline dispensing systems, A. C. Evans, SP407, pp. 97-107 (June 1975).

Net weight—Policy and procedure:

USDA net weight philosophy and procedures, I. Fried, SP407, pp. 136-142 (June 1975).

Temperature correction of petroleum products at retail:

Temperature correction of petroleum products at retail, H. E. Harris, SP407, pp. 181-196 (June 1975).

Key words: certification; certified reference materials; materials; meaningful measurements; measurement; reference materials; SRM's; standard materials; standard reference materials; standards.

This book presents the proceedings of the 6th Materials Research Symposium on “Standard Reference Materials and Meaningful Measurement” held at the National Bureau of Standards, Gaithersburg, Maryland, on October 29 through November 2, 1973. The symposium was sponsored by the NBS Institute for Materials Research. The purpose of the symposium was to explore ways that Standard Reference Materials (SRM’s) could be used more effectively to bring about meaningful measurements both on a national and international scale, to explore the meaning of meaningful measurements, and to review the major paths now used to reach these measurements.

Starting with the relationship of SRM’s to a national measurement system, the symposium reviewed SRM activities at the international level, various national programs, and industrial needs. The use of statistics, selection criteria, and steps for certifying SRM’s were reviewed. Fifteen panel sessions reviewed the current status of SRM’s and outlined future needs. These proceedings include the following papers (indented):

Activity by the International Organization for Standardization with respect to standard reference materials, F. I. LaQue, SP408, pp. 68-73 (Mar. 1975).

Selection criteria of a material as standard reference material and steps for certification, G. Milazzo, SP408, pp. 127-145 (Mar. 1975).

National RM program in Germany (FRG), R. J. A. Neider, SP408, pp. 167-188 (Mar. 1975).

The current status of SRM activities in Japan, T. Tsuchiya, SP408, pp. 189-200 (Mar. 1975).

National SRM programs in Poland, T. Plebanski, SP408, pp. 201-223 (Mar. 1975).

The SRM story at NBS, R. E. Michaelis, SP408, pp. 246-257 (Mar. 1975).

Chemical composition control problems and solutions related to metals and alloys, R. S. Cremisio, SP408, pp. 275-297 (Mar. 1975).

Measurement problems in physical and mechanical properties of industrial metals and the use of SRMs, J. Convey, SP408, pp. 298-319 (Mar. 1975).

Industrial SRM needs and measurement problems in inorganic materials—chemical properties, V. A. Stenger, SP408, pp. 336-354 (Mar. 1975).

Key words: bibliography of metric information; customary units; history of measurement systems; metric chart; metric information.

This kit is a compilation of seven metric information items and is intended primarily for the teacher, student, and others seeking authentic information on the metric system.

A handy, wallet-sized card that converts customary units of measure into metric units and vice versa; a 15 centimeter (6 inch) ruler: "What About Metric," which explains in simple terms all anyone needs to know about using metric units in daily living; a brief history of measurement systems, and a colorful chart explaining base units of the metric system; a bibliography of metric information that also includes sources of metric teaching aids for educators, and an article by Dr. Richard W. Roberts, Director of the National Bureau of Standards.

Key words: accelerators; acoustic facilities; calorimeters; electrical measurements facilities; high pressure facilities; high temperature facilities; spectroscopy facilities.

Among the major technical facilities of the NBS laboratories in Gaithersburg, Md., and Boulder, Colo., are some which are unique and many which feature equipment that is relatively uncommon. These important resources deserve to be more widely known and used by the scientific and engineering community, including the Bureau's own staff, other Government agencies, industrial research associates, academic researchers, and postdoctoral fellows. Those facilities which are available for shared use, either occasional or extended, are briefly described in the pages of this publication.

Key words: biocompatibility; biomaterials; blood protein; ceramic implants; implantable electrodes; metallic implants; nerve prosthesis; synthetic implants; thromboresistance.

This volume is based on papers presented at the Symposium on Biomaterials, held in conjunction with the Ninth Annual Meeting of the Association for the Advancement of Medical Instrumentation, New Orleans, L.A., April 19-20, 1974. It provides a review of special topics in biomaterials research selected to focus attention on some noteworthy achievements. The topics covered include plasma-polymerized polymers and their application in biomedicine; biocompatibility of ceramic materials and their application both as inert coatings for synthetic implants and as porous materials for bone repair; the selection of metallic implant materials through engineering and medical considerations; in vitro testing of thromboresistance; adsorption of blood proteins on synthetic substrates; a prosthesis for nerve regeneration; and properties of fibrous biomaterials. These proceedings include the following papers (indented):

Key words: plasma-formed polymers; polymer films; polymerization; polymer permeability.

The deposition of polymeric coatings through Rf plasma techniques is a unique process from several points of view. By introducing monomeric gases into an inert gas Rf plasma, the monomers are converted to ultrathin continuous polymer films. These films can be made to vary in thickness from less than 1 μm to 10 μm or more. These materials are insoluble to common organic solvents and are not attacked by strong mineral acids. In addition, the monomeric materials in the reactor are distilled gases and are therefore quite pure in comparison to monomers used for ordinary linear polymerizations. As a result, the polymer coatings which are formed do not contain residual catalysts or activators and are in a highly purified state. We have utilized the plasma polymerization process to produce polymer films intended for biomedical application. Plasma coatings have been formed from a wide variety of monomers. These coatings have been applied to various nonmetallic, metallic and organic substrates. In each instance it was found that continuous adherent films could be deposited after suitable substrate preparation and reactor operation parameters were established. It has been our experience that a general cleaning procedure for all substrates cannot be dictated and that the preparative steps involved are dictated by the environment to which the final product will be subjected.

Key words: biocompatibility; inflammatory response; plasma polymers; tissue reaction.

Different polymer films generated by Rf plasma techniques and deposited on glasses of varying chemical composition, on implant alloys, and on formed prosthetic polymers have been implanted in New Zealand white rabbits and various canine species and have shown minimum tissue reactions after periods of time up to six months. It has further been found that the substrates upon which the plasma polymers are formed are more detrimental to cell cultures than the polymers themselves. These findings, along with other implant work, indicate that plasma-formed polymers will play a definite role as biocompatible materials in the future.

Key words: bioglass-ceramic; ceramic implants; flame spray coating; hip prosthesis; segmental bone replacement.

Recent studies of bioglass, bioglass-ceramic, and alumina implants have produced an understanding of the chemical nature of interfacial tissue reactions to bioceramics. Significant differences between hard and soft tissue reactions are due to the influence of surface chemical reactivity on the ultrastructural histology as revealed by transmission electron microscopy. Modern surface characterization of the implants correlates with the histological reactions. Applications of the results to a variety of orthopaedic prostheses show promise in animal experiments. Biomechanical analyses of interfacial bonding between bioceramic prostheses and tissues are presented.

Soft tissue response to a series of dense ceramic materials and two clinically used biomaterials. W. C. Richardson, Jr., S. F.
Key words: biocompatibility; ceramic implants; histological evaluation; implant characterization.

Disc-shaped implants of spinel, alumina, mullite, zircon, a cast Co-Cr-Mo alloy, and ultra-high molecular weight polyethylene (UHMWPE) were implanted in the paraspinalis muscle of twelve adult, male, White New Zealand rabbits. Prior to implantation the implants were characterized with respect to size and shape, weight and surface roughness. After periods of 1 month, 2 months, and 4 months the rabbits were sacrificed and the tissue specimens were retrieved with the implants still intact. Histological examination of the tissues surrounding the implants along with changes in the size and shape, weight, and surface roughness of the implants were used as criteria for evaluating these materials for implant purposes.

No surface degradation of any of the materials was detected using scanning electron microscopy. Fibrous tissue seems to adhere to the UHMWPE implants more than any other material used in this study. Large amounts of fibrous tissue were also found to adhere to the cast Co-Cr-Mo alloy implants.

The histological results indicated that within the limits of this investigation, the biocompatibility of the ceramic materials used in this study compares favorably with the clinically used cast Co-Cr-Mo alloy implants and the UHMWPE implants.

Key words: corrosion; inflammatory response; metallic implants; systemic effects.

The aim of this investigation is the development of improved alloys for short term (0.5 to 5 years) orthopaedic implants. The program is interdisciplinary in nature—simultaneous studies of corrosion, inflammatory response, and systemic effects of iron, nickel, cobalt, titanium, and tantalum base alloys are being determined. Corrosion tests under *in vitro* and *in vivo* conditions have been performed via linear polarization and other electrochemical methods.

The inflammatory responses of various implant alloys are being determined by both *in vivo* and *in vitro* experiments. *In vitro* chemotactic assays on rabbit neutrophilic granulocytes and mononuclear cells are performed in the presence and absence of appropriate metal ion concentrations. Corrosion rate data described above are employed to select the proper concentrations.

Systemic effects of metallic corrosion products have been determined via radioisotope and analytical techniques. Radioactive metallic salts at appropriate concentrations are injected intravenously in rats of known age and sex. Following this, the concentration of metallic products is determined as a function of time in various biological samples (plasma, urine, feces, etc.). These data permit the establishment of models which can predict the distribution of individual elements released from continuously corroding metal implants.

Key words: implantable hybrid cells; pacemakers; palladium black; platinum black; polarization; porous electrodes.

Porous platinum and palladium black electrodes have been used as cathodes for reducing body oxygen in implantable hybrid cells supplying energy to pacemakers. The power-generating capabilities of a cell are greatly decreased under load, i.e., increased current density, due to polarization at the electrode interface. A greatly increased surface area of the porous electrodes, i.e., number of sites for the electrode reaction, permits a greater current density with lower overpotential or polarization. Similarly, at the pacemaker stimulating electrode and at electrodes used in making electrical impedance measurements there is polarization and a consequent loss of energy in a charge transfer at the electrode interface. Porous electrodes in these cases have also greatly reduced the overpotential. The physical electrochemical properties of the porous electrodes have been characterized by specific adsorption, i.e., BET measurements; scanning electronmicrographs; galvanostatic and potentiostatic measurements; and electrical impedance measurements. Histopathological studies have been made in order to determine the biocompatibility of the tissue-electrode interface.

Key words: biomaterial properties; biomechanics; composites; fiber orientation; fibrous biomaterials.

Many factors influence the interaction between bone or soft tissue and implanted synthetic biomaterials, e.g., biocompatibility, implant configuration, functional requirements, bone and tissue structure, and relative mechanical properties. Of the many active factors, one aspect is considered here: the theoretical consequences of the fibrous-lamellar structure of bone, and of the degree of fibrous orientation present in the individual lamellae. This orientation is known to be statistically dispersed about certain preferred directions in each layer, with possible large orientation changes from layer to layer. Analysis of this type of structure is presented with graphical illustration of the effects of orientation and of statistical dispersion of orientation on conventional engineering material parameters.

New biomaterials are being evolved which combine fiber reinforcement with polymer resin matrices (e.g., graphite fibers/polycarbonate matrix). Such materials may be tailored to yield certain specific properties by controlling fiber orientation and quantity. Materials of this type are of interest in implants which may be required to behave in a similar fashion to adjacent bone tissue (as in bone splints, hip prostheses, etc.). The analysis presented here provides a rapid and convenient basis for calculating the effect of controlled and dispersed fibrous orientation on material properties.

The methods described lay a base for first approximations and show certain directions which should be followed in further investigation. Graphical results include examples for both fibrous bone tissue models and synthetic types of fiber-reinforced biomaterials.

Key words: blood coagulation; blood compatibility; blood platelet consumption; kinetic clotting test.

An *in vitro* blood compatibility test was developed to evaluate thromboresistant properties of materials. This method is called the closed-cell kinetic blood coagulation test. A closed cell system eliminates any air-blood interface. The blood is withdrawn directly from the animal into the cell, minimizing the exposure to foreign surfaces other than the one being studied and eliminating the use of anticoagulants through the process.

The technique includes the simultaneous blood filling of
eight cells with the test materials, and eight cells lined with a control material. As a control material we have selected silicone rubber, which has reasonably good thrombore- sistant properties, is widely accepted, and commercially available. The cells are opened at different predetermined times, and the clot formation is then measured by two com- plimentary methods: weighing the clot and colorimetry of the unclotted blood. The two methods correlate and can differentiate between red and white thrombus.

The results are presented as clot formation curves versus time for the material under test and for the control. The variability of blood properties makes this control curve essential.

Detailed analyses of the curves will offer a new approach to the understanding of the mechanism of thrombus forma- tion on various types of materials. Results will be presented for tests conducted on Hydron®, segmental polyurethane, purified natural rubber, as well as chemically treated tissue.

Key words: adsorbed protein conformation; blood protein; protein conformation.

The likelihood that surface-induced blood coagulation results from specific interactions between proteins and materials has led to a study of the conformation of adsorbed blood proteins. Infrared difference spectroscopy was used to determine the bound fraction, i.e., the fraction of carbonyl groups of an adsorbed molecule directly interacting with a silica surface, and ellipsometry was used to measure the average extension (thickness) of adsorbed protein films. In situ measurements were made on serum albumin, fibrinogen, and prothrombin as a function of the amount adsorbed, time of adsorption, and surface energy.

The bound fraction results obtained for serum albumin and prothrombin indicate that the internal bonding of these globular proteins is sufficient to prevent changes in conformation while adsorbed, even at low surface population. The bound fraction of fibrinogen increases with increasing adsorption, suggesting possible interfacial aggregation. The conformation of all three proteins was found by both I.R. difference spectroscopy and ellipsometry to be independent of the time of adsorption. In addition, the ellipsometric studies show that while the absorbance of fibrinogen and prothrombin does not vary for a number of surfaces, their extensions increase with decreasing surface energy.

Studies of cross-linked and denatured serum albumin have shown that changes in conformation concomitant with adsorption of the native protein, if they occur, are small.

Key words: neurorrhaphical procedures; peripheral nerve repair; tubular prosthesis.

The design rationale and requirements of a system of su- tureless nerve repair employing a special thin walled porous stainless steel tube and a vacuum technique for applying the tube and approximating the nerve ends will be outlined. A description of the tubular prosthesis, its fabrication, the surgical instruments and neurorrhaphical procedures will be presented.

A slurry dipping process has been developed for the production of uniform “green” tubes in quantity. These are sintered in a hydrogen atmosphere to impart the strength required to retain their tubular configuration under the forces imposed by the surgical procedures and the vacuum pressure. Placing the porous tube on the nerve and drawing the nerve ends into approximation is both simple and rapid.

Key words: histological evaluation; nerve axons; surgical procedure.

The principal neuroanatomical aspects of peripheral nerve repair are the approximation of the severed ends and the minimizing of trauma during the approximation. The method of using vacuum to draw the severed ends down a porous tube seems to take these two factors into consideration. The porous tube provides a shielded environment for the regenerating nerve to grow into the approximated distal end. The porosity allows for the escape of edematous fluids, prevents the invasion of scar tissue and provides for the flow of nutritional fluids.

Histological and statistical results of the procedures are presented. In most instances the axons of the regenerating nerve grow across the gap and occupy the intact neurilema sheaths of the degenerating distal segments.

Key words: building design; consumer protection; fire control; fire detection; fire research; fire spread; flammability.

The mission of the Center for Fire Research is to insure the development of the technical base for the standards and specifi- cations needed in support of the National goal to reduce fire losses by 50 percent over the next generation. A systems approach to accomplish this mission is described. The Center consists of three basic programs in the area of Fire Science and five applied research programs in the area of Fire Safety Engineering. Each applied program addresses an aspect of the Fire Problem, using fundamental information supplied by the basic research function. Active participation by staff members in voluntary standards organizations is the principal means of making this technology available for codes and standards needed to reduce the Nation’s fire loss.

Key words: codes; consensus system; directory; Federal Government—standardization; industry standards activities; national standards activities; recommended practices; specifications; standardization activities; standards; states—standardization activities; test methods.

This Directory serves as a guide to standardization activities in the United States. It supersedes a Directory of the same title, issued in 1967, as National Bureau of Standards Miscellaneous Publication 288. Included in the Directory are summaries of the standardization activities of trade associations, technical and other professional societies representing industry and commerce, and state and Federal governments. For the first time this Directory covers nonengineering and nonindustry organizations. SP417 contains current descriptive summaries of more than 580 organizations.

Criteria for inclusion are that the organizations have stand- dardization activities such as standards-writing groups, that they assist in the development of standards, or that they issue standards or disseminate standards information.
The standardization activities summaries are grouped into three sections: associations, states, and agencies of the Federal Government. In each section, the summaries are arranged alphabetically by organization. Two types of indexes are included in SP417 to assist the reader in identifying an activity: (1) a subject index of NBS activities and (2) a listing of organizations classified into 24 subject areas. Supercedes NBS Misc. Publ. 288.

Key words: annual report; computer; energy; environment; health; product safety; research; science and technology; standards.

This document describes how resources were utilized during fiscal year 1974 and highlights major achievements as a result of work performed at the National Bureau of Standards. Using the theme, "Standards for daily living," the book presents brief discussions of accomplishments within major program areas. The report serves as 1) an annual account of NBS activities and 2) promotional information about NBS. The Table of Contents includes: From the Director; Standards for Daily Living: Historical Pioneer, Catalyst for Change, Information Programs; The Year in Review: Expanding Measurement Capabilities, Toward Solving the Energy Problem, Improving Man's Environment, Striving for Safer Products, Aiding Health Care, Advancing Computer Technology; Interaction is the Key: Public Interest, Government Projects, Industry Cooperation, Information Services; Funds and Facilities; Organization; People.

Key words: conservation; conversion; cost; cryogenics; economics; embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities.

The National Bureau of Standards played a vital role in developing hydrogen technology for the space age and is now engaged in efforts to adapt and improve this technology for the commercial use of hydrogen fuel. This document is a summary report on selected hydrogen-fuel topics and was prepared to identify cost and technical barriers to the commercial use of hydrogen fuel and to generate reference data for policy-planning, decision-making and design. Cryogenic hydrogen fuel technology is emphasized in the economic and systems analyses reported herein. Using the best available technical and economic data, hydrogen fuel is not currently cost competitive with alternate fuels; however, we must not reject hydrogen on the basis of current economic comparisons. Increased efficiencies of production, liquefaction, and energy conversion may drastically change these comparisons of today as will increased fossil fuel prices and more stringent environmental and pollution constraints. Hydrogen appears currently marketable in certain integrated utility systems, in transoceanic transport of energy produced far at sea, and is a necessary element in a wide variety of growing industrial processes and in the liquefaction of coal. This publication identifies research and development needs within selected areas of NBS competence and future research plans are outlined.

Key words: base units; centennial volume; history of SI; International Bureau of Weights and Measures; International System of Units; measurements; SI; Treaty of the Metric.

This is the English version of the Centennial volume of the International Bureau of Weights and Measures (BIPM) translated from the French. Metrology—the science of measurement—is traced from man's earlier efforts to the world's most modern, uniform, and coherent measurement system, the International System of Units (SI). Detailed accounts are given of the 1875 Treaty of the Metric—to which 18 nations, including the United States, were signatories—and the work of the International Bureau of Weights and Measures which was created by the Treaty and now the international province of 44 nations. Historical reviews are given of the development of the base and derived units of the SI, specifically mass, length, gravimetry, manobarametry, thermometry, electricity, photometry, radioactivity, x and gamma rays, and neutron measurements.

Key words: flow measurement, water; instruments, flow measurement; open channel flow measurement; pipe flow measurement; standards, flow measurement.

Selected information sources on methods and standards for making measurements of water and wastewater flow in the field are listed and described. Both closed conduit and free surface flows are treated, but emphasis is on open channel flow measurements needed in water resource engineering and in water pollution control. Instrumets and methods covered include weirs, flumes, current meters (and velocity traverse methods), dilution techniques, pipe flow instruments, acoustic meters and others. In addition to summarizing the basic properties of each instrument or method and referring users to the best available sources of detailed information on performance and field application, potential sources of error are described and quantified where possible.

Key words: biomedical; conference; cross section; nuclear; standards; technology.

These proceedings are the compilation of 221 papers presented at the Conference on Nuclear Cross Sections and Technology held in Washington, D.C. on March 3-7, 1975. The Conference summarized the present status of nuclear cross sections and technology and discussed future cross section needs. Special emphasis is placed on reactor technology and biomedical applications of nuclear science and the measurement of standard cross sections. These proceedings include the following papers (indented):

Key words: lattices; nuclear data; parameter; reactivity.

Key words: applications of decay data; ENDF-B/IV decay-data file.

The scope of ENDF/B has recently been expanded to include radioactive-nuclide decay data. In this paper, the content and organization of the decay data which are included
in ENDF/B are presented and discussed. The application of decay data in a wide variety of nuclear-related activities is illustrated by a number of examples. Two items pointed out by the ENDF/B decay-data compilation effort are treated: the identification of deficiencies in the data; and the importance of a radioactive-nuclide metrology effort oriented toward supplying these needs in a systematic fashion.

Key words: decay heat; ENDF/B-IV; fission products; half lives; yields; 235U; 239Pu.

Calculations of decay heat from fission products have been made using the summation method for fast and thermal reactor systems. Results of these calculations for both "burst" and long exposure times are presented and compared with previous experimental results and summation calculations. In addition, uncertainty estimate calculations are given which used both exact and approximate summation method formulas. The above calculations require as input libraries containing data for each individual fission product nuclide. Our source of data has been ENDF/B-IV, where fission yield, cross section and decay data (half lives, beta and gamma energies, branching, etc.) for 824 fission product nuclides are contained in the fission product and fissionable isotope files.

Key words: afterheat; decay heat; error estimates; fission products; loss of coolant accident; sensitivity.

This paper presents calculational results on the decay heat associated with the thermal fission of 235U and 239Pu. Calculations are based on the summation of the energies which are released by individual fission products. Two cases have been considered: the first corresponds to one instantaneous fission, the other to a 900 days irradiation time. In both cases the sensitivities of the afterheat to respectively independent yields, half-lives, average beta plus gamma energies of 122 instable fission products have been derived. This information has been used to calculate the afterheat uncertainties from experimental and evaluated nuclear data errors, when available. Results relating to the instantaneous fission of 235U and 239Pu are compared to calorimetric measurements between 100 and 105 second cooling time. Errors in the afterheat corresponding to a 900 days irradiation time have been estimated for cooling times ranging from 1 to 1000 seconds which are appropriate for loss of coolant accident analyses in light water reactors. The computer programs which have been developed can be applied to any irradiation and cooling time conditions.

Key words: data; flux; LMFBR; neutron.

The overall interaction of nuclear data, methods and nuclear performance predictions of an LMFBR is described. Areas of successful applications of the recent Evaluated Neutron Data File (ENDF/B) to an LMFBR design are shown to be numerous. Design areas where improvements in the Evaluated Neutron Data File would have significant impact on the development of the LMFBR industry are listed. Specific cross sections where improvements in the neutron data would be beneficial to the LMFBR industry are enumerated. In order to provide insight into why these developments are required, an application of nuclear data to the determination of the intrinsic neutron source strength in an LMFBR are described in relation to the EXVessel Low Level Flux Monitor system design.

Key words: accidents; breeders; fast reactors; LMFBR; recriticality; safety.

The current state of knowledge with respect to the analysis of potential accident sequences in fast breeder reactors and the understanding of associated accident phenomena, as well as implications to reactor design, are reviewed.

After PHENIX, what is the importance of nuclear data programs for the FBR development?, J. Y. Barre, J. Bouchard, and J. P. Chaudat, SP425, pp. 51-61 (Oct. 1975).

Key words: FBR development; integral experiments; nuclear data; PHENIX.

In the fast reactor physics approach chosen in France, the integral experiments serve as a reference. The significance of differential nuclear measurements, in this philosophy, is presented.

The programs carried out on critical facilities and operating fast power reactors up to the end of this year will solve the last major problems arising from nuclear data inaccuracies for commercial plants. Results obtained on PHENIX during start-up and operation validate this approach. After the end of 1975, the nuclear data needs concern mainly safety, plant operation and fuel cycle analysis. Nonnuclear uncertainties largely dominate the effects of nuclear data uncertainties for these problems. Evaluations must be sufficient to reach the requested accuracies.

Key words: proton-recoil spectrometry; Pu-Be and 226Ra neutron spectra; spectra unfolding.

A 5-cm by 5-cm NE-213 scintillator mounted on a 56 AVPM tube is used with a bridge utilizing two high voltage supplies and giving good linearity and good pulse shape discrimination. The cross-over timing method is used to discriminate against gamma-ray events. Measurements of a 226Ra and a D-T source were used to test the linearity of the system. The 226Ra measurement is in good agreement with earlier results and is fit by a Maxwellian distribution with a temperature of 1.43 MeV. A modified version of the COOLC unfolding code was used to obtain neutron spectra. This code, FORIST, optimizes the neutron energy resolution through an iterative process. A measured Pu-Be spectrum is used to demonstrate the benefits of the modified unfolding procedure. The Pu-Be spectrum is also in good agreement with earlier results. The 8.97 MeV peak of the Pu-Be neutron spectrum is resolved when the FORIST code is used, but not when the COOLC code is used with the window width data distributed with the COOLC and FERDOR code package.

Key words: absolute efficiency of fast neutron detectors.

A central problem in fast neutron research is that of finding the absolute efficiency of neutron detectors. Using the associated particle method for this purpose, we have designed a chamber to count He particles from the $^6$Li($^3$He,$\alpha^5$He) or the $^3$H($^3$He,$\alpha^5$He) reaction in coincidence with
neutron events. The reactions take place in deuterium or tritium gas and a \( \Delta E \) solid state counter at 80, 65, or 43° to the 2-10 MeV deuterium beam direction detects the He particles with 100 percent efficiency. To reduce background we allow the deuterons to pass out of the gas chamber through a Ni window and stop the beam \( \sim 150 \) cm from the counters. With the \( \Delta E \) reaction we have obtained \( \sim 2 \) percent efficiency calibration of the central portion of a liquid scintillator in the 9-10 MeV energy range. With the \( \Delta E \) reaction this calibration can be extended to \( \sim 27 \) MeV and the efficiency can be mapped out as a function of position in the scintillator.

Key words: astrophysics; cross sections; fission; reaction rates; thick targets.

A technique for measuring nuclear cross sections using thick targets and an empirical approximation for energy loss has been developed by our group at the Nuclear Physics Laboratory of the University of Colorado. Over the past two years we have measured thick target yields of over thirty nuclear reactions of interest in astrophysics and CTR applications. From these yields we can derive average cross sections and thermonuclear reaction rates, \( N_t <a_v> \). We will describe the technique and data analysis methods and give some examples of our results.

Key words: detector; flux; Monte Carlo; neutrons; scintillators; time-of-flight.

A detector has been designed to have a greater than 95 percent efficiency in the range of 250 - 1000 keV neutron energy. The detector is modeled from a similar but larger detector by Poenitz. The efficiency calculations were made with a modified version of Monte Carlo, which is a Monte Carlo calculation of multiple neutron scattering in a scintillator. The detector is a 12.6 cm \( \times \) 17.78 cm cylinder of NE 110 with a 5.08 cm \( \times \) 2.54 cm reentrant hole. The scintillator is mounted on an RCA 8854 photomultiplier tube which has been selected for low noise. Calculated efficiencies are presented as well as comparisons with experimental measurements.

Key words: associated particle technique; neutron detector; neutron flux monitor; neutrons; neutron standards; \( \Delta E \) reaction.

An associated particle apparatus employing the \( \Delta E \) reaction is now in routine use at the NBS. The apparatus consists of two target chambers with ports at 20° and 25° which give a useful neutron energy range of 100 keV to 1 MeV for protons from the 3 MV Van de Graaff. Electrostatic deflection, fast energy discrimination and pulsed beam time of flight techniques are used to reduce background in the neutron-associated \( \Delta E \) pulse height spectrum to less than 1 percent. Neutron fluxes in the associated cone range between 30 and 100 n/sec at the lowest and highest bombarding energies. The spatial profile of the neutron cone is broadened by coulomb scattering of the \( \delta \) He\( ^{++} \) in the tritiated titanium target and has a width less than 12° (full width at one-tenth maximum) for neutron energies above 300 keV. The apparatus has been used to calibrate a “black” detector described by Lamaze. The results of this calibration will be compared to a Monte Carlo calculation of the efficiency.

Key words: counter; flux; hydrogen; monitor; neutron; proportional.

The use of a hydrogen filled proportional counter as a neutron flux monitor for standard neutron reaction cross section measurements at the 200 m flight path of the NBS Linac is described. Efficiency uncertainties approaching 1 percent are obtainable.

Key words: fast ionization chamber; fission/alpha; spherical electrodes; \( \alpha; \) \( ^{244}\)Cm.

The large difference in initial ionization can be used to limit the size of alpha pulses relative to fission pulses in an ionization chamber, if the track lengths are both short. In parallel plate chambers this condition is not well met. We have developed a spherical plate chamber in which the ratio of maximum/minimum track length is 3. In the present (small sample) version, the maximum track is 6 mm, with deposit and neutron beam diameters of 1 cm. At optimum, with pure CH\( _4 \) gas, an electron collection time of \( \sim 22 \) ns is expected across the 2 mm gap. It is expected that the worst alpha/fission current pulse ratio will not exceed 1/14. Thus fission isotope with alpha half lives of 30 years or more (e.g., \( ^{244}\)Cm) may be studied with 1-2 nanosecond risetime current amplifiers; in addition, very small spontaneous fission branching ratios may be better determined. Comparisons of this new chamber with a parallel plate chamber and initial results on \( ^{244}\)Cm (~16 \( \mu \)g sample) will be presented. The ORELA pulsed neutron source permits measurements below 20 eV which are inaccessible to underground explosion experiments.

Key words: calibrations of the NBS P2 chamber; comparison of shape and magnitude of photoneutron cross sections; nuclear reactions \( \gamma; ^{26}\)Cu, \( \gamma; ^{216}\)Po, \( \gamma; ^{208}\)Pb, \( \gamma; ^{208}\)Bi(y,n).

The shape and magnitude of the photoneutron cross sections for \( \gamma; ^{216}\)Po, \( \gamma; ^{208}\)Pb, and Bi are compared to find out a systematic discrepancy between the cross sections obtained using the NBS P2 chamber as a bremsstrahlung beam monitor and those obtained by other experimental techniques such as the positron annihilation-in-flight. The former cross sections in general are observed to be systematically larger than the latter. The discrepancy of about 10 percent is demonstrated in the peak cross section values for medium nuclei. This may be explained in the good direction by a systematic discrepancy of 6 percent in the calibration constants of the NBS P2 chamber given at several laboratories, because the lowest values in these calibrations have been widely used to determine the photoneutron cross sections from measured neutron yield curves. The highest values can almost eliminate the 10 percent discrepancy. The definite discrepancy cannot be demonstrated for heavy nuclei because of the large discrepancies of 20 percent or more found in the cross sections obtained with \( \gamma; \)-rays from positron annihilation-in-flight.
Key words: capture gamma rays; cross sections; dosimetry; filtered beams; neutrons.

A scandium filter that views a manganese scatterer has been installed in a through tube of the National Bureau of Standards Reactor (NBSR). The use of a resonant scatterer eliminates unwanted core neutrons and core gamma rays. This produces a pure 2-keV neutron beam with only 3 percent higher energy neutron contamination and a 1 mkr/hr gamma-ray background. This should be compared with previously reported results in which the high energy contaminant was approximately 50 percent, thus severely limiting the utility of such a filter. Details of the filter construction, the use of titanium with the scandium to reduce background, the optimization of the beam for different types of experiments, and the application of 2-keV neutrons to neutron dosimetry, cross-section measurements and capture gamma-ray studies are discussed.

Key words: measured Th fission and deduced $\Gamma_1$ below 260 eV; measured $^{148}$Nd(n,α); measured $^{235}$U fission below 35 keV, deduced $\Gamma_1$ of 6.7, 21 and 37 eV resonances.

The Rensselaer Intense Neutron Spectrometer (RINS) is obtained by driving a 75-ton lead slowing down spectrometer with the intense pulsed neutron source from the RPI 100-MeV electron linac. For the same linac beam power, RINS produces a useable neutron flux which is $10^3$ to $10^4$ greater than that obtained with a conventional time-of-flight spectrometer. Fission measurements upon $^{238}$U have shown strong threshold fission above 700 eV and have determined the fission widths of the 6.7, 21 and 37 eV resonances to be (10 ± 5), (70 ± 30) and (8 ± 6) eV respectively. No strong threshold fission was observed in $^{232}$Th, and an upper limit of (15 ± 10) eV is obtained for $\Gamma_1$ for the Th resonances below 260 eV. Measurements of $^{149}$Nd (n,α) have shown that the RINS system is readily capable of measuring $\sim 1 \mu$ eV partial widths with only several mg of sample.

A modular minicomputer multiparameter data gathering and virtual memory operating system for the NBS neutron standards program, R. A. Schrack, H. T. Heaton II, and D. Green, SP425, pp. 97-98 (Oct. 1975).

Key words: CAMAC; disc; minicomputer; modular; multiparameter; on-line.

The new above-ground neutron time-of-flight system has recently been completed at the National Bureau of Standards linear accelerator facility. A computer system has been developed that will permit the accumulation of multiparameter data simultaneously from several experiments, using an inexpensive minicomputer and a small moving head disc storage unit. The operating system is modular in form, allowing different experimenters to rapidly construct a software system to their requirements. Data gathering and analysis programs are interchanged between core and disc as required. Interfacing hardware has been modularized using the CAMAC system.

Key words: C(n,n), E=9-15 MeV, measured $\sigma(E_{\alpha}^{\text{abs}})$; D(d,n)$^3$He and C(n,n) spectra; neutron TOF facility.

A fast neutron time-of-flight (TOF) facility has been constructed in order to measure neutron differential cross sections required for the CTR program. The facility combines the outstanding capabilities of the Cyclo-Graph accelerator with those of a good energy resolution, high mechanical precision, very low background TOF spectrometric-geometrometer. The facility provides the capability for measurements of scattering cross sections with magnitudes of a few mb/sr to $\approx 5$ percent absolute accuracy in the energy range 6-15 MeV. The D(d,n)$^3$He source spectra at 0° are practically devoid of extraneous neutrons produced by deuteron reactions with the all-metal, ultraclean beam transport system.

Key words: facility; neutron-induced reactions; $^{14}$C data; 56 MeV.

Nearly monoenergetic beams of neutrons, variable in energy from below 10 to above 60 MeV are produced via intense beams of protons and deuterons from the sector focusing isochronous cyclotron at Crocker Nuclear Laboratory. The neutron production target and collimation system are connected to a scattering chamber containing detector telescopes, all in vacuum. D.E, E and time-of-flight signals from each telescope are interfaced to a PDPI5/40 computer via CAMAC and optimized on-line and off-line data processing can be carried out. There are a number of examples of the use of these cross sections: Neutron induced reactions on carbon have provided us with a better understanding of energy dependence of neutron detection efficiencies in plastic scintillators. Data from carbon and other tissue-resident elements are necessary for an understanding of microscopic dose distributions produced by neutrons.

Key words: after-pulse; detector; gamma-flash; photomultiplier; pulse suppression; scintillator.

Spurious pulses occurring after large light output events in a scintillator (after pulsing) have been observed in semiconducting first dynode photomultipliers (RCA 8850 series). The after-pulsing apparently has two components, an isochronous component occurring at a fixed time interval after the initial light pulse and an asynchronous component with a long duration lasting at least 40 usec. The time interval between the isochronous bursts is related to the types of residual gases in the photomultiplier. In the RCA 8850 series tubes, the asynchronous after-pulsing consists of very low amplitude pulses and appears to be primarily due to single electron events, the number of these events being related to the main pulse amplitude. To obtain after pulse suppression, a fine stainless steel mesh was stretched tightly over the glass window of the photocathode. The mesh was then pulsed (FWHM = 250 ns) during the light flash to + 300 volts relative to the photocathode potential. The isochronous and asynchronous after-pulsing was completely suppressed. Further details are presented.

Key words: absolute efficiency determination; cross section measurements; neutron detector.
A neutron detector has been constructed and calibrated for the accurate measurement of total neutron-production cross sections. The detector consists of a polyethylene sphere of 24 in diameter in which $^9$BF$_3$ counters have been installed radially. The relative efficiency of this detector has been determined for average neutron energies, from 30 keV to 1.5 MeV by counting neutrons from $^3$Li(p,n)$^7$Be. By adjusting the radial positions of the BF$_3$ counters in the polyethylene sphere the efficiency for neutron detection was made nearly constant for this energy range. Measurement of absolute efficiency for the same neutron energy range has been done by counting the neutrons from $^3$V(p,n)$^{12}$Cr and $^{56}$Fe(p,n)$^{58}$Co reactions and determining the absolute number of residual nuclei produced during the measurement of neutron yield. Details of absolute efficiency measurements and the use of the detector for measurement of total neutron yields from neutron producing reactions such as $^{23}$Na(p,n)$^{25}$Mg are given.

Key words: calibration; construction; Na-D photoneutron sources; radiolysis; spectrum.

Photoneutron sources are a convenient source of neutrons in the intermediate energy range, and because of this they are often used to make absolute cross section measurements. In this paper, the construction of two sodium-deuterium sources is described. One of the sources uses deuterated polyethylene shells and the other utilizes heavy water. The methods used in the manipulation of the sources are outlined. The effects of radiolysis on the yields from the sources is discussed together with the unique features of the Michigan manganese bath system used in their calibration. The results of Monte Carlo calculations of the neutron spectra are given.

Key words: dosimetry; filtered beams; neutrons; spectrometry.

An iron-filtered, neutron-beam facility that provides a well collimated source of 25-keV neutrons has been developed at the National Bureau of Standards (NBS) Reactor. For selected physics experiments and monoenergetic calibration of neutron dosimeters, the beam flux may be tailored to provide $5 \times 10^6 \text{ cm}^{-2} \cdot \text{s}^{-1}$ with 99 percent 25-keV neutrons. For other experiments, such as calibration of fast-neutron spectrometers, fluxes of $10^6 \text{ cm}^{-2} \cdot \text{s}^{-1}$ might be obtained with as many as 13 identifiable peaks in the energy range 25 keV to 1.5 MeV.

Key words: neutron cross sections; new results; new techniques; review.

During the past several years there has been very little funding available for construction of new facilities for neutron measurements. The most important changes in the field have come through the development of new experimental techniques at existing facilities. These techniques and resulting measurements in the area of programmatic neutron data and neutron physics research will be discussed.

Key words: calculated $\sigma_f$; deduced channel spectrum; $E = 3.5 \text{ MeV}$; fission; nuclear reactions: Pu isotopes; U: $^{235}$U(n, f).

Recent measurements on the resonance cross sections of isotopes of uranium and plutonium are reviewed, with the objective of determining average parameters suitable for calculations at higher energies. The average parameters obtained are useful in two ways: they provide the necessary input for statistical calculations of resonance cross sections in the unresolved region, and they provide a normalization point for the calculation of smooth cross sections above the unresolved region. The particular problem we address in this paper is the systematic trend of average fission cross sections from 3-5 MeV, which have been found to follow the equation $\sigma_f = -39.031 + 17.231 Z^2 A^{1/3}$. We find that a very simple statistical model calculation, based on R-matrix parameters which adequately describe the total cross section from 20 keV to 20 MeV, can provide a qualitative understanding of this systematic behavior.

Key words: activation; capture techniques; high resolution methods; Moxon-Rae; review; total absorption.

A review of currently-used techniques to measure neutron capture cross sections is presented. Measurements involving use of total absorption and Moxon-Rae detectors are based on low-resolution detection of the prompt $\gamma$-ray cascades following neutron captures. In certain energy ranges activation methods are convenient and useful. High resolution $\gamma$-ray measurements with germanium detectors can give information on the parameters of resonance capture states. The use of these techniques is described.

Key words: nuclear reactions $^1N$, $^{27}$Al, $^{56}$Fe, Mo, $^{108}$Tm, W, $^{235}$U, review selected (n,$\gamma$) measurements, evaluations, $\sigma(E_\gamma)$, $\sigma(E_\gamma)$; $^{108}$Tm(n,$\gamma$), $E = 14.2 \text{ MeV}$, calculated $\sigma(E_\gamma)$; $^{14}$Na(n,$\gamma$), $E =$ thermal, calculated $\sigma(E_\gamma)$.

The current Evaluated Nuclear Data File (ENDF/B, Version IV) contains information on prompt gamma-ray production from neutron-induced reactions for some 38 nuclides. In addition, there is a mass of fission product yield, capture, and radioactive decay data from which certain time-dependent gamma-ray results can be calculated. These data are needed in such applications as gamma-ray heating calculations for reactors, estimates of radiation levels near nuclear facilities and weapons, shielding design calculations, and materials damage estimates. The prompt results are comprised of production cross sections, multiplicities, angular distributions, and energy spectra for secondary gamma-rays from a variety of reactions up to an incident neutron energy of 20 MeV. These data are based in many instances on experimental measurements, but nuclear model calculations, generally of a statistical nature, are also frequently used to smooth data, to interpolate between measurements, and to calculate data in unmeasured regions. The techniques and data used in determining the ENDF/B evaluations will be reviewed in this paper, and comparisons of model-code calculations and ENDF data with recent experimental results will be given.

Key words: application; charged particle; cross section; emission; neutron; techniques.
Several fields of practical importance are existing for neutron induced charged particle reactions despite their low position within the cross section hierarchy. A survey is given on the experimental techniques employed to obtain information on cross sections, energy and angular distribution for this class of reactions. The obtainable accuracies are discussed and compared with the accuracies requested for the practical applications. The main areas of work, presently neglected, requiring future attention can be identified: (1) Reactions on medium mass nuclei not accessible by the activation method and (2) the neutron energy region between 6 and 12 MeV where suitable neutron sources are not easily available.

Key words: concrete and steel shield; gamma-ray spectrum unfolding; integral measurements; neutron spectrum unfolding; NE-213 detector; nitrogen cross sections.

The pulsed-white-neutron-source, time-of-flight method and an NE-213 detector have been used for two integral shielding measurements. Incident-neutron-energy-dependent measurements of scattered neutrons and secondary gamma rays from small samples of Be, C, N, H-O, and Fe have been performed. Results for N, including unfolded energy spectra of scattered neutrons and secondary gamma rays at 125°, are presented. Time-dependent measurements of leakage neutrons and secondary gamma rays from a thick concrete and steel shield are described, and some data are presented.

Key words: adjustment; evaluation; fission products; sensitivity analysis; σ, 6^{101,102,103}\textsuperscript{Ru}; 127\textsuperscript{I}.

Part of the results of integral measurements, which have been performed in the STEK-facility for about 60 fission product nuclei, have been analysed and used for adjustment of capture cross sections needed for fast breeders. This paper gives an outline of the method used to obtain these adjusted cross sections as well as some conclusions for σ, 6^{101,102,103}\textsuperscript{Ru}; 127\textsuperscript{I}.

Key words: beryllium; carbon; integral cross section tests; iron; niobium.

Measurements of neutron leakage spectra in the energy range 1 to 15 MeV from homogeneous spherical assemblies have been made using an NE-213 spectrometry system. These benchmark-type measured spectra will be compared with detailed computed spectra as an integral test of evaluated nuclear data. Preliminary ANISN calculations using cross section sets based on ENDF/B-III are presented and compared with the measurements. Measurements on a 22-cm diam beryllium sphere, a 25-cm diam niobium sphere, and a 46-cm diam polyethylene (CH\textsubscript{2})\textsubscript{3} sphere, each with a 22\textsuperscript{26}CF source at the sphere center, have been made. The niobium calculation slightly underpredicts the leakage spectrum below 9 MeV. The beryllium and polyethylene calculations are in general agreement with the measurements, though discrepancies are seen for small energy ranges. Measurements have also been made for a 76-cm diam iron sphere with a 14-MeV source at the sphere center. The preliminary iron calculation (ENDF/B-III) greatly underpredicts the leakage spectrum from 1 to 8 MeV.

Key words: correlation; covariance; ENDF/B; standard cross section; uncertainty file.

A file of cross-section uncertainty information for use in reactor performance uncertainty analysis should take into account the propagated effects of uncertainties in the standard cross sections used. This problem has been analyzed using first-order error theory in terms of the uncertainy in the standard cross sections and the energy-dependent weight given to each underlying experimental result in obtaining an evaluated cross section. Three cases occur depending on whether the energy dependence of the standard was utilized, and if so whether the absolute magnitude or only the shape of the standard cross section was used in an underlying experiment. The analysis yields the uncertainties in and correlations among the evaluated cross sections. The resulting uncertainty files need not reflect explicitly to the uncertainties in standards and can use the same set of formats employed for other uncertainty data.

**Shielding benchmark experiments and sensitivity studies in progress at some European laboratories.** G. Hein, M. Mattes, W. Matthes, R. Nicks, and H. Rief, SP425, pp. 177-183 (Oct. 1975).

Key words: benchmark; cross sections; graphite; neutron; sodium; water.

A 100 group standard library based on ENDF/B3 has been prepared by I KE and JRC. This library is used for the analysis of the current European and Japanese iron benchmark experiments. Further measurements are planned for checking the data sets for graphite, sodium, and water. In a cooperation between the I KE and JRC groups coupled-neutron-photon cross section sets will be produced.

Point data are processed at I KE by the modular programs system RSYST (CCDC 6600) for elaborating the ENDF/B data, whereas the JRC group, apart from using standard codes such as SUPERTOG 3, GAMLEG, etc., has developed a series of auxiliary programs (IBM 360) for handling the DLC 2D and POPOP libraries and for producing the combined neutron-photon gamma library就可以了 (119 groups). Sensitivity studies in progress at I KE make possible improvements in methods and optimization of calculation efforts for establishing group data. A tentative sensitivity study for a 3-dimensional MC approach is in progress at Ispra. As for nuclear data evaluation, the JRC group is calculating barium cross sections and their associated gamma spectra.

Key words: activation method; group constants; iron; neutron spectrum; one-dimensional transport calculation; stainless steel; time-of-flight.

In order to assess group constants (JAEI-FAST, ABBN, DLC-2D, etc.) for iron and stainless steel, neutron
energy spectra from 1 keV to a few MeV in iron and stainless-steel assemblies were measured by the time-of-flight method. Neutron spatial distributions measured by the activation method (\( ^{238} \text{U}(n,p)\)\(^{239}\)Co and \( ^{237} \text{U}(n,\gamma)\)\(^{238}\)Au) showed a spherical symmetry around the photoneutron source, and enabled us to use one-dimensional transport codes (ANSIS, DTF-IV, etc.). The measured neutron spectra agree with the predicted by ANISN code with D1C-2D for both materials. However, C/E agreement is poorer below the 25 keV resonance when JAERI-FAST constants for iron are used in calculation. This disagreement was considerably reduced by using a modified set of constants. General shape of fast-neutron spatial distributions agrees with the theoretically predicted for all cases.

Key words: cross sections; flux; neutrons; reaction rates; spectra.

An ENDF/B file of evaluated energy dependent cross sections for dosimetry applications has been established. The fission and most reliable nonfission reaction cross sections on this file are used with current recommended sets of evaluated measured reaction rates for several benchmark spectra to establish multiple foil derived flux-spectra with Monte Carlo uncertainties for comparison with spectrum and calculated spectra. It is concluded that integral data testing of cross sections on the ENDF/B-IV file is presently limited to the \( \pm 5 \) to 10 percent (1σ) range because of uncertainties in the benchmark flux-spectra.

Key words: fission products; gamma spectra; photoneutron spectra; reactors; \(^{2} \text{H} \); \(^{2} \text{Be} \).

Fission-product gamma-ray and photoneutron spectra from thermal and fast fission of \(^{235} \text{U} \), \(^{239} \text{U} \), \(^{238} \text{U} \), and \(^{239} \text{Pu} \) have been calculated at 27 time intervals between 1 and 1000 hours following reactor shutdown. The gamma spectra calculations were made using CINDER, a depletion and fission-product code, which has been revised, extended, and variedly dimensioned for applications to many problems involving irradiated materials. ENDF/B-IV yield and decay data for all fission products with half-lives \( > 15 \) minutes and gamma energies above \( ^{2} \text{Be} \) threshold were used. An interesting general feature of the spectra is that they harden with time. The photoneutron spectra were calculated with PHONEX, a program general enough to operate on arbitrary gamma spectra incident on specific materials, e.g., \(^{2} \text{Be} \) and \(^{2} \text{H} \). Time-dependent distributions of photons and photoneutrons/fission were calculated in 66 energy groups (50 keV grids). The constancy of these source strengths between \( -10 \) and 200 hours following reactor shutdown indicates the possibility of sourceless start-ups.

Key words: nuclear enterprises; nuclear materials, plutonium; safeguard; uranium.

An overview of the risks and safeguards relevant to the possible theft or national diversion of special nuclear materials from peaceful nuclear enterprises is presented.

Key words: actinide; cross sections; fission.

The understanding of the fission process has made great progress recently, as a result of the calculation of fission barriers, using the Strutinsky prescription. Double-humped shapes were obtained for nuclei in the actinide region. Such shapes could explain, in a coherent manner, many different phenomena: fission isomers, structure in near-threshold fission cross sections, intermediate structure in subthreshold fission cross sections and anisotropy in the emission of the fission fragments. A brief review of fission barrier calculations and relevant experimental data is presented. Calculations of fission cross sections, using double-humped barrier shapes and fission channel properties, as obtained from the data discussed previously, are given for some U and Pu isotopes.

The fission channel theory of A. Bohr has greatly influenced the study of low-energy fission. However, recent investigation of the yields of prompt neutrons and \( \gamma \)-rays emitted in the resonances of \(^{238} \text{U} \) and \(^{239} \text{Pu} \), together with the spin determination for many resonances of these two nuclei cannot be explained purely in terms of the Bohr theory. Variation in the prompt neutron and \( \gamma \)-ray yields from resonance to resonance does not seem to be due to such fission channels, as was thought previously, but to the effect of the (n, \( \gamma \)) reaction.

The number of prompt fission neutrons and the kinetic energy of the fission fragments are affected by the energy balance and damping or viscosity effects in the last stage of the fission process, from saddle point to scission. These effects are discussed for some nuclei, especially for \(^{238} \text{Pu} \).

Key words: actinide burnup; cross section sets; neutron spectrum; transplutonium; waste management; yield.

Large quantities of heavy actinides will be byproducts of burning plutonium and uranium fuel in nuclear power reactors. Chemical recovery and subsequent recycle in reactors will be for the production of \(^{239} \text{Pu} \) and \(^{233} \text{U} \) as heat sources and \(^{238} \text{U} \) as a unique source of neutrons or for the ultimate conversion of heavy actinides to shorter-lived fission products to reduce long-term waste storage problems. Test measurements and production yields have provided data for developing a consistent set of multigroup cross sections which give excellent predictions of actinide concentrations in a variety of reactor environments and exposures. These multigroup cross sections are compatible with advanced reactor theory calculational codes.

Key words: deduced \( \gamma \)-ray nuclear reactions measured \( ^{230} \text{Th} \), \(^{235} \text{Pu} \), \(^{238} \text{U} \), \(^{235} \text{U} \), \(^{239} \text{Np} \), \(^{237} \text{Pu} \), \(^{239} 

Neutron induced fission cross sections have been obtained for 26 actinide nuclei using \(^{2} \text{He} \) and \(^{2} \text{He} \) reactions to determine fission probabilities and then multiplying these values by calculated compound nuclear neutron reaction cross sections. Comparison with existing (n, \( \gamma \)) data shows this to be a feasible approach for obtaining reliable estimates for (n, \( \gamma \)) cross sections where direct measurements are not possible. Theoretical developments in interpreting fission probability measurements are discussed.

Key words: actinide fuel, fertile material, and wastes; recycle concept; transuranium element production; waste recycling in a 235U-238Th reactor.

A plausible method for reducing the storage problems and hazards now associated with long-lived actinide wastes might be to recycle and convert these to fission products. Several reactor types can be envisaged for this purpose. We note that in a 235U-238Th reactor, the production of 237Np, Pu and transplutonium isotopes is greatly reduced compared to a 235U-239U reactor because several additional neutron captures are required to reach the same mass. Hence, the 235U-238Th reactor can be employed to effectively reduce Np, Pu, Am, and Cm wastes to fission-product wastes which entail shorter (~1000 yr) storage times.

Key words: heavy actinide burnup; multigroup cross sections; neutron reactions, heavy actinides; reactor production experiments.

A consistent set of multigroup neutron cross sections was developed for nuclides in the chain from 239Pu to 244Es. Evaluated multigroup cross section data were combined with experimental test measurements and production yields from long-term reactor irradiations in flux spectra of varying hardness. Thus 37- and 84-group data were derived in part from ENDF/B and existing Savannah River Laboratory evaluated libraries. Where differential data were lacking, resonance-model calculations and integral cross section values were combined to form the multigroup data. The data were tested with the JOSHA system to calculate the reactor environment as a function of time and to predict the concentration of actinide nuclides in the chain. Cross section data were modified within experimental uncertainties until predicted nuclide concentrations matched experimental results within reasonable limits over the range of neutron flux spectra.

Key words: actinide management; neutron capture cross sections; Pu isotopes, 241Am.

The capture cross sections of the isotopes heavier than 239Pu are of great importance for the core physics, fuel recycle, and waste management for power reactors. Since total cross sections are not sufficient, a program for the measurement of these needed capture cross sections is being carried out at ORNL. Measurements have been almost completed on 240Pu, 241Pu, and 242Pu and have been planned for 242Pu and possible 237Np and 243Am. The capture gamma-ray detector used is the "total energy detector" which is a modification of the Moxon-Rae detector. Fission, when present, is detected with fast neutron counters. Results obtained on 240Pu, 241Pu, and 242Pu will extend continuously from thermal neutron energies to 350 keV. The cross sections are normalized at thermal neutron energies and the neutron flux is measured relative to the 10B(n,α) cross section up to 2 keV and 4Li(n,α) at higher neutron energies. The accuracy of the techniques used varies with the sample but is about 8 percent. With such cross sections the long range management of the actinides produced in power reactors can be planned on a more systematic basis.

Key words: neutron cross section; standard; 4Be, 9Be.

The 10B(n,α)4Li, 19Be(n,α)7Li and 9Be(n,α)7Li capture cross sections have been measured between 1- and 1500-keV neutron energy. The neutron spectrum was measured using proton scattering as observed in a methane-filled proportional counter. Gamma rays from the 10B(n,α)4Li reaction were observed with a high-resolution Ge Lβ spectrometer, and the reaction products from the 9Be(n,α)7Li and 9Be(n,α)7Li reactions were observed in a large ion chamber. In an auxiliary measurement, the ratio of the 10B(n,α)4Li cross section to the hydrogen scattering cross section was obtained between 200 and 1000 keV by observation of interactions in a specially constructed 10BF3 proportional counter containing a methane additive.

Key words: absolute cross section measurements; manganese bath; neutron cross sections; photoneutron sources; surface barrier detectors; 4Li(n,α).

A value of 356 mb ± 12 percent was obtained for the 4Li(n,α) cross section at 964 keV. Neutrons were produced using a spherical Na-Be photoneutron source, calibrated relative to NBS-H using The University of Michigan manganese bath. Thin 4Li targets enriched to 95 atom percent 4Li were vapor deposited onto the electrode surfaces of a 42 micron thick, fully depleted Si surface barrier detector. A summary of the data, corrections, and error analysis is presented.

Key words: cross sections; fast-neutron reactions; lithium; nuclear reactions; (n,α) cross sections.

The angular anisotropy in the 4Li(n,α)H reaction at 25 keV has been measured in two sets of experiments performed at an iron-filtered beam facility (99% of the flux at 25 keV) at the NBS Reactor. First, a surface-barrier detector coated with 80 μg/cm² of 4LiF (front face) was used as a 2π detector. This detector was placed in four different angular positions with respect to the neutron beam: front face at 90° and 45° to the beam; back face at 90° and 45° to the beam. The pulse-height distributions of both the 4H and 4He were recorded for these four positions yielding a forward-to-backward asymmetry of 1.59 ± 0.11 in the center-of-mass system. A second detector was placed coaxially with the first (at 90°) to the beam) and in such a way as to subtend a 45° cone. Coincidence measurements, that simultaneously recorded the distributions in both detectors, yielded an asymmetry in the back-to-forward 45° cone of 1.80 ± 0.06 in the center-of-mass system. The existence of such a large anisotropy at this low energy and the possibility of similar behavior at still lower energies (i.e., 1–2 keV) should result from s-p wave interference. This would give rise to a constant anisotropy that is experimentally masked by the 1/ν behavior of the isotropic s-s interference terms at lower energies.

Neutron total cross section of 4Li from 10 eV to 10 MeV, J. A. Harvey and N. W. Hill, SP-245, pp. 244-245 (Oct. 1975).

Key words: nuclear reactions; 4Li, σeff, En = 10 eV to 10 MeV.
Transmission measurements have been made at OREL upon two metal samples of $^1$H(98.72%) with inverse sample thicknesses of 0.1 of 1.99 and 2.987 blatom. The measurements at low energies (from 10 eV to 300 keV) were made using a "1.1 glass scintillation detector at 17.878 m and 78.203 m at high energies (from 50 keV to ~10 MeV) using an NE-110 scintillation detector at 78.203 m. The total cross section data from both samples and detectors are in good agreement and are believed to be accurate to 1 to 2 percent below 1 MeV. Total cross section data obtained from both samples at 25 discrete energies up to 1 MeV using an iron-filtered beam are in good agreement with the continuous spectra data.

Key words: measured $\sigma_r(E), E = 1.5-5.0$ MeV $\sigma_t(0.5, E) = 1.8-4.0$ MeV; $\Omega_{mon}$ = 20 to 160$^\circ$; nuclear reaction $^{12}$C(n,n)$^{12}$C; R-function analysis.

Angular distributions of neutrons elastically scattered from $^{12}$C were measured from 1.8-4.0 MeV at intervals of $\geq$ 20 scattering angles distributed between 20-160 deg. Incident neutron energy solutions were 20-50 keV. All differential cross sections were determined relative to those of the H(n,n) reaction. In addition, total neutron cross sections were deduced from monoenergetic ($\Delta E = 2$ keV) neutron transmissions in the energy range 1.5-5.0 MeV. The experimental results were interpreted in terms of a multilevel R-matrix analysis including considerations of previously reported cross sections and polarizations. The resulting R-matrix parameters are compared with the Yale values deduced from observed scattered neutron polarizations. The measured values and analysis suggest physically consistent standard carbon total and scattering cross sections readily referenced in measurement applications.

Key words: cross sections; dosimetry; evaluation; fission spectrum; neutron flux; neutrons.

A variety of measurement methods over more than two decades provides a base for proper evaluation of the fission spectrum shape. The evaluation presented recommends a Maxwellian reference description for $^{235}$U (spontaneous fission) and $^{238}$U (thermal-neutron-induced fission) with average energy parameters of 2.13 MeV and 1.97 MeV respectively over the energy range 0.25 to 8 MeV. A further multigroup summary of the experimental data presents the final evaluation as an empirical adjustment of Maxwellian segments and includes an estimate of credible departures from the true spectrum shape. The reference Maxwellian shapes differ from the final evaluated shape by < 2 percent over the above energy range. A few basic integral quantities, fission neutron age in water and the fission-spectrum-averaged fission cross section for $^{238}$U, $^{235}$U, and $^{237}$Np, are reviewed briefly, based on the results of the evaluation. Two features of fission neutrons make them a useful reference for certain measurement problems in nuclear technology: the fission spectrum shape is preserved above ~1 MeV in important reactor-associated neutron environments, and small, intense sources of pure $^{239}$U fission neutrons are now available. A restricted class of related applications using fission neutron sources is discussed.

Key words: dosimetry; fission cross sections; neutron standards; uranium-235 cavity fission spectrum.

High-accuracy integral cross section ratio measurements have been performed in the thermal-neutron-induced uranium-235 fission neutron spectrum. This involves the basic fission reactions $^{235}$U(n,f), $^{239}$Pu(n,f), $^{238}$U(n,f) and $^{237}$Np(n,f); and the gold capture and $^{111}$In(n,n)$^{111}$In dosimetry reactions. The uranium-235 fission neutron spectrum is generated at the center of a one meter diameter spherical cavity within a graphite thermal column. Simple and variable geometrical arrangements were used and evaluated for neutron field purity. The fission rates were determined with the NBS double fission chamber as well as with others of different size and design. All fission detectors were validated within a parallel program of interlaboratory comparisons in the MOL-ΣΣ Standard Neutron Field. The activation rates have been measured with calibrated gamma spectrometers. The resulting integral cross section ratios relative to the $^{238}$U(n,f) reaction are, for $^{239}$U(n,f): 3.94 ± 0.08; $^{235}$U(n,f): 5.93 ± 0.13; $^{237}$Np(n,f): 4.35 ± 0.13; $^{111}$In(n,n)$^{111}$In: 0.620 ± 0.019; and $^{197}$Au(n,γ)$^{198}$Au: 0.287 ± 0.014.

Key words: fast reactors; fission chambers; fission rates; mass assay; MOL-ΣΣ facility; uranium-238 capture rates.

Interlaboratory comparisons have been made during the past two years, of techniques that are currently applied for the measurement of fission rates and uranium-238 capture rates in a number of zero-power fast assemblies related to the LMFBR program. This effort has involved the exposure of absolute fission chambers and of activation foils, to the MOL-ΣΣ central neutron field. Long term flux level monitoring accuracy of better than ± 0.5 percent in MOL-ΣΣ has been achieved. The perturbation of the neutron field by the access hole has been studied extensively. Uncertainties in measured reaction rates estimated by each laboratory relative to flux monitors are between ± 1.5 percent and ± 3.5 percent. Interlaboratory agreement for $^{235}$U, $^{238}$U, and $^{239}$Pu fission rates is in the range ± 0.5 to ± 1.3 percent. Poor agreement is obtained for the $^{238}$U capture rate measurements and further interlaboratory efforts are recommended including complementary experimental techniques. A set of ΣΣ preferred values of central fission rate ratios and uncertainties is presented.

Key words: eta; fissile nuclei; manganese bath; nu-bar: $^{252}$CF.

Measurements using the manganese bath technique are central to the discrepancy that has existed between measured values of $\bar{v}$ for $^{252}$CF. Manganese bath measurements of $\bar{v}$ belong to the lower group of values, while the $\eta$ measurements are consistent with the higher $\nu$ values. A three-part study was performed to see if the discrepancy could be explained by differences in manganese bath techniques: (1) A $^{252}$CF source previously calibrated by De Volpi was calibrated in the NTR manganese bath; (2) The
recommendations made by De Volpi for altering the MTR eta values were carefully considered, and (3) the results of the Monte Carlo calculations of the MTR experiment, carried out at Bettis Atomic Power Laboratory, were examined in detail. The study produced insignificant changes in the eta values.

**Key words**: fission spectrum; spectrum averaged cross section; $^{252}$U(n,f); $^{254}$Cf.

A measurement of the absolute $^{252}$U fission cross section for $^{254}$Cf spontaneous fission neutrons has been performed with two double fission chambers in compensated beam geometry. The fission chambers are mounted 10 cm apart on opposite sides of a small volume, single encapsulated $^{254}$Cf source ($4 \times 10^8$ n/sec, 0.34 cm$^3$ capsule vol. = 2 g steel and aluminum). In this geometry the effect of source position errors is small. The $^{254}$Cf neutron source strength was determined with a Manganous Sulfate bath relative to the internationally compared Ra-Be photon standard neutron source, NBS-I, presently known to ± 1.1 percent. Uncertainty in the Manganese bath comparison of NBS-I and the Cf source was ± 0.4 percent; the $^{252}$U fissionable deposit masses have been ascertained to ± 1.3 percent. Five scattering corrections were applied to the data: source capsule (0.6 ± 0.8) percent, fission chamber (1.1 ± 0.4) percent, support structure (0.6 ± 0.5) percent, platinum deposit backing (1.3 ± 0.8) percent and total room rotation (0.5 ± 0.2) percent. The observed $^{252}$U fission cross section is 1204 ± 29 mb. A computed value of 1245 mb is obtained using an evaluated $^{254}$Cf fission neutron spectrum and ENDF/B-IV for the $^{252}$U(n,f) cross section.

**Fission cross section ratios in the $^{238}$U neutron field** ($^{238}$U; $^{235}$U; $^{238}$Pu; $^{239}$Np), D. M. Gilliam, C. Eisenhauer, H. T. Heaton II, and J. A. Grundl, *SP425*, pp. 270-272 (Oct. 1975).

**Key words**: fission cross section; fission spectrum; $^{238}$U; $^{235}$U; $^{238}$Pu; $^{239}$Np.

In a $^{238}$Cf neutron field, ratios of spectrum-averaged fission cross sections have been measured by back-to-back counting in a double fission ionization chamber with interchangeable deposits of $^{235}$U, $^{238}$U, $^{238}$Pu, and $^{239}$Np. These ratio measurements provide integral tests for evaluated cross section data. The dominant error in the ratio measurements was the ± 1.4 percent to ± 2.1 percent uncertainty in the fissionable deposit masses. Redundant mass assay methods were employed for all deposit nuclides. Corrections of up to (1.4 ± 7) percent were necessary for inelastic scattering effects on the neutron energy distribution in the cases of $^{235}$U and $^{239}$Np. For $^{235}$U and $^{239}$Pu fission rates, a correction of (0.45 ± 0.20) percent was made for the contribution of neutrons moderated and back-scattered by laboratory structures. The cross section ratios observed in the present measurements were as follows: 1.000 ± 1.7 percent; 1.500 ± 1.6 percent; 1.105 ± 2.2 percent for $^{235}$U; $^{238}$U; $^{238}$Pu; $^{239}$Np, respectively. In comparison to the observed integral cross section ratios, the corresponding values derived from ENDF/B-IV data were 2.3 to 6.0 percent lower.

**Key words**: activity measurement; cross sections; fission spectrum; neutron source; scattering corrections; threshold detectors.

An open-air experiment for measuring cross sections averaged over the californium-252 spontaneous fission spectrum was described. In a low-scattering arrangement the $^{252}$Cf source was enclosed by the sample materials for irradiation. From the source strength ($3 \times 10^{18}$ n/sec as of Jan. 1973) and the activities of the generated nuclides, average cross sections for the reactions $^{251}$Al(n,p)$^{252}$Na, $^{245}$Ft(n,p)$^{245}$Mm, $^{245}$Ft(n,p)$^{245}$Mm, and $^{245}$Ft(n,p)$^{245}$Se were derived. The influence of neutron scattering in the source and samples has been taken into account by means of Monte Carlo calculations; in addition, this influence in the samples was studied experimentally by activating samples of various thicknesses.

**Key words**: gas scintillation transmission counters; neutron flux determination; 1 ≤ $F_n$ ≤ 30 MeV.

A flux detector system was developed in order to determine the fast neutron flux between 1-30 MeV obtained with the Karlsruhe isochronous cyclotron. The counter system represents a telescope-like proton recoil device using solid radiators and gas scintillation transmission counters. Flux determination is accomplished separately between about 1-6 MeV and ~ 5-30 MeV, with a small energy interval of overlap. Below 6 MeV, recoil protons are detected in a single gas scintillation chamber viewed by three photomultipliers requiring a fast coincidence. Above this range, high energy recoil protons are identified by coincidences in three adjacent chambers and by their specific energy losses. Since the transmission of the entire flux counter system is better than 99 percent, it can be used for simultaneous flux measurements in partial cross section determination. The accuracy for the determination of the neutron flux is about 5 percent.

**Key words**: evaluation; nuclear reactions $^{238}$U, $^{239}$U, $^{239}$Pu, $^{240}$Pu(n,F)$(n,n')$, $(n,n)$, $E = 0-1$ eV.

Evaluations have continued to better define the 2200 m/s nuclear data for the fissile isotopes. The author has been participating in such evaluations with both the International Atomic Energy Agency (IAEA) and the USAEC National Neutron Cross Section Center (NNCSC). Each study is faced with the same dilemma: the measured values of a given parameter form a set which is reasonably self-consistent, yet the average values of the interrelated parameters constitute a set which is significantly inconsistent. The obvious discrepancy is between the values of alpha deduced with high accuracy from irradiation experiments with the values which result from the ensemble of values of the other parameters which by themselves form a reasonably self-consistent set. However, the inconsistency could result from error assignments which are too small for two or more parameters, e.g., fission and eta. In order to expedite ENDF/B-IV, the NNCSC evaluation fixed certain input parameters including the thermal shapes which are in good agreement with differential data. As a result the least-squares-compromise adjusted absorption, fission, and nubar values by several tenths percent. In the IAEA evaluation, the primary adjustments of the LOQ fit were in nubar and g, values which implicitly infer significant systematic errors in the directly measured capture shapes. The Electric Power
Research Institute has initiated studies to attempt to resolve this dilemma which is crucial to analyses of fission power reactors. These are: (1) A simultaneous LSF fit to energy-dependent differential partial and total data; (2) A reevaluation of the accuracy assignment of absolute fission cross section values; and (3) A reexamination of irradiation alpha experiments with sophisticated analytical methods. Further experiments which would improve the knowledge of the thermal parameters include: (1) Confirmatory measurements of capture shapes extended to lower neutron energies; (2) Confirmatory measurements relative to the monoenergetic eta experiments; (3) Accurate coherent scattering amplitude measurements in the thermal region for all isotopes; (4) Measurement of the total cross section of $^{239}\text{U}$ from thermal to several tenths eV; (5) Improved thermal fission critical experiments and analysis for $^{239}\text{Pu}$; and (6) Confirmatory high accuracy absolute fission cross-section experiments.

Key words: Cf-252 spontaneous fission neutron yield; E = 0.0253 eV and 20 °C Maxwellian; fission-neutron yields; half-lives of U-233, U-234, Pu-239; mean energy of fission neutron spectrum; neutron cross-sections; neutron data evaluation; U-233, U-235, Pu-239, Pu-241; Westcott g-factors.

The paper presents a new consistent set of best values of 2200 m/s and 20 °C Maxwellian neutron cross-sections, fission-neutron yields, and Westcott g-factors for U-233, U-235, Pu-239, and Pu-241, and of related reference values such as the spontaneous fission-neutron yield of Cf-252, the mean fission-neutron spectrum energies of the five nuclides named, the α-decay half-lives of U-233, U-234, and Pu-239 and others.

This consistent set of values is derived from a multi-parameter least-squares fit of all available experimental data, after reviewing and, where feasible, reassessing the authors’ quoted values and errors usually after consultation with the authors.

The new best set of values is significantly different from that of the Second IAEA Review of 1969. The major changes are due to new lower experimental values of f (CF-252) and of half-lives. Also discussed are some disturbing unresolved discrepancies among experimental data, which leave the accuracies of some parameters, for example the uranium fission cross-sections, still unsatisfactory.

Key words: Au(n,γ); C(nα); H(nα); neutron flux determination; standard cross sections; $^3\text{He}(n,p)$; $^6\text{Li}(n,α)$; $^{10}\text{B}(n,α)$; $^{238}\text{U}(n,f)$; $^{257}\text{Np}(n,γ)$.

The recent worldwide advances in nuclear technology, particularly fast fission and fusion reactors, have revealed the need for accurate neutron reaction cross sections for the design of these systems. The accuracies of these cross sections are generally limited by the standard cross sections relative to which they are measured. With the exception of the hydrogen scattering cross section, there have been serious problems with each of the standards in the energy region where it is being used as a standard. New measurements of many of these standards have been recently completed which will have a strong impact on the quality of these cross sections. A review will be presented of the status of the neutron cross section standards presently employed for measurements of neutron cross sections. Light element, capture and fission standards will be included. Special emphasis will be placed on the techniques which have been used to obtain the neutron flux for measurements of neutron cross section standards.

Key words: cross sections; light elements; R-matrix; standards: $^7\text{Li}$; $^9\text{B}$.

The application of multilevel, multichannel R-matrix theory to the analysis of reactions in light nuclear systems is outlined. The discussion then specializes to describe analyses of reactions in the $^7\text{Li}$ and $^9\text{B}$ systems, which contain (n,α) cross sections widely used as neutron standards. Comprehensive R-matrix analyses which were incorporated in Version IV of the Evaluated Nuclear Data File (ENDF/B-IV) for neutron reactions from $^7\text{Li}$ and $^9\text{B}$ are described, giving the reactions and data analyzed, the resulting parameters, and predicted cross sections. The effects of new experimental information on the ENDF/B-IV results are discussed for both lithium and boron. Particular attention is given to the perplexing question of determining the $^7\text{Li}(n,α)$ cross section in the region of the 240 keV resonance. Suggestions for further experimental work are given.

Key words: computers; data; decay; ENSDF; evaluation; files; formats; levels; nuclear structure; radiations; reactions; tables; γ-rays.

The evaluated nuclear structure data contained in “Nuclear Data Sheets” are available in computer-readable form. Experimentally established properties of nuclear levels are included as well as radiations from nuclear reactions and radioactive decay. Portions of the data can be selected for distribution in several formats on magnetic tape or computer cards. A variety of different listing and drawing formats are also available.

Key words: evaluation; nuclear data; plutonium; uranium.

For the design and optimization of reactors a precise knowledge of the microscopic neutron data is needed. For this purpose new evaluations for a number of important fast reactor materials have been performed at this laboratory. In the paper we discuss reevaluations of $^{239}\text{U}$ and $^{240}\text{Pu}$. To check the quality of the presently evaluated data in reactor physics calculations, their effect on $k_{eff}$ for a large variety of critical assemblies is studied. Calculation shows that with the evaluated data for $^{239}\text{U}$, $^{240}\text{Pu}$, $^{238}\text{Pu}$, $^{239}\text{Pu}$, $^{241}\text{Pu}$, and $^{242}\text{Pu}$ the value of $k_{eff}$ for a large number of critical assemblies can be reasonably well reproduced without any adjustment of the data.

Key words: cross sections; energy distributions; photon; tertiary; theoretical.

Calculations are presented for the energy distributions of secondary particles resulting from neutron-induced binary and tertiary reactions on $^{28}\text{Si}$.  

68

Key words: capture cross section; elastic and inelastic scattering cross sections; evaluation; fission product; optical model; resonance cross section; statistical model; total cross section.

Evaluation of 28 fission product nuclear data for fast reactors is performed for total, capture, elastic scattering and inelastic scattering cross sections up to 15.0 MeV. Resonance parameters as well as the data of resonance integrals are surveyed. The cross sections reproduced with these parameters are adjusted so as to fit the thermal values and are connected smoothly with the cross sections obtained by the statistical model calculations. For some nuclides whose resonance parameters are not experimentally obtained yet, the statistical model calculations are carried out down to fairly low energy point. The cross section values thus obtained are used as the expectation values of averaged cross sections in the resonance region. Numerical data obtained are stored on the magnetic tape in the ENDF/B format.

Key words: evaluated half-lives; evaluated γ-ray intensities; ILRR program.

The half-lives and γ-ray intensities associated with radioactive decay have been evaluated for nuclides of interest to the Interlaboratory LMFBR Reaction Rate program. The results indicate that for most of the isotopes the decay parameters are known sufficiently well to meet the ILRR goals of 2 1/2 or 5 percent accuracy in reaction rate measurements.

Key words: fluorine; iron; photon; reaction; tertiary.

The code is used to calculate neutron-induced binary reaction, tertiary reaction and associated gamma-ray-production cross sections of 19F, 40Ca and 56Fe. Comparisons with experimental data show much improved agreements over those previously possible.

Key words: cross section; neutrons; nuclear model.

Previously, neutron cross sections in the MeV range for nuclei ranging in Z from 21 through 41 were calculated using a hybrid empirical-statistical model code THRESH. The formalism includes level density. Coulomb barrier, and competing reaction effects and has been useful in the prediction of unmeasured cross sections or normalized to point measurements to generate complete excitation curves. Reaction data up to 20 MeV in the Z range 21 through 83 are used to refine the model and extend its range of validity. A least squares fitting technique optimizes the choice of parameters with the resulting matrix used to determine parameter uncertainties and correlations. Fitted cross sections and their calculated uncertainties are compared with measurements and quoted errors. A range of uncertainty is assigned to predicted cross sections.

Key words: level densities and positions of K-bands in rare earth and actinide nuclei.

Level densities for the rare earth and actinide nuclei have been calculated using a modified version of the Ericson formalism. The assumption was made, that K (the projection of J on the symmetry axis of the nucleus) is a good quantum number in the compound nucleus. Individual level densities for the different (KJ) values of the compound nucleus formed by low energy neutron interactions were calculated. The results show good agreement with the interpretation of recent results obtained on U-235 in this laboratory. Using the above calculations it is also possible to infer from the measured level densities the positions of the band heads of different K bands in the compound nucleus. The results also indicate that the K bands responsible for the level densities exclude the ground state rotational band. Levels built on the higher lying β and γ vibrational bands and their composites are sufficient in number to explain the observed level densities.

Key words: doorway states, optical model; neutron strength function.

Systematic fluctuations are reported for the s-wave neutron strength functions of adjacent mass target nuclei with odd and even neutron number. Within the 3S and 4S single-particle resonances, the fluctuations appear to be related to odd-even variaions in the doorway state density which are correlated with the excitation energy. A simple model calculation successfully reproduces the strength function fluctuations in the first peak of the split 4S resonance (143 ≤ A ≤ 160). An examination of all available even-Z strength function data suggests a general trend; S-odd > S-even near single-particle resonances and S-even > S-odd between resonances. This result is discussed in terms of the optical model spreading width W and other fundamental nuclear properties.

Key words: actinide nuclide; fast-neutron-induced fission; fission; fission fragment; fission product; kinetic energy; mass yield; prompt neutron; scission point; statistical theory.

Making use of a model based on the statistical theory in which the scission-point distance is treated as an adjustable parameter, calculations were performed to obtain the mass yields of fission products, the kinetic energies of fission fragments and the numbers of prompt neutrons from neutron-induced fission of 232Th, 235Pa, 238U, 239U, 238U, 237Np, 239Pu, and 241Pu for incident-neutron energies ranging from thermal to 14.7 MeV. Calculated results reproduced experimental values well. The proposed method could be used in the estimation of unknown physical quantities in fission.

Key words: calculations; complex interaction; semi-direct model; volume form; (n,γ) cross sections.

The knowledge of the correct values of (n,γ) cross sec-
tions for high energy neutrons is of great interest for studies into nuclear reaction mechanisms as well as for reactor shielding purposes and in particular fusion-reactor design. The use of theoretical estimates is therefore required to fill the gaps in the available experimental data. For this purpose the semi-direct capture model has been refined (a) by replacing the previous surface form factors of the interaction by volume form factors, (b) by including quadrupole terms in addition to the dipole ones. Calculations, based on the refined model, agree satisfactorily with experimental data.

Key words: angular distribution; inelastic scattering; proton emission; scattered neutron.

Measured cross-sections of 14 MeV-neutrons scattered inelastically on \(^{56}\)Fe are analyzed to carry out investigations about the reaction mechanism. It is shown that a considerable part of direct inelastic scattering has to be added to the evaporation and pre-equilibrium processes in order to reproduce the data, especially the angular distribution, for energies of the scattered neutron above 7 MeV.

Key words: calculated \(\sigma(E)\), (n,\(\alpha\)), (n,\(\alpha\)) Hauser-Feshbach; nuclear reactions Fe group.

The Hauser-Feshbach statistical model is used to calculate (n,\(\alpha\)) and (n,\(\alpha\)) cross sections for Fe-group elements to provide information on helium production within fusion reactors. A parametrization of the cross sections is discussed.

Key words: bound level parameters; spin assignments; thermal cross sections.

A parametric fit to the total cross section of Sc-45 based on the Breit-Wigner multilevel formalism was carried out. To reproduce the minimum in the total cross section at 2.0 keV and to get an acceptable fit for the low energy resonances, the spins of the bound level, the 3.24, and 4.27 keV resonances are 4.34 respectively. At higher energies the spins adopted for the resonances at 6.5, 7.9, 8.9, and 11.7 keV were 3.43.4. The parameters of the bound level are \(E_a=-270\) eV, \(\Gamma_a=2.05\) eV (J = 4) and \(\Gamma_\gamma=0.38\) eV.

Key words: nuclear reactions: Al, Si, \(^{40}\)Ca, \(^{54}\)Cr, \(^{90}\)Zr, \(^{138}\)Ba(\(n,\gamma\)), \(E_a>2.5\) keV, measured \(\sigma(n,\gamma)\), \(^{6}\)Li monitor, enriched targets, deduced resonance parameters, correlation coefficient, valence component.

High resolution neutron capture cross section measurements have been made at the Oak Ridge Electron Linear Accelerator on Al, Si, \(^{40}\)Ca, \(^{54}\)Cr, \(^{90}\)Zr, and \(^{138}\)Ba for the energy range above 2.5 keV. These data have been analysed at Lucas Heights where capture measurements with Ge(Li) and Moxon-Rae detectors have provided complementary information. While valence model calculations are important for these nuclides in explaining the shape of the \(\gamma\)-ray spectra and the observed correlation between reduced neutron and radiative widths, the valence component cannot adequately account for the observed radiative widths and a substantial single particle component, uncorrelated with neutron widths, is required.

Key words: analysis; cross sections; evaluation; information; processing; radiation; shielding.

Activities developed at the Radiation Shielding Information Center (RSIC) play an important role in the utilization of nuclear cross sections in various radiation transport applications and help improve the general utility of the national ENDF/B effort. The activities involving processed and evaluated data libraries on behalf of RSIC's various sponsoring agencies are described.

Key words: capture; chromium; cross section; evaluation; neutron; resonance.

Experimental results are examined. An extensive comparison of recent sets of results allows a point-wise evaluation of the capture cross section versus energy. Moreover a set of resonance parameters has been chosen. The curve calculated with these parameters and a smoothly varying background agrees pretty well with the point-wise evaluation.

Key words: cross sections; ENDF/B; neutrons; reactors; resonances; unresolved.

We discuss some limitations of the statistical approach to the representation of cross sections in the unresolved region and suggest that the actual Doppler-broadened cross sections should be used instead.

Key words: benchmark; cross sections; helium; neutron.

Comparisons of integral helium production measurements with predictions based on ENDF/B Version IV cross sections have been made. It is concluded that ENDF/B helium production cross section file should be established in order to ensure a complete and consistent cross section evaluation to meet accuracies required for LMFBFR, CTR, and LWR applications.

Fast reactor fission yields for \(^{238}\)U, \(^{239}\)U, \(^{240}\)U, \(^{241}\)Pu, and recommendations for the determination of burnup on FBR mixed oxide fuels. W. J. Maeck, SP425, pp. 378-384 (Oct. 1975).

Key words: burnup monitors; capture-to-fission; dilution mass spectrometry; fast fission yields; yields vs. energy; \(^{238}\)U, \(^{239}\)U, \(^{240}\)U, \(^{241}\)Pu.

Absolute fast reactor fission yields are presented for over 40 stable and long-lived isotopes of Kr, Rb, Sr, Zr, Mo, Ru, Sh, Xe, Cs, Ba, La, Ce, Nd, and Sm for \(^{238}\)U, \(^{239}\)U, \(^{240}\)U, and \(^{241}\)Pu irradiated in EBR-II. A method for ordering fission yields as a function of neutron energy is given. Recommendations for the determination of burnup on mixed-oxide fuels irradiated in a fast reactor are given.

Effects of nuclear data uncertainties upon LMFBR fuel cycle

Key words: breeding ratio; cross section uncertainties; equilibrium cycle; fuel cycle; reactivity swing; sensitivity study.

Fuel cycle sensitivity calculations have been performed to determine the effect which nuclear data uncertainties have upon the long term properties of a typical LMFBR. These effects are assessed by direct comparison of a series of fuel cycle calculations which evaluate the approach to equilibrium conditions. The effects of uniform cross section adjustments (for the fission and capture cross sections for $^{235}$U, $^{239}$Pu, $^{240}$Pu, and $^{241}$Pu) upon the fuel cycle characteristics, including breeding ratio, doubling time, power distribution, fissile loading, fissile mass discharge rates, control requirements and reactivity swing are presented for the initial burn cycle and the equilibrium cycle. ENDF/B-3 data are used for a data reference. Several of the cross section modifications produced significant uncertainties in LMFBR design parameters. The effects of these changes upon the fuel cycle characteristics propagate from cycle to cycle but, in general, do not increase with time. The most significant effects were produced by uncertainties in $\sigma_f$ for $^{239}$Pu and $^{241}$Pu, and $\sigma_r$ for $^{235}$U. Uncertainties in these cross sections produce large changes in control requirements, breeding potential, and reactivity swing.

Key words: critical assemblies; ENDF/B-IV; fission spectrum; inelastic scattering; sensitivity; $^{239}$Pu.

The fission spectrum and the inelastic scattering spectrum of ENDF/B-IV $^{239}$Pu data were modified. The variations of $k_{eff}$ and of the leakage spectrum induced by these modifications were calculated for a bare $^{239}$Pu critical sphere, as a typical metallic assembly. In certain cases these modifications lead to substantial variations in $k_{eff}$. Guides for reasonable changes in the representation of the spectra were obtained. The variations in $k_{eff}$ and in the leakage spectrum caused by these reasonable changes were found to be within their experimental errors.

Key words: calculation; comparison; Doppler broadening; line shape.

Key words: burnup calculation; burnup model; critical boron concentration; fission products; KWO; RSYST.

An effort was made to reproduce the measured shape of the critical boron concentration for the KWO reactor (PWR) during the first cycle starting from basic nuclear data (ENDF/B1). The overall results are quite satisfactory but there are some local differences up to 80 ppm.

Key words: cumulative yields; delayed-neutrons; fission products; half-lives; independent yields; mass spectrometry.

A Spectrometer for On-Line Analysis of Radionuclides (SOLAR) has been installed at a 1 MW TRIGA reactor at Washington State University. Fission product ions from a combination target/ion source located within the thermal column are brought out to a 60° magnetic sector mass spectrometer. Surface ionization provides copious beams of $\text{Br}^+$ and $\text{Cs}^+$ ions and less intense beams of $\text{Br}^-$ and $\text{I}^-$ ions with negligible contamination by other elements. About 40 fission product nuclides can thus be chemically and physically separated in times of less than 1 second. Past results on independent and cumulative fission yields along with measurements of half-lives of some very neutron-rich nuclides will be presented. Current work on delayed-neutron emission probabilities and energy spectra of delayed neutrons from individual nuclides will be described.

Key words: adjustment; critical assemblies; cross sections; evaluation; integral data; sensitivities; uncertainties.

The ENDF/B-4 cross sections of the principal isotopes of U and Pu are adjusted by critical-mass data on 15 metallic assemblies. Only very minor cross-section modifications are needed in order for neutronic calculations to reproduce the integral data well within their experimental errors. The nature of the adjustments and the quality of the input integral data are discussed.

Key words: ilmenite concrete; Monte Carlo; neutron attenuation; time of flight.

Energy distributions of neutrons transmitted through slabs of normal (density = 147 lb/ft$^3$) and ilmenite loaded (240 lb/ft$^3$) concretes have been obtained using time of flight methods, for concrete thicknesses increasing in 3 inch steps from 0 to 18 inches. The incident spectrum was a photonorium continuum from aluminium irradiated with 35 MeV bremsstrahlung, and was generally similar to a fission neutron spectrum.

The measured distributions are compared with the results of a Monte Carlo calculation, and agree well with the experimental errors. Results from the calculations are used to extrapolate to greater thicknesses and other ilmenite concrete densities.

Analysis of the BNL ThO$_2$, $^{233}$U exponential experiments, D. Dabby, \textit{SP}245, pp. 415-418 (Oct. 1975).

Key words: cross sections: ThO$_2$ resonance integral; $^{233}$Th; $^{232}$U.

The BNL ThO$_2$-3 w/o $^{233}$U light-water-moderated exponential experiments were analyzed to evaluate (1) cross section library sets for $^{233}$U and $^{232}$Th, and (2) correlations with measured ThO$_2$ resonance integral data. A total of six cross section library sets were evaluated, including ENDF/B-2 and ENDF/B-3 libraries for $^{232}$Th, ENDF/B-2 library for $^{233}$U, and ThO$_2$ resonance integral correlations based on data by Weitman and Pettus, Hardy and Palowitch, and corrections to the latter data by Steen. A modified version of the LEAPARD code was used throughout this analysis. The principal results of this work are as follows: (1) The library set containing ENDF/B-2 data for $^{233}$U and ENDF/B-3 data for $^{232}$Th, together with ThO$_2$ resonance integral correlation based on Steen's corrections to the Hardy and Palowitch data, yields the best agreement with measurements, giving an average $k_{eff}$ of 0.9975 with a standard deviation of 0.0067 for the 21
analyzed configurations. (2) With respect to this "best" set, the ENDF/B-2 = Th data is less reactive than the corresponding ENDF/B-3 data by 0.14%k. (3) The ThO₂ resonance integral correlation based on data by Weitman and Pettus yields resonance integrals that are consistently higher than those produced by the correlation with Steen's values, even though the latter is normalized to an infinitely dilute resonance integral of 85.9 barns (0.5 eV cutoff), while the former is normalized to a corresponding value of 80 barns. Thus, with respect to the "best" set, the ThO₂ resonance integral correlation based on the Weitman and Pettus data is less reactive by ~0.75%k.

Key words: cross sections; linearization; paging; pre-processing; relative error; thinning.

Criteria of importance to the generation of linear cross section tabulations are presented. Algorithms for reducing or thinning such tables within a desired accuracy criterion and the implementation of paging techniques for efficient utilization of large data tables are reviewed.

Key words: high plutonium productivity; moderation-jacket in blanket; thermal boosts.

It is shown that the productivity of a blanket can be substantially improved by introducing a "moderation-jacket" around the inner blanket facing the fast core. The operational procedure and the expected significance of the jacket are investigated. For a flux level similar to that of EBR-II, it is shown that one can shorten the plutonium production time by 34.5 percent for 0.7 percent plutonium density buildup and 15.4 percent for 1.5 percent plutonium density buildup. The overall time saving is about 100 days per recycling from density buildup of 0.7 to 2.0 percent.

Key words: application of nuclear cross section; Monte Carlo method; 14 MeV neutron shielding.

A neutron generator shielding house, in which a 14 MeV neutron generator with a 4π yield of 1 × 10¹³ neutrons per second is installed, was built with labyrinth geometry and made of ordinary concrete and paraffin block. Rough estimation for fast neutron flux in a direction directly above the neutron generator target, but outside the shielding layers, is 7.7 × 10¹² n/cm²-s, which was resulted from the approximation that for 14 MeV neutrons the flux is reduced by a factor of 10 for each 15 inches of solid concrete, or for each 8.2 inches of paraffin wax, disregarding the effect of scattering from the surrounding shielding materials. In order to take the geometrical effect of the shielding into consideration, a computer program, FORTRAN IV, was devised for calculating the neutron flux at the same location, using the Monte Carlo technique in a simplified 1-dimensional diffusion of neutron through the shielding layers. The result of this calculation was about 10⁻¹ n/cm²-s, in good agreement with the result of measurement using a BF₃ counter.

Key words: cross section sensitivity; gamma ray; neutron; transport calculations.

Time dependent neutron and secondary gamma-ray transport calculations for 14 MeV and fission sources were performed in air-over-ground geometry utilizing cross sections from the DNA working cross section library. These calculations were compared with earlier calculations which have been widely used in weapon effects studies. Several significant differences were found attributed to the different cross sections used in the calculations.

Key words: air transport; cross sections; neutrons; nitrogen; sensitivity calculation.

The sensitivity of the transport of 14-MeV neutrons in sea level air to uncertainties in the ENDF/B-II-III values of the various nitrogen cross sections has been calculated using the correlated sampling Monte Carlo neutron transport code SAMPXEP. The source consisted of a 14.0 to 14.9-MeV band of isotropic neutrons and the fluences (0.5 to 15.0 MeV) were calculated at radii from 50 to 1500 metres. The maximum perturbations, assigned to the ENDF/B-II or base cross section set in the 6.0 to 14.5-MeV energy range were: (1) 2 percent to the total, (2) 10 percent to the total elastic, (3) 40 percent to the inelastic and absorption and (4) 20 percent to the first Legendre coefficient and 10 percent to the second Legendre coefficient of the elastic angular distributions. Transport calculations were carried out using various physically realistic sets of perturbed cross sections, bounded by evaluator-assigned uncertainties, as well as the base set. Results show that in some energy intervals at 1500 metres, the differential fluence level with a perturbed set differed by almost a factor of two from the differential fluence level with the base set.

Key words: cross section; fission neutrons; inelastic scattering; iron; minima; Monte Carlo.

Using Monte Carlo Method, we are able to study the mechanisms of neutron transport in natural iron and their relations to the cross section properties. Fission neutrons in 15 MeV to 10 keV range are discussed. It is concluded that the low energy spectrum exiting from a small bare sphere is particularly sensitive to inelastic cross sections near the threshold. For larger, and for reflected spheres, inelastic scattering plays a much less important role. At distances of practical significance (< 1 meter) it is found that transport in the regions of cross section minima, while significant, does not provide dominant channels in determining the penetrating neutron spectra.

Key words: gas-cooled fast breeder reactor; neutron-coupled gamma-ray cross sections.

The generation, application, and testing of neutron-coupled gamma-ray cross sections required for Gas-Cooled Fast Breeder Reactor shield analysis are described.

Key words: cross section; interpolation; Monte Carlo; probability; resonance; thinning; unresolved.

Improvements in the methods used to represent cross sections in the data library for the Monte Carlo code VIM are discussed. The degree to which observed difficulties have been eliminated and the reliability of the current VIM library based on ENDF/B Version 3 data are illustrated by comparison of broad-group cross section calculations made by VIM and by ETOE-2/MC-2.

Key words: benchmark; cross section; eigenvalue; Monte Carlo; multigroup; reactor; resonance; slowing-down; stochastic; transport.

A comparison of solutions by the Monte Carlo code VIM and by ETOE-2/MC-2 of a zero-dimensional slowing-down problem in the homogeneous ZPR-6 Assembly 7 core composition demonstrates the ability of either code to provide a reliable computational benchmark capability for such calculations.

Key words: CRBR; decay heat; ENDF/B-IV fission product; LMFBR; ORIGEN.

Recently evaluated ENDF/B-IV fission product data have been used in decay heat calculations for typical LMFBR fuel assemblies exposed to 100,000 MWD/MT burnup. The decay heat and radioactivity of the fuel assemblies have been calculated as a function of time from discharge. Important contributors to the decay have been identified.

Key words: cross section; sensitivity; shield; two dimensional.

A cross section sensitivity analysis of iron in a family of concrete shields is performed to illustrate the dependence of the cross section sensitivity to the spatial distribution of reinforcing steel. The results of this study demonstrate that one dimensional sensitivity methods can be inadequate for multidimensional problems.

Key words: benchmarks; data testing; GCFR; integral measurements.

Measurements of reaction rate ratios and neutron spectra in GCFR benchmark lattices are described. An important feature of the lattices is that rod fuel elements are included. Several data sets have been tested against the experiments and deficiencies indicated.

Key words: Anger positron camera, lung function; radioactive tracers.

Radioactive nitrogen, oxygen and ozone have been used for dynamic lung-function studies on live dogs with an Anger positron camera. In particular an attempt was made to determine the feasibility of this method to study early functional changes caused by ozone.

Key words: cross sections; pion; star formation.

Through the use of a simple model in which true absorption of a pion in flight by a nucleus is treated analogously to collisional broadening in optics, the energy dependent mean free path for star formation in water is calculated. Besides the absorption cross section, the cross sections for elastic and inelastic scattering are presented.

Key words: analysis by Monte Carlo; angular dependence; deep penetration of neutrons in Fe + H shield; measured neutron spectra; shielding, 238U(p,xn), E0 = 800 MeV.

Measurements were made to check: (a) calculation of the neutron flux produced by 800-MeV protons on a cylinder of depleted uranium, and (b) computations of the energy-dependent neutron flux, as a function of thickness for a rectangular shield surrounding the target. A proton recoil spectrometer was used to measure neutron fluxes from the shield between 300 keV and 7 MeV. Agreement has been obtained between the proton recoil data and Monte Carlo calculations for shields composed of steel and gypsum for thicknesses between 0.48 and 1.37 m. Agreement is good at most angles for energies above 1 MeV.

Key words: activation; Apollo; background; computation, decay-schemes; cross-sections; scintillators; spacecraft; gamma-rays; spallation.

A calculation is outlined which predicts energy-loss spectra observed in detector materials due to the decay of radioactive nuclides which are produced by particle irradiation in spaceflight. The input decay schemes and cross-section requirements are described. Examples are given from the Apollo gamma-ray spectrometer experiments.

Key words: air particulate matter; proton scattering; quantitative analysis.

Proton scattering has been applied to the problem of elemental quantitative analysis of air particulate matter. Elements up through chlorine may be resolved using 16 MeV protons incident upon targets up to about 1 mg/cm² in thickness. Using the FSU Super FN Tandem Accelerator and a large area solid state proton detector, an analysis can be performed in several minutes. Combination of this technique with proton induced x-ray emission analysis provides a means of quantitative analysis for all elements. These accelerator based methods are being applied to studies of the composition of air particulate matter in diverse locations such as St. Louis, Mo.; Los Angeles, Ca.; several cities in Florida; and Bermuda.

Key words: depth; deuterium; diffusion; elastic; helium; migration; oxide; proton; range; scattering.

A proton elastic scattering technique is described which makes possible direct accurate depth profile measurements of light element isotopes (deuterium, tritium, helium, etc.) in metal or insulator hosts. Several examples of the application of this technique to current problems are given in the fields of energy research and neutron generator target evaluation.

Key words: E=800 MeV: isotope production; La,Mo,V(p,spallation); measured a; nuclear medicine; nuclear reactions.

The intense beam of medium-energy protons (600 to 800 MeV) from the LAMPF accelerator will be used to prepare multi-cure quantities of radioisotopes of value in diagnostic and therapeutic nuclear medicine. Thin-target cross section measurements of spallation-induced reactions represent a significant segment of the LASL Medical Radioisotope Research Program, as these data provide a basis for calculating specific radioisotope yields in thick targets, evaluating potential isotopic interferences, and monitoring hot-cell operations. Recent measurements include the cross sections (cumulative yields) of \(^{131}\text{La},^{127}\text{Xe},^{98}\text{Sr},\text{and}^{90}\text{K}\) formed in the interaction of 800-MeV protons with La, Mo, and V targets; they are reported to be 51±3 mb, 51±7 mb, 24.5±0.8 mb, and 5.4±0.3 mb, respectively. Comparison with previous results at 590 MeV are made, and quantity and product quality estimates are presented for biomedical isotopes under the irradiation conditions expected to prevail at LAMPF.

Key words: analysis; application; concrete; feasibility; gamma rays; neutrons.

A technique has been developed which employs two neutron sources (\(^{232}\text{Th}\) and \(^{238}\text{U}\)) and three NaI(Tl) detectors to determine the H, Ca, Si and C content of calcareous aggregate concrete in its plastic state. These elements are indicative of the water, cement, fine aggregate and coarse aggregate components which along with air entrainment are key factors in strength determination. Results are presented which demonstrate the feasibility of the technique for analysis of typical samples in a total time of the order of 10 minutes.

Key words: industrial gauging; isotopes; Monte Carlo calculations; multiple scattering.

We use nuclear isotopes for gauging and control of industrial products. The use of recycled materials have made paper, steel, plastic, etc., into ever-changing composite media, forcing us to update calibrations empirically. This paper lists those areas of research that would benefit our work. Specifically, we need: differential cross sections for electrons scattered from most common elements, as a function of energy below 3.6 MeV; Monte Carlo calculations that simulate isotopic sources (Kr-85, Sr-90/Y-90) interacting with common materials; phenomenological models or empirical expressions that codiess scattering formulations and Monte Carlo results into forms usable for gauge design.

Key words: astrophysical production of Li, Be and B; E=45-100 MeV; E=74, 1.5; nuclear reactions \(^{11}\text{C}(p,l)\).

Cross sections for the production of mass 6 to 11 isotopes from proton spallation of carbon targets have been measured at bombarding energies of 45, 55, 60, 65, 75 and 100 MeV. The results of these measurements and similar studies by other groups are used to test theories of Li, Be and B nucleosynthesis. The measured abundance ratios for \(^{6}\text{Li}/^{9}\text{Li},^{10}\text{B}/^{9}\text{B},^{7}\text{Li}/^{9}\text{Be}\) and \(^{11}\text{B}/^{10}\text{B}\) can be reproduced using measured cross sections and models which propose interstellar proton fluxes \(\phi(E)\) of the form \((m_{\text{p}}C^{2}+E)^{-2}\), \(E^{-\gamma}\) (\(\gamma = 1.5-2.0)\) or \(E^{-3}\) for \(E > 30\) MeV. If a substantial amount of \(^{11}\text{Li}\) is synthesized via some other source. The cross sections for formation of \(^{6}\text{Li},^{7}\text{Be}\) and \(^{11}\text{B}\) are also of importance because of possible high LET effects in biological material exposed to cosmic radiation. Our measurements are compared with calculated cross sections that have been used to estimate LET effects.

Key words: cross sections; excitation function; proton; rhenium.

The production cross reaction of long lived isotopes produced by proton bombardment of rhenium has been measured between 15 and 160 MeV. A set of stacked graphite disks impregnated with rhenium was used as a target. The data have been used to calibrate a high temperature graphite thickness gauge.

A need for \((p,n)\) cross sections for selected targets at lower energies, H. S. Aebi, SP425, pp. 512-515 (Oct. 1975).

Key words: acceleration mechanisms; neutrons; nuclear reactions; protons; solar flares.

We have argued elsewhere that protons of energy \(< 10\) MeV are probably accelerated, in the active regions on the sun, for several days, following a solar flare. These protons must undergo nuclear interactions with the constituents of the solar atmosphere producing, among other things, neutrons. Being electrically neutral the neutrons are not affected by the solar or interplanetary magnetic fields. So they should be observable when the active regions lie on the earth-sun line. No solar neutrons have been detected so far. We think that the reason for this null-result is that the energy response of most of the detectors used, peaks at too high an energy (\(< 100\) MeV). Recent discovery of solar deuterons indicates that the solar neutrons probably have lower energies. They are probably produced in \((p,n)\) reactions involving C,N,O,Ne,Mg,Se,Si,Sc,Fe, etc. The available cross sections, in the energy range 3.4 MeV to 30 MeV, certainly bear out this expectation for Fe. The cross sections for some other elements are as yet unknown. Our conclusions are presented and the urgent need for the determination of the \((p,n)\) cross sections for other elements is discussed.
The measurement of thermal neutron constants of the soil; application to the calibration of neutron moisture gauges and to the pedological study of soil. P. Couchat, C. Carre, J. Marcese, and J. Le Ho, *SP* 245, pp. 516-519 (Oct. 1975).

Key words: calibration; neutron moisture gauge; pedology; soil; thermal neutron constants.

The neutronic method for measuring the water content of soils is more and more used by agronomists, hydrogeologists, and pedologists. On the other hand the studies on the phenomena of slowing down and diffusion process have shown a narrow relation between the thermal absorption ($\Sigma_\alpha$) and diffusion ($\Sigma_\delta$) constants and the thermal flux developed in the soil around a fast neutron source like Am-Be. Then, the authors present two original applications of the direct measurement of $\Sigma_\delta$ and $\Sigma_\alpha$.

The method described consists in the measurement, in a cube of graphite with an Am-Be source in the middle, on one side of the perturbation of the thermal flux, obtained by the introduction of 300 g of soil, and on the other side of the transmitted thermal flux measured through the same sample of soil, on a side of the cube.

After calibrating the device, these two parameters give $\Sigma_\alpha$ and $\Sigma_\delta$ which are easily introduced in the calibration equation of neutron moisture gauge. Also these two values are useful for the pedologists because $\Sigma_\alpha$ is connected to clay content in the soil and $\Sigma_\delta$ is connected to the type of clay by the way of rare earth contents.

Key words: activation cross-section; bone mineral; in vivo neutron-activation analysis; therapy.

Nuclear data is used in modern medicine in a myriad of ways. Activation cross sections are used in the calculation of radioisotope production rates for both neutron and charged particle activation. The radioisotopes so produced are used in diagnostic nuclear medicine for the early detection of disease and for therapy either by external radiation or by internal radiation. The calculation of radiation dose from externally administered radioisotopes involves a knowledge of the decay scheme, mode and energy of decay, internal conversion coefficients, x-ray fluorescent and Auger electron yields. The decay scheme of radioisotopes including parent-daughter equilibria is essential knowledge for their accurate assay and for the understanding of radioisotope generators. Range-energy relationships for neutrons of various energies, charged particles, gamma-rays and electrons are also necessary for therapy and dose considerations. Applications to in vivo neutron activation analysis and photon absorptiometry for bone mineral measurement are also considered. An attempt is made to briefly describe these applications and to point out where more basic nuclear data measurements would be helpful.

Key words: dosimeter; radiography; radiotherapy; tissue.

Over 400 patients have been treated with fast neutrons from a cyclotron at Hammersmith Hospital, London, using 16 MeV deuterons on beryllium. A large variety of malignant disease is included in this trial. A randomized trial of fast neutron therapy for cancer of the mouth and throat is in progress and preliminary results will be given. Fast neutron radiographs are often taken to check the positions of the fields used on the patients. These show no contrast from bone, but demonstrate only the presence of gas-filled cavities. As a diagnostic method, fast neutron radiography suffers from a number of disadvantages, the main ones being lack of sensitivity of the image-forming system and the hazard to the patient due to a large quality factor. Estimation of the absorbed dose given to different types of tissue is an important factor in the medical use of fast neutrons. More data are needed on the processes whereby fast neutrons impart energy to matter, particularly for neutrons above 15 MeV.

Key words: absorbed dose; cell survival, heavy particles, OER; radiotherapy.

The extent to which transport calculations of biomedical interest for negatively charged pions, neutrons, protons, alpha particles, and heavier ions can presently be performed is reviewed.

Key words: cosmic-ray reactions; lunar chemistry; lunar y-rays; neutron capture; nonelastic scattering.

Chemical compositions of the surfaces of the moon and certain planetary bodies can be determined by orbital gamma-ray spectroscopy. The major sources of y-ray lines (and radionuclides) in the moon are the decay of the primordial radioelements (U, Th, and 40K) and nuclear reactions induced by the bombardment of the moon by cosmic-ray particles. The major cosmogenic y-ray lines are produced by neutron nonelastic scattering and neutron capture reactions. The fluxes of y-ray lines expected from the moon for each major source have been calculated. Gamma-rays from the moon were measured by y-ray spectrometers during the Apollo 15 and 16 missions. The preliminary analysis of the data show that O and Si vary little over the moon's surface, that Mg, Fe, and Ti have higher concentrations in the maria than in the lunar highlands, and that the radioelements are significantly more abundant in and near the western nearside maria than in the rest of the moon.

Key words: fission; measurement; ratio; 235U.

We have measured the ratio of the 235U fission cross section to the 6Li(n,α) reaction for neutron energies from thermal to 1 MeV. This experiment is the third in a series which is designed to measure the relative fission cross section of 235U from thermal to 20 MeV. The first two experiments covered the energy range from 0.8 to 20 MeV, and used the n,p scattering reaction to measure the energy dependence of incident flux.

The average number of prompt neutrons, $\bar{N}_p$, from neutron induced fission of 235U between 0.2 and 1.4 MeV. F. Käppeler and R. E. Bandel, *SP* 245, pp. 549-552 (Oct. 1975).

Key words: $\bar{N}_p$ = 0.2-1.4 MeV; fast time-of-flight technique; number of prompt fission neutrons; 235U.

For the clarification of existing discrepancies in the energy dependence of $\bar{N}_p$ for 235U an experiment was performed which was based on a method independent of current techniques. A considerable reduction of background and correction problems was achieved by renouncing on an absolute measurement. Thus the resulting systematic uncer-
tainty was 0.6 percent. In the energy range between 0.2 and 1.4 MeV the shape of $F_p$ was measured at 22 points in steps of 50 keV with an average energy resolution of 3.3 percent. Repetition of several runs with modified experimental conditions ensured the consistent reproduction of the results. It was found that $F_p$ of $^{235}$U shows distinct deviations of up to 2 percent from a linear energy dependence.

Monte Carlo analysis of direct measurements of the thermal eta (0.025 eV) for $^{235}$U and $^{238}$U, J. J. Ullo and M. Goldsmith, SP425, pp. 553-556 (Oct. 1975).

Key words: E = 0.25 eV; eta; fission neutrons per absorption; nuclear reactions; $^{239}$U; $^{235}$U.

In support of the LWBR program, the manganes bath measurements of eta of $^{235}$U and $^{238}$U at 0.025 eV were analyzed using Monte Carlo methods. The calculated values of eta, including statistical, cross-section, and experimental uncertainties, are $\eta^{235} = 2.2993 \pm 0.0082$ and $\eta^{238} = 2.0777 \pm 0.0064$. The systematic corrections to the experiments were also studied in detail.

Key words: E = 0.0253 eV; eta; fission neutrons per absorption; nuclear reactions; $^{235}$U; $^{238}$U.

Monte Carlo analysis of the ORNL manganese bath measurements of eta of $^{235}$U and $^{238}$U at 2200 m/sec yields: $\eta^{239} = 2.3019 \pm 0.0086$ and $\eta^{235} = 2.0746 \pm 0.0078$. The analysis was confirmed by calculating measured quantities used by the experimentalists in their determinations of $\eta^{239}$.

Key words: $\gamma_1$, $\gamma_{1.5}$, $\gamma_{1.75}$; $^{240}$Pu(n,f); 500 to 10 000 eV.

The neutron subthreshold fission cross section of $^{240}$Pu has been measured from 500 eV to 10 000 eV using the Oak Ridge Electron Linear Accelerator neutron facility. A total of 82 fission widths were obtained from area and shape analysis of those resonances which define the class II states at $\approx 782$ eV, $\approx 1406$ eV, $\approx 1936$ eV, and $\approx 2700$ eV. The average square of the coupling matrix element for the first three class II states is $4.08 \pm 1.63$ eV². The average class II fission width is $2.47 \pm 0.96$ eV. Approximately 22 clusters of class I resonances were observed below 10 keV, which results in a value of 450 $\pm$ 50 eV for the average class II level spacing. Assuming parabolic inner and outer barriers, the following barrier parameters were obtained: $V_1 - B_0/h\omega_0 = 0.59 \pm 0.06$ and $V_2 - B_2/h\omega_0 = 0.54 \pm 0.006$.

Measurement of the $^{239}$Pu fission cross-section and its ratio to the $^{235}$U fission cross-section in the energy range from 1 keV to 1 MeV, D. B. Gayther, SP425, pp. 564-567 (Oct. 1975).

Key words: cross-sections; fission; measured; neutrons; 1 keV $\rightarrow$ 1 MeV; $^{239}$Pu; $^{235}$U.

The cross-section for the $^{239}$Pu(n,f) reaction has been measured on the Harwell 45 MeV linac using the time-of-flight method. Fission events were recorded by detecting the prompt neutrons and the incident neutron flux spectrum was measured with a detector which was calibrated against two standard detectors. The cross-section was normalized in the 10 to 30 keV energy interval to agree with the recent evaluation of Sowerby et al. Comparison with this evaluation shows agreement to within 5 percent at energies above a few keV. The agreement with the ENDF/B-IV evaluation is generally within 4 percent throughout the complete energy range. A similar comparison is made for the ratio of the $^{239}$Pu and $^{235}$U fission cross-sections, obtained from the present measurement, and a previously published measurement of the $^{235}$U(n,f) cross-section made with the same equipment.

Key words: cross-sections; fission; measured; neutrons; ratio; $^{239}$U; $^{235}$U; 600 keV-22 MeV.

The ratio of the neutron induced fission cross-sections of $^{239}$U and $^{235}$U have been measured in the energy range from 600 keV to 22 MeV using the time-of-flight method on the Harwell synchrocyclotron, at a nominal resolution of 0.5 ns/m. Fission fragments were detected in a gas scintillation chamber containing foils of each material mounted back-to-back and perpendicular to the incident beam. The measured cross-section ratio was normalized at 14 MeV to the ratio evaluated by Sowerby et al. The estimated standard deviation error in the ratio measurements is $\pm 2 \frac{1}{2}$ percent. Comparison with other recent data shows reasonable agreement throughout most of the energy range.

Precision measurement of prompt fission neutron spectra of $^{238}$U, $^{235}$U and $^{239}$Pu, P. J. Johannson, B. Holmqvist, T. Wiedling, and L. Jeki, SP425, pp. 572-575 (Oct. 1975).

Key words: fast fission neutron spectra; TOF-technique; $^{235}$U; $^{238}$U; $^{239}$Pu.

Prompt neutron spectra from fission of $^{235}$U, and $^{239}$Pu have been measured at incident neutron energies of 0.10, 0.18, 0.53 and 2.07 MeV. A major effort was made to obtain an accurate experimental determination of the efficiency and energy response function of the time-of-flight neutron detector in the energy range 0.15 to 15 MeV. The spectra have been analytically described by the so-called Watt distribution, as well as with a Maxwell distribution. It is shown that the Watt relation gives a somewhat better description of the spectra than the Maxwell formula. The angular correlation between incident-neutrons and fission-neutrons was measured for $^{235}$U and $^{238}$U at an incident neutron energy of 2.07 MeV. The data indicate some slight anisotropies, being rather small or even negligible for $^{235}$U and somewhat more pronounced for $^{239}$U. The results show that the shape of the neutron energy distribution is independent of the angle of observation.

Key words: fission channels; J; multilevel fits; polarized neutrons; polarized target; $^{238}$U(n,f).

A polarized beam of neutrons and a polarized $^{235}$U target have been used to determine the spins of resonances below 150 eV. Most spins are assigned by inspection of the data; others by comparison with multilevel or single-level fits. Previously published data on fission fragment angular distributions, in conjunction with our spin assignments, indicate that two or more fission channels are available to each spin state. The ratio of symmetric to asymmetric fission appears to be uncorrelated with the resonance spin.

Key words: spins of $^{235}$U resonances.
Experiments were performed at OREL to measure the low energy fission cross section of $^{235}$U:235. Times of flight of the neutrons causing fission and the fission fragment energy detected by a solid state detector were recorded event-by-event. Analysis of the data showed marked pulse height variation among resonances. Several of the large resonances were shown to be composites and the level density obtained is much higher than previously determined. The results were interpreted by the hypothesis that K is a good quantum number in the compound nucleus. This assumption and the systematic variation of the fission fragment energies among resonances enabled us to assign J and K quantum numbers to many levels. Three families of fission resonances were seen: J = 4+: K = 2; J = 4+: K = 1; and J = 3+: K = 1. Our results have implications as to the accuracy of fission cross section measurements and to the calculation of cross sections in the unresolved energy region.

**Key words:** capture; normalization; strength functions.

The neutron capture cross section of $^{238}$Pu has been measured from 5 to 70 keV. The high-low bias method was used to distinguish between capture and fission events. Transmission experiments were also made in the resonance region. A normalization method was developed using the absorption and transmission data from six resonances. Using an average s-wave reaction width of 22 MeV, an s-wave strength function of $1.16 \times 10^{-4}$ and our measured capture cross section, we have determined p-wave contributions to the $^{238}$Pu capture cross section below 70 keV.

*Spontaneous fission decay constant of plutonium-238, R. Gay and R. Sher, *SP*425*, pp. 587-590 (Oct. 1975).*

**Key words:** coincidence counting; decay constant; plutonium-238; safeguards data; spontaneous fission; track recorders.

The spontaneous fission decay constant of plutonium-238 was measured by two methods: fission-track counting in mica and coincidence counting of the fission fragments in solid-state detectors. The efficiency of the mica track detector was determined by thermal column irradiation of the plutonium source-mica detector assembly and subsequent counting of tracks arising from plutonium-239 fission. The coincidence counting result was combined with a determination of the Pu$^{238}$ alpha emission rate of the sample to obtain the spontaneous fission decay constant. The results of the two methods were $\lambda_{sf} = (4.75 \pm 0.12) \times 10^{-15}$ sec$^{-1}$ and (4.9 $\pm 0.4) \times 10^{-15}$ sec$^{-1}$, respectively.

*Neutron-induced fission cross sections of $^{235}$U, $^{234}$U, $^{236}$U, and $^{238}$U with respect to $^{235}$U, J. W. Behrens, G. W. Carlson, and R. W. Bauer, *SP*425*, pp. 591-596 (Oct. 1975).*

**Key words:** fission cross section ratios; linear accelerator; time-of-flight technique; uranium isotopes $^{234}$U, $^{235}$U, $^{236}$U, $^{238}$U; 0.001 to 30 MeV.

Ratios of the neutron-induced fission cross sections of $^{235}$U, $^{234}$U, $^{236}$U, and $^{238}$U relative to $^{235}$U and of $^{236}$U relative to $^{238}$U were measured with fission ionization chambers at the LLL 100-MeV electron linear accelerator. The time-of-flight technique was used to measure the cross section ratios as a function of neutron energy from 0.1 to 30 MeV, except for the $^{234}$U/$^{235}$U and $^{236}$U/$^{235}$U ratios, which were measured from 0.001 to 30 MeV and 1 to 30 MeV, respectively. The continuous energy spectrum of the neutron source allowed us to cover the entire energy range of each ratio in one measurement. The threshold cross section method was used to normalize the ratios independent of other cross section measurements. Typical energy resolutions of the data are 5 percent at 20 MeV and 1.5 percent at 1 MeV. Most of the data have counting uncertainties smaller than 4 percent. Systematic errors are discussed, and current results are compared with previous measurements.

Sub-barrier fission in $^{239}$U has first been observed by R. Block et al., using ionization chambers for fission fragment detection. In the present measurements a liquid scintillator was used to detect prompt fission neutrons. Thereby, with a sample of 250 g of $^{239}$U, neutron time-of-flight measurements could be performed at a 30 m flightpath with a nominal resolution of 1.3 nsec/m. The result of the present investigation is a full confirmation of the findings of Block et al. This includes a confirmation, by high resolution data, of the fact that the resonance at 721.0 eV and 1210.7 eV contribute most strongly to the observed fission in the two sub-barrier structures at low neutron energies. Their fission widths are found to be (0.85 $\pm 0.13$) MeV and (0.25 $\pm 0.05$) MeV, respectively (assuming $\Gamma = 23$ MeV). For most of the other resonances in these two structures only upper limits for the fission widths are obtained.

Capture-to-fission ratio of $^{234}$U from the measurement of low-energy $\gamma$-rays, F. Corvi and P. Giacobbe, *SP*425*, pp. 599-602 (Oct. 1975).

**Key words:** E = 86 eV – 31.6 keV; enriched target; measured capture-to-fission ratio; nuclear reactions $^{235}$U(n,f) and $^{235}$U(n,$\gamma$).

A new technique of $\alpha$-determination is presented, consisting of measuring with a Ge(Li)-detector low-energy $\gamma$-ray spectra following neutron absorption in $^{234}$U, as a function of neutron energy. A relative value of $\alpha$ can then be deduced assuming that the intensity of a given capture (fission) $\gamma$-ray is proportional to the average capture (fission) cross-section. Such an assumption is thoroughly discussed in the text. More specifically, $\alpha$ was taken proportional to the ratio between the intensity of the 642 keV capture transition and those of the fission $\gamma$-rays at 352 keV and 1280 keV. Average $\alpha$-values with statistical errors less or equal to $\pm 5$ percent were determined for 20 intervals in the range 86 eV – 31.6 keV.

The relative fission cross section of $^{234}$U has been measured up to 200 keV with a nominal resolution of 1.0 ns/m, using a thin foil plastic scintillator detector. The data have been analyzed in order to detect nonstatistical effects due to intermediate structure. Statistical tests which have been applied to this fission and similar total cross section data include calculations of the auto-correlation function and Wald-Wolfowitz tests on the cross-section and on the autocorrelations. The comparison of the results indicates the presence of intermediate structure effects in fission cross section which may be interpreted on the basis of the double-humped deformation potential.

The $^{234}$Pu neutron induced fission cross section from 0.01 eV to 50 eV and its normalization, C. Wagemans and A. J. Deruytter, *SP*425*, pp. 603-606 (Oct. 1975).

**Key words:** normalization; Westcott g-factor; $^{234}$Pu fission cross-section.
The neutron induced fission cross-section of $^{239}$Pu has been measured at an 8 m flightpath of the CBNM Linac (from 50 eV to below thermal energy) with respect to the $^{10}$B(n,α)$^7$Li cross-section. Several fission integrals were calculated as well as the 20.44 $^\circ$C Westcott factor $g_1 = 1.046 \pm 0.006$. Special attention is given to normalization problems.

Key words: delayed neutron; energy spectrum, $\beta$ - n time-of-flight; fission; group 2; $^{239}$U(n, f).

Energy spectrum of the second group delayed neutrons ($T_{\gamma} = 22$ sec.) from photo-fissions of $^{239}$U has been obtained using a time-of-flight technique between beta-particles and neutrons. Experimental results show a fine structure in the spectrum. The six prominent peaks of energies 200-, 240-, 280-, 380-, 540- and 750-keV are observed.

Key words: linac source; neutron energy 0.8 to 20 MeV; relative to n-p scattering; U235 fission cross section.

Energy dependence of the fission cross section of $^{238}$U with respect to the n-p scattering reaction was measured for neutron energies from 0.8 to 20 MeV. The LLL linac target was used as the pulsed neutron source; neutron energies were measured by time-of-flight technique. A $^{235}$U ion chamber was designed and operated to make the fission detection efficiency independent of the angular distribution of fission fragments. The neutron flux monitor consisted of an annular polyethylene radiator with a shielded proton recoil detector. Data in the energy range from 3 to 20 MeV were obtained with a 3.3 mg/cm$^2$ radiator; a 0.31 mg/cm$^2$ radiator was used for the range from 0.8 to 4 MeV. Both sets of data were normalized to yield the average fission cross section value of 1.198 b in the overlapping region from 3 to 4 MeV. Total error in the relative $^{235}$U(n,f) cross section is 1 percent below 7 MeV, 2 percent at 14 MeV, and 6 percent at 20 MeV.

Key words: $E_n = 20-550$ keV; $\sigma_f$($^{238}$U) shape.

The Karlsruhe 800 l liquid scintillator detector and 3 MV pulsed Van de Graaff were used to measure the shape vs. neutron energy of the $^{238}$U capture yield relative to a gold capture sample and relative to $^{235}$U fission. The resulting cross section shape computed from the gold capture cross section is consistent with that computed from a recent evaluation of the $^{238}$U fission cross section. Below 100 keV a significant intermediate structure is observed which corresponds to that in recent ORNL data.

Key words: doorway states; intermediate structure; $^{238}$U capture cross section.

Recent measurements of the $^{238}$U neutron capture cross section show large fluctuations in the unresolved resonance region. To test whether or not the observed long-range fluctuations of the neutron capture represent departures from the compound nuclear model, the Wald-Wolfowitz runs and correlation tests were applied to the $^{238}$U neutron capture data obtained at OREL A. The Wald-Wolffowitz runs test deals with the statistic, $R$, which is the number of upbroken sequences of data points above or below a given reference line. This statistic is to be compared with the expected value of runs $E(R) \pm \sigma(R)$ arising from randomly distributed data. In the correlation test we have computed the first serial correlation coefficient of the data as well as its expected value and variance for a set of random data. In both tests one computes the probability, $P$, for the given statistical entity to depart from its expected value by more than $\epsilon$ standard deviations. Both tests confirm the presence of intermediate structure between 5 and 100 keV. The range of the structure far exceeds the width of the experimental resolution and level widths.

Key words: comparison: cross sections; fission, absorption; measurement; $^{238}$Pu.

A comparison of the results of two different experimental methods of measuring the neutron absorption and fission cross sections for $^{238}$Pu made. These measurements were normalized at thermal energy and extend to 200 keV. The ratio of the neutron capture to fission cross section for $^{238}$Pu derived in these two experiments is shown to be in good agreement.

Key words: fast neutron fission; prompt fission neutron spectrum; T-O-F technique; U-235.

There exists a large number of measurements of the prompt fission neutron spectrum of $^{238}$U. The discrepancies in the results, however, indicate systematic errors which might be attributable to the different experimental equipment and facilities used at the various laboratories. This measurement is a collaboration between the Harwell Nuclear Physics Division and the Neutron Physics Laboratory in Studsvik. The purpose was to repeat measurements on $^{238}$U at Studsvik and Harwell. The experiments were performed on IBIS, the Harwell neutron time-of-flight facility and the experimental parameters of importance were chosen to be identical, viz the same incident neutron energy, detector angle, sample size and composition etc., and also the highly critical parameters, viz the neutron detector response function and the energy calibration of the neutron time-of-flight spectrometer, were obtained by using the same experimental technique and nuclear reactions.

Key words: fission cross section; manganese bath; NBS-II; track-etch detector; $^{238}$U; $^{24}$Na; $^{8}$Be(n,y).

The fission cross section of $^{238}$U for Na-Be photoneutrons has been measured with absolute flux determination. The neutron flux was determined absolutely (i.e., without significant dependence on other cross section data) by using a manganese bath to compare the photoneutron source with the standard source NBS-II. Fission counts were accumulated with the source positioned symmetrically between two identical detectors, all suspended in a low-albedo laboratory. Fission fragments passing through limited solid angle apertures were recorded on polyester track-etch films. Use of a projection microscope counting system allowed rapid
measurement of track diameters, so that the smallest tracks could be distinguished reliably from background pits that were not much smaller in diameter. The masses of the \( \text{U}_3\text{O}_8 \) deposits (7 mg each) were determined by microbalance weighings. After making a small correction for the calculated energy distribution of the source neutrons, a value for the fission cross section at 964 keV of 1.21 barns is obtained. The mean level spacing, corrected for 18 percent of missed resonances in the 0 to 50 eV energy range, is 0.55 ± 0.05 eV. The s-wave neutron strength function value in the 0 to 150 eV energy range, is equal to (0.94 ± 0.09)×10^(-4). The average radius of a 43 resonances is (43.77 ± 0.72) meV. Only preliminary results of the fission experiment are available now: 38 fission widths are given up to 32 eV neutron energy, with the average value \( \langle \Gamma_f \rangle \approx 0.23 \) meV; the statistical distribution of these fission widths corresponds to a \( \chi^2 \) law with 4 degrees of freedom. An area analysis of the Los Alamos fission data has also been done, from which we obtain 36 \( \Gamma_f \) values in the 20 to 50 eV energy range; the corresponding average value is: \( \langle \Gamma_f \rangle \approx 0.52 \) meV; the statistical distribution obeys to a \( \chi^2 \) law with 15 degrees of freedom, in disagreement with the Saclay results.

### Structures in \( ^{235}\text{Th}(n,f) \) and \( ^{236}\text{U}(n,f) \) cross sections, J. Blons, C. Mazur, and D. Paya, \textit{SP425}, pp. 642-645 (Oct. 1975).

Key words: cross sections; structures; \( ^{235}\text{Th}(n,f) \); \( ^{236}\text{U}(n,f) \).

The \( ^{235}\text{Th}(n,f) \) and \( ^{236}\text{U}(n,f) \) cross sections have been measured relative to that of \( ^{238}\text{U} \) up to 6 MeV. The best energy resolution was 3 keV at 1.6 MeV. Below the fission threshold of \( ^{238}\text{U} \), intermediate structures are observed. In the \( ^{235}\text{Th}(n,f) \) cross section, the broad vibrational resonances located above 1 MeV are resolved into sharp structures which are interpreted as rotational states. The angular anisotropy of fission fragments has also been measured in the same energy range. Thereby, values of \( K \) and \( J \) have been determined for each structure. The moment of inertia of \( ^{235}\text{Th} \) in shape isomer deformation has been deduced.

Key words: fusion reactor design; nuclear data for fusion.

The nuclear data needs associated with the development of fusion as an energy source will be discussed in terms of seven areas of design application including: fusion fuel cycles, tritium breeding performance (for concepts based on the D-T fuel cycle), nuclear heating, radiation damage effects, induced activity, radiation shielding, and hybrid concepts. Dosimetry applications will also be considered. The areas of application described above will be related to specific types of nuclear data and to the programmatic requirements of the Controlled Thermonuclear Research effort. The paper concludes with a summary of recent activities relevant to CTR nuclear data needs.

### Model calculations as one means of satisfying the neutron cross section requirements of the CTR program, D. G. Gardner, \textit{SP425}, pp. 651-658 (Oct. 1975).

Key words: applications to CTR; cross-section calculations; fast neutron reactions; gamma-ray production; isomers; radiation widths; statistical model codes.

A large amount of cross-section and spectral information for neutron-induced reactions will be required for the CTR design program. To undertake to provide the required data through a purely experimental measurement program alone may not be the most efficient way of attacking the problem. It is suggested that a preliminary theoretical calculation be made of all relevant reactions on the dozen or so elements that now seem to comprise the inventory of possible construction materials to find out which are actually important, and over what energy ranges they are important. A number of computer codes for calculating cross sections for neutron induced reactions have been evaluated and extended. These will be described and examples will be given of various types of calculations of interest to the CTR program.

Key words: CTR energy production; nuclear reactions.

The copious production of neutrons in the "standard" CTR fuels has led to a renewed interest in proposals that various "exotic" fusion fuels be investigated. These fuels invariably involve reactions on lithium, beryllium, or boron isotopes in which most of the energy is liberated in the form of charged particles. Obtaining reaction cross sections at the appropriate energies or extrapolating the yield into accessible energy regions is, however, not always a straightforward procedure; and each reaction may require the development of new techniques. By means of selections from among such "exotic" fuel reactions, I shall show examples of experimental techniques for charged particle cross-section measurements at low energies and some techniques for extrapolation to still lower energies.

Key words: cross-section data and systematics; cross-section measurement; excitation functions; fast neutrons; nonelastic interactions; nuclear reactions; sources and spectra.

Sources of fast-neutrons and their spectra are discussed briefly. A critical survey of experimental techniques employed in studies of nuclear reactions (excluding fission) at \( E_n \approx 14 \) MeV is presented. The recent experimental cross-section data are described concisely. Special attention is paid to the case of low-yield reactions, such as processes with trinucleon emission. A review of recently discussed cross-section systematics together with an outline of some of the theoretical implications is given.

Key words: cross sections; fusion reactors; perturbation sensitivity; uncertainties.

A computational method to quantitatively determine cross section requirements is described and applied to a particular CTR design project. In order to provide a rational basis for the priorities assigned to new cross section measurements or evaluations, this method includes a quantitative assessment of the uncertainty of currently available...
data, the sensitivity of important nuclear design parameters to selected cross sections, and the accuracy desired in predicting nuclear design parameters. Perturbation theory is used to combine estimated cross section uncertainties with calculated sensitivities to determine the variance of any nuclear design parameter of interest. Selected computational results are presented for a model of the Tokamak Fusion Test Reactor.

Key words: fusion blanket neutronics; nuclear reactions; $^{238}$U.

Neutronic calculations have been made for a hybrid DT fusion reactor blanket in which the initial region is fueled with depleted uranium followed by lithium and graphite. The important parameters of the blanket are the tritium production, fissions, $^{238}$U captures, and thermal flux in the graphite. The sensitivity of these integral parameters was studied as a function of $^{238}$U region thickness and the $^{238}$U microscopic data used. In particular the effect of modifying some improbable secondary neutron energy distributions of $^{238}$U on both versions III and IV of ENDF/B was calculated. Calculations were made for multigroup data obtained by collapsing over constant and $E^{-1}$ weighting functions below the fusion peak. Results were also obtained for a narrow DT fusion neutron peak and for neutron source distribution resulting from an essentially exact calculation of a mirror plasma driven by 100 keV neutral $^3$H and $^3$He.

Key words: advanced-fuels; DD: D$^3$Li; fusion-dynamics: 1-layer; reactivity-coefficients.

Should magnetic confinement of hot plasma prove satisfactory at high beta ($\langle 8\pi^2 n T_B / B^2 \rangle > 0.2$), nuclear fusion fuels other than DT will be important in future fusion reactors. The prospect of the advanced fusion fuels DD and $^6$LiD in such fusion reactors appears very promising provided the system is large, well reflected and has a sufficiently high density and temperature (high beta). Steady state burning of DD can ensue in a 60 kG field, 5m radius reactor for $\beta > 0.1$ and wall reflectivity $R_w = 0.9$. The first generation thermonuclear reactions between D and D or $^6$Li produce the very active, energy-rich fuels $^4$He which exhibit a high burnup probability in very hot plasmas. Steady state burning of $^6$LiD has also been demonstrated theoretically for low concentrations of $^6$Li; however, important features of the $^6$Li system still need to be incorporated in the calculation. In particular, there is a need for new and improved nuclear cross section data on over 80 reaction possibilities.

A study of the $^4$Li(n,t) reaction between 2-10 MeV, C. M. Bartle, SP425, pp. 688-691 (Oct. 1975).

Key words: angular distribution; 2-10 MeV; $^4$Li(n,t).

Absolute $^4$Li(n,t) cross section measurements are reported between 2.16 and 9.66 MeV. The results agree with the Pendlebury evaluation. The possibility of unfolding angular distributions from the pulse-height distributions in $^4$Li(Et) is investigated.

Absolute cross sections for neutrons from $^4$Li + d reactions at energies between 0.2 and 0.9 MeV, A. J. Elwyn, R. E. Holland, F. J. Lynch, J. E. Monahan, and F. P. Moorings, SP425, pp. 692-696 (Oct. 1975).

Key words: $E_n = 0.2-0.9$ MeV; measured $(d\sigma / dE, d\eta) (\theta, E_n)$, $\sigma (E_n)$ for $^7$Be breakup reaction; measured $\sigma (E_n)$ for $^4$Li(d,n)$^7$Be reactions.

Absolute differential and total cross sections in reactions of deuterons with $^6$Li have been measured for neutrons corresponding to the formation of $^7$Be in both its ground and its first excited state, and for the continuum neutrons involved in the breakup of $^7$Be at deuteron energies between 0.2 and 0.9 MeV. Discussion of the experimental procedure is presented. The results indicate that the breakup neutrons are a substantial portion of the total neutron production cross section in this reaction. The reaction rates of the various neutron production reactions are presented.

Key words: deduced $\sigma$ and $\langle \sigma \rangle$; measured $\sigma(\theta)$; nuclear reactions; $^4$Li(p,p); $^4$Li(p,$^3$He); $^4$Li($^3$He,p); $^4$Li(d,p); $^4$Li(d,$\alpha$).

Investigations of proton, deuteron and helium induced reactions on $^6$Li are of importance in connection with the advantages of fusion reactor cycles involving only charged particles. The cross section data for many of these reactions are incomplete and poorly known. We report measurements of the absolute cross sections of the reactions $^4$Li(p,p), $^4$Li(p,$^3$He), $^4$Li($^3$He,p) at $E_p = 3-12$ MeV, $^4$Li(d,p), $^4$Li(d,$\alpha$) at $E_d = 2.25-6$ MeV and $^4$Li($^3$He,p) at $E = 3-6$ MeV. Our data are combined with available information in the literature to determine reaction rate parameters as a function of the temperature of the reacting nuclei.

Phase shift analysis of nD, nT, DD, DT, TT, nD and nT cross sections, C. Abulaffio and A. Peres, SP425, pp. 701-703 (Oct. 1975).

Key words: alpha particles; cross sections; deuterons; neutrons; phase shifts: tritons.

Explicit formulas are given for the elastic and inelastic cross sections of neutrons, deuterons, tritons and alpha particles. These formulas, obtained by a phase shift analysis, are the best fit to currently available experimental data, for all angles and energies up to 14 MeV.

Key words: implications for fusion-fission blanket calculations; spectra from 10 keV to 15 MeV compared with calculations; $^{238}$U pulsed sphere measurements.

The neutron emission spectra from $^{238}$U spheres pulsed with 14-MeV neutrons have been measured from the source energy down to 10 keV and have been compared with calculations employing ENDF/B-IV and ENDF1 cross sections. The low energy spectra (10 keV to 1 MeV) are best described using ENDF/B-IV cross sections while the high energy spectra (2 MeV to 15 MeV) are best described using ENDF1 cross sections. It is concluded that use of ENDF1 cross sections should yield the best estimate of tritium breeding and ENDF/B-IV that of Pu breeding in a CTR fusion-fission blanket.

The $^{239}$Nbh(n,2y)$^{239}$Nb, $^{258}$Nbh reaction for the CTR reactor technology program, P. J. Persiani, E. M. Pennington, Y. D. Harker, and R. L. Heath, SP425, pp. 708-711 (Oct. 1975).
Key words: afterheat; blanket; cross-section; experiment; fusion; radioactivity; resonance-levels.

Depending on the assumptions made of the neutron cross-section behavior in the high-energy region, the captures in $^{94}$Nb have been found to be the major components influencing the afterheat and radioactivity in fusion reactor design problems. Preliminary blanket designs indicate that about 60 percent of the capture rates in $^{94}$Nb occur above 1 keV and 90 percent occur above 100 eV. Therefore an important and timely cross-section need is an estimate and measurement of the $^{94}$Nb($n$,$y$)$^{95}$Nb, $^{96}$Nb reaction in the keV-MeV energy region. Nuclear level systematic studies using the two known positive energy resonances, the thermal cross-section, the resonance integral and the apparent high-density of the low-lying levels in $^{95}$Nb, have suggested postulating the existence of negative energy levels or level. These considerations involved the postulated negative energy resonances, and assumptions about positive energy resonances above 50 eV and average unresolved parameters based on nuclear systematics. The experimental technique to obtain a measured integrated cross-section in the fast fusion spectrum of the Coupled Fast Reactivity Measurements Facility (CFRMF) and the Argonne Fast Source Reactor (AFSR) is investigated with foils of $^{94}$Nb containing 4.1 percent $^{94}$Nb utilizing Ge(Li) spectrometry.

Key words: cyclic activation: formation cross sections measurements: isomeric states.

The formation cross sections for the isomeric states in Mg, Al, Y, In, Hf, Ti, Pb, and Bi by the (n,p), (n,n), and (n,2n) reactions have been measured using the cyclic activation technique and a Ge(Li) detector. The half-lives of the induced isomeric activities were determined using a wide range time-to-pulse height converter and a multichannel analyzer.

Key words: advanced fusion fuels; Doppler effect; fusion cross sections; fusion energy multiplication; fusion reactivities: Two-Component Torus (TCT).

Tables and graphs of fusion reactivities ($\sigma\nu$) are readily available for fusion in thermalized (Maxwellian) plasma using common fuels. However, plans to construct the Two-Component Torus (TCT) have created a need for reactivities to characterize fusion via high-energy beams interacting with low-temperature target plasmas. Such reactivities are derived in the present paper for a variety of fuels including $D \rightarrow T$, $D \rightarrow ^{3}$He, $D \rightarrow ^{4}$He, $T \rightarrow ^{4}$He, and $p \rightarrow ^{4}$He. Some examples of the use of these reactivities in two-component calculations are also described.

Key words: Bondarenko; f-factors; fusion reactors; niobium: Reference Theta-Pinch Reactor: tritium breeding.

The Bondarenko formalism used to account for resonance self-shielding effects (temperature and composition) in a Reference Theta-Pinch Reactor is reviewed. A material of interest in the RTPR blanket is $^{94}$Nb, which exhibits a large number of capture resonances in the energy region below 800 keV. Although $^{94}$Nb constitutes a small volume fraction of the blanket, its presence significantly affects the nucleonic properties of the RTPR blanket. The effects of self-shielding in $^{94}$Nb on blanket parameters such as breeding ratio, total afterheat, radioactivity magnet-coil heating and total energy depositions have been studied. Resonance self-shielding of $^{93}$Nb, as compared to unshielded cross sections, will increase tritium breeding by ~7 percent in the RTPR blanket, and will decrease blanket radioactivity, total recoverable energy, and magnet-coil heating. Temperature effects change these parameters by less than 2 percent. The method is not restricted to the RTPR, as a single set of Bondarenko f-factors is suitable for application to a variety of fusion reactor designs.

Key words: enriched target; measured $\sigma_{E}(E)$, $\sigma_{p}(E)$, $\sigma_{n}(E)$, nuclear reactions $^{238}$U($n$,$y$), $^{238}$U($n$,$y$), $E = 30-1800$ eV; $^{238}$U resonances deduced $I_{p}$. $I_{y}$.

Capture, scattering and total cross-section measurements have been performed on $^{238}$U, over an energy range from 30 eV up to 1.8 keV. The neutron width $I_{p}$ could be determined for 97 levels and the capture width $I_{y}$ for 57 among them. The average radiative width $\gamma_{r} = (23.0 \pm 0.3$ (stat.) $\pm 1.5$ (syst.)) $\times 10^{-5}$ MeV. For the $s$-wave strength function we find $S_{s} = (1.03 \pm 0.14) \times 10^{-4}$.

p-wave assignment of $^{238}$U neutron resonances, F. Corvi, G. Rohr, and H. Weigmann, SP$^2$45, pp. 733-737 (Oct. 1975).

Key words: enriched targets; measured $\sigma(E)$, $\sigma_{p}(E)$, and $\sigma_{n}(E)$, $^{238}$U deduced resonances. $\pi$, $\gamma$; nuclear reactions $^{238}$U($n$, $y$), $E = 10-1600$ eV.

A method of p-wave assignment of $^{238}$U resonances is presented, consisting of measuring the fraction of capture $\gamma$-rays above 4.3 MeV for neutron resonances in the range 10-1600 eV. In this way, 57 resonances showing an enhancement of the high energy $\gamma$-ray yield, were identified as $p$-waves. In addition, a capture cross-section measurement was performed on a 6.32 $\times 10^{-5}$ at/barn thick sample in order to obtain the $\gamma_{r}$ values of such small resonances. The derived final estimates of the p-wave strength functions $S_{p}$ and of the s-wave level spacing $D_{s}$ are: $S_{p} = (2.3 \pm 0.2) \times 10^{-4}$; $D_{s} = (2.4 \pm 1.0) \times 10^{-5}$ MeV.

Key words: background; JAERI linac; natural U: resonance parameters $I_{p}$, up to 5 keV; three thicknesses; transmission measurements; 190-m flight path.

Neutron transmission measurements on natural U samples were performed in the energy region from 20 eV up to 30 keV on a 190-m flight path of the JAERI 120-MeV linac neutron time-of-flight spectrometer. Samples were all metallic slabs with three thicknesses of 0.00725, 0.0144 and 0.0236 atoms/barn, respectively. One of them was cooled down to 77 K to reduce Doppler broadening. The best nominal resolution of the measurements was 0.3 nsec/m. A special attention has been paid to determine the background, because the shape of the background was found to depend on the thickness of the sample in the beam. Resonance parameters $I_{p}$ are obtained in the energy region up to about 5 keV with the Atta-Harvey area-analysis program. Results are compared with currently available experimental data.

Evidence for structure in the sequence of s-wave levels in $^{238}$U,
Key words: collective motion; correlations; level densities; resonance levels; $^{238}$U; $^{16}$O; $^{18}$O.

The levels in $^{238}$U show unusual clusterings of large and small levels as evidenced by runs statistics and sequential correlation of values of $^{16}$O. Also, $^{16}$O is found to show significant correlation with $^{18}$O. These effects are interpreted in terms of a model which assumes that excitation states are built upon persistent states of collective vibration and that an entering neutron seeks to form those states involving minimum change of particle motion.

Key words: gross fission products; neutron cross section; time-of-flight; 1-240 eV.

Fast-chopper time-of-flight transmission measurements have been made using gross fission product samples of different irradiation and cooling histories, in order to find isotopic identifications and parameters of fission product resonances. The covered energy range was from 1 eV to 240 eV with resolutions of 47 ns/m and 94 ns/m. Some prominent fission product resonances have been found and can partly be identified. From the transmission analysis the $^{235}$U content and burnup can be calculated within $\pm$ 5 percent.

High resolution total neutron cross section in $^{56}$Fe and $^{58}$Fe, M. S. Pandey, J. B. Garg, J. A. Harvey, and W. M. Good, SP425, pp. 748-753 (Oct. 1975).

Key words: high resolution; total neutron cross section; $^{56}$Fe; $^{58}$Fe.

High resolution neutron total cross-section measurements on $^{56}$Fe and $^{58}$Fe have been made using the ORELA facility and resonance parameters are reported up to an energy of 500 keV. The total cross-section data were analyzed by R-matrix multi-level code for broad, interfering s-wave resonances. For narrow and noninterfering s-wave resonances and 1s-0-wave resonances transmission data were analyzed using Harvey-Atta code of area analysis. From these values of resonance parameters, the values of level density (D) and strength function for s- and p-wave neutron scattering have been determined. Statistical distributions of spacing and reduced neutron widths are presented. A large number of p-wave resonances are observed which have not been reported before.

Thick sample transmission measurement and resonance analysis of the total neutron cross section of iron, S. Cierjacks, G. Schmalz, R. Töpke, R. R. Spencer, and F. Voss, SP425, pp. 754-757 (Oct. 1975).

Key words: Fe(n), $E_n = 0.5-30$ MeV; measured $\sigma_{tot}(E)$; multilevel R-matrix resonance analysis.

New transmission measurements on natural iron samples were performed at the 190 m flight path of the Karlsruhe fast neutron time-of-flight spectrometer, allowing for an improved resolution of 0.015 ns/m. The measurements were carried out in the energy range from 0.5-30 MeV using two largely different sample thicknesses. The thick sample results indicate, that the deep s-wave minima are now fully explored in the energy range below the inelastic scattering threshold at about 850 eV. From the highly resolved transmission data resonance parameters were determined by multilevel R-matrix analysis. The results of the thick sample measurements between 0.5-30 MeV and the resonance parameters determined in the range between 500-800 keV are presented.

Key words: cross sections; ($n, \gamma$); photon energy.

For the past three years neutron-induced gamma-ray production cross sections have been made for a variety of elements at the Oak Ridge Electron Linear Accelerator. A large, well shielded, NaI spectrometer was used as the gamma-ray detector and ORELA as the neutron source. The facility provides a consistent data set for neutron energies from 0.7 to 20 MeV and photon energies from 0.3 to 10.5 MeV. Typically the samples are flat plates of the element of $\approx 0.02$ atoms/barn thickness, although several elements studied required samples in compound form. The data are accumulated in a two-parameter array, gamma-ray pulse height versus neutron time-of-flight. Data reduction was accomplished by binning in desired neutron-energy groups and in fixed photon-energy groups. For each neutron-energy group the data were unfolded using FERD unfolding routine, and the results are in the form of absolute differential cross sections, $d^2 \sigma / dE d\Omega$, for each photon-energy bin. So far data have been obtained for 20 elements (Li, C, N, O, F, Mg, Al, Si, Ca, Fe, Ni, Cu, Zn, Nb, Ag, Sn, Ta, W, Au, and Pb).

Key words: cross sections; fluorine; neutron-induced low-energy photons; tantalum.

Differential cross sections for the production of low energy photons (nit 240 keV) by neutron interactions in fluorine and tantalum have been measured for neutron energies between 0.1 and 20 MeV. Photons were detected at 92° using an intrinsic germanium detector. Incident neutron energies were determined by time-of-flight techniques for a white source spectrum.

Key words: $E_\gamma$ to 21 MeV; $E_\gamma$ to 10 MeV; $\sigma_{n,\gamma}$ measurements.

The gamma-ray production cross-section measurement program at IRT is described. Neutrons from epithermal energies to 21 MeV were produced with the IRT Linac and gamma rays resulting from neutron interactions were detected with a Ge(Li) spectrometer system. Representative results are presented for C, N, Al, Si, and Fe.

Key words: $E_n = 14.2$ MeV; measured $d\sigma / d\Omega d\Omega$; nuclear reaction (n,$\gamma$).

A pulsed 14.2 MeV neutron source and a NaI(Tl) gamma-ray spectrometer were used to measure gamma-ray production cross sections for several elements in the range A = 12 to 239. Angular distributions for some of the more
prominent gamma ray groups were obtained. Complete gamma-ray production cross sections were measured for all the sample materials, including those in which no clearly separable gamma ray groups appeared.

Key words: parameters of bound level of Ar-36.

To compare the predictions of the valence model with measured partial radiative widths of Ar-36 an accurate knowledge of the bound-level parameters is required. This is achieved by carrying out a Breit-Wigner parameter fit to the total cross section of Ar-36 measured by Chrien et al. and renormalized to the recommended values of the thermal capture and scattering cross sections. The result is as follows:

$$E_o = -10 \text{ keV}, \Gamma_{\gamma}^{92.3} = 1.26 \text{ eV}.$$  

Key words: nickel-59; resonance integral; resonance parameters; thermal cross section.

The thermal cross section and resonance integral for Ni-59 have been measured in integral measurements using the pile oscillator technique. The results are $\sigma_{\gamma}(2200 \text{ m/sec}) = 92 \pm 4 \text{ barns}$ and $\Gamma_{\gamma} = 125 \pm 8 \text{ barns}$. Separate differential measurements of the neutron total cross section from 0.5 eV to above 2 keV were performed at the RPI linear accelerator. A resonance was observed at 203 eV and analyzed by shape and area methods. Parameters for the resonance have been determined. The integral and differential results were compared and found to be in reasonable agreement.

Key words: measured $\sigma(E)$ for (n,n), (n,$\gamma$), $E = 1 \text{ eV}-\text{few keV}$; nuclear reactions; summary of deduced $E_o$, $\Gamma_{\gamma}^{92.3}$, $\Sigma$, $(D_o)$; various statistical tests.

A review of the results of high resolution, high intensity neutron time of flight spectroscopy with the Columbia University Nevis Synchrocyclotron is presented. The review includes a brief description of the experimental facilities and a summary of resonance parameter results.

Key words: deduced $\Sigma_{\gamma}^{92.3}$ (M1) and $\Sigma_{\gamma}^{92.3}$ (E1); $E_o = 9 \text{ MeV}$; measured $\sigma(E_o, \theta)$; nuclear reactions $^{139}$Ba($\gamma$,n), $^{140}$Ce($\gamma$,n).

The E1 and M1 radiative strength functions have been measured for nuclei with atomic mass number near $A = 140$ and at an excitation energy of approximately $9 \text{ MeV}$ using the threshold photonutron technique. A method was developed for extracting the dipole strength even though the first excited state of the daughter nucleus is near the ground state. The photonutron spectra were measured at laboratory angles of $90^\circ$ and $135^\circ$ and with high resolution (0.5 ns/m) using the time-of-flight spectrometer associated with the Argonne high-current linac. In particular the dipole strengths found in $^{139}$Ba and $^{140}$Ce are discussed. These results are compared with theoretical estimates and with the radiative strengths of nuclei in the mass range $50 < A < 250$.

Analyzing powers of the $^{13}$Li($^3$He, d)$^{12}$C reaction, M. Karim and J. C. Overley, SP425, pp. 788-791 (Oct. 1975).

Key words: deduced analyzing powers $A(0)$, measured yield asymmetries; nuclear reactions: $^6$Li($^3$He, d)$^7$C, $E = 0.2$-1.4 MeV.

We have measured analyzing powers for the $^3$He($^3$He, d) reaction for neutron energies between 0.2 and 1.4 MeV. An energy continuum of neutrons was produced by bombarding a thick lithium metal target with a 3.5-MeV, nanosecond-pulsed proton beam. The partially polarized neutrons emitted at 50° were incident on an evaporated $^6$Li target. A silicon surface barrier detector was used to measure triton and $\alpha$-particle yields as a function of particle energy. Tritons were distinguished from $\alpha$ particles with time-of-flight techniques. Yield asymmetries were determined at laboratory angles of 35°, 60° and 80° with angular resolutions of $\pm 5^\circ$. The $\alpha$-particle yield asymmetries were converted to backward angle triton asymmetries, providing data at six angles. Analyzing powers as a function of angle were deduced. Although results are tentative, analyzing powers near 90° and 250 keV are negative ($\sim -0.3$) while above 700 keV they are large and positive ($\sim +0.91$) and vary slowly with neutron energy.

Key words: cross section; neutron; resonance; sodium-22; thermal; Westcott.

We describe a simple method for determining the neutron-absorption cross sections for radionuclides produced and consumed in a reactor-neutron flux. Data were obtained for $^{22}$Na which through application of Westcott's procedure, yielded the following: $\sigma_{\gamma} = 51.1 \pm 3.1 \text{ Kbars}$, $\Sigma_{\gamma} = 2.3 \pm 0.1$, and $\Sigma = 100 \pm 10 \text{ Kbars}$.

Evidence for valence neutron capture in s-wave neutron capture in $^{38}$Ar and $^{38}$Fe, S. F. Mughabghab, SP425, pp. 795-798 (Oct. 1975).

Key words: thermal capture spectra; valence capture in $^{38}$Ar and $^{38}$Fe.

The valence and channel neutron model of Lane and Lynn remarkably account for partial radiative widths of neutron resonances in the 3p-giant resonance. In this investigation, evidence is presented for valence neutron capture at and in the neighborhood of the 3s giant resonance in target nuclei Ar-36 and Fe-54. In addition, the variation of the correlation coefficient $\rho(\gamma_E, \Sigma_{\gamma}^{92.3}, (23 + 1) \Sigma_{\gamma}^{92.3})$ with the reduction power factor $n$ of the $\gamma$ ray energy is studied.

Key words: deduced $E_o$, $\Gamma_{\gamma}^{92.3}$, $\Sigma$, $\Gamma_{\gamma}^{92.3}$; measured $\sigma(E)$; nuclear reactions $^{208}$Bi(n,n), (n,$\gamma$), $E = 500 \text{ eV}-75 \text{ keV}$.

Neutron time of flight transmission measurements were made on several samples of $^{208}$Bi using the Nevis Synchrocyclotron of Columbia University. The resonance parameters are given for 29 levels to 75 keV. Out of the 29 observed levels 10 were $l = 0$ and 19 were $l = 1$ levels. The implied s- and p-strength functions are $10S_{1/2} = (0.60 - 0.12i)_{0.29}$ and $10S_{1/2} = (0.19 - 0.06i)_{0.69}$.

Key words: Ge detector; Fe-filtered beam; neutron cap-
Neutron capture cross sections of $^{90}$Nb, $^{127}$I, $^{165}$Ho, $^{197}$Au and $^{238}$U were measured near 24 keV using the Fe-filtered-beam method. A 15 cm thick Fe filter was placed in the neutron time-of-flight beam produced by the KUR 46-MeV electron linac. Capture $\gamma$-rays were detected by two CaF$_2$ total energy detectors located on a 12 m flight path. Pulse-height weighting was used to determine the relative capture efficiency. The neutron flux was determined with the detector via the $^{10}$B$(n,\alpha\gamma)$ reaction and saturated resonance capture in Ag at 5.2 eV. Multiple scattering corrections were applied to the data, resulting in 24 keV capture cross sections of 0.33, 1.10, 0.76, 1.26, 0.68 and 0.50 barns for $^{90}$Nb, $^{127}$I, $^{165}$Ho, $^{197}$Au and $^{238}$U, respectively. Total errors are 5 to 7 percent, with an estimated systematic error of 4 percent.

Key words: measured $\sigma(E)$; nuclear reactions $^{12}$C(n,2n), $E = 23-34$ MeV; statistical model calculations: $^{238}$U(n,2n), $E = 13-18$ MeV.

The excitation functions of the reaction $^{12}$C(n,2n)$^{14}$C for incident neutron energies from 23 to 34 MeV and of $^{238}$U(n,2n)$^{240}$U from 13 to 18 MeV have been measured with activation techniques. The results are compared with existing data and interpreted with the statistical model approach. The calculations performed for $^{238}$U include fission competition and preequilibrium contributions to account for an enhanced (n,2n) yield at projectile energies above 15 MeV.

Key words: diffuse neutron scattering; incoherent neutron scattering; point defects.

A discussion is given of the way in which small incoherent scattering cross-sections can be obtained as a by-product of point defect scattering studies. A table with $\sigma_{in}$-values for ten elements is given.

Key words: air transport; benchmark; profiles; sensitivity; uncertainties.

Sensitivity analysis is applied to the study of an air transport benchmark calculation to quantify and distinguish between cross-section and method uncertainties. The boundary detector response was converged with respect to spatial and angular mesh size, $P_1$ expansion of the scattering kernel, and the number and location of energy grid boundaries. The uncertainty in the detector response due to uncertainties in nuclear data is 17.0 percent (one standard deviation, not including uncertainties in energy and angular distribution) based upon the ENDF/B-IV "error files" including correlations in energy and reaction type. Differences of approximately 6 percent can be attributed exclusively to differences in processing multigroup transfer matrices.

Key words: benchmark experiments; dosimetry; fast reader testing; fission products; shielding; thermal reactor testing.

Benchmark experiments offer the most direct method for validation of nuclear data. Benchmark experiments for several areas of application of nuclear data have been specified by CSEWG. These experiments are surveyed and tests of recent versions of ENDF/B are presented.

High energy $\gamma$-ray transitions to low lying states in $^{57}$Fe following neutron capture in $^{56}$Fe were investigated for individual resonances in the energy region 7-70 keV by the Karlsruhe 3 MV pulsed Van-de-Graaff-accelerator by means of a 50 cc Ge(Li)-detector. As a result relative partial radiation widths for transitions of 4 resonances were determined.

Key words: fluctuations; neutron strength functions; optical potential; quasi-particles.

Strength function fluctuations are interpreted in terms of variation of the quasi-particle state density. The anomalous behaviour of the neodymium isotopes is described and an account of the fluctuations of $S_n$ in the 3S and 4S size resonances is given. Fluctuations of the local strength fluctuations with energy are discussed.

Key words: alpha particles; cross section; helium; nickel; neutron; spectrum.

The cross section for the reaction $^{59}$Ni(n,α)$^{56}$Fe was measured at three neutron energies from 0.029 to 0.042 eV. The alpha particles were recorded using a Si surface barrier detector. The measurements were made relative to Li-6. Within experimental errors the cross section ratio remained constant for the three energies. Assuming that the 1/ν law applies the $^{59}$Ni(n,α) cross section at 0.0253 eV is found to be 22.2 ± 1.7 barn.

Key words: benchmark experiments; dosimetry; fast reader testing; fission products; shielding; thermal reactor testing.

Benchmark experiments offer the most direct method for validation of nuclear data. Benchmark experiments for several areas of application of nuclear data have been specified by CSEWG. These experiments are surveyed and tests of recent versions of ENDF/B are presented.

High energy $\gamma$-ray transitions to low lying states in $^{57}$Fe following neutron capture in $^{56}$Fe were investigated for individual resonances in the energy region 7-70 keV by the Karlsruhe 3 MV pulsed Van-de-Graaff-accelerator by means of a 50 cc Ge(Li)-detector. As a result relative partial radiation widths for transitions of 4 resonances were determined.

Key words: correlations; covariances; data adequacy; estimated uncertainties; evaluations; neutron transport.

The need to communicate estimated uncertainties in evaluated nuclear data to be used in the assessment of their adequacy in applications has been recognized in the ENDF/B system. Starting with ENDF/B-IV, the data files contain formatted data describing the estimated covariances of some of the microscopic cross sections in such a form that they can be processed by computer codes to generate covariance matrices of quantities used in solving neutron transport problems such as group cross sections. The basic concepts behind the representation of such quantities will be described and the work done so far in the representation and manipulation of such quantities will be discussed. Problem areas not yet addressed in ENDF/B-IV but under study will be discussed.

Key words: computer codes; multi-group data; survey.

The features of three code systems that produce multigroup neutron data are contrasted. These include the ETOE-2/MC²-2/SDX, MINX/SFPHINX and AMPX code packages. These systems all contain a fairly extensive set of processing capabilities with the current evaluated nuclear data files—ENDF/B. They were designed with different goals and applications in mind. This paper discusses some of their differences and the implications for particular situations.

Key words: E = 6-15 MeV; measured σ(En); nuclear reactions ⁵⁶Fe, ⁶⁰Co, ⁷⁶Ge, ⁷ⁱSe, ⁸⁵Y, ⁹⁳Nb, ⁹⁸Rh, ¹⁰⁶Sn, ¹⁰⁷Ru, ¹⁰⁸Ta, ¹⁰⁹Pd, ¹⁰⁹Bi, ²³⁵U(n,2n); ²³⁶U(n,3n).

Cross sections for the (n,2n) and (n,3n) reactions have been measured for several nuclides between 6 and 15 MeV using a large liquid scintillator to count the neutrons directly. Measurements were made relative to fission cross section of ²³⁵U for ⁵⁶Fe, ⁶⁰Co, ⁷⁶Ge, ⁷¹Se, ⁸⁵Y, ⁹³Nb, ⁹⁸Rh, ¹⁰⁶Sn, ¹⁰⁷Ru, ¹⁰⁸Ta, ¹⁰⁹Pd, ¹⁰⁹Bi, ²³⁵U, and for the natural elements Pt and W. The relative accuracy was generally in the range 5 to 10 percent. The present results are compared with previous measurements.

Key words: excitation curve; neutron elastic scattering; ¹¹³In*: 0.335-14.7 MeV.

Cross sections for the reaction ¹¹³In(n,n')¹¹³In have been measured by the activation method from a threshold energy of 0.335 MeV to 14.74 MeV. Cross sections at energies below 5.3 MeV were based on neutron flux measurements determined with a calibrated neutron long counter, while at higher energies measurements were made relative to the known cross section for the ²³⁵U(p,n)²³⁶P reaction. An effective cross section for a ²³⁵U fission neutron spectrum calculated from the measured excitation curve is 173 ± 9 mb.

Key words: E = 0.3-3.0 MeV; nuclear reaction ²³⁹U(n,n) and ²³⁹U(n',n); σ(0,E); 0°<θ<160°.

Cross sections for the neutron excitation of the 2+(45 keV), 4+(148 keV) and 6+(308 keV) states in ²³⁹U were measured to incident energies of 0.3 MeV. The experimental resolution was sufficient to resolve these components throughout the measured energy range. Particular attention was given to energies near threshold and in the few MeV range where direct reaction contributions are appreciable. The experimental results were compared with theoretical estimates based upon statistical and coupled-channel models deduced from comprehensive studies of neutron scattering from heavy-rotational-deformed nuclei. An evaluated inelastic scattering data set was derived from the present experimental and calculational results and previously reported experimental values and compared with respective values from the ENDF-IV file.

Key words: measured σ(E,θ); nuclear reactions C(n,n), C(n,n'), E = 9-15 MeV.

Measurements have been made of the differential elastic and inelastic scattering cross sections, at 28 angles each, for 9, 9.21, 9.6, 10, 10.25, 10.74, 11, 11.22, 11.79, 12, 13, 14, 15, and 15 MeV neutrons incident upon natural carbon. The measurements were made with the TUNL FN tandem accelerator and a high-precision goniometer time-of-flight spectrometer. Monte Carlo simulation has been used to correct the differential cross sections for multiple scattering. Absolute uncertainties are typically 5 percent. These data partially fill the 9-15 MeV gap in the elastic and inelastic scattering data set required for the CTR program.

Key words: Hauser-Feshbach; inelastic-scattering; measurements; MeV range 2 to 4.5; neutrons; time-of-flight.

Fast neutron inelastic scattering cross sections have been measured for the elements Al, Ti, V, Mn, Fe, Ni, Nb, Pb and Bi by the time-of-flight technique. The measurements were made in the energy range of 2 to 4.5 MeV in steps of 0.25 MeV and at a scattering angle of 125°. The experimental results are compared to the excitation functions calculated on the basis of the Hauser-Feshbach formalism and corrected for the effects of the level width fluctuations.

Key words: E = 2 to 5 MeV; measured T = (E,θ) absolutely for ¹²C(n,n) reaction then determined A = (E,θ) for other reactions; nuclear reactions ¹¹B(n,n); ⁴Li(n,n); ⁹Be(n,n); ¹²C(n,n) and ¹⁶O(n,n); R-function and phase-shift analyses; θ = 20 to 150°.

Photoneutrons from the target of the Yale LINAC were polarized by elastic scattering from a cylinder of graphite.
The polarized neutrons were observed at angles of 50 and 130° and their energies determined with a time-of-flight resolution of 0.75 ns m⁻¹. The absolute polarization of the neutrons was measured in a true double-scattering experiment; this polarized source then was used to measure the analyzing powers of the reactions \( ^{10}E \) at 8.9-11.9, 20.4, and 27.0 MeV over wide ranges of energy and angle. These reactions are of interest from three viewpoints: i) the design of fission and fusion power reactors; ii) absolute neutron standards; and iii) fundamental theory. General, multi-level R-function analyses and phase-shift analyses of the observed analyzing powers were made in all cases. Differential and total cross sections were predicted and compared with currently available measurements.

Key words: fast neutrons; inelastic scattering; isomeric state; level scheme; optical model; rhodium-103.

Cross sections for elastic and inelastic scattering of fast neutrons from \(^{109}Rh\) were measured at energies up to 1500 keV. Additional information about the level scheme followed from \((n,n')\gamma\) measurements. The effective cross section for excitation of the isomeric state at 40 keV was derived from these results and compared with excitation measurements and theoretical results.

Key words: cross section; differential; elastic; inelastic; neutron; scattering.

The ORNL program to measure neutron elastic and inelastic scattering cross sections for 26 nuclides from C to \(^{238}U\) in the 4-8.5 MeV energy range is summarized. Data acquisition and reduction techniques are reviewed and typical results given. The nuclides investigated are tabulated.

Key words: differential elastic scattering cross section; fast neutrons; scattering geometry; uniform sensitivity neutron counter.

A new technique has been developed for the absolute measurements of differential elastic scattering cross sections of nuclei for fast neutrons. The method is based on constant angle scatterers shaped in the form of a surface of revolution around the source to detector line as axis. Elastically scattered neutrons have been discriminated by the multiple bias technique applied to recoil proton plastic detectors. The results obtained for sulphur for 14.8 MeV neutrons will be presented.

Key words: angular distributions; carbon-neutron elastic and inelastic scattering; \(E_n = 8.0-14.5\) MeV; excitation functions.

Differential elastic and inelastic cross sections for fast neutrons scattered by carbon have been measured between 8.0 and 14.5 MeV. No other results on \(^{12}C\) seem to have been reported at this time, between 9 and 14 MeV. A complete and consistent set of data for carbon, including total, elastic and inelastic, \((n,a)\) and \((n,a'\gamma)\) cross sections, is now available for energies below 14.5 MeV.

Key words: \(E_n = 2.0-4.1\) MeV; level schemes; \((n,n')\gamma\) reaction; \((n,n')\gamma\) model; \(^{76,78,80,82}Se, ^{76}Ge\).

The energy levels and the decay schemes of \(^{76}Se, ^{78}Se\), \(^{76}Ge\), and \(^{82}Ge\) have been studied through the measurements of \((n,n')\gamma\) differential cross sections. Gamma-ray excitation functions have been measured between 2.0- and 4.1-MeV incident neutron energy, and angular distributions have been observed for all of these isotopes.

Key words: deduced optical-model parameters; enriched targets; measured \(\sigma(\theta)\); nuclear reactions \(^{76,78,80,82}Se(n,n), (n,n'), E = 6-10\) MeV.

Differential cross sections for neutron elastic and inelastic scattering from \(^{76}Se\), \(^{78}Se\), \(^{80}Se\), and \(^{82}Se\), have been measured at 8-MeV incident neutron energy and from \(^{76}Se\) and \(^{82}Se\) at 6- and 10-MeV incident energies. The differences observed in the elastic scattering cross sections are interpretable as the effects of isospin term in the scattering potentials. A full analysis of the elastic scattering data are presented.

Fast neutron capture and activation cross sections, W. P. Pemitz, \(SP425\), pp. 901-904 (Oct. 1975).

Key words: fast neutron capture; Co, Ni, Cu, Zn, Nb, Ho, Ta, \(^{208}U\); theory and experiment.

Fast neutron capture cross sections were measured in the energy interval from 0.02 to 0.7 MeV using white source neutron time-of-flight techniques and from 0.3 to 3.0 MeV using monoenergetic neutrons. Target materials were Co, Ni, Zn, Cu, Nb, Ho, Ta, Au and \(^{208}U\). A 13001 liquid scintillator was used as a capture \(\gamma\)-ray detector. Flat efficiency neutron detectors and/or the standard capture cross section of Au were used for the neutron flux determination. Fast neutron capture and activation cross sections were calculated in terms of the statistical model. The Hauser-Feshbach formalism and a gamma cascade model previously described were used.

Key words: average \(\Gamma, D, S^0\) and \(S^1\); capture cross sections.

Capture cross section measurements have been made on \(^{106}Pd, ^{151,152}Eu\) and \(^{203}Rh\) from 20 eV to 200 keV. Capture data in the resolved resonance region are combined with our own transmission data to obtain a consistent capture normalization. For these experiments, the statistical uncertainty of the normalization is ± 4 percent for \(^{152}Eu, ^{153}Eu\) and \(^{152}Pd\) and ± 8 percent for \(^{203}Rh\). The statistical uncertainty of the keV capture cross section point data is about ± 4 percent. The information derived from these measurements is the measured keV capture cross section and the average \(s\) and \(p\) wave parameters \(\Gamma, D, S^0\) and \(S^1\).

Integral capture cross-section measurements in the CFRMF for LMFBR control materials, R. A. Anderl, Y. D. Harker, E.
Key words: boron carbides; capture cross sections; CFRMF reactor; control materials; europium oxides; fast reactors; neutron reactions; tantalum.

Integral capture-cross sections for separated isotopes of Eu and Ta are reported for measurements in the Coupled Fast Reactivity Measurements Facility (CFRMF). These cross sections along with that measured in the CFRMF for $^{10}$B(n,α) provide an absolute standard for evaluating the relative reactivity worth of EuO, B$_2$C and Ta in neutron fields typical of an LMFBFR core. Based on these measurements and for neutron fields characterized by the $^{235}$U+$^{238}$U reaction rate spectral index ranging from 23 to 50, the infinitely dilute relative worth of EuO$_2$ has been estimated to be 25% to 40% percent higher than that for B$_2$C and 80 to 100 percent higher than that for Ta.

Key words: iron filter; Mn(n,γ) neutron capture gamma-rays; Li filter; $^{141}$Gd(n,γ); $^{142}$Gd(n,γ).

Essentially monenergetic neutrons with keV energies can be obtained from a reactor by using suitable filters. To date, prompt γ-ray spectra have been measured using 24-, 25- and 1-keV neutrons, obtained through Fe + Al + S, Sc + Ti and Li filters, respectively. Two features of these data are of note to reactor shielding. First, the radiative capture spectra from higher Z nuclei usually result from an average over many resonance states. Hence statistical fluctuations in the primary γ-ray intensities, to which the corresponding thermal neutron capture spectra are subject, are averaged out. Second, such data provide information on the dependence of radiative capture spectra on neutron energy. The data shows that at 24 keV there is a significant p-wave contribution to these spectra, even for those mass regions where the ratio of the p-to-s wave strength function is close to a minima. This occurs because the smallness of the relative penetrability at 24 keV (0.04 to 0.08 for 100 < A < 240, is compensated for by the branching ratio $\Gamma_{p}/\Gamma$ which is now much larger for p-wave than for s-wave resonances.

Measurement of the γ-ray production cross sections from inelastic neutron scattering in some chromium and nickel isotopes between 0.5 and 10 MeV, F. Voss, S. Cierjacks, D. Erbe, and G. Schmied, SP425, pp. 916-919 (Oct. 1975).

Key words: $E_{\gamma} = 0.5$-10 MeV; $^{53}$Cr, $^{54}$Ni, $^{60}$Ni (n,γ) experimental results of γ-ray production cross sections.

At the Karlsruhe fast neutron time-of-flight spectrometer the investigation of γ-ray production cross sections of technologically important materials has been continued with the elements Cr and Ni. The excitation functions for the γ-ray production cross sections in inelastic neutron scattering have been measured at 125° from threshold to 10 MeV. The Karlsruhe cyclotron was used to produce a pulsed beam of neutrons having a continuous energy spectrum between ~ 0.5 and 30 MeV. The incident neutron energy was determined by the time of flight technique. The energy resolution ranged from 2.2 keV at 1 MeV to 70 keV at 10 MeV. Neutron flux determination was accomplished by use of a calibrated proton recoil detector. Preliminary results are shown for the γ-ray energies 1434 keV in $^{53}$Cr, 1454 keV in $^{50}$Ni and 1333 keV in $^{60}$Ni and compared with the results of other authors.

Key words: relative $^{6}$B standard; 24.3 keV neutron activation cross sections.

Using high-resolution detection techniques, intensities of specific activation lines from $^{197}$Au(n,γ)$^{200}$U(n,γ),$^{237}$Np(n,γ), and $^{114}$In(n,γ) were measured. Using the BNL HFBR iron-filtered neutron beam. From a comparison with the reaction $^{10}$B(n,γ), cross sections at 24.3 keV were determined.

Key words: measured capture gamma rays resolution approximately 80 keV; nuclear reactions $^{208}$Pb(n,γ)$^{209}$Bi $E_{n} = 11.2$ MeV.

The spectrum of gamma rays emitted by $^{208}$Pb from 11-MeV neutron capture has been measured with a Ge(Li) detector. Although the statistical quality of the data is poor it seems apparent that two-particle, one-hole states, as well as single-particle states, play a prominent role in fast neutron capture in $^{208}$Pb.

Key words: $E_{\gamma} = 24.3$ keV: neutron capture γ-rays: width correlations.

The characteristics of neutron capture γ-ray spectra near $E_{\gamma} = 24.3$ keV are discussed. The E-1 transitions following the capture of p-wave neutrons show a marked preference for populating low-lying states with s or d single-particle character. This preference introduces a significant correlation between partial (n,γ) cross sections and the neutron reduced widths for final states as measured in the (d,p) reaction.

Shape analysis and width correlation studies based on neutron capture data for $^{56}$Fe, $^{58}$Ni, $^{60}$Ni and $^{64}$Ni, F. H. Fröhner, SP425, pp. 929-933 (Oct. 1975).

Key words: nuclear reactions $^{56}$Fe, $^{58}$Ni, $^{60}$Ni(n,γ), $E = 6-150$ keV, deduced $\Gamma_{\ell}$, width correlations: shape analysis.

Previously reported neutron capture data were analyzed up to 150 keV for $^{56}$Fe, $^{58}$Ni and $^{60}$Ni, and up to 30 keV for $^{64}$Ni with a newly developed multilevel shape analysis code with the aim to improve and extend older area analysis results, to check whether the reported correlations between neutron and radiation widths are not produced e.g. by neglect of multilevel effects in the older self-shielding and multiple-scattering calculations and to search for channel effects such as asymmetric peak shapes.

γ-ray production cross sections for neutron inelastic scattering from Cr, Ni, $^{92}$Zr, and $^{94}$Zr from 3 to 6 MeV, G. Tessler and S. S. Glickstein, SP425, pp. 934-937 (Oct. 1975).

Key words: Cr, Ni, Zr; $E_{\gamma} = 3.6$ MeV; (n,γ); nuclear reactions; γ-production.

Cross sections for γ-ray production by neutron inelastic scattering from Cr, Ni, $^{92}$Zr, and $^{94}$Zr have been measured for incident neutrons in the energy range 3-6 MeV. The γ-rays were detected with a 55 cm$^2$ coaxial Ge(Li) anti-Compton spectrometer located at 55° to the incident neutron direction. Background associated with neutrons scattering from the samples into the Ge(Li) detector was suppressed
by the pulsed beam time-of-flight technique. Assignment of γ rays to transitions from specific energy levels of the isotopes of Cr, Ni, and Zr has been made using γ-ray energies determined from this work and energies and level schemes reported in the literature. Many of the observed γ rays could not be assigned to known levels.

Key words: angular distributions; differential cross sections; neutron cross sections; neutron time-of-flight spectroscopy.

Angular distributions of neutrons scattered elastically and inelastically from nitrogen-14 and oxygen-16 have been measured at neutron energies of 5.04, 6.25 and 9.29 MeV. Neutron flux attenuation and multiple scattering corrections were made using a modified version of an existing computer code. Special consideration was given in the modification of the code to develop an angular resolution function to treat the effects on multiple scattering corrections due to the solid angle subtended by the scattering sample at the neutron producing target. Graphs and tabulated results are presented as center of mass differential scattering cross sections versus the cosine of the center of mass scattering angle.

Key words: calculated σ(θ); measured σ(θ); nuclear reactions $^{16}$Nd(n,n), (n,n'), $^{148,160}$Sm(n,n), (n,n'), $^{152,154}$Sm(n,n + n'), E = 7.0 MeV.

Deformation effects in neutron scattering from isotopically enriched SmO$_2$ samples have been studied at an incident neutron energy of 7 MeV where a maximum of the deformation effects was observed in total cross section measurements on the same isotopes.

Differential cross sections for elastic scattering and inelastic scattering (first 2$^+$ state) were measured for $^{150}$Sm and $^{152}$Sm and for $^{146}$Nd, which was included in this study to aid in separating isospin effects from deformation effects. Cross sections for the sum of elastic and inelastic scattering (first 2$^+$ state) were determined for $^{152}$Sm and $^{146}$Sm.

Experimental cross sections are compared to the results of nonspherical optical-potential coupled-channel calculations.

Key words: fast neutrons; Pb; scattering; small angles; U.

By the application of a new technique, absolute cross sections for the small-angle elastic scattering of neutrons by U have been accurately determined at various energies in the range 7-14 MeV. The data show less strong forward-peaking at small angles than previously reported results. In addition, measurements of the small-angle scattering by Pb were also carried out over the same energy range; and the results, while in conflict with some previous reported measurements, are, apart from normalization, in excellent agreement with optical model calculations based on the energy independent, nonlocal potential of Perey and Buck.

Key words: compared with calculated excitation functions; measured $\sigma(E_n, 90^\circ)$ for ground, 45, 148 keV states; nuclear reactions $^{238}$U(n,n), (n,n'), $E = 0.9-2.7$ MeV; time-of-flight.

Differential cross sections have been measured via the time-of-flight method for neutrons scattered at 90° from the ground and first two excited states, at 45 and 148 keV, of $^{238}$U in the bombarding energy range 0.9 to 2.7 MeV. The $^{1}$(1,0) reaction was the neutron source. The $^{1}$Li($n$,n)Be reaction was the neutron source. The $^{1}$Li($n$,n)Be reaction was the neutron source.

Absolute measurements of neutron radiative capture cross sections for Na$^{23}$, Cr, Mn$^{55}$, Fe, Ni, Rh$^{103}$, Ta, U$^{238}$ in the keV energy range, C. Le Rigoleur, A. Arnaud, and J. Taste, $SP^{425}$, pp. 953-956 (Oct. 1975).

Key words: absolute radiative capture cross sections; keV energy range – Na$^{23}$, Cr, Mn$^{55}$, Fe, Ni, Rh$^{103}$, Ta, U$^{238}$.

The absolute measurements of several neutron radiative capture cross sections in the keV energy range are presented. The total energy weighting technique was used. Absolute neutron flux was done. Special care was given to the correction arising from the neutron sensitivity of the gamma detector.

Key words: absolute values; fluctuations; Monte Carlo calculations for corrections; total energy weighting technique; 4$\beta$ detector.

This reference capture cross-section has been measured by two different absolute methods: prompt γ measurements, activation method. The results obtained are in good agreement with the two methods and with Poenitz's recommendation.

Key words: Fe; multigroup capture cross section; Na$^{23}$; self shielding factor; 24 keV; 160 keV.

We present experimental values of the multigroup capture cross section and self shielding factor for natural iron and Na$^{23}$ between 24 keV and 160 keV. The capture rate is measured with a shielded neutron flux $\phi$ as $\phi \exp (-\sigma N X)$ after transmission through a sample of iron or Na$^{23}$, at room temperature. The self shielding factors at the non zero dilution are obtained by analytical calculation.

Key words: Auger electron spectroscopy; elemental depth profiling; ion microprobe mass analysis; ion optics; local thermal equilibrium (LTE); mineral analysis; secondary ion mass spectrometry (SIMS); surface analysis.

This book is the formal report of the Workshop on Secondary Ion Mass Spectrometry (SIMS) and Ion Microprobe Mass Analysis held at the National Bureau of Standards in September 1974. Invited and contributed papers cover a range of topics in the SIMS field: design of SIMS instrumentation; factors affecting secondary ion collection; techniques of reducing secondary ion mass spectra to yield quantitative compositional information; comparisons of SIMS with Auger electron spectroscopy (AES); techniques of obtaining elemental depth profiles and the instrumental and physical factors affecting such profiles; and applications of SIMS to the study of geological samples. The papers include both tutorial reviews and detailed reports on current research in SIMS. The volume should be of interest to all workers in the SIMS and surface analysis fields. These proceedings include the following papers (indented):

A critical discussion of the local thermal equilibrium model for the quantitative correction of sputtered ion intensities. C. A. Andersen, SP427, pp. 79-119 (Oct. 1975).

Key words: ASHRAE 90-P; building codes; mobile homes; NCSBCS.

The National Conference of States on Building Codes and Standards had its formal beginning in Wisconsin in 1967. Its formation represented a response by the States to recommendations for intergovernmental reforms in the area of building codes, prepared by the Advisory Commission on Intergovernmental Relations. The formative meeting held in Wisconsin was a direct outgrowth of an earlier exploratory meeting, involving several States, called by the National Bureau of Standards. At this meet-

Key words: annual report; computer; energy; environment; measurement; product safety; research; science; standards; technology.

This publication highlights the major achievements of the National Bureau of Standards during FY75 and describes how resources were utilized during this period. In addition, the report will contain sections featuring the Bureau's interaction with the public and private sectors and emphasizing the historical perspective in relation to the Bureau's 75th anniversary and the nation's bicentennial. This publication will serve as (1) an annual accounting of major NBS activities and (2) promotional information on NBS services and capabilities.

Sections of the report feature: increasing measurement competence, sharing measurement techniques, exploring our energy options, expanding computer utilization, preserving environmental quality, promoting better materials use, improving product safety, providing information as a resource, organization, funds and facilities, people.

3.8. APPLIED MATHEMATICS SERIES

Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

No publications issued in this series during this period.
3.9. NATIONAL STANDARD REFERENCE DATA SERIES

Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NBS. Program under the authority of National Standard Data Act (Public Law 90-396).

Key words: atomic energy levels, N I, N II, N III; multiplet tables, N I, N II, N III; nitrogen spectra, N I, N II, N III; spectra, N I, N II, N III; wavelengths, nitrogen spectra N I, N II, N III.

The present publication is the fifth Section of a series being prepared in response to the persistent need for a current revision of two sets of tables containing data on atomic spectra as derived from analyses of optical spectra. As in the previous sections, Part A contains the atomic energy levels and Part B the multiplet tables. The first three spectra of nitrogen, N I, N II and N III, are included. The form of presentation is described in detail in the text of Section I.

Key words: aqueous solution; chemical kinetics; data compilation; hydrated electron; radiation chemistry; rates.

A compilation of rates of reactions of hydrated electrons with other transients and with organic and inorganic solutes in aqueous solution appeared in NSRDS-NBS43, and covered the literature up to early 1971. This supplement includes additional rates which have been published through July 1973.

Key words: aqueous solution; chemical kinetics; data compilation; hydrogen atom; radiation chemistry; rates.

Rates of reactions of hydrogen atoms (from radiolysis of water and other sources) with organic and inorganic molecules, ions, and transients in aqueous solution have been tabulated. Directly measured rates obtained by kinetic spectroscopy or conductimetric methods, and relative rates determined by competition kinetics are included.

Key words: carbonates; crystal structure transformation; nitrates; nitrites; phase transformation; x-ray diffraction data.

A critical survey of the data describing crystal structure transformations in inorganic nitrates, nitrites, and carbonates is compiled. Data on crystallographic, thermodynamic, spectroscopic, electrical, dielectric, and other properties are given for each solid. Experimental techniques used to obtain the data are given and comments on the data are included in the tables. The literature is surveyed up to June 1973. References have been selected on the basis of their pertinence to the data cited.

Key words: chemical kinetics; data compilation; methanol; radiation chemistry; rates; review.

Product yields and primary yields in the radiolysis of methanol in the solid, liquid and vapor phase have been compiled and reviewed. Preferred values for G of the major products in the vapor and liquid states are listed. Rates of reactions of solvated and trapped electrons and other transient ions and radicals, and optical absorption and esr parameters for e- and H, CH3OH and CH3O- are also included.

Key words: cumulative property index; data compilations; National Standard Reference Data System.

A property index to data contained in publications of the National Standard Reference Data System during the period 1964-1972 is presented. Data compilations published in the NSRDS-NBS series, other publication series of the National Bureau of Standards, scientific journals, and books of commercial publishers are included. When used with the cumulative property index published annually since 1972 in the Journal of Physical and Chemical Reference Data, this index serves as an entry to the complete output of the NSRDS program.

Key words: chromates; crystal structure; crystal structure transformations; perchlorates; phase transformations; phosphates; sulfates; thermodynamic data; x-ray diffraction data.

Literature dealing with crystal structure transformations of simple inorganic sulfates, phosphates, perchlorates and chromates has been critically reviewed. Data on thermodynamic, crystallographic, spectroscopic, dielectric and other properties are given. Experimental techniques employed to obtain the data are indicated and comments on the data are made wherever necessary. All pertinent references to the published literature (up to 1974) are listed.
Disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

Key words: air leakage measurement; building heat transfer; computer programs; dynamic thermal performance; heat flow analysis; heating and cooling loads; temperature predictions; thermal analysis; thermostat setback; transient heat flows.

Measurements of the dynamic heat transfer in a four bedroom townhouse were made under controlled conditions in a large environmental chamber to explore the validity of a computer program developed at NBS, labelled NBSLD, for predicting heating and cooling loads and inside air temperatures. This study was supported jointly by the Department of Housing and Urban Development and the National Bureau of Standards, and is a part of a broader research program supported by both agencies to improve performance test procedures and criteria for housing.

The test house was a factory-produced four bedroom townhouse of modular design and of lightweight (wood) construction. Tests were performed with simulated outside summer, winter and fall diurnal temperature cycles. The inside temperature was maintained at about 75 °F. Also during the tests, the activities of a six-member family were simulated.

The time-varying energy requirements were measured, and these values were compared with computer predicted values. For example, the disparity between predicted and measured daily heating energy requirements averaged 3.1 percent with a maximum departure of 4.9 percent for five tests. The computer program NBSLD was experimentally validated for predicting the peak heating and cooling loads and the energy requirements for the test house.

The air leakage of the house was measured by a tracer gas technique over a range of outdoor conditions, and algorithms were developed to account for its effect on heating loads and energy requirements.

Separate tests were also performed to investigate the energy savings achieved by night temperature setback. An 8-h 9 °F setback from 75 °F produced an 11 percent diurnal savings in energy for an average nighttime temperature of 20 °F and a 9 percent savings in energy was achieved for the same setback when the average nighttime temperature was 2 °F.

Key words: DWV; performance testing; reduced-size vents; trap-seal retention; venting; venting criteria; vents, reduced-size.

This report describes the experimental findings of tests on a full-scale two-story plumbing system with reduced-size vents under a range of operating conditions including tests with the earlier work on full-scale systems of substantially different geometry, criteria for sizing reduced-size vents are given for general application to conventional 1-2 story housing units. In addition to the practical evidence in terms of acceptable trap performance, the current study provided fundamental evidence of the excessive present design criteria. For the first time measurements were obtained which relate traditional design criteria (air flow and vent pressure) to presently recommended performance criteria (trap-seal retention) under dynamic conditions. These findings indicate that the vents can be sized on the basis of 1.5 in water gage (equals 372 pascals) suction in the vent rather than the 1.0 in W.G. (equals 248.8 Pa) presently specified in the plumbing codes. Also air demands measured were significantly less than assumed in current practice for short stacks and for systems with vent networks.

Key words: buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornadoes; wind.

A methodology is presented for survey and evaluation of existing buildings to determine the risk to life safety under natural hazard conditions and estimate the amount of expected damage. Damage to both structural and nonstructural building components resulting from the extreme natural environments encountered in earthquakes, hurricanes, and tornadoes is considered. The methodology has the capability of treating a large class of structural types including braced and unbraced steel frames, concrete frames with and without shear walls, bearing wall structures, and long-span roof structures. Three independent but related sets of procedures for estimating damage for each of the natural hazards are included in the methodology. The first set of procedures provides a means for qualitatively determining the damage level on the basis of data collected in field surveys of the building. The second set utilizes a structural analysis of the building to determine the damage level as a function of the behavior of critical elements. The third set is based on a computer analysis of the entire structure. All three sets of procedures are based on the current state of the art. The procedures are presented in a format which allows updating and refining. Numerical examples illustrating application of the procedures are included.

Key words: contact resistance; electrical codes; electrical connections; fire safety; house wiring; materials properties; performance testing.

In the Operation BREAKTHROUGH research and demonstration program the U.S. Department of Housing and Urban Development became concerned with the inability to properly evaluate innovative electrical connections. Long life requirements, fire safety considerations, the lack of adequate technical information, and long established conventional practices and evaluation procedures have led to slow-changing regulations concerning electrical connections used in branch circuit wiring.
in housing. This report discusses the present methods of evaluating electrical connections, the technical parameters involved, and innovative electrical connection developments. Innovations involving electrical connections may lead to significant advancements in housing construction if it could be demonstrated that functional and safety requirements over the expected life of the electrical connections were adequately satisfied. Research is needed to enable prediction of long-term performance of electrical connections based on the results of accelerated performance tests.

Key words: bridge decks; chloride ions; concrete; corrosion; deicing salts; epoxy coatings; organic coatings; polyvinyl chloride coatings; steel reinforcing bars.

This work was undertaken to ascertain the feasibility of using organic coatings, especially epoxies, to protect the steel reinforcing bars embedded in concrete of bridge decks from rapid corrosion. This corrosion is caused by the chloride ions from the most commonly applied deicing salts, sodium chloride and calcium chloride. Altogether, 47 different coating materials were evaluated to some extent, consisting of 21 liquid and 15 powder epoxies; 5 polyvinyl chlorides; 3 polyurethanes; 1 polypropylene; 1 phenolic nitrile; and one zinc rich coating. The chemical and physical durabilities, chloride permeabilities, and protective qualities of the coatings were assessed. The bonds between coated and uncoated bars and concrete were measured by both pullout and creep tests.

The results indicate that both epoxy and polyvinyl chloride coatings, if properly applied, should adequately protect steel reinforcing bars from corrosion. However, only the epoxy coated bars had acceptable bond and creep characteristics when embedded in concrete. The powder epoxy coatings overall performed better than the liquid epoxies, and four powder epoxy coatings have been identified as promising materials to be used on reinforcing bars embedded in concrete decks of experimental bridges.

Key words: corrosion of underground pipes; district heating; hot and chilled water systems; insulation of underground pipes; specifications for underground systems.

This publication contains the keynote address and all the technical papers presented during the Symposium on Underground Heat and Chilled Water Distribution Systems, which was held on November 26 and 27, 1973 in Washington, D.C.

The Symposium was sponsored jointly by the National Bureau of Standards, the National Capital Chapter of the American Society of Heating, Refrigerating and Air-Conditioning Engineers, the Building Research Institute and the Association of Physical Plant Administrators.

The subject matter covered in the papers includes energy, economics, design criteria, heat transfer, corrosion protection, specification, operation, and maintenance related to underground pipes. These proceedings include the following papers (indented):

The energy situation and central plant, T. R. Casberg, BSS66, pp. 5-8 (May 1975).

Key words: central plant system; coal gasification; heat pump system; heat recovery and conservation system; nuclear fuel; on-site power generation system; petroleum problems.

Several optimistic myths regarding the energy situation in the United States are clarified by using factual data leading to an inevitable conclusion that there exists a real, rough and long lasting energy shortage.

The author stresses that the energy crisis demands engineers to forget yesterday’s data on building design practices and fuel costs, and to play an entirely new ball game that requires new thinking, a fresh approach, and a daring attitude. Several innovative approaches pertaining to central plant concept, such as on-site power generation, solar energy utilization, large scale heat pumps and energy storage are discussed.

Economic advantages of central heating and cooling systems, J. E. Mesko, BSS66, pp. 9-17 (May 1975).

Key words: central heating and cooling plants; cost analysis; cost comparison; economics; future trend; local building heating/cooling plants; Southeast Federal Area, Washington, D.C.

Economic comparisons between central and local building heating and cooling plants have been prepared and analyzed. Inherent and basic economic advantages in the distribution of heat and cooling from a single central district plant, over those practically attainable from individual local building plants, are analyzed and presented graphically. Factors contributing to the economic advantages of central plants are described.

The cost comparison performed for a 30-year future time period for the Southeast Federal Area of Washington, D.C., indicates that by year 2000 it will cost 15 to 20 percent less annually to own and operate a properly selected and phased central plant system than the optimum cost local plant systems.

Heat transfer studies of underground chilled water and heat distribution systems, T. Kusuda, BSS66, pp. 18-41 (May 1975).

Key words: chilled water pipe; earth temperature; heat transfer; multiple pipe system; underground pipe.

Heat transfer theory of underground pipe systems which include systems of more than one pipe at different temperatures buried in the same trench is summarized in this paper. Experimental observation made on a two-pipe chilled water system connecting the Pentagon and another Federal Office Building (FOB2) in Washington, D.C., was used to verify the theoretical analysis. In addition, the paper presents a concept of using integrated 10 ft average temperatures 110ET of selected earth temperature stations in the United States for design calculations.

The 110ET’s could be used for selecting the pipe insulation in lieu of the ground water temperatures on certain average temperatures, which are currently being used.

Key words: anodes; cathodic protection; coatings; corrosion; deterioration; inhibitors; materials selection; nonmetallics; rectifiers; water treatment.
Corrosion failures occur in all types of heat and chilled water distribution systems unless precautions are taken. Failures are expensive and cause shutdowns, hazardous conditions, occasional catastrophies and inconvenience to involved personnel and the general public. Corrosion leaks cause wetting of thermal insulation, resulting in thermal losses. For new construction, a corrosion survey should be made to determine best course of action, materials to use and the precautions needed to achieve the desired life of the piping. Cathodic protection is necessary for steel conduit or direct burial piping. Protection is also needed for steel pipe in insulative backfills. Mini-tunnels need to be kept dry or protection used. Internal corrosion is controlled with inhibitors. Nonmetallic materials and various means of construction should be considered to establish the best long-term approach. For existing systems, a survey should be made to determine if protection, repairs or replacement is the best course. Several case histories illustrate typical corrosion problems.

Available types of underground heat distribution systems, H. A. Borger, BSS66, pp. 52-59 (May 1975).

Key words: heat distribution; heating; high temperature water; hot water; insulation; piping; steam; underground piping.

This paper briefly discusses the main features and characteristics of various types of currently-available underground heat distribution systems, including concrete trenches, clay tile conduits, pressure testable steel conduits, sectionalized conduits, insulating envelopes, and sealed insulation systems.

Design criteria for auxiliary equipment for underground heating and cooling distribution systems, R. O. Couch, BSS66, pp. 60-72 (May 1975).

Key words: accesses; ball joints; concrete manholes; expansion joints; expansion loops; o-ring gaskets; pre-fabricated manholes; restrained piping.

Manholes are an important and necessary part of any distribution system. They may be made of concrete or pre-fabricated steel. Design considerations must be given to sizing, accesses, ventilation, sumps, and miscellaneous equipment. Expansion provisions must also be provided for piping in distribution systems by using natural piping flexibility, expansion joints, ball joints, or gasketed couplings on the pipe.

Federal agency specification for underground heat distribution systems, L. V. Irvin, Jr., BSS66, pp. 73-77 (May 1975).

Key words: ASTM; criteria; Federal Construction Council; interagency; prequalification; system performance; tri-service; underground heat distribution.

Past and present efforts of the Federal Construction Council (FCC) Task Group on Underground Heat Distribution Systems are reviewed. It is pointed out that the present FCC criteria, properly implemented by Inter-Agency performance specifications, have been very successful in reducing the number of system failures. It is also noted that these criteria are too inflexible, and have resulted in the use of unnecessarily expensive systems in some areas and prevented the acceptance of promising new concepts. The FCC criteria are now being updated and are expected to be made available in early 1974. General provisions of the proposed criteria, activities in other areas such as ASTM, which will affect Agency Specifications, and plans for revising the present specifications are discussed.

Specifications for an underground heated and chilled water system for private sector contracts, G. S. Campbell, BSS66, pp. 78-87 (May 1975).

Key words: cascade heater; insulated underground piping; insulation; limitation of liability: "or equal" specifications; performance specifications; schematic diagrams; specifications; specification writer.

Based on 30 years experience in Consulting Engineering, an overview is given of the technical specifications required (1) to show the designers' intent, (2) to set out clearly the material and equipment required under the proposed contract, and (3) to establish the construction methods which will be required for certain operations. The necessary capabilities of a specification writer are suggested. The true scope of a complete specification is outlined and a workable format is given. The impossibility of following the "3 names and catalogue numbers" approach is shown. A comment as to the practicality of the performance specification is given. Certain design considerations underlying an underground heated and chilled water system are enumerated. The need for accurate site utility information is emphasized. The need for accurate delineation of contract limits in the Contract Documents is shown. The typical equipment in the Central Energy Plant serving an underground system is enumerated. The various types of piping materials and their applications are discussed. Particular attention is given: cascade heaters, pumps, and insulated underground piping. The problems of protecting insulation are explored. Several thoughts on unexpected design and installation problems are given. The need for Limitation of Designer Liability is explained. Finally, a method is suggested to obtain maximum competition at minimum contract cost.

Key words: condensate return; epoxy; fiberglass reinforced plastic; filament-wound; insulated; molded; morpholine; prefabricated steel conduit; Qualified Products List; teline.

In 1967 approximately 3,700 lineal feet of uninsulated fiberglass reinforced plastic (FRP) pipe was installed for condensate return service in a steel conduit with an insulated steam line at the Naval Weapons Center, China Lake, California. The FRP fittings failed. Factors contributing to the failures were: (1) improper supports for the FRP line which prevented free movement; and, (2) the FRP elbows installed had a lower pressure rating than specified. The testing procedure followed to evaluate the product of another FRP pipe manufacturer and measures taken to provide a successful condensate return system are discussed.

Inter-building heat energy distribution systems; growth, operation and maintenance experience, W. L. Viar, BSS66, pp. 102-115 (May 1975).

Key words: anchor; controls; corrosion; growth; metering; modern; museum; primary; reliability; renovation; secondary; system; variable.

District heating concepts are used in heat energy supply to the vast majority of buildings at the University of Vir-
ginia. Building ages and construction methods range from 1825 to the present. A number of buildings are too distant from the central heating plant, and are heated by their respective small fired-furnace circulating water systems. Services distributed underground from the central plant include multi-pressure steam lines, medium temperature hot water and domestic hot water. Demands have increased severely on all systems, particularly since 1952. During the period 1965-75 University building space will have been increased by about 112 percent; not all new loads will be placed on central heating facilities. Growth, renovation and upgrading effects on operation and maintenance of heat generating and distributing equipment and personnel have been encumbering at times. Proper planning, scheduling, design and construction followed by satisfactory performance of equipment, systems and personnel have been combined to achieve adequate winter conditioning for this institution, with continuity. Summer air conditioning is relatively new here. Refrigeration units are scattered, vary from one-half to 1,000 tons capacity, have been added in less than systematic fashion, to be generous. There is no inter-building distribution of chilled liquids to date. It is envisioned that central heating and central cooling concepts will ultimately be blended here for most efficient utilization and rejection of heat energy in the pursuit of controlled environment.

**Cathodic protection can be an effective means for preventing corrosion on underground metallic structures**, R. C. Young, BSS66, pp. 116-119 (May 1975).

**Key words:** cathodic protection; insulating joints; non-conducting coating; sacrificial anodes; soil resistivity.

Cathodic protection can effectively prevent electrochemical corrosion on underground metallic piping and other structures for as long as the use of the piping is required. However, the system must be designed to suit the soil environment, and physical makeup of the structure by someone fully experienced in such work. Thorough inspection must be maintained during installation to assure that the system is properly installed as verified by a completion check by a knowledgeable person. Included in the final report should be a maintenance program to monitor the cathodic protection system preferably one that can be made by regular maintenance personnel. The maintenance program should be carried out fully, and any failures that occur should be remedied promptly otherwise early failure of the structure may be experienced.

**Operation and maintenance of steel conduit systems**, R. J. Ruschell, BSS66, pp. 120-121 (May 1975).

**Key words:** design specification; guide and installation procedures; steel conduit system.

Thousands of manhours have been devoted to preparing a “Guide Specification for Military Construction, Heat Distribution Systems Outside of Buildings”. This specification has been in mandatory use since 1965 by the Department of Defense and other Federal and State agencies. The system design and installation procedures have incorporated the knowledge and experience of many of the most able mechanical engineers from government and private industry. Only minor changes have been made to the Guide Specification during the past twelve years. No guide or procedure has been issued in regard to maintaining these underground systems. Additional years of useful economic life could be realized from a program of inspection and prompt repair procedures where indicated.

**Key words:** air leakage; Arctic; central heat distribution systems; construction materials; drainage; insulation; permafrost; seasonal frost; snow drifting; utilidors; ventilation.

Buried, on-grade and elevated central heat distribution systems have been built in the cold regions of the Northern Hemisphere. Heating lines are frequently routed along with water lines, sewers and other utilities in conduits known as utilidors. In areas where the ground is permanently frozen, systems are generally designed to prevent thaw and subsidence of the supporting soil as well as prevent freezing liquids in the lines. One approach is to support the utilidor on piles. Such utilidors are often elevated several feet above the surface to minimize snow drifting problems. Elevated utilidors can be obstructions to the movement of individuals and vehicles in a community. Elevated utilidors subjected to differential heave and settlement have developed gaps through which cold air infiltrated and caused freezups.

The bulb of thaw created around a buried conduit containing warm utilities can be a collecting point for ground water, especially in the spring. Flooding can result unless the conduit is watertight or provisions are made to redirect the ground water. Many large buried utilidors in Siberia are ventilated in the winter to annually refreeze the surrounding soil.

Provisions for winter maintenance are important features of all central heat distribution systems in cold regions.

To illustrate the above points, design and performance data are presented in this paper for several central heat distribution systems in Alaska, Canada, Greenland and Siberia.

**Key words:** fire performance of piping; functional performance of piping; performance characteristics for piping; thermal/structural performance of piping; thermoplastic piping in plumbing.

The paper is a review of existing information on the physical characteristics of thermoplastic piping that are of particular interest in considering its potential for use in residential, above-ground plumbing. The presentation is oriented to considerations of adequacy of functional performance of plumbing systems from the user’s/owner’s viewpoint in contrast with the typical product-specifications oriented format reflected in current standards.

Not only are the physical characteristics emphasized that relate most directly to the determination of functional performance of installed systems, but the importance of design and installation detail in the context is discussed.

In conclusion, this review indicates the need for better use of existing knowledge as well as for some research and test development work particularly in the areas of thermal properties, response to building fires, and resistance to water hammer.

**BSS70. Windows and people: A literature survey. Psychological reaction to environments with and without windows**, B. L. Col-
The use of plastic pipe in plumbing systems of multiple-occupancy buildings has raised considerations regarding fire safety. To provide needed data, ten full-scale fire endurance tests were performed involving a total of 39 plumbing chase and wall assemblies containing plastic and metal drain, waste, and vent (DWV) systems typical of installations serving one or two story buildings. Two tests were conducted using plumbing chase configurations simulating kitchen sink drain systems. The PVC DWV piping in these installations did not contribute to spread of fire from one side of the construction to the other. Six fire endurance tests were conducted in which the performance of ABS, PVC, copper and iron was compared directly in kitchen sink drain systems as installed in wood-stud and gypsum-board walls. The stacks ranged from 2 inch to 4 inch in diameter and laterals from 2-1/2 inch to 4 inches. In these tests it was noted that the plumbing configuration and wall construction details, particularly the sealing of plumbing penetrations, seriously affected the fire endurance of the barrier. Satisfactory performance was achieved when certain conditions were met. In the two tests involving nominal 2 by 4 steel-stud and gypsum-board walls it was determined that the one-hour fire resistance rating of the wall was reduced considerably when ABS or PVC DWV was installed within it using the construction details described in this report. These details included back to back 1-1/2-in diameter laterals feeding directly into 2-in diameter stacks.

Key words: accelerations; buffeting; building codes; buildings; deflections; dynamic response; gust factors; structural engineering; wind engineering; wind loads.

Certain shortcomings of current procedures for computing alongwind structural response have been shown to result in unrealistic estimates of tall building behavior under the action of strong winds. Differences between predictions of fluctuating response based on various such procedures may be as high as 200 percent. In recent years, advances in the state of the art have been made which provide a basis for significantly improved alongwind response predictions. The purpose of the present work is to present a procedure for calculating alongwind response which incorporates and utilizes these advances. The basic structural, meteorological and aerodynamic models employed are described, and expressions for the alongwind deflections and accelerations, consistent with those models, are derived. A computer program is presented for calculating the alongwind response of structures with unusual modal shapes or for which the contribution of the higher modes to the response is significant. For more common situations, a simple procedure is presented which makes use of graphs and on the basis of which rapid manual calculations of the alongwind deflections and accelerations can be performed. Numerical examples are given to illustrate the use of the computer program and of the graphs. Results of numerical calculations are used to discuss some of the approximations and errors inherent in the models employed.

Key words: acoustics; air infiltration; air leakage; architectural acoustics; building acoustics; doors; energy conservation; heat loss from buildings; heat transfer; sound transmission loss; thermal resistance; thermal transmittance; windows.

Laboratory tests of sound transmission loss, thermal trans-
mittance, and rate of air leakage were conducted on full scale (9 feet high \( \times \) 14 feet wide; 2.7 \( \times \) 4.3 meters) specimens of typical residential exterior wall constructions, either unbroken or penetrated by a door or window. The walls were of wood frame construction with gypsum board drywall interior finish and exterior finishes of wood siding, stucco, or brick veneer. Additional acoustical tests were run on a number of individual doors and windows. A total of 109 acoustical tests and 48 thermal tests are reported. The resultant data are compared with literature data on similar constructions. Correlations developed among the several quantities measured will assist more rational design where both energy conservation and noise isolation must be considered.

Key words: building design; building energy analysis; energy conservation options; energy design optimization; heating and cooling load calculation.

The design phase of the GSA-Manchester Building included extensive analysis of the building design and operation to determine the potential for energy conservation. Described in this report are highlights and a summary of the calculations performed during the design phase. The analysis included a study of the exterior shell, ventilation rate, lighting and occupancy levels, room temperature controls, and nighttime flushing of the building using outdoor air, on the predicted yearly energy consumption of the building.

Key words: boiler oversizing; efficiency vs. heating load; modular boilers; modular concept; seasonal efficiency.

The modular concept of boiler operation was examined in a laboratory test of five gas-fired, cast iron, hydronic boilers. Four of the boilers, each having an input rating of 85,000 Btu per hour, were arranged so that they could either be operated like a single boiler (i.e., all of the boilers either on or off) or as a modular installation in which the boilers are sequentially fired to match the number in operation with the heating load. The fifth boiler had an input rating of 300,000 Btu per hour and was operated as a single boiler installation. Efficiency vs. heating load curves were obtained for the single boiler installation, the four small boilers run like a single boiler and the modular installation operated with and without water flowing through the "idle" modules. These efficiency curves were then used to theoretically predict the effect of the modular concept and boiler oversizing on the seasonal efficiency of gas-fired heating plants. It was found that under certain conditions the use of a gas-fired modular boiler installation instead of a single large boiler could result in considerable energy savings.
3.11. FEDERAL INFORMATION PROCESSING STANDARDS

Key words: COBOL; data processing; Federal Information Processing Standard; information interchange; information processing; programming language; software; standards conformance.

This FIPS PUB announces the adoption of the American National Standard COBOL (X3.23-1974) as the Federal Standard COBOL. This revision supersedes FIPS PUB 21 and reflects major changes and improvements to the COBOL specifications. The American National Standard defines the elements of the COBOL Programming Language and the rules for their use. The standard is used by implementors as the reference authority in developing compilers and by users for writing programs in COBOL. The primary purpose of the standard is to promote a high degree of interchangeability of programs for use on a variety of automatic data processing systems.

The COBOL language is intended for use in computer applications that emphasize the manipulation of characters, records, and files.

Key words: ADP standards; computers; data processing; Federal Information Processing Standards; metric conversion; SI units; standards.

The use of SI (International System of Units) within the United States is increasing. The Secretary of Commerce has established the policy that publications of the Department will provide dual-dimensions to the extent practicable.

The Federal Information Processing Standards (FIPS) Program in response to Public Law 89-306 (the Brooks Act) strives to improve the utilization of ADP equipment, goods and services within the Federal Government through the establishment of uniform Federal automatic data processing standards. These standards and guidelines which are published by the National Bureau of Standards as FIPS contain specifications which should be expressed as dual-dimensions. Accordingly, this guideline will be used in the preparation of all new FIPS PUBS and existing FIPS PUBS when revised.

Key words: American Standard Code for Information Interchange; ASCII, coded character subsets; codes, data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets.

This FIPS PUB announces the adoption of the American National Standard X3.41-1974, Code Extension Techniques for Use with the 7-Bit Coded Character Set of ASCII. This standard specifies methods of extending the 7-bit code of ASCII (FIPS 1), remaining in a 7-bit environment or increasing to an 8-bit environment, building upon the structure of ASCII to describe various means of extending the control and graphic sets of the code. It also describes techniques for constructing codes related to ASCII so as to allow application dependent usage without preventing the interchangeability of their data and describes 8-bit codes for general information interchange in which ASCII is a subset.

Key words: American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets.

This FIPS PUB announces the adoption of the American National Standard X3.32-1973, Graphic Representation of the Control Characters of American National Standard Code for Information Interchange. This standard specifies graphical representations for the 34 characters of ASCII (FIPS 1) for which a graphic representation is not indicated in FIPS 1. Graphical representations are given for the 32 control functions of columns 0 and 1 as well as the characters "Space" and "Delete." Two forms of graphical representations for each of the 34 characters are provided: a pictorial symbol, and a 2-letter alphanumeric code.

Key words: data communication equipment; data processing terminal equipment; data transmission (high speed); Federal Information Processing Standards; synchronous signaling rates; teleprocessing; wide band.

This FIPS PUB announces the adoption of the American National Standard X3.36-1975, Synchronous High Speed Data Signaling Rates Between Data Terminal Equipment and Data Communications Equipment, and is the same as Federal Standard Number 1001. This standard specifies a series of signaling speeds for synchronous high speed serial data transfer.

Key words: access controls; ADP security; computer security; Federal Information Processing Standards; information management; personal data; physical security; privacy risk assessment.
This publication provides guidelines for use by Federal ADP organizations in implementing the computer security safeguards necessary for compliance with Public Law 93-579, the Privacy Act of 1974. A wide variety of technical and related procedural safeguards are described. These fall into three broad categories: Physical security, information management practices, and computer system/network security controls. As each organization processing personal data has unique characteristics, specific organizations should draw upon the material provided in order to select a well-balanced combination of safeguards which meets their particular requirements.

Key words: benchmarking; benchmark mix demonstration; computer selection; Federal Information Processing Standard; workload representation.

This publication provides general guidelines to be used by Federal agencies as best practices of benchmark mix demonstrations for validating hardware and software performance in context with processing the users' expected actual workload. It treats selection of the benchmark mix, sanitation of the benchmark mix, planning for the benchmark mix demonstration, and conducting the benchmark mix demonstration.

Key words: COBOL; Federal Standard COBOL; program conversion; programming aids; programming languages.

Since COBOL is a "living" language, in the sense that it is under constant development and clarification, the Federal community which relies heavily on COBOL to satisfy their programming needs has a large degree of assurance that COBOL will continue to meet their data processing needs as future generation systems are introduced. However, along with the advantage of having more sophisticated and better COBOL tools to interact with new systems requirements, there is a short term disadvantage. As clarifications and new facilities are added, they must interact with the language specifications already standardized, and this interaction sometimes requires changes in source programs. An analysis, in the form of narrative descriptions and syntax comparisons, is provided to aid in the transitioning of COBOL programs for use with compilers developed in accordance with the 1968 COBOL Standard (FIPS PUB 21) to compilers developed in accordance with the 1974 COBOL Standard (FIPS PUB 21-1).
3.12. PRODUCT STANDARDS

Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The purpose of the standards is to establish nationally recognized requirements for products, and to provide all concerned interests with a basis for common understanding of the characteristics of the products. The National Bureau of Standards administers the Voluntary Product Standards program as a supplement to the activities of the private sector standardizing organizations.

Key words: construction and industrial plywood; industrial plywood; plywood, construction, and industrial.

This Voluntary Product Standard covers requirements and methods of test for the wood species, veneer grading, glue bonds, panel construction and workmanship, dimensional tolerances, marking, moisture content, and packing of plywood intended for construction and industrial uses.

Also included are a glossary of trade terms and a quality certification program. Information regarding generally available sizes, methods of orderings, and reinspecting practices, is provided in the appendix.

Key words: containers for petroleum products; jerry-cans; petroleum products, containers for; plastic containers for petroleum products.

This Voluntary Product Standard covers requirements and methods of test for the material, design, and properties of plastic containers (jerry-cans) intended for use with petroleum products. Methods of identifying containers that conform to the requirements of the standard are included.

Key words: diamond powder, grading; grading of diamond powder; powder, diamond; sizes, sub-sieve of diamond powder.

This Voluntary Product Standard covers the quality requirements of sub-sieve sizes of diamond powder and establishes the standard particle size ranges for micron sizes. It establishes size designations of the size ranges and the grading limits that are acceptable in each size range. It also gives a method of inspection to determine compliance with this standard and directions for the labeling of powder to indicate such compliance.

Key words: foam mattresses; hospital mattresses; latex; latex foam mattresses; latex foam for hospitals; mattresses.

The purpose of this Voluntary Product Standard is to establish nationally recognized dimensional and quality requirements for latex foam mattresses intended for use in hospitals, and to provide producers, distributors, and users with a basis for common understanding of the characteristics of this product.
3.13. TECHNICAL NOTES

Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other Government agencies.

Key words: accuracy; appearance; error analysis; gloss; photometry; reflectance; scattering; spectrophotometry; specular gloss.

The 20-, 60-, and 85-degree specular gloss scales are established at NBS with an accuracy of about one half gloss unit. This is one of many programs of the spectrophotometry group of the Optical Radiation Section of NBS directed toward improving the accuracy and assurance of spectrophotometric measurements made throughout the scientific and industrial community.

The specular gloss scales are established through a unique technique employing polarized light flux both parallel and perpendicular to the plane of incidence. General calibration equations are derived. NBS instrumentation and measurement procedures are described. Instrument calibration and error analyses are performed. Some of the analyses can also be applied to reflectance measurements in general.

Key words: electric near-field probe; electromagnetic-field hazard; field-strength measurements; magnetic near-field probe; near-field measurements; r-f hazard measurements; semiconducting transmission line.

This publication describes the development and design of small electric and magnetic near-field probes for measuring hazard-level fields up to 20,000 V/m and 100 A/m, respectively. They were originally designed to be used over the frequency range from 10 to 30 MHz, and consist of short dipole antennas and small, single-turn balanced, loop antennas to measure the electric- and magnetic-field components, respectively. The probes are intended for use by various researchers in their electromagnetic, radiation-exposure programs for determining the effects of hazard-level, nonionizing, EMI fields on living tissue, electroexplosive devices, and volatile fuels.

In order to later extend the use of the probes to frequencies above 30 MHz, a detailed analysis was made of several types of measurement errors likely to be encountered. The principal errors result from a variation with frequency in the effective length and impedance of the dipoles; and the electric-dipole response and partial resonance of the loops. Corresponding corrections are given for each type of error as a function of the operating frequency from 10 to 1000 MHz, and as a function of the physical and electrical sizes of the probes.

As a result of the analysis, the dipoles can now be used for measurements at frequencies up to 750 MHz and the loops to 75 MHz with an estimated uncertainty of 0.5 dB. Applying recommended corrections will provide a substantial further increase in the usable frequency range.

Key words: clocks; coordinate time; general relativity; time.

This paper investigates some of the possible operational procedures for synchronizing clocks at fixed sites spread around on the earth's surface, to within a 1 nanosecond level of accuracy. Since a common synchronization procedure is by transport of standard clocks in commercial jet airline flights, and most of the effects we shall discuss are fractional corrections to the elapsed time, as a criterion of whether an effect is significant at the 1 nanosecond level we take for comparison purposes an elapsed time $T_e = 10$ hours. This is a typical time for an intercontinental airplane flight. Analysis of a number of effects which might affect clock synchronization is carried out within the framework of general relativity. These effects include the gravitational fields of the earth, sun, and moon, and orbital motion, rotation, and flattening of the earth. It is shown that the only significant effects are due to the gravitational field and rotation of the earth, and motion of the transported clocks. Operational procedures for construction of a synchronized coordinate clock network using light signals and transported standard clocks are discussed and compared.

Key words: accuracy evaluation; atomic beam frequency standards; cavity phase shift.

For atomic beam frequency standards, an analysis is described for estimating the frequency bias due to distributed cavity phase difference over finite beam widths, and for estimating the resulting inaccuracy in power shift and beam reversal experiments. Calculated atomic trajectories and simplified r-f field distributions are used, as well as certain assumptions about beam tube alignment. The results are applied to one of the present NBS primary time and frequency standards and a shorter tube geometry.

One conclusion is that beam reversal experiments are not necessarily much more accurate than power shift experiments and that the use of both methods (plus the use of pulse techniques) is desirable.

Key words: accuracy; atomic clocks; clocks; crystal oscillator; frequency standards; stability; survey of clocks.

Precision oscillators used in PTTI applications include quartz crystal, rubidium gas cell, cesium beam, and hydrogen maser oscillators. A general characterization and comparison of these devices is given including accuracy, stability, environmental sensitivity, size, weight, power consumption, availability and cost. Areas of special concern in practical applications are identified and a projection of future performance specifications is given. An attempt is made to predict physical and performance characteristics of new designs potentially available in the near future.

TN663. Characterization of a high frequency probe assembly for integrated circuit measurements, R. L. Jesch and C. A. Hoer,
Key words: high frequency probe assembly; integrated circuit transistors; parasitic element; S-parameters.

A detailed, application-oriented description of a measurement technique that characterizes a high-frequency probe assembly for integrated circuit measurements is given along with the procedure that extracts the parasitic effects of the probe assembly from measurements made at the input connectors of the probe assembly. The scattering parameters of an integrated-circuit device or transistor can now be extracted and accurately determined up to 2 GHz at the wafer stage of assembly. This represents a significant advance over conventional techniques that enable only dc parameters to be measured. Measurement results using this technique are given along with the precision of values obtained as well as the nature of the measurement bias introduced by the probe assembly.

Key words: cryogenic technology; data; energy fuel; hydrogen; hydrogen properties; LNG/SNG; production; safety; storage.

This NBS Technical Note is a compilation of references dealing directly and indirectly with the possible future use of hydrogen as a fuel. The references were selected using an automated information system operated by the Cryogenic Data Center. This bibliography of references emphasizes the use of cryogenic technology in the hydrogen field. Articles are indexed under 40 subject headings and an author index is included. Over 1600 references are included in this bibliography.

Key words: laser; power; pyroelectric.

A 1 cm² plastic (PVF2) pyroelectric detector, developed in this laboratory, has been applied to measure low level laser power. The result is a compact instrument which has a low noise equivalent power (10⁻⁹ W/Hz²/3), and fast response (1 s averaging time), and which is precise (σ = ± 1%), uniform (± 1%), and inherently free from short term drift. This note describes the fabrication of the detector, the design of the instrument, and the results of an extensive evaluation of three such instruments.

Key words: automobile; detection; dispersion; explosion; fire; hydrogen; leakage; methane; safety; vents.

Gasoline-powered automobiles are being converted to operate on gaseous fuels such as H₂ or CH₄. These fuels are commonly stored in containers located in the trunk of the car. Potential leakage of these gaseous fuels into the passenger compartment of the vehicle constitutes a safety threat. Definitive experiments were performed to identify the explosion hazards, establish venting criteria and obviate general safeguards for H₂ or CH₄ fueled passenger vehicles. Appropriately designed ventilation systems significantly reduce the safety hazards associated with accumulated combustible gases. Vents are recommended for all autos converted to burn H₂ or CH₄ and may possibly be eliminated in new cars that are designed for gaseous fuel operation. Combustible gas warning systems are recommended, at least in the interim, for all (converted and new-design) gaseous fueled vehicles. H₂ and CH₄ gases appear equally safe as vehicular fuels if used in properly designed vehicles.

Key words: antennas; error analysis; far-field pattern; near-field measurements; planar scanning; plane-wave spectrum.

General expressions are derived for estimating the errors in the sum or difference far-field pattern of electrically large aperture antennas which are measured by the planar near-field scanning technique. Upper bounds are determined for the far-field errors produced by (1) the nonzero fields outside the finite scan area, (2) the inaccuracies in the positioning of the probe, (3) the distortion and nonlinearities of the instrumentation which measures the amplitude and phase of the probe output, and (4) the multiple reflections. Computational errors, uncertainties in the receiving characteristics of the probe, and errors involved with measuring the input power to the test antenna are briefly discussed.

Key words: dissemination; frequency; high frequency broadcasts; standard; time.

Methods to determine time or frequency by reception of NBS high frequency radio broadcasts are discussed. Results are shown for calibration of time signals to within ±100 microseconds and calibration of frequency offset with a resolution of better than 1 part in 10⁶. These results are achieved by using a systematic approach and refined measurement technique.

Key words: accurate frequency measurement; accurate time measurement; frequency; frequency stability; frequency stability analysis; models of frequency stability; picosecond time difference measurements.

The specification and performance of precision oscillators is a very important topic to the owners and users of these oscillators. This paper presents at the tutorial level some convenient methods of measuring the frequencies and/or the frequency stabilities of precision oscillators—giving advantages and disadvantages of these methods.

Conducting such measurements, of course, gives additional understanding of the performance of the given pair of oscillators involved. Further it is shown that by processing the data from the frequency measurements in certain ways, one may be able to state more general characteristics of the oscillators being measured. The goal in this regard is to allow the comparisons of different manufacturers' specifications and more importantly to help assess whether these oscillators will meet the standard of performance the user may have in a particular application.

The methods employed for measuring frequency are designed for state-of-the-art oscillators, and an effort has been made to allow for fairly simple, inexpensive, and/or commonly available components to be used in the measurement systems. The method
for measuring frequency stability is basically that recommended by the IEEE subcommittee on Frequency Stability of the Technical Committee on Frequency and Time of the IEEE Group on Instrumentation & Measurement.

Key words: attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis.

This technical note describes in detail a new NBS instrument for the measurement of the scattering parameters ($S_{ij}$) of RF and microwave components. The instrument is the Time Domain Automatic Network Analyzer (TDANA). It utilizes time domain pulse measurements to obtain frequency domain parameters. The frequency range is dc to 18 GHz with a lower upper limit for large values of attenuation. The instrument consists of three major components: an ultra-fast pulse generator, a broadband sampling oscilloscope, and a digital minicomputer.

Key words: admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; reflection coefficient; reflectometer; self-calibration; six-ports; vector voltmeter; voltage.

This review paper brings together a number of old and new methods for measuring voltage, current, power, impedance, and phase angle using only amplitude type detectors. Vector voltmeters and reflectometers can be constructed to measure all of these quantities in terms of four amplitude measurements made on four arms of a six-port junction. Whereas previous uses of this type of instrument depended on precision components for accuracy, new equations switch this dependence primarily to detector linearity and only secondarily on the properties of the measuring device itself.

Key words: frequency; questionnaire; standard frequency and time broadcasts; time.

The users of the National Bureau of Standards (NBS) radio stations WWV and WWVH were surveyed by means of a questionnaire. The questionnaire was distributed to the station mailing list, published in some periodicals, and its availability was announced on the stations themselves and publicized in other periodicals. More than 12,000 completed questionnaires were returned, which revealed, among other things, that the 5, 10, and 15 MHz transmissions were the most used frequencies; 25 MHz was the least used. Of the information contained on the broadcasts, the voice time-of-day announcement was the most important, and the DUTI values the least important. In general the returns were very supportive of the services, with only two of the more than 12,000 responses advocating a complete shutdown of the broadcasts.

Key words: building codes; buildings; energy conservation; standards.

Presentations included in this document are those of other Federal Agencies, States, technical societies and industry organizations.

This document is a companion document to NBS Technical Note 789, "Technical Options for Energy Conservation in Buildings."

Key words: accidents; FFACTS; gasoline; gasoline containers; gasoline incidents; gasoline-related fires; ignition-causing activities; ignition sources; volatile flammable liquids; volatile flammable liquids incidents.

Gasoline was involved in 72 percent of the 645 volatile flammable liquids fire incidents found in the NBS Flammable Fabrics Accident Case and Testing System as of December 1973. These gasoline incidents, particularly those that were container-related, were studied in detail. Male victims outnumbered females approximately 5 to 1. Both males and females, ages 6-20, were injured more frequently than would have been expected if the incidents for each sex had been distributed uniformly over all age groups. Starting or tending an open fire caused ignitions most frequently and involved primarily males ages 13-45. Children were injured most from knocking over or dropping a container of gasoline close to an ignition source and playing with gasoline and an ignition source. Matches were the most frequent ignition source. Containers ranged from large gasoline cans to kitchen measuring cups, although gasoline cans were reported most often. The youngest children were involved most with some of the largest containers. The remaining victims were involved primarily with smaller, more easily managed containers. There was no indication that the gasoline containers, by themselves, contributed substantially to these incidents. The problem was one of human error—misuse or abuse of the gasoline, the container, or both.

Key words: computer programs; contour plotting; constrained refinement; crystallographic calculations; Fourier section; Fourier synthesis; least squares.

This report gives detailed descriptions and instructions for use of a system of programs for crystallographic calculations, including least-squares refinement with generalized systems of constraints, calculation of bond distances and angles with errors, Fourier synthesis, plotting of contours in Fourier maps, and preparation of structure factor tables for publication.

Key words: accelerometer; performance characteristics; piezoelectric; test method; thermal radiation; thermal transient; zero shift.

103
A simple, inexpensive method was developed for determining the effects of thermal transients on the zero output and sensitivity of piezoelectric accelerometers. Thermal transient stimuli are generated by an incandescent lamp and can be made to heat the top or side of the test accelerometer. Fourteen commercial accelerometers were tested using this technique. Zero shifts with magnitudes as high as 640 g* were observed. Zero shifts up to 2 percent of full-scale resulted from one-second duration transients, and up to 7 percent of full-scale from fifteen-second transients. These results were obtained at a radiation power density of 1.8 W/cm². No changes of accelerometer sensitivity exceeding experimental uncertainties were noted as a result of the thermal transients used.

Key words: boundary initial problems; measurement; pressure transducer; transducer calibration; vibration.

By making appropriate physical approximations and idealizations a theoretical explanation is found for a vibratory phenomenon observed in calibrating pressure transducers inside thin liquid filled cylinders. The theoretical explanation requires proving the equivalence of two boundary initial problems which define the vibratory phenomenon. A short, general and complete proof of this equivalence is given.

Key words: analytical chemistry; computers; data acquisition; data processing; fluorimetry; laboratory automation; real-time.

The National Bureau of Standards Analytical Chemistry Division uses a centralized computer system to automate a number of experiments. Computer software for a fluorimetry application is described in this report. The file and program structure used is quite general and can be applied to other experiments as well.

Key words: buildings; fire loads; occupancy live loads; load surveys; structural engineering; survey techniques.

The development of a survey program for determining the fire loads and live loads in office buildings is described. Considerations involved in planning the program which is directed toward establishing the factors affecting the loads in buildings are presented. The type of data to be collected and a data collection technique which utilizes visually observed information on the characteristics of building content items to determine weight are discussed. Procedures employed to select buildings to be included in a nation-wide office building load survey being conducted by the National Bureau of Standards and a sampling plan for selecting rooms to be surveyed in these buildings are also discussed.

Key words: architecture; bibliography; building; construction; design; law enforcement facilities.

Citations and abstracts are provided on literature concerning the planning, design, and construction of law enforcement facilities in the United States and in foreign countries. In addition, plans of 21 select law enforcement facilities are included.

Key words: activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; radiation; radiography.

This report summarizes all those programs which depend on the NBS reactor. It covers the period from July 1973 through June 1974. The programs range from the use of neutron beams to study the structure and dynamics of materials through nuclear physics, and neutron standards and neutron radiography to sample irradiations for activation analysis, isotope production and radiative effects studies.

Key words: building construction; detectors; flame spread; furnishings; interior finishes; noncombustible; smoke development; sprinklers; survey.

A questionnaire survey on selected fire protection engineering topics was sent to 422 persons from every state and major city in the United States and, also, parts of Canada. The surveyed included architects, engineers, insurance and government representatives, academics, and fire services personnel. One hundred and eighty-six questionnaires were returned, a 46.2 percent return rate. This return rate is more than double the National average on survey returns. The questionnaire covered topics such as the adequacy of the term "noncombustible" as contained in the National Fire Protection Association's National Fire Code, hazards of fire loading concepts, code regulation and enforcement, furnishings, sprinkler systems and smoke detectors. In addition to the questionnaire data, many of the surveyed took the time to write in various unsolicited comments.

Although this survey does not represent a statistical study approach, it is the best effort to date to gather and document the current professional thinking on fire protection matters. When the data permitted, obvious and significant group thought ideas and patterns are documented. The objective of this survey is to collect and document professional opinions on selected fire protection engineering topics for the purpose of determining current professional thinking, and indications of future trends of thought.

Key words: cracks; flaws; ion beam milling; metals; microscopy; surfaces.

The technique of ion beam milling coupled with subsequent optical and scanning electron microscopy has been applied as a means of detecting and characterizing small surface intersecting cracks. Two types of cracked specimens involving different metals were studied. Various orientations of the crack plane, crack direction, and ion beam were explored. The technique is capable of increasing the sensitivity for detection of small cracks and also removing distorted surface layers and revealing the crack more accurately.

Key words: bituminous roof membranes; fatigue testing; flexural fatigue; performance criteria; roofing; temperature effects; tensile fatigue; test methods.

Tensile and flexural fatigue tests were performed on built-up roof membrane specimens (ASTM Designation: D2523-70) fabricated from four different material systems. The tensile fatigue tests were run under cyclic load control conditions while specimens tested in flexural fatigue were run under cyclic mid-span displacement control. Tests were run at ambient laboratory conditions, generally 70 ± 2 °F (21 ± 1 °C), and at 0 ± 2 °F (−18 ± 1 °C). Curves based on the experimental results are plotted relating the peak load or displacement to the median fatigue lifetimes for specimens fabricated from each material. Performance criteria for roof membrane subject to fatigue loading are recommended.

Key words: automated information retrieval; cost benefit; public good; scientific and technical information; semi-public good; subsidization; total cost recovery; user charges.

This paper examines the cost-benefit implications of alternative pricing and capacity investment decisions for automated scientific and technical information retrieval systems. Two typical systems are examined and numerical examples presented. In the first system, search requests are entered on-site. The numerical examples show how setting price to maximize net social benefit precludes total cost recovery and implies subsidization. In the second hypothetical system, search requests are entered from remote access terminals. Allowance is made for random arrival rates, and distinction is made between system charges to users and other user incurred costs. With these refinements, the numerical examples show how, for certain ranges of output, total cost recovery is consistent with the maximization of net social benefit. The paper then examines the “public good” attributes of scientific and technical information retrieval systems and concludes that such systems can be viewed as “semi-public goods,” since the information stored has the characteristics of a public good while access to this information has the characteristics of a private good. Based on the public good considerations and the numerical examples, the paper concludes that subsidization for the fixed costs is warranted to the extent that all reasonable alternatives which maximize net social benefit preclude total cost recovery.

Key words: data conversion; dynamic measurements; electrical measurements; electronic instrumentation; signal conditioning; systems; time domain.

Recognizing the proliferation of sophisticated modern electronic instrumentation in the field of electrical measurements, the Electricity Division of the National Bureau of Standards recently initiated a new program in the general area of dynamic measurements and standards in support of such instrumentation. Recognizing further that the vastness and complexity of the field would require, at the earliest stages of the program, identification of the most critical problem areas, the Electricity Division held a workshop on 23 and 24 September, 1974, at the Bureau's Gaithersburg site, to assist it in ascertaining just what these areas in fact were. The basic idea of the Workshop was to bring together a broadly representative group of some twenty-five leading manufacturers and prime users, working in a free and open atmosphere, in order to have them delineate the present and future critical support needs in the field of dynamic electrical measurements for modern electronic instrumentation, with emphasis on physical standards, standardized measurement methods, new calibration and measurement assurance services, relevant data, and most important, new measurement methodologies. The overall objectives of the Workshop were generally met, and a number of significant specific programs and projects consistent with the mission of the Electricity Division were identified.

Key words: atmospheric chemistry; chemical kinetics; data evaluation; gas phase; photoabsorption cross section; photochemistry; quantum yield; rate constant.

A table of data for gas phase chemical reactions and photochemistry of neutral species is presented. Specifically, it gives preferred values for reaction rate constants, photoabsorption cross sections, and quantum yields of primary photochemical processes and also cites recent experimental work. It is intended to provide the basic physical chemical data needed as input data for calculations modelling atmospheric chemistry. An auxiliary table of thermochemical data for the pertinent chemical species is given in the appendix.

Key words: accident patterns; apparel; apparel fires; burn injury; FFACS: fire; flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim's activity; victim's reactions.

This final report on an in-depth study of apparel fire accident variables focuses on the physical parameters of fabrics and garments involved in apparel fires and the relationship between these parameters and injury severity. Interactions between accident variables are summarized and recommendations for remedial action and further research are included. Garments involved in apparel fire accidents were classified by degree of fit and amount of the body covered. Fires in which the garment configurations involved covered over half the body (the dress/shift and pants/top configurations) were shown to be associated with more extensive burn injuries than fires involving configurations covering smaller areas (loose tops, fitted pants, and loose pants). Degree of fit could not be shown to be directly related to injury severity. Within garment configuration classifications, age was shown to be a major determinant of injury severity, with victims over 65 years of age receiving a significantly higher percentage of severe burns than those in the 21-65 age group. In accidents involving loose tops, fitted pants, and loose pants the presence of flammable liquids in the accident sequence appeared to be the dominant factor in determining injury level. In addition, when accidents involved flammable liquids, (1) the fabrics involved tended to be heavier, (2) the fit of the garment at point of ignition was closer, and (3) the proportion of cellulose/synthetic blend and 100 percent synthetic fabrics was higher than in accidents which did not involve flammable liquids. Because of the many human and physical variables shown to be associated with an apparel fire accident, the author suggests a broad fire prevention
program which includes both product regulation and public education.

Key words: building codes; extreme value distributions; hurricanes; probability distribution functions; reliability; risk; statistical analysis; storms; structural engineering; wind loads; wind speeds.

With a view to assessing the validity of current probabilistic approaches to the definition of design wind speeds, a study was undertaken of extreme wind speeds based on records taken at 21 U.S. weather stations. For the purpose of analyzing extreme value data, a computer program was developed, which is described herein. The following results were obtained: (1) the assumption that a single probability distribution is universally applicable to all extreme wind data sets in a given type of climate was not confirmed, and (2) predictions of 100-year wind speeds based on overlapping 20-year sets of data taken at the same station differed between themselves by as much as 100 percent. Similar predictions for 1000-year winds differed by as much as a few hundred percent. Since wind pressures are proportional to the square of the wind speeds, errors of such magnitude are unacceptably high for structural design purposes. It is therefore suggested that while, in principle, probabilistic methods provide the most rational approach to specifying design wind speeds, it is of the utmost importance that the possible errors inherent in this approach be carefully taken into account.

Key words: annual report; calibrations; progress report; standards; temperature scale; thermometry.

This report summarizes the progress in calendar 1974 of the technical program of the temperature section of the Heat Division, Institute for Basic Standards. Separate sections of the report are devoted to the various projects, to highlights of the year's activities, and to other agency interactions.

Key words: analog-to-digital; conversion; digital; electricity; electric power; measurement; sampling; simulation; wattmeter.

A system is described that determines average electric power by periodically sampling current and voltage waveforms and calculating the result from digitized values of measured instantaneous currents and voltages. System performance is modeled on a digital computer to investigate the effects of noise, harmonics and sampling time errors on the result of a simulated power measurement. With 15 bit analog-to-digital conversion and 512 measured sample points an accuracy of 0.01 percent can theoretically be obtained from dc up to 5 kHz.

Key words: absolute cross section; beam profile; electron scattering; scattering angle; solid angle; spectrometer.

A comprehensive calibration of the geometry of the NBS electron scattering apparatus is described. A complete set of measured parameters is tabulated in this report. Combining these parameters with observed values of certain variables as described herein permits the accurate determination of the solid angle, scattering angle, and target angle for each cross section measurement made with the apparatus. The uncertainty in a cross section measurement due to the imprecision of the geometry calibrations is less than one part in 10^4.

Key words: Caterpillar Tractor Co.; computer program; documentation; engineering drawing; General Motors Corporation; metric conversion; rounding; test problem; tolerance.

The programs in this package are designed to convert dimensions and other quantities appearing on engineering drawings from metric to U.S. customary units and vice versa. They were developed by Caterpillar Tractor Co. and General Motors Corporation. In addition to the programs themselves, the package contains documentation explaining how to get the programs running on different computers and how to use them, and test problems to permit users to verify that the programs run correctly on their own computers. The Caterpillar program converts 31 different metric units to their U.S. customary equivalents. In contrast, the General Motors programs convert in both directions but work with millimetres and inches only. The General Motors programs also use rounding conventions differing somewhat from those employed in the Caterpillar program. Both the Caterpillar and the General Motors programs are written in American National Standard FORTRAN and are suitable for use on a wide range of computers with little or no modification. The Caterpillar program is operated in batch mode while the General Motors programs are interactive.

Key words: buildings; deflections; instrumentation; structural response; wind loads.

The development and testing of an electro-optical device for the direct measurement of lateral deflections of tall structures are described. The device utilizes a tracking telescope mounted on a fixed reference and a light source attached to the structure of the level for which lateral deflections are to be measured. Operating characteristics of the system are based on the results of tests carried out over a period of several months in one of the elevator shafts of a 12-story building.

Key words: dynamic analysis; NBS analyzer; NBS FORTRAN test routines; networking; systematic testing; testing tools.

This report is a first step toward identifying effective software test and measurement tools, and developing a guide for their usage network-wide. The utility of two tools, the NBS FORTRAN Test Routines and the NBS Analyzer, is studied experimentally, and indications of their role in systematic testing in a networking environment are given.

In 1973 the National Bureau of Standards (NBS) distributed three calibrated test solutions to interested laboratories. Two of these solutions each contained nine gamma-ray-emitting radionuclides that the participants were asked to identify and quantify. The third solution contained $^{90}Sr$ and $^{90}Y$, and participants were asked to perform a quantitative radioactivity analysis of the mixture. The results reported by all of the participating laboratories are given here. Most of the activity values reported for the mixed gamma-ray-emitting solutions were within ±20 percent of the corresponding NBS values, but less than half of the laboratories reported $^{90}Sr$ and $^{90}Y$ activity values both of which were within ±20 percent of the NBS values.

Key words: computer security; data security; privacy; privacy costs; security costs.

On February 20, 1975, the ICST hosted a one-day round-table discussion on the economic aspects of privacy and data security costs. The workshop was chaired by Gary Bearden, U.S. Civil Service Commission. The participants were Walter L. Anderson, General Accounting Office; Richard A. Eberhart, Office of the Secretary, Department of Commerce; Paul Bassett, Jr., Vice President, 3M Company; Robert Caravela, Federal Trade Commission; Theodore Clemence, Bureau of Census; Richard L. Nolan, Harvard Business School; Stan Halper, Cooper and Lybrand; and Larry Simonette, Peat, Marwick, Mitchell and Company. The group discussed the benefits EDP managers or data base administrators might gain from the privacy requirements, the processes for identifying direct or hidden costs, and processes for allocating costs.

Key words: command languages; computers; man-machine systems; networks; system commands; user protocols.

A user-terminal protocol is defined which enables a user at a terminal to access computerized information systems. The basic functions such as identification, authorization, and validation are outlined and various signals and messages making up the protocol are identified. The purpose of the paper is to establish a basis for standardization and development of a unified user protocol.

Key words: computerized fingerprint identification; fingerprint; pattern recognition.

A procedure is described for automatically determining whether two fingerprint impressions were made by the same finger. The procedure uses the x and y coordinates and the individual directions of the minutiae (ridge endings and bifurcations). The identity of the two impressions is established by computing the density of clusters of points in $\Delta x$, $\Delta y$ space where $\Delta x$ and $\Delta y$ are the differences in coordinates that are found in going from one of the fingerprint impressions to the other.

Key words: buildings; fire growth; flame spread; heat release; interior linings; material ignitability; performance criteria; room fires; smoke; wood crib.

A variety of wall and ceiling panels in a full-scale room corner have been exposed to a fire from a standardized wood crib, simulating the environment produced by the burning of a single item of furniture, to evaluate their contribution to room fire growth. A total of twenty room corner tests were performed using selected combinations of eight wood-base and gypsum board-base interior finish materials on the walls and ceilings. Gas temperatures and velocities, surface temperatures, heat fluxes, smoke densities, and concentrations of oxygen, carbon dioxide and carbon monoxide were measured. Ignition times of newsprint, cotton fabric and plywood in the lower part of the room were also recorded. The results of these full-scale tests were compared with laboratory tests of the ease of ignition, surface flame spread, heat release rate and smoke generation on the same materials. The maximum upper room gas temperature has been found to agree with the ignition of such indicators as newsprint and plywood, and to represent a measure of fire hazard in terms of potential involvement of all combustible contents or room flashover. A temperature range of 450 to 650 °C appears to be the boundary between limited and full involvement.

Key words: computer networks; interactive computing; man-machine interaction; performance measurement; time-sharing.

The Network Measurement System (NMS) represents the implementation of a new approach to the performance measurement and evaluation of computer network systems and services. By focusing on the service delivered to network customers at their terminals, rather than on the internal mechanics of network operation, measurements can be obtained which are directly relevant to user needs and management concerns. Furthermore, the type of measurement necessary to implement this approach can be made directly, without perturbing the network system under test.

This technical note introduces the service concept and other background information necessary to understand the need for and use of the NMS. The fundamental distinction between service and internal efficiency is clarified, both in general and in the environment of computer networks. A number of different measures of service are then discussed, followed by the presentation of several models of interactive use of networks. Then, the practical aspects of gathering data and applying this information to service measurement are reviewed, leading to a presentation of the NMS as it is implemented. The note ends with a discussion of applications for the NMS.

Key words: atomic and molecular data; chemical kinetics; colloid and surface properties; mechanical properties; nuclear data; solid state data; standard reference data; thermodynamic data, transport properties.

This is a report on the status of the National Standard Reference Data System as of April 1975. Current activities and
functions of the Office of Standard Reference Data are summarized. A complete list of data evaluation projects supported by the Office of Standard Reference Data during Fiscal Year 1975 is included; this list also includes projects which received financial support during the previous fiscal year, and which are still actively involved in some aspect of data compilation and evaluation. The list of projects includes continuing data centers in the United States whose activities fall within the scope of the system, but which are not formally affiliated with it. A list of publications resulting from the Standard Reference Data program is provided.

Key words: Computer communications; computer networking; data communications; networks; performance requirements; telecommunications.

In general, when telecommunications services are used as a means of interchanging information between information processing systems, or between terminals and systems, a number of parameters determine how well that interchange is performed. This report examines the following characteristics of telecommunications services: 1. Transfer Rate; 2. Availability; 3. Reliability; 4. Accuracy; 5. Channel Establishment Time; 6. Network Delay; 7. Line Turnaround Delay; 8. Transparency; 9. Security.

These terms are all defined and their significance discussed. The effects of these factors on data communication networks are illustrated.

Key words: Accelerated weathering; durability of waterproofing materials; masonry; performance criteria; waterproofing materials; water repellent materials.

The initial effectiveness and durability characteristics of fifty-five clear masonry waterproofing materials were evaluated using laboratory tests. This report contains the results of initial performance tests including water absorption, water vapor transmission, resistance to efflorescence and change in appearance. Durability tests, including periodic measurement of water absorption after exposure to accelerated weathering and outdoor exposure, were also conducted. Based on test results, performance criteria for clear waterproofing materials were developed. In addition, recommendations for the application of waterproofing materials were formulated. Finally, the report contains a summary of a survey concerning field experiences with waterproofing and a brief theoretical discussion of water flow.

Key words: Calibration factor; computer amplitude reference; computer storage media; disk calibration; disk pack; magnetic disk; Standard Reference Surface; unrecorded disk surface.

This publication describes the design requirements and the operation of the NBS test bed that is used for calibrating unrecorded magnetic disk pack surfaces for low and medium density use. The signal level calibration is made with respect to a reference level that is derived from the NBS Standard Amplitude and Data Reference Surfaces that are held in repository at NBS. The techniques for calibrating the measurement system with the NBS repository Reference Surfaces and the calibration of candidate reference disks are described in detail.

Key words: Architecture; building; building codes; building design; disaster mitigation; earthquakes; engineering; environmental hazards; housing; inspection and testing; safety.

This report on the Nicaraguan Building Regulatory System has been prepared under the auspices of the Organization of American States and the United States Agency for International Development. It presents an overview of the building regulatory system in Nicaragua; its activities in review of designs, issuance of building permits, inspection of construction, control of quality of materials, and issuance of occupancy permits. The technical bases for these activities are the building code and standards, the laboratory facilities for control of the quality of building materials, and the processes for development and application of codes and standards. Recommendations address the status and development of this system and its technical bases.

The losses in the December 23, 1972, Managua Earthquake provided dramatic evidence of the need for effective implementation of good building standards. Repetitions of these tragic losses elsewhere in Nicaragua and in a reconstructed Managua are certain unless a good building code is developed and adopted, its use and design by architects and engineers enforced by careful review of designs, and the implementation of these designs by the builders assured by inspection of construction and testing of building materials. A summary and critical review of U.S. building regulatory practices for areas with severe natural hazards is presented in Appendix B for guidance in building regulatory system planning and development. A survey of housing performance in Managua is presented in Appendix C to illustrate that earthquake resistant construction is feasible and economical for Nicaragua and other nations with comparable resources.

Key words: Capacitors; energy conservation; fluorescent lamp; fluorescent luminaire; lighting efficiency; power factor.

Reducing energy consumption in existing buildings by reducing the number of lamps presents technical problems when more than one fluorescent lamp operates from a single ballast. A preliminary investigation was made whereby capacitors were substituted for one fluorescent lamp in a two-lamp luminaire which operated with a single ballast. Under optimum conditions, lighting efficiency (foot-candles per watt) was nearly as high at reduced power input as it was with two lamps operating normally. No failures in lighting equipment or capacitors occurred and no fire hazards, other safety hazards or other unsatisfactory occurrences were observed. A more thorough investigation involving a number of parameters is needed to ascertain the feasibility of this modification.

108
Key words: database applications; database management systems; selection criteria; software features; system evaluation; system features; user experiences.

This report presents an objective overview of features of six selected database management systems (DBMS) and Federal user experiences with these systems. Application criteria were developed in order to aid in the evaluation and selection of DBMS.

The advantages of generalized DBMS over traditional methods of software system development are discussed. The criteria for choice of the six systems' features are presented. The data reported were gathered from two sources: vendors and users. Vendor information consisted of side-by-side presentation of features of the six DBMS. User experiences reported are summarized under appropriate headings. This information is used to derive application criteria for assessing the usability and operational suitability of DBMS to a variety of data processing requirements.

The six systems reviewed are: ADABAS, IMS/VS, INQUIRE, MODEL 204, SYSTEM 2000, and TOTAL.

Key words: biology; career; ecological; electricity; energy; environment; fusion; medicine; nuclear; power; radiation; reactor; research; utilities.

These proceedings are a collection of invited papers given at the Nuclear Science Education Day Conference held on November 29, 1973 at the National Bureau of Standards, Gaithersburg, Md. The program was sponsored jointly by the ANS (Washington Chapter) and the NBS for secondary school science teachers and outstanding science students in the Washington area. Four main topics are covered: research and development in nuclear energy applications; man, environment, and nuclear energy; nuclear science frontiers; and career opportunities in nuclear science. These proceedings include the following papers (indented):

- **The role of the public in the evaluation process**, G. Charnoff, TN888, pp. 34-37 (Nov. 1975).

Projected national and regional manpower needs for environmental and nuclear scientists, R. L. Murray, TN888, pp. 77-80 (Nov. 1975).

Educational opportunities at institutions of higher learning, D. Duffy, TN888, pp. 81-84 (Nov. 1975).

Key words: impact; objectives; output; performance measurement; production indices; production measurement.

This report describes an experiment in productivity measurement conducted at the National Bureau of Standards. The experiment concludes that no matter how sophisticated the analysis and synthesis processes become, statistical counts of output media (e.g., publications, citations, invited talks) will not serve as reliable measures of R&D productivity.

The conduct of the experiment included a work sampling study, a communications study, an output analysis, a value analysis approach to developing criteria for selection and evaluation of programs, construction of a rating system for evaluation of programs, and construction of a model of the R&D process.

Key words: retrofitted solar residence; solar collector; solar heating and cooling system; solar-powered absorption refrigeration.

During 1972 and 1973, the National Bureau of Standards conducted controlled laboratory tests on a factory-built four-bedroom house having a floor area of 110 m² (1200 ft²) equipped with a conventional gas furnace and central electric air conditioner incorporated into a forced air distribution system. During 1974, the house was moved onto the NBS grounds and a solar heating and cooling system was designed to be added to the house. Calculations have been made to show that more than 75 percent of the yearly energy needs for heating, cooling, and supplying domestic hot water could be obtained from the sun.

This report deals with the design and construction of the retrofitted system. It consists of 45 m² (485 ft²) of double-glazed, flat-plate solar collector, 5.7 m³ (1500 gallons) of water storage, and a 10,000 W (3 ton) lithium bromide absorption air cooling unit.
3.14. CONSUMER INFORMATION SERIES

Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

Key words: color; environment; experimenting with; harmony; hues; illumination; light; personal uses; relationships; uses.

If you are like most consumers, color is at once a delight, a challenge, and a problem. Color is a delight because it can convert an otherwise drab costume, scene, or room into a thing of beauty. It is a challenge because it brings out our creative ability and enables us to brighten and enliven our surroundings at a comparatively cheap cost. It is a problem because, improperly used, it can fail in its purpose, and if we are unsure of the ways in which colors go together, the choice of a tie, a lipstick, a drapery fabric, or a wall paint to match furniture and carpet can become an unpleasant chore.

Because of the importance of color in our daily lives, and the widespread lack of knowledge about the relationship of colors, we are pleased to bring you this extraordinary booklet as a part of our Consumer Information Series. It has been written in simple language, but in its scientific accuracy, and in the precise selection and printing of illustrative colors, it meets the exacting standards of a scientific treatise. Although it was designed to be of practical value to you in solving everyday color problems, we believe Color in Our Daily Lives will also become a treasured possession.

Key words: building economics; consumer information; energy conservation; home economics; home improvements; insulation.

This booklet is a consumer-oriented adoption of BSS64 (Retrofitting Existing Housing for Energy Conservation: An Economic Analysis) which provides basic energy conservation information of an economic nature to homeowners. It is concerned primarily with energy conservation improvements which will decrease heating and cooling costs in houses. Investment in insulation, storm windows and doors, and weatherstripping/caulking is examined with regards to different climates and different energy prices in order to determine the combination of these improvements which will provide the greatest long-run economies in space heating and cooling to the homeowner. Information of a general nature on the proper use of such improvements is outlined and further references are listed.
3.15. NBS INTERAGENCY REPORTS

A special series of interim or final reports on work performed by NBS for outside sponsors (both government and non-government). In general, initial distribution is handled by the sponsor; public distribution by the National Technical Information Service (NTIS), Springfield, Va. 22161, in paper copy or microfiche form unless otherwise stated. When ordering this series from NTIS you must order it by the “COM, PB, AD, or N” number listed at the end of each entry.

Key words: accident patterns; apparel; apparel fires; burn injury; FFACTS; fire: flammable fabrics; garment fires; garment parameters; injury severity; victim’s activity; victim’s reactions.

Fire accidents result from the interaction of a number of environmental, human, and physical factors, all of which may effect the severity of the burn injury. Using information gathered from case histories in the Flammable Fabrics Accident Case and Testing System, this study seeks to identify patterns in the apparel fire accident variables; (1) activity preceding the accident, (2) parameters of fabrics and garments involved, (3) reaction of victim, and (4) severity of the burn injury. It will also attempt to define the extent and nature of the relationships between these accident variables.

This interim report gives a detailed description of the methodology employed in the development and completion of the study, with emphasis on accident pattern identification and classification for apparel fire incidents. Preliminary results of the study are included which identify certain recurring patterns of activity leading to burn injuries.

Key words: fire retardant; fire test; heat release ignition; mattress; smoke; toxic gases.

Full scale fire tests of a neoprene and two different types of flame-retardant polyurethane mattresses were performed in a room-sized compartment at the National Bureau of Standards. The mattresses were tested in two orientations, horizontal and vertical and with two types of coverings, a fire retardant treated cotton and a high temperature nylon ticking, in addition to the bare mattress insert. In addition to the visual observations, the burning rates, ceiling temperatures, optical density of the smoke, and the toxic gas concentrations were measured. This series of tests were repeated on small mattress sections to examine the relevance of small scale tests as a means of predicting full scale behavior. The flame spread index was measured with the radiant panel (ASTM E162); and the smoke and toxic gas concentrations were measured in the NBS smoke density chamber. Measurements were also performed in the heat release rate calorimeter and the ease of ignition test apparatus.

Key words: analysis of toxic materials; atmospheric analysis; industrial hygiene; reference materials.

Techniques are described that may be used to prepare filters on which are deposited prescribed amounts of heavy metals, for use as reference materials in industrial atmospheric analysis. Working solutions, prepared from pure metals and highly purified acids and water, are pipetted onto the filters held in jigs to facilitate their application. The techniques were used to prepare three sets of reference materials containing the following metals: Set 1 = Pb, Cd, Zn, Sn; Set 2 = Pb, Zn, Mn; Set 3 = Be. The amounts of each metal deposited on the filters correspond to those expected when collecting personal samples, in atmospheres when the concentrations are both below and above the TLV levels.

Key words: gas blending system; hydrogen cyanide; ion selective electrode; occupational safety.

A system capable of producing well-defined test atmospheres of HCN in air (or any other desired diluent) and an analytical system for the analysis of these gas mixtures is described. This system provides a means of calibration of the various analytical systems for HCN now in use. The analytical unit of the system can also be used for the determination of hydrogen cyanide in industrial atmospheres. By collecting the HCN in a sodium hydroxide solution, and measuring the cyanide content by the use of a cyanide-ion selective electrode, concentrations of HCN in air between 5 and 500 ppm were measured. This method is rapid and convenient and can easily be performed by a technician or adapted to automation.

Key words: acrolein; gas chromatography analysis; gas dilution system; occupational safety.

A system capable of producing well-defined test atmospheres of acrolein in air (or any other desired diluent) and an analytical system for the analysis of these gas mixtures is described. Using a bulk mixture of 9.0 ppm acrolein in nitrogen, and accurately blending this with a stream of clean, dry air, concentrations between 0.05 and 0.50 ppm can be produced. This system provides a means of calibration of the various analytical systems for acrolein now in use.

Key words: gas chromatography analysis; gas dilution system, methyl bromide; occupational safety.

A system capable of producing well-defined test atmospheres of methyl bromide in air (or any other desired diluent) and an analytical system for the analysis of these gas mixtures is described. Using a bulk mixture of 1000 ppm methyl bromide in nitrogen, and accurately blending this with a stream of clean, dry air, concentrations between 5 and 100 ppm can be produced.
This system provides a means of calibration of the various analytical systems for methyl bromide now in use.

Key words: arsine; gas-blending; Gutzeit method; spectrophotometry.

A gas-blending system originally designed for chlorine-air mixtures was modified for producing arsine-air mixtures in the concentration range from 0.02 to 0.25 ppm. This system has been tested in order to provide accurately known concentrations of arsine-in-air for calibration of analytical monitoring devices. An analytical method has been developed for checking the concentration of arsine in the working standard and consists of the spectrophotometric measurement of an arsine-diethylidithiocarbamate complex in solution.

Key words: fluoride analysis; gas-blending; HF-air mixtures; ion-specific electrode.

A gas-blending system was constructed for producing hydrogen fluoride-air mixtures in the concentration range from 1 to 20 ppm for the purpose of calibrating analytical monitoring devices. The system has been tested by measuring these HF concentrations using a fluoride ion-specific electrode.

Key words: cut; edges, hazardous; experimental studies; human tolerances; injury; injury thresholds; inspection of edges; laceration; safety; simulation; skin; skin cutting; synthetic materials; cutting; toys.

Human skin specimens were cut in vitro with edges of varying geometry over a normal force range of 0 to 89 newtons. Generally, at a given force, the smaller the included angle and tip radius of an edge, the deeper the resulting cut. For a given edge and skin specimen, empirical curves fitted to the data indicate that the depth of cut increases with force, and that this rate of increase diminishes exponentially. Based on the experimental data, a convention was proposed for labeling the edges as safe or hazardous.

Synthetic materials were sought which, when applied in a specific manner to the test edges, would be completely penetrated by only those edges labeled hazardous. Then such materials could be used in an inspection procedure for unknown edges. Tests were conducted on many synthetics, but only a few showed possibilities in this regard.

Key words: impulse; impulse generator calibration; impulse noise; impulse noise generator.

This report covers work performed by the Electromagnetics Division, Institute for Basic Standards, National Bureau of Standards, on a Signal Corps contract to develop a calibration system for impulse noise generators. Various technical approaches are discussed with their respective problems. A prototype system which was constructed is presented along with some measurements of its capability. Finally another approach is suggested utilizing newer techniques and instrumentation which should come closer to achieving the desired level of performance.

Key words: alloy phases; constitution diagrams; noble metals; phase diagrams; phase equilibria; platinum group metals.

Six binary constitution diagrams involving the noble metals are presented. These diagrams include the V-Ru, V-Rh, Nb-Os, Nb-Pd, Nb- Pt and Ta-Pd alloy systems. Experimental alloys were prepared from starting materials having a nominal purity of at least 99.9 percent and precautions were taken to insure that no significant contamination was introduced during alloy preparation and heat-treatment. Temperatures were measured to an accuracy within ± 20 °C.

Key words: calibration; carbon films; low temperature; thermometry; vacuum deposition.

This is a summary of work done on NASA(Marshall Space Flight Center) purchase order H-92167A concerning Carbon Thin Film Thermometry. Optimum film deposition parameters were sought on an empirical basis for maximum stability of the films. One hundred films were fabricated for use at the Marshall Space Flight Center. 10 of these films were given a precise quasi-continuous calibration of temperature vs. resistance with 22 intervals between 5 and 80 K using primary platinum and germanium thermometers. Sensitivity curves were established and the remaining 90 films were given a three point calibration and fitted to the established sensitivity curves. Hydrogen gas-liquid discrimination set points are given for each film.

Key words: cryogenics; infrared detector; low capacity; reliability; shipboard; 77 K refrigerator.

The Naval Ordnance Laboratory (NOL) has asked the Cryogenics Division of the National Bureau of Standards to investigate and evaluate 1) commercially available refrigerators, 2) refrigerators under development, and 3) new or novel ideas applicable to a refrigerator to cool infrared detectors in a shipboard Forward Looking Infrared (FLIR) system. Although a refrigerator has been selected for two prototype FLIR units, the study was initiated to select the most appropriate refrigerator for additional purchases of FLIR units. The FLIR requires a refrigerator capacity of approximately 2 watts at 77 K and a physical configuration allowing for an interface to the FLIR unit. Information was collected by interviewing FLIR manufacturers, surveying refrigerator manufacturers and by contacting users of similar systems. Correlation of this information with the NOL requirements is presented herein. The primary difference between airborne and shipborne refrigerators and a shipborne refrigerator is the accessibility for minor repairs on-board ship although major repairs may be deferred for extended periods of time. It is anticipated that the shipboard units will operate away from major maintenance facilities, for periods as long as 6 months, with the refrigerator operating at least half of this time. Thus, reliability and ease of maintenance are emphasized when evaluating the various systems.

Key words: electroexplosive device safety; electromagnetic compatibility; electromagnetic interference; stray energy sensor.

Qualification of weapon and missile systems for electroexplosive device (EED) safety has been a continuing problem in the military services. Quantitative measurement of stray energy in EED's has been hampered by limitations of existing sensors. This report describes a new video diode detector instrumented EED (VIDEED) which responds to both the normal pin-to-pin energy (which would heat an EED bridgewire) and to the pin-to-case voltage (which might cause EED ignition due to arcing).

Also described in this report are the amplifiers, cables, adapters and recorders which make up the rest of the measuring system. Mention is also made of the test procedures used in testing the VIDEED system.

Key words: attenuation; clay; gravel; measurements; microwave; skin depth.

The objective of this work was to establish the feasibility of using active microwave techniques to differentiate between the different subsurface layers in a pavement system. The electromagnetic attenuation properties of clay and gravel soils were measured as a function of moisture content and frequency. Measurements were done at frequencies in the 0.5-4.5 GHz range. Soil samples were compounded in the laboratory at approximately 10, 50 and 90 percent saturation. Sample thickness was in the range 2.5-20.3 cm. Each homogeneous sample was sealed in a polyethylene container to retain the total moisture and to maintain a constant moisture content with depth.

Key words: amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; mine noise; spectral density; time-dependent spectral density.

Measurements of the absolute value of electromagnetic noise and attenuation along a hoist rope were made in an operating hard-rock mine. Lucky Friday Mine, located near Wallace, Idaho. Spectra of electromagnetic noise generated by various pieces of equipment, spectra of specific noise signals at various depths, and noise and attenuation on the 4250 foot (1295 meter) hoist, were measured. Three techniques were used to make the measurements. First, noise was measured over the entire electromagnetic spectrum of interest for brief time periods. Data were recorded using broadband analog magnetic tape for later transformation to spectral plots. Second, noise amplitudes were recorded at several discrete frequencies for a sufficient amount of time to provide data for amplitude probability distributions. A third technique gave attenuation data through the direct measurement of field strength at various depths.

The specific measured results are given in a number of spectral plots, amplitude probability distribution plots and amplitude curves as a function of depth.

Key words: composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity.

Results of six months of study on Materials Research in Support of Superconducting Machinery (April through September, 1974) are reported to the sponsor, the Advanced Research Projects Agency of the U.S. Department of Defense. The report is divided into five sections: thermal conductivity, magnetoelastic conductivity, fatigue and fracture-toughness properties, properties of advanced composites, and elastic properties. The temperature range 4 to 300 K is covered by the study. Materials studied are either being used or are candidates for use in superconducting machinery and include: aluminum alloys, composites, inconels, OFHC copper, stainless steels, and titanium alloys.

Special results of the study include: fracture-toughness and fatigue-crack growth-rate data for AISI 310, Ti-5 Al-2.5 Sn, A286 stainless steel, and Inconel 750 at 4.76, and 300 K; initial reports of tensile testing of composites at 4 K; a second review paper on advanced-composite low-temperature behavior; magnetoelastic conductivity measurements on OFHC copper and Inconel 718 indicate that, in a magnetic field, the thermal conductivity may change by 100 percent; anomalous low-temperature elastic behavior of AISI 300 series stainless-steel alloys; and thermal conductivity data for OFHC copper, Inconel 750, and Inco Low-Expansion-Alloy. These data provide considerable insight into material characteristics at extremely low temperatures, assisting in material selection and efficient design.

Key words: absolute (unambiguous) readout; piston; precision attenuator; sensor; waveguide-below-cutoff.

A coaxial precision waveguide-below-cutoff attenuator is described which utilizes an absolute (unambiguous) electronic digital readout of displacement in inches in addition to the usual gear-driven mechanical counter/dial readout in decibels. The attenuator is rack-mountable and has the input and output rf connectors in a fixed position. The attenuator rate for 55, 50, and 30 MHz operation is given along with a discussion of sources of errors. In addition, information is included to aid the user in making adjustments on the attenuator should it be damaged or disassembled for any reason.

Key words: antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides.

This bibliography lists the publications of the NBS Electromagnetics Division between June 30, 1973 and June 30, 1974.

NBSIR 74-398. Provisional values for the thermodynamic functions of ethane, R. D. Goodwin, 342 pages (June 1, 1974). Order from NTIS as COM 75-10130.

Key words: densities; enthalpies; entropies; equation of state; internal energies; isobars; isochors; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; specific heats; speeds of sound; vapor pressures.

Thermophysical properties are tabulated at uniform temperatures over the entire range of fluid states from 90 to 600 K along
isobars to 700 bar. A new, rational equation of state is employed for the first time. Thermodynamic functions in the compressed liquid at $T < T_f$ are obtained by use of specific heats $C_p(T)$ along a high pressure isobar.

NBSIR 74-449, Fire endurance tests on walls and plumbing chases containing either metallic or nonmetallic drain waste and vent systems, W. J. Parker, 83 pages (Nov. 1973). Order from NTIS as COM 75-10049.

Key words: ABS; cast iron; copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC; smoke; toxic gases; vent; waste.

Two full scale non-load bearing ASTM E-119 fire endurance tests were performed on plumbing chase and wall assemblies containing polyvinyl chloride (PVC) drain, waste, and vent (DWV) systems typical of installations serving two or more stories. For the systems tested which were typical of kitchen sink drain systems constructed and installed according to typical plans, the PVC piping did not contribute to the spread of fire through the plumbing chase to the adjoining dwelling during the test which lasted 50 minutes. A test failure was neither associated with the plastic piping in the test nor with the indication that there would have been a failure due to the piping if the test had continued for one hour.

Three full scale non-load bearing ASTM E-119 fire endurance tests were also run on walls with enclosed DWV systems of acrylonitrile butadiene styrene (ABS), PVC, copper, and iron.

Neither PVC nor ABS piping contributed to fire spread in a plumbing system consisting of 2-inch stacks and 1½-inch back-to-back laterals in a 2 x 3 fir-stud-and-gypsum-board wall. In one test in which the stacks and laterals were 4 inches in diameter and in another test in which the distance between wall surfaces was decreased by using 2 x 4 studs, the effective fire endurance rating of the wall assembly was reduced by the installation of the plastic plumbing.

This progress report on the fire endurance evaluation of five plumbing chase and wall assemblies is limited to construction assemblies in which the openings around the laterals were carefully sealed with plaster spackling. Additional tests are in progress to examine the effect of leaving the openings unsealed.

Key words: burets; capacity; flasks; meniscus; pipets; volumetric calibration.

This report describes a procedure for testing small volumetric apparatus. The procedure is based upon a determination of the volume of water either contained or delivered by the vessel. There are techniques described for cleaning, reading the meniscus, filling, draining and weighing the contained or delivered volume.

Key words: acceleration; automation; calibration; measurements; minicomputer; shakers; standards; transducers; vibration; vibration exciters; vibration pickups.

The report describes an automated system for accelerometer calibration under realtime control by a small, dedicated digital computer. The hardware components of the system and the software programs are given. The software automatically regulates the rate and amount of data collected based on analysis of input data. Printout of the frequency response of test accelerometers is on a teletypewriter and also can be stored on a magnetic tape. Manual operation of the system is also described.

Key words: acoustics; noise measurement; noise (sound); railroad yard; trains.

A field investigation of noise emission from railroad operations was conducted. The objectives of the study were the establishment of a data base on the noise levels associated with railroad operations, both line (trains in transit) and yard, and the development of measurement procedures that could be utilized in regulations applicable to the noise from rail carrier equipment and facilities. For trains in transit, measurements were made as a function of horizontal distance from the tracks [five locations at 25, 50, 100, 200 and 400 feet] and as a function of microphone height [three different heights at the 25 and 50 foot microphone locations]. Train passby data are presented as the maximum A-weighted sound level observed during the passby and as Single Event Noise Exposure Levels (both A-weighted and one-third octave band levels). A-weighted sound level measurements were made at the boundary of the railyard, at 0.1 second intervals, for periods of time ranging from 1 to 23 hours over several days. These data are presented as the energy equivalent sound level and the level exceeded ten percent of the time. The directionality of retarder noise was also investigated. Measurements were made of the noise emitted in various directions during retarder operation.

Key words: aging of paper; archival materials; natural aging; old paper; paper, aging of; paper, stability of; paper testing; stability of paper.

Effort on a long range program on the Development of Specifications for Archival Record Materials has included: (1) Reappraisal of research needs; (2) a study of 18 papers made in 1937, tested before and after dry aged in aging in 1937, and tested again in 1973; (3) evaluation of 19 commercial papers, evaluated before and after moist accelerated aging in 1963, and tested again in 1973; and (4) development of specifications for copies from office copying machines.

A review of the literature on stability of paper and data obtained in this laboratory over the past several years indicate that a fresh approach is needed to a study of the stability of paper. The following tasks are suggested: (1) Continue to use handsheets of known composition; (2) study old papers to determine changes that probably have occurred during natural aging; (3) confine testing to methods that give some clues concerning what happens during aging such as zero span tensile, wet strength, peroxide formation, functional group content, and molecular chain length distribution; and (4) study the effect of cycling of relative humidity on the properties of paper.

Key words: cooperative programs; foreign visitors; information exchange; international building technology; international organization memberships; professional interaction.

This report summarizes the Center for Building Technology’s 1973 international activities including formal cooperative programs, exchange programs, special projects, international or-
ganization memberships, foreign guests at CBT, and CBT foreign travel.

NBSIR 74-521. HATCH – A model for fish hatchery analysis, F. C. Johnson, 73 pages (July 8, 1974). Order from NTIS as COM 75-10187.

Key words: benefit/cost; fish hatchery analysis; fish hatchery management; fish hatchery operation; mathematical model.

The HATCH model is an automated system for analyzing the physical, biological and economic factors of fish hatchery operation and for computing optimal hatchery management policies.

Key words: analysis of biological processes; economic performance; fisheries management; fisheries regulation; mathematical models; salmon fisheries model.

The salmon fishery modelling project is a joint State-Federal program for the development of improved techniques for analyzing the economic and biological effects of changes in the Pacific Coast salmon fishery regulatory parameters. This interim report covers the initial program design phase of the project.

NBSIR 74-523. Preparations for gage block comparison measurements, C. D. Tucker, 14 pages (July 9, 1974). Order from NTIS as COM 75-11126.

Key words: deburring; gage blocks, gage block comparator; linear variable differential transformer.

The methods described here for the cleaning and deburring of gage blocks can be useful to those individuals who have not established formal laboratory procedures for these operations. Many individuals may employ valid methods that vary somewhat from those employed at the National Bureau of Standards.

Many of the gage block comparators that are in use have not been periodically evaluated by the user. It is the intent of this report to set forth guidelines and procedures that may be used conveniently by metrologists to aid in obtaining more meaningful comparisons of gage blocks by the use of probe-type transducers.

Key words: abnormal loading; building; gas explosion; load-bearing masonry; load-bearing walls; masonry; masonry research; progressive collapse.

Five case studies of susceptibility to progressive collapse were made of non-reinforced masonry bearing wall buildings. All were assumed to comply with governing building codes. Based on the assumed failure mechanisms, analysis indicated that two of the structures had excellent resistance to progressive collapse, one was marginal, and two had little resistance to progressive collapse. Analytical approaches used are illustrated and areas of needed research are identified.

Key words: activated carbon; air sampling; gas standards; industrial hygiene.

The method in widespread use for the determination of the concentration of organic solvents in the work atmosphere consists in collection of the solvent by adsorption on activated charcoal followed by desorption with carbon disulfide and measurement by gas chromatography. This report describes techniques developed to produce reference standards for this determination and modifications in the analytical procedure to improve its precision and accuracy.

Key words: battery separators; nickel-cadmium batteries; satellite batteries; separator materials.

An evaluation intended to determine the potential suitability and probable efficacy of a group of separator materials for use in nickel-cadmium (Ni-Cd) satellite batteries was carried out. These results were obtained using test procedures established in an earlier evaluation of other separator materials, some of which had also been used in experimental battery cells subjected to simulated use conditions.

The properties that appear to be most important are: high electrolyte absorbivity, good electrolyte retention, low specific resistivity, rapid wettablity and low resistance to air permeation. Wicking characteristics and wet-out time seem to be more important with respect to the initial filling of the battery with the electrolyte.

While the properties of some of these materials indicate that they would be satisfactory, no specific conclusions can be drawn as to their actual effectiveness without further testing after they have been subjected to simulated use conditions in experimental cells.

Key words: benefit/cost analysis; building safety; economics; progressive collapse; standards.

Public and government concern about the progressive collapse of buildings caused by abnormal loading has resulted in the development of draft standards to provide protection against progressive collapse. From society's viewpoint, standards for protection against progressive collapse should result in a level of protection which is more efficient (i.e., the net social benefits from protection should be increased). An economic model utilizing the principles of benefit-cost analysis is developed which establishes a methodology for determining the efficiency of various levels of protection against progressive collapse. An application of the model to a partial evaluation of a specific standard demonstrates some of the capabilities of the model. Recommendations are made for a complete evaluation of this standard and for the further refinement of the model.

Key words: fluorescence measurement; instrumentation, luminescence measuring; luminescence measurement; phosphorescence measurement.

This project involved two activities, 1) the fabrication and calibration of phosphor standards for use in the Postal Service Model 4A8 Phosphorimeter and 2) the construction of an instrument to perform the calibration function. Both of these relate to the standardization of the phosphorescent and fluorescent activi-
ty of the luminescent coatings applied to postage stamps by the Bureau of Engraving and Printing. The purpose of the luminescent coatings is to facilitate detecting the orientation of envelopes in facer-canceler machines during mail processing.

Work on the project entailed the fabrication of approximately 60 phosphor standards, which are hand-sized aluminum blocks into which stamp-sized wafers of luminescent materials are mounted. Fabrication was carried out following the specific procedures supplied by the Postal Service, with however, authority to verify or alter the process as necessary. On the other major project effort, an instrument was designed and constructed following in general the basic design of an earlier broadband device developed under a prior project. Quantitatively in this system, evaluations are ultimately referred to calibrations at NBS of the relative irradiance of a lamp in the ultraviolet and visible regions of the spectrum.

This report, one of two covering the project activities, describes the preparation of luminescent wafers, their assembly into phosphor standards and the test procedures on completed standards. It includes a tabulation of the calibrated values of the new standards.

Key words: composite materials; fiber-reinforced-plastic rod; glass-reinforced-polyester rod; guys, antenna; processing parameters, pultrusion; pultrusion; reinforced plastic rod; stress rupture of FRP rod; test methods, FRP rod; weatherability, FRP rod.

Thirteen samples of pultruded, glass fiber-reinforced-polyester rod material were used by a different combination of the manufacturing process parameters for each. These samples were tested to evaluate the effects of nine different process parameters on the properties and characteristics of the rods. Elevated-temperature stress-rupture tests under saturated humidity were used as an accelerated measure of long-term weatherability. The test results were somewhat inconsistent, but it appears that certain process parameters, such as collimation and ultrasonic agitation of the rovings during pultrusion, were beneficial to both tensile strength and weatherability. Other parameters, such as pretensioning of the rovings, were beneficial to weatherability but detrimental to tensile strength. Additives to the resin system were generally detrimental.

A high speed tension test method was developed and it was found that the strength of the rod is substantially greater under high loading rates.

An approximate relationship was observed between transverse tensile strength and electrical breakdown voltage. However, neither of these characteristics, nor surface hardness, correlated with axial tensile strength or weatherability.

Key words: bar code reader; filters; optical wedge; photodetector; relative spectral output; wavelength.

The spectral characteristics of two bar code readers (submitted by the U.S. Postal Service under Task No. 1, Agreement No. 74-02934 [Mod. No. 1]) have been measured as a function of wavelength in the approximate interval of 450 to 1200 nm.

Key words: air analysis; air sampling; gas analysis; hydrogen fluoride; industrial hygiene; sodium acetate; sorber; solid; work atmosphere.

The efficiencies of several solid substances in a sorption tube for collecting trace quantities of hydrogen fluoride gas in work atmosphere have been evaluated. Reagent-grade sodium acetate crystals proved to be a very efficient sorbent for hydrogen fluoride. Its solubility in water and pH buffer properties are highly advantageous for subsequent fluoride determination by the ion selective electrode. Experimental results are presented for collection efficiencies of hydrogen fluoride gas at several concentration levels, flow rates, and collection times, the effects of elevated temperatures and humidity, and also breakthrough, bleed-out, storage and shipment studies. Specifications for construction of the sorption tubes are also given.

Key words: chloride; crevice corrosion; ellipsometry failure prediction; molybdenum; repassivation kinetics; stainless steels; stress corrosion; testing techniques.

A study of the effect of alloying chromium and molybdenum in ferritic stainless steels has been made using techniques to study repassivation kinetics (trio-ellipsometry) and depassivation kinetics (a recently developed ellipsometry technique for studying optical changes occurring within a crevice). Results indicate that chromium additions affect both repassivation and depassivation processes while molybdenum appears to affect only the repassivation processes. A discussion is given of a generalized mechanism for localized corrosion which postulates that susceptibility to attack is determined by the competition between depassivation and repassivation processes.

Constant strain rate studies were performed using AISI 304 stainless steel exposed to acidified 1.0N NaCl solution (pH = 3.0). In this particular environment, repassivation kinetics measurements using the trio-ellipsometric technique had shown that the metal dissolution rates were rather large due to reduced film repair kinetics, indicating the possibility of susceptibility to stress corrosion cracking (SCC). Reduced time to failure and maximum sustained load at a one strain rate suggest a relationship between SCC, repassivation kinetics, and rate of pure metal production.

A review of current approaches to the study of stress corrosion and a discussion of how these approaches can lead to new failure prediction tools is given.

Key words: adjustment for trend; calibration; capsule type thermometers; intercomparison; IPTS-68; platinum resistance thermometers; wire-to-wire calibration.

In this report we describe a procedure for the calibration of capsule type platinum resistance thermometers, PRT(s), using one or more standard platinum resistance thermometers, SPRT(s), in the temperature range of 0-35 °C. These PRT(s) were designed to be used in density work through hydrostatic weighing where SPRT(s) cannot be used because of space and other limitations, but the procedure is thought to be generally useful in other applications as well.

The schedule of intercomparisons was designed to eliminate possible trends in temperature variations of the constant tem-
temperature bath setup. Results of calibration can be expressed either in terms of the two constants alpha (a) and delta (b), or in a table relating R(t)/R(0) to t_max within the range of calibrations.

The uncertainty of the values of t_max calibrated by this procedure is believed to be within 2 millidegrees Celsius, not including the uncertainty of the SPRT that is used as standard.

Key words: building codes; construction materials; fire endurance ratings; fire tests; gypsum.

This paper describes the development of a test method for determining that the core material in a gypsum board sample qualifies as Type X. A 2 inch (5.08 cm) by 16 inch (40.64 cm) specimen is flexurally stressed during the test by suspending a weight from the cantilevered end of the test sample. The specimen is swiveled into the center of a two burner turbulent flame at an average temperature of 1,780 °F (971 °C). The burners are positioned from above and below. The test is terminated when the specimen either breaks or deflects through an arc three times the specimen thickness. Results show this method to be repeatable with a coefficient of variation equal to ± 8 percent for a given type of material from a single manufacturer.

Key words: environmental tests; product safety.

A study was conducted to determine the feasibility of establishing a set of generic environmental test parameters that would be applicable to all types of consumer products, with a potential for developing injury producing hazards as a result of environmentally induced failure. It was concluded that this approach is not a practical one. It is apparent that the safety of a product or type of product should be determined on the basis of simulated environmental tests appropriate to its specific end use.

Key words: false alarm; fire detector; fire test; residential smoke detector; semiconductor gas sensor; sensor contamination.

This paper examines some aspects of Taguchi semiconductor gas sensors and their use as residential fire/smoke detectors based on theoretical and experimental considerations. It was found that these sensors have difficulty detecting fires involving complete combustion along with a greater than normal propensity to false alarm to other than fire conditions. Both of these problems raise serious questions as to the suitability of these sensors as residential fire/smoke detectors, at least at their present state of development.

Key words: combustion products; full-scale fire; radiative heat transfer.

The contribution of radiative heat transfer from hot combustion products to corridor floors is examined. Data from full-scale corridor fire experiments is used to calculate emissivity and absorptivity of the combustion products. An empirical model based on attenuation by absorption is used to specify the absorption coefficient due to particulates in the products. In these experiments it is shown that radiation from the combustion products is just as significant as radiation from convectively heated walls and ceiling of the corridor. Calculations show that the ratio of radiant heat transfer to the floor due to ceiling emission to that by combustion product emission ranges from about 0.2 to 0.7. Also, molecular gas radiation and particulate radiation can both be significant for the combustion products. Calculations show that the emissivity of the gaseous combustion products alone would be about 0.3, but the inclusion of soot particles yields an emissivity for the total combustion product mixture of as high as 0.73, based on the experimental data considered.

Key words: accelerometer; calibration; low frequency; signal insertion; vibration.

The purpose of this study was to compare the frequency response of selected piezoelectric accelerometers using a signal insertion method to the response using traditional mechanical vibration tests. Signal insertion methods included "voltage insertion" and "change insertion" techniques. The signal is inserted in series with the electrical low-side of the accelerometer by means of a suitable series resistance. Commercially available insertion devices were used. Confidence in the use of insertion methods is increased where there is agreement between the results from insertion tests and mechanically excited tests.

NBSIR 74-600. Thermodynamics of chemical species important to rocket technology, C. W. Beckett, 200 pages (Oct. 1, 1974). Order from NTIS as ADA008935.

Key words: bibliography on spectroscopy of fluorides and oxides of the lanthanide series; calculation of dissociation energies; electrical resistivity; enthalpy of transition; graphite; infrared matrix isolation spectroscopy; melting point; radiance temperature; reaction of Ba(g) and excited ozone; reaction of Fe(g) and oxygen; review of literature on rate of diffusion and mass-spectrometric data; scandium group and rare-earth gaseous monoxides; specific heat; total emittance; vanadium; zirconium.

Using a subsecond-duration transient technique the specific heat, electrical resistivity, and hemispherical total emittance were simultaneously measured over the temperature range 1500-3000 K for some grades of graphite. Similar measurements were made on vanadium, and zirconium in the temperature range of 1500-2100 K. Melting points and radiance temperature (at 650 nm) are reported for zirconium and molybdenum. The temperature of the transition from the α-β phase of zirconium and the energy difference of these phases has also been measured using the subsecond duration transient technique.

The products of the reaction of Fe(g) and O2 have been investigated and identified using the methods of infrared matrix isolation spectroscopy. A preliminary report on the study of the reaction of Ba(g) with vibrationally excited ozone is also presented.

The dissociation energies of the scandium group and rare-earth gaseous monoxides are evaluated by reviewing the literature available on Knudsen effusion rates and mass-spectrometric data. Criteria are discussed for choosing data for evaluation of dissociation energies. A bibliography of the available literature on the spectroscopy of fluorides, oxides, and oxyfluorides belonging to the lanthanide series is given.

Key words: distribution of largest values; efficient estimators; extreme values; linear unbiased estimators; statistics; Type I distribution.

This report presents the essentials of modern efficient methods of estimating the two parameters of a Type I extreme-value distribution. These methods are an essential phase of the analysis of data that follow such a distribution and occur in the study of high winds, earthquakes, traffic peaks, extreme shocks and extreme quantities and phenomena generally. Methods are given that are appropriate to the quantity of data available—highly efficient methods for smaller samples and nearly as efficient methods for large or very large samples. Necessary tables are provided. The methods are illustrated by examples and summarized as a ready guide for analysts and for computer programming. The report outlines further work necessary to cover other aspects of extreme-value analysis, including other distribution types that occur in failure phenomena such as consumer product failure, fatigue failure, etc.

Key words: automobile side impact; crush characteristics; displacement measurements; door structure; drop tests; dynamic crush tests; impact collisions; plastic deformation; static crush tests; strain measurements; structural components; test procedures.

Static and dynamic test procedures were developed for evaluating the crush characteristics of automotive structural components which perform a major structural function in side impacts. Laboratory tests were conducted on several 1969 to 1971 4-door intermediate size automobiles to evaluate the crush characteristics of some of their structural components. Static crush tests were conducted in the 12-million-lb capacity universal testing machine at the National Bureau of Standards, employing its large working space. The dynamic tests were conducted using the monorails attached to the sensitive crosshead and the tie-down floor system which is incorporated in the foundation of this machine. The crush loads were applied perpendicular to the vehicle side for each of the tests. The response of the structural components was established based on the evaluation of displacement and/or strain measurements and detailed examination of the permanently deformed components following each test. Empirical factors were obtained which are useful for comparison of static and dynamic crush characteristics of a vehicle side door structure over a limited loading range. Further development of the test procedures is required in order to extend the range over which such results would be meaningful.

Key words: consumer products; criteria for safety standards; federal regulations; hearing impairment; hearing survey; noise emission; speech communication interference.

The Consumer Product Safety Commission is charged with the responsibility for promulgating safety standards to protect the public against unreasonable risks of injury associated with consumer products. There is a risk of injury from noisy products, directly by damage to hearing and indirectly by degradation of essential speech communication. This report develops criteria relevant to the specification of Safety Standards for noisy consumer products. Consumer product noise is discussed in relation to the existing body of knowledge regarding noise induced hearing loss and speech communication. Levels of product noise are identified that should protect against hearing impairment and against speech communication degradation. Methods of measurement for consumer product noise are described and a bibliography of standards relevant to the regulation of noisy consumer products is provided. A list of products that are potentially hazardous to the hearing of the operator is included with typical levels and usage patterns. The list is based upon reported data and some measurements made at NBS. Possible discrepancies among noise regulations established by different governmental agencies are discussed with suggestions for obtaining uniformity.

Key words: emergency messages; hearing loss; lawn mowers; noise emission; noise pollution; product safety.

A procedure is described for measuring the noise emission from power lawn mowers. The procedure covers both walk-behind and riding mowers, including suggestions of maximum noise levels for protection from hearing loss and for reception of emergency messages. The procedure employs a microphone located near the ear of the operator and mounted on a back-pack worn by the operator.

NBSIR 74-610. Investigation of procedures for determination of thermal performance characteristics of plastic piping used in housing. M. Tryon, 36 pages (Nov. 1974). Order from NTIS as COM 75-10072.

Key words: chlorinated polyvinyl chloride; hardness; internal stress; polyvinyl chloride; thermal mechanical analysis (TMA); thermal properties; thermogravimetric analysis (TGA); thermoplastic pipe.

The rapid growth of the use of thermoplastic pipe for plumbing in housing has prompted a study to determine the critical factors affecting the performance of the pipe materials. The emphasis in this preliminary study is on thermal properties such as the softening point, relaxation of thermal stress, glass transition temperature, hardness-temperature relationship, and decomposition temperature. The techniques used were thermal mechanical analysis (TMA), thermogravimetric analysis (TGA), and hardness. Preliminary results obtained on several pipe samples of PVC and CPVC commercial samples are reported.

Key words: air pollution; critical flow; laminar flow; nozzle; porous plug; sulfur dioxide concentration; carbon dioxide concentration.

The building and evaluation of a second configuration of a prototype SO2 and CO polluted air delivery system (PADS) is discussed. The delivery system was built to deliver sulfur dioxide (SO2) and carbon monoxide (CO) at a rate of 5 liters per minute. The design concentrations by volume were 1.0, 0.5, 0.1, and 0.04 parts per million (ppm) of SO2 in air and 50, 20, and 2 parts per million of CO in nitrogen. It consists of a diluent air delivery system utilizing a critical flow sonic nozzle and three separate pollutant flow systems utilizing laminar flow porous plugs, one plug for each desired output concentration. The system is contained in a dispatch case and the gases are delivered to it from pressurized containers through detachable supply lines.

118
By maintaining specific upstream pressures on the critical flow nozzle and the laminar flow porous plugs, PADS 2 produced average output concentrations of: 0.95, 0.50, 0.117, and 0.057 ppm of SO$_2$; and 52.9 and 18.1 ppm of CO. These concentrations were determined by measurements with NBS calibrated analyzers. The expected output concentrations were 0.03, 0.52, 0.103, and 0.05 ppm of SO$_2$ and 51.2, 18.0, and 1.49 ppm of CO based on flow calibrations of the individual components. The uncertainty of the output concentration is estimated to be about 7 percent.

Key words: floor slipperiness; resilient flooring; slipperiness standards; frictional tests; slip tests; coefficient of friction; human perambulation.

The National Commission on Product Safety reported in 1970, that falls in the home each year kill about 12,000 and injure 6,000,000 in the U.S.A. Slippery floors are listed as a large contributor to these very high casualty figures. Although there are some standardized test methods that are or might be suitable for such standards, there are no slipperiness standards for flooring. Thus, there is an immediate need for studies aimed at the development and establishment of such standards. Consequently, a preliminary study of floor slipperiness was sponsored by the Building Safety Section of the Center for Building Technology. The study included a state-of-the-art investigation on flooring slipperiness research and a laboratory evaluation of three existing test methods for measuring floor slipperiness. Samples of the three most commonly used resilient flooring materials, namely: vinyl asbestos, vinyl and linoleum were used in the study. The sliding material components for the frictional tests were leather and a commonly used styrene butadiene sole and heel rubber. The tests were performed both dry and wet. The results from this study were used in planning a large comprehensive study, which would lead to the development of accepted floor slipperiness standards. This report contains the results of the preliminary study.

Key words: consumer products; flammable liquid containers; gasoline cans; mechanical tests; product standards; safety.

Because of the concern for safety in the storage and use of gasoline and other flammable liquids around the home, this study was made to determine if standards can be established to minimize the flammable liquid hazard by controlling or standardizing the containers. Attention was focused on performance standards for stability, leakage, carrying handle strength, and pour spout strength. In general, it was found that the technology involved in existing voluntary standards for safety cans could be applied to flammable liquid containers for home use for all of the above factors except pour spout strength.

Key words: building technology; cooperation; fire safety; hydraulics; wind loads.

This is a status report of the progress achieved under the "Joint Complementary Research Program" sponsored by the Building Research Establishment (UK) and the Institute for Applied Technology (US), during the period July 1973 through June 1974. The program includes three projects: Wind Loads on Buildings; Design of Water Supply and Drainage Installations in Buildings; and Fire Detection in Buildings, each of which is discussed in the report.

Key words: children; consumer safety; guns; hearing damage; noise; standard apparatus; toys.

In recent years, a great concern has been expressed for consumer protection and safety, especially for children. As an outgrowth of this concern, acoustical testing of potentially-hazardous noise-producing toys has been carried out at the National Bureau of Standards for the Consumer Product Safety Commission under the authority of the Toy Safety Act of 1969. This report outlines a methodology which was developed to measure the noise levels of toy guns. In addition, the rationale and technical back-up for the methodology are discussed, and the regulations setting allowable noise levels for toy guns are given.

Key words: capillary tubes; density sensor; flow nozzle; laminar flow; liquid properties; viscosity sensor.

In-line density and viscosity sensors for liquids are developed to utilize measurements of differential pressure across a nozzle and a coiled capillary tube respectively, with known flowrates through each provided by a flow generator. Theory and principles of operation and instructions for calibration and use of the sensors are discussed, along with design considerations for the sensors and associated equipment. A calibration of the sensors demonstrated that viscosity and density each could be measured with a computed standard deviation of one percent. Viscosity was varied over the range of about 1 to 11 centistokes whereas density of the fluids used was near 0.8 g cm$^{-3}$. Application of well known similarity considerations is used to make the results applicable to other liquid densities, provided influence of other liquid properties (high vapor pressure, for instance) does not interfere.

Key words: home playground equipment; stability; strength; test; testing; tipping.

Stability tests were performed on some items of home playground equipment to measure the magnitude of the force, applied to generate tipping moment, required to start the tipping of the equipment.

Strength tests were conducted by loading certain components of home playground equipment with estimated loads to determine if the tested equipment had adequate strength.

Key words: abuse testing; dynamic stability; hazards; obstruction; riding toys; stairway; static stability; test weight; tilt angle; toy testing.

Stability and abuse tests were conducted on 88 riding toys in order to provide information which can be utilized to set realistic abuse performance levels for riding toys, as well as characterize...
the types of stability hazards associated with this class of toys. The results of these tests are summarized in tabular form and a description of the discrepancies encountered as well as photographs of these discrepancies are presented.

The appendices of this report contain photographs of each test specimen as well as the tabulated raw data for each test conducted.

Key words: bus-on-freeway operations; choice and captive riders; cost allocation formula; incremental costs and revenues; reverse commute bus service; Shirley Highway; transportation planning.

Bus-on-freeway operations generally provide peak period commuter transit service to persons traveling from suburban residences through congested corridors to jobs in the major employment centers of metropolitan areas. In a few cases, peak period reverse commute operations may provide service to persons traveling from residences near the downtown employment centers to jobs in the suburbs. In early 1973, two major Shirley Highway Express-Bus-on-Freeway Demonstration Project reverse commute routes began service to office buildings in Northern Virginia.

An analysis of this reverse commute service revealed that it was a successful operation because it provided considerable benefits to its patrons and was slightly profitable to the bus operator on an incremental cost basis.

Four conditions which were important for the success of the service were found to be important for the success of reverse commute operations, in general. The conditions are as follows: (1) A given route should serve a concentrated, high employment area. (2) The route should be accessible to people currently working within the employment area and to captive riders who can fill jobs there. (3) It should be possible to fit most of the reverse commute trips into existing bus schedules. (4) It should be possible to pair with peak direction trips any trips that cannot be fit into existing bus schedules.

Using a procedure which incorporates these conditions, one employment area within the Shirley Highway Corridor was identified as having potential as a market for a reverse commute service.

Key words: carrier trapping; gamma-ray detector; germanium; Ge(Li) detector; infrared response; silicon.

In response to a problem that arose with regard to the availability of germanium for lithium-drifted germanium detectors [Ge(Li) detectors], a comprehensive program was undertaken aimed toward the development of a method for the rapid specification of germanium quality for nuclear radiation detector use, and the determination of factors affecting germanium quality. Measurements on a large number of germanium crystals, most of which had been rejected for detector use, and intercomparison of these measurements and the methods employed, led to significant developments in the measurement of lithium mobility and driftability, carrier trapping, and semiconductor defect and impurity determination via an improved infrared response (IRR) technique. The present improvement of the infrared response technique resulted in the observation of a number of discrete energy levels lying within the forbidden gap of germanium unobserved in previous studies. It was possible to assign the proper position of energy levels detected by IRR in the upper or lower half of the energy gap. It was thus possible, in some instances, to determine the nature of the defects responsible for the observed energy level from results reported in the literature. The goal of developing a method for the rapid specification of germanium quality was achieved.

Key words: film thickness; film uniformity; fingerprint impressions; fingerprint readers; image quality; ink films; lubricity.

Tests were conducted on several types of ink to determine their influence on the quality of fingerprint impressions which they could produce. The thickness and uniformity of the film used to ink the fingers were found to be the most significant factor in providing high quality impressions. A method is described for metering out printer's ink and estimating whether or not a uniform film of near optimum thickness has been rolled out on a glass inking plate.

Key words: AC impedance; calcium apatites; calcium hydroxide; crystal growth; electrolysis; interfacial polarization; ionic conduction; mass transport.

In order to convert single crystals of calcium fluorapatite to calcium hydroxyapatite, an electrolytic cell technique will be explored. To utilize such a technique, the cathode compartment must consist of a source of hydroxyl ions and a barrier to the flow of all others. Ca(OH)2 has been selected for the cathode material, backed by a Pt electrode in an atmosphere containing H2O and O2. Ca(OH)2 crystals have been grown and Ag as well as Pt electrodes applied to them. Their ac admittance as a function of temperature has been measured and analyzed. A Warburg contribution to the admittance was observed to depend upon the presence of O2. Equivalent circuits have been generated from the data allowing us to tentatively characterize the electrical properties of the electrode crystal system.

NBSIR 74-629. Thermal properties of selected plastic piping used in housing, M. Tryon, 28 pages (Apr. 1975). Order from NTIS as COM 75-11281.

Key words: ABS; coefficient of expansion; CPVC; glass transition temperature; hardness; PB; polybutylene; polyvinyl chloride; PVC; residual stress; thermoplastic piping.

In a study of four thermoplastic piping materials, the following performance-related properties were measured: coefficient of thermal expansion, glass transition temperature, residual stress, hardness, and hardness-temperature coefficient. The purpose of the study was to determine typical values of these properties for each of the piping materials. Results are given with recommendations for performance tests and changes in previously-proposed interim performance criteria.

Key words: absorption; drying; phosphorous pentoxide; water vapor.
NASA proposal No. 7401-6-01A by the GCA Corporation describes a proposed air drying process which has been analyzed. The drying process, intended to reduce the water vapor content of a stratospheric sample to below one part per million by weight, is based upon the removal of the water as it passes through a phosphorous pentoxide absorber. The analysis indicates that the method is feasible. Dependence on ram pressure to maintain flow through the absorber appears questionable and consideration should be given to other means.

Key words: accelerated aging; aging; natural aging; paper; permanent; paper, stability; permanent papers; record papers; stability of paper.

A group of 36 book papers made in the NBS paper mill in 1937 were tested in 1937 before and after accelerated aging for 72 hours at 100 °C, and in 1973 after 36 years of natural aging. The data show that fairly good correlations exist between accelerated aging and natural aging when changes in alpha cellulose, copper number and, to a lesser extent, tearing strength, were used as criteria of change. pH is a reasonably good criterion of stability. It appears that zero span tensile strength, wet strength as a percentage of dry strength, and brightness are useful criteria for evaluating the aging of paper. When data in this report are compared with data from earlier reports, it appears that dry accelerated aging at 100 °C more nearly corresponds to natural aging than accelerated aging at 90 °C and 50 percent relative humidity.

Key words: carpool matching; carpools; computer programs; transportation; urban transportation.

This report documents the NBS computerized carpool matching programs and the procedures used in maintaining the coordinate data base required by the matching system. The report includes flowcharts, input/output formats, and program listings for the programs, plus details of the manual process for coordinate coding. The matching program produces, for each person desiring it, a list of others residing within a pre-specified distance of him, and is thus applicable to a single work destination having primarily one work schedule. The system is currently operational on the National Bureau of Standards' UNIVAC 1108 computer and was run in March of 1974, producing lists for about 950 employees in less than four minutes computer time. Subsequent maintenance of the system will be carried out by the NBS Management and Organization Division.

Key words: solar energy; standard; standard test; thermal performance; thermal storage; thermal test.

A study has been made at the National Bureau of Standards of the different techniques that could be used for testing thermal storage devices and rating them on the basis of thermal performance. This document outlines a proposed standard test procedure based on that study. It is written in the format of a standard of the American Society of Heating, Refrigerating, and Air Conditioning Engineers and specifies the recommended apparatus, instrumentation, and test procedure.

Key words: solar collector; solar energy; solar radiation; standard; standard test; thermal performance.

The National Bureau of Standards has made a study of the different techniques that could be used for testing solar collectors and rating them on the basis of thermal performance. This document outlines a standard test procedure based on that study. It is written in the format of a standard of the American Society of Heating, Refrigerating, and Air Conditioning Engineers and specifies the recommended apparatus, instrumentation, and test procedure.

Key words: bias; efficiency; extreme values; linear unbiased estimators; simplified estimators; statistics; type I distribution.

Methods for extreme-value analysis (for the Type I extreme-value distribution) that have optimum properties involve up to 20 quantities (depending on sample size) whose values are known to 6 decimal places. The present note shows how to modify these to much simpler values involving 2 decimal places that are more convenient to use yet sacrifice very little of the optimum features.

Key words: coefficient of thermal expansion; elastic constants; infrared laser window materials; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index.

We have measured the following parameters of chemical vapor deposited polycrystalline ZnSe (CVD ZnSe): Refractive index and change of index of refraction with temperature (dn/dT) over the wavelength range 0.5 μm to 18 μm using the method of minimum deviation; the coefficient of linear thermal expansion and dn/dT at 10.6 μm using Fizeau interferometry; and the elastic moduli and photoelastic moduli using Fizeau and Twyman-Green interferometry. A sensitive technique has been developed for measuring stress-optical constants of materials that exhibit a small stress-optical effect.

Key words: construction; Hurricane Agnes; housing; mobile homes; mobile home parks; performance data; regulatory process; standards.

In a study at the National Bureau of Standards (NBS), funded by the Department of Housing and Urban Development (HUD), methods for inspecting mobile homes to identify performance problems, recording the problems and analyzing the problem data were developed. Maintenance work orders for 2881 mobile homes, a part of 12,500 provided by HUD for emergency housing in the aftermath of Hurricane Agnes, at Wilkes-Barre, Pa., were reviewed and computer coded by an interdisciplinary team of engineers. Also, performance data were obtained from State and other Federal agencies for over 967 privately owned mobile homes. A second task was the field inspection of 257 mobile homes to assist in the determination of the causes and con-
sequences of the problems identified in the data acquisition task. Computer techniques were developed to process the data and print out problem summation tables, graphs to establish trends, compile data on obvious problems and ferret out those problems which may not be obvious. This first report documenting the data acquisition and analysis methodology will be followed by a series of reports which will present results and relate them to current standards, the regulatory and insurance processes.

Key words: airport approach and threshold lights; glass prism; impact tests; light bases; optical cover assembly; photometric measurements; static tests.

Static and impact load tests were performed on two style FAA-E-2491 airport in-pavement approach and threshold lights which were mounted in light bases encased in concrete. Static tests were conducted using either a 6-inch diameter steel plate or a rubber pad through which loads were applied to the center of the light optical cover assembly. Drop tests were conducted using a 5-lb steel ball which was directed to impact at various locations on the optical cover assembly. The old style lights were found to comply with load requirements for the current specification. The maximum load sustained by both style lights when loaded through a rubber pad was about two-thirds of the maximum load sustained when loading directly through the steel plate. A discussion is given of the photometric measurements of the light beam displacement measured during the load tests, the deflections and strains of two new style lights measured under two loading conditions and the test procedures for determining the performance of approach and threshold lights.

Key words: computer applications; OMNITAB II; Minitab; statistical computing; text editing.

This report contains specific suggestions for computer applications at the Ecuadorian Bureau of Standards (INEN). The suggestions, based on observations and discussion during a 10-day visit by the author in Quito, Ecuador, cover editing and typesetting of Ecuadorian standards, data storage and retrieval, and statistical analysis of experimental data.

NBSIR 75-651. Procedural options to reduce the risk of injury from products installed in residences, S. W. Stiefel, C. W. Hand, and D. W. Corrigan, 94 pages (June 1975). Order from NTIS as COM 75-11221.

Key words: building codes; Consumer Product Safety Act; product safety; residence-related products; residential safety; safety implementation approaches; safety standards.

The Consumer Product Safety Commission's (CPSC) list of consumer products with high relative incidence of reported injuries includes many products which are integral parts of the consumer's residence, such as stairs, doors, architectural glass, furnaces and water heaters. The safety aspects of these products are influenced by on-site construction practices and design considerations which are regulated through local building codes. The problem is to identify operational methods the CPSC can employ in dealing with unreasonable hazards associated with component parts of residential units.

This report identifies, for products installed in homes, (1) the product history stages, (2) institutional groups, (3) hazard sources, and (4) countermeasures available to the CPSC. It structures relationships among these four elements for evaluating the impacts of alternative countermeasures. Current mechanisms for control of products installed in homes are presented and sixteen potential countermeasures are postulated.

Key words: air compressors; error of sound power measurement; noise; noise measurement; sound power level; standard test procedures for sound power measurement.

This report describes investigations of the accuracy and precision of various measurement methodologies for determining the estimated sound power output of "large" machines in the free field over a reflecting plane. One purpose of this investigation is to place empirical error bounds on many of the free field measurement procedures currently proposed or in use; and in particular, compare the results of "near-field" and "far-field" measurements. The sources used for the investigation included 17 portable air compressors of various types (powered by internal combustion engines), a "reference" sound source, and a loudspeaker driven by a pure tone source. The data recorded include sound pressure level (A-weighted, linear, and 1/3-octave band) on an 84 point hemispherical array of seven metre radius, and "near-field" measurements, sampled every square metre, on a rectangular surface one metre from the machine surface. These data were reduced to provide information on the deviation of "near-field" sound power determinations from "far-field" power level (using subsets of the data as appropriate to various methodologies). The measured data for seventeen sources suggests that the value of a sound power estimate based on "near-field" sound pressure level measurements may be an upper bound to the sound power level estimated from far field measurements, subject to the limitations of sampling error. Estimates of total achievable measurement error of A-weighted sound power level of near field determinations relative to far field determinations are made for several measurement methodologies, based on the experimental data.

Key words: acoustics; air compressor; internal combustion engine; noise; sound power level; sound pressure level.

This report presents recommendations and supporting rationale on a measurement methodology for portable air compressors. The methodology provides for the determination of A-weighted sound power level or the equivalent weighted sound pressure level at a reference distance. A-weighted level is used because of its correlation with community response to noise from internal combustion engine noise. It is recommended, however, that the spectra associated with the regulated source be monitored in some manner to insure that the spectra remain similar to those for which A-weighted sound level retains good correlation with community response. The methodology uses weighted sound level measurements at eight positions on a curved surface surrounding the source at a distance of one metre from the surface of the machine. Data recorded at these positions are used to calculate the average weighted sound pressure level of the machine on the measurement surface. This is combined with the area of the measurement surface to give the sound power level of the machine. From this value, a rating sound pressure at a rating distance may be calculated by subtracting a constant value. Procedures which permit the rapid estimation of A-weighted sound level are included. These are applicable for estimation of A-weighted sound level in a variety of circumstances.
when the sound power or equivalent sound pressure level at a reference distance is known.

Key words: calibration; dynamic; photo flashbulb; pressure; pressure measurement; pressure transducer; thermal transient; transducer.

A method is being developed to apply short-duration thermal transients to pressure transducers and to observe the effects of these transients on transducer performance. The method consists of monitoring pressure transducer output as the transducer is exposed to radiation resulting from the ignition of a photographic flashbulb or from the discharge of an electronic flash. During this reporting period, the work has been exploratory in nature to determine values for method parameters. Thermal energy pulses as high as 0.4 J lasting 4 ms have been generated using an electronic flash; pulses as high as 1 J lasting 18 ms have been generated using No. 22 flashbulbs.

Work being performed for other agencies is also described briefly.

Key words: brittle solids; dislocation networks; electron microscopy; healing; indentations; microcracking; moiré patterns.

Transmission electron microscopy is used to examine the nature of microcracking about small-scale indentations in two highly brittle solids, sapphire and carboureum. The observed crack geometry is discussed in terms of an earlier model of indentation fracture beneath a point force, in which both loading and unloading half-cycles contribute to the crack growth. The residual interfaces are characterized mainly by moiré patterns, sometimes by dislocation networks. These observations are discussed in relation to spontaneous closure and healing mechanisms, and the “lattice mismatch” necessary for their production estimated at about one part in a thousand. It is shown that cleavage steps comprise the main source of obstruction to lattice restoration across the interfaces. Mechanical and thermal treatments of the indented surfaces are found to influence the extent of the residual cracking. Some practical implications of the observations are discussed.

Key words: abrasion; brittle solids; brittle surfaces; chipping; fracture; hardness; indentation; residual stress; stress analysis; wear rate.

A description is given of the mode of chipping fracture observed in highly brittle solids. It is pointed out that residual stresses about indentation deformation centers play a vital role. The implications of this mode in a number of mechanical phenomena are discussed.

An explicit model for the wear of brittle surfaces under fixed abrasive conditions is presented in terms of indentation fracture concepts. The predicted wear rate for glass agrees with that observed experimentally to within an order of magnitude. Some implications concerning the parameters which influence the abrasion process, particularly the hardness, are discussed.

Key words: consumer information; consumer products; energy conservation; energy efficiency; energy use; household appliances; household equipment; labeling; residential.

The Voluntary Labeling Program for Household Appliances and Equipment to Effect Energy Conservation was established in response to an April 18, 1973 Presidential directive. Final procedures for the program became effective October 26, 1973. Only major energy consuming household appliances and equipment are covered. Purposes of the program are to encourage manufacturers to place energy efficiency labels on their appliances and to encourage consumers to utilize this information in making purchase decisions.

Specifications containing labeling requirements for each type of product are developed by NBS with assistance from consumers, retailers, manufacturers and interested Federal agencies. During the first full year of program operation, final specifications for labeling room air conditioners and proposed specifications for labeling refrigerators, combination refrigerator-freezers, and freezers were issued. Two consumer information pamphlets were published and other consumer information and education activities were undertaken. Labeling specifications for water heaters, clothes washers and dryers, and ranges and ovens were under development. This was accomplished, with assistance from manufacturers, retailers, consumers and other agencies, by a staff of six funded at a level of $375,000 per year.

At year’s end, twenty-four room air conditioner manufacturers and private brand labelers, representing an estimated 95 percent of U.S. sales of this appliance, were participating in the program.

Key words: brittle solids; ceramic surfaces; degradation; fracture; indentation; strength.

A theory of strength loss for brittle surfaces in contact situations, developed in a previous paper for "blunt" indenters, is here extended to the case of "sharp" indenters. A prior fracture mechanics analysis of crack growth beneath ideal cone indenters serves as the basis for determining the prospective surface degradation of ceramic components in service. Compared to blunt indenters, severe degradation can occur at the lower contact loads. However, at high loads the extent of degradation becomes remarkably insensitive to indenter geometry. Essential theoretical predictions are verified by bend tests on glass slabs. The effect of indenter "sharpness" and initial specimen surface flaw state are investigated systematically, along with some secondary rate effects in the contract process. The possibility of minimizing degradation via adjustment of material parameters (including hardness) or surface condition (e.g., residual stresses, frictional properties) is briefly discussed.

Key words: air pollution; chemical analysis; paraarosamine method; quality control; reference materials; sulfur dioxide.
The development of reference materials to serve for quality control and performance evaluation of measurements of sulfur dioxide by the pararosaniline method is described. Powder samples consisting of sodium sulfite dispersed in mannitol can be prepared to evaluate measurements for the concentration levels of ambient interest. The samples are sufficiently stable in routine use, with a service life of at least three months. By the use of a series of five samples of graded sulfite content, measurement errors greater than five percent are significantly detected. A detailed procedure for preparation of the samples is included. Preliminary studies of an alternate method for preparation of quality control samples, by a freeze-drying process are also described.

Key words: brittle solids; ceramic surfaces; cracks; degradation; fracture; Hertzian; indentation; strength.

Indentation fracture mechanics is used to develop a theoretical basis for predetermining the strength properties of brittle surfaces in prospective contact situations. Indenters are classified as "blunt" or "sharp," of which only the first is considered in the present work. The classical Hertzian cone crack conveniently models the fracture damage incurred by the surface in this class of indentation event. Significant degradation is predicted to occur at a critical contact load; however, with increasing load beyond this critical level the degradation rate becomes relatively slight. Bend tests on abraded glass slabs confirm the essential features of the theoretical predictions. The role of controlling variables in the degradation process, notably starting flaw size and indenter radius, is systematically investigated. An indication is also given as to optimisation of material parameters. The analysis leads to some novel suggestions concerning surface preparation procedures that might be followed in order to minimize strength losses.

Key words: computers; information systems; mass transportation; telephone systems.

This preliminary analysis of Point-to-Point Trip Management (PTPTM) was prepared for the Urban Mass Transit Administration in Washington, D.C. PTPTM is concerned with providing prospective riders of mass transit with the necessary detailed information for particular trips. This report contains the results of a literature search on automation in the telephone information center, and analyzes the data collected from 29 existing centers. Additionally, on-site visits were made to three operational centers, and tapes of actual telephone inquiries and responses were obtained and analyzed. The use of microfile and computers are examined as an aid to the operators in these centers. Total automation of these centers is also discussed. Conclusions and recommendations for further study in this area, and an annotated bibliography, are also part of this report.

NBSIR 75-666. Post optimality and parametric analysis with the National Bureau of Standards' linear programming subroutine RVSMPX, T. B. Ayers, 47 pages (Feb. 1975). Order from NTIS as COM 75-11381.

Key words: algorithms; linear programming; parametric programming; post-optimality analysis.

This report is a sequel to NBS Report 10695 (February 1972), "The National Bureau of Standards' Linear and Quadratic Programming Subroutines," which documented one phase of an effort to provide users of the facility operated by the National Bureau of Standards' Computer Services Division, with reliable, clearly-described solution algorithms for selected frequently-arising classes of special mathematical problems. The present report presents subroutines which perform post-optimality analysis and parametric programming studies on linear programming problems solved by the National Bureau of Standards' RVSMPX subroutine. (The present versions of these codes use internal storage only).

Key words: branch circuits; contact resistance; electrical codes; electrical connections; fire safety; housewiring; performance testing.

During the Operation BREAKTHROUGH Research and Demonstration program the U.S. Department of Housing and Urban Development became concerned with the inability to properly evaluate innovative electrical connections. Innovation in electrical connections has been very slow because of the long-life requirements, stringent fire safety requirements, long established conventional practices and evaluation procedures and lack of a performance base for describing requirements. This preliminary report presents the framework for a proposed method to evaluate electrical connections on a performance basis and supplements information contained in a previous report on current technology of electrical connections used in residential branch circuit wiring. Innovations involving electrical connections may lead to significant advancements in housing construction if it can be demonstrated that functional and safety requirements over the expected life of electrical connections were adequately satisfied. Research is needed to enable prediction of long-term performance of electrical connections based on the results of accelerated performance tests.

Key words: aluminum; ducts; fire tests; flexible connectors; furnace pressures; glass fiber; heat ventilating and air conditioning systems; high-rise buildings; optical density; steel; terminal units.

The report describes fire tests on four flexible connectors of the type used in air conditioning systems. Four flexible connectors (aluminum, felted glass fiber, steel, and woven glass fiber) were exposed to a standard ASTM E-119 fire test. The results were in agreement with previous results in which a different sized branch duct was used in the assemblies. The results indicated a need to control furnace pressures. The test results were used to develop a proposed test method for fire testing flexible connectors. This proposed test method is described in the report.

Key words: background; mercury in coal; trace analysis; x-ray fluorescence; x-ray spectrography.

Limits of detection for mercury in coal have been determined on both a wavelength-dispersive and an energy-dispersive x-ray spectrometer. They are between 2 and 3 ppm under best conditions for both spectrometers. Techniques for reducing the background intensity measured by the energy-dispersive system
are discussed along with methods of preparing coal specimens for analysis in both instruments.

Key words: aluminum wire; consumer product safety; electrical failures; electrical fires; electrical wiring; fire hazards.

In the mid-1960s, aluminum wire began to be used in significant quantities for residential branch-circuit wiring. Reports of problems from various localities in the U.S. raised serious concern and controversy as to the safety of this application. An official determination on this matter is within the jurisdiction of the Consumer Product Safety Commission. This report reviews the history of the use of aluminum in residential wiring and describes the characteristics essential to data to be used to evaluate the performance of aluminum wiring in the field. The examination of existing field data shows that no available data have the characteristics necessary to develop a reliable estimate of the level of risk to consumers associated with aluminum wiring. Neither can the available data be used to establish the relative risk of aluminum compared to copper wiring. There is only a gross estimate of the extent to which aluminum wiring is now in use in U.S. residences. Statistically sound estimates of risk would be possible only after data collection on a large scale.

Key words: buildings; combustibility; fire intensity; flames; furnishings; heat release; ignition; smoke; thermal radiation; upholstery; waste receptacle.

A variety of upholstered chairs and wood cribs were burned within a ventilated compartment. The experimental measurements of weight loss, smoke concentration, temperature and heat flux levels are summarized. A reproducible fire obtained from burning a standardized wood crib array was found to be capable of representing the essential features of incidental fires of moderate intensity.

Key words: enforcement; legislation; mobile homes; regulation; standards; state-of-the-art study.

This study examines the extent to which the nationally recognized standard for the construction of mobile homes (i.e., ANSI Standard A119.1/NFPA 501B) has been adopted and amended by the individual States that have implemented enforcement programs for the regulation of mobile homes. Summary data is presented on the existing status of the various versions of the standard adopted in each State. State-adopted amendments to the technical requirements in the national standard are compiled by State and construction discipline for comparative analysis.

Key words: calibration; calibration table; densitometer; densitometry; optical density; optical density standard.

The adjustment and calibration of a densitometer are considered. This is accomplished through the use of physical measurement standards with a procedure appropriate for the instrument, and brings the instrument response in line with measurements traceable to NBS. The difference between primary and secondary physical measurement standards for diffuse (visual) density is discussed. A calibration table is suggested for best use of the instrument and a computer program (BASIC language) is provided that will calculate and print a table relating instrument reading to diffuse (visual) density.

Key words: aluminum ultrasonic standards; ASTM-type reference blocks; fabrication of reference blocks; immersion testing; longitudinal waves; metallurgical variables; non-destructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics.

A program to improve the quality, reproducibility and reliability of nondestructive testing through the development of improved ASTM-type ultrasonic reference standards is described. Reference blocks of aluminum, steel, and titanium alloys are to be considered. Equipment representing the state-of-the-art in laboratory and field ultrasonic equipment was obtained and evaluated. RF and spectral data on ten sets of ultrasonic reference blocks have been taken as part of a task to quantify the variability in response from nominally identical blocks. Techniques for residual stress, preferred orientation, and micro-structural measurements were refined and are applied to a reference block rejected by the manufacturer during fabrication in order to evaluate the effect of metallurgical condition on block response. New fabrication techniques for reference blocks are discussed and ASTM activities are summarized.

Key words: computer security; computing technology; election administration; public administration; state and local government; systems analysis; technology utilization; vote-tallying.

The results of a systems analysis and evaluation conducted on the role of automatic digital processing in vote-tallying are presented. Included in the report are descriptions of hardware, software, and administrative problems encountered in fourteen elections in which electronic computing technology was utilized.

Methods of ensuring more confidence in the accuracy and security of the vote-tallying process are presented and described. These methods include aids to audits of calculations, physical controls over ballots and computer records, and guidelines for the use of computer programs, computer facilities, and teleprocessing. Methods of improving the election preparation process also are presented and described. These involve the development and implementation of design specifications and acceptance tests for computer programs, election equipment and supplies, and guidelines for pre-election checkout of vote-tallying systems and for assurance of management control.

Institutional factors are discussed which should be considered if improved accuracy and security controls and more effective election preparations are to be implemented. Recommendations for additional research and other activities including a possible Federal role are provided.

Key words: enforcement process; field inspection; house...
A field inspection study of mobile homes was conducted for the Department of Housing and Urban Development. The objective of the study was to evaluate the causes of mobile home problems by physically inspecting available units at various locations in the United States. A total of 257 units were inspected consisting mostly of mobile homes purchased by HUD and used as temporary housing for victims of the 1972 Hurricane Agnes disaster. The total number of problems found was 3,528 for the 257 units inspected. Of these problems, 2120 were directly related to inadequacies in the ANSI A119.1 Standard for Mobile Homes or the mobile home enforcement process (plan review, certification of designs, plant inspection), 934 were routine maintenance problems, and 374 were attributed to mechanical/electrical appliances and equipment. This report presents a computer listing of all problems plus photographic examples of observed problems.

The number of mobile homes included in this study is small when compared to the total number of mobile homes now in use in the United States. Additionally, this was a problem oriented study and did not attempt to document the many areas of satisfactory mobile home performance.

Key words: bus-on-freeway operations; commuter surveys; mode choice decisions; park-and-ride; Shirley Highway; transportation planning.

The market for fixed route transit operations is not limited to travelers within walking distance of transit stops. This was demonstrated by the Shirley Highway Express Bus-on-Freeway Project as project promoted park-and-ride operations led to sizable increases in bus patronage: Park-and-riders, commuters who traveled by auto to a bus stop and then by bus to work, greatly expanded the market for the fixed route bus service in the Shirley Highway Corridor area.

This report presents results of a study of the successful park-and-ride operation within the Shirley Highway Corridor area: Suburban fringe parking lots coupled with the high speed buses of the Shirley Highway Express Bus-on-Freeway Project. Demographic characteristics of the park-and-riders as well as characteristics of their present park-and-ride and previous commute trips are examined. Factors important in the commuters' decisions to park-and-ride are identified. The report also describes the survey procedures used in the study.

Key words: computer techniques; enforcement process; housing; Hurricane Agnes; mobile home parks; mobile homes; performance data; standards.

Performance of mobile homes as housing units is of broad concern to mobile home owners. This study report prepared at the National Bureau of Standards (NBS) and funded by the Department of Housing and Urban Development (HUD) presents mobile home problem data obtained from two separate data sources. The first data base for 2881 units was selected from maintenance records retained by HUD on 12,500 mobile homes used as emergency housing following the Hurricane Agnes disaster at Wilkes-Barre, Pennsylvania. The second source consisted of data for 967 privately-owned units collected from the files of various Federal, state, and private agencies responsible for regulation or consumer protection functions with regard to mobile homes. The mobile home performance problem data was processed using computer techniques to produce problem summation tables which facilitated evaluation. Although the mobile home problems experienced in various categories are highlighted in this report, no attempt was made to relate these results to current standards, regulatory or mortgage insurance (durability) processes. Analyses of this kind are planned for future reports in this series.

NBSIR 75-691. A characterization and analysis of NBS corridor fire experiments in order to evaluate the behavior and performance of floor covering materials, J. G. Quintiere, 89 pages (June 1975). Order from NTIS as COM 75-11015.

Key words: corridor fire spread; energy release rate; fire induced flow; flame propagation; flashover; floor coverings; radiant heat flux.

Data is presented for four fire experiments which examine the fire propagation from a room fire to a floor covering material in a corridor. The four floor covering materials include a nylon and an olefin carpet, vinyl sheet, and red oak flooring. Limited flame spread occurred for the vinyl sheet material; however, the three other materials involved full fire propagation in the corridor. The data are analyzed to examine the factors influencing fire propagation. Included in this analysis is the rate of energy contribution from the room fire and floor covering material, the rate of flame spread, heat transfer to the floor covering, and flow interactions between the room and corridor. A review of previous related experiments is also presented.

Key words: bicycle attachments; children; consumer safety; model airplanes; noise; toys.

In recent years, a great concern has been expressed for consumer protection and safety, especially for children. As an outgrowth of this concern, acoustical testing of potentially-hazardous noise producing toys has been carried out at the National Bureau of Standards for the Consumer Product Safety Commission under the authority of the Toy Safety Act of 1969. This report outlines a methodology which was developed to measure the noise levels of model airplanes and noise producing bicycle attachments. The technical back-up and rationale for the development of the methodology are discussed. In addition, data taken using the proposed methodology are presented.

Key words: ETIP; incentives; innovation; procurement; product improvement; specifications.

The topic of the symposium was "Government and Industry—A Joint Effort Toward Technological Innovation in Product Development for Government and Public Procurement." The general objectives of the symposium were to open government-industry dialogue on ways to encourage technological innovation in the development of products purchased by the Federal Government; to explore methods of developing a "spin-off" effort so that the consumer marketplace might benefit from such innovations; to set up a procedure for analyzing the effect on the consumer marketplace and to establish procedures for continuing a government-industry dialogue. The plenary session...
provided participants with information designed to generate dialogue and to develop source material. Workshops were organized to consider specific product grouping in: Office Machines (typewriters, calculators, copiers, and microfiche); Furniture (wood and metal office types); Containerization/Packaging: ADP-Peripheral/Supplies; Instrumentation (optical and electrical measuring devices); Electrical Equipment (appliances and powered hand tools); Automotive Products (after market replacement parts and tires); Photographic and Audio Visual; Chemical (coatings, cleaning agents and detergents).

Key words: quality assurance; regulation; safety standards; sampling plan; sampling scheme.

Various means available to a regulator for gaining compliance with mandatory safety standards are examined. Particular attention is given to his option of mandating a sampling plan or scheme along with the standard. It is concluded that this option as well as the others identified are all viable under suitable conditions and should be available to the regulator for his possible application on a case by case basis.

Key words: acutance; calibration; computer programs; microdensitometry; photographic edges; transfer function.

The method by which photographic edges made at NBS are calibrated is presented and discussed in some detail. The programs associated with the computational aspects of the analysis are listed, covered in narrative form, and their limitations and options are presented. The possible use of these edges to determine microdensitometer transfer function is discussed and limitations and relative error of all the calculations and procedures are covered in detail. Program listings are in BASIC language.

NBSIR 75-700. Results of full-scale fire tests with photoelectric smoke detectors, R. W. Bukowski and R. G. Bright, 55 pages (Sept. 1975). Order from NTIS as COM 75-11280.

Key words: fire detectors; ionization chamber smoke detectors; photoelectric smoke detectors; smoke detectors; Taguchi gas sensors.

In February 1974, a series of full-scale fire tests were conducted to determine whether photoelectric-type smoke detectors could respond to the same types of fires used to assess the performance of ionization-type smoke detectors. The types of fires employed in the tests are the same as those outlined in Underwriters’ Laboratories, Inc., Standard No. 167. In addition to the UL-167 standard fires, fires involving polyurethane (flammable mode) and cotton (smoldering mode) were added to the test series. One detector, utilizing a Taguchi gas sensor (TGS), was included in the test series for evaluation purposes. The test results indicated that the better photoelectric smoke detectors, i.e., those having little obstruction to slow-moving smoke can, in general, detect the same test fires as the ionization chamber smoke detectors in approximately the same time scale. For the smoldering cotton fire, the photoelectric detectors were significantly faster than the ionization chamber detectors. The TGS fire detector was unable to detect most of the test fires.

Key words: high-rise buildings; photoelectric smoke detector; smoke control; smoke movement simulation; smokeproof tower.

A study was made by the National Bureau of Standards to evaluate the effectiveness of a smokeproof stairwell tower installed in a high-rise apartment building. Tests were also made of photoelectric-type corridor smoke detectors. A quantitative experimental technique of smoke simulation and smoke movement measurement was used. Factors diminishing the effectiveness of the stair towers, preventing smoke infiltration and limiting the response of the detectors, are noted.

Key words: firefighters; firefighter’s turnout coats; protective clothing.

These design criteria cover requirements for the sizing, construction, outer shell, inner linings, weight, and thickness for firefighters’ turnout coats as well as test methods, labeling requirements, and design considerations. Included also is a list of options and other items of concern to potential users of the criteria and a sample purchase specification to be used in conjunction with the criteria.

Key words: brick; failure; failure theories; masonry; shear strength; shear test; shear walls; stress distribution; stresses; structural engineering.

Various failure hypotheses for wall panels subjected simultaneously to diagonal compressive load and to vertical compressive edgeload are compared with the results of thirty-two tests on four types of brick masonry walls which were published elsewhere. It is concluded that failure can occur by joint separation or by splitting. A failure hypothesis is advanced which is shown to be in good agreement with the test results examined.

Key words: ASTM E 84; carpets; energy balance; flame spread; mass balance; test method.

Five experiments were conducted using an ASTM E 84 tunnel test facility. These included a calibration test, three standard tests involving carpet materials, and one test in which a carpet material was tested on the floor of the duct. In addition to the measurements recorded during a standard test, instrumentation was added to measure inlet air velocity, temperature within the test section of the duct, and heat flux. From these measurements mass and energy balances were determined for each experiment. The results indicate that inlet air mass flow rate dropped during a test and appears to depend on the extent of burning in the duct. The energy balance results indicate that for the calibration run about half of the energy of the gas burner is lost by radiation and convection to the walls in the test section of the tunnel. During combustion of a test specimen, significant energy losses occur in the last 9 feet of the test section even after the flame tip has reached the exit of the tunnel.

Key words: safeguards; surveillance; tamper-resistant; television.
This report describes a tamper-resistant television system. This system will be part of a larger system used for verifying compliance with certain international arms control or safeguard agreements. This work is part of a joint U.S.-Canada safeguards research program to develop and evaluate tamper-resistant, tamper-indicating techniques and instrumentation that might be applicable in safeguarding reactors or other nuclear facilities. The principal design objectives are to provide a system capable of unattended operation, data storage capacity for a period up to 90 days, and resistance to deception by insertion of false video information on the transmission line or substitution of false scenes in the camera's field of view. These objectives are accomplished by utilizing commercial high-resolution closed-circuit TV and photography coupled with a video encoding technique which perturbs the luminance signal in a different pattern for each recorded picture. Motion detectors, utilizing the video signal, provide the ability to selectively record pictures when motion occurs in preselected areas, and protect the system against insertion of false scenes. The incorporation of these additional features adds comparatively little complexity to ordinary closed circuit TV while greatly increasing its effectiveness as a surveillance tool for safeguards applications.

Key words: calibration; dynamic; liquid column; pressure; sinusoidal pressure; transducer.

Work continues on the development of a method of producing sinusoidally varying pressures of at least 34 kPa zero-to-peak with amplitude variations within ±5 percent up to 2 kHz for the dynamic calibration of pressure transducers.

Sinusoidally varying pressures of 34 kPa zero-to-peak have been produced, to date, between 40 Hz and 750 Hz by vibrating a 10-cm column of a dimethyl siloxane liquid at 36 °C zero-to-peak. Damping of the liquid column was accomplished by packing the fixture tube with a number of smaller diameter tubes.

NBSIR 75-710. A small-scale enclosure for characterizing the fire buildup potential of a room, W. J. Parker and B. T. Lee, 23 pages (June 1975). Order from NTIS as COM 75-11030.

Key words: fire growth; fire tests; flashover; room fires; scale models; thermal radiation.

A 0.76 by 0.76 m (30 by 30 inch) enclosure with a 0.61 m (24 inch) high ceiling was used to model some fires in a 3 × 3 × 2.4 m (10 × 10 × 8 ft) burnout room. Temperatures, oxygen concentrations, air velocity, and convective and radiative heat fluxes were measured. The highest average air temperature in the upper part of the room was taken as a measure of the fire buildup potential of the room. Upper air temperatures attained in the model were similar in most cases to those in the full-scale compartment. From energy balance considerations this air temperature was related to the oxygen depletion in the room and was shown to correlate well with the oxygen content of the combustion gas and air exhausting from the model and full-scale room fires.

NBSIR 75-711. Site analysis and field instrumentation for an apartment application of a total energy plant, J. B. Coble and P. R. Achenbach, 65 pages (May 1975). Order from NTIS as COM 75-10689.

Key words: air conditioning; air pollution; central utility systems; data acquisition system; efficiencies; electrical power; energy conservation; energy costs; fuel utilization; heat recovery; total energy systems; utilities for housing; utility system performance.

Under sponsorship of the Department of Housing and Urban Development, the National Bureau of Standards developed criteria in a feasibility study to select a site for, and to evaluate the requirements of a total energy system on one or more OPERATION BREAKTHROUGH housing sites. The total energy system produces its own electrical, heating and cooling energy services independent of the local utility system. Six OPERATION BREAKTHROUGH sites were selected for the feasibility study: Jersey City, N.J.; Macon, Ga.; Memphis, Tenn.; Indianapolis, Ind.; St. Louis, Mo.; and Sacramento, Calif. Ranking parameters for final selection were: number of dwelling units, density of dwelling units, climatic factors, energy utilization, owning and operating costs, and developer's attitude.

The Jersey City site was chosen as the location for the installation, evaluation, and field study of the total energy system. The site covers six acres, has four apartment buildings containing 488 dwelling units, a 50,000-sq-ft commercial building, an elementary school, a swimming pool, and the total energy plant.

The buildings and the total energy plant are being extensively instrumented to provide data on fuel utilization, system efficiencies, electrical and thermal energy generation, energy utilized and rejected. The environmental impact of the total energy plant with respect to noise, vibration, air pollution, and esthetics is under evaluation. The installed system will be compared with several types of conventional energy systems.

Key words: economic optimization; HVAC systems; life-cycle cost analysis; solar energy; solar heating and cooling.

This report addresses economic issues important to the design, and evaluation of solar heating and cooling systems in buildings. It explains and illustrates with simple, but realistic examples the use of life-cycle cost analysis and benefit-cost analysis to evaluate and compare the economic efficiency of solar and conventional energy systems. It also explains the conditions for making cost-effective tradeoffs in solar system/building design. By presenting the basic methods and assessing the appropriateness of alternative assumptions, the paper provides a resource document for researchers and analysts.

NBSIR 75-713. A file management system for a laboratory automation facility, P. S. Shoenfeld and L. J. Kuetzel, 54 pages (June 1975). Order from NTIS as COM 75-11134.

Key words: data acquisition; file system; laboratory automation; multiprogramming; operating system; real-time.

The National Bureau of Standards' Analytical Chemistry Division operates a centralized laboratory automation facility built around a multiprogrammed minicomputer. A file manager was developed which allows the dynamic creation and manipulation of sequential disk files. Although the system was developed for real-time data acquisition, it is a general purpose addition to the computer's operating system and may be used for a variety of applications. A new operating system function was developed to allow the queued scheduling of programs. This is used to achieve more efficient multiprogramming. A comprehensive file utility package is also provided.

Key words: baby cribs; children's furniture; product safety; product testing; safety regulations; standard development.

A sample of non-standard size baby cribs was tested for com-

Key words: building systems; housing systems; large-panel structures; precast concrete construction; progressive collapse; structural design; structural joints.

The design solutions used by five U.S. precast concrete housing systems to comply with a provision against progressive collapse are studied and compared. Some common characteristics of the design solutions are identified.

Key words: certification programs, ETIP; incentives; innovation; life cycle costing; procurement; product testing; specifications; unsolicited proposals.

The general objectives of the conference are to recommend ways to encourage information interchange and interaction between federal, state and local procurement levels and industry; to explore the use of special incentives such as life cycle costing, value incentives clauses, and unsolicited proposals as a means to promote innovation in products purchased by all levels of government; to establish the interrelationship between marketing, R&D and procurement and develop approaches to acquire the latest technology through the procurement process; to explore various product testing and evaluation efforts such as certification programs, tests by independent, company owned and association laboratories, university and government laboratories. Workshops were organized to consider procurement mechanisms, information interchange, testing and evaluation of products, and the interrelationship between marketing, R&D and procurement. Workshops were grouped as follows: (1) Procurement Incentives, (2) Interaction and Information Interchange, (3) Marketing, R&D and Government Procurement Cycles, (4) Product Testing and Evaluation, (5) Qualified Products Lists and Bid Samples, (6) Qualified Manufacturers, (7) Methods and Techniques of Contracting.

Key words: AM General Bus; arson; critical radiant flux; fire retardant; flammability; flooring radiant panel test; Metro; motor vehicle safety standard 302; urethane.

The Center for Fire Research at the National Bureau of Standards has conducted a study of the fire safety of a bus supplied by the Washington, D.C., Metropolitan Transit Authority. The objectives of the work were: (1) to determine the minimum ignition from source necessary to initiate a fire in the bus, and (2) to determine the means by which a fire, once started, is most likely to grow and spread.

A series of small-scale laboratory tests were run in addition to the three full-scale tests. Tests showed that accidental ignition by a cigarette or dropped match is unlikely. However, the seat can be ignited with one or two matches, if applied at the proper location, as by an arsonist. In full-scale tests, ignition of the seat occurs readily with the following ignition sources: (1) a small bag of paper trash on the seat, (2) a newspaper under the seat, (3) if the contents of a can of lighter fluid is poured on the seat.

Fire growth and spread in the bus is primarily through involvement of the seat cushioning. Fire spreads from seat to seat with little direct involvement of other interior materials. In all three tests, between one and two minutes after the urethane ignited, dense smoke filled the bus space seriously reducing visibility. Spread of fire beyond the seat of origin is not necessary for the level of smoke to be formed.

Key words: economic incentives; housing development; integrated utilities; utilities.

This report provides information to the Department of Housing and Urban Development-Modular Integrated Utility System (HUD-MIUS) program about the economic decision-making process for implementation of a MIUS by utility companies, developers, and a combination of these two groups.

Information was obtained through informal telephone interviews from these participant groups about their economic analysis of utility investment alternatives. The content of these conversations was synthesized into economic criteria which are perceived by each participant to be most important in evaluating alternative utility investments. From the analysis of these economic criteria, the possible combinations of participants and roles in the implementation of a MIUS are specified. These combinations are ranked, according to the degree of likelihood that each method will actually be employed.

The conclusion of this report is that a MIUS is most likely to be implemented by a governmental body, such as a municipal utility or governmental developer.

Key words: aluminum wire; consumer product safety; current cycle testing; electrical connection failure; electrical receptacles; residential wiring.

This report is a compendium of information on aluminum wiring in residences, originally prepared for the Consumer Product Safety Commission. It contains a summary of experimental research carried out at the NBS laboratories on the problems of terminating aluminum wires to screw connections as well as other pressure connectors. Since this report is an overview of the technical aspects of the aluminum wiring problem, it also contains a review by NBS staff members of available material furnished by Underwriters Laboratories and Battelle Institute. Both of these institutions are major contributors to this particular field of information.

The report also includes abstracts by NBS staff of some four volumes of testimony taken at public hearings at Washington, D.C. and Los Angeles, California during the spring of 1974. Additional information on the pertinent physical properties of aluminum, information on failure mechanisms, possible corrective actions, connector cycling tests, etc., is given in a brief literature survey and two relevant memoranda on the subject. The report concludes with a fairly extensive bibliography.

NBSIR 75-729. Nondestructive tests to determine concrete
strength — A status report, J. R. Clifton, 39 pages (July 1975). Order from NTIS as PB246858.

Key words: compressive strength; concrete; flexural strength; formwork removal; nondestructive testing; surface hardness.

Individual and combined nondestructive test methods have been critically reviewed as potential methods to determine safe formwork removal times. The techniques reviewed are the Windsor probe, the Schmidt Rebound Hammer, pull-out measurements, push-out cylinders, ultrasonic pulse velocity measurements, and the maturity and equivalent age concepts. The individual methods themselves do not give good estimates of the in situ strengths of concretes and it is recommended that future research emphasize combined methods.

A proposed research program which emphasizes combined nondestructive test methods has been developed.

Key words: contact fracture; degradation; Hertzian cracks; indentation fracture; median vents; penny crack.

A study is made of the mechanics of two basic types of indentation fracture, cone cracks ("blunt" indenters) and median cracks ("sharp" indenters). The common feature which forms the central theme in this work is that both crack types, in their well-developed stages of growth, may be regarded as essentially "penny-like." On this basis a universal similarity relation is derived for equilibrium crack dimension as a function of indentation load. Experimental measurements confirm the general form of this relation. A more detailed fracture mechanics analysis is then given, to account for additional, contact variables evident in the data. Notwithstanding certain analytical limitations, the study serves as a useful basis for investigating a wide range of contact-related problems, both fundamental and applied, in brittle solids.

NBSIR 75-731. A study of air-gap breakdown at 28.5 kilohertz, F. R. Kotter, 42 pages (June 20, 1975). Order from NTIS as COM 75-11071.

Key words: air gap; electrical breakdown; insulator flashover; lightning protection; VLF antenna; voltage breakdown.

Measurements of the electrical breakdown of both quasi-uniform and highly nonuniform-field air gaps at a frequency of 28.5 kHz are reported. Gaps between a variety of electrode geometries ranged from a few centimeters to over two meters in length.

Breakdown voltages significantly below the corresponding 60 Hz values were observed with electrodes for which appreciable pre-breakdown discharges occurred, and a pattern of "anomalous" flashovers at considerably lower than the normal breakdown voltages was noted with quasi-uniform field gaps. The results obtained appear to correlate well with the data found in the literature for higher frequencies but lower voltages.

On the basis of the gap behavior observed, a prototype protective gap system designed for application to the tower base insulator assembly of a VLF (15 to 30 kHz) radio transmitter was tested and found satisfactory.

Key words: calibration; dynamic, electronic flash; photoflash bulb; pressure; pressure transducer response; thermal transient; transducer.

The continuing development of a test method for evaluating the effects of short-duration thermal radiant-energy transients on pressure transducer performance is described. The method consists of monitoring pressure transducer output as the transducer is exposed to radiation resulting from the ignition of a photographic flash bulb or from the discharge of an electronic flash. Precision of the method is to be at least adequate for the method to serve as a first-cut screening test. During this reporting period, the following three parameters were investigated for each of three radiation sources: (1) the amount of energy per unit area available as a function of distance from the source, (2) the response of a selected transducer as a function of distance from the source, and (3) flash duration. Repeatability of the method for each source was determined. Work being performed for other agencies is also described briefly.

Key words: consumer products, CPSC proposed regulation; pacifiers; product safety; safety requirements; safety testing.

This report is concerned with a review of a regulation proposed by the Consumer Product Safety Commission on the safety of infants’ pacifiers. In addition, the results of a laboratory evaluation of the efficacy of various requirements and testing procedures are given.

Key words: certification of steel belted radial tires; high speed radial tire hazard; radial tire failures.

Two police fatalities and one permanent disability have been caused by catastrophic failures of steel belted radial ply tires during high speed police operations. More than 200 other failures were reported by one State highway patrol department. The report recommends that police departments use caution in selecting tires for patrol cars, and that tire manufacturers be required to provide evidence that the tires sold for police use have been tested and certified at speeds of at least 125 miles per hour.

Key words: bibliographies; building fires; construction materials; fire departments; fire tests; flame spread test; flammability tests; flammable fabrics; Operation BREAKTHROUGH; protective clothing.

“Fire Research Publications, 1974” is a supplement to the previous editions which covered the years 1969-1972 (NBSIR 73-246) and 1973 (NBSIR 74-511). Only publications prepared by the members of the Center for Fire Research (CFR), by National Bureau of Standards (NBS) personnel under contract or grant to the CFR, or by NBS personnel or external laboratories under contract or grant from the CFR are cited. Articles published in NBS house organs also are cited.

NBSIR 75-737. Mathematical methods of site selection for electronic message systems (EMS), C. Witzgall, 44 pages (June 1975). Order from NTIS as COM 75-11472.

Key words: communication; cost-benefit; deployment; electronic transmission; facility location; mail; mathematical
programming; message network synthesis; network optimization; satellite; service improvement.

The concept of electronic message (mail) transmission has been the subject of several feasibility studies during the past decade. It requires the installation of electronic message handling facilities at selected locations. If transmission is to be via communications satellite, then any such facility can transmit to and receive from any other one. In this report, the mathematical aspects of choosing the number and locations of these facilities are examined. An inventory of solution methods is presented, along with recommendations as to which among them should be employed or developed further.

Key words: calibration procedures; force plate; pavement skid resistance; skid accident reduction; tire-pavement interface forces.

The equations for the variation of the external forces acting at the tire-pavement interface of a symmetrical two-wheeled towed trailer are given. Estimates, derived from experimental results, have been made for the displacement of the tire-interface with respect to the ground of an unrestrained locked test tire on the trailer. A description of the force plate calibration test frame, instrumentation and test method is given. The means of applying simultaneous vertical (normal) and horizontal (longitudinal) forces at the contact surface of the air-bearing plate in accordance with the equations are discussed. The change in force plate output with changes in the dimensions of the trailer calibrated in-turn with the force plate are given. A method of locating the coordinate axes of the internal force sensors with respect to level is given. Consistent application of these methods to both the force plate and trailer transducer calibrations results in reduced vertical-to-horizontal cross-axis differences.

Key words: accelerated aging; natural aging; permanence; record materials; record papers; stability.

A specification for copies from office copying machines for permanent records has been prepared and is progressing through a standards organization. A project on the effects of 36 years of natural aging on a group of book papers of known composition was completed and reported. Work on the accelerated aging of handsheets at various relative humidities is incomplete, but data already obtained show that a low relative humidity is desirable in an accelerated aging procedure. Data on the sorption of oxygen by papermaking pulp at elevated temperatures are inconclusive.

Key words: calibration; construction; impact; interface; piezoelectric polymer; polymer; pressure; pressure transducer; theory; transducer.

Described are development efforts relating to the design, construction, and calibration of a piezoelectric polymer transducer for the recording of pressure transients developed over the interface between two bodies as a result of impact. A bilaminate design was selected which uses electrically poled sheets of 25-μm poly(vinylidene fluoride) as the active material. The intended primary response of the transducer is to compression in the thickness direction, which is produced by either hydrostatic or normal pressure; the transducer was also found to respond to extension in the membrane direction. Individual-sheet activity in the thickness-compression mode is approximately 15 pC/N, resulting in a bilaminate transducer pressure response of 4.5 μV/Pa(30 mV/psi). Instructions for poling sheets and for constructing transducers are given in detail. Static and dynamic methods for characterizing transducer output are described. In particular, in order to simulate field conditions in which the transducer may bend or stretch, or both, during impacts, a drop-test procedure with curved impactors has been devised and a theoretical analysis (simplified to the extent of considering the membrane-stress contribution negligible) has been developed to yield the interface pressure.

Key words: flame retardancy; mass spectrometry; optical spectroscopy; phosphorus, polyester.

A combination of mass spectrometric and optical spectroscopic studies has been made to establish a mechanism for phosphorus controlled flame retardancy in thermoplastics. It is shown that a vapor phase mode of flame inhibition can account for the known flame retardancy effect of triphenylphosphine-oxide in polyester substrates.

NBSIR 75-744. Proposed implementation for development of user-terminal protocols for computer network access, A. J. Neumann, 16 pages (July 1975). Order from NTIS as COM 75-11072.

Key words: command languages; computer; man-machine systems; networks; system commands; user protocols.

This report summarizes activities undertaken at the National Bureau of Standards in the area of User-Terminal Protocol Standardization with support from the National Science Foundation, during the latter part of 1974 and 1975. Also discussed are present status of related standardization activities in areas of command languages, terminal keyboards, and terminology. Legal implications of standardization are indicated, and establishment of a Federal Task Group for Standardization is proposed to work under the Federal Information Processing Standards Coordinating and Advisory Committee (FIPSACAC).

Key words: fisheries; fishery; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; State of Washington; Washington State; Washington State Fisheries.

The salmon fishery modeling project is a joint State-Federal program for the development of improved techniques for analyzing the economic and biological effects of regulatory changes in the Pacific Coast salmon fisheries. This interim report covers the second segment of the project-the implementation of a multi-species, multi-stock fishery analysis model. This segment of the project was sponsored by the Washington State Department of Fisheries under Service Contract No. 588.

Key words: character recognition; context research; data
bases: optical character recognition; pattern recognition; reading machines.

A reference data set contained on magnetic tape has been generated for research in optical character recognition and related fields. The data set contains video data in 16 levels for each point in a 24 x 24 scanning grid, applied to approximately 30,000 characters. The input material, on some 2200 simulated address mailpieces, includes a range of character quality from excellent to poor.

The data set was prepared by first microfilming the address fields and printing positive transparencies. Then preselected characters were scanned in the NBS FOSDIC. Through the use of calibrated gray scales which were filmed and scanned along with the addresses, corrections were applied to assure linearity of overall response.

A second reference data set was also prepared from the same input material of simulated mailpieces. Through analysis of the recognition results printed out during runs on one address reader, details of identification on both alphanumeric and numeric recognition modes were noted. These were encoded into six-character groups on the data tapes, formatted to provide one such group for each input character in the original addresses. Recognition results are shown for approximately 110,000 input characters.

Key words: authority; building; energy; legislation; regulations; state.

Information describing the status of State regulations and authority to regulate energy use in new and existing buildings is presented in tabular form. The tables reference available information on pending bills, acts, or general authority which is embodied in a State Building Code Act. Programs relating to solar energy, insulation, and other building energy items are also listed.

Key words: accident research; consumer products; injury data; opinion survey; portable circular saws; power saws; radial arm saws; safety: table saws.

Two activities of an investigation of power saws are described: a review of power saw injury data and two surveys of saw manufacturers’ opinions concerning safety aspects of saw use and design. The injury data reviewed consisted of information from the National Electronic Injury Surveillance System and from summaries of In-Depth Investigation Reports compiled by the Consumer Product Safety Commission. The two surveys, dealing with portable circular saws and table and radial arm saws respectively, were directed toward obtaining the opinions of technical representatives of power saw manufacturers on five major areas of saw use and design, i.e., electrical safety, blade contact hazards and prevention, accidental starting, the design of various saw components and the judged adequacy of saw instruction manuals. Power saw engineers and designers recognize some problems with present saw designs, especially relating to kickbacks. Overall, however, the survey respondents believe saws to be reasonably free from hazards introduced by product design. The area in which the saw manufacturers believe the most hazards to exist is that of the operator’s use of power saws. This human element in saw accidents is recognized as a major contributor to saw related injuries, but little is known about how to assure that safe practices will be followed. Areas for further study are suggested.

Key words: electrets; hydrophone; piezoelectric; polymers; polyvinylidene fluoride; pyroelectric; radiometer; transducers.

The purpose of this Symposium-Workshop was to bring together scientists and program managers from federal (primarily DoD), industrial, university, and foreign laboratories who are involved in the research on and manufacture of piezoelectric and pyroelectric polymer materials and devices, in order to exchange information and stimulate further work on the new and rapidly developing measurement technology involving polymer transducers. This meeting is particularly important at this time because highly active polymer films are not yet available to device manufacturers in the U.S. or to potential users such as DoD.

Key words: abatement; barrier materials; building materials; housing; lead-based paint; lead poisoning; paint removal.

This report describes the first stage of an experimental lead paint hazard abatement program carried out in 30 dwelling units in Washington, D.C. The entire program will ultimately involve the abatement of lead paint hazards in a total of approximately 250 dwelling units located in three or more cities.

The procedures, demonstrated in Washington, included: paint removal methods using chemical solvents and a heat producing device; the replacement of components such as windows, doors and wood trim; and the installation of flexible sheet and rigid board barrier materials over existing lead paint on wall.

The report presents procedures and the forms used in inspecting and selecting dwellings for lead paint hazard abatement, evaluations of the suitability and implementation characteristics of the abatement methods and recommendations for their use.

Subsequent reports will present the results of comparable programs in additional cities and a final report will compare the cost-effectiveness of the alternative abatement methods.

NBSIR 75-763. Thermodynamic and transport properties of ethylene and propylene, I. A. Neduzhii (Principal Author), 210 pages (June 1972). Order from NTIS as COM 75-11276.

Key words: critically evaluated data; ethylene; propylene; thermodynamic properties data; transport properties data.

A comprehensive review of the data on the thermodynamic and transport properties of ethylene and propylene is given. Subjects covered include equation of state for liquid and vapor, second virial coefficient, enthalpy, etc., heat capacity, speed of sound, viscosity, and thermal conductivity. New experimental measurements are given for several properties, especially speed of sound, densities of the liquid and transport properties. Tables of properties covering the temperature range from 160 K to 500 K are given. The book has been translated into English from the original Russian.

Key words: adhesive materials; composites; dental materials; polymer grafting; resins; restorative materials; sealants; wear resistance.
A diversity of experimental approaches is being investigated to develop techniques which can be applied in formulation of adhesive restorative and caries-preventive dental materials. A newly developed testing procedure, still in the evaluation stage, has demonstrated expected ranking of adhesive bond strengths within a group of selected coating agents, both coupling and release types. Deterioration on exposure to water of cohesive bond strength in the Bis-GMA matrix has been indicated without concurrent deterioration of the coupling agent. A monomer system with potential as a composite or pit and fissure sealant resin and giving a polymerizable liquid of desired viscosity at room temperature was derived from three low-melting, crystalline isomers of ether-ester linked aromatic dimethacrylates. A series of monomers of varying chemical structure was evaluated for possible application in photopolymerization experiments designed to investigate modification of hard tissue by grafting. Modifications to extend the running time of a dental restorative wear-generating experiment three-fold and which allow the computerized recording of ten, instead of two, depth of wear measurements around the circular wear track have significantly reduced the standard error of measurement. Surface coating techniques being developed to strengthen interfacial bonding in dental cements and other dental materials show more promise with titanate than with carbon reinforcing fibers.

Key words: building composite; building material; conditioning; equilibration; gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; testing.

The measured properties of building materials and their composites sometimes reflect the conditions to which they have been exposed while being prepared for test. Conditioning these materials to some standard reference state is sometimes used to minimize this effect.

A methodology for establishing conditioning requirements for building composites and materials is presented and its use illustrated by applying it to two building composites.

Key words: AID; assistance; economics; foreign relations; industrializing nations; LD C's; measurement services; OAS; standardization.

On November 3-16, 1974, a Workshop was held at the National Bureau of Standards, Gaithersburg, under the sponsorship of AID and the Organization of American States, the object of which was to give standards officials of industrializing nations insight into the standards and measurement systems in the United States and the role of the National Bureau of Standards, so that these officials might consider what parts of the U.S. system might usefully be adapted to conditions in their home countries. The report contains copies of speeches and presentations by the U.S. hosts and the participants from the other nations. In addition, information is given on the general agenda of discussions, presentations, and tours of laboratories at NBS and other U.S. organizations.

NBSIR 75-770. The equation of state for ammonia, L. Haar and J. Gallagher, 27 pages (Sept. 1975). Order from NTIS as COM 75-11370.

Key words: ammonia; correlation; gas; liquid; thermodynamic properties; thermodynamic surface.

An outline is presented of the basic results of the extensive correlation for the thermodynamic properties of ammonia recently completed at this laboratory. Computer programs are presented for the calculation of thermodynamic properties in the range including the triple point temperature to 5/3 the critical temperature and pressures from the dilute gas to 8000 bar.

Key words: air; analytical; anemometer; dynamic response; experimental; lug; unsteady flow.

The results of an analytical and experimental investigation of the dynamic response of a helicoid anemometer are presented. The experimental investigation was conducted using the NBS Unsteady Flow Facility and data are presented which illustrate the dynamic behavior in a spatially uniform, fluctuating flow with varying amplitudes, frequencies, and mean velocities. An analytical model governing the dynamic response is also presented and compared with the experimental results.

NBSIR 75-774. Calibration of Kerr systems used to measure high voltage pulses, R. E. Hebner, Jr., 51 pages (Aug. 7, 1975). Order from NTIS as COM 75-11364.

Key words: automated measurements; dielectrics; dividers; electrical measurement; electric fields; electro-optics; high voltage measurements; insulating fluids; Kerr effect; nitrobenzene; pulse measurements; space charge.

The purpose of this work is to define, develop and refine techniques for calibrating pulse voltage measurement systems, particularly those based on the electro-optic Kerr effect. The approach used exploits the assumed frequency independence of the Kerr coefficient of nitrobenzene. Theoretically, the Kerr coefficient should exhibit the same frequency dependence as the relative permittivity. Measurements have shown the relative permittivity to be approximately frequency independent over the frequency range from direct voltage to 10 Hz. The realization of this calibration approach has been hampered by the fact that the electric field distribution, in the liquid exhibiting the electro-optic Kerr effect, is itself frequency dependent.

This report describes the present best comparison of cell calibration under direct voltage with calibration under low frequency alternating voltage and calibration under pulsed high voltage. The results under all three types of waveforms agree to within ±0.5 percent. From these results it can be inferred that it is feasible to use an electro-optic Kerr system as an independent, and possibly more accurate, device against which to calibrate other pulse voltage measurement systems.

In addition to this discussion of Kerr system calibration, the report contains two appendices. One presents an improved technique for analysis of data obtained from a Kerr system and the other discusses space charge in a nitrobenzene-filled Kerr cell.

Key words: civilian R&D policy; ETIP; incentives; innovation; procurement policy; regulatory policy; small business policy; technology.

This internally prepared report describes the overall accomplishments of the experimental Technology Incentives Program.
in carrying out its mission. Progress is compared with the plans that were established in a program plan approved by the Secretary of Commerce in February of 1974. An appendix to the report describes the purpose and shows progress of each of the individual projects that ETIP has launched.

Key words: birefringence; elastic constants; infrared-laser window materials; interferometry; KCl; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; ZnSe.

The refractive index of each of two prismatic samples of chemical vapor deposited (CVD) ZnSe was measured from 0.5086 μm to 18.2 μm by means of the minimum-deviation method on a precision spectrometer. Data were obtained at temperatures near 20 °C and 34 °C and each set of data was fitted to a three-term Sellmeier-type dispersion equation, which permits refractive index interpolation within several parts in 10^-4. From the data obtained at the two temperatures, dn/dT was calculated for both samples. A comparison of refractive index and dn/dT is made with other types of ZnSe. Preliminary photoelastic data are presented for single crystal specimens of Ge, reactive atmosphere processed (RAP) KCl, and KCl doped with KI. The Ge data, which were obtained at 10.6 μm differ from previously reported data. Data on the two types of KCl were obtained at 10.6 μm, 0.633 μm and 0.644 μm. These data are compared with values from the literature. Also presented are revised photoelasticity data for CVD ZnSe. The design of an improved stressing apparatus that was developed for the measurement of photoelastic constants is discussed.

Key words: airport; airport capacity; airport simulation; models; model validation; runway capacity; simulation; validation.

This report documents exercises of the DELCAP airport simulation model performed to validate the outputs of that model. Airport throughput levels were calculated by DELCAP for five runway configurations, with three or four appropriate operating policies chosen for each, and for three different mixes of aircraft types. These estimates from DELCAP agreed well, generally within 6 to 8 percent, with current values provided by the FAA. An attempt at validating DELCAP's delay-figure output, using existing data on scheduled and actual times of aircraft departures and arrivals, is also reported. It proved unsuccessful, because available data are not sufficient to isolate that portion of total delay which DELCAP is designed to measure, i.e., terminal area ATC delay. A collection effort to accumulate the necessary data is formulated. Appendices to the report contain program listing, flowcharts, descriptions of program changes from earlier versions, and user instructions for the model's operation.

Key words: accidents; burn injuries; burn severity; explosives; fabric fires; FFACTS; flammable liquids; gas; gasoline; ignition-causing activities; ignition sources; injury disposition.

From the NBS Flammable Fabrics Accident Case and Testing System as of December 1973, flammable liquids, gas, and dry explosives were found to be involved in 832 incidents, injuring 863 victims. Volatile flammable liquids represented 77 percent of the incidents; 72 percent of these liquids were gasoline. Male victims outnumbered females more than 3 to 1. Young adults, ages 21-45, and youth, ages 13-20, were injured most frequently. Children and youth were injured primarily through what was considered as play activities. Adults generally were injured while engaged in activities traditionally considered as being oriented to the particular sex involved. Streetwear, particularly shirts/blouses, was reported most frequently as igniting first. Thirty-six percent of the fabrics represented in these incidents were contaminated with a flammable liquid. Most of the victims sustained burn injuries covering 1-10 percent of their bodies; only 6 percent sustained burn injuries covering 61 percent or more of their bodies. Most of the victims were hospitalized for treatment of their injuries. Although the very young and the elderly were involved in these incidents less frequently than other age groups, they generally were burned more severely and represented 46 percent of the victims who died in the hospital or were dead on arrival.

NBSIR 75-785. The review of standardization and measurement services at the Ecuadorian Institute for Standardization, R. Estrada and H. S. Peiser, 17 pages (June 27-29, 1974). Order from NTIS as PB246345.

Key words: AID; development assistance; economics; Ecuador; less developed countries; measurement services; review; standardization; survey.

An international team of specialists visited the Ecuadorian Institute for Standardization on June 27-29, 1974, to review the operations of that organization in light of the recommendations made two years earlier by a Survey of Standardization and Measurement Services in Ecuador conducted by a team which was organized and sponsored by the U.S. National Bureau of Standards and the U.S. Agency for International Development. The review consists of the historical background of the Institute, results of the 1972 Survey, and recommendations for future planning.

Key words: electrets; piezoelectricity; polarization; polymers; polyvinylchloride; polyvinylfluoride; polyvinylidenefluoride.

A model for piezo- and pyroelectricity in polymers is presented. These effects are true piezo- and pyroelectricity rather than electrostriction, conduction, electromechanical effects or the motion of conductors in the field of space charges. Two distinct types of polymers can be piezoelectric. Amorphous polymers are piezo- and pyroelectric by virtue of a nonequilibrium but kinetically stable net dipole orientation. The semicrystalline polymers are piezoelectric due to alignment of polar, ferroelectric crystals dispersed in the amorphous phase. In both types the magnitudes of the piezo- and pyroelectric effects are in accord with the expected temperature and pressure dependence of the dipolar polarization. Space charges embedded in the polymer normally will not produce a piezo- or pyroelectric current. Those embedded near the crystal-liquid interfaces tend to reduce the piezo- and pyroelectricity. Improved orientation of dipoles and reduction of ionic impurities should increase p and d for PVF2 by a factor of three above typical values presently reported. The sensitivity of amorphous polymers is limited mainly by dipole moment per unit volume and breakdown strength.

NBSIR 75-793. Microsecond-resolution pulse calorimetry for semiconducting materials at high temperatures (a feasibility stu-
Key words: capacitor discharges; heat capacity; high-speed measurements; high temperature; thermodynamics; uranium dioxide.

A feasibility study was conducted for the applicability of microsecond-resolution pulse heating techniques to the measurement of selected thermodynamic properties of semiconducting substances at high temperatures. The method of pulse heating of the specimen using capacitor discharges is described and general design considerations, including electrical circuitry and various physical, electrical and chemical phenomena, are presented. Measurements of experimental quantities, such as current, voltage, temperature, and pressure are described. The special problems in relation to measurements of heat capacity and vapor pressure of uranium dioxide in the temperature range 2000 to 6000 K are discussed. It is concluded that the capacitor discharge circuitry and the measurement of the experimental quantities, although difficult, are not likely to present major problems. However, problems are likely to stem from the experiment chamber and the specimen. The nature of these problems is discussed, and the performance of some preliminary experiments is suggested.

Key words: fire resistance ratings; fire test furnace; heat balance; heat transfer; temperature-time curve.

Tests were conducted in the NBS wall panel furnace as part of a CIB international cooperative program to measure and compare heat transfer in fire endurance furnaces. Additionally, a heat balance analysis showed that a cellular concrete block wall specimen absorbed more heat by convection than by radiation. The rate of radiant heat transfer was found to decrease slowly, while the furnace exhaust heat loss increased during the test from 42 to 58 percent of the heat output. The calculated radiant heat fluxes incident at furnace walls was found to be somewhat lower than the experimental values measured at the test wall.

Key words: caulks and sealants; clock thermostats; energy conservation; insulation; retrofitting; storm doors; storm windows; tax credit; vapor barriers; weatherstripping.

The Federal Energy Administration requested the National Bureau of Standards to develop criteria for retrofitting for possible use by the Internal Revenue Service in implementing the Presidential initiative authorizing tax credit to homeowners. Criteria are recommended for materials and products considered eligible for proposed tax credit for retrofitting one and two family residences to conserve energy. The materials considered include insulation and vapor barriers, storm windows and doors, caulking and weatherstripping, and clock thermostats. A list of these retrofit materials was compiled by generic type and recommendations made on their installation.

In addition to recommended criteria for materials and products eligible for tax credit, desired levels of performance for the retrofit materials are presented as a guide to homeowners to achieve maximum benefits in energy conservation through retrofitting.

Key words: Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; fishery modeling; modeling; salmon; salmon fishery; salmon information system; Washington State Fisheries.

This report contains an analysis of the official salmon statistical information system of the Washington State Department of Fisheries relative to the changing data requirements of the Department. Recommendations are given for revising the current system in order to assure the availability of complete, accurate statistics on a timely basis. In addition, the principal requirements are identified for the development of improved procedures for generating input to the hatchery and fishery management models in use by the Department. This project was sponsored by the Washington State Department of Fisheries under Service Contract No. 626.

NBSIR 75-797. An evaluation of a range-top warning light system, M. E. Stef f and J. J. Persensky, 22 pages (July 1975). Order from NTIS as COM 75-11465.

Key words: consumer products; human factors; kitchen; ranges; reaction time; safety; warning lights.

A descriptive analysis of In-Depth Injury Investigations of range-related accidents revealed a series of incidents where range-users were unaware that surface elements were energized. One proposed solution to this problem involved a system of four warning lights to indicate individual surface unit activation. A laboratory study using human subjects evaluated the effectiveness of such a system. The backgrounds against which the warning lights were fitted and the intensity of the lights were not shown to influence subjects' responses in a reaction time task; however, the position of the lights and the type of ancillary task being performed by the subject did. These results are discussed in terms of product design and safety, and implications of the study for methodological development are considered.

Key words: hazard level fields; power density meter calibration; TEM transmission cells.

This report describes techniques for calibrating power density meters used by the Department of Defense in measuring high intensity (hazard level) RF fields in the frequency range 20 kHz to 1000 MHz. It reports on part of the work sponsored by the Calibration Coordination Group (CCG), of the Department of Defense covering the frequency range 20 kHz to 20 GHz.

Several techniques were considered for producing a standard field including parallel plate and parallel wire transmission lines, transverse electromagnetic mode (TEM) transmission cells, various directive antennas and open ended waveguide (OEG). The major emphasis in this report is on the TEM cells, which are recommended for the frequency range 20 kHz to 500 MHz. Design and evaluation details and an error analysis associated with the TEM cell measurement system are given. Power density levels can be established in the cells from a few \( \mu W/cm^2 \) to 100 mW/cm\(^2\) with uncertainties less than \( \pm \) 1 dB.

Limited information is also given describing the use of OEG, the recommended technique for the frequency range 300 MHz to 2.6 GHz, and giving the results of intercomparisons among parallel plate lines, TEM cells, OEG, and standard gain horns.

NBSIR 75-806. Phase equilibrium and flow-induced desorption data for He-CO, He-N\(_2\)O, and He-N\(_2\) systems, W. G. Steward,

Key words: binary mixture; cavitating venturi; enhancement factors; experimental vapor-liquid equilibria; flow induced desorption; helium-carbon monoxide system; helium-nitrous oxide system; Henry's law constants; two phase choking; two phase flow.

Liquid-vapor equilibrium data were obtained for the helium-carbon monoxide and helium-nitrous oxide systems at pressures to 138 bars. Liquid and vapor phase compositions were measured at nominal temperatures of 80, 85, 90, 100, and 120 K (144, 153, 162, 180, and 216 °C) for the helium-carbon monoxide system, and at 235, 245, 265, and 285 K (423, 441, 477, and 513 °C) for the helium-nitrous oxide system. Internal consistency of the data was checked by using pseudo-Henry's law constants and enhancement factors.

The effects on flow of helium absorption and subsequent flow-induced desorption were investigated by means of reduced scale model experiments. Friction losses attributable to helium desorption in the long channels proved to be negligible both in experimental measurements and in calculations based on assumed equilibrium of liquid and gas. Contrarily, the assumption of phase equilibrium leads to gross miscalculations of flow rates in cavitating or near cavitating nozzles or venturis. Actual venturi mass flow rates reached in the experiments were fifty times the theoretical choking flow rates; however, definite mass flow rate reductions due to helium desorption were measured, ranging from four percent for nitrogen to twelve percent for nitrous oxide. Pertinent experiences in handling these fluids and operating the test equipment are also discussed.

Key words: cryogenic; heat transfer; hemisphere; horizontal cylinder; liquid deuterium, liquid hydrogen, liquid nitrogen; natural convection; sphere; vertical cylinder.

Quasi-steady natural convection of liquid deuterium, hydrogen, and nitrogen within a sphere, hemisphere, horizontal cylinder, and vertical cylinder has been studied experimentally for the case of a nearly isothermal wall. A single expression relating the Nusselt and Rayleigh numbers,

\[ Nu = 0.104 \, Ra^{0.321} \]

fits the deuterium and nitrogen data over the range \( 7 \times 10^4 < Ra < 6 \times 10^4 \), while the hydrogen Nusselt numbers are 8 percent lower. The temperature field within the vessel is virtually free of horizontal temperature gradients. A single dimensionless temperature profile characterizes the vertical temperature distribution for each vessel shape, with the profiles for the sphere, hemisphere, and horizontal cylinder being nearly identical.

Key words: antennas; arrays; coordinate transformations; data processing; group representations; measurements; near field; non-planar; patterns; scanning; spherical; symmetry.

The advantages and limitations of near-field antenna measurements are compared with those of conventional far-field measurements. Further, the advantages and limitations of planar, circular cylindrical, and spherical scanning are compared.

Spherical scanning is advantageous for arrays steered well off-axis and for antennas with wide angle side lobes, but the data processing has been quite impractical except for very simple antennas and probes. A new highly efficient data processing scheme is given for spherical scanning with and without probe pattern correction. The translation-of-centers transformation of the probe pattern coefficients (required only with the probe pattern correction) is carried out once and for all for a given probe, scanning radius, and frequency. The routine computations involve Fast Fourier "Transforms" and multiplication by matrices with constant elements, matrices which are independent of the detailed nature of the probe, the radius of the scanning sphere, the points at which measurements are made, and the nature of the test antenna. The FFT's and matrix multiplications supplant matrix inversion, ordinary solution of simultaneous equations in more than two unknowns, ordinary numerical integration, and (in process) ordinary evaluation of functions, even for computation of the far field. Except for the truncation of the infinite series of spherical modes, no analytical or data processing approximations are made, even in the use of the FFT.

So that readers may draw from their understanding of planar and cylindrical scanning, a unified theory of near-field data processing is given, treating planar, cylindrical, and spherical scanning as mere special cases.

Key words: composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity.

Results of six months of study on materials in support of superconducting machinery (October 1974 through March 1975) are reported to the sponsor, the Advanced Research Projects Agency of the U.S. Department of Defense. The report is divided into five sections: thermal conductivity, magnetothermal conductivity, fatigue and fracture-toughness properties, properties of advanced composites, and elastic properties. The temperature range 4 to 300 K is covered by the study. Materials studied are either being used or are candidates for use in superconducting machinery and include: aluminum alloys, composites, copper, age-hardened, nickel-base superalloys, stainless steels, and titanium alloys.

Special results of the study include: thermal conductivity data for comparison of the effects of heat treatment on age-hardenable alloys, the first determination of a complete set of elastic constants for a composite at liquid helium temperature, boron-aluminum composite tensile data at 4 K, and a summary of fatigue crack-growth rate behavior at 4 K for a number of different structural alloys. These data provide considerable insight into material characteristics at extremely low temperatures, assisting in material selection and efficient design.

NBSIR 75-812. The Kapitza conductance of the (100) surface of copper and polycrystalline indium and niobium, N. S. Snyder, 51 pages (June 1975). Order from NTIS as COM ADA012889.

Key words: heat transfer to helium II; interfacial thermal resistance; Kapitza conductance of copper; Kapitza conductance of indium; Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; (100) surface of copper.

Measurements of the Kapitza conductance to liquid helium II across the (100) surface of single crystals of copper are presented. The temperature range of these measurements was 1.6 to 2.1 K.
The sample surfaces were subjected to several different treatments. Some surfaces were cleaned by low energy argon ion bombardment, annealed in an ultrahigh vacuum system, and preserved under vacuum until purified liquid helium was admitted. Other surfaces were intentionally damaged by machining and/or exposure to the atmosphere. The conductance after these latter treatments was found to be about a factor of three higher than that of the more ideally cleaned and annealed surfaces, and a significant increase in the temperature dependence of the conductance was also observed. Indications are that these effects on the conductance are produced primarily by the last few atomic layers of the solid, so extensive cold-working, which impairs the thermal conductivity of the bulk, need not be undertaken to improve surface heat transfer. This finding has important implications for the design of practical heat transfer surfaces. Good reproducibility was found for the conductances of similarly treated surfaces and good correlation with studies of damage carried out by X-ray diffraction. The relationship of these results to the numerous current theories of the Kapitza conductance is discussed. Conductance measurements of polycrystalline niobium and indium are presented in the appendices.

Key words: critical point; density; enthalpy; equation of state; hydrogen; index of refraction PVT; saturation properties; scaling laws; specific heat.

A 32 term modified Benedict-Webb-Rubin equation of state has been applied to data for parahydrogen. The adjustable parameters in the equation of state were determined using 2665 points including very recent measurements at low pressures and high pressures. The new values extend the range of the PVT data sufficiently to warrant a refitting of the equation of state.

Temperatures for the data range from the triple point to about 700 K with pressures reaching 3000 atmospheres near ambient temperatures. The PVT data were adjusted to the T and scale. In addition, extensive modifications have been made to the previously accepted PVT surface in the region near the critical point. These modifications have been made on the basis of more recent refractive index data and the application of scaling law equations. Detailed comparisons between experimental and calculated values are given for density. Corresponding comparisons are made for enthalpy and the specific heat at constant pressure.

NBSIR 75-816. Performance characteristics of a liquid helium pump, P. R. Ludtke, 55 pages (July 1975). Order from NTIS as COM 75-11133.

Key words: cavitation; cryogenic motors; induction motors; liquid helium pumps; motor efficiency; net positive suction head; pump efficiency; pump performance.

Part A of this report presents performance data for a simple, preinduced, single stage, centrifugal liquid helium pump powered by a close-coupled submersible cryogenic induction motor. Data on pump efficiency and the motor efficiency are given, and the effects of decreasing the pump leakage loss and removing the pre-inducer were also investigated.

Part B describes a study of the cavitation characteristics of the pump in liquid helium I. The net positive suction head at cavitation of the pump was extensively investigated, and found to be near zero; the effects of removing the inducer, changing the pump inlet geometry, and varying the helium temperature were determined.

Key words: antenna parameters; attenuation; automated measurements; EM metrology; field strength; impedance; laser parameters noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides.

This bibliography lists the publications of the NBS Electromagnetics Division between June 30, 1974 and June 30, 1975.

Key words: computer modeling; cooldown; cryogenic flow; stresses; two phase flow.

This report covers computer simulation studies of liquid hydrogen fill and vent systems for the space shuttle. The computer programs calculate maximum and minimum permissible flow rates during cooldown as limited by thermal stress considerations, fill line cooldown time, pressure drop, flow rates, vapor content, vent line pressure drop and vent line discharge temperature. The input data for these programs are selected through graphic displays which schematically depict the part of the system being analyzed. The computed output is also displayed in the form of printed messages and graphs. Digital readouts of graph coordinates may also be obtained.

Procedures are given for operation of the graphic display unit and the associated minicomputer and timesharing computer.

Key words: accuracy; antenna; calibration; Cassiopeia A; error analysis; flux density; ground station; G/T (system gain/system noise temperature); radio star.

An error analysis for absolute flux density measurements of Cassiopeia A is discussed. The lower-bound quadrature-accumulation error for state-of-the-art measurements of the absolute flux density of Cas A around 7 GHz is estimated to be 1.7% percent for 3σ limits. The corresponding practical error for the careful but not state-of-the-art measurement is estimated to be 3.46% percent for 3σ limits.

Key words: cooling system; cryogenics; helium-cooled electrical leads; helium impurities; microwave cavities; negative differential flow resistance; pressure measurement; system dynamics; thermometers.

This is the first annual report on a program of helium-related research in support of superconducting power transmission. Program areas reported on are concerned with the dynamics of helium cooling systems — theoretical aspects of oscillatory behavior and experiments — and helium related measurements. The latter include pressure measurement, temperature measurement and the problem of impurity levels in the helium refrigerant.

NBSIR 75-901. Smoke and carbon monoxide formation from materials tested in the smoke density chamber, T. Y. King, 40 pages (Oct. 1975). Order from NTIS as PB246860.

Key words: carbon monoxide; electrostatic precipitation; heat flux; oxygen depletion; particulate mass; scanning electron microscope; smoke.

The effects of physical and chemical factors on the smoke and carbon monoxide generated by burning polymers and red oak in the NBS Smoke Density Chamber are reported.
Smoke and carbon monoxide formation was found to depend on irradiance level and oxygen concentration in the chamber. Smoke optical density correlations with particulate mass density showed that the ratio of these two varied with material composition and burning conditions.

Key words: experiments; full-scale; gas tracer; interstitial space; penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF₆); Veterans Administration Hospital.

A series of full-scale smoke movement experiments was conducted using a sulfur hexa-fluoride (SF₆) gas tracer, smoke simulation system. The experiments were designed to study smoke movement in a hospital building with an interstitial space between floors. The penetration of smoke through ceiling and interstitial space and the vertical smoke movement in such a building were investigated.

Key words: consumer products; electrical breakdown; gases; hazard; high voltage; sharp edges; sharp points; threshold.

Experiments were made to determine the feasibility of using the phenomenon of electrical breakdown in air to characterize sharp metallic edges and points. A fixed voltage was applied between a sample edge or point and a parallel plane, and threshold gap length for breakdown observed. Results were quite favorable for edges, but not for points, and the polarity on the sample was required to be negative.

Key words: computer; data processing; index; information processing; privacy; requirements definition; security; systems design.

This index is a list of certain requirements which must be considered by Federal technical and administrative personnel in order to comply with those provisions of the Privacy Act of 1974 relating to automated systems design and development. This index has been derived from the Office of Management and Budget (OMB) guidelines for implementing those provisions. Each requirement listed contains a reference to an applicable part of the Privacy Act and to a page and column number of the OMB guidelines as they appear in the Federal Register. Therefore, these documents must be used in conjunction with this index. Furthermore, a familiarity with these documents will increase the utility of this index.

Key words: humidity; humidity chamber; microbiological growth; relative humidity; salt solutions; saturated salt.

An apparatus has been developed for studying the growth of microbiological organisms on food under controlled conditions of humidity and temperature. This apparatus contains twenty-eight individual humidity chambers within a temperature controlled bath. A wide range of humidities can be provided within the individual chambers by means of saturated salt solutions. These chambers can be maintained at stable temperatures from 5 to 50 °C with a constancy and uniformity within ±0.02 °C. Individual chambers may be conveniently removed or changed without affecting the other chambers.

NBSIR 75-956. An interference simulator for quantitative determination of the susceptibility of flame detectors to false alarm, A. Scheidweiler, 16 pages (Nov. 1975). Order from NTIS as PB247654.

Key words: false alarms; false alarm simulator; fire detection; fire detector; flame detection; flame detector.

All fire detectors are susceptible to false alarms, i.e., responding to fire-like conditions when no fire is present. Of all the known fire detectors, flame detectors are probably the most false alarm prone of any of the fire detectors, primarily because these detectors are subjected to more environmental influences resembling the detectors' operating mode than any other fire detector.

In this paper, the author describes an investigation into the susceptibility of flame detectors to false alarms. The author describes a test apparatus, constructed and used by his firm, to evaluate the susceptibility of currently-available flame detectors to false alarms. In addition, the apparatus can be used to evaluate prototype flame detectors.

The data developed indicates the false alarm susceptibility of each type of flame sensor. The data also provides a means of selecting a flame detector having the greatest resistance to known or predictable pseudo-fire sources.

Key words: acoustics (sound); environmental acoustics; instrumentation; noise monitoring; outdoor noise.

An Outdoor Noise Monitoring System is described. This system uses a microprocessor for automatic calibration. The design concepts of the system are applicable to other remote noise monitoring systems.
4. TITLES AND ABSTRACTS OF PAPERS PUBLISHED IN NON-NBS MEDIA, 1975

Reprints from the journals listed in this section may often be obtained from the authors. See page 5 for additional information.

Key words: aerosols; Fair Packaging and Labeling Act; packages; proliferation; voluntary standardization.

The purpose of this presentation is to familiarize the manufacturers of aerosol packages with the undue proliferation provision of the Fair Packaging and Labeling Act, and of Commerce responsibilities in interpreting proliferation. The scope of the talk centers upon the application of the undue proliferation provision to aerosol packages offered for sale at retail. A discussion of the market of several aerosol products and their place in the retail outlet is considered in light of the consumer's ability to make value comparisons. Considerations of a technical and/or marketing nature are discussed in view of problems which affect voluntary standardization. Finally, and of great importance, the manufacturer's responsibility within the spirit of the Fair Packaging and Labeling Act is discussed.

Key words: directional-hemispherical; polyvinyl fluoride; pyroelectric detectors; reflectance.

A new type of reflectometer has been developed for measuring directional-hemispherical spectral reflectances in the infrared region. The instrument is based upon a cavity-shaped pyroelectric detector that itself collects the radiation reflected by the test sample, thereby obviating the need for an intermediate collector such as an integrating sphere or concave mirror. This detector is made from an electrically polarized plastic film of polyvinyl fluoride, coated with gold-black on its inner surface and backed with brass shim on its outer surface in order to provide mechanical strength. The reflectometer has been used with a Fourier spectrometer to measure spectral reflectances over the wavelength range 5-30 μm.

Key words: charge transfer; CO₂⁻: infrared spectrum; ion-molecule aggregates; matrix isolation; molecular structure.

Absorptions which appear near 1600 cm⁻¹ on co-deposition at 14 K of Ar:CO₂ mixtures with an alkali metal have been assigned to ν₂ of an M⁻…CO₂⁻ ion pair, with an OCO valence angle near 130°. Molecular aggregates contribute significantly to the observed spectrum.

Key words: combustion; laser ignition; spectra (visible); titanium.

The combustion of titanium specimens is supported by a laser in gaseous oxygen. Utilizing a high-speed mechanical shutter driven by a time-delay circuit, the presence of titanium and its oxides is monitored above the surface of the burning Ti metal as a function of time. Spectra are taken with a grating spectrometer and are compared for various stages of the combustion process. The stages are defined by the shape of the total emitted intensity curve. Discrete spectra of titanium and titanium monoxide are seen in emission but disappear as the combustion progresses. The results are correlated with metallographic and x-ray analyses of quenched specimens.

Key words: crystal surfaces; density; lamella thickness; paraffins; polyethylene; unit cell; x ray.

The unit-cell dimensions of a given polyethylene have previously been shown to vary nearly linearly with the reciprocal of lamella thickness. Data obtained at 153.2 and 296.2 K are presented to show that the slope of this dependence is different for crystals of orthorhombic n-paraffins, melt-crystallized polyethylene, and solution-crystallized polyethylene. Within the limits of error, all extrapolate to the same basal area at infinite lamella thickness, and this agrees with the measured value for sample crystallized from the melt under high pressure to yield a long period of about 3500 Å. Since the effect is a surface one, it is proposed that these differences result from the differences between methyl interactions, fold interactions, different fold planes, domains, etc. It is shown that the variation of cell dimension with lamella thickness leads to a quadratic term in the variation of macroscopic density. This term permits the separation of the thickness and density of a lower-density surface layer in a two-phase model.

Key words: compatibility; standard fields; susceptibility; testing; transverse electromagnetic.

A new technique developed at the National Bureau of Standards (NBS) for establishing standard, uniform, electromagnetic (EM) fields in a shielded environment is described. The technique employs transverse electromagnetic (TEM) transmission cells that operate at 50 Ω impedance-matched systems. A uniform TEM field is established inside a cell at any frequency of interest below that for which higher order modes begin to propagate. Standard field strength levels from 10 μV/m to 500 V/m can be established with uncertainties of less than 1.0 dB to 2.0 dB inside the NBS cells for frequencies from dc to 500 MHz. The cells are especially useful for calibrating EM radiation hazard meters, for emission and susceptibility testing of small to medium sized equipment, and for special low level calibration of very sensitive field strength meters.

A unique portable system has been developed for measuring rf attenuation over a dynamic range of 65 dB at 30 MHz. A Superconducting QUantum Interference Device (SQUID) is the basis of the system.

Measurements made with this system have an rms deviation from the NBS National Reference Standard of ± 0.002 dB.

A SQUID is a loop of superconducting metal closed by a Josephson junction, operating in liquid helium. It converts variations in magnetic flux to periodic variations in impedance which are sensed at microwave frequencies. This provides a convenient, natural means of measuring electrical quantities such as voltage, current, power and attenuation.

Key words: humidity measurement; moisture; standard; water vapor.

A comprehensive study of the humidity measurement system is being conducted by Arnold Wexler, Chief of the Humidity Section in the Mechanics Division at NBS.

Key words: equation of state; freezing; freezing criteria; melting; molecular correlation functions; phase transitions.

Using Monte Carlo simulations, we investigate average molecular arrangements that occur with the fluid-solid transition in a classical Lennard-Jones system. The crystalline order of the solid phase is explicitly shown by the angularly averaged molecular correlation functions which, in the solid, exhibit a behavior not observed in the fluid. The pair and triplet correlation functions delineate the crystalline pattern of the ordered phase out to internuclear separations of many nearest-neighbor distances. A molecular criterion for freezing is reported which claims a proportionality between the values of the pair correlation function in the fluid at the positions of the first and second nearest neighbors. The general behavior of the triplet correlation function in the fluid phase is interpreted. We also compare predictions for melting pressures and the densities of the coexisting fluid and solid phases.

Key words: analog states; electron scattering; inelastic electron scattering; particle-hole model; resonance energy; 14C.

A search for the lowest-energy T=2 state in 14C has been attempted employing inelastic electron scattering techniques. Spectra obtained at 61 and 81 MeV incident-electron energy and 145.7° scattering angle fail to reveal significant structure at the predicted resonance energy. The implications of this result are discussed in terms of the particle-hole model and the ground-state structure of the 14B analogue of this level.

Key words: densimeter; density; differential; transformer.

We describe the use of a differential transformer to detect the position of the buoy in a magnetic densimeter, an instrument for precise measurement of fluid densities. This detector can be used in cases where the buoy is not visible and it can be assembled from commercial electronic components.

Key words: line-broadening; rubidium; satellite.

Measurements are presented for the blue-wing satellite bands of the Rb first resonance line (780 nm) emitted in the presence of the noble gases Ne, Ar, Kr, and Xe. The continuum intensity per spectral interval and perturber density is expressed as a fraction of the total Rb (780 nm) fluorescence from optically thin vapor. Over the ~10 sup 18 to ~10 sup 19 cm sup -3 density range investigated this normalized satellite-peak intensity is found to scale linearly with perturber density and approximately exponentially in -1/T, T being the absolute temperature. In the classically forbidden region beyond the satellite peak the intensity drops exponentially with frequency for Xe perturbers, but departs from exponential behavior in the Ar and Kr data. We observe undulations in the spectra between line center and the satellite. This is expected due to the possibility of interference between contributions to the transition probability at two internuclear separations, the separations at which the difference potential equals the photon energy.

Key words: electrokinetic potential; glass; interface; liquid/solid interface; solid/liquid interface; surfaces; Zeta-potential.

Electrokinetic potentials of several glasses of well defined bulk composition in aqueous electrolyte solutions were computed from streaming current measurements. The composition of the bulk is reflected in the magnitude of the potential and in the shape of the curves relating the electrokinetic potential and the pH of the solution. No differences have been found between the crystalline and the vitreous state of silica. Addition of AlO to the bulk results not in doping effects but rather in surface neutralization making the surface less acidic. Glasses with an appreciable amount of B2O3 have higher negative potentials at the same pH, and the derivatives of electrokinetic potential vs pH show them to belong to a different type of surface than vitreous or crystalline silica. Studies involving controlled pore glasses of various pore sizes have shown the importance of below-the-surface ionic penetration and/or adsorption in the pores in establishing the solid-movable liquid interfacial electrical equilibrium.

Key words: detector circuits; power measurement; pulse circuit; pyroelectricity.

A square-law detector for picosecond baseband pulse comparison techniques has been realised using the pyroelectric effect. By using thin-film techniques, a broadband signal transfer to the detector was obtained. The theoretical principles of the detector and some applications are briefly discussed. Attention is given to measurements of pulse-energy content, pulse autocorrelation function and pulse crosscorrelation function.

14734. McLaughlin, W. L., Solid-phase chemical dosimeters, (Proc. Int. Conf. on Sterilization by Ionizing Radiation, Vien-

Key words: dose distribution; dosimetry; dyes; electron beams; gamma rays; glasses; plastics; radiation chemistry; radiation sterilization; solid-state detectors; spectrophotometry.

The radiation chemistry and response characteristics of some solid-phase chemical dosimeters (plastics, dyed plastics, and glasses) are reviewed. The analysis used for dosimetry is mainly spectrophotometry in the ultraviolet and visible spectrum. Systems having a reproducible response and a stable optical absorbance are selected from as many as 28 candidate systems, some of those showing promise for radiation sterilization applications being: polymethyl methacrylate, dyed polymethyl methacrylate, polycarbonate, tetrazolium salt in polyvinyl alcohol, dyed polychlorostyrene, and dyed polyamide. Major sources of dosimetric error, such as temperature and dose rate dependence instability, non-uniformities, and batch differences, are examined.

Key words: IPTS-68; melting point; secondary temperature standards; temperature scales; Y₂O₃.

Modern day pyrometry permits the measurement of temperature with maximum uncertainties ranging between about 0.1 °C at 1064 °C (gold point) and 2 °C at 3525 °C. These uncertainties refer to the realization of the International Practical Temperature Scale (IPTS) and represent the level of accuracy a temperature per se can be determined under optimized conditions. Unfortunately, the measurement of a material property as a function of temperature imposes experimental constraints which seriously degrade the inherent accuracy of the temperature measurement system, often to unknown levels. Consequently, in situ temperature calibrations are required which must employ the use of a well characterized reference material compatible with the environment of the experiment. Suitable secondary temperature reference standards are not generally available and this lack is being addressed by the High Temperature Commission (UPAC) through its current melting point program on Y₂O₃ and formerly by its efforts on Al₂O₃.

The determination of fixed points presents many experimental difficulties relevant to a wide range of physico-chemical measurements and can serve as an illustrative example of the high temperature problems which may be encountered. Through a description of the experimental determination of the melting point of Y₂O₃ (2422 °C) this paper delineates major problem areas and includes discussions on IPTS, temperature measurement techniques and calibration and materials behaviour and compatibility.

Key words: fluid-solid phase transition; Lennard-Jones model; melting and freezing densities; Monte Carlo simulation; symmetry change; van der Waals isotherm.

Monte Carlo calculations for 108- and 256-particle Lennard-Jones systems have been carried out at 140 temperature-density points in the vicinity of the fluid-solid phase transition. Several types of initial configurations have been used, including fcc lattice arrays, disordered arrays, and combinations of lattice and disordered arrays. The results of runs at high densities show that for small periodic systems the calculations are dependent on the initial configuration and that such systems can exist in many different metastable states from which minimum energy states are not accessible in runs of the order of 10⁶ to 10⁷ configurations. In the vicinity of the smallest density at which the fcc lattice is stable, the calculated pressure-volume curve exhibits many of the features of a "van der Waals loop"; however, because a single phase is thermodynamically unstable over part of this region, the loop cannot be completely resolved through machine calculations. The use of the van der Waals loop to estimate the melting parameters for the Lennard-Jones system leads to fluid and solid densities 3 to 4 percent lower than those calculated by the indirect method of Hansen and Verlet.

Key words: laser; laser calorimetry; laser energy measurements; laser power measurements.

A calorimeter was built to measure the total energy emitted by a CW laser whose output wavelength is in the region from 1 μm to 11 μm. This instrument can measure energies from 10⁸ to approximately 10¹⁰ joules with about 5 percent uncertainty and it can measure energies down to about 10⁶ joules with a larger uncertainty. The calibration factor for this device is approximately 2.26 × 10⁶ joules/volt, where one volt corresponds to a temperature interval of approximately 12 °C. The laser power that can be accommodated by this instrument ranges from about 500 watts to 100,000 watts. The maximum beam diameter it will accept is 10 cm.

Key words: automated measurements; computer; concepts; reliability; state-of-the-art; survey.

The primary intent of this paper is to give a state-of-the-art survey of automated-computer controlled measurements in the context of what has been done in the past that has direct bearing on the present work and the directions that the near future work will take.

The paper will cover some of the evolution of computer controlled measurement systems including concepts utilized in the system designs. The discussion will start with the concept of utilizing the computer to handle large amounts of data from traditional systems to give more data handling reliability and then go into the concepts of using the computer not only to collect the data but to control the actual measurement instruments to allow for even more reliability and in some cases improved measurement accuracy. From there, it will go into the concept of using the computer not only to control the instruments and collect the data but to actually model the system. Here, numerical data which represents system parameters is stored in the computer memory and later utilized to correct the measurement data so that the system will appear nearly perfect and an improvement in measurement accuracy is achieved.

Finally, a summary of the state-of-the-art in automated computer controlled measurement equipments and techniques will be given. It will be given in the context of measurement accuracy achieved, measurement efficiency, reliability, and measurement

Key words: automatic measurement; coaxial standards; network parameters; reflection coefficient; scattering coefficients; transmission coefficient; waveguide standards; 2-port standards.

2-port standards have been developed for evaluating the performance of automatic systems which measure network parameters over a broad frequency range.

The standards consist of short sections of coaxial line or waveguide which include or produce simple discontinuities. One can calculate the complex reflection and transmission coefficients for any frequency given the dimensions.

In use, the standards are terminated by a port of the measurement system which is made effectively non-reflecting by means of a calibration procedure and computer correction.

A number of types of standards are described and measurements with a typical automatic system are presented.

Key words: antenna radiation patterns; gain measurement.

In the communication being commented on, a method is "proposed" for correcting for the effects of the measuring antenna in the determination of far-field aerial patterns from near-field measurements. This method was previously proposed in a talk in 1963 and has been substantially implemented in theoretical, experimental, and computational work. References are given.

Key words: autocorrelation; detector; pulse; pyroelectric.

A pulse comparison technique is described which yields the autocorrelation function and the power spectrum of a repetitive time-domain waveform. The autocorrelation function is realized with a sliding short in a coaxial transmission line to provide time delay; a pyroelectric bolometer to provide multiplication through a square law voltage response; and a capacitor to provide integration. Problems of realization of a perfect time delay and integration limitations are considered, and it is found that noise fluctuations yield the main time resolution limitation that is equivalent to 8 ps for 15-V pulses and a 50-s integration time. The pyroelectric voltage-sensing bolometer is then compared to a pyroelectric capacitance sensing bolometer. It is shown that the capacitance sensing bolometer can handle much longer pulse durations than the voltage sensing bolometer. It is also demonstrated that the sensitivities of the two techniques are equivalent in a typical case at a capacitance sensing bolometer bridge voltage of 3 V. Measurement results of the autocorrelation function and power spectrum, using a voltage sensing pyroelectric bolometer, are given for a nominal 15-V, 500-ps time duration, whose baseband pulses have a 100-pps (pulses per second) repetition rate.

Key words: bolometer; cryogenics; dielectric; glass-ceramic; optics.

This paper corrects a definitional error in the previous paper on this topic and reports a considerably better dielectric material for this type of detector (i.e., $d_{jkl}dt$ values as large as 30% K$^{-1}$ in the range 0.3 to 10 K). Computed responsivity (times the square root of the detector area) based on this material varies from $6 \times 10^{5}$ to $2 \times 10^{4}$ V·W$^{-1}$·cm for reservoir temperatures between 0.3 and 10 K. The corresponding variation of the detectivity is from $2 \times 10^{4}$ to $1 \times 10^{11}$ cm·W$^{-1}$·Hz$^{1/2}$.

Key words: coatings; electroplated coatings; metal coatings; test methods for metal coatings; testing electrodeposits.

A brief description and evaluation is given of each of the methods used to test electroplated coatings for thickness, corrosion resistance, porosity, internal stress, ductility, hardness, and solderability.

Key words: alloy data; bibliography; index; Knight shifts; NMR: rare earth metals and alloys; soft x ray.

The Alloy Data Center (ADC) has deep-indexed about 18,000 papers dealing with physical properties of metals and alloys, and maintains these in a computerized file. Of these, approximately 3,000 contain information on transuranic or rare earth metals (including Sc, Y, La), or alloys with one or more such components. These literature references have been printed out alphabetically by chemical symbol to form a rare-earth annotated bibliography, which is available as an NBS Special Publication. The ADC collects all nuclear magnetic resonance (NMR) and soft x-ray spectroscopy (SXS) papers, and many papers dealing with other electronic-structure related properties as well. This bibliography, therefore, contains all NMR and SXS papers for rare-earth related metallic materials. The ADC does not intend to compete with the Rare Earth Information Center, which is far more comprehensive for many other physical properties of rare earth materials. Rather, this bibliography of the ADC's holdings is thought to represent a valuable bibliographic tool in the interim period until the Rare Earth Information Center has completed its conversion to an automated system.

Key words: crystal; defect; disclination; dislocation; elasticity; jog; kink; multiplication; plasticity; Volterra.

A regenerative mechanism is proposed which can lead to unlimited multiplication of disclinations. This mechanism consists of a glissile segment of a disclination pinned by two sessile "jogs," and therefore is similar to a Frank-Read source for dislocations. It is also possible to have a U-mill, Z-mill, and L-mill for disclination multiplication. It is further shown that a single source can give rise to disclinations of opposite signs (and this allows rotation in both directions of that part of the crystal above the source, relative to the part below), depending upon the direction in which the source operates.

14746. Zhukov, V. V., Weisman, I. D., Bennett, L. H., Nuclear

Key words: anisotropic Knight shift; Cd; Hg; isotropic Knight shift; Knight shift; Korringa product; nuclear magnetic resonance; spin-lattice relaxation.

Experimental isotropic and anisotropic Knight shift data on $^{113}$Cd and on $^{199}$Hg in Cd-Hg alloys have been obtained between room and liquid-helium temperatures. The $^{113}$Cd spin-lattice relaxation times in Cd and in a Cd + 10 at.% Hg alloy have also been measured at these temperatures. The Hg concentration dependence of the anisotropic and isotropic Knight shifts at the $^{199}$Hg site was found to be qualitatively similar to that of the corresponding shifts at the $^{113}$Cd site. The Korringa relation for $^{113}$Cd is obeyed, indicating that only one mechanism contributes to the Knight shift and spin-lattice relaxation. The ratio of isotropic Knight shifts, (Hg:Cd), extrapolated to zero Hg concentration, 4.67, is somewhat greater than the ratio, 3.69, of atomic hyperfine fields. This suggests that the amount of electronic "$\pi" character at the Cd Fermi surface is anomalously low due to anisotropy effects and that adding Hg rapidly destroys the anisotropy by weakening and symmetrizing the lattice potential.

Key words: corrosion; passivation; single crystals; sulfuric acid; titanium.

Anodic polarization measurements have been made potentiostatically on single crystal and polycrystalline titanium in 1N H$_2$SO$_4$ at 23 C (73 F). Three low index surfaces, (0001), (1120), and (1010) were studied together with polycrystalline rolled sheet material. A strong influence of crystallographic orientation on the anodic current densities was found in both the active and the passive regions. The most active surface was (1120), the least active (0001). The most passive surface was also (0001), unless the specimen had been in a cathodic region, whereupon that orientation became the most reactive. That effect and others that are associated with titanium hydride formation are discussed. The effect on the reactivity of the polycrystalline surface due to preferred orientation texture is mentioned.

Key words: alloy; directional solidification; incongruent melting alloy; peritectic reaction; Sn-Cd alloys; structure.

The structure of Sn-Cd two-phase peritectic alloys directionally solidified at various values of $G^\gamma$ (temperature gradient in the liquid divided by growth rate) is reported. The minimum value of $G^\gamma$ as a function of composition required for the solidification of two-phase peritectic alloys with a planar liquid-solid interface is estimated using a simple constitutional supercooling stability criterion. At a value of $G^\gamma$ just below this minimum value, these alloys solidify with a nonplanar interface consisting of cells of $\alpha$ (the high temperature phase) and intercellular $\beta$ (the low temperature phase). This produces a coarse rod-like microstructure consisting of rods of $\alpha$ phase imbedded in a $\beta$ matrix. At a value of $G^\gamma$ above this minimum value, these alloys solidify with a planar interface which alternately deposits bands of $\alpha$ and $\beta$ transverse to the growth direction. No coupled growth of $\alpha$ and $\beta$ at a planar interface is observed in Sn-Cd two-phase peritectic alloys as was expected. To understand this, an analysis of coupled (elastic-like) growth of two-phase peritectic alloys is presented and contrasted with the results of the Jackson-Hunt theory of lamellar eutectic growth. This calculation indicates that the coupled growth of two-phase peritectic alloys is unlikely on theoretical grounds.

Key words: copper; heat transfer; helium 3-3 helium 4; Kapitza resistance; phonon-electron interaction; phonon-quasiparticle interaction; powder; sintering.

The recently measured value of the phonon-electron thermal resistance is too low to have been seen in previous measurements of the Kapitza resistance of high surface area materials below 0.1 K. We report here measurements of the thermal resistance between dilute $^3$He and copper powder of characteristic spherical diameter, based on adsorption studies, of 1.6 $\mu$m. With this powder we should expect to see, below about 50 mK, the phonon-electron thermal resistance and the phonon-$^3$He quasiparticle thermal resistance. However, measurements down to 15 mK on three different samples of this powder show no signs of these additional resistances. The thermal resistance-surface area product has the typical Kapitza resistance behavior of $R\sigma T^3 = $ constant for temperatures below that where the thermal resistance of the liquid in the sponge dominates. The value for the constant is in fair agreement with the value 280 cm$^2$/K/W that we find for annealed bulk OFHC copper in dilute $^3$He.

Key words: deformation; dislocations; face-centered cubic metals; faults; Fourier analysis; review; stacking fault energy; x-ray diffraction.

Stacking-fault energies can be determined by measuring the positions and profiles of x-ray diffraction lines. Use of this method has been hampered by the uncertainty of the relationship between stacking-fault energy and the ratio of microstrain to stacking-fault probability. Microstrains and stacking-fault probabilities have been determined for five fcc metals by x-ray diffraction line profile analysis. For these metals, Ag, Au, Cu, Al, and Ni, stacking-fault energies have been estimated from a comprehensive updated review of the experimental literature. A linear correlation does exist between $\gamma$ and $(\epsilon_\gamma^2)_{\text{111}}/a$ and thus, the x-ray technique can be applied more confidently. The possible role of elastic anisotropy is also considered.

Key words: astrophysics; early-type stars; radiative transfer; spectral line formation; stellar atmospheres.

A method is presented that makes possible, for the first time, the calculation of extended spherical non-LTE model stellar atmospheres in hydrostatic and radiative equilibrium. This method is a generalization of the complete-linearization technique of Auer and Mihalas. Models have been obtained for a star with $M = 60 M_\odot, L = 1.25 \times 10^6 L_\odot, and R = 24 R_\odot$, whose atmosphere is characterized by an effective temperature $T_{\text{eff}} = 39,500$ K and a surface gravity log $g = 3.45$, i.e., with a spectral type near O6. These models are differentiated by the magnitude and radial dependence of a radiation force multiplier $y$ that is inserted into the equation of hydrostatic equilibrium to simulate the effect of radiation force on opacity sources which have not been included
explicitly in the calculation. Models have been obtained very close to the limit at which the radiation force and gravity balance; as this condition is approached, the atmospheres become more and more extended. Only hydrogen and helium (\(Y = 0.1\)) have been included, and six hydrogen lines have been treated explicitly. Although these models show only modest extension, they predict \(La\) in emission, the lower Balmer lines in absorption, the Balmer jump in absorption, and an infrared excess and ultraviolet deficiency relative to the visual. Continuous energy distributions and the profiles and equivalent widths of \(La, H\alpha, H\beta,\) and \(H\gamma\) are tabulated. The models predict an intrinsic reddening of the colors of extended envelopes relative to plane-parallel atmospheres. A procedure for the extraction of the intrinsic colors of luminous stars from heavily reddened observations is described.

Key words: mechanical relaxation; methyl branches; paraffins; polyethylene; potential energy calculations; relaxation strength; two-site model.

A two-site model for a relaxation process has been used in conjunction with the results of illustrative potential-energy calculations on a model system to examine the effects of substituted methyl branches on the chain packing and mechanical relaxation of a linear hydrocarbon host crystal. The results indicate that a branched molecule can be accommodated in an array of linear chains in two different modes of packing and that each mode has two orientations. For one of the modes, the two orientations have nearly equal energies. Upon mechanical deformation of the array, this mode gives rise to a relaxation. The relative strengths are evaluated for different deformations, some of which yield values of the order of those observed experimentally. This relaxation is much weaker for unbranched chains in the planar zigzag conformation.

Key words: atomic spectra; chlorine; halogens; photoionization.

*Ab initio* Hartree-Fock calculations in the single-configuration approximation predict that the \(3s\ 3p^6\ ^2S\) level of Cl I lies far above the ionization limit, although this level is observed to be the lowest of all even \(j = 1/2\) levels other than \(3s\ 3p^4\ ^4P\) and \(3P\). The solution of this anomaly lies in configuration interaction with the high-lying portion of the \(3s\ 3p^4\ ^4P\) continuum, which is sufficiently strong to depress the computed \(s^p\) level to its observed position. This interaction with the continuum is an extension of the well-known interaction of \(s^p\) with the discrete \(s^p\ ^n\) Rydberg series, and is important in all neutral third-row elements Al to Cl, as well as in Br and I and probably other fourth- and fifth-row elements. The effect is, however, somewhat smaller in Br I and Cl I than in Cl II, with the result that there exists no bromine or iodine level that is primarily \(s^p\) in nature. The interactions produce large changes in computed transition probabilities and photoionization cross sections.

Key words: annealing; crystalline polymers; material transport; thickening; volume change.

A previous theory of thickening has been extended to encompass the possible dependence of cooperative chain transport on lamella thickness and crystallinity changes during annealing. These have marked effects on the thickening rate leading to changes in slope and departures from straight-line behavior of the plots of lamella thickness versus the logarithm of time. The resulting curves bear a resemblance to many experimental ones in the literature. Also brought out by the analysis is the important fact that the volumes of the coherently thickening domains are not known from experiment.

14755. Sugar, J., Spector, N., Spectrum and energy levels of doubly ionized europium (Eu III), J. Opt. Soc. Amer. 64, No. 11, 1484-1497 (Nov. 1974).

Key words: energy; energy levels; europium; ionization; spectrum.

The spectrum of Eu III obtained with a 6 A sliding-spark discharge has been measured from 2000 \(\AA\) to 9000 \(\AA\). Of the 890 spectral lines observed, one-third are classified in an energy-level scheme consisting of 104 excited levels. These belong to the \(4F\) configuration and to the \(4^f(4F)6d, 4^f(4F)6s,\) and \(4^f(4F)6p\) subconfigurations. Except for \(4^f\), calculations of these configurations with least-squares-adjusted parameters were carried out. A reasonably suitable truncation for the energy matrices of each configuration was found.

Key words: dissociation; electron; ionization; molecular oxygen.

The electron energy dependence of the angular distribution of \(O^+\) produced by dissociative electron attachment to NO has been measured in the energy range 8.0-11.0 eV. The distributions are observed to be anisotropic and of a form that is nearly \(\sin^2\) at all energies. Deviations from a \(\sin^2\) dependence are discussed in terms of the relative contributions of different partial waves to the differential cross section. The results indicate that the final repulsive negative-ion resonances involved must be either \(\Sigma\) or \(\Delta\) states.

Key words: experimental; fluorine; gas; graphs; liquid; tables; torsional crystal; viscosity.

A torsionally oscillating quartz crystal has been used to make absolute measurements of the coefficient of shear viscosity for compressed fluid fluorine at temperatures from 90 to 300 K, at pressures up to 20 MPa, and for saturated liquid fluorine at temperatures from 70 to 144 K. Special features of the viscometer, necessary to provide an instrument suitable for measurements on an extremely reactive fluid such as fluorine, are described. The accuracy of the results is estimated to be of the order of 2 percent with the precision somewhat better, approximately 0.5 percent. The dependence of the viscosity on density has been investigated by representing the gaseous data along isotherms in power-series expansions. Dilute-gas viscosities were subsequently derived from this analysis. An equation has been developed that can be used to calculate the viscosity of fluorine over the range of the present measurements. Comparisons with experimental data and theoretical predictions are presented for the few measurements and calculations previously attempted for fluorine.

Key words: crystal structure; cyclic nitramine; organic compound.

The crystal structure of dinitropentamethylenetetramine, or DPT, C₆H₁₄N₄O₄, has been studied by three-dimensional x-ray (Mo Kα) diffraction data. The unit cell is monoclinic P2₁/c, with a = 9.345 (5), b = 8.284 (5), c = 11.566 (5) Å, β = 105.6 (1)° and Z = 4. The structure was solved by direct methods and refined by full-matrix least-squares methods to a final R = 0.035, R_w = 0.037. The two N-N=O groups in a DPT molecule are planar, with the two nitramine carbons out of the plane. The molecule has approximate mirror symmetry bisecting each of the two nitro groups.

Key words: building; codes; earthquake damage; earthquakes; hazards; hospital; natural disasters; seismic; structural engineering.

The December 23, 1972, earthquake in Managua, Nicaragua caused extensive damage to structures throughout the city of Managua. There was damage to virtually every building in Managua, a city of approximately 400,000 inhabitants. An estimated 10,000 people were killed, mostly in the collapse of homes, built of native taguezal construction. The city contained numerous reinforced concrete structures designed to recent standards. Although many of these buildings were heavily damaged, with some collapses, some had only minor damage. There were also several structures of structural steel.

The paper provides an overview of structural effects and discusses the performance of selected buildings in Managua illustrating the range of performance of modern construction. Damage to numerous other buildings will be discussed. The paper, while emphasizing the structural effects on buildings, also discusses the performance of non-structural elements, mechanical equipment, etc.

Key words: polyvinylfluoride; polyvinylidene fluoride; pyroelectrics.

Through detailed investigations of the modulation frequency response of pyroelectric detectors, nonuniform polarizations have been shown to exist in polyvinylfluoride and polyvinylidene fluoride plastics. The nonuniform polarization is also confirmed by measurements using multilayer structures. The direction and magnitude of the gradients in polarization are dependent on the magnitude and polarity of the poling voltage. The gradients in the polarization for PVF and PVF₂ are opposite in direction. Using structures that allow for poling to 2 × 10⁶ V/cm uniform polarizations, the highest responsivities and improved frequency responses were obtained.

Key words: patrol car definitions; patrol car functions; patrol car systems; patrol car terms.

This document contains the definitions of terms related to four-wheeled, on-road vehicles used in law enforcement. The terms and definitions have been selected on the basis of usefulness to those responsible for the selection, procurement, and use of those vehicles.

Key words: alkane; electronically excited molecule; hydrogen iodide; n-butane; radical scavenging; vacuum ultraviolet photolysis.

The photolysis of n-C₄D₉ has been investigated with 8.4 eV and 10.0 eV photons, using H1 to scavenge free radicals through the reaction: R₉ + H₁ → R₉H + 1 (where R₉ is a fully deuterated alkyl or alkynyl radical). From the results of such experiments, the quantum yields of the molecular and radical products are obtained over a pressure range from 3 to 47 torr at both energies. In addition, the photolysis of CD₃CD₂CH₂CD₃ and CD₃CD₂CH₂CH₃ have been investigated in the presence of radical scavengers over a range of pressures at both energies. The results are discussed with particular emphasis on deriving the quantum yields of all the primary processes, and following changes in the quantum yields as a function of energy. Major conclusions are: (a) the quantum yield of the process (C₄D₉ → C₃D₉ + D₉) diminishes from 0.70 to 0.37 when the photon energy is increased from 8.4 to 10.0 eV; (b) the relative overall importance of direct C-C bond cleavage processes, alkane elimination processes, and D-atom elimination processes do not change significantly as a function of energy; (c) processes involving breakage of the 2, 3 C-C bond strongly predominate over processes involving the 1, 2 C-C bond at both energies, although there is a lower probability for localization of the energy in the center bond when the energy is increased.

Key words: arc; f-values; iron and oscillator strengths.

Oscillator strengths for 534 lines of Fe I have been measured from a wall-stabilized arc. These lines have wavelengths between 2900 and 5800 Å and cover a wide range in intensity and upper energy level. Lifetime values were used in normalizing to an absolute scale and in determining the arc temperature. This temperature agreed with that found independently, using LTE plasma diagnostics. Comparisons with other recent oscillator strength measurements generally show agreement within combined error estimates.

Key words: electron impact; helium; ionization; theoretical study.

The triple differential cross section for the electron impact ionization of helium is calculated in the Coulomb-projected Born approximation, including exchange. Detailed comparison is made with the ordinary Born result and with available experiment in both the coplanar and non-coplanar geometries. The agreement with experiment in almost all cases is appreciably better for the Coulomb-projected Born results than for the ordinary Born results.

Key words: accuracy evaluation; atomic beam frequency standards; cavity phase shift; second order Doppler shift.

It is shown that the Ramsey resonance curves for most atomic
beam machines can be conceived as depending on two distributions of velocity, \( \rho(V) \) and \( \xi(V) \), the second being a correction for beam width.

An analysis and computer program are described which permit one to obtain \( \rho, \xi \) and the nominal microwave power parameter from three or more measured Ramsey resonance curves at properly spaced power levels whose ratios are known. The determination from the functions \( (\rho, \xi) \) of bias errors due to second order Doppler shift, cavity phase difference, and cavity pulling is described.

The method may also be used to improve an experimentally obtained velocity distribution (i.e., one obtained through the pulse technique); to provide the proper function \( \xi \); and to provide diagnostic checks of the measurement technique and the validity of the model chosen for the transition probability.

The method is applied to the NBS frequency standard. Error estimates indicate that it is feasible by microwave power shift measurements to evaluate the total bias error due to the above sources to within one part in \( 10^{13} \).

Key words: antenna measurements; data reduction; near field; probe correction; probe design; spherical scan.

A new data reduction scheme makes practical the determination of patterns of electrically large antennas from near-field spherical scans.

Key words: Einstein coefficients; line strengths; Meinel bands; molecular spectra; OH: radiative lifetimes; spin uncoupling; vibration-rotation interaction; vibrational transitions.

The theoretically derived dipole moment function of \( \text{OH}(\chi \Pi_2) \) obtained by Stevens, Das, Wahl, Neumann, and Krauss is used to calculate the absolute intensities of the vibrational-rotational transitions of the \( \text{OH} \) Meinel bands. The calculations take full account of the spin uncoupling and vibration-rotation coupling which markedly influence the radiative transition probabilities. The effect of lambda doubling on the vibrational transitions is analyzed and generally found to be negligible. Results are tabulated for \( \Delta v = v' \pm v'' \) ranging from the fundamental transitions \( \Delta v = 1 \) to the \( \Delta v = 5 \) overtone, for \( v' = 1-9 \) and \( J' = 0.5-15.5 \). A comparison is made with available data, and various features of the \( \text{OH} \) spectrum are examined that are of anomalous and experimental interest. Thermally averaged emission rates are presented for \( \Delta v = 1-5 \), and the validity of the rotational temperatures commonly derived from experimental intensity distributions is questioned.

Key words: atomic physics; atomic structure; radiative strengths; radiative transition probabilities; spectra.

Multiconfiguration calculations of energy levels and bound-bound radiative transition probabilities for four astrophysically important ions of the Be isoelectronic sequence are presented. Convergence of the results with respect to the number of configurations included in the expansion is discussed. Results are presented for all ions from models with 11 and 16 configurations; including transition probabilities for 24 allowed electric dipole transitions. Some significant differences with previous calculations are obtained. The theoretical lifetimes are generally in good accord with those obtained by the beam-foil technique, and the results of other \textit{ab initio} calculations.

Key words: Coriolis resonance; high resolution; infrared; \( \text{NO}_2 \): spin splitting; \( 2p_5 \).

The \( 2p_5 \) \( B \)-type band of \( \text{NO}_2 \) has been measured, assigned and the spin splitting has been accounted for satisfactorily. Ground-state rotational constants have been obtained by fitting 6 microwave pure rotational transitions with 119 ground-state combination differences obtained in this work. The resulting ground-state rotational constants in \( \text{cm}^{-1} \) are:

\[
\begin{align*}
\Delta v'' &= 8 \cdot 002366 \pm 0.000048, \\
\Delta v' &= (1 \cdot 943 \pm 0.048) \times 10^{-5}, \\
\Delta v &= (3 \cdot 24 \pm 0.20) \times 10^{-7}, \\
\Delta v' &= (0 \cdot 410448 \pm 0.000013), \\
\Delta v'' &= (1 \cdot 8 \pm 0.7) \times 10^{-6}, \\
\Delta v' &= (2 \cdot 685 \pm 0.20) \times 10^{-3}, \\
\Delta v &= (2 \cdot 95 \pm 0.26) \times 10^{-4}, \\
H_{12} &= (2 \cdot 04 \pm 0.95) \times 10^{-6},
\end{align*}
\]

where uncertainties are \( 3 \sigma \). Upper-state constants have also been obtained. Anomalous line intensities are observed throughout the band. The most striking of these anomalies is the observation of very strong \( 6^2 \) \( P_5 \) series even for moderately high \( K \) values while no \( 6^2 \) \( P_5 \) \( R \) lines have been observed.

Key words: intracavity technique; ion cyclotron resonance; mass spectrometry; negative ions; photodetachment; tunable dye laser.

An intracavity dye laser technique has been used to study the photodetachment of electrons from gaseous \( \text{OH}^- \) ions in an ion cyclotron resonance (icr) spectrometer. Enhancement of the photodetachment effect by a factor of 6.8 when comparing the intracavity technique to a double-pass experiment has been observed. Under the conditions of these experiments approximately 93 percent of the \( \text{OH}^- \) ions in the i.e. cell undergo photodetachment using the intracavity technique.

Key words: ion cyclotron resonance; mass spectrometry; negative ions; photodetachment; spin-orbit coupling; tunable dye laser.

The photodetachment of electrons from gaseous \( \text{SH}^- \) ions has been studied in an ion cyclotron resonance mass spectrometer using a flashlamp-pumped organic dye laser as a light source. The onset of the photodetachment process at 538.7 \pm 0.3 \text{ nm} \ (2.301 \pm 0.001 \text{ eV}, 18563 \pm 10 \text{ cm}^{-1}) \) agrees well with that obtained in an earlier study. Coarse structure in the photodetachment curve with a spacing of 11.8 \text{ nm} \ (0.052 \text{ eV}, 422 \text{ cm}^{-1}) \) has been identified with spin-orbit coupling in the \( \text{SH}^- \) radical. Finer structure, with a spacing of ca. 2.5 \text{ nm} \ (0.011 \text{ eV}, 89 \text{ cm}^{-1}) \), has also been observed in the curve, but remains unexplained.

14772. Sengers, J. M. H. L., Greer, W. L., Sengers, J. V., Scaled
The viscosity and thermal conductivity coefficients of dense fluid argon have been calculated using the modified Enskog theory and the equilibrium statistical mechanical perturbation theory of Barker and Henderson. Agreement with experimental transport data is shown to be, in general, quite good. The results of these calculations are also compared to those obtained using the modified Enskog theory and an experimental equation of state. In this case, the results are seen to be excellent, which indicates that this approach provides us with a method of predicting transport properties of simple dense fluids from fundamental molecular theory.

Key words: delay line; picosecond; pulse measurement; superconductivity.

With the aid of a high quality superconducting delay line, it is now possible to perform direct oscillographic measurements of the picosecond transition times of very fast electrical signals that do not furnish pretriggers. A 15 meter superconducting delay line has been constructed. It has an attenuation of 14 dB/km at 1 GHz. The 10 percent-90 percent transition time of this line and its associated air lines leading into and out of the liquid helium dewar is 18 ps. Some applications of this delay line are shown. They include the measurement of the pulse outputs from mercury switch and spark gap pulse generators and the transient response of a traveling wave oscilloscope.

Key words: density; entropy; free volume; glasses; glass transition; liquid; polymer; poly(vinyl acetate); PVT; relaxation; viscosity.

Techniques and procedures are described which are appropriate to obtain proper PVT data on liquid-glass systems. As a result of the non-equilibrium character of glasses (resulting from their very long viscoelastic relaxation times), the thermodynamic history of glass formation has considerable influence on structure and corresponding properties. Accordingly, highly systematic experimental procedures are necessary to obtain meaningful data to properly specify the properties of a liquid-glass system.

Most of the data presented here pertain to poly(vinyl acetate), and amorphous polymer, for which the thermodynamic response is considered to be in a qualitative sense typical of the liquid-glass systems. This polymer is particularly convenient to study because of its glass transition near room temperature. Through the appropriate choice of histories, two types of glass transition temperatures (with their corresponding PVT surfaces) may be observed and defined. One of these may be considered to be a thermodynamic transition applicable to thermodynamically reversible systems, the other, a kinematic transition for which dT/dP approximates the isoviscous state. The latter is therefore of interest in application to fluid transfer analysis at high pressures. In general, the values of dT/dP of the former exceed those of the latter by roughly a factor of two. The thermodynamic data describing these two transitions make possible the proper evaluation of the Ehrenfest Relations for liquid-glass systems.

The use of high pressure to "permanently" densify glasses during formation is described. This procedure results in com-
The results from the more recent experiments of this type reveal certain contradictions with present phenomenological and molecular theories. A few of the more promising examples are given along with the types of modifications necessary for more accurate prediction of thermodynamic and kinematic properties.

Key words: breath alcohol; instruments; performance standard; specifications; test procedures.

The variety of commercially available breath alcohol instruments for use in law enforcement programs has been increasing steadily. As a result of these developments, officials involved in countermeasures programs are requesting guidance concerning their reliability. The need for accuracy of the measured values obtained with these instruments has been emphasized in the courts. Therefore, it is essential that criteria be established to provide a basis for the selection of acceptable breath-testing equipment. In response to this need, the National Highway Traffic Safety Administration (NHTSA) has sponsored the development of a performance standard [1]. Instruments which are in compliance with this standard will be placed on a qualified products list. Funds used to purchase such equipment can then be utilized more effectively. Performance standards are currently being developed by the National Bureau of Standards for NHTSA. The first of these standards, described in detail in reference 1, applies to evidential breath alcohol instruments. Some selected highlights from this standard will be the subject of this presentation.

Key words: anomalous transmission; as-grown copper crystal; crystal perfection; Czochralski growth; Lomer-Cottrell locks; sessile dislocations; x-ray topography.

X-ray diffraction topography using transmission geometry has revealed an interesting array of extremely straight and narrow long-line images in sizeable copper single crystals grown under particular growth conditions by the Czochralski technique. These images are analyzed and elucidated by a model of Lomer-Cottrell dislocations. The formation of these sessile dislocations usually aids the growth of large copper crystals of high perfection. The high degree of perfection over the entire volume of the crystals accounts for macroscopic arrangements of Lomer-Cottrell dislocations which have not previously been observed by electron microscopic techniques.

Key words: aluminum; field emission; tungsten; work function.

Aluminum adsorption on tungsten has been investigated by field electron microscope techniques. Changes in average work function and work functions of the (001) plane and (111) region were determined as a function of aluminum deposition. The average work function exhibits a minimum of about (4.11 ± 0.04) eV (relative to an assumed value of 4.50 eV for the tungsten substrate) and reaches a value of (4.21 ± 0.04) eV for thick deposits. The (001) plane and (111) region exhibit complicated work function dependences on aluminum coverage. Some qualitative observations of aluminum on tungsten surface diffusion are also reported.

Key words: economics; history; iron mechanisms; microbial corrosion; prevention.

A review of the corrosion of iron by microorganisms with extensive literature survey intended as a Chapter for a 1-volume book entitled “Microbial Iron Metabolism.” Includes a historical survey and economic significance of microbial corrosion, general principles of corrosion, a brief discussion of the electrochemical theory of corrosion, the thermodynamics and kinetics of corrosion, electrochemical techniques for measuring the rate of corrosion, and prevention of corrosion. The microorganisms, including fungi and bacteria involved in the corrosion of iron, are discussed extensively as well as the prevention of microbial corrosion of iron.

Key words: diagonally dominant; diagonal matrix; D-stability; Gersgorin’s theorem; Lyapunov’s theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal.

Sufficient conditions for an n by n matrix to be D-stable are surveyed. Use is made of some transformations under which the D-stables are invariant and relations among the conditions are given. The verifiability of the thirteen conditions cited is also discussed. The lack of an effective characterization of D-stability motivates the discussion.

Key words: enthalpy; entropy; equations of state; helium; pressure.

Accurate helium properties must be measured to develop refrigeration systems for superconducting motors and generators. Normally when measuring these properties a double iteration is necessary on the equation of state to find density and temperature. In this paper new state equations are developed which eliminate iterative procedures. These equations are subsets of three overlapping sets of reference equations. They are thermodynamically consistent to the reference equations by a small degree of error, but have been found useful for many calculations.

Key words: antennas; extrapolation; measurements; near-field.

Near-field antenna measurements can yield especially accurate patterns and gain values, since they are subject to the precise control of a closely-coupled laboratory system and are free of errors due to ground reflections and grazing reflections.
from the walls of an "anechoic" chamber. Moreover, for a planar, circular-cylindrical, or spherical scanning surface, the far-field pattern may be computed from near-field data without significant approximation, provided the probe pattern is known, the medium is homogeneous and isotropic, and the medium, probe, and antenna or array are electrically linear. (The full complex-vector transmitting, receiving, and scattering properties of the antenna and probe are expressed by means of a generalization of an n-port scattering matrix, each mode (e.g., plane wave of a given direction and polarization) being considered as a port. Data processing consists primarily of a Fast Fourier Transform, followed in the spherical case by a matrix multiplication.) If the antenna is mounted on a conventional rotator, "spherical scanning" requires no probe transport.

For fixed orientations of two antennas, exact functional forms for the received signal as a function of distance permit correction for multiple-reflection and proximity effects and so yield accurate far-field values from measurements made on small ranges.

Recent NBS developments and measurements with these techniques will be described.

Key words: electrode review; ion-selective electrodes; membrane electrodes; potentiometry.

The state of the art of the newer non-glass types of ion-selective electrodes is reviewed. This survey includes the theory, characteristics, and methodology of the solid-state, liquid ion-exchange and heterogeneous membrane electrodes.

The applications of these sensors to a wide variety of scientific disciplines is discussed, ranging from various physicochemical studies and biochemical research to industrial analysis and control systems. Since this field has been growing so rapidly in the past several years, only a few of the many applications of ion-selective electrodes are presented. Special emphasis is placed on the experimental ferric ion-selective electrode as a possible sensor in corrosion studies. Much remains to be done with these sensors in the very fruitful and socially relevant areas of environmental pollution and public health. Ion-selective electrodes can provide a wealth of information if used with the proper precautions and their usefulness is limited only by the imagination and ingenuity of the users.

Key words: acoustical measurements; acoustics; noise measurement; reverberation chambers; sound energy measurement; sound power measurement.

The total energy of a sound field in reverberation chambers is usually sampled by an array of microphones. Each measures the time-average of the squared sound pressure at its location. This is equivalent to sampling the time-average of the potential energy density of the sound field. It would be advantageous to measure as well the time-averaged squared particle velocity. This would yield the kinetic-energy density, which added to the potential-energy density would then yield the total-energy density. A principal advantage of the total energy density is that its spatial variance is in general appreciably less than the potential variance. We find this from an analysis of the variances for the eigenmodes of rectangular chambers having reflecting (rigid) walls. A microphone for total energy density can be made from a spatial array of six elements arranged at the corners of a regular octahedron. Electret microphones seem to be particularly suitable for the elements. The total energy density can be computed from the sums and differences of the electret outputs, with the help of integrated circuits, and displayed as a running function of time, e.g., as a graphic recording. For a standing-wave tube, only two elements are needed, and the total-energy-density microphone then takes a very simple form.

Key words: stellar atmospheres; stellar coronae; ultraviolet stellar spectrum.

Using the Princeton spectrometer on the satellite Copernicus, a strong emission line has been detected in the K0 giant Beta Gem at 1218.4 Å, which is identified as the 'S_1- 'P_2' intercombination line of O v. The strength of the line is such that it is probably formed in a corona at temperatures near 260,000 K rather than in an analog of the solar chromosphere-corona transition region.

Key words: inventory theory; topological groups.

The problem treated is that of finding those probability distributions of fractional "tails" on the input volumes to a utilization facility during successive time periods that yield a time-invariant distribution of backlog levels. It is shown that this reduces to the determination (which is carried out) of all closed subgroups of the circle group.

Key words: agriculture; environment; isotope dilution; mass spectrometry; NBS Standard Reference Material; orchard leaves; trace mercury.

A stable isotope dilution procedure in conjunction with the spark source mass spectograph was developed for determining sub-µg g⁻¹ concentrations of mercury in orchard leaves. A 5-g sample was spiked with a solution of mercury, isotopically enriched in 201Hg and 199Hg served as a carrier. After wet-ashing the sample with nitric and perchloric acids under reflux and distilling most of the acid, the isotopically equilibrated mercury was electrodeposited onto high-purity gold wires for sparking in the mass spectograph. The concentration was calculated from the altered isotope ratio, 201Hg/200Hg, and other data. The results were compared with those obtained by atomic absorption spectrometry and neutron activation, leading to a certified value of 0.155 ± 0.015 µg g⁻¹ for the mercury content of Orchard Leaves, SRM 1571 of the National Bureau of Standards.

Key words: linear programming; network flows; single commodity; transportation; transportation problem.

This note demonstrates a simple solution method for the following single-commodity flow problem: Given a set of origins
each with a known supply, and a set of destinations each with a known demand, find the minimum possible capacity for a vehicle which is to perform all the origin-to-destination transfers one at a time.

Key words: concave functions; networks; optimal locations.

The problem treated is that of locating \( n \) centers (processing facilities) in a network, so as to minimize the total transportation cost associated with their use. On the assumption that all movements occur between a vertex and a center nearest it, \textsc{hakimi} has shown that only vertex locations for the centers need be considered. The present paper shows that this conclusion remains valid under alternative assumptions more appropriate for some applications.

Key words: sun-faculae; sun-photospheric models; van der Waals line broadening.

We develop a relatively simple procedure for deriving models of upper photospheric regions based on the damping wings of the Ca II resonance and infrared triplet lines. The procedure is used to derive a facular model but can also be applied to late-type stars. We compare our model to that of Chapman.

Key words: damage risk criteria for impulse noise; gunfire noise; noise-induced hearing damage; noise of police firearms.

In an effort to provide guidelines for law enforcement personnel to protect their hearing, the peak pressure level and signal duration \((A\) and \(B\) duration) of eight popular firearms were measured and compared with the requirements of OSHA (1970), CHABA DRC (1968), and EPA levels (1974). Small condenser microphones and a storage oscilloscope were used to record the blast wave signatures from a 9-mm automatic, 0.357-cal. Magnum revolver, 0.41-cal. Magnum revolver, 0.22-cal. revolver, 0.45-cal. automatic, 0.44-cal. Magnum revolver, 12-gauge shotgun, and 0.22-cal. rifle. Measurements were made at the ear of the person shooting and at the approximate position of a neighbor at a firing range. Some measurements were also made at a practice firing range. A portable tape recorder was found useful for recording gun signals and measuring \(B\) durations. The peak pressure levels of the signatures of all the firearms tested exceed the OSHA maximum of 140 dB. It was found that in an anechoic environment the noise from five of the handguns exceeded the CHABA DRC (1968), while the noise of all from the firearms tested, except the 0.22-cal. rifle, exceeded the EPA levels (1974). At a sound-insulated firing range, the noise from all of the firearms tested, except the 0.22-cal. rifle, exceeded the CHABA DRC (1968), while all the firearms tested exceeded the EPA levels (1974).

Key words: apparel; burn injury; fabric; fire modeling; flame spread; flammability; flammability testing; garments; heat transfer; ignition.

The objective of this paper is to give a brief overview of the present status of attempts to model real life accidents involving garment fires in the laboratory, and to suggest experiments which could be carried out in the textile laboratories of home economists. The main purpose of laboratory modeling should be the definition of hazard due to the ignition and burning of garments varying in fit, fiber content, and fabric weight and construction.

Hazard from burning garments depends on the ease of ignition, rate of flame spread, heat transfer to the body, and the ease of extinguishing the garments. The literature on each of these factors is briefly reviewed, and suggestions are made for experiments which could illustrate the effects of various fabric and garment parameters on injury hazard.

Key words: coefficients of discharge; expansion factor; flow coefficients; flowmeter; fluid meter coefficients; rotameter; variable area meter.

Data acquired in the years 1958 to 1960 at the Naval Ship Engineering Center under sponsorship of the American Society of Mechanical Engineers are used to derive semiempirical equations for the performance of two variable area meters with both liquid and gas flow. As the measurements are put to a usage for which they were not intended, the data treatment is considered illustrative of the application of a flow equation derived by an analysis based upon a force and momentum balance. The hydraulic flow coefficient is expressed in terms of a function of \((a)\) pressure drop divided by float weight and \((b)\) a dimensionless length ratio \(\beta\) for float position. Density ratio is used to modify the function of \(\beta\) to derive the expansion factor \(Y\) for gas flow as suggested by the analysis. Reasonable agreement between measured and derived values of \(Y\) is demonstrated, and approximate measures of the velocity profiles in the meter are derived from the correlation equations. One set of air tests at one float position in which the viscous influence number \(N\) was changed from 500,000 to 783,000 indicated (within this range) a possible insensitivity of the derived function of \(\beta\) to change of \(N\).

Key words: acoustics; acoustical holography; acoustical measurement; paraholography; reverberation chambers; sound propagation.

We describe a method for experimental determination of the complex of plane waves composing the sound field in a reverberation chamber. The basic holographic principle is comparison of the actual sound field with a family of reference plane waves having precisely known directions of propagation, sound pressures, and phases. The reference waves are not "real" waves but are created electronically, on the electrical side of microphones sensing the actual sound field, so as to be "parallel" to real waves.

Key words: implicit model; least-squares analysis; transformed weights.

The most generalized algorithm for the least-squares estimation of parameters in nonlinear, implicit models is the modified Deming approach. This technique is very complicated; however, simpler approaches for many problems lead to reasonable solutions. One widely accepted alternative is the transformation of Hust and McCarty. This article offers another equally simple alternative: geometrically transformed weights.

Key words: fluorine; methylthiotetrafluorophosphorane; nuclear magnetic resonance; phosphorus.

The low-temperature $^19F$ NMR spectrum of the stereochemically nonrigid compound, CH$_3$SPF$_4$, shows three fluorine environments, one for the equatorial and two for the nonequivalent axial fluorine atoms. Each of the twelve lines of the upfield $^19F$ (axial) resonance shows further fine structure, due to coupling between $^19F$ and the protons of the CH$_3$S group. The outer peaks of the two multiplet components reveal apparent quintet structure which, based on a computer simulation of the $^19F$ spectrum of CH$_3$SPF$_4$, is rationalized in terms of accidental overlap of two quartets.

Key words: air leakage; cooling load measurement; refrigerated enclosures; testing of vehicles; wind effects on structures.

A laboratory test method is needed that can be used universally for rating or acceptance of refrigerated vehicles and containers employed in international transport. Various investigators have shown that air and moisture leakage into an insulated body under the influence of impact air pressure or wind can represent a significant fraction of the total cooling load. Since road testing and laboratory testing of vehicles and containers under realistic air flow conditions are both complex and expensive, simplified test procedures are urgently needed for simulating the effect of air leakage during cooling load tests. By making certain logical assumptions regarding the distribution of openings in an insulated body and the nature of the fluid flow through these openings, it is shown that a negative pressure of 1 mm W.G. (0.04 in W.G.) inside the cargo space will produce an air leakage into the body as large as 100 km/hr (62.5 mph) wind on one end or a 50 km/hr (31.3 mph) wind on one long side of most vehicles and containers. A second simplified method involves determining the total cooling load by the addition of the measured heat transmission with interior heating and a calculated air leakage effect based on a measured air flow rate and an assumed change in sensible and latent heat content of the leakage air. Both of these methods need laboratory study.

Key words: atmospheric acoustics; infrasound; physiological effects of infrasound.

The Colloque International sur les Infra-sons, held 24-27 September 1973 in Paris, France, was organized by the Centre National de la Recherche Scientifique and by the Groupement des Acousticiens de Langue Francaise. Professor L. Piminov planned the program of the Colloquium to "contain all aspects of atmospheric infrasounds, namely production, diffusion, detection and measurements; infrasounds of natural sources (oceanic origin, high atmosphere, meteorites, etc...); infrasounds of technical origins, technical applications of infrasounds, the inconveniences of infrasounds in physiology and industry, particularly in the chambers of combustion, detection of explosions, etc..." Infrasound was regarded as being oscillations at frequencies below 20 Hz.

Key words: gas counting; microcalorimetry; tritium standards.

The calibration of the National Bureau of Standards tritium standards by microcalorimetry and gas counting will be described.

Key words: Cassegrain; reflecting objective; spectrometers; spherical aberration; third-order theory; unit magnification.

Cassegrainian-type reflecting objectives are useful as in-line imaging devices for fast spectrometer systems. They are inherently free from chromatic aberrations and may be corrected for spherical aberration. A particularly simple design, consisting of two mirrors with oppositely equal curvatures, is possible when unit magnification is desired. This system has zero third-order spherical aberration, and all other aberrations are small also. Its main disadvantage is the loss due to the central obstruction of the beam, amounting to about 28 percent exclusive of reflection losses.

Key words: electrode response in biological fluids; electrodes; ion-selective electrodes; microelectrodes.

The response of ion-selective electrodes in biological fluids may be affected by a wide variety of physical and chemical factors. These may influence the indicator electrode directly or may affect the liquid junction of the reference electrode. A brief discussion is presented of the various sources of error and uncertainty in electrode measurements in biologic media especially with microelectrodes. A serious need exists for the development of practical standards for the calibration of ion-selective electrodes in physiologic media in order to ensure the consistency of interlaboratory measurements.

Key words: photodetector; photodetector spectral response; photomultiplier tubes; phototubes.

An instrument has been designed to plot automatically the relative spectral response of a phototube over the range of 0.35 μm to 0.84 μm. The response as a function of wavelength is recorded directly by using a digital printer or an x-y plotter.

Key words: dipole moment function; dissociation energy; electronic structure; hydroxyl radical; potential curve; self-consistent-field.

Accurate theoretical potential and dipole moment curves are presented for the $X^2 \Pi$, state of the hydroxyl radical. The
theoretically determined dissociation energy is 4.53 eV as compared to the experimental value of 4.63 eV. The computed dipole moment at the experimental equilibrium internuclear separation is 1.674 D, which is in excellent agreement with the most reliable experimental value of 1.66 ± 0.01 D. A detailed, general prescription for constructing optimized valence configuration wave functions for diatomic hydrides is presented with OH as a specific example.

A theory which describes the angular distributions of electrons photoemitted from chemisorbed atoms is presented. Due to hole delocalization and preferential orientation, interference effects due to emission from various centers in a molecule do not average out, as they do in gas phase photoionization and much more structural information pertaining to chemisorption bonds is contained in such measurements.

14807. Plummer, E. W., Wacławski, B. J., Vorburger, T. V., Photoelectron spectra of the decomposition of ethylene on (110) tungsten, Chem. Phys. Lett. 28, No. 4, 510-515 (Oct. 15, 1974). Key words: C2H4 decomposition; chemisorption bonds; LEED; photoelectron spectra; tungsten; work function.

Photoelectron spectra, LEED patterns, and work function changes were obtained for ethylene adsorbed on (110) tungsten at room temperature, and with subsequent heat treatment. For saturated adsorption of C2H4 on (110)W at room temperature, features in the photoelectron spectrum were observed which are believed to be due to the C — H, C — C, and C — metal bonds in an adsorbed species of the form C2H3. The work function decreased by 1.2 eV at saturation, but LEED showed no change from the clean surface pattern. Upon heating to ≈ 500 K, where hydrogen is known to desorb, the C — H bond was broken, whereas the C — C and C — metal bonds remained. The work function increased, from saturation, by ≈ 0.6 eV and the LEED pattern exhibited a large diffuse background with no new spots. Upon heating to ≈ 1100 K the C — C bond broke and the LEED pattern order into the characteristic carbon contamination pattern.

Long vibrational progressions are observed in the electron impact energy loss spectrum of NO2 in the 1.5-4.1 eV energy loss range. These progressions can be assigned to the 1 18 3 3 2 transition and suggest that the 1 18 3 3 2 state is asymmetric.

The total neutron cross section of carbon was measured over the energy range 1 keV to 15 MeV, using the U.S. National Bureau of Standards electron linear accelerator as a pulsed neutron source. Neutron energies were measured by the time-of-flight method. The measurement accuracy is estimated to be ± 3/4 percent below 100 keV and ± 1 percent above. The carbon cross section was fit with a polynomial from 0.001 to 1.4 MeV with the following coefficients

\[ \sigma = 4.757 - 3.419 E + 1.548 E^2 - 0.328 E^3, \]

where \( \sigma \) is in barns and E in MeV. Data are compared with other results.

14810. Hessel, M. M., Smith, E. W., Drullinger, R. E., Transition dipole moment of Na2 and its variation with internuclear distance, Phys. Rev. Lett. 33, No. 21, 1251-1254 (Nov. 18, 1974). Key words: electronic dipole moment; internuclear distance; laser fluorescence; Na2; transition moment.

The electronic transition dipole moment was determined for the transition X'g Σ g+ → B'1u of Na2 and was found to be 6.8 ± 0.5 r D over a range of internuclear distance \( r \) of 2.6 - 5.0 Å. Our results agree with earlier lifetime measurements and are in qualitative agreement with semiquantitative theoretical calculations, but they strongly disagree with the recent work of Calender, Gersten, Leigh, and Yang.

Monochromatic 15.1 MeV plane-polarized photons have been scattered from seven additional targets having their E1 giant resonances near 15 MeV. They are In, Sb, Nd, Hg, Pb, Th, and U. Photons scattered through 90° were observed in the planes both parallel and perpendicular to the plane of the polarization vector. The observation of photons scattered along the polarization vector by the spherical vibrators indicates that the giant resonance is coupled to the quadrupole oscillations of the nuclear surface. The agreement with the predictions of the dynamic collective model is not particularly striking though there is little doubt that the phenomenon is qualitatively understood.

14812. Cavallaro, L. M., Schima, F. J., Unterweger, M. P., Decay of 128Xe, Phys. Rev. C 10, No. 6, 2631-2632 (Dec. 1974). Key words: enriched source; Ge(Li) detector; measured T1/2; pressurized ionization chamber; radioactivity 128Xe; \( \gamma \) relative intensity.

The half-life of isotopically separated 128Xe was determined by measurement in a 4\( \pi \) pressure ionization chamber. The value obtained was 5.245 days with an uncertainty of 0.006 days which is the linear sum of the standard error at the 99 percent confidence limit and the estimated systematic errors. This result was confirmed by two separate half-life measurements employing a Ge(Li) detector. The \( \gamma \) rays which deexcite the level at 383 keV in 128Xe have been observed. The intensities of the 383- and 221-keV \( \gamma \) rays relative to the 302-keV \( \gamma \) ray intensity were found to be 0.489 and 0.020 with the respective standard errors calculated to be 3.8 percent and 40 percent.

14813. Lamaze, G. P., Carlson, A. D., Meier, M. M., A new measurement of the 128Be(α, Li) branching ratio, Nucl. Sci. Eng. 56, 94-96 (1975). Key words: 128Be(α, Li) reaction; branching ratio; gas proportional counter; neutrons; nuclear physics; T(p,n) neutrons.

To resolve a discrepancy in determinations of the 128Be(α, Li) branching ratio, a new measurement has been made at the National Bureau of Standards (NBS). The measurement was made with a 128Be gas proportional counter and monoenergetic 790-keV neutrons obtained at the NBS 3-MV Van de Graaff labora-
tory. A branching ratio of 0.66 ± 0.03 was obtained. This determination agrees with the measurements of Petree et al. and Davis et al.

Key words: energy levels; hafnium; ionization energies; Slater parameters.

The spectra of hafnium produced by a sliding-spark discharge operating at peak currents of 6 to 1200 A were photographed in the spectral range of 400 to 2100 Å. Sixty-three lines of Hf iv were measured in the limited range of ~500-900 Å, of which 43 were classified. New levels in the 4P^nl doublet system of Hf iv were found for nl = 6f, 7p, and 8s. In addition, the resonance transition array 4P^5d-4P^3d was interpreted. In Hf v 216 lines were observed. With these data, all levels of the configurations 4P^nl for nl = 6s, 7s, 6p, 5d, and 6d were found except for two levels of 4P^6d. Theoretical interpretations are given of all of the above configurations. Values for the ionization energies of both species were derived.

Key words: aversion for sound; avoidance; differential reinforcement of high rate; escape; high school students; key press; pure tones; second order schedules.

High school students tapped rapidly on a telegraph key to reduce the intensity of a continuous acoustic stimulus presented through earphones. Failure to respond resulted in an intensity increase of 1 dB every 4 sec. In Experiment 1, a group of 19 students responded to three pure tones (125, 1,000, and 8,000 Hz) and a white noise. The different asymptotic levels observed after 4 min were taken as a measure of equal-aversion levels for the stimuli. In Experiment 2, the effect of the starting intensity level (45, 70, and 90 dB SPL) was determined for a 1,000-Hz tone. Differences in the asymptotic intensity levels observed after 6 min were not significant. In Experiment 3, no significant effect was found upon varying the number of responses required to produce a 1-dB intensity decrement in a 1,000-Hz tone. Together, the experiments demonstrated the feasibility of determining equal-aversion levels for sounds.

Key words: Mössbauer; NQR; nuclear quadrupole coupling; organotin; organometallic.

A precise redetermination of the 116Sn Mössbauer spectral parameters of a large number of organotin (IV) halides and of the tin (IV) tetrahalides has been made. The 35Cl NQR resonance spectra of (CH3)2SnCl and of (n-C5H11)3SnCl2 have been measured for the first time. These data, in conjunction with literature values of other halogen frequencies in this series, yield correlations of both the central tin atom Mössbauer isomer shift and quadrupole splitting values with the reduced ligand NQR coupling constants. The correlations may be interpreted qualitatively in terms of the bonding trends expected on the basis of ligand electronegativities, and the uniformities of the correlations strongly indicate a lack of sharply defined structural variations within these compounds.

Key words: aberration integrals; asymptotic aberration coefficients; electron lenses; strong lenses; third-order aberration coefficients; two-tube electrostatic lens; weak lenses.

The third-order asymptotic aberration coefficients of round electrostatic electron lenses are formulated, following Hawkes, in a form independent of object and aperture positions. Six quantities are sufficient to specify completely the third-order aberration properties of electrostatic electron lenses. Equations for these six quantities are derived in the form of integrals involving derivatives of the axial potential no higher than the second. Using these equations and our previously calculated potentials and first-order trajectories we have computed the six aberration coefficients for the two-tube electrostatic lens for voltage ratios from 1.1 to 10 000. The results are believed accurate to better than 0.2 percent.

Key words: materials characterization; Mössbauer spectrometry; nuclear resonance.

This book chapter entitled “Mössbauer Spectrometry,” which appears in Systematic Materials Analysis, Vol. III, pp. 241-267, J. H. Richardson and R. V. Peterson, Eds., Academic Press, Inc., New York, 1974, is essentially tutorial. This chapter describes the theory and practice of this technique in a manner oriented toward the student on the graduate level or analyst who finds himself with a materials characterization problem. This chapter draws heavily on already published material, and written. I hope, with the intention of conveying to the reader what information can be obtained by this technique. The chapter includes theory, instrumentation, sample preparation, and gives examples of application in the areas of mineralogy, metallurgy, magnetic properties, chemical structure and bonding, solid-state studies, and data handling.

Key words: piezoelectric transducers; standards of ultrasonic power; ultrasonic power; ultrasonic transducers.

Ultrasonic beam power from specially-designed quartz piston transducers can be determined from an appropriate set of electrical measurements. The characterized transducers can be used as transportable standards of ultrasonic power. A highly accurate twin-T null circuit is employed for the measurement of electrical conductances of half-wave resonant quartz transducers under certain loading conditions. This permits calculation of the equivalent resonant radiation conductance which, when multiplied by the square of the applied voltage, yields the emitted ultrasonic power into a load. Quartz transducers, thus characterized, can serve as standards of ultrasonic power for checking or calibrating ultrasonic power measuring equipment such as radiation force, calorimetric, and acousto-optic devices. With the equipment used at the National Bureau of Standards, uncertainties are estimated at less than ± 5 percent in the frequency range from 1 to 5 MHz.

Key words: acoustic navigation aids; applied psychoacoustics; applied psychology; aversiveness; foghorns; preference; pure tones.

Ten college students gave preference judgments for 4 pure tones (120, 300, 500, and 835 Hz) and 11 tone complexes constructed from combinations of the pure tones. Equal aversion (tolerance) levels were also measured for the four pure tones and for five of the composites. Sensation-level measures were employed to express aversion thresholds in order to take account of the differential sensitivity of the human ear at different frequencies. Certain operational conclusions were suggested for the design of acoustic navigation aids. The higher frequency pure tones and complexes were generally more preferred, and were also tolerated at higher sensation levels. The 120-Hz pure tone was a highly non-preferred signal. The presence of a 120-Hz component in any composite lowered both the preference value and the maintained sensation level. In the case of the moderately preferred 500-Hz pure tone, adding another more-preferred, pure-tone components increased the preference for the signal.

Key words: bibliography; Biometrika; Chi-square tests; correlation, regression; R. A. Fisher; Francis Galton; frequency curves, method of moments; Karl Pearson; statistics; Tables for Statisticians and Biometricians; W. F. R. Weldon.

A review of the life and work of Karl Pearson (1857-1936), founder of the science of statistics. His student days at Cambridge and in Germany. His pre-1890 career as a professor of applied mathematics and mechanics, as a philosopher of science, and as a social reformer. The role of Francis Galton and W. F. R. Weldon in redirecting his career to founder (1891-1936) of the science of statistics. Method of Moments and Pearson System of Frequency Curves: Correlation and Regression; Chi Square Tests, Biometrika; Annals of Eugenics: The Treasury of Human Inheritance; Tables for Statisticians and Biometricians; Tracts for Computers; Tables of the Incomplete $\Gamma$-function; Tables of the Incomplete $\beta$-function. Bibliography of principal Original Works; and of major Secondary Literature.

Key words: automated measurements; bolometer unit calibration; power equation concept.

The power equation concept has been implemented into a multitone precision bolometer unit calibration system employing automation techniques in conjunction with an automatic network analyzer (ANA) system. Using statistical methods the system is being evaluated as a calibration transfer system operating in the 2-12, 4-GHz frequency range at 1-10 mW. Preliminary results reported here show a single measurement standard deviation of 0.2-1 percent from 2-10 GHz. Upon a successful evaluation, the system will be qualified as an integral part of the national measurement system.

Key words: differential scanning calorimetry (DSC); electronic and thermal coupling; instrumental limitations; supercooling; theoretical model; thermal analysis; thermodynamic properties.

A model system for differential scanning calorimetry (DSC) is developed in which the electronic response of the instrument is coupled with the heat flow across an interface. Equations are derived which relate the time constants for this two-step process with the thermal properties of the sample and the amplitudes, areas, slopes and dwell times of DSC traces. The cases discussed include first and second order transitions, partial and total "supercooling" and effects of a temperature dependence of the heat capacity and the rate of temperature change. The magnitude of the lag terms of these cases is determined from typical experimental data. The equations permit an independent determination of the interfacial time constant and an assessment of the limits for the validity of the theoretical model.

Key words: delay line; picosecond; pulse measurement; superconductivity.

A high-quality superconducting delay line now makes it possible to perform direct oscillographic measurements of the picosecond transition times of very fast electrical signals that do not furnish pretriggers. A 15-m superconducting delay line package has been assembled. The package consists of connectors, connector adapters, normally conducting input/output air lines, and a 15 m length of a miniature 1.6-mm superconducting coaxial transmission line. The package exhibits an attenuation of 0.8 dB at 10 GHz and a system 10-90 percent transition time of 18 ps. Some applications of this delay line are shown. They include the measurement of the pulse output from a mercury switch and the transient response of a traveling-wave oscilloscope.

Key words: adapter; automation; efficiency; microwave; microwave measurement; network analyzer.

154
Although conceptually straightforward, the application of existing automated network analyzers to the problem of adapter evaluation is inhibited by the limited accuracy of the detection process, the requirement for several impedance standards at each frequency, and software problems. A hardware modification, which yields improved accuracy for adapter evaluation, is described. An alternative calibration procedure is outlined which exploits this improved accuracy potential, and which requires only one impedance standard.

Key words: Flicker noise; frequency stability; noise measurement; oscillator stability.

A method is given for estimating the intensity of random noise frequency modulation of an individual oscillator, using data obtained by comparing it with two or more other oscillators. This method is appropriate even if the oscillators available for comparison are less stable than the oscillator being evaluated, but their frequency fluctuations must be independent. The statistical uncertainty of the results is discussed briefly.

Key words: Allan variance; flicker of frequency modulation; Johnson noise; linewidth; random walk frequency modulation; spectral density of frequency fluctuations $S(f)$; white phase modulation.

A technique is presented that allows one to measure directly the fluctuations of the natural resonant frequency of quartz crystal resonators in a passive circuit. This technique greatly aids in modeling the noise in both crystal resonators and crystal controlled oscillator circuits. Definite changes of slope in the spectral density of the frequency fluctuations, as a function of frequency offset from the natural resonant frequency of the crystals indicate that several mechanisms are contributing to the frequency instabilities in crystals. Our measurements also indicate that the electronics in the oscillators seriously degrade the frequency stability for sample times less than 100 s. The effects are especially dramatic for times less than 1 s.

Key words: cavity phase shift; cesium beam tube; frequency synthesis; pulse method; Ramsey dual interaction region; second-order doppler; velocity distribution.

A method has been developed which measures the velocity distribution of the atoms in a beam tube using the Ramsey dual interaction region principle. The method involves pulsing the RF excitation signal at a period related to the atoms' time-of-flight between the interaction regions. The pulse method, with its ability to measure velocity distribution enables calculations of cavity phase shift and second-order Doppler effect. This research has motivated the development of a system, complete unto itself, for determining the accuracy of cesium beam tubes. Design goals for the system are outlined. The system development to date is discussed. Frequency synthesis is accomplished at 5,00688 MHz. This avoids frequency synthesis at X-band and thereby eliminates packaging and weight problems. A novel synthesizer design is used which incorporates a digital frequency lock of the 5,00688 MHz VCXO. A resolution of 1.4 millihertz/second is realizable; lock is within $2 \times 10^{-10}$ at one second of a 5,0000 MHz reference with potential to better than $1 \times 10^{-12}$ at one second. This synthesizer and its application to the accuracy evaluation system are discussed. Some results on the evaluation of commercial cesium beam tubes are given.

Key words: application of standards; basic standards; cesium standards; frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption time standards.

The last comprehensive survey on atomic frequency standards was given by A. O. McCoubrey in 1966 (Proc. IEEE 54, p. 116). This survey reviews the more recent historical background of atomic frequency standards leading to the present developments. A discussion of the underlying physical and engineering principles is given. Modern atomic frequency standards, including their performance, are compared quantitatively, and projections are attempted at likely future developments and performance characteristics.

As in 1966, the standards principally used in technical and scientific applications are rubidium gas cell devices, cesium beam tubes, and hydrogen maser oscillators. However, substantial advances in physical and performance characteristics can be reported.

New developments include passive hydrogen devices, saturated absorption stabilized lasers, ion storage devices, and atomic beams in the far infrared and infrared region, as well as new techniques to evaluate frequency biases such as those encountered in cesium and hydrogen standards.

The survey includes a discussion of the effects of past and current developments in atomic frequency standards on the technical and scientific user community.

Key words: argon; critical review; krypton; measurement technique; methane; self-diffusion coefficient.

Data for the self-diffusion coefficient (D) of several simple fluids — He, Ne, Ar, Kr, Xe, CH4, H2, N2, CF4, CO2, and SF6 — in the dense gas and liquid states are reviewed. The general behaviour of the self-diffusion coefficient with respect to temperature and density is examined making use of the excess function approach. Tabulated values of D for methane and argon are presented as a function of temperature, pressure and density. The pressure range covered is 2-50 MPa and the temperature range is 170-320 K for methane and 100-250 K for argon. The estimated error of the tabulated coefficients is ± 10 percent.

Key words: cross sections; excited states; ionization; mass
spectroscopy; radiation chemistry; rare gases.

Photoexcitation of the argon resonance states in the presence of xenon leads to Xe$_2^+$. Kinetic analysis indicates rapid near- resonant energy transfer between argon and xenon atoms. The possibility of an analogous mechanism in other rare gas systems is examined.

Key words: antiferromagnetism; comparison of magnetic properties of glasses and crystals; Gd(PO$_4$)$_3$; glass; magnetic order; polycrystal; vitreous Gd(PO$_4$)$_3$.

We have measured the magnetic susceptibilities of vitreous and polycrystalline Gd(PO$_4$)$_3$. The Weiss constants for these materials were found to be -0.3 K. Vitreous Gd(PO$_4$)$_3$ exhibited short-range antiferromagnetic order below 0.175 K and polycrystalline Gd(PO$_4$)$_3$ short-range order between 0.242 K and 0.052 K and long-range order below 0.052 K.

Key words: CMN; cryomagnetism; low temperature specific heat; magnetic dipole interaction; paramagnetic salt.

The magnetic contribution to the low-temperature specific heat of cerous magnesium nitrate (CMN) was determined by the Casimir-Du Pré ac susceptibility method in the region of 1 K. The value found for the coefficient of the major ($T^2$) term is in good agreement with that determined in this laboratory in magnetic cooling experiments. It is some 10 percent less than that calculated for the magnetic dipole interaction between the Ce$^{3+}$ ions.

Key words: apatite; calcospherulites; calcui; petrography; pineal.

Calcifications of the pineal gland in the form of calcospherulites have been studied by optical microscopy, electron microscopy, electron probe analysis, X-ray diffraction, thermogravimetry, and infrared and chemical analysis. Complex calcospherulite textures have been observed which have a granular substructure made up of apatite crystals averaging 218 Å in length and 38 Å in width. These apatite crystals appear to be a carbonate-containing hydroxyapatite, mineralogically similar to enamel.

Key words: broadcasting; dissemination; frequency; satellite; synchronization; time.

An experiment concerning the broadcasting of time and frequency information from geostationary satellites is discussed. Included are discussions on satellite motion, time delay, Doppler shift, and delay calculations. Ground station requirements, data recovery techniques, and timing resolution and accuracy are also included. Delay computation aids for the user were designed to provide free space delays between the master clock and the user. Measurements made in North and South America demonstrated a timing resolution of about 10 μs and an accuracy of 25 μs.

Key words: conversion; international standards; legislation; measurement language; metrication; metric system.

Whatever the relative merits of the metric system, it has won overwhelming international approval in the last 20 years. The Chinese, Japanese, Indians, and all English-speaking nations of the British Commonwealth are abandoning their traditional measurement language and going metric. The metric system has been legal in the United States since 1866. In the past our major trading partners used the British Imperial system of measurements which also forms the basis for our customary system of units. Major industrial companies and some state educational systems in the United States are now switching. Legislation is before Congress that would coordinate and facilitate an orderly change from predominately customary to predominately metric usage on a voluntary and reasonable basis. This paper explores the problems that would accompany such a change in technology, economics, international relations, and other areas.

Key words: Josephson junction; quantum interference; rf attenuation; superconductivity.

A unique portable system has been developed for measuring RF attenuation over a dynamic range of 62 dB at 30 MHz. A superconducting quantum interference device (SQUID) is the basis of the system. A SQUID is a loop of superconducting metal closed by a weak point contact called a Josephson junction, operating in liquid helium. It converts variations in magnetic flux to periodic variations in impedance which are sensed at microwave frequencies. This provides a convenient natural means of measuring electrical quantities such as voltage, current, power, and attenuation.

Key words: charge transfer; Franck-Condon factors; ion-molecule reactions; methane; rare gas ions; rate constants; silane.

Rate constants for reacti of a number of thermal ions with methane and silane have been determined. It is demonstrated that within experimental error none of the reactant pairs undergoes a charge transfer reaction with a rate constant higher than the estimated collision rate constant. It is concluded that there is no evidence for the occurrence of charge transfer reactions of thermal ions by an "electron jump" mechanism involving nonspiralling ion-molecule collisions in which no momentum is transferred.

Key words: aberrations; aspheric optics; ellipsoidal reflector; Fermat’s principle; Hamiltonian point characteristic; limiting aperture; unit magnification.

Ellipsoidal reflectors are useful for the 1:1 imaging of small objects without spherical and chromatic aberration. The magnitude of the off-axis aberrations of such reflectors is computed by application of Fermat's principle to the Hamiltonian point characteristic. The limiting form of the mirror aperture for which these aberrations do not exceed a set tolerance is an ellipse whose semiaxes depend on object size and angle of incidence.

Key words: Ca II; spectral line; stellar chromospheres.

Existing high resolution stellar profiles of the Ca II and Mg II resonance lines suggest a possible width-luminosity correlation of the k lines, minimum features. We show that such a correlation can be simply understood if the continuum optical depth of the stellar temperature minimum, $\tau_{\lambda}$, is relatively independent of surface gravity as suggested by three stars studied in detail.

Key words: atmospheric physics; radiometric physics; radiometry; solar conversion.

This report presents recommendations of a workshop on accuracy radiometry for solar conversion that was jointly sponsored by NOAA and NSF.

Key words: after-pulse; GaP first dynode; neutron; photoelectron; photomultiplier; resolution; suppression.

After-pulsing suppression of semiconducting first dynode photomultipliers (RCA 8850 series) has been successfully accomplished by applying a positive pulse to a wire mesh directly in contact with the tube face.

Key words: ion-molecule reactions; mass spectrometry; photoionization; rate constants; reaction mechanisms; vinyl halides.

Theoretical molecular rate coefficients have been obtained for the reactions of the parent monomer ions in the vinyl halides with the respective neutral molecules when the ions are formed by photoionization at or very near the ionization thresholds. The values obtained are as follows: $\text{C}_2\text{H}_5\text{F}^+$, 0.27 eV above threshold, $k = 3.2 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$; $\text{C}_2\text{H}_5\text{Cl}^+$, within $kT$ of threshold, $k = 1.78 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$, and $\text{C}_2\text{H}_5\text{Br}^+$, 0.2 eV above threshold, $k = 1.25 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$. An increase in photon energy drastically lowers the values of these coefficients. The reactions of $\text{C}_2\text{H}_5\text{F}^+$ and $\text{C}_2\text{H}_5\text{Cl}^+$ were also investigated at high pressures in order to elucidate certain aspects of the cationic polymerization scheme. The formation of $\text{C}_2\text{H}_5\text{Cl}^+$ and $\text{C}_2\text{H}_5\text{Br}^+$ is reported for the first time. The factors controlling the relative importance of various modes of dissociation of the vinyl halide dimer ions are discussed in terms of thermodynamic and structural considerations.

Key words: measurement education; metrology curriculum.

A discussion of the cooperative NBS-GWU metrology program.

Key words: accuracy; atomic clocks; cesium standards; hydrogen standards; hydrogen storage device; methane stabilized helium-neon lasers; noise studies; quartz crystal oscillators; quartz crystal resonators.

Since the last CIC, significant progress has been made in various laboratories leading to new capabilities and new future uses of atomic clocks. This paper summarizes the contributions of the National Bureau of Standards to these developments and tries to forecast future developments.

Two primary cesium standards, NBS-4 and NBS-5, are now in operational use with an accuracy of near $1 \times 10^{-13}$, and with a stability of better than $1 \times 10^{-14}$ (sample time of 3 hours). The concept and feasibility of a passive hydrogen storage device has been demonstrated leading to the projection of long term stabilities (hours to weeks) of at least $1 \times 10^{-14}$ for these devices. Studies of different electronic systems as well as wall and magnetic field effects promise significant improvements in the accuracy of hydrogen standards. Methane stabilized helium-neon lasers were operated and demonstrated excellent frequency stabilities, and research on a methane beam system is in progress. Novel noise studies of quartz crystal resonators confirmed that quartz crystal oscillators with short-term stabilities of parts in $10^{-9}$ (1 millisecond) are possible, an important fact in its own right and of significance to the development of atomic clocks of extreme short-term stability.

Key words: attenuation coefficient; compilation; Compton scattering; cross section; crystallography; photoelectric absorption; photons; Rayleigh scattering; x rays.

Tables of total cross sections (in barns/atom) for photon interaction with atoms, representing sums over the photoelectric effect, coherent (Rayleigh) scattering, and incoherent (Compton) scattering cross sections are presented for 87 elements from Z = 1 to 94 at the 24 wavelengths from 0.4970 to 2.7496 angstroms (24.942 to 4.509 keV) which are of most use in x-ray crystallography. Corresponding tables of mass attenuation coefficients (in cm$^2$/g) are also given. These tables are an interpolation from a more extensive compilation (UCRL-50174 (1969) by McMaster et al) and the input data and procedures for constructing the latter compilation are described.

Key words: band assignments; carbon monoxide; electronic spectrum; emission spectrum; high resolution spectrum; vacuum ultraviolet region.

New spectrograms of CO below 1200 Å reveal that emission bands terminating on the high energy $E_0$ $^3\Pi$ and $^1\Pi$ states plus most of the previously reported unidentified emission bands of CO actually originate from molecular nitrogen. Four new emis-
sion band systems in CO, tentatively identified as $\Pi^0 - \Xi^0\Sigma^+$, $\Pi^0 - \Xi^0\Sigma^+$, $\Pi^0 - \Xi^0\Sigma^+$, and $\Sigma^+ - \Xi^0\Sigma^+$, have been observed. The corresponding $T_{\text{on}}$'s are 98917, 102804, 99963, and 105724 cm$^{-1}$, respectively.

Key words: atoms; electron excitation; excitation transfer; gaseous electronics; lasers; molecules.

Applications of the results of research in the physics of gaseous electronics to recent laser technology are illustrated. Excitation transfer, charge exchange, metastable atom production and destruction are dominant processes in the HeNe laser and the metal ion lasers. Rather extensive data on cross sections for elastic and inelastic scattering, attachment and ionization in gases such as $\text{N}_2$ and $\text{CO}_2$ make possible fairly accurate predictions of the gain, efficiency, etc., of $\text{CO}_2$-$\text{N}_2$-He lasers. The new class of ground state dissociation lasers is discussed in terms of a proposed laser utilizing stimulated emission between the bound excited state and the dissociating ground state of the $\text{LiXe}$ molecule.

Key words: configurational; glass; glass transition: hole theory; polymer; poly(vinyl acetate); PVT; thermodynamic; liquid.

Recent experimental PVT data on poly(vinyl acetate) are analyzed using the hole theory of Simha-Somecky. The data were obtained at temperatures from $-30$ to $100^\circ\text{C}$ and pressures up to 800 bars. These ranges encompass the glass transition and include large portions of the liquid and glassy regions. Three different thermodynamic histories of glass formation, all isobaric cooling at $5^\circ\text{C/hr}$, were applied. With the variable formation history the glass was formed by isobaric cooling runs at different pressures. In the two constant formation histories each of the glasses was formed by a different formation pressure, namely atmospheric and 800 bars, with subsequent temperature and pressure changes in the glass in each case. In the equilibrium state good agreement between the theoretical and experimental PVT surfaces results, in accord with earlier observations on amorphous systems. As for the transitions the theory gives the correct values of $dT/dP$ using the assumption that the hole fraction $h$ be constant along either of the two constant formation transition lines. Similarly, the generalization of the Ehrenfest type relation involving the single ordering parameter $h$ results in good numerical agreement with the experimental values of $dT/dP$ for the variable formation transition line. As previously demonstrated, $H$ does not freeze at temperatures below the glass transition, thus a constant $h$ does not describe the structure of the glass. Parameters which describe the extent of freezing are evaluated. The fact that these parameters are independent of formation pressure would be consistent with the existence of a single entropy surface with formation pressure, as suggested by other experimental evidence.

Key words: charge density; Coulomb energy; Coulomb excitation; electron scattering; form factors; sum rules; transition charge.

The integral properties of elastic and inelastic Coulomb form factors are examined. Relations are given for the nuclear Coulomb energy, central charge density, transition charge, radial moments, and squared density integral.

Key words: categorical data; contingency tables; loglinear model; minimum discrimination information; statistical analysis.

This is an expository paper on the statistical analysis of categorical data arranged in the form of contingency tables. Beginning with a 2×2 table, the estimation and testing of parameters in the loglinear model is illustrated and compared to that for the linear model in the continuous case. This is followed by detailed analysis of two examples: one for a three-way table on biomedical data, and one for a four-way table on social survey data.

Key words: constrained refinement; hindered rotation; hydrogen bonds; hydroxylammonium; neutron diffraction; perchlorates; thermal motion; torsional oscillation.

The structure of the phase of hydroxylammonium perchlorate, NH$_2$OHClO$_4$, which is stable at 25°C has been refined from 3-dimensional neutron diffractometer data. The structure has space group $P2_1cn$, cell dimensions $a = 7.52\ (2)\ \text{Å},\ b = 7.14\ (1)\ \text{Å},\ c = 15.99\ (2)\ \text{Å}$, and 8 formula units per unit cell. There are very large thermal motions of the hydrogen atoms, and the environment of the two crystallographically different NH$_2$OH$^+$ ions suggests hindered rotation of each NH$_2$ group around the axis defined by the N-O bond. Therefore the structure was refined using a model in which the perchlorate groups and the hydroxyl hydrogens were given conventional anisotropic temperature factors, but the ONH$_3$ groups were treated as rigid bodies, each with an isotropic translation, and isotropic libration of the group as a whole, and a torsional oscillation of the NH$_3$ group. The final weighted $R$ for 684 observed reflections was 0.051. There are 12 hydrogen bonds between the NH$_2$OH$^+$ ions and the ClO$_4^-$ ions, and one hydrogen bond between NH$_2$OH$^+$ ions. The apparent r.m.s. amplitude of torsional oscillation of the NH$_2$-O groups about the N-O vector, as derived from the structural refinement, is $25^\circ$, and is therefore consistent with frequent reorientation of the NH$_3$ parts of the NH$_2$OH$^+$ ions. Other apparent r.m.s. amplitudes in the structure are only slightly higher than normal values. The NH$_2$OH$^+$ ions are in staggered conformations and the ClO$_4^-$ ions are essentially regular tetrahedra.

Key words: crystal; ferri surface; interstitial hydrogen; lattice dynamics; palladium hydride; phonons.

The [110] transverse branch of the phonon dispersion relation in a single crystal of PdH$_{0.05}$ has been measured and compared to the results for pure Pd. A limited amount of data has been taken for other branches, and the mean frequency ratio (PdH$_{0.05}$/Pd) observed for all measurements is 0.995. No change was observed in the shape or strength of the anomaly in the [110] T branch.

Key words: barriers to planarity; cyclobutane; cyclobutane-
$d_s$; isotope effect; kinetic energy terms; potential functions.

The infrared and Raman data on the ring-puckering vibration in
cyclobutane and cyclobutane-$d_s$ have been reexamined including
the coordinate dependence of the reduced mass in the Hamil-
tonian. This was done for the purpose of estimating the im-
portance of these small terms in the determination of barrier
heights for four-membered rings and also on the determination of
the dihedral angle corresponding to the potential minimum.

The conclusions reached are that there is an isotopic depen-
dence of the barriers to planarity in cyclobutane and
cyclobutane-$d_s$ yielding a difference of $\sim 14$ cm$^{-1}$, but the
precise value of the difference in barrier heights is ill determined.
The higher-order kinetic energy terms in the Hamiltonian can ac-
count for a spread of $\sim 3$ cm$^{-1}$ in each of the barriers derived
for cyclobutane and cyclobutane-$d_s$, depending on the details of the
model used for the vibration, but not a difference of $14$ cm$^{-1}$,
which undoubtedly indicates the effects of coupling with other
vibrational modes. It is also found that the derived values of the
dihedral angles are quite sensitive to the details of the vibrational
model, in fact, much more so than to the uncertainties in the
bond distances and bond angles. A relationship between the
potential constants derived for cyclobutane and cyclobutane-$d_s$
assuming an effective constant reduced mass and those derived
for a semirigid model is demonstrated.

14856. Filliben, J. J., The probability plot correlation coefficient
test for normality, Technometrics 17, No. 1, 111-117 (Feb.
1975).

Key words: correlation coefficient; medians; normal dis-
tribution; order statistics; probability plot; statistical
methods; statistics; tests of distributional hypotheses.

This paper introduces the normal probability plot correlation
coefficient as a test statistic in complete samples for the com-
posite hypothesis of normality. The proposed test statistic is con-
tceptually simple, is computationally convenient, and is readily
extendible to testing non-normal distributional hypotheses.
An empirical power study shows that the normal probability plot
correlation coefficient compares favorably with 7 other normal
test statistics. Percent points are tabulated for $n = 3(150(5)100$.

No. 2, 625-629 (Feb. 1975).

Key words: high sensitivity; intracavity absorption; laser;
quantitative analysis.

The characteristic of a laser with an intracavity absorption
cell have been calculated for the case in which the gain atoms are
homogeneously broadened and the absorber atoms are in-
homogeneously broadened. The sensitivity of the laser intensity
the density of absorbers is determined.

in Polymer Handbook, 2nd Edition, J. Brandrup and E. H. Im-
mergut, Eds., pp. V-7-V-12 (John Wiley & Sons, Inc., New

Key words: butyl rubber; constants; natural rubber;
neoprene; physical constants; polymers; properties; rub-
bers; styrene-butadiene rubbers.

Selected values from 65 published literature references are tabu-
lated for about 30 physical constants (mechanical, optical,
thermal, etc.) for natural rubber, styrene-butadiene rubber
(SBR), butyl rubber (11R), and polychloroprene rubber (CR or
neoprene). This is revision and extension of the tables published
in 1966 in the first edition of the Polymer Handbook, J. Bran-
drup and E. H. Immergut, ed.

Laser induced photochemical enrichment of chlorine isotopes,

Key words: dye laser; isotope; isotope separation;
photochemistry.

Chlorine isotopic abundances were significantly altered by
laser induced, selective excitation of particular isotopic species
of triphosphogene followed by a chemical reaction between the
electronically excited triphosphogene and diethyoxylene. The
concentration of $^{35}$Cl in triphosphogene was changed from 75 to 64
percent or 80 percent depending upon the isotopic species ini-
tially excited.

14860. Uttton, D. B., Proton spin-lattice relaxation in cerous mag-
(Jan. 15, 1975).

Key words: cerous magnesium nitrate hydrate; lattice;
proton; relaxation; spin: 65-335 K.

The proton spin-lattice relaxation in powdered CeMg$_2$(NO$_3$)$_2$·
$\cdot 24$H$_2$O has been measured in the temperature range 65-335 K.
In contrast to other paramagnetic salts it has been found that the
nuclear relaxation due to nuclear dipole-dipole interactions is
comparable in magnitude with the relaxation due to the elec-
tronic moments on the paramagnetic ions in this temperature
range. Below 160 K the relaxation times are independent of the
resonance frequency and have a temperature dependence given
by $\tau_r = 0.375 \exp(-182/7)$ sec. This is attributed to relaxation
via the Ce$^+$ ions and hence makes it possible to calculate a value
for their relaxation times. It is also concluded that the second
excited doublet of the Ce$^{3+}$ ions is at an energy of 200±18 K.
At higher temperatures two relaxation time minima are observed.
At 14 MHz the minimum values are 71 and 69 msec at 244 and
303 K, respectively. The weak temperature dependence of the
NMR second moment indicates that 180° flips of the water
molecules provide the relaxation mechanism in this temperature
range. Calculated values of $\tau_r$, using the published crystallo-
graphic data, and assuming that there are two types of water
molecule, are in reasonable agreement with experiment. The ob-
served activation energies are approximately 6.8 and 9.5
kcal/mole.

14861. West, E. D., Case, W. E., Current status of NBS low-
power laser energy measurement, (Proc. 1974 Conf. on Preci-
1-5, 1974), IEEE Trans. on Instrumentation and Measure-
ments, IM-23, No. 4, 422-425 (Institute of Electrical and Elec-

Key words: laser calorimeter; laser energy; laser power.

A set of four electrically calibrated calorimeters is currently in
use at the Boulder Laboratories of the National Bureau of Stan-
dards to calibrate and test devices for measuring average laser
power in the range from 100 $\mu$W to 1 W and energies in the range
0.03 to 10 J. Laser sources used with these calorimeters are arg-
on, krypton, helium-neon and neodymium-doped YAG, all
CW, and pulsed YAG with pulse energies about 0.1 J and pul-
sewidths of about 200 ms and 30 ns.

The calorimeters have been intercompared as a check on
systematic errors. The national standard is taken as the average
for three of the calorimeters of the current C4 design, because
these were designed to permit better measurements of the ab-
sorptance and window transmittance. Deviations from the group
average are $-0.12$, $-0.01$, and $+0.13$ percent. The earlier
standard C3-1 differs from the group average by $+0.21$ percent.

14862. Feezey, J. J., Meijer, P. H. E., Magnetic properties of
paramagnetically doped crystals Fe$^{3+}$, Nd$^{3+}$ and Ho$^{3+}$ in various
In this work we calculate the energy levels, wave functions and transition probabilities for a number of compounds whose crystal field parameters have been determined. We introduce a convergence criterion in the diagonalization of the Hamiltonian matrices dependent upon a self consistency test on the eigenvectors. This assures us of numerically accurate wave functions.

First we calculated energy level and susceptibility differences in (Nd^{3+})PbMoO_4 dependent on the multipolar constants $\theta_{\mu}$ used with the published $A_{\mu}^{m}$ to determine the crystal field parameters $B_{\mu}^{m}$. Calculated energy levels as a function of external magnetic field strength and orientation are compared with experimental results for three different sets of published crystal field parameters, $B_{\mu}^{m}$, for (Fe^{3+})TiO_2. The ground state energy levels, and wave functions, have been calculated for the non-Kramers Ho^{3+} ion in the crystals PbMoO_4, LaCl_2 and HoCl_2. Easily distinguishable variations in the temperature dependence of the $\chi_{xx}$ component of the susceptibility are found as a function of the host crystal. It is pointed out that susceptibility calculations, based upon measured crystal field parameters, in conjunction with subsequent susceptibility measurements, provide a good check on the validity of the crystal field parameters.

We propose chromospheric models of plages to explain profiles of the Ca II H, K, $\lambda 8498$, $\lambda 8542$, and $\lambda 8662$ lines described in Paper I. These models are consistent with boundary conditions imposed by the photosphere and the Lyman continuum. We find that increasing emission in these lines is consistent with a picture of increasing temperature gradient in the low chromosphere and the resulting increase in pressure and electron density at similar line optical depths. With this picture we suggest how to empirically determine the distribution of chromospheric parameters across the solar disk directly from Ca II filtergrams. We also propose that the high density aspects of solar activity are produced by steep temperature gradients in the lower chromosphere and thus by the enhanced heating mechanisms that steepen these gradients.

The hydrogen positions in Ca(H_2PO_4)_2 \cdot H_2O have been determined and the structure refined to $R_e = 0.068$ and $R = 0.055$ using 1045 neutron data. No evidence is found for any disorder of the protons. The two crystallographically distinct H_2PO_4 - ions are hydrogen bonded to each other and to the water molecule. The oxygen atom of the water coordinates to a calcium ion and a hydrogen atom from H_2PO_4 - along its lone-pair orbital directions with distances Ca...O_1 = 2.479 Å and H...O_2 = 1.679 Å. One of the hydrogen atoms of the water molecule is 2.106 and 2.315 Å from two oxygen atoms, with O_2-H...O angles of 110.9 and 147.5°. The distances and angles indicate that only the stronger of these two interactions is structurally significant. The other hydrogen atom of the water molecule is involved in a hydrogen bond with H...O = 1.823 Å and the angle O-H...O = 160.4°.

Key words: cross sections; D_2^+: dissociative recombination; product D^*(n=4).

Crosed beams of electrons and D_2^+ ions were used to measure absolute cross sections for the dissociative recombination process, $e + D_2^+ (X \Sigma_g^+) \rightarrow D + D^*(n=4)$ over a range of electron energies extending from 0.6 to 7 eV. The process was monitored by detecting a known portion of the 485.9-nm emission resulting from radiative decay of the product D^*(n=4) atoms. The cross sections, which correspond to a known vibrational-state distribution of the target ions, exhibit the same dependence on electron energy as recent measurements of the total dissociative recombination cross section reported by Pearlt and Dolder, and have a magnitude of about 10 percent of the total cross section, suggesting that the product D atoms are formed in excited states with a variety of principal quantum numbers. Systematic measurement uncertainties at high confidence are about 14 percent, and random uncertainties are at the 25 percent (standard deviation) level. The calculation of cross sections from the observed light intensities depends on the mean lifetimes and branch ratios for 485.9-nm emission, whose evaluation in turn requires assumptions concerning the recombination process. The situation is complicated by the presence of an electron-beam-confining magnetic field in the collision volume, which causes the incident ions and product atoms to experience a transverse motional electric field. A time-independent perturbation calculation of the weak-field Stark and Zeeman effects was performed and mean lifetimes and branch ratios were estimated under different assumptions concerning the recombination process. Assuming that all perturbed product $n=4$ states are equally populated by dissociative recombination yields an experimental cross section of $1 \times 10^{-18}$ cm^2 at 0.7 eV, decreasing to $3.3 \times 10^{-17}$ cm^2 at 3 eV, and to $1 \times 10^{-16}$ cm^2 at 7 eV. Assuming that only the perturbed 4s states are initially populated, results in cross sections larger by some 50 percent.

Key words: accuracy; acoustics; noise; precision; repeatability; reproducibility.

This is an invited editorial pointing out the need for uncertainty estimates in papers published in the noise field.

Key words: microwave spectra; predicted spectra; radio astronomy; silicon molecules; structures; unidentified molecular lines.

Several small silicon molecules are considered as possible sources for the unidentified molecular lines: U81.5, U86.2, U89.2, and U90.7. The best spectroscopic and structural data available have been utilized to predict the lowest rotational transitions for SiO+, SiN, SiC, HSIN, and for vibrationally excited SiO. Transitions from each of these molecules are predicted to occur close to one or more of these unidentified molecular lines. Rotational transitions which could aid the confirmation of each of the suggested assignments are also presented. In all cases, an effort has been made to estimate the uncertainties for the predicted transitions.

Key words: cryogenic; energy; fuel; hydrogen.

Our impending fossil fuel shortage is a clear challenge to the cryogenics industry and government to provide efficient and economical means of satisfying specific national fuel requirements. Large scale production of liquid hydrogen was stimulated by the U.S. space exploration program. Now, civilian demands for synthetic fuels beckon cryogenic hydrogen.

National and world energy shortages are briefly summarized to demonstrate the relevance of synthetic fuels in satisfying future energy markets. A perspective of national energy needs, as they relate to cryogenic hydrogen fuel, is given. Hydrogen and alternate synthetic fuels are briefly reviewed and potential applications for cryogenic hydrogen are described. Technical research and development efforts, required to satisfy specific current and future national needs, are identified. The mechanism for implementation of synthetic fuels and the indistinct timetable for transition to these fuels are discussed.

Key words: boiling heat transfer; convective heat transfer; heat transfer; liquid hydrogen; slush hydrogen.

Heat transfer to slush hydrogen was measured at one atmosphere and at triple-point pressure. The data were compared with those for heat transfer to liquid hydrogen, and to classical heat transfer correlations for nucleate boiling. The slush data fit convective heat transfer correlations quite well. In general, the data show that for a given heat flux, the temperature difference between the wall and the bulk liquid is not as highly influenced by pressure as predicted by the correlation for nucleate boiling.

Key words: binary mixture; excess Gibbs energy; experimental phase equilibrium data; heat of mixing; liquid-vapor equilibrium; nitrogen-methane system.

A study was undertaken to obtain liquid-vapor equilibrium data for the nitrogen-methane system at uniform temperature increments between the triple point of methane and the critical point of nitrogen. The measured liquid and vapor phase equilibrium compositions and the derived excess Gibbs energy values for six isotherms from 95 to 120 K are compared with the corresponding values taken from other investigations. The excess Gibbs energy for the equilibrium mixture exhibits a zero to slightly positive temperature dependence, in qualitative agreement with calculations based on the Snider-Herrington hard sphere model. This temperature dependence of the excess Gibbs energy also suggests that the excess enthalpy (heat of mixing) must be equal to or slightly less than the excess Gibbs energy.

Key words: bulk modulus; compressibility; elastic constants; elasticity Lamé constant; Poisson ratio polycrystals; shear modulus; single crystals; Young’s modulus.

The equivalence of the methods of Laurent and Eudier and of Voigt for averaging cubic single-crystal elastic coefficients to obtain polycrystal elastic constants is proven and discussed. Other ways to obtain Voigt’s equations are enumerated.

Key words: cryogenics; electricity; energy; helium; power; superconductivity.

The electrical industry is faced with a need for dramatically larger generators to optimize the utilization of large new power sources, such as gigawatt-sized fast breeder reactors. Earlier increases in generator capacity have been achieved by improving the cooling of the heat-producing components of the generator. For the first time in the evolution of power generators, a unique technology, superconductivity, is available to the electric machine designer. Superconductivity may offer a way of achieving higher capacities while maintaining present costs, weights, and overall dimensions.

In the Fall of 1971, the Cryogenics Division of the NBS began a program in cooperation with industry to accelerate the application of superconductivity to large scale generators. The program stopped short of actual experimental construction since sufficient funds did not become available, but did endure sufficiently to demonstrate outstanding industry-government cooperation in this area of national need. This paper presents the results of several government-industry studies conducted in the course of this program in order to show such potential benefits from the use of cryogenics as improved generator rating, efficiency, reliability, transportation and site erection, cost and power system stability.

Key words: acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning.

This initial report presents an inventory or “catalog” of peak A-weighted sound levels measured during an extensive parametric study conducted to characterize the noise generated by typical rib, cross-bar and retread type truck tires. A test sample of nine tread designs, estimated to represent 70-80 percent (these exact designs) of the truck tire population on the road today, was investigated considering the following variables: wear, loading, speed, pavement surface, and tire location. Test vehicles included both single-chassis vehicles and a tractor-trailer.

The results show that the A-weighted sound level increased with either an increase in load or speed. The “pocket retread” design always produced the highest level followed by the crossbar tires and then the rib tires. This ranking held for both new and half-worn tires. The influence of wear and pavement surface is more complex. For all of the tread designs except one there was an increase in noise level between the new and half-worn states. The results for different pavement surfaces are much the same as with wear in that the generated noise appears to depend on both the specific tread design and the surface roughness. Individual tires do contribute differently to the overall level depending on their location on the vehicle. In some cases, significant reductions in the noise level were observed when "noisy"
tires were mounted inboard of "quieter" tires.

The report includes a discussion of the measurement and analysis techniques utilized for the establishment of this data base.

Key words: acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning.

This report is the second in a series of reports to be published as a result of Department of Transportation sponsored truck tire research conducted by the National Bureau of Standards. In conjunction with the first report (OST-ONA-71-9) which contains details of the test design, test procedures, and all data acquired during the first period of testing, this report presents an inventory of peak A-weighted sound levels generated by typical rib, cross-bar and retread type truck tires. A test sample of nine tread designs, estimated to represent 70-80 percent (based on discussions with fleetowners) of the truck tire population on the road today, was investigated considering the following variables: wear, loading, speed, pavement surface, and tire location. Test vehicles included both single-chassis vehicles and tractor-trailers.

The results show that the A-weighted sound level increased with either an increase in load or speed. The "pocket retread" design always produced the highest level followed by the cross-bar tires and then the rib tires. This ranking held for tires in all states of wear. The influence of wear and pavement surface, however, is more complex. In general there was an increase in noise level between the new and half-worn states and a slight decrease between the half-worn and fully-worn states. The influence of pavement surface on the generated noise depends on the specific trend design, tire wear condition and the surface roughness. Tires do contribute differently to the overall noise level depending on their location on the vehicle. The data for tractor-trailer tests, for instance, would strongly indicate that the major contribution is made by the tires mounted on the drive axles of the tractor and that the relative contribution of tires mounted on either the front or rear trailer axles depends on the specific tire type and speed of the vehicle.

Future reports will broaden the data to include one-third octave band spectral data, directability data in the form of equal sound level contours and other refined analysis of the data reported herein and in OST-ONA-71-9.

Key words: acoustics; military vehicles; noise; sound; tire noise; truck tires.

This report presents the A-weighted sound level and one-third octave band spectral data resulting from a study conducted to characterize the noise generated by military truck tires. The study was conducted by the National Bureau of Standards in cooperation with the U.S. Department of Transportation under the sponsorship of the U.S. Army Tank-Automotive Command. The data base established will allow for comparison of the tire noise generated by military and commercial truck tires.

The study investigated the influence of load and speed on the noise generated by tires with four different tread designs: the standard Army tire, a retread of Army design and commercial tires with rib and cross-bar type tread patterns. Army and commercial trucks were utilized as test vehicles.

In addition, the report includes a discussion of the measurement and analysis techniques utilized for the establishment of this data base.

Key words: applications (optical, magnetic); electronic properties; oxides.

A short overview of the optical, magnetic, electrical and surface properties of oxides is presented. Some of the major applications (electronic, electro-optical, magnetic devices, high temperature components, catalysts, etc.) are listed and the relevant physical parameters are being discussed.

Key words: audio-frequency; bridge; four-terminal resistance; high current; operational amplifier; phase angle; resistance; transformer-ratio-arm.

The design and performance of an audio-frequency four-terminal resistance bridge is described which compares resistors from 1 to 0.001 Ω over a frequency range of 50 Hz-10 kHz.

Current scaling establishes equal voltage across the resistors, permitting the standard to have the larger value and most optimum design while dissipating less power than the unknown. An amplifier-aided two-stage current transformer forms the ratio arms. Ratios of 1, 2, 4, 5, 10, and 20 are available, and a maximum applied current of 200 A is accommodated. Bridge ratio errors are less than 2 × 10^-6 in both magnitude and phase at frequencies up to 1 kHz, increasing to 2 × 10^-5 at 10 kHz.

Simple transformer scaling techniques are described for producing accurate and stable resistance standards at the 0.001-Ω level.

Key words: analog-to-digital conversion; digital; electricity; electric power; measurement; sampling; wattmeter.

Average electric power can be measured by a system that samples voltages and currents at predetermined intervals. The sampled signals are digitized and the result is computed by numerical integration. The response of the system agrees with that of a standard electrodynamic wattmeter within 0.02 percent from dc to 1 kHz, with the possible exception of zero power factor measurements. Measurements up to 5 kHz can be made with somewhat greater uncertainties.

Key words: cavitation; cavity pressure; steam; steam vapor pressure; thermodynamic effects; vapor pressure.

A method for predicting thermodynamic effects of cavitation (changes in cavity pressure relative to steam vapor pressure) is presented. The prediction method accounts for changes in liquid, liquid temperature, flow velocity, and body scale. Both theoretical and experimental studies used in formulating the method are discussed. The prediction method provided good agreement
between predicted and experimental results for geometrically
scaled venturis handling four different liquids of widely diverse
physical properties. Use of the method requires geometric
similarity of the body and cavitated region and a known
reference cavity-pressure depression at one operating condition.

14880. Brauer, G. M., Termini, D. J., Grafting of polymeric side
chains to soft tissues, J. Biomed. Mater. Res. 8, 451-470
(1974).

Key words: ceric ion initiated grafting; chemical attachment
to ratskin; grafting to tissues; persulfate initiated grafting;
surface grafting; tissue modification.

Soft tissues such as calfskin or ratskin can be modified by
acrylic, methacrylic or vinyl monomers containing a variety of
functional groups using ceric ions, persulfate-bisulfite or
comonomers forming donor-acceptor complexes as initiators.
Reactions take place within 20 minutes to 3 hours under experi-
mental conditions which, with suitable changes, might be
tolerated clinically. The resulting products are insoluble in sol-
vents for the respective homopolymers. It is likely that the
polymeric side chain is attached chemically to the collagenous
backbone. With ratskin, the grafting takes place mainly at the
surface, resulting in a change in wettability and water sorption
of the substrate. Modified hydrophilic, hydrophobic or even oil
repellent surfaces can be prepared by judicious choice of
monomer used. Thus, hydrophobic, oleophobic subdermal rats-
skin surfaces are obtained on reaction with fluorinated monomers.
Treated ratskins appear more resistant to micro-
organisms than the original substrate. It is conceivable that the
polymeric side chains could act as adhesive liners since the
modified surface may improve the ability of the substrate to ad-
here to restorative materials.

14881. Lentner, K. J., A current comparator system to establish
the unit of electrical energy at 60 Hz, IEEE Trans. Instrum.

Key words: calibration; current comparator; electrical energy
unit; metrology; standard; unit; watthour meter calibration;
watthour meter.

A compensated current comparator system to establish the
United States legal unit of electrical energy at the National Bu-
reau of Standards at energy levels of approximately 30 and 60 kJ
is described. Analysis of the system uncertainties and experi-
mental data indicates that the registrations of three standard type
watthour meters were determined with total estimated uncertain-
ties of about 30 ppm at unity power factor (PF) and 40 ppm at
0.5 PF. Of these uncertainties, 18 ppm represents the three stan-
dard deviation bound for the effects of random errors, and the
remainder the root sum of squares of bounds to possible calibra-
tion and systematic effects. These results indicate that it should
now be possible to disseminate the energy unit with uncertainties
less than the presently quoted 500 ppm.

14882. Ambrose, J. R., Kruger, J., Tribo-ellipsometric studies of
the relationship between repassivation kinetics and stress corro-
sion of low carbon steel, (Proc. 5th Int. Congress on Metallic
Corrosion, Tokyo, Japan, May 21-27, 1972), Paper in 5th In-
ternational Congress on Metallic Corrosion, pp. 406-409 (Na-
tional Association of Corrosion Engineers, Houston, Texas,
1974).

Key words: chloride; ellipsometry; low carbon steel;
nitrate; nitrite; repassivation; stress corrosion.

Since the susceptibility of a material to stress corrosion
 cracking (SCC) may be related to the rupture of a protective film
and the repassivation rate of the material thus exposed, a
 technique, tribo-ellipsometry, has been developed which simu-
lates film rupture by abrading off the surface oxide. During the
subsequent repassivation of this exposed surface, tribo-ellips-
ometry allows simultaneous determination of film growth
kinetics by ellipsometry and current transient following removal
of a protective film. From these measurements a repassivation
rate $R_{c}$ (total change/film thickness) can be determined. Using
$R_{c}$, the following results were found: 1) SCC susceptible system
(1N NaNO$_2$ at 90 °C) - partial passivation, high rate of metal
dissolution; 2) SCC nonsusceptible system -(1N NaNO$_2$ at 25
°C) - rapid and effective passivation low metal dissolution rate;
and 3) SCC nonsusceptible but highly corrosive system (1N
NaCl) - no passivation, high metal dissolution rate.

14883. Kasa, I., Closed-form mathematical solutions to some net-
work analyzer calibration equations, (Proc. 1974 Conf. on
Precision Electromagnetic Measurements, London, England,
July 1-5, 1974), IEEE Trans. Instrum. Meas. IM-23, No. 4,
399-402 (Dec. 1974).

Key words: calibration; sliding termination; standards.

A general evaluation procedure is described for calibration of
a linear complex reflectometer (network analyzer and for two-
port measurements. New closed-form formulas and procedures
are given for two practical cases: 1) calibration or measurement
with two known standards and a sliding termination; 2) calibra-
tion or measurement by one standard and two different
sliding terminations.

The reflection coefficient magnitudes and phases of these slid-
ing terminations need not be known.

The closed-form formulas make it possible to determine
 calibration constants by direct calculation without approxima-
tions or complicated multivariable iterations.

14884. Lias, S. G., Ion-molecule reactions in radiation chemistry,
(Proc. NATO Advanced Study Institute Conf. on Ion-
Molecule Interactions, Biarritz, France, June 24-July 6, 1974),
Paper in Interactions Between Ions and Molecules, P.

Key words: ion-molecule reaction; ion structure; ionic frag-
mentation; radiation chemistry; rate constants.

This brief review presents several illustrations of how ion-
molecule reactions are studied in radiation chemical experiments
and also of the kinds of information about ion-molecule reactions,
and other ionic phenomena (such as fragmentation and isome-
rization) which have been obtained from such experiments. Ab-
solute rate coefficient determinations through spectroscopic
measurements in the gas and liquid phase radiolysis, as well as
absolute and relative rate coefficient determinations based on
chemical analysis of reaction products are described. Illustra-
tions from radiation chemical investigations which have given
unique information about mechanistic details of certain ion-
molecule reactions in hydrocarbon systems are also presented.
A historical review and general description of the conditions
prevailing in radiation chemistry experiments are also included.

14885. Zobrist, D. W., Fassbender, P., Bearden, F. E., Costrell,
L., Software standards and CAMAC, Instrum. Technol. 22,

Key words: CAMAC: computer systems; control systems;
industrial control; software; standards.

One month prior to a meeting of the International Purdue
Workshop on Industrial Computer Systems, the idea was con-
ceived to demonstrate software transportability, using ANSI
X3.9-1966 Standard FORTRAN and ISA-S61.1 external
procedures for process control, and the demonstration was to
point out the need and potential of standards in other areas. Two
complete computer systems, including peripherals and CAMAC
interfaces, and process instrumentation, were borrowed from a
dozen scattered sources. The systems were hooked up and
running in about two days. This article describes the demonstra-
tion project, the many obstacles encountered, and lessons
learned.

14886. Wachtman, J. B., Jr., Highlights of progress in the science
12, 509-519 (Dec. 12, 1974).

Key words: ceramics; fracture; fracture mechanics; glass;
impact damage; strength; thermal shock; time to failure.

Rapid, catastrophic propagation of cracks is described in
terms of stress concentration and energy balance conditions
from a fracture-mechanics viewpoint. Slow crack propagation by
stress corrosion or other mechanisms is also presented in frac-
ture-mechanics terms. Data on slow crack propagation and ac-
companying acoustic emission in a variety of ceramics and
glasses are reviewed. A survey is presented of the application
of these results to the quantitative treatment of strength, de-
pendence of strength on loading rate, time to failure, proof test-
ing, acoustic emission monitoring, thermal shock, impact damage,
and erosive machining. Some limitations in the application of
fracture mechanics to ceramics are discussed.

14887. Klein, R., Yates, J. T., Jr., Nitric oxide and its decomposi-
tion on the (110) plane of tungsten, (Proc. 2nd Int. Conf. on

Key words: decomposition; nitric oxide; tungsten.

Nitric oxide is adsorbed on the (110) plane of tungsten with a
high sticking coefficient independent of coverage. Programmed
thermal desorption of a W(110) surface with adsorbed NO
shows no desorbed NO, but only nitrogen. Two peaks are ob-
erved in the resulting nitrogen desorption spectra. The first, ap-
pearing at low coverages of NO, shifts to lower temperatures
with increasing initial coverage. The second appears at higher
coverages and shifts slightly to higher temperatures with increas-
ing coverage. The temperature region covering both states is
900-1350 K for the temperature rates employed. A simple, con-
sistent model is developed. Work function-relative coverage
measurements for NO on W(110) show an initial slow ∆φ in-
crease, a linear portion, and a maximum. The maximum ∆φ is
0.85 eV and the saturated coverage value is 0.72 eV.

14888. Raiss, T. C., Atomic absorption spectrometry—general
considerations for the application of experimental techniques,
(1974).

Key words: accuracy; atomic spectroscopy; atomic vapor;
chemical analysis; evaluation; interferences; light sources;
precision.

In applying atomic absorption spectrometry to an analytical
problem, the analyst must have an understanding of the basic in-
strumental components. The essential components of an atomic
absorption instrument consist of a primary source of radiation,
a means of producing atomic vapor from the analyte, wavelength
selection, signal detection, and readout. While several types of
radiation sources are available, hollow cathode lamps are the
primary choice for most workers in the field.

The production of atomic vapor of the analyte is probably the
most important parameter in atomic absorption spectrometry.
The selection of the oxidant-fuel or nonflame method of produc-
ing neutral atoms will depend upon the concentration of analyte
and the matrices. While the analyst has a wide choice of methods

at his disposal, an understanding of the problems related to the
production of atomic vapor is essential to obtain the maximum
precision and accuracy. Also, interferences, sample preparation,
and methods for evaluation of data are discussed.

14889. Weissman, I. D., Bennett, L. H., McAlister, A. J., Watson,
R. E., LaNi5-εPt2ε; NMR investigation of structural and elec-

Key words: alloys; contact term; core polarization, exch-
change enhancement; Knight shifts; LaNi5; LaNi5-εPt2ε;
LaPt; NMR; ordering; relaxation times; solid solutions.

Pt-site Knight shifts k, relaxation times, and crystallographic
data have been obtained for the LaNi5-εPt2ε (0 ≤ ε ≤ 5) system.
There are two transition-metal sites: one, A, in a La layer and
one, B, between La layers; different k’s are observed for each
site. The system is found to be completely miscible and NMR in-
tensities and crystallographic results show that Pt prefers the B
site and that considerable ordering occurs for ε ≤ 4. The 199Pt k’s
are -1 percent and ~ 0 percent for the A and B sites, respective-
ly, in LaPt; the A-site k is approximately 0 at LaNi5Pt and the
B-site k reaches ~ 2 percent in LaNi5-εPt2ε. The shifts, taken
together with relaxation times, indicate that α-band effects
dominate, particularly for the A-site, in LaPt, and that the Pt
atoms on both sites become more transition-metal-like with in-
creasing ε. Exchange enhancement is shown to be an essential
factor at the Ni-rich end. Variations in chemical activity, as in
hydride formation, are discussed in light of these electronic dif-
fferences between LaNi5 and LaPt.

14890. Collin, G. J., Réactions des ions iso-C4H8^+ et t-C4H8^+ avec
12, 2341-2347 (1974).

Key words: free radical reactions; G-values; ion-molecule
reactions; neopentane; proton transfer; radiolysis.

The radiolysis of neopentane has been studied in gas and liquid
phases. It was shown that, in the liquid phase, the iso-C4H8^+ ion
reacts at least as quickly with isobutene as with methylcyclopen-
tane. The t-C4H8^+ ion reacts at least 10 times more rapidly with
isobutene and the main reaction is one of resonant transfer of a
proton with isobutene: fewer than 5 percent of the t-C4H8^+ ions
add to isobutene. In the gas phase, the condensation reaction is
more important than that of resonant proton transfer since
proton transfer represents only 30 percent of the total reaction:

\[ k(\text{addition})/k(\text{transfer}) = 2.35 \pm 0.15 \].

Finally, the resonant transfer of a deuterium occurs about 2.9 more slowly than proton
transfer.

14891. DePrima, C. R., Johnson, C. R., The range of A^+1A^+ in
GL(n, C), Linear Algebra and Its Applications 9, 209-222
(1974).

Key words: adjoint; Hilbert’s Theorem 90; involution; nor-
mal; similar; spectrum; unitary.

Let A be an invertible linear operator on a finite dimensional
complex Hilbert space. We carry out a detailed study of the map
\[ A \rightarrow A^+1 A^+ = \Phi (A) \]. It is shown that the range of \( \Phi \) is exactly the
set of all invertible operators T for which \( T^+ \) is similar to \( T^* \). In
particular, unitaries and similarities of unitaries are in the range
of \( \Phi \) and we prove, among other things, the equivalence of the
assertions: (i) \( T \) is similar to a unitary, (ii) every \( A \in \Phi^{-1}(T) \) is
congruent to a normal operator, (iii) there exists \( B \in \Phi^{-1}(T) \) whose field of values omits the origin of the complex plane. For
general \( T \) in the range of \( \Phi \), we determine all \( A \in \Phi^{-1}(T) \) in
terms of the self-adjoint invertible operators fixed by the map \( X \rightarrow T^* XT \). Many of the results contained in this paper have
known analogues for operators which are similar to their ad-
joint.

Key words: astronomy; cartography; geophysics; laser; lunar distance; moon; selenody.

Laser ranges from the McDonald Observatory to the three Apollo retroreflectors have been used to obtain simultaneous solutions to the selenocentric coordinates of the three arrays, using two different approaches. The original coordinates, which were obtained either from LEM orbit determination or from orbital triangulation, suffered adjustments that were compatible with their a priori uncertainties, which ranged up to about a kilometer. It was decided also to correct the lunar moments of inertia. The corrections thus far obtained are not definitive, since the differential residuals are still of significant size. Nonetheless, order of magnitude reductions in the differential residuals have been secured.

Key words: rubidium; spectra; ultraviolet; wavelengths.

The spectrum of Rb II has been observed in a pulsed radiofrequency discharge with the NBS 10.7-m normal-incidence vacuum spectrograph, the NBS 10.7-m Eagle spectrograph in air, and the NBS 3.34-m plane-grating spectrograph in air. The observations cover the regions 1489-2661 Å and 4380-10 081 Å. The wavelengths of the strong resonance lines in the 550-741 Å region were accurately measured in the 3rd and 4th orders with a sliding-spar discharge. Analysis of the spectrum has provided the positions of the previously missing levels of the $4p^4 4d, 4f$, and $6d$ configurations. The energy-level system has been extended to include the complete $4p^4 5f, 5g, 6f$, and $6g$ configurations, most of the levels of the $4p^4 6p, 7f, 7g, 8s$, and $9s$ configurations, and parts of the levels of the $4p^4 7d, 8d, 8f, 8g, 9d$, and $9f$ configurations. 600 lines are classified as transitions between 165 levels. Most of the observed configurations have been theoretically interpreted. The energy parameters determined from least-squares fits to the observed levels are compared with Hartree-Fock calculations. The ionization energy, derived from the $4p^3 n_f 3/2 [9/2], n = 4 - 7$ and $4p^3 n_g 3/2 [11/2], n = 5 - 8$, series, is 220 105.0 ± 0.5 cm$^{-1}$ (27 289 ± 0.001 eV).

Key words: spectra; tantalum.

The spectrum of Ta V produced with a sliding-spar discharge was photographed in the region of ~200-2000 Å utilizing grazing-incidence and normal-incidence spectrographs. A system of seventy excited energy levels was deduced from 228 spectral lines. These arise from excitations out of both the $4f$ and $5p$ closed shells of the $4f^{14} 5s^2 5p^6$ ground configuration, giving the observed configurations $4f^{13} nl$ with $n = 5d, 6s, 6p, 6d, 7s$ and $5p^3 nl$ with $n = 5d, 6s, 6p$. Radial integrals were fitted for all of these configurations. A value of 785 130 ± 400 cm$^{-1}$ for the ionization energy was derived. A graph of lowest excited levels of $4f^{13} 5d$ and $5p^3 5d$ from Lu IV to Re VIII predicts the crossing of these configurations after W VII.

Key words: compressibility; single crystal; x-ray diffraction.

The beryllium diamond-anvil pressure cell described by Weir, Piermarini and Block has been mounted on a Bond diffractometer equipped with an orients of the fixed-x type. Molybdenum radiation is used to penetrate the diamonds and beryllium of which the cell is constructed, and special techniques are required to retain adequate precision in measuring cell parameters using diffraction angles in the low 2θ range. The method described provides high sensitivity in determining peak positions and eliminates the effect of centering errors on measured values of 2θ. Under favorable conditions, diffraction angles are measured with an accuracy of ±0.001° in 2θ. The method has been tested by measuring the lattice parameter of vacuum float zone refined silicon. Measurements of the compressibilities of silicon and of α-Be (N, 3) (orthorhombic) have been carried out using the method of Barnett, Block, and Piermarini to determine pressure by measuring the shift in the R-line fluorescence spectrum of ruby.

Key words: alcohols; alkyl halides; chemical ionization; ion-molecule reactions; mass spectrometry; mercaptans.

Mixtures of isobutane with small amounts (0.01-1%) of added $t$-C$_6$H$_4$Cl, $t$-C$_6$H$_4$Br, $t$-C$_6$H$_4$OH, and $t$-C$_6$H$_4$SH have been studied in a high-pressure mass spectrometer as a function of total pressure, temperature, and concentration of additive. It is seen that proton transfer occurs only to $t$-C$_6$H$_4$SH, and even in this case, proton transfer is a minor process. The major reaction observed with each of the four molecules is the formation of a condensation ion which dissociates rapidly to give (C$_6$H$_5$O$^+$ + HX) or (C$_6$H$_5$O$^+$ + neutral products) where X is Cl, Br, OH, or SH. The formation of C$_6$H$_5$O$^+$ is favored under all conditions, but the formation of C$_6$H$_5$O$^+$ becomes more important as the pressure is raised or the temperature is lowered. When i-C$_3$D$_6$ is substituted for i-C$_6$H$_4$Cl, it is seen that in the mercaptan, where proton transfer may be slightly exothermic, the departing hydrogen sulfide molecule carries away a D species from the reacting tert-butyli ion with a high probability; conversely, in t-C$_6$H$_4$Br, the departing hydrogen bromide molecule has a low probability of containing a hydrogen species from the reacting tert-butyli ion. This result suggests that when proton transfer competes with the displacement reaction, the two reactions proceed through the same intermediate ion, a C$_6$H$_4$SH$^+$ species, in which "internal" proton transfer has occurred. The product C$_6$H$_4$SH$^+$ undergoes an analogous displacement reaction with all of these molecules to form the following as products: (C$_6$H$_5$O$^+$ + HX) and (C$_6$H$_5$O$^+$ + neutral products). The C$_6$H$_5$O$^+$ product ion also undergoes a displacement reaction with all of these molecules to form as products (C$_5$H$_5$H$_2$ + HX).

Key words: electron probe microanalyzer; microanalysis; qualitative analysis; quantitative analysis; specimen preparation; x rays.

A brief overview of the way in which electron-probe
microanalysis can be used to obtain information from microvolumes comprising 10^{-12} g or less of specimen material is presented. Elemental identification, distribution, and quantitative analytical procedures are outlined. Energy-resolving detectors and wavelength-dispersive spectrometers are compared; analysis of elements with atomic number < 11 is also briefly considered in this context. An example of the solution of a service failure by means of elemental-distribution mapping is offered. Finally, an indication is given of the accuracy which can be expected from quantitative electron-probe microanalysis.

Key words: analysis; assay in serum; bacterial growth calorimetry; enzyme catalyzed processes; glucose; microcalorimetry; serum thermochemistry of enzyme processes.

A single-reaction-vessel, batch-type, conduction microcalorimeter is described, having a volume of about 0.3 ml. The sensitivity in terms of electrical output voltage per unit of heat transfer power is 60 mV - W^{-1}. The lower limit of detectable thermal power is about 0.1 µW, and the lower limit of total heat that can be measured is < 0.2 µd. The calorimeter is calibrated electrically and by known chemical reactions such as the neutralization of HCl by NaOH in solution. The calorimeter has been applied to the measurement of enzyme catalyzed biochemical processes. On the basis of measurements made in aqueous buffer solutions, the hexokinase catalyzed phosphorylation of glucose has been used to assay glucose in the complex medium human serum and blood plasma, with results that correlate well with customary clinical laboratory procedures. The growth of Enterobacter cloacae, Proteus rettgeri, and Klebsiella pneumoniae in the calorimeter under controlled conditions show characteristic energy variation patterns. In a somewhat larger reaction cell, the fertilization and growth of Arbacia punctulata eggs were observed.

Key words: charge transfer reactions; cycloalkanes; cyclohexane; gas phase; methylocyclopentane; parent ions.

The structure and reactivity of the C,H^+ ion formed in the fragmentation of cyclohexane and methylocyclopentane parent ions has been examined ([C,H_{12}]^+) \rightarrow C,H^+ + C,H^+. It is noted that C,H^+ consists of 1-C,H^+, 2-C,H^+, and 2-C,H^+. The relative abundances of these isomer ions depend on the energy content of the cycloalkane ion. According to the mass spectral cracking pattern of cyclohexane-1,2,2,3,3,4-d_6 the high energy parent ion splits out C,H^+ without extensive prior rearrangement. The C,H^+ so formed is analogous to the C,H^+ ion produced in the photoionization or radiolysis of cyclobutane. The various C,H^+ isomers react with the cycloalkanes by acceptance of an H^- entity: C,H^+ + C,H = C,H_8^+ + C,H. The relative reaction rates, which are determined by means of isotopic labeling experiments, differ widely with a change in the structure of both the reactant ion and the reactant molecule, with the rate of reaction being generally higher for the more exothermic process.

Key words: acoustics; electroacoustic transducers; nearfield measurements.

Recently developed and successfully applied analytical techniques for the measurement of microwave antennas at reduced distances are "translated" into corresponding techniques for the measurement of electroacoustic transducers in fluids. The basic theory is formulated in scattering-matrix form and emphasizes the use of plane-wave spectra for the representation of sound fields. This theory, in contrast to those based on asymptotic description of transducer characteristics, is suitable for the formulation and solution of problems involving interactions at arbitrary distances. Two new techniques (in particular) are described. One, utilizing deconvolution of transverse scanning data, taken with a known transducer at distances d which may be much less than the Rayleigh distance d_0= D/(2), provides a means of obtaining complete near-field characteristics, corrected for the effects of the measuring transducer. Applicability of a (two-dimensional, spatial) scanning theorem and of the "fast Fourier transform" algorithm, with greatly facilitate the necessary computations, is shown. The second technique provides a means of extrapolating received signal as a function of distance (observed with d ~ d_0) to obtain on-axis values of effective directivity. Other possible applications are indicated. These techniques rigorously utilize observed transducer output, which need not be simply related to pressure or normal velocity at a point.

Key words: aluminum; flame emission spectrometry; interferences; repetitive optical scanning.

The distribution of atomic aluminum emission in the nitrous oxide-acetylene flame was investigated by means of repetitive optical scanning in the derivative mode. In this system, the difficulties encountered with this source from the CN, CH, and C_2 bands were overcome. This technique which doesn't require a separation or preconcentration step was applied to the determination of aluminum in various types of ferrous materials. The results were compared with other classical methods. By the proposed method aluminum was also determined in a high-purity iron at the 5 µg/g level with a relative standard deviation of 10 percent.

Key words: cuprous oxide; elastic constants.

The elastic constants C_{ij} of single-crystal CuO measured to 3 kbar show linear variation with pressure. The best-fit values of the C_{ij} and dC_{ij}/dP are: C_{11} = 1028.8, C_{14} = 121.0, C' = C_{11} - C_{12}/2 = 81.9 kbar, dC_{11}/dP = 3.62, dC_{14}/dP = 0.69, and dC'/dP = -0.63; respectively. The elastic behavior of CuO is found to be anomalous in that dC_{ij}/dP and dC'/dP are both negative, and dC'/dP, where µ is the isotropic shear modulus, is significantly negative (−0.67). This anomalous behavior suggests an instability of crystal structure. The high- and low-temperature limiting values of Grüneisen γ, γ', and γ, computed from the dC'/dP are −1.98 and −3.59, respectively. The value of γ is in fairly good agreement with the reported Grüneisen γ value based on the nuclear quadrupole relaxation data. The negative Grüneisen γ values are consistent with the observed negative thermal expansion. The implication of γ being appreciable more negative than γ, that the coefficient of thermal expansion of CuO should become more negative at low temperatures.

Key words: absolute radiation detector; absorption measurements; filters; GM counter; sensitive detector; vacuum ultraviolet.

The applicability of GM and proportional counters naturally extends into the vacuum ultraviolet (vuv) spectral region. A simple modification to this detector enables GM counters to be used to measure very small cross section variations or to be used as high efficiency detectors over a narrow spectral range with excellent second order discrimination.

Key words: isotope dilution; isotopes; mass spectrometry; molybdenum; nickel; normalization; standard reference materials; thermal ionization.

General exact equations and iteration techniques have been developed for internal normalization to eliminate the effect of thermal fractionation from isotope ratio measurements, and therefore isotope dilution analyses, by thermal ionization mass spectrometry. The techniques are applicable to more than 20 elements and have been extensively applied to the determination of Mo in ore concentrates (55% Mo) and silicate trace standards (50 and 500 ppm M). The standard deviations of all internally corrected Mo isotope ratio measurements were < 0.1 percent. The Mo sample size was 40 mg, but normalization techniques should apply to mg and smaller samples with a more sensitive ion detection system. Procedures are described for the chemical separation of Mo from matrix interferences and for the mass spectrometric analysis of Mo. Application of the techniques to Ni in three pollution standard reference materials is described.

Key words: powder diffraction standard, silicon; silicon powder diffraction standard; standard, powder diffraction; standard reference material, silicon.

A silicon powder Standard Reference Material, SRM-640, has been prepared for use as a standard in powder diffractometry. Powder diffraction measurements were performed with a tungsten internal standard and a high-angle goniometer. The measured $d/\lambda$ is 3.525176. With $\lambda$ (Cu Ka, peak) taken as 1.5405981 Å, $a = 5.430880$ (35) Å, uncorrected for refraction. Comparison of $a$ with values obtained with a single crystal from one of the boules reveals a difference of 3 parts in 10<sup>5</sup>. This difference suggests a subtle systematic error in powder diffractometry or a change in lattice spacing near crystal boundaries. Use of the SRM should permit individual measurements of lattice parameters to be made reproducible near 1 part in 10<sup>3</sup> and an absolute accuracy of at least 3 parts in 10<sup>5</sup>.

Key words: potassium nitrate; procedure of ICTA Standards Committee and NBS; standard in thermal analysis; transition from I → III.

Because of questions concerning the suitability of potassium nitrate as a dynamic temperature standard for DTA, the relation between the experimental procedure and the resulting curves was ascertained for the Standard Reference Material KNO<sub>3</sub>. The material behaves differently on cooling in open pans than in cylindrical holders because confinement in the latter case initiates reversion to the room temperature form. Under the conditions of use as a dynamic temperature reference material, the curves are accurately reproducible.

Key words: barium vapor; configuration interaction; N<sub>4d</sub> ionization thresholds; photoabsorption; 4d absorption; 4f orbital contraction.

The absorption spectrum of gaseous barium was obtained between 120 Å, the region of the N<sub>4d</sub> thresholds. The similarity to lanthanum of some of the features observed in barium suggests that the 4f orbital contractions and overlaps the 4d orbit. This contraction produces two terms, 3P and 3D, of the 4d<sup>4</sup>f configuration below the 4d ionization limits, while the large electrostatic exchange interaction drives the 4P term of this configuration some 10 eV above the limit. Furthermore, extensive mixing of the 4d<sup>4</sup>(6s)<sup>4</sup>p configuration with 4d<sup>4</sup>(5d)<sup>4</sup>p<sup>6</sup>p and 4d<sup>4</sup>(5d)<sup>4</sup>e<sup>6</sup>p produces many weak resonances in addition to the resonances associated with the 4d<sup>4</sup>f configuration. A suggested classification of these features is given with the aid of known features of the La 1 spectrum. Finally, from the known x-ray splitting of the N<sub>4d</sub> threshold and the energy interval between the 6s<sup>4</sup>6p<sup>2</sup>P and 6s<sup>4</sup>6p<sup>4</sup>15 levels in La 1 and La II, the ionization thresholds of the 4d electron were determined to be 814 800 (1000) cm<sup>-1</sup> and 792 500 (1000) cm<sup>-1</sup>.

14908. Lias, S. G., Rebbert, R. E., Auslosso, P., Carbonium ions in radiation chemistry. II. Isomerization processes in C<sub>3</sub>H<sub>5</sub>·<sup>+</sup> and C<sub>3</sub>H<sub>5</sub>·<sup>+</sup> ion, J. Amer. Chem. Soc. 92, No. 22, 6430-6440 (Nov. 4, 1970).

Key words: butyl ion; carbonium ion; ion fragmentation; isomerization; propyl ion.

The structures of propyl and butyl ions formed in the gas-phase radiolysis of appropriate alkanes have been deduced from the structures of the neutral products formed in proton transfer reactions with ammonia, or from the isotopic structures of hydride (or deuteride) transfer reaction products formed in labeling experiments. n-Propyl ions rearrange within 10<sup>-10</sup> sec to the sec-propyl or the protonated cyclopropane structure. Rearrangement to the sec-propyl ion is favored under all conditions but increases in importance with increasing internal energy content of the ion. Both isomerization reactions are reversible, but the rate constants of the reverse reactions are very low owing to the energy requirements of these processes. The isomerization of the sec-butyl ion to the t-butyl structure is observed; this rearrangement also increases in importance with increasing internal energy content of the ion. The H (or D) atoms in the secondary and tertiary carbonium ions are seen to undergo energy-dependent hydrogen-scrumbling processes. The protonated cyclobutane ion formed by proton transfer to cyclobutane isomerizes mainly to the sec-butyl structure. The results presented here demonstrate that most of the propyl and butyl ions formed in the dissociation of butane and hexane parent ions, respectively, originate as primary carbonium ions from simple C-C cleavage processes, rather than being formed initially with the secondary structure, as they are at the threshold energies.

Key words: dicalcium phosphate dihydrate; fluorapatite; fluoride; hydroxyapatite; tooth enamel.

Significant amounts of CaHPO₄·2H₂O (DCPD) were deposited in tooth enamel by pretreatment with a solution saturated with respect to DCPD. When these enamel samples were treated with a given fluoride solution, the fluoride uptake increased with increasing amounts of DCPD produced by the pretreatment. The interactions between enamel and acidic solutions to yield DCPD can be understood as dissolution-precipitation reactions and analyzed through the use of solubility phase diagrams.

Key words: asymmetric rotors; doublet states; HO₂; laser magnetic resonance; least squares fit; rotational analysis; Zeeman spectrum.

Mathematical techniques are presented which have proved useful in assigning the laser magnetic resonance pure-rotation spectrum of HO₂, i.e., useful in assigning an absorption spectrum obtained when molecular energy levels are Zeeman shifted by an external magnetic field until transition frequencies coincide with a fixed-frequency radiation source. The techniques described should have general applicability to the laser magnetic resonance vibration-rotation spectrum of any molecule in an orbitally non-degenerate electronic state and a doublet electronic spin state (S = 1/2). Equations involving both Zeeman line positions and Zeeman line intensities are presented. These allow the assignment of Mᵢ quantum numbers, the determination of the spin-rotation interaction constant γ and rotational quantum number N for both the upper and the lower state, and the determination of the zero-field transition frequency. The equations can be used without prior knowledge of the molecular structure or energy levels.

Key words: antiferromagnetism; cerous magnesium nitrate; dipole-dipole interaction; ferromagnetism; ground state; magnetic; permutation group; quantum mechanics.

The general quantum-mechanical extension of Luttinger and Tisza's approach to the ground state of crystals with dipole-dipole and exchange interactions is given. It is shown that within this approach the ground state can only be ferro- or antiferromagnetic if the unit cell contains only one or two magnetically equivalent atoms or ions.

Key words: archaeological materials; Egyptian glasses; galena ores; kohl; lead isotopes; Ptolemaic and Roman Periods.

The determination of isotope ratios in lead extracted from a variety of archaeological materials is very useful for classifying the objects according to their geographical origins. On the basis of data for lead from about 450 ancient objects and galenas, geographical patterns have been established. Our previous studies have included metallic leads, bronze alloys, silver and gold coins, pigments, glazes, and glasses from many areas of the Ancient World. In this study we have investigated specimens of ancient Egyptian glasses and glazes containing the colorant-opacifier Pb₂Sb₂O₅, samples of kohl (which consist of powdered galena) and a few ores from Egypt. The leads used for making the pigment and kohl are similar to one another, but very different from leads from other parts of the Ancient World, and are almost certainly made of locally-occurring galena ores. Relatively small differences among the ancient Egyptian kohls separate those dating from different dynasties. Glasses and bronzes of the Ptolemaic and Roman Periods excavated in Egypt do not contain the same type of lead found in the earlier glasses and kohls. The later leads are of the Laurion, "Levantite" and Italian types. The authenticity of one very important glass object of the XVIIIth Dynasty has been verified by this technique.

Key words: channeling of electrons; crystal orientation; Kossel; lattice spacing determination; microdiffraction; scanning electron microscopy; strain analysis; x ray.

The Kossel method is a divergent beam x-ray diffraction technique which requires a point source of x rays for optimum application. The scanning electron microscope provides the investigator with an almost ideal point source of x rays as well as a means for viewing the actual region irradiated.

Using Kossel patterns, one can study regions about 15 μm in size or larger. In particular, precise lattice spacing data from small crystal regions can be obtained. Furthermore, orientation information of micocrystals or crystal-line inclusions can be obtained within 1/4 to 1/2° of arc. Complete elastic stress-strain analysis of crystals can also be carried out. The method can also be combined with x-ray topographic methods to provide basic perfection data.

Methods for determining lattice spacings are critically compared. The most satisfactory general method—the regressive analysis of the conic equation (RACE) method is fully discussed. Information obtainable from the stress-strain analysis will be outlined, and the reliability limits of the computed strains is discussed using Fe-3 1/4 PCT-Si as an example. Instrumental requirements indicated by the results of the reliability analysis are described. Finally, some of the newer possibilities such as comparison with channeling pattern results are taken up.

Key words: electrolyte solutions; ionic cosphere; structure of solutions; thermodynamics of mixture.

The structural effect of water on aqueous ionic solutions is best interpreted by the concept of ion-solvent cosphere overlapping, developed by Gurney and Frank. Friedman has advanced a theory which includes the overlapping effect. The success of the theory to fit experimental data for several 1-1 electrolytes up to 1 molal concentration has proven the existence of the overlapping effect.

Experimentally, one of the best methods of differentiating the ionic cosphere overlapping effect seems to be the study of mixed electrolyte solutions. The excess function of mixing, ΔₐQ°, is a measure of the difference of the excess function of the mixture...
from those of the pure binary electrolyte solutions. In the common ion mixture, this difference has been shown from the same charge ion interactions. Recently, Robinson, Wood, and Reilly have derived theoretically that the same effects are specific. The specificity of the same charge ion interactions appears to rise from the cosphere overlapping effect. Gurney postulated a rule that the mean activity coefficients, based on the order-disorder character of each ionic cosphere, go “from dissimilar character downward to similar character.” The ionic cosphere overlapping effects on the thermodynamics of mixtures to parallel the same rule.

Key words: carbon dioxide; CO₂; critical point; nucleation; supercooling.

We have observed supercooling in liquid CO₂ near the critical temperature greatly exceeding that allowed by existing theories of homogeneous nucleation.

Key words: block structure; control flow; GOTO-less programming; language design; precompiler; quality software; structural programming.

STAPLE is a structured programming language with nested block structure in the source language to indicate flow of control. The semantics of the non-control structures are essentially the same as FORTRAN. The design goals were an easily implemented, easily modified tool for experiments and demonstrations of structured versus unstructured programming techniques.

Key words: cavity resonators; dielectric constant; loss measurements.

Dielectric constant and loss measurements made by three government laboratories (of the USSR, Canada, and the U.S.A.) are compared. The two materials measured were glasses. The measurements utilized cavity resonators in the H₂₀ mode. The errors in dielectric constant reported by the laboratories were usually ±0.3 percent; actual differences between laboratories of the average correct results were only ±0.05 percent. The loss tangent results disagreed when multimoding occurred; however, the errors may be as low as ±0.0002 or ±3 percent, whichever is the larger, if multimoding is avoided.

Key words: archaeology; isotopic ratios; Laurion; lead; mass spectrometry; ores.

The lead isotopic ratios of a carefully selected suite of ore samples from the Laurion region have been determined by a precise mass spectrometric procedure. The ores were taken from various levels in mines, some known to have been worked in ancient times. All are nearly indistinguishable isotopically within the precision of the method (±0.05%), and they closely match leads from archaeological objects found in Greece. A comparison with isotopic data for ores from other mining regions in the ancient world has been made. The uniformity of the Laurion ores facilitates the interpretation of lead isotope data for archaeological objects from Greece.

Key words: coherent radiation; Josephson junction; microstrip; quality factor; transmission coefficient.

A major factor in the practical utilization of any Josephson device for microwave and higher frequency applications (such as the generation and detection of electromagnetic radiation) is the success with which the junction device can be coupled to an external transmission line. As part of an experimental investigation of the electrodynamics of small arrays of Josephson tunnel junctions, the properties of the coherent radiation emitted both by individual junctions and by coupled junction systems have been studied at frequencies between 2 and 12 GHz. Near 9 GHz, more than 10⁻⁹ W of coherent radiation has been detected from a single Pb-Pb oxide-Pb junction coupled via waveguide. The development of thin film devices in which the tunnel junctions form part of a microstrip line have made it feasible to observe directly (in a single device) the radiation emitted both at the fundamental geometrical frequency and at the low order harmonics. The observed temperature dependence of the junction cavity Q indicate the low temperature losses are primarily due to cavity loading of the external transmission line.

Key words: computer science; laboratory accreditation; measurement; national measurement system; technology transfer; voluntary standards.

As technology becomes more complex, and as world trade increases, there is a growing need for measurement capabilities and consensus standards. In this interview the Director of the National Bureau of Standards discusses the role of NBS in these vital areas.

Key words: pressure; manometry; mercury manometer.

The most accurate pressure measurements attainable in the range of 5 X 10⁻¹⁰ Pa to 1.3 X 10⁻¹² Pa can be made by using mercury manometers. In the design of a mercury manometer the principal concerns are those of locating the crown of the meniscus, and of determining the height of the mercury column. Different techniques are cited by describing some accurate instruments in use at BIPM, NRLM, NBS and VNIIM.

Key words: communications; law enforcement; mobile transceiver; performance standard; transceiver; transmitter.

This standard for law enforcement communications transmitters specifies minimum performance requirements for mobile transmitters. Frequency ranges over which the standard applies are 25-50 MHz, 150-174 MHz, and 400-512 MHz.
Key words: cameras; demand cameras; employee theft; fixed surveillance; motion picture surveillance; robbery; sequence cameras; shoplifting; surveillance; surveillance cameras.

The guide discusses the methods and types of fixed surveillance photography and their application in combating criminals. Its purpose is to provide the potential user with the necessary general background information to analyze his security needs, decide if photographic surveillance seems to answer those needs, plan generally what type of system best fits his requirements, and discuss his needs intelligently with the manufacturers and installers of the equipment. Fixed surveillance photography involves the use of permanently installed cameras and equipment to monitor areas where criminal activity is likely. The three types of equipment addressed are still cameras, motion-picture cameras, and television systems.

Key words: Ac DRRS; coaxial cable effects; coaxial star connectors; extrapolation techniques; four-pair admittances; permutation techniques; precision admittance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances.

The purpose of this paper is twofold: 1) to show how extrapolation techniques can be used to obtain well-defined and versatile measuring systems; and 2) to apply such techniques to the measurement of four-pair admittances with two-pair bridges. When four-pair admittances are large, measurements with two-pair bridges have limited precision, but with reasonably small admittances, measurement precision is essentially equal to that attained with four-pair bridges.

Key words: Ac transformer-ratio bridge; platinum resistance thermometer; standard cell enclosure; standard cells.

Groups of standard cells are needed to maintain the National Bureau of Standards (NBS) volt between periodic realignments via 2elh. An enclosure to hold six standard cells has been designed and three enclosures have been assembled. The enclosures consist of four concentric aluminum cylinders separated by foamed polystyrene insulation. Two of the four cylinders are controlled, an outer one by a platinum resistance thermometer and dc amplifier and the inner one at 30 °C by a second platinum resistance thermometer and an ac transformer-ratio bridge followed by a phase-sensitive detector, a dc amplifier, and a heater. The innermost of the four cylinders is a thermally lagged cell compartment. The temperature excursions over periods of at least several days were found to be less than 20 µK, thus having a negligible effect on the standard cell EMF's.

Key words: aircraft; air pollution; automobile; standard reference materials.

Accurate measurement of emissions is best accomplished by means of specific measurement methods using instruments which are calibrated by reference to Standard Reference Materials. The National Bureau of Standards has developed a number of gas Standard Reference Materials during the past two years for the measurement of pollutant gases in automobile exhaust emissions. These Standard Reference Materials include carbon monoxide in nitrogen, propane in air, carbon dioxide in nitrogen and nitric oxide in nitrogen at concentrations relevant not only to auto exhaust emissions but also to aircraft exhaust emissions. The technical problems associated with the development of those Standard Reference Materials are discussed and a description of the ranges of concentrations available is outlined.

Key words: absolute farad; absolute ohm; calculable capacitor; cross capacitor; electrical units; farad; ohm; units.

A recently completed calculable cross capacitor in conjunction with a previously described collection of ac and dc bridges has made possible a highly accurate measurement of the farad and the ohm. The cross capacitor and its auxiliary equipment, as well as those components of the measurement system which have not been covered in prior publications, are described in detail. The measurements indicate that the National Bureau of Standards (NBS) unit of capacitance is given by F_{NBS} = 1 F + 1.787 µF, and that the NBS unit of resistance is given by Ω_{NBS} = 1 Ω - 0.819 µΩ.

Key words: gyromagnetic ratio of the proton; fine structure constant; volt transfer.

The EMF's of standard cells are now being transferred between laboratories over a 1 1/2-km cable with a precision of 4 parts in 10^8 to provide an instantaneous comparison of the 2elh and γ_p experiments being carried out at the two facilities. This is accomplished by transferring a constant current that produces a 1-V drop across standard resistors located at both ends of the cable.

Key words: automated measurement systems; gyromagnetic ratio; magnetic field; protons; solenoid.

An increase in the accuracy of the gyromagnetic ratio of the proton can be achieved by determining the magnitude of a calculable magnetic field to higher accuracy. Such an increase requires dimensional measurements of a physical object to an absolute accuracy of a few parts in ten million. A unique computer-controlled automated measurement system for carrying out such measurements has been developed at the U.S. National Bureau of Standards and is currently in operation at its nonmagnetic facility. This measurement system provides an order of magnitude improvement over all previous measurements.

Key words: critical heat flux; film boiling; forced convection; heat transfer; helium; nucleate boiling; subcritical; supercritical.

Results of an experimental investigation of heat transfer to liquid helium under forced downward flow conditions are reported for a 0.213 cm i.d. x 10 cm long vertical test section subject to the following range of operating conditions: System pressures ~1-2 atm (0.1-0.2 MN/m²); Mass velocities ~4-65 g/s-cm²; Heat fluxes ~0.01-1 W/cm²; Inlet subcooling ~0-0.3 K.

Data are presented for the nucleate and film boiling regions and a correlation has been developed for predicting the critical heat flux (transition from nucleate to film boiling). A comparison of forced convection boiling of helium with other modes of helium heat transfer (pool boiling and supercritical) is also included.

Key words: calibration; piston gages; pressure measurement.

Piston gages are instruments which measure pressure as force per unit area. There are a number of sources of error among which elastic distortion is the largest. Several types of piston gages have been developed to reduce the elastic distortion errors and to allow operations at a variety of pressures. A minimum of elastic distortion error is found with the controlled clearance piston gage. Other sources of error include temperature effects, air buoyancy, and head corrections. To reach the highest precision operating procedures must be followed which insure adequate control of all important parameters.

Key words: critical region; dielectric constant; equation of state; homogeneity; light scattering; power laws; refractive index; scaling; Schlieren method; specific heat; speed of sound; x-ray scattering.

A review is given of experimental methods for the determination of thermodynamic properties in the critical region of gases. The typical experimental difficulties: near-instability of the system, long equilibrium times and gravity effects, are discussed. Optical and dielectric measurements for the determination of density and of density gradients, are emphasized. A survey of the potential of light and x-ray scattering experiments is given. Other topics covered are constant-volume specific heat, conventional P-V-T, coexistence curve and speed of sound determinations. The discussion of experimental methods is preceded by a summary of the present state of critical region thermodynamics; power laws, gas-liquid symmetry, homogeneity, scaling and extended scaling are discussed.

Key words: capacitance-diaphragm gauge; Knudsen radiometer; McLeod gauge; micromanometer; quartz Bourdon gauge; static expansion; thermal transpiration; vapor-stream pumping; viscosity gauge.

Methods of measurement and calibration are analyzed for the range 1 kPa to 100 μPa (namely 10 torr to 10⁻⁴ torr). Those procedures are considered for which measurements data, uncertainty analyses, and history exist in sufficient amount to allow for a reasonable confidence in their use. Precision liquid column micromanometers of the point contact and interferometric principles are compared. Capillarity, density, leveling, sorption and leakage, and length measurement uncertainties are derived. McLeod gauge operation and uncertainties are derived including thermal transpiration and vapor-stream pumping effects at the cold trap. Viscosity manometers of the oscillating vane and spinning disc are described. The Knudsen radiometer manometer is considered. Uncertainties are detailed for the volumetric pressure divider-static expansion calibration procedure. The precision of transfer gauges is included.

Key words: capacitor discharges; high-speed measurements; high temperatures; thermodynamics; thermophysics.

Electrical discharge techniques (millisecond and submillisecond resolution) which may be used for the measurement of thermodynamic properties of electrically conducting fluids (liquids and gases) at high temperatures (above 2000 K) are described. Design considerations, including electrical circuit characteristics and discussion of various phenomena, are presented. Measurement of experimental quantities, such as current, voltage, temperature, are discussed and various other high-speed techniques, such as high-speed photography, high-speed recording, are reviewed. Pertinent examples of utilization of discharge techniques for the measurement of thermodynamic properties are given.

Key words: regional maintenance of the volt; standard cells; surveillance of local units of voltage; voltage standards; voltage transport standards; unit of voltage.

In cooperation with five industrial standards laboratories, the National Bureau of Standards (NBS) studied the feasibility of establishing a regional volt maintenance and surveillance program in the greater Los Angeles, Calif., area. The objectives were to improve surveillance, to reduce dependence on NBS, and to have each laboratory maintain its unit of voltage to within 1 ppm of the U.S. legal volt. A two-phase program was established, the first to characterize the five laboratories and the second to carry out the surveillance. After 3 years all laboratories were found to be maintaining their unit to within better than 1 ppm of the U.S. legal volt.

Key words: cryogenic; energy; hydrogen; research and development.

As liquid hydrogen pervades the commercial fuel market, new and improved products and technologies will be needed. To meet
these demands appropriate research and development (R&D) must be performed on hydrogen fuel systems. Candidate markets for cryogenic hydrogen-energy systems are reviewed and discussed, and associated R&D needs are outlined herein. A wide variety of cryogenic R&D opportunities exist.

Key words: current comparator; low temperature electrical measurement; quantum interference device; ratio- transformer; resistive divider; superconductivity.

The application of superconducting direct-current comparators to the measurement of resistance ratios is described. One comparator consists of a binary set of ratios between 1:1 and 160:1, providing for self-calibration by a buildup procedure. A second comparator exhibiting discrete ratios of 1:1, 10:1, and 100:1 is also described. Ratio uncertainty of less than 1 part in 10^6 is achieved by enclosing the ratio windings in overlapping toroidal superconducting shields. Superconducting quantum interference devices (SQUID's) serve as flux sensors for the comparators. One of these current comparators is used to calibrate a 100-0:1-0 resistive divider, which at a current of 10 mA exhibits a self-heating error of 0.0023 ppm.

Key words: p-type GaN; Schottky barrier diode; single crystal GaN; \(^{14}\text{N}^+\) implantation.

A rectifying Schottky barrier diode has been prepared in a thin film single crystal of GaN. Surface N-vacancy concentration was reduced by means of \(^{14}\text{N}^+\) implantation.

Key words: air pollution; instrument; measurement; oxides of nitrogen; sulfur dioxide.

The pollution measurement needs driving the development of new techniques are reviewed as an introduction. These include needs for more sensitivity and more simplicity in actual use. Selected examples are described as illustrations: The phenomenon of chemiluminescence is used to measure ozone, sulfur, and oxides of nitrogen. Chemiluminescence refers to the emission of light from excited product molecules formed when the substance to be measured undergoes a chemical reaction. Fluorescence is used to measure SO_2 and NO. The molecule of interest is radiated with one wavelength light and emits (fluoresces) another wavelength which is detected. Absorption of infrared radiation by a pollutant molecule can be used to measure low concentrations. The use of tunable diode lasers to measure sulfur dioxide and ethylene is described. Also described is the technique of tuning the pollutant absorption into coincidence with a fixed laser line by application of magnetic or electric fields. This technique, perturbation spectroscopy, has been used for vinyl chloride and nitric oxide measurement. Finally, a brief mention is made of the importance of long path techniques and possible approaches.

Key words: adjoint; annihilation; buildup factor; concrete; gamma radiation; moments.

Gamma-ray buildup factors in ordinary concrete have been calculated by the moments method. Results for concrete kerma and air kerma are tabulated for source energies from 15 MeV to 15 keV. Parameters are given that allow calculation of the buildup factor by means of a simple analytic expression. Comparisons are made with earlier calculations, and the effects of annihilation radiation are discussed.

Key words: arrays; Josephson junctions; microstriplines; microwave filters; voltage standard.

A promising method for microwave coupling to thin-film Josephson devices via microstrip techniques has been developed which has significant advantages over more traditional waveguide techniques. In particular, direct determination of intrinsic junction cavity parameters such as the geometrical resonance frequencies and Q values are made practical and compact cryogenic multi-octave microwave holders readily realized. The results of coupling experiments with Pb-Pb oxide-Pb and Nb-Nb oxide-Pb tunnel junctions are discussed and applications of these results to the design and construction of shielded single junction 2e/h devices and small multi-junction arrays are described.

Key words: gauge theories; lepton; muon; M-spin; scattering amplitudes; Weinberg.

M-spin conservation is shown to be a property of Salam-Weinberg gauge theories. Amplitude relations such as \(A(\nu_e \rightarrow \nu_e') - A(\nu_e \rightarrow \nu_e') - A(\nu_e \rightarrow \nu_e')\) derived from M-spin invariance alone also hold for the gauge theories up to the breaking due to Higgs scalars.

Key words: adhesion; adhesive restoratives; bonding to teeth; dental cements; dental sealants; reactivity of tooth surfaces.

The development of a truly adhesive restorative material is a primary goal of researchers in the field of dental materials. This review discusses the many fundamental investigations dealing with the reactivity of the tooth-adherent surface, followed by discussions of methods to modify hard tissue surfaces with the aim of enhancing adhesion. Potential adhesive systems are described that exhibit clinically significant adhesion to the hard tissues, especially enamel, in an environment approximating that encountered in the oral cavity. Evaluation of future adhesives will necessitate the development of well-designed standardized in vitro testing procedures that correlate with clinical experience. About 190 references are included in this extensive survey of studies conducted both at the National Bureau of Standards and by many other investigators.

Key words: critical point; critical solution point; density; magnetic; diffusion; pressure; gradient, concentration; gradient; density; gravity, effects of 3-methylpentane; mixture; liquid; nitroethane; sedimentation.
Precise measurements of density profiles in the system nitroethane+3-methylpentane near the critical solution point demonstrate that concentration gradients form rapidly, but true equilibrium is not achieved even after long times. The data are in qualitative agreement with computer calculations of the behavior of a critical mixture in gravitational field which show that the initial gradients form by sedimentation. Thus, effects due to gravity may affect careful experiments in critical mixtures.

Key words: carbon monoxide; chemisorption; defraction low energy electron; ruthenium; work function Auger spectroscopy.

The adsorption of CO on Ru(001) has been studied using a combination of techniques: LEED/Auger, Kelvin probe contact potential changes, and flash desorption mass spectrometry. Adsorption of CO is reversible at temperatures and pressures as high as 700 K and $10^{-4}$ torr, respectively. Two binding states of CO are identified, and isosteric heats determined both from work function changes and from LEED intensity measurements agree well with flash desorption energies. A disordering of the CO layer due to repulsive interactions between neighbors at high coverages is postulated. Electron beam-induced LEED patterns are characterized and found to have a high cross section ($\sim 7 \times 10^{-17}$ cm$^2$) at $\sim 110$ eV.

Key words: asymptotic approximations; connection formulas; error bounds; ordinary differential equations; parabolic cylinder functions; turning points; wave scattering; Weber functions.

Differential equations of the form

$$d^2w/dx^2 = (u(x) + g(x))w$$

are considered for large values of the real parameter $u$. Here $x$ is a real variable ranging over an open, possibly infinite, interval $(x_1, x_2)$, and $a$ is a bounded real parameter. It is assumed that $f_u(x_1)$ and $g_u(x_2)$ are free from singularity within $(x_1, x_2)$, and $f_u(x)$ has exactly two zeros, which depend continuously on $a$ and coincide for a certain value of $a$. Except in the neighbourhoods of the zeros, $g_u(x)$ is small in absolute value compared with $e^{|f_u(x)|}$.

By application of the Liouville transformation, the differential equation is converted into one of four standard forms, with continuous coefficients. Asymptotic approximations for the solutions are then constructed in terms of parabolic cylinder functions.

Key words: asymptotic approximations; error bounds; Legendre functions; parabolic cylinder functions; turning points; Weber functions.

By application of the theory for second-order linear differential equations with two turning points developed in the preceding paper, some new asymptotic approximations are obtained for the associated Legendre functions when both the degree $n$ and order $m$ are large. The approximations are expressed in terms of parabolic cylinder functions, and are uniformly valid with respect to $x \in (1, 1)$ and $n(n + 1/2) \epsilon [\delta, 1 + \Delta]$, where $\delta$ and $\Delta$ are arbitrary fixed numbers such that $0 < \delta < 1$ and $\Delta > 0$. The values of $m$ and $n + 1/2$ are either both real, or both purely imaginary. In all cases explicit bounds are supplied for the error terms associated with the approximations.

Key words: contrasts in emergent intensity; radiatively controlled lines.

It is argued that visible contrasts can arise even in a line that is controlled wholly by an external radiation field. Lateral differences in the local shapes of the line absorption profile are shown to account for such contrasts. Two cases are treated explicitly: (a) a profile locally broadened by mass flow, and (b) a profile locally narrower due to the suppression of turbulent velocities, as might result from the presence of magnetic fields.

Key words: proportional limit; stiffness of testing machines.

A new method for determining the proportional limit of engineering materials, characterized by maximum stress rate, is presented. Simultaneous measurement of stress rate and strain rate also permits a new means of measuring machine stiffness which has certain advantages over present techniques.

Key words: contrast curves; low contrast resolution; night vision; objective lenses; resolution test; variable contrast resolution.

This document provides two test methods for determining the comparative image quality of objective lenses intended for use on passive portable night vision devices. The two test methods are called the low contrast resolution test and the variable contrast resolution test. The criterion for lens evaluation in both tests is the limiting resolution of the image of a three bar test pattern, as a function of the contrast of the pattern.

Key words: laser spectroscopy; methane spectra; recoil; saturated absorption.

Conventional wisdom holds that natural lifetime sets the basic resolution limit in Saturated Absorption Spectroscopy. Since suitable molecular transitions are known which have lifetime-limited line Q above $10^2$, it is interesting to try to achieve such resolution experimentally. By minimizing the usual broadening effects and by using large apertures (5 cm) to minimize the transit broadening, we have studied the hyperfine structure of a certain methane transition at 3.39 $\mu$m. Our highest resolution ($2.4 \times 10^4$) leads to good evidence for recoil splitting (not shift) of the observed absorption line. Another factor of 2 resolution increase is expected from the new absorption cell (38 cm diam by 13 m length).

Key words: anechoic chamber evaluation; omni-directional probe; reflectivity; three-dimensional scanning.

This paper describes an experimental technique for evaluating anechoic chamber reflectivity utilizing a new NBS isotropic probe mounted on a polyfoam track and support structure designed for probing the chamber’s quiet zone in all three orthogonal planes. The probe is omni-directional within ±1 dB and has sufficient sensitivity to permit evaluation of reflectivity levels as low as 59 dB. It can be used from 150 MHz to 10.0 GHz. Complete scattering information is obtained without applying a receiving antenna pattern correction with only 3 orthogonal scans per frequency required. The paper presents a brief treatment of the theory involved, a description of the system and measurement technique employed; and a discussion of typical measurement results.

Key words: arsine; infrared high resolution; perturbation-allowed transitions; resonances; secular determinants; spectra; structure.

High resolution infrared measurements are reported on arsine (AsH\(_3\)) from 2260 to 1960 cm\(^{-1}\). Numerous perturbation-allowed transitions have been found and are used to determine the \( C_6 \) rotational constant. Ten ground state rotational constants are determined including one that describes the splitting of the \( k = 3 \) levels. A complete equilibrium structure is determined. A total of 26 upper state constants are determined by means of a computer program which simultaneously fits both \( \nu_1 \) and \( \nu_3 \) bands and includes many off-diagonal matrix elements. This analysis will fit transitions through \( J = K = 12 \) to within experimental error, but it is concluded that to fit higher rotational transitions the perturbing effects of \( 2\nu_3 \) must be taken into account explicitly.

Key words: adapter; automation; calibration; microwave.

Although conceptually straightforward, the application of existing automated network analyzers to the problem of adapter evaluation is inhibited by the limited accuracy of the detection process, the requirement for several impedance standards at each frequency, and software problems. This paper describes a simple hardware modification, which for adapter evaluation yields an order of magnitude improvement in accuracy. An alternative calibration procedure is outlined which exploits this improved accuracy potential, and which requires only one impedance standard.

Key words: aromatic hydrocarbons; gas chromatography; hydrocarbon analysis; partition coefficient; sea water; stripping cell.

A stripping cell is described which can be used to analyze and to measure partition coefficients of hydrocarbons in sea water. Small hydrogen bubbles evolved electrolytically from a gold electrode are allowed to rise up a cylindrical cell containing a known amount of sea water. The dissolved hydrocarbons in the sea water are equilibrated with the hydrogen bubbles. The hydrocarbon concentration in the headspace is determined by gas chromatography. The partition coefficient and hydrocarbon concentration in the sea water are determined from the volume of sea water and the hydrocarbon concentration in the headspace after a given volume of hydrogen has bubbled through the cell.

Key words: kinetics; mass spectrometry; nitrogen dioxide; oelfin; ozone; rate constant.

A beam sampling mass spectrometer designed for the study of chemical reactions in the gas phase is described. It is a three stage, differentially pumped instrument using a molecular beam chopper and phase sensitive detection. The reactions of ozone with NO\(_2\) and some olefins were studied using a temperature controlled stopped-flow reactor in conjunction with the beam sampling mass spectrometer.

Key words: dose distributions; dosimetry; dye dosimeters; electron beams; radiation curing; radiation processing; radiocromic dyes; thin films.

Thin radiocromic dye film dosimeters, calibrated by means of calorimetry, make possible the determination of absorbed-dose distributions due to low-energy scanned electron beam penetrations in moderately thin coatings and laminar media. For electrons of a few hundred keV, calibrated dosimeters of about 30-60 \( \mu \)m thickness may be used in stacks or interleaved between layers of materials of interest and supply a sufficient number of experimental data points throughout the depth of penetration of electrons to provide a depth-dose curve. Depth doses may be resolved in various polymer layers on different backings (wood, aluminum, and iron) for scanned electron beams (\( E_{\text{ave}} = 400 \text{ keV} \)) having a broad energy spectrum and diffuse incidence, such as those used in radiation curing of coatings, textiles, plastics, etc. Theoretical calculations of such distributions of energy depositions are relatively difficult to achieve.

Key words: automobile; destructive interference; directivity; emergency vehicle; insertion loss; masking noise; siren; sound power level; sound pressure level.

A test program involving 23 test automobiles: four electronic sirens and nine electromagnetic sirens has been completed. Measurements have been made of the directivity and sound power level-frequency spectra of the sirens, of the insertion loss (sound attenuation) of the automobiles, of the masking noise in the automobiles while being driven over a test route of our different segments, and of the phase cancellation due to reflection for an electronic siren. Measurements of directivity were made also for a pair of electronic siren speakers in three different arrangements.

Key words: ace type pin tumbler lock; check plate tamper resistance; salt spray corrosion resistance; waved lock.

This standard establishes minimum performance requirements and test methods for metallic handcuffs intended to be used to restrict the physical movement of apprehended persons. Specific tests are described including visual inspection, dimensional measurements, test loading of handcuffs, test loading of locking mechanism, check plate tamper resistance, and salt spray corrosion resistance.

Key words: acoustic emission; calibration of transducers; electrostatic transducers; Lamb’s problem; seismic pulses; ultrasonic transducers.

A method for obtaining the signatures (waveforms) of certain acoustic-emission events has been developed. The waveform is that at the source, free of contamination by ringing of the specimen, apparatus, and transducer. The technique is based on the comparison of two signals at the transducer, one from the event in question and one from an artificial event of known waveform. The apparatus is also adapted to the calibration of transducers in a certain sense. The configurations of source (real or simulated acoustic-emission event) and receiving transducer correspond to those of some special cases of Lamb’s problem. As a byproduct, the results may be of some interest to seismologists.

Key words: analysis; construction; cost; design; economics; flexibility; law enforcement facilities; performance; planning; present value analysis.

This report is concerned with the application of techniques from building economics to the problems involved in the planning, design, and construction of law enforcement facilities. The formulas involved in the present value method of analysis are derived, and their use in analyzing the costs of alternative courses of action are explained and illustrated. Tabular equivalents of the formulas are given to facilitate the costing analysis.

Key words: correlation; forced convection; heat transfer; helium; supercritical.

Heat transfer has been investigated for supercritical helium at 2.5 atm flowing inside a vertical tube with inlet bulk fluid temperatures less than the transposed critical temperature. Results indicate that for high heat flux conditions, the heat-transfer coefficient passes through a maximum and then deteriorates as the fluid temperature approaches the transposed critical temperature. This is contrary to the predictions of a correlation developed in an earlier study of supercritical helium heat transfer under low heat flux conditions, which only predicts enhancement in heat transfer as the transposed critical temperature is approached.

The experimental data are presented and conditions under which heat-transfer deterioration was observed are discussed. The probable limitations to the validity of the above mentioned heat-transfer coefficient correlation, developed for a different range of experimental data, are also discussed.

Key words: computer simulation (transient thermal); current crowding (transistors); power transistors; thermal impedance measurements; thermal response measurements; transistors (thermal measurements).

Differences between the measured thermal impedance of power transistors when determined by the pulsed heating curve and cooling curve techniques are discussed. These differences are shown to result primarily because the power density distributions of these devices change as the devices heat: as a result of these changes the heating curve and the cooling curve are not conjugate. It is shown that the cooling curve technique, when the cooling curve is initiated from the most non-uniform steady-state thermal distribution, (maximum voltage, maximum power) will indicate a larger value for the thermal impedance than will the pulsed heating curve technique, even for pulses in excess of the dc power level. A one-dimensional model for power transistor cooling is described. The theoretical predictions of the model are shown to be in good agreement for practical applications with three-dimensional computer simulations and experimental results. Using this model, it is possible to estimate an average junction temperature and the area of power generation at steady-state. Both TO-66 and TO-3 encased devices of mesa and planar structures were included in this study.

Key words: boron; electron scattering; giant resonance; longitudinal; reduced widths; transverse.

Electrons with incident energies between 52.3 and 90.0 MeV have been scattered from the nucleus of 11B. Spectra of scattered electrons corresponding to excitation energies up to 32 MeV were observed at angles of 75° and 145°. Form factors of the states at 2.12, 4.44, 5.02, 8.57, and 8.93 MeV, and of the continuum region up to 30 MeV, have been separated into longitudinal and transverse components. The 11B dipole giant resonance is smooth relative to those of 14C and 13C. A mixed M1-E2 transition was observed at 13.0 MeV and a broad transverse resonance, possibly magnetic, was seen at 15.5 MeV.

Key words: beam splitter; CO2 laser; high power laser material.

Beam splitters for 10-µm lasers are discussed and then applied to the precision measurement of high average powers. In particular, beam splitter stability has been investigated in various materials over the 20-600-W power range with power densities up to 1 kW/cm². The absolute beam splitter ratios are given along with the achieved measurement precisions. The semiconductors investigated were GaAs, CdTe, and ZnSe in addition to one alkali-halide KCl. Standard deviations for the beam splitter ratios of 1 percent over the power range were typical. Absolute ratios
agree with the predictions from Fresnel's equations to 1 percent or better. The best measurement was made on ZnSe when a standard deviation of 0.4 percent was obtained for the measurement of a ratio that agreed with a calculation from Fresnel's equations to better than 0.5 percent.

Key words: adsorption theory; aggregate, adsorption by; collagen; dental materials; dentin; enamel; surface area; teeth; water vapor adsorption.

There is a continuing need for the complete characterization of the physical and chemical properties of dental materials. Among these properties is surface area. The problem is further complicated by the fact that most dental materials are, themselves, mixtures of two or more identifiable components. If the vapor adsorptive properties of these components are different in the mixture from that which would be expected of them collectively, then interaction is present. Interaction must not be confused with the lack of additivity which results from the limitations of the BET theory applied to mixtures. Equations are derived herein to estimate the extent of this latter source of variability and to correct for it giving a “true” surface area for the aggregate. Conversely, the adsorptive properties of either component can be calculated from the properties of the mixture and the remaining component together with the percentage composition. An immediate application can be made in determining the water-vapor adsorptive properties of human dental collagen without necessitating its removal from dentin. Any attempt to extract it chemically may produce denaturation or chain rupture thus precluding the possibility of direct determination. In the case of nitrogen adsorption, however, interaction definitely is indicated.

Key words: deduced wave functions; electron scattering; measured form factors; nuclear reactions; $^1\text{H}$; $^9\text{Be}$(e,$\alpha$).

Electron scattering form factors have been measured for the first six excited states in $^1\text{H}$ and for the 2.429-MeV $^1\text{H}(s)$ level in $^9\text{Be}$. The form factors for the lowest $T=1$ level in $^1\text{H}$ along with the previously measured ground-state magnetic moment are used to specify the $T=0$ and $T=1$ wave functions for the mass-14 system assuming a p-shell valence particles in an LS-coupling basis. The amplitudes of the various configurations so derived are generally in poor agreement with previous determinations, although the present wave functions yield values of the lifetime of the first $T=0$ state in $^1\text{H}$ and of the $^2\text{H}$ ground-state quadrupole moment that are in excellent agreement with previous measurements. The present data are not sufficiently precise to allow a direct separation of the $T=0$ and $T=1$ components for the first four negative-parity excited states. However, for two of these states which are excited primarily by $1^1\text{S}$ transitions, a comparison of the radiative strengths determined in this experiment with previous lifetime measurements sets a lower limit of 2 percent for the $T=1$ admixture.

Key words: elastic and inelastic electron scattering; low lying levels; weak coupling; $^{88}\text{Sr}$; $^{88}\text{Y}$.

Inelastic scattering cross sections of low-lying levels and elastic scattering cross sections have been measured in $^{88}\text{Sr}$ and $^{88}\text{Y}$ using the National Bureau of Standards Linac and electron scattering facility. Incident-electron energies were varied between 45 and 121 MeV corresponding to a momentum transfer range of 0.4 to 1.0 fm$^{-1}$. Data were accumulated at two scattering angles, 110.5 and 128.2°. We present elastic scattering form factors and inelastic scattering form factors and $B(E2)$ values for the 1.84- and 2.74-MeV states in $^{88}\text{Sr}$, and the 1.51-, 1.74-, 2.21-, 2.52-, 2.86-, and 3.1-MeV states in $^{88}\text{Y}$. A simple configuration mixing model based on the weak-coupling model has been applied to the octupole states in $^{88}\text{Y}$. The measured elastic form factors for both nuclei have been fitted with a Fermi charge distribution.

Key words: apparatus and methods; chemiluminescence; emission spectra; free radicals; kinetics of reactions; lasers, infrared; photochemistry.

The rate constant for the decay of vibrationally excited ozone, $\text{O}_3'$, in the $\text{O}_3'+\text{NO}$ reaction system has been measured from 153 to 373 K. Vibrationally excited $\text{O}_3'$ was produced in the asymmetric stretch normal mode by absorption of square wave modulated emission from a CO$_2$ laser tuned to the $P(30)$ $9.6$ μm transition. Under appropriate experimental conditions, a rapid $V \rightarrow V$ coupling process involving all three normal modes of $\text{O}_3'$ is believed to set up a Boltzmann population distribution among them. Reaction or relaxation of $\text{O}_3''$ out of this subset of normal modes is observed to proceed through a weighted average of rate constants. From the effects of temperature and buffer gas pressures an assessment can be made as to the predominant loss mechanism for the various modes. While there are three separate convolution schemes which appear to fit our data, we are persuaded to emphasize one whereby all three modes contribute via a reaction channel described by $k_a = (2.0 \times 10^{-11}) \exp(-1525/T)$ cm$^3$ molecule$^{-1}$ · sec$^{-1}$ while $k_b$ alone is active in a $V \rightarrow T$ relaxation process given by $k_b = (1.0 \times 10^{-9}) \exp(-39.2/T)$ cm$^3$ molecule$^{-1}$ · sec$^{-1}$. A comparison of the Arrhenius parameters for the reaction channels of $\text{O}_3'$ with parameters for the corresponding processes involving thermal $\text{O}_3'$ yields specific information about the effect of vibrational energy on the reaction dynamics.

Key words: calibration accuracy; effective area; effective radiated power; extrapolation method; gain comparison method; microwave antenna; power gain; satellite.

Accuracy considerations in the measurement of the power gain of a large microwave antenna are discussed. Using the gain comparison method with a standard antenna of approximately 40-dB gain, a large antenna with a power gain of approximately 60-dB can be calibrated to within an error of 0.17 dB (3σ).

Key words: electronics; Josephson effect; precise measurements; superconductivity.

This review will sketch the present state of affairs in applications of Josephson junctions and SQUIDs to: magnetometry, DC and RF metrology, detection and amplification of elec-
tromagnetic signals, frequency metrology, noise thermometry and computers. It will also mention recent progress in super-stable oscillators using superconducting resonant circuits, pulse transmission lines, and thin-film devices to detect radiation or charged particles. Many of these topics are maturing nicely.

Key words: automorphs; elliptic classes; finite fields; genus; modular group; natural homomorphism; parabolic classes.

The congruence subgroups of the classical modular group which can be defined as the automorphs modulo \( q \) of some fixed matrix are studied, and their genera determined.

Key words: aluminum alloys; bulk sample samples; casting; directional solidification; rapid quenching.

A technique has been developed for casting relatively large samples (~ 100 g) of concentrated alloys. It was used to prepare Al-Mg castings having Mg concentrations near the maximum limit of solid solubility. Concentration gradients and nonequilibrium eutectic solidification were minimized by the rapid cooling and directional solidification that are characteristic of the technique.

Key words: aberration integrals; asymptotic aberration coefficients; electron optics; electrostatic lens; third-order aberration coefficients; two-tube lens.

The third-order asymptotic aberration coefficients of round electrostatic lenses are reformulated in terms of the coordinates formed by the projections of the asymptotic incident and final rays onto the reference plane of the lens. In this formulation, all aberration coefficients are finite for all lenses, in contrast to the formulation in terms of coordinates projected onto the focal planes of the lenses, where all of the coefficients become infinite in the limit of very weak lenses and for certain strong lenses. Equations for the six third-order aberration coefficients are derived in the form of integrals involving derivatives of the axial potential no higher than the second. Using these equations and previously calculated potentials and first-order trajectories, we have computed the six aberration coefficients for the accelerating and decelerating two-tube electrostatic lens for voltage ratios from 1.1 to 10,000. The results are believed accurate to better than 0.2 percent.

Key words: chemisorption; image potential shifts; polarization energy shift; relaxation energies.

The upward shift in atomic energy levels (or decrease in electron binding energies) which occurs upon sorption of an atom on a metal surface due to polarization of the valence band electrons, is considered. The polarization shift or extra-atomic relaxation energy is treated within the framework established by Hedin, Johansson, and Lundqvist and the results are related to image potential shifts which have been previously discussed in chemisorption theories.

Key words: calcium fluoroborate; calcium salts; crystal structure; single crystal; tetrahedral anion; x-ray diffraction.

\( \text{Ca(BF}_4\) crystallizes in the orthorhombic space group \( \text{Pnma} \) with \( Z = 8 \). The unit-cell parameters are \( a = 9.2792 \text{(6)}, b = 8.9103 \text{(10)} \) and \( c = 13.3719 \text{(10)} \). The structure was refined by full-matrix least-squares calculations to \( R_w(F) = 0.025, R = 0.024 \), using 2896 measurable x-ray data collected by a computer technique and corrected for absorption. The refinement allowed for anisotropic thermal motion, isotropic secondary extinction and anomalous dispersion. The structure consists of columns of \( \text{BF}_4^- \) ions and columns of alternating \( \text{Ca}^{2+} \) and \( \text{BF}_4^- \) ions, all parallel to \( [010] \). There are twice as many \([\text{Ca}^{2+}, \text{BF}_4^-]\) columns as \([\text{BF}_4^-] \) columns. All columns are linked together through \( \text{Ca}_2\text{F}_2 \) bonds. The \( \text{Ca}^{2+} \) ion is coordinated by a square antiprisms of fluorine atoms, each from a different \( \text{BF}_4^- \) ion. Each fluorine atom is bonded to one \( \text{Ca}^{2+} \) ion, and the four \( \text{Ca}^{2+} \) ions bonded to a \( \text{BF}_4^- \) ion are arranged approximately tetrahedrally about the \( \text{BF}_4^- \) ion. Although neither of the two crystallographically discrete \( \text{BF}_4^- \) ions occupies a site of special symmetry, each is essentially tetrahedral in configuration.

Key words: additive; deformation; dental; porcelain; properties.

A colloidal silica-based substitute for the water added to dental porcelain has been developed which restricts rounding on firing and gives greater and indefinitely prolonged unfired biscuit strength. In conjunction with product evaluation, it has been found that both the modulus of rupture and the diametrical tensile strength of dental porcelains can be measured with a high degree of precision.

Key words: chemisorption; field emission; ion neutralization; photoemission; surface spectroscopy.

Chemical bonds formed between substrate and adsorbed atoms are characterized by new electronic energy levels which are derived from the atomic orbitals of each constituent. These energy levels are being observed experimentally through the techniques of field emission energy distributions, uv photoemission spectroscopy, and ion neutralization spectroscopy. These spectroscopies will be considered in the light of present day theoretical understanding of both the measurement and the chemisorption process.

Key words: dislocation; multiaxial; plasticity; thermodynamics.

This paper presents a first-order consideration of dislocation motion through a multiaxial stress field. The concept of plastic power dissipation is developed as a measure of plastic flow due to multiaxial stresses. A result which emerges is the concept of
the second-order activation volume tensor for plastic power dissipation. Usually, this is a deviatoric tensor with the same principal axes as the stress, which then only interacts with the deviatoric stress. Results are given for a biaxial yield surface calculated as a surface of constant plastic power dissipation. The yield surface varies from a Tresca to a von Mises shape, depending on the scalar activation volume, the uniaxial yield stress, and the temperature. Generally for low temperature conditions the yield surface resembles the Tresca yield surface, and its shape approaches the von Mises shape at a high temperature limit. The activation volume tensor is explicitly demonstrated for all materials in a state of uniaxial tension and for materials with a von Mises-like yield surface in any multiaxial stress state. Extension of this treatment to include the internal stress and prestrain and stress history effects on the yield surface is discussed.

Key words: NMR; switching; ultrasonic.

The rounding of pulses is a convenient way to suppress transients when rf signals are switched with balanced mixers or semiconductor switches. The use of a serial-in, parallel-out shift register for shaping the leading and trailing edges of pulses is described. The original pulse is clocked through a shift register and the outputs of the register are weighted and added to form a new pulse. The maximum rise time is equal to the clock period times the bit-capacity of the register.

Key words: angular distributions; chemisorption; photoemission; photoionization; surfaces.

A theory of the angular distributions of electrons photoemitted from submonolayer films of chemisorbed atoms is presented. Chemisorption is treated within the surface-molecule limit of the Anderson model. It is shown that the key features which differentiate between solid-state photoemission and atomic photoionization are the localization of the hole left behind in the photoexcitation process and the preferential orientation of atomic or molecular orbitals (in photoemission from solids or chemisorbed atoms). The differential photoionization cross sections or angular distributions for spatially oriented atoms and surface molecules are obtained and contours of constant emission intensity, as projected on a flat fluorescent screen which is parallel to the surface, are presented. It is shown that the chemisorption bonding geometry can be ascertained from such measurements.

Key words: chemisorption; field emission; photoemission; single crystals; surface electron spectroscopy; surface state; tungsten.

A knowledge of the distribution of electrons both in energy and space at a surface is essential to the understanding of surface properties. Several techniques have been developed recently which have the potential capability of measuring the energy level spectrum of a surface. Two of these techniques, field emission and photoemission, will be discussed including a description of what can be measured, how it can be interpreted and the degree of consistency of the data. Experimental data will be presented to illustrate: (1) the surface density of states on clean single crystals and its relationship to bulk density of states; (2) the nature of the chemisorption bond and density dependent transitions; (3) dissociative or non-dissociative adsorption and (4) catalytic reactions involving adsorption of hydrocarbons.

Key words: electron impact; electron scattering resonances; exponential attenuation; low energy; negative ions: nitric oxide; nitrous oxide: total scattering cross section.

Total electron scattering cross sections for NO and N₂O in the energy range 0-10 eV were obtained from exponential attenuation in a straight-line collision chamber without a confining magnetic field. Good agreement is obtained with previous measurements where available. For NO, cross sections have been obtained for the first time for resonance structure in the energy range 0-2.5 eV. There appear to be small, sharp resonances between the large resonances. For both NO and N₂O the cross section is observed to increase rapidly at very low energies. Structure in the cross sections is interpreted in terms of electronic states of NO⁺ and N₂O⁺.

Key words: attenuation length; inelastic electron scattering; surface plasmons.

A quantitative theory of surface and bulk plasmon excitation in several electron spectroscopies (transmission, XPS, and Auger from thin film sandwiches) is presented. It is shown under what circumstances, the usual exponential attenuation law is valid.

Key words: bone mineral; dental caries; electric currents; mechanism; solubility.

The dissolution of apatites, during formation of caries lesions in enamel or remodeling of bone, has two aspects, thermodynamic and kinetic, which are intimately related. One can approach a full understanding of these processes by taking into account how each aspect affects the other.

The rate of transport of calcium relative to that of phosphate ions is a dominant consideration. These rates are likely to be controlled to a considerable degree by the permselective properties of the plaque and the outer layer of enamel acting as a very complex and variable membrane. Alteration of the properties of this membrane, therefore, becomes a potentially valuable means for preventing caries.

The thermodynamic properties of the apatite enter into the caries dissolution process in another way: the subsurface nature of the typical incipient lesion very probably relates to the variable solubility of the apatite in enamel mineral. Solubility measurements with enamel show that much of it is more soluble than synthetic preparations of pure hydroxyapatite and that its solubility changes with its composition and location.

14986. Okabe, H., Photodissociation of acetylene and

Key words: acetylene; bond dissociation energy; bromoaetylene; C2H; fluorescence; photodissociation; vacuum ultraviolet.

The photodissociation of C2H and BrC2H in the vacuum ultraviolet produces nearly identical quasicontinuous emissions in the region 4000 to above 5500 Å. It is concluded that the continua are most likely associated with the electronically excited C2H (C2H+) in both cases. Based on this conclusion the following spectroscopic and thermochemical data are derived from the thresholds of incident wavelength to produce the continua (1305 ± 3 Å and 1540 ± 3 Å, respectively, for C2H2 and BrC2H). The electronic energy of C2H, E(0;0;0) < 4.11 ± 0.05 eV, D(0;0;0)BrC2H = 91.1 ± 1 kcal mol-1 (381 ± 4 kJ mol-1), and D(0;0;0)C2H2 = 64.2 ± 1.5 kcal mol-1 (269 ± 6 kJ mol-1). The photolysis of BrC2H yields the C2 Swan bands in addition to the C2H+ by the spin forbidden process. The fluorescence yield has been measured as a function of incident wavelength for C2H2 and BrC2H. The fluorescence yield curves follow the absorption spectra of C2H2 and BrC2H, indicating that the C2H+ is predissociated from the initially formed electronic states. The C2H+ yield from C2H2 increases rapidly below the incident wavelength, 1200 Å. Bond dissociation energies and the heats of formation of haloacetylenes are estimated in comparison with the corresponding cyanogen halides. Primary photochemical processes in C2H2 are discussed.

Key words: calibration of detectors; corrections for second order radiation; far ultraviolet; noble gas double ionization chamber; synchrotron radiation; transfer standard detectors.

Radiometric transfer standards consisting of windowless diodes with cathodes made of anodized aluminum oxide on aluminum are now available from the National Bureau of Standards with calibrations in the 200-600 Å wavelength range. This extends the previously existing range of calibration for these diodes (600-1200 Å). For wavelengths shorter than 600 Å, synchrotron radiation at NBS-SURF is used as the source of radiant energy. A noble gas double ionization chamber is used to calibrate a secondary standard diode that is then intercompared with the transfer standards. Monitors take into account variations in the intensity of synchrotron radiation and in beam position. Methods of accounting for the effects of second-order radiation in the incident flux and secondary ionization in the double ionization chamber are discussed. Calibration uncertainties are about 10 percent.

Key words: metal detector; weapons detection.

Performance requirements and methods of test have been established for hand-held metal detectors used for determining the location of metal weapons carried on a person. Requirements are specified which indicate a detector's suitability for use in each of specified applications.

Key words: absorption spectrum; barium; heat pipe; inner shell excitation; shape resonance; two-electron excitations.

A plastic windowed heat pipe was used in conjunction with the NBS-170 MeV synchrotron and a 3-m grazing incidence spectrograph to observe transition 4d5s5p6s3d → 4d4s5p6s2 nf, n in the spectral region 110Å-150Å. By replacing the plastic windows with tin, excitations involving transitions 5p6s2 → 5p6s2 nd, ns were observed in the spectral region 520Å-650Å.

Key words: duplexer; fm transceiver; land-mobile communications; law enforcement; repeater; vertical antenna.

This report is concerned with FM repeaters used in land mobile communications systems. Repeater systems are described with emphasis on appropriate antenna site selection, signal-rejection techniques, and specialized transmission-line components for the transmission and reception of signals. Repeaters using the vehicle transceiver are mentioned. Repeaters at microwave frequencies are described to the extent that their use for control and as audio links is pertinent. Measurement techniques that are unique to land-mobile repeaters are discussed.

Key words: air; automotive exhaust emission; detection; fluorescence; nitric oxide; nitrogen; quencher.

An accurate, rapid, and simple technique is described for the measurement of nitric oxide in standard reference mixtures of NO in N2. The technique investigated is based on the measurement of the fluorescence intensity emitted by NO when it absorbs 213.8-nm radiation from a Zn discharge lamp (the A1476 nm = 1 = X1pi/2 (v = 0) transition). The fluorescence is in the 220-300-nm region and its intensity is proportional to the 213.8-nm light intensity and the NO concentration. The fluorescence intensity at a constant light intensity level increases linearly with NO concentration in the 0.015-7-ppm range to within 1 percent error. In the 7-932-ppm range, the intensity increases sublinearly with NO concentration because of efficient self-quenching of the fluorescence. The signal-to-noise ratio is 1.0 at 10 ppb for a 1-minute counting time. The quenching half pressures of NO, H2O, CO2, O2, Cl2, HCl, CH4, and H2 are, respectively, 0.34 ± 0.03, 0.65 ± 0.06, 8.3 ± 0.6, 0.65 ± 0.05, 0.1 ± 0.1, 5.6 ± 0.4, 56 ± 4, and 115 ± 8 torr. The application of this method to detect NO and SO2 in automotive exhaust is discussed.

Key words: blood banking; donor attitudes; donor eligibility; donor participation rates; donor recruitment; donor retention; foreign donor programs; non-donor attitudes.

To study the motivation and actions of potential and active blood donors, a literature search, a limited survey, and associated analytic efforts were undertaken. It is estimated that 61
million of the 114 million age-eligible donors meet Red Cross criteria of health-eligibility. The 1971 donor participation rate, calculated as the percentage ratio of active donors to eligible donors, was estimated to be between 8 and 9 percent. Total collections appear to be increasing at a stable rate of 1 percent per year and 15 percent of each year’s collections apparently come from first-time donors. Thus, 14 percent of those who donate blood in any given year must replace other donors who have stopped donating. Roughly 25 percent of those who are health-eligible to donate blood have done so in the last ten years. Literature and survey analyses indicate that donor reaction rates are considerably underestimated by most collectors. A limited survey showed that the main reason for nonparticipation is fear, while common reasons for discontinuing participation are adverse reaction and medical disqualification.

Key words: H₂S; sulfur Kβ emission and K-absorption spectra; sulfur K shell binding energy; x-ray spectra.

The sulfur Kβ emission in fluorescence and K absorption from gaseous H₂S were measured on a double crystal spectrometer. The sulfur Kβ spectrum consists of four peaks. The three strongest peaks are shown to be single vacancy transitions of electrons from the three outer MO’s to fill the single K shell vacancy. The weak fourth peak on the high energy side of the three line structure is identified as a double vacancy transition. The sulfur K-absorption spectrum consists of three peaks of decreasing intensity with increasing photon energy. The unusual breadth (FWHM of 1.50 eV) and asymmetry on the high energy side of the first peak is ascribed to the Frank-Condon factors of the transitions to the unoccupied antibonding MO’s 3b, and 6a. The other two peaks, which are narrow, are identified as transitions to Rydberg levels. In addition, the binding energy of the sulfur K shell electron was estimated to be 2478.3 eV. The sulfur L₂,₃ absorption of H₂S is also discussed briefly.

Key words: antennas; near-field measurements; phased arrays.

The results of applying the planar near-field measurement technique to two experimental phased array antennas are described. Fast and efficient tests are used to determine the required scan area and data point spacings. The use of these tests enable one to reduce the amount of data required for some antennas without seriously increasing the errors in computed far-field parameters.

Measurements were made at different distances from the antennas, with the probe transmitting and receiving, and for both sum and monopulse difference patterns of the test antenna. Comparisons between the far-field patterns computed from the near-field data and those measured on far-field ranges are presented.

Key words: automation techniques; bolometer units; calibration; power equation concept.

The power equation concept has been implemented into a multioctave precision bolometer unit calibration system employing automation techniques in conjunction with an automatic network analyzer system. The system was qualified as a calibration transfer system operating in the 2-12.4 GHz frequency range at 1 to 10 mW with a single measurement standard deviation of 0.2 percent to 1 percent from 2-10 GHz.

Key words: free radical scavenging; hydrocarbons; isobutane; neopentane; primary photochemical processes; quantum yields; vacuum ultraviolet photolysis.

The photolysis of neopentane has been studied using photons of energies 7.6, 8.4, and 10.0 eV, at pressures in the range 1-760 torr and in the liquid phase. Quantum yields of all molecular and radical products smaller than C₂ have been determined in the gas phase experiments, and have been estimated in the liquid phase. In contrast to results obtained with other alkanes studied to date, hydrogen elimination is found to be an unimportant process in the photolysis of neopentane. The two predominant primary processes are elimination of methane (neo-C₅H₁₂ → CH₄ + iso-C₃H₈) and direct C-C bond cleavage (neo-C₅H₁₂ → CH₃ + t-C₃H₈). A fraction of the t-C₃H₈ radicals dissociate further unless collisionally stabilized, either by loss of a H atom or by loss of a methyl radical (presumably preceded by an initial rearrangement to the isobutyl structure). With an increase in photon energy, the importance of direct bond cleavage increases at the expense of the methane elimination process. In the liquid phase, secondary decomposition processes are quenched, and the estimated quantum yields of primary processes are similar, at all energies, to those found in the 7.6 eV gas phase photolysis at high pressures.

Quantum yields of molecular and radical products formed in the 7.6 and 8.4 eV photolysis of isobutane are also reported and are discussed briefly, with particular emphasis on the effect of energy on the mechanisms of the molecular elimination processes: (iso-C₃H₈ → CH₄ + C₂H₆) and (iso-C₃H₈ → iso-C₃H₈ + H₂). For both of these primary processes, the lower energy pathway, in which the olefin is formed directly, predominates at 7.6 eV, but diminishes in importance relative to the higher energy channel (presumably involving carbene formation) when the photon energy is increased.

Key words: continuum radiation; diodes; irradiance standard; synchrotron radiation; transfer standard detectors; vacuum ultraviolet radiation standards.

Conceptually it is straight-forward to apply the calculable continuum distribution of synchrotron radiation to problems requiring a source of known irradiance. However, in practice many factors affect the accuracy of such a calibration. These factors will be discussed with reference to the NBS 170 MeV synchrotron. The calibration facility at NBS-SURF has been utilized in the 200Å-1200Å spectral range by Air Force Cambridge Research Laboratories and the Naval Research Laboratory to calibrate rocket monochromators. Transfer radiometric standards consisting of windowless diodes with cathodes made of anodized aluminum oxide on aluminum have been developed.
and calibrated for wavelengths between 200Å-600Å. Diodes have been calibrated with a double ionization chamber using synchrotron radiation from NBS-SURF as a source. Methods accounting for beam motion, second order radiation in the beam, as well as multiple ionization in the double ionization chamber will be discussed.

Key words: combinatorial systems with axiom; degrees of unsolvability; general decision problems; Markov algorithms; many-one reducibility; recursive functions; r.e. many-one degrees; r.e. one-one degrees; semi-Thue systems; splinters.

A constructive proof is presented which shows the existence of a Markov algorithm with axiom whose decision problem is of any prescribed r.e. many-one degree of unsolvability. This result is then shown to be best possible in that it does not hold for r.e. one-one degrees. And, finally, a theorem concerning the degree representation of splinters of recursive functions is proven as a direct corollary to the aforementioned results.

Key words: cavity method for dielectrics; dielectric constant; dielectric loss; international comparison; laboratory intercomparison; permittivity; standard dielectric.

Dielectric constant and loss measurements made by three national laboratories (of the USSR, Canada, and USA) are compared. The two materials measured were glasses. The measurements utilized cavity resonators in the H<sub>r</sub> mode. The errors in dielectric constant reported by the laboratories were usually ±0.3 percent; actual differences between laboratories of the average corrected results were only ±0.05 percent. The loss tangent results disagreed when multimoding occurred; however, the errors may be as low as ±0.0002 or ±3 percent, whichever is the larger, if multimoding is avoided.

Key words: absorption spectra; force constants; HBS; infrared; molecular spectra; spectra; thioborine.

The gas-phase high-resolution spectrum is reported for ν<sub>1</sub> of the linear molecule thioborine (HBS) from 2775 cm<sup>-1</sup> to 2720 cm<sup>-1</sup>. Band centers and rotational constants are given for the 10<sup>0</sup> - 000 transitions of H<sub>1</sub>B<sub>3</sub>S, H<sub>1</sub>B<sub>4</sub>S, H<sub>1</sub>B<sub>4</sub>S and for the 11<sup>0</sup> - 010 transitions of H<sub>1</sub>B<sub>3</sub>S and H<sub>1</sub>B<sub>4</sub>S. A valence force field is determined from measured values of ν<sub>1</sub>, D<sub>e</sub> (the centrifugal distortion) and q (the l-doubling constant). The remaining unobserved vibrational fundamentals are calculated from the force constants.

Key words: ethyl alcohol; interstellar chemistry; molecular cloud; molecular spectroscopy; radio astronomy; Sagittarius B2.

Three transitions of trans-ethyl alcohol (CH<sub>3</sub>CH<sub>2</sub>OH) were detected in emission toward the Sagittarius B2 molecular cloud. The 6<sub>b</sub> - 5<sub>b</sub> transition at 85,265.46 MHz, the 4<sub>b</sub> - 3<sub>b</sub> transition at 90,117.51 MHz, and the 5<sub>a</sub> - 4<sub>a</sub> transition at 104,808.58 MHz were observed at V<sub>ls</sub> = 60 km s<sup>-1</sup>. The abundance of ethyl alcohol in the Sgr B2 cloud is comparable to that of many molecules previously detected there. Careful comparison of the abundance of ethyl alcohol with chemically related molecules such as its isomer dimethyl ether, acetaldehyde, and methyl alcohol may provide important information about mechanisms for molecular formation in the interstellar medium.

Key words: acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; truck; urban planning.

This report is the third in a series of reports published as a result of a Department of Transportation sponsored truck tire noise research conducted by the National Bureau of Standards. The previous reports (OST-ONA-71-9 and OST/TST-72-1) contained details of the test design, test procedures, and an inventory of maximum A-weighted sound level data for typical rib, crossbar, and retread type truck tires. A test sample of nine tires designs, estimated to represent 70-80 percent (based on discussions with fleet owners) of the truck tire population on the road today, was investigated considering noise levels as a function of the following variables: wear, loading, speed, pavement surface, and tire location. Test vehicles included both single-chassis vehicles and tractor trailers. The existing data base is expanded in this report to include one-third octave band spectral data, directionality data in the form of equal A-weighted sound level contours and other refined analysis of the data. Such data can serve as the groundwork for understanding the generation mechanisms by which tires produce noise—the first step in developing the necessary data to design quiet tires scientifically.

Key words: acetylene; discharge; ethynyl (HC<sub>3</sub>); infrared spectrum; interstellar molecule; matrix isolation; structure; vacuum ultraviolet photolysis.

Detailed isotopic studies of the infrared absorptions characteristic of the products of the decomposition of C<sub>2</sub>H<sub>2</sub> in a mild discharge through argon trapped at 14 K indicate that H<sub>3</sub>C<sub>3</sub> is an important product and that an absorption at 3612 cm<sup>-1</sup> can be assigned to the carbon-hydrogen stretching fundamental of this species. The data suffice for determination of the stretching and stretching-interaction force constants of H<sub>2</sub>C<sub>3</sub>, which, in turn, have permitted estimates of the bond lengths. The carbon-hydrogen bond is found to be exceptionally strong, and the carbon-carbon bond is intermediate between that characteristic of ground-state C<sub>2</sub>H<sub>2</sub> and that of C<sub>2</sub>H<sub>2</sub>. The estimated rotational spacing is in excellent agreement with that found for H<sub>2</sub>C<sub>3</sub> in recent observations of the interstellar medium.

Key words: circular polarization; maser; onion; pumping processes; radio astronomy; silicon monoxide.

Circircular polarization has been observed in the J = 2 - 1, ν = 1 SiO emission from the Orion A molecular source (OMC 1). The
net polarization was observed at two different times separated by three days.

Key words: crossed beams; cross section; electron impact; excitation; Hg.

Crossed beams of electrons and Hg ions have been employed to measure absolute cross sections for 165.0-nm emission, corresponding to the transition Hg(6p 3P1/2,3/2)→Hg(6s 3S1/2). The emission cross section, which is nearly identical to the excitation cross section for Hg(6p 3P3/2) near threshold, has a value of about 1.2×10^{-16} cm^2 at 7.51-electron volt, rises to a maximum of 2.26×10^{-16} cm^2 at 13 eV, and falls to 0.64×10^{-16} cm^2 at 274 eV. The cross section exhibits considerable structure in the energy region from threshold to the onset of the first cascade (7s 3S1/2,3/2) at 11.9 eV; this structure is likely due to interference from autoionizing states of neutral Hg. The total uncertainty at a "good" confidence level is about 18 percent, taken as the quadrature sum of random uncertainty (5% at 90% confidence level) with systematic uncertainties (17% at a level equivalent to 90% confidence level). At threshold, the Gaunt-factor formula of Seaon predicts a value of about 3 times that measured, but the two converge to within about 15 percent for electron energies ranging from 13 to 274 eV. The results are also in reasonable agreement with a semi-classical Gryzinski-type calculation for energies above several times threshold. The data give an emission cross section of (2.8±0.5)×10^{-16} cm^2 at 6.8 eV for 194.2 nm (6p 2P3/2→6s 3S1/2). Analysis of data taken with some metastable 6s^2 7D ions in the target beam indicates that the mean cross section for excitation of the 6s 2P3/2 level from the 6s 2D metastable states is larger than that for excitation from the 6s 2S1/2 ground state. Additional measurements of 398.4-nm emission (6p 2P3/2→6s^2 7D3/2) yield a cross section of about 6×10^{-16} cm^2 near threshold, and a branching ratio (6P3/2→6S1/2)/(6P3/2→7D3/2) of 350/1.

Key words: classical modular group; congruence groups; elliptic class numbers; genus; index; level; parabolic class number.

Explicit formulas in terms of coset decompositions are derived for the parabolic class number and elliptic class numbers of all subgroups of finite index of the classical modular group Γ. It is shown that these are multiplicative arithmetic functions of the level for congruence subgroups of Γ.

Key words: iron; spectra; ultraviolet; wavelengths.

The spectrum of Fe VI has been observed by using a vacuum sliding-spark discharge and the 10.7-m grazing-incidence spectrograph and the 10.7-m normal-incidence spectrometer at the National Bureau of Standards, Washington, D.C. More than 400 lines have been classified in the region 250-1 580 Å. All terms of the configurations 3d^0, 3d 4s, 3d 4p, except 3d^2(5S^2)3S^2 have been established. The estimated uncertainty of the level values is ±0.4 cm^{-1}. The 3d^0, 3d 4s and 3d 4p level structure has been theoretically interpreted. The energy parameters determined from a least-squares fit of the observed level values are compared with Hartree-Fock calculations. From the complete set of 3d^0 levels all forbidden lines of Fe VI from 1 387 to 10 000 Å have been predicted. All but two lines in the spectrum of the star

RR Telecopi previously identified as forbidden Fe VI lines have been confirmed and 6 of the otherwise unexplained lines have been identified as [Fe VI].

Key words: aluminum; spectra; wavelengths.

A total of 225 new lines of Al iv have been observed in the wavelength range 400-4700 Å, leading to the determination of all of the levels of the 2p^4p, 4d, 4f, 5s, 5f, and 5g configurations. Results of parametric calculations for the configurations are presented. An ionization energy of 967 804±15 cm^{-1} has been derived.

Key words: Balmer lines; four dimensional rotation group; hydrogen; plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering.

The plasma-broadened H and H spectral-line profiles of hydrogen were calculated retaining the time ordering in the S matrices of the width-shift operator by diagonalizing the (O4) group. Significant changes occur: The H peak is decreased 15 percent, the half-width is increased 25 percent, and the H relative dip is decreased 23 percent without significant alteration of the maximum intensity of half-width. Agreement with experiment is improved appreciably.

Key words: cyclohexane; cyclopropanes; ion-molecule reactions; olefins; photoionization.

The cy-C4H4H^+ ions formed in the photoionization of cyclohexane (resonance lines of argon: 11.6-11.8 eV) react with cyclic (C3 and C4) and unsaturated hydrocarbons by H transfer. This reaction is quantitative with propene, 1-butene, 1-pentene, 1,3-butadiene, and isobutene. This transfer is efficient only if there is a terminal double bond. There is ring opening with the C3 and C4 hydrocarbons. H atom transfer reactions are also observed between cy-C4H4H^+ ions and several compounds and the structure of the radical formed in such a reaction is determined by chemical analysis. With cis-2-butene, there is only charge transfer reaction.

Key words: catalysis; electronic structure; platinum; soft x-ray appearance potential; tungsten; tungsten carbide; x-ray photoemission.

The purpose of this comment is to note that two sets of experimental data, namely x-ray photoemission and soft x-ray appearance potential, are only apparently inconsistent in their measurement of the electron distribution in tungsten carbide.

Key words: accuracy; atomic fluorescence; automatic scatter correction; cadmium; chemical interferences; data evaluation; precision; production of atomic vapor; zinc.
The scattering of exciting radiation by matrix components is a major physical interference for trace analysis in atomic fluorescence spectrometry (AFS), which must be eliminated before practical "real sample" analysis can be performed. Using an instrumental arrangement for automatic scatter correction, trace cadmium and zinc are analyzed in Standard Reference Materials, Coal, Bovine Liver, Orchard Leaves, and Fly Ash, without prior separation or preconcentration. The effects of scatter and chemical interferences are evaluated for premixed argon (entrained air)—hydrogen and air—acetylene flames. Precision and accuracy of the results of AFS analysis are compared with data from analysis by atomic absorption.

Key words: base; dental; cement; dental; cement; polycarboxylate; cement; reinforced; fiber reinforcement; polycrylic-itaconic acid; polycarboxylate; potassium titanate.

Mechanical properties of polycarboxylate cements are greatly improved by incorporation of high modulus fibers such as potassium titanate into acrylic-itaconic acid and acrylic-itaconic-acetone acid copolymers. Other desirable properties of the cements are not changed by the addition of fibers.

Key words: absolute frequency measurements; laser frequency synthesis; xenon laser.

Absolute infrared frequency measurement has been extended to 148 THz (the highest frequency ever directly measured) with measurement of the two strong cw laser lines of Xe. The frequencies were synthesized with stabilized C02 and 3.39-µm He-Ne lasers and mixed on a W-Ni point-contact diode. The measured frequencies are \( \nu_{\text{C}02(3.0 \mu \text{m})} = 147.915 850(15) \) THz and \( \nu_{\text{Xe}(0.5 \mu \text{m})} = 85.459 997(3) \) THz.

Key words: compressibility; elasticity; finite deformation; hyperelasticity; rubbery materials; strain-energy function; volume-extension.

Experimental data on the volume changes accompanying simple tension of peroxide vulcanizates of natural gum rubber, as first reported by Penn in Trans. Soc. Rheol. 14, 509 (1970), are further interpreted within the framework of the theory of a hyperelastic material. Motivated by the formal connection between a hyperelastic material and a nonlinear viscoelastic fluid (Trans. Soc. Rheol. 9, 27 (1965)), and a mathematical result on the decomposition of the scalar potential of that fluid (Z. Angew. Math. Phys. 23, 780 (1972)), the interpretation of Penn's data leads to an explicit construction of a strain-energy function for rubbery materials:

\[
W(I_1, I_2, I_3) = C_1 (I_1 - 3) + C_2 (I_2 - 3) + \frac{\mu}{8K} (I_3 - 1),
\]

Key words: alloys; Cu; hyperfine fields; magnetism; Mn; Mössbauer effect; Ni; Pb; Sb.

At 4.2 K the magnetic hyperfine field, \( \mu_b \), at Sb in the C\(_{4}\) structure alloys Ni\(_{x}\),Cu\(_{y}\)MnSb, 0 < x < 1, increases from 296 kG at x = 0 to 504 kG at x = 0.6. For x < 0.7, \( \mu_b \) decreases rapidly and is characterized by a broad Gaussian distribution. For example, at x = 0.8 the average \( \mu_b \) is 327 kG and the width of the distribution, \( \sigma_{\mu_b} \), is 130 kG. Using the recent model of Blandin and Campbell based on the RKKY interaction, the increase of \( \mu_b \) with x for x < 0.7 can be shown to arise primarily from the increase in electron concentration. A similar explanation might also apply to the 600 kG \( \mu_b \) at Sb in Pd\(_{x}\)MnSb if it is assumed that Pd contributes 0.25 electron to the conduction band. The large hyperfine fields at Sb in the above alloy systems appear to be consistent with the predictions of extant theoretical models.

Key words: bibliographic citations; publications; Samuel Stanley Wilks; S. S. Wilks.

Full bibliographic citations for thirty-one "other writings" of Samuel Stanley Wilks not included in "The Publications of S. S. Wilks," in February 1965 issue of the Annals of Mathematical Statistics (Vol. 36, No. 1, pp. 24-27), together with the observation that his writings and those of his younger brother, Syrrell Singleton Wilks, are lumped together under "S. S. Wilks" in the volumes of the Science Citation Index.

Key words: collective model; giant resonances; isospin purity; nuclear density; nuclear models; nuclear structure.

The recently observed resonance at \(-11\) MeV in \(^{208}\text{Pb}\) is interpreted as the miniature quadrupole resonance (associated with the giant quadrupole resonance at \(22\) MeV) implied by the three-fluid hydrodynamical model. A difficulty arises with the miniature dipole resonance; this may signify that the simple hydrodynamic model has reached the limits of its validity. A numerical error in a previous publication is corrected.

Key words: adsorption; hydroxyapatite; ion exchange; nucleation; reaction rate; surface.

The interaction of synthetic hydroxyapatite with nickelous [Ni\(_{x}\)] or cupric [Cu\(_{x}\)] ions from aqueous nitrate solutions was investigated. Nickelous ions exchange with the calcium ions of the adsorbent and follow the Langmuir adsorption isotherm; the saturation amounts of the adsorbate for two apatite samples have approximately the same ratio as their surface areas. With Cu\(_{x}\), the initial uptake seems to be independent of concentration and almost equal to the saturation amount of nickelous ions for the same apatite sample. Subsequently, the apatite dissolves in concert with the growth of some form of copper phosphate as a separate phase on the apatite surface if an excess of cupric ions is present. This reaction follows a zero order rate law for dilute solutions. A phenomenological theory is developed which explains the various kinetic facets.

Key words: cross sections; fission; neptunium-237; neutron reactions; pile neutrons; plutonium-239; uranium-234; uranium-235; uranium-238.

The capability to measure absolute fission rates per nucleus at a remote laboratory site [the Coupled Fast Reactivity Measurement Facility (CFRMF) at Aerojet Nuclear Company] has been established to a precision level of better than ± 1 percent and was sustained at that level for a period of two years. Double fission ionization chambers and solid-state track recorders were used in a series of irradiations designed to calibrate fission activation detectors used for reactor fuels and materials dosimetry. The array of reference and working fissionable deposits involved in the measurements included five isotopes: $^{239}$Pu, $^{238}$U, $^{237}$Np, and $^{234}$U. Isotopic masses for the fissionable deposits were determined from interrelated components of mass assay: (a) relative and absolute alpha counting, (b) fission comparison counting in thermal-neutron beams, (c) mass spectrometry, and (d) quantitative deposition employing solutions of known fissionable element concentration. Absolute accuracies for the fission rates per nucleus measured in CFRMF are in the range of ± 1.5 to ± 2.5 percent and are dominated by uncertainties in the fissionable deposit masses. Fission cross-section ratios for the CFRMF central spectrum are $(1.000: 1.145 ± 0.017 : 0.0485 ± 0.0007 : 0.354 ± 0.008)$ for $(^{238}$U; $^{239}$Pu; $^{234}$U; $^{237}$Np), respectively.

Key words: aramid fiber; composites; cryogenic; epoxy; glass fiber; thermal conductivity.

Thermal conductivity data are presented for two fibre-epoxy composites. The fibre in one composite is glass and an aramid-class polymer in the other. Measurements were conducted on a glass-epoxy specimen in the direction perpendicular to the fibres at temperatures from 14 to 100 K. The aramid-epoxy specimen was measured parallel to the fibres at 5, 76, 196, and 276 K. Data are presented both in graphical and tabular form.

Key words: density; enthalpy; entropy; hydrogen; properties of fluids; specific heat; velocity of sound.

NBS compressibility measurements and thermodynamic properties data for parahydrogen have been extended to higher temperatures and pressures. Results of an experimental program are presented in the form of new PVT data in the temperature range 23-300 K at pressures up to 800 bar. Also given are tables of thermodynamic properties on isobars to 1000 bar including density, internal energy, enthalpy, entropy, specific heats at constant volume and constant pressure, velocity of sound, and the surface derivatives $(\partial P/\partial T)$ and $(\partial P/\partial V)$. The accuracy of the data is discussed and comparisons are made with previous data.

Key words: arc; experimental; oscillator strengths; Ti i; Ti ii; Ti iii.

Absolute oscillator strengths of Ti i, Ti ii, and Ti iii transitions in the wavelength region from 2440 Å to 3500 Å have been experimentally determined using a wall-stabilized arc. Titanium in the form of heated TiCl, was admixed with argon plus 5 percent H₂ and introduced into the arc, which was operated at a current of 40-60 amperes. Axis temperatures and electron densities ranged from 11,000 K to 12,500 K and $3.5 \times 10^{16}$ cm⁻³ to $8.7 \times 10^{16}$ cm⁻³, respectively.

Key words: National Bureau of Standards; performance of plumbing systems; plumbing code; principles of hydraulics.

This paper discusses some of the historical aspects of plumbing research and plumbing code committee work (Part I). Fundamentals of hydraulics are reviewed as they relate to the intent of plumbing codes (Part II), and current NBS programs on the evaluation of plumbing systems in the laboratory and in the field are discussed (Part III). Considerations involved in implementing the performance approach are covered briefly.

Key words: geometrically total spectral radiant power; gonioradiometer.

In this paper, the measurement of geometrically total spectral radiant power, i.e., the spectral radiant power emanating in all directions from a light source, is discussed. A gonioradiometer employing a silicon photodiode and a set of narrow band interference filters was used for these measurements. The experiment is described, some exploratory measurements are presented, and the uncertainties which this method introduces are estimated.

Key words: electron accelerator; new facility; radiation; storage ring; synchrotron radiation; vacuum ultraviolet.

At NBS the accelerator providing synchrotron radiation in the vacuum ultraviolet is being converted from a synchrotron to a storage ring which we anticipate will accelerate a 50 mA electron beam to a maximum energy of 240 MeV. These changes will extend the useful spectral range of the continuum vacuum ultraviolet radiation down to wavelengths somewhat below 40 Å. Increased intensity, greater spacial and temporal stability are other advantages that this conversion will provide. Even at wavelengths greater than 200 Å the intensity is expected to increase by a factor of at least 100 to a value of $4 \times 10^{19}$ photons per sec per milliradian of orbit for an instrument resolution of $\Delta \lambda / \lambda = 0.001$. It should be of general interest that SURF-II is being constructed so as to be compatible with a large user group.

Key words: detector; laser; pollution; vinyl chloride.

Stark modulated absorption of CO and CO₂ infrared laser radiation by vinyl chloride is the basis for sensitive and selective detection of this gas. Using the P(13) line of the 20-19 band of the CO laser (1609 cm⁻¹, 6.22 μm), a 2 pcmp C₂H₃Cl in air sample is observed in an extracavity absorption cell with a 5/1 signal-
to-noise ratio after 50 seconds of integration. The response of the signal to concentration of C₃H₇Cl is linear over at least 3 orders of magnitude to within experimental uncertainty which is a few percent. Similar results are obtained using a CO₂ laser operating on the P(42) line of the 001-100 band (929.2 cm⁻¹, 10.84 μm).

Key words: cement; concrete; fiber-reinforced cements; fiber-reinforced concretes; glass fibers; mechanical properties; organic fibers; review; steel fibers.

This review is concerned with developments, through 1974, in the research and technology, but not applications, of fiber reinforced cementitious materials including hardened cement pastes of gypsum, portland and high alumina cement and their concretes. Essentially, only materials reinforced with short, discontinuous and discrete fibers are covered, because long rods, continuous meshes and woven fabrics are not classified as discrete fibers in this review.

Key words: airport; airport capacity; airport simulation; models; model validation; runway capacity; simulation.

This report documents exercises of the DELCAP airport terminal area simulation model performed to validate the maximum throughput calculations of that model. DELCAP was run for five different runway configurations, with three or four appropriate operating policies chosen for each, and for three different mixes of aircraft types. Throughput estimates from DELCAP are found to be in general agreement with current values provided by the FAA. One specific instance of greater discrepancy is identified, and a remedy for it is proposed. Changes made in DELCAP since its original documentation in 1971 are described in an appendix.

Key words: Auger electron spectrometry; electron probe x-ray microanalysis; energy loss spectrometry; scanning electron microscopy; scanning transmission electron microscopy.

Some predictions concerning future trends in the SEM field have been made. Economic and personnel considerations have been taken into account in arriving at these predictions. Micrographic and analytical requirements and capabilities were also considered. For electron transparent specimens, scanning transmission electron microscopy (STEM) will become a major research method. Auger and energy loss spectrometry will join x-ray emission as analytical methods used for the analysis of such samples. Greater advantages will probably arise from improvements in electron source brightness and from advantages afforded by low energy loss electron detectors. Finally, the SEM field can only profit as the quality and quantity of educational opportunities in the field expand.

Key words: composite; cryogenics; superconducting coil; thermal conductivity.

Thermal conductivity measurements have been performed on longitudinal and transverse sections of a superconducting coil at 5, 79, 196, and 276 K. The composite coil sections are composed of copper-stabilized niobium-titanium wire embedded in epoxy. Tabular and graphical data are presented. These data are compared to values calculated on the bases of components of the coil sections. Reasonably good agreement is obtained.

Key words: ammonium bromide; ammonium ion; neutron scattering; orientational disorder; reorientation; residence time; single crystal.

The ammonium ion reorientations in a single crystal of NH₄Br in its disordered CsCl phase have been investigated by quasielastic neutron scattering at 373 K. Neutron spectra were measured at four different crystal orientations (with the [110] planes of the crystal in the scattering plane) and data were recorded simultaneously at a variety of scattering angles providing a range of momentum transfers for elastic scattering, 0.5 Å⁻¹ ≤ q ≤ 2.5 Å⁻¹. The experimental results were fit to models allowing instantaneous random jumps around the C₄ and C₆ axes of the (NH₄)⁺ ions using a variety of analytical procedures that are described in some detail. The results of these fits establish conclusively that the ammonium ion reorientations are dominated by 90° jumps around the C₄ axes with an average time τ between jumps of 3.2 ± 0.4 psec at 373 K. The inelastic part of the measured neutron spectra shows a torsional vibration peak at 305 cm⁻¹, in good agreement with previous values. The results and analysis demonstrate the value of single crystal measurements in neutron studies of dynamic orientational disorder in solids.

Key words: absorptance; calorimeter; cavity; laser energy measurements; laser power measurements; radiometry.

Methods used at the National Bureau of Standards for determining the power or energy in laser beams depend on calorimetric comparison of laser power or energy and the calibrating electrical power or energy. For this comparison, it is essential to know the fraction of the incident radiant energy that is converted to heat and measured by the calorimeter. This fraction, the effective spectral absorptance, is measured by adding an auxiliary calorimeter, which covers practically all of the opening in the main calorimeter. A laser beam enters the main calorimeter through a small hole in the auxiliary calorimeter. The reflected laser energy and the excess thermal radiation are measured by the auxiliary calorimeter. The data analysis is based on the theory of calorimetry derived from a linear heat-flow problem. Time-dependent functions relating the transient temperature responses of the calorimeters to various constant power inputs are determined experimentally from known electrical inputs. The effective absorptance is found by comparing transient responses for electrical and laser inputs.

Key words: adjustable; lens holder.

The construction of a simple, adjustable lens holder is
described. This lens holder is unique in that it will firmly hold small lenses without taking up space at the edge of the lens or stopping them down.

Key words: geomagnetism; magnetometer; SQUID; superconducting device.

A type of cryogenic SQUID (superconducting quantum interference device) magnetometer was designed for geomagnetic measurements. Field tests of the instrument including comparisons to observatory variometers, a rubidium magnetometer, an induction loop, and a flux-gate magnetometer showed the new cryogenic systems to be reliable, accurate, portable, and simple to operate. Directional measurements of natural magnetic field fluctuations as small as 0.0001 gamma with periods from 0.5 sec to several hours were demonstrated.

Key words: coherent neutron scattering; dispersion relation; lattice dynamics; palladium deuteride; phonon frequency distribution; single crystal.

The frequency-wave-vector dispersion relations of a single crystal of PdD$_{0.63}$ have been measured by coherent neutron inelastic scattering at 78, 150, 220, and 295 K. The acoustic modes are considerably lower in frequency than the corresponding modes for pure Pd, in accord with the observed lattice expansion. The optic modes, in which D motions predominate, show considerable dispersion. In particular, the shape of the motions predominate, show considerable dispersion. In particular, the shape of the [100] LO branch shows conclusively that second-neighbors D-D interactions are comparable to the first-like-neighbor D-D interactions.

Key words: iron-silicon alloys; Lorentz force; magnetic domains; photomicrography; scanning electron microscope; strain effects.

The mechanism and experimental arrangement by which magnetic contrast can be observed from materials of cubic anisotropy are indicated. Transformer alloy Fe-3.2Si is used as an example to illustrate the effects of tensile strain, magnetic field switching, residual stress, and inclinations on magnetic structure.

Key words: backscattered electrons; electron specimen interaction; Monte Carlo simulation; particle analysis; scanning electron microanalysis; x-ray microanalysis; x-ray source size.

Conventional quantitative electron microanalysis methods have been shown to be satisfactory when semi-infinite, planar specimens normal to the electron beam are analyzed. However, in the case of particulate analysis, the surface may be irregular, the specimen dimensions may be less than the electron beam inter-action volume and the x-ray absorption path will be irregular. Currently the only tractable approach to the analysis of particulates is to use a Monte Carlo simulation of electron and x-ray interactions to predict x-ray intensity as a function of particle geometry. A program to carry out this task was devised and tested in several ways for both electron and x-ray parameters. A detailed document of results of these tests, and results on a variety of specimens including aluminum spheres, nickel cylinders, alloy steel wear particles and others show good agreement between theory and experiment.

Some practical considerations have to be taken into account when such methods are used in real analytical situations, e.g., (1) the cost of preparing a calibration curve by the Monte Carlo method, (2) analytical strategy, e.g., what specimen to use in the SEM, what operating voltage and what is the effect of using either energy dispersive or wavelength dispersive detection systems, and (3) applicability to multicomponent particles. From a discussion of these we conclude that the Monte Carlo method can be employed profitably by laboratories having a need for quantitative information concerning particulate matter.

Key words: automated inspection of photomasks; critical dimension determination; defects; detection of visual defects; integrated circuit photomasks; photomask inspection; photomasks; photoplate quality.

The results of a nationwide review of automated IC photomask inspection methods are presented. Major photomask inspection problems of detection of visual defects and registration errors, and the determination of critical dimensions and photoplate quality are discussed. This review indicates that for high-volume, large-scale integrated circuits, the greatest concern is for the detection of visual defects. Next in order of importance are the detection of registration errors, and then the accurate determination of critical dimensions. Automated inspection systems and technologies currently available for this are discussed including: microdensitometer-digital computer systems, laser beam scanning systems, spatial filtering systems and microscope-television-digital computer systems. Suggested criteria for an ideal photomask inspection system are the simultaneous inspection for 2-µm visual defects, the determination of registration tolerances to within ±0.5 µm and the determination of the accuracy of the dimensions to tolerances of ±0.5 µm on a single photomask in ten minutes.

Key words: interferometer; phase locked loop; tracking; ultrasonic.

A pulsed ultrasonic interferometer was designed and constructed that has the ability to track changes in transit time as the ambient pressure and temperature of the sample are changed. The stability over 17 h approached one part in 10$^4$. This instrumentation will be incorporated into an automated high pressure transfer standard calibration system.

Key words: CAMAC; computer interfacing; control
A standardized instrumentation system for computer automated measurement and control (CAMAC) is gaining wide international acceptance for industrial and laboratory applications. The system features a fully specified pathway together with modular functional units that are completely compatible with each other and that are available from diverse sources. The system is nonproprietary and can be freely used without license or restriction of any kind.

Key words: chemisorption; CO; ESCA; XPS; ruthenium; x-ray photoelectron spectroscopy.

The CO valence levels for a monolayer of CO adsorbed on the basal (001) face of ruthenium have been observed by XPS. The assignment of the observed peaks is discussed.

Key words: angular momentum; cryogenic; flowmeter; liquid nitrogen; measurement; positive displacement; turbine; vortex shedding.

This paper reviews the joint National Bureau of Standards-Compressed Gas Association program in which (1) all the types of flowmeters used in the U.S. for custody transfer of liquid nitrogen were tested, (2) a tentative national code on cryogenic liquid-measuring devices was adopted, (3) use of transfer standards for testing cryogenic flowmeters was started and (4) tests on some temperature and density compensation devices were completed.

Data from the test program are presented in summary form for flowmeters operating on several principles. Highlights of the code requirements and transfer standard test results are described. Densitometer and temperature compensation test data are presented.

Key words: carbon abundance; molecular spectra; non-LTE; solar model; upper photosphere.

Non-LTE synthetic spectra derived from a detailed analysis of the formation of the CN(0,0) λ3883 Å spectrum are compared with center-limb photoelectric spectra taken at Kitt Peak National Observatory. Significant non-LTE effects are found and the Kurucz, Altrock-Cannon, Mount-Linsky II, and HSRA models are compared. We derive a solar carbon abundance of log A C = 8.30 ± 0.10 for the Mount-Linsky model and log A C = 8.40 ± 0.10 for the Altrock-Cannon model, compared to the HSRA value of log A C = 8.55 ± 0.10, assuming a nitrogen abundance of log A N = 7.93. In addition we specify the regions of formation for the CN(0,0) 3883.35 Å bandhead at disc center and limb.

Key words: adsorption; carbon monoxide; catalysis; LEED; oxygen; ruthenium.

The adsorption of oxygen on the ruthenium (001) surface has been studied using a combination of techniques: LEED/Auger, Kelvin probe contact potential changes, and flash desorption mass spectrometry. Oxygen is rapidly adsorbed at 300 K, forming an ordered LEED structure having apparent (2 x 2) symmetry. Two binding states of oxygen are inferred from the abrupt change in surface work function as a function of oxygen coverage. LEED intensity measurements indicate that the oxygen layer undergoes an order—disorder transition at temperatures several hundred degrees below the onset of desorption. The order—disorder transition temperature is a function of the oxygen coverage, consistent with two binding states. A model involving the adsorption of atomic oxygen at θ < 0.5 and the formation of complexes with higher oxygen content at θ > 0.5 is proposed. The oxidation of CO to form CO2 was found to have the maximum rate of production at a ruthenium temperature of 950 K.

Key words: cryogenics; dielectric constant; loss tangent; machinable glass-ceramic; specific heat; thermal conductivity.

Measurements of the dielectric properties (2-300 K), specific heat (2-20 K), and thermal conductivity (2-22 K) are reported for a mica-containing glass-ceramic which has a machinability in the range from brass to low-carbon steel. The dielectric constant increases with increasing temperature and is field independent for field strengths up to at least 70 kV cm-1 at low temperatures. Power-supply-limited attempts to measure the dielectric breakdown strength at low temperatures are consistent with the reported strength at room temperature (1.4 MV cm-1). The thermal properties are similar to fused silica with two exceptions: the thermal conductivity does not show the "knee" at ~ 10 K typical of amorphous materials, and the specific heat deviates strongly from a T3 law below 3.5 K.

Key words: helium; hydrodynamics; one dimensional flow; single phase fluid; thermodynamics; transposed critical line.

Fluid flow processes in helium within the range 4-10 K and 10-100 N cm-2 pressure are similar to those of ordinary fluids near their critical points. Three thermodynamic parameters, the Gruneisen parameter, isentropic compressibility, and velocity of sound, which are weakly non-catalytic near the critical point, are used to describe fluid flow processes in fluids in the near critical range. It is found that if temperature is not used as a variable in a fluid state equation, flow profiles can be easily evaluated in a single-phase fluid region, including close to or transcending the transposed critical line.

Key words: analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization; nuclear materials safeguards; safeguards.

Maintenance of effective safeguards requires a program for routine assessment of plant safeguards systems in terms of their...
capabilities to satisfy safeguards aims. Plant internal control systems provide capabilities for detection of unprevented diversion and can provide assurance that diversion has not occurred. A procedure called Diversion Path Analysis (DPA) enables routine assessment of the capabilities of internal control systems to indicate unprevented diversion and identification of safeguards problem areas in a plant. A framework for safeguards system design is also provided which will allow flexibility to accommodate individual plant circumstances while maintaining acceptable diversion detection capability. The steps of the procedure are described and the practicality of the analytical procedure is shown by referring to a demonstration test for a high throughput process where plant personnel were major participants. The boundary conditions for the demonstration case are given, along with some conclusions about the general procedure.

Key words: analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization; nuclear materials safeguards; safeguards.

A procedure, "diversion path analysis," has been developed for systematic analysis of diversion possibilities in plants using SNM. The procedure can be applied to diversion possibilities countered by physical protection and materials balance accounting but special emphasis is given to diversion possibilities in high throughput production areas. A parallel practicality study is discussed which used plant production data and had a working diversion indication objective of 500 grams and 24 hour response for a single diversion of attractive material by a single employee without collusion given that the employee may alter any records to which he had access. Explanation of the procedure, its relation to plant internal control, relations or internal control data monitoring to existing safeguards techniques and implementation implications are presented.

Key words: contact burn; heat conduction; human tissue; thermal impact; thermal potential; thermal safety.

The thermal impact exerted by a hot surface to human tissue is the rate of thermal energy delivered from it to the tissue. If the physiological reaction to the thermal impact is beyond the limit of a cell's resistance, a burn may result. Therefore, the severity of a burn is determined by two processes: physiological and physical. Once the physiological reaction to the thermal impact is determined on the basis of the severity of the burn, the thermal potential could be controlled to a safe level by means of a physical process with the aid of modern technology to provide the materials needed. It is this process that is of interest in the area of thermal safety. In the present study we wish to minimize the thermal impact of a hot surface on human tissue. An analytical solution of the linear heat conduction equation as applied to a three layer model is obtained under a given selected set of initial and boundary conditions. The parameters derived from the solution are discussed and subjected to appropriate experiments. The results verify the assumed conditions.

Key words: building energy use; conservation; energy conservation; electricity saved; fuel consumption.

The National Bureau of Standards has a major facility at Gaithersburg, Md. Over 3,000 people are housed in some 25 buildings, and rather strict temperature and humidity control must be maintained in much of the laboratory space. The climate control system uses a rather complex cool/reheat cycle to maintain proper humidity. Following a thorough analysis of the climate control system, steps were taken that reduced consumption of both electricity and fuel by 20 percent. The procedures by which these savings were realized are detailed.

Key words: superconductive transition temperatures; superconductivity; temperature; thermometric fixed points.

Research at NBS has shown that some elements exhibit very sharp and reproducible superconductive transitions. This research led to the development of a device, now offered through the Office of Standard Reference Materials, which permits ±0.001 K reproducibility at the superconductive transitions of Pb (Tc = 7.2 K). In (Tc ~ 3.4 K), Al (Tc ~ 1.2 K), Zn (Tc ~ 0.85 K), and Cd (Tc ~ 0.5 K). To extend the usefulness of the device, NBS has been examining the width and reproducibility of the superconductive transitions of Nb5Sn (Tc ~ 18 K), Ir (Tc ~ 0.1 K), Be (Tc ~ 0.023 K), and W (Tc ~ 0.015 K) with the view of establishing these materials as additional fixed points. This article describes these superconductive fixed points.

Key words: age hardening: copper-titanium; Dla; metastable solvus; microstructural sequence method; nucleation; ordering; precipitation; spinodal decomposition.

The early stages of spinodal decomposition in age hardening Cu-Ti alloys have been studied by electron microscopy. The alloys (1.55, 3.08 and 5.17 w/o Ti) decomposed on the quench from solutionizing temperatures into Ti enriched and Ti lean regions. Superlattice reflections, at 1/5[420]m positions as well as 1/2[210]m reflections were observed in the diffraction patterns of the as quenched 5.17 w/o Ti alloy. The alloys continued to decompose when aged at elevated temperatures. A sequence of microstructures was used to show that continuous phase separation, and hence spinodal decomposition, was the mechanism of decomposition. The metastable two phase structure which formed from the spinodal process was aligned and periodic from the start of the process. The Ti enriched phase was ordered, with the D1a(Ni3Mo:14/m) structure. Reversion experiments were performed to determine the position of the coherent metastable solvus. When aging treatments were performed near this solvus, heterogeneous nucleation of the metastable phase was observed.

Key words: atomic structure; inner shell; N4.5\v: resonance cross section profiles; spectroscopy; vacuum ultraviolet; xenon; 4d absorption.
In xenon, the cross section has been measured over the energy range 64-70 eV (194-177 Å) for two series of resonances that converge to the $4d^5s^25p^6(^1D_{2S-2P})$ limits. By a parametrization technique the cross-section amplitude and widths of these resonances have been obtained. The oscillator strength, averaged over the interval between resonances, and the widths of resonances in each series are essentially constant. The oscillator strength in these $4d^5s^25p^6(^1D_{2S-2P})$ series is small (0.06) compared to the total continuum oscillator strength integrated over open $p$ and $f$ channels. The ratio of the cross section at the $4d^5s^25p^6(^1D_{2S-2P})$ limit to the cross section at the $4d^5s^25p^6(^1D_{2S})$ limit had a value of 1.4(4), consistent with the ratio of the statistical weights of the $N_{p,f}$ levels.

Key words: ab initio calculation; level shifts; line broadening; molecular oxygen; predissociation; spin-orbit matrix elements.

The predissociation line broadening in the Schumann-Runge bands of $O_2$ is interpreted through an ab initio calculation of the pertinent repulsive potential energy curves and spin-orbit matrix elements. The ab initio results provide an overall qualitative picture of the predissociation which is further refined through a detailed comparison of calculated level shifts and widths with experimental data. The position of the dominant repulsive curve is also deduced by a deperturbation of the level shift in the second vibrational difference. The predissociation is dominated by the $^1I_9$ state crossing the $B - \Sigma^-$ state around 1.875 Å with a spin-orbit matrix element of 65 cm$^{-1}$. The $^1I_9$ and $^3I_9$ states have small spin-orbit matrix elements and play only minor roles in the predissociation. The calculated and experimental widths are in agreement for low and high vibrational levels. The apparent experimental widths between $v = 5$ and 11 are shown to be inconsistent with the theoretical analysis, the difference probably being due to line blinding.

Key words: effects of nuclear weapons; fission product gamma rays; gamma ray penetration; initial nuclear radiations; neutron penetration; radiation shielding.

Calculations and resulting data are described which are intended for use in estimating the protection afforded by buildings against nuclear radiations emitted from a nuclear burst in the first half minute or so. The basic source configuration is that for which one assumes equal likelihood of the explosion occurring on a ring of elevation 30 deg above the horizontal, relative to a structure located on the ring axis. Source spectra and angular distributions corresponding to large distance (≥ 1 mile) from burst point to structure are used. As sources we discuss here only gamma rays from fission products and from neutron interactions with air molecules.

Key words: conductivity; doped ceria; high temperature; MHD electrodes; mixed ceria.

A number of ceria compositions and ceria-based mixtures show promise as electrode material in MHD generators. This paper discusses the electrical conductivity and some of the chemical stability aspects of cerium oxide, cerium-zirconium oxide, Ta-doped CeO$_2$ and Ta doped CeO$_2$-ZrO$_2$.

Key words: delayed coincidence; f value; imprisonment; lifetime; mean life: resonance radiation; transition probability; U 1; uranium.

Measurements of the mean life of the 27 887-cm$^{-1}$ level in U 1 have been made at a single vapor density using electronic excitation and a method of delayed coincidence. The lifetime values were obtained by optically detecting the decay of the 3584.9-Å resonance transition. Using branching ratios obtained from known relative f values, the average of the measured lifetimes was corrected for imprisonment of the resonance radiation, and absolute f values were derived from the corrected lifetime giving the following results: $\tau_1 = 7.3 \pm 1.1$ nsec, $f_{3584} = 0.18 \pm 0.03$, and $f_{4797} = 0.20 \pm 0.03$. The error given with each quantity is the standard deviation as determined from the dispersion of the individual measurements. A systematic error of 1 percent due to possible nonlinearities in the time scale of the system is also assigned to the results. Unaccounted for systematic errors affect only the correction in the measured lifetime, which is small compared to the statistical error. The lifetime and f values are presented in comparison with the experimental results of another group of workers.

Key words: calibration; electrical measurement; electro-optics; high voltage measurement; impulse measurement; Kerr effect; laser systems.

A portable system for the measurement of high voltage pulses based on the electro-optic Kerr effect has been constructed and tested. This system is designed to measure microsecond risetime pulses having a duration of less than one hundred microseconds and peak values from one thousand volts to more than one hundred thousand volts.

Key words: measurement accuracy; national temperature measurement system; temperature scale; thermometer calibration; thermometer production; thermometry.

The National Temperature Measurement System is briefly described. The nature of the international temperature scale and the standard thermometers are noted, along with the accuracy levels which are possible with the latter. The "commerce" of thermometry—the producers of sensors, calibrations, and measurements as well as the major users—is outlined, with particular emphasis upon the manner in which the National Bureau of Standards interacts with and contributes to the rest of the system.

Key words: ellipsometry; optics; thin films.

Computer calculations were done to evaluate the error in an ellipsometric determination of film thickness and refractive in-
dex, due to the unknown presence of a contamination film. The
methods employed are described, and typical results are given.

15062. Schooley, J. F., Soulen, R. J., Jr., Superconductive fixed
points for thermometry in cryogenics, Instrument Society of
America International Instrumentation-Automation

Key words: fixed points; SRM 767; superconductivity;
transition temperatures.

Research at the National Bureau of Standards has shown that
several elements exhibit very sharp and reproducible supercon-
ductive transitions. This research led to the development of a
device, now offered to the cryogenics industry through the Office
of Standard Reference Materials, which permits the attain-
ment of ±0.001 K reproducibility at the superconductive transitions
of Pb (Tc, ~ 7.2 K), In (Tc, ~ 3.4 K), Al (Tc, ~ 1.2 K), Zn (Tc,
~ 0.85 K), and Cd (Tc, ~ 0.5 K). The device is easily mounted
into a cryogenic facility and the superconductive transitions are
readily observed using a simple a.c. bridge circuit recently
developed. Care must be taken, however, to exclude ambient
magnetic fields or to correct the transitions for the field present
in the laboratory. In order to extend the usefulness of the device,
we have been examining the width and reproducibility of the superconductive transitions of Nb3Sn (Tc, ~ 18 K), Ir (Tc, ~ 0.1 K),
Be (Tc, ~ 0.023 K), and W (Tc, ~ 0.015 K) with the view of
establishing these materials as additional fixed points.

15063. Laughlin, D. E., On the imaging of composition modula-

Key words: composition modulations; contrast mechanism;
electron diffraction; electron microscopy; lattice images;
modulation images; satellites; spinodal decomposition.

A new interference contrast mechanism in transmission electron
microscopy is presented and compared with the well known
lattice imaging technique. This mechanism is termed “modula-
tion imaging” as it may be used to study the periodic composition
modulations which occur in crystalline alloys which undergo
spinodal decomposition.

15064. Wiese, W. L., Kelleher, D. E., Helbig, V., Variations in
Balmer-line Stark profiles with atom-ion reduced mass, Phys.
Rev. A 11, No. 6, 1854-1864 (June 1975).

Key words: Balmer; hydrogen; ion dynamics; plasma; Stark
broadening.

Calculations of the Stark broadening of hydrogen lines show the
radiating atoms and the perturbing ions as quasistatic. The
present experiment represents an attempt to determine whether the
possible breakdown of this approximation near the center of the
line can account, at least partially, for the existing discrepan-
cies between theoretical and experimental profiles in the core of
the Balmer lines. The central regions of Hα, Hβ, Hγ, and Hδ
profiles have been measured in a well-stabilized arc over a range of
atom-ion relative velocities by varying the atom-ion reduced
mass. The cores of all four lines exhibit a significant dependence
on the reduced mass. With increasing reduced mass, the experi-
mental profiles gradually show more structure, but still less than
the theories predict. Extrapolation of the results for Hα and Hδ
to infinite reduced mass, i.e., to the static case, gives results that
agree quite well with recent calculations.

15065. Armstrong, G. T., Domalski, E. S., Energy from wastes,
Report of the Conference on Thermodynamics and National
Energy Problems, Warrenton, Va., June 10-12, 1974, pp. 386-
400 (National Academy of Sciences, National Research

Key words: fuel from waste; incinerators; organic waste
conversion; thermodynamic data for incinerators; waste
utilization.

Today I am your garbage man. I hope you will consider this an
honorable estate. The problem posed by accumulating wastes of all
kinds can be enormous; failure to solve it effectively can be fatal to
any human community. How fortunate we would be not just to
prevent it from overwhelming us, but to find a simultaneous
solution to another equally grave problem. There are signs that
this can be done, at least in part.

15066. Voigt, P. A., Measurement of U i and U ii relative oscillator

Key words: flow-stabilized arc; oscillator strength; U i; U ii;
wall-stabilized arc.

Relative gf values for 49 prominent U i i lines and 21 of the
strongest U i lines have been measured. The U ii measurements
were made using a wall-stabilized arc into which the uranium
was introduced in the form of UF6. The U i values were mea-
sured with a flow-stabilized arc which is essentially a free-burn-
ing arc stabilized by streaming argon around one of the elec-
trodes which is formed from a molten ball of uranium held in a
tungsten cup. Temperatures in the wall-stabilized and flow-sta-
bilized were 10500 K and 5500 K, respectively. The U i relative
gf values were placed on an absolute scale employing a recent
time determination for the 27887 cm-1 level of U i. This
absolute scale was extended to the U ii values by measuring the
relative intensity of a U i and a U ii line in the wall-stabilized
arc.

15067. Hougen, J. T., Radford, H. E., Evenson, K. M., Howard,
C. J., Analysis of the laser magnetic resonance spectrum of HO2,
J. Mol. Spectrosc. 56, 210-228 (1975).

Key words: asymmetric rotor levels; HO2; magnetic
resonance; rotational constants; spectral assignments; spin
splitting; Zeeman spectrum.

An analysis of the previously detected laser magnetic
resonance spectrum of HO2 is carried out by (i) assigning Mj,
quantum numbers to each observed Zeeman line, (ii) determining
the quantum numbers (N'Kne, N'Kme) and energies of the zero-field asymmetric rotor transitions involved, and
(iii) determining the values of the zero-field spin-rotation
doublet splittings in the upper and lower states of each asymmet-
cric rotor transition. The rotational transitions obtained lie in the
region 50-150 cm-1, with quantum numbers 4 ≤ N ≤ 19 and 1 ≤
K, ≤ 4. They are fit to an asymmetric rotor program to obtain the
three rotational constants A, B, and C and the three symmetric-
top centrifugal distortion constants Dk, DK, and DS. The spin
splitting fits are to an approximate theoretical expression involv-
ing two adjustable linear combinations of components of the
spin-rotation interaction tensor e. Because of the lack of spectra
from other isotopic species, a unique molecular geometry cannot
be derived.

15068. Reader, J., Epstein, G. L., Resonance lines of Cs, Ba, and

Key words: barium; cerium; cesium; ionization energy;
lanthanum; wavelengths.

The resonance line spectra of ions in the Xe i isoelectronic
sequence, consisting of the 5 transitions to the 5p15s ground
state from levels with J = 1 in the 5p65d and 6s configurations,
have been observed for Cs, Ba, and La. The observations
were made with a sliding spark on the 10.7-m normal-incidence
vacuum spectograph at NBS. The resonance transitions from
the 5p65d and 7s configurations were also observed for these
ions, except for that from \(5p^6d^3P\), of Ba III. Several resonance transitions from higher \(nd\) and \(ns\) levels were also observed. Estimated values for the \(J = 1\) levels of the \(5p^7s\) configuration of Ce \(v\) were obtained by extrapolation. The derived ionization energies in eV are Cs II 23.17(4), Ba III 35.79(6), La IV 45.95(6), Ce \(v\) 65.55(25).

Key words: flame spread and smoke development; high-rise; human behavior; life safety; plastics.

This study focuses on life safety aspects of high-rise buildings located within the United States. A high-rise building is defined as one which exceeds 24.4 meters (80 feet) and is of a Light or Ordinary hazard occupancy classification as specified by the National Fire Codes, “Standard for Installation of Sprinkler Systems.” Volume 6, No. 13, 1974. The purpose of this study is to identify and analyze the high-rise fire problems to formulate research recommendations to the Programmatic Center for Fire Research at the National Bureau of Standards.

A comprehensive review of the pertinent literature indicates that only a limited number of high-rise fire problems exist. These include increasing fuel loads and fire spread potential, smoke development and movement, life safety and occupant evacuation, and fire department operations. These specific problem areas relate to building evacuation and the vertical movement of smoke and toxic gases through a building.

A major finding of this study is that fire fatalities occurring within high-rise buildings have been few in number, historically. However, with changing construction techniques and materials, this fire experience record is subject to change. The future high-rise fire problem must be managed through the use of progressive engineering design which will keep pace with innovative high-rise building technology and interior design concepts.

Key words: line broadening; rubidium.

Normalized emission spectra of the optically excited Rb resonance lines (7800 Å, 7948 Å) have been measured in the presence of He, Ne, Ar, Kr, and Xe for about 50 Å on either side of the lines. The perturber gas pressures were in the range 100-1100 torr and the temperature was 318 K. The spectra, normalized to the total emission, are shown to be due to binary collisions. Shifts and widths of the Lorentzian cores of the lines were obtained, at pressures sufficiently low for impact theory to apply. The widths are corrected for the Rb hf's and the instrument function. Various power-law fits to the near-wing intensities are presented and compared to theoretical expectations. The red satellites reported by other authors are found to be, in the low-pressure limit, mere shoulders on the line wing for Ar and Kr, while Xe barely produces an actual peak. The measured linewidths and shifts are compared to previous measurements.

Key words: computer graphics; computer networks; graphics; networks; protocol; standards.

Common protocols provide a means for the interchange of information between dissimilar systems in a computer network. This paper discusses the background and philosophy of the common graphics protocol currently under development for the ARPANET and outlines the details of its design. Other applications for such a protocol are suggested.

Key words: computer graphics; cost-benefit analysis; cost-effectiveness; economics; performance evaluation.

This paper assesses the state of the art in cost-benefit analyses of computer graphics systems and suggests an approach for developing improved methodology. Cost-benefit analyses are distinguished from analyses of system performance in that the latter is directed at optimizing system performance at a given level of investment, while the former is directed at justifying the investment itself.

Computer graphic system design alternatives are first outlined. Then methods of analyzing the performance and costs of computer systems in general and graphic systems in particular are discussed. With this information it is shown how cost-effectiveness analyses may be performed. The next crucial step is to conduct benefit analysis, an ill-defined art. The results of benefit analysis must be combined with cost-effectiveness analysis in order to perform the desired cost-benefit analysis.

An experimental methodology is suggested for better performing benefit analyses of computer graphics systems. A more rigorous formulation of the cost-benefit procedure is then outlined. No attempt is made in this report to actually perform such an analysis.

Key words: algebra of currents and quarks; constituent quarks; current quarks; hadronic structure; meson transformation; meson spectroscopy.

In this review a summary of our attempt to establish and understand the connection between hadron spectroscopy and the algebra of currents is discussed. In addition, our present knowledge of meson structure and decays is reviewed.

15074. Hurst, W. S., Note on the measurement of the response of oceanographic temperature sensors, J. Geophys. Res. 80, No. 18, 2663-2666 (June 20, 1975).

Key words: oceanographic temperature measurements; temperature measurement; temperature sensors; thermometry; time constant; time response.

The response times of three different types of oceanographic platinum resistance temperature sensors were measured employing the conventional rotating water container procedure. At low sensor immersion velocities (<100 cm/s) the response was strongly dependent upon the details of the sensor insertion velocity for one sensor design. With carefully defined measurement procedures, reproducible values for the “time constant” were obtained, but their application in data analysis must be treated with caution.

Key words: atom; collision; Cs\(_2^+\); ion; Li\(_2^+\); low energy; Na\(_2^+\); pseudopotential; Rb\(_2^+\); resonant charge transfer.

The interaction between an atom and ion of the same element leads to gerade and ungerade states of the diatomic molecular ion. The energy splittings between the gerade and ungerade states determine the cross section for resonant charge transfer. Using the JWKB approach these energy splittings are derived from the asymptotic forms of the wave functions for the isolated
atom and ion. Pseudopotential calculations of the splittings are reported for $\text{Li}_2^+$, $\text{Na}_2^+$, $\text{Rb}_2^+$, and $\text{Cs}_2^+$, and are used together with previous ab initio and model-potential calculations to test the JWKB method. The comparison shows that the method is sufficiently reliable to facilitate accurate calculations of the cross sections for resonant charge transfer at low energies.

Key words: crossed beams; cross section; $D_2^+$; dissociative recombination; electron scattering; $\lambda$-radiation.

Cross sections have been measured as a function of electron energy (1.4 to 7.5 eV) for production of $L_a$ photons from the dissociative recombination of electrons and $D_2^+$. Ions made in a low-pressure ion source by electron bombardment and formed into a beam are reacted at right angles with a magnetically confined electron beam. Recombination was observed by detecting $L_a$ photons from resultant excited atoms. It was demonstrated that a large fraction of the observed light arises from cascade to the $2p$ state from levels of higher principal quantum number. The measured cross section is thus presented as an upper limit for formation of $D(2p)$ in the dissociative recombination process. The results, represented approximately by the expression $\sigma(2p) < (7.6 \times 10^{-18})E^{-1.3} \text{ cm}^2$, indicate that recombinations leading to formation of a $D(2p)$ are a small fraction of the recombination measured by Peart and Dolder.

Key words: access; access control; authentication; computer networks; computer security; computer terminals; personal identification.

The advent of time-sharing and computer networking has resulted in a proliferation of computer users, many of whom are located remotely from the computer which serves them. This has been accompanied by increased opportunities for unauthorized users to gain access to computers and has focused attention on the problem of identifying and authenticating properly authorized users. The requirements of the recently-enacted Privacy Act of 1974 calls for a number of safeguards in the handling of personal information by the Federal agencies, and personal identification of personnel authorized to have access to such information is an important aspect of the implementation of this law. This paper considers the various approaches to personal identification and authentication, on the basis of things known to an individual, things possessed by an individual, and characteristics of an individual, such as appearance, handwriting, voice, fingerprints, and hand geometry.

A set of evaluation criteria is presented as a guide in selecting personal identification systems for various applications. It is pointed out that currently-available systems are vulnerable in varying degrees to erroneous recognition and circumvention, and therefore should be incorporated into a hierarchical security system which utilizes a variety of safeguards, including auditing features to provide a record of what is accessed, by whom, and for what purposes.

Key words: half-life measurement; isomeric decay; isotope $^{113}\text{In}$; radioactivity; rate of charge measurement; $4\pi$ pressure ionization chamber.

A precise determination of the $^{113}\text{In}^-$ half-life has been made by means of a nominal $4\pi$ pressure ionization chamber. The value obtained was 99.21 min with an uncertainty of 0.13 min which is the linear sum of the component of random error at the 99 percent confidence level and the estimated systematic errors.

Key words: atomic; inner shell; photoionization; quantum-mechanical.

This chapter of “Inner Shell Processes” (to be published by Academic Press) provides a survey of theoretical methods used in treating inner shell photoeffect. The subject is approached from a quantum-mechanical viewpoint and various approaches are related within this context.

Key words: decay of swirling flow; helical flow; pressure differential during swirling flow; swirling flow.

The decay of swirling flow fields in steady-state flow in cylindrical, unobstructed, smooth pipes is considered from measurements made in two pipes. With water flowing in one pipe, mean point velocities and static pressures including wall pressures were measured at several stations along the pipe. With liquid hydrocarbons flowing in the other pipe, measurements were made of wall pressure and the swirling motion of the fluid, as sensed by a vanned rotor. The investigation included the pipe Reynolds number ($Re$) range 12,500 to 200,000 and for the vortex flows generated, the product $K/MD$ varied from 0 to 0.9, where $K$ is the angular momentum flux, $M$ is the axial momentum flux, and $D$ is the pipe i.d. Results including those of other sources show that $K$ decreases exponentially along the pipe at a decay rate $\beta$ ranging from about 2 percent per pipe diameter at $Re = 200,000$ to 4 percent per pipe diameter at $Re = 12,500$; and that data scatter and values of $\beta$ for other sources demonstrate dependence of $\beta$ on the inlet geometry, and possibly on $K$ and system turbulence characteristics. Other results show the ratio of the pressure gradient along the wall during swirling flow to nonswirling flow varies primarily with the angular momentum flux. The behavior of swirling flow fields is not well known, and these facts can aid in an improved description of swirling fields in which the performance of flow measurement and control devices might be evaluated.

Key words: breakdown passivity; chloride; ellipsometry; iron; passivity; pitting.

The breakdown of passive films on iron in pH 8.4 sodium tetraborate/boric acid solution by the action of chloride ions has been studied using a combination of ellipsometric and electrochemical techniques. Two induction times associated with the breakdown process were observed. At $t_i$, anodic current increases due to increased ionic conduction through the film, followed at $t_f$ by a localized growth of thick oxide film. These induction times are influenced by chloride ion concentration, time of passive film growth, and temperature of film growth.
Growth kinetics of the passive film in the presence of chloride ion is indistinguishable from that in its absence below a potential $E_c^2$, that potential above which ferrous ion is not found in solution. Above this potential, breakdown occurs and film growth in the presence of chloride ion results in no limiting thickness.

The results indicate that adsorption and complete penetration by chloride ion to the metal surface is necessary to initiate pitting. When complete penetration occurs, subsequent precipitation of porous $\gamma$-FeOOH allows easy local dissolution leading to pitting. After breakdown, a lowering of potential to values below $E_c^2$ causes an apparent repassivation of the film as indicated by the fact that raising the potential above $E_c^2$ results in another incubation period before breakdown.

Key words: digital processing of decay rates; digital sampling; graphics display terminal; interactive program; least-squares analysis; real-time analyzer; reverberation room; spectrum shaping.

The installation of a 64K byte minicomputer to the NBS Sound Laboratory has made the capabilities of digital processing available for application to the various types of reverberation room measurements. The present work applies this technique to reverberant field decay rate measurements. Such measurements conducted with analog equipment are limited by the amount of time and labor required to make and process the large number of decay curves necessary to achieve precise results. Reduction of these limitations is realized by interfacing the computer to digital sampling equipment capable of processing thirty 1/3-octave bands simultaneously. Through control of the reverberation room source sound and signal-processing equipment, the computer can conduct decay measurements and apply a least-squares analysis to the stored data to compute the decay rates. The software is to be expanded into an interactive program allowing the experimenter to observe the data on a display device and insert his own decisions into the data reduction process.

Key words: intermolecule-force; parity-violation.

We have measured the circular polarization of $\gamma$ rays from thermal neutron capture in $^{113}$Cd and find a $P_{\gamma} = (6.0 \pm 1.5) \times 10^{-4}$ for the combined 8.51- and 9.04-MeV transitions. This value was measured using a transmission Compton polariometer and pulse-counting technique. The value confirms the existence of parity-nonconserving terms in the internucleon force.

Key words: cleavage; compilation; crystal; crystal habit; crystal space group; crystal structure types; density; determination; identification; minerals; optical properties; twinning; unit cell dimensions.

This edition, which will comprise two volumes, is a thoroughly revised and updated work, containing over 24,000 entries. Some 7,500 carbon-containing crystalline compounds are given in Volume I. They are listed, within each crystal system, according to increasing values of a determinative number: $alb$ ratio in triclinic systems, $ela$ ratio in dimetric systems, cubic cell edge $a$ in the isometric system. Conventional rules insure the uniqueness of crystal setting.

For each crystalline species the following properties are listed on the first line: axial ratio(s) and interaxial angles not fixed by symmetry, cell dimensions, space group or diffraction aspect, number of formula units per cell, crystal structure (whether determined), measured density, $x$-ray calculated density. Then come: name of the compound, synonym(s), chemical formula, literature reference, transformation matrix (when the original data had to be recast to conventional cell and setting). Additional information includes some or all of the following: crystal-structure type (if any), goniometric axial ratio(s), crystal habit, cleavages, twinning, color, optical properties, indices of refraction, optical orientation (except in the anorthic system), melting point, transition point.

Nearly all the data were obtained from original sources. "Limits of error" on numerical values are quoted from the reference. The data have been tested for self-consistency by means of computer programs. Any erratum found either in the reference or in an abstracting journal (e.g., Structure Reports) is specifically mentioned: erroneous values are thus identified. Editorial critical remarks point out possible errors in the literature.

Formula and name indexes enable one to learn if crystallographic information is available on any given compound, thereby providing a starting point for bibliographic searches.

Key words: calibration; diamond cell; fluorescence; high pressure; hydrostatic pressures; ruby.

The pressure dependence of the $R_1$ ruby fluorescence line has been calibrated at 25 °C against the compression of NaCl. Pressures are determined using the Decke equation of state for NaCl. The dependence is linear to 195 kbar following the equation $P_{\text{sat}} = 2.746(\Delta \Lambda)$, where $P$ is in kbar and $\Delta \Lambda$ in Å. The uncertainty in the value of the slope, $dP/d\Lambda$, expressed in terms of a 95 percent confidence interval is $2.746 \pm 0.014$ kbar Å$^{-1}$. The coefficient of the quadratic term $(\Delta \Lambda)^2$ is not significantly different from zero; and the quadratic term makes indeed a negligible contribution to the fit. Taking into account the reported uncertainty associated with the Decke equation of state for NaCl, the value of the slope is $2.740 \pm 0.016$ kbar Å$^{-1}$ within a 95 percent confidence interval.

Key words: auto headlamp glass; population; refractive index; RI variance; statistics; temperature coefficient.

The work described in this paper was designed to evaluate the refractive index (RI) variance within and between auto headlamp glass currently manufactured in the U.S.A. The purpose is to provide the criminalist with a reliable statistical data base for decision making when confronted with this type of evidence. A precision refractometer was used to measure point-to-point RI variations within the lens components of new and used lamps. At least 13 pieces of glass from each of 46 lenses were evaluated. The spread of RI for all glasses was found to be $1.475 - 1.478$. From these data it was ascertained that the headlamp glass population consists of three groups: newer and older glass made by Company A and all glass made by Company B. The newer glass significantly differs by $3 \times 10^{-3}$ in RI from the other two groups whose distribution of RI values overlap. This difference is many times larger than the standard deviation within each group and within a single lens. The change in RI with temperature was determined.

Key words: automated test equipment; automated tests for jet engine fuel controls; computer interfacing; digital computer controlled tests; jet engine fuel control testing; minicomputer applications; minicomputer controlled tests; supervisory control; test equipment reliability.

The adjustment and calibration of the fuel control, the accessory which meters flow to the engine burners, requires long-term bench tests involving many often repeated manual operations. Minicomputer-based hardware and software systems, developed during 1968-1971, which control an existing production test stand are reviewed. The systems automating this stand, used in the rework of TF-30 engine controls, simulate engine parameters burner pressure and drive shaft speed using supervisory control. Also, metered fuel flow is measured and read out. An auxiliary panel at the test stand containing readout and input devices enables the operator to run the test. This prototype system has served as basis for two test systems, under contract and slated for production, which will automate nine stands.

Key words: adsorption; gel permeation chromatography; hydrogen bonding; liquid chromatography.

Chloroform, methanol and benzoic acid are hydrogen bonding compounds that are simultaneously adsorbed and self-associated during liquid chromatography from carbon tetrachloride with polystyrene/divinylbenzene (Styragel). An equation is derived to treat the measured distribution coefficient dependence upon solute concentration. In dilute solution, chloroform and methanol exhibit the effect of adsorption without appreciable self-association. At higher concentrations methanol and benzoic acid show markedly less adsorption. This is the expected result as larger associated species are formed and then excluded sterically. The agreement between theory and experiment is better if one assumes that only the monomeric species is adsorbed. Experiments of this type are easily performed and they provide a helpful insight into the chromatographic mechanism.

Key words: angular distributions; bond geometry; chemisorption; energy distributions; oxygen on (100) tungsten; surface bonds; uv photoemission.

Recent theoretical work has suggested the possibility of determining chemisorption bond geometry by the use of uv photoemission. This possibility is being investigated experimentally in an apparatus developed at NBS. The apparatus is described, and preliminary results are presented which show energy distributions as a function of emission angle for electrons photoemitted from W(100), both clean and with adsorbed oxygen. The results obtained at $h\nu=21.2$ eV for several emission angles indicate substantial angular dependence of the photoelectron distributions, not only for the clean (100) surface, but also more dramatically, with an oxygen adlayer.

Key words: ferromagnetic transition metals; field emission; spin polarization; strongly correlated metals; surface density of states; theory.

It is shown that the combination of spin-polarization and field-emission energy distribution measurements on ferromagnetic transition metals will provide direct information about the onedimensional surface density of states in a direction normal to the metal surface for a given spin.

Key words: electron energy distribution; field emission; tungsten; work function.

Field emission has proven to be a very useful technique for obtaining work function changes from single crystal planes or from the whole emitter. The inability to independently measure the electric field has limited the accuracy of field emission total current measurements for determining absolute work functions. Young and Clark's method of combining field emission energy distribution measurements and total current versus voltage measurements to eliminate the electric field as an unknown is not adequate because it does not take into account the effects of the surface density of states present in the energy distribution. In this paper we discuss a technique to overcome this problem, which involves a series of measurements taken as a function of electric field and an extrapolation to zero field. The method yields reliable values of the work function for the low index (flat) (100) and (112) planes of tungsten but not for the high index (rough) (013) and (111) faces.

Key words: adsorbate atom; dielectric function; electronic states; optical adsorption.

We calculate the dielectric response of adsorbate atoms on a metal surface assuming an Anderson model of the system. The dielectric function is then used to predict the change in the surface optical reflectance caused by the adsorbates. General results are obtained for substrates with one and two electron bands with and without the assumption of momentum conservation in the band-to-band optical transitions. A detailed analysis is carried out for the single-band momentum-conserving case. Here, the model is the same as that studied by Caroli and Kjollerstrom if the substrate density of states and various matrix elements are taken to be constants. However, we find an additional nonnegligible contribution omitted in their analysis. In other single-band cases, the range of good behavior which may be obtained for different parameter ranges and provide expressions to be used in data analyses.

Key words: computer; evaluation; measurement; performance; service; utility.

Interactive conversational computing requires more appropriate measures of performance than those presently applied toward improving the efficiency of system operation. A “stimulus-acknowledgement-response” model has been conceptualized to describe the man-computer interaction. A data acquisition system called the Network Measurement Machine has been developed meeting the objective of being able to measure the delivery of computer services to any user. A set of analysis pro-
grams providing statistical summaries of workload, response, and communications utilization analysis over subsets of a conversation, such as use of specific software services, are potentially useful to systems designers and implementers. A sample application is presented with preliminary results.

Key words: enthalpy of combustion, dry basis; enthalpy of combustion, saturated basis; enthalpy of formation, hydrocarbons, heating value; hydrocarbons: International System of Units.

Equity in the sale of natural gas or other gases for fuel purposes requires that the total calorific values be accurately known and that the same values be used throughout the industry for gases of identical properties. This paper gives the total calorific values (gross heats of combustion at constant pressure) of gaseous H_2, H_2S, CO, CH_4 and 49 selected other gaseous hydrocarbons, C_1 to C_8, in the ideal gas state at standard conditions of 60°F and 30 in. Hg (288.71 K and 101591.3 N · m⁻²) on a molar basis, on a dry volumetric basis and on a water-saturated volumetric basis. Units used are kJ · mol⁻¹, MJ · m⁻³, Btu_0 · (scf)⁻¹.

A supplementary table is given for the total calorific values of the same substances in the ideal gas state at the slightly different standard conditions of 60°F and 14.73 psia (288.71 K and 101559.8 N · m⁻²) on a dry volumetric basis and on a water-saturated volumetric basis. Units used in this table are MJ · m⁻³ and Btu_0 · (scf)⁻¹. Total calorific values for real-gas methane are also given on the above bases. Enthalpies of combustion and molar heat capacities of crystalline carbon (graphite), and all the above named gases are given in the thermodynamic standard states at 298.15 K. Procedures for making the calculations, and necessary auxiliary data are given. Implications of the possible change of the measurement system to metric units are discussed.

Key words: field emission; field ionization; ion neutralization; surface spectroscopy; tunneling.

The extension into the vacuum of the exponential tail of the wave function makes it possible remarkably sensitive techniques based on field ion emission, ion neutralization and field ionization.

Key words: bonded resistance strain gage; combined effects; evaluation tests; fatigue; high temperature; performance characteristics.

Since it is usually impossible to determine the performance characteristics of the specific resistance strain gages that will actually be used in a test program, we must depend upon their behavior being predictable from tests that have been conducted on other gages. When resistance strain gages first became available, information about their performance was limited. The situation was further complicated during World War II when a number of organizations began producing gages, usually for their own use. A similar situation arose when the need for strain measurements at elevated temperatures induced a number of organizations to produce gages for such use. User and third party evaluation testing was instrumental in the development and characterization of the gages during these times. Today most manufacturers carry out continuing testing and evaluation programs to insure that the user can rely upon their products and to maintain and enhance their competitive positions in the field. However, the user must continue to carry out such tests when special requirements or test conditions are encountered.

A brief history of evaluation testing of bonded resistance strain gages is given, and two evaluation tests are described.

Key words: giant resonance; intermediate structure; nuclear structure; particle-hole model; quasi-bound states; two-particle two-hole states.

The reaction theory of Fano is applied to the analysis of the ¹⁶N(ρ, γe)¹⁶O data vis à vis the ¹⁶N(d, γe)¹⁶O data. The result is consistent with the Gillet model which attributes the structure near 22.9 MeV in ¹⁶O to a 2p-2h quasibound state.

Key words: identification of compounds by refractive index; micro determination of refractive index; microscope for accurate determination of refractive index; multiple prisms.

Steep optical-glass prisms in contact with the liquid being measured bend a collimated monochromatic beam. The deflected beam enters the microscope, and an image of the target forms at the back focal plane of the objective. The distance of the image from the center is proportional to the sine of the angle of deviation and rigorously related to determinable constants of the system and the refractive index of the liquid. Accuracy increases with steepness of prism, but the refractive index range served by any one is thereby reciprocally decreased. Sine of the angle of deflection, angle of the particular prism being used, and the refractive index of the prism are sufficient for direct calculation of the refractive index of the liquid. When the angle of the prisms is 72°, an accuracy of 10⁻² is achieved. Each prism (with a numerical aperture of 0.11) can then serve a range of only 0.06 in index. This necessitates a series of prisms of selected optical properties, each serving 0.05 in index and providing a comfortable overlap. About 1 cubic millimeter of liquid is required for a full determination.

Key words: baseline studies; fresh water sampling; sampling device; sea water sampling; trace organic analysis; water pollution.

Analytical chemists have become more involved in projects concerning water pollution, environmental impact statements and hydrocarbon baseline studies. A device for obtaining replicate and representative samples of the aquatic environment under consideration is needed. A water sampler has been designed to meet this need.

15100. Unassigned.

Key words: absorption spectroscopy; air pollution; laser; NO₂.
An argon ion laser emits several laser lines in the visible region of the optical spectrum. The absorption coefficients of NO\textsubscript{2} at these laser emissions were measured in a multiple pass absorption cell. A differential technique, in which the ratio of the transmitted intensities of the argon laser emissions is measured, is described to determine the concentration of NO\textsubscript{2} in a polluted atmosphere over path lengths of several kilometers. Measurement of ratios eliminates interferences from particle scattering and thermal index gradients. Evaluation of the data taken in the 48 meter multipass cell indicates that concentrations of NO\textsubscript{2} less than one part per million could be determined in a 1 km optical path.

Key words: calorimeter; energy equivalents; energy measurement; heat transfer; internal energy measurement; isoperibol calorimeters; measurement theory.

A calorimeter can be modeled as a large number of volume elements or cells in each of which the temperature may be considered uniform, and each of which can store heat and exchange heat with other cells. Application of the first law of thermodynamics to this set of cells leads to representations of the usual calorimetric equations for the energy change expressed in terms of measurable or estimatable heat capacities, heat transfer coefficients, temperatures, and work terms for the individual cells. Analysis of the results yields a framework within which most of the design and measurement problems of isoperibol calorimeters can be treated.

Key words: calorimeter; fabrics; flammability; heat of combustion; rate of combustion.

A calorimeter has been designed, calibrated, and tested to measure the total amount of heat released and the rate of heat released from the combustion of fabrics in air. Calibration of the calorimeter gave a reproducibility of \pm 3 percent for total heat measurements and \pm 5 percent on rate measurements. Consideration of systematic errors gives an expected accuracy of \pm 7 percent for total heat and \pm 10 percent for combustion rate measurements. Measurements on cotton show that 90 percent of the standard heat of combustion is released when cotton is burned in air. The rate of heat release for cotton is independent of fabric weight. The constancy of rate of heat release as determined calorimetrically confirmed the result implied by the 45° test measurements on flame spread rate. The rate and amount of heat release of other commercial fabrics and blends were also measured.

Key words: electroexcitation; electron scattering; form factors; intermediate coupling; reduced transition probability; \(^{31}\)P.

Form factors for the electroexcitation of the \(^{3/2}^+\) (1.27 MeV), \(^{5/2}^+\) (2.23 MeV), and \(^{3/2}^+\) (3.51 MeV) states in \(^{31}\)P have been measured for momentum transfers from 0.36 to 0.80 fm\(^{-1}\) at the NBS electron scattering facility. In addition, form factors for the 2.23 MeV state in the momentum transfer range 0.74 to 1.78 fm\(^{-1}\) have been extracted from data obtained in a previous experiment. Using the DUELS distorted-wave code the \(B(E2, \omega)\) \(\downarrow\) were found to be 6.0 \pm 0.9, 6.9 \pm 0.3, and 2.7 \pm 0.3 W.u. for the 1.27, 2.23, and 3.51 MeV states, respectively. The form factors for these states, calculated using wave functions derived in an intermediate-coupling vibrational calculation, are compared with the data.

Key words: electrodisintegration; electron scattering; inelastic electron scattering; monopole excitation; monopole strength; \(^{3}\)He.

A broad electric monopole excitation peaking at 6.4 MeV has been observed in the breakup of \(^{3}\)He induced by inelastic electron scattering. The monopole cross section was obtained from the observed cross section by subtracting the electric-dipole contributions converted from photodisintegration cross sections by using the virtual photon theory, and also subtracting the magnetic multipole contributions obtained from a 180° electron-scattering experiment. The extracted monopole matrix element is 2.4 \pm 0.5 fm\(^2\).

Key words: automated systems; fluidic logic; gas chromatography; plasma chromatography; sampling.

Fluidic logic sampling systems have been developed for analytical detectors such as the plasma chromatograph and flame ionization detector. Automated systems are reported for gases and vapor-phase samples which are rapid, quantitative and reproducible. Sample modulation systems, multiplexers, parallel-to-serial converters and sequential samplers have been developed which give no leakage or cross-talk signals. Other applications in analytical chemistry are proposed.

Key words: calibrated XUV detectors; irradiance; radiometry; second order diffracted radiation; synchrotron radiation; XUV grating monochromators.

A technique is presented of using a single calibrated XUV detector for radiometric measurements of synchrotron radiation after the radiation passes through a monochromator that produces a mixture of first and second order diffracted radiation. Irradiance measurements are made with the synchrotron source operating at two different energies for the orbiting electrons. The known change in the spectral distribution produced by the electron energy change is used to calculate the flux in both first and second order. The dependence of the precision of these determinations on the two detected currents and the detector calibration at both first and second order wavelengths is calculated. Experimental results using the National Bureau of Standards synchrotron (SURF-II) are presented, and anticipated results for the new NBS electron storage ring (SURF-II) are calculated.

Key words: electrical resistivity; graphite; heat capacity; high-speed measurements; high temperature; thermal emittance; thermodinamics.

Measurements of heat capacity, electrical resistivity and hemispherical total emittance of Poco and pyrolytic graphites in the temperature range 1,500 to 3,000 K by a sub-second duration pulse heating technique are described. For a given graphite grade, heat capacities of different specimens were in agreement within 0.5 percent. The difference between the results of the two different grades was about 1.8 percent: the results of Poco being higher than those of pyrolytic. Electrical resistivity of the Poco graphite was about four times greater than that of pyrolytic graphite (parallel to basal planes). Hemispherical total emittance of Poco graphite was almost twice that of pyrolytic graphite.

Key words: activation energy; ammonium-ion dynamics; ammonium perchlorate; jump reorientations; quasi-elastic neutron scattering; residence times.

An investigation of the rotational motion of ammonium ions in NH4ClO4 is reported. Quasielastic neutron scattering measurements were made on a polycrystalline sample at temperatures between 65 and 150 K. The shapes and widths of the quasielastic scattering peaks as a function of momentum transfer are consistent with instantaneous reorientation about the four C3 axes. Residence times are derived as a function of temperature yielding an activation energy of 2.3 kJ/mole and a frequency factor 1/τo of 3.7 x 10^4 s^-1.

Key words: C=N bond; infrared spectrum; isotopic substitution; matrix isolation; methyl azide; methylenimine; normal coordinate analysis; photolysis; thermodynamic properties.

Eleven isotopic species of methylenimine have been prepared by the mercury-arc photolysis of methyl azide isolated in argon, nitrogen, and carbon dioxide matrices at 4 and at 14 K. Sufficient concentrations of methylenimine were obtained for identification of all of the vibrational fundamentals except the NH stretching mode. Using a recent ab initio structural calculation for this molecule, it has been possible to derive a set of valence-force potential constants which provide a satisfactory fit to all of the infrared spectroscopic data. The magnitude of the carbon-nitrogen stretching force constant is appropriate for a double bond. The temperature dependence of the thermodynamic properties of methylenimine has also been calculated.

Key words: ethane; gas phase kinetics; ion-molecule reactions; mass spectrometer; product ions.

The ion-molecule reactions in ethane have been investigated in a mass spectrometer at pressures from 0.1 to 5 torr and at temperatures ranging from 189 to 410 K. The major primary ions, C2H5+, C2H3+, and C2H4+, react with ethane to form the respective addition ions, C2H5CH2+, C2H3CH3+, and C2H4CH3+. Under these conditions, the addition ions dissociate to give all the product ions which have been attributed to reactions of these primary ions in previous studies. The major product ions resulting from these dissociation reactions are the C3H5+ and C5H7+ ions, formed by dissociations of the C5H5+ and C5H7+ ions, respectively. The rate constants for disappearance of the primary ions decrease as the temperature is raised from 189 to 410 K, from 2 x 10^-10 to 0.9 x 10^-10 cm^3/molecule sec for the ethylene ion, from 2.5 x 10^-10 to 0.5 x 10^-10 cm^3/molecule sec for the ethyl ion, and from 2 x 10^-10 to 0.5 x 10^-10 cm^3/molecule sec for the ethane ion. There is no evidence that any of the product ions react further with ethane to give higher molecular weight addition ions under these conditions of temperature and pressure. When H2O is added to ethane the ethylene ion is intercepted in a rapid reaction to form the C2H4·H2O+ complex, which reacts further with water to add a second, a third, and a fourth molecule of water.

Key words: bridge decks; chlorides; concrete; corrosion; epoxy coatings; organic coatings; steel reinforcing bars.

This study was undertaken to ascertain the feasibility of using organic coatings, especially epoxies, to protect steel reinforcing bars embedded in concrete of bridge decks from rapid corrosion. This corrosion is caused by chloride ions from the deicing salts, sodium chloride and calcium chloride. Altogether, 47 different coatings were evaluated to some extent, of which 36 were epoxy coatings.

The results of this study indicate that some epoxy coating, if properly applied, should adequately protect steel reinforcing bars from corrosion. Epoxy coated bars had acceptable bond and creep characteristics when embedded in concrete and therefore can be used in existing bridge designs. Epoxy coated bars can also be used in other concrete structures.

Key words: air exchange measurement; air infiltration measurement; building ventilation; sulfur hexafluoride tracer.

Air infiltration measurements were made in a four-bedroom townhouse by the tracer dilution method using sulfur hexafluoride (SF6) as the tracer gas. The house was contained in an environmental chamber with control over both the inside and outside temperature, with essentially no wind velocity. The well-known correlation between inside/outside temperature difference and infiltration rate was observed, and under conditions of negligible wind velocity the effect of sealing doors and ducts was investigated. Simultaneous use of SF6 and He as tracer gases gave no evidence that molecular diffusion played a significant role in the measurement.

Different methods of collecting air samples for analysis were compared. SF6 measurements were also compared with air exchange rates imposed on the house by means of a fan. Finally, the effects of poor mixing were analyzed by comparing the expected results in the case of perfect mixing with those expected in the case of air exchange without mixing and with imperfect mixing.

Key words: bead-spring model; chain molecules; chain stiffness; deoxyribonucleic acid; dilute solutions; hydrodynamic interaction; polystyrene; viscoelasticity; Zimm theory.

The viscoelastic properties of chain molecules varying in flexibility and length have been calculated by use of the bead-spring model theory of Zimm. In the evaluation of the hydrodynamic in-
interaction parameter, the number of springs in the bead-spring model, \( N \), has been selected from the range in which the properties predicted by the theory are insensitive to the value of \( N \). The results for limiting viscosity number agree with those predicted by the Yamakawa-Fuji theory of the limiting viscosity number of wormlike chains. The theory also fits the experimental data of Johnson on a sample of polystyrene of molecular weight 600,000 in theta solvents at infinite dilution. The viscoelastic properties of some moderate molecular weight deoxyribonucleic acid solutions are predicted to deviate from the non-free-draining behavior toward the free-draining behavior.

Key words: fluorescence; Mössbauer spectroscopy; porous glass.

Fluorescence and Mössbauer spectroscopy in conjunction with elemental analysis have been used to verify that the fluorescence which develops in commercial porous glass, doped under reducing conditions, is due to Sn(II). The fluorescence shown by in-house-formulated, porous, high silica glass impregnated with Sn(II)Cl, and sintered under various conditions is used to substantiate this conclusion. Corrected fluorescence spectra for the Sn(II) species and isomer shifts and quadrupole splitting for various Sn species in glasses are also given.

Key words: boundary layer; grid; intermittency; moments; statistical properties; turbulence; velocity-gradients.

Higher-order moments of turbulent velocity gradients and their behavior with Reynolds number were measured in the nearly isotropic turbulent field generated by a square-mesh grid and in a turbulent boundary layer along a flat plate with zero pressure gradient. Hot-wire anemometry and instrumentation combining analog and digital methods were used to measure moments up to the fourteenth order. Measurements of such higher-order moments required that particular attention be given to their validity. Involved herein was the evaluation of such effects as nonlinearity, averaging intervals, and the adequacy of the statistics for the tails of the probability density distributions. The results obtained are compared with those of other investigators for a variety of flow configurations in the laboratory as well as in the atmosphere. The concept of the intermittency of the small-scale structure and the theoretical approach involving lognormality of the probability density distribution of the dissipation rate are evaluated.

Key words: colorimetry; highway signs; photoelectric tristimulus colorimeters; photometry of retroreflective materials; retroreflective sign materials.

Because color-coded applications of highway signs increase, specification of colors and color tolerances are required. In order to assure that the requirements are met within specified regions, a measurement technique needs to be developed and described. To accomplish these goals the U.S. Department of Transportation contracted with the National Bureau of Standards to conduct the required studies and make the necessary recommenda-
tions. Having previously performed a study for daytime conditions, the National Bureau of Standards was competent to perform a study for nighttime conditions. The colorimetric properties of 126 samples of retroreflective materials of 7 different colors were measured with 3 telecolorimeters in simulated nighttime conditions. One spectrophotometer was used to measure color of 38 of the samples in simulated daytime conditions. The colors measured were: red, orange, brown, yellow, green, blue and silver (white). Differences of color measured by means of different telecolorimeters on the same samples were evaluated.

As a result of these studies procedures for making colorimetric and photometric measurements were developed and are included in this report. On the basis of the color measurements and their variability tentative recommendations for color boundaries were prepared and are also included in this report.

Key words: electric utilities; hot cell inspection; in-service inspection; nondestructive testing; nuclear power; reactor components.

The article is a description of American Nuclear Society Topical Meeting "Nondestructive Testing in the Nuclear Power Industry" held in Columbus, Ohio, September 23-25, 1974. Key statements and key papers in the various sessions at the 2 1/2 day meeting are discussed to give readers of the ANS journal, Nuclear News, an idea of what was presented at the meeting.

Key words: flatness; gage blocks; interferometry; length measurement; parallelism.

Geometric properties of gage blocks are important in many length measurement applications. Methods are described for measuring the flatness of gaging faces and the parallelism between opposing gaging faces. These methods, used for many years, employ interferometers and electro-mechanical gage block comparators.

Key words: Ag I; $f$-value; imprisonment; lifetime; mean life; resonance radiation; silver; transition probability.

The mean life of the $5p^2P_{3/2}$ resonance level in Ag I has been measured at two different vapor densities using electronic excitation and a method of delayed coincidence. The lifetime values, obtained by optically detecting the decay of the $5p^2P_{3/2} \rightarrow 5s^2S_{1/2} (3280.68 \text{ Å})$ resonance transition, increase with increasing vapor density. This vapor density dependence was interpreted as being due to the imprisonment of the $3281 \text{ Å}$ resonance radiation. The Holstein theory of the imprisonment of resonance radiation was applied to the lifetime-versus-vapor density data to yield the following results: $\tau_0 = 6.5 \pm 0.6 \text{ ns}$, $A_{2285} = 1.53 \pm 0.14 \times 10^{-7} \text{ s}^{-1}$, and $f_{2285} = 0.50 \pm 0.05$. The error limits were derived primarily from estimated uncertainties in the measured mean lives and possible variations in the vapor densities during the runs. Experimental results of other workers are presented for comparison with the results of the present work.

Key words: anelastic relaxation; calcium fluoride; defect pairs; dielectric relaxation; EPR lifetime broadening; fluorine interstitials; gadolinium ions; reorientation processes.

Measurements are reported of the temperature dependence of EPR lifetime broadening in the spectrum of Gd$^{3+}$ ions in tetragonal sites in CaF$_2$ and of dielectric and anelastic relaxation in similar specimens. Concentrations ranged from 0.01 to 0.27 mol percent GdF$_3$, and the crystals were annealed in flowing He plus H$_2$ at various temperatures. The strongest relaxation modes ($R_i$) arising from pairs formed from Gd$^{3+}$ ions trap F$^{-}$ interstitials could be identified in both the dielectric ($T_{11}$) and the anelastic ($E_{0}$) spectra. The rate constants are $\ln T_0 = -32.83 \pm 0.24$ ($T_0$ measured in seconds) and $Q = 0.44 \pm 0.005$ eV, and are to be associated with jumps of the F$^{-}$ interstitials originating at the nearest-neighbour sites to the Gd$^{3+}$ ions. A low-temperature relaxation ($Q \approx 0.2$ eV) was observed in the anelastic spectrum with trigonal symmetry and also in the dielectric spectrum. It was found to consist of several components. It is argued, contrary to earlier conclusions, that this relaxation is not an additional mode of the same centre giving rise to $R_i$. A higher temperature relaxation ($Q \approx 1.1$ eV) was seen only in the anelastic spectrum, and was approximately isotropic. It too cannot be identified on the basis of present information.

Key words: ambient temperatures; dislocation mechanisms; fracture mechanics; sapphire; slow crack growth; thermal activation.

A recent paper attempts to explain the strain-rate dependence of the strength of sapphire filaments using a dislocation assisted slow crack growth model. We propose an alternative model which gives a quantitative prediction of the observed behavior. This model, based on fracture mechanics measurements of slow crack growth in the absence of dislocation activity, considers that the crack growth is a thermally activated bond rupture process.

Key words: alcohol; glass; mechanism; silicon carbide; wear.

Normal alcohols were used as cutting fluids in a study of friction and wear of soda lime silicate glass against silicon carbide. Abrasion surfaces were 600 grit silicon carbide paper and a roughened plate of hot-pressed silicon carbide. As the alcohol chain length increased, the coefficient of friction decreased. This result was attributed in part to better lubrication of the abrading surfaces by the long chain length alcohols. The wear rate and the coefficient of friction were strongly dependent on pullout of carbide grains from the silicon carbide paper. Wear on fresh abrasive paper was independent of alcohol chain length. As the paper becomes used, long chain length alcohols were more effective cutting fluids. On the silicon carbide plate, the wear rate decreased in a non-linear fashion as the alcohol chain length increased. For all conditions, the highest wear rate and coefficient of friction were obtained in water. Data are explained in terms of classical theories of friction and wear.

Key words: alkali cyanides; crystal dynamics; dispersion curves; orientation; phonons; rotational disorder; single crystal.

The lattice dynamics of KCN and NaCN in their disordered cubic phase has been studied by coherent inelastic neutron scattering and infrared reflection measurements. Acoustic phonon branches for cyanide single crystals were measured in the [001] direction, with more limited measurements taken in the [110] direction. The one-phonon scattering generally appeared as weak peaks superimposed on a large background of non-one phonon scattering, particularly as measurements were extended to higher energy. No peaks clearly assignable to optical phonons were observed in the neutron measurements but the infrared reflection spectra for polycrystalline pellets were analyzed to derive TO and LO phonon energies (at $q = 0$) of 17.0$\pm$0.6 and 28.5$\pm$2.5 meV. These measurements (and a comparison with the rather easily measured acoustic and optical phonons in a KBr crystal of similar volume) indicate that phonons do not exist as well-characterized excitations in the cyanides at higher frequencies and finite wave vectors. The unusual character of these results is attributed to the dynamical disorder of the cyanide ions in the fcc crystal and is compared with recent phonon measurements in the analogous face centred cubic phase of ND$_4$I. The [001] transverse acoustic branches of both KCN and NaCN show unusually low frequencies below $q = 0.5$, which are consistent with recent elastic constant results and with the very large Debye-Waller factors derived from previous neutron diffraction results, and suggest further that the phase transitions in the cyanides are "driven" by a soft shear mode.

Key words: fracture probability; slow crack growth; strength degradation; sustained loading.

The strength degradation that occurs at sustained load, due to slow crack growth, is calculated in terms of the slow crack growth parameters. It is shown that the degradation is only significant in specimens with an initial strength marginally larger than the initial strength of the last specimen that failed at the sustained load.

Key words: averaging spheres; diffusing effectiveness; efficiency; flux averaging; photometry; spectrophotometry.

The design of averaging spheres without internal target is described. The performance of such spheres is analyzed theoretically and tested experimentally. In a final design, an efficiency of 40 percent is achieved for visible and near-uv wavelengths. The averaging effectiveness is characterized by signal variations of the order of 1 part in $10^4$ for beam displacements of several 0.1 mm.

Key words: cryothermometry; low temperature; thermometry.

The subject of temperature measurement below 0.3 K is reviewed, with particular attention paid to developments reported in the period 1970-1974. Sensors, measurement techniques, primary and secondary thermometers, and fixed points are discussed and attempts are made to assess the accuracy and relative merits of the various devices and methods.

15128. Melmed, A. J., Stein, R. J., Field-ion microscopy of silicon,

Key words: actinides; Coulomb term; energy; excitation energy; metal; 5f electron.

Relativistic Hartree-Fock-Wigner-Seitz band calculations have been performed for the actinide metals Ac through Am in order to estimate 5f excitation energies. Our calculations predict that the tetravalent state (i.e., four s-d conduction electrons) is favored for the lighter elements with a crossover to a trivalent ground state occurring near uranium. We find the Coulomb energy, \( U \), for 5f electron hopping to increase from 2-3 eV at Th to 4-5 eV at Am.

Key words: defects in crystals; diffusion; drift velocity; driving force; matrix equations; non-cubic crystals.

From a complete-path approach in which defects are followed from the time of their creation at defect sources to the time of their destruction at defect sinks, general matrix equations are developed which relate the atom drift velocity \( v_i \) for diffusion in a driving force to simple matrices whose elements can be written by inspection. Previous equations for \( v_i \) have been restricted either to crystals and defects having high symmetry or to cases where the \( x \) components of any atom jumps were either \( \pm b \) or 0. By contrast, the present equations involve no such restrictions. They apply to diffusion by interstitial, vacancy, and other more complex mechanisms, independent of the presence of symmetry planes, and allow calculation of diffusion drift velocities even when the individual atom jumps provide a variety of jump distances along the diffusion direction. These equations apply, for example, when jumps to both nearest- and next-nearest-neighbor sites are allowed and to diffusion in arbitrary crystallographic directions even in noncubic crystals. The present equations can be expressed in terms of a general matrix \( S \). The relation of \( S \) to the less general matrices \( S' \) and \( S'' \) defined previously for crystals having mirror symmetry planes normal to the diffusion direction is discussed.

Key words: administration of computing; computer services; management; microeconomics; pricing.

Microeconomics has much to offer the computer services manager. This article reviews some of the traditional topics in microeconomics and shows how they can be applied to the market for computer services. The topics covered include supply, demand, costs, and pricing. The most significant application of microeconomics is in setting prices—so much so that microeconomics is frequently called “price theory.” Accordingly, the thrust of the article is towards providing a sound framework for the pricing of computer services.

Key words: constraints; equation of state; fluid; least squares; parameter estimation; \( p-V-T \); statistical weighting; thermodynamic properties.

Methods and techniques for calculating the thermodynamic properties of a fluid from a mathematical model of the \( p-V-T \) equation of state are given. Criteria for choosing a mathematical form for the equation of state are discussed. Numerical and statistical parameter estimation techniques presented include linear and non-linear least squares; constraints; simultaneous use of different kinds of data; significance tests and statistical weighting. Formulas for many of the derived thermodynamic properties are also presented.

Key words: asymmetric lineshapes; photoelectron spectroscopy; photoemission; x-ray edge singularities.

Creation of a deep localized hole in the process of x-ray photoemission from metals is followed by a drastic rearrangement of the surrounding electrons in the Fermi sea. This rearrangement in which low-energy electron-hole pairs are produced, in analogy with gas-phase atomic shake-up processes, gives rise to a low-energy tail in the hole spectral density with an integrable (Mahan) singularity at the energy corresponding to zero-energy pair production. When the usual (symmetric) broadening of the hole is included, the resulting hole line shape becomes a skew resonance, with the asymmetry indices growing with the strength of the electron-hole interaction. The case in which the hole potential is switched on instantaneously (the sudden or impulse limit) has been treated by Doniach and Suničić. However, the potential switching-on time is a function of the speed at which the excited electron leaves the region of the hole. In this paper we calculate the skew line shapes for finite hole-creation times, going continuously from the adiabatic to sudden limits. The photoemission line shape, for a given hole state, varies smoothly from the symmetric result given in the adiabatic approximation to the asymmetric result of Doniach and Suničić obtained in the sudden approximation, as the photon energy is increased above the photoionization threshold value.

Key words: CO; electron excitation; energy loss spectra; resonance decay; resonant structure; threshold.

Electron impact excitation functions of numerous states in CO have been measured at 45° scattering angle with resolutions of 16-23 meV FWHM. The decay peak of the 10.04 eV resonance can be seen in the results for the \( a' \Pi \), \( a' \Sigma^+ \), and \( A \ ' \Pi \) vibrational levels. There was no evidence of resonant excitation of the \( a' \Sigma^+ \) state near 8 eV as suggested by Newton and Thomas. Excitation functions of the \( b' \Sigma^+ \), \( B' \Sigma^- \), \( C' \Sigma^- \), \( e' \Pi \), and \( E' \Pi \) states, and a previously unobserved state at 11.26 eV show numerous sharp resonances in the first few eV above threshold. Energy loss spectra in the 8-14 eV loss region show peaks corresponding to known states as well as to unidentified states. No sign of the metastable state at about 9.5 eV seen by Wells, Borst, and Zipf could be detected in direct excitation, but
an indirect excitation process involving the $A \Pi$ state is consistent with the data.

Key words: density of states; elastic tunneling; tunneling junctions.

The theory that the tunneling current in a non-superconducting tunnel junction depends on the densities of states of the electrodes has been known for some time although Harrison has suggested that it is in fact not correct. In this paper Harrison's suggestion is critically discussed and the expression for the tunneling current is written in a way that emphasizes its dependence on the *surface* densities of states of the electrodes and takes into account the band structure of the oxide barrier. We find

\[ J = \int_{-\infty}^{\infty} d \omega \left[ f_1(\omega) - f_2(\omega) \right] \sum_{k_\parallel} D(\tau_r, \tau_s; \omega, k_\parallel) \xi(\omega, k_\parallel) \rho(\tau_r, \omega, k_\parallel) \rho(\tau_s, \omega, k_\parallel) \]

where $f_1, f_2$ are the Fermi functions of the left and right hand electrodes, $D$ is the probability that an electron tunnels from a point $\tau_s$ in the barrier near the left hand electrode to a point $\tau_r$ in the barrier near the right hand electrode, $\xi$ depends on the oxide and is a slowly varying function of $\omega$ and $k_\parallel$, the electron momentum parallel to the electrode surfaces, $\rho$ is the one dimensional density of states of the left hand electrode in the direction normal to the electrode at a position $\tau_r$ in the barrier for electrons of energy $\omega$ and momentum $k_\parallel$, and $\rho_{\tau_s}$ has a similar meaning. This expression for $J$ reduces to that previously derived by Harrison if the electrodes as well as the oxide barrier are treated in a WKB approximation. In this limit $J$ has no dependence on the densities of states due to cancellations from the factor $\xi$. Recent field emission experiments and theory have shown that the tunneling current is dependent on the electrode density of states so the expression for $J$ given above must be used. It is suggested that the failure to observe such effects in tunnel junctions is due to imperfections in the junction and that tunneling in metal-vacuum-metal junctions or in perfected tunnel junctions will give density of states information.

Key words: analytical chemistry; computer; data acquisition; laboratory automation operating system; teleprocessor.

The Analytical Chemistry Division at the National Bureau of Standards has developed a centralized computer facility for laboratory automation, which is described in this paper. This facility consists of two major components. These are the teleprocessor, which handles all communication between the laboratory and the computer, and the computer itself. Also described are the essential system software packages including the Operating System, the File System, and the Data Acquisition System.

Key words: critical refractive index; Fabry-Perot interferometer; Lorenz-Lorentz function; methane; rectilinear diameter law; refractive index; refractometric virial coefficients.

The refractive index of gaseous and liquid methane was measured between 95 and 300 K and to pressures of 225 bar (1 bar = 10^8 Pa). The measurements were performed at the ^{199}Hg vapor green line, $\lambda = 546.2$ nm, with a Fabry-Perot interferometer referred to vacuum. The refractive index data were combined with the previously measured densities of methane to calculate the Lorenz-Lorentz (L.L.) function. Refractometric virial coefficients were obtained from analysis of the small ($\sim 0.5\%$) maximum exhibited by the (L.L.) function with increasing density. $B$, the second refractometric virial coefficient, is estimated to be $\approx 6.0$ (cm/\text{mol}^2) and is almost independent of temperature between 220 and 300 K. The critical point refractive index, $n_c = 1.10333$, was extrapolated from a rectilinear diameter treatment of the saturated liquid and vapor results. The critical point refractive index was combined with an estimate of the critical point (L.L) function to yield a critical density of methane, $\rho_c = 10.16 \pm 0.01$ mol/l.

Key words: cw dye laser; detector spectral response; electrically calibrated pyroelectric detector; radiometry; spectral irradiance; spectral radiant power density.

A new approach to radiant power measurements is described. A continuously tunable cw dye laser was used to measure the absolute spectral response of a silicon photodiode and narrow band-pass filter by comparison with an electrically calibrated pyroelectric detector. The filtered photodetector was then used to measure the spectral power density from a standard lamp that had been calibrated by the classical technique. The agreement of better than 1 percent between the two measurements is well within the uncertainties identified with each measurement individually, of the order of 1 percent. A number of advantages in the new technique are identified.

Key words: austenite; iron alloys; stacking fault energy; stainless steel; x-ray diffraction.

The stacking fault energies of seven commercial austenitic Fe-Cr-Ni, Fe-Cr-Ni-Mn and Fe-Mn-Ni alloys have been determined by x-ray diffraction line profile analysis. From comparison with existing data on laboratory alloys with similar compositions, it is concluded that both Ni and C increase $\gamma$ while Cr, Si, Mn, and N decrease $\gamma$. Regression analysis of data produced in this study provides an expression relating $\gamma$ to commercial alloy composition in terms of Ni, Cr, Mn, and Mo alloy concentrations.

Key words: crystal oscillator; frequency calibrator; frequency offset; NBS traceability; phase comparison; television.

The National Bureau of Standards checks the frequency of the network television color signals and publishes the results. Here is a way to use that information to calibrate your own oscillator.

Key words: argon; correlated molecular collisions; density expansions; fluoride; oxygen; statistical analysis; viscosity coefficient.

Experimental viscosity data for gaseous argon, oxygen, and
fluorine were analyzed as a function of density and temperature. Necessary conditions were applied to investigate if a given isotherm was consistent statistically with a given density function. It was found that the low temperature isotherms were consistent with the theoretically suggested density function, which involves terms logarithmic in the density. At higher temperatures, however, these logarithmic terms did not appear to be statistically significant.

Key words: contrast; electron probe microanalysis; electron spectroscopy for chemical analysis (ESCA); ion microprobe analysis; scanning electron microscopy; surface analysis.

Several modern techniques for the characterization and analysis of surfaces and shallow layers of nonmetallic materials are discussed, with particular emphasis on their relevance to technological problems. These include electron and ion probe microanalysis, scanning electron microscopy, ion scattering analysis, and secondary ion mass spectroscopy of surfaces.

Key words: elastic dumbbell model; flow instability; flow with longitudinal gradient; flow with transverse gradient; gradient dependence of normal stress differences; gradient dependence of viscosity; hydrodynamic interaction; intrinsic stress tensor; intrinsic viscosity.

The simplified necklace or the equivalent modified elastic dumbbell model with consideration of hydrodynamic interaction among the beads and its change with coil expansion was used for the calculation of the intrinsic stress tensor in laminar flow with transverse and parallel gradient as function of the conventional gradient $y$ and the dimensionless gradient parameter $\beta$. The expansion of the Gaussian coil in flow first increases and then decreases the hydrodynamic interaction. As a consequence the intrinsic viscosity $[\eta]_x$ of sufficiently large macromolecules and the effective average hydrodynamic resistance coefficient $A$ of the bead show first a decrease to a minimum and a subsequent gradually slower increase with the gradient. In laminar flow with parallel gradient this effect yields a deformatonal instability which may play some role in drag reduction of turbulent flow by polymer additives. Experimental evidence will have to conform or to refute these two interdependent phenomena. In the latter case, one suspects that the neglect of anisotropy of hydrodynamic interaction is the main cause of the unrealistic predictions of intrinsic hydrodynamic properties of polymer solutions.

Key words: computer simulation; crystal growth; fcc.

Positive and negative crystal growth has been simulated on a (100) surface of a fcc crystal. The results show considerable similarities with the behavior of simple cubic surfaces, as far as the values of the interatomic bond energy and of the free energy for crystalization at which transition from smooth to rough surfaces occur. Growth rates are smaller, reflecting the formation of a sizable area where both deposition and removal of atoms is hindered. The surface roughness at equilibrium is similar to that obtained by computer simulation by other authors on a (100) surface of a Kossel crystal and it is close to that of a two-dimensional square lattice.

Key words: oscillatory flows; permeability; ripple; sand transport.

Permeability effects on the movement of sand in oscillatory flows are observed in laboratory experiments which approximate prototype conditions at the seabed under progressive waves. A natural sand is used, wave periods range between 3 and 14 seconds, and sand surfaces are naturally rippled. The apparatus has a symmetry which removes all effects, except those of permeability, which might cause a net movement of the sand. Onshore and offshore directions are determined by phase relationships between the horizontal flows and superposed vertical permeability flows. A positive permeability effect is found, in that the ripple profiles move in the onshore direction. The velocity of this motion is measured and described in a simple dimensionless plot. The associated net transport of sand is not observed directly but can be inferred, to an extent, from the motion of the ripple profiles. The effects of permeability sand transport are cumulative, and can be significant in coastal processes of long duration.

Key words: high-speed measurements; high temperature; pulse calorimetry; thermodynamics; thermophysical properties.

A system is described for the transient (subsecond) measurement of selected thermal and related properties of electrically-conducting substances in the temperature range 1500 K to the melting point of the specimen. The method is based on resistive self-heating of the specimen from room temperature to any desired high temperature in less than 1 s by the passage of an electrical current pulse through it; and on measuring and recording the experimental quantities every 0.4 ms with a full-scale signal resolution of one part in 8000. The system has been used to measure heat capacity, electrical resistivity, hemispherical total emittance, normal spectral emittance, and the melting point of selected refractory elements and alloys. The results of preliminary experiments have shown the potential application of the system to measurements of temperatures and energies of solid-solid phase transformations and heat of fusion at high temperatures.

Key words: oxygen; ruthenium; satellite; shake-up; structure; x-ray photoelectron spectroscopy.

The O 1s XPS peaks from monolayers of CO and oxygen adsorbed on the basal (001) face of a ruthenium single crystal are observed to have satellites whose position and intensity are sensitive to the chemical environment.

Key words: dimensional measurement; image enhancement;
imaging methods; nondestructive evaluation; radiography; serviceability.

Quantitative aspects of radiography are described and illustrated. Radiography is a widely used method for nondestructive testing. It offers the advantage of giving an image of objects as a permanent inspection record. Voids, inclusions, and cracks in homogeneous materials and welds can be detected. The size, shape and location of discontinuities are revealed if the change in density or thickness is of the order of one percent and covers a sufficient area to be resolved by the radiographic technique. The measurement of the dimensions and depth of an object can be made and, in certain circumstances, such measurements are possible to accuracies of ± 0.001 inch.

In addition, radiography can be used effectively as an accept-reject criterion, especially in conjunction with well defined specifications and reference radiographs.

Novel radiographic methods that offer advantages in improving image contrast are briefly discussed. Included are image enhancement methods and radiography employing neutrons, monoeenergetic x-radiation, or charged particles.

Key words: atom; dye laser; electric quadrupole; fine structure; ionization; multiphoton; sodium.

Two flashlamp-pumped, tunable, dye lasers have been utilized to study three-photon ionization in atomic sodium. The resulting ion yield shows large peaks at laser frequencies which correspond to electric quadrupole transitions. This is the first direct observation of electric quadrupole effects in multiphoton ionization. The 3p $^2S_{1/2} \rightarrow 4f$ matrix element is determined, and the fine-structure splitting of the 3p state is measured.

Key words: critical phenomena; divergences at critical points; free energy surface; geometry of thermodynamic surfaces; thermodynamics.

Gibbs made extensive use of geometrical concepts in his development of thermodynamics. In this talk we examine the use of geometrical ideas to clarify our understanding of the thermodynamics of fluids in the vicinity of the critical point. The influence of Gibbs on recent developments in the study of critical phenomena is emphasized.

Key words: Arbacia punctulata; calorimetry; cleavage of cells; development of cells; fertilization; growth of cells; heat production; marine eggs; metabolism; microcalorimetry.

Heat production is an important aspect of the thermodynamics and kinetics of the initiation and subsequent metabolic—and perhaps physical—processes of growth. Tremendous advances in speed, sensitivity, and accuracy of heat measurements have come about from the use of modern techniques and semiconductor materials. Yet little, if anything, has been done on such simple systems as marine eggs since the 1924 measurements of Rogers and Cole.

We have repeated that work with the advanced microcalorimeter of the National Bureau of Standards (Prosen, 1973) which has been developed and used in clinical studies of enzyme reactions and bacterial growth. The instrument had been modified to accommodate a larger 3.4 ml reaction vessel to adapt it for biological work. This isothermal, heat-flow instrument measures the heat production of two solutions (0.75 ml and 1.50 ml) before and after mixing with an output signal of 0.2 volt/watt an ultimate sensitivity of 0.1 μsec or 90 μcoul/hr (corresponding to 0.1 μk), and with a response half-time of 2 minutes.

Since a constant-temperature room was not available it was necessary to place additional insulation around the calorimeter to limit baseline drift to 3μw/hr or less. The original plan was to measure the heat production of several thousand Arbacia eggs and corresponding sperm in the separate compartments of the reaction vessel and to follow it—after fertilization by mixing—for a few hours or several cell divisions. This has been accomplished but not as yet satisfactorily since no greater than 90 percent fertilization has been achieved in the vessel. It was first found that no fertilization or development took place in the plastic reaction vessels used, although controls in glass gave over 95 percent. A glass vessel with ports sealed with paraffin also proved unsatisfactory. Finally the original plastic vessels operated properly (90% fertilization) after flushing them with sea water for several days. The vessel ports are closed with o-ring seals.

Egg and sperm counts are incomplete, but our preliminary results are as follows: (all measurements were made in natural sea water containing 0.0001 molar EDTA and pH 7.8). Unfertilized eggs gave about 0.3 μw/1000 eggs after 1 hour with a gradual drop with time. Fertilized eggs gave about 0.6 μw/1000 eggs after 1 hour and with some small variations and a gradual drop with time. Sperm heat was also measured but results are not complete. Fertilization runs in the calorimeter gave similar heats for the unfertilized and the fertilized separate runs above and showed no burst of heat upon fertilization. Fluctuations suggest a possible correlation with stages of development.

There is no immediate explanation for the fact that these values are about twice as large as those of Rogers and Cole. However, different conditions were used and in one experiment with greater loading (50,000 eggs/ml in place of the usual 10,000 eggs/ml) we obtained their value. They used 100,000 eggs/ml. We conclude that it should not be difficult to extend the range of experiments to include measurements of fertilization and early development of a variety of marine eggs.

Key words: electron energy-loss; oscillator strengths; oxygen.

Oscillator strengths for O$_2$ from 6 to 14 eV are derived from the energy-loss spectrum of 100 eV incident electrons. Integrated $f$ values for the Schumann-Runge bands and continuum, which span four orders of magnitude in intensity, agree well with high-resolution photoabsorption measurements. Vibrational structure superimposed on the Schumann-Runge continuum, previously assigned to the (3s 3p$^2$) $^2$I$_{13/2}$ Rydberg state, contributes less than 0.5 percent to the total oscillator strength determined for that region. These data also yield $f$ values for discrete bands in the region between 9.5 and 14.0 eV, where line saturation problems complicate oscillator strength analysis of the optical data. An oscillator strength sum of 0.198 is obtained for all transitions below the ionization potential at 12.07 eV.

15153. Powell, C. J., Cross sections for ionization of inner-shell

Key words: cross sections; electron probe microanalysis; electrons; inner-shell.

A survey has been made of available theoretical and experimental cross-section data for the ionization of inner-shell electrons by electron impact in the energy range of interest to electron probe microanalysis and to Auger-electron spectroscopy.

Key words: chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; handling; hydrogen; oxidizers; oxygen; propellants; safety information; thermodynamic properties.

This Register describes thirty-eight (38) organizations that catalog and file information in their data systems on fuel and oxidizers. The fuels include hydrogen, methane (LNG) and hydrazine-type fuels (UDMH); the oxidizers include oxygen, fluorine, f20x, nitrogen tetroxide and ozone. The type of available information covers thermophysical properties, propellant systems, propellant fires-control-extinguishment, propellant explosions, propellant combustion, propellant safety, and fluorine chemistry. These organizations have assembled and collated their information so that it will be useful in the solution of engineering problems.

Key words: calibration; compatibility; cryogenic; liquid oxygen; measurement; oxygen; performance; pressure; survey; transducer.

This publication is part of an oxygen safety review in progress by the NASA Aerosol Safety Research and Data Institute (ASRD). The objectives of the review include: 1. Recommendations to improve NASA oxygen handling practices by comparing NASA and contractor oxygen systems including the design, inspection, operation, to failure of oxygen equipment from a variety of sources so that hazards may be defined and remedial measures formulated. 3. Contributions to safe oxygen handling techniques through research. 4. Formulation of criteria and standards on all aspects of oxygen handling, storage, and disposal.

The special publication summarizes the current state-of-the-art in pressure measurement in the region of 50 to 150 k (the liquid state of oxygen). The report is not limited to oxygen-proofed systems alone as this would have severely limited the report. The published literature available in the cryogenic region generally is quite restricted. The survey includes information on cleaning and materials compatibility, calibration methods and descriptions of representative transducers. A summary of recommendations is presented as well as an extensive bibliography arranged by transducer type.

Key words: charged particle penetration; dosimetry; electron slowing down; electron transport; scaling; W-value.

Douthat has found that plots of electron spectra calculated for different initial energies nearly coincide if a suitable choice of scaled variables is adopted for abscissas and ordinates. This paper provides a rationale for this choice of variables, reformulates the degradation equation in terms of the new variables, and shows how the trend of the solution of the transformed equation can be predicted semi-quantitatively by inspection.

Key words: aerosols; condensation; droplets; evaporation; kinetic theory; Knudsen number expansion; nucleation.

When the mass flux \( \Gamma \) to a liquid droplet is expanded in terms of a parameter \( \alpha \) which is the ratio of the droplet size to the mean free path (inverse Knudsen number), one obtains a series of the form \( \Gamma = [1 + \frac{1}{\alpha}] \frac{\Gamma_0}{\alpha} + \ldots \). As shown in a previous paper, the coefficients in this series are determined by integrals associated with sequences of successive collisions among a number of vapor molecules and the droplet. For a droplet surrounded by its pure vapor, we have calculated the coefficient \( \Gamma_0 \) of the first inverse Knudsen number correction to the free molecular growth rate \( \Gamma \) assuming that the vapor molecules can be treated as hard spheres. For most nonequilibrium conditions, the ratio \( \Gamma_0/\Gamma_0 \) turns out to be positive, rather than negative, as heretofore was assumed in the literature. This result implies that the reduced growth rate \( \Gamma/\Gamma_0 \) will pass through a maximum as a function of the Knudsen number.

Key words: aromatic amine; charge-transfer complexes; color; dental material; methacrylate, phthalate; N,N-dimethyl-p-toluidine; ultraviolet spectroscopy.

Yellow mixtures form on adding essentially colorless N,N-dimethyl-p-toluidine (DMPT) to colorless methacrylate monomers containing phthalate, isophthalate, or terephthalate diester groups. The color-causing interactions between the amines and monomers were investigated using ultraviolet spectroscopy. Equations were derived for predicting interactions between formulation ingredients and DMPT that would lead to undesired color.

Key words: composites, dimethacrylates: monomers: resins; synthesis.

Crystalline aromatic diether methacrylates can be prepared from dihydric phenols or their bis(2-hydroxyethyl) derivatives by simple condensation procedures. Three solid isomers form a liquid ternary eutectic when mixed in suitable proportions.

Key words: cw dye laser; frequency stabilization; intensity stabilization.

A system is described for stabilizing a cw dye laser frequency to a high-finesse optical cavity. The length of this optical cavity is locked to a CH3-stabilized He-Ne laser with a tunable frequency-offset technique. A very fast servo system (using an intracavity KD*P crystal), a long dye laser cavity, and the stabilized optical cavity result in an absolute frequency stability of 1 kHz for an integration time of 10^-4 sec and 300 Hz for 300 sec. Intensity is stabilized to one part in 10^6.

Key words: adhesive bonding; chelation; comonomers; coupling agents; dental materials; hard tooth tissues; metal ions; mordant.

A number of hypothetical concepts are presented to serve as a guide for experimentation. The concepts include the combined use of etching and surface-active comonomers to obtain improved adhesive bonding between polymers and hard tooth tissues, and the use of certain metal ions to augment the interaction between the coupling agents and the tooth surfaces.

Key words: carries mechanism; dicalcium phosphate dihydrate; enamel mineral solubility; pyrophosphate formation.

Tooth enamel, when treated with dilute H_3PO_4 solutions, dissolved incongruently with formation of large CaHPO_4·2H_2O crystals. Equilibrated solutions were saturated with respect to CaHPO_4·2H_2O, and a mineral more soluble than well-crystallized, synthetic Ca_3(PO_4)_2·H_2O, probably an impure, defective apatite. The CaHPO_4·2H_2O crystals formed at considerably higher pH values than expected because of enhanced solubility of the apatitic phase in enamel. Pyrolysis of carious enamel revealed the presence of acidic calcium phosphate presumed to be CaHPO_4·2H_2O.

Key words: comment to editor; discrete; frequencies; nondivergent radiation.

A high-resolution spectroscopic study has been made of the radiation emitted in the forward direction from cylindrical targets bombarded with electrons. The discrete energy bands previously reported by Das Gupta were not observed for photon energies from 4 to 200 keV.

Key words: acrylic resin; cement; medical materials; orthopedic materials; polymethylmethacrylate, self-curing; surgical bone cement; total hip replacement, cement.

Polymethylmethacrylate cement is characterized in terms of chemical composition, handling characteristics, and physical properties; the dough time, setting time, handling time, and temperature rise were found to be most affected by environmental temperature and kneading of the dough mass. As the set material ages, the residual monomer content gradually decreases and the strength increases. A volume shrinkage of up to 5 percent was observed. The porosity, which is increased by rapid mixing, may reach 10 percent. The mechanical properties of the cement approximate those of polymethylmethacrylate denture base materials. Some variability encountered in the handling qualities of the cement could be attributed only to the variability of different batches.

Key words: activation analysis; characterization; chemical composition; chromatographic analysis; coulometry; electron probe microanalysis; ion-selective electrodes; mass spectrometry; polarography; spectrochemical analysis; thermal analysis; wet chemistry; x-ray fluorescence.

Determination of the chemical composition of solids, i.e., information on the identity and location of the atoms in a particular material, is essential if one is to have confidence that the material can be reproduced. In this chapter an integrated summary of pertinent information on many different analytical techniques is presented. Summaries of sensitivities and precisions to be expected using these techniques are given. Applications to specific characterization problems are discussed and examples are given from the literature, of detailed studies of a number of high purity materials which illustrate the present state-of-the-art for the characterization of practical samples.

Key words: 60Co; gamma rays; Josephson junction; noise thermometer; thermometer.

In order to establish an absolute low temperature scale we are comparing a (hcp) single crystal 60CoCo γ-ray anisotropy thermometer to a Josephson junction noise thermometer in the temperature region below 0.04 K. The temperature dependences of both thermometers are governed by independent fundamental relations. Once the parameters of each system are established, the temperatures obtained should be absolute, i.e., no previous calibration is needed, nor is any extrapolation used to determine the temperature. We have examined the possible sources of error in a single crystal Co γ-ray anisotropy thermometer. The reproducibility of the anisotropy at a fixed temperature is within the statistical uncertainty of the measurements; systematic errors arise from the uncertainty in the value of the hyperfine interaction, neglect of a possible quadrupole interaction and/or a small admixture of M3 radiation, mosaic spread of the crystall, solid angle correction factor, effects of closure domains and domain walls, variation in background radiation, and effect of scattered γ-rays. The effects of these errors can be calculated and subsidiary experiments can be performed to check these calculations.

Key words: molecules; noble gases; radiation; sodium.

The normalized emission spectra resulting from the perturbation of Na atoms by 1-1000 torr of noble gas have been measured in the range 10-150 nm about the 589 nm resonance line. This spectrum, due to the A-X and B-X transitions of the Na-noble gas molecules, was measured with 1.5 nm resolution. The Na, in a cell at a temperature of 417 ± 5 K, was optically pumped to the 3P_1/2 and 3P_3/2 states by resonance radiation. The resulting emission was measured at several Na densities to obtain the normalized emission spectra in the limit of zero radiation entrapment. Using the Franck-Condon principle, or equivalently the quasistatic theory of line broadening, and density factors, the A^1S^1/2 and X^1S^1/2 state potentials for NaAr, NaKr, and NaXe have been obtained from the pressure dependence of the spectra.
Continuum absorption and emission coefficients for these molecules, obtained by application of the same theories, are also presented. The analysis identifies the low pressure limit of the spectrum as due to free collision states above the angular momentum barrier. The population factors corresponding to quasibound, orbiting resonances are evaluated and used in this analysis.

Key words: Axilrod-Teller correction; dense liquid; excess function; hydrodynamic limit; molecular dynamics; rare gases; velocity autocorrelation function; 11-6-8 potential.

The pressure, energy and self-diffusion coefficient have been calculated for an 11-6-8 fluid using the method of molecular dynamics. A comparison with data for argon, krypton and xenon is presented. It is shown that agreement between theory and experiment for the thermodynamic properties is generally within the estimated precision of the calculated and experimental values, provided three-body and quantum corrections are included in the calculation, except when the density approaches the triple-point density. Agreement between theoretical and experimental self-diffusion coefficients is satisfactory at all densities after allowance is made for the long-time behaviour of the velocity autocorrelation function. We demonstrate that three-body forces are important in the liquid and that our estimates of such forces are very close to those suggested by Barker, Fisher and Watts.

Key words: cavity theory; dosimetry; Fano theorem; ionization chambers; radiation measurement; radiation transport.

Fano’s proof that uniform radiation fields result when sources and interactions are strictly proportional to local density is discussed in connection with an alternative proof formulation.

Key words: cryogenic; dynamic mechanical properties; glass-fiber composites; literature review; static mechanical properties; thermal properties.

Objective is to provide an understanding of the general magnitude of property values obtainable within the cryogenic temperature range, to provide a feel for the relative literature ranking of specific composite types with regard to a specific property, and to impart an understanding of the temperature sensitivity of the property of interest. A bibliography and bibliography-property cross-reference is included. This is Part I of a two-part series. Part II will consider advance composites.

Key words: international measurement; measurement system; national economy; national/international measurement system.

National and international measurements are vital to our national economy. They are vital in business transactions measuring the quality of materials and goods, vital to our citizens in measuring the performance and safety of products, and vital to government for measuring compliance with national laws. This measurement “system” must have anchor points and its quality must be monitored and improved. The National Bureau of Standards was established by Congress in 1901 to accomplish that function.

Key words: field of values; Hermitian matrix; normal matrix; positive definite.

For n by n complex matrices A the following two facts are proven by elementary techniques: 1. If $A^n$ is never normal, $m \in I^r$, then the equation $x^m = 0$ has a solution $0 \neq x \in C^r$, $m \in I^r$; 2. If $H(A) = (A + A^*)/2$ is positive definite, then $H(A^n)$ is positive definite for all $m \in I^r$ if and only if $A$ is Hermitian.

Key words: correlation function; experimental data; hydrodynamic behavior; methane; molecular dynamics; potential function; self-diffusion coefficient; 11-6-8 potential function.

Self-diffusion coefficients of methane have been calculated over a wide density range using the method of molecular dynamics. Methane intermolecular interactions were modelled using an m-6-8 potential with coefficients determined from viscosity data for the dilute gas. After adding a contribution to the diffusion coefficient due to the long-time behaviour of the velocity autocorrelation function, agreement with experimental data is within the estimated errors given for both the calculated values and the experimental data.

Key words: adenosine-5'-triphosphate; biochemical enzyme catalyzed reactions; glucose; heat measurements; hexokinase; metabolic processes; microcalorimetry; thermochemistry; thermodynamics.

The enthalpies of the hexokinase-catalyzed phosphorylation of glucose, mannose, and fructose by ATP to the respective hexose 6-phosphates have been measured calorimetrically in TRIS/TRIS-HCl buffer at 25.0, 28.5, and 32.0 °C. The effects on the measured enthalpy of the glucose/hexokinase reaction due to variation of pH (over the range 6.7 to 9.0) and ionic strength (over the range 0.02 to 0.25) have been examined. Correction for enthalpy of buffer protonation leads to $H^o$ and $\Delta C_p^o$ values for the processes: $\Delta Q-D-hexose + ATP^o = \Delta Q-D-hexose 6$-phosphate$^2+ + ADP^o + H^o$. Results are $H^o = -23.8 \pm 0.7$ kJ·mol$^{-1}$ and $\Delta C_p^o = 156 \pm 2$ J·mol$^{-1}$·K$^{-1}$ for glucose, $H^o = -21.9 \pm 0.7$ kJ·mol$^{-1}$ and $\Delta C_p^o = 10 \pm 140$ J·mol$^{-1}$·K$^{-1}$ for mannose, and $H^o = -15.0 \pm 0.9$ kJ·mol$^{-1}$ and $\Delta C_p^o = 41 \pm 160$ J·mol$^{-1}$·K$^{-1}$ for fructose. Combination of these measured enthalpies with Gibbs energy data for hydrolysis of ATP$^o$ and that for the hexose 6-phosphates lead to $\Delta S$ values for the above hexokinase-catalyzed reactions.

Key words: diffusion equations; finite-difference techniques; impurity redistribution; moving boundary
problems; numerical methods; partial differential equations; semiconductor technology.

Finite difference techniques and a particular computer algorithm are given for a one dimensional diffusion problem in a composite domain with time dependent domain and moving interfacial boundary. The physical problem involves the redistribution of an impurity (boron) caused by the oxidation of a semiconducting crystal (silicon). The boundary conditions at the interfacial boundary express conservation of mass and the propensity of the impurity to be dissolved in one rather than the other of the two adjacent materials (the segregation condition). The novel feature of the algorithm is its employment of the integral form of the conservation of mass boundary condition instead of the conventionally used differential form.

Key words: coexisting densities; finite system; “flat” loop; fluid-solid phase transition; Lennard-Jones System; Monte Carlo Studies.

The issue between SRM and HV is shown to be the uncertainty in the coexisting densities obtained by the two methods and not the methods themselves.

Key words: cryogenic insulation; powders; thermal conductivity; thermal diffusivity.

The thermal conductivity and thermal diffusivity of selected evacuated porous insulations have been measured between 4 and 300 K to better understand the heat transport mechanisms. The thermal conductivity of both perlite and uncoated microspheres can be represented by \( k = bT^3 \) to within the experimental error. The conductivity of aluminum coated microspheres was found to be highly dependent upon sample history.

Key words: branching; freezing points; metastable fluids; nonlinear operator; pair correlation function; single particle probability density.

The subject of this article is the fluid-solid transition and, in particular, an analysis of crystallization in terms of quantities which describe the average local arrangements of molecules in a fluid. We determine whether it is possible to predict the existence of crystalline solutions for the local molecular density from a Hamiltonian which is invariant under all translations and rotations. Crystallization is studied using the single probability density, the pair correlation function, and the intermolecular potential energy. An integral equation is obtained for these quantities, and we pursue the existence of crystalline (i.e., periodic but nonconstant) solutions for the single probability which branch from the fluid (i.e., constant) solution which is the number density. The phenomenon of crystallization, that is, the existence and determination of these solutions, can then be represented as a nonlinear eigenvalue problem. The analysis is applied to hard sphere systems in one, two, and three dimensions. Crystallization to close-packed lattices is found in two and three dimensions when the isotropic media are overcompressed by amounts which depend on the structures to which the fluids crystallize. That is, the fluid persists into a portion of the metastable region. The nature of the crystalline solutions is analyzed in the neighborhood of the branching eigenvalues, and the relation between these special eigenvalues and equilibrium freezing points is discussed. The stability of these crystalline solutions is determined by comparing the values of a free energy-like functional on these solutions with its value for the fluid.

Key words: conference; temperature; thermometry.

Key words: improper integrals; integrals; numerical analysis; numerical integration; numerical quadrature; Riemann integral; singularities.

Let \( R \) be the class of all functions that are properly Riemann-integrable on \([0, 1]\), and let \( IR \) be the class of all functions that are properly Riemann-integrable on \([a, 1]\) for all \( a > 0 \) and for which

\[
\lim_{a \to 0^+} \int_a^1 f(x) \, dx
\]

exists and is finite. There are computational schemes that produce a convergent sequence of approximations to the integral of any function in \( R \); the trapezoid rule is one. In this paper, it is shown that there is no computational scheme that uses only evaluations of the integrand, that is similarly effective for \( IR \).

15181. Unassigned.

Key words: levitation; magnetic suspension; materials fatigue data; refrigeration; superconducting magnets; transportation.

The current status (December 1972) of worldwide research on high speed ground transportation techniques is reviewed. Particular attention is given to studies of magnetic levitation using superconducting magnets, including comparison with alternative magnetic techniques and with air suspension systems. Superconducting levitation appears to be a strong contender in the U.S. Department of Transportation hopes to select in the late 1970's the best of the possible levitation techniques for subsequent advanced development. Cryogenic engineering research needed in support of major development of a superconducting levitated system is identified.

Key words: heat detector; optical radiation sensor; poling; polymer; polyvinyl fluoride; polyvinylidene fluoride; pyroelectric effect; relative spectral response; ultraviolet detector.

This report summarizes the results of a program to develop optical radiation sensors for fire detection using polymeric pyroelectric sensing elements. Emphasis has been placed on techniques for constructing such devices, including methods of enhancing the pyroelectric response. Materials investigated included polyvinyl fluoride (PVF) and polyvinylidene fluoride.
Highlights reported include achievement of a value of specific detectivity, D'*, of $2 \times 10^4$ cm$^2$ Hz$^{1/2}$/W and the construction of a set of sensors useful over a wavelength range extending from the ultraviolet to the infrared.

Methods of characterizing the performance of sensor elements are described.

Key words: correlation; critical point; equation of state; methane; thermal conductivity; thermal conductivity coefficient; viscosity coefficient.

An equation is proposed to calculate the viscosity and thermal conductivity coefficients of methane from the dilute gas to the dense liquid. The range of validity of the equation is approximately 95-400 K for pressures up to 50 MPa (500 atm). The reliabilities of the coefficients calculated are estimated at approximately 2 percent and 5 percent for the viscosity and thermal conductivity coefficients, respectively. The equation includes a contribution for the thermal conductivity enhancement in the critical region.

Key words: bone; chemical grafting; collagen; rat skin; surface modification; tissue surfaces.

Various techniques to modify hard and soft tissues, with the aim of enhancing adhesion, are reviewed. Treatment of enamel surfaces with acids enhances adhesion because of mechanical interlocking of resin at the enamel resin interface. Coupling agents have had some success in promoting adhesion of tooth structure to dental restoratives.

Special emphasis is given to chemical grafting techniques to obtain covalent bonding to tissue surfaces which are investigated in our laboratory.

The grafting of monomers to soft and hard tissues so that after polymerization of the monomer the proteinaceous surface is bonded covalently to the polymeric side chain, offers an attractive technique for improving surface characteristics of skin, bone or dentin. Grafting monomers containing additional functional groups that are potential reactive centers for further modification of the collagenous surfaces appears feasible. Grafting to soft tissues can be conducted in the presence of various redox systems, but grafting to bone is best accomplished with persulfate-bisulfite initiator. Modification of the tissue surface is indicated by changes in wettability, decreased water sorption and improved resistance to mold growth. Surfaces with the desired degree of hydrophil to lipophil balance to suit specific applications may be prepared. The modified surfaces could be useful as adhesion promoting liners for restorative resins.

Key words: creep; dental amalgam; marginal ditching.

Marginal ditching of dental amalgam restorations was related to the physical property of creep in clinical studies directed by Mahler. Because of his conclusions and similar results in other studies, a recommended revision of the ADA Specification No. 1, Alloy for Dental Amalgam, includes a creep test. This effort to improve the specification and limit the certification of alloys to those having good marginal integrity is dependent upon well planned, clinical research.

Key words: Gallium phosphides; high pressure; metallic phase transitions; phonon dispersion; Raman scattering; silicon.

One- and two-phonon Raman spectra of Si and GaP were measured at room temperature for pressures up to 135 kbar. An opposed diamond-anvil high-pressure cell was employed in the experiments, and its design and use for Raman scattering are described in detail. Mode Grüneisen parameters and quadratic pressure coefficients were measured for phonons at several zone-boundary critical points as well as at $q = 0$. In addition the general effect of pressure on large portions of the phonon dispersion near the zone edge could be inferred. In both materials zone-boundary TA modes “softened” with increasing pressure, while optical phonons shifted to higher energy. Using the high-pressure Raman data a calculation of the thermal-expansion coefficient of Si as a function of temperature (negative at low temperature) achieved fair agreement with experiment. Measured and theoretically calculated mode Grüneisen parameters are compared for several tetrahedral semiconductors. The Raman spectrum of Si was measured up to the metallic ($\beta$-Sn structure) transformation at 125 $\pm$ 5 kbar. This transition is discussed within the context of the bond-charge model.

Key words: binary systems; cryogenic fluids; interaction second virial coefficients; review; solid-vapor equilibria; unlike molecule interactions.

The current status of knowledge regarding solid-vapor equilibrium is reviewed. Available data are summarized for systems composed of He, Ne, Ar, Kr, Xe, H$_2$, N$_2$, O$_2$, F$_2$, CO, CO$_2$, CH$_4$, C$_2$H$_6$, C$_4$H$_8$. Currently used experimental techniques are described, including experimental difficulties. Methods for theoretical description of solid-vapor equilibrium are given. The value of solid-vapor equilibrium data is discussed, with emphasis on the information furnished regarding unlike-molecule interactions.

15189. Unassigned.

Key words: architectural psychology; dwelling unit; federal building research; industrialized housing; occupant behavior; Operation Breakthrough; performance evaluation.

Occupants of Operation Breakthrough and of conventional housing were interviewed about their homes and on related topics. The opinions of these two groups of occupants were compared in order to determine comparability of the housing based on the opinions of their occupants. The matching of OBT and conventional housing, their occupants and their sites was relatively successful. The comparison of occupant opinions lead to the conclusion that OBT housing was favorably evaluated and that its evaluation was at least as good as if not superior to that of
the conventional housing. The conclusion is discussed in the context of earlier research on industrialized housing and in terms of the goals of the Operation Breakthrough program.

B. Galloway, J. Dent. Res. Symp. 9, No. 4, 105-117 (1975). Key words: biomaterial; bone cement; orthopaedic material; poly(methyl methacrylate); specification; surgical bone cement.

A proposed specification covering handling characteristics and physical and chemical properties of bone cement composed primarily of methyl methacrylate has been prepared on the basis of data from the authors' studies and from various other sources. Under handling characteristics, requirements included relate to dough, handling and setting time, proper plasticity for insertion and temperature rise on setting. Mechanical properties specified include compressive strength and indentation and recovery characteristics. Maximum limits are proposed for water sorption and solubility. Suggested packaging requirements are also included.

Key words: A15 phases; iridium alloys; superconductivity; vanadium alloys.

Superconducting transition temperatures, $T_c$, and initial slopes of the critical magnetic field curves have been determined for A15 phase V-Ir alloys. Samples investigated range from $V_{c1}Ir_{0.6}$ to $V_{c1}Ir_{0.9}$ at 2% steps. $T_c$ increases with increasing Ir content, from $<15$ mK for $V_{c1}Ir_{0.6}$ to 1.85K for $V_{c1}Ir_{0.9}$. Low temperature ordering annals do not markedly affect the superconducting properties of these alloys. Metallurgical aspects of these materials are discussed.

Key words: dosimetry; fusing; furnace annealing; glow curve; maximum heating temperature; peak height; reproducibility; sensitivity loss; superlinearity.

A method of LiF thermoluminescence dosimetry (TLD) requiring no furnace annealing is described which can be used with many general-purpose commercial TLD readers. With this method, one produces LiF TLD characteristics similar to those obtained after conventional annealing. Glow-curve areas following successive identical exposures of a sample reproduce to within a relative standard deviation of 1 percent, but peak heights are less reproducible. Supralinearity characteristics are similar to those of conventionally annealed samples. While fading is somewhat more pronounced, it is not prohibitive for many medical applications. Maximum nominal planchet temperatures of 300 °C during readout produce essentially complete annealing in the medical exposure range, without appreciable loss in sensitivity due to successive irradiations and readouts, while sensitivity losses sometimes amount to as much as 8-10 percent for maximum nominal readout temperatures of 400 °C.

Key words: behavior; behavioral suppression; emission; microwave radiation; microwaves; product safety; radiation effects; resonant cavity; rehus; suppression.

The heads of two rhesus monkeys were irradiated in a 383-MHz resonant cavity immediately before and during performance of a four-choice forced-choice serial reaction task. CW radiation at integral dose rates of 0.001-17.5 W were delivered to the head. No effects were observed below a critical dose level (= 23 W/kg) derived from integral dose rate and body mass. Above this level, behavioral suppression occurred, i.e., correct response rate was profoundly altered. The effect was completely reversible and repeatable in one of the subjects—the other subject did not recover completely and was sacrificed for histological examination which revealed no gross or microscopic damage. The nature of the effect suggests a neurochemical rather than an electrical or mechanical basis for the results.

Key words: hydroxyapatite; nonstoichiometry; solid-to-solution ratio; solubility; surface chemistry.

Brown et al. have formulated a thermodynamic treatment for the solubility of hydroxyapatite in which recognition of a distinction between surface and lattice contributions is explicitly made. Verification of the applicability of this approach to the Ca(OH)$_2$-H$_2$PO$_4$-H$_2$O system has been carried out by Avnimelech et al. The purpose of the present study is to apply the theory of Brown et al. to the quaternary system Ca(OH)$_2$-H$_2$PO$_4$-H$_2$O-HCl. Three solution series, each involving a given HCl concentration, were prepared with solid-to-solution ratios of 0.2, 0.4, 0.5, 0.8, 1.0, and 2.0 g/100 ml. Solutions were agitated for 5 days at 25 °C, after which they were filtered. pH, Ca and P were determined and ion activity products and electroneutrality imbalances were calculated. The findings indicate that the Ca/P ratios in the final solutions varied with both the solid-to-solution ratio and the initial HCl concentration. However, the ion activity products for hydroxyapatite were essentially constant. These results indicate that the contribution of the surface to the overall dissolution reaction relative to that of the lattice must be taken into account, but in conformity with theory standard solubility product principles are applicable to the final equilibrium reaction.

Key words: IR; laser, optically pumped; waveguide cavity.

A single-frequency CW CO$_2$ laser has been used to pump ethyl alcohol, methyl chloride, ethyl chloride, and methylene chloride, generating 8 new CW far-infrared (FIR) laser lines from 234 to 1700 μm.

Key words: deduced $Q_{EC}$, log ft, $J^*$; enriched $^{89}$Kr target; isotope separated sources; measured L/K EC ratio; multiwavelength proportional counter; radioactivity $^{89}$Kr [from (n,$\gamma$)].

The L/K electron capture (EC) ratio of $^{89}$Kr was measured to be 0.146 ± 0.005 utilizing the wall-less, anticoincidence, multiwavelength proportional counter technique and a reactor-produced, mass separated $^{89}$Kr source. From this value, the $Q_{EC}$ and log ft values were determined to be 305 ± 28 keV and 11.6 respectively, assuming EC decay only to the ground state. If there is 4 percent EC branching to a reported 276 keV level, $Q_{EC}$ becomes
15198. Davis, R. M., Technology as a deterrent to dehumanization, Science 185, 737 (Aug. 30, 1974).

Key words: dehumanization; deterrent; technologies.

This requested editorial discusses the role of technology as one of the better deterrents to dehumanization. It cites the confusion surrounding the use of the newer technologies of computers, automation and communication in terms of their benefits or disadvantages to the public. It highlights the need for better scientific advice in these areas to senior policy makers.

Key words: artifacts; balance; computer; impermanence; intelligence; power; science; technology.

This requested editorial discussed the relative but changing balance between man and computer in the accomplishment of so-called intellectual tasks. It highlights the impermanence of the balance and emphasizes the need for people to better understand their need to define the man-computer interrelationship.

Key words: American National Standards Institute; Computer Society of the IEEE; Data Communication Standards; Electronics Industries Association; International Standards Organization; International Telecommunications Union.

This paper provides an overview description of a number of organizations that are involved in the development of industry, American national and international standards pertaining to data communications. The significant organizations include: the Computer Society of the Institute of Electrical and Electronic Engineers, the Electronics Industries Association, the American National Standards Institute, the International Standards Organization and the International Telecommunications Union. The functions and objectives of the pertinent committees, subcommittees and task groups sponsored by these organizations as well as various formal and informal interworking relationships among them are described. Timely information includes a discussion of presently unresolved technical issues being addressed by the data communication standards community as well as listings of the standards approved by each of the organizations described.

Key words: desorption energy; desorption kinetics; physical adsorption; tungsten (111); work function; xenon.

The physisorption of Xe on W(111) and of Xe on partial layers of oxygen chemisorbed on W(111) has been studied using flash desorption and work function methods. It has been found that xenon adsorbs up to monolayer coverages at 104 K. Xenon desorbs from W(111) as a single binding state following first order kinetics. At low coverages \( \Theta_{xe} < 0.07 \) the binding energy decreases with increasing coverage possibly because of the presence of high energy adsorption sites due to crystal imperfections and edge effects. For \( \Theta_{xe} > 0.07 \) the desorption data fit a first order rate expression with a desorption energy of 9.3 kcal/mol and preexponential \( \tau = 10^{16} \) s\(^{-1}\). The observed work function change of \( -1.1 \pm 0.1 \) eV is consistent with monolayer estimates reported in field emission studies of physisorbed xenon on tungsten. The effect of preadsorbed oxygen layers on the physisorption of xenon on this surface is very striking. The energy of desorption shifts as much as 50 percent higher for a moderate exposure of oxygen. Several physisorption models are explored along with estimates of dispersion and electrostatic interaction contributions.

Key words: optical devices; optics, precision; reflector, cat’s-eye; retroreflector, cat’s eye.

The cat’s-eye retroreflector is a passive optical system consisting of a secondary mirror placed at the focal point of a primary lens. We analyze the cat’s eye using the paraxial ray matrix approach. The position of the equivalent reflecting surface and the angular field of view of a realizable cat’s eye are functions of the radius of curvature of the secondary mirror. The field of view is maximum for a secondary mirror with a concave radius of curvature equal to the focal length of the primary lens. We further derive the general dependence of retrorefection errors on misadjustment of the secondary mirror.

Key words: breath alcohol analyzers; dichromate oximetry; performance standards; reference ethanol solutions.

Stability studies were carried out on ampules samples of ethanol-water solutions. These solutions are used to measure performance capabilities of breath alcohol detection instruments.

Key words: education; efficiency comparison; household appliances; household equipment; label developments; labeling: label specification; monitoring priorities; product classes; test methods; voluntary.

The features of the Department of Commerce Program for the Voluntary Labeling of Major Household Appliance and Equipment to Effect Energy Conservation are presented. These procedures were published in the Federal Register on October 26. The steps involved in carrying out the program are (1) setting of priorities among products, (2) establishment of product classes where appropriate, (3) setting of test methods to be used, (4) developing a system for comparing the efficiency of similar products, (5) development of a label that is meaningful to consumers, (6) publication of a Proposed Label Specification in the Federal Register with time for comment, (7) evaluation of comments, (8) publication of the Final Label Specification, (9) education of the public as to the meaning of the program, and (10) monitoring of the program to insure compliance.

Key words: combination; flash photolysis-gas chromatography; methyl; methylene; radicals; rate constant.

The chemistry of the reaction between methyl and triplet methylene radicals has been examined by means of flash photolysis of azomethane and ketene followed by gas chromatographic analysis of the hydrocarbon products. Using the combination rate constant of triplet CH₃ = 3.1 x 10⁻¹¹ cm³ molecule⁻¹ sec⁻¹ and the combination of CH₃ = 9.5 x 10⁻¹¹ cm³ molecule⁻¹ sec⁻¹, a value of 1.0 ± 0.1 x 10⁻¹⁰ cm³ molecule⁻¹ sec⁻¹ for the reaction CH₃ + CH₃ → C₂H₅* + C₂H₅* has been determined.

Key words: acoustics; noise (sound); tire noise; transportation noise.

The relative importance of tire noise to overall vehicle noise is established. A general description is then given of the tire engineering process and of tire structures. The important parameters influencing tire noise are discussed, based on presently available data, followed by an identification of unknown and contradictory areas. The basic mechanisms of tire-noise generation, although not well understood, are investigated largely from a theoretical viewpoint. Areas for future research and development are identified based on gaps in the existing physical data base and a rather primitive level of understanding of noise-generating mechanisms.

Key words: collective excitations; liquid rubidium; neutron scattering; propagating modes; scattering function; short wavelength.

The short-wavelength collective excitations in liquid rubidium at 320 K have been studied by coherent neutron scattering. For values of k = 2π/λ up to 1.0 Å⁻¹, clear evidence of propagating modes was found from the shape of the scattering function S(k,ω) at constant values of k. This result shows that the existence of such modes does not depend upon either quantum effects or low thermal population of the modes.

Key words: contact lens; contact lens motion; diffusion; hydrodynamics; mathematical model; oxygen; oxygen tension; oxygen tension distribution.

A method of predicting the oxygen tension distribution under a contact lens is illustrated for some simple, but practical, lens motions. A hydrodynamic theory is used to find those regions which receive fresh tear fluid during a blink. Then a diffusion model is solved to find the oxygen tension distribution at all times between blinks. The results are compared with earlier models in which details of the fluid flow were neglected, as were variations of oxygen tension with position under the lens. Depending on the motion of the lens, the tear fluid exchange factor can be quite large without eliminating regions in which the oxygen tension is below critical levels. The results suggest that the situation can be improved if the lens is designed for large displacements, with the blink, in the direction parallel to the cornea.

Key words: chain correlation; chain statistical parameters; light scattering; Monte-Carlo computations; chase transition; scattering function.

The effects of volume exclusion on polymer chain conformations can be determined from the study of the angular dependence of radiation scattered by chain molecules. It is found that useful information can be obtained only when the variable x is large, where x is the product of the square of the magnitude of the scattering vector and of the mean square radius of gyration. Hence, solutions of macromolecules of very high molecular weight are needed for these investigations. The theoretical treatment of the scattering function is based on several assumptions. The validity of these assumptions is examined by computing, using a Monte-Carlo technique, various moments of intramolecular separations and comparing the results so obtained, in the limit of a chain of infinite length, with the analytical results. The computations seem to verify the validity of the theoretical model. The scattering behavior of solutions of recently synthesized polystyrene of Mn = 4.4 x 10⁶ in cyclohexane at various temperatures and in benzene at 40° was investigated. From the log-log plots of the scattering function vs. x, a statistical parameter was calculated, whose value depends on the magnitude of long-range correlations between any pair of chain elements. It is found that above the O temperature this parameter is practically independent of temperature and that its numerical value was found to agree well with the value obtained from Monte-Carlo calculations. In the neighborhood of the O temperature, this parameter decreases rapidly with decreasing temperature, indicating a first-order transition in chain conformation.

Key words: maser; M-type stars; molecular emission; Orion Nebulae; silicon monoxide; rotational transitions.

The J = 1-0 rotational transition of the second vibrational state (v = 2) of SiO has been detected in late M-type variable stars and in the center of the Orion Nebula. This transition of SiO requires 3520 K of excitation for pumping the observed maser line. The ground (v = 0), and third (v = 3) vibrational states were not detected.

Key words: CP-violation; decays; direct tests; kaon; lepton-asymmetry; momentum-dependence; Weisskopf-Wigner.

Two tests are proposed for directly establishing violation of CP invariance in neutral-kaon decay. Provided that there exist only two neutral kaons, these tests rely on the principles of quantum theory and relativistic kinematics and, in particular, are independent of the Weisskopf-Wigner approximation made in the theory of Lee, Oehme, and Yang. One of these tests can be made using data that will soon be available and the other can be made with existing techniques.

Key words: borosilicate glass; chemical durability; phase separation.

The chemical durability of a borosilicate glass was measured by a powder extraction test (ASTM C 225-68). It was found that a progressive decrease in chemical durability occurred during prolonged heat treatments at temperatures ranging from 29 to
84° below the immiscibility temperature. Following these extreme thermal histories, which are not normally encountered in standard forming and annealing conditions, the amount of extractable alkali increased by as much as 20 fold.

Key words: airport pavements; bridge inspection; neutron testing; pipeline inspection; railroad inspection; transportation; vehicle inspection.

The Conference on Emerging Techniques for Nondestructive Field Testing held August 13-14, 1974, at the Transportation Systems Center in Cambridge, Mass., was jointly organized by the American Society for Nondestructive Testing (ASNT) and the U.S. Department of Transportation (DOT). More than 100 persons attended to learn more about the conference theme, “Opportunities for NDT in Transportation.”

A primary purpose of the meeting was to make the NDT community aware of some of the nondestructive testing objectives and problems of DOT; in the expectation that organizations or individuals who had solutions, or potential solutions to such problems would make them available. The meeting itself provided the initial opportunity for this interaction.

The meeting proceedings, as contained in this issue of Materials Evaluation, provide a larger audience for this interaction possibility. My suggestion—read the papers and offer ideas or comments for possible solutions to NDT problems to the authors, or to the Conference Chairman, Dr. Michael Lauriente, Office of the Secretary of Transportation, U.S. Department of Transportation, Washington, D.C. 20590. We hope many readers of Materials Evaluation will respond and make the conference theme a reality!

Key words: dimensional measurement; gamma radiography, image enhancement; neutron radiography; nondestructive testing; proton radiography; real-time techniques; three-dimensional radiography; x-radiography.

This article is a review of radiographic nondestructive testing for a planned nondestructive testing issue of Standardization News (ASTM). Several new ideas in radiographic methods are described following a brief review of conventional gamma and x-radiography. New ideas discussed include high definition radiography, xeroradiography, electron radiography, image enhancement, real-time systems, three-dimensional methods, neutron radiography, and proton radiography.

Key words: density; density calibration; density measurement; density standard; volume standard.

NBS has measured the densities of four single crystal silicon objects to a standard deviation of 0.26 ppm with a systematic error of 0.7 ppm. These objects will be used as working standards to which density work in the United States will be referred. A redundant hydstatic comparison test involving two standards at a time has been devised, the use of which facilitates the efficient propagation of the density information contained in these crystals into other objects which may be used as standards by other laboratories. This article describes a method of employing this redundant comparison procedure.

Key words: counting independent parameters; phonon dynamical matrix; time reversal symmetry.

The effects of time-reversal symmetry in reducing the maximum number \( M \) of real parameters in the phonon dynamical matrix at fixed \( \mathbf{k} \) are taken into account to yield the following result: either (I) \( \mathbf{k} \) is not in the star of \( \mathbf{k} \) in which \( \mathbf{\Delta} \mathbf{k} = \mathbf{\Sigma}_{\mathbf{n}} n_{\mathbf{n}} \), or (II) it is, in which case \( \mathbf{\Delta} \mathbf{k} = \mathbf{\Sigma}_{\mathbf{n}} n_{\mathbf{n}} + 1/2 + \mathbf{\Sigma}_{\mathbf{n}_{\mathbf{n}} n_{\mathbf{n}} } (n_{\mathbf{n}} - 1/2)/2 + \mathbf{\Sigma}_{\mathbf{n}_{\mathbf{n}} n_{\mathbf{n}} } n_{\mathbf{n}} , \) where \( n \) is the number of atoms per unit cell. In the expression for \( \mathbf{\Delta} \mathbf{k} \), one sum over all \( r \) in cases (a), (b), and (c), respectively, where (a) \( \mathbf{b} \), and (c) refer to the three cases of Wigner in the Herring criterion. The analysis is also applied to compute a lower upper bound \( M \) within the rigid-molecule model as discussed group theoretically in the context of inelastic-neutron-scattering experiments by Casella and Trevino.

Key words: acoustics; machinery noise; noise; sound; sound power.

A brief discussion is given of some of the advantages of using sound power rather than sound pressure at a particular location to describe the noise emission from a particular source. To avoid confusion between sound pressure levels and sound power levels, both of which are usually expressed in decibels, it is proposed that in communications with users, the sound power levels of stationary sources be expressed in terms of Noise Emission Number, which is numerically equal to the A-weighted sound power level expressed in bels rather than decibels.

Key words: detection; detectors; fire fatalities; gas detectors; ionization chamber detectors; performance standards; photoelectric detector.

The loss of life by fire in the home is a significant problem in the U.S. Had the homes been equipped with an early-warning, fire detection device between 40 and 50 percent of the people killed in these fires might have been saved. One early warning fire detection device which shows great promise is the single-station, smoke detector. This fact is being recognized by many more code authorities in the U.S. As a consequence, an increasing number of the U.S. building codes are requiring the installation of single-station smoke detectors in all new housing.

There are problems, however, with several of the single-station, smoke detectors on the market. In addition, there is a lack of good published performance standards for these detectors, standards that would improve the quality of smoke detectors offered for sale in the marketplace and would eliminate many of the problems.

The National Bureau of Standards, in conjunction with the approvals testing laboratories and the detector manufacturers, is developing performance standards for the single-station, smoke detector. Development and publication of these standards will have a material effect on improving the quality of smoke detectors sold in the U.S.

15219. Radebaugh, R., Siegwarth, J. D., Holste, J. C., Heat transfer between sub-micron silver powder and dilute He\textsuperscript{4} solutions, (Proc. 5th Int. Cryogenic Engineering Conf., Kyoto,
The thermal resistance between copper cells lined with silver powder of 0.1–0.2 \( \mu \)m diameter and a dilute stream of Helium in Helium was measured between 15 and 250 mK. The results show that this powder can give an order of magnitude lower thermal resistance at 15 mK than an equal volume of copper powder of 1.8 \( \mu \)m diameter. The scientific and engineering significance of such a low resistance in a small volume is discussed. At the higher temperatures \( R \) is proportional to \( T^{-1} \), which can be explained by a liquid thermal resistance and a resistance at the joint between the powder and the cell walls.

15220. Chang, C. C., Dodge, W. R., Murphy, J. J. H., \( ^3\)He(\( \gamma, d \))\( ^1\)H cross section from 10 to 21 MeV, Phys. Rev. C 9, No. 4, 1300-1308 (Apr. 1974).

Key words: cross section structure; excitation energy distribution function; \( ^3\)He electrodisintegration; \( ^3\)He excited states; \( ^3\)He photodisintegration.

A measurement of the \( ^3\)He(\( \gamma, d \))\( ^1\)H 90° differential cross section between 10 and 21 MeV was made. The \( ^3\)He(\( \gamma, d \))\( ^1\)H cross section was converted into a \( ^3\)He(\( \gamma, d \))\( ^2\)H cross section. The shape of the \( ^3\)He(\( \gamma, d \))\( ^1\)H cross section agrees with recent theoretical calculations. We find no evidence for the anomalies (structure) in the \( ^3\)He(\( \gamma, d \))\( ^1\)H 90° differential cross section at excitation energies of 14.5 and 19.5 MeV reported in two recent experiments.

15221. Braun, W., Kurylo, M. J., Kaldor, A., Infrared laser enhanced reactions: \( V \to V \) and \( V \to T \) energy transfer in the \( \text{O}_2\text{SiF}_3\text{O}_2 \) system, Chem. Phys. Lett. 28, No. 3, 440-444 (Oct. 1974).

Key words: apparatus and methods; deactivation; energy transfer; infrared laser; luminescence; ozone.

Rapid \( V \to V \) energy transfer between SiF\(_4\) and O\(_3\) has been observed following laser excitation of either O\(_3\) or SiF\(_4\). A CO\(_2\) laser tuned to either the 9.6 \( \mu \)m P(30) or P(32) transitions was used to promote vibrational excitation in O\(_3\) and SiF\(_4\), respectively. In experiments employing the P(32) transition, the \( V \to V \) transfer to O\(_3\) and subsequent reaction of O\(_3\) with NO were used to obtain the rate constant of \( V \to T \) deactivation of SiF\(_4\) by O\(_3\).

\[
\text{SiF}_4 + \text{O}_3 \rightarrow k_8 (6.3 \pm 1.4) \times 10^{-13} \text{cm}^3 \text{ molecule}^{-1} \text{s}^{-1}.
\]

Fractional modulation measurements of the chemiluminescence generated by the O\(_3\) + NO reaction were used in experiments employing the P(30) transition to obtain a rate constant for the \( V \to V \) energy transfer between O\(_3\) and SiF\(_4\).

\[
\text{O}_3 + \text{SiF}_4 \rightarrow k_{-8} (3.8 \pm 0.5) \times 10^{-11} \text{cm}^3 \text{ molecule}^{-1} \text{s}^{-1}.
\]

Key words: acoustic centers; attenuation of sound; sound absorption.

A free-field method is described for measuring the attenuation of sound at ultrasonic frequencies. It makes use of the systematic deviation from the inverse square law caused by attenuation when a sound receiver is drawn away from a sound source. Measurements of attenuation from 20 to 100 kHz, made in air in a small anechoic chamber under ambient environmental conditions, were in good agreement with theoretical calculations. The sum of the distances between the acoustic centers of the transducers and the vibrating elements is obtained as a by-product of the procedure.

Key words: crystal structure; low temperature; meta-stable compound; neutron diffraction; NH\(_4\)ClO\(_4\); thermal motion.

The crystal structure of ammonium perchlorate has been studied at 298, 78, and 10 K by means of neutron diffraction. The NH\(_4\)ClO\(_4\) crystal has an orthorhombic unit cell, space group Pnma, with four formula units per cell at all three temperatures. The unit cell dimensions at 298 K are \( a = 9.92, b = 5.82, c = 7.45 \) Å, as determined previously; at 78 K, \( a = 9.92, b = 5.85, c = 7.39 \) Å; and \( a = 9.89, b = 5.89, c = 7.30 \) for 10 K. Initial positions of H atoms were determined from a difference Fourier map of the room temperature data. However, a least-square refinement of these data did not converge. The thermal motions and orientations of the ammonium groups at low temperature (10 and 78 K) were determined by means of a constrained refinement which treated the ammonium group as a rigid body; these results are compared with the results obtained by the conventional least-squares method. Both refinements show that the librational motions about one of the three principal axes have particularly large rms amplitudes: 21° for the 10 K structure and 30° for the 78 K structure. Each ammonium group is surrounded by 10 oxygen atoms with short N–O distances ranging from 2.9 to 3.25 Å. The ClO\(_4\) group and NH\(_4\) + group each have essentially ideal tetrahedral structure. They are linked together by NH–H...O type hydrogen bonds, one for each hydrogen, to form a three-dimensional network. Examination of the rms amplitudes for libration and the hydrogen bonding of the NH\(_4\) + ions indicates that two of the four hydrogens are bound identically, one hydrogen is bound more rigidly, and the fourth more weakly. These results suggest that the rotational motions of the ammoniums are quite complex even at 10 K.

Key words: diamond-anvil pressure cell; fixed point pressure scale; high pressure; NaCl pressure scale; pressure measurement; ruby fluorescence; semiconductors; transition pressures.

A diamond-anvil type optical cell of improved design has produced static pressures in gasketed samples up to 500 kilobar as measured by the ruby fluorescence technique. The ruby R\(_1\) line pressure shift is linear to 291 kilobar, and the maximum measured shift is extrapolated to 500 kilobar assuming continued linearity of the pressure dependence. The ultimate pressure capability of this diamond cell has not been established. Transition pressures in the semiconductors Si, ZnSe, ZnS, and GaP measured by the ruby method indicate that the revised 1970 fixed point scale and the ruby (NaCl) scale diverge above 135 kilobar and disagreement may be as much as a factor of 2 in the 500 kilobar range with the ruby scale defining the lower pressure.

Key words: bulk modulus; compressibility; Debye temperature; elastic constant; nickel-chromium-iron alloys; Poisson's ratio; shear modulus; sound velocity; Young's modulus.

The zero-magnetic-field low-temperature elastic properties of two polycrystalline nickel-chromium-iron alloys were determined ultrasonically between 4 and 300 K. Results are given for: longitudinal and transverse sound velocities, Young's modulus, shear modulus, bulk modulus, Poisson's ratio and elastic Debye temperature. Effects of alloying are discussed. The elastic property changes due to additions of chromium and iron to nickel are reviewed comprehensively.

Key words: radiometry; rise time; temporal response; transfer standard detector; XUV photodiode.

For the spectral region between 200 Å and 1200 Å the NBS radiometric transfer standard detector is a windowless photodiode with a 2.5 cm diameter cathode made of evaporated aluminum on whose surface a 150 Å thick Al₂O₃ layer has been anodized. A study has been made of the response of these diodes to pulsed radiation. A Garton-type flashlamp was modified to provide pulses of radiation with a duration of about 1 nsec. These pulses were passed through a half-meter Seya-Namioka vacuum monochromator and the zero order radiation was allowed to fall on the cathode of the diode. The emitted cathode current of the diode across a 50 Ω load was displayed by an oscilloscope. Output pulses were observed with instantaneous amplitudes as high as 1 mA with no evidence of saturation. The rise time of the diode output pulses was on the order of 300 nsec which was the expected rise time of the flashlamp. In order to confirm that the rise time was flashlamp limited, a diode with a tungsten cathode was substituted for the Al₂O₃ diode. The temporal results were identical. Thus we are able to conclude that the NBS windowless Al₂O₃ radiometric transfer standard diodes have a rise time shorter than 300 nsec.

Key words: ignition; ignition boundary; solid fuel.

A theoretical model describing radiative ignition of a solid fuel is constructed and is numerically analyzed. The model includes the effects of gas phase reaction and a finite value of the absorption coefficient of the solid (in-depth absorption of incident radiation). It is found that the gas phase reaction must be included in the model in order to understand radiative ignition of a solid fuel and to find its ignition boundary. The in-depth absorption of the incident radiation by a solid fuel significantly affects the ignition delay time. The results indicate that there is a finite range of values for pyrolysis or gas phase reaction activation energy for which ignition will occur. This finding has a direct bearing on efforts to reduce material ignitability.

Key words: humidity; hygrometer; microwave refractometer.

This hygrometer is designed to measure the humidity of atmospheric air over the vapor pressure range 3-7400 Pa (0.03-74 mbar). The instrument is an adaption of a microwave refractometer using two cavities operating at 12 GHz. One cavity is exposed to the moist test air and the other is exposed to the same air sample with all the water vapor removed. Both cavities are maintained at the same fixed temperature in a thermostated oven and at the same total pressure. The difference in frequency between the cavities is automatically null by a tuning probe in the sampling cavity. The instrument was calibrated by two independent methods. One involved the measurement of the resonance frequency of the sampling cavity as a function probe penetration and using this in a theoretically derived equation for vapor pressure. The second involved the measurement of the probe penetration as an empirical function of known vapor pressure of a test gas. These two methods yielded results which agreed on the average to better than 0.5 percent for vapor pressures up to 3050 Pa (30.5 mbar).

Key words: accident patterns; apparel; apparel fires; burn injury; FFACCT; fire; flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim's activity; victim's reactions.

Activities preceding an apparel fire accident are identified and related to age, sex, and the severity of burn injury. After age six, activity patterns were strongly related to the victim's sex, with men the primary victims of accidents involving flammable liquids, gases, or high voltage electricity, and women more susceptible to direct flame ignition. The majority of cases studied had burns over less than 20 percent of the total area of their body. When flammable liquids were involved, there tended to be fewer minor injuries and more moderately serious injuries than in accidents not involving intermediary materials. Age and defensive capability were major factors determining extent of injury, with persons over 65 and those with limited ability suffering more serious injuries than other groups. Included are recommendations for remedial action.

Key words: carpets with and without underlayement; corridor fires; energy models; finished interior; full scale experiments; interaction; measurements; smoke; smoke and flame spread; temperature; with and without forced air; velocity.

This report outlines the NBS full scale experimental program to investigate the growth and spread of fire and smoke into and through a corridor when a fire is initiated in an adjoining room. The program proposes energy models to investigate both the contribution of the corridor interior finish surfaces and their interactions under the full scale fire situation. As a status report it describes in detail the experimental facilities and approaches for the program.

A summary of the tests conducted to date is presented. It is shown that flames can propagate the length of a 30 foot corridor, with a combustible floor covering as the only source of fuel in the corridor, when initiated by 2.7 psf of wood cribs in an adjacent room. Typical quantitative measurements of temperature, velocity, smoke and energy are also presented. In addition, comparative discussions are presented for tests with and without forced air draft and carpet tests with and without underlayement.

Key words: evaporation; magnetic retention; masks; sputtering; substrates; thin films.

The "use of a magnet to clamp a magnetic metal mask to the
substrate during sputtering" of thin film patterns has been described by Ingle. A similar technique was described previously by Jones and Castle in this journal and in a patent.

15232. Unassigned.

Key words: anaerobic corrosion; cathodic depolarization theory; Charles Thom Award: Desulfovibrio desulfuricans; whole whiskers; mechanism; microbial corrosion; mild steel; oxidizing agent; Schreiber's; sulfate-reducing bacteria; Vaniante.

Charles Thom Award address presented by the author at the General Meeting of the Society for Industrial Microbiology held at Memphis State University, 11-16 August 1974. (The Thom Award honors the first president of the Society for Industrial Microbiology. The later Charles Thom was a noted microbiologist who worked for the U.S. Department of Agriculture and his research on molds helped to produce many of today's antibiotics.)

The author's investigations of the mechanism of anaerobic corrosion by sulfate-reducing bacteria, which led to the observation that a marine strain produced extracellularly, a strong oxidizing agent which caused extensive corrosion of mild steel under anaerobic conditions, are detailed. The formation of whole whiskers, structures which resemble fungal mycelia, by the reaction of ferrocyanide or ferricyanide on metals are described.

Key words: air pollution; ethene; kinetics; mass spectrometry; ozone; propene; rate constant.

The rate constants for the reactions of ozone with ethene and propene have been measured over the temperature range 235.0-362.0 K, using a stopped-flow system coupled to a beam-sampling mass spectrometer. The rate constants found, at a total pressure of about 500 N m⁻², in the presence of molecular oxygen, were 

$$k(C_2H_4) = (5.42 \pm 3.19) \times 10^{-12} \exp(-2557 \pm 167/T) \text{ cm}^3 \text{ mol}^{-1} \text{ sec}^{-1}$$  

and 

$$k(C_3H_6) = (3.70 \pm 1.42) \times 10^{-12} \exp(-1897 \pm 109/T) \text{ cm}^3 \text{ mol}^{-1} \text{ sec}^{-1}.$$  

Key words: crystal chemistry; flux growth; garnet; hydrogarnet; indium silicates; inorganic synthesis; solid solubility silicates; x-ray powder analysis.

The following indium silicates were synthesized hydrothermally and in air: indium grossular, Ca₃In₂Si₂O₁₂; indium aegirine, NaIn₄Si₃O₁₂; indium beryl, Be₃In₄Si₃O₁₂; indium thortveitite, In₂Si₂O₇; indium melanokite, Pb₂In₃Si₄O₁₂; and strontium indium hydrogarnet, Sr₃In₁₂(OH)₁₂.

Complete solid solubility was found between ferric iron and indium silicates and hydrogarnet end members. Single crystals of indium aegirine up to 2 cm in length were grown in a Na₂WO₄ flux by slow cooling.

The crystal chemical and geochemical behavior of trivalent indium is similar to that of scandium. The ionic radius of trivalent indium of 0.81 Å given by Pauling is confirmed.

Key words: amino sugars; chemical shifts; magnitude spectra; nitrogen-15 nuclear magnetic resonance spectroscopy; nuclear Overhauser effects.

Derivatives of 6-amino-6-deoxy-D-galactose-6-¹⁵N and 6-D-glucose-6-¹⁵N and the corresponding unlabeled compounds have been synthesized via reactions of appropriate 6-O-tolyl-p-sulfonyl or 6-deoxy-6-ido derivatives with potassium phosphohalide-¹⁵N (or ¹⁴N), followed by hydrazinolysis of the phthaloyl group. ¹⁵N n.m.r. spectra of the amino sugar derivatives have been measured directly at 9 MHz by pulse-Fourier transform techniques. The recording of spectra of ¹⁵N in natural abundance in the amino sugar derivatives was aided by proton irradiation which caused a substantial negative, nuclear Overhauser effect (NOE), even for derivatives in which the ¹⁵N nucleus is not directly bonded to a proton. For example, irradiation of the protons of 6-deoxy-1,2,3,4-di-O-isopropylidene-6-ethylamino-α-D-galactopyranose (I) -6-¹⁵N at 90 MHz inverted the ¹⁵N signal and enhanced its intensity by a factor of 3.4, which indicates a NOE of -4.4. One half gram of this derivative (¹⁵N enrichment, 99%) yielded a ¹⁵N spectrum with a signal/noise ratio of 36:1 when excited by a single pulse. With ¹⁵N at natural abundance in 0.75 g of 1, 8.192 pulses (112 min) were required to give a ¹⁵N signal/noise ratio of 13:1. The negative NOE on the ¹⁵N signal of 1-6-¹⁵N was removed (with inversion of the signal, but no shift) by addition of the relaxation reagent, chromium (III) acetylacetonate to a concentration of 0.02M.

Key words: crazing; crystalline polymer solid; diffusion; elastic deformation; permeability; plastic deformation; sorption.

The sorption and diffusion of low molecular weight penetrants proceeds almost exclusively through the amorphous component of the semicrystalline polymer solid. The diffusive transport properties and geometrical distribution of the amorphous component are substantially modified by mechanical and thermal treatment. Deformation of spherical material first loosens the structure and then transforms it into a densely packed fibrous structure with a great many taut tie molecules in the amorphous component. Annealing lets the crystals grow in thickness, removes crystal defects, sharpens the boundaries between crystalline and amorphous component, and relaxes the taut tie molecules. The resulting changes of transport properties cannot be described in a satisfactory manner by crystallinity and orientation but require a detailed consideration of morphology. The elastic tensile deformation enhances sorption and diffusion by reducing the density of amorphous component. The high anisotropy of diffusion and the drastic reduction of sorption and diffusion of fibrous material are the consequence of the microfibrillar morphology with the large fraction of highly aligned and closely packed taut tie molecules which eliminate many sorption sites, enormously reduce the diffusivity, and increase its concentration dependence. The anisotropy may be reduced during plastic deformation of the fibrous material by the increased number of interfibrillar tie molecules.

Key words: copper alloy; copper; cryogenics; dilution refrigerator; heat exchanger; Kapitza resistance; liquid helium; powder; silver.
This paper describes experiments done on three types of miniature heat exchanger for dilution refrigerators. These have liquid volumes on the order of 0.1 cm³. The first is a continuous exchanger incorporating Cu(Cr) powder, the second is a continuous exchanger incorporating sub-micron silver powder, and the third is a discrete exchanger incorporating 1.8 μm copper powder. The first two were not successful and the reasons are not entirely clear. The third exchanger performed about as calculated and permits an order of magnitude reduction in liquid volumes from that normally used.

Key words: absolute fission rates; neutron dosimetry; reactor fuels; reactor materials.

Recently, the accuracy requirements for fast reactor fuels and materials dosimetry surpassed the existing capabilities of fission foil activation measurements. In order to improve this capability by direct calibration of activation detectors, absolute fission rates per nucleus have been measured in fast neutron fluxes suitable for both fission activation foils and for fission fragment detectors. This paper presents results for absolute fission fragment emission rates from 239Pu, 238U, 235U, and 237Np exposed to the first of these fast neutron fluxes, the spectrum of the CFRMF Reactor at ANC.

Key words: atomic oxygen; gas phase; kinetics; mechanism; organic compounds; rate constants.

The reactions of atomic oxygen (O\textsuperscript{OP}), in the gas phase, with organic compounds are reviewed. The various techniques used in these studies are discussed critically. The kinetics and mechanisms of the reactions of atomic oxygen with organic compounds are discussed in detail.

Key words: archival language; archival quality; content decay; content density; content lifetimes; storage media.

This paper develops some archival language and discusses factors which must be considered when an archival data storage system is designed. These include types of contents, content decay rates, content and medium lifetimes, content density and system costs. Other archival storage quality factors such as information security and recovery are considered.

Key words: attachment, low-temperature; radiation shield; temperature gradient; x-ray.

A commercial high-temperature, high-vacuum diffractometer attachment, which was originally designed for heating samples from ambient temperatures to 2600 K using metal ribbon heaters, has been modified for low-temperature use. This has been accomplished simply by the construction of a new sample holder and a change of the port used for evacuation. With these modifications, controlled temperatures down to 100 K can be achieved easily.

Key words: flames; laser excitation; mass spectrometry; radicals.

Recent studies on sampling reactive species from flames and related laser-excited systems are described. Consideration is given to the possible effect of probe-related perturbations on the experimental data. It is concluded that such perturbations are not significant under the present experimental conditions.

Key words: chemistry; clinical laboratory capability; critique; hematology; microbiology; sampling.

The February 1974 issue of CLINICAL CHEMISTRY published a critique of two NBS Interagency Reports. The Bureau has prepared a reply, written by the senior author of both NBS reports, and coordinated through the Institutes for Applied Technology and Materials Research.

Key words: scanning electron microscope; SEM applications; SEM dynamic experiments; SEM specimen preparation; SEM stroboscopy; stereomicroscopy.

Techniques of specimen preparation for scanning electron microscopy, including degreasing, electropolishing, and deposition of conductive coatings, are discussed. Stereomicroscopy, the technique of obtaining images with depth information, is described. Dynamic experiments conducted in situ in the scanning electron microscope (SEM) are considered. Examples of dynamic experiments, including tensile straining and the application of magnetic fields, are given. Stroboscopy, the imaging of high frequency, cyclical events is described. Practical applications of the SEM to a range of materials science problems are described in detail. The problems include: (1) examination of fractured metals and composites; (2) investigation of lunar soil; (3) failure analysis of a corroded steam boiler; (4) recognition of mineral phases; (5) characterization of wear particles; (6) examination of human teeth; (7) orientation and crystal perfection analysis with electron channeling effects; (8) examination of magnetic recordings; (9) examination of magnetic domain structures; (10) operation of an integrated circuit; and (11) observation of ferroelectric domains.

Key words: electron probe microanalysis; empirical methods; Fe-Si alloys; Monte Carlo methods; quantitative analysis; scanning electron microscopy.

Quantitative microprobe analysis is considered from the classical point of view as well as the so-called empirical approach. The relations used to convert raw data to mass fractions are discussed and scrutinized with respect to sources of error in the final analysis. Histograms depicting the typical spread of results are used to show what can be expected. By way of illustration, the complete planning and execution of the analysis of binary silicon-iron alloy is described in detail. Brief mention is made of
special specimen geometries such as thin films or fracture surfaces and means to obtain analyses from them. An extensive reference list is appended.

Key words: crystal spectrometers; elemental distribution; elemental identification; energy dispersive spectrometers; microanalysis; specimen preparation.

Element identification and distribution as determined by electron probe microanalytical techniques is explained. Both energy dispersive systems and curved crystal spectrometers are considered from the point of view of ease and accuracy of identification and distribution determination. A series of examples including minerals, meteorites, composite materials, superalloys and tool steel is discussed in terms of solution of practical problems by elemental identification and distribution.

For accurate quantitative electron probe microanalysis, specimen preparation plays a crucial role. Therefore, effects of specimen preparation are evaluated in terms of surface roughness, instrumental design and nature of the specimen. The role of standards in the analysis is outlined. Finally a series of examples involving compositional analysis is presented.

Key words: empirical methods; minicomputers; on-line analysis; quantitative electron probe microanalysis; scanning electron microscope; SRM-480.

This chapter deals with rapid means to perform data reduction for quantitative electron probe microanalysis with the aid of small computational devices (desk calculator to 8K machine). Included will be a complete discussion of a ZAF program packaged for on-line data reduction and the basis for use of the hyperbolic approximation on-line. For the laboratory which only does occasional quantitative analysis, a brief discussion is given of how to obtain an analysis with a desk calculator in a reasonable time—about two hours for a six component system or 30 minutes for a binary starting from scratch is needed. Solved examples are included.

Key words: contrast; electron beam instrumentation; electron probe microanalyzer; instrumental development; scanning electron microscope; signal processing.

This chapter traces the evolution of the scanning electron microscope and the electron probe microanalyzer from birth to the present. A number of major developments both instrumental and methodological are outlined. The purpose is to familiarize the novice with these developments; for the experienced SEM user, the chapter aim is to remind one of the significant stages of instrumental development. Points touched upon include the discovery and exploitation of various SEM contrast mechanisms such as topographic, voltage and magnetic contrast as well as stages in the development of signal and image processing.

Key words: scanning electron microscope; SEM contrast formation; SEM image defects; SEM image formation; SEM image quality; signal processing.

The image formation process in the scanning electron microscope (SEM) is described in detail. The major components of the image formation system are the scan coils, scan generator, signal detectors, amplifiers, and the cathode ray tube display. Various types of signal detectors are described: the Everhard-Thornley detector for back-scattered and secondary electrons, the solid state detector for backscattered electrons, specimen (absorbed) current detection, x-ray detectors, and cathodoluminescence detectors. Contrast formation is explained. The relationship between the image quality and the characteristics of the signal is detailed. For a given contrast level, a threshold beam current exists which must be exceeded to obtain a useful image. Various types of signal processing for image enhancement are described: black level suppression (differential amplification); gamma processing (non-linear amplification); time derivative signal transformation; and Y-modulation. The application of these signal processing techniques renders image details more readily visible to the human eye. Image defects are considered. Moiré effects can be obtained in images of periodic objects. If two contrast mechanisms are present in an image, one may dominate, requiring special signal processing techniques for detection of the weaker contrast.

Key words: cathodoluminescence; electron beam induced conductivity contrast; electron channeling contrast; magnetic domain contrast; scanning electron microscope; voltage contrast.

This chapter considers several mechanisms of contrast formation in the scanning electron microscope (SEM). The physical origin of each mechanism is considered in detail. Electron channeling contrast results from effects of the periodic arrangement of atoms in a crystal on the penetration of the incident electrons. Type I magnetic contrast arises from effects of leakage fields outside the specimen on emitted secondary electrons. Type II magnetic contrast is related to effects of the internal magnetic field on the primary electrons as they undergo scattering in the specimen. Voltage contrast arises from the effect of surface potentials on the collection of emitted secondary electrons. Electron beam induced conductivity contrast (EBIC) occurs in certain semiconductors through the formation of electron-hole pairs, locally changing the conductivity from the interaction of the primary electrons. Cathodoluminescence results due to the emission of visible light when electron-hole pairs recombine. The characteristics of each contrast mechanism are related to the SEM operating parameters required for successful image formation.

Key words: D-stable matrix; positive diagonal matrix; quadratic forms; spectrum.

The problem of characterizing the class of D-stable matrices has remained unsolved since its suggestion in a paper by Arrow and McManus [1] in 1958. In this note we present a necessary
condition involving real quadratic forms which is not sufficient and a sufficient condition involving complex quadratic forms which is not necessary.

Key words: anharmonic constant; Coriolis resonance; high resolution; infrared spectrum; nitrogen dioxide; spin splitting.

The \( v_1 + v_3 \) band of \(^{14}\text{NO}_2\) has been recorded with resolution of 0.028 cm\(^{-1}\). Ground state and upper state rotational constants have been obtained. The band center obtained, \( v_0 = 2355.1517 \pm 0.0011 \) cm\(^{-1}\) (error cited is 3\(\sigma\)), has been combined with the band centers recently determined for \( v_3 \) and \( v_2 \) to calculate \( \chi_{23}^{\pm} = -11.348 \pm 0.020 \) cm\(^{-1}\) where the uncertainty cited is based on reasonable estimates of the absolute frequency error.

Key words: conformation; half-chair; inositol; mercuric acetate; phenylsotriazole; p.m.r.; symmetrical.

The application of mercuric acetate reagent to conversion of inosose phenylasozanes into phenylsotriazoles in 40-47 percent yield is described. Analysis of p.m.r. spectra of inositol phenylsotriazole esters (e.g., acetates, propionates, benzoates) and of their parent compounds on "decoupling" of their hydroxyl groups (by protonation, or deuterium exchange) showed a symmetrical pattern (presence of a simple, two-fold axis of symmetry in an AA'BB' system); a half-chair conformation of these phenylsotriazole esters in solution was deduced from the p.m.r. spectra. Free inositol phenylsotriazoles in solution exist exclusively in a half-chair conformation.

Key words: rubidium; spectra; ultraviolet; wavelengths.

The spectrum of doubly ionized rubidium, \( \text{Rb} \text{III} \), was observed with a pulsed-rf light source on two 10.7 m normal-incidence spectographs at NBS. Wavelengths and classifications were obtained for 103 Rb \text{III} lines, 90 of which were newly observed. The three missing levels of the \( 4p^74d \) configuration, \( (\text{nP})^7F_92 \) and \( (\text{D})^7G_{7/2,9/2} \), and the one missing level of the \( 4p^55p \) configuration, \( (\text{U})^5S_1 \) \( 1/2 \), were located. The \( 4p^4(\text{D})^5S_d^5S_{d1/2} \) level was also located. Improved values were determined for 13 excited levels.

Key words: molecular CO2; molecular oxygen; O and C Kα x-ray emission spectra; O K absorption spectra.

The oxygen and carbon Kα emission and oxygen K absorption spectra of the molecular gases O2 and CO2 are reported. The spectra were obtained on two different spectrometers, both with single flat crystal configurations. All the emission spectra were excited by direct electron bombardment and are in fair agreement with an interpretation based on allowed electric dipole transitions between single vacancy states and molecular orbital theory for the molecules. The oxygen K absorption of O2 and CO2 is dominated by a strong resonance peak before the K-shell threshold which is interpreted as being due to the transition of oxygen K electrons to the first unoccupied valence orbital of the respective molecules.

Key words: hafnium; levels; spectra; tungsten; wavelengths.

Observations of W vii were carried out in the spectral range 100 to 2000 Å utilizing normal- and grazing-incidence spectographs. The light source was a sliding spark operated at peak currents of 1000 to 3000 A. Eighty-five energy levels of \( 4f^{9}6p^1 \) and \( 5p^1n \) configurations were deduced for \( nL = 5d, 6s, 6p, 6d, 7s \) and \( 7p \).

These are based on the classification of 310 lines in the range 130 to 1436 Å. Calculations of all observed configurations were carried out with configuration interaction (CI) for the purpose of fitting radial integrals and confirming the analysis. The strong CI between \( 6p^1n \) and \( 7p^1n \) configurations where \( nL = 5d, 6p, 6d \) provided well-defined CI integrals in good agreement with Hartree-Fock values. A value of 984100 ± 500 cm\(^{-1}\) was derived for the ionization energy from the \( 4f^{9}6s^3 \) series. The resonance lines of Hf v for \( 5p^1-5p^15d, 6s \) are given. A revised value for the ionization energy of W vi is given.

Key words: dipole moment; ethylamine; pyrolysis reactions; rotational spectrum; structure; vinylamine.

Microwave rotational spectra assignable to gas phase vinylamine (\( \text{CH}_2 = \text{CHNH}_2 \)) have been detected in the pyrolysis decomposition products of ethylamine. Stark effect and hyperfine structure measurements have aided the assignment of the spectrum and allow the determination of the \(^{14}\text{N} \) nuclear electric quadrupole coupling constants and the electric dipole moment for vinylamine. The spectrum of the first excited inversion vibrational state has been assigned. Relative intensity measurements indicate that the inversion state lies about 65 ± 25 cm\(^{-1}\) above the ground state. The spectral evidence suggests that vinylamine has a nonplanar equilibrium structure with \( r(C-N) = 1.40 \) Å and \( \angle \text{CCN} = 125^\circ \).

15259. Lewis, D. C., On the determination of the minority carrier lifetime from the reverse recovery transient of pnR diodes, Solid-State Electron. 18, 87-91 (1975).

Key words: carrier lifetime; reverse recovery; semiconductor diodes.

The determination of the minority carrier lifetime of \( pn \) diodes with abrupt junctions and recombination (R) contacts is discussed. It is confirmed that the base transit time of diodes with sufficiently small base widths (less than approximately three minority carrier diffusion lengths) affects the reverse recovery transient and that large error can be introduced if the minority carrier lifetime of a diode with a small base width is computed using an expression which was derived for diodes with an infinite base width. Approximations to the general expression for the minority carrier lifetime as a function of the storage time and base width are developed, and the errors associated with their use are analyzed. In addition the effect of measurement errors on the determination of lifetime in short base diodes is discussed.

A procedure is described which can be used to compute the minority carrier lifetime of \( pnR \) diodes in which the ratio of the base width to the minority carrier diffusion length is larger than some small number. The applicability of the procedure and the approximations which are developed are a function of the ratio of the diode base width to the minority carrier diffusion length (\( W/L \), and the forward to reverse current ratio \( (I^f/I^r) \) at which
the experimental measurements are made. An example is given which shows that less than 1 percent error is introduced in the computed lifetime by the approximations if the lifetime is computed from measurements made at \( f / \lambda = 4 \) and 8 for diodes such that \( W / L > 2 \times 10^{-4} \).

Key words: atomic energy levels; atomic line shapes; atomic spectra; atomic transition probabilities; bands; molecular; energy levels; atomic; line shapes; atomic; molecular bands; molecular spectra; rotational constants.

Research at the National Bureau of Standards in spectroscopy pertinent to astronomy is summarized. Publications on atomic spectra, atomic transition probabilities and line broadening, and molecular spectra are referenced and work in progress is discussed.

Key words: applications; chemical analysis; microwave; qualitative analysis; quantitative analysis; rotational spectra.

Traditional analytical techniques have been successfully employed on a great variety of systems for identifying stable reaction products as well as for purity analysis and reaction efficiency. However, most analytical techniques generally can only be applied to "well behaved" chemical systems. Since gas phase reaction products do not always follow the "well behaved" guideline, an alternate analytical tool, such as microwave spectroscopy, could prove beneficial for analyzing such systems and may well provide some new routes to synthetic chemistry. A general review of the present state-of-the-art for applications of microwave techniques to analytical studies will be presented. An attempt will be made to describe the limitations and advantages of microwave spectroscopy for probing chemical systems for product identification and for optimization of the efficiency of gas phase chemical reactions. As an illustration, some recent results obtained in our laboratory on the complex pyrolytic decomposition reactions of ethylamine will be described. Further examples of possible applications will be taken from typical industrial processes which employ vapor phase chemical synthesis techniques.

Key words: comet; \( \text{HCN}, \text{HC}_3\text{N}; \) Kohoutek; \( \text{OH}; \) radio; search.

Comet Kohoutek (1973) was observed with the NRAO 140-foot (43 m) radio telescope in the period 1974 January 4-7 in an attempt to detect the following molecular transitions: \( \text{HC}_3\text{N}, J = 1-0, v = 0; \text{HCN}, J = 1-2, v = 2, I = 0; \text{HCN}, J = 6, I = 2; \) and \( \text{OH}, \quad \Pi_{1/2}, J = 5/2, F = 3-3. \) All results for these lines were negative. An unidentified line was possibly detected at 8189 MHz.

Key words: lifetime of excitations; neutron scattering; perturbation of elementary excitations; quantum liquids; roton minimum; \( ^{4}\text{He}+^{4}\text{He} \) solutions.

We report inelastic-neutron-scattering measurements on liquid \( ^{4}\text{He}, ^{4}\text{He} \) in the Q region from 0.8 to 2.3 \( \text{Å}^{-1} \) at 1.6 K. The shifts and increases in natural linewidth of the single excitation peaks relative to pure \( ^{4}\text{He} \) at the same temperature were determined by a least-squares fitting procedure. The shifts vary from a small, possibly negative, value at the roton minimum to positive values around 0.5 K at both ends of the Q range. The full widths at half-maximum of the extra broadening vary from 0.5 to 1.5 K over the same range.

Key words: activation energy; hydrogen diffusion; neutron scattering; quasielastic scattering; resonance time; tantalum hydrides; vibrational amplitude.

Neutron inelastic scattering spectra have been measured as a function of temperature and scattering angle for \( \alpha-\text{TaH}_5 \) and for \( \alpha-\text{TaH}_5 \) in its \( \alpha \) and \( \beta \) phases. The widths of the quasielastic peaks vs momentum transfer \( Q \) have been derived and compared for several models for hydrogen diffusion. The results suggest the dominance of tetrahedral jumps in the diffusion process, although no completely satisfactory theoretical fit was obtained. Residence times \( \tau \) between 1.6 (340 °C) and 4.0 (148 °C) \( \text{ps} \) for \( \alpha-\text{TaH}_5 \) and between 2.4 (300 °C) and 7 (153 °C) \( \text{ps} \) for \( \alpha-\text{TaH}_5 \) were derived from the fit of the observed widths to the tetrahedral model. These results indicate a significant concentration dependence of the diffusion rates in \( \alpha-\text{TaH}_5 \), with activation energies for diffusion of 10.4 \( \pm \) 1.2 kJ/mol in \( \alpha-\text{TaH}_5 \) and 15 \( \pm \) 1.2 kJ/mol for \( \alpha-\text{TaH}_5 \). "Effective" mean square amplitudes of proton vibration of 0.02-0.04 \( \text{Å} \) were obtained from the \( Q \) dependence of the quasielastic peak intensities, in reasonable agreement with the values predicted from relatively crude vibration frequency distributions obtained from our inelastic scattering spectra in the \( \alpha \) phase. Our results are compared in detail with previous neutron results on \( \text{VH}_2 \) and \( \text{NbH}_5 \). On the basis of this comparison it is tentatively concluded that the very high "Debye-Waller factors" obtained for \( \text{VH}_2 \) and some other hydrides are related to high hydrogen diffusion rates.

Key words: measurement; measurement compatibility; reference methods; Standard Reference Materials.

The role of Standard Reference Materials (SRM’s) in helping to provide measurement compatibility is explored. Measurement compatibility is simply the ability of elements within a measurement infrastructure to achieve the same measurement values. It is shown that measurement compatibility results when measurements are made on the basis of accuracy. SRM’s are well-characterized materials whose properties are certified on the basis of accuracy. Therefore, laboratories within a measurement infrastructure become compatible when SRM’s are used.

Sections cover these topics: (a) sources of information concerning the current availability and types of SRM’s produced; (b) two examples of the impact of SRM’s are given; and, (c) a discussion of future directions and needs is expounded.

Key words: data files; data network; data on-line; international data service; on-line data; reference data service; standard reference data.
This paper describes a prototype on-line data retrieval and data computation system and discusses the scientific, technical, and organizational characteristics required to make such a system economically viable reality.

The general characteristics of the envisioned system are: 1. Authoritative data collections and well-documented sources stored on a reliable time-shared computer system; 2. Extended precision representation and computing where required; 3. Efficient programs to generate data not explicitly stored; 4. Easy to use conversational on-line access from inexpensive terminals; 5. A reliable and extensive communication network to eliminate or reduce toll charges; 6. Low user charges.

As envisioned, the charges for connect time should cover the communications costs, the computer costs, and the monthly cost of keeping the data and programs stored on the disc. The economics of the situation argue for building up the data files from small self-contained segments so as to expedite the collection, validation and maintenance of the data base; and to minimize the search time for the user. Of equal importance is the fact that the more compact a particular file is, the fewer uses of it will be required to cover its monthly storage cost.

Examples are given of the use of the system for solving a number of problems in thermodynamics and thermochemistry and in chemical kinetics.

Key words: ASTM E84; building materials; carpets; fire tests; flame spread tests; floor coverings; interlaboratory evaluation; smoke measurement; tunnel test.

Results of an interlaboratory evaluation of the American Society for Testing and Materials (ASTM) Test for Surface Burning Characteristics of Building Materials (E 84-70), involving eleven laboratories and nine materials including four carpets, are reported. Data on flame spread, smoke, and fuel contribution were analyzed statistically to determine the reproducibility and repeatability of the test method. Selected physical characteristics of each tunnel are tabulated and compared relative to specifications in the test method. The between-laboratory coefficient of variation (reproducibility) in flame spread classification (FSC) was found to range from 7 to 29 percent for the four carpets and from 18 to 43 percent for the other materials tested. The between-laboratory coefficients of variation for smoke developed and fuel contribution ranged from 34 to 85 percent and from 22 to 117 percent, respectively, for all materials tested. The causes of higher variability in smoke and fuel contribution measurement between laboratories are not definitely known but may reasonably be attributed to variations in tunnel construction, instrumentation, and operation in different laboratories.

Key words: acylated 1,1-bis(acylamido)-1-deoxypentitols; conformational analysis; conformational nomenclature; exponential filtering; Fourier transform; p.m.r. spectroscopy.

The conformations of eight acylated 1,1-bis(acylamido)-1-deoxypentitols in solution have been studied by pulse, Fourier-transform, p.m.r. spectroscopy at 90 MHz. The arabinosyl and lyxosyl derivatives adopt the zigzag conformation whereas the ribosyl and xylosyl derivatives favor different sickle conformations. The validity of the conformational assignments of these derivatives by the p.m.r. method is discussed. The relative merits and accuracy of the continuous-wave and pulse-Fourier p.m.r. spectroscopic methods in the conformational analysis of carbohydrates are appraised, and the applicability of the exponential filtering technique to enhancement of either the sensitivity or the resolution of their spectra is demonstrated.

Key words: flame spread; floor covering material; heat release rate; ignition.

A small laboratory size experiment was used to observe the characteristics of flame spread over various carpets under various constant external radiant fluxes (0.10 ~ 0.27 cal/cm² sec or 0.4 ~ 1.15 w/cm²). The results indicate that a minimum radiant flux is necessary to sustain flame spread over a carpet surface for the carpets tested. By increasing radiant flux, the flame spread velocity increases sharply and can reach several m/sec. At a high external radiant flux, preheating time is the controlling factor for flame spread velocity. Ignitability, weight loss, and net heat release rate were also measured under various radiant fluxes. The effect of an underlayment on ignitability, flame spread speed, weight loss, and net heat release rate, was also observed for various carpets.

Key words: BC₁₃ (boron trichloride); boron; CO₂ (carbon dioxide); enrichment; infrared; isotopes; TEA laser.

Mixtures of BC₁₃ and H₂S are irradiated with 10.55 μm radiation (P(16) l ine of the 901-100 band of CO₂) from a TEA laser. After several hours of irradiation it is found that the maximum ¹⁰B to ¹¹B ratio of recovered gaseous boron containing material (primarily unreacted BC₁₃) is 0.413 ± 0.004. The corresponding ratio of the BC₁₃ starting material is 0.242 ± 0.002. The ¹⁰B concentration has therefore been increased from 19.5 to 29.2 percent. Further, by irradiating similar mixtures with 10.18 μm radiation (R(30) line of the same CO₂ vibrational band) this ratio changes to 0.169 ± 0.002, the ¹⁰B concentration being lowered to 14.4 percent. All experiments are performed in a small static system and chemical procedures for recovering milligram quantities of BC₁₃ selectively enriched in either isotope are described.

Key words: crystal structure; deuterium peroxide; hydrogen bonds; hydrogen peroxide; neutron diffraction; structure refinement; thermal motion.

The structure of deuterated hydrogen peroxide, D₂O₂, at ~ 15 °C was refined by least-squares methods from three dimensional neutron diffraction data. The data were fitted to two models, one with conventional anisotropic temperature factors and the other with the molecule treated as a rigid body except for torsional oscillations of the O−O groups about the O−O bond. The weighted agreement indices were 0.030 over 106 observed reflections for the conventional model and 0.032 over 102 reflections for the rigid body model. The structure is tetragonal, space group P₄₁2₁2₁ or P₄₂₁2₁, with a = 4.045 Å, c = 7.97 Å, Z = 4. Position parameters for the two models are essentially the same. The O−O distance in the molecule, 1.455(2) Å, is identical to that found in H₂O₂, but the O−D bond is about 0.015 Å shorter than the O−H bond, 0.993 Å as compared with 1.008 Å when corrected for thermal motion by the riding model. The O−O distance corrected for thermal motion in the rigid body model is
1.49 Å, in fair agreement with the value 1.48 Å found in the vapor phase.

Key words: angular field of values; diagonal; diagonally dominant; field of values; Gersgorin; Hadamard product; Hermitian; positive definite; spectrum.

Coefficient-wise multiplication was introduced by Hadamard and has been studied for certain square matrices by I. Schur and later authors. For AEMn(C), the n by n complex matrices, this paper examines the Hadamard product of A and A*. Upper estimates are given for the largest characteristic root of this necessarily Hermitian product, and three conditions on A sufficient for the product to be positive definite are presented.

Key words: chemistry; clinical laboratory capability; critique; hematology; microbiology; sampling.

The December 1973 issue of LAB WORLD published a critique of two NBS Interagency Reports. The Bureau has prepared a reply, written by the senior author of both NBS reports, and coordinated through the Institutes for Applied Technology and Materials Research.

Key words: collaborative reference program; interlaboratory testing; laboratory performance; paper test methods.

Brief editorial description of NBS-TAPPI Collaborative Reference Program, including participants, advantages, methods included, procedure, and related programs.

Key words: CO; energy surface; F2; hydrides; LiH2; MCSCF; O2; O2; polarizability; Van der Waals.

In this brief presentation recent and new applications of the multiconfiguration self-consistent field (MCSCF) method to the direct calculation of atomic polarizabilities, excited states of the same symmetry, Van der Waals forces, and triatomic energy surfaces are presented.

These calculations utilizing the BISON system, have been carried out over the past several years as part of collaborative research between Argonne National Laboratory, the National Bureau of Standards, and the Lawrence Livermore Laboratory.

Key words: image contrast; monoenergetic x-ray beams; optimum radiographic systems; transmission radiography; x-ray image signals; x-ray scatter.

With monoenergetic x-ray beams incident on polystyrene phantoms, the spectra of the transmitted x rays were measured with a scintillation spectrometer. The scattered and unscattered components of the transmitted x-ray fluence at a point on the beam axis were determined as a function of (i) the incident x-ray energy (18, 22, 32, 49, 58, 69, and 660 keV), (ii) the phantom thickness (5.3, 10, and 21 cm), (iii) the scatter solid angle determined by the exposed area of the phantom and the separation distance of the image plane (0.090, 0.31, 0.66, 1.8, 3.5, 4.3, 4.8, and 5.1 sr), and (iv) the beam diameter at the image plane (25, 17, and 10 cm). The results indicate that, as the incident x-ray energy decreases from 660 to 30 keV, the contribution of the scattered component to the transmitted fluence increases from approximately 50 to 90 percent for the 21-cm phantom and from 21 to 50 percent for the 5.3-cm phantom. For typical cases, the data show the effect of the scatter component on the ratio of the image to the background signals. In addition, the examples show that optimum conditions for maximizing this signal ratio may be obtained by a careful selection of the incident x-ray energy for low-, medium-, and high-contrast objects.

Key words: absorbed dose rate; depth dose; dose distribution; dye films; electron beams; optical cell; pulse radiolysis; radiation dosimetry; radiochromic dyes.

When a liquid solution in an optical cell is irradiated by an intense pulsed electron beam, it may be important in the chemical analysis of the solution to know the distribution of energy deposited throughout the cell. For the present work, absorbed dose distributions were measured by thin radiochromic dye film dosimeters placed at various depths in a quartz glass pulse radiolysis cell. The cell was irradiated with 30 ns pulses from a field-emission electron accelerator having a broad spectrum with a maximum energy of ~2 MeV. The measured three-dimensional dose distributions showed sharp gradients in dose at the largest penetration depths in the cell and at the extreme lateral edges of the cell interior near the optical windows. This method of measurement was convenient because of the high spatial resolution capability of the detector and the linearity and absence of dose-rate dependence of its response.

Key words: absorbed dose rate; cellulose triacetate; dosimetry; dyed cellophane; dyed plastics; electron beams; gamma radiation; plastic films; polymethyl methacrylate; polyvinyl chloride; radiation processing; radiochromic dyes.

Several practical plastic and dyed plastic dosimeters were examined under irradiation conditions similar to those used for radiation processing of materials. Cellulose triacetate, polymethyl methacrylate, polyvinyl chloride, dyed polymethyl methacrylate, dyed cellophane and dyed nylon were given fractionated and uninterrupted absorbed doses in the megard range with 60Co γ-rays and 10 MeV electron beams. It was found that with some systems, differences in radiation response due to dose-rate and temperature dependence can cause large systematic errors in dose interpretation. Poor reproducibility of response may result from batch-to-batch differences or intra-batch variations in thickness, distribution of sensitizers and background optical density. When using these routine dosimeters, careful calibration of the response and monitoring of factors contributing to poor reproducibility are essential.

Key words: acceptance tests; confidence intervals; criminalistics; errors; goodness of fit; normal distribution; significance tests; standards; statistics.

This paper is intended to tell "why-we-do-it-this-way." After preliminary remarks on randomness, errors, and distribution functions, various techniques of statistical analysis are discussed. These include significance tests, confidence intervals, and goodness of fit test. Finally, several examples will be discussed: 1) Performance requirements for breath alcohol testers; 2) bivariate discrimination for gunshot residue detection; and 3) Matching "profiles," e.g., trace element analyses or the output of a speech frequency analyzer.

Key words: cobalt; complexes; hexakis(imidazole)cobalt(II) nitrate; imidazole; neutron; structure: x ray.

The structure of the title compound was determined by x-ray and neutron diffraction techniques. The hydrogen bonding in the structure was uniquely determined from the neutron data. Bond distances and angles obtained with the two techniques are compared.

Key words: copolymerization; pentafluorostyrene; polymerization; pressure radiation; reactivity ratios; tetrafluoroethylene.

Tetrafluoroethylene (A) and 1,2,3,4,5-pentafluorostyrene (B) were irradiated at 15 °C at autogenous pressure by use of 30-92 mole-percent A and at 5000 atm by use of 42-99.9 mole-percent A. The high-pressure results indicate that the reactivity ratio r1 for monomer addition to A-ended radicals is 0.005; the other reactivity ratio r2 appears to vary from 15 to 60 generally increasing with the A content of the charge. At autogenous pressure r1 is small, but a precise determination is not possible because of the very low polymerization rate when the A content of the charge is high. However, if r1 is less than 0.01, then values of r2 vary from 15 to 50, again generally increasing with the A content of the charge. Mixtures of A and B exhibit positive deviations from Raoult's Law. Activity coefficients were measured at autogenous pressure and used in an attempt to correct r1 for the nonideality of solution. The range of r2 was reduced only slightly to 8-27, and charges with high A contents now generally gave low values of r2; consequently, this approach was not regarded as a success. Another attempt was made to account for the apparent variation in r2 by ascribing influence to the penultimate units of the radicals. Improved agreement between theoretical and observed compositions resulted, but significant discrepancies remained unexplained. Rate data agreed well with those calculated from a theoretical copolymer rate equation using values of r1 and r2 of 0.0045 and 40, respectively. The equation predicts an almost proportional decrease in rate with increasing proportions of A in the charge from 0 to 99 mole-percent A.

Key words: binary; gravity modes; nonadiabatic; oscillations; resonances; stellar.

The nonadiabatic oscillations of a star, driven by an outer rotating gravitational field, have been studied by the use of matched asymptotic expansions. The interior and envelope solutions in this procedure are derived in Sections 2 and 3. The results apply to stars which have a convective core and a radiative envelope, and they are discussed in Section 4.

We find that the resonances of the free gravity modes are damped by radiative dissipation, which operates in a relatively thin region below the surface of the star. Due to that dissipation, some properties of the dynamical tide have observable consequences in close binary systems: i) A torque is applied to a binary component; this serves to make it corotate with its companion in a time which can be short compared to its nuclear life. ii) Before that synchronization is achieved, the brightness distribution over the surface of the star is in general phase shifted relative to the external driving potential.

Key words: adhesion failure; cohesive failure; polymeric bond failure; scanning electron microscopy (SEM); x-ray photoelectron spectroscopy (ESCA).

X-ray photoelectron spectroscopy (ESCA) has been used to identify very thin layers of polymeric species remaining on aluminum plates after the polymer was cured and stripped from the aluminum. Two polymers were studied. In one, the residual polymeric carbon was used as the tracing signal; in the other, the polymeric silicon was used. In both cases, the polymeric species was partially sputtered from the aluminum surface by an argon ion gun. A reduction in the polymeric signal relative to a standard signal was noted. The results of this study show that, when the polymers studied were mechanically pulled from the aluminum substrate, the failure was a cohesive separation within the polymer, rather than failure at the polymer-aluminum interface. Scanning electron microscopy was used to show that the residual polymer does not remain on the surface as "clumps" or "islands," but rather as a smooth surface a few atomic layers thick.

Key words: crystal structure; organic crystal; x-ray diffraction.

The crystal of 1,3,5,7-tetraeco-t-1,3,5,7-tetracyclo-octane, C14H20O8H8, is tetragonal, a = b = 10.540(2) and c = 12.137(3) Å, with 4 molecules per unit cell. Systematic absences are consistent with space group P41212 (enantiomorphous with P41212). The structure was solved by direct methods and refined to a final R index Rw = 0.037 and R = 0.039 for 1244 observed reflections. The molecule consists of alternate CH2 and N—CO—CH3 groups in a puckered C—N ring, having a boat shape conformation with a twofold rotation axis through the center of the C—N ring and perpendicular to the mean plane of the puckered ring. The heavy atoms of each acetyl group are essentially coplanar with its neighboring nitrogen atom. The molecular thermal motion may be represented chiefly by three motions: a libration about the twofold rotation axis and two intramolecular bending motions about the C—C diagonal of the C—N ring.

Key words: burn hazard; consumer products; contact temperature; thermesthesiometer; thermometry.
Surface temperature measurement alone is insufficient to establish the hazard to the human of contact with a hot or cold object. A metal surface is more likely to cause thermal injury than a plastic surface at the same temperature. An instrument equipped with a measuring probe has been developed for indicating the temperature that would be experienced if human contact were made with the hot surface in question. The correct value of interface contact temperature can be read for a selected contact time without knowing the composition or temperature of the heated material under test.

Key words: chromosphere, sun; photosphere, sun; radiative transfer; solar flares.

Homogeneous plane-parallel model atmospheres for solar flares have been constructed to approximately simulate observations of flares. The wings of the Ca II lines have been used to derive flare upper photospheric models, which indicate temperature increases of ~100 K over the temperature distribution in the pre-existing facula at a height of 300 km above $\tau = 1$. In the case of flares covering sunspots the temperature rise seems to occur much higher in the atmosphere. We solve the transfer and statistical equilibrium equations for a three-level hydrogen atom and a five-level calcium atom in order to obtain the chromospheric flare models. The general properties of flares, including $n$, $N$, and Lyman continuum intensity are approximately reproduced. We find that with increasing flare importance the height of the upper chromosphere and transition region occur lower in the solar atmosphere, accounting for the factor of 60-600 increase in pressure in these regions relative to the quiet Sun. The Ca II lines profiles agree with observations only by assuming a macrovelocit distribution that increases with height. Also the chromospheric parts of flares appear to be highly inhomogeneous. We show that shock and particle heated flare models do not agree with the observations and propose a thermal response model for flares. In particular, it appears that heating in the photosphere is an essential aspect of flares.

Key words: cerebellar model; control theory; data storage; distribution memory; hierarchical control; manipulator control.

The storage of manipulator control functions in the CMAC memory is accomplished by an iterative process which, if the control function is sufficiently smooth, will converge. There are several different techniques for loading the CMAC memory depending on the amount of data which has already been stored and the degree of accuracy which is desired. The CMAC system lends itself to a "natural" partitioning of the control problem into manageable subproblems. At each level the CMAC controller translates commands from the next higher level into sequences of instructions to the next lower level. Data storage, or training, is accomplished first at the lowest level and must be completed, or nearly so, at each level before it can be initiated at the next higher level.

Key words: asymmetric diffusion coefficients; diffusion in liquid crystals; lyotropic liquid crystal.

The asymmetric diffusion of small molecules in a liquid crystal host is examined via three models. The small molecules are represented by spheres and the liquid crystal host by aligned cylinders. DASH is a continuum model which allows one to use the results of electrical conductivity problems to calculate the diffusion coefficient. LASH is an extension of polymer lattice counting models. CASH is a molecular dynamics computer simulation which provides experimental data to check the analytical models. It is found that DASH is a better representation of the diffusion asymmetry than LASH for the low liquid crystal densities examined on the computer. The cylinder sphere pair correlation function is also calculated in CASH and this gives evidence for liquid order around the liquid crystals.

Key words: lithium; molecules; noble gases.

The normalized emission spectrum of the Li($2p \rightarrow 2s$) resonance transition has been measured in the presence of 10-1000 torr of noble gas. Fluorescence at 100-3000 Å from the atomic line, due to the $X-X$ and $B-X$ bands of Li-noble gas molecules, has been measured as a continuum with 1.5 nm resolution. The lithium is optically excited in a 670 K cell. The lithium is optically thin (~10^{-4} torr) so that the continuum emission per excited lithium atom is obtained from the normalized emission. The attractive $A$-state potentials for Li-Ar, Kr, and Xe have been constructed by analysis of the $A-X$ band spectra in the limit of high and low noble-gas densities. At high densities each spectrum is due to an equilibrium vibrational distribution of $A$-state molecules, whereas at low densities only free collision states contribute. The ratio of the two spectra thus depends on the excited state potential and has been used to determine this potential where it is attractive. Absorption and stimulated emission coefficients for Li-noble gas vapors are also deduced from the data.

Key words: coherence measurement; microdensitometry; optical imaging; partial coherence.

An improved method of measuring spatial coherence is described and some sources of measurement errors are discussed. Partial coherence in the image plane of an optical system is discussed and results of coherence measurements are given that demonstrate the scaling of the coherence function for coherence intervals large compared to the diameter of the Airy disk and the limiting value for the coherence interval equal to the diameter of the Airy disk. The application of these results to microdensitometry is discussed and results of coherence measurements in the source plane of currently-used classical microdensitometers are given.

Key words: arc; calibrations; hydrogen; plasma; radiometry; spectral radiance; vacuum ultraviolet; wall-stabilized.

A wall-stabilized hydrogen arc can be utilized as a standard source of spectral radiance since the continuum emission coefficient is calculable to within a few percent. Previous efforts to apply this concept have been impeded by relatively large uncertainties associated with the plasma diagnostics. The present approach yields absolute intensities independent of the radiometric standards or the accuracy of any plasma diagnostics. The
hydrogen arc is operated at high temperatures where the continuum emission coefficient reaches a broad, unique, and calculable maximum. Comparisons with other primary standards are consistent with the estimated uncertainty in the arc continuum intensities.

Key words: differential thermal analysis; DTA: kinetics; pyrolysis; TGA: thermal analysis; thermal degradation; thermogravimetric analysis.

An apparatus was developed for measuring the rate at which vapors are evolved during the thermal degradation of materials and thereby deriving the kinetics of such reactions. Requisite to the operating scheme of the apparatus is the provision of a high-temperature zone to convert condensable or tarry vapors into noncondensable form. The apparatus yields a direct measure of reaction velocity, rather than the integrated indication obtained with thermogravimetric analysis. This simplifies the identification and calculation of kinetic parameters. Increases in sensitivity and operating range are also achieved. Flexibility in operation is obtained that permits the separate recording of reactions that tend to overlap. Although the apparatus principally has been operated using a combustible gas indicator to meter the evolved vapors, a number of options are available for the latter function, including flowmeters and various continuous gas analyzers. The applicability of the method appears promising.

Key words: asymmetry; coexistence curve; compressibility; critical exponents; critical point; decorated lattice gas; hole-particle symmetry; law of corresponding states; liquid; Padé approximant; power law; slope of the coexistence curve diameter.

The coexistence curve and the compressibility-like quantity \( \rho \) at the coexistence curve are calculated for Mermin's decorated lattice gas. We tabulate the Padé approximants to the Ising model properties which were used in these calculations. It is shown that for the proper choice of the adjustable parameter in the model the asymmetries in the coexistence curve and in \( \rho \) over a large temperature range, \( T_c/2 < T < T_c \), are qualitatively similar to that in real fluids. Also, similar correlations between the overall coexistence curve asymmetry and the amplitudes of divergences for the critical region occur in the model and in real fluids. Based on our model calculations, several predictions for fluid behavior near the critical point are listed: (1) The asymptotic asymmetry in the coexistence curve and in \( \rho \) at the coexistence curve should be most observable for fluids with large overall asymmetry such as SF\(_6\), NH\(_3\), and H\(_2\)O; (2) the range of the asymptotic asymmetry for \( \rho \) is expected to extend somewhat beyond \( t = 1 - (T/T_c) = 0.1 \) for such fluids; (3) in order to obtain an estimate for the compressibility exponent \( \gamma \) that is within a few percent of the true asymptotic value, experiments will have to be confined to the range \( t < 10^{-2} \). Recent experimental data for \( \rho \) at the coexistence curve are found to be consistent with the model for \( t > 10^{-2} \), but are inconclusive closer to the critical point.

Key words: Avogadro number; crystal repeat distance; density; isotopic abundance; silicon.

Measurements are reported on the densities and isotopic-abundance ratios of nearly perfect Si single crystals. These, when combined with optical interferometry of the crystal repeat distance, yield a new value for the Avogadro constant. This result, \( N_A = 6.022 \times 10^{23} \text{ mol}^{-1} \) (1.05 ppm), represents a more than thirty-fold reduction in the uncertainty of previous direct measurements.

Key words: clinical; contamination; errors; soft glass pipets; unwashed soft glass pipets.

Soft-glass, Pasteur-type pipets are widely used as disposable transfer pipets, especially in clinical and biochemical laboratories. These pipets possess an alkaline surface contamination that can affect the accuracy of chemical analyses if proper precautions are not taken. Microtitrations of aqueous rinsings from these pipets have consistently yielded values of 0.1 to 0.2 \( \mu \text{mol} \) of hydroxide equivalent per pipet. A possible detrimental effect of this residue was demonstrated, using chloroform solutions of bilirubin. Absorbance was diminished by as much as 5 percent when unwashed, soft-glass pipets were used to transfer these solutions to spectrophotometric cells. Absorption and fluorescence characteristics of other unidentified surface contaminants are also described. The effect of multiple rinsings is discussed and several ways are suggested for cleaning these pipets. Oven drying must be avoided, however, since it enhances alkali release.

Key words: dispersion relations; pion-nucleon amplitudes; pion-nucleon cross section; pion-nucleon scattering; pion-nucleon scattering; sum rules.

A number of energy weighted sum rules relating amplitudes and differential cross sections for forward elastic and charge exchange scattering to the total pion-nucleon cross section are derived from dispersion relations.

Key words: amorphous alloys; amorphous magnetism; coercive magnetic force; magnetic structure; neutron diffraction; recrystallization: terbium-iron.

Sputtered alloys of composition \( \text{Tb}_x \text{Fe}_{1-x} \) with \( x = 0.118, 0.45 \) and 0.75 were shown by neutron diffraction to be amorphous. Line-width measurements of an annealed sputtered sample with \( x = 0.333 \) indicate microcrystallinity with a particle size of \( \sim 100 \text{ Å} \).

Key words: electrons; ions; molecules; nitrogen.

Translational kinetic energy and angular distributions of \( N^+ \) from dissociative ionization of \( N_2 \) have been measured at electron energies close to threshold. For electron energies above 50 eV the energy distributions agree favorably with earlier measurements of Kieffer and Van Brunt. The ion energy distributions at
electron energies below 50 eV are dominated by a feature peaked at a kinetic energy below 1 eV in agreement with recent measurements of Locht et al. For electron energies closest to threshold the angular distribution of N⁺ associated with this feature is consistent with the previously proposed mechanism involving excitation of the C₂Σ⁺ state followed by predissociation. At higher electron energies the degree of anisotropy increases and then rapidly decreases suggesting a significant contribution from direct excitation to the Σ₂⁺ repulsive state of Ne⁺ leading to fragments in their ground states.

Key words: angular distribution; asymmetry; photoionization; rare gases.

Results of calculations of angular distributions of photoelectrons from the outer p subshells of Ne, Ar, Kr, and Xe are presented for electron energies between 0 and 2 Ry (27.2 eV).

Key words: atomic data; atomic energy levels; atomic line shapes; atomic spectra; data compilations; gas lasers; transition probabilities.

The operation and current work of the NBS Atomic Energy Levels Data Center is reviewed briefly, and some of the other activities of this type, at NBS and elsewhere, are noted. The data include atomic wavelengths, energy levels, transition probabilities and line shapes and shifts, and gas laser transition data. References to some recent and forthcoming compilations of atomic spectral data are included.

Key words: data; Standard Reference Data Program; well-defined, measurable properties.

The Standard Reference Data Program deals primarily with physical and chemical property data. The properties covered are well-defined, measurable properties and the systems include pure substances and mixtures that can be adequately characte-data by experienced scientists. The program is managed by the National Bureau of Standards under a mandate from the Congress of the United States to make critically evaluated reference data readily available to scientists, engineers and the general public.

Key words: calibration; gage blocks; measurement assurance.

Recently the Optical Physics Division of the National Bureau of Standards was faced with a potentially serious set of problems in the gage block calibration laboratory: labor costs were escalating, metrical standards threatened to greatly increase the workload, and the system in use (interferometry) did not lend itself to providing a desired Measurement Assurance Program. The introduction of a new system that provides better accuracy, lower cost and the possibility of a MAP was undertaken. The methods used to install the calibrations, to design the system, to develop the program, and to test the system are described.

Key words: consumer products; contact temperature; thermocouple; thermometry.

Exploration of the problem concerning hazards to consumer products has shown that laboratory engineers can usefully apply basic measurement practices towards improving safety and developing new measuring tools. Some novel and relatively simple redesign features will be presented concerning a common household appliance that can significantly reduce its electrical and thermal hazards. Included in the paper are details of an instrument which tests for burn hazard by simulating the human response to a hot surface. The advantage of the new instrumentation is that a thermal safety standard can be written around one specified contact temperature for nearly any material regardless of its composition or surface temperature.

Key words: oscilloscopes; pulse; pulse generators; pulse measurement; transmission lines.

A general review of pulse measurement research at the National Bureau of Standards is described which includes work with electrical pulse generators using mechanical switches, avalanche transistors, snap off diodes, tunnel diodes, and laser pulses. Pulse transmission studies which include skin effect, nonuniform dielectric, lossy liquid dielectric and superconductivity are also mentioned together with pulse measurement techniques which include oscillographic techniques and pulse autocorrelation. The interfacing of picosecond pulse measurement instruments with a minicomputer is also described. This has resulted in an Automatic Pulse Measurement System (APMS) which has already been used to measure transmission coefficients S₂₁ of some microwave networks.

Key words: critically evaluated numerical data; National Standard Reference Data System; physical sciences.

The National Standard Reference Data System (NSRDS) represents an effort to provide critically evaluated numerical data in the physical sciences. It is a decentralized program coordinated from the National Bureau of Standards, but enlisting the help of experts throughout the country. Activities of interest to chemical engineers are discussed.

Key words: handgun detection; metal detector; performance standard; security; weapon detection.

The Law Enforcement Standards Laboratory at the National
Bureau of Standards (BNS) is developing performance standards for equipment used in the criminal justice system. They will be promulgated primarily by the National Institute of Law Enforcement and Criminal Justice, Department of Justice. This paper discussed the development of a standard for walk-through metal weapon detectors. The standard contains requirements and test methods for such things as detection performance, effects of walking speed and throughput rate, alarm indicator, controls, stability, ambient and generated magnetic field, and interference with other detectors.

Key words: associated matrices; Burnside theorem; irreducible representations; matrix groups.

The principal result is that if $G$ is any irreducible subgroup of $GL(n, C)$ ($C$ the complex field) such that $|\text{tr}(TA)|$ is uniformly bounded for all $A \in G$ and some fixed $n \times n$ nonzero matrix $T$, then $G$ is equivalent to a unitary group. Similar results are proved for certain associated representations of $G$.

Key words: bounded representations; Burnside; irreducibility; unitary groups; Weyl.

It is shown that an irreducible matrix group with uniformly bounded trace is itself uniformly bounded, and so equivalent to a unitary group. This result is used to prove that certain matrix groups preserving certain scalar valued functions are unitary.

Key words: calibration of thermometers; low-temperature calibration of thermometers; platinum resistance thermometers; resistance thermometers; two-way structural analysis.

Calibration procedures are developed for platinum resistance thermometers in the temperature range 2.5-14 K. Two recommended methods require calibration points at the boiling point of liquid helium (4.215 K) and the triple point of hydrogen (13.81 K); in addition, the first method requires a point at 7.201 K while the second method requires the slope of the calibration curve at 13.81 K. For temperatures from 3.5 to 14 K, the calibrations are accurate to within 0.01 K for the first method and 0.025 K for the second method. For temperatures from 2.5 to 3.5 K, the calibrations are somewhat less accurate. Therefore, if a thermometer has been calibrated for temperatures of 13.81 K and above, its calibration may be easily extended to lower temperatures with sufficient accuracy for many applications. These calibration procedures were developed from two-way structural analysis of the accurate calibrations of 12 platinum resistance thermometers.

Key words: methane; molecular dynamics; potential function; specific heat; statistical mechanical ensembles; thermodynamic properties; three body forces.

Thermodynamic properties of methane in the dense gas and liquid states have been calculated by the method of molecular dynamics. The methane pair interactions were modelled using a spherically symmetric $m$-$6$-$8$ potential, and the most significant three-body and quantum effects were included. Agreement between calculated and experimental values for the energy and pressure is generally good except at low temperatures and high densities. The specific heat at constant volume is also briefly discussed.

Key words: absorption spectra; infrared; molecular energy levels; ozone; pollution; spectra.

The $\nu_1 + \nu_2$ band of ozone ($O_3$) near 2110 cm$^{-1}$ has been measured and analyzed using a Watson-type Hamiltonian including all seven sextic centrifugal distortion terms. Two weak perturbations have been found between $K = n$ of $\nu_1 + \nu_2$ and $K = n + 3$ of $2\nu_2$. Those perturbations locate the band center for $2\nu_2$ at about 2058 cm$^{-1}$. Aside from those perturbations the interactions of $\nu_1 + \nu_2$ with $2\nu_2$ and $\nu_2$ have not been taken into account in the analysis. Effective band constants and an atlas listing line wavenumbers and assignments are given.

Key words: acoustics; automobile; noise (sound); tire noise; transportation noise.

Automobiles, the primary mode of transportation in the United States, contribute significantly to the noise environment due to the large number in operation. In this report, one aspect of automobile noise is discussed; namely, the contribution to overall vehicle noise resulting from the interaction of the tires with the road surface. The results of this pilot study, which investigated the influence of selected parameters on automobile tire noise levels, in conjunction with a review of the open literature, serve as the basis for comparison of parametric trends between truck (for which an extensive noise data base exists) and automobile tires. As was the case with trucks, vehicle speed, road surface characteristics and tread design are major factors affecting automobile tire noise. The effect of pavement surface is more significant for automobile tires than for trucks since the texture within the tire-road interaction zone is on the same scale as the tread element spacing typical of passenger car tires. Load and wear, significant factors for truck tires, do not affect automobile tires as much due to the fact that the majority of automobile tires utilize rib tread designs. On the basis of the limited data available in the literature, factors such as inflation pressure, number of plies, tire dimensions, tire cord material, etc., do not appear to be significant factors affecting automobile tire noise.

Key words: bremsstrahlung beams; cross section; fission barrier shape; fission isomer; photofission.

The influence of a double-humped fission barrier on the photofission cross section far below the top of the barrier is considered. In the region about 2 MeV below the top of the outer barrier and at a cross section in the region of $10^{-9} - 10^{-8}$ b, the photofission is expected to become almost entirely isomeric or delayed fission. When this occurs a "shelf" should appear in the photofission cross section where the cross section changes with energy far more slowly than at higher $\gamma$-ray energy. The cross section on the shelf can therefore be orders of magnitude higher than otherwise expected. While the angular distribution near the top of the barrier is expected to have a well-defined and nonisotropic angular dependence, the angular distribution on the shelf is expected to be isotropic. The cross sections, although small, appear to be measurable with bremsstrahlung beams in the
3- to 5-MeV range using a several hundred μA electron beam. Successful experiments of this type should provide information on the shape of the inner and outer barriers at much lower excitation energies than possible by other techniques.

Key words: permanent adjoint; positive semidefinite hermitian matrix; symmetry class of tensors.

In this note an inequality is proved for generalized matrix functions. When specialized to the permanent, the inequality suggests a conjecture concerning a relation between the permanent and determinantal adjoints. The general inequality extends a conjectured inequality of Doković to another class of matrices.

Key words: materials reliability; nondestructive evaluation.

This paper is an abridged version of a recent report by a federal ad hoc working group on NDE. In the report, the NDE field is surveyed in order to foresee probable future growth areas and the technical developments which will be required to support this growth. Major NDE involvement is expected to continue in aerospace, to grow enormously along with the nuclear power industry, and to become a more important factor in ground transportation, general manufacturing, maintenance of machinery, and medical diagnosis. Technical issues and challenges are reviewed.

Key words: acutance; identification (faces); image quality; Modulation Transfer Functions.

The performance required of imaging devices should be based on the needs of the user. In analyzing these needs, three psychophysical levels of visual task performance must be considered: detection, recognition, and identification. The experimental data base for these levels of performance is very uneven. Many detection studies have been performed, fewer have addressed problems of recognition, and rarer still are investigations associated with identification. This study determined experimentally the observer's perception of the image quality required for the identification of faces, as determined by two criteria: (1) the average observer and (2) 90 percent of the population. The subjective response from the human observer was then transformed into a physical descriptor amenable to direct measurement by instruments. The Modulation Transfer Function is recommended as the physical correlate for subjective facial identification.

Key words: cermet; chromium plating; codeposition; composite coating; dispersion plating; electroplating; hard particles; wear-resistance; wear-tests.

Particles were included in a chromium deposit with the addition of a monovalent cation, e.g., thallium nitrate, in a small amount to the sulfate chromic acid bath. Using these additives, hard particles, lubricating particles, and metal powders were incorporated in a chromium matrix on vertical surfaces. When even less than 1 wt % of hard particles such as diamond, boron carbide or silicon carbide were codeposited with the chromium, resistance to wear was increased up to threefold over that of a hard, bright chromium deposit as measured by an abraser type wear-testing device.

Key words: adsorption; Auger spectroscopy; catalysis; infrared spectroscopy; kinetics; photoelectron spectroscopy.

A survey of a number of modern methods of surface science is given. The objective is to provide the reader with a general appreciation of the new advances in surface science which relate to fundamental thinking about heterogeneous catalysis.

Key words: analysis; clinical chemistry; glucose; microcalorimetric; thermochemistry.

Microcalorimetric measurement of enthalpy change for the hexokinase catalyzed reaction of ATP with glucose (in TRIS/HCl buffer containing MgCl₂) was carried out with glucose concentrations from zero to 1350 mg/liter⁻¹. A linear relationship between measured heat and glucose concentration was found, from which the reaction enthalpy was calculated to be 61.4 kJ/mole⁻¹. This linear relation, combined with calorimetric measurements of the same process carried out with 0.15 ml samples of human serum, was used to calculate glucose concentrations in the serum. For 45 samples containing glucose levels ranging from 420 to about 4000 mg/liter⁻¹ the results show only slight systematic differences from measurements made by the glucose oxidase procedure of Gochman and Schmitz.

Key words: electret; dipoles; glass; piezoelectric; polarization; polyvinyl chloride; pyroelectric.

The total polarization due to molecular dipoles in a glassy electret is computed using an Onsager cavity approach. From this result, all the possible contributions to the piezoelectric and pyroelectric coefficients are considered. It is shown that there are major contributions from the variation in dielectric constant and, for pyroelectricity, from thermal motion. These results account well for experimental data for polyvinyl chloride.

Key words: europium ions; fluorescence; fluorescence standards; inorganic ion-doped fibers; microspectrofluorimetry; uranyl ions.

Uranil and europium ion-doped fibers of 5-45 μm diameter were prepared which emit in the green and red spectral regions, respectively. Measurements were made of fluorescence flux as a function of fibre length, dopant concentration, slit shape and fibre diameter. The flux was found to be proportional to fibre length and fluorophor concentration and proportional to the square of the fibre radius. In addition, the fluorescence flux as a function of aperture size and shape and fibre position has been measured experimentally and compared to computer generated fluorescence flux envelopes. It is suggested that inorganic ion-doped fibers are suitable for use as microspectrofluorimetric standards.

227
Key words: crack growth; fracture; fracture mechanics; porcelain; strength; structural ceramics.

A new method in design of structural ceramic components is discussed. The method is based on an understanding of crack growth in these materials and provides a means of estimating the time to failure under load.

15323. Unassigned.

Key words: chloroform; deuteron; NMR; pressure dependence; relaxation; reorientation; temperature dependence.

Deuteron NMR spin-lattice relaxation measurements have been performed on the neat liquid CDCl₃ over the range 28 °C < T < 165 °C and at pressures up to 5 kbar (5 × 10⁶ N/m²). These measurements enable one to determine τ₀, the correlation time for molecular reorientation about the axes perpendicular to the symmetry axis. The data are presented as a function of all three state variables, P, V, and T. An attempt is made to describe the data in terms of various simple models for reorientation including activation and free volume models. Each of these models predicts certain aspects of the data but fails in other areas. In particular, the activation model fails to predict the correct behavior at constant temperature and the free volume theories generally fail to predict the constant volume experiments. Deviations from the Debye and microviscosity theories were also noted. The mean time between collisions τ₀ was calculated from τ₀ assuming both Gordon's J-diffusion model and the equivalence of τ₀ and τ₀, the angular momentum correlation time. These values of τ₀ were then compared with the predictions of the cell model for liquids in which τ₀ is simply the mean free path divided by the mean velocity. Generally, the data did not fit the cell model; however, at constant pressure, the cell model did predict the changes in τ₀ quite well. Qualitative suggestions are made to account for the discrepancies. Finally, the possibility that H-bonding exists in CHCl₃ and affects the generality of these results by changing the quadrupole coupling constant and disturbing the dynamics of the system is discussed. It is concluded that these effects are small if they exist at all.

Key words: building systems; communications equipment; concealed objects; emergency equipment; Law guidelines; protective equipment; security systems vehicles; voluntary standards; weapons.

In January 1971, at the request of the U.S. Department of Justice, the National Bureau of Standards established a new organization, the “Law Enforcement Standards Laboratory.” This Laboratory, which is presently funded entirely by the National Institute of Law Enforcement and Criminal Justice, the research arm of the Law Enforcement Assistance Administration, has been given the task of developing voluntary performance standards, specifications, and guidelines for equipment used by U.S. law enforcement and criminal justice agencies. The objective of this program is to assist Federal, state and local law enforcement organizations in the selection and procurement of equipment used by these agencies. In addition to standards development, the Laboratory is developing the methods for measuring the actual performance levels of the equipment.

Key words: impulse response; linear microdensitometry; microdensitometry; optics; slit imagery; transfer function.

In the development of modern linear microdensitometry, the underfilling the efflux optics, with total collection of light after it passes through the sample. The system is designed so that the light distribution impinging on the sample, reduced from an illuminated slit or circular aperture through the linear optical system. The maximum frequency response of the system is obtained when the sample is illuminated with the impulse response of the reorientation of the inuflux optics. However, the theoretical impulse response can only be realized by uniformly distributing light and this is photometrically impossible. Similarly, because the system images an illuminated aperture onto the sample, scanning with a pure, geometrically-characterized slit or spot is not possible due to lens response and diffraction. These two problems are investigated, both coherent and incoherent illumination.

For both impulse response and slit image, the MTF is investigated, and its deviation from the ideal is calculated. The results are characterized in terms of RMS-MTF over the spectrum for 10, 5, 2, and 1 percent levels. The controlling parameter is the ratio N/R, where R is the reduction factor employed for the inuflux optics, and N is the number of resolution elements contained within the nominal object slit width. The study shows that there are significant differences in these values for the same RMS difference level, with coherent and incoherent illumination, and that there are compromises to be made with both kinds of illumination. The results of this study facilitate calculation of system response for any configuration of object slit and inuflux optics (within the linear microdensitometer system), and includes limits on slit sizes for operation with impulse response and geometrically characterized slit images for the sampling aperture. The effects expected with the linear polarization associated with laser illumination (the most common source of high-energy, coherent radiation) is discussed, but not included in this scalar treatment.

Key words: annealing temperature; atoms; stoichiometry; superconducting; transition temperature.

Measurements of the superconducting transition temperature (Tc) of V-Rh A15 alloys reveal that long range order induced by low temperature annealing may cause Tc to decrease rather than increase. The behavior of Tc with ordering is discussed for the systems V-Au, V-Pt, V-Ir, V-Os and V-Rh.

Key words: combination; kinetics; methyl; nitric oxide; oxygen; rate constants.

Rate constants for the combination of methyl radicals with NO and O₂ have been measured by flash photolysis of azomethane coupled with product analysis by gas chromatography. Values of the rate constants have been obtained over the temperature range from 30 to 700 °C with He, Ne, and Ar as quenching molecules.

The high-pressure limits were obtained through an RRKM model calculation and were found to be

\[ \text{CH}_3 + \text{NO} + M \rightarrow \text{CH}_3\text{NO} + M \]

\[ k_c = 3.2 \times 10^{-11} \text{ cm}^3/\text{molec} \cdot \text{sec} \]
CH₃O₂ + O₂ + M → CH₃O₂ + M

\[ k_n = 1.7 \times 10^{-12} \text{ cm}^3/\text{molec} \cdot \text{sec} \]

The rate constants were measured relative to the methyl combination reaction \( k_1 \) with \( k_1 = 9.5 \times 10^{-11} \text{ cm}^3/\text{molec} \cdot \text{sec} \). The RRKM model suggests \( D_0(\text{CH}_3 - \text{O}_2) = 32 \pm 3 \text{ kcal/mole} \).

Key words: mechanical relaxation; methyl branches; paraffins; polyethylene; potential energy calculations; relaxation mechanism; relaxation strength; site model.

A site model has been used in conjunction with potential-energy calculations to examine the role of isolated molecules with methyl branches in the mechanical relaxations of a linear hydrocarbon host crystal. The results indicate that there are two possible relaxation modes and that the one involving molecular rotation is energetically favorable over the one involving rotation and translation. For some modes of deformation, the calculated relaxation strengths are comparable to the experimentally measured ones. Furthermore, the barriers determined in this work yield calculated curves of the logarithmic decrement as a function of temperature which are comparable to the experimental ones. The relaxation is much weaker for unbranched chains in the planar zigzag conformation.

15330. Torchia, D. A., J. Lyrada, J. R., Jr., Quattrone, A. J., Molecular dynamics and structure of the random coil and helical states of the collagen peptide, \( \alpha_1 \)-CB2, as determined by \( ^{13} \text{C} \) nuclear magnetic resonance, Biochemistry 14, No. 3, 887-900 (1975).

Key words: C-13 magnetic resonance; collagen; polymers; polypeptides; protein structure; relaxation times.

Carbon-13 chemical shifts, spin-lattice \( (T_1) \) and spin-spin \( (T_2) \) relaxation times, and \( ^{13} \text{C}-^{1} \text{H} \) nuclear Overhauser enhancements (NOE) have been determined for the random coil and triple helical states of the \( \alpha_1 \)-CB2 fragment of rat skin collagen. Assignment of all aliphatic resonances of this 36 residue peptide in the random coil state (30°) has been achieved with the aid of model polypeptide containing pyrrylidine residues. The chemical shifts and intensities of the Pro and Hyp \( ^{13} \text{C} \) resonances show that \( \geq 90% \) of the X-Pro and X-Hyp bonds are in both helix and coil conformations. From 7 measurements rotational correlation times \( (\tau_R) \) of ca. 0.45 nsec are calculated for interior \( ^{13} \text{C} \) carbons in the coil, while \( \tau_R \) values of the side chain and near terminal carbons are found to be 2-9 times smaller. These results along with the narrow natural line widths (3-5 Hz) and maximal NOE values \( (2.8 \pm 0.3) \) demonstrate the high degree of backbone mobility, due to segmental motion, in the unordered state of the peptide. By contrast, the broad lines (50-90 Hz) and small NOE values \( (1.3 \pm 0.3) \) for the \( \alpha \) carbons in the helical state \( (2^{°}) \) suggest much slower motion. The line widths and NOE values together with the \( ^{13} \text{C}-^{1} \text{T} \) values \( (0.025-0.040 \text{ sec}) \) correspond to correlation times which are in reasonable agreement with those calculated for an axially symmetric rigid ellipsoid, undergoing rotational diffusion, having dimensions approximating those of a collagen-type triple helical aggregate of three \( \alpha_1 \)-CB2 chains. A satisfactory computer simulation of the experimental \( 2^{°} \) spectrum is obtained by assigning the narrow aliphatic resonances in the spectrum (line widths 5-40 Hz) to (a) carbons in the small amounts of \( \alpha_1 \)-CB2 (3 mol %) and \( \alpha_1 \)-CB1 (2.5 mol %) random coil conformations, (b) carbons in the flexible terminal triplets of the helix, and (c) Ala, Leu, and Phe methyl and phenyl carbons. The side chain carbon line widths obtained from the simulation — when compared with side chain line widths calculated for a rotating rigid ellipsoid with internal motion — indicate rapid axial reorientation of methyl and phenyl groups. With the exception of the Hyp residue the line widths suggest local motion for at least some carbons in most other side chain moieties. The Hyp \( \text{C}^\beta \) and \( \text{C}^\gamma \) line widths indicate the presence of little if any rapid Hyp ring motion.

Key words: air pollution; chemical analysis; industrial hygiene; mercury; piezoelectric detector; trace analysis.

A quartz piezoelectric crystal detector with gold evaporated onto the electrode as the sensor substrate has been developed for the detection of small mass changes caused by the selective adsorption of mercury vapor from an air sample. Incorporation of the crystal into a variable oscillator circuit and measurement of the change in frequency of the crystal due to the increase in mass allows a highly sensitive indication of the amount of mercury present in the air sample down to the subpart-per-billion level. Thus, the selectivity of mercury adsorption onto gold films and the sensitivity of the piezoelectric sensor are combined in this instrument. Calibration curves are obtained from part-per-million to subpart-per-billion concentrations of mercury. Reversibility is achieved by placing the sensor in an oven, raising the temperature to \( 150 °C \), and flow switching a stream of clean, dry air over the detector. This detector has potential use both as an air pollution sensor and in industrial hygiene applications.

Key words: diffusion; doping; Fe-57; iron-doped; lattice distortion; Mössbauer spectroscopy; quadrupole splitting; temperature dependence.

Iron-57 Mössbauer spectra have been obtained of single crystal and powdered samples of rutile (\( \text{TiO}_2 \)) doped to about one percent by weight in isotopically enriched iron. Spectral patterns found for powdered samples are consistent with theoretical expectations for substitutional doping with a uniform distribution of oxygen vacancies and impurity ions. The temperature dependence of the ferrous pattern indicates a slight shift in position of the neighboring oxygen ions to accommodate the relatively large size of the dopant ion. Spectral parameters from the single crystal samples differ radically from those of the powder samples or the “ideal lattice” theory. Variations in stoichiometry, charge compensation mechanisms, or other diffusion-related phenomena are assumed to be responsible. Single crystal results do, however, furnish graphic evidence that trivalent iron diffuses faster in rutile than the larger divalent species.

Key words: AFO; chemical doping; complex equilibria; purification (evaporative); vacuum vaporization.

A simplified, direct approach is presented to the description of complex equilibria involving vaporization into vacuum. Emphasis is on the basic problem-solving process and on modification of existing techniques. Sequential solutions are presented to problems involving purification of a melt by vaporization into vacuum. The effects of concentration of melt and oxygen partial pressures on vaporization rates are demonstrated.

Key words: CHFS; CHFSH; dimethyl disulfide; infrared spectrum; matrix isolation; pyrolysis; s-trithione; thioformaldehyde; ultraviolet photolysis; vacuum ultraviolet photolysis.

HCS has been trapped in argon and nitrogen matrices at 14 K as a product of the pyrolysis of s-trithione or (CHFS) and of the ultraviolet or vacuum ultraviolet photolysis of CHFSH. A small concentration of HCSS has also been observed upon vacuum ultraviolet photolysis of a mixture of CHF and HFS in an argon matrix. The isotopic data support the assignment of absorptions at 993 and at 1063 cm⁻¹ to the out-of-plane deformation and the C=5 stretching fundamentals of HCSS. Absorptions in the CH-stretching region which were assigned to HCSS in an earlier gas-phase study were confirmed in the matrix experiments. Studies of the vacuum ultraviolet photolysis of CD4SH have provided information on the mechanism of the photolysis process.

Key words: effect; laser; magnetic resonance: oxygen; rotational structure: Zeeman.

Using the 108- and 84-μm D2O laser lines, new laser-magnetic-resonance (LMR) spectra of the oxygen molecule in its ground state (X2Πv, ν = 0) are observed and analyzed. The corresponding transitions are n = 15 → 17 and n = 19 → 21, respectively. Bauer, Kamper, and Lustig's values of the g factors are consistent with our results, but Hendrie and Kusch's values are not. Combining all LMR results with other results, we obtain rotational parameters B̃ = 43.1004608(75) GHz and B̃ = 0.14520(20) MHz.

Key words: dipole moment: excited states: MC-SCF: molecular geometry: NO2: spectra.

Traditional spectroscopic analysis of the complex and irregular absorption spectrum of NO² has provided a relatively small amount of information concerning the nature of the excited states. An extensive ab initio investigation has been undertaken, therefore, to provide a basis for interpretation of the experimental results. Multiconfiguration self-consistent-field (MC-SCF) wavefunctions have been computed for the low-lying X2Σ₅⁺, A2Pi, B2Pi, C2Πi, 4A1, 4A1, and 2Σ+₁ electronic states of NO₂. The minima of the A2Pi, B2Pi, and C2Πi states have all been found to be within 2 eV of the minimum of the X2Σ₅⁺ ground state; for these states, C₂, potential surfaces have been constructed for purposes of a spectral interpretation. The 4A2, 4A1, and 2Σ⁺₁ states are all more than 4 eV above the minimum of the ground state and have been examined in less detail. The study described here significantly improves on previous NO₂ ab initio calculations in three important areas: (1) the double-zeta plus polarization quality basis set is larger and more flexible; (2) the treatment of molecular correlation is more extensive; and (3) the electronic energies have been calculated for several different bond lengths and bond angles in each state. For the four lowest doublets the following spectral data have been obtained:

| B2A1 | 1.66 | 1.20 | 180 |
| A2B2 | 1.18 | 1.26 | 102 |
| X2A1 | 0.00 | 1.20 | 134 |

The ground state experimental constants are included in parentheses. The estimated accuracy of the various parameters is ± 0.02 Å for bond length, ± 2° for bond angle, ± 10 percent for the vibrational frequencies, ± 0.10 D for dipole moments, and ± 0.3 eV for the adiabatic excitation energies. An unusual feature has been found for the 2Σ⁺₁ state. The equilibrium geometry of this linear state has two unequal bond lengths of 1.20 and 1.42 Å and the inversion barrier is approximately 800 cm⁻¹.

Key words: aluminium point: calibration: freezing point: freezing-point cell: platinum resistance thermometer: tin point: zinc point.

Six platinum resistance thermometers were "calibrated" at the triple point of water and at the freezing points of tin, zinc and aluminium. By extrapolating the "quadratic relation" the freezing point of pure aluminium was found to be 660.407 ± 0.005 "degrees C." The advantages of having a platinum resistance thermometer calibrated at a fixed point (e.g., aluminium point) near the upper temperature limit are demonstrated.

Key words: elementary divisors: irreducible character: symmetry class of tensors.

Let V be a complex inner product space of dimension n and let \( \nabla V \) be the space of m contravariant tensors over V. Given a subgroup G of Sₘ and an irreducible character \( \chi \) on G, we define a subspace \( V_m(G) \) in \( \nabla V \). If \( T: \nabla V \to \nabla V \) is linear, let \( II: \nabla V \to \nabla V \) be the mth Kronecker product of T. Then \( V_m(G) \) is invariant under \( II: T \) and we let \( K(T) \) be the restriction of \( II: T \) to \( V_m(G) \). In this paper we prove that if the rank of T is large enough, then the elementary divisors of K(T) are linear if and only if the elementary divisors of T are linear. This result has previously been proved only for the case that \( \chi \) is linear.

Key words: critical field, fixed point: iridium; transition temperature.

The residual resistivity ratio, superconducting transition temperature, magnetization curves, and critical magnetic field data of several samples of iridium have been measured. It is found that the magnetic properties of superconducting iridium are highly dependent on the metallurgical state of the sample, whereas the transition temperature is relatively less sensitive.
The use of iridium as a superconductive thermometric fixed point at 0.1 K is critically examined.

15340. Shih, A., van der Waals forces between a Cs atom or a CsCl molecule and metal or dielectric surfaces, Phys. Rev. A 9, No. 4, 1507-1514 (Apr. 1974).

Key words: cesium beam; cesium chloride beam; gold surfaces; van der Waals forces.

The interaction potentials between a spherically symmetric atom (Cs) and a highly conducting surface (gold) or a dielectric surface (glass) are investigated by the atomic-beam-depletion technique. The observed beam profile is least-squares fitted to an \( r^{-3} \) potential. The derived interaction constant for the gold surface is 0.59 and 0.67 of the values predicted by Bardeen and Mavroyannis, respectively. A glass surface is found to have an interaction constant 0.65 that of gold. The measurements have also been obtained for a polar molecule (CsCl). With a gold surface the observed beam profile is almost identical to that for stainless steel (reported earlier) in spite of their difference in dc conductivity. Further, the observed constant for an insulator (glass surface) is 0.86 that of gold. With gold, the interaction constant obtained for a cesium-halide molecule, with a strong permanent dipole moment, is smaller than that for a Cs atom with zero dipole moment.

Key words: eigenvalues; Hadamard inequality; positive definite; real part.

Denote the real part \( A \in M_n(C) \) by \( H(A) = 1/2(A + A^*) \). We provide dual inequalities relating \( H(A^{-1}) \) and \( H(A^{-1}) \) and an identity between two functions of \( A \) when \( A \) satisfies \( H(A) > 0 \). As an application we give an inequality (for matrices \( A \) satisfying \( H(A) > 0 \)) which generalizes Hadamard’s determinant inequality for positive definite matrices.

Key words: OSRM; pure cadmium; superconductive transition temperature; superconductive transition width; thermometric fixed point.

We have examined the superconductive transition of a single crystal of cadmium at temperatures from 0.1 K to its transition temperature, \( T_c \), and in magnetic fields from 0-27 gauss. We have measured \( T_c \) as \( 0.515 \pm 0.002 \) K on the T-02 scale. We have compared its transition width and its \( T_c \) with polycrystalline samples prepared for thermometric fixed-point devices. The single-crystal transition width is \( \sim 250 \mu K \) at \( H = 0 \), compared to 2-6 mK for the polycrystalline samples. However, the \( T_c \)'s of the polycrystalline samples agree within 0.5 mK with that of the single crystal. We have examined the width of the single-crystal transition as a function of applied field, and find a minimum width of about 25 \( \mu K \) for 0.5 gauss. These data will be discussed in terms of transition temperature theory.

Key words: bulk modulus; chromium alloys; compressibility; Debye temperature; Doring effect; elastic constants; iron alloys; magnetic transition; nickel alloys; Poisson’s ratio; pulse-echo method; sound velocity; Young’s modulus.

The elastic properties of four austenitic stainless steels — AISI 304, AISI 310, AISI 316, and A286 — are reported over the temperature range 300-4 K. These properties include longitudinal (reciprocal compressibility), Poisson’s ratio, and elastic Debye temperature. Elastic constants were determined from measurements of longitudinal and transverse soundwave velocities using an ultrasonic (10 MHz) pulse-superposition method. Measurements were made in the absence of a magnetic field; these alloys undergo paramagnetic-to-antiferromagnetic transitions at low temperatures. For all four alloys, the shear modulus behaves regularly with respect to temperature. The other elastic constants, all of which have a dilatational component, decrease anomalously at temperatures below 80 K. The largest anomaly, about 3 percent, is in the bulk modulus of the 304 alloy; this modulus is lower at 0 than at 300 K. Results are interpreted on the basis of the Döring effect, which results from a large volume magnetostriction in the magnetic phase. This may be the first report of a Döring effect in antiferromagnetic materials.

Key words: aluminum; analysis; business; differential cathode ray polargraphy; iron; lead; nickel; orchard leaves.

The need for certified botanical and biological standards both in research and in industrial and field applications is leading to the development and production of a number of new Standard Reference Materials by the National Bureau of Standards. The first of these to be produced and certified is an orchard leaf standard. The determination of a number of important trace elements by cathode ray polargraphy was investigated and found to offer considerable advantages in sensitivity and accuracy over many other techniques. In addition, several elements may be determined simultaneously in the same solution. The methods were developed and applied to the analysis and certification of nickel, lead, bismuth, and iron in the orchard leaves. Results were also obtained for aluminum which has not yet been certified. Nickel was determined on 1 g samples after extraction with dimethylglyoxime and CHCl\(_3\). Lead and bismuth were determined concurrently on 1 g samples after a sodium diethylthiocarbamate separation. Iron and aluminum were determined on 0.25 g samples after cupferron separations. Details of the methods are given and the results are compared with those obtained by other techniques.

Key words: combustion; Hilbert transform; laser ignition; oxygen; titanium.

The combustion of bulk titanium in one atmosphere oxygen is studied using laser ignition and several analytical techniques. These were high-speed color cinematography, time and space resolved spectra in the visible region, metallography (including SEM) of specimens quenched in argon gas, x-ray and chemical product analyses, and a new optical technique, the Hilbert transform method. The cinematographic application of this technique for visualizing phase objects in the combustion zone is described. The results indicate an initial vapor phase reaction immediately adjacent to the molten surface but as the oxygen uptake progresses the evaporation approaches the point of congruency and a much reduced evaporation rate. This and the accumulation of the various soluble oxides soon drive the reaction zone below
the surface where gas formation causes boiling and ejection of particles. The buildup of rutile cuts off the oxygen supply and the reaction ceases.

15346. Yakowitz, H. Use of divergent-beam x-ray diffraction to measure lattice expansion in LiF as a function of thermal-neutron dose up to \(6 \times 10^{16}\) nvt, J. Appl. Phys. 43, No. 11, 4793-4794 (Nov. 1972).

Key words: Kossel diffraction; lattice expansion; LiF; NBS reactor; radiation damage; thermal neutrons.

The lattice expansion of LiF was measured by means of the divergent-beam (Kossel) x-ray diffraction method at three levels of thermal-neutron dose, 0.45, 2, and \(6 \times 10^{16}\) nvt, respectively. The lattice parameter of LiF increases due to the production of Frenkel defects resulting from the LiF(n,a)H reaction. At \(6 \times 10^{16}\) nvt, the lattice expansion was found to be 0.13 \pm 0.02 percent which is in good agreement with previously reported values.

Key words: chemisorption; ESCA: oxygen; physical adsorption; tungsten; xenon.

X-ray photoelectron spectroscopy (ESCA) has been used to study the physical adsorption of Xe and the chemisorption of oxygen by W (111). An ultrahigh vacuum ESCA spectrometer has been modified such that thermal desorption behavior from the W (111) crystal can be directly compared with ESCA spectra of the adsorbed species. In addition, since the work function of a W (111) crystal covered with one monolayer of Xe is accurately known from previous work, the binding energy of the Xe(3d_{5/2}) adsorbate level can be accurately compared to the gaseous Xe(3d_{5/2}) level.

When Xe is physisorbed to 1 monolayer the Xe (3d_{5/2}) level exhibits a binding energy (relative to the vacuum level) which is 2.1 eV below that found for Xe (g). At lower Xe coverages the shift becomes monotonically greater, approaching 2.6 eV at a Xe coverage of 0.05. This 0.5 eV shift downward is accompanied by an increase of only 0.05 eV in adsorption energy as coverage decreases, and may be partially caused by the presence of 10-20 percent of extraneous adsorption sites other than W (111) which adsorb Xe with higher adsorption energy. The adsorption energy of Xe may also be increased by coadsorption of oxygen and the Xe (3d_{5/2}) binding energy exhibits a corresponding shift downward as adsorbed oxygen coverage is increased to \(\theta_o = 0.5\). Electron relaxation processes affecting the final state are dominant factors in determining the magnitude of the chemical shift upon adsorption, in agreement with the predictions of Shirley. The magnitude of the relaxation effect seems to be very sensitive to small changes in Xe adsorption energy. Similar effects have been seen for chemisorption of CO.

*The adsorption of O_2 at 120 K by W (111) yields a single broad O(1s) peak whose linewidth decreases with increasing coverage. The final spectra at \(\theta_o = 1\) monolayer are very similar to those obtained at temperatures of 300 K or above on polycrystalline tungsten.*

Key words: computation and flow analysis; FORTRAN use; programming aids; syntax analysis.

A recent revival of interest in measuring program execution behaviour has led to a number of distinct approaches. Arguments are given for a fairly simple method of modifying FORTRAN source code to collect frequency counts. No symbol table is necessary and only a single reserved name is introduced into the code.

Key words: line broadening; rubidium; sodium.

We discuss what can be learned from line shapes and the basic ideas of how they are interpreted with theoretical approximations. Only "pressure" or neutral-gas broadening will be considered, not "Stark" or plasma broadening. We will give examples of recent theoretical and experimental work, but this is not intended as a review and we will concentrate on our measurements in the far wings of the lines.

Key words: bremsstrahlung beam; cross section; fission barrier shapes; \(\gamma\)-ray strength; isomeric fission; level density; photofission.

The photofission cross section of \(^{238}\) U was measured in the 2.75- to 5.75-MeV range. Cross sections as small as \(2 \times 10^{-11}\) b were detected. A shell was observed which had been predicted to occur in the cross section owing to the dominance of radiative decay of levels in the second well. Barrier penetrabilities for both inner and outer barriers were determined from these measurements and together with penetrabilities from other measurements were used to infer a potential shape for \(^{238}\) U. The total \(\gamma\)-ray strength function in the second well at 4.25 MeV was found to be \(1.3 \times 10^{-9}\). From comparison of expected and measured cross sections at the lowest energies, the density of levels effective in photofission at 3 MeV was found to be greater than 4 per MeV.

Key words: enthalpy of formation; ions; mass spectrometry; methyl; methylene; photoionization; radicals; vacuum ultraviolet.

Photoion yield curves for \(^{2}H_2^+\) and \(^{2}H_2^+\) from methane have been remeasured near threshold at 298 and 115 K and the curve for \(^{2}H_2^+\) from ketene has been measured at 298, 215, and 130 K. For methane there is no evidence for the ion-pair process yielding \(^{2}H_2^+ + \cdot'H\). The temperature shift of the \(^{2}H_2^+\) curve is kBT, indicating only two available rotational degrees of freedom in the dissociation process. Including a negligible kinetic energy release at threshold, the estimated threshold at T = 0 results in \(\Delta H_{\text{f}}(\text{CH}_2) = 35.6 \pm 0.2\) kcal mol\(^{-1}\). No temperature shift is observed for the \(^{2}H_2^+\) curve from methane. Assuming zero kinetic energy release, the result \(\Delta H_{\text{f}}(\text{CH}_2) = 93.7 \pm 0.5\) kcal mol\(^{-1}\) is obtained. The \(^{2}H_2^+\) curve from ketene exhibits a shift of kBT with temperature. Neglecting kinetic energy release, the estimated threshold at T = 0 results in \(\Delta H_{\text{f}}(\text{CH}_2) = 93.5 \pm 0.4\) kcal mol\(^{-1}\).

15352. McCulloh, K. E., Threshold energies for formation of \(\text{OH}^+\) and \(\text{NH}_2^+\) by dissociative photoionization of water and ammonia,
Key words: ammonia; dissociative photoionization; NH⁺; OH⁺: photoionization; threshold energies; water.

A photoionization mass spectrometer incorporating a monochromator of 0.5 Å resolution has been employed to remeasure photoion yield curves near threshold for OH⁺ from water vapor at temperatures of 215 and 298 and for NH⁺ from ammonia at 160 and 298 K. From the observed temperature shifts of these curves it is inferred for both molecules that essentially the entire rotational energy is available for dissociative ionization. On this basis the threshold energies for formation of the fragment ions are corrected for the effect of rotationally excited molecules. The enthalpies of formation of OH⁺ and NH⁺ are discussed in relation to thermochemical quantities for the neutral OH and NH₂ radicals. Similar results are reported for OD⁺, ND⁺, and NHD⁺ fragment ions.

Key words: antiferromagnetism; ferroelectricity; solid-state transitions; superconducting temperature calibration; thermometric fixed points.

The general question of the usefulness of thermometric fixed-point devices based upon phase transitions in solids is examined. It appears that both the method of detection and the intrinsic character of the transition relate to thermometric precision and practical utility of such devices. Promising systems which are discussed are the AC mutual inductance detection of superconductive transitions and the AC heat capacity detection of antiferromagnetic and ferroelectric transitions.

Key words: electrostatic; energy.

This note gives a simplified derivation for the energy associated with an electrostatic field by extended use of the expression for the energy of a parallel plate capacitor.

Key words: air pollution; kinetics; mass spectrometry; olefin; ozone; photochemical smog; rate constant.

The temperature dependence of the rate constants for the reactions of ozone with some olefins has been studied using a stopped-flow reactor in conjunction with a beam-sampling mass spectrometer. The effect of molecular oxygen on the measured rate constants was studied, and it was concluded that molecular oxygen scavenges free radical species which could further react with ozone. Rate constants, measured in the presence of molecular oxygen, are as follows (in cm³ mol⁻¹ s⁻¹): log k (1-butene) = (9.247 ± 0.033) - (1686 ± 20)/2.3037; log k (2-methylpropene) = (9.281 ± 0.026) - (171 ± 23)/2.3037; log k (cis-2-butene) = (9.272 ± 0.087) - (956 ± 54)/2.3037; log k (trans-2-butene) = (9.555 ± 0.069) - (1051 ± 43)/2.3037; log k (2-methyl-2-butene) = (9.582 ± 0.119) - (826 ± 78)/2.3037; and log k (2, 3-dimethyl-2-butene) = (9.230 ± 0.237) - (294 ± 196)/2.3037.

A good linear correlation is found between the activation energy for the reaction and the ionization potential of the olefin.

Key words: distribution functions; finite volumes; Kirkwood-Salsburg equation; perturbation expansion; strip operator; thermodynamic limit.

Ruelle has shown that the solutions of the Kirkwood-Salsburg equation for a finite volume A become, in the limit as A → ∞, the solutions to the Kirkwood-Salsburg equation for an infinite volume, i.e.,

\[ \lim_{A \to \infty} \rho_A = \rho + \lim_{A \to \infty} \epsilon(A), \lim_{A \to \infty} \epsilon(A) \to 0. \]

The form of \( \epsilon \) is not obtained. We show that for the first order contribution to the solution of the Kirkwood-Salsburg equations obtained via a perturbation scheme developed in an earlier paper that

\[ \epsilon(A) \approx \lim_{A \to \infty} -e^{-\kappa r}, \]

where \( \kappa \) is a positive real constant which can be specified and \( R \) is the minimum distance from the container walls to the particles of the system.

Key words: alkanes; esters; heat capacity; heats of vaporization; oligomers; rates.

The liquid heat capacities and heats of vaporization of three linear esters of poly(hexamethylene sebacate) with hexyl-capped end groups (Mmol.wt.) = 370, 655, and 939 have been determined. The heats of vaporization of the oligomers measured at a mean temperature were corrected to 323.15 to 523.15 K by use of the experimental liquid (melt) heat capacities and the calculated gas heat capacities. The corrected heats of vaporization were fitted to the equation \( \Delta H_f = S(T)M_f + I(T) \), where the temperature dependence of the slope and intercept are represented, respectively, as \( S(T) = C T + b \) and \( I(T) = a T + b \), and \( \alpha \) is an exponent. The results indicate (at corresponding molecular weights and constant temperature) that the ratio of the liquid heat capacities of the oligomer ester and the \( n \)-alkane, and similarly the ratio of the heats of vaporization, depend on the number of carboxyl groups in the oligomer ester chain.

Key words: Mössbauer spectrometry; quantitative analysis; Staninic oxide; tin ores.

In this work, Mössbauer spectrometry was applied to the non-destructive, quantitative analysis of tin in oxide in two NBS-SRM tin ore concentrates. Systematic errors of 10 to 25 percent were observed when these ore samples were measured versus calibrant samples prepared from A.R. tin oxide. The effect of heat treatment of the ores on the resonant absorption intensity is also discussed.

Key words: dielectric loss; dielectric relaxation; molecular motions; nuclear magnetic resonance absorption; polyoxymethylene crystals; solid state polymerization; trioxide crystals.

After exposure to ionizing radiation, trioxide polymerizes rapidly at temperatures between 50 and 60 °C. The nature of the molecular motions involved in this solid-state reaction is not clear. Line narrowing in nuclear magnetic resonance absorption has been reported as one indication of such motions. No related dielectric loss peaks were found in trioxide at temperatures from −180 to 55 °C and frequencies from 1 to 10 000 Hz. Ionic conductivity is large above room temperature and it may play an important role in this polymerization reaction.

Key words: energy loss; ionization loss; most-probable energy loss; target thickness.

The most-probable ionization loss has been measured for relativistic electrons passing through thin absorbers of carbon, aluminum, and copper. Incident energies of 50 and 100 MeV were used. Target thicknesses ranged from 48 to 614 mg/cm² and encompass the range of thicknesses most frequently used in electron scattering experiments at these energies. The measured values of the most-probable ionization losses are in good agreement with the theoretical predictions of Sternheimer. The techniques for using values of the ionization loss to determine the target thickness in electron scattering experiments are presented.

Key words: dc transformer; granular aluminum films; magnetic coupling; superconducting dc transformer; type II superconducting films; vortex coupling.

The temperature dependence and magnetic field dependence of the coupling force have been measured in two transformer systems, one with primary and secondary film thicknesses of 4 and 4 μm comparable with the superconducting penetration depth λ (d/λp ∼ d/λs ∼ 1) and one with film thicknesses small compared with the penetration depth (d/λp ∼ d/λs ∼ 10⁻¹). The results show that (i) the coupling force is nearly two orders of magnitude greater in the thick-film transformer than in the thin-film transformer; (ii) there exists a transition field above which the coupling force decreases very rapidly, typical values for the transition field being quite low (≈ 0.5 G); and (iii) the temperature dependence of the coupling force over much of the range investigated is simply proportional to the temperature dependence of λp⁻²λs⁻². A Gibbs free-energy theory describing the coupling force has been numerically evaluated and compared with these data. The results show that the theory can be used to predict accurately both the absolute magnitude and the field and temperature dependences of the coupling force for wide-ranging values of the operating parameters.

Key words: fine particles; laser Raman; micro-Raman; particle analysis; particulates; Raman spectroscopy.

A conventional laser Raman spectrometer has been modified and used to obtain useful Raman spectra from discrete solid particles as small as 0.7 μm in linear dimensions. Spectra obtained from single, micrometer-sized particles of several inorganic and organic compounds are reported. Simplified calculations are discussed which provide an estimate of detectability levels and other problems associated with these measurements. Certain parameters that must be considered in the design of an instrument especially intended for use in the chemical characterization of single fine particles are reviewed in the light of this work.

Key words: cost sharing; efficiency; equity; recreation; redistribution of income; water resources.

This comment critiques an article in *Land Economics* entitled “Cost Sharing for Recreation: Efficiency and Equity,” by William Miller and Bruce Scherr. These authors presented in their article a general set of policy conclusions regarding cost sharing for recreation that were based on a case study they made of a Soil Conservation Service project and on theoretical work by Harold Marshall. This comment questions the validity of the conclusions and policy implications for the general case, clarifies the relationship of Marshall’s work to that of Miller and Scherr, and suggests an alternative approach to measuring the redistribution of income effects of a recreation project.

Key words: acoustics; human factors; human occupancy; illumination; interdisciplinary approach; physiology; psychology.

The human factors which affect design are not always known or understood. The Center for Building Technology of the National Bureau of Standards has mobilized an unusual aggregation of experts to study the human factors involved in building design and physical occupancy.

This interdisciplinary approach looks, for example, at the need for windows, the optimum level of illumination, individual’s reactions to noise levels and human behavior during fires. They are also trying to find out how much can be learned from the occupants of the housing built under Operation Breakthrough by conducting interviews with the tenants, interrogating visitors, studying work orders, and asking for comments from those moving out of the developments.

The human factors approach is not new but psychological and physiological test techniques have improved a great deal in the past couple of decades so that designers and builders should now be able to provide more pleasant, comfortable and efficient environments for human occupancy.

Key words: dimethyl ether; internal motion; interstellar molecules; Orion; radio astronomy.

Interstellar dimethyl ether, (CH₃)₂O, has been detected in emission from the direction of the Orion Nebula molecular cloud. The observed velocity of the 6ν₀ → 5ν₁ transition 90.9 GHz is in excellent agreement with other molecules observed toward Orion. Observations of the 2ν₁ → 1ν₁ transition at 86.2 GHz and the 2ν₁ → 2ν₀ at 31.1 GHz support the dimethyl ether detection and indicate that either (CH₃)₂O has two distinct velocity components in Orion or certain internal motion states are preferentially populated. This molecule has a large collisional cross-section and C₂ᵥ symmetry; hence it should be useful for future studies of molecular pumping models.

Key words: automorphic functions; Poincaré series; polynomial approximation.

The purpose of the present paper is to extend Knopp's Main Lemma to the case $q > 1$. Knopp's proof involves substantial use of the Bers' spaces of automorphic forms. Since the character of these spaces in the cases $q = 2$ and $1 < q < 2$ is vastly different, our proof bears only superficial resemblance to Knopp's. Indeed, the situation is this: If one replaces $q = 2$ by $q > 1$ at every stage of Knopp's proof, the proof turns out to be valid. However, verification of two of the resulting statements is just hard and requires techniques far outside Knopp's paper.

Key words: correlation factor; diffusion; drift mobility; electric field; random walk; symmetry plane; vacancy.

Diffusion of a substitutional solute in a face-centered-cubic metal is discussed in terms of the complete path of the defect giving rise to mass transport. For diffusion in the absence of an applied field, these results are equivalent to the matrix method of Howard for the calculation of the correlation factor. In an applied field, however, the possibility that during the lifetime of a defect it may cause a tracer atom to make a series of successive jumps in the positive field direction or alternatively a series of successive jumps antiparallel to the field can appreciably influence the form of the equations. The tracer can, with decreasing probability, find itself several or many jump distances from its original position. Previous descriptions of this process restricted the tracer to two adjacent planes perpendicular to the applied field. In the present paper, generalized equations are derived for diffusion in an applied field with successive jumps by the tracer in one direction being explicitly allowed. To illustrate the use of these equations, the diffusion of an isolated tracer by a single vacancy is evaluated for a case where successive jumps in one direction are allowed, and also for comparison it is evaluated with the assumption that arrival of the vacancy at the symmetry plane passing through the tracer normal to the diffusion direction returns the vacancy to equilibrium. The latter approach restricts the tracer to two adjacent planes in a sequence of correlated jumps but is shown to give the same mobility. Thus use of the symmetry plane does not affect the results. In contrast to previous equations, the present treatment is applicable to situations where symmetry planes are not present. Thus, it will allow calculation of drift mobilities when the defect or crystal symmetry is more complex, as for diffusion via vacancies which can dissociate.

Key words: characterization; instruments; measurement; statistical surface parameters; surface finish; surface parameters.

The surface microtopography of an electrodeposited is determined by a variety of parameters, particularly the physical and chemical character of the initial substrate. Modern instrumentation for quantitative measurement of substrate and electrodeposited surface microtopography are reviewed. Statistical parameters associated with measured surface profiles which permit concise geometrical characterization of height distributions, periodicities along the surface, etc., are defined and discussed. Illustrative examples based on measurements of electrodeposited surfaces are reported together with appropriate characterizing parameters.

Key words: design standards; earthquake load; masonry construction; precast concrete construction; progressive collapse; structural connection; structural design; wind load.

The design of ties between masonry bearing walls and precast concrete floor panels is discussed.

Key words: high amplitude; internal rotation; PF$_5$; pseudorotation; Raman; vibration.

The gas phase Raman spectrum of the $\nu_3$ fundamental of PF$_5$ has been observed under spectral resolutions approaching 1 cm$^{-1}$. With the use of a two dimensional harmonic oscillator basis set and a potential function of the form $V(r,\phi)=(1/2)W^{-a} - b \cos(3\phi)p^2 + c\phi$, an adequate fit to the $\nu_3$ region was obtained. The barrier to axial-equatorial fluorine atom interchange was estimated to be 1371 cm$^{-1}$ (3.92 kcal/mole).

Key words: association links; command language design; interactive user; language transformation; mental work.

Although the definition of "mental work" remains elusive, systematic means/methods should be considered for gaining evidence about interactive language features requiring more/less effort of the human mind. The suggested approach employs a structuring of the user's conceptual reference spaces into sets of "action primitives," peculiar to the type of computer-aided task involved. An interactive command language can then be regarded as the range of some transformation on the user's set of action primitives. The nature and efficiency of that transformation, in conjunction with the inherent number of mental association links, are hypothesized to have direct relationships to the level of required mental work. The user's delay or "think time," expended immediately preceding command utilization, is one measurable quantity that should be useful as a work level indicator.

Key words: building codes; building standards; housing; performance criteria.

The testing and evaluation of Operation Breakthrough housing systems relied heavily on a special set of performance criteria developed especially for the program. Valuable experience was gained in this application of performance criteria.

The Breakthrough program is assessed with respect to how effectively the criteria were formulated, the level of guidance and information provided, whether all the criteria were used and implemented, and the problems and difficulties encountered. The experience indicates that performance criteria should not be used as a substitute for specific standards and should be reserved
for guiding and evaluating innovative schemes. Performance criteria are rarely simple and can be successfully implemented only in situations where compliance can be objectively measured. Particular difficulties arise in the assessment of durability. Performance criteria can provide valuable guidance in areas outside the domain properly regulated by codes and standards. Inflexible application in such areas, however, could inhibit the evolution of new concepts.

Key words: bead-spring model; block-copolymers; dilute solutions; dynamics; limiting viscosity number; solution properties; viscoelasticity; Zimm theory.

A theory for the dynamics of block-copolymer molecules in dilute solution has been developed by modifying the bead-spring model theory of Zimm to take into account the existence of dissimilar segments in block copolymers. The eigenvalue equation encountered in the theory has been solved numerically by extending the method of Lodge and Wu. The applications of the theory have been illustrated with calculations for the viscoelastic properties of poly(styrene-b-methyl methacrylate) solutions and poly(styrene-b-cis-1,4-isoprene) solutions. It is found that, for some block copolymers in solution, the calculated values of the viscoelastic properties deviate significantly from the values for the parent homopolymers toward the values predicted by the free-draining case.

Key words: adhesion; bonding; composites; coupling agents; monomers; polymers; primers; sealants.

The concept of surface-active comonomers of higher functionality is proposed as a means of increasing reliability of the bonding between preventive and restorative dental materials and tooth structures.

Key words: clinical chemistry; standard reference materials.

This is an interview of Mr. Cali by one of the editors of Lab World concerning the status of our NBS Clinical Standard Reference Materials Program. Topics discussed were the financing of the program, the technical output of the program, the goals of the program, the problems of accuracy in clinical chemistry, and how reference methods and SRM’s are used to bring and to improve the accuracy in this field. Future possibilities and directions are also discussed as well as interactions between NBS and other government agencies and professional societies.

Key words: freeze drying; instrumental neutron activation analysis; lyophilization; neutron activation analysis; preconcentration; radioactive tracers; river water; trace elements; tracers; water.

A method for the concentration of trace elements in water by lyophilization is described. This method has important applications in the multielement analysis of natural water samples by neutron activation. The results of the evaluation of trace element retention yields, using radioactive tracers, indicate that at least Na, Sc, V, Cr, Fe, Co, Zn, As, Se, Br, Rb, Sr, Ag, Cd, Sb, Cs, Ba, Tb and Ce are retained quantitatively (greater than 95%) in the freeze dried residue of a river water sample. Hg and I were found to be lost substantially and Au was retained at the 95 percent level. A bug made from linear polyethylene film is used as the sample container for freeze drying and neutron irradiation and is the only measurable blank in the preconcentration process. The results of a typical analysis of a freeze dried estuarine sample with the determined sample/blank ratios for each element are presented.

Key words: microdensitometry; microphotometry; optical density.

Microdensitometry is the science of measuring the optical densities of very small areas. Microdensitometers are usually equipped to scan along a line and continuously record the varying density with respect to distance. The principal application of microdensitometry is in the field of image structure analysis. The maximum resolving power of a transmission instrument is the quotient of the sum of the numerical apertures of the illuminating and using objectives to the wavelength of the light. With high numerical apertures, 1800 cycles/mm has been recorded.

Since microdensitometers measure optical density as a function of position, the principal calibrations are the photometric calibration and the length calibration. The photometric scales of microdensitometers are most often calibrated by placing a step tablet of known densities in the sample position. The length scale of a microdensitometer may be calibrated by scanning a glass scale or stage micrometer.

Key words: evaluation; National Bureau of Standards; online information retrieval systems; use statistics.

The National Bureau of Standards Library has had a year of experience in offering on-line information retrieval systems to users. Users were encouraged and assisted to access systems directly if they wished. Cost and use statistics for selected data bases are given.

Key words: fission track dating; neutron flux; neutron irradiation; plate annealing; uranium glasses; U-238 fission decay constant.

The rate of spontaneous fission decay of uranium-238 is determined in 4π geometry by the fission track method. Uranium glasses of known age of manufacture were used. Spontaneous tracks have accumulated since the time of manufacture and induced tracks to determine the uranium content were produced by thermal neutron irradiations. Spontaneous tracks in all glasses were found to be partially annealed. By correcting for this annealing effect, a $\lambda_{f}^{238} = 8.7 \pm 0.6 \times 10^{-17}$ yr $^{-1}$ was obtained. Uncertainty in the neutron dose is the largest source of error.

Key words: energy levels; rhenium; spectrum.

Six terms of the 4f155s5p6(S0)nl doublet system of Re VII have been found, including nl = 5d, 5f, 6s, 6p, 6d, and 7s. Thirteen spectral lines were classified in this system of levels. The partially resolved hf of the 6s-6p multiplet was used to derive a value for the hyperfine splitting of the 6s level in agreement with a predicted value. The ionization energy of Re VII derived from the ns series is 82.7 ± 0.06 eV.

Key words: ionization energy; nuclear moment; spectrum; tantalum.

The hyperfine structure of the 6s2S1/2-6p2P1/2 line of Ta V at 1708 Å has been resolved using a 150 A sliding spark discharge. The 6p-6s multiplet was identified and the ionization energy was reetermined. With these new data a value for the nuclear dipole moment of 195Ta of (2.36 ± 0.02)μn is derived. New wavelengths are given for all previously classified lines.

Key words: computer programs; gaseous hydrogen; graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; solid hydrogen; tables.

This handbook is the result of an extensive survey of the thermophysical properties of hydrogen, including densities and the thermodynamic, transport, electrical, optical, and molecular properties for the gaseous and liquid states. A thorough bibliography of published work on each property is given. Recommended references are cited for those properties which have been critically surveyed. Other references are listed which were reviewed but not considered as basic source material. Each property is described and defined; selected values are presented for the more common properties; and where appropriate, graphical presentations are also made. The major tables cover the range 25-5000 K with pressures to 15,000 psia (14-3000 K to 100 MPa). In addition, for property values beyond this range, recommended references are given, where available.

Key words: alkyl sulfone; crystal structures; diethyl sulfone diime; hydrogen bonds; neutron diffraction; sulfone.

(C2H5)2S(NH)2, orthorhombic, F22d (No. 43), a = 5.44, b = 10.59, c = 16.13 Å, Z = 8. The structure was refined from neutron diffraction data. The molecules lie on twofold axes, and are linked together by a three-dimensional network of N-H...N hydrogen bonds. The methyl groups are in an eclipsed conformation.

Key words: carbonyl compound; four-center reactions; halocarbon ions; ion cyclotron resonance; ion-molecule reaction; rate constants.

The mechanisms of the reactions of CF3+, CF2Cl+, CCl3F+, and CCl3+ with aldehydes, ketones, esters, acids, and acetic anhydride have been examined, and rate constant determinations have been made. Both four-center reactions and displacement reactions are observed. For aldehyde and ketone reactants, a four-center reaction resulting in the formation of a monohalogenated carboxonium ion predominates; the importance of this reaction vis-à-vis more exothermic displacement processes is explained in terms of a preference for attack by the ion on the carbonyl oxygen atom. In the case of reactions of C2O2- (X = F, Cl) ions with esters or acids, the most commonly observed reactions are displacements and four-center reactions resulting from attack by the ion on the acyl oxygen. The displacement results in the formation of acylum ions, and the four-center reactions, in the formation of C2O2X+ ions (R = alkyl group).

The competition between these two reactions is examined in terms of the relative exothermicities of the two channels and the time required for reaction to occur in the ion molecule complex. The results indicate that, for ion-molecule reactant pairs which react through only one channel, the probability that an ion-molecule collision will lead to reaction is influenced by the exothermicity of reaction.

Key words: environmental samples; neutron activation analysis; tellurium; uranium.

A procedure for the simultaneous determination of tellurium and uranium is described. The procedure utilizes thermal neutron activation followed by sample combustion and a gas phase separation of the volatile radionuclides of interest. This method is sensitive enough to permit the measurement of tellurium and uranium at their naturally occurring levels in materials of biological and environmental origin. The procedure has been successfully employed to determine the tellurium and uranium concentrations in three Standard Reference Materials (SRM's) currently being offered by the National Bureau of Standards, and in atmospheric particulate material collected in rural Maryland.

Key words: absorption spectrum; accidental predissociation; carbon monoxide; emission spectrum; perturbation; Rydberg state.

The perturbation in the E - X(0-0) band of the CO absorption spectrum has been shown to be due to an unusual accidental predissociation. The intermediate predissociated state has not yet been identified.

Key words: electron energy loss; germanium; material structure; optical properties; scattering.

The characteristic electron energy loss spectrum of germanium was studied in a transmission type experiment as a function of the changes in structure due to electron bombardment. The structure of the material was characterized by electron micrograph and diffraction techniques. The electron energy loss spectrum of germanium was studied up to 45 eV, and loss peaks were observed at 15.7 eV and 31.6 eV as well as a 6 eV carbon loss. The positions of the most intense characteristic energy loss peak at 15.7 eV and its first multiple were constant for a large variation in the lattice parameters for the individual films.

Magnetism and its modern date; in seen Analytical frequency and comparison function, crete the packed correlations. The magnetic spin density function contains a very broad major peak, dominated by the Tb-Tb pair distribution function, with a maximum near 3.6 A. Longer range correlations are very much weaker. The principal features of the atomic structure can be accounted for by considering only near neighbor correlations between terbium and iron atoms in a random close-packed arrangement.

Inelastic scattering studies have revealed a significant shift in the magnetic density of states to lower energy in the amorphous material relative to the crystalline TbFe2 counterpart. No discrete spin-wave excitations or critical scattering near Tc could be observed.

Key words: alloy; electronic structure; interstitial; lattice dynamics; niobium deuteride; phonons.

The acoustic modes of the phonon dispersion relation in Nb, NbD$_{0.8}$ and NbD$_{0.4}$ have been measured at 473 K for phonons with wave vectors along the [100], [110], and [111] axes by coherent neutron scattering. The observed neutron groups for both alloys were well defined, with little or no apparent broadening. The results are compared to similar data for Nb-Mo alloys and with previous lattice-dynamics results for PdD$_{0.85}$. This comparison shows that despite differences in detail, the general features of the dispersion relations of NbD$_3$ and Nb-Mo are similar after allowing for the differences in lattice parameters for the two alloys. The measured dispersion curves and derived phonon frequency distributions for the Nb-D alloys are quite different from the analogous results for PdD$_{0.85}$ in that the average acoustic phonon frequencies increase with increasing deuterium concentration and lattice parameter.

15393. Wassermann, L., Samuel, D., Yuwiler, A., Carpenter, B. S., Location of catecholamines in the brain using the $^{15}$O(n, o)$^{15}$N reaction, *ANS Trans.* 18, 85 (1974).

Key words: densitometry; lens evaluation; microdensitometry; microscopy resolution charts; National Measurement System.

Studies of the National Measurement System are currently in progress at the National Bureau of Standards. These studies are an attempt to understand the infrastructure and impact of measurement throughout our economy. One particular microstudy is entitled Optics. This brief article gives an overview of the developments to date; i.e., description of the infrastructure, identification of various users and the techniques of the study.

Key words: calibration; economic dimensions; National Measurement System; surface finish; surface roughness.

A brief description of the National Measurement System for Surface Finish is given together with a descriptive block diagram. The economic dimensions of the measurement system are discussed briefly. A biographical sketch of the author is included.

Key words: impulse response; lens aberrations; optical transfer function; partial coherence; pupil function; wavefront shearing interferometry.

The pupil function, a description of the wavefront errors associated with a lens (in terms of a phase distribution over its exit pupil), has long been used by lens designers since it is implicit in the determination of aberrations. Pupil functions require interferometry for measurement. The analysis of interferograms has been facilitated in modern times by the development of high-speed digital computers, automatic fringe scanners and laser sources and can be put on a routine, low-cost basis. When the theory of partial coherence is applied to the analysis of imaging systems, the pupil function is seen to be the fundamental measure of lens performance, because from this one description, the other measures of system behavior can be derived. Further, since the pupil function can be determined with great precision, a polynomial expansion can be curve-fitted in the computer to list the aberration coefficients out to orders whose height is a function of the size of the available computer core. It is thus practical to provide not only transfer function but also a diagnosis of the lens ill, quantitatively. However, white-light response cannot be measured directly and must be synthesized from measurements at several wavelengths; the techniques for accomplishing this are well-known but are presently not implemented at NBS, where wave-front shearing interferometry has been utilized for measurement of the pupil function. Among the problems for which pupil function measurement is a solution are the cascading of lenses in imaging systems and the evaluation of microscope objective/eyepiece response.

Key words: ambient concentration; chemiluminescent measurement; continuous monitor; strong acid aerosols.

The deleterious effect of sulfuric acid aerosol on human health has been demonstrated. Currently, no real time monitors for strong acid aerosols are available. This work represents an effort to develop an instrument for monitoring strong acid aerosols in
real time without going through collection and extractions procedures.

Key words: alkaline earth oxides; Born-Mayer potential; first-neighbor interactions; ionicity; Lundquist three-body potential; second-neighbor interactions; shell model.

A model potential for the alkaline-earth oxides was developed and tested. The interionic potential contains the usual Coulombic and two-body short-range terms, such as those which have been used in previous alkali halide calculations, plus many-body terms which are incorporated by means of the Lundquist three-body approximation in which only the spherically symmetric term in the overlap-charge-density expansion is retained. The three-body interactions contribute to both the long-range and the short-range forces. Additional short-range central-force interactions between nearest-neighbor ions and next-nearest-neighbor ions are included; these are modeled by means of a Born-Mayer plus van der Waals potential. The electronic polarizabilities of the ions are described by a shell model. Parameters in the model potential and in the shell model are evaluated using the elastic constants and their pressure derivatives, the low- and high-frequency dielectric constants, the infrared dispersion frequency, and the equilibrium interionic separation. Three constraints on the shell model are required. The model does not give satisfactory results in that (1) the trend in an effective charge parameter, \( \chi \), through this family of oxides runs counter to that for the Phillips ionicities and (2) the Born-Mayer potential parameters appear to be highly anomalous compared with those for other ionic crystals. The principal weakness of the model apparently resides in its neglect of bond-bending (noncentralforce) terms, which results in an overestimate of the overlap contribution to the bond-stretching terms, in excessive deviations in the effective charges from the classical valences, and in departures of the Born-Mayer potential parameters from the values found in alkali halide and alkaline-earth fluorides.

Key words: axisymmetric analysis; cables (ropes); composite materials; contour plotting; end fittings for FRP rod and rope; finite element analysis; FRP rod; FRP rope; materials testing; nonlinear analysis (shear); potted end fittings; structural engineering; tensile strength; transversely isotropic materials.

Improved structural end fittings of two basic types were developed for use with fiber-reinforced-plastic (FRP) rod and rope materials. Each type of end fitting is essentially a metal sleeve that is attached to the FRP material by a thick layer of potting material. Tensile tests demonstrated that the new end fittings can equal or approach the full tensile strength of E-glass-reinforced-plastic rod and rope. In tensile strength, the new fittings are superior to commercially available end fittings. An axisymmetric finite element analysis was developed to study the transfer of load from a rod or rope, through the potting material, to the metal fitting. In the analysis the FRP material and the potting material are assumed to be transversely isotropic. The results of both the analytical study and the laboratory tests indicate the importance of using a relatively thick layer of low-stiffness potting material with these fittings.

Key words: brittle solids; dislocation networks; electron microscopy; healing; indentations; microcracking; moiré patterns.

Transmission electron microscopy is used to examine the nature of microcracking about small-scale indentations in two highly brittle solids, sapphire and carborundum. The observed crack geometry is discussed in terms of an earlier model of indentation fracture beneath a point force, in which both loading and unloading half-cycles contribute to the crack growth. The residual interfaces are generally found to exhibit moiré fringe contrast, and occasionally to contain dislocation networks. These observations are discussed in relation to spontaneous closure and healing mechanisms, and the associated "lattice mismatch" is estimated at about one part in a thousand. It is suggested that cleavage steps comprise the main source of obstruction to lattice restoration across the interfaces. Mechanical and thermal treatments of the indented specimens are found to influence the extent of the residual cracking. Some practical implications concerning the strength degradation of brittle solids are discussed.

Key words: ceramics; failure prediction; fracture; inclusions; nondestructive inspection.

The stress concentrations that occur at inclusions due to thermal expansion and elastic modulus mismatch are discussed and the stress intensity factors at interface cracks that result from these stresses are calculated. It is shown that conservative failure prediction based on an equivalence between inclusion size and crack size is usually acceptable if the shear modulus \( \mu \) or thermal expansion coefficient \( \alpha \) for the inclusion is larger than the matrix values. If, however, \( \mu \) and \( \alpha \) are smaller for the inclusion than the matrix, extensive cracking can develop at the inclusions which may lead to premature failure. For this case the only effective methods for failure prediction are techniques which give directly the maximum stress intensity factor, i.e., proof testing and/or acoustic emission.

Key words: aluminum oxide; electrical conductivity; high temperature; ionic charge transport.

The electrical conductivity of polycrystalline and single crystal \( \text{Al}_2\text{O}_3 \) has been determined between 1000 and 1650 °C. Measuring the conductivity between the outside and inside surface of a thin-walled, hollow tube eliminates the adverse effects of gas or surface conduction. An analysis of possible electronic and ionic charge transport mechanisms shows that none of these processes fully accounts for the magnitude of the observed conductivity. Migration of \( \text{Al}^{2+} \) ions (or \( \text{Al}^{3+} \) vacancies) yields the largest values and offers at present the best explanation for electrical conduction in \( \text{Al}_2\text{O}_3 \).

Key words: air infiltration; dynamic pressure differential; wind velocity.

Currently available methodology for estimating air leakage into and out of buildings does not directly take into account the
fluctuating nature of the outdoor wind conditions. The air leakage into and out of commercial building offices was studied with particular attention to the time history of outdoor wind velocity and pressure differential across the window. It was found that the air leakage measured was generally quite different from that which could be calculated. The reason for this discrepancy was postulated to be due to a complex process caused by the dynamically varying pressure differential across the window, flow occurring through the window in both directions simultaneously, and finally to the particular experimental configuration used.

Key words: codes; masonry; standards; structural design.

Provisions of present U.S. Code and Design Standards are clarified and interpreted in response to a question by a reader of Civil Engineering magazine.

Key words: flow measurement study; fluid flow measurement system; measurement system identity; technology assessment.

A technological assessment of gas and liquid flow measurements, excluding cryogenics, is being conducted. A description is being prepared of the interrelationships that exist within and between the identifiable parts of the fluid flow measurement system which is identified as an important component of the overall National Measurement System. The approach of this study is to gather pertinent information from contacts throughout the system. The technology assessment has identified many attributes that can be used to quantify this system. A data base is being developed which will be helpful in recognizing major trends of future applications of fluid flow measurement.

Key words: computer program; metric conversion; round off.

At least six computer programs to assist manufacturing companies in metric conversion are now available. The principal characteristics of these programs and the requirements for programs for metric conversion are discussed. NBS' plans to issue a metric conversion package are described.

Key words: fluence; kerma; kerma factors; microdosimetry; neutron dosimetry; neutron energy deposition.

Neutrons generate secondary particles (p, α, C, N, O, etc.) when they interact with tissue. It is through these secondary particles that nearly all of the energy deposition and biological effects occur. It is therefore of interest to determine the total energy transferred to the charged particles (kerma), the initial spectrum of the secondary particles, the slowing-down spectrum, and the details of the energy deposition by these secondary charged particles. We are continuing to study all of these quantities. Further along in the energy deposition process, one is interested in the delta-ray production cross sections and absorbed dose distributions due to the delta rays. We have not yet focused on this problem. In this report we shall discuss kerma calculations and some studies of the energy deposition in spherical volumes.

Key words: body fluids; fluorine; lead; mercury; reference samples; trace elements.

The measurement of elemental concentration in body fluids has been widely used to give indication of exposure to certain toxic materials and/or a measure of body burden. To understand fully the toxicological effect of these trace elements on our physiological system, meaningful analytical data are required along with accurate standards or reference samples. The National Bureau of Standards has prepared for the National Institute for Occupational Safety and Health (NIOSH) a number of reference samples containing selected toxic trace elements in body fluids. The reference samples produce include mercury in urine at three concentration levels, five elements (Se, Cu, As, Ni and Cr) in freeze-dried urine at two levels, fluorine in freeze-dried urine at two levels and lead in blood at two concentration levels. These reference samples have been found to be extremely useful for the evaluation of field and laboratory analytical methods for the analysis of toxic trace elements. In particular the use of at least two calibration points (i.e., "normal" and "elevated" levels) for a given matrix provides a more positive calibration for most analytical techniques over the range of interest for occupational toxicological levels of exposure.

Key words: analysis; biological materials; chlorofom; chromium; environmental materials; neutron activation; radiochemical separation; solvent extraction; tribenzylamine.

Chromium occurs in many biological and environmental materials but only in trace amounts (ppm level), which makes the determination by usual chemical methods very difficult and sometimes impossible. Destructive neutron activation analysis, utilizing the reaction 54Cr (n, γ) 56Cr, can eliminate many of the difficulties encountered with other techniques. A detailed description of chromium determination in various biological (e.g., liver and urine) and environmental (e.g., coal and fly ash) samples using the NBS Reactor, coupled with a very selective radiochemical separation procedure, will be discussed.

Key words: corridor; fire spread; flashover; floor covering; radiative heat transfer.

Full-scale corridor fire experiments designed to evaluate the
potential fire hazard of floor covering materials exposed to a room fire are described. A phenomenological account of events leading to rapid fire propagation along the corridor is presented for one experiment. Mechanisms responsible for the rapid fire propagation, termed flameover, are explored through measurements and analysis of the data. Before flameover the corridor floor is heated by radiation which enables flames to spread into the corridor. On the wood floor considered, flame spread velocity accelerates from ~10^-2 ft/sec to ~1 ft/sec following flameover. Causative factors of flameover appear to be the increase in flame height of the fire floor, and a reduction of air supply to the burn room due to a change in flow pattern between the corridor and burn room. Calculations show that air flow to the burn room steadily drops as the corridor fire develops resulting in incomplete combustion for the room fire.

Key words: arc plasma; iron; lifetimes; oscillator strength; transition probabilities; wall-stabilized arc.

Fe I and Fe II lines were measured in emission from a wall-stabilized arc, which was operated in argon with an admixture of FeCl3. Lines were selected for measurement which would permit a check on the consistency of several previously reported data. These include oscillator strength measurements of Fe II lines as well as lifetime values for several atomic levels of Fe I and Fe II. Overall, good consistency was found among most of the data.

Key words: blackbody calibrations; hydrogen continuum; primary standard; radiometry; vacuum ultraviolet; wall-stabilized arc.

A hydrogen arc has been applied for the purpose of making spectral radiance calibrations in the wavelength region 1450 to 3600 Å. Absolute calibrations using the hydrogen continuum as a primary standard are presently possible with an estimated uncertainty of ±5 percent. Such accuracies are much better than can be obtained presently by any other source calibration method in the uv. The hydrogen arc standard has been compared with two other calibration methods. Agreement with tungsten strip lamp calibrations in the visible and near uv and with the blackbody ceiling calibration in the uv is within the combined experimental uncertainties associated with the various methods.

Key words: high temperature; hydrogen arc; line broadening; Lyman alpha; optically thin; Stark profile.

The Stark profile of the hydrogen line Ly-α requires the least elaborate theoretical treatment of all hydrogen lines, reflected in the fact that all calculations reported so far show very similar results. Yet one of the two different type published experiments, even after reexamination, shows significant deviations from the theoretical profile. From the available data, it is not clear whether a physical effect went undetected in the experiments or whether the calculations should be revised. An investigation on the Ly-α profile under very different experimental conditions is reported here. While self-absorption in the previous experiments has been lowered by greatly diluting the hydrogen plasma with inert gases like Ar or He, in this investigation thin line wings are achieved in a pure plasma by operating at very high temperatures. Above 17,000 K the emission coefficient of Ly-α in a constant pressure, almost completely ionized plasma decreases rapidly with increasing temperature. The absorption coefficient does even more so because the blackbody radiation at the wavelength of Ly-α increases drastically. The properties of a pure hydrogen plasma are very well known and allow very accurate diagnostic measurements. The electron density at these high temperatures is close to 1.8 × 10^12 cm^-3 and almost independent of the temperature, certainly an advantage in a line broadening experiment. The high temperature arc plasma has been shown to be very close to local thermodynamic equilibrium.

Key words: approximation; asymptotics; asymptotic theory; error analysis; ordinary differential equations; turning points.

Considerable progress has been made during the past fifteen years in the error analysis of asymptotic solutions of linear ordinary differential equations. In addition to computational applications, realistic error bounds provide insight into the doubly asymptotic nature of many of the approximations, thereby avoiding the need for the somewhat unsatisfactory concept of generalized asymptotic expansions. The methods that have been developed for constructing error bounds have also led to the solution of some recalcitrant problems involving two or more turning points.

Key words: automotive fuel flowmeter environment; automotive fuel flowmeters; flowmeter evaluation; flowmeter evaluation test setup; flowmeters; gasoline flowmeter.

Fuel economy measurement procedures are being developed by the Transportation Systems Center. Flowmeters will be used to measure the gasoline consumed by the engine of an automobile either on the road or on a dynamometer. The role played by NBS in this work is to survey commercially available meters and find which ones might be suitable, to determine the environment in which they will be ultimately used, and to measure their accuracy in a laboratory simulation of that environment.

A discussion will be given of: (1) the different kinds of possibly suitable flowmeters to measure gasoline flow to the carburetor, (2) the environment of the flowmeter in an automobile (flowmeter temperature; fuel temperature, pressure, density, viscosity, color, opacity, flow pulsations, backflow, and swirl due to elbows; line voltage fluctuations; electromagnetic radiation from ignition; vehicle attitude with respect to the vertical; and vibration), and (3) plans for a test setup for evaluating and calibrating these meters in the laboratory under conditions simulating the automotive environment.

Key words: energy storage; hydrogen utilization; power generation; synthetic fuels.

Results are given of a feasibility study of alternatives for producing peak power. Fuel cells, batteries, and superconducting magnetic storage are considered as well as gas turbines and pumped storage. The fuels considered are hydrogen, from coal or electrolysis, synthetic natural gas, and methanol. Fuel storage alternatives include liquid, compressed gas, and for hydrogen, metallic hydride.

15417. Unassigned.

Key words: atomic abundances; CN spectra; non-LTE molecular spectra; photospheres; stellar; radiative transfer.

A detailed non-LTE study of the CN(0,0) 3883 Å band-head spectrum of Arcturus (K2 III) provides an accurate determination of the carbon, nitrogen, and oxygen abundances in Arcturus. Non-LTE effects are significant, and we find that the Ayres-Linsky model provides an adequate fit to the observations for [CN] = 1/3 [CN], and [O] = 0.60 [O], or for [CN,N] = 1/6 [C,N,O], but the latter abundances are unlikely. The upper photospheric microturbulence is found to be 2.5 ± 0.2 km s⁻¹.

Key words: ceramics; crack propagation; delayed failure; fracture; proof testing; Weibull analysis.

Proof testing is discussed as a design method for assuring the reliability of structural components. The advantages of proof testing over the statistical approach used for design lies in the insensitivity of the proof testing method to the detailed history of handling or processing of structural components. Methods are presented for developing and using proof test diagrams that assure minimum lifetime after proof testing. Procedures of proof testing and precautions that must be followed during proof testing are discussed. Provided these precautions are followed, proof testing offers a general method for assuring the reliability of structural components under stress.

Key words: acoustics; noise; sound.

This paper is a digest of a paper to be given orally at the Northeast Electronics Research and Engineering Meeting (NEREM) of the IEEE in November 1973. Since its length was severely limited, the paper can only describe the subject matter to be covered in the oral presentation. A discussion will be given of current instrumentation for measurement of environmental noise and noise emission from machinery and equipment—in both occupational and community situations. Emphasis will be placed on available measurement standards, problem areas, and trends in sound measurement instrumentation.

Key words: atom transport; diffusion in crystals; kinetic diffusion equations; mechanism for diffusion; random walk; vacancies.

The kinetic-atomic theory of diffusion is discussed and reviewed. Any such theory must involve a model providing a detailed picture of the paths as the atoms move through the material. Diffusion paths and diffusion mechanisms therefore are important in this theory and are discussed first. Both short-circuit diffusion mechanisms along easy diffusion paths and possible volume-diffusion mechanisms through regions of regular crystal structure are described. Simple random-walk diffusion equations are derived which yield expressions for the tracer diffusion coefficient D* and the atom drift velocity u in terms of atom jump frequencies. It is noted that diffusion frequently occurs by a vacancy mechanism. When this is the case, the random-walk equations must be modified to include both correlation-factor effects and vacancy-wind effects. The origin and influence of these effects are discussed. A comparison is made between the kinetic-atomic diffusion equations and the thermodynamic-continuum diffusion equations. It is noted that cross terms which yield a dependence of the atom flux of species i on the concentration gradients or chemical potential gradients of other species k appear in these equations.

Key words: ceramics; crack healing; crack propagation; cyclic fatigue; failure prediction; high temperature; static fatigue.

High temperature slow crack growth processes in several ceramic materials are examined under static and cyclic loading conditions. Data obtained at temperatures up to 1400 °C are used for purposes of failure prediction and for analysis of the slow crack growth phenomena. It is shown that purity plays a major role in slow crack growth resistance particularly in the hot-pressed materials, and that cycling in the low frequency regime does not significantly enhance the rate of slow crack growth. The slow crack growth mechanisms appear to be primarily plasticity related, and some discussion of these is presented.

Key words: angular aperture; computer optimization of electron optics; electron beam transport; electron energy analyzers; field aperture.

The design of electron energy analyzers is discussed, with special emphasis on the electron optical system used to transport electrons from the source to the energy dispersing element.

Key words: cavity theory; depth dose; dose distributions; dosimetry; dyes; electron beams; radiochromic dyes; thin films.

A thin self-supported or laminated layer of radiation-sensing material is useful for measuring or monitoring the energy deposited by a radiation beam passing through that layer. If (1) the film is thin enough in relation to the range of the incident radiation particles in the absorbing material and (2) the incident radiation spectrum can be approximated sufficiently, the absorbed dose or dose rate in materials surrounding the thin layer can be determined by applying fairly simple cavity-theory considerations (i.e. factoring by stopping power ratios in the case of charged-particle beams). Some sensing materials that may be used as dosimeters in accelerator beams are thin calorimetric bodies, solid-state detectors, and ceramic, plastic, or dyed plastic layers. Major sources of error that must be accounted for are instabilities, nonlinearity, variations of response with dose-rate and spectral changes, environmental factors, and inconsistencies in the quality of the sensing material, and imprecisions in the analysis of the radiation effect. A primary advantage afforded by thin-film dosimetry is its capability of supplying dose distribution data near interfaces of different materials.

Key words: black level suppression; nonlinear amplification; scanning electron microscope; signal differentiation; signal processing; Y-modulation.

Signal processing applied during the formation of SEM images can greatly aid the microscopist in obtaining a maximum amount of information from a specimen. Signal processing is necessary in order to overcome basic limitations of the eye in extracting information from the SEM cathode ray tube display or from photographs of the display. The four most commonly encountered forms of signal processing are black level suppression (differential amplification), nonlinear amplification (gamma), signal differentiation, and Y-modulation. Black level suppression and gamma processing are useful in producing enhanced image contrast over a small range of input signal. Signal differentiation preferentially enhances high frequency components of the image and is therefore effective for emphasizing edges. Y-modulation is particularly sensitive to fine detail and enhances the effect of surface texture.

Key words: crack propagation; fracture; glass; zeta potential.

In this paper the effect of zeta potential on crack propagation in glass is studied. Results indicate that in aqueous environments the zeta potential has no effect on crack growth. Reasons for this null effect are discussed.

Key words: analysis; biological and botanical samples; differential linear sweep voltammetry; environmental samples; fossil fuels; lunar samples.

The application of differential linear sweep voltammetry to the analysis of many types of environmental samples is described. The methods are applicable to the determination of many trace elements in almost any matrix. Results will be given and compared with those obtained by other techniques.

Key words: adaptive control; cerebellum model; control theory; manipulator control; Perceptron.

CMAC is an adaptive system by which control functions for many degrees of freedom operating simultaneously by referring to a table rather than by mathematical solution of simultaneous equations. CMAC combines input commands and feedback variables into an input vector which is used to address a memory where the appropriate output variables are stored. Each address consists of a set of physical memory locations, the arithmetic sum of whose contents is the value of the stored variable. The CMAC memory addressing algorithm takes advantage of the continuous nature of the control function in a way which promises to make it possible to store the necessary data in a physical memory of practical size.

Key words: bone; dosimetry; dyes; electron dosimetry; energy dependence; gamma rays; muscle; radiochromic dosimeters; x-ray spectra.

Conventional solid dose meters, such as plastic films, powders, emulsions, glasses, ceramics and gels, have a response to ionizing photons and electrons that varies markedly over a broad spectrum when compared with the absorption characteristics of biological tissues. New radiochromic dyed plastic dose meters have been developed with x- and gamma-ray and electron energy absorption cross-sections (calculated) and radiation energy responses (experimental) corresponding approximately to those for human muscle and bone, for a spectrum from a few keV to at least 10 MeV. Three-dimensional solid dose meters useful over the absorbed dose range of $10^2$ to $10^5$ rad are formed by thermosetting a selected combination of monomers containing the radiochromic dye in solution. Thin-film dose meters for the dose range $10^5$ to $10^8$ rad are formed by casting on optically flat surfaces strippable layers of special combinations of polymers and dyes in solution. The response of these systems to x and gamma rays and electrons has been studied over various radiation spectra, dose-rates and temperatures during irradiation.

Key words: bond pull test (nondestructive); metallurgical; reliability (microelectronic); transistors; wire bond.

Nondestructive wire-bond pull tests are often specified by high-reliability electronic device users in order to eliminate weak, poorly made wire bonds. The main problem with the test has been in establishing a pull-force level which will assure that the bonds are adequately strong but will not damage them during the test. In the present work, factors affecting the nondestructive wire-bond pull-test are examined. The variables, such as wire
and bond-loop elongation, bond geometry, bond deformation, and the mean and standard deviation of the destructive bond pull test are studied to determine their influence on the nondestructive test. Different pull-force criteria are derived for wire with high elongation, such as is used in power devices, and for wire with low elongation, typically used for bonding integrated circuits.

Key words: bonds (wire); failure modes; metalurgical failure modes; microelectronic; thermocompression bonds; ultrasonic bonds.

Various metalurgical failure modes of gold and aluminum wire bonds are described. Examples are taken from both low and high power devices. Whenever possible, known methods of avoiding these failure modes are given.

Wire bond failure modes can be divided into two categories. The first is comprised of those failure modes that are caused by poorly controlled or poorly designed manufacturing processes that result in lower product yield or higher per unit bonding cost, as well as those processes that predispose the device to early field failure. The second category is comprised of the failure modes of adequately made bonds that are caused to fail by environmental stresses during the operating life of the device.

The most frequent causes of failures are discussed in detail. These include nonoptimized bonding schedules, cracks in the heels of ultrasonic bonds, intermetallic formation, poor metallization, and inadequate gassivation removal. Assuming that the package is hermetic, or for plastic devices that humidity and other corrosion producers are not present, then the primary wire bond failure modes in the second category result from environmental temperature exposure and the number of power or thermal cycles experienced by the device during operation. Both of these can induce intermetallic formation. The latter can cause metalurgical flexure-fatigue at the bond heel or in the wire.

Key words: crack growth; fracture; glass; static fatigue; strength.

After a brief review of those factors that determine the strength of glass (brittleness, surface flaws, susceptibility to stress corrosion cracking), a discussion will be given of how fracture mechanics techniques can be used to understand the physics and chemistry of glass strength. In this paper we assume that the strength of glass is limited by the growth of cracks that are always present in normal glass surfaces. Fracture mechanics techniques can be used to characterize the crack growth and to relate the growth to experimental parameters such as temperature, environment, and glass composition. Crack growth data obtained in this manner can be used to develop a deeper understanding of fracture mechanisms, and to develop charts that can be used for the design of glass structural components. Examples of both applications are given in the paper.

Key words: microstructure; paraffin crystals; plastic deformation; polymer crystals; radiation damage; x-ray topography.

The internal microstructure of large melt-grown paraffin (n-icosane, C_{2n+1}H_{2n}) single crystals was examined by the Laue x-ray diffraction projection topographic technique. Crystal selection was facilitated by use of an electro-optical system which permitted instantaneous display of Laue transmission x-ray diffraction patterns on a television monitor. The crystals were oriented and topographic diffraction planes were selected by the use of a standard (001) stereographic projection plotted from computed angles between crystallographic planes. A second electron-optical system which permitted direct viewing of the topographic images was used for rapid alignment of the Laue camera and ensured uniformly exposed topographs. X-ray topographs were obtained from crystals in the as-grown, plastically deformed, and -irradiated states. The results indicate that both plastic deformation and y irradiation caused marked changes in the microstructure of the crystals, and that x-ray topography can be successfully exploited to determine such changes in hydrocarbon crystals.

Key words: blast waves; computer simulation; interatomic potentials; lattice dynamics; molecular dynamics; shock waves.

The application of computer molecular dynamics (CMD) techniques to the understanding of blast wave phenomena in solids is discussed. Examples of CMD studies of simple systems undergoing plane shock waves are reviewed and the inadequacy of some of the assumptions made in the conventional continuum approach examined. Recent advances made in obtaining approximate interatomic potentials for complex solids from conventional lattice-dynamical studies are reviewed for NaN_3 and KN_3. These results are discussed in the context of extending the scope of CMD calculations.

Key words: accelerators; dose distributions; dosimetry; electron beams; food irradiation; food preservation; gamma rays.

The program at the NBS Center for Radiation Research contributing to food preservation by irradiation includes measurement studies with several high-energy electron accelerators and radionuclide sources such as cobalt-60. Investigations are made on large-dose measurement systems, chemical dosimeters, and thin-film imaging systems used for high-resolution dose-distribution studies.

Key words: high temperature; hydrogen cyanide; infrared; molecular term values; spectra; spectroscopy.

The infrared absorption of HCN near the fundamental band at 3311 cm^{-1} has been measured at temperatures up to 1200 K. Transitions involving high rotational states (up to J = 62) have been measured. These give an improved value for the sextic centrifugal distortion term H_6. Many hot-band transitions have been observed and assigned to transitions originating in vibrationally excited states up to 4000 cm^{-1} above the ground state. These measurements give new data on vibrational states involving moderately high bending quantum numbers and indicate that new terms are needed to fit the ro-vibrational energy levels.

Key words: crustal movements; earth rotation; geophysics; lasers; lunar cartography; lunar gravity; moon; plate tectonics.

Progress since 1971 on laser measurements of the lunar distance is reported. The current status of analysis work based on lunar distance data is described. New lunar and geophysical results which have been obtained by the joint efforts of a number of different institutions are discussed briefly.

Key words: apparel; apparel fires; burn injury; defensive capability; FFACS; fire; flammable fabrics; garment fires; garment parameters; injury severity; reaction patterns; victims.

This study is based on information from 1,126 fire accident cases in the NBS computerized data base. FFACS. The defensive actions taken by persons involved in apparel fires are described and the effect of these reactions on the severity of the resultant burn injuries is discussed. In general, “running” was the most frequent first reaction with “beating flames with hands” and “trying to remove clothing” ranking second and third in frequency. However, the relative frequency of reactions varied with age, sex and type of accident. The effectiveness of various reactions was analyzed considering both the extent of injury incurred, measured by the percent total area of body burned, and the number of additional reactions required to extinguish the fire. The victim’s defensive capability (i.e., his ability to recognize danger and take appropriate action) was also found to have an effect on the level of injury severity.

Key words: ionic conductivity; nonstoichiometry; potassium antimonate; rubidium niobate; rubidium tantalate; sodium antimonate; sodium antimonate fluoride.

The phase equilibrium relations of four systems were investigated in detail. These consisted of sodium and potassium antimonates with antimony oxide and tantalum and niobium oxide with rubidium oxide as far as the ratio 4Rb2O:11B2O3 (B = Nb, Ta). The ternary system Na2SnO3·Sn2O3·NaF was also investigated extensively to determine the actual composition of the body centered cubic sodium antimonate. In addition, various other binary and ternary oxide systems involving alkali oxides were examined in lesser detail. The phases synthesized were screened by ion exchange methods to determine mobility of the alkali ion within the niobium, tantalum or antimony oxide (fluoride) structural framework. Five structure types were found to be of sufficient interest to warrant further investigation. These structure types are (1) hexagonal tungsten bronze (HTB). (2) pyrochlore, (3) the hybrid HTB-pyrochlore hexagonal ordered phases, (4) body centered cubic antimonates and (5) 2K2O·3Nb2O5. Although all of these phases exhibit good ion exchange properties only the pyrochlore has so far been prepared with Na+ ions as an equilibrium phase and as a low porosity ceramic. Fortunately Sb3+ in the channel apparently interferes with ion conductivity in this case, although relatively good ionic conductivity was found for the metastable Na+ ion exchanged analogs of RbTaO4·F and KTaWO4 pyrochlore phases. Small crystals of the other phases can generally be prepared by flux techniques and ion exchanged with Na+. However, in the one case where congruency allows large crystals to be pulled from the melt (4Rb2O:11Nb2O5) ion exchange techniques up to ~ 450 °C are not sufficient to complete replacement with Na+ ions.

Key words: flame spread; floor covering materials; ignition.

Characteristics of horizontal flame spread over the surface of a porous material, a carpet in this study, are studied experimentally and theoretically under various external radiant fluxes (0.1–0.27 cal/cm²/sec). It is observed that the size of flame is increased significantly by increasing the external radiant flux. This increases the radiative heat feedback from the flame so that it becomes comparable to or greater than the convective heat feedback. The external radiation can also cause an unstable motion of the flame front. This effect is probably due to the production of volatile pyrosylation products ahead of the flame front instead of under it. The theoretical calculation indicates that the thermal emission loss from the heated sample is significant and the internal radiation in the porous material must be included in the model.

Key words: acetyanilide; bomb calorimetry; calorimetry; chlorobenzene acid; combustion; creatinine; fluorobenzoc acid; nitocin acid; reference materials: thermochemical; thermochemical standards; thianthrene; urea.

Combustion measurements using a rotating bomb adiabatic aneroid calorimeter have been used to make a preliminary evaluation of ten substances as potential thermochemical reference materials for combustion of organic compounds containing N, S, Cl and F. p-chlorobenzene acid, p-fluorobenzene acid, and urea are recommended for acquisition, certification, and distribution. Thianthrene may also be suitable. For the ten substances including in addition to the above: o- and m-chlorobenzenes, o-fluorobenzene, nitocin acid, acetyanilide, and creatinine, typical combustion data are given, showing corrections applied; and mean thermodynamic functions at 25 °C are given together with error estimates. The results are compared with other work. Recommendations and a discussion of the role of standard reference materials for thermochemistry are given.

Key words: autoionizing states; electron excitation; energy loss; resonances; threshold; xenon.

An electron energy-loss spectrum and excitation functions for the four lowest excited states in Xe have been measured at a scattering angle of 45° in the near-threshold region (8-14 eV). Four peaks in the energy-loss spectrum above the 5P 3/2 ionization
may, Biology, presented nonequilibrium nitrogen at.

Key words: electron; energy loss; methane; n-hexane; oscillator strengths; spectra.

The derivation of oscillator strengths from electron energy loss spectra are discussed and results obtained for methane and n-hexane are compared to optical data.

Key words: electron; electron scattering; energy loss; methane; n-hexane; oscillator strength.

Electron energy loss spectra were obtained for methane from 8.0 to 14.0 eV and for n-hexane from 0-20 eV with the NBS Model AN-1 electron impact spectrometer. These data were obtained for 100 eV incident electrons scattered within about 20 milliradians of the forward direction. Relative oscillator strengths were derived from the data by correcting for the finite angular acceptance of the apparatus with the assumption that the generalized oscillator strength can be approximated by its optical oscillator strength limit. The apparent oscillator strength distributions are placed on an absolute scale by normalization at one energy to a dE/dE value determined optically. Comparisons of these results with available photoabsorption and other electron impact measurements will be presented.

Key words: electron; energy loss; oscillator strengths; spectra.

A summary is presented of the technique used to determine dipole oscillator strength values from electron energy loss spectra. Data on benzene is presented as an example.

Key words: electron; energy loss; molecular oxygen; oscillator strengths; spectra.

The oscillator strengths for molecular oxygen are determined from electron energy loss measurements and are compared to the available optical data.

15447. Hughes, E. E., Development of standard reference materi-

Key words: calorimetry; chemical energy; chemical thermodynamic data; energy scale (chemical); equilibrium measurements; mass spectrometry; measurement system; spectroscopy; state measurements; thermochemistry.

The thermochemical measurement system outlined here is an extension of the concept of a measurement system in that it deals with a class of physicochemical information, rather than with a metrology. Thermochemical quantities are defined, classified as archival thermochemical data, and thermochemical laboratory test data, and their source methodologies are categorized as calorimetry, equilibrium and state measurements, optical and mass spectrometry and theory. The relationship of thermochemical to nonthermochemical calorimetry is outlined. The propagation of measurements from standards laboratory to ultimate user is described for archival and for test laboratory thermochemical data.

Key words: consumer information; efficiency; energy; label; refrigerator/freezers; room air conditioning.

The purpose and legal/administrative authority for the Department of Commerce Voluntary Labeling Program for Household Appliances and Equipment to Effect Energy Conservation are described. The procedures for executing this program are outlined, with examples of experience in developing labels for room air conditioners and refrigerator/freezers.

Key words: β-cristobalite; electron microscopy; oxidation; silicon nitride; silicon oxynitride; $Si_3N_4$.

The reaction product layer produced on hot-pressed silicon nitride, $Si_3N_4$, during oxidation at temperatures from 1000 to 1400 °C was examined by transmission electron microscopy. The oxide was found to have at least two crystalline phases — silicon oxynitride $Si_3O_2N_2$ and β-cristobalite $SiO_2$, and two amorphous phases. The microstructure of the phases and of the silicon nitride near the reaction interface is discussed.

Key words: adjoint; concrete; gamma-ray penetration; moments; neutron penetration; secondary gamma rays.

A system of computer codes using the moments method to calculate penetration of neutrons and gamma rays in bulk media is described. Results are presented for the penetration of fission neutrons incident at various angles on concrete. The use of adjoint joint procedures for calculating gamma-ray buildup factor data are also described and results are presented for the penetration of gamma rays from point sources emitting at various conical angles in a concrete medium. Finally, the two types of calculations are combined to produce data for penetration of gamma rays produced in concrete by a neutron source.

15454. Wehrli, R., Metrology and the construction industry: Potential problems and promising opportunities, AIAJ., pp. 50-54 (May 1974).

Key words: building industry; conversion; engineering; human and modular standards; metroization; product-dimensions.

Conversion to the metric system, now nationally underway but still unorganized, challenges the building industry especially to plan promptly for hard conversion (metroization's approaching later stages). Why planning now is needed to accomplish competent hard conversion is examined in relation to standards. Because the building industry will need new dimensional standards for products to achieve a successful, final conversion, three types of hard conversion standards should be fixed upon to avoid haphazard pitfalls as conversion advances. The three standards briefly examined are engineering, modular, and human and their possible interrelationships.

Key words: cryogenics; helium pump; power transmission; refrigeration; superconducting cables.

A major problem in simultaneously cooling a number of test sections of superconducting power transmission cables is the wide variation in cable operating pressures and temperatures. It is feasible to couple a single large refrigerator to the cables with individual pumped helium circulation circuits. The system is flexible in both pressure and temperature and in the temperature rise along the length of the cable. The total refrigeration capacity required for a test facility is derived from current estimates of cable characteristics. A single refrigerator is shown to be less expensive than individual refrigerators for each cable even when the penalties for pump work and heat transfer through large temperature differences are included. Sufficient process calculations are included to show that the system is practical, and a draft specification for the refrigerator is given.

Key words: improved limits of detection; iodine-129; isotopic separation; neutron activation.

Iodine-129 levels have been published for biological matrices that naturally accumulate iodine such as animal thyroid and kelp. However, published procedures have insufficient sensitivity to determine $^{129}$I in other environmental and biological species. A unique procedure has been developed for the determination of $^{129}$I which couples neutron activation with mass separation. The procedure results in a significant improvement in sensitivity, thus allowing analyses to be performed on a variety of matrices which heretofore had not been investigated. Method development and analytical procedures are presented and analytical results at the $10^{-15} - 10^{-14}$ gram $^{129}$I level are given.

Key words: coal; fission track technique; fly ash; mica detector; polycarbonate detector; rapid analysis; uranium.

The analysis of coal and combustion waste products for uranium will become increasingly important with the greater use of coal for supplying energy needs. A fission track technique, as demonstrated with NBS Standard Reference Material Trace Elements in Coal (SRM 1632) and Trace Elements in Fly Ash (SRM 1633), provides a rapid and inexpensive method for U analysis.

Key words: mercury; stabilization; standard reference material; trace element; water standard.

The National Bureau of Standards has completed development work and analytical certification on two Mercury in Water Standard Reference Materials (SRM). SRM 1641 has a mercury content of 1.52 ± 0.05 µg Hg²⁺ per gram of water and is intended as a "spike" standard for natural waters. SRM 1642 has a mercury content of 1.20 ± 0.05 ng Hg²⁺ per gram of water and is intended as a benchmark trace standard used for analytical methods development.

These Standards have been stabilized using a new technique developed at NBS. Shelf life of the trace solutions has been demonstrated to be greater than one year with expectation of an even longer storage capability.

Key words: activation analysis; Ge(Li) detector; solvent extraction.

The method for the determination of hafnium in standard reference steels is described. The method combines neutron activation analysis with a solvent extraction procedure using bis(2-ethylhexyl) phosphate as the extractant. A subsequent back extraction into 2N hydrofluoric acid is done finally before counting. The samples were counted on a 60cc Ge(Li) in configuration with a 2048 channel analyzer. Using this method of analysis as described fast determination of hafnium can be made with routine 3-4% precision and accuracy.

Key words: calibration; pressure measurement; primary pressure standards.

Key words: CIRP; surface; surface finish; surface integrity; surface questionnaire; surface survey.

CIRP Committee “S” has developed a survey to determine surface roughness and surface integrity requirements for machined components. Specifically, the survey is designed to develop a comprehensive international response concerning the status of surface technology as related to all types of material removal processes, and the surface conditions produced which affect parts performance. The design of the survey is discussed, the status is outlined, and a partial list of survey questions is presented.

Key words: Ca II emission; chromospheres; stellar; photospheres, stellar.

We construct models for the upper photosphere and chromosphere of Arcturus based on the H, K, and IR triplet lines of Ca II and the $h$ and $k$ lines of Mg II. The chromosphere model is derived from complete redistribution solutions for a five-level Ca II ion and a two-level Mg II ion. A photospheric model is derived from the Ca II wings using first the "traditional" complete redistribution limit and then the more realistic partial redistribution approximation. In particular, the temperature and mass density of the temperature minimum region and the chromosphere-transition region boundary are computed and the pressure $P_0$ in the transition region and corona estimated. We find $T_{\text{min}}/T_{\text{eff}} = 0.77$ for Arcturus, Procyon, and the Sun and a trend of increasing mass at the temperature minimum with decreasing gravity. We find $P_0$ to be about 1 percent of the solar value, and on this basis estimate the surface brightness of the Arcturus transition region and coronal spectrum to be much less than for the Sun. Finally, the partial redistribution calculation for the Ca II K line indicates that the emission width is at least partially determined by damping rather than Doppler broadening, suggesting a reexamination of previous explanations for the Wilson-Bappu effect.

Key words: calibration filters; chrysotile; environmental health; improved methodologies; particulates: quartz; self-generated atmosphere.

Differential thermoanalysis methods provided an independent measurement of quartz and chrysotile asbestos in the preparation of calibration standards needed by environmental control agencies. In this study it was found that 30-500 µg of chrysotile asbestos could be measured with a relative standard deviation of 15 percent. Sealed silver containers were used to provide a self-generating atmosphere which reduced the spread of the dehydroxylation peak and improved both selectivity and sensitivity. A repeat-measurement of the thermal curve, after the dehydroxylation, provided a correction for the matrix baseline. Under similar experimental conditions, microgram quantities of quartz were determined with a relative standard deviation of ~ 2 percent. However, there was a 50 percent difference between the NBS-ICTA SRM 759 and commercially prepared material.

It was shown that this difference could be eliminated by thermally treating the commercial product.

Key words: electron energy loss; low energy electron impact; N$_2$O; oscillator strengths.

The apparent oscillator strengths for N$_2$O in the energy loss range of 4.5 to 14 eV are presented at 0.01 eV intervals. Measurements were made with an incident energy of 100 eV and at a scattering angle of within 20 milliradians of the incident direction.

Key words: cryogenic; gas industry; liquefied natural gas; research; survey; technology.

A comprehensive analysis of near and long term research needs has been conducted by the U.S. Gas Industry covering operational areas of Production and Exploration, Synthetic Supply, Transmission, Distribution, Utilization, and LNG.

Identifiable research needs are reported for the area of LNG encompassing time frames of: 1974-1978 (in detail, year by year); 1979-1985 (in 5 year period); 1986-2000 (as specific as possible); beyond 2000 (as believed necessary).

A year by year examination of LNG research priorities for the first five years are considered vital to overcome the potential suppression of growth in the LNG industry that could result from lack of available technology. Assessments of technical LNG needs beyond 1978 cannot, of course, be too well defined and must be examined annually for purposes of updating.

The National Bureau of Standards Cryogenics Division has become the governmental focal point for LNG research. A survey of NBS LNG research and how these relate to the future technological growth of the LNG industry are discussed.

Key words: charge distribution; Coulomb energy; deuteron; electrostatic; interaction potential; neutron.

The electrostatic interaction energy of a deuteron was computed for a model in which the neutron charge distribution was taken as a superposition of two exponentials of total charge + e and - e. Because the interaction potential is of short range the result is sensitive to the interior deuteron wave function. For a Reid hard-core wave function the computed energy is 1 keV.

Key words: apparel; carpets; curtains; draperies; fabrics; flammability; garments; test methods; textiles; upholstered furniture.

Tests for the flammability of textile items, that are presently under development at NBS, are described.

Key words: absorbed dose; calorimeter; dosimetry; electrons; ionization chamber; radiation standard.

Graphite calorimeters are being developed at several national standards laboratories to serve as absorbed-dose standards for fast electron beams for radiation therapy. Two such calorimeters have been constructed at the National Bureau of Standards, and compared to ionization chambers of the same size and shape by determining the quotient of the calorimeter response by the ionization chamber response. That quotient will be the factor used to convert the response of an ionization chamber calibrated in absorbed-dose units in a cobalt-60 beam to absorbed-dose units in high-energy electron beams.

Key words: accuracy; errors in activation analysis; precision; radiation detection.

Accuracy and precision in activation analysis was investigated with regard to counting of induced radioactivity. The various parameters discussed include configuration, positioning, density, homogeneity, intensity, radiosotopic purity, peak integration, and nuclear constants. Experimental results are presented for many of these parameters. The results obtained indicate that counting errors often contribute significantly to the inaccuracy and imprecision of analyses. The magnitude of these errors ranges from less than 1 percent to 10 percent or more in many cases.

Key words: electron impact; energy loss spectra; oxygen; ozone; triplet states.

Energy loss spectra of ozone were measured at scattering angles of 45, 75, and 90° and incident energies below 10 eV to look for previously unobserved triplet states. A broad continuum between 1.3 and 2 eV energy loss was seen which we believe is due to excitation of these states.

Key words: f-sum rule; f-values; lithium sequence; oscillator strength distribution; oscillator strengths; systematic trends.

A recent study on the oscillator strength distributions of several spectral series throughout the lithium isoelectronic sequence is described. In this work critically compiled oscillator strength data for discrete and continuum transitions have been subjected to four principal constraints: (a) to fit into systematic trends along the lithium isoelectronic sequence, (b) to fit into systematic trends within spectral series, (c) to comply with the requirement of continuity across the spectral series limit, and (d) to adhere to f-sum rules. The best available data require only minor modifications to adhere closely to all these constraints, which gives these data—for which several illustrative examples are presented—a very high degree of reliability.

Key words: applications; material detection; nuclear quadrupole resonance; piezometry; thermometry.

Since the early work on NQR over twenty years ago it has been suggested that the temperature dependence of NQR frequencies can be used as a thermometer. A natural extension of this idea is to use an NQR frequency to measure pressure. A review is given of the work that has been done to investigate these applications of NQR. The criteria for the choice of material and measurement technique are discussed with emphasis on chlorine compounds since they have received the most attention. As an example, the accuracy and precision obtainable with the Cl³⁻ NQR in KClO₃ (for which accurate measurements are available) will be described.

There has been some renewed interest in using characteristic NQR frequencies to detect the presence of specific materials. As an example, estimates are given for the signal-to-noise ratio to be expected for nitrogen compounds when the material is not located within the detector coil.

Key words: chain rupture; crystalline polymer; ESR investigation of radicals; fibrous structure; mechanical breakdown; microfibrillar structure; radical formation; tie molecules.

ESR detects radicals formed in a strained polymer sample as a consequence of chain rupture and, hence, for a while was considered the best method for investigation of molecular effects during tensile straining. It turned out that a sufficiently high number of radicals for ESR detection is only obtained in highly oriented material with well developed fibrous structure.

The primary end-of-chain radicals are too reactive and unstable so that, as a rule, they are not observable by ESR except at cryogenic temperatures. By proton transfer, more stable center-of-chain radicals are formed which are normally measured. They yield information about primary chain rupture. The much more easy rupture of bonds adjacent to center-of-chain radicals breaks less strained chains (secondary rupture), but does not produce any new radicals. Hence, the ESR information about chain rupture is rather incomplete and has to be supplemented by other methods as for instance IR which detects the unsaturated end groups formed during radical transfer and secondary chain rupture.

250
Since the broken chains are not exactly the same chains which before rupture were responsible for elastic modulus and tensile strength one has no direct correlation between the radical population and the load-elongation curve of the sample even if no secondary rupture is involved. It turns out that the specific morphology, in particular the presence of point defects of fibrous structure caused by the ends of microfibrils, is responsible for crack nucleation and growth to critical size which finally leads to sample failure. The chain rupture partially monitored by the radical population is a moderately reliable indicator of the effects leading to failure but not the cause of it.

Key words: Colorado River; cost sharing; efficiency; equity; salinity control.

The increase in salinity concentrations in the southwestern United States and Mexico imposes economic costs on water users. Cost-sharing rules influence the selection of techniques and of scales for salinity control projects, yet there is no established Federal policy for sharing the costs of salinity control. Based on efficiency and equity criteria, a package of rules is suggested. Charging salt polluters and salinity control beneficiaries are potential policies, the final choice being constrained by legal and political institutions. Two specific rules are for the Federal government to share the same proportion costs of all techniques (structural and nonstructural) used to provide salinity control, and to share costs in proportion to benefits received at the margin. Implications are that nonfederal interests, especially irrigators, would bear most of the costs of salinity control.

Key words: cross section; drift tube; experimental; molecule; negative ion; O_2^-; O_3^-; O_3^-; photodetachment; photodissociation.

Total photodestruction cross sections for O_2^-, O_3^-, and O_3^- ions have been measured over a photon energy range of 1.93-2.71 eV using a drift tube mass spectrometer coupled with an argon ion laser and a tunable dye laser. The O_2^- ion is found to photodetach at these photon energies with a cross section which varies from 1.2 to 2.5×10^{-18} cm^2. The O_3^- ion photodissociates to form O^- over this energy range with a cross section which varies from 0.1 to 7.3×10^{-18} cm^2 and exhibits structure indicative of the vibrational levels of a predissociating excited state. Structure is also observed in the O_3^- photodetachment cross section which varies from 1.0 to 2.0×10^{-18} cm^2, and in the O_3^- photodetachment cross section.

Key words: chemical analysis; coulometry; electrochemical analysis; ion-selective electrodes; polarography.

A brief review is presented, in popular style, of the various electrochemical techniques that are applicable to chemical analysis. Techniques described include polarography, coulometry and potentiometry employing ion-selective electrodes. The use of electrochemical sensors in titrimetry is also pointed out.

Key words: electrochemistry; ellipsometry; gallium arsine; passivity.

Both p- and n-type gallium arsine in aqueous electrolytes display the phenomenon of passivity once sufficiently high prepassive cd's are attained. This can be achieved for the n-type by illumination, whereby a transition is observed from hole-limited anodic dissolution to passive film formation as the light intensity is increased. Ellipsometric studies reveal that the passive film on either n- or p-GaAs dissolves at a comparatively high rate, and so reaches a steady-state thickness in a rather short time.

Coulometric measurements indicate that the passive film contains gallium and arsenic in their +3 oxidation states. The ionization of Ga and As at the GaAs/film interface is shown to require holes, in like manner to anodic dissolution in the absence of a passive film. The electrical and optical properties of the passive film suggest uniformity of composition for thickness greater than about 50 Å, whereas thinner films show higher conductivity and refractive index.

The passive film on GaAs supports typically large electric fields and exhibits negligible electronic conductivity and porosity. Under proper conditions a nonpassive anodic film can be formed at potentials in the active region. It is much less soluble than the passive film, continues to thicken indefinitely and therefore appears to be porous.

Key words: International System of Units; measurement units; metric units; SI; systems of units; units of measurement.

Several systems of measurement units used in engineering are discussed. The multiplicity of units for the same quantity and the use of the same name for units of different quantities led to the adoption of the International System of Units (SI) in 1960. This system is one of the many metric systems that have been introduced since 1793. SI is a single, rational, coherent system consisting of seven base units, two supplementary units, and units derived from them, always with a factor of one relating them. In this sense, SI is a unitary rather than a decimal system. SI provides one and only one unit for each quantity and does not use the same name for units of two different quantities. Prefixes are provided for convenience in expressing decimal multiples and submultiples of SI units, but they are not essential to SI. The present confusion existing in units for quantities which relate to rotation or vectors is discussed. The inclusion of the radian in such units as moment of inertia, angular momentum, and torque is necessary. Some improvements needed in SI are mentioned. The simplicity and rational nature of SI should relieve the engineer from memorizing equations cluttered with conversion factors dependent on irrational units seldom understood.

Key words: absorbed dose rate; calorimetry; chemical dosimetry; electron beams; gamma radiation; radiation dosimetry; radiochromic dyes.

A procedure for calibrating liquid dose meter systems in pulsed high-intensity electron beams is presented. The chemical change produced in solution by a totally absorbed collimated beam has been compared with the heat deposited in a calorimeter exposed to the same beam under identical conditions. Thin film dose meters containing radiochromic dyes, which were known to have a response that does not vary with absorbed dose-rate, were used to monitor the energy absorbed during irradiations. A quasi-adiabatic calorimeter and a cell of the same geometry for containment of the dosimetry solutions are described. The G-value for dye formation in 2-mmol/litre pararosaniline cyanide in 2-methoxy ethanol (O₂-saturated) has been determined in the range of dose-rates from 10⁻¹² to 10⁶ rad/s.

Key words: critical evaluation; crystal structure; data analysis; molecular structure.

The motivations for holding a conference on structural information are discussed. The use of structural data in chemistry, physics and related disciplines is reviewed. The major points brought out during the conference are summarized.

Key words: apparel fires; burn injury severity; fabric flammability; FFACS; garments.

The effect of three parameters, fiber content, fabric content, fabric burn time (a function of ease of ignition and rate of flame spread), and garment configuration and fit, on frequency of involvement in accidental garment fires and on the extent of resulting injury was investigated using fabrics and data from the National Bureau of Standards Flammable Fabric Accident Case and Testing System (FFACS). Cellulose-containing fabrics are overrepresented in FFACS though this may be, in part, the result of biases in the data base. The extent of injury appears to be more closely related to garment configuration and fit than to fiber content and fabric burn time.

Key words: computer networks; networks.

This paper is intended to provide an introduction to the capabilities and limitations involved with the use of today's computer networks. While the treatment is at times brisk, this is intentional, in order to emphasize the applicability of networks for a wide range of applications—and the equally wide range of problems.

Key words: interlaboratory test; photodiode detectors; photometry.

The results of an intercomparison of measurement of spectral sensitivity of two silicon photodiodes are presented. The comparison was part of the activities of CORM (Council for Optical Radiation Measurement). The manufacturer, nine industrial laboratories, and NBS measured the two cells. The results were statistically analyzed and are presented here in tabular and graphical form.

Key words: chromospheres, stellar: He emission; photospheres, stellar.

The formation of the Balmer series member He in the near red wing of the Ca II H line is discussed for two cases: the Sun (He absorption profile) and Arcturus (He emission profile). It is shown that although the He source functions in both stars are dominated by the Balmer continuum radiation field through photoionizations, the line formation problems in the two stars are quantitatively different, owing to a substantial difference in the relative importance of the stellar chromosphere temperature inversion compared with the stellar photosphere.

Key words: computer graphics; cost-benefit analysis; economic analysis; graphics; minicomputers.

This report surveys the evolution of satellite graphics systems from closely coupled display channels to free-standing, minicomputer-based systems. Particular attention is paid to the assignment of functions to the host and satellite systems. Some intuitive types of analysis in support of this assignment are presented, followed by the description of an economic analysis which may be universally applied.

Key words: astrophysics; energy loss; radiative transfer; spectral line formation; stellar atmospheres.

This note presents evidence that the claims advanced by Wilson, Tung & Sen regarding the adequacy of Wilson & Sen's half-range moment method for treating the outward peaking of the radiation field in a spherical system are unjustified. In particular, the emergent intensity obtained by Wilson et al. is shown to be negative for 0 < μ << 0.5 and greatly in error for larger values of μ. A discussion is presented of the essential indeterminacy of the Wilson-Sen half-range method. It is suggested that the good values obtained by Wilson et al. for the mean intensity and the Eddington factor arise from their choice of the arbitrary function A(r) to include the known asymptotic forms of the source function.

Key words: conversion: FORTRAN; Metric System.

The NBS Computer Program Package for Metric Conversion is written in American National Standard FORTRAN and is designed to compile and run on a wide variety of large scale computers with little or no modification. This paper consists largely of a description of the package and a discussion of its applicability to the COMMON Computers consisting of the IBM System 370, System 360, the 1130, 1800, System 3, and System 7.
The package has been satisfactorily tested on a System 370 Model 165. It may be expected to compile and run satisfactorily on any 370 or on any 360 Model 22.195 of adequate configuration when one of the available AMERICAN NATIONAL STANDARD FORTRAN Compilers is used.

It will probably not run on the 1130, the 1800, the System 3, or System 7 with any IBM supplied FORTRAN compiler due to the extensive use made of features contained in ANS FORTRAN but not in ANS BASIC FORTRAN.

The package should compile and run on a 1130 of adequate configuration with a DNA 1130 ANS FORTRAN Computer with little or no modification.

Key words: cryogenics; dielectrics; electrocaloric; heat switches; polarization; refrigeration.

The most significant development in the project for the last six months was the discovery that SrTiO3 glass ceramics showed only heating effects at 4 K for both polarization and depolarization. At the same time, the pit ting problem for ceramming temperatures above 1100 °C was partially solved.

Several electrothermal measurements have been done on the SrTiO3 glass-ceramic samples to try to understand why they behave as they do. In addition an apparatus for measurement of DC polarization and hysteresis was completed. The results from these measurements are consistent with the electrothermal measurements. Studies of several new materials have begun in order to better understand the electrocaloric effect near 4 K and in hopes of finding a satisfactory refrigerant material.

The gold-plated multiple leaf heat switch was shown to be useful for heat loads up to about 1 watt at 4 K. The magnetothermal conductivity measurements on single crystal beryllium indicate that it could be used for both the upper and lower switch. Further work on some details of the heat switches has been temporarily suspended in order to concentrate fully on solving the refrigerant material problem.

Key words: error of sound power; far-field power; near-field power; sound power estimation.

A review is presented of several sound power estimation procedures for free field above a reflecting plane condition. Particular emphasis is placed on potential sources of measurement error. Both near field and far field procedures are included in the discussion. Estimates of magnitudes of individual sources of error are discussed.

Key words: method of measurement, electrical; semiconductor devices; temperature, peak; thermal properties; transistors, power, safe-operating area.

A technique is described which uses straightforward electrical measurement procedures to determine the peak junction temperature of power transistors. To determine the peak temperature, standard electrical measurement techniques are altered to account for the difference between the distributions of the calibration and measurement currents in the active area of the device. For relatively uniform temperature distributions, the electrically determined peak junction temperature is only about 6 percent or less below the infrared measured peak temperature whereas the standard electrically measured temperature is about 10 to 25 percent below the infrared measured peak temperature. For severely nonuniform temperature distributions, when only about 20 percent of the total active area of the device is dissipating power at steady state, the electrically determined peak temperature is within 11 percent of the infrared measured peak temperature while the standard electrically measured temperature is more than 40 percent below the infrared measured peak temperature. Device operating conditions for which the junction temperature as determined by standard electrical methods, infrared techniques, and the electrical peak temperature technique equals the manufacturer's specified maximum safe operating temperature are compared with one another and with the manufacturer's specified safe operating limits. It is suggested that the electrical peak temperature technique can be used to generate more realistic safe operating area limits and to determine the validity of specified safe operating limits of power transistors. Devices used in this study include TO-66 and TO-3 encased devices, of both mesa and planar structure, with clip and wire leads, manufactured by a variety of techniques (epi-base, single-diffused, and multiple-diffused).

Key words: alarms: burglar alarms: intrusion alarms: intrusion detection.

This document provides definitions in layman language of terms commonly used in the commercial intrusion alarm field.

Key words: buyer; computer software; marketplace; performance measurement; quality; seller; specifications; validation.

There is probably no more elusive commodity bought and sold today than computer software. We have the almost ludicrous situation of a marketplace where the buyer does not know how to describe his product. The software market practices now existing in software transactions can be displaced by imposing quality control procedures during software production, by demanding specifications or documentation at the time of software transaction and by utilizing validation services and performance measurement services to support the buyer of software.

Key words: accuracy; clinical chemistry; measurement; reference methods; standard reference materials.
Compatibility of measurement in clinical chemistry is of utmost importance if results are to be comparable between laboratories and across time and distance. It is shown that compatibility may most easily be brought about on a measurement system based on accuracy. Five components are required to bring about meaningful measurement in clinical chemistry: (1) A rational, self-consistent system of units of measurement; (2) The materials to realize in practice the defined units and their derivatives; (3) The availability of accurate methods of measurement, analysis, or test based on the well-characterized materials (SRM) of 2; (4) The transfer method; (5) The assurance of the long-term integrity of the measurement process.

The National Bureau of Standards (NBS) is now providing a comprehensive supply of SRM's for the clinical chemistry laboratory. In addition, it is cooperating with professional societies and other government agencies to help develop reference methods.

Key words: consumer; product safety; regulation; standards.

A short history of NBS contributions to consumer product safety is presented. The role of NBS in providing technical support to Federal regulatory agencies, including the Consumer Product Safety Commission, is discussed; several safety-related research projects are described.

Key words: Brooks Bill; computer security; congressional concern; controlled accessibility; data sensitivity; measures of risk; standards; user identification.

Problems of computer security are a major impediment to effective computer utilization today. These problems have technological, legal, moral and ethical aspects. The National Bureau of Standards is concentrating its efforts on the technological aspects of computer security. This NBS project is entitled "Controlled Accessibility to Computer Systems." There is considerable national concern over computer security expressed by Congress, Federal, state and local governments, private groups and citizen committees. The NBS efforts are aimed at meeting these concerns through the development and issuance of guidelines, quantitative measures of risk and effectiveness and standards. These mechanisms for resolving the problem are intended principally for government use although they should be of nearly equivalent utility in the private sector.

Key words: bus-on-freeway demonstration project; bus rider surveys; bus system evaluation; bus transit; traffic monitoring.

The Shirley Highway Bus-on-Freeway Demonstration Project seeks to ease traffic congestion and shorten travel times for bus and auto travelers commuting during rush hour periods via the Shirley Highway Corridor from Northern Virginia suburbs to employment centers in Washington, D.C. This and other project goals, which include reducing vehicle-caused air pollution and improving bus service, can be attained by effecting an auto-to-bus modal shift by persons commuting via the Corridor area. Three project elements—(1) an exclusive bus lane on the Shirley Highway and bus priority lanes within the District of Columbia; (2) improved bus service including new-look/new-feature buses; and (3) park-and-ride facilities will, according to the premise under which the project was conceived, effect this modal shift and achieve a substantially increased bus market share. The demonstration project is sponsored by the Department of Transportation.

The Technical Analysis Division, National Bureau of Standards, is evaluating project performance with emphasis on the effectiveness of the three project elements. This paper describes evaluation procedures used during the first year and identifies difficulties encountered with various monitoring procedures, as well as presenting preliminary conclusions and plans for future activities.

Key words: acoustical measurements; acoustics; national measurement system; noise; noise control; noise emission; sound.

This paper indicates the relationship of the acoustical measurements required for the effective implementation of noise abatement and control to the social system termed the National Measurement System. The relevant physical quantities being measured are described, and the infrastructure of the relevant acoustical standardization institutions is indicated. The interactions occurring between the participants in the system are specified, and the impacts, status and trends of the system in adapting to changing technology are discussed. Finally, the interactive role of NBS in the National Measurement System is briefly outlined.

Key words: acoustical measurements; acoustics; impact noise; noise emission; reverberation rooms; sound transmission.

A detailed (eight-page) questionnaire dealing with "Laboratory Measurements of Noise Emission and of Acoustical Properties of Building Elements and Materials" was developed by an INCE Measurement Survey Task Group. Copies of this questionnaire were distributed to more than 120 organizations believed to possess acoustical laboratory facilities. Since acoustical measurements are an integral element in the conduct of acoustical research, it is believed that the results of this survey will be important in the development of research priorities. This paper provides a qualitative description of the questionnaire in order to indicate its scope.

Key words: audiometric standards; building acoustics; community noise; earphones; environmental noise; instrumenta-
tion: measurement methodologies; microphones; psychoacoustics; reverberation room; sound level meters.

A brief description of the National Bureau of Standards' recent research activities in acoustics and noise measurements is presented.

Key words: buildings; codes; design criteria; regulatory system; safety; standards; structural loading.

The paper identifies and briefly discusses the factors that collectively influence the structural safety of a building. These include the probability of occurrence of extreme loading, the factors of design and construction process that determine the building's response, and the function of the building that influences both its design and the consequences of an extensive structural failure. Those factors within the sphere of influence and concern of individuals responsible for the design and supervision or regulation of construction are then discussed in further detail to point out deficiencies in current knowledge or practice. Finally, conclusions and recommendations are made with respect to these deficiencies.

Key words: consumer activism; control proliferation; industry; interaction; package quantity standards; voluntary standards; working with government.

Consumer activism and concomitant opening-up of agency activities means industries must reevaluate their strategies for working with government. NBS, short on regulatory authority but holding a strong suit in technology, is sensitized to economic realities and encourages interaction. Getting your story told early and often, can lead to effective voluntary standards and perhaps draw praise from enlightened consumer advocates. Since inflation and metircation portend another effort to control the proliferation of the number of package sizes, industry may want to reconsider their package quantity standards.

Key words: K2SO4-LaCrO3 system; K2SO4-MgO system; phase relations; vapor pressure; vaporization equilibria.

The phase relations for the K2SO4-MgO and K2SO4-LaCrO3 systems were determined using quenching techniques along with x-ray diffraction and DTA data. The systems were studied in open and closed Pt containers. The K2SO4-MgO system is a simple eutectic-type with the eutectic located at 1067 °C and ~ 2 mol percent LaCrO3. The K2SO4-LaCrO3 system in air (open system) is more complex and can not be represented by a binary-type system.

Key words: hydrosulfides; libration; neutron scattering; phase transition; quasi-elastic scattering.

The atomic motions in sodium- and caesium-hydrosulfide have been studied with inelastic neutron scattering using a hybrid time-of-flight spectrometer at the NBS reactor. The incident neutron wavelength was 2.43 Å, the time-of-flight resolution 3.7 percent, and the momentum transfer range for elastic scattering covered in this experiment was 0.4-3.5 Å⁻¹. NaHS and CsHS are members of a broad group of compounds M⁺(XY) which have cubic symmetry in the crystalline phase just below the melting point, and a lower symmetry at temperatures below a crystal phase transition point. The measured inelastic neutron scattering spectra above and below the phase transition showed that librational motions about equilibrium orientations persist in passing through the transition. A temperature- and momentum-transfer(Q)-dependent broadening of the quasi-elastic scattering peaks, however, indicates a rapid reorientation of the SH⁻ ions in the high-temperature cubic phases. The experimentally obtained quasi-elastic scattering peaks have been compared with predictions for the shape of the quasi-elastic scattering as derived from different models, in which the SH⁻ ions were assumed to reorient with rapid jumps between a limited number of quasi-equilibrium orientations. Plots of the experimental full width at half maximum of the quasi-elastic peaks versus Q show oscillations as predicted by the theoretical calculations. The differences in the rotational disorder in the two compounds studied are discussed and relaxation times τ and activation energies for the SH⁻ motions are given. The τ values derived for fcc NaSH vary from 0.4 to 0.2 ps between T = 103 °C and T = 212 °C, while the values for bcc CsSH vary from 2 ps (T = 23 °C) to 0.90 ps (T = 140 °C).

Key words: bricks; buckling; deflection; loads (forces); masonry; moments; slenderness ratio; stability; structural engineering; walls.

This is a closure of the American Society of Civil Engineers Proceedings Paper 8143, published in May 1971.

Key words: adhesively bonded joints; composite materials; composite-plate reinforcement; contour plotting; cracks; reinforcement of; cutouts; reinforcement of: finite element analysis; joints, adhesively bonded; reinforcement, composite plate; reinforcement, cutouts and cracks.

Finite element computer analyses of the reinforcement of cutouts and cracks in metal sheet, by bonded overlays of composite material, are described. The analyses articulate the separate responses of the sheet, the overlays, and the adhesive. Contour plots of computed stress and strain fields are automatically generated by the computer programs. Strains measured on the
surfaces of several reinforced-sheet tensile specimens were, for the most part, in good agreement with strains predicted by the analyses. Qualitative correlations between certain failure modes observed in the test specimens and the stress distributions given by finite element analysis are apparent. The same analytical approach is currently being used to study weld/bond and fastener/bond joints, and it could be used to study other problems such as hole repair in metal or composite sheet and embedded defects in laminar material.

Key words: density; fluorocarbon copolymer; morphology; permeation; permeation tubes; polymer structure; sulfur dioxide.

Liquid SO$_2$ sealed into tubes made of a fluorocarbon copolymer permeates the walls of the tube at a temperature-dependent but accurately reproducible rate. Sulfur dioxide dispensers made in this way are called permeation tubes and are useful for calibrating instruments that measure SO$_2$ concentrations in air. The National Bureau of Standards calibrates SO$_2$ permeation tubes and makes them available as Standard Reference Materials. The permeation rate in a batch of nominally identical tubes varies enough that each Standard Reference Material tube must be individually calibrated. Changes in the length or radial dimensions of the tubes are much too small to explain most of this variation. An excellent (negative) correlation is found between the measured permeation rate and the density of the polymer (or weight per unit length). Since both the measured density and the permeation rate for this semi-crystalline polymer depend upon morphological factors, but in different ways, x-ray diffraction measurements of the thickness and orientation of the lamellar crystals were made and a mathematical model was set up to identify the morphological factors which can cause variations in the permeation rate.

Key words: electrical conductivity; MHD materials; phase equilibrium; slag; vaporization; viscosity.

The National Bureau of Standards, under sponsorship of the Office of Coal Research, has initiated a program of materials research appropriate to open cycle, coal fired MHD. The program consists of several interrelated projects in the areas of vaporization, viscosity, electrical conductivity and phase equilibria. This paper is intended as a review of the progress achieved thus far. Initial work has concentrated on the behavior of coal slag in MHD environment since there is definite lack of data in this area. Slag specimens have been obtained under real MHD conditions and analyzed by a variety of techniques. For the most part slags are composed largely of Al$_2$O$_3$-FeO-Fe$_2$O$_3$-SiO$_2$ mixtures. The portions of each as well as the amount of glassy (liquid) or crystalline material vary depending upon the location sampled in the MHD system. From the data obtained on real slags, synthetic model slags were prepared for more systematic study. Viscosity-temperature relationships of both real and model slags indicate similar temperature coefficients but large differences in viscosity values at one given temperature (e.g. at 1500 °C viscosity range between 1.0 to 2.1 log$_{10}$ poises). The electrical conductivity of a number of slags have also been determined to 1700 K in various environments. Electrical conduction is apparently caused by the transfer of electrons between Fe$^{2+}$ and Fe$^{3+}$ and is largely electronic rather than ionic. Vaporization studies have concentrated on the evaporation behavior of synthetic slags under their own vapor pressure. These data indicate the initial stages of evaporation are governed by a nonequilibrium process involving the decomposition of Fe$_2$O$_3$. Equilibrium, however, is achieved with respect to the evaporation of SiO$_2$ from the slag solution (activity of SiO$_2$ is near unity). Important also to MHD is the effect of seed reactions on insulators and electrodes. In this respect the phase equilibrium diagrams for the K$_2$SO$_4$-MgO and the K$_2$SO$_4$-LaCrO$_3$ systems have been determined. Both systems (under their own vapor pressure) behave in a similar manner with melting beginning a few degrees below the melting point of K$_2$SO$_4$ (1069 °C).

Key words: computer; detector-ray; discriminator; emitter-couple; integrated circuit; signal processor.

The resolution of the NBS high resolution electron spectrometer has been improved recently by installing a new 48 channel detector array at its focal plane, in place of the original channel array that has been in use for some time. This has necessitated the design and construction of a new electronics system to accommodate the increased amount of information from the detectors. The new detector system digitally processes the signals from the detectors after amplification and discrimination. It is coupled on line to a computer which accumulates and manipulates the processed data.

An effective and economical solution has been found for the construction of a large logic network for nuclear data accumulation. The functions provided are those normally found only in modular form; e.g., coincidence, with the necessary time resolution. Time differences for simultaneous signal paths have been restricted to ±1 ns maximum with a minimum pulse width of 5 ns for any pulse input. The entire system is dc coupled and the pulse pair resolution, measured during construction, is 10 ns.

Key words: data center; data compilation; data evaluation; energy program; thermodynamics; transport properties.

The expected uses for numerical data in the national energy program are discussed. The uses and activities of mission-oriented data centers and discipline-oriented data centers in mission-oriented tasks are also discussed. It is concluded that both types of activities will be needed for the effective carrying out of currently proposed energy initiatives. A listing of existing discipline-oriented data centers in the area of thermodynamics and transport properties that could make a contribution to a national energy program is given.

Key words: Annals of Mathematical Statistics; Army Experiment Design Conferences; Dodd, E. L.; educational
testing; history of mathematical statistics in the U.S.A.; Hotelling, Harold; likelihood-ratio tests; multivariate analysis; order statistics: Princeton University; Rietz, H. L.; Shewhart, W. A.; statistical tolerance limits: Wilks, S. S.; Wishart, John.

A biography of Professor Samuel Stanley Wilks (1906-1964) of Princeton University, with particular attention to his early life, notes on the persons who shaped his professional development, review of his many-faceted professional career and his role in initiating and launching the U.S. Army's annual series of Conferences on the Design of Experiments in Army Research, Development and Testing.

Key words: buckling; compression members; concrete; cracking; deflection; eccentricity; equilibrium; loads (forces); masonry; stability; stress distribution; structural engineering.

This is a closure of the discussion of ASCE Proceedings Paper 8253 by Felix Y. Yokel.

Key words: accident investigation; hydrogen energy systems; hydrogen experts; hydrogen fuel; hydrogen production; hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; hydrogen transportation.

This register presents the names of approximately 235 individuals who are considered experts, or very knowledgeable, in various fields of technology related to hydrogen. Approximately 90 organizations are represented. Each person is listed by organizational affiliation, address, and principal area of expertise. The criteria for selection of names for the register are extensive experience in a given field of work, participation in or supervision of relevant research programs, contributions to the literature, or being recognized as an expert in a particular field. The purpose of the register is to present, in easy form, sources of dependable information regarding highly technical areas of hydrogen technology, with particular emphasis on safety. The register includes two indexes: an alphabetical listing of the experts and an alphabetical listing of the organizations with which they are affiliated.

Key words: alkali dimer; magnetic rotation; molecular constants: perturbations; sodium molecule; spectroscopy.

Perturbations have been observed in the A ¹Σµ+ state of the diatomic sodium molecule. For each rotational perturbation three discontinuities have been observed. This indicates the ¹Σµ state is perturbed by a ¹Σ1 state.

Key words: base-metal thermocouples; cryogenic thermocouples; noble-metal thermocouples; nonstandardized thermocouples; refractory metal thermocouples; standardization; temperature measurement; thermocouples; thermometry.

A broad overall view of the current status of thermocouple thermometry is given. The salient features and limitations of standard thermocouple types are reviewed, and some of the recent changes in standardization are noted. Some of the nonstandardized thermocouple types are discussed, giving particular attention to those employed at cryogenic temperatures and to those intended for use above the temperature limits or under conditions where the standard types are inadequate. Commonly used materials for insulation and protection are described, and some examples are noted of applications where stringent requirements are placed on thermocouple performance.

Key words: calibration; nickel-base alloys; nickel-chromium alloys; nickel-silicon alloys; reference tables; temperature measurements; thermal emf; thermocouples; thermoelectric reference data; thermometry.

This paper reviews the development of the new nickel-base thermocouple alloys Nicrosil and Nisil by the Australian Defense Standards Laboratories (now the Materials Research Laboratories of the Australian Government Department of Defense), and their standardization by the U.S. National Bureau of Standards.

The relevant properties of the new alloys are described, and they are shown to have much higher environmental, structural and thermoelectrical stabilities, and to be more suitable for use at the higher operating temperatures, than existing Type K nickel-base thermocouple materials.

The standardization procedures are summarized, including the derivation of reference tables. Calibration data were obtained over the range 5 K to 1575 K, from prototype alloys specially fabricated by five major manufacturers of base-metal thermocouple alloys in the U.K., the USA and Sweden.

Key words: Henry's constants; liquid-vapour phase equilibria; methane; nitrogen.

Isothermal composition measurements for both the equilibrium liquid and vapour phases have been determined for the nitrogen + methane system at eight temperatures between 112.00 and 180.00 K, and at pressures from 1 to 49 atm (1 to 50 bar). The internal consistency of these data is checked by comparing experimental and calculated thermodynamically consistent vapour phase compositions. Derived Henry's constants are used to provide a comparison between these data and those of other investigators.

Key words: critical current densities; critical currents; granular aluminum films; granular films; Type II superconducting films; vortex pinning.

A relatively simple principle is experimentally demonstrated for producing extremely low critical-current density materials for application in quantum flux-flow devices. Essentially the technique consists of making the scale of structural disorder in
the material small compared with the vortex core size. The smaller this ratio, the smaller the effects of bulk pinning, and the smaller the resulting critical-current density. Data for this study were obtained using superconducting granular aluminum films evaporated in a cylindrical geometry designed to eliminate edge-pinning effects. The data show J, to exhibit a sharp minimum as a function of grain size, with the lowest values of J occurring in those films having the smallest ratio \( D/(g_0) \). Here \( D \) is the average grain size, \( g_0 \) is the BCS coherence length, and \( l \) is the electronic mean free path. The normal-state resistivity \( \rho_n \) can be used as an index of \( D/(g_0) \) for the granular aluminum system, with the lowest critical-current densities occurring in films prepared to have a \( \rho_n \) of about 10 \( \mu \Omega \) cm. In addition to discussing the dependence of the critical current on microstructure, data on the temperature dependence and electric field dependence of \( J_c \) are presented.

Key words: carbon dioxide; Clausius-Mossotti function; intermolecular forces; m-6-8 potential quadrupolar gas; second virial coefficient; viscosity coefficient.

Collision integrals and equilibrium pressure and dielectric second virial coefficients are calculated for a nonspherical m-6-8 model potential energy function. The results are applied in a correlation of the physical properties of carbon dioxide. It is shown that the inclusion of nonspherical contributions in the calculation of the collision integrals has a small but significant effect with respect to the accurate representation of data. The Mason-Monchick approximation that nonspherical molecules collide with fixed relative orientations is briefly discussed. Agreement between calculated and experimental values for the viscosity coefficient, the thermal conductivity coefficient, the second virial coefficients and the isotopic thermal diffusion factor is generally satisfactory.

Key words: aluminum alloy; bulk modulus; compressibility; Debye temperature; elastic constant; nickel steels; Poisson's ratio; shear modulus; sound velocity; Young's modulus.

The low-temperature elastic properties have been determined for five commercial alloys that have possible structural applications at cryogenic temperatures. The alloys are 5083-0 aluminum and four ferritic steels: 3.5, 5, 6, and 9 percent nickel. An ultrasonic (10 MHz) pulse-superposition method was used to measure longitudinal and transverse wave velocities. Using the velocities and the mass density as input, the following elastic constants were calculated: longitudinal modulus, Young's (ten- sile) modulus, shear (rigidity) modulus, bulk modulus (reciprocal compressibility), and Poisson's ratio. Measurements were made semicontinuously from 300 to 4K. The room-temperature composition dependence of iron-nickel alloys is reviewed comprehensively up to 12 percent nickel. Debye temperatures were calculated from the elastic constants. A discussion is given of the temperature dependences of the elastic constants and differential relationships among the elastic constants.

Key words: bulk modulus; composite; compressibility; elastic compliance; elastic stiffness; piezoelectric oscillator; Poisson's ratio; shear modulus; Young's modulus.

A resonant piezoelectric oscillator method for measuring elastic moduli was applied to composite materials. The complete set of elastic compliances of a superconducting coil composite was determined semicontinuously between 4 and 300 K. Also, two moduli of a layered fiber-glass-epoxy composite were determined; this composite is essentially the matrix material of the coil composite. The Young's moduli, shear moduli, Poisson ratios, and elastic stiffness coefficients are also reported. Results agree closely with elastic data obtained by conventional testing methods.

Key words: antiferromagnetism; cerium magnesium nitrate; dipole-dipole coupling; ferromagnetism; ground state; permutation group; quantum mechanics; spin cluster; spin-Hamiltonian.

In this paper we perform a complete quantum-mechanical calculation of the ground-state energy of a system of spins 1/2 that are coupled by dipole-dipole forces. The only hypothesis used is the assumption that the ground state has two times the periodicity of the underlying magnetic lattice. This paper is the application to a specific crystal of results derived in a preceding paper. The Hamiltonian is decomposed in eight invariant pieces each with its own coupling constant. The basis wave functions are decomposed according to the eight one-dimensional representations of the permutation group that leaves the cluster invariant. The results are given in the form of tables applicable to any compound that has the spins situated on a Bravais lattice. The calculation is applied to cerous magnesium nitrate and we show that the results for the lowest state of each representation are leading to a spectrum that is different from the results obtained with the classical or Hartree method. Although the lowest state is still the same antiferromagnetic configuration, it turns out now that this state lies barely below the ferromagnetic state: the order in which the ferromagnetic and antiferromagnetic levels appear is different from the order obtained in a classical calculation.

Key words: galvanomagnetism; quantum transport theory; semiconductors; thermomagnetism.

A density-matrix formalism developed earlier for the evaluation of Ohmic magnetococonductivity is further elaborated and applied to other magnetotransport effects in nonpolar semiconductors in the presence of a magnetic field of arbitrary strength. The difference from earlier transport theories lies in a natural extension of the scattering dynamics beyond the strict Born approximation. The well-known divergence difficulties of older theories, usually removed by any of a number of ad hoc cutoff procedures, do not appear here. The transverse-conductivity expression turns out to be equivalent to that of some earlier theories of cyclotron resonance extrapolated to zero frequency, but derived in a different way. When applied to elastic scattering of electrons in a simple model of a semiconductor, the theory gives galvanomagnetic and thermomagnetic coefficients within the range of values usually seen experimentally, showing the basic correctness of the theory. It is then applied to the magnetophonon effect, where the resonance peaks are shown to be finite. An in-
interesting inversion of one of the peaks in the Ettingshausen-Nernst coefficient is found. Landau-level broadening and phonon drag are not included in the present paper, although they can be incorporated when deemed important.

Key words: dilution refrigerator; \( \gamma \)-ray anisotropy thermometry; Josephson junctions; noise thermometry; temperature.

We report on the present status of a comparison of the temperatures obtained from a Josephson junction noise thermometer and a \( \text{Co} \) \( \gamma \)-ray anisotropy thermometer. The data reported here cover the range of 12 to 35 mK in 16 steps varying from \( 0.5 \) to \( 2 \) mK. Owing to improvements in: temperature stability of our dilution refrigerator, analysis of noise thermometer data, and the \( \gamma \)-ray data acquisition system, these new results have considerably less scatter than those reported previously. The overall agreement between both thermometers is about 1 percent.

Key words: copper NMR thermometer; \( \gamma \)-ray thermometer; noise thermometer; superconducting transition temperatures; temperature.

Recent studies of several superconductors (W, Be, \( \text{Ir} \) \text{Rh} \( \text{Ir} \), \( \text{AuAl} \), and \( \text{AuIn} \)) showed them to provide useful temperature reference temperatures below 0.5 K. Samples of each material were used to intercompare the temperature scales obtained from noise, \( \gamma \)-ray, and copper NMR thermometers from 0.024 to 0.208 K. The results of this intercomparison are given in tabular form.

Key words: aluminium; aluminium alloys; bulk modulus; compressibility; Debye temperature; elastic constants; elasticity; Poisson ratio; pulse-echo method; sound velocity; Young's modulus.

The elastic properties of four annealed polycrystalline commercial aluminium alloys were studied between 4 and 300 K using a pulse-superposition method. Results are given for longitudinal sound velocity, transverse sound velocity, Young's modulus, shear modulus, bulk modulus (reciprocal compressibility), Poisson's ratio, and elastic Debye temperature. The elastic stiffnesses of the alloys increase from 4 to 13 percent on cooling from room temperature to liquid helium temperature. The elastic constant-temperature curves exhibit regular behaviour.

Key words: calorimetry; depth dose; dose distributions; dosimetry; electron beams; holographic interferometry; holography; isodose; radiation imaging; radiation measurements.

Holographic interferometry was used to image and measure ionizing radiation depth-dose and isodose distributions in transparent liquids. Both broad and narrowly collimated electron beams from accelerators (2-10 MeV) provided short irradiation times of 30 ns to 0.6 s. Holographic images and measurements of absorbed dose distributions were achieved in liquids of various densities and thermal properties and in water layers thinner than the electron range and with backings of materials of various densities and atomic numbers. The lowest detectable dose in some liquids was of the order of a few kRad. The precision limits of the measurement of dose were found to be \( \pm 4 \) percent. The procedure was simple and the holographic equipment stable and compact, thus allowing experimentation under routine laboratory conditions and limited space.

Key words: crack propagation; cryogenics; fracture toughness; mechanical properties; nickel steels.

Fracture toughness tests over the interval 298 to 4 K for fatigue crack growth rate tests at 298, 111, and 70 K are reported on selected iron-nickel (Fe-Ni) alloys which are commercially available for potential use in storage or transportation of liquefied natural gas (LNG). These alloys include Fe-6Ni and Fe-5Ni in newly developed three-step heat treatments and Fe-9Ni in the quenched and tempered condition. Linear elastic fracture mechanics parameters \( K_c, K_{ij} \) and \( J \)-integral test data are presented for 1.25-in.-thick compact specimens. Discussion includes comparisons of fatigue crack growth rate and fracture data between alloys.

Key words: bone; collagen; grafting modification of collagenous surfaces; hard tissue; rat skin; soft tissue.

Collagen, soft tissue, and bone can be modified at 37 °C by allowing them to react with acrylic, methacryl, or vinyl monomers using ceric ions, persulfate-bisulfite or cromonomers forming donor-acceptor complexes as initiators. The polymeric methacrylate side chain is chemically attached to collagen; similar bonding may occur on reaction with other monomers. With rat skin, the reaction takes place mainly at the surface whereas a higher yield of more homogeneous product is formed on grafting onto collagen. Grafting onto bone is best accomplished with persulfate-bisulfite initiator. Modification of the collagenous surface is indicated by changes in wettability, decreased water sorption, and improved resistance to mold growth; e.g., hydrophobic oleophobically surfaces are obtained with fluorinated monomers. The modified surfaces could be useful as adhesion-promoting liners for restorative materials.

Key words: absorption; bremsstrahlung; electrons; ions; laser; plasma.

A correction factor, which arises from the logarithmic phase
factor in Coulomb waves, is shown to be necessary in the treatment of multiphoton free-free absorption in ultrashort laser fields.

Key words: bulk modulus; compressibility; Debye temperature; elastic constants; nickel-base alloys; Poisson’s ratio; shear modulus; sound velocity; Young’s modulus.

The elastic properties of a nickel-chromium-iron-molybdenum alloy were determined between room temperature and liquid-helium temperature by measuring both the longitudinal and transverse sound-wave velocities in a polycrystalline material. These properties include: the longitudinal modulus. Young’s modulus, the shear modulus, the bulk modulus (reciprocal compressibility), and Poisson’s ratio. Except for a small anomaly in the bulk modulus, this material exhibits regular elastic-constant/temperature behavior.

Key words: absolute frequency measurements; laser frequency synthesis; water vapor laser.

A far infrared (FIR) frequency synthesis technique using saturated-absorption stabilized CO₂ lasers and a point-contact diode has been used to measure frequencies of a number of strong CW H₂O, D₂O, and CH₃OH laser lines. The first frequency measurements of the 79-μm H₂O, the 73- and 108-μm D₂O, and 11 CO₂-pumped CW CH₃OH laser lines are reported. This measurement is the first demonstration of the general usefulness of CO₂ lasers for accurate synthesis of FIR frequencies.

Key words: dental caries; hydroxyapatite; ion activity product; solubility; tooth enamel.

Solubility of human dental enamel in H₃PO₄ was studied in the pH range of 4.5 to 7.6. Thermodynamic solubility of the enamel mineral was calculated in terms of the ion activity product, (Ca⁺²)(PO₄⁻³)(OH⁻)., for hydroxyapatite. The solubility product varied from 7.2×10⁻⁵⁵ to 6.4×10⁻⁵⁵ mol⁻¹ liter⁻¹ depending on the cumulative amount of the dissolution of the solid in a series of repetitive solutions of solubility experiments.

Key words: aircraft noise; annoyance; noise; psychoacoustics; speech interference.

A method is proposed to measure both the interference of speech by noise and the annoyance caused by such interference. It is based upon a nonverbal preference procedure developed at the National Bureau of Standards called an “acoustic menu.” Subjects listen to audible speech signals in a background of noise. At the same time the subjects are given a limited opportu-
Measurements, has been completed at the Radiological Research Accelerator Facility at Brookhaven National Laboratory. Fourteen groups of scientists, from six countries, performed measurements to determine the separate neutron and photon (x- and gamma-ray) tissue kermas in free air for four energies of monoenergetic neutrons, 15.5, 5.5, 2.1, and 0.67 MeV, and for a source of fission neutrons, $^{235}$U. For the two highest energies, measurements were also made to determine the separate absorbed doses in tissue of neutrons and of photons at three depths in a large water phantom.

Key words: access procedures; command language; computer networks; macros; minicomputers; protocols.

While a large variety of computer resources is available to online users of computer networks, access to these resources is often complex and cumbersome. This paper describes a Network Access Machine (NAM) which acts as a network access point for a user at his terminal and assists the user through the automatic execution of access procedures.

Key words: correlation factor; diffusion; divacancy; driving force for diffusion; impurity diffusion; ion drift velocity; nonrandom diffusion; vacancy wind effect.

Nonrandom diffusion can result both from the presence of atomic driving forces and from the motion of defects in a crystal. Defect-related nonrandom effects appear in two different ways in the kinetic diffusion equations, as correlation effects and as defect-wind effects. The origins of these effects during diffusion in a driving force are discussed. Kinetic expressions for the drift velocity ($v_{d}$) are derived from expressions for the effective frequencies of independent atoms jumps and are related to the tracer diffusion coefficient $D^*$. For impurity diffusion in an electric field, deviations from the Nernst-Einstein relation result from defect-wind effects. Recently developed equations for the ion-impurity drift-mobility when diffusion occurs via divacancies moving on one of the sub-lattices in the NaCl structure are summarized. Possible extensions of the simple equations used here to more complex situations are discussed.

Key words: mixtures; molecular weight distribution; monodisperse poly-$\alpha$-methylstyrene; thermal degradation.

When a mixture of two monodisperse samples of poly-$\alpha$-methylstyrene is thermally degraded, the components behave independently as a first approximation, as shown by GPC and rate of volatilization data. The ratio $M_{m}/M_{a}$, before approaching the ultimate value of 2.0, first goes through a minimum at a much lower value.

Key words: automated computer access; computer networking; macro processor; minicomputer-based systems; operating systems.

A minicomputer based Network Access Machine to establish the access path between a user at a terminal and a computer network resource is described. The minicomputer maintains a file directory from which access procedures are referenced. Access procedures take the form of macros which expand to produce machine dependent dialogue. The dialogue consists of the messages to be sent to the computer network and the expected responses. Actual responses are compared with the expected response to ensure that resource access is proceeding normally.

Key words: computer network management; computer networking research; management evaluation; resource sharing.

Computer networking technology is adequately developed now to support research and experimentation to expand computing resource sharing. Whether progress will be made depends upon organizational initiative among multiple institutions, to pool personnel and capital so as to effectively address the major issues in management approach, support and software design that limit the feasible interdependence of computing operations. The organizational requirements are partially revealed by examining progressive stages of resource sharing in organizational and operational terms rather than such technical aspects as load sharing or program sharing that have been introduced in the past. Five stages are identified, ranging from simply establishing multiple service access to the advanced stage where multiple institutions organize for joint development of new resources. A preliminary evaluation framework for new management arrangements is presented when these stages are mapped against the four functional levels inherent in computer network management.

15546. Unassigned.

Key words: computer network; management; network.

This report presents a condensation of the results of a study of management practices in different computer networks. Five networks were chosen as typical of different approaches to network implementation and management: Advanced Research Projects Agency (ARPA) Network, MERIT Network, Triangle Universities Computation Center (TUCC), Oregon State Regional Network, and Tymnet, a commercial network. A common format is employed to survey each network.

Key words: bend contours; contrast formation; crystalline materials; electron channelling contrast; electron channelling patterns; scanning electron microscope.

In the scanning electron microscope contrast can be obtained which is related to the crystallographic nature of a specimen through the mechanism of electron channelling. This contrast
This tutorial paper discusses briefly the origin of electron channelling contrast. The stringent electron-optical conditions required to detect the contrast are described. The formation of the ECP and the SACP technique are discussed. Finally, the use of electron channelling contrast in conventional micrograph operation and the types of information which can be obtained are described.

Key words: image quality; neutron converters; neutron radiography; neutron scintillator; thermal neutron detection; x-radiographic paper.

X-ray sensitive paper is evaluated for use as an image detector for thermal neutron radiography. With a gadolinium oxysulfide scintillator the paper requires an exposure of $6 \times 10^4$ n/cm² and yields a radiograph displaying 25 to 50 μm spatial resolution and 4 to 6 percent contrast. The paper is convenient (10 second processing) and inexpensive, and provides good quality images.

Key words: automation; calibration; fuel control; jet engine; minicomputer; multi-task; performance testing; process control; real-time; RTOS.

The National Bureau of Standards (NBS) has designed an automated process control system for the calibration of jet engine fuel controls. The principal aim of this system is to relieve the test operator of the necessity of setting up test conditions and to provide a means of fast and accurate data acquisition. When operated under a vendor-supplied real-time operating system, the NBS software affords ease of modification to suit changing test requirements, ease of maintenance, and a degree of transferability between similar applications. Attributes contributing to these design goals include a modular program structure, use of a high-level programming language (FORTH) for applications routines, a well-structured file system and utility package, and a mnemonic test-oriented language developed for coding test procedures.

Key words: $a^2\Pi$; CO; dipole moment; excited state; SCF; vibrational transition intensities.

The dipole moment function of the $a^2\Pi$ state of CO is calculated using the multi-configuration self-consistent-field method of Wahl and Das. Only the dominant valence charge-transfer correlation configurations are mixed with the Hartree-Fock configuration since only the region between the classical turning points of the $v = 1$ vibrational level is considered. The calculated function does not agree with the shape of the fitted dipole moment function of Wicke et al. Configurations chosen on the basis of the model of optimized valence configurations do not determine an accurate dipole moment function for an open shell system.

Key words: air pollution; carbon monoxide; gas analysis; permeation tubes; propane; sulfur dioxide.

The preparation of standards for the measurement of a particular pollutant, either at ambient levels or at source concentrations, requires either an absolute method of preparation or an accurate method of analysis. Few, if any, accurate methods of analysis are applicable at the low concentrations generally associated with air pollution and consequently, most standards have been prepared in this laboratory by a gravimetric technique. The factors which effect the degree of accuracy which can be attained are discussed in detail for the following gases: nitric oxide, nitrogen dioxide, carbon monoxide, carbon dioxide, sulfur dioxide, hydrocarbons, and oxygen. In general, an uncertainty of less than ± 1 percent can be achieved for these substances at concentrations where their mixtures with air or nitrogen are stable. The stability of these mixtures is, therefore, an equally important consideration in the preparation of accurate gas standards. The instability is either due to reaction within the container between the components of the mixture or between a component and the material of the container, or is due to adsorption on the walls of the container. Methods of assessing the degree of instability and methods of preventing it are discussed.

Key words: cross sections; electron impact; electrons; secondary; ionization.

Measurements have been made of the distribution in energy and angle of secondary electrons from ionizing collisions of electrons with several atoms and molecules. Such data have been published for a wide range of the relevant variables. Some of these measurements have now been repeated in other laboratories. Some recent interpretative efforts also reveal trends in the data that were not previously apparent.

Key words: fibrous structure; plastic deformation; polymer solids.

The plastic deformation of fibrous material obtained primarily by sliding motion of fibrils. In first approximation the displacement of their centers of mass is well describable by the affine transformation corresponding to the deformation of the bulk sample. Such a sliding motion of fibrils does not affect the morphology of the micro-fibrils. But it smooths by chain unfolding the surface inhomogeneities of the fibrils caused by microfibril ends which act as point defects of the microfibrillar lattice. That makes possible a more perfect lateral contact between adjacent fibrils resulting in a steadily increasing resistance to plastic deformation. The sliding motion of fibrils produces a shearing stress on skewed fibrils yielding a slight shear displacement of microfibrils. But in spite of its smallness, it enormously extends the interfibrillar tie molecules by chain unfolding and this enhances their fraction per amorphous layer.

Key words: bond rupture; chain rupture; ESR; fibrils; loadelongation curve; microcracks; microfibrils; radicals.

The failure of an axially strained polymer solid having a fibrous structure is caused by formation, coalescence, and growth of microcracks up to critical size crack, which then propagates catastrophically through the cross-section of the sample. The primary candidates for microcrack formation are the ends of microfibrils where the material connection by tie molecules to the rest of the sample is almost completely interrupted. The opening of microcracks and sliding motion of fibrillar elements ruptures locally the most strained taut tie molecules and, thus, produces radicals detectable by ESR. But, chain rupture is the consequence and not the cause of displacement of the strong fibrillar elements. It also does not substantially affect the load carrying properties of the sample which mainly depend on the lateral autoadhesion of microfibrils and fibrils and on their quasi-viscous resistance to axial displacement. Hence, one has to reject the completely inadequate models trying to base the observed load-elongation curve of such samples on the load carrying properties of those tie molecules which are eventually ruptured upon straining. Some examples of these models are treated explicitly.

Key words: building codes; probability distribution function; reliability; risk; statistical analysis; storms; structural engineering; wind loads; wind speeds.

The reliability of the probabilistic approach to the definition of design wind speeds depends upon the extent to which it is possible to model adequately the probabilistic behavior of extreme wind speeds. In this connection, questions arise regarding the type of probability distribution best suited for this purpose and the adequacy of 20-year long wind records, i.e., of such records as have been used as a basis for developing wind maps included in various building codes and standards. With a view to answering these questions, the writers undertook a statistical study of wind speed records taken at 20 U.S. weather stations. The following results were obtained: (1) the assumption currently accepted in the literature that a single probability distribution is universally applicable to all extreme wind data sets, was not confirmed; (2) predictions of 100-year wind speeds based on overlapping 20-year sets of data taken at the same station differed between themselves by as much as 65 percent. These results suggest that extreme caution should be exercised in establishing or using probabilistically defined design wind speeds, particularly if records of sufficient length, considerably in excess of 20 years, do not exist.

Key words: density, brass; ductility, brass; electrical resistivity, brass; electrodeposited brass; electroplated brass; internal stress, brass; mechanical properties, electrodeposited brass; properties, electrodeposited brass; tensile strength, brass; wear rate, brass.

Electrical resistivity, density, hardness, wear rate, tensile strength, internal stress, and ductility of electrodeposited 70-30 brass were measured and microstructures were observed. The deposits were obtained from a high speed cyanide bath designed to deposit 70-30 brass. Included are property data for deposits of other compositions obtained from the same bath under conditions other than normal.

Key words: coating thickness; coating thickness gages: coatings, electrodeposited coatings; electroplated coatings; metal coatings; properties, electrodeposits; thickness gages; thickness measurement.

In addition to dimensional tolerance, thickness is very significant to coating characteristics such as wear, corrosion, porosity, electrical resistance, magnetic properties, ductility, other mechanical properties and monetary value. Many methods of measuring the thickness of electrodeposits are available, and a number of gages are manufactured domestically. These gages are nondestructive, but they are not applicable to all coatings. Measurement accuracies of ±5 to ±10 percent are normally expected.

Key words: comonomer concentration; copolymer; crystallization; defect energy; equilibrium dissolution temperature;
equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; lamella thickness; melting.

Equations are developed for the bulk free energy of fusion, melting temperature, crystal thickness, and nucleation rate of copolymer crystals containing an arbitrary concentration of comonomer units. These equations which represent advances over earlier ones are shown to be consistent with experimental data for copolymers of 1- and 3-lactide and cis- and trans-isopropenes. Analysis of the lactide data confirms an earlier prediction that the crystal thickness should increase linearly with increasing small concentrations of the comonomer units for crystallizations carried out at the same temperature. Further, this linear dependence is shown to extend to crystals containing both equilibrium and nonequilibrium concentrations of the comonomer units. The nucleation rate equation is in agreement with the observed linear dependence of the logarithm of the growth rate on the comonomer concentration in isoprene copolymers. The following are consistent with the experimental data for the lactides: 461 K, equilibrium melting temperature of the homopolymer; 403 K, equilibrium dissolution temperature in xylene; 1370 cal/mol of monomer (5730 J/mol) heat of fusion; 26.5 erg/cm² (2.65 × 10⁻² J/m²) surface free energy and 585 cal/mol (2447 J/mol) comonomer defect energy. Directions for future research are suggested.

Key words: Ca II; Ho; solar chromosphere; spectral line formation.

The line formations of Ho and Ca II H and K are compared in order to differentiate the various mechanisms giving rise to observable contrasts in the emergent intensities. Table II summarizes the criteria for distinguishing between horizontal spatial variations in temperature, density, and turbulent velocity.

Key words: analytic functions; functional equations; Hurwitz’s theorem.

It is shown that the functional equation

\[ f(x) + f(ax) + f(bx) = 0 \quad 1 < a < b \]

has a nontrivial solution which is continuous for all real values of x and only if \( b \neq a \). Generalizations for the equation

\[ \sum_{i=1}^{n} f(a_i x) = 0, \quad 1 = a_1 < a_2 < ... < a_n \]

are also derived.

Key words: modulation; notation; optical density; propagation; reflectance; reflectance factor; symbols; transmittance; transmittance factor.

Reflectance, transmittance, and optical density are regarded as kinds of flux modulation factors. Transmittance is defined as the ratio of transmitted flux to the incident flux, while transmittance factor is here defined for an optical system as the ratio of the emergent flux with the sample in the system to the emergent flux with the sample removed. Transmission density is defined as the negative logarithm of transmittance factor. Reflection, transmission, and fluorescence are considered generically as propagation and generalized modulation terms are given. A coordinate system and functional notation are adopted to systematize the description of optical systems which use or measure modulation. Simplified notation of the form \( D(g:S; g'S) \) describes most cases.

Key words: dicalcium phosphate dihydrate; fluorapatite; fluoride; pit and fissure sealant; tooth enamel.

Pyrolysis experiments revealed that small amounts of CaHPO₄ · 2H₂O are formed in enamel during conditioning of teeth with 50 percent H₃PO₄ for pit-and-fissure sealants. Unlike the CaHPO₄ · H₂O which forms on the enamel during the pretreatment, CaHPO₄ · 2H₂O is only sparingly soluble in water and would not be rinsed away in the clinical situation. The presence of CaHPO₄ · 2H₂O in enamel is undesirable because it may slowly dissolve and loosen the sealant. On the other hand, because of its high reactivity with fluoride, the CaHPO₄ · H₂O may be converted to Ca₃(PO₄)₂F before sealant application, thereby further reducing caries tendency. Several basic-phosphate-fluoride solutions which had previously been shown to produce Ca₃(PO₄)₂F when reacted with CaHPO₄ · 2H₂O were applied to acid-etched enamel samples. Significant enamel-fluoride uptake was obtained. SEM examinations of the samples show that these fluoride treatments produced no discernible deposits of Ca₃F₂ on the surface which might interfere with sealant penetration and bonding.

Key words: curve crossing; O(1D); O(1S); quenching rate; spin-orbit coupling; transition probability.

The quenching rate for O(1S) by O(3P) into the O(3D) + O(1D) channel is calculated using a theoretically calculated spin-orbit coupling matrix element. An upper bound to the rate is found to be \( 2.0 \times 10^{-14} \text{ cm}²\text{s}^{-1} \) which is much smaller than the experimental value. The low value of the rate constant is the result of a spin-orbit coupling matrix element of about 3 cm⁻¹ at the relevant curve crossing.

Key words: accelerometer; calibration; harmonic distortion; low frequency; pickup; vibration; vibration exciter.

The development of the low-frequency-vibration apparatus described in this report was done in response to a need to establish and verify vibration-pickup performance at infrasonic frequencies. The exciter design is an extension of the Dimoff type exciters and, in fact, many of its components are identical.

The motion of such an exciter must have very low distortion and minimal components of motion in all directions other than axial. In addition, the attainable amplitude must be large enough to produce a transducer signal that can be accurately measured. The attainable amplitude and accuracy of transducer calibration on this exciter is limited by transducer size, weight, geometry and vibration sensitivity. Examples of the types of accelerometers which can be calibrated on this exciter are servo or force balance, piezoelectric, piezoresistive and strain gage.

Key words: density of air; mass measurement.
It has always been assumed that the measurement of the difference in mass between two objects would be the same in all laboratories. Recent National Bureau of Standards measurements involving dissimilar objects (effective density ranging from 2.7 to 16.6 grams per cubic centimeter) at a wide variety of pressures (0.5 to 2 atmospheres) have been made with sufficient precision to test this assumption. The results show unsuspected discrepancies which may approach 1 milligram in a kilogram in the assignment of mass values when dissimilar materials are involved. These discrepancies have not been noted in the past because precision comparisons of both like and unlike materials have nearly always been made in a relatively restricted range of environmental conditions. The worldwide mass measurement system is therefore consistent, because similar materials have been used in the construction of weight sets, but possibly offset with respect to the mass unit as embodied in the platinum-iridium defining artifact.

Key words: acceleration; automation; calibration; measurements; shakers; standards; transducers; vibration; vibration exciters; vibration pickups.

Accurate calibration of accelerometers requires that accurate measurement techniques be developed and maintained. No single vibration exciter or calibration procedure is adequate for the present calibration frequency range. This paper gives a summary of the various calibration procedures used in calibration of accelerometers and reference exciters at the National Bureau of Standards.

Key words: automation; human relations; job enrichment; organizational development; project management; system integration.

The process of designing and installing an automated system must consider problems of human relations. If the automation will affect the operation of diverse groups within an organization, then the legitimate and conflicting interests of these groups must be recognized, and their cooperation achieved through compromise. Successful automation must include the establishment of a new network of human communications.

The effect of the automation should not be to eliminate or downgrade jobs, but to enrich or increase responsibilities, leaving the repetitive, tedious jobs to the machines. Specialists in job design should be included on the automation team.

Well-designed automation should integrate diverse groups in an organization through improved data flow, but may divorce outside data users completely if their needs are not considered in the design process. An ombudsman with the responsibility of correcting design errors to satisfy outside users’ requirements should be provided.

Key words: absorption cross section; chlorine atom; dichlorodifluoromethane; freons; photochemistry; quantum yields; stratosphere; trichlorofluoromethane.

The photochemical decomposition of CFCl3 and CF2Cl2 has been investigated, using added CH4 and C2H6 as chlorine atom interceptors. From the quantum yields of the stable products formed at 213.9, 184.9, 163.3 and 147 nm, quantum yields of the primary photofragments CFCl2, CF2Cl, CFCl, CF2, CF and Cl, were derived. At wavelengths close to the absorption threshold, detachment of one chlorine atom from CFCl3 and CF2Cl2 occurs with a quantum yield of 0.95 ± 0.05. As the photon energy increased, there is a rapidly increasing probability that absorption of a photon will lead to the release of two chlorine atoms:

\[ \text{CFCl}_3 + h\nu \rightarrow \text{CFCl} + 2\text{Cl} \]

\[ \text{CF}_2\text{Cl}_2 + h\nu \rightarrow \text{CF}_2 + 2\text{Cl} \]

The CFCI or CF2 formed in these processes (which are most likely in the ground singlet state) are unreactive towards the parent halocarbons, or alkanes. They combine with other free radicals to form stable products. No evidence was found for the cleavage of C-F bonds, or the elimination of stable chlorine molecules.

In the vicinity of the absorption threshold, the absorption cross-sections of CF2Cl2 and CFCl diminish sharply with a decrease in temperature.

Key words: ambiguities; geometrical; indexing; patterns; powder diffraction.

There are cases in which different lattices give calculated powder patterns with the identical number of distinct lines in identical 2θ angular positions. The number of planes (hkl) contributing to each reflection may differ, however. The lattices having this property are related to each other by transformation matrices with simple rational elements. The resulting ambiguity in indexing of powder patterns is, in these cases, geometrical rather than accidental.

Key words: accuracy; accurate measurement in clinical chemistry; clinical chemistry; clinical reference materials; standardization.

Reference Materials (RM’s) are necessary and critical components of measurement systems, especially useful in helping to achieve compatibility in large laboratory networks, such as those existing in clinical chemistry. What the measurement process is and how RM’s fit into this process is discussed. The role of accuracy in helping achieve compatibility is explained and the role of RM’s within an accurate measurement system is elucidated. Because RM’s are the mechanism for transferring accuracy throughout a measurement network, the criteria for their production and certification are important. They include a knowledge and/or assurance of: purity, homogeneity, stability, continuity and availability of supply and information. Because measurement compatibility in clinical chemistry involves human life, only RM’s of highest quality and integrity should be used. Clinical RM’s should therefore bear a certificate (or guarantee). Minimal requirements for such certification are discussed.

Currently available clinical RM’s from the National Bureau of Standards (NBS) are listed.

Key words: crystal structure explosives: least-squares refinement; molecular packing; tetraazacyclooctane derivatives: x rays.
C,H,N,O	extsubscript{6}, monoclinic. \( P2_1/c \), \( a = 7.422(1) \), \( b = 13.253(2) \), \( c = 6.156(1) \text{ Å} \), \( \beta = 103.38(1)^\circ \). \( Z = 2 \), \( D_v = 1.63 \text{ gcm}^{-3} \), \( F(000) = 304 \). X-ray intensities were measured with Mo K\( \alpha \) radiation. The structure was solved by direct methods and refined by full-matrix least-squares calculations to final \( R \) and \( R_w \) values of 4.1 and 4.8 percent, respectively, for 1149 observed reflections.

Key words: activation energy; compensation; epitaxial gallium arsenide; high energy neutron; impurity conduction; reciprocal Hall coefficient; transition regime; \( ^{60} \text{Co} \) gamma.

The effects of \( ^{60} \text{Co} \) \( \gamma \)-ray and high-energy neutron displacement damage on impurity conduction in epitaxial gallium arsenide were investigated. The activation energy \( (e_I) \) associated with the transition regime of the impurity conduction process was found to increase by a factor of 5 as a result of \( ^{60} \text{Co} \) \( \gamma \) irradiation, and only by a factor of 1.6 for a comparable neutron irradiation. In addition, the ratio of the Hall carrier density at low and high temperatures, \( (n_\text{Hall}(T_\text{low}))/(n_\text{Hall}(T_\text{high})) \), decreased by a larger amount for \( ^{60} \text{Co} \) \( \gamma \) irradiation than for neutron irradiation. The effects of neutron irradiation are explained in terms of increased compensation. For the case of \( ^{60} \text{Co} \) \( \gamma \) irradiation, it is postulated that a new donor level is introduced which does not participate in the impurity conduction process, it is found that \( e_I \) is proportional to \( e_0 \) (the conduction-band activation energy) and varies inversely with neutral donor spacing in accord with the model proposed by Mikoshiba. Also \( \rho_\text{Hall} \), the hopping regime resistivity, is found to vary inversely with the square of the free-carrier concentration and exponentially with the quantity \( 0.6/N_\text{Hall} \).

Key words: atomic spectra; ionization energies; lanthanides; spectra: rare earths.

Values for the ionization energies of four-times-ionized lanthanides are derived from interpolated spectroscopic properties of the \( 4f^6 \text{ns} \) Rydberg series.

Key words: atomic absorption; atomic fluorescence; cobalt; interferences: iron; nickel: separations.

A summary is presented of the published work on the determination of iron, cobalt, and nickel by atomic absorption, emission, and fluorescence spectrometry. Optimum conditions for atomicization and excitation are described for flame and non-flame methods for the three techniques. Spectral characteristics for wavelength ranges of analytical interest are given for the three elements with their sensitivity and/or detection limits. Interferences encountered under optimum instrumental conditions are minimal; however, separation techniques are described for each element. The paper contains 174 references in which numerous applications are described.

Key words: dichlorotetracyanoplatinocopper; neutron diffraction; structure.

The crystal and molecular structure of dichlorotetracyanoplatinocopper(II), \text{CuC}_2\text{H}_4\text{N}_2\text{Cl}_2,\text{Cu} was determined by single-crystal neutron diffraction techniques. This compound crystallizes in the monoclinic system with \( a = 13.657 \) \( b = 9.200 \) \( c = 14.900 \) \( \beta = 118.04(1) \), space group \( C21/c \), \( q = 1.63 \text{ gcm}^{-3} \). The structure was refined by least-squares calculations to a conventional \( R \) value of 3 percent for 1143 reflections. The \( \text{CuC}_2\text{H}_4\text{N}_2\text{Cl}_2 \) molecule is centrosymmetric with the \( \text{Cu} \) atom at the center of a distorted octahedron formed by two chlorine atoms and a nitrogen atom from each of four pyrazole rings. The accurate location of the hydrogen atoms shows that the conformation of the complex is due to intramolecular hydrogen bonding. The coordination distances \( \text{Cu-Cl} \) and \( \text{Cu-N} \) \( (2.84 \text{ and } 2.02 \text{ Å, respectively}) \) are significantly different from those of the corresponding nickel analog \( (\text{Ni-Cl} \text{ and Ni-N } 2.51; \text{ and } 2.10, 2.09 \text{ Å, respectively}) \).

Key words: absorbed dose; dosimetry; electrons; ionization chambers; standards; stopping power ratio.

In the course of an NBS absorbed-dose standards program, theoretical and experimental determinations have been made of the conversion factor \( C \) that relates the absorbed dose from electron beams to the ionization in an air cavity. The average medium/air stopping-power ratio—which is proportional to \( C \) —has been calculated as a function of the beam energy (1 to 60 MeV) and of the depth in a water phantom, and similar stopping-power ratios have also been obtained for other phantom materials (carbon, polystyrene, acrylic plastic, muscle). The conversion factor in graphite has been measured at energies between 15 and 50 MeV and depths between 0.9 and 51 g/cm\(^2\) with the use of a calorimeter and a parallel-plate ionization chamber. These measurements were made with beams broadened by lead scattering foils with various thicknesses from 0.144 to 1.584 g/cm\(^2\). The extrapolation of the results to zero scattering-foil thickness provided conversion factors that could be compared with theoretical \( C \)-values for broad, parallel, monoenergetic electron beams. The agreement was found to be close (mean difference of 0.3% and r.m.s. difference of 0.8%). Comparisons have also been made with other \( C \)-values found in the literature and recommended by medical physics organizations. The overall conclusion can be drawn that the conversion factor is known reliably at the 1 percent level of accuracy.

Key words: coatings: copper; density; electrodeposited coatings; electrodeposits: metal coatings.

Density of electrodeposits can give information about their soundness and composition. It can be measured by direct determination of the volume and mass of the deposit, but the best measurements are made by conventional hydrostatic techniques. A 2 liquid hydrostatic method of measurement is described. This method involves hydrostatic weighing with a float in a two liquid system. Data obtained by this method are given as an example. These data show a significant density variation between 11 one-half gram samples cut from a 6 gram piece of electrodeposited copper.
A personal dosimeter for mercury vapor in air based on the use of a piezoelectric sensor with a selective coating has been developed and evaluated. The sensor is a gravimetric device which indicates an integrated total exposure to mercury vapor. The mass of the material deposited or adsorbed is determined by measuring the change in oscillation frequency of the crystal. The sensor is small enough to be worn on a worker's clothing and is compatible with existing miniature air pumps. The adsorbed mercury can be desorbed by heating and the sensor can be reused many times. The precision and accuracy of this measurement technique, the effect of sampling flow rate, storage, sample concentration, interferences, sampling period, sensitivity and range, lifetime of the sensor, and other parameters considered in the development of prototype devices are discussed.

Key words: brick; dolomitic mineral; masonry; mortars (materials); walls.

To assess the contribution of dolomitic limes to dimensional stability of masonry construction, 65 brick masonry walls, 34 by 40 by 8 in (0.86 by 1.0 by 0.20 m), were constructed. The program involved the following design variables: 6 hydrated limes ranging in autoclave expansion from 0.10 to 15.1 percent; 2 types of brick, one with high water absorption and high autoclave expansion, and the other with low water absorption and insignificant autoclave expansion; and, 2 mortars of cement:lime:sand proportions of 1:1:6 and 1:2:9 by volume. Half of the walls were subjected to temperature and moisture cycles, performed indoors, for 3 1/2 years; the other half were tested outdoors for 14 years. Half of the indoor and outdoor exposed walls were spring loaded at 25 psi (1.7 × 10^5 N/m^2). Observed expansion of the walls was found to be related to the potential expansions (as measured by the autoclave test) of the limes. The largest wall expansion took place with the following combination: high potential expansive lime; stable, low absorption brick; unloaded wall; and, 14 year outdoor exposure. In the 14-year outdoor exposure, loss of bond and resulting damage from freezing were complicating factors. The effects of lime, mortar mix, brick, loading, and exposure on the dimensional instability of the masonry walls are discussed.

Key words: gloss; optical properties; tolerances.

The instrument tolerances of the published TAPP1 method for 75° specular gloss are unnecessarily strict. The 1934 report of Zabel and Wink on which the tolerances were based has been re-examined. Improvement in the photometric linearity on instruments and a statistical approach to the combined effect of a number of sources of uncertainty, reveal that if the goal for overall uncertainty is still to be one gloss unit, geometric tolerances could be increased by a factor of 7.

Dimensions and tolerances are all based on the dimension “d” rather than the unit distance of which d is only a part. All dimensions have been rounded to simple figures. The proposed dimensions and tolerances are tabulated.

Key words: line broadening; lithium; noble gases.

The normalized fluorescence spectrum of the Li 6708-A resonance line perturbed by the noble gases has been measured for 100 A either side of the resonance line, at a temperature of 400 ± 10 °C. The noble-gas pressure range of 100-1800 torr was investigated. It was observed that the line wings scale linearly with this pressure for 2 < |Δλ| < 100 A, and it was demonstrated that a Lorentzian-broadened line core can be observed for this pressure range. The Li density was ~ 10^6/cm^3 and was varied to establish the fluorescence spectrum in the limit of no radiation entrapment. The central region of the line has been measured with high resolution and compared to calculated profiles due to the various fine structure and isotopic line components, each broadened by a convolution of Lorentz, Doppler, and instrumental profiles. The shift and Lorentz broadening rates, as well as the wavelengths for transition to non-Lorentzian behavior, are reported. In contrast to the heavier alkali-metal-noble-gas cases, no distinctive far-wing features such as satellites or sharp inflections are observed. This is consistent with the much larger collision velocities for the Li case.

Key words: carbon abundance; molecular spectra; solar photosphere.

A detailed non-LTE analysis of solar CN spectra strongly suggests a revised carbon abundance for the Sun. We recommend a value of log A_C = 8.35 ± 0.15 which is significantly lower than the presently accepted value of log A_C = 8.55. This revision may have important consequences in astrophysics.

Key words: Ar; atoms; autoionizing; cross sections; electron impact; excitation; He;inelastic; Ne.

Cross sections for the excitation of bound states of atoms by electron impact have been found to contain structures at incident energies near to the energies of short lived autoionizing states of the target atoms. These structures look superficially like resonance structures, but in fact they seem to be caused by a post-collision interaction between inelastically scattered and ejected electrons. Examples are given of these structures in He, Ne, and Ar. A quantum mechanical "shake-down" model to explain these structures is also described and compared with the experimental data.

Key words: Federal libraries; library cooperation.

Federal support of cooperative library service is influenced by the direct participation of Federal libraries in consortia and various networks. An overview of Federal library activity reveals many instances in which leadership for major cooperative programs was given by librarians in Federal libraries, e.g., the Library of Congress shared cataloging began in 1901. This paper documents trends in cooperation by the more than 2,000 libraries of the Federal Government.

Key words: air pollution; chemical analysis; dosimeter; industrial hygiene analysis; mercury; personnel monitor; piezoelectric sensor; trace analysis.

Key words: gloss; optical properties; tolerances.

The instrument tolerances of the published TAPP1 method for 75° specular gloss are unnecessarily strict. The 1934 report of Zabel and Wink on which the tolerances were based has been re-examined. Key words: bead-spring model; block copolymers; concentrated solutions; dynamics; Rouse theory; solution properties; viscoelasticity.

A theory for the viscoelasticity of block-copolymer molecule solutions in the free-draining limit has been developed by modifying the bead-spring model theory of Rouse to take into account the existence of dissimilar segments in block copolymers. The eigenvalue problem encountered in the theory has been solved numerically by matrix computations. Furthermore, for the case of a diblock copolymer, a simple form of the secular equation which is useful for extracting the eigenvalues has been obtained. The applications of the theory have been illustrated with calculations for the viscoelastic properties of poly(styrene-b-cis-1,4-isoprene) solutions. It is found that the calculated properties for the diblock copolymer are nearly the same as those for the Rouse theory while the calculated properties for the symmetric trilob copolymers deviate from those of the Rouse theory.

Key words: abatement; detection; heat-gun; lead paint; materials evaluation; performance specification; rehabilitation; renovation.

The article briefly discusses the history of lead paint poisoning and discusses the safety hazards of lead paint in renovation and rehabilitation work in housing and buildings. Techniques for lead paint detection and methods for abatement are discussed for reference by the specifications writer, architect, design professional, engineer, contractor and other individuals who may be confronted with the hazards of lead paint. The information is from investigations by NBS for the HUD research program on lead paint. A suggested performance specification for lead paint hazard abatement methods is offered as a guideline for materials evaluation. Also a selected bibliography of NBS publications is included for reference by the building community.

Key words: arsenic; calibration of devices; gas-blending systems: hydrogen fluoride; phosgene.

The calibration of analytical monitoring devices is a prerequisite for making accurate measurements. For this purpose, self-contained gas-blending systems are being constructed and evaluated at the NBS for producing known concentrations of specific industrial contaminants in air from one-half to five times the TLV. This is accomplished by accurate dynamic dilution of a known relatively high concentration of the contaminant (i.e., standardized gas mixture) with air as a diluent to yield the desired range of concentrations. The development and evaluation of systems for producing known concentrations of hydrogen fluoride, arsenic, and phosgene in air are reported including the measurement of the stability of these gases, and the determination of the concentrations upon dilution employing specific analytical methods.

Key words: electrons; ion trap; positive molecular ions; recombination.

This paper is a report on recombination measurements made by studying electron-ion collisions in ion traps. We briefly review two-body recombination processes between electrons and ions and the means by which they have previously been measured. The trapping scheme and its realization for collision work is discussed, and results for some recombination measurements are given.

Key words: CO2 laser; electrical discharge; gas mixture; time delay.

Time lags for the growth of power input, i.e., formative time lags, have been measured in typical CO2 laser gas mixtures at pressures from 200 to 760 torr using parallel plane electrodes with the 1- and 2-cm gaps illuminated by a trigger discharge. The measured time lags are about twice the values predicted using a single avalanche growth model and theoretical ionization and attachment coefficients.

Key words: innovation; procurement; specifications: standards; technology; transfer.

Public procurement at the federal, state or local levels can be a major influence on the adaptation, implementation and transfer of technology. Through the procurement process, problems can be defined, prototypes can be tested, cost/benefits determined and finally the product can be bought. This final step is what has traditionally been lacking in the technology transfer process. This paper describes ongoing experiments, at the federal, state or local levels, aimed at determining the transfer potential of such market incentives as the use of performance specifications, life cycle costing, value incentive clauses, consensus standards and test methods versus the traditional lowest price for lowest acceptable quality.

Key words: cryogenic resistor; current comparator; Josephson device; microwave coupling; SQUID: superconducting switch; tunnel junction; voltage standard.

The design and operation of a cryogenic voltage comparator system for precision 2e/h measurements is described. Major improvements embodied in the new 2e/h system include the use of (1) a single microstrip-line-coupled Josephson tunnel junction to obtain usable step voltages up to 10 mV at 10.0 GHz, (2) a cryogenic voltage divider comprised of two resistors whose ratio is calibrated with a low temperature dc current comparator, (3) a
SQID null detector, and (4) superconducting switching. The accuracy of the present 196:1 divider system is estimated to be about 2 parts in $10^4$ on the basis of preliminary tests and is limited by resistor self-heating during calibration.

Key words: cryogenic resistors; current comparators; low temperature; shielding; SQID; superconducting shield; superconductivity.

Cryogenic direct current comparators, utilizing superconducting shields and Superconducting Quantum Interference Devices (SQID's), provide current ratios of up to 100/1 or higher with accuracies of $\leq 1 \times 10^{-7}$ and current resolutions of $\leq 6 \times 10^{-11}$ A. Two types of comparators differing in the shielding arrangement of the ratio windings are described. One type consists of unit windings inside a seamless Pb tube; the other consists of multi-turn ratio winding within an overlapping toroidal superconducting shield. For both shielding configurations, SQID's serve as flux sensors for the comparators. The application of these comparators to the measurement of resistance ratios is described.

Key words: chromospheres; stellar coronae; stellar ultraviolet.

The ultraviolet spectrometer of the Princeton Experiment Package aboard the Copernicus satellite has been used to obtain high-resolution measurements of $\lambda$ $\alpha$ in the Mg $\Pi$ A2800 doublet, and upper limits on $\lambda$ $\alpha$ in the K giants $\alpha$ Tau and $\beta$ Gem. The intensities and line shapes are compared with earlier observations of $\alpha$ Boo. The $\lambda$ A and Mg $\Pi$ profiles for $\alpha$ Tau resemble those for $\alpha$ Boo, in that they are highly asymmetrical, while $\beta$ Gem shows much more symmetrical profiles. The asymmetries for all lines except for those of $\alpha$ Boo and the Mg $\Pi$ lines of $\alpha$ Tau could be due to interstellar absorption. In the case of $\beta$ Gem only, the O vi intercombination line at 1218 A is observed, suggesting a well-developed corona substantially cooler than that of the sun. The L$n$ profiles of $\alpha$ Tau and $\beta$ Gem are consistent with the low interstellar hydrogen abundance in the solar neighborhood previously obtained from a similar observation of the $\alpha$ Boo L$n$ profile. The strength of the Mg $\Pi$ A2796 line can be used to measure transition region and coronal pressures, and indicates a decrease in both with later spectral type and/or increasing luminosity.

Key words: frequency source; Josephson radiation; Josephson tunnel junction; junction array; microstrip-line-coupling; thin-film device.

The results of a continuing study of the microwave radiation emitted by pairs of Josephson tunnel junctions simultaneously coupled to each other and an external microwave source are reported. Injection-locking of the junctions was observed and some qualitative features of the phenomenon are discussed.

Key words: emission line stars; line profiles; stellar atmospheres; stellar limb darkening.

Spherical static non-LTE model atmospheres are presented for stars with $M/M_\odot$ = 30 and 60 at various points on their evolutionary tracks, and for some nuclei of planetary nebulae at two points of a modified Harman-Seaton sequence. The method of Mihalas and Hummer was employed, which uses a parametrized radiation force multiplier to simulate the force of radiation arising from the entire line spectrum. However, in the present work the density structure computed in the LTE models was held fixed in the calculation of the corresponding non-LTE models: in addition, the opacity of an "average light ion" was taken into account. The effects of sphericity, as distinct from those arising from a density structure modified by a large radiation force, were investigated by computing a few planar models using the same parametrized radiation force multiplier as for the spherical models. These effects were found to be quite significant even though the atmospheric extension never becomes very large. The temperatures for the non-LTE models are generally lower, at a given depth, than for the corresponding LTE models when $T_{\text{eff}} < 45,000$ K, while the situation is reversed at higher temperatures. The continuous energy distributions are generally flattened by extension. The Lyman jump is in emission for extended models of massive stars, but never for the models of nuclei of planetary nebulae (this is primarily a temperature effect). The Balmer jumps are always in absorption. The Lyman lines are in emission and the Balmer lines in absorption; He ii $\lambda$4686 comes into emission in the most extended models without hydrogen line pumping, showing that it is an indicator of atmospheric extension. Very severe limb darkening is found for extended models, which have apparent angular sizes significantly smaller than expected from the geometrical size of the star. Extensive tables are given of monochromatic magnitudes, continuum jumps and gradients, Str"omgren-system colors, monochromatic extensions, and the profiles and equivalent widths of the hydrogen lines for all models, and of the He ii lines for some of the 60 M$\odot$ models.

Key words: air constituents; critical region parameters; ethylene; heavy noble gases; helium; linear model; methane; NBS equation; scaling laws; statistical analysis; steam; universality.

$P-V-T$ data in the critical region of six fluids (He, $^4$He, Xe, O$_2$, CO$_2$, and H$_2$O) have been analyzed in terms of two scaled equations of state using the methods of statistical analysis. The results confirm the hypothesis of universality of critical behavior for these gases to within the current experimental accuracy. The results also support the validity of hyperscaling relations between thermodynamic and correlation function exponents for gases. Using the hypothesis of universality we then present critical-region parameters for fourteen fluids in terms of a universal equation of state.

Key words: air pollution; light scattering; particulate matter.

An instrument has been developed which determines the size distribution of particulate matter in air in essentially real time by
a forward lobe light scattering method. The basic concept involves the simultaneous measurement of the intensity of light scattered by a single particle at two small scattering angles. The ratio of the two intensities is a direct measure of the size and is fairly independent of the index of refraction of the particle. Numerical solutions of the Mie equations for spheres have indicated that the sizing error by this method is no greater than 15 percent for the range of particle sizes from 0.1 to 10 μm for essentially all possible indices of refraction. In addition, techniques have been found which extend the lower limit of size determination to 0.05 μm and which may permit some degree of chemical characterization of the particle.

Key words: conservation; materials recovery; natural resources; reclamation.

This paper reports the nontechnical and technical findings of the workshop on ferrous metals. Discussions include the technology for the use of municipal ferrous scrap, the economic outlook, and potential markets for ferrous waste. Eight recommendations are suggested for improved recovery of ferrous waste.

Key words: market pulp; paper; waste; pulp, secondary; recycled paper; secondary pulp; waste paper.

The U.S. consumed more than 60 million tons of paper and paperboard in 1973, about 20 percent of which was recycled. Steel is the only product that is consumed in larger quantities than paper. The principal disincentives for paper recycling are (1) the ready availability of virgin wood fibers, (2) lack of research on recycling of paper, (3) economics favor the use of virgin fibers, and (4) contaminants in wastepaper present major problems in recycling. In spite of the large amount of wastepaper that is available, a wastepaper shortage occurred in 1973 and has continued into 1974 because of problems in collection, fluctuation of the wastepaper market, and lack of manufacturing capacity. It is anticipated that about 32 million tons of paper and paperboard are available for recycling. About 130 pulp mills with a capacity of 600 tons per day would be needed to recycle this amount of wastepaper, which would produce about 24 million tons of recycled paper. The capital for building these mills is not available, and if a large number of secondary fiber mills were built immediately, it would create chaos in the virgin fiber industry. It is suggested that market pulp mills, located in or near large municipalities, be erected as needed to provide the need for more market pulp. This secondary pulp would be available to many mills that now are not equipped to process wastepaper.

Key words: algorithms; mathematical programming standards; testing.

This talk discusses the Mathematical Programming Society's newly formed Working Committee on Algorithms, whose domain of interest includes the accuracy, availability, and transportability of computer codes for the solution of mathematical programming problems. The Committee, it is hoped, will satisfy the pressing need for real achievements in these areas. The discussion will focus on the goals and accomplishments to date of the Committee, and will stress the importance of a good working relationship between it and the O.R. community.

Key words: AIA/NBS Architect-in-Residence; architectural research; daylight research; National Bureau of Standards; programs for architects; research communication.

There has been a long standing need for more effective interchange between the building community and researchers. The American Institute of Architects and the National Bureau of Standards have established an Architect-in-Residence program to help foster better communications between these groups. The first year of the program is now one-half completed and the activities of the Architect-in-Residence have fallen into three areas: (1) a resource for ongoing research activities at CBT; (2) liaison with the building community; and (3) a personal research project. This latter activity is a study of “The Introduction and Control of Natural Light in Buildings” and exemplifies the objectives of the program, the interrelationship of research work at CBT and the needs and demands of the working building community.

Key words: management science; mathematical models; numerical analysis; operations research; systems analysis.

The “technology” of management science (MS) is here broadly construed to include physical equipment (e.g., high speed computers), formal techniques (such as linear programming), paradigms and insights from various disciplines, and at the most basic level the analytical aptitudes of the management scientist. A middle ground is struck between those who consider this technology adequate and sound for the applications in question, and those who regard it as relatively useless for the nonquantitative value-laden problems facing nonmilitary government agencies. The discussion of adequacy and soundness includes the elements of: practical availability of methods and data (the technology’s “raw material”); soundness in actual employment; and usefulness in principle when values and/or qualitative considerations are prominent. Some speculative comments are offered concerning the disparity, between promise and actuality, in MS contributions to governmental decision-making and operating procedures. In particular, some principal advantages of MS technology seem subject to considerable negation by typical attributes of large organizations.

Key words: continuum; electron scattering; helium-3; monopole state; multipole decomposition; zero range approximation.
The continuum spectra of $^3$He have been measured up to excitation energies of 40 MeV by means of inelastic electron scattering. Incident electron beam energies between 60 and 120 MeV were used, corresponding to a momentum transfer range of 0.3 fm$^{-1}$ to 1.1 fm$^{-1}$. Scattered electrons were observed at two angles, 92.6 and 127.7°. The radiation corrected spectra and the form factors are presented, and compared with calculations based on a zero-range approximation. In this model, the sharp rise from the $p + d$ threshold previously reported may be identified as $a^5S \rightarrow a^3S$ Coulomb monopole transition.

Key words: buildings; codes and standards; cyclones; natural disasters: structural engineering; wind damage; wind loads.

Damage to buildings in Darwin, Australia caused by Cyclone Tracy is described. The approximate cyclone track and probable maximum wind speeds are presented along with an assessment of the performance of several types of buildings under extreme wind loading. Australian activities in reconstruction are discussed and it is concluded that what happened at Darwin provides a strong argument for the reassessment of residential construction practices in the United States.

Key words: Darlington hot spot screen; Darlington thermal resistance: emitter-only switching; hot spot screen for Darltons; integrated power Darlington thermal resistance: thermal resistance measurement.

A method for measuring the thermal resistance, $R_\theta$, of integrated power Darlington transistors is described that is based upon the emitter-only switching technique. It is shown that for specified measurement conditions this method can be used to measure the average thermal resistance, $R_{\theta(1,2)}$, of the output and input transistors of the Darlington pair and is therefore applicable to production-line monitoring of the thermal characteristics of the Darlington. It is shown that although a direct measurement of the thermal resistance, $R_{\theta(1,2)}$, of the output transistor cannot be made for most Darltons, an indirect determination of $R_{\theta(1,2)}$ can be made using the emitter-only switching technique and a simple equation. Comparisons of the differences between the infrared-determined thermal resistance and the electrically-measured thermal resistance of Darltons and of discrete power transistors illustrate that the accuracy of the Darlington measurements is comparable with that achievable for discrete devices. It is also shown that measurements which attempt to use the collector-base voltage of the output transistor of the Darlington as a temperature-sensitive parameter, either alone or in conjunction with an output commutating diode (when present), are too sensitive to the magnitude of the measuring current to be reliable. Also, the use of the base-current screen for hot spots, as used for discrete transistors, is marginally applicable to integrated Darltons, but it is shown that the emitter-base voltage sensed during emitter-only switching is quite effective for detecting hot-spot formation.

Key words: ion-pair; O$_2$; photodissociation; predissocia- tion; Rydberg states; valence states.

Valence states of O$_2$ that correlate adiabatically to the ion pair asymptote, O$^+$($^5S$) + O$^-$($^2P$), have been calculated using the multi-configuration description of the electronic structure. The production of the ion pair is attributed to valence-Rydberg mixing that predissociates Rydberg states of the excited O$_2$ ion such as those leading to the b$^3\Sigma_u^+$ state. The electronic states required the calculation of excited states of a given symmetry. This is possible with the BISON-MC codes if the rigorous restriction on orthogonality to the lower states is relaxed. For homonuclear valence states, in particular, this should be a good approximation.

Key words: electrical resistivity; high-speed measurements; high temperature; melting point; normal spectral emittance: radiance temperature: zirconium.

A subsecond duration pulse heating method is used to measure the melting point, radiance temperature (at 650 nm) at the melting point, and electrical resistivity (above 2,100 K) of zirconium. The results yield a value of 2,128 K for the melting point on the International Practical Temperature Scale of 1968. The resistivity temperature (at 650 nm) of zirconium at its melting point is 1.940 K, and the corresponding normal spectral emittance is 0.367. At 2,100 K electrical resistivity is 128.7 x 10$^{-8}$ Ωm. Estimated inaccuracy is 8 K in the melting point and in the radiance temperature, and 3 percent in the normal spectral emittance and in the electrical resistivity.

Key words: electron microscopes; horizontal resolution; optical instruments; stylus instruments; surface texture measurement: surface texture parameters; vertical resolution.

This paper reviews existing methods of surface finish measurement. The methods are considered from the standpoint of measurement systems whose components—specimen surface, measuring instrument, analyzing equipment and data display devices are equally important. Stylus, optical and electron optical instruments are evaluated and compared in terms of peak-to-valley-range, measurement area, vertical resolution, horizontal resolution, and profile measuring capability. Finally, the use of a digital computer as part of a measurement system will be discussed.

Key words: composite model of leptons; electron number; leptonic quarks: forks; muon-electron universality; muon number; neutrino quarks; strong interactions; three triplet model.

We give ten criteria for composite models of leptons and present two models which satisfy a number of these criteria. Both models use three triplets of leptonic analogs of quarks which we call "leptoquarks": the first model uses fractionally charged leptoquarks and the second model uses integrally charged ones. In the second model, leptoquarks and quarks could be identical and there is a possibility of unifying the description of leptonic and hadronic phenomena. Both models assign leptons to nonsingulet representations of SU(3)$^c$. A plausible SU(3)$^c$ mass formula allows the known leptons to be less massive than baryons if leptoquarks and quarks are identical.

Key words: dibromotetrafluoroethane; fire tests; flame spread index; heat release rate; ignition temperature; rigid urethane foam; smoke.

The fire performance characteristics of a dibromotetrafluoroethane-blown rigid polyurethane foam with a core density of 0.046 g/cm³ were measured by several laboratory test methods. Measurements included: surface flammability, smoke and gases generated at elevated temperature and during combustion, ignition temperature, rate of heat release, and fire growth. The maximum concentration of the blowing agent in the specimen was approximately 13 wt percent. The release of the blowing agent from the heated specimen began at about 60 °C and reached a rate of about 3 wt percent/hr at 100 °C. The material had a flame spread index (ASTM E 162) of 11 and smoke levels (NFPA 258-T) of 170 and 480, maximum specific optical density under nonflaming and flaming exposures, respectively. The measured rate of heat release was 8.8 W/cm², about five times that of a fibrous glass insulation. The measured flash ignition temperature was 530 °C for the material.

Key words: degrees of unsolvability; propositional calculus; recursion theory; undecidability.

A partial implicative propositional calculus (PPC) is an inference system having as axioms some finite set of tautologies of the implicative calculus. Its rules of inference are substitution and modus ponens. Its decision problem is the problem of deciding for an arbitrary well-formed formula whether or not it may be inferred. A given PPC is said to be n-adic if at most n propositional variables appear in any of its well-formed formulas. In this paper we investigate decision problems for triadic (3-adic) PPC’s. The major results presented are: (i) every r.e.

Key words: corridor fire; experiments; flame spread; floor-covering: test method: theory.

In recent years, much attention has been given to measuring the potential flame spread hazard of building corridors, in which a floor covering material is the only combustible present. The intention has been to develop standards for floor coverings which will limit corridor flame spread when the corridor is exposed to a large room fire. Under such circumstances, flame spread along the corridor floor is promoted by radiant heat transfer due to the room fire.

The proposed test method measures the flame spread characteristics of a floor covering material under an external radiant heat flux. One parameter the test measures is the external heat flux at the point of extinguishment. This has been interpreted as the minimum or “critical” radiant heat flux required to support flame spread. A theoretical model was developed to simulate the physical characteristics of the test method and sample materials.

The test method can be applied to measure the potential hazard of building corridors with floor coverings by comparing the critical flux measured for a material with an anticipated corridor heat flux due to a large fire. Results are presented which display corridor floor heat flux for various room fire intensities. These results are compared to theoretical predictions which illustrate the effect of corridor geometry and fire conditions on heat flux to the floor.

Key words: cell; Kovar; sapphire; temperature; thickness.

We describe high quality optical cells designed for ease of cleaning and accurate definition of optical path length. The cells perform well from liquid nitrogen temperatures to 500 K at pressures up to 11 MPa (112 atm).

Key words: calorimeter; dosimetry; electron beam; interferometer; radiation chemical kinetics; radiation measurement; refractive index: temperature measurement.

A double-beam interferometer has been designed for detecting changes of refractive index in transparent liquids associated with the absorption of ionizing radiation energy. Due to short electron beam pulses from an accelerator. The response time of the interferometer is less than 0.2 μsec, and refractive index changes of the order of 10⁻⁶ can be measured, corresponding to a temperature change of ~ 10⁻³ °C and an absorbed dose in water of ~ 350 rad. The interferometer can be used as either a real-time or integrating radiation dosimeter, if the temperature coefficient of the refractive index (dn/dT) is known for the irradiated liquid in the temperature region of interest.

Key words: application procedures; built-up roofing systems; composite membrane; composition; performance criteria.

The Composite Roofing Membrane is an indispensable component of the built-up roofing system. The paper reviews the functions of the membrane’s components and the importance of application procedures on the quality and performance of the membrane. The impact of the development of performance criteria for the composite roofing membrane is described.

Key words: computer networks; computer terminals; networking technology; value-added networks.

The technological characteristics of existing approaches to computer networking technology are reviewed for the purpose of identifying those features which lend themselves particularly well to the interconnection of computers, as well as computer terminals.

Key words: Monte Carlo analysis; ordered spans; self-avoiding polymer chains; shape of polymer chains; spans; unrestricted polymer chains.
An N-step random walk on a cubic lattice is adopted as a model of a random polymer chain. The spans, or extents, of each random walk configuration in the principal lattice directions are arranged in order of magnitude, $\xi_1 \geq \xi_2 \geq \xi$. In the case of the unrestricted random walk, the average values of the ordered spans ($\langle \xi_i \rangle$ and $\langle \xi_{i,j} \rangle$, $i = 1, 2, 3$) are calculated analytically in the limit of large $N$. The limiting relative values of the first moments, $\langle \xi_i \rangle$ are $1.61:1.267:1$; and the limiting values of the second moments ($\langle \xi_{i,j} \rangle$ = $2.710:1.600:1$. In the case of the restricted or self-avoiding walk, the corresponding average spans ($\langle \xi_i \rangle$) and $\langle \xi_{i,j} \rangle$ are estimated for $N \leq 150$ by using a Monte Carlo procedure. The same Monte Carlo procedure is used to estimate the values of $\langle \xi_{i,j} \rangle$ and $\langle \xi_{i,j}^2 \rangle$ for $N \approx 1000$. On the assumption that the rate of approach of the average ordered spans of the self-avoiding walks to their asymptotic forms is similar to the rate of approach of the average ordered spans of the unrestricted walks to their asymptotic forms, the following estimates are obtained for the ordered spans of the self-avoiding walks: $\langle \xi_i(N) \rangle = \xi_i N^{0.61}$ for $N \geq 1$ and $\xi_{i,j} = \xi_{i,j}^2 : \xi_{i,j}^2 = 1.75 : 1.31 : 1$. The relative values of the estimates of the second moments of these ordered spans for $N \geq 1$ are $\langle \xi_{i,j}^2 \rangle : \langle \xi_{i,j}^2 \rangle = 1.08 : 1.71 : 1$. A simple ellipsoidal model is analyzed in order to obtain estimates of the intrinsic spans of the two kinds of random walks. It is assumed that all random walks have the same intrinsic dimensions and form (ellipsoidal), but that their principal axes are oriented at random. The average ordered spans with respect to a set of orthogonal space-fixed axes of this randomly oriented ensemble of ellipsoids depend uniquely on the principal diameters of the ellipsoid (intrinsinc spans). A procedure is devised to solve the inversion problem of determining the relative lengths of the principal diameters which correspond to a given set of relative ordered moments with respect to space-fixed axes. The relative values obtained for the principal diameters of the ellipsoid are $2.59 : 1.61 : 1$ in the case of the unrestricted random walk and $3.05 : 1.77 : 1$ in the case of the self-avoiding walk.

Key words: high-speed measurement; high temperature; iron; phase transformation; thermodynamics.

A system based on an accurate pulse heating technique is described that can be used for investigations of solid-solid phase transformations at temperatures above 1500 K. The system is capable of heating the sample from room temperature to its melting point in less than 1 s and of measuring the pertinent experimental quantities every 0.4 ms with a full-scale signal resolution of approximately one part in 8000. Specimen temperature is measured with a high-speed photoelectric pyrometer and recordings of experimental quantities are made with a high-speed digital data acquisition system. Application of the technique to investigations at the $\gamma \rightarrow \delta$ transformation point of iron is described. Measurements yielded the following results: 1683 K for the transformation temperature, 890 J/mol for the transformation energy, and 0.36 for the normal spectral emittance (at 0.65 $\mu$m) at the transformation point.

Key words: adhesive bonding; aging tests (materials); composite materials; glass fibers; housing system; laminates; reinforced plastics; shear strength; sustained loading; tensile strength.

A series of tests was performed on sandwich panel housing components made with glass fiber-reinforced polyester (FRP) laminates. Specifically, long- and short-tests were performed to evaluate the adhesive bonds between the FRP laminate facings and cores of the panels. Specimens of two different FRP laminates were analyzed and their bonding characteristics with two different adhesives were studied. The test data show that the bond strength was significantly affected by the laminate formulation, adhesive formulation, adhesive thickness, sustained loading, and temperature.

Key words: applications; chemical analysis; microwave: qualitative analysis; quantitative analysis; rotational spectra.

Traditional analytical techniques have been successfully employed on a great variety of systems for identifying stable reaction products as well as for purity analysis and reaction efficiency. However, most analytical techniques generally can only be applied to "well behaved" chemical systems. Since gas phase reaction products do not always follow the "well behaved" guideline, an alternate analytical tool, such as microwave spectroscopy, could prove beneficial for analyzing such systems and may well provide some new routes to synthetic chemistry. A general review of the present state-of-the-art for applications of microwave techniques to analytical studies will be presented. An attempt will be made to describe the limitations and advantages of microwave spectroscopy for probing chemical systems for product identification and for optimization of the efficiency of gas phase chemical reactions. As an illustration, some recent results obtained in our laboratory on the complex pyrolytic decomposition reactions of ethyleneamine will be described. Further examples of possible applications will be taken from typical industrial processes that employ vapor phase chemical synthesis techniques.

Key words: angle-plied laminates; boron/epoxy; composite materials; creep; viscoelasticity; linear and nonlinear.

Tensile creep tests were performed at 75 °F (24 °C) and 300 °F (149 °C) on 26 specimens cut from ±30-deg and ±45-deg laminates of boron/epoxy composite material to characterize the creep behavior of these materials. A linear viscoelastic laminate theory proposed by McQuillen was compared with the experimental data for the tests run at 75 °F (24 °C). The predicted creep strains differed greatly from the measured values, indicating that the linear theory is not applicable to laminates with these filament orientations. A general creep equation of the form $\epsilon = k\alpha m$ was fitted to the experimental data with excellent correlation. The stress exponents $m$ varied from 1.79 to 5.17 for the four series of tests, thus characterizing the nonlinear behavior of boron/epoxy laminates with these filament orientations.

Key words: charge recombination rate constants; cobalt gamma radiolysis; hydrocarbons; ion-molecule reaction; neutralization mechanisms; pulse radiolysis.
A discussion is presented of the fate of unreactive hydrocarbon ions in various selected gaseous systems. It is shown that experiments performed with the high radiation dose rates obtained in pulse radiolysis experiments have several advantages over conventional low dose rate experiments for the elucidation of the mechanism of homogeneous neutralization of unreactive hydrocarbon ions. This is so because the charged species has a much shorter life-time with respect to neutralization under high dose rate (pulse radiolysis) conditions, so that the reaction of the ions with minor impurities or accumulated products is much less probable than in low dose rate experiments. It is further shown through a few examples, that quantitative information about the rate constants of neutralization events and ion-molecule reactions can be obtained when the dose rate is high enough for neutralization and chemical reaction to be in competition. Once reliable rate constants for neutralization and ion-molecule reactions are derived, one can obtain a quantitative evaluation of the products which will be formed in the pulse radiolysis of a hydrocarbon gas mixture from a computer calculation.

Key words: bioassay; combustion products; fire; hazard assessment; toxicity.

Fire statistics show that at least 50 percent of the fire related deaths can be attributed to “smoke inhalation.” Detailed investigations of fire fatalities and autopsies of fire victims show that the interaction of carbon monoxide, pulmonary injury, alcohol and cardiovascular disease plays a role in many of these deaths.

The research efforts designed to assess the toxicological effects of products of thermal degradation can be divided into three broad categories: (1) assessment based on extensive chemical analysis, (2) assessment based on analyzing for specific toxicants and (3) assessment based on bioassay techniques frequently combined with analysis for a few selected toxicants.

Assessment categories 1 and 2 have mainly addressed the problem of the gaseous phase of the degradation products, with little consideration given to the particulate phase (smoke). These methodologies illustrate the limitation of basing a hazard assessment on the assumption that the toxicity of the fire environment is due solely to a few known toxicants. In addition, the particulate phase may play a predominant role in the inhalation toxicity that cannot be assessed with chemical analysis. One concludes that due to the complexity of the fire environment, an assessment of this hazard will require the combined efforts of toxicologist, chemists and combustion scientists.

Key words: bituminous roof membranes; performance attributes; performance criteria; physical and engineering properties; test methods.

This report is the last in a series of publications on performance criteria for built-up roof membranes. To remind the reader of the scope of these articles, the authors' introductory remarks for Part I follow. The development of a performance approach to bituminous built-up roof membranes is described and preliminary performance criteria are recommended. A number of test methods have been developed in order to obtain data to evaluate roofing membranes against the recommended criteria. Twenty attributes that affect the performance of roof membranes under service conditions are identified and laboratory tests are described for measuring the engineering properties of the membrane that pertain to many of these attributes. A level of performance is recommended for nine of the identified performance attributes.

Key words: corridors; fire induced flow; recirculating flow; scale-model; smoke movement; stratified flow; theory.

The flow induced by a room fire was studied within a corridor for a scale model configuration. The effect of corridor exit opening was determined for a fixed room door opening and temperature gradient. Velocity and temperature measurements were made. At the room doorway and corridor exit the thermally stratified flow would enter and leave with a sharp boundary between the counter current flows. However, within the corridor the flow was more complex, giving rise to a large recirculating zone traversing the corridor length and trapped between the hot ceiling jet and entering cold flow. Smoke tracer visualization techniques illuminated these complex flow patterns along with mixing caused by shedding vortexes. These flow results are quantitatively presented and their nature is discussed. The measured total mass flow rate induced into the corridor was measured and compared to theoretical results. At this time, the implications of these complex corridor flows in a scale-model must be limited until they are verified in similar full-scale experiments and their nature is more thoroughly understood.

Key words: privacy; privacy legislation; privacy planning.

Reporting on the joint NBS/MITRE workshop, Planning for Action—the Privacy Mandate, the article provides, in capsule form, a description of the workshop with specific attention to those comments of use to EDP managers.

Key words: data; fire: fire incident system; fire service: incident reports; loss; National Fire Data System.

The Fire Incident System (FIS) is based on a data file of individual fire incident reports from the fire services. The pilot implementation of the Fire Incident System is an integral part of the National Fire Data System. This paper examines the objectives of the pilot project, describes the system and its participants, and discusses the project status.

Key words: cost-benefit analysis; cost-effectiveness; economics; interactive systems; performance evaluation.

This report assesses the state-of-the-art in cost-benefit analyses of interactive systems and suggests an approach for developing improved methodology. Cost-benefit analyses are distinguished from analyses of system performance in that the former are not directed at optimizing system performance at a given level of investment, while the latter are directed at justifying the investment itself.

Methods of analyzing the performance and costs of computer systems in general and interactive systems in particular are discussed. With this information it is shown how cost-effective-
ness analyses may be performed. The next crucial step is to conduct benefit analysis, an ill-defined art. The results of benefit analysis must be combined with cost-effectiveness analysis in order to perform the desired cost-benefit analysis.

An experimental methodology is suggested for better performing benefit analyses of interactive systems. A more rigorous formulation of the cost-benefit procedure is then outlined. No attempt is made in this report to actually perform such an analysis.

Key words: CMN; entropy; magnetic susceptibility; magnetic temperature; thermodynamic temperature.

Correction of a small systematic error present in our earlier measurements leads to a much improved determination of the magnetic temperature (T*) scale for single crystal CMN. These latest results are compared with recently published findings of another laboratory.

Key words: clothing flammability; fabric flammability; fire hazard; fire investigation; flammability testing; hazard analysis; hazard quantification.

The Office of Information and Hazard Analysis (OCHA) performs its hazard analysis function by means of a multifaceted program combining in-depth case history investigation of fire accidents, laboratory experimentation, fire testing, and data analysis to identify and characterize specific hazards.

Hazard characterization serves to influence the formulation of basic fire research, to guide test method development for codes and standards, to identify data required to be collected, and to provide input to public education for fire safety. These functions are performed in concert with other United States government agencies, including the National Fire Prevention and Control Administration (NFPCA) in the Department of Commerce with which we have a close working relationship, and the Consumer Product Safety Commission which we support in product standard development.

The main portion of this paper describes the current fire hazard analysis process illustrated by results from the fabric flammability project, describes how this process is evolving into the more quantitative process of the future, and discusses the data needed for future hazard models.

Key words: binary mixture; experimental vapor-liquid equilibria; helium-carbon monoxide system; helium-nitrous oxide system; Henry’s constants.

Liquid-vapor data are reported for the helium-carbon monoxide system at 80, 85, 90, 100, and 120K and for the helium-nitrous oxide system at 195, 215, 235, 245, 255, 265, and 285K at pressures up to 138 bars. The data are analyzed for internal consistency using pseudo-Henry’s law constants and enhancement factors.

Key words: HO₂; hydroperoxyl; microwave.

Using a Zeeman-modulated cavity spectrometer with a 10 sec time constant and a phase locked klystron, we have observed in the products of a discharge-flow system, Zeeman components of the six allowed zero-field lines at 65.070 ± 0.002, 65.082 ± 0.002, 65.098 ± 0.002, 65.373 ± 0.002, 65.397 ± 0.002, and 65.401 ± 0.002 MHz, and of one forbidden zero-field line at 65.369 ± 0.002 MHz. The Q of the Fabry-Perot cavity is about 10,000, and the magnetic field was swept from 0-30 G. Chemical tests indicate that the observed lines are due to HO₂. They have been assigned and least-squares fitted using a simple theoretical model to yield a value of 65.185 ± 0.002 MHz for the f₁₋f₀o asymmetric rotor transition frequency of HO₂, a value of 208.2 ± 0.02 MHz for the linear combination (ε₉₀ + ε₁₋₀)/2 of elements of the electron spin-molecular rotation interaction tensor, a value of 28.2 ± 0.02 MHz for the nuclear spin-electron spin Fermi contact interaction parameter σ, and a value of 4.2 ± 0.02 MHz for the spin-spin tensor interaction parameter λ. These constants are in excellent agreement with three less precise constants obtained from an earlier laser magnetic resonance study and have been confirmed by recent more accurate measurements of Saito.

Key words: crack nucleation; elevated temperature; failure prediction; Larson-Miller parameter.

There is a great need for the standardization of methods for predicting elevated temperature material failure. Generally, metallurgical instability limits the accuracy of these methods. Quantitative metallurgical models predicting lifetimes from microscopic parameters are virtually nonexistent. Here an elementary metallurgical model of the well-known Larson-Miller parameter is developed, based on the thermally-activated nucleation of Griffith-type cracks. The concept of the activation volume for fracture is introduced. The analysis permits calculation of the size and surface energy of crack nuclei from stress-rupture curves. These are computed theoretically from stress rupture data of typical high temperature iron- and nickel-base alloys. No independently measured nuclei size data exists, but the surface energies agree with energies obtained from similar alloys by direct measurement. The analysis also predicts that the stress-rupture lifetime is a sensitive function of crack nucleus surface energy, and gives a quantitativemeasure for the iliability of the constant in the Larson-Miller parameter predicted from microstructural values.

Key words: compressibility; interferometry; light scattering; methane; sound velocity; specific heat ratio.

Brillouin scattering techniques have been used to measure the velocity of hypersonic waves in gaseous and liquid methane. Measurements were made on the saturated liquid and vapour and along selected isotherms to a maximum pressure of about 17.5 MPa. The data, which agree well with previously measured ultrasonic velocities, have been combined with PVT data to obtain the isentropic compressibility and the ratio of specific heats.

Key words: data analysis; mean; standard deviation; statistics; updating estimates.

Hanson's article describes an elegant procedure for recomputing the weighted mean and standard deviation of a series of numbers when new values are added. As he observes, in the case of unit weights a considerable simplification occurs; however, he does not present the simplest equations for this case. This remark derives simple results for updating mean and standard deviation in the case of unit weights, when only the previous values of mean, standard deviation, number of occurrences and the new datum are known.

Key words: calibration; ground antenna; standard antenna gain; three-antenna extrapolation.

Accuracy considerations in the measurement of the power gain of a large microwave antenna are discussed. The analysis indicates that, using the power gain comparison method with a standard antenna of nominally 40-dB gain, a large antenna with a power gain of nominally 60 dB could be calibrated to within an error of 0.17 dB (3σ). The power gain of the standard antenna is considered to be determined via the generalized three-antenna extrapolation method. Individual sources of errors in both the generalized three-antenna extrapolation method and the power gain comparison method are discussed.

Key words: computer; consumer; contract; evaluation; network: performance.

This short paper describes measurement of computer network services from the consumer's viewpoint. Two common measures of performance are described. The ICST Network Measurement Machine and its data analysis programs are presented as a prototypical device capable of measuring network service for analysis according to various criteria. Sample results are given. Application of measurement to procurement and contractual obligations is discussed.

Key words: microcomputers; minicomputers; networks; standards.

Both minis and micros have found their way into extensive use as a part of computer networks. Minicomputers have a head start, but microcomputers will fast catch up in numbers, especially as a part of terminals connected to networks. Mini/micro network configurations can be divided into two categories, local and distributed. Most research-oriented and operational networks can be placed directly into one of these categories. Successful development and operation of these networks employing minis and micros requires a variety of standards, both internally and externally.

Key words: GaAs; laser; photoconductive; sampling oscilloscope.

An optically strobed sampling oscilloscope is described in which a GaAs laser diode is used to strobe a GaAs photoconductive sampling gate.

Key words: electronically calibrated; pyroelectric; radiometer.

The performance and detailed operation of an electrically calibrated pyroelectric radiometer are discussed.

Key words: Josephson effect; phase slip; weak superconductivity.

The details of the Josephson effect in thin metal bridges are difficult to derive quantitatively, and many papers have been written on the subject attempting to describe quantitatively such qualitative features as irreversible phase slip, instantaneous 2π phase slip, variation of order parameter in time and space, Bernoulli effect, and others. It does not seem to be generally recognized that all of these qualitative features are universal attributes of the Josephson effect and occur also in tunnel junctions. In addition, when a steady voltage is impressed across a junction, a term in the electric field is set up (in addition to the Bernoulli field) which has a rather complex temporal and spatial variation.

Key words: oscilloscopes; pulsed wavemeter timing.

A pulsed wavemeter technique is described that is useful as a source of microwave frequency sine waves for the time base calibration of sampling oscilloscopes.

Key words: cylinder scattering; electromagnetic scattering; lossy dielectric; multilayer cylinder; reference values; scattering.

The theoretical scattering solution for a plane wave incident normally on a lossy dielectric multilayer circular cylinder of infinite length is outlined. Numerical values of the modal scattering coefficient for TE and TM modes are given for several single and multilayer cylinders. Verifications of the results are described. The values may serve as reference data.

Key words: attenuation; automation; detector; insertion loss; microwaves; phase angle; ratio; six-port junction; vector voltmeter; voltage.

An arbitrary six-port junction is analyzed as a microwave vector voltmeter, measuring the amplitudes and phase differences of two input signals in terms of power readings taken at the remaining four ports. The junction may be calibrated for measuring the
complex ratio of these two signals using a self-calibration procedure which requires no attenuation or phase standards.

Key words: automation; calibration; directional coupler; microwave; microwave power.

Although the application of automated methods to power calibration problems in the UHF and microwave region has been described by a number of authors, the primary orientation has been towards the calibration of bolometer mounts and similar items. Little has been published on the problem of calibrating directional-coupler-bolometer-mount assemblies, which also play a major role in the calibration and measurement of UHF and microwave power.

This paper develops a theoretical basis for several different approaches to this measurement problem.

Key words: detector; dye laser; GaAs; photoconductor; picosecond; pulse.

The letter reports the development of a fast-response bulk photoconductor that can be used as a photodetector and as an optically gated switch. The photoconducting material used is semi-insulating, chromium-doped GaAs, a sample of which is mounted in a 50 Ω stripline holder. An estimated detector transition time of 92 ps or less was obtained from tests made with a mode-locked dye laser.

Key words: arc; hydrogen; negative ion; plasma; resonance; vacuum ultraviolet.

Calculations by Macek have shown that the H- photoabsorption cross section should be affected by a shape resonance at 1129.5 Å. This experiment is an attempt to observe the resonance in emission according to the reaction e + H → [H-] + H+ + hv. The plasma is in a condition of local thermodynamic equilibrium and is generated by a stationary wall-stabilized hydrogen arc. With an axis temperature of 14,000 K and 1 atm pressure, the H+ free-bound continuum contributes only about 2 percent of the total radiation which is dominated in the 1130-Å region by the Ly-α wing. However, the peak of the shape resonance, according to Macek, should have a cross section about 25 times greater than the continuous free-bound cross section; therefore, it should appear as a very noticeable 50 percent structure superimposed on the Ly-α wing. Except for some small features which are attributed to weak molecular emission, there is no obvious indication of the shape resonance in either deuterium or hydrogen spectra between 1105 and 1135 Å. It is estimated that the minimum feature which could have been detected at 1129 Å was about 2 percent of the total signal.

Key words: directional coupler; picosecond; pulse generator; risetime; trigger; tunnel diode.

Present tunnel diode (TD) pulse generators have distortions in the pulse baseline and topline due to feedthrough of the triggering signal. This paper presents a new technique for reducing the trigger-induced distortions. A directional coupler is used to couple the trigger signal to the TD.

Key words: coal gasification; cryogenics; energy crisis; hydrogen economy; LNG; superconducting electrical equipment and instrumentation.

This paper reviews some of the ways cryogenics can help solve the energy crisis. Five specific areas are covered: the use of LNG, the conversion of coal to fuel gas using oxygen from air separation plants, the use of superconductors in power plants and electrical transmission lines, superconducting instruments for geophysical exploration of new energy resources, and the Hydrogen Economy.

Key words: applied research; building codes; building design; building standards; diffusion of information; regulation.

Outlines a means enabling environmental design researchers to participate in the formulation of regulatory policies affecting buildings. The standards system is shown to be an underused channel for relaying research findings to building professionals and the regulatory system is shown to be a potential means for directing building technology toward socially-valued ends. Notes include a brief listing of standards- and codes-generating organizations.

Key words: Census Bureau; Consumer Product Safety Commission; data; fire; households; injury; loss; National Fire Data System; National Fire Survey; survey.

A survey of over 33,000 U.S. households was conducted in April, 1974. It was sponsored by the National Bureau of Standards and the Consumer Product Safety Commission. This paper discusses the survey scope and the accuracy of the national estimates. Estimates are presented of the number of household-related fires, classified by such parameters as ignition source and room of origin. Property loss and injury estimates are given.

Key words: communications; computer security; cryptography; data security; encryption; network security; security.

Encryption can be an effective process for protecting data during transmission within distributed computer systems and networks. The degree of protection provided by encryption depends on the encryption algorithm employed, the implementation of the algorithm and the administrative procedures regulating the use of algorithm. Additional security requirements of user identification, access authorization and security auditing may be satisfied by combining encryption technology with a network access control machine in a network security center. This paper presents an encryption algorithm for use in computer data communications.
and the security requirements that are satisfied by proper use of the algorithm. It also discusses the use of a network access control machine to enforce access restrictions for the network.

Key words: impulse generator; picosecond; spectrum; spectrum amplitude; step recovery diode.

A baseband impulse generator recently developed at NBS is described. It is completely solid state and features a 100 kHz maximum repetition rate, 50 ohm source impedance, an extremely narrow 100 ps duration impulse of 8 volts amplitude, and a flat spectrum greater than 60 dBµV/MHz up to 5 GHz. The generator was evaluated on the NBS Automatic Pulse Measurement System which measured the time domain waveform with a sampling oscilloscope and computed the spectrum on a minicomputer.

Key words: antennas; measurement; polarization.

Absolute polarization parameters have previously been obtained using a 3-antenna measurement technique. By a modification of this approach, the accuracies of the results are significantly increased, and the measurements are easier to perform. This work demonstrates the power and utility of using complex rather than scalar polarization parameters in formulating polarization problems.

Key words: antenna gain; G/T; radio star; satellite communications.

This talk highlights often-overlooked or poorly treated aspects in G/T error analyses for satellite communication earth terminals. In particular, correction factors due to star size, differential system temperature, antenna pointing, and refractive attenuation used in G/T measurements are discussed in detail.

Key words: attenuation; automated measurement; network analyzer; pulse; S parameters; time domain.

NBS has recently developed a Time Domain Automatic Network Analyzer (TDANA). It measures the S parameters of RF and microwave networks as a function of frequency using pulse measurement techniques. The signal source is typically a tunnel diode pulse generator with a 10-90 percent risetime of less than 20 ps. This generator produces a useful amplitude spectrum extending from dc to beyond 18 GHz. The receiver is a sampling oscilloscope with a 20 ps risetime. The oscilloscope is controlled by a minicomputer. The data measured by the oscilloscope is stored and processed in the minicomputer. The minicomputer averages the data to improve the signal to noise ratio, then Fourier transforms the time domain data into frequency domain data and calculates the S parameters. Examples of measurements are presented. They include the measurement of 40 dB attenuators to 12.5 GHz.

Key words: calibration; calibration factor; directional coupler; measurement; microwave; microwave power.

Although the application of automated methods to power calibration problems in the UHF and microwave region has been described by a number of authors, the primary orientation has been towards the calibration of bolometer mounts and similar items. Little has been published on the problem of calibrating directional-coupler-bolometer-mount assemblies, which also play a major role in the calibration and measurement of UHF and microwave power.

This paper describes several approaches to this measurement problem.

Key words: building retrofit; building systems; energy conservation in buildings; HVAC automatic control; HVAC systems; measurement of building energy.

Energy conservation measures at the National Bureau of Standards site are being carried out under two separate but interrelated programs: a low-investment, immediate-impact program and a long-range, major retrofit program. The low-investment program has already been implemented and includes lighting reductions, thermostat resettings and nighttime shutdowns of heating, ventilating, air conditioning systems. Data on energy usage before and after this program was instituted are presented. The methodology and analysis of the long-range program are also presented. Various building energy conservation options were considered and evaluated by means of a mathematical model. Quantitative estimates of savings for each are presented. The decision to invest in automatic controls for the air conditioning systems of the laboratory complex and steam/chilled-water power plant is discussed.

Key words: antennas; error analysis; measurements; near-field.

In recent years, planar near-field antenna measurements have been developed and used in a number of applications. One of the primary concerns with this, or any, measurement approach is the accuracy of the results; that is, how do errors in measured near-field quantities affect the accuracies of far-field parameters such as gain, side lobe level, monopulse difference level, beam width, etc. Some efforts have been made in the past to estimate these errors, but the results have been limited in generality and primarily of a qualitative nature.

We have used a two-fold approach to obtain equations giving reasonable upper-bound errors resulting from systematic and random errors in the near-field measurements. The strategy has been to derive error expressions from the equations relating near and farfield quantities and also to simulate errors on actual mea-
sured near-field data. The simulation has been given some direction to, and confirmed the results of the analysis. The errors which have been investigated are: truncation of the measurement area, x, y, and z-position errors of the probe, amplitude and phase uncertainties of the measured data, and multiple reflections between the probe and test antenna. The results not only give the effects of errors in a given quantity, but also specify the form of the error (i.e., linear, quadratic, periodic, etc.) which will produce the largest effect. This information is very valuable in designing the measuring equipment so that these types of errors can be avoided or minimized.

Key words: attenuation; microwave; phase angle; ratio; self-calibration; six-port; vector voltmeter; voltage.

An arbitrary six-port junction is analyzed as a microwave vector voltmeter, measuring the amplitudes and phase difference of two input signals in terms of power readings taken at the remaining four ports. The junction may be calibrated for measuring complex voltage ratios using a self-calibration procedure which requires no standards.

Key words: Allan variance; argon gas noise source; cross correlation; solid state noise source; stability measure.

A measure for the stability of solid state noise sources is discussed. Its applicability is demonstrated. A technique similar to cross correlation is employed to separate the instabilities of the noise source from those of the measurement system.

Key words: advanced fiber composites; cryogenics; dynamic mechanical properties; literature review; static mechanical properties; thermal properties.

The low-temperature mechanical and thermal properties of advanced-fiber reinforced structural composites are reviewed. The magnitude and range of particular properties are discussed with respect to composite type and temperature. A property-material cross reference is given with a 128-entry bibliography. This is Part 2 of a two-part series. Part 1 considered glass-reinforced composites.

Key words: acquisition; CODASYL; computer; data base management; designers; evaluation; selection; users.

This report presents a method for the selection and acquisition of a data base management system as part of the development of an automated information processing system. It does not attempt to discuss all aspects of information systems, but only those that are pertinent to the utilization of a data base management system. Those issues which relate to information system design, as well as the design and implementation considerations of a data base management system are deferred. This report is the third in a series of CODASYL System Committee reports on its efforts to build up an expertise in and to develop advanced languages for data processing. The report should be of significant value to users and designers of such systems, since it approaches the question of evaluation and selection by relating users needs to system capabilities.

Key words: collision resolution; hash tables; polynomial search; pseudo-random numbers; scatter storage.

Necessary and sufficient conditions are given for a simple collision resolution polynomial bi**k to search fully a hash table of prime size. Sufficient conditions are then established which ensure a search of all locations of any table using a polynomial bi**k + ai. Observations on special cases for bi**k + ai relate this polynomial to the more simple search bi**k. A final example illustrates a typical pseudo-random sequence generated by a polynomial bi**k + ai.

Key words: benchmark testing; data base management; performance measurement; test data bases; test transactions.

A benchmark test approach for generalized data base software is described. Although the benchmark test has been designed to experiment on one specific data base management system, the approach is rather general and applicable to many data base management systems that are currently available. The benchmark test consists of the specification of a test data base and the specification of a set of processing transactions to exercise the candidate software on the test data base. This benchmark test can be used both to measure the performance of a data base management system, and as a saturation test. The two parameters to be used in the saturation test are data base size and workload. The data base size is varied by increasing the number of records within the test data base. The workload is varied analytically via a queuing model.

Key words: bibliography; calorimetric measurements; fluid mixtures; Joule-Thomson coefficients; phase equilibria; review.

This bibliography contains references to experimental data for ten equilibria properties of fluid mixtures. The data considered are: solid-liquid, solid-vapor, solid-liquid-vapor, liquid-liquid, liquid-vapor, and gas-gas. In addition, there are sections on liquid mixture densities, gas or vapor mixture densities, Joule-Thomson coefficients, and calorimetric measurement.

Key words: coordinate time scales; frequency calibration; international frequency comparisons; optimum frequency estimate; primary frequency standards; relativity; SI second; time scale accuracy algorithm; time scale stability.

The accuracy of the rate or frequency of an atomic time scale is the degree to which its unit agrees with the SI second. Primary
frequency standards are constructed in such a manner that they provide the most accurate possible physical realization of the S1 second. These standards are then used to calibrate or construct an atomic time scale which may also be used as a stable reference standard.

Mathematical models characterizing the performance of both the primary frequency standards and reference standards are developed, and based on these models a current best estimate of the S1 second is derived utilizing current and previous calibrations.

The modeling techniques and theory are applied to the NBS primary frequency standards and atomic time scale system and a significant improvement is realized in the accuracy of the frequency estimate so derived. We estimate that the second used by the Bureau International de l'Heure in generating TAI and UTC was too short by about 9 ± 2 parts in 10^10 during the fall of 1974.

Key words: crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; time domain stability.

Recent measurements of the inherent short-term stability of quartz crystal resonators will be presented. These measurements show that quartz resonators are much more stable for times less than 1 s than the best available commercial quartz oscillators. A simple model appears to explain the noise mechanism in crystal controlled oscillators and points the way to design changes which should permit more than 10 orders of magnitude improvement in their short-term stability. Stabilities of order 1 part in 10^12 at 0.001 s appear obtainable. The achievement of short-term stabilities of this level would in many cases greatly reduce the time necessary to achieve a given level of accuracy in frequency measurements. Calculations show that a reference signal at 1 THz, derived from frequency multiplying a 5 MHz source with the above measured crystal stability, should have an instantaneous or fast linewidth of order 1 Hz. These calculations explicitly include the noise contribution of our present multiplier chains and will be briefly outlined.

Key words: clock; frequency stability; frequency standard; time comparison.

Based on a commercially available rubidium standard, the National Bureau of Standards (NBS) developed a portable rubidium clock. Technical modifications which improve the temperature and magnetic environment characteristics allow stabilities in the 10^-12 range under typical clock transport conditions. The physical size is such that the clock can be carried as hand baggage on commercial airlines allowing up to 18-hours continuous battery operation.

Key words: frequency multiplication; linewidth; multiplier chain; precision oscillator; rf spectrum; spectral density of phase fluctuations; spectral purity.

A novel experimental technique is introduced and used to measure the effect of frequency multiplication on the RF spectrum of an oscillator. This technique makes it possible to produce the RF spectrum at X band—where measurements are relatively straightforward—that would have been produced by frequency multiplication of the 5-MHz source to any frequency from 9.2 GHz to 100 THz (10^4 Hz). A simplified theory is developed and shown to reproduce the experimental results for the relative power in the carrier and noise pedestal, and the shape and the width of the carrier and noise pedestal, to within the measurement uncertainty of 2 or 3 dB, from 5 MHz to 10 THz. The calculations are easily made using analytical techniques from the measurement of the spectral density of phase fluctuations of the source, the effective input spectrum density and the bandwidth of the multiplier chain, and the frequency multiplication factor. It is shown that present 5-MHz crystal-controlled oscillators are useful as a precision source to ~500 GHz. Suggestions for extending their range to ~100 THz are made.

Key words: cavity stabilization; frequency multiplication; funnel diode oscillator; parametric oscillator; superconducting oscillator.

Advances in superconducting technology during the last decade have resulted in many experimental applications in the generation of stable frequencies. The properties which make superconducting resonators attractive are their high Q, high frequency, and high operating power level. A variety of techniques can be used to make a superconducting cavity the frequency determining element of an oscillator. They include cavity stabilization via injection locking of a free-running oscillator, negative feedback to a voltage-controlled oscillator, positive feedback around an amplifier, and coupling to a negative resistance amplifier. These techniques are discussed in terms of some of their theoretical and practical limitations with particular emphasis placed on the goal of achieving state-of-the-art frequency stability. The best performance obtained with a superconducting oscillator to date is summarized.

At NBS, work on superconducting oscillators is primarily motivated by the need for a microwave signal which can be multiplied to the infrared and used to measure the frequency of a laser with no loss in precision as compared to the primary cesium standard. The signal source which has been selected for this purpose is the superconducting parametric oscillator. Its principles of operation are discussed along with the reasons why it is expected to have state-of-the-art short-term frequency stability.

Key words: laser frequency measurements; speed of light.

Since the advent of the laser and saturated absorption locking of the laser, the extension of radio frequency technology into the optical region has produced exciting new results, such as a 10 000 fold increase in the resolution of spectroscopy in this region and a new value of the speed of light, 100 times more accurate than the previously accepted value. This paper will describe the techniques and results achieved.

Key words: length; mass; National Bureau of Standards; reference methods; SI units.

The universal language of measurement is provided by the International System of Units. Progress leading to the present definitions of some of the SI base units, and research that may lead to improved definitions, is described. Work at the National Bureau of Standards that is of interest to analytical chemists, such as atomic weight determinations, standard reference data, physical constants, calibrations, etc., is also described.

Key words: building research; building standards; economics of energy conservation; energy conservation; energy conservation research; energy savings.

Initiation of an energy conservation program for buildings revealed that, until very recently, buildings and the mechanical and electrical equipment installed therein have been designed for low first cost, with little attention given to energy cost. Current efforts to draft energy conservation standards for buildings showed that neither the energy conservation potential nor the life-cycle costs of many well-known energy conservation techniques are established. The research program of the National Bureau of Standards on energy conservation in buildings is presented in overview, and selected projects are discussed in some detail to show the types of information being developed in the laboratory, and in full-scale studies of new and existing buildings. Additional research needs for energy standards purposes are identified.

Key words: CH; free radical; HCO; HO$_2$; laser magnetic resonance; OH; pollution.

Laser magnetic resonance spectroscopy provides one of the most sensitive techniques ever devised for the detection of free radicals such as OH, CH, and HCO. Paramagnetic molecules inside a laser cavity are Zeeman tuned into coincidence with the laser frequency and a decrease in laser power is detected. With this technique, the reaction rates of free radicals can be measured in a reaction flow system.

Key words: laser frequency: laser wavelength: length standard; speed of light.

Recent frequency and wavelength measurements of a methane stabilized laser yield a value of the speed of light 100 times less uncertain than the previously accepted value. Various possibilities using lasers as radiation sources for a new length standard are discussed. One possibility is to fix the value of the speed of light in the redefinition of the meter.

Key words: crystal oscillator; frequency calibration; network-originated programs; NBS traceability; phase comparison; television.

This letter is a reply to a previous letter to the editor regarding accuracy of TV color signals to calibrate oscillators.

Key words: accuracy; accuracy evaluations; cavity phase shift; cesium beam tube; frequency stability; interaction length; phase noise; primary frequency standards; Ramsey cavity.

The National Bureau of Standards has two primary standards for frequency and the unit of time. They are both cesium devices and are designated NBS-4 and NBS-5. The design of NBS-5 is discussed in detail, including its relationship to its predecessor NBS-III, and a brief description of NBS-4 is given. NBS-4 and NBS-5 have been used since January 1973 for a total of twelve calibrations of the NBS Atomic Time Scale.

The application of pulsed microwave excitation, and the use in the accuracy evaluations of frequency shifts due to known changes in the exciting microwave power are discussed. Measurements of the atomic velocity distributions are reported.

A stability of $9 \times 10^{-16}$ derived from the comparison of NBS-4 and NBS-5 is reported for averaging times of 20,000 s, and data on accuracy are given. Results obtained to date give an evaluated accuracy of $1-2 \times 10^{-15}$ with indications that this accuracy may be improved in the future.

The bias-corrected frequencies of NBS-4 and NBS-5 agree to within $(1 \pm 10) \times 10^{-15}$ with the value obtained for NBS-III in 1969 -- which value is preserved in the rate of the NBS Atomic Time Scale.

Key words: atomic clocks; frequency measurements; frequency stability; phase delay; precise time metrology; subpicosecond time difference measurements; time stability.

Recently a time difference measurement system was developed in the Frequency and Time Standards Section of the National Bureau of Standards and independently at the National Research Council which shows more than three orders of magnitude improvement over that which is currently available commercially. Current state-of-the-art time difference measurement devices have specified accuracies of about 1 nanosecond. Measurement precision and potential accuracy of better than 1 picosecond has been demonstrated in this new time difference measuring device. This has significant implications in frequency and time metrology using: state-of-the-art frequency standards and clocks. A brief report was given on this measurement system at the PTTI Planning Meeting at the Naval Research Laboratory on the 5th of December 1974. This paper will give more detailed circuit diagrams necessary to build up such a measurement system.

This particular measurement system has the advantage that it can measure time differences with accuracies of a few picoseconds and with repetition rates ranging from a few milliseconds to as slow a repetition rate as would be desirable, thus expanding convenient measurement of time domain stabilities of frequency and time standards over several decades with only one measurement system. The system is also very amenable to self-calibration and self-noise analysis. Specifically, a fractional frequency stability of about $10^{-16}$ was measured for the noise of this measurement system at a sample time of $10^4$ s.

Key words: diatomic mercury; excimer molecules; fluorescence; lasers; NaK molecule; spectroscopy.

This paper will briefly outline several new laser measurements techniques which we have developed for the analysis of excited electronic states of diatomic molecules. For molecules which have bound ground states, a visible laser is used to selectively excite a single vibration-rotation level in the electronic state of interest. We then use DC Stark effect, RF double resonance and various fluorescence techniques, as discussed in Sections I and II, to obtain excited state dipole moments, lifetimes, quenching cross sections, transition moments as a function of intermolecular distance, and other molecular structure data. We have also developed new laser excitation techniques and used optical double resonance methods for excimer molecules which have repulsive ground states and are bound only in their excited states. These techniques, discussed in Sections III and IV, have been used to obtain potential energy curves, f-values, lifetimes and various kinetic rates.

Key words: BaO; chemical reactions; chemiluminescent; electronic spectra; heat-pipe oven; N_2O.

A heat-pipe oven has been used to contain and control the chemiluminescent reaction Ba + N_2O => BaO + N_2. The heat-pipe oven permits Ba vapor to be maintained at any desired pressure. Reactions were easily controlled by varying the flow rate of N_2O or pressure of Ba. A large volume (about 20 cm^3) of chemiluminescence was produced and spectra were taken from 0.1 to 1.0 torr. In addition to emission from BaO A^2-X^2, numerous atomic Ba lines also have been observed. The device is well suited to the study and control of chemical reactions between metal vapors and oxidizers.

Key words: crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; time domain stability.

A new technique is presented which makes it possible to measure the inherent short-term stability of quartz crystal resonators in a passive circuit. Comparisons with stability measurements made on crystal controlled oscillators indicate that noise in the electronics of the oscillators very seriously degrades the inherent stability of the quartz resonators for times less than 1 s. A simple model appears to describe the noise mechanism in crystal controlled oscillators and points the way to design changes which should improve their short-term stability by two orders of magnitude. Calculations are outlined which show that with this improved short-term stability it should be feasible to multiply a crystal controlled source to 1 THz and obtain a linewidth of less than 1 Hz. In many cases, this improved short-term stability should also permit a factor of 100 reduction in the length of time necessary to achieve a given level of accuracy in frequency measurements.

Key words: laser frequency measurements; laser strainmeter; saturated absorption spectroscopy; speed of light; the meter.

Three papers are reproduced which summarize some applications and uses of highly stabilized lasers and applications. Laser frequency measurements, the speed of light, a redefinition of the meter, ultrahigh resolution saturated absorption spectroscopy, the design and operation of a methane absorption stabilized laser strainmeter are all discussed.

Key words: indirect synthesis; phase noise; squarewave servos.

The cesium clock transition is at 9.192, 631.770 Hz by definition. In the design of a cesium frequency standard, it is common to generate a 5-MHz signal which is locked to this transition. Since 5-MHz cannot be directly multiplied to match the exact clock transition frequency, usually another frequency is synthesized and mixed in such a way that the clock transition frequency is produced.

This paper describes a synthesizer using a 5-MHz reference which has an output frequency of 5.00688 MHz which is very nearly an integer submultiple of the cesium clock transition frequency. Indirect synthesis is used in which an internal (number controlled) oscillator is locked at a prescribed frequency offset relative to the reference. Resolution (quantization error) is 1.4 parts in 10^13. A frequency stability plot φ(Δf) of the synthesizer noise is presented. The synthesizer can be made very compact and reliable. Since its output has low phase noise, the signal may be multiplied directly to the cesium clock transition frequency. In a cesium standard, this simplifies the amount of microwave hardware compared to traditional schemes. The design concepts of the synthesizer can easily be extended in order to implement squarewave frequency modulation of the beam tube RF excitation.

Key words: dynamical matrix; matrix, dynamical; phonon dynamical matrix; real parameters.

We apply the algorithm developed earlier by one of us to several illustrative examples and compare with results obtained by Warren and Worlton where difficulties occur as noted by these authors.

Key words: consolute point; critical exponent α; critical phenomena; critical solution point; density; gravity effects; mixture, binary; mixture, liquid; nitroethane; thermal expansion; 3-methylpentane.

We report precise measurements of the density as a function of temperature in the one-phase region near the consolute point in nitroethane + 3-methylpentane. We find evidence of the critical anomaly in the thermal expansion, but are not able to determine a unique value for the critical exponent α. We have performed computer experiments to determine under what conditions α could be extracted from thermal expansion data.

Key words: acoustic phonons; lattice sodium-chloride; translational dynamics.

Dispersion curves for translational phonons propagating in the high-symmetry directions of sodium-chloride-phase NdI have been determined at room temperature by coherent inelastic neutron scattering from single crystals. Acoustic phonons were well defined throughout the Brillouin zone. Optic phonons were considerably more difficult to measure because of the low signal-to-background ratio. The observed phonon energies were fitted to a "simple" and a "breathing" shell model with general repulsive short-range forces out to second neighbors. The results of the model fitting lead to conclusions similar to those reached in previous alkali halide studies. Model predictions of crystal properties are generally in good agreement with observation. The best fit model was used as in interpolation formula to calculate the density of states, g(ε). The mean-square displacements are in excellent agreement with those derived from the neutron-diffraction results of Seymour and Pryor. The lattice-dynamics results are compared with similar results obtained recently for the NaCl phases of the alkali cyanides.

Key words: communications; computer; evaluation; measurement; network; performance.

This publication consists of an abstract only which describes computer networks, measures of service, measurement of service delivery, measured effects and applications.

Key words: equilibrium structure; ground state constants; infrared spectrum; nitrogen dioxide; 2ν₁ band; nitrogen dioxide; ν₂ band; upper state constants; vibration-rotation interaction constants.

The infrared spectra of two B type bands, ν₂ and 2ν₁, of ¹⁴ΝΟ₂ have been recorded under high resolution. Ground state combination differences from these bands have been combined with combination differences obtained in previous studies and eight pure rotational microwave transitions to yield improved ground state rotational constants. Upper state constants and band centers for the ν₂ and 2ν₁ bands are also reported. The 2ν₁ band contains internal intensity anomalies believed to arise from a weak Coriolis interaction with the much stronger ν₁ + ν₂ band. Equilibrium rotational constants have been calculated. The equilibrium structure of the molecule is: r₁ = 1.1945 ± 0.0005 Å and Θ = 133.85 ± 0.10°. For the sake of comparison, effective, substitution, and average structures are also reported.

Key words: axiomatic field theory; composite particles; Haag's theorem; nuclear structure; quantum field theory; relativistic nuclear physics.

It is proposed that by this time the development of physics has progressed to a point where one can tackle the "hydrogen atom" problem of nuclear physics, viz., a description of the deuteron "from first principles." This requires to formulate the problem in terms of strong interaction relativistic field theory. The contemporary work is done instead almost exclusively in terms of the quasi-relativistic framework of effective Lagrangian theory. The inherent inaccuracies of this framework are reviewed. A framework for actually solving the relativistic field theory problem is described. It requires inescapably to consider the composite structure of the deuteron. The nature of the stationary solutions is discussed; their relation to the results of the covariant treatment is explained, and the relevance to certain theorems of field theory is pointed out.

Key words: coaxial; cylindrical; error; line; loss; response; skin effect; step; time; transition.

The purpose of this paper is to characterize the time domain step response error in the analysis of coaxial lines terminated in their characteristic impedance.

Key words: acoustical thermometry; fixed points: lead and indium transition temperatures; low temperature fixed points; low temperature thermometry; superconducting transition temperatures of lead and indium.

This note presents the temperature values for the superconductive transition fixed points (Tc) of lead and indium. Values of Tc derived by interpolations on the NBS P(2-20K) 1965 scale are given. Determinations of isotherms by the NBS acoustical thermometer produced Tc's of 7.199 K ± 1.3 mK for lead and 3.414 K ± 1.3 mK for indium.

Key words: data base technology; data manipulation, data structured; data manipulation, relational.

Practitioners of data base technology have been somewhat confused by the many different theories and systems for describing and manipulating data. The two major philosophies which have emerged may be termed the relational or set theoretic approach and the data structured or procedural approach. There are obviously differences in these, but there are also similarities.

This paper looks at these approaches from three aspects: (1) The method of describing data and its structure; (2) the methods of manipulating this data; and (3) the time of binding the data name to its operation.

Key words: driver information; highway; highway signing; human factors; information displays; standards.

In 1969 the Federal Highway Administration (FHWA) issued National Standards for Directional and Other Official Signs allowing owners of privately-operated scenic and historical sites to erect directional signs in a zone extending from the edge of the right-of-way to a distance 660 ft (201.2 m) beyond. Objectors to
these Standards sought increases in the height, length, total area, and number of signs allowed. FHWA requested the assistance of the National Bureau of Standards (NBS) to respond to these requests and to evaluate the Standards with respect to the needs of motorists. NBS reviewed pertinent literature and analyzed hypothetical Standards-conforming signs. The analysis showed that the sign dimensions needed to display legible messages vary considerably as the values of each design variable (e.g., vehicle speed) are changed. For many speeds, sign locations, and driver characteristics, Standards-conforming signs are inadequate. The following conclusions were reached: (1) The Standards should require that sign characters be legible at the levels of visual acuity required by state driver licensing regulations. (2) Maximum sign size should be specified in terms of the visual angle subtended, rather than as a maximum physical size, and (3) technical material does not support any change to the number of signs allowed to the spacing between signs, or to the spacing from signs to interchanges or exits.

Key words: chloroform; infrared spectra; molecular reorientation; Raman spectra; vibrational relaxation.

Vibrational and rotational (dipole and second-order tensor) correlation functions were obtained by Fourier inversion of infrared and Raman vibrational band contours of the three \( \pi \) and one \( \pi \) fundamentals of liquid CHCl\(_3\), CDCl\(_3\), and isotopically pure CH\(_2\)Cl\(_2\). All correlation functions are nonexponential at short times and approximately for long times. The symmetry axis of the molecule reorients by "free" jumps of about 1/3 rad, turning through a root-mean-square angle of 1 radian within 2 ps by about 13 orientational jumps. Computer simulations show that \( J \) diffusion is too fast beyond 1 ps and that \( M \) diffusion fits the data up to 4 ps (\( \tau_c = 0.12 \) ps); thereafter, \( M \) diffusion is too slow. The Raman rotational correlation time is approximately equal to the NMR quadrupolar correlation time: the infrared rotational correlation time is only 0.75 of a corresponding dielectric relaxation time. Vibrational relaxation in the symmetric near-infrared carbon-hydrogen stretch is of the same order of importance as rotational relaxation; however, the dynamics of the vibrational relaxation of this mode do not support the presence of "hydrogen bonding" in the neat liquid. In the symmetric far-infrared carbon-chlorine deformation mode, vibrational relaxation is of considerably lesser significance than rotational relaxation throughout the whole time domain, whereas the rate of vibrational relaxation of the symmetric infrared carbon-chlorine stretch is intermediate to those of the other two symmetric fundamentals. None of these modes obeys vibrational energy dissipation or resonance vibrational energy transfer mechanisms induced by dipole-dipole interaction. The ratios of the derived polarizability tensor elements, which are required to evaluate the rotational correlation function of the degenerate mode (carbon-hydrogen deformation), were computed from formulations relating them to the bond polarizabilities: It appears that its Raman and infrared correlation functions do not contain the same vibrational correlation function and that the respective contour is determined essentially by nonorientational relaxation processes. An extensive analysis of the experimental errors inherent in our Raman band contour determinations is presented, as well as a critical comparison of our conclusions with previous results in the literature.

Key words: ammonium perchlorate; lattice dynamics; Raman scattering; structure.

The Raman spectra of oriented single crystals of ammonium perchlorate have been measured as a function of temperature between 12 and 300 K. The results are consistent with the assignment of NH\(_4\)ClO\(_4\) to the \( D_{3h} \) space group at all temperatures. A weak \( B_{1g} \) mode at 180 cm\(^{-1}\) is assigned as an NH\(_4\)+ libration. Anomalous temperature dependence is observed for low frequency \( B_{1g} \) and \( B_{3g} \) lattice modes. Detailed results are presented for these modes in the range 18-80 K.

Key words: Gaussian lineshapes; Lorentzian; phase sensitive detector.

Calculations are made of the response to Gaussian and Lorentzian lineshapes of a phase-sensitive detector operated at twice the modulation frequency. The modulation traverses the line resonance condition twice each cycle. Sensitivity to variations in linewidth, modulation width, and line center position are discussed. These are compared with the more common operation where small modulation widths result in signals proportional to the derivatives of the lineshape. A discussion is made of the effects on the phase-sensitive detector output of signals at the harmonics of the modulation frequency.

Key words: bubble content analysis; gas analysis; inclusions in glass; Raman spectroscopy of sulfur; sulfur identification.

Raman scattering spectroscopy was conducted on solid deposits in bubbles in glass. Elemental sulfur was identified as forming small spherical deposits, amorphous in appearance. An analysis of the gas contents of the bubbles was also conducted and the changes of concentration with successive heat-treatments provided an estimate of the process of bubble formation.

Key words: gas analysis; inclusions in glass; Raman scattering.

Laser Raman spectroscopy is used to identify the gaseous contents of inclusions in glass. This test is offered as a valuable complement to other analytical techniques. It requires relatively simple specimen preparation, offers good sensitivity to the gases of interest and is a nondestructive test. Further, since the sample is not contained in a confining test apparatus, the temperature of the contents of the bubble may be raised, for example, to vaporize solid deposits for analysis. Spherical bubbles 0.5 mm in diameter have been routinely analyzed without special optics and with good signal-to-noise ratio. The elements of the theory and practice of laser Raman spectroscopy are outlined and their application to the study of the gaseous content of inclusions is discussed in detail.

Key words: band gap; band structure; electronic structure; energy bands; optical properties; silicon.

We report the first observation of the \( \Gamma_{2g} \rightarrow L_{1} \) (second indirect) transition in Si based on optical absorption studies. The
energy, $(1650 \pm 10)\text{ meV}$, measured for this critical point shows that there remains a large discrepancy between theoretical band structure calculations and experimental results for this material.

Key words: baseline studies; gas chromatography; gas chromatography-mass spectrometry; hydrocarbon; liquid chromatography; marine sediments; pollution; seawater.

The low concentration of hydrocarbons anticipated in pollution baseline studies necessitates the development of analytical techniques sensitive at the sub-microgram per kilogram concentration level. The method of analysis developed in this laboratory involves dynamic headspace sampling for volatile hydrocarbon components of the sample, followed by coupled-column liquid chromatography for the nonvolatile components. These techniques require minimal sample handling, reducing the risk of sample component loss and/or sample contamination.

Volatile sample components are separated from the matrix in a closed system and concentrated on a TENAX-GC packed pre-column, free from large amounts of solvent and ready for GC/GC-MS analysis. Nonvolatile compounds, such as the benzo-pyrenes, may be extracted from large volumes of water and concentrated on a Bondapak C18 packed pre-column for coupled-column liquid chromatographic separation and analysis. Results of the application of these techniques to the analysis of samples from sites of known low level hydrocarbon contamination are presented and discussed.
5. LISTING OF NBS PAPERS BY MAJOR SUBJECT AREA

This section provides a listing of 1974 papers organized by primary subject matter. It permits users of this catalog to scan the Bureau's output by major subject category. The user should bear in mind that a paper is listed once by major subject even though it might well contain other secondary subject matters of interest. The key-word index permits the reader to determine the overall context of a paper, and provides an excellent secondary reference source.

The categories currently in use for classifying NBS publications are listed below and are followed by a listing of each paper by category. Full citations (including key-words and abstracts) will be found under the appropriate publication series, which is included in the paper title. Also of use will be the key-word index (mentioned above) and the author index. See Section 6 for information on their organization and use.

Acoustics and Sound

Analytical Chemistry

Looking at the collection efficiency problem through the ion microscope optics, G. Slodzian, SP427, pp. 33-61 (Oct. 1975).

A critical discussion of the local thermal equilibrium model for the quantitative correction of sputtered ion intensities, C. A. Andersen, SP427, pp. 79-119 (Oct. 1975).

Application of SIMS microanalysis techniques to trace element and isotopic studies in geochemistry and cosmochemistry, J. F. Lovering, SP427, pp. 135-178 (Oct. 1975).

NBSIR 75-713. A file management system for a laboratory automation facility, P. S. Shoenfeld and L. J. Kaetzel, 54 pages (June 1975); Order from NTIS as COM 75-11134.

A need for (p,n) cross sections for selected targets at lower energies, H. S. Alhwalawi, SP425, pp. 512-515 (Oct. 1975).

The measurement of thermal neutron constants of the soil: application to the calibration of neutron moisture gauges and to the pedological study of soil, P. Couchat, C. Carre, J. Marcesses, and J. Le Ho, SP425, pp. 516-519 (Oct. 1975).

A measurement of the fission cross section of $^{235}$U from 1 keV to 1 MeV, J. B. Czirr and G. S. Sidhu, SP425, pp. 546-548 (Oct. 1975).

The average number of prompt neutrons, $n_p$, from neutron induced fission of $^{235}$U between 0.2 and 1.4 MeV, F. Käppeler and R. E. Bandl, SP425, pp. 549-552 (Oct. 1975).

Monte Carlo analysis of direct measurements of the thermal eta (0.025 eV) for $^{232}$Th and $^{238}$U, J. J. Ullo and M. Goldsmith, SP425, pp. 553-556 (Oct. 1975).

Parameters of the subthreshold fission structure in $^{240}$Pu, G.
The total cross section and the fission cross section of $^{241}$Am in the resonance region, resonance parameters, H. Derrien and B. Lucas, SP425, pp. 637-641 (Oct. 1975).

Structures in $^{232}$Th(n,f) and $^{235}$U(n,f) cross sections, J. Blons, C. Mazur, and D. Paya, SP425, pp. 642-645 (Oct. 1975).

Nuclear data needs for fusion reactor design, D. Steiner, SP425, pp. 646-650 (Oct. 1975).

Model calculations as one means of satisfying the neutron cross section requirements of the CTR program, D. G. Gardner, SP425, pp. 651-658 (Oct. 1975).

A study of the $^7$Li(n,$^a$Li) reaction between 2-10 MeV, C. M. Bartle, SP425, pp. 688-691 (Oct. 1975).

Absolute cross sections for neutrons from $^4$Li + d reactions at energies between 0.2 and 0.9 MeV, A. J. Elwyn, R. E. Holland, F. J. Lynch, J. E. Monahan, and F. P. Mooring, SP425, pp. 692-696 (Oct. 1975).

Phase shift analysis of $^6$Li, $^7$Li, $^9$Li, $^10$B, $^11$B, $^12$C and $^13$C cross sections, C. Abulaffio and A. Peres, SP425, pp. 701-703 (Oct. 1975).

The $^{90}$Zr(n,$^a$Zr) and $^{90}$Zr(n,$^a$Nb) reaction for the CTR rector technology program, P. J. Persiani, E. M. Pennington, Y. D. Barker, and R. L. Heath, SP425, pp. 708-711 (Oct. 1975).

p-wave assignment of $^{238}$U neutron resonances, F. Corvi, G. Rohr, and H. Weigmann, SP425, pp. 733-737 (Oct. 1975).

Evidence for structure in the sequence of s-wave levels in $^{238}$U, E. Melkonian, J. P. Felvinci, and W. W. Havens, Jr., SP425, pp. 742-743 (Oct. 1975).

High resolution total neutron cross-section in $^{56}$Fe and $^{59}$Fe, M. S. Pandey, J. B. Garg, J. A. Harvey, and W. M. Good, SP425, pp. 748-753 (Oct. 1975).

Thick sample transmission measurement and resonance analysis of the total neutron cross section of iron, S. Cierjacks, G. Schmalz, R. Töpke, R. R. Spencer, and F. Voss, SP425, pp. 754-757 (Oct. 1975).

Analyzing powers of the $^3$Li(n, t)$^4$He reaction, M. Karim and J. C. Overley, SP425, pp. 788-791 (Oct. 1975).

Evidence for valence neutron capture in s-wave neutron capture in $^{36}$Ar and $^{54}$Fe, S. F. Mughabghab, SP425, pp. 795-798 (Oct. 1975).

Measurements of thermal neutron cross sections for helium production in $^{20}$Ni, J. McDonald and N. G. Sjöstrand, SP425, pp. 810-812 (Oct. 1975).

Measurement of (n, 2n) and (n, 3n) cross-sections for incident energies between 6 and 15 MeV, J. Fréhaut and G. Mosinski, SP425, pp. 855-858 (Oct. 1975).

Inelastic neutron excitation of the ground state rotational band of $^{204}$Pb, P. Guenther and A. Smith, SP425, pp. 862-865 (Oct. 1975).

Differential elastic scattering cross sections of sulphur for 14.8

Measurement of the y-ray production cross sections from inelastic neutron scattering in some chromium and nickel isotopes between 0.5 and 10 MeV, F. Voss, S. Cierjacks, D. Erbe, and G. Schmalz, SP425, pp. 916-919 (Oct. 1975).

y-ray spectra from $\lambda=1$ neutron capture near 24 keV, K. Rimawi and R. E. Chrien, SP425, pp. 926-928 (Oct. 1975).

Shape analysis and width correlation studies based on neutron capture data for $^{56}$Fe, $^{60}$Ni, $^{60}$Ni and $^{61}$Ni, F. H. Fröhner, SP425, pp. 929-933 (Oct. 1975).

y-ray production cross sections for neutron inelastic scattering from Cr, Ni, $^{92}$Zr, and $^{94}$Zr from 3 to 6 MeV, G. Tessler and S. S. Glickstein, SP425, pp. 934-937 (Oct. 1975).

Elastic and inelastic differential neutron scattering cross sections for $^{238}$U from 0.9-2.7 MeV, J. J. Egan, G. H. R. Kegel, G. P. Couchell, A. Mittler, B. K. Barnes, W. A. Schier, D. J. Pul-

Operations Analysis and Applications

NBSIR 74-521. HATCH — A model for fish hatchery analysis, F. 
C. Johnson. 73 pages (July 8, 1974). Order from NTIS as 
COM 75-10187.

NBSIR 74-522. First interim report on salmon fishery modelling, 
F. C. Johnson, 21 pages (July 8, 1974). Order from NTIS as 
COM 75-10080.

NBSIR 74-602. Efficient methods of extreme-value methodology, 
J. Lieblein. 32 pages (Oct. 1974). Order from NTIS as COM 
75-10048.

NBSIR 74-624. The Shirley Highway Express-Bus-on-Freeway 
Demonstration Project. A study of reverse commute service, R. 
Waksman. 44 pages (Dec. 1974). Order from NTIS as COM 
75-10412.

NBSIR 75-665. Point-to-Point Trip Management Program 
(preliminary analysis), W. G. Kienstra and D. J. Minnick, 26 
pages (Feb. 7, 1975). Order from NTIS as COM 75-10421.

NBSIR 75-745. A model for salmon fishery regulatory analysis, 
F. C. Johnson, 33 pages (July 10, 1975). Order from NTIS as 
PB247657.

NBSIR 75-783. Validation of the DELCAP airport simulation 
model, J. F. Gilsinn, 167 pages (July 1975). Available from the
Processing and Performance of Materials

15346. Yakowitz, H., Use of divergent-beam x-ray diffraction to measure lattice expansion in LiF as a function of thermal-neutron dose up to 6·10^-6 nvt, J. Appl. Phys. 43, No. 11, 4793-4794 (Nov. 1972).

Properties of Materials: Thermodynamic and Transport

Standard Reference Data

Activity by the International Organization for Standardization with respect to standard reference materials, F. L. LaQue, SP408, pp. 68-73 (Mar. 1975).

Calibration and test materials for physicochemical measurement, H. Kienitz, SP408, pp. 118-126 (Mar. 1975).

Selection criteria of a material as standard reference material and steps for certification, G. Milazzo, SP408, pp. 127-145 (Mar. 1975).

National RM program in Germany (FRG), R. J. A. Neider, SP408, pp. 167-188 (Mar. 1975).

The current status of SRM activities in Japan, T. Tsuchiya, SP408, pp. 189-200 (Mar. 1975).

National SRM programs in Poland, T. Plebanski, SP408, pp. 201-223 (Mar. 1975).

The SRM story at NBS, R. E. Michaelis, SP408, pp. 246-257 (Mar. 1975).

Chemical composition control problems and solutions related to metals and alloys, R. S. Cremisio, SP408, pp. 275-297 (Mar. 1975).

Measurement problems in physical and mechanical properties of industrial metals and the use of SRM's, J. Convey, SP408, pp. 298-319 (Mar. 1975).

Industrial SRM needs and measurement problems in inorganic materials—chemical properties, V. A. Stenger, SP408, pp. 336-354 (Mar. 1975).

SRM needs and measurement problems in science—chemical properties, T. W. Mears, SP408, pp. 395-410 (Mar. 1975).

Surfaces and Interfaces

NBSIR 74-398. Provisional values for the thermodynamic functions of ethane, R. D. Goodwin, 342 pages (June 1, 1974). Order from NTIS as COM 75-10130.

NBSIR 74-600. Thermodynamics of chemical species important to rocket technology, C. W. Beckett, 200 pages (Oct. 1, 1974). Order from NTIS as ADA008935.

NBSIR 75-763. Thermodynamic and transport properties of ethylene and propylene, I. A. Neduzhii, Author), 210 pages (June 1972). Order from NTIS as COM 75-11276.

NBSIR 75-770. The equation of state for ammonia, L. Haar and J. Gallagher, 27 pages (Sept. 1975). Order from NTIS as COM 75-11370.

15244. Herron, J. T., Huie, R. E., Rate constants for the reactions of ozone with ethene and propene, from 325.0 to 362.0 K, J. Phys. Chem. 78, No. 21, 2085-2088 (1974).

Technology Incentives

NBSIR 75-721. Economic objectives of utility companies and developers in evaluating a MUS, B. J. Bartter, 39 pages (Nov. 1975). Order from NTIS as PB246864.

Other Subjects of General Interest

The role of the public in the evaluation process, G. Chernoff, TN888, pp. 34-37 (Nov. 1975).

Assessing environmental effects, the risk and benefit concept, B. E. Leonard, TN888, pp. 38-45 (Nov. 1975).

Radiation utilization in medicine and biology, V. P. Bond, TN888, pp. 50-61 (Nov. 1975).

Projected national and regional manpower needs for environmental and nuclear scientists, R. L. Murray, TN888, pp. 77-80 (Nov. 1975).

Educational opportunities at institutions of higher learning, D. Duffy, TN888, pp. 81-84 (Nov. 1975).

NBSIR 75-785. The review of standardization and measurement services at the Ecuadorian Institute for Standardization, R. Estrada and H. S. Peiser, 17 pages (June 27-29, 1974). Order from NTIS as PB246345.

6. INDEXES

6.1 HOW TO USE THE INDEXES

In addition to the usual author index, a subject index is provided in the form of a permuted key word index. In this type of index the key words in each publication or paper are arranged by shifting each group of key words along the horizontal printing line so that each key word in turn has an opportunity to appear alphabetically. The user is thus able to locate papers of interest to him through the subject-related words he finds in the key word index.

The index symbols used in the author and key word indexes are explained in the following three tables. These tables also give the pages on which the abstracts of the various publication series begin.

Table A. Symbols for the Periodicals

<table>
<thead>
<tr>
<th>NBS Journal of Research</th>
<th>Index Symbol</th>

G

6.3. KEY WORD INDEX

A
Ab initio calculation; level shifts; line broadening; molecular oxygen; predissociation; spin-orbit matrix elements; 15053.
Ab initio calculations; atomic negative ions; binding energy; electron affinity; excited states; experimental methods; fine structure splitting; recommended values; semiempirical calculations; J. Phys. Chem. Ref. Data 4, No. 3, 539-576 (1975).
Abatement; barrier materials; building materials; housing; lead-based paint; lead poisoning; paint removal; NBSIR 75-761.
Abatement; detection; heat-guns; lead paint; materials evaluation; performance specification; rehabilitation; renovation; 15591.
Aberration integrals; asymptotic aberration coefficients; electron lenses; strong lenses; third-order aberration coefficients; two-tube electrostatic lens; weak lenses; 14817.
Aberration integrals; asymptotic aberration coefficients; electron optics; electrostatic lens; third-order aberration coefficients; two-tube lens; 14974.
Aberrations; aspheric optics; ellipsoidal reflector; Fermat’s principle; Hamiltonian point characteristic; limiting aperture; unit magnification; 14840.
Abnormal loading; building; gas explosion; load-bearing masonry; load-bearing walls; masonry; masonry research; progressive collapse; NBSIR 74-526.
Abrasion; brittle solids; brittle surfaces; chipping; fracture; hardness; indentation; residual stress; stress analysis; wear rate; NBSIR 75-659.
ABS; cast iron; copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC; smoke; toxic gases; vent; waste; NBSIR 74-449.
ABS; coefficient of expansion; CPVC; glass transition temperature; hardness; PB; polybutene; polyvinyl chloride; PVC; residual stress; thermoplastic piping; NBSIR 74-629.
ABS; DWV; fire endurance; fire spread; fire test; gases; plastic pipe plumbing; PVC; smoke; BSS72.
Absolute cross section; beam profile; electron scattering; scattering angle; solid angle; spectrometer; TN871.
Absolute cross section measurements; manganese bath; neutron cross sections; photoneutron sources; surface barrier detectors; $^4\text{Li}(\gamma,\alpha)$; SP425, pp. 236-239.
Absolute efficiency determination; cross section measurements; neutron detector; SP425, pp. 108-111.
Absolute efficiency of fast neutron detectors; SP425, pp. 66-68.
Absolute farad; absolute ohm; calculable capacitor; cross capacitor; electrical units; farad; ohm; units; 14927.
Absolute fission rates; neutron dosimetry; reactor fuels; reactor materials; 15239.
Absolute frequency measurements; laser frequency synthesis; xenon laser; 15014.
Absolute frequency measurements; laser frequency synthesis; water vapor laser; 15534.
Absolute ohm; calculable capacitor; cross capacitor; electrical units; farad; ohm; units; absolute farad; 14927.
Absolute radiation detector; absorption measurements; filters; GM counter; sensitive detector; vacuum ultraviolet; absolute radiation detector; 14903.
Absolute radiative capture cross sections; keV energy range—Na$^{23}$, Cr, Mn$^{54}$, Fe, Ni, Rh$^{103}$, Ta, U$^{238}$; SP425, pp. 953-956.
Absolute ratios; atomic weight; isotopic abundance; potassium; reference standard; J. 79A No. 6, 713-725 (1975).
Absolute ratios; atomic weight; isotopic abundance; silicon; J. 79A No. 6, 727-735 (1975).
Absolute (unambiguous) readout; piston; precision attenuator; sensor; waveguide-below-cutoff; NBSIR 74-394.
Absolute values; fluctuations; Monte Carlo calculations for corrections; total energy weighting technique; $\delta$ββ detector; SP425, pp. 957-960.
Absorbed dose; calorimeter; dosimetry; electrons; ionization chamber; radiation standard; 15471.
Absorbed dose; cell survival; heavy particles; OER; radiotherapy; SP425, pp. 533-539.
Absorbed dose; dosimetry; electrons; ionization chambers; standards; stopping power ratio; 15579.
Absorbed dose; intercomparison; kerma; neutron dosimetry; neutron radiobiology; neutron therapy; 15540.
Absorbed dose rate; calorimetry; chemical dosimetry; electron beams; gamma radiation; radiation dosimetry; radiographic dyes; 15482.
Absorbed dose rate; cellulose triacetate; dosimetry; dyed cellulose; dyed plastics; electron beams; gamma radiation; plastic films; polymethyl methacrylate; polyvinyl chloride; radiation processing; radiographic dyes; 15278.
Absorbed dose rate; depth dose; dose distribution; dye films; electron beams; optical cell; pulse radiolysis; radiation dosimetry; radiographic dyes; 15277.
Absorptance; calorimeter; cavity; laser energy measurements; laser power measurements; radiometry; 15033.
Absorption; bremsstrahlung; electrons; ions; laser; plasma; 15532.
Absorption; drying; phosphorous pentoxide; water vapor; NBSIR 74-631.
Absorption coefficients; barothermal behavior; Green’s function; heat diffusion; weakly absorbing materials; J.79A No. 5, 639-648 (1975).
Absorption cross section; chlorine atom; dichlorofluoromethane; freons; photochemistry; quantum yields; stratosphere; trichlorofluoromethane; 15571.
Absorption measurements; filters; GM counter; sensitive detector; vacuum ultraviolet; absolute radiation detector; 14903.
Absorption spectra; force constants; HBS; infrared; molecular spectra; spectra; thioborine; 15000.
Absorption spectra; infrared; molecular energy levels; ozone; pollution spectra; 15311.
Absorption spectroscopy; air pollution; laser; NO$_2$; 15101.
Absorption spectrum; accidental predissociation; carbon monoxide; emission spectrum; perturbation; Rydberg state; 15386.
Absorption spectrum; barium; heat pipe; inner shell excitation; shape resonance; two-electron excitations; 14989.
Abstracts, NBS publications; key words; publications; SP305. Supplement 6.
Abuse testing; dynamic stability; hazards; obstruction; riding toys; stairway; static stability; test weight; tilt angle; toy testing; NBSIR 74-623.
Ac DRRS; coaxial cable effects; coaxial star connectors; extrapolation techniques; four-pair admittances; permutation techniques; precision admittance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; 14924.
Ac impedance; calcium apatites; calcium hydroxide; crystal growth; electrolysis; interfacial polarization; ionic conduction;
frequency; frequency stability; frequency stability analysis; models of frequency stability; picosecond time difference measurements; TN669.

Accurate measurement in clinical chemistry; clinical chemistry; clinical reference materials; standardization; accuracy; 15573.

Accurate time measurement; frequency; frequency stability; frequency stability analysis; models of frequency stability; picosecond time difference measurements; accurate frequency measurement; TN669.

Ace type pin tumbler lock; cheek plate tamper resistance; salt spray corrosion resistance; warded lock; 14959.

Acetanilide; bomb calorimetry; calorimetry; chlorobenzoic acid; combustion; creatinine; fluorobenzoic acid; nicotinic acid; reference materials; thermochemical; thermochemical standards; thianthren; urea; 15441.

Acetylene; bond dissociation energy; bromoacetylne; C₂; C₃H; fluorescence; photodissociation; vacuum ultraviolet; 14986.

Acetylene; discharge; ethyl (HC₂); infrared spectrum; interstellar molecule; matrix isolation; structure; vacuum ultraviolet photolysis; 15003.

Acoustic centers; attenuation of sound; sound absorption; 15222.

Acoustic emission; beam-lead bonds; boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; incremental sheet resistance; measurement methods; SP400-12.

Acoustic emission; calibration of transducers; electrostatic transducers; Lamb's problem; seismic pulses; ultrasonic transducers; 14960.

Acoustic facilities; accelerators; calorimeters; electrical measurements facilities; high pressure facilities; high temperature facilities; spectroscopy facilities; SP413.

Acoustic navigation aids; applied psychoacoustics; applied psychology; aversiveness; foghorns; preference; pure tones; 14821.

Acoustic phonons; lattice sodium-chloride; translational dynamics; 15692.

Acoustical holography; acoustical measurement; paraholography; reverberation chambers; sound propagation; acoustics; 14796.

Acoustical measurement; paraholography; reverberation chambers; sound propagation; acoustics; acoustical holography; 14796.

Acoustical measurements; acoustics; noise measurement; reverberation chambers; sound energy measurement; sound power measurement; 14786.

Acoustical measurements; acoustics; national measurement system; noise; noise control; noise emission; sound; 15500.

Acoustical measurements; acoustics; impact noise; noise emission; reverberation rooms; sound transmission; 15501.

Acoustical thermometry; fixed points; lead and indium transition temperatures; low temperature fixed points; low temperature thermometry; superconducting transition temperatures of lead and indium; 15697.

Acoustics; acoustical holography; acoustical measurement; paraholography; reverberation chambers; sound propagation; 14796.

Acoustics; air compressor; internal combustion engine; noise; sound power level; sound pressure level; NBSIR 75-653.

Acoustics; air infiltration; air leakage; architectural acoustics; building acoustics; doors; energy conservation; heat loss from buildings; heat transfer; sound transmission loss; thermal resistance; thermal transmittance; windows; BSS77.

Acoustics; automobile; noise (sound); tire noise; transportation noise; 15312.

Acoustics; electroacoustic transducers; near-field measurements; 14900.

Acoustics; human factors; human occupancy; illumination; interdisciplinary approach; physiology; psychology; 15364.

Acoustics; impact noise; noise emission; reverberation rooms; sound transmission; acoustical measurements; 15501.

Acoustics; machinery noise; noise; sound; sound power; 15217.

Acoustics; military vehicles; noise; sound; tire noise; truck tires; 14875.

Acoustics; national measurement system; noise; noise control; noise emission; sound; acoustical measurements; 15500.

Acoustics; noise; precision; repeatability; reproducibility; accuracy; 14866.

Acoustics; noise; sound; 15420.

Acoustics; noise measurement; noise (sound); railroad yard; trains; NBSIR 74-488.

Acoustics; noise measurement; reverberation chambers; sound energy measurement; sound power measurement; acoustical measurements; 14786.

Acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning; 14873.

Acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning; 14874.

Acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; truck; urban planning; 15002.

Acoustics; noise (sound); tire noise; transportation noise; 15206.

Acoustics (sound); environmental acoustics; instrumentation; noise monitoring; outdoor noise; NBSIR 75-962.

Acquisition; CODASYL; computer; data base management; designers; evaluation; selection; users; 15668.

Acrolein; gas chromatography analysis; gas dilution system; occupational safety; NBSIR 73-258.

Acrylic resin; cement; medical materials; orthopedic materials; polymethylmethacrylate; self-curing; surgical bone cement; total hip replacement; cement; 15164.

Actinide; cross sections; fission; SP425, pp. 202-213.

Actinide burnup; cross section sets; neutron spectrum; transplutonium; waste management; yield; SP425, pp. 214-217.

Actinide fuel; fertile material, and wastes; recycle concept; transuranium element production; waste recycling in a ²³³U-²³²Th reactor; SP425, pp. 222-223.

Actinide management; neutron capture cross sections; Pu isotopes; ²³⁴Am; SP425, pp. 229-231.

Actinide nuclide; fast-neutron-induced fission; fission; fission fragment; fission product; kinetic energy; mass yield; prompt neutron; scission point; statistical theory; SP425, pp. 342-345.

Actinides; Coulomb term; energy; excitation energy; metal; 5f electron; 15129.

Activated carbon; air sampling; gas standards; industrial hygiene; NBSIR 74-530.

Activation; Apollo; background; computation; decay-schemes; cross-sections; scintillators; spacecraft, gamma-rays; spallation; SP425, pp. 480-483.

Activation; capture techniques; high resolution methods; Moxon-Rae; review; total absorption; SP425, pp. 139-148.

Activation analysis; characterization; chemical composition; chromatographic analysis; coulometry; electron probe microanalysis; ion-selective electrodes; mass spectrometry; polarography; spectrochemical analysis; thermal analysis; wet chemistry; x-ray fluorescence; 15165.

Activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; radiation; radiography; TN860.

Activation analysis; Ge(Li) detector; solvent extraction; 15459.

Activation cross-section; bone mineral; in vivo neutron-activa-
Adjoint: Hilbert's Theorem 90; involution; normal; similar; spectrum; unitary; 14891.
Adjustable: lens holder; 15034.
Adjustment: critical assemblies; cross sections; evaluation; integral data; sensitivities; uncertainties; SP425, pp. 405-408.
Activation energy; ammonium-ion dynamics; ammonium perchlorate; jump reorientations; quasi-elastic neutron scattering; residence times; 15109.
Activation energy; compensation; epitaxial gallium arsenide; high energy neutron; impurity conduction; reciprocal Hall coefficient; transition regime; **6Co gamma; 15375.
Activation energy; hydrogen diffusion; neutron scattering; quasi-elastic scattering; resonance time; tantalum hydrides; vibrational amplitude; 15264.
Activation method; group constants; iron; neutron spectrum; one-dimensional transport calculation; stainless steel; time-of-flight; SP425, pp. 184-188.
Activity measurement; cross sections; fission spectrum; neutron source; scattering corrections; threshold detectors; SP425, pp. 273-276.
Actual system performance; computer performance evaluation; performance prediction; simulation; software validation; tools; SP406, pp. 79-82.
Acutance; calibration; computer programs; microdensitometry; photographic edges; transfer function; NBSIR 75-699.
Acutance; identification (faces); image quality; Modulation Transfer Functions; 15316.
Acylated 1,1-bis(acylamido)-1-deoxypentitolis; conformational analysis; conformational nomenclature; exponential filtering; Fourier transform; p.m.r. spectroscopy; 15268.
Adapter; automation; calibration; microwave; 14954.
Adapter; automation; efficiency; microwave; microwave measurement; network analyzer; 14826.
Adaptive control; cerebellum model; control theory; manipulator control; Perceptron; 15428.
Additive; deformation; dental; porcelain; properties; 14977.
Adenosine-5'-triphosphate; biochemistry; enzyme catalyzed reactions; glucose; heat measurements; hexokinase; metabolic processes; microcalorimetry; thermochrometry; thermodynamics; 15174.
Adhesion; adhesive restoratives; bonding to teeth; dental cements; dental sealants; reactivity of tooth surfaces; 14943.
Adhesion; bonding; composites; coupling agents; monomers; polymers; primers; sealants; 15374.
Adhesion failure; cohesive failure; polymeric bond failure; scanning electron microscopy (SEM); x-ray photoelectron spectroscopy (ESCA); 15283.
Adhesive bonding; aging tests (materials); composite materials; glass fibers; housing system; laminates; reinforced plastics; shear strength; sustained loading; tensile strength; 15624.
Adhesive bonding; chelation; cocomomers; coupling agents; dental materials; hard tooth tissues; metal ions; mordant; 15161.
Adhesive materials; composites; dental materials; polymer grafting; resins; restorative materials; sealants; wear resistance; NBSIR 75-766.
Adhesive restoratives; bonding to teeth; dental cements; dental sealants; reactivity of tooth surfaces; adhesion; 14943.
Adhesively bonded joints; composite materials; composite-overlay reinforcement; contour plotting; cracks; reinforcement of; cutouts; reinforcement of; finite element analysis; joints; adhesively bonded; reinforcement, composite overlay; reinforcement, cutouts and cracks; 15508.
Adiabatic calorimetry; branched polyethylene; calorimetry; cryogenic temperature; heat capacity; linear polyethylene; polyethylene; thermodynamic properties; J.79A No. 2, 437-441 (1975).
Adjoint; annihilation; buildup factor; concrete; gamma radiation; moments; 14940.
Adjoint; concrete; gamma-ray penetration; moments; neutron penetration; secondary gamma rays; 15453.
Alloy phases; constitution diagrams; noble metals; phase diagrams; phase equilibria; platinum group metals; NBSIR 73-115

Alloys; contact term; core polarization; exchange enhancement; Knight shifts; LaNi₅; LaNi₅₋ₓPₓ; LaPt₅; NMR; ordering; relaxation times; solid solutions; I4889

Alloys; Cu; hyperfine fields; magnetism; Mn; Mössbauer effect; Ni; Sb; Pd; 15016

Alpha particles; cross sections; deuterons; neutrons; phase shifts; tritons; SP425, pp. 701-703

Alpha particles; cross section; helium; nickel; neutron; spectrum; SP425, pp. 810-812

Alternating tensor; Capelli's identity; Cartesian tensor; group representation; invariant; isotropic tensor; Kronecker delta; orthogonal group; tensor; algebra; J.79B Nos. 1 and 2. 49-58 (1975).

Aluminium; aluminium alloys; bulk modulus; compressibility; Debye temperature; elastic constants; elasticity; Poisson ratio; pulse-echo method; sound velocity; Young's modulus; 15528

Aluminium alloys; bulk modulus; compressibility; Debye temperature; elastic constants; elasticity; Poisson ratio; pulse-echo method; sound velocity; Young's modulus; aluminium; 15528

Aluminum point; calibration; freezing point; freezing-point cell; platinum resistance thermometer; tin point; zinc point; 15337

Aluminum; analysis; business; differential cathode ray polarography; iron; lead; nickel; orchard leaves; 15344

Aluminum; ducts; fire tests; flexible connectors; furnace pressures; glass fiber; heat ventilating and air conditioning systems; high-rise buildings; optical density; steel; terminal units; NBSIR 75-673

Aluminum; field emission; tungsten; work function; 14780

Aluminum; flame emission spectrometry; interferences; repetitive optical scanning; 14901

Aluminum; spectra; wavelengths; 15008

Aluminum alloy; bulk modulus; compressibility; Debye temperature; elastic constant; nickel steels; Poisson's ratio; shear modulus; sound velocity; Young's modulus; 15522

Aluminum alloys; bulk alloy samples; casting; directional solidification; rapid quenching; 14973

Aluminum oxide; electrical conductivity; high temperature; ionic charge transport; 15402

Aluminum ultrasonic standards; ASTM-type reference blocks; fabrication of reference blocks; immersion testing; longitudinal waves; metallurgical variables; nondestructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics; NBSIR 73-685

Aluminum wire; consumer product safety; electrical failures; electrical fires; electrical wiring; fire hazards; NBSIR 75-677

Aluminum wire; consumer product safety; current cycle testing; electrical connection failure; electrical receptacles; residential wiring; NBSIR 75-723

Al₂O₃; chemical doping; complex equilibria; purification (evaporative); vacuum vaporization; 15333

AM General Bus; arson; critical radiant flux; fire retardant; flammability; flooring radiant panel test; Metro; motor vehicle safety standard 302; urethane; NBSIR 75-718

Ambient concentration; chemiluminescent measurement; continuous monitor; strong acid aerosols; 15397

Ambient temperatures; dislocation mechanisms; fracture mechanics; sapphire; slow crack growth; thermal activation; 15122

Ambiguities; geometrical; indexing; patterns; powder diffraction; 15572

American National Standards Institute; Computer Society of the IEEE; Data Communication Standards; Electronics Industries Association; International Standards Organization; International Telecommunications Union; 15200

American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data in-
terchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; FIPS PUB 35.
American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; FIPS PUB 36.
Amino sugars; chemical shifts; magnitude spectra; nitrogen-15 nuclear magnetic resonance spectroscopy; nuclear Overhauser effects; 15236.
Ammonia; correlation; gas; liquid; thermodynamic properties; thermodynamic surface; NBSIR 75-770.
Ammonia; dissociative photoionization; NH\textsuperscript{2+}, OH\textsuperscript{-}; photoionization; threshold energies; water; 15352.
Ammonium bromide; ammonium ion; neutron scattering; orientational disorder; reorientation; residence time; single crystal; 15032.
Ammonium ion; neutron scattering; orientational disorder; reorientation; residence time; single crystal; ammonium bromide; 15032.
Ammonium perchlorate; jump reorientations; quasi-elastic neutron scattering; residence times; activation energy; ammonium-ion dynamics; 15109.
Ammonium perchlorate; lattice dynamics; Raman scattering; structure; 15701.
Ammonium-ion dynamics; ammonium perchlorate; jump reorientations; quasi-elastic neutron scattering; residence times; activation energy; 15109.
Amorphous alloys; amorphous magnetism; coercive magnetic force; magnetic structure; neutron diffraction; recrystallization; terbium-iron; 15297.
Amorphous component; fold surface; polymer crystals; regular folds; adsorbed layer; J. 79A No. 5; 613-617 (1975).
Amorphous magnetism; coercive magnetic force; magnetic structure; neutron diffraction; recrystallization; terbium-iron; amorphous alloys; 15297.
Amorphous materials; magnetic materials; neutron diffraction; rare earths; 15388.
Amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; mine noise; NBSIR 74-391.
Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; fishery modeling; modeling; salmon; salmon fishery; salmon information system; Washington State Fisheries; NBSIR 75-796.
Anaerobic corrosion; cathodic depolarization theory; Charles Thom Award; Desulfovibrio desulfuricans; hollow whiskers; mechanism; microbial corrosion; mild steel; oxidizing agent; Schreiber'site; sulfate-reducing bacteria; Vivanite; 15233.
Analog states; electron scattering; inelastic electron scattering; particle-hole model; resonance energy; \(^{14}\text{C}\); 14729.
Analog-to-digital conversion; digital; electricity; electric power; measurement; sampling; wattmeter; 14878.
Analog-to-digital conversion; digital; electricity; electric power; measurement; sampling; simulation; wattmeter; TN870.
Analysis; application; concrete; feasibility; gamma rays; neutrons; SP425, pp. 496-499.
Analysis; assay in serum; bacterial growth calorimetry; enzyme catalyzed processes; glucose; microcalorimetry; serum thermochromy of enzyme processes; 14898.
Analysis; biological and botanical samples; differential linear sweep voltammetry; environmental samples; fossil fuels; lunar samples; 15427.
Analysis; biological materials; chloroform; chromium; environ-
ment materials; neutron activation; radiochemical separation; solvent extraction; tribenzylamine; 15409.
Analysis; business; differential cathode ray polarography; iron; lead; nickel; orchard leaves; aluminum; 15344.
Analysis; characterization; composition; General Materials; properties; Research Materials; Standard Reference Materials; SP260, 1975-76 Edition.
Analysis; clinical chemistry; glucose; microcalorimetric; thermochromy; 15319.
Analysis; construction; cost; design; economics; flexibility; law enforcement facilities; performance; planning; present value analysis; 14961.
Analysis; cross sections; evaluation; information; processing; radiation; shielding; SP425, pp. 363-366.
Analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization; nuclear materials safeguards; safeguards; 15048.
Analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization; nuclear materials safeguards; safeguards; 15049.
Analysis by Monte Carlo; angular dependence; deep penetration of neutrons in Fe + H shield; measured neutron spectra; shielding; \(^{238}\text{U}(p,xn), E_p = 800 \text{ MeV}; SP425, pp. 476-479.
Analysis of biological processes; economic performance; fisheries management; fisheries regulation; mathematical models; salmon fisheries model; NBSIR 74-522.
Analysis of toxic materials; atmospheric analysis; industrial hygiene; reference materials; NBSIR 73-256.
Analytic functions; functional equations; Hurwitz's theorem; 15563.
Analytical; anemometer; dynamic response; experimental; lag; unsteady flow; air; NBSIR 75-772.
Analytical; computer systems modeling; end users; performance; SP406, pp. 123-126.
Analytical chemistry; computer; data acquisition; laboratory automation operating system; teleprocessor; 15136.
Analytical chemistry; computers; data acquisition; data processing; fluorimetry; laboratory automation; real-time; TN857.
Analytical models; evaluation; measurement; networks; performance; quotes; SP406, pp. 119-121.
Anchor; controls; corrosion; growth; metering; modern; museum; primary; reliability; renovation; secondary; system; variable; BSS66, pp. 102-115.
Anechoic chamber evaluation; omni-directional probe; reflectivity; three-dimensional scanning; 14952.
Anelastic relaxation; calcium fluoride; defect pairs; dielectric relaxation; epr lifetime broadening; fluoride interstitials; gadolinium ions; reorientation processes; 15121.
Anemometer; dynamic response; experimental; lag; unsteady flow; air; analytical; NBSIR 75-772.
Anger positron camera; lung function; radioactive tracers; SP425, pp. 469-471.
Angle; dimension; logarithm; neper; radian; J. 79B Nos. 3 and 4; 127-135 (1975).
Angle-plied laminates; boron/epoxy; composite materials; creep; viscoelasticity; linear and nonlinear; 15626.
Angular aperture; computer optimization of electron optics; electron beam transport; electron energy analyzers; field aperture; 15423.
Angular dependence; deep penetration of neutrons in Fe + H shield; measured neutron spectra; shielding; \(^{238}\text{U}(p,xn), E_p = 800 \text{ MeV}; analysis by Monte Carlo; SP425, pp. 476-479.
Angular distribution; asymmetry; photoionization; rare gases; 15299.
Angular distribution; inelastic scattering; proton emission; scattered neutron; SP425, pp. 350-353.
Angular distribution; 2-10 MeV; \(^{4}\text{Li}(n,\alpha); SP425, pp. 688-691.
Appliance: bone cement; computer; energy: energy labels; fire fatalities; hydrogen fuel; magnetohydrodynamics; metric changeover; safety: air conditioners; DSIN/BBS 59, No. 6, 121-144 (1975).

Application: charged particle; cross section; emission; neutron techniques; SP425, pp. 156-160.

Application: concrete; feasibility; gamma rays; neutrons; analysis; SP425, pp. 496-499.

Application of nuclear cross section; Monte Carlo method; 14 MeV neutron shielding; SP425, pp. 426-430.

Application of standards: basic standards; cesium standards; frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; time standards; 14830.

Application procedures: built-up roofing systems; composite membrane; composition; performance criteria; 15620.

Applications: chemical analysis; microwave; qualitative analysis; quantitative analysis; rotational spectra; 15261.

Applications: chemical analysis; microwave; qualitative analysis; quantitative analysis; rotational spectra; 15625.

Applications: material detection; nuclear quadrupole resonance; piezometry; thermometry; 15475.

Applications of decay data; ENDF/B-IV decay-data file; SP425, pp. 14-20.

Applications (optical, magnetic); electronic properties; oxides; 14876.

Applications to CTR; cross-section calculations; fast neutron reactions; gamma-ray production; ionizers; radiation widths; statistical model codes; SP425, pp. 651-658.

Applied psychoacoustics; applied psychology; aversiveness; foghorns; preference; pure tones; acoustic navigation aids; 14821.

Applied psychology; aversiveness; foghorns; preference; pure tones; acoustic navigation aids; applied psychoacoustics; 14821.

Applied research; building codes; building design; building standards; diffusion of information; regulation; 15655.

Approximation; asymptotics; asymptotic theory; error analysis; ordinary differential equations; turning points; 15414.

Aqueous solution; chemical kinetics; data compilation; hydrated electron; radiation chemistry; rates; NSRDS-NBS43. Supplement.

Aqueous solution; chemical kinetics; data compilation; hydrogen atom; radiation chemistry; rates; NSRDS-NBS51.

Ar; atoms; autoionizing; cross sections; electron impact; excitation; He; inelastic; Ne; 15586.

Aradim fiber; composites; cryogenic; epoxy; glass fiber; thermal conductivity; 15021.

Arbacia punctulata; calorimetry; cleavage of cells; development of cells; fertilization; growth of cells; heat production; marine eggs; metabolism; microcalorimetry; 15151.

Arc; calibrations; hydrogen; plasma; radiometry; spectral radiation; vacuum ultraviolet; wall-stabilized; 15291.

Arc; experimental; oscillator strengths; Ti I; Ti II; Ti III; 15023.

Arc; f-values; iron and oscillator strengths; 14763.

Arc; hydrogen; negative ion; plasma; resonance; vacuum ultraviolet; 15652.

Arc plasma; iron; lifetimes; oscillator strength; transition probabilities; wall-stabilized arc; 15411.

Archaeological materials; Egyptian glasses; galena ores; kohl; lead isotopes; Ptolemaic and Roman Periods; 14912.

Archaeology: isotopic ratios; Laurion; lead; mass spectrometry; ores; 14918.

Architectural acoustics; building acoustics; doors; energy conservation; heat loss from buildings; heat transfer; sound transmission loss; thermal resistance; thermal transmittance; windows; acoustics; air infiltration; air leakage; BSS77.

Architectural psychology; dwelling unit; federal building research; industrialized housing; occupant behavior; Operational Breakthrough; performance evaluation; 15190.

Architectural research; daylight research; National Bureau of Standards; programs for architects; research communication; ALA/NBS Architect-in-Residence; 15606.

Architecture; bibliography; building; construction; design; law enforcement facilities; TN859.

Architecture; building; building codes; building design; disaster mitigation; earthquakes; engineering; environmental hazards; housing; inspection and testing; safety; TN885.

Archival language; archival quality; content decay; content density; content lifetimes; storage media; 15241.

Archival materials; natural aging; old paper; paper; aging of; paper; stability of; paper testing; stability of paper; aging of paper; NBSIR 74-501.

Archival quality; content decay; content density; content lifetimes; storage media; archival language; 15241.

Arctic; central heat distribution systems; construction materials; drainage; insulation; permafrost; seasonal frost; snow drifting; utilitores; ventilation; air leakage; BSS66, pp. 122-135.

Argon: Barker-Henderson perturbation theory; modified Enskog theory; thermal conductivity; transport properties; viscosity; 14775.

Argon; correlated molecular collisions; density expansions; fluoride; oxygen; statistical analysis; viscosity coefficient; 15141.

Argon; critical review; krypton; measurement technique; methane; self-diffusion coefficient; 14831.

Argon gas noise source; cross correlation; solid state noise source; stability measure; Allan variance; 15666.

Army Experiment Design Conferences; Dodd, E. L.; educational testing; history of mathematical statistics in the U.S.A.; Hotelling, Harold; likelihood-ratio tests; multivariate analysis; order statistics; Princeton University; Rietz, H. L.; 15513.

Aromatic amine; charge-transfer complexes; color; dental material; methacrylate, phthalate; N,N-dimethyl-p-toluidine; ultraviolet spectroscopy; 15158.

Aromatic hydrocarbons; gas chromatography; hydrocarbon analysis; partition coefficient; sea water; stripping cell; 14955.

Arrays; coordinate transformations; data processing; group representations; measurements; near field; non-planar; patterns; scanning; spherical; symmetry; antennas; NBSIR 75-809.

Arrays; Josephson junctions; microstriplines; microwave filters; voltage standard; 14941.

Arsine; calibration of devices; gas-blending systems; hydrogen fluoride; phosgene; 15592.

Arsine; gas-blending; Gutzeit method; spectrophotometry; NBSIR 73-260.

Arsine; infrared high resolution; perturbation-allowed transitions; resonances; secular determinants; spectra; structure; 14953.

Arson; critical radiant flux; fire retardant; flammability; flooring radiant panel test; Metro; motor vehicle safety standard 302; urethane; AM General Bus; NBSIR 75-718.

Artifacts; balance; computer; impermanence; intelligence; power; science; technology; 15199.

ASCII, coded character subsets; codes; data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets; FIPS PUB 35.

ASCII, coded character subsets; codes; data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets; FIPS PUB 36.

As-grown copper crystal; crystal perfection; Czochralski
growth; Lomer-Cottrell locks; sessile dislocations; x-ray topography; anomalous transmission; 14779.
ASHRAE 90-P; building codes; mobile homes; NCSBCS; SP429.
Aspheric optics; ellipsoidal reflector; Fermat's principle; Hamiltonian point characteristic; limiting aperture; unit magnification; aberrations; 14840.
Assay in serum; bacterial growth calorimetry; enzyme catalyzed processes; glucose; microcalorimetry; serum thermochemistry of enzyme processes; analysis; 14898.
Assistance; economics; foreign relations; industrializing nations; LDC's; measurement services; OAS; standardization; AID; NBSIR 75-769.
Associated matrices; Burnside theorem; irreducible representations; matrix groups; 15307.
Associated particle technique; neutron detector; neutron flux monitor; neutrons; neutron standards; T(p,n)He reaction; SP425, pp. 75-77.  
Association links; command language design; interactive user; language transformation; mental work; 15371.
ASTM, criteria; Federal Construction Council; interagency; prequalification; system performance; tri-service; underground heat distribution; BS566, pp. 73-77.
ASTM E 84; carpets; energy balance; flame spread; mass balance; test method; NBSIR 75-705.
ASTM E84; building materials; carpets; fire tests; flame spread tests; floor coverings; interlaboratory evaluation; smoke measurement; tunnel test; 15267.
ASTM-type reference blocks; fabrication of reference blocks; immersion testing; longitudinal waves; metallurgical variables; nondestructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics; aluminum ultrasonic standards; NBSIR 75-685.
Astronomy; cartography; geophysics; laser; lunar distance; moon; selenodyne; 14892.
Astrophysical production of Li, Be and B; E = 45 - 100 MeV; L = Li, Be, B; measured σ(E) for A = 6, 7, 9, 10, 11; nuclear reactions 12C(p,l); SP425, pp. 504-508.
Astrophysics; cross sections; fusion; reaction rates; thick targets; SP425, pp. 69-72.
Astrophysics; early-type stars; radiative transfer; spectral line formation; stellar atmospheres; 14751.
Astrophysics; energy loss; radiative transfer; spectral line formation; stellar atmospheres; 15489.
Asymmetric diffusion coefficients; diffusion in liquid crystals; lyotropic liquid crystal; 15288.
Asymmetric lineshapes; photoelectron spectroscopy; photoemission; x-ray edge singularities; 15133.
Asymmetric rotor levels; HO2; laser magnetic resonance; rotational constants; spectral assignments; spin splitting; Zeeman spectrum; 15067.
Asymmetric rotors; doublet states; HO2; laser magnetic resonance; least squares fit; rotational analysis; Zeeman spectrum; 14910.
Asymmetry; coexistence curve; compressibility; critical exponents; critical point; decorated lattice gas; hole-particle symmetry; law of corresponding states; liquid; Padé approximant; power law; slope of the coexistence curve diameter; 15293.
Asymmetry; photoionization; rare gases; angular distribution; 15299.
Asymptotic aberration coefficients; electron lenses; strong lenses; third-order aberration coefficients; two-tube electrostatic lens; weak lenses; aberration integrals; 14817.
Asymptotic aberration coefficients; electron optics; electrostatic lens; third-order aberration coefficients; two-tube lens; aberration integrals; 14974.
Asymptotic approximations; connection formulas; error bounds; ordinary differential equations; parabolic cylinder functions; turning points; wave scattering; Weber functions; 14946.
Asymptotic approximations; error bounds; Legendre functions; parabolic cylinder functions; turning points; Weber functions; 14947.
Asymptotic theory; error analysis; ordinary differential equations; turning points; approximation; asymptotics; 15144.
Asymmetric; asymptotic theory; error analysis; ordinary differential equations; turning points; approximation; 15144.
Atmospheric acoustics; infrasound; physiological effects of infrasound; 14800.
Atmospheric analysis; industrial hygiene; reference materials; analysis of toxic materials; NBSIR 73-256.
Atmospheric chemistry; chemical kinetics; data evaluation; gas phase; photodissociation cross section; photochemistry; quantum yield; rate constant; TN866.
Atmospheric physics; radiometric physics; radiometry; solar conversion; 14842.
Atom; autoionizing; collision; cross section; electron; experiment; positive ion; review; Rydberg states; 15536.
Atom; collision; Cs2; ion; Li2+; low energy; Na2+; pseudopotential; Rb+; resonant charge transfer; 15075.
Atom; dye laser; electric quadrupole; fine structure; ionization; multiphoton; sodium; 15149.
Atom transport; diffusion in crystals; kinetic diffusion equations; mechanism for diffusion; random walk; vacancies; 15421.
Atomic; inner shell; photoionization; quantum-mechanical; 15079.
Atomic; instrumental broadening; line shapes; line shifts; pressure broadening; resonance broadening; Stark broadening; van der Waals broadening; SP366-2.
Atomic absorption; atomic fluorescence; cobalt; interferences; iron; nickel; separations; 15577.
Atomic abundances; CN spectra; non-LTE molecular spectra; photospheres, stellar; radiative transfer; 15418.
Atomic and molecular data; chemical kinetics; colloid and surface properties; mechanical properties; nuclear data; solid state data; standard reference data; thermodynamic data; transport properties; TN881.
Atomic beam frequency standards; cavity phase shift; second order Doppler shift; accuracy evaluation; 14765.
Atomic beam frequency standards; cavity phase shift; accuracy evaluation; TN660.
Atomic clocks; cesium standards; hydrogen standards; hydrogen storage device; methane stabilized helium-neon lasers; noise studies; quartz crystal oscillators; quartz crystal resonators; accuracy; 14846.
Atomic clocks; clocks; crystal oscillator; frequency standards; stability; survey of clocks; accuracy; TN662.
Atomic clocks; frequency measurements; frequency stability; phase delay; precise time metrology; subpicosecond time difference measurements; time stability; 15684.
Atomic data; atomic energy levels; atomic line shapes; atomic spectra; data compilations; gas lasers; transition probabilities; 15300.
Atomic diffusion mechanisms; diffusion; random walk; review article; thermodynamic diffusion equations; vacancy diffusion mechanisms; 15539.
Atomic energy levels; atomic line shapes; atomic spectra; atomic transition probabilities; bands; molecular; energy levels; atomic; line shapes, atomic; molecular bands; molecular spectra; rotational constants; 15260.
Atomic energy levels; atomic line shapes; atomic spectra; data compilations; gas lasers; transition probabilities; atomic data; 15300.
Atomic energy levels; atomic spectrum; copper; doubly ionized copper; electron configuration; ionization potential; wavelengths; J79A No. 3, 497-521 (1975).

Atomic energy levels; N 1, N 11, N 111; multiplet tables; N 1, N 11, N 111; nitrogen spectra; N 1, N 11, N 111; spectra. N 1, N 11, N 111; NSRDS-NBS3. Section 5.

Atomic fluorescence; automatic scatter correction; cadmium; chemical interferences; data evaluation; precision; production of atomic vapor; zinc; accuracy: 15012.

Atomic fluorescence; cobalt; interferences; iron; nickel; separations; atomic absorption: 15577.

Atomic form factor; Compton scattering; cross sections; gamma rays; incoherent scattering function; photons; Rayleigh scattering; tabulations; x-rays; J. Phys. Chem. Ref. Data 4, No. 3, 471-538 (1975).

Atomic line shapes; atomic spectra; atomic transition probabilities; bands; molecular; energy levels; atomic; line shapes; atomic; molecular bands; molecular spectra; rotational constants; atomic energy levels; 155260.

Atomic line shapes; atomic spectra; data compilations; gas lasers; transition probabilities; atomic data; atomic energy levels; 155300.

Atomic negative ions; binding energy; electron affinity; excited states; experimental methods; fine structure splitting; recommended values; semiempirical calculations; ab initio calculations; J. Phys. Chem. Ref. Data 4, No. 3, 539-576 (1975).

Atomic oxygen; gas phase; kinetics; mechanism; organic compounds; rate constants; 15240.

Atomic physics; atomic structure; oscillator strengths; radiative transition probabilities; spectra: 14768.

Atomic spectra; atomic transition probabilities; bands; molecular; energy levels; atomic; line shapes; atomic; molecular bands; molecular spectra; rotational constants; atomic energy levels; atomic line shapes; 155260.

Atomic spectra; chlorine; halogens; photoionization: 14753.

Atomic spectra; data compilations; gas lasers; transition probabilities; atomic data; atomic energy levels; atomic line shapes; 155300.

Atomic spectra; ionization energies; lanthanides; spectra; rare earths: 15576.

Atomic spectroscopy; atomic vapor; chemical analysis; evaluation; interferences; light sources; precision; accuracy: 14888.

Atomic spectrum; copper; doubly ionized copper; electron configuration; ionization potential; wavelengths; atomic energy levels; J. 79A No. 3, 497-521 (1975).

Atomic structure; inner shell; N \( \pi \), \( \sigma \); resonance cross section profiles; spectroscopy; vacuum ultraviolet; xenon; 4d absorption: 15054.

Atomic structure; oscillator strengths; radiative transition probabilities; spectra; atomic physics: 14768.

Atomic transition probabilities; bands; molecular; energy levels; atomic; line shapes; atomic; molecular bands; molecular spectra; rotational constants; atomic energy levels; atomic line shapes; atomic spectra: 155260.

Atomic vapor; chemical analysis; evaluation; interferences; light sources; precision; accuracy; atomic spectroscopy: 14888.

Atomic weight; coulometry; electrochemical equivalent; zinc atomic weight: J. 79A No. 6, 737-745 (1975).

Atomic weight; coulometry; electrochemical equivalent; zinc atomic weight: J. 79A No. 6, 747-759 (1975).

Atomic weight; isotopic abundance; potassium; reference standard; absolute ratios; J. 79A No. 6, 713-725 (1975).

Atomic weight; isotopic abundance; silicon; absolute ratios; J. 79A No. 6, 727-735 (1975).

Atoms; autoionizing; cross sections; electron impact; excitation: He; inelastic; Ne; Ar: 15586.

Atoms; electron excitation; excitation transfer; gaseous electronics; lasers; molecules: 14849.

Atoms; stoichiometry; superconducting transition temperature; annealing temperature: 15327.

Attachment, low-temperature; radiation shield; temperature gradient; x-ray: 15242.

Attenuation; automated measurement; network analyzer; pulse; S parameters; time domain: 15661.

Attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters: NBSIR 74-395.

Attenuation; automated measurements; EM metrology; field strength; impedance; laser parameters noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; NBSIR 75-818.

Attenuation; automation; detector; insertion loss; microwaves; phase angle; ratio; six-port junction; vector voltmeter; voltage: 15649.

Attenuation; clay; gravel; measurements; microwave; skin depth; NBSIR 74-381.

Attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; TN672.

Attenuation; interlaboratory standard; measurement; rotary-vane attenuator; Monogr. 144.

Attenuation; microwave; phase angle; ratio; self-calibration; six-port; vector voltmeter; voltage: 15665.

Attenuation coefficient; compilation; Compton scattering; cross section; crystallography; photoelectric absorption; photons; Rayleigh scattering; x-rays: 14847.

Attenuation length; inelastic electron scattering; surface plasmons: 14984.

Attenuation of sound; sound absorption; acoustic centers: 15222.

Audio-frequency; bridge; four-terminal resistance; high current; operational amplifier; phase angle; resistance; transformer-ratio-arm: 14877.

Audiometric standards; building acoustics; community noise; earphones; environmental noise; instrumentation; measurement methodologies; microphones; psychoacoustics; reverberation room; sound level meters: 15502.

Audit; certification; code-independent; documentation; optimization; precision; run statistics; security; terminology; validation; warranty; accuracy; SP406. pp. 141-144.

Auger electron spectrometry; electron probe x-ray microanalysis; energy loss spectrometry; scanning electron microscopy; scanning transmission electron microscopy: 15030.

Auger electron spectroscopy; elemental depth profiling; ion microprobe mass analysis; ion optics; local thermal equilibrium (LTE); mineral analysis; secondary ion mass spectrometry (SIMS); surface analysis; SP427.

Auger spectroscopy; catalysis; infrared spectroscopy; kinetics; photoelectron spectroscopy; adsorption: 15318.

Au(n,y); C(n,n); H(n,n); neutron flux determination; standard cross sections; \(^{3}\)He(n,p); \(^{6}\)Li(n,a); \(^{10}\)B(n,a); \(^{33}\)U(n,f); \(^{237}\)Np(n,\(\alpha\)); SP425. pp. 293-301.

Austenite; iron alloys; stacking fault energy, stainless steel; x-ray diffraction: 15139.

Austenitic stainless steel; electrical resistivity; high temperature; low temperature; standard reference materials; thermal conductivity: SP260-46.

Authentication; computer networks; computer security; computer terminals; personal identification; access; access control: 15077.
Axiomatic field theory; composite particles; Haag’s theorem; nuclear structure; quantum field theory; relativistic nuclear physics: 15695.

Axisymmetric analysis; cables (ropes); composite materials; contour plotting; end fittings for FRP rod and rope; finite element analysis; FRP rod: FRP rope; materials testing; non-linear analysis (shear); potted end fittings; structural engineering; tensile strength: 15399.

A15 phases; iridium alloys; superconductivity; vanadium alloys: 15192.

α-11; CO: dipole moment; excited state; SCF: vibrational transition intensities: 15551.

B

Baby cribs; children’s furniture; product safety; product testing; safety regulations; standard development: NBSIR 75-714.

Background; computation; decay-schemes; cross-sections; scintillators; spacecraft; gamma-rays; spallation; activation; Apollo; SP425, pp. 480-483.

Background; JAERI linac; natural U: resonance parameters Γυ up to 5 keV; three thicknesses; transmission measurements; 190-m flight path: SP425, pp. 738-741.

Background; mercury in coal; trace analysis; x-ray fluorescence; x-ray spectroscopy: NBSIR 75-675.

Backscattered electrons; electron spectrometer interaction; Monte Carlo simulation; particulate analysis; scanning electron microanalysis; x-ray microanalysis; x-ray source size: 15038.

Bacterial growth calorimetry; enzyme catalyzed processes; glucose; microcalorimetry; serum thermochemistry of enzyme processes; analysis; assay in serum: 14898.

Balance; computer; impermanence; intelligence; power; science; technology; artifacts: 15199.

Ball joints; concrete manholes; expansion joints; expansion loops; o-ring gaskets; prefabricated manholes; restrained piping; accesses: BS5366, pp. 60-72.

Balmer; hydrogen; ion dynamics; plasma; Stark broadening: 15064.

Balmer lines; four dimensional rotation group; hydrogen; plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering: 15099.

Balmer lines; hydrogen plasma; ion motion; line shapes; reduced mass; Stark broadening: 15463.

Band assignments; carbon monoxide; electronic spectrum; emission spectrum; high resolution spectrum; vacuum ultraviolet region: 14848.

Band gap; band structure; electronic structure; energy bands; optical properties; silicon: 15705.

Band structure; electronic structure; energy bands; optical properties; silicon; band gap: 15705.

Bands, molecular; energy levels; atomic; line shapes; atomic; molecular bands; molecular spectra; rotational constants; atomic energy levels; atomic line shapes; atomic spectra; atomic transition probabilities: 15260.

BaO; chemical reactions; chemiluminescent; electronic spectra; heat-pipe ovens; N2O: 15686.

Bar code reader; filters; optical wedge; photodetector; relative spectral output: wavelength; NBSIR 74-580.

Barium; cerium; cesium; ionization energy; lanthanum; wavelengths; 15068.

Barium; heat pipe; inner shell excitation; shape resonance; two-electron excitations; absorption spectrum: 14989.

Barium vapor; configuration interaction; N2P3; ionization thresholds; photoabsorption; 4d absorption; 4f orbital contraction: 14907.

Barker-Henderson perturbation theory; modified Enskog theory; thermal conductivity; transport properties; viscosity; argon: 14775.

Barothermal behavior; Green’s function; heat diffusion; weakly absorbing materials; absorption coefficients: J79A No. 5, 639-648 (1975).

Barrier materials; building materials; housing; lead-based paint; lead poisoning; paint removal; abatement: NBSIR 75-761.

Barriers to planarity; cyclobutane; cyclobutane-d; isotope effect; kinetic energy terms; potential functions: 14855.

Base; dental; cement; dental; polycarboxylate; cement; reinforced; fiber reinforcement; polycrylic-itaconic acid; polycarboxylate; potassium titanate: 15013.

Base metals alloys; noble metal alloys; temperature scale; temperature standards; thermoelements; thermometry: Monogr. 125 Suppl. 1.

Base units; centennial volume; history of SI; International Bureau of Weights and Measures; International System of Units; measurements; SI; Treaty of the Metre; SP420.

Baseline studies; fresh water sampling; sampling device; sea water sampling; trace organic analysis; water pollution: 15099.

Baseline studies; gas chromatography; gas chromatography-mass spectrometry; hydrocarbon; liquid chromatography; marine sediments; pollution; seawater: 11076.

Base-metal thermocouples; cryogenic thermocouples; noblemetal thermocouples; nonstandardized thermocouples; refractory metal thermocouples; standardization; temperature measurement; thermocouples; thermometry: 15517.

BASIC; capacitance-voltage measurements; computer programs; dopant profiles; error function; Gaussian diffusion; plotting; computer; semiconductors; silicon; SP400-11.

Basic standards; cesium standards; frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; time standards; applications of standards: 14830.

Battery separators; nickel-cadmium batteries; satellite batteries; separator materials: NBSIR 74-541.

BCl3 (boron trichloride); boron; CO2 (carbon dioxide); enrichment; infrared; isotopes; TEA laser: 15270.

β-crystobalite; electron microscopy; oxidation; silicon nitride; silicon oxynitride; Si3N4: 15452.

Bead-spring model; block copolymers; concentrated solutions; dynamics; Rouse theory; solution properties; viscoelasticity: 15590.

Bead-spring model; block-copolymers; dilute solutions; dynamics; limiting viscosity number; solution properties; viscoelasticity; Zimm theory: 15373.

Bead-spring model; chain molecules; chain stiffness; deoxyribonucleic acid; dilute solutions; hydrodynamic interaction; polystyrene; viscoelasticity; Zimm theory: 15114.

Beam profile; electron scattering; scattering angle; solid angle; spectrometer; absolute cross section; TN871.

Beam splitter; CO2 laser; high power laser material: 14965.

Beam-lead bonds; boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; incremental sheet resistance; measurement methods; microelectronics; SP400-12.

Behavior; behavioral suppression; exposure; microwave radiation; microwaves; product safety; radiation; radiation effects; resonant cavity; rhesus; suppression: 15194.

Behavioral suppression; exposure; microwave radiation; microwaves; product safety; radiation; radiation effects; resonant cavity; rhesus; suppression; behavior: 15194.
Bell prover; calibration; inspection; liquefied petroleum gas; pressure; report form; temperature; temperature compensator; test; vapor meter; volume; H117. Benchmark; cross section; eigenvalue; Monte Carlo; multigroup; reactor; resonance; slowing-down; stochastic; transport; SP425, pp. 451-454. Benchmark; cross sections; graphite; neutron; sodium; water; SP425, pp. 177-183. Benchmark; cross sections; helium; neutron; SP425, pp. 375-377. Benchmark; profiles; sensitivity; uncertainties; air transport; SP425, pp. 825-833. Benchmark experiments; dosimetry; fast reader testing; fission products; shielding; thermal reactor testing; SP425, pp. 834-841. Building; gas explosion; load-bearing masonry; load-bearing walls; masonry; masonry research; progressive collapse; abnormal loading; NBSIR 74-526. Building acoustics; community noise; earphones; environmental noise; instrumentation; measurement methodologies; microphones; psychoacoustics; reverberation room; sound level meters; audiometric standards; 15502. Building acoustics; doors; energy conservation; heat loss from buildings; heat transfer; sound transmission loss; thermal resistance; thermal transmittance; windows; acoustics; air infiltration; air leakage; architectural acoustics; BS 577. Building acoustics; force platforms; impact noise; instrumentation; mechanical impedance; noise; 15462. Building codes; building design; building standards; diffusion of information; regulation; applied research; 15655. Building codes; building design; disaster mitigation; earthquakes; engineering; environmental hazards; housing; inspection and testing; safety; architecture; building; TN 885. Building codes; building standards; housing; performance criteria; 15372. Building codes; buildings; deflections; dynamic response; gust factors; structural engineering; wind engineering; wind loads; accelerations; buffeting; BS 574. Building codes; buildings; energy conservation; standards; TN 789-1. Building codes; construction materials; fire endurance ratings; fire tests; gypsum; NBSIR 74-588. Building codes; Consumer Product Safety Act; product safety; residence-related products; residential safety; safety implementation approaches; safety standards; NBSIR 75-651. Building codes; extreme value distributions; hurricanes; probability distribution functions; reliability; risk; statistical anal-
Building codes; mobile homes; NCSBCS; ASHRAE 90-P; SP429.

Building codes; probability distribution function; reliability; risk; statistical analysis; storms; structural engineering; wind loads; wind speeds; 15538.

Building composite; building material; conditioning; equilibration; gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; testing; NBSIR 75-767.

Building construction; detectors; flame spread; furnishing; interior finishes; noncombustible; smoke development; sprinklers; survey; TN861.

Building design; building energy analysis; energy conservation options; energy design optimization; heating and cooling load calculation; BSS78.

Building design; building standards; diffusion of information; regulation; applied research; building codes; 15655.

Building design; consumer protection; fire control; fire detection; fire research; fire spread; flammability; SP416.

Building design; disaster mitigation; earthquakes; engineering; environmental hazards; housing; inspection and testing; safety; architecture; building; building codes; TN883.

Building economics; consumer information; energy conservation; home economics; home improvements; insulation; CIS8.

Building energy analysis; energy conservation options; energy design optimization; heating and cooling load calculation; building design; BSS78.

Building energy use; conservation; energy conservation; electricity saved; fuel consumption; 15051.

Building fires; construction materials; fire departments; fire tests; flame spread test; flammability tests; flammable fabrics; Operation BREAKTHROUGH; protective clothing; bibliographies; NBSIR 75-736.

Building heat transfer; computer programs; dynamic thermal performance; heat flow analysis; heating and cooling loads; temperature predictions; thermal analysis; thermostat setback; transient heat flows; air leakage measurement; BSS57.

Building industry; conversion; engineering; human and modular standards; metrication; product-dimensions; 15454.

Building material; conditioning; equilibration; gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; testing; building composite; NBSIR 75-767.

Building materials; carpets; fire tests; flame spread tests; floor coverings; interlaboratory evaluation; smoke measurement; tunnel test; ASTM E84; 15267.

Building materials; housing; lead-based paint; lead poisoning; paint removal; abatement; barrier materials; NBSIR 75-761.

Building research; building standards; economics of energy conservation; energy conservation; energy conservation research; energy savings; 15679.

Building retrofit; building systems; energy conservation in buildings; HVAC automatic control; HVAC systems; measurement of building energy; 15663.

Building safety; economics; progressive collapse; standards; benefit-cost analysis; NBSIR 74-542.

Building standards; diffusion of information; regulation; applied research; building codes; building design; 15655.

Building standards; economics of energy conservation; energy conservation; energy conservation research; energy savings; building research; 15679.

Building standards; housing; performance criteria; building codes; 15372.

Building systems; communications equipment; concealed objects detectors; emergency equipment; Law Enforcement Standards Laboratory; procurement guidelines; protective equipment; security systems vehicles; voluntary standards; weapons; 15325.

Building systems; energy conservation in buildings; HVAC automatic control; HVAC systems; measurement of building energy; building retrofit; 15663.

Building systems; housing systems; large-panel structures; precast concrete construction; progressive collapse; structural design; structural joints; NBSIR 75-715.

Building technology; cooperation; fire safety; hydraulics; wind loads; NBSIR 74-618.

Building thermal response; comfort indices; human comfort; predicted indoor habitability index; air conditioning criteria; BSS71.

Building ventilation; sulfur hexafluoride tracer; air exchange measurement; air infiltration measurement; 15113.

Buildings; codes; design criteria; regulatory system; safety; standards; structural loading; 15503.

Buildings; codes and standards; cyclones; natural disasters; structural engineering; wind damage; wind loads; 15609.

Buildings; combustibility; fire intensity; flames; furnishings; heat release; ignition; smoke; thermal radiation; upholstery; waste receptacle; NBSIR 75-679.

Buildings; computer codes; computer networks; computers; copyrights; energy; epoxies; hazard; metric conversion; piezoelectric accelerometers; sun; DIM/NBS 59, No. 4, 73-96 (1975).

Buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornadoes; wind; BSS61.

Buildings; deflections; dynamic response; gust factors; structural engineering; wind engineering; wind loads; accelerations; buffeting; building codes; BSS74.

Buildings; deflections; instrumentation; structural response; wind loads; TN873.

Buildings; energy conservation; standards; building codes; TN789-1.

Buildings; fire growth; flame spread; heat release; interior linings; material ignitability; performance criteria; room fires; smoke; wood crib; TN879.

Buildings; fire loads; occupancy live loads; load surveys; structural engineering; survey techniques; TN858.

Buildup factor; concrete; gamma radiation; moments; adjoint; annihilation; 14940.

Built-up roofing systems; composite membrane; composition; performance criteria; application procedures; 15620.

Bulk alloy samples; casting; directional solidification; rapid quenching; aluminum alloys; 14973.

Bulk modulus; chromium alloys; compressibility; Debye temperature; Doring effect; elastic constants; iron alloys; magnetic transition; nickel alloys; Poisson's ratio; pulse-echo method; sound velocity; Young's modulus; 15343.

Bulk modulus; composite; compressibility; elastic compliance; elastic stiffness; piezoelectric oscillator; Poisson's ratio; shear modulus; Young's modulus; 15523.

Bulk modulus; compressibility; elastic constants; elasticity Lamé constant; Poisson ratio polycrystals; shear modulus; single crystals; Young's modulus; 14871.

Bulk modulus; compressibility; Debye temperature; elastic constant; nickel-chromium-iron alloys; Poisson's ratio; shear modulus; sound velocity; Young's modulus; 15225.

Bulk modulus; compressibility; Debye temperature; elastic constant; nickel steels; Poisson's ratio; shear modulus; sound velocity; Young's modulus; aluminum alloy; 15522.

Bulk modulus; compressibility; Debye temperature; elastic constants; elasticity; Poisson ratio; pulse-echo method; sound velocity; Young's modulus; aluminum; aluminum alloys; 15528.

Bulk modulus; compressibility; Debye temperature; elastic con-
Butyl rubber; constants; natural rubber; neoprene; physical constants; polymers; properties; rubbers; styrene-butadiene rubbers; 14838.

Buyer, computer software; marketplace; performance measurement; quality; seller; specifications; validation; 15495.

C

Ca ii: Ho; solar chromosphere; spectral line formation; 15562.

Ca ii: spectral line; stellar chromospheres; 14841.

Ca ii: emission; chromospheres; stellar; photospheres; stellar; 15465.

Cables (ropes); composite materials; contour plotting; end fittings for FRP rod and rope; finite element analysis; FRP rod; FRP rope; materials testing; nonlinear analysis (shear); potted end fittings; structural engineering; tensile strength; 15399.

Cadmium; chemical interferences; data evaluation; precision; production of atomic vapor; zinc; accuracy; atomic fluorescence; automatic scatter correction; 15012.

Calcium apatites; calcium hydroxide; crystal growth; electrolysis; interferential polarization; ionic conduction; mass transport; Ac impedance; NBSIR 74-628.

Calcium fluoride; defect pairs; dielectric relaxation; epr lifetime broadening; fluorine interstitials; gadolinium ions; reorientation processes; anelastic relaxation; 15121.

Calcium fluoroborate; calcium salts; crystal structure; single crystal; tetrahedral anion; x-ray diffraction; 14976.

Calcium hydroxide; crystal growth; electrolysis; interferential polarization; ionic conduction; mass transport; Ac impedance; calcium apatites; NBSIR 74-628.

Calcium salts; crystal structure; single crystal; tetrahedral anion; x-ray diffraction; calcium fluoroborate; 14976.

Calciospheredules; calculi; petrography; pineal; apatite; 14835.

Calculable capacitor; color; computer simulation; electricity; energy-environment; fire safety; measurement system; nuclear power plant; productivity; subway; DIMINBS 59, No. 12, 266-291 (1975).

Calculable capacitor; cross capacitor; electrical units; farad; ohm; units; absolute farad; absolute ohm; 14927.

Calculated σ(E), (α,n), (n,α), Hauser-Feshbach; nuclear reactions Fe group; SP 425, pp. 354-356.

Calculated σ(θ); measured σ(θ); nuclear reactions 144Ndx(n,n), (n,α), 148NdxMm(n,n), (n,α), 150NdxMm(n,n)+ SP 425, pp. 942-945.

Calculated <σ/α>; deduced channel spectrum; E = 3-5 MeV; fission; nuclear reactions; Pu isotopes; U; SP 425, pp. 129-138.

Calculation; comparison; Doppler broadening; line shape; SP 425, pp. 392-397.

Calculation of dissociation energies; electrical resistivity; enthalpy of transition; graphite; infrared matrix isolation spectroscopy; melting point; radiation temperature; reaction of Ba(g) and excited oxygen; reaction of Fe(g) and oxygen; NBSIR 74-600.

Calculations; complex interaction; semi-direct model; volume form; (n,γ) cross sections; SP 425, pp. 346-349.

Calculi; petrography; pineal; apatite; calciospheredules; 14835.

Calibrated XUV detectors; irradiance; radiometry; second order diffracted radiation; synchrotron radiation; XUV grating monochromators; 15107.

Calibration; calibration factor; directional coupler; measurement; microwave; microwave power; 15662.

Calibration; calibration table; densitometer; densitometry; optical density; optical density standard; NBSIR 75-682.

Calibration; capsule type thermometers; intercomparison; IPTS-68; platinum resistance thermometers; wire-to-wire calibration; adjustment for trend; NBSIR 74-586.

Calibration; carbon films; low temperature; thermometry; vacuum deposition; NBSIR 74-355.
adiabatic calorimetry; branched polyethylene; J.79A No. 2, 437-441 (1975).

Calorimetry: depth dose; dose distributions; dosimetry; electron beams; holographic interferometry; holography; isodose; radiation imaging; radiation measurements; 15529.

Calorimetry: energy equivalents; energy measurement; heat transfer; internal energy measurement; isoperibol calorimeters; measurement theory; 15102.

Calorimetry: enthalpy; entropy; Gibbs energy; heat capacity; heat of fusion; heat of vaporization; thermodynamic properties; triple point; bromobenzene; J.79A No. 5, 619-628 (1975).

CAMAC: computer interfacing; control systems; instrumentation; instrumentation standards; standards; 15041.

CAMAC: computer systems; control systems; industrial control; software; standards; 14885.

CAMAC disc: minicomputer; modular; multiparameter; online; SP425, pp. 97-98.

Camera guidelines: computerized elections; dental fillings; metre; ozone problem; police communications; water pollution; x-rays; air pollution; DIM/NBS 59, No. 5, 97-120 (1975).

Cameras: demand cameras; employee theft; fixed surveillance; motion picture surveillance; robbery; sequence cameras; short-living surveillance; surveillance cameras; 14923.

Capacitance-diaphragm gauge: Knudsen radiometer; McLeod gauge; micromanometer; quartz Bourdon gauge; static expansion; thermal transpiration; vapor-stream pumping; viscosity gauge; 14933.

Capacitance-voltage measurements: computer programs; dopant profiles; error function; Gaussian diffusion; plotting; computer; semiconductors; silicon; BASIC; SP400-11.

Capacitance-voltage methods: Darlington pairs; deep depletion; dopant profiles; electrical properties; electron beam evaporator; electron beam induced damage; electronics; epilayer layer thickness; filar eyepiece; flying-spot scanner; hermeticity; hydrogen chloride gas; SP400-17.

Capacitor discharges: heat capacity; high-speed measurements; high temperature; thermodynamics; uranium dioxide; NBSIR 75-793.

Capacitor discharges: high-speed measurements; high temperatures; thermodynamics; thermophysics; 14934.

Capacitors: energy conservation; fluorescent lamp; fluorescent luminaire; lighting efficiency; power factor; TN866.

Capacity: flask; meniscus; pipets; volumetric calibration; burets; NBSIR 74-461.

Capelli's identity: Cartesian tensor; group representation; invariant; isotropic tensor; Kronecker delta; orthogonal group; tensor; algebra; alternating tensor; J.79B Nos. 1 and 2, 49-58 (1975).

Capillary tubes: density sensor; flow nozzle; laminar flow; liquid properties; viscosity sensor; NBSIR 74-620.

Capsule type thermometers; intercomparison; IPTS-68; platinum resistance thermometers; wire-to-wire calibration; adjustment for trend; calibration; NBSIR 74-586.

Capture: chromium; cross section; evaluation; neutron; resonance; SP425, pp. 367-370.

Capture: normalization; strength functions; SP425, pp. 584-586.

Capture cross section: elastic and inelastic scattering cross sections; evaluation; fission product; optical model; resonance cross section; statistical model; total cross section; SP425, pp. 320-323.

Capture cross sections: average f; D, S° and S†; SP425, pp. 905-907.

Capture cross sections; CFRMF reactor; control materials; europium oxides; fast reactors; neutron reactions; tantalum; boron carbides; SP425, pp. 908-911.

Capture gamma rays; cross sections; dosimetry; filtered beams; neutrons; SP425, pp. 89-92.

Capture techniques: high resolution methods; Moxon-Rae; review; total absorption; activation; SP425, pp. 139-148.

Capture-to-fission; dilution mass spectrometry; fast fission yields; yields vs. energy; 233U, 235U, 238U, 239Pu; burnup monitors; SP425, pp. 378-384.

Carbon: integral cross section tests; iron; niobium; beryllium; SP425, pp. 169-172.

Carbon: neutron total cross section; pulsed neutron sources; time-of-flight; 14809.

Carbon: abundance; molecular spectra; non-LTE; solar model; upper photosphere; 15044.

Carbon: abundance; molecular spectra; solar photosphere; 15585.

Carbon dioxide: Clausius-Mossotti function; intermolecular forces; m-6-8 potential quadrupolar gas; second virial coefficient; viscosity coefficient; 15521.

Carbon dioxide: CO2; critical point; nucleation; supercooling; 14915.

Carbon dioxide concentration; air pollution; critical flow; laminar flow; nozzle; porous plug; sulfur dioxide concentration; NBSIR 74-612.

Carbon films: low temperature; thermometry; vacuum deposition; calibration; NBSIR 74-355.

Carbon (graphite): ceramics; composites; data sources; glasses; properties; SP396-2.

Carbon monoxide: catalysis; LEED; oxygen; ruthenium; adsorption; 15045.

Carbon monoxide: chemisorption; definition low energy electron; ruthenium; work function Auger spectroscopy; 14945.

Carbon monoxide: electronic spectrum; emission spectrum; high resolution spectrum; vacuum ultraviolet region; band assignments; 14848.

Carbon monoxide: electrostatic precipitation; heat flux; oxygen depletion; particulate mass; scanning electron microscope; smoke; NBSIR 75-901.

Carbon monoxide: emission spectrum; perturbation; Rydberg state; absorption spectrum; accidental predissociation; 15386.

Carbon monoxide: gas analysis; gas standards; nitric oxide; nitrogen dioxide; sulfur dioxide; air pollution; 15447.

Carbon monoxide: gas analysis; permeation tubes; propane; sulfur dioxide; air pollution; 15552.

Carbon resistors: cryogenics; liquid helium; millikelvin; thermometry; 15537.

Carbonates: crystal structure transformation; nitrates; nitrates; phase transformation; x-ray diffraction data; NSRDS-NBS53.

Carbonium ion: ion fragmentation; isomerization; propyl ion; butyl ion; 14908.

Carbon-neutron elastic and inelastic scattering; E_n = 8.0-14.5 MeV; excitation functions; angular distributions; SP425, pp. 889-892.

Carbonic acid: four-center reactions; halocarbon ions; ion cyclotron resonance; ion-molecule reaction; rate constants; 15384.

Career: ecological; electricity; energy; environment; fusion; medicine; nuclear; power; radiation; reactor; research; utilities; biology; TN888.

Caries mechanisms: dicalcium phosphate dihydrate; enamel mineral solubility; pyrophosphate formation; 15162.

Carpet: curtains; draperies; fabrics; flammability; garments; test methods; textiles; upholstered furniture; apparel; 15470.

Carpet: energy balance; flame spread; mass balance; test method; ASTM E 84; NBSIR 75-705.

Carpet: fire tests; flame spread tests; floor coverings; laboratory evaluation; smoke measurement; tunnel test; ASTM E84; building materials; 15267.

Carpet: with and without underlayment; corridor fires; energy models; finished interior; full scale experiments; interaction; measurements; smoke; smoke and flame spread; temperature; with and without forced air; velocity; 15230.
Central; centroid; facility location; graph; tree; J.79B Nos. 3 and 4, 107-115 (1975).

Central heat distribution systems; construction materials; drainage; insulation; permafrost; seasonal frost; snow drifting; utilidors; ventilation; air leakage; Arctic; BSS66, pp. 122-135.

Central heating and cooling plants; cost analysis; cost comparison; economics; future trend; local building heat/cooling plants, Southeast Federal Area, Washington, D.C.; BSS66, pp. 9-17.

Central plant system; coal gasification; heat pump system; heat recovery and conservation system; nuclear fuel; on-site power generation system; petroleum systems; BSS66, pp. 5-8.

Central utility systems; data acquisition system; efficiencies; electrical power; energy conservation; energy costs; fuel utilization; heat recovery; total energy systems; utilities for housing; utility system performance; air conditioning; air pollution; NBSIR 75-711.

Center; centroid; facility location; graph; tree; J.79B Nos. 3 and 4, 107-115 (1975).

Ceramic implants; flame spray coating; hip prostheses; segmental bone replacement; bioglass-ceramic; SP415, pp. 19-36.

Ceramic implants; histological evaluation; implant characterization; biocompatibility; SP415, pp. 37-44.

Ceramic implants; implantable electrodes; metallic implants; nerve prosthesis; synthetic implants; thromboresistance; biocompatibility; biomaterials; blood protein; SP415.

Ceramic surfaces; cracks; degradation; fracture; Hertzian; indentation; strength; brittle solids; NBSIR 75-664.

Ceramic surfaces; degradation; fracture; indentation; strength; brittle solids; NBSIR 75-661.

Ceramics; composites; data sources; glasses; properties; carbon (graphite); SP396-2.

Ceramics; crack healing; crack propagation; cyclic fatigue; failure prediction; high temperature; static fatigue; 15422.

Ceramics; crack propagation; delayed failure; fracture; proof testing; Weibull analysis; 15419.

Ceramics; failure prediction; fracture; inclusions; nondestructive inspection; 15401.

Ceramics; fracture; fracture mechanics; glass; impact damage; strength; thermal shock; time to failure; 14886.

Cerebellar model; control theory; data storage; distribution memory; hierarchical control; manipulator control; 15287.

Cerebellum model; control theory; manipulator control; Perceptron; adaptive control; 15428.

Ceric ion initiated grafting; chemical attachment to ratskin; grafting to tissues; persulfate initiated grafting; surface grafting; tissue modification; 14880.

Cerium; cesium; chromium; copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Cerium; cesium; ionization energy; lanthanum; wavelengths; barium; 15068.

Cermet; chromium plating; codeposition; composite coating; dispersion plating; electroplating; hard particles; wear-resistance; wear-tests; 15317.

Cerous magnesium nitrate; dipole-dipole interaction; ferromagnetism; ground state; magnetic; permutation group; quantum mechanics; antiferromagnetism; 14911.

Cerous magnesium nitrate; dipole-dipole coupling; ferromagnetism; ground state; permutation group; quantum mechanics; spin cluster; spin-Hamiltonian; antiferromagnetism; 15524.

Cerous magnesium nitrate hydrate; lattice; proton; relaxation; spin; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Certification; certified reference materials; materials; meaningful measurements; measurement; reference materials; SRM's; standard materials; standard reference materials; standards; SP408.

Certification; code-independent; documentation; optimization; precision; run statistics; security; terminology; validation; warranty; accuracy; audit; SP406. pp. 141-144.

Certification; meaningful measurement; measurement; measurement system; precision; reference method; specificity; SRM; standard reference material; systematic error; Monogr. 148.

Certification of steel belted radial tires; high speed radial tire hazard; radial tire failures; NBSIR 75-734.

Certification programs; ETIP incentives; innovation; life cycle costing; procurement; product testing; specifications; unsolicited proposals; NBSIR 75-716.

Certified reference materials; materials; meaningful measurements; measurement; reference materials; SRM's; standard materials; standard reference materials; standards; certification; SP408.

Cesium; chromium; copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Cesium; ionization energy; lanthanum; wavelengths; barium; cerium; 15068.

Cesium beam; cesium chloride beam; gold surfaces; van der Waals forces; 15340.

Cesium beam tube; frequency stability; interaction length; phase noise; primary frequency standards; Ramsey cavity; accuracy; accuracy evaluations; cavity phase shift; 15683.

Cesium beam tube; frequency synthesis; pulse method; Ramsey dual interaction region; second-order doppler; velocity distribution; cavity phase shift; 14828.

Cesium chloride beam; gold surfaces; van der Waals forces; cesium beam; 15340.

Cesium standards; frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; time standards; application of standards; basic standards; 14830.

Cesium standards; hydrogen standards; hydrogen storage device; methane stabilized helium-neon lasers; noise studies; quartz crystal oscillators; quartz crystal resonators; accuracy; atomic clocks; 14846.

CFRMF reactor; control materials; europium oxides; fast reactors; neutron reactions; tantalum; boron carbides; capture cross sections; SP425, pp. 908-911.

CF-252 spontaneous fission neutron yield; E = 0.0253 eV and 20 °C Maxwellian; fission-neutron yields; half-lives of U-233, Pu-239; mean energy of fission neutron spectrum; neutron cross-sections; SP425, pp. 286-292.

C=N bond; infrared spectrum; isotopic substitution; matrix isolation; methyl azide; methyleneamine; normal coordinate analysis; photolysis; thermodynamic properties; 15110.

CH; free radical; HCO; HO2; laser magnetic resonance; OH; pollution; 15680.

Chain correlation; chain statistical parameters; light scattering; Monte-Carlo computations; chase transition; scattering function; 15209.

Chain folds; crystallization rate; molecular weight; nucleation theory; polyethylene; regime 1; regime II; spherical; axialite; J.79A No. 6, 671-699 (1975).

Chain folds; fractions; homogeneous nucleation; molecular weight; nucleation theory; polyethylene; surface free energies; J.79A No. 6, 701-711 (1975).

Chain molecules; chain stiffness; deoxyribonucleic acid; dilute solutions; hydrodynamic interaction; polystyrene; viscoelasticity; Zimm theory; bead-spring model; 15114.

Chain rupture; crystalline polymer; ESR investigation of radicals; fibrous structure; mechanical breakdown; microfibrillar structure; radical formation; tie molecules; 15476.
Coal slags: MHD; thermionic emission; vaporization; viscosity; 15449.

Coating thickness: coating thickness gages; coatings; electrophoretic deposits; electrophoretic coatings; metal coatings; properties of electrophoretic deposits; thickness gages; thickness measurement; 15560.

Coating thickness gages; coatings; electrophoretic coatings; electrophoretic coatings; metal coatings; properties of electrophoretic coatings; thickness gages; thickness measurement; coating thickness; 15560.

Coatings: copper; density; electrophoretic coatings; electrophoretic coatings; metal coatings; 15500.

Coatings: corrosion; deterioration; inhibitors; materials selection; nonmetals; rectifiers; water treatment; anodes; cathodic protection; BSS66, pp. 42-51.

Coatings: electrophoretic coatings; electrophoretic coatings; metal coatings; properties of electrophoretic coatings; thickness gages; thickness measurement; coating thickness; 15560.

Coatings: electrophoretic coatings; metal coatings; test methods for metal coatings; testing electrophoretic; 14743.

Coaxial; cylindrical; error; line; loss; response; skin effect; step; time; transition; 15696.

Coaxial cable effects: coaxial star connectors; extrapolation techniques; four-pair admittances; permutation techniques; precision admittance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; Ac DRRS; 14924.

Coaxial standards; network parameters; reflection coefficient; scattering coefficients; transmission coefficient; waveguide standards; 2-port standards; automatic measurement; 14739.

Coaxial star connectors; extrapolation techniques; four-pair admittances; permutation techniques; precision admittance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; Ac DRRS; coaxial cable effects; 14924.

Cobalt: complexes; hexakis(imidazole)cobalt(ii) nitrate; imidazole, neutron; structure; x ray; 15280.

Cobalt; interferences; iron; nickel; separations; atomic absorption; atomic fluorescence; 15577.

Cobalt gamma radiolysis; hydrocarbons; ion-molecule reaction; neutralization mechanisms; pulse radiolysis; charge recombination rate constants; 15627.

COBOL: Federal Standard COBOL; program conversion; programming aids; programming languages; FIPS PUB 43.

Co-convergent; contra-convergent; Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences; J.79B Nos. 1 and 2, 63-69 (1975).

Co-convergent; contra-convergent; Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences; J.79B Nos. 3 and 4, 103-105 (1975).

CODASYL: computer; data base management; designers; evaluation; selection; users; acquisition; 15668.

Code-independent; documentation; optimization; precision; run statistics; security; terminology; validation; warranty; accuracy; audit; certification; SP406, pp. 141-144.

Codeposition; composite coating; dispersion plating; electroplating; hard particles; wear-resistance; wear-tests; cermet; chromium plating; 15317.

Codes; consensus system; directory; Federal Government—standardization; industry standards activities; national standards activities; recommended practices; specifications; standardization activities; standards; states—standardization activities; test methods; SP417.
Competition products; fire; hazard assessment; toxicity; bioassay; 15628.

Competition products; full-scale fire; radiative heat transfer; NBSIR 74-596.

Comet; HCN; HC3N; Kohoutek; OH; radio; search; 15262.

Comfort indices; human comfort; predicted indoor habitability index; air conditioning criteria; building thermal response; BSS71.

Command language; computer networks; macros; minicomputers; protocols; access procedures; 15541.

Command language design; interactive user; language transformation; mental work; association links; 15371.

Command languages; computer; man-machine systems; networks; system commands; user protocols; NBSIR 75-744.

Command languages; computers; man-machine systems; networks; system commands; user protocols; TN877.

Comment to editor; discrete; frequencies; nondivergent radiation; 15163.

Communication; cost-benefit; deployment; electronic transmission; facility location; mail; mathematical programming; message network synthesis; network optimization; satellite; service improvement; NBSIR 75-737.

Communications; computer; evaluation; measurement; network; performance; 15693.

Communications; computer security; cryptography; data security; encryption; network security; security; 15657.

Communications; law enforcement; mobile transceiver; performance standard; transceiver; transmitter; 14922.

Communications equipment; concealed objects detectors; emergency equipment; Law Enforcement Standards Laboratory; procurement guidelines; protective equipment; security systems vehicles; voluntary standards; weapons; building systems; 15325.

Community noise; earphones; environmental noise; instrumentation; measurement methodology; microphones; psychoacoustics; reverberation room; sound level meters; audiometric standards; building acoustics; 15502.

Commute surveys; mode choice decisions; park-and-ride; Shirley Highway; transportation planning; bus-on-freeway operations; NBSIR 75-689.

Comonomer concentration; copolymer; crystallization; defect energy; equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; lamella thickness; melting; 15651.

Comonomers; coupling agents; dental materials; hard tooth tissues; metal ions; mordant; adhesive bonding; chelation; 15161.

Compared with calculated excitation functions; measured $\sigma(E, \theta)_{\text{g}}$ for ground, 45. 148 keV states; nuclear reactions 239U(n,n), (n,n'), $E = 0.9-2.7$ MeV; time-of-flight; SP 425, pp. 950-952.

Comparison; cross sections; fission; absorption; measurement; 239Pu; SP 425, pp. 627-630.

Comparison; Doppler broadening; line shape; calculation; SP 425, pp. 392-397.

Comparison of magnetic properties of glasses and crystals; Gd(PO$_4$)$_3$; glass; magnetic order; poly crystal; vitreous Gd(PO$_4$)$_3$; antiferromagnetism; 14833.

Comparison of shape and magnitude of photon neutron cross sections; nuclear reactions Cu, 64Cu, Pr, Pb, 209Pb, Bi(\gamma,n); calibrations of the NBS P2 chamber; SP 425, pp. 83-88.

Compatibility; cryogenic; liquid oxygen; measurement; oxygen; performance; pressure; survey; transducer; calibration; 15155.

Compatibility; standard fields; susceptibility; testing; transverse electromagnetic; 14725.

Compensation; epitaxial gallium arsenide; high energy neutron; impurity conduction; reciprocal Hall coefficient; transition regime; 56Co gamma; activation energy; 15755.

Compilation; Compton scattering; cross section; crystallography; photoelectric absorption; photons; Rayleigh scattering; x-rays; attenuation coefficient; 14847.

Compilation; crystal; crystal habit; crystal space group; crystal structure types; density; determination; identification; minerals; optical properties; twinning; unit cell dimensions; cleavage; 15084.

Complete elliptic integrals; hyperbolic function; infinite integrals; modified Bessel functions; noise theory; signal statistics; trigonometric functions; Bessel functions; J. 79B Nos. 3 and 4, 137-170 (1975).

Complex equilibria; purification (evaporative); vacuum vaporization; $\text{A}_2\text{O}_3$; chemical doping; 15333.

Complex interaction; semi-direct model; volume form; (n,\gamma) cross sections; calculations; SP 425, pp. 346-349.

Complexes; hexakisimidazole)cobalt(it) nitrate; imidazole; neutron; structure; x-ray; cobalt; 15280.

Composite; compressibility; elastic compliance; elastic stiffness; piezoelectric oscillator; Poisson's ratio; shear modulus; Young's modulus; bulk modulus; 15523.

Composite; cryogenics; superconducting coil; thermal conductivity; 15031.

Composite materials; composite-overlay reinforcement; contour plotting; cracks, reinforcement of; cutouts, reinforcement of; finite element analysis; joints, adhesively bonded; reinforcement, composite overlay; reinforcement, cutouts and cracks; adhesively bonded joints; 15508.

Composite materials; contour plotting; end fittings for FRP rod and rope; finite element analysis; FRP rod; FRP rope; materials testing; nonlinear analysis (shear); potted end fittings; structural engineering; tensile strength; transversely isotropic materials; 15399.

Composite materials; creep; viscoelasticity; linear and nonlinear; angle-ply laminates; boron/epoxy; 15626.

Composite materials; elastic constants; filled polymers; mechanical properties; particular composites; shear modulus; theory of elasticity; J. 79A No. 2, 419-423 (1975).

Composite materials; fiber-reinforced-plastic rod; glass-reinforced-polyester rod; guys, antenna; processing parameters, pultrusion; pultrusion; reinforced plastic rod; stress rupture of FRP rod; test methods; FRP rod; weatherability; FRP rod; NBSIR 74-557.

Composite materials; glass fibers; housing system; laminates; reinforced plastics; shear strength; sustained loading; tensile strength; adhesive bonding; aging tests (materials); 15624.

Composite membrane; composition; performance criteria; application procedures; built-up roofing systems; 15620.

Composite model of leptons; electron number; lepton quarks; lorks; muon-electron universality; muon number; neutrino quarks; strong interactions; three triplet model; 15614.

Composite particles; Haag's theorem; nuclear structure; quantum field theory; relativistic nuclear physics; axiomatic field theory; 15695.

Composite particles; interacting quantum fields; nuclear structure; particle structure; relativistic bound systems; relativistic nuclear physics; Monogr. 147.

Composite-overlay reinforcement; contour plotting; cracks, reinforcement of; cutouts, reinforcement of; finite element analysis; joints, adhesively bonded; reinforcement, composite overlay; reinforcement, cutouts and cracks; adhesively bonded joints; composite materials; 15508.

Composites; coupling agents; monomers; polymers; primers; sealants; adhesion; bonding; 15374.

Composites; cryogenic; epoxy; glass fiber; thermal conductivity; aramid fiber; 15021.

Composites; data sources; glasses; properties; carbon (graphite); ceramics; SP 396-2.
Composites; dental materials; polymer grafting; resins; restorative materials; sealants; wear resistance; adhesive materials; NBSIR 75-766.

Composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity; NBSIR 74-393.

Composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity; NBSIR 75-810.

Composites; fiber orientation; fibrous biomaterials; biomaterial properties; biomechanics; SP415, pp. 63-74.

Composites, dimethacrylates; monomers; resins; synthesis; 15159.

Composition; General Materials; properties; Research Materials; Standard Reference Materials; analysis; characterization; SP260, 1975-76 Edition.

Composition; performance criteria; application procedures; built-up roofing systems; composite membrane; 15620.

Composition modulations; contrast mechanism; electron diffraction; electron microscopy; lattice images; modulation images; satellites; spinodal decomposition; 15063.

Compressibility; critical exponents; critical point; decorated lattice gas; hole-particle symmetry; law of corresponding states; liquid; Padé approximant; power law; slope of the coexistence curve diameter; asymmetry; coexistence curve; 15293.

Compressibility; Debye temperature; elastic constant; nickel-chromium-iron alloys; Poisson’s ratio; shear modulus; sound velocity; Young’s modulus; bulk modulus; 15225.

Compressibility; Debye temperature; Doring effect; elastic constants; iron alloys; magnetic transition; nickel alloys; Poisson’s ratio; pulse-echo method; sound velocity; Young’s modulus; bulk modulus; 15343.

Compressibility; Debye temperature; elastic constant; nickel steels; Poisson’s ratio; shear modulus; sound velocity; Young’s modulus; aluminum alloy; bulk modulus; 15522.

Compressibility; Debye temperature; elastic constants; elasticity; Poisson ratio; pulse-echo method; sound velocity; Young’s modulus; aluminum; aluminum alloys; bulk modulus; 15528.

Compressibility; Debye temperature; elastic constants; nickel-base alloys; Poisson’s ratio; shear modulus; sound velocity; Young’s modulus; bulk modulus; 15533.

Compressibility; elastic compliance; elastic stiffness; piezoelectric oscillator; Poisson’s ratio; shear modulus; Young’s modulus; bulk modulus; composite; 15523.

Compressibility; elastic constants; elasticity Lamé constant; Poisson ratio polycrystals; shear modulus; single crystals; Young’s modulus; bulk modulus; 14871.

Compressibility; elasticity; finite deformation; hyperelasticity; rubbery materials; strain-energy function; volume-extension; 15015.

Compressibility; interferometry; light scattering; methane; sound velocity; specific heat ratio; 15639.

Compressibility; single crystal; x-ray diffraction; 14895.

Compression members; concrete; cracking; deflection; eccentricity; equilibrium; loads (forces); masonry; stability; stress distribution; structural engineering; buckling; 15514.

Compressive strength; concrete; flexural strength; formwork removal; nondestructive testing; surface hardness; NBSIR 75-729.

Compton scattering; cross section; crystallography; photoelectric absorption; photons; Rayleigh scattering; x rays; attenuation coefficient; compilation; 14847.

Compton scattering; cross sections; gamma rays; incoherent scattering function; photons; Rayleigh scattering; tabulations; x rays; atomic form factor; J. Phys. Chem. Ref. Data 4, No. 3, 471-538 (1975).

Computation and flow analysis; FORTRAN use; programming aids; syntax analysis; 15348.

Computation, decay-schemes; cross-sections; scintillators; spacecraft; gamma-rays; spallation; activation; Apollo; background; SP425, pp. 480-483.

Computer; concepts; reliability; state-of-the-art; survey; automated measurements; 14738.

Computer; consumer; contract; evaluation; network; performance; 15642.

Computer; cryogenic; cryptography; data; energy labeling; energy needs; fluid safety; materials; NBS, GSA experiment; optical spectra; plastic pipes; thermal conductivity; DIMINBS 59, No. 9, 193-216 (1975).

Computer; data acquisition; laboratory automation operating system; teleprocessor; analytical chemistry; 15136.

Computer; data base management; designers; evaluation; selection; users; acquisition; CODASYL; 15668.

Computer; data processing; index; information processing; privacy; requirements definition; security; systems design; NBSIR 75-909.

Computer; detector-ray; discriminator; emitter-couple; integrated circuit; signal processor; 15511.

Computer; energy; energy labels; fire fatalities; hydrogen fuel; magnetohydrodynamics; metric changeover; safety; air conditioners; appliance; bone cement; DIMINBS 59, No. 6, 121-144 (1975).

Computer; energy; environment; health; product safety; research; science and technology; standards; annual report; SP418.

Computer; energy; environment; measurement; product safety; research; science; standards; technology; annual report; SP437.

Computer; evaluation; hardware monitors; measurement; performance; software monitors; throughputs; SP406, pp. 99-102.

Computer; evaluation; measurement; performance; service; utility; 15093.

Computer; evaluation; measurement; network; performance; communications; 15693.

Computer; impermanence; intelligence; power; science; technology; artifacts; balance; 15199.

Computer; man-machine systems; networks; system commands; user protocols; command languages; NBSIR 75-744.

Computer amplitude reference; computer storage media; disk calibration; disk pack; magnetic disk; Standard Reference Surface; unrecorded disk surface; calibration factor; TN884.

Computer application; desorption; dry weight determination; moisture content; surface area; water content; water vapor adsorption; adsorption; J79A No. 4, 565-576 (1975).

Computer applications; OMNITAB II: Minitab; statistical computing; text editing; NBSIR 75-649.

Computer architecture; computer performance evaluation; installation management; measurement; modeling; monitoring; operating systems; performance objectives; SP406.

Computer architecture; functional evaluation; hardware monitor; measurement tools; performance measurement; SP406, pp. 75-78.

Computer codes; computer networks; computers; copyrights; energy; epoxies; hazard; metric conversion; piezoelectric accelerometers; sun; buildings; DIMINBS 59, No. 4, 73-96 (1975).

Computer codes; multi-group data; survey; SP425, pp. 848-854.

Computer communications; computer networking; data communications; networks; performance requirements; telecommunications; TN882.

Computer efficiency; evaluation; measurement; performance; power; work; SP406, pp. 131-134.

Computer graphics; computer networks; graphics; networks; protocol; standards; 15071.

Computer graphics; cost-benefit analysis; cost-effectiveness; economics; performance evaluation; 15072.
Computer graphics; cost-benefit analysis; economic analysis; graphics; minicomputers; 15488.

Computer interfacing; control systems; instrumentation; instrumentation standards; standards; CAMAC; 15041.

Computer interfacing; digital computer controlled tests; jet engine fuel control testing; minicomputer applications; minicomputer controlled tests; supervisory control; test equipment reliability; automated test equipment; automated tests for jet engine fuels control; 15087.

Computer measurement; technical societies; SP406, pp. 151-153.

Computer measurement and evaluation; computer science curriculum; hardware monitors; modeling; SP406, pp. 159-163.

Computer modeling; cooldown; cryogenic flow; stresses; two phase flow; NBSIR 75-820.

Computer network; management; network; 15547.

Computer network management; computer networking research; management evaluation; resource sharing; 15545.

Computer networking; data communications; networks; performance requirements; telecommunications; computer communications; TN882.

Computer networking; macro processor; minicomputer-based systems; operating systems; automated computer access; 15544.

Computer networking research; management evaluation; resource sharing; computer network management; 15545.

Computer networks; computer security; computer terminals; personal identification; access; access control; authentication; 15077.

Computer networks; computer terminals; networking technology; value-added networks; 15621.

Computer networks; computers; copyrights; energy; epoxies; hazard; metric conversion; piezoelectric accelerometers; sun; buildings; computer codes; DIM/NBS 59, No. 4, 73-96 (1975).

Computer networks; graphics; networks; protocol; standards; computer graphics; 15071.

Computer networks; interactive computing; man-machine interaction; performance measurement; time-sharing; TN880.

Computer networks; macros; minicomputers; protocols; access procedures; command language; 15541.

Computer networks; National Science Computer Network; network management; 15448.

Computer networks; networks; 15485.

Computer optimization of electron optics; electron beam transport; electron energy analyzers; field aperture; angular aperture; 15423.

Computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; security, file access; security, identification (password); security, input and output processing; security software; SP406, pp. 83-86.

Computer performance analysis; measurement; performance monitoring; performance variability; SP406, pp. 109-112.

Computer performance evaluation; installation management; measurement; modeling; monitoring; operating systems; performance objectives; computer architecture; SP406.

Computer Performance Evaluation (CPE); CPE education; CPE imagination; CPE instrumentation; CPE policy; EDP productivity; SP406, pp. 33-38.

Computer performance evaluation; efficiency measurement data; measures of computer performance; system effectiveness; SP406, pp. 61-64.

Computer performance evaluation; computer resource allocation; computer service parameters; computer system performance; cost/effectiveness; cost/performance; performance evaluation; user control of computing; users’ performance evaluation; SP406, pp. 65-71.

Computer performance evaluation; performance prediction; simulation; software validation; tools; actual system performance; SP406, pp. 79-82.

Computer performance evaluation; efficiency; measurement; research and development; accounting; SP406, pp. 155-157.

Computer performance measurement; software physics; software units; software work; SP406, pp. 135-137.

Computer program; documentation; engineering drawing; General Motors Corporation; metric conversion; rounding; test problem; tolerance; Caterpillar Tractor Co.; TN872.

Computer program; metric conversion; round off; 15406.

Computer programs; contour plotting; constrained refinement; crystallographic calculations; Fourier section; Fourier synthesis; least squares; TN854.

Computer programs; dopant profiles; error function; Gaussian diffusion; plotting; computer; semiconductors; silicon; BASIC; capacitance-voltage measurements; SP400-11.

Computer programs; dynamic thermal performance; heat flow analysis; heating and cooling loads; temperature predictions; thermal analysis; thermostat setback; transient heat flows; air leakage measurement; building heat transfer; BSS57.

Computer programs; gaseous hydrogen; graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; solid hydrogen; tables; 15382.

Computer programs; microdensitometry; photographic edges; transfer function; acutance; calibration; NBSIR 75-699.

Computer programs; transportation; urban transportation; carpool matching; carpools; NBSIR 74-633.

Computer resource allocation; computer service parameters; computer system performance; cost/effectiveness; cost/performance; performance evaluation; user control of computing; users’ performance evaluation; users’ performance measures; SP406, pp. 65-71.

Computer science; laboratory accreditation; measurement; national measurement system; technology transfer; voluntary standards; 14920.

Computer science curriculum; hardware monitors; modeling; computer measurement and evaluation; SP406, pp. 159-163.

Computer security; computer terminals; personal identification; access; access control; authentication; computer networks; 15077.

Computer security; computing technology; election administration; public administration; state and local government; systems analysis; technology utilization; vote-tallying; NBSIR 75-687.

Computer security; congressional concern; controlled accessibility; data sensitivity; measures of risk; standards; user identification; Brooks Bill; 15498.

Computer security; cryptography; data security; encryption; network security; security; communications; 15675.

Computer security; data security; privacy; privacy costs; security costs; TN876.

Computer security; energy efficiency; electroatalysis; fluorides; heart; heat pump; laser; ozone; radiometer; stabilizer; toy safety; DIM/NBS 59, No. 11, 241-264 (1975).

Computer security; Federal Information Processing Standards; information management; personal data; physical security; privacy risk assessment; access controls; ADP security; FIPS PUB 41.

Computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; security, file access; security, identification (password); security, input and output processing; security software; software monitors; SP406, pp. 83-86.

Computer selection; Federal Information Processing Standard; workload representation; benchmarking; benchmark mix demonstration; FIPS PUB 42.
Computer service parameters; computer system performance; cost/effectiveness; cost/performance; performance evaluation; user control of computing; users' performance evaluation; users' performance measures; computer performance evaluation; SP406, pp. 65-71.

Computer services; management; microeconomics; pricing; administration of computing; 15131.

Computer simulation; crystal growth; fc crystal growth; roughness; surfaces; 15144.

Computer simulation; electricity; energy-environment; fire safety; measurement system; nuclear power plant; productivity; subway; calculable capacitor; color; DIM/NBS 59, No. 12, 266-291 (1975).

Computer simulation; interatomic potentials; lattice dynamics; molecular dynamics; shock waves; blast waves; 15434.

Computer simulation (transient thermal); current crowding (transistors); power transistors; thermal impedance measurements; thermal response measurements; transistors (thermal measurements); 14963.

Computer Society of the IEEE: Data Communication Standards; Electronics Industries Association; International Standards Organization; International Telecommunications Union; American National Standards Institute; 15200.

Computer software; marketplace; performance measurement; quality; seller; specifications; validation; buyer; 15495.

Computer storage media; disk calibration; disk pack; magnetic disk; Standard Reference Surface; unrecorded disk surface; calibration factor; computer amplitude reference; TN884.

Computer system; factors; measurement; parameters; performance; performance terminology; predictability; requirements; variables; workload; SP406, pp. 53-60.

Computer system performance; cost/effectiveness; cost/performance; performance evaluation; user control of computing; users' performance evaluation; users' performance measures; computer performance evaluation; computer resource allocation; SP406, pp. 65-71.

Computer system performance evaluation; experimental assessment of system behavior; performance data analysis; performance data presentation; performance monitoring; SP406, pp. 103-108.

Computer systems; control systems; industrial control; software; standards; CAMAC; 14885.

Computer systems modeling; end users; performance; analytical; SP406, pp. 123-126.

Computer techniques; enforcement process; housing; Hurricane Agnes; mobile home parks; mobile homes; performance data; standards; NBSIR 75-690.

Computer terminals; networking technology; value-added networks; computer networks; 15621.

Computer terminals; personal identification; access; access control; authentication; computer networks; computer security; 15077.

Computerized elections; dental fillings; metre; ozone problem; police communications; water pollution; x rays; air pollution; camera guidelines; DIM/NBS 59, No. 5, 97-120 (1975).

Computerized fingerprint identification; fingerprint; pattern recognition; TN878.

Computers; copyrights; energy; epoxies; hazard; metric conversion; piezoelectric accelerometers; sun; buildings; computer codes; computer networks; DIM/NBS 59, No. 4, 73-96 (1975).

Computers; court records; fire safety; forensic science; law enforcement; methane; metric; police protection; safer streets; security systems; WWV/WWVH; accelerator facilities; DIM/NBS 59, No. 3, 49-72 (1975).

Computers; data; decay; ENSDF; evaluation; files; formats; levels; nuclear structure; radiations; reactions; tables; y-rays; SP425, pp. 309-312.

Computers; data acquisition; data processing; fluorometry; laboratory automation; real-time; analytical chemistry; T N857.

Computers; data processing, Federal Information Processing Standards; metric conversion; SI units; standards; ADF standards; FIPS PUB 34.

Computers; energy research; ethylene; fabric flammability; glass standards; household fires; jet engines; measurement seminars; metric; protecting nuclear fuels; DIM/NBS 59, No. 1-1-24 (1975).

Computers; information systems; mass transportation; telephone systems; NBSIR 75-665.

Computers; man-machine systems; networks; system commands; user protocols; command languages; TN877.

Computing technology; election administration; public administration; state and local government; systems analysis; technology utilization; vote-tallying; computer security; NBSIR 75-687.

Concave functions; networks; optimal locations; 14791.

Concealed objects detectors; emergency equipment; Law Enforcement Standards Laboratory; procurement guidelines; proactive equipment; security systems vehicles; voluntary standards; weapons; building systems; communications equipment; 15325.

Concentrated solutions; dynamics; Rouse theory; solution properties; viscoelasticity; bead-spring model; block copolymers; 15590.

Concepts; reliability; state-of-the-art; survey; automated measurements; computer; 14738.

Concrete; corrosion; deicing salts; epoxy coatings; organic coatings; polyvinyl chloride coatings; steel reinforcing bars; bridge decks; chloride ions; BSS65.

Concrete; corrosion; epoxy coatings; organic coatings; steel reinforcing bars; bridge decks; chlorides; 15112.

Concrete; cracking; deflection; eccentricity; equilibrium; loads (forces); masonry; stability; stress distribution; structural engineering; buckling; compression members; 15514.

Concrete; feasibility; gamma rays; neutrons; analysis; application; SP425, pp. 496-499.

Concrete; fiber-reinforced cements; fiber-reinforced concretes; glass fibers; mechanical properties; organic fibers; review; steel fibers; cement; 15028.

Concrete; flexural strength; formwork removal; nondestructive testing; surface hardness; compressive strength; NBSIR 75-729.

Concrete; gamma radiation; moments; adjoint; annihilation; buildup factor; 14940.

Concrete; gamma-ray penetration; moments; neutron penetration; secondary gamma rays; adjoint; 15453.

Concrete and steel shield; gamma-ray spectrum unfolding; integral measurements; neutron spectrum unfolding; NE-213 detector; nitrogen cross sections; SP425, pp. 161-164.

Concrete manholes; expansion joints; expansion loops; o-ring gaskets; prefabricated manholes; restrained piping; access; ball joints; BSS66, pp. 60-72.

Condensate return; epoxy; fiberglass reinforced plastic; filament-wound; insulated; molded; morpholine; prefabricated steel conduit; Qualified Products List; tieline; BSS66, pp. 88-101.

Condensation; droplets; evaporation; kinetic theory; Knudsen number expansion; nucleation; aerosols; 15157.

Conditioning; equilibration; gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; testing; building composite; building material; NBSIR 75-767.

Conductivity; doped ceria; high temperature; MHD electrodes; mixed ceria; 15057.

Conference; cross section; nuclear; standards; technology; biomedical; SP423, Volumes I and II.
Cooperation; fire safety; hydraulics; wind loads; building technology; NBSIR 74-618.
Cooperative programs; foreign visitors; information exchange; international building technology; international organization memberships; professional interaction; NBSIR 74-514.
Coordinate time; general relativity; time; clocks; TN659.
Coordinate time scales; frequency calibration; international frequency comparisons; optimum frequency estimate; primary frequency standards; relativity; SI second; time scale accuracy algorithm; time scale stability; 15672.
Coordinate transformations; data processing; group representations; measurements; near field; non-planar; patterns; scanning; spherical; symmetry; antennas; arrays; NBSIR 75-809.
Copolymer; crystallization; defect energy; equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; lamella thickness; melting; comonomer concentration; 15561.
Copolymerization; pentafluorostyrene; polymerization; pressure radiation; reactivity ratios; tetrafluoroethylene; 15281.
Copper; cryogenics; dilution refrigerator; heat exchanger; Kapitza resistance; liquid helium; powder; silver; copper alloy; 15238.
Copper; density; electrodeposited coatings; electrodeposits; metal coatings; coatings; 15580.
Copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; molybdenum; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).
Copper; doubly ionized copper; electron configuration; ionization potential; wavelengths; atomic energy levels; atomic spectrum; J. 79A No. 3, 497-521 (1975).
Copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC; smoke; toxic gases; vent; waste; ABS; cast iron; NBSIR 74-449.
Copper; heat transfer; helium 3-helium 4; Kapitza resistance; phonon-electron interaction; phonon-quasiparticle interaction; powder; sintering; 14749.
Copper alloy; copper; cryogenics; dilution refrigerator; heat exchanger; Kapitza resistance; liquid helium; powder; silver; 15238.
Copper NMR thermometer; y-ray thermometer; noise thermometer; superconductive transition temperatures; temperature; 15527.
Copper-titanium; Dla; metastable solvus; microstructural sequence method; nucleation; ordering; precipitation; spinodal decomposition; age hardening; 15053.
Copyrights; energy; epoxies; hazard; metric conversion; piezoelectric accelerometers; sun; buildings; computer codes; computer networks; computers; DIM/NBS 59, No. 4, 73-96 (1975).
Core polarization; exchange enhancement; Knight shifts; LnN6; LnN6-xPt6; LaPt6; NMR; ordering; relaxation times; solid solutions; alloys; contact term; 14889.
Coriolis resonance; high resolution; infrared; NO2; spin splitting; 2p1/2; 14769.
Coriolis resonance; high resolution; infrared spectrum; nitrogen dioxide; spin splitting; anharmonic constant; 15253.
Corrections for second order radiation; far ultraviolet; noble gas double ionization chamber; synchrotron radiation; transfer standard detectors; calibration of detectors; 14987.
Correlated molecular collisions; density expansions; fluorine; oxygen; statistical analysis; viscosity coefficient; argon; 15141.
Correlation; covariance; ENDF/B; standard cross section; uncertainty file; SP425, pp. 173-176.
Correlation; critical point; equation of state; methane; thermal conductivity; thermal conductivity coefficient; viscosity coefficient; 15184.
Correlation; forced convection; heat transfer; helium; supercritical; 14962.
Correlation; gas; liquid; thermodynamic properties; thermodynamic surface; ammonia; NBSIR 75-770.
Correlation coefficient; medians; normal distribution; order statistics; probability plot; statistical methods; statistics; tests of distributional hypotheses; 14836.
Correlation factor; diffusion; drift mobility; electric field; random walk; symmetry plane; vacancy; 15367.
Correlation factor; diffusion; vacancy factors; driving force for diffusion; impurity diffusion; ion drift velocity; nonrandom diffusion; vacancy wind effect; 15542.
Correlation function; experimental data; hydrodynamic behavior; methane; molecular dynamics; potential function; self-diffusion coefficient; 11-6-8 potential function; 15173.
Correlation, regression; R. A. Fisher; Francis Galton; frequency curves, method of moments; Karl Pearson; statistics; Tables for Statisticians and Biometricians; W. F. R. Weldon; bibliography; Biometrika; Chi-square tests; 14822.
Correlations; covariances; data adequacy; estimated uncertainties; evaluations; neutron transport; SP425, pp. 842-847.
Correlations; level densities; resonance levels; 230U; 162O; 19F; collective motion; SP425, pp. 742-743.
Correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; reflection coefficient; reflectometer; self-calibration; six ports; vector voltmeter; voltage; admittance; automated precision measurements; TN673.
Corridor; fire spread; flashover; floor covering; radiative heat transfer; 15410.
Corridor fire; experiments; flame spread; floorcovering; test method; theory; 15617.
Corridor fire spread; energy release rate; fire induced flow; flame propagation; flashover; floor coverings; radiant heat flux; NBSIR 75-691.
Corridor fires; energy models; finished interior; full scale experiments; interaction; measurements; smoke; smoke and flame spread; temperature; with and without forced air; velocity; carpets with and without underlayment; 15230.
Corridors; fire induced flow; recirculating flow; scale-model; smoke movement; stratified flow; theory; 15630.
Corrosion; deicing salts; epoxy coatings; organic coatings; polyvinyl chloride coatings; steel reinforcing bars; bridge decks; chloride ions; concrete; BSS65.
Corrosion; deterioration; inhibitors; materials selection; nonmetals; rectifiers; water treatment; anodes; cathodic protection; coatings; BSS65, pp. 42-51.
Corrosion; epoxy coatings; organic coatings; steel reinforcing bars; bridge decks; chlorides; concrete; 15112.
Corrosion; growth; metering; modern; museum; primary; reliability; renovation; secondary; system; variable; anchor; controls; BSS66, pp. 102-115.
Corrosion; inflammatory response; metallic implants; systemic effects; SP415, pp. 45-54.
Corrosion; passivation; single crystals; sulfuric acid; titanium; 14747.
Corrosion of underground pipes; district heating; hot and chilled water systems; insulation of underground pipes; specifications for underground systems; BSS66.
Cosmic-ray reactions; lunar chemistry; lunar y-rays; neutron capture; nonelastic scattering; SP425, pp. 540-545.
Cost; cryogenics; economics; embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities; conservation; conversion; SP419.
Cost; design; economics; flexibility; law enforcement facilities;
Critical point; decorated lattice gas; hole-particle symmetry; law of corresponding states; liquid; Padé approximant; power law; slope of the coexistence curve diameter; asymmetry; coexistence curve; compressibility; critical exponents; 15293.

Critical point; density; enthalpy; equation of state; hydrogen; index of refraction PVT; saturation properties; scaling laws; specific heat; NBSIR 75-814.

Critical point; equation of state; methane; thermal conductivity; thermal conductivity coefficient; viscosity coefficient; correlation; 15184.

Critical point; ethane; equation of state; fluids; methane; orthobaric densities; specific heats; vapor pressures; coexistence boundary; J. 79A No. 1, 71-79 (1975).

Critical point; nucleation; supercooling; carbon dioxide; CO2; 14915.

Critical radiant flux; fire retardant; flammability; flowing radiant panel test; Metro; motor vehicle safety standard 302; urethane; AM General Bus; arson; NBSIR 75-718.

Critical refractive index; Fabry-Perot interferometer; Lorenz-Lorentz function; methane; rectilinear diameter law; refractive index; refractometric virial coefficients; 15137.

Critical region; density profile; dielectric constant; linear model; oxygen; scaling laws; statistical analysis; critical coefficients; critical exponents; 14772.

Critical region; dielectric constant; equation of state; homogeneity; light scattering; power laws; refractive index; scaling; Schlieren method; specific heat; speed of sound; x-ray scattering; 14932.

Critical region parameters; ethylene; heavy noble gases; helium; linear model; methane; NBS equation; scaling laws; statistical analysis; steam; universality; air constituents; 15601.

Critical review; krypton; measurement technique; methane; self-diffusion coefficient; argon; 14831.

Critical solution point; densimeter; magnetic; diffusion; pressure; gradient; concentration; density; gravity; effects of; 3-methylpentane; mixture; liquid; nitroethane; sedimentation; critical point; 14944.

Critical solution point; density; gravity effects; mixture; binary; mixture; liquid; nitroethane; thermal expansion; 3-methylpentane; consolute point; critical exponent $\alpha$; critical phenomena; 15691.

Critically evaluated data; enthalpy; entropy; equilibrium constant of formation; free energy of formation; Gibbs energy function; heat capacity; heat of formation; thermochromic tables; J. Phys. Chem. Ref. Data 4, No. 1, 1-176 (1975).

Critically evaluated data; enthalpy; entropy; equilibrium constant of formation; Gibbs energy function; heat capacity; heat of formation; thermochromic tables; J. Phys. Chem. Ref. Data 4, No. 2, 457-470 (1975).

Critically evaluated data; elemental; propylene; thermodynamic properties; data; transport properties; data; NBSIR 75-763.

Critically evaluated numerical data; National Standard Reference Data System; physical sciences; 15305.

Critique; hematology; microbiology; sampling; chemistry; clinical laboratory capability; 15244.

Critique; hematology; microbiology; sampling; chemistry; clinical laboratory capability; 15273.

Cross capacitor; electrical units; farad; ohm; units; absolute farad; absolute ohm; calculable capacitor; 14927.

Cross correlation; solid state noise source; stability measure; Allan variance; argon gas noise source; 15666.

Cross section; crystallography; photoelectric absorption; photons; Rayleigh scattering; x rays; attenuation coefficient; compilation; Compton scattering; 14847.
Cross section; differential; elastic; inelastic; neutron; scattering; SP425, pp. 883-885.

Cross section; drift tube; experimental; molecule; negative ion; O$_2$; O$^-$; O$_3$; photodetachment; photodissociation; 15478.

Cross section; D$_2$; dissociative recombination; electron scattering; La radiation; crossed beams; 15076.

Cross section; eigenvalue; Monte Carlo; multigroup; reactor; resonance; slowing-down; stochastic; transport; benchmark; SP425, pp. 451-454.

Cross section; electron; experiment; positive ion; review; Rydberg states; atom; autoionizing; collision; 15556.

Cross section; electron impact; excitation; Hg$^+$; crossed beams; 15005.

Cross section; emission; neutron; techniques; application; charged particle; SP425, pp. 156-160.

Cross section; evaluation; neutron; resonance; capture; chromium; SP425, pp. 367-370.

Cross section; fission barrier shape; fission isomer; photofission; bremsstrahlung beams; 15313.

Cross section; fission barrier shapes; γ-ray strength; isomeric fission; level density; photofission; bremsstrahlung beam; 15350.

Cross section; fission; neutrons; inelastic scattering; iron; minima; Monte Carlo; SP425, pp. 440-443.

Cross section; helium; nickel; neutron; spectrum; alpha particles; SP425, pp. 810-812.

Cross section; interpolation; Monte Carlo; probability; resonance; thinning; unresolved; SP425, pp. 447-450.

Cross section; neutron; resonance; sodium-22; thermal; Westcott; SP425, pp. 792-794.

Cross section; neutrons; nuclear model; SP425, pp. 332-334.

Cross section; nuclear; standards; technology; biomedical; conference; SP425, Volumes I and II.

Cross section; sensitivity; shield; two dimensional; SP425, pp. 459-465.

Cross section measurements; neutron detector; absolute efficiency determination; SP425, pp. 108-111.

Cross section sensitivity; gamma ray; neutron; transport calculations; SP425, pp. 431-435.

Cross section sets; neutron spectrum; transplutonium; waste management; yield; actinide burnup; SP425, pp. 214-217.

Cross section structure; excitation energy distribution function; $^3$He electrodisintegration; $^3$He excited states; $^3$He photodisintegration; 15220.

Cross section uncertainties; equilibrium cycle; fuel cycle; reaction swing; sensitivity study; breeding ratio; SP425, pp. 385-388.

Cross sections; deuterons; neutrons; phase shifts; tritons; alpha particles; SP425, pp. 701-703.

Cross sections; dosimetry; evaluation; fission spectrum; neutron flux; neutrons; SP425, pp. 250-253.

Cross sections; dosimetry; filtered beams; neutrons; capture gamma rays; SP425, pp. 89-92.

Cross sections; D$_2$; dissociative recombination; product D$^+(n = 4); 14865.

Cross sections; electron impact; electrons; secondary; ionization; 15553.

Cross sections; electron impact; excitation; He; inelastic; Ne; Ar; atoms; autoionizing; 15586.

Cross sections; electron probe microanalysis; electrons; inner-shell; 15153.

Cross sections; END/F/B; neutrons; reactors; resonances; unresolved; SP425, pp. 371-379.

Cross sections; energy distributions; photon; tertiary; theoretical; SP425, pp. 317-319.

Cross sections; evaluation; information; processing; radiation; shielding; analysis; SP425, pp. 363-366.

Cross sections; evaluation; integral data; sensitivities; uncertainties; adjustment; critical assemblies; SP425, pp. 405-408.

Cross sections; excitation function; proton; rhenium; SP425, pp. 509-511.

Cross sections; excited states; ionization; mass spectrometry; radiation chemistry; rare gases; 14832.

Cross sections; fast-neutron reactions; lithium; nuclear reactions; (n,a) cross sections; SP425, pp. 240-243.

Cross sections; fission; actinide; SP425, pp. 202-213.

Cross sections; fission; neutronium-237; neutron reactions; pile neutrons; plutonium-239; uranium-234; uranium-235; uranium-238; 15020.

Cross sections; fission, absorption; measurement; $^{239}$Pu; comparison; SP425, pp. 627-630.

Cross sections; fission spectrum; neutron source; scattering corrections; threshold detectors; activity measurement; SP425, pp. 273-276.

Cross sections; fluorine; neutron-induced low-energy photons; tantalum; SP425, pp. 762-765.

Cross sections; flux; neutrons; reaction rates; spectra; SP425, pp. 189-192.

Cross sections; fusion; reaction rates; thick targets; astrophysics; SP425, pp. 69-72.

Cross sections; fusion reactors; perturbation; sensitivity; uncertainties; SP425, pp. 674-679.

Cross sections; gamma rays; incoherent scattering function; photons; Rayleigh scattering; tabulations; X rays; atomic form factor; Compton scattering; J. Phys. Chem. Ref. Data 4, No. 3, 471-538 (1975).

Cross sections; graphite; neutron; sodium; water; benchmark; SP425, pp. 177-183.

Cross sections; helium; neutron; benchmark; SP425, pp. 375-377.

Cross sections; light elements; R-matrix; standards; $^4$Li; $^6$B; SP425, pp. 302-308.

Cross sections; linearization; paging; pre-processing; relative error; thinning; SP425, pp. 419-421.

Cross sections; neutrons; nitrogen; sensitivity calculation; air transport; SP425, pp. 436-439.

Cross sections; (n,xy); photon energy; SP425, pp. 758-761.

Cross sections; pion; star formation; SP425, pp. 472-475.

Cross sections; structures; $^{3}$He(Th); $^{3}$He(U); SP425, pp. 642-645.

Cross sections; ThO$_2$ resonance integral; $^{3}$HeTh; $^{3}$HeU; SP425, pp. 415-418.

Crossecross sections; beam; electron impact; excitation; Hg$^+$; 15005.

Crossecross sections; cross section; D$_2$; dissociative recombination; electron scattering; La radiation; 15076.

Cross-section; experiment; fusion; radioactivity; resonance levels; afterheat; blanket; SP425, pp. 708-711.

Cross-section calculations; fast neutron reactions; gamma-ray production; isomers; radiation widths; statistical model codes; applications to CTR; SP425, pp. 651-658.

Cross-section data and systematics; cross-section measurement; excitation functions; fast neutrons; nonelastic interactions; nuclear reactions; sources and spectra; SP425, pp. 664-673.

Cross-section measurement; excitation functions; fast neutrons; nonelastic interactions; nuclear reactions; sources and spectra; cross-section data and systematics; SP425, pp. 664-673.

Cross-sections; fission; measured; neutrons; 1 keV - 1 MeV; $^{239}$Pu; $^{238}$U; SP425, pp. 564-567.

Cross-sections; fission; measured; neutrons; ratio; $^{239}$U; $^{238}$U; 600 keV-22 MeV; SP425, pp. 568-571.

Cross-sections; scintillators; spacecraft; gamma-rays; spillation; activation; Apollo; background; computation; decay-schemes; SP425, pp. 480-483.

Crush characteristics; displacement measurements; door struc-
ture; drop tests; dynamic crush tests; impact collisions; plastic deformation; static crush tests; strain measurements; structural components; test procedures; automobile side impact; NBSIR 74-605.

Cryogenic; Crustal movements; earth rotation; geophysics; lasers; lunar cartography; lunar gravity; moon; plate tectonics; 15437.

Cryogenic; Cryogenics; cryptography; data; energy labeling; energy needs; fluid safety; materials; NBS, GSA experiment; optical spectra; plastic pipes; thermal conductivity; computer; DIM/NBS 59, No. 9, 193-216 (1975).

Cryogenic; energy; fuel; hydrogen; 14868.

Cryogenic; energy; hydrogen; research and development; 14936.

Cryogenic; epoxy; glass fiber; thermal conductivity; aramid fiber; composites; 15021.

Cryogenic; flow; flowmeters; liquid nitrogen; measured; positive displacement; 14774.

Cryogenic; flowmeter; liquid nitrogen; measurement; positive displacement; turbine; vortex shedding; angular momentum; 15043.

Cryogenic; gas industry; liquefied natural gas; research; survey; technology; 15468.

Cryogenic; heat transfer; hemisphere; horizontal cylinder; liquid deuterium; liquid hydrogen; liquid nitrogen; natural convection; sphere; vertical cylinder; NBSIR 75-807.

Cryogenic; liquid oxygen; measurement; oxygen; performance; pressure; survey; transducer; calibration; compatibility; 15155.

Cryogenic flow; stresses; two phase flow; computer modeling; cooldown; NBSIR 75-820.

Cryogenic fluid safety; explosions; fires; fuels; handling; hydrogen; oxidizers; oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; 15154.

Cryogenic fluids; interaction second virial coefficients; review; solid-vapor equilibria; unlike molecule interactions; binary systems; 15188.

Cryogenic insulation; powders; thermal conductivity; thermal diffusivity; 15177.

Cryogenic motors; induction motors; liquid helium pumps; motor efficiency; net positive suction head; pump efficiency; pump performance; cavitation; NBSIR 75-816.

Cryogenic resistor; current comparator; Josephson device; microstrip line; microwave coupling; SQUID; superconducting switch; tunnel junction; voltage standard; 15506.

Cryogenic resistors; current comparators; low temperature; shielding; SQUID; superconducting shield; superconductivity; 15597.

Cryogenic technology; data; energy fuel; hydrogen; hydrogen properties; LNG/SNG; production; safety; storage; TN664.

Cryogenic temperature; heat capacity; linear polyethylene; polyethylene; thermodynamic properties; adiabatic calorimetry; branched polyethylene; calorimetry; J.79A No. 2, 437-441 (1975).

Cryogenic thermocouples; noble-metal thermocouples; nonstandardized thermocouples; refractory metal thermocouples; standardization; temperature measurement; thermocouples; thermometry; base-metal thermocouples; 15517.

Cryogens; dielectric; glass-ceramic; optics; bolometer; 14742.

Cryogens; dielectric constant; loss tangent; machinable glass-ceramic; specific heat; thermal conductivity; 15046.

Cryogens; dielectrics; electrocaloric; heat switches; polarization; refrigeration; 15491.

Cryogens; dilution refrigerator; heat transfer; helium 3; helium 4; Kapitza resistance; liquid helium; powder; silver; 15219.

Cryogens; dilution refrigerator; heat exchanger; Kapitza resistance; liquid helium; powder; silver; copper alloy; copper; 15238.

Cryogens; dynamic mechanical properties; glass-fiber composites; literature review; static mechanical properties; thermal properties; 15170.

Cryogens; dynamic mechanical properties; literature review; static mechanical properties; thermal properties; advanced fiber composites; 15667.

Cryogens; economics; embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities; conservation; conversion; cost; SP419.

Cryogens; electricity; energy; helium; power; superconductivity; 14872.

Cryogens; energy crisis; hydrogen economy; LNG; superconducting electrical equipment and instrumentation; coal gasification; 15654.

Cryogens; fracture toughness; mechanical properties; nickel steels; crack propagation; 15530.

Cryogens; helium pump; power transmission; refrigeration; superconducting cables; 15455.

Cryogens; helium-cooled electrical leads; helium impurities; microwave cavities; negative differential flow resistance; pressure measurement; system dynamics; thermometers; cooling system; NBSIR 75-823.

Cryogens; infrared detector; low capacity; reliability; shipboard; 77 K refrigerator; NBSIR 74-372.

Cryogens; liquid helium; millikelvin; thermometry; carbon resistors; 15537.

Cryogens; superconducting coil; thermal conductivity; composite; 15031.

Cryomagnetism; low temperature specific heat; magnetic dipole interaction; paramagnetic salt; CMN; 14834.

Cryothermometry; low temperature; thermometry; 15127.

Cryptography; data; energy labeling; energy needs; fluid safety; materials; NBS, GSA experiment; optical spectra; plastic pipes; thermal conductivity; computer; cryogenic; DIM/NBS 59, No. 9, 193-216 (1975).

Cryptography; data security; encryption; network security; security; communications; computer security; 15657.

Crystal; crystal habit; crystal space group; crystal structure types; density; determination; identification; minerals; optical properties; twinning; unit cell dimensions; cleavage; compilation; 15084.

Crystal; defect; disclination; dislocation; elasticity; jog; kink; multiplication; plasticity; Volterra; 14745.

Crystal; ferrous surface; interstitial hydrogen; lattice dynamics; palladium hydride; phonons; 14854.

Crystal chemistry; flux growth; garnet; hydrogarnet; indium silicates; inorganic synthesis; solid solubility silicates; x-ray powder analysis; 15235.

Crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; time domain stability; 15673.

Crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; time domain stability; 15687.

Crystal dynamics; dispersion curves; orientation; phonons; rotational disorder; single crystal; alkali cyanides; 15124.

Crystal field parameters; energy levels; holmium 3+ ions; neodymium 3+ ions; susceptibility; convergence criterion; 14862.

Crystal growth; electrolysis; interfacial polarization; ionic conduction; mass transport; Ac impedance; calcium apatites; calcium hydroxide; NBSIR 74-628.

Crystal growth; fcc crystals; roughness; surfaces; computer simulation; 15144.

Crystal habit; crystal space group; crystal structure types; densi-
Crystallography: crystal orientation; Kossel: lattice spacing determination; microdiffraction; scanning electron microscopy: strain analysis; x-ray: channeling of electrons; 14913.

Crystal oscillator: frequency calibrator; frequency offset: NBS traceability; phase comparison: television; 15140.

Crystal oscillator: frequency calibration: network-originated programs: NBS traceability; phase comparison: television; 15682.

Crystal oscillators: frequency standards; stability: survey of clocks: accuracy: atomic clocks; 15662.

Crystal perfection: Czochralski growth; Lomer-Cottrell locks; sessile dislocations: x-ray topography; anomalous transmission; as-grown copper crystal; 14779.

Crystal repeat distance: density; isotopic abundance; silicon; Avogadro number; 15294.

Crystal space group: crystal structure types; density; determination; identification: minerals; optical properties; twinning; unit cell dimensions; cleavage; compilation; crystal; crystal habit; 15084.

Crystal spectrometers: elemental distribution; elemental identification: energy dispersive spectrometers: microanalysis; specimen preparation; 15247.

Crystal structure; cyclic nitramine; organic compound; 14758.

Crystal structure; data analysis: molecular structure; critical evaluation; 15483.

Crystal structure: deuterium peroxide; hydrogen bonds; hydrogen peroxide: neutron diffraction; structure refinement; thermal motion; 15271.

Crystal structure; diffraction: isotopes; molecular dynamics; neutron: nuclear reactor; radiation; radiography; activation analysis; TN860.

Crystal structure; integrated intensities: lattice constants: peak intensities: powder patterns; reference intensities; standard; x-ray diffraction; 14767.

Crystal structure; low temperature; meta-stable compound; neutron diffraction; NH4ClO4: thermal motion; 15223.

Crystal structure; organic crystal; x-ray diffraction; 15284.

Crystal structure; single crystal; tetrahedral anion; x-ray diffraction; calcium fluoroborate; calcium salts; 14976.

Crystal structure explosives: least-squares refinement; molecular packing: tetrazacyclooctane derivatives; x-rays; 15574.

Crystal structure transformation; nitrates; nitriles; phase transformation; x-ray diffraction data: carbonates; NSRDS-NBS53.

Crystal structure transformations: perchlorates; phase transformations; phosphates; sulfates; thermodynamic data: x-ray diffraction data; chromates; crystal structure; NSRDS-NBS56.

Crystal structure types: density; determination; identification: minerals; optical properties; twinning; unit cell dimensions; cleavage; compilation; crystal; crystal habit; crystal space group; 15084.

Crystal structures: dimethyl sulfone dimine; hydrogen bonds; neutron diffraction; sulfone; alkyl sulfone; 15383.

Crystal surfaces: density; lamella thickness; paraffins; polyethylene; unit cell: x-ray; 14724.

Crystalline materials: electron channeling contrast; electron channelling patterns: scanning electron microscope: bend contours; contrast formation; 15548.

Crystalline polymer; ESR investigation of radicals; fibrous structure; mechanical breakdown; microfibrillar structure; radical formation: tie molecules; chain rupture; 15476.

Crystalline polymer solid: diffusion; elastic deformation; permeability; plastic deformation; sorption; crazing; 15237.

Crystalline polymers: material transport; thickening; volume change; annealing; 14754.

Crystallization: defect energy; equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; lamella thickness; melting; comonomer concentration; copolymer; 15561.

Crystallization rate; molecular weight; nucleation theory; polyethylene: regime I; regime II; spherulite; axialite; chain folds; J.9A No. 6; 567-699 (1975).

Crystallographic calculations; Fourier section; Fourier synthesis; least squares; computer programs; contour plotting; constrained refinement; TN854.

Crystallography; photoelectric absorption; photons; Rayleigh scattering; x rays: attenuation coefficient; compilation; Compton scattering; cross section; 14847.

Crystallography: Cesium ion; Li*; low energy; Na*; pseudopotential; Rb*; resonant charge transfer; atom; collision; 15075.

CTR energy production; nuclear reactions; SP425, pp. 659-663.

Cu; hyperfine fields; magnetism; Mn; Mössbauer effect; Ni; Sb; Pd; alloys; 15016.

Cumulative property index; data compilations: National Standard Reference Data System; NSRDS-NBS55.

Cumulative yields; delayed-neutrons; fission products; half-lives; independent yields; mass spectrometry; SP425, pp. 401-404.

Cuprous oxide; elastic constants; 14902.

Current; impedance; microwave circuit parameters; microwave measurements: phase angle; power; ratio; reflection coefficient; reflectometer; self-calibration; six-ports; vector voltmeter; voltage; admittance; automated precision measurements; correlator; TN673.

Current comparator; electrical energy unit; metrology; standard; unit; watthour meter calibration; watthour meter; calibration; 14881.

Current comparator; Josephson device; microstripe; microwave coupling; SQUID; superconducting switch; tunnel junction; voltage standard; cryogenic resistor; 15596.

Current comparator; low temperature electrical measurement; quantum interference device; ratio transformer; resistive divider; superconductivity; 14937.

Current comparators; low temperature; shielding; SQUID; superconducting shield; superconductivity; cryogenic resistors; 15597.

Current crowding (transitors); power transistors; thermal impedance measurements; thermal response measurements; transistors (thermal measurements); computer simulation (transient thermal); 14963.

Current cycle testing; electrical connection failure; electrical receptacles; residential wiring; aluminum wire; consumer product safety; NBSIR 75-723.

Current quarks; hadronic structure; meson transformation; meson spectroscopy; algebra of currents and quarks; constituent quarks; 15073.

Curtains; draperies; fabrics; flammability; garments; test methods; textiles; upholstered furniture; apparel; carpets; 15470.

Curve crossing; O(D); O(S); quenching rate; spin-orbit coupling; transition probability; 15566.

Customary units; history of measurement systems; metric chart; metric information; bibliography of metric information; SP410.

Cut; edges, hazardous; experimental studies; human tolerances; injury; injury thresholds; inspection of edges; laceration; safety; simulation; skin; skin, cutting; synthetic materials; cutting; toys; NBSIR 73-262.

Cutouts, reinforcement of; finite element analysis; joints, adhesively bonded; reinforcement, composite overlay; reinforcement, cutouts and cracks; adhesively bonded joints; composite materials; composite-overlay reinforcement; contour plotting; cracks, reinforcement of; 15508.
D

Damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornadoes; wind; buildings; BSS61.

Damage risk criteria for impulse noise; gunfire noise; noise-induced hearing damage; noise of police firearms; 14793.
Darlington hot spot screen; Darlington thermal resistance; emitter-only switching; hot spot screen for Darlings; integrated power Darlington thermal resistance; thermal resistance measurement; 15610.

Darlington pairs; deep depletion; dopant profiles; electrical properties; electron beam evaporator; electron beam induced damage; electronics; epitaxial layer thickness; filament eyepiece; flying-spot scanner; hermeticity; hydrogen chloride gas; image shearing eyeepiece; SP400-17.

Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; measurement methods; microelectronics; micrometry; MOS devices; oxide films; SP400-12.

Darlington thermal resistance; emitter-only switching; hot spot screen for Darlings; integrated power Darlington thermal resistance; thermal resistance measurement; Darlington hot spot screen; 15610.

Data; decay; ENSDF; evaluation; files; formats; levels; nuclear structure; reactions; tables; y-rays; computers; SP425, pp. 309-312.

Data; energy fuel; hydrogen; hydrogen properties; LNG/SNG; production; safety; storage; cryogenic technology; TN664.

Data; energy labeling; energy needs; fluid safety; materials; NBS, GSA experiment; optical spectra; plastic pipes; thermal conductivity; computer; cryogenic; cryptography; DIMINBS 59, No. 9, 193-216 (1975).

Data; fire; fire incident system; fire service; incident reports; loss; National Fire Data System; 15632.

Data; fire; households; injury; loss; National Fire Data System; National Fire Survey; survey; Census Bureau; Consumer Product Safety Commission; 15656.

Data; flux; LFMBR; neutron; SP425, pp. 39-44.

Data; Standard Reference Data Program; well-defined, measurable properties; 15301.

Data acquisition; data processing; fluorimetry; laboratory automation; real-time; analytical chemistry; computers; TN857.

Data acquisition; file system; laboratory automation; multiprogramming; operating system; real-time: NBSIR 75-713.

Data acquisition; laboratory automation operating system; teleprocessor; analytical chemistry; computer; 15136.

Data acquisition system; efficiencies; electrical power; energy conservation; energy costs; fuel utilization; heat recovery; total energy systems; utilities for housing; utility system performance; air conditioning; air pollution; central utility systems; NBSIR 75-711.

Data adequacy; estimated uncertainties; evaluations; neutron transport; correlations; covariances; SP425, pp. 842-847.

Data analysis; mean; standard deviation; statistics; updating estimates; 15640.

Data analysis; molecular structure; critical evaluation; crystal structure; 15483.

Data base applications; data base management systems; selection criteria; software features; system evaluation; system features; user experiences; TN887.

Data base management; designers; evaluation; selection; users; acquisition; CODASYL; computer; 15668.

Data base management; performance measurement; test data bases; test transactions; benchmark testing; 15670.

Data base management systems; selection criteria; software features; system evaluation; system features; user experiences; data base applications; TN887.

Data base technology; data manipulation, data structured; data manipulation, relational; 15698.

Data bases; optical character recognition; pattern recognition; reading machines; character recognition; context research; NBSIR 75-746.

Data center; data compilation; data evaluation; energy program; thermodynamics; transport properties; 15512.

Data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets; FIPS PUB 35.

Data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets; FIPS PUB 36.

Data communication equipment; data processing terminal equipment; data transmission (high speed); Federal Information...
Phys.
No.

Data compilation; data evaluation; energy program, thermodynamics; transport properties; data center: 15512.

Data compilation; density; electrical conductance; molten salt mixtures; standard reference data; surface tension; viscosity; chlorides; J. Phys. Chem. Ref. Data 4, No. 4, 871-1178 (1975).

Data compilation; hydrated electron; radiation chemistry; rates; aqueous solution; chemical kinetics; NSRDS-NBS43. Supplement.

Data compilation; hydrogen atom; radiation chemistry; rates; aqueous solution; chemical kinetics; NSRDS-NBS51.

Data compilation; methanol; radiation chemistry; rates; review; chemical kinetics; NSRDS-NBS54.

Data compilations; gas lasers; transition probabilities; atomic data; atomic energy levels; atomic line shapes; atomic spectra; 15300.

Data compilations; National Standard Reference Data System; cumulative property index; NSRDS-NBS55.

Data conversion; dynamic measurements; electrical measurements; electronic instrumentation; signal conditioning; systems; time domain; TN865.

Data evaluation; energy program, thermodynamics; transport properties; data center; data compilation: 15512.

Data evaluation; gas phase; photoabsorption cross section; photochemistry; quantum yield; rate constant; atmospheric chemistry; chemical kinetics; TN866.

Data evaluation; precision; production of atomic vapor; zinc; accuracy; atomic fluorescence; automatic scatter correction; cadmium; chemical interferences; 15012.

Data files; data network; data on-line; international data service; on-line data; reference data service; standard reference data; 15266.

Data handling language; interactive computing; interpretative computer programming language and operating system; medical automation; minicomputer-based systems; MUMPS; MUMPS Development Committee; MUMPS Language Standard; H118.

Data manipulation; data structured; data manipulation, relational; data base technology; 15698.

Data manipulation; relational; data base technology; data manipulation, structured; 15698.

Data network; data on-line; international data service; on-line data; reference data service; standard reference data; data files; 15266.

Data on-line; international data service; on-line data; reference data service; standard reference data; data files; data network; 15266.

Data processing; Federal Information Processing Standard; information interchange; information processing; programming language; software; standards conformance; COBOL; FIPS PUB 21-1.

Data processing; fluorimetry; laboratory automation; real-time; analytical chemistry; computers; data acquisition; TN857.

Data processing; group representations; measurements; near field; non-planar; patterns; scanning; spherical; symmetry; antennas; arrays; coordinate transformations; NBSIR 75-809.

Data processing; index; information processing; privacy; requirements definition; security; systems design; computer; NBSIR 75-909.

Data processing. Federal Information Processing Standards; metric conversion; SI units; standards; ADP standards; computers; FIPS PUB 34.

Data processing terminal equipment; data transmission (high speed); Federal Information Processing Standards; synchronous signaling rates; teleprocessing; wide band; data communication equipment; FIPS PUB 37.

Data reduction; near field; probe correction; probe design; spherical scan; antenna measurements; 14766.

Data security; encryption; network security; security; communications; computer security; cryptography; 15657.

Data security; privacy; privacy costs; security costs; computer security; TN876.

Data sensitivity; measures of risk; standards; user identification; Brooks Bill; computer security; congressional concern; controlled accessibility; 15498.

Data sources; glasses; properties; carbon (graphite); ceramics; composites; SP396-2.

Data storage; distribution memory; hierarchical control; manipulator control; cerebellar model; control theory; 15287.

Data testing; GCFR; integral measurements; benchmarks; SP425, pp. 464-468.

Data transmission (high speed); Federal Information Processing Standards; synchronous signaling rates; teleprocessing; wide band; data communication equipment; data processing terminal equipment; FIPS PUB 37.

Daylight; fenestration; psychological; solar glass; spaciousness; sunshine; view; windowless; windows; BSS70.

Daylight research; National Bureau of Standards; programs for architects; research communication; AIA/NBS Architect-in-Residence; architectural research; 15606.

De transformer; granular aluminum films; magnetic coupling; superconducting dc transformer; type II superconducting films; vortex coupling; 15361.

DD; D'Li; fusion-dynamics; l-layer; reactivity-coefficients; advanced-fuels; SP425, pp. 683-687.

D(d,n)He and C(n,n) spectra; neutron TOF facility; C(n,n), E = 9-15 MeV, measured at E=0; SP425, pp. 99-102.

Deactivation; energy transfer; infrared laser; luminescence; ozone; apparatus and methods; 15221.

Debugging; Interdata 70; OS AIDOS; RTOS; software; 15538.

Deburring; gage blocks; gage block comparator; linear variable differential transformer; NBSIR 74-523.

Debye temperature; Doring effect; elastic constants; iron alloys; magnetic transition; nickel alloys; Poisson's ratio; pulse-echo method; sound velocity; Young's modulus; bulk modulus; chromium alloys; compressibility; 15343.

Debye temperature; elastic constant; nickel-chromium-iron alloys; Poisson's ratio; shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; 15225.

Debye temperature; elastic constant; nickel steels; Poisson's ratio; shear modulus; sound velocity; Young's modulus; aluminum alloy; bulk modulus; compressibility; 15522.

Debye temperature; elastic constants; elasticity; Poisson ratio; pulse-echo method; sound velocity; Young's modulus; aluminum; aluminum alloys; bulk modulus; compressibility; 15528.

Debye temperature; elastic constants; nickel-base alloys; Poisson's ratio; shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; 15533.

Decay; ENSDF; evaluation; files; formats; levels; nuclear structure; radiations; reactions; tables; γ-rays; computers; data; SP425, pp. 309-312.

Decay constant; plutonium-238; safeguards data; spontaneous fission; track recorders; coincidence counting; SP425, pp. 587-590.

Decay heat; Eγ; En; ENDF/B-IV; fission products; half lives; yields; 233U; 235U; SP425, pp. 21-28.

421
Decay heat; ENDF/B-IV fission product; LMFR; ORIGEN; CRBR; SP425, pp. 455-458.

Decay heat; error estimates; fission products; loss of coolant accident; sensitivity; afterheat; SP425, pp. 29-38.

Decay of swirling flow; helical flow; pressure differential during swirling flow; swirling flow; 15080.

Decays: direct tests; kaon; lepton-asymmetry; momentum-dependence; Weisskopf-Wigner; CP-violation; 15211.

Decomposition; nitric oxide; tungsten; 14887.

Decorated lattice gas; hole-particle symmetry; law of corresponding states; liquid; Padé approximant; power law; slope of the coexistence curve diameter; asymmetry; coexistence curve; compressibility; critical exponents; critical point; 15293.

Deduced analyzing powers A(θ); measured yield asymmetries; nuclear reactions; 4Li(n, t)4He; E = 0.2-1.4 MeV; SP425, pp. 788-791.

Deduced channel spectrum; E = 3-5 MeV; fission; nuclear reactions; Pu isotopes; U; 238U(n,f); calculated <σf>; SP425, pp. 129-138.

Deduced Eα, I J, gI, Sα, Sα; measured σα(E); nuclear reactions 209Bi(n, n′), E = 500 eV-75 keV; SP425, pp. 799-801.

Deduced optical-model parameters; enriched targets; measured σα(θ); nuclear reactions 167-168, 82Se(n, n′), E = 6-10 MeV; SP425, pp. 897-900.

Deduced Qcα, log f, I; enriched 86Kr target; isotope separated sources; measured I/L, K, EC ratio; multiwire proportional counter; radioactivity 81Kr [from (n, γ)]; 15197.

Deduced σα dv(σv); measured σα(θ); nuclear reactions 4Li(p, p); 4Li(2He); 4Li(He,p); 4Li(d,p); 4Li(2d,a); SP425, pp. 697-700.

Deduced Σν(1) (M1) and Σν(1) (E1); E2 = 9 MeV; measured σα(Eα, θ); nuclear reactions 139Ba(n, α), 140Ce(y, n); SP425, pp. 784-787.

Deduced σνγ; SP425, pp. 218-221.

Deduced wave functions; electron scattering; measured form factors; nuclear reactions; 14N*; 9Be(α, 4He); 14967.

Deep depletion; dopant profiles; electrical properties; electron beam evaporator; electron beam induced damage; electronics; epitaxial layer thickness; film eyepiece; flying-spot scanner; hermeticity; hydrogen chloride gas; image bearing eyepiece; laser interferometry; SP400-17.

Deep penetration of neutrons in Fe + H shield; measured neutron spectra; shielding; 238U(p, x, n); E = 800 MeV; analysis by Monte Carlo; angular dependence; SP425, pp. 476-479.

Defect; disclination; dislocation; elasticity; jog; kink; multiplication; plasticity; Volterra; crystal; 14745.

Defect energy; equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; lamella thickness; melting; comonomer concentration; copolymer; crystallization; 15561.

Defect pairs; dielectric relaxation; EPR lifetime broadening; fluorine interstitials; gadolinium ions; reorientation processes; anelastic relaxation; calcium fluoride; 15121.

Defects; detection of visual defects; integrated circuit photomasks; photomask inspection; photomasks; photoplate quality; automated inspection of photomasks; critical dimension determination; 15039.

Defects in crystals; diffusion; drift velocity; driving force; matrix equations; non-cubic crystals; 15130.

Defensive capability; FACTS; fire; flamable fabrics; garment fires; garment parameters; injury severity; reaction patterns; victims; apparel; apparel fires; burn injury; 15438.

Deflection; eccentricity; equilibrium; loads (forces); masonry; stability; stress distribution; structural engineering; buckling; compression members; concrete; cracking; 15514.

Deflection; loads (forces); masonry; moments; slenderess ratio; stability; structural engineering; walls; bricks; buckling; 15507.

Deflections; dynamic response; gust factors; structural engineering; wind engineering; wind loads; accelerations; buffeting; building codes; buildings; BS574.

Deflections; instrumentation; structural response; wind loads; buildings; TN873.

Deformation; dental; porcelain; properties; additive; 14977.

Deformation; dislocations; face-centered cubic metals; faults; Fourier analysis; review; stacking fault energy; x-ray diffraction; 14750.

Deformation; fold surface; gold decoration; polymer crystals; poly(oxymethylene); surface layer; adsorbed polymer; J.79A No. 5, 609-611 (1975).

Defraction low energy electron; ruthenium; work function Auger spectroscopy; carbon monoxide; chemisorption; 14945.

Degradation; fracture; Hertzian; indentation; strength; brittle solids; ceramic surfaces; cracks; NBSIR 75-664.

Degradation; fracture; indentation; strength; brittle solids; ceramic surfaces; NBSIR 75-661.

Degradation; Hertzian cracks; indentation fracture; median vents; penny crack; contact fracture; NBSIR 75-730.

Degrees of unsolvability; general decision problems; Markov algorithms; many-one reducibility; recursive functions; r.e. many-one degrees; r.e. one-one degrees; semi-Thue systems; splinters; combinatorial systems with axiom; 14998.

Degrees of unsolvability; propositional calculus; recursion theory; undecidability; 15616.

Dehumanization; deterrent; technologies; 15198.

Deicing salts; epoxy coatings; organic coatings; polyvinyl chloride coatings; steel reinforcing bars; bridge decks; chloride ions; concrete; corrosion; BS565.

Delay line; picosecond; pulse measurement; superconductivity; 14776.

Delay line; picosecond; pulse measurement; superconductivity; 14825.

Delayed coincidence; f value; imprisonment; lifetime; mean life; resonance radiation; transition probability; U 1; uranium; 15058.

Delayed failure; fracture; proof testing; Weibull analysis; ceramics; crack propagation; 15419.

Delayed neutron; energy spectrum, β – n time-of-flight; fission; group 2; 238U(γ, f); SP425, pp. 61-614.

Delayed-neutrons; fission products; half-lives; independent yields; mass spectrometry; cumulative yields; SP425, pp. 401-404.

Demand cameras; employee theft; fixed surveillance; motion picture surveillance; robbery; sequence cameras; shoplifting; surveillance; surveillance cameras; cameras; 14923.

Dense liquid; excess function; hydrodynamic limit; molecular dynamics; rare gases; velocity autocorrelation function; 11-6-8 potential; Axilrod-Teller correction; 15168.

Densimeter; density; differential; transformer; 14730.

Densimeter; magnetic; diffusion; pressure; gradient; concentration; gradient; density; gravity; effects of; 3-methylpentane; mixture; liquid; nitroethane; sedimentation; critical point; critical solution point; 14944.

Densities; enthalpies; entropies; equation of state; internal energies; isobars; isochores; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthorhombic densities; specific heats; speeds of sound; vapor pressures; NBSIR 74-398.

Densitometer; densitometry; optical density; optical density standard; calibration; calibration table; NBSIR 75-682.

Densitometry; lens evaluation; microdensitometry; microscopy resolution charts; National Measurement System; 15394.

Densitometry; optical density; optical density standard; calibration; calibration table; densitometer; NBSIR 75-682.
Density; density calibration; density measurement; density standard; volume standard; 15215.

Density; determination; identification; minerals; optical properties; twinning; unit cell dimensions; cleavage; compilation; crystal; crystal habit; crystal space group; crystal structure types; 15084.

Density; differential: transformer; densimeter; 14730.

Density; electrical conductance; molten salt mixtures; standard reference data; surface tension; viscosity; chlorides; data compilation; J. Phys. Chem. Ref. Data 4, No. 4, 871-1178 (1975).

Density; electrodeposited coatings; electrodeposits; metal coatings; coatings; copper; 15580.

Density; enthalpy; entropy; hydrogen; properties of fluids; specific heat; velocity of sound; 15022.

Density; enthalpy; equation of state; hydrogen; index of refraction PVT; saturation properties; scaling laws; specific heat; critical point; NBSIR 75-814.

Density; entropy; free volume; glasses; glass transition; liquid; polymer; poly(vinyl acetate); PVT; relaxation; viscosity; 14777.

Density; fluorocarbon copolymer; morphology; permeation; permeation tubes; polymer structure; sulfur dioxide; 15509.

Density; gravity effects; mixture; binary; mixture; liquid; nitroethane; thermal expansion; 3-methylpentane; consolidate point; critical exponent α; critical phenomena; critical solution point; 15691.

Density; isotopic abundance; silicon; Avogadro number; crystal repeat distance; 15294.

Density; lamella thickness; paraffins; polyethylene; unit cell; x ray; crystal surfaces; 14724.

Density, brass; ductility; brass; electrical resistivity; brass; electrodeposited brass; electroplated brass; internal stress; brass; mechanical properties; electrodeposited brass; properties; electrodeposited brass; tensile strength; brass; wear rate; brass; 15559.

Density calibration; density measurement; density standard; volume standard; density; 15215.

Density expansions; fluorene; oxygen; statistical analysis; viscosity coefficient; argon; correlated molecular collisions; 15141.

Density measurement; density standard; volume standard; density; density calibration; 15215.

Density of air; mass measurement; 15568.

Density of states; elastic tunneling; tunneling junctions; 15135.

Density profile; dielectric constant; linear model; oxygen; scaling laws; statistical analysis; critical coefficients; critical exponents; critical region; 14772.

Density sensor; flow nozzle; laminar flow; liquid properties; viscosity sensor; capillary tubes; NBSIR 74-620.

Density standard; volume standard; density; density calibration; density measurement; 15215.

Dental; porcelain; properties; additive; deformation; 14977.

Dental amalgam; marginal ditching; creep; 15186.

Dental caries; electric currents; mechanism; solubility; bone mineral; 14985.

Dental caries; hydroxyapatite; ion activity product; solubility; tooth enamel; 15535.

Dental cements; dental sealants; reactivity of tooth surfaces; adhesion; adhesive restoratives; bonding to teeth; 14943.

Dental fillings; metre; ozone problem; police communications; water pollution; x rays; air pollution; camera guidelines; computerized elections; DIM/NBS 59, No. 5, 97-120 (1975).

Dental materials; dental; methacrylate, phthalate; N,N-dimethyl-p-toluidine; ultraviolet spectroscopy; aromatic amine; charge-transfer complexes; color; 15138.

Dental materials; dentin; enamel; surface area; teeth; water vapor adsorption; adsorption theory; aggregate, adsorption by; collagen; 14966.

Dental materials; hard tooth tissues; metal ions; mordant; adhesive bonding; chelation; comonomers; coupling agents; 15161.

Dental materials; polymer grafting; resins; restorative materials; sealants; wear resistance; adhesive materials; composites; NBSIR 75-766.

Dental sealants; reactivity of tooth surfaces; adhesion; adhesive restoratives; bonding to teeth; dental cements; 14943.

Dentin; enamel; surface area; teeth; water vapor adsorption; adsorption theory; aggregate, adsorption by; collagen; dental materials; 14966.

Deoxyribonucleic acid; dilute solutions; hydrodynamic interaction; polystyrene; viscoelasticity; Zimm theory; bead-spring model; chain molecules; chain stiffness; 15114.

Deployment; electronic transmission; facility location; mail; mathematical programming; message network synthesis; network optimization; satellite; service improvement; communication; cost-benefit; NBSIR 75-737.

Depth; deuterium; diffusion; elastic; helium; migration; oxide; proton; range; scattering; SP425, pp. 488-491.

Depth dose; dose distribution; dye films; electron beams; optical cell; pulse radiolysis; radiation dosimetry; radiocromatic dyes; absorbed dose rate; 15277.

Depth dose; dose distributions; dosimetry; dyes; electron beams; radiocromatic dyes; thin films; cavity theory; 15424.

Depth dose; dose distributions; dosimetry; electron beams; holographic interferometry; holography; isodose; radiation imaging; radiation measurements; calorimetry; 15529.

Design; economics; flexibility; law enforcement facilities; performance; planning; present value analysis; analysis; construction; cost; 14961.

Design; law enforcement facilities; architecture; bibliography; building; construction; TN859.

Design criteria; regulatory system; safety; standards; structural loading; buildings; codes; 15503.

Design specification; guide and installation procedures; steel conduit system; BSS66, pp. 120-121.

Design standards; earthquake load; masonry construction; precast concrete construction; progressive collapse; structural connection; structural design; wind load; 15369.

Designers; evaluation; selection; users; acquisition; CODASYL; computer; data base management; 15668.

Desorption; dry weight determination; moisture content; surface area; water content; water vapor adsorption; adsorption; computer application; J.79A No. 4. 565-576 (1975).

Desorption energy; desorption kinetics; physical adsorption; tungsten (111); work function; xenon; 15201.

Desorption kinetics; physical adsorption; tungsten (111); work function; xenon; desorption energy; 15201.

Destructive interference; directivity; emergency vehicle; insertion loss; masking noise; siren; sound power level; sound pressure level; automobile; 14958.

Desulfovibrio desulfuricans; hollow whiskers; mechanism; microbial corrosion; mild steel; oxidizing agent; Schreibersite; sulfate-reducing bacteria; Vivianite; anaerobic corrosion; cathodic depolarization theory; Charles Thom Award; 15233.

Detection; detectors; fire fatalities; gas detectors; ionization chamber detectors; performance standards; photodetector; 15218.

Detection; dispersion; explosion; fire; hydrogen; leakage; methane; safety; vents; automobile; TN666.

Detection; fluorescence; nitric oxide; nitrogen; quencher; air; automotive exhaust emission; 14991.

Detection; heat-gun; lead paint; materials evaluation; performance specification; rehabilitation; renovation; abatement; 15591.

Detection of visual defects; integrated circuit photomasks; photomask inspection; photomasks; photoplate quality; auto-
mated inspection of photomasks; critical dimension determination; defects: 15039.

Detector: dye laser; GaAs; photoconductor; picosecond; pulse: 15651.

Detector: flux; Monte Carlo; neutrons; scintillators; time-of-flight; SP425, pp. 73-74.

Detector: gamma-flash; photomultiplier; pulse suppression; scintillator; after-pulse; SP425, pp. 106-107.

Detector: insertion loss; microwaves; phase angle; ratio; six-port junction; vector voltmeter; voltage; attenuation; automation: 15649.

Detector: laser; pollution; vinyl chloride: 15027.

Detector: pulse; pyroelectric; autocorrelation: 14741.

Detector circuits; power measurement; pulse circuit; pyroelectricity: 14733.

Detector: spectral response; electrically calibrated pyroelectric detector; radiometry; spectral irradiance; spectral radiant power density; cw dye laser: 15138.

Detector: ray; discriminator; emitter-couple; integrated circuit; signal processor; computer: 15511.

Detectors: fire fatalities; gas detectors; ionization chamber detectors; performance standards; photoelectric detector; detection: 15218.

Detectors: flame spread; furnishings; interior finishes; noncombustible; smoke development; sprinklers; survey; building construction: TN861.

Deterioration: inhibitors; materials selection; nonmetallics; rectifiers; water treatment; anodes; cathodic protection; coatings; corrosion: BSS66, pp. 42-51.

Determination: identification; minerals; optical properties; twinning; unit cell dimensions; cleavage; compilation; crystal; crystal habit; crystal space group; crystal structure types; density: 15084.

Deterrent; technologies; dehumanization: 15198.

Deuterium: diffusion; elastic; helium; migration; oxide; proton; range; scattering; depth: SP425, pp. 488-491.

Deuterium: NMR; pressure dependence; relaxation; reorientation; temperature dependence; chloroform: 15324.

Deuterium peroxide; hydrogen bonds; hydrogen peroxide; neutron diffraction; structure refinement; thermal motion; crystal structure: 15271.

Deuteron; electrostatic; interaction potential; neutron; charge distribution; Coulomb energy: 15469.

Deuterons; neutrons; phase shifts; tritons; alpha particles; cross sections: SP425, pp. 701-703.

Development assistance; economies; Ecuador; less developed countries; measurement services; review; standardization; survey: AID: NBSIR 75-785.

Development of cells; fertilization; growth of cells; heat production; marine eggs; metabolism; microliterometry; Arbacia punctulata; calorimetry; cleavage of cells: 15151.

Diagnostic case histories; diagnostic systems; failure detection; failure diagnosis; failure prevention; failure prognosis; SP436.

Diagnostic systems: failure detection; failure diagnosis; failure prevention; failure prognosis; diagnostic case histories: SP436.

Diagonal; diagonally dominant; field of values; Gersgorin; Hadamard product; Hermitian; positive definite; spectrum; angular field of values: 15272.

Diagonal matrix; D-stability; Gersgorin’s theorem; Lyapunov’s theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal; diagonally dominant: 14782.

Diagonalizable matrix; partitioned matrix; J.79B Nos. 1 and 2, 45-48 (1975).

Diagonally dominant; diagonal matrix; D-stability; Gersgorin’s theorem; Lyapunov’s theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal: 14782.

Diagonally dominant; field of values; Gersgorin; Hadamard product; Hermitian; positive definite; spectrum; angular field of values; diagonal: 15272.

Diamond cell; fluorescence; high pressure; hydrostatic pressures; ruby; calibration: 15085.

Diamond powder; grading; grading of diamond powder; powder; diamond; sizes; sub-sieve of diamond powder; P562-74.

Diamond-anvil pressure cell; fixed point pressure scale; high pressure; NaCl pressure scale; pressure measurement; ruby fluorescence; semiconductors; transition pressures: 15224.

Diatomic mercury; excimer molecules; fluorescence; lasers; NaK molecule; spectroscopy: 15685.

Dibromotetrafluoroethane; fire tests; flame spread index; heat release rate; ignition temperature; rigid urethane foam; smoke: 15615.

Dicalcium phosphate dihydrate; fluorapatite; fluoride; hydroxyapatite; tooth enamel: 14909.

Dicalcium phosphate dihydrate; enamel mineral solubility; pyrophosphate formation; caries mechanism: 15162.

Dicalcium phosphate dihydrate; fluorapatite; fluoride; pit and fissure sealant; tooth enamel: 15565.

Dichlorodifluoromethane; freons; photochemistry; quantum yields; stratosphere; trichlorofluoromethane; absorption cross section; chlorine atom: 15571.

Dichloroethyl sulfide; enalapril; formation; heat; mustard gas; combustion: J.79A No. 5, 634-638 (1975).

Dichlorotetrapyrazole copper; neutron diffraction; structure: 15578.

Dichromate oxidimetry; performance standards; reference ethanol solutions; breath alcohol analyzers: 15203.

Dielectric; glass-ceramic; optics; bolometer; cryogenics: 14742.

Dielectric constant; dielectric loss; international comparison; laboratory intercomparison; permittivity; standard dielectric; cavity method for dielectrics: 14999.

Dielectric constant; equation of state; homogeneity; light scattering; power laws; refractive index; scaling; Schlieren method; specific heat; speed of sound; x-ray scattering; critical region: 14932.

Dielectric constant; linear model; oxygen; scaling laws; statistical analysis; critical coefficients; critical exponents; critical region; density profile: 14772.

Dielectric constant; loss measurements; cavity resonators: 14917.

Dielectric constant; loss tangent; machinable glass-ceramic; specific heat; thermal conductivity; cryogenics: 15046.

Dielectric function; electronic states; optical adsorption; adsorbate atom: 15092.

Dielectric loss; dielectric relaxation; molecular motions; nuclear magnetic resonance absorption; polyoxyethylene crystals; solid state polymerization; trioxane crystals: 15359.

Dielectric loss; international comparison; laboratory intercomparison; permittivity; standard dielectric; cavity method for dielectrics; dielectric constant: 14999.

Dielectric relaxation; EPR lifetime broadening; fluorine interstitials; gadolinium ions; reorientation processes; anelastic relaxation; calcium fluoride; defect pairs: 15121.

Dielectric relaxation; molecular motions; nuclear magnetic resonance absorption; polyoxyethylene crystals; solid state polymerization; trioxane crystals; dielectric loss: 15359.

Dielectrics; dividers; electrical measurement; electric fields; electro-optics; high voltage measurements; insulating fluids; Kerr effect; nitrobenzene; pulse measurements; space charge; automated measurements; NBSIR 75-774.

Dielectrics; electrocaloric; heat switches; polarization; refrigeration; cryogenics: 15491.
Dimethylsulfide; infrared spectrum; matrix isolation; pyrolysis; s-trithiane; thioformaldehyde; ultraviolet photolysis; vacuum ultraviolet photolysis; CH$_2$SH; CH$_3$SH; 15334.

Diodes; irradiance standard; synchrotron radiation; transfer standard transferors; vacuum ultraviolet radiation standards; continuum radiation; 14997.

Diophantine equation; infinite descent; quadratic residues; J. 79B Nos. 1 and 2, 41-44 (1975).

Dipole moment; ethylenamine; pyrolysis reactions; rotational spectrum; structure; vinyllamine; 15258.

Dipole moment; excited state; SCF; vibrational transition intensities; a$^2$II; CO; 15551.

Dipole moment; excited states; MC-SCF; molecular geometry; NO$_3$; spectra; 15336.

Dipole moment function; dissociation energy; electronic structure; hydroxyl radical; potential curve; self-consistent-field; 14805.

Dipole-dipole coupling; ferromagnetism; ground state; permutation group; quantum mechanics; spin cluster; spin-Hamiltonian; antiferromagnetism; cerous magnesium nitrate; 15524.

Dipole-dipole interaction; ferromagnetism; ground state; magnetic; permutation group; quantum mechanics; antiferromagnetism; cerous magnesium nitrate; 14911.

Dipoles; glass; piezoelectric; polarization; polyvinyl chloride; pyroelectric; electret; 15320.

Dirac theory; hydrogen; line strength; oscillator strength; relativistic corrections; spectroscopy; J. 79A No. 5, 629-633 (1975).

Direct tests; kaon; lepton-asymmetry; momentum-dependence; Weisskopf-Wigner; CP-violation; decays; 15211.

Directional coupler; measurement; microwave; microwave power; calibration; calibration factor; 15662.

Directional coupler; microwave; microwave power; automation; calibration; 15650.

Directional coupler; picosecond; pulse generator; risetime; trigger; tunnel diode; 15653.

Directional solidification; incongruent melting alloy; peritectic reaction; Sn-Cd alloys; structure; alloy; 14748.

Directional solidification; rapid quenching; aluminum alloys; bulk alloy samples; casting; 14973.

Directional-hemispherical; polyvinyl fluoride; pyroelectric detectors; reflectance; 14721.

Directivity; emergency vehicle; insertion loss; masking noise; siren; sound power level; sound pressure level; automobile; destructive interference; 14958.

Directory; Federal Government-standardization; industry standards activities; national standards activities; recommended practices; specifications; standardization activities; standards; states—standardization activities; test methods; codes; consensus system; SP417.

Disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornadoes; wind; buildings; damage; BSS61.

Disaster mitigation; earthquakes; engineering; environmental hazards; housing; inspection and testing; safety; architecture; building; building codes; building design; TN885.

Disc; minicomputer; modular; multiparameter; on-line; CAMAC; SP425, pp. 97-98.

Discharge; ethynyl (HC$_3$); infrared spectrum; interstellar molecule; matrix isolation; structure; vacuum ultraviolet photolysis; acetylene; 15003.

Disclination; dislocation; elasticity; jog; kink; multiplication; plasticity; Volterra; crystal; defect; 14745.

Discrete; frequencies; nondivergent radiation; comment to editor; 15163.

Discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; TN672.

Discriminator; emitter-couple; integrated circuit; signal processor; computer; detector-ray; 15511.

Disk calibration; disk pack; magnetic disk; Standard Reference Surface; unrecorded disk surface; calibration factor; computer amplitude reference; computer storage media; TN884.

Disk pack; magnetic disk; Standard Reference Surface; unrecorded disk surface; calibration factor; computer amplitude reference; computer storage media; disk calibration; TN884.

Dislocation; elasticity; jog; kink; multiplication; plasticity; Volterra; crystal; defect; 14745.

Dislocation mechanisms; fracture mechanics; sapphire; slow crack growth; thermal activation; ambient temperatures; 15122.

Dislocation networks; electron microscopy; healing; indentation; microcracking; moiré patterns; brittle solids; 15400.

Dislocation networks; electron microscopy; healing; indentation; microcracking; moiré patterns; brittle solids; NBSIR 75-658.

Dislocations; face-centered cubic metals; faults; Fourier analysis; review; stacking fault energy; x-ray diffraction; deformation; 14750.

Dispersion; explosion; fire; hydrogen; leakage; methane; safety; vents; automobile; detection; TN666.

Dispersion curves; orientation; phonons; rotational disorder; single crystal; alkali cyanides; crystal dynamics; 15124.

Dispersion plating; electroplating; hard particles; wear-resistance; wear-tests; cermet; chromium plating; codeposition; composite coating; 15317.

Dispersion relation; lattice dynamics; palladium deuteride; phonon frequency distribution; single crystal; coherent neutron scattering; 15036.

Dispersion relations; pion-nucleon amplitudes; pion-nucleon cross section; pion-nucleon scattering; pion-nucleus scattering; sum rules; 15296.

Displacement measurements; door structure; drop tests; dynamic crush tests; impact collisions; plastic deformation; static crush tests; strain measurements; structural components; test procedures; automobile side impact; crush characteristics; NBSIR 74-605.

Dissemination; frequency; high frequency broadcasts; standard; time; TN668.

Dissemination; frequency; satellite; synchronization; time; broadcasting; 14836.

Dissociation; electron; ionization; molecular oxygen; 14756.

Dissociation energy; electronic structure; hydroxyl radical; potential curve; self-consistent-field; dipole moment function; 14805.

Dissociation laser; excimers; excited state kinetics; f-values; mercury molecules; new spectroscopic techniques; optical excitation; potential curves; Monogr. 143.

Dissociative photoionization; NH$_3$; OH$^-$; photoionization; threshold energies; water; ammonia; 15352.

Dissociative recombination; electron scattering; La radiation; crossed beams; cross section; D$_2^+; 15076$.

Dissociative recombination; product D$_2^+(n=4)$; cross sections; D$_2^+; 14865$.

Distribution; low utilization; overhead; suboptimization; subsystem measurement; variability; SP406, pp. 45-52.

Distribution functions; finite volumes; Kirkwood Salsburg equation; perturbation expansion; strip operator; thermodynamic limit; 15356.
Dosimetry: dyes; electron beams; radiochromic dyes; thin films; cavity theory; depth dose; dose distributions; 15424.

Dosimetry: dyes; electron dosimetry; energy dependence; gamma rays; muscle; radiochromic dosimeters; x-ray spectra; bone; 15429.

Dosimetry: electron beam; interferometer; radiation chemical kinetics; radiation measurement; refractive index; temperature measurement; calorimeter; 15619.

Dosimetry: electron beams; food irradiation; food preservation; gamma rays; accelerators; dose distributions; 15435.

Dosimetry: electron beams; holographic interferometry; holography; isodoses; radiation imaging; radiation measurements; calorimetry; depth dose; dose distributions; 15529.

Dosimetry: electron slowing down; electron transport; scaling; W-value; charged particle penetration; 15116.

Dosimetry: electrons; ionization chamber; radiation standard; absorbed dose; calorimeter; 15471.

Dosimetry: electrons; ionization chambers; standards; stopping power ratio; absorbed dose; 15579.

Dosimetry: evaluation; fission spectrum; neutron flux; neutrons; cross sections; SP425, pp. 250-253.

Dosimetry: fading; furnace annealing; glow curve; maximum heating temperature; peak height; reproducibility; sensitivity loss; supralinearity; 15193.

Dosimetry: Fano theorem; ionization chambers; radiation measurement; radiation transport; cavity theory; 15169.

Dosimetry: fast reader testing; fission products; shielding; thermal reactor testing; benchmark experiments; SP425, pp. 834-841.

Dosimetry: filtered beams; neutrons; capture gamma rays; cross sections; SP425, pp. 89-92.

Dosimetry: filtered beams; neutrons; spectroscopy; SP425, pp. 116-118.

Dosimetry: fission cross sections; neutron standards; uranium-235 cavity fission spectrum; SP425, pp. 254-257.

Doublet states: HO2; laser magnetic resonance; least squares fit; rotational analysis; Zeeman spectrum; asymmetric rotors; 14910.

Doubly ionized copper; electron configuration; ionization potential; wavelengths; atomic energy levels; atomic spectrum; copper; J.79, No. 3, 497-521 (1975).

Drain: fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC; smoke; toxic gases; vent; waste; ABS; cast iron; copper; NBSIR 74-449.

Drainage: insulation; permafrost; seasonal frost; snow drifting; utilidors; ventilation; air leakage; Arctic; central heating distribution systems; construction materials; BS566, pp. 122-135.

Drained weight: laws and regulations; metrication; metric conversion; net weight; package control; petroleum products; scales; survey; temperature compensation; uniformity; weights and measures; digital indicators; SP407.

Draperies; fabrics; flammability; garments; test methods; textiles; upholstered furniture; apparel; carpets; curtains; 15470.

Drift mobility; electric field; random walk; symmetry plane; vacancy; correlation factor; diffusion; 15367.

Drift tube; experimental; molecule; negative ion; O2+: O3-; O4-; photodetachment; photodissociation; cross section; 15478.

Drift velocity; driving force; matrix equations; non-cubic crystals; defects in crystals; diffusion; 15130.

Driver information; highway; highway signing; human factors; information displays; standards; 15699.

Driving force; matrix equations; non-cubic crystals; defects in crystals; diffusion; drift velocity; 15130.

Driving force for diffusion; impurity diffusion; ion drift velocity; nonrandom diffusion; vacancy wind effect; correlation factor; diffusion; divacancy; 15542.

Drop tests; dynamic crush tests; impact collisions; plastic deformation; static crush tests; strain measurements; structural components; test procedures; automobile side impact; crush characteristics; displacement measurements; door structure; NBSIR 74-605.

Droplets; evaporation; kinetic theory; Knudsen number expansion; nucleation; aerosols; condensation; 15157.

Dry weight; ears; energy; health care; hospitals; measurement science; meter; metric; pulses; robot; sound; construction; DIM/NBS 59, No. 10, 218-239 (1975).

Dry weight determination; moisture content; surface area; water content; water vapor adsorption; adsorption; computer application; desorption; J.79, No. 4, 565-576 (1975).

Drying; phosphorous pentoxide; water vapor; absorption; NBSIR 74-631.

D-stability; Gersgorin’s theorem; Lyapunov’s theorem; M-matrix; oscillatory; positive definite; principal minor; Routh–Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal; diagonally dominant; diagonal matrix; 14782.

D-stable matrix; positive diagonal matrix; quadratic forms; spectrum; 15252.

DTA; kinetics; pyrolisis; TGA; thermal analysis; thermal degradation; thermogravimetric analysis; differential thermal analysis; 15292.

Ductility; brass; electrical resistivity; brass; electrodeposited brass; electroplated brass; internal stress; brass; mechanical properties; electrodeposited brass; properties; electrodeposited brass; tensile strength; brass; wear rate; brass; density; brass; 15359.

Ducts; fire tests; flexible connectors; furnace pressures; glass fiber; heat ventilating and air conditioning systems; high-rise buildings; optical density; steel; terminal units; aluminum; NBSIR 75-673.

Duplexer; fm transceiver; land-mobile communications; law enforcement; repeater; vertical antenna; 14990.

Durability of waterproofing materials; masonry; performance criteria; waterproofing materials; water repellent materials; accelerated weathering; T/883.

 Dwelling unit; federal building research; industrialized housing; occupant behavior; Operation Breakthrough; performance evaluation; architectural psychology; 15190.

DWV; fire endurance; fire spread; fire test; gases; plastic pipe; PVC; smoke; ABS; B3572.

DWV; performance testing; reduced-size vents; trap-seal retention; venting; venting criteria; vents, reduced-size; BS560.

Dye dosimeters; electron beams; radiation curing; radiation processing; radiochromic dyes; thin films; dose distributions; dosimetry; 14957.

Dye films; electron beams; optical cell; pulse radiolysis; radiation dosimetry; radiochromic dyes; absorbed dose rate; depth dose; dose distribution; 15277.

Dye laser; electric quadrupole; fine structure; ionization; multiphoton; sodium; atom; 15149.

Dye laser; GaAs; photoconductor; picosecond; pulse; detector; 15651.

Dye laser; isotope; isotope separation; photochemistry; 14859.

Dyed cellophane; dyed plastics; electron beams; gamma radiation; plastic films; polymethyl methacrylate; polyvinyl chloride; radiation processing; radiochromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; 15278.

Dyed plastics; electron beams; gamma radiation; plastic films; polymethyl methacrylate; polyvinyl chloride; radiation processing; radiochromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; dyed cellophane; 15278.

Dyes; electron beams; gamma rays; glasses; plastics; radiation chemistry; radiation sterilization; solid-state detectors; spectrophotometry; dose distribution; dosimetry; 14734.

Dyes; electron beams; radiochromic dyes; thin films; cavity
Early-type stars; radiative transfer; spectral line formation; stellar atmospheres; astrophysics; 14751.

Earphones; environmental noise; instrumentation; measurement methodologies; microphones; psychoacoustics; reverberation room; sound level meters; audiometric standards; building acoustics; community noise; 15502.

Ears; energy; health care; hospitals; measurement science; meter; metric; pulses; robot; sound; construction; dry weight; DTM/NBS 59, No. 10, 218-239 (1975).

Earth rotation; geophysics; lasers; lunar cartography; lunar gravity; moon; plate tectonics; crustal movements; 15437.

Earth temperature; heat transfer; multiple pipe system; underground pipe; chilled water pipe; BSS66, pp. 18-41.

Earthquake damage; earthquakes; hazards; hospital; natural disasters; seismic; structural engineering; building; codes; 14759.

Earthquake load; masonry construction; precast concrete construction; progressive collapse; structural connection; structural design; wind load; design standards; 15369.

Earthquakes; engineering; environmental hazards; housing; inspection and testing; safety; architecture; building; building codes; building design; disaster mitigation; TN885.

Earthquakes; hazards; hospital; natural disasters; seismic; structural engineering; building; codes; earthquake damage; 14759.

Earthquakes; hurricanes; natural hazards; structural engineering; tornadoes; wind; buildings; damage; dynamic analysis; BSS61.

Ea; E2; ENDF/B-IV; fission products; half lives; yields; 233U; 239Pu; decay heat; SP425, pp. 21-28.

Eccentricity; equilibrium; loads (forces); masonry; stability; stress distribution; structural engineering; buckling; compression members; concrete; cracking; deflection; 15514.

Ecological; electricity; energy; environment; fusion; medicine; nuclear; power; radiation; reactor; research; utilities; biology; career; TN888.

Economic analysis; graphics; minicomputers; computer graphics; cost-benefit analysis; 15488.

Economic dimensions; National Measurement System; surface finish; surface roughness; calibration; 15395.

Economic incentives; housing development; integrated utilities; utilities; NBSIR 75-721.

Economic optimization; HVAC systems; life-cycle cost analysis; solar energy; solar heating and cooling; NBSIR 75-712.

Economic performance; fisheries management; fisheries regulation; mathematical models; salmon fisheries model; analysis of biological processes; NBSIR 74-522.

Economies; Ecuador; less developed countries; measurement services; review; standardization; survey; AID; development assistance; NBSIR 75-785.

Economies; embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities; conservation; conversion; cost; cryogenics; SP419.

Economies; flexibility; law enforcement facilities; performance; planning; present value analysis; analysis; construction; cost; design; 14961.

Economies; foreign relations; industrializing nations; LDC’s; measurement services; OAS; standardization; AID; assistance; NBSIR 75-769.

Economies; history; iron mechanisms; microbial corrosion; prevention; 14781.

Economies; interactive systems; performance evaluation; cost-benefit analysis; cost-effectiveness; 15633.

Economies; performance evaluation; computer graphics; cost-benefit analysis; cost-effectiveness; 15072.

Economies; progressive collapse; standards; benefit-cost analysis; building safety; NBSIR 74-542.

Economies; future trend; local building heat/cooling plants; Southeast Federal Area, Washington, D.C.; central heating and cooling plants; cost analysis; cost comparison; BSS66, pp. 9-17.
Electron excitation; energy loss: resonances; threshold; xenon; autoionizing states; 15442.
Electron excitation; excitation transfer; gaseous electronics; lasers; molecules; atoms; 14849.
Electron excitation coefficient; electron ionization coefficient; electron-ion recombination coefficient; electron swarm; electron transport coefficients; ionized gases; electrical breakdown of gases; J. Phys. Chem. Ref. Data 4, No. 3, 577-856 (1975).

Electron impact; electron scattering resonances; exponential attenuation; low energy; negative ions; nitric oxide; nitrous oxide; total scattering cross section; 14983.
Electron impact; electrons, secondary; ionization; cross sections; 15553.
Electron impact; energy loss; excitation; NO2; 14808.
Electron impact; energy loss spectra; oxygen; ozone; triplet states; 15473.
Electron impact; excitation; Hg+; crossed beams; cross section; 15005.
Electron impact; excitation; He; inelastic; Ne; Ar; atoms; autoionizing; cross sections; 15586.
Electron impact; helium; ionization; theoretical study; 14764.
Electron ionization coefficient; electron-ion recombination coefficient; electron swarm; electron transport coefficients; ionized gases; electrical breakdown of gases; electrical discharges; J. Phys. Chem. Ref. Data 4, No. 3, 577-856 (1975).
Electron lenses; strong lenses; third-order aberration coefficients; two-tube electrostatic lens; weak lenses; aberration integrals; asymptotic aberration coefficients; 14817.
Electron microscopes; horizontal resolution; optical instruments; stylus instruments; surface texture measurement; surface texture parameters; vertical resolution; 15613.
Electron microscopy; healing; indentations; microcracking; moiré patterns; brittle solids; dislocation networks; 15400.
Electron microscopy; healing; indentations; microcracking; moiré patterns; brittle solids; dislocation networks; NBSIR 75-658.
Electron microscopy; lattice images; modulation images; satellites; spinodal decomposition; composition modulations; contrast mechanism; electron diffraction; 15063.
Electron microscopy; oxidation; silicon nitride; silicon oxynitride; Si3N4; β-cristobalite; 15452.
Electron number; lepton quarks; lorks; muon-electron universality; muon number; neutrino quarks; strong interactions; three triplet model; composite model of leptons; 15614.
Electron optics; electrostatic lens; third-order aberration coefficients; two-tube lens; aberration integrals; asymptotic aberration coefficients; 14974.
Electron probe microanalysis; electron spectroscopy for chemical analysis (ESCA); ion microprobe analysis; scanning electron microscopy; surface analysis; contrast; 15142.
Electron probe microanalysis; electrons; inner-shell; cross sections; 15153.
Electron probe microanalysis; ion-selective electrodes; mass spectrometry; polarography; spectrochemical analysis; thermal analysis; wet chemistry; x-ray fluorescence; activation analysis; characterization; chemical composition; chromatographic analysis; coulometry; 15165.
Electron probe microanalysis; empirical methods; Fe-Si alloys; Monte Carlo methods; quantitative analysis; scanning electron microscopy; 15246.
Electron probe microanalyzer; microanalysis; qualitative analysis; quantitative analysis; specimen preparation; x rays; 14897.
Electron probe microanalyzer; instrumental development; scanning electron microscope; signal processing; contrast; electron beam instrumentation; 15249.

Electron probe x-ray microanalysis; energy loss spectrometry; scanning electron microscopy; scanning transmission electron microscopy; Auger electron spectrometry; 15030.
Electron scattering; energy loss; methane; n-hexane; oscillator strength; electron; 15444.
Electron scattering; form factors; sum rules; transition charge; charge density; Coulomb energy; Coulomb excitation; 14851.
Electron scattering; form factors; intermediate coupling; reduced transition probability; 15104.
Electron scattering; giant resonance; longitudinal; reduced widths; transverse; boron; 14964.
Electron scattering; helium-3; monopole state; multipole decomposition; zero range approximation; continuum; 15608.
Electron scattering; inelastic electron scattering; particle-hole model; resonance energy; 154C; analog states; 14729.
Electron scattering; inelastic electron scattering; monopole excitation; monopole strength; 15105.
Electron scattering; La radiation; crossed beams; cross section; D2+; dissociative recombination; 15076.
Electron scattering; measured form factors; nuclear reactions; 14N; 9Be(e,e'); deduced wave functions; 14967.
Electron scattering; scattering angle; solid angle; spectrometer; absolute cross section; beam profile; TN871.
Electron scattering; resonances; exponential attenuation; low energy; negative ions; nitric oxide; nitrous oxide; total scattering cross section; electron impact; 14983.
Electron slowing down; electron transport; scaling; W-value; charged particle penetration; dosimetry; 15156.
Electron specimen interaction; Monte Carlo simulation; particulate analysis; scanning electron microanalysis; x-ray microanalysis; x-ray source size; backscattered electrons; 15038.
Electron spectroscopy for chemical analysis (ESCA); ion microprobe analysis; scanning electron microscopy; surface analysis; contrast; electron probe microanalysis; 15142.
Electron swarm; electron transport coefficients; ionized gases; electrical breakdown of gases; electrical discharges; electron attachment coefficient; electron detachment coefficient; J. Phys. Chem. Ref. Data 4, No. 3, 577-856 (1975).
Electron transport; scaling; W-value; charged particle penetration; dosimetry; electron slowing down; 15156.
Electron transport coefficients; ionized gases; electrical breakdown of gases; electrical discharges; electron attachment coefficient; electron detachment coefficient; electron diffusion coefficient; J. Phys. Chem. Ref. Data 4, No. 3, 577-856 (1975).
Electronic and thermal coupling; instrumental limitations; supercooling; theoretical model; thermal analysis; thermodynamic properties; differential scanning calorimetry (DSC); 14924.
Electronic dipole moment; internuclear distance; laser fluorescence; NaA; transition moment; 14810.
Electronic instrumentation; signal conditioning; systems; time domain; data conversion; dynamic measurements; electrical measurements; TN865.
Electronic properties; oxides; applications (optical, magnetic); 14876.
Electronic spectra; heat-pipe ovens; N2O; BaO; chemical reactions; chemiluminescent; 15686.
Electronic spectrum; emission spectrum; high resolution spectrum; vacuum ultraviolet region; band assignments; carbon monoxide; 14848.
Electronic states; optical adsorption; adsorbate atom; dielectric function; 15092.
Electronic structure; energy bands; optical properties; silicon; band gap; band structure; 15705.
Electronic structure; hydroxyl radical; potential curve; self-con-
sistent-field; dipole moment function; dissociation energy; 14805.

Electronic structure; interstitial; lattice dynamics; niobium deuterie; phonons; alloy; 15389.

Electronic structure; platinum; soft x-ray appearance potential; tungsten; tungsten carbide; x-ray photoemission; catalyzed; 15011.

Electronic transmission; facility location; mail; mathematical programming: message network synthesis; network optimization; satellite; service improvement; communication; cost-benefit; deployment; NBSIR 75-737.

Electronically excited molecule; hydrogen iodide; n-butane; radical scavenging; vacuum ultraviolet photoysis; alkane; 14762.

Electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; photomasks; photoresist; resistivity; scanning electron microscopy; semiconductor devices; SP400-8.

Electroplated coatings; metal coatings: properties of electrodeposits; thickness gages; thickness measurement; coating thickness; coating thickness gages; coatings; electrodeposited coatings; 15560.

Electroplating; hard particles; wear-resistance; wear-tests; cermets; chromium plating; codeposition; composite coating; dispersion plating; 15317.

Electrostatic; energy; 15354.

Electrostatic; interaction potential; neutron; charge distribution; Coulomb energy; deuterium; 15469.

Electrostatic lens; third-order aberration coefficients; two-tube lens; aberration integrals; asymptotic aberration coefficients; electron optics; 14974.

Electrostatic precipitation; heat flux; oxygen depletion; particulate mass; scanning electron microscope; smoke; carbon monoxide; NBSIR 75-901.

Electrostatic transducers; Lamb’s problem; seismic pulses; ultrasonic transducers; acoustic emission; calibration of transducers; 14960.

Elemental depth profiling; ion microprobe mass analysis; ion optics; local thermal equilibrium (LTE); mineral analysis; secondary ion mass spectrometry (SIMS); surface analysis; Auger electron spectroscopy; SP427.

Elemental distribution; elemental identification; energy dispersive spectrometers; microanalysis; specimen preparation; crystal spectrometers; 15247.

Elemental identification; energy dispersive spectrometers; microanalysis; specimen preparation; crystal spectrometers; element distribution; 15247.

Elementary divisors; irreducible character; symmetry class of tensors; 15338.

Elevated temperature; failure prediction; Larson-Miller parameter; crack nucleation; 15638.

Ellipsoidal reflector; Fermat’s principle; Hamiltonian point characteristic; limiting aperture; unit magnification; aberrations; aspheric optics; 14840.

Ellipsometry; gallium arsenide; passivity; electrochemistry; 15480.

Ellipsometry; iron; passivity; pitting; breakdown passivity; chloride; 15081.

Ellipsometry; low carbon steel; nitrate; nitrite; repassivation; stress corrosion; chloride; 14882.

Ellipsometry; optics; thin films; 15061.

Elliptic class numbers; genus; index; level; parabolic class number; classical modular group; congruence groups; 15066.

Elliptic classes; finite fields; genus; modular group; natural homomorphism; parabolic classes; automorphs; 14972.

EM Metrology; field strength; impedance; noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; NBSIR 74-395.

EM metrology; field strength; impedance; laser parameters noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; NBSIR 75-818.

Embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities; conservation; conversion; cost; cryogenics; economics; SP419.

Emergency communications; Fast Fourier transform; Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; mine noise; spectral density; time-dependent spectral density; amplitude probability distribution; digital data; NBSIR 74-391.

Emergency equipment; Law Enforcement Standards Laboratory; procurement guidelines; protective equipment; security systems vehicles; voluntary standards; weapons; building.
systems; communications equipment; concealed objects detectors; 15325.

Emergency messages; hearing loss; lawn mowers; noise emission; noise pollution; product safety; NBSIR 74-608.

Emergency vehicle; insertion loss; masking noise; siren; sound power level; sound pressure level; automobile; destructive interference; directivity; 14958.

Emission; neutron; techniques; application; charged particle; cross section; SP 4245, pp. 156-160.

Emission anisotropy; fluorescence; fluorescence quantum yield; fluorescence standards; flurometry; polarization; spectrofluorimetry; viewing angle; J. 73A No. 1, 1-15 (1975).

Emission line stars; line profiles; stellar atmospheres; stellar limb darkening; 15600.

Emission spectra; free radicals; kinetics of reactions; lasers; infrared; photochemistry; apparatus and methods; chemiluminescence; 14969.

Emission spectrum; high resolution spectrum; vacuum ultraviolet region; band assignments; carbon monoxide; electronic spectrum; 14848.

Emission spectrum; perturbation; Rydberg state; absorption spectrum; accidental predissociation; carbon monoxide; 15386.

Emitance; hafnium; high-speed measurements; high temperatures; specific heat; thermodynamics; electrical resistivity; J. 73A No. 2, 431-436 (1975).

Emitter-couple; integrated circuit; signal processor; computer; detector-ray; discriminator; 15511.

Emitter-only switching; hot spot screen for Darlington; integrated power Darlington thermal resistance; thermal resistance measurement; Darlington hot spot screen; Darlington thermal resistance; 15610.

Empirical methods; Fe-Si alloys; Monte Carlo methods; quantitative analysis; scanning electron microscopy; electron probe microanalysis; 15346.

Empirical methods; minicomputers; on-line analysis; quantitative electron probe microanalysis; scanning electron microscopy; SRM-480; 15348.

Employee theft; fixed surveillance; motion picture surveillance; robbery; sequence cameras; shoplifting; surveillance; surveillance cameras; cameras; demand cameras; 14923.

E to 21 MeV; E to 10 MeV; (n,xy) measurements; SP 4245, pp. 766-769.

Enamel; surface area; teeth; water vapor adsorption; adsorption theory; aggregate; adsorption by; collagen; dental materials; dentin; 14966.

Enamel mineral solubility; pyrophosphate formation; caries mechanism; dicalcium phosphate dihydrate; 15162.

Encryption; network security; security; communications; computer security; cryptography; data security; 15657.

End fittings for FRP rod and rope; finite element analysis; FRP rod; FRP rope; materials testing; nonlinear analysis (shear); potted end fittings; structural engineering; tensile strength; transversely isotropic materials; axisymmetric analysis; cables (ropes); 15399.

End users; performance; analytical; computer systems modeling; SP 406, pp. 123-126.

ENDF/B; neutrons; reactors; resonances; unresolved; cross sections; SP 4245, pp. 371-379.

ENDF/B; standard cross section; uncertainty file; correlation; covariance; SP 4245, pp. 173-176.

ENDF/B-IV; fission products; half lives; yields; 235U; 239Pu; decay heat; Ead; Ee; SP 4245, pp. 21-28.

ENDF/B-IV; fission spectrum; inelastic scattering; sensitivity; 239Pu; critical assemblies; SP 4245, pp. 389-391.

ENDF/B-IV decay-data file; applications of decay data; SP 4245, pp. 14-20.

ENDF/B-IV fission product; LMFBR; ORIGEN; CRBR; decay heat; SP 425, pp. 455-458.

End-user satisfaction; performance evaluation; performance factors; resource utilization; SP 406, pp. 39-42.

Energy; electrostatic; 15354.

Energy; energy labels; fire fatalities; hydrogen fuel; magnetohydrodynamics; metric changeover; safety; air conditioners; appliance; bone cement; computer; DTM/NBS 59, No. 6, 121-144 (1975).

Energy; energy levels; europium; ionization; spectrum; J75X.

Energy; environment; fusion; medicine; nuclear; power; radiation; reactor; research; utilities; biology; career; ecological; electricity; T888.

Energy; environment; health; product safety; research; science and technology; standards; annual report; computer; SP 418.

Energy; environment; measurement; product safety; research; science; standards; technology; annual report; computer; SP 437.

Energy; epoxies; hazard; metric conversion; piezoelectric accelerometers; sun; buildings; computer codes; computer networks; computers; copyrights; DTM/NBS 59, No. 4, 73-96 (1975).

Energy; excitation energy; metal; Sr electron; actinides; Coulomb term; 15129.

Energy; fuel; hydrogen; cryogenic; 14868.

Energy; health care; hospitals; measurement science; meter; metric; pulses; robot; sound; construction; dry weight; ears; DTM/NBS 59, No. 10, 218-239 (1975).

Energy; helium; power; superconductivity; cryogenics; electricity; 14872.

Energy; highway safety; lead; pressure transducer; railway safety; silicon devices; water heaters; windowless buildings; auto fuels; DTM/NBS 59, No. 8, 169-192 (1975).

Energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities; conservation; conversion; cost; cryogenics; economics; embrittlement; SP 419.

Energy; hydrogen; research and development; cryogenic; 14936.

Energy; label; refrigerator/freezers; room air conditioning; consumer information; efficiency; 15451.

Energy; legislation; regulations; state; authority; building; NBSIR 75-747.

Energy balance; flame spread; mass balance; test method; ASTM E 84; carpets; NBSIR 75-705.

Energy bands; optical properties; silicon; band gap; band structure; electronic structure; 15705.

Energy conservation; electricity saved; fuel consumption; building energy use; conservation; 15051.

Energy conservation; energy conservation research; energy savings; building research; building standards; economics of energy conservation; 15679.

Energy conservation; energy conservation guide; energy conservation opportunities; energy conservation program; industrial energy conservation; H115. Supplement 1.

Energy conservation; energy costs; fuel utilization; heat recovery; total energy systems; utilities for housing; utility system performance; air conditioning; air pollution; central utility systems; data acquisition system; efficiencies; electrical power; NBSIR 75-711.

Energy conservation; energy efficiency; energy use; household appliances; household equipment; labeling; residential; consumer information; consumer products; NBSIR 75-660.

Energy conservation; fires; gasoline consumption; glass SRM; hazardous chemicals; leap second; playground equipment safety; scientific data; silicon devices; time; DTM/NBS 59, No. 2, 25-48 (1975).
Enthalpy of formation; ions; mass spectrometry; methyl; methylene; photoionization; radicals; vacuum ultraviolet; 15351.

Enthalpy of formation, hydrocarbons, heating value; hydrocarbons; International System of Units; enthalpy of combustion, dry basis; enthalpy of combustion, saturated basis; 15094.

Enthalpy of transition; graphite; infrared matrix isolation spectroscopy; melting point; radiance temperature; reaction of Ba(g) and excited ozone; reaction of FeTg and oxygen; review of literature on rate of effusion and mass-spectrometric data; NBSIR 74-600.

Entropy; equations of state; helium; pressure; enthalpy; 14783.

Entropy; equilibrium constant of formation; free energy of formation; Gibbs energy function; heat capacity; heat of formation; thermochemical tables; critically evaluated data; enthalpy; J. Phys. Chem. Ref. Data 4, No. 1, 1-176 (1975).

Entropy; equilibrium constant of formation; ethylene; Gibbs energy function; Gibbs energy of formation; heat capacity; ideal gas thermodynamic properties; internal rotation; internal rotation barrier height; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).

Entropy; free volume; glasses; glass transition; liquid; polymer; poly(vinyl acetate); PVT; relaxation; viscosity; density; 14777.

Entropy; Gibbs energy; heat capacity; heat of fusion; heat of vaporization; thermodynamic properties; triple point; bromobenzene; calorimetry; enthalpy; J.79A No. 5, 619-628 (1975).

Entropy; hydrogen; properties of fluids; specific heat; velocity of sound; density; enthalpy; 15022.

Entropy; magnetic susceptibility; magnetic temperature; thermodynamic temperature; CMN; 15634.

Environment; ethane data; facilities; fire research; fire safety; graffiti; product standards; programming language; air conditioners; buses; subway cars; centennial; electric power; DIM/NBS 59, No. 7, 145-168 (1975).

Environment; experimenting with; harmony; hues; illumination; light; personal uses; relationships; uses; color; CIS.6.

Environment; fusion; medicine; nuclear; power; radiation; reactor; research; utilities; biology; career; ecological; electricity; energy; TN888.

Environment; health; product safety; research; science and technology; standards; annual report; computer; energy; SP418.

Environment; intercalibration; intercomparison; radioactivity; radionuclide; radiostrontium; TN875.

Environment; isotope dilution; mass spectrometry; NBS Standard Reference Material; orchid leaves; trace mercury; agriculture; 14789.

Environment; measurement; product safety; research; science; standards; technology; annual report; computer; energy; SP437.

Environmental acoustics; instrumentation; noise monitoring; outdoor noise; acoustics (sound); NBSIR 75-962.

Environmental hazards; housing; inspection and testing; safety; architecture; building; building codes; building design; disaster mitigation; earthquakes; engineering; TN885.

Environmental health; improved methodologies; particulates; quartz; self-generated atmosphere; calibration filters; chrysotile; 15466.

Environmental materials; neutron activation; radiochemical separation; solvent extraction; tribenzyamine; analysis; biological materials; chloroform; chromium; 15409.

Environmental noise; instrumentation; measurement methodologies; microphones; psychoacoustics; reverberation room; sound level meters; audiometric standards; building acoustics; community noise; earphones; 15502.

Environmental samples; fossil fuels; lunar samples; analysis; biological and botanical samples; differential linear sweep volumetry; 15427.

Environmental samples; neutron activation analysis; tellurium; uranium; 15385.

Environmental tests; product safety; NBSIR 74-590.

Enzyme catalyzed processes; glucose; microcalorimetry; serum thermochemistry of enzyme processes; analysis; assay in bacterial growth; calorimetry; 14898.

Enzyme catalyzed reactions; glucose; heat measurements; hexokinase; metabolic processes; microcalorimetry; thermochemistry; thermodynamics; adenosine-5’-triphosphate; biochemistry; 15174.

Epitaxial gallium arsenide; high energy neutron; impurity conduction; reciprocal Hall coefficient; transition regime; 60Co gamma; activation energy; compensation; 15575.

Epitaxial layer thickness; epitaxial growth; flight; flying-spot scanner; hermeticity; hydrogen chloride gas; image sensing; laser interferometry; measurement methods; microelectronics; microtechnology; MOS devices; oxide films; photomask inspection; resistivity; SP400-17.

Epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; measurement methods; microelectronics; micrometry; MOS devices; oxide films; photomask inspection; resistivity; scanning low energy electron probe; semiconducutor devices; SP400-8.

Epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; incremental sheet resistance; measurement methods; microelectronics; micrometry; MOS devices; oxide films; resistivity; scanning low energy electron probe; semiconducutor devices; SP400-12.

Epoxy; hazard; metric conversion; piezoelectric accelerometers; sun; buildings; computer codes; computer networks; computers; copyrights; energy; DIM/NBS 59, No. 4, 73-96 (1975).

Epoxy; fiberglass reinforced plastic; filament-wound; insulated; molded; morpholine; prefabricated steel conduit; Qualified Products List; teline; condensate return; BSS66, pp. 88-101.

Epoxy; glass fiber; thermal conductivity; aramid fiber; composites; cryogenic; 15021.

Epoxy coatings; organic coatings; polyvinyl chloride coatings; steel reinforcing bars; bridge decks; chloride ions; concrete; corrosion; deicing salts; BSS65.

Epoxy coatings; organic coatings; steel reinforcing bars; bridge decks; chlorides; concrete; corrosion; 15112.

EPR lifetime broadening; fluorine intermediates; gadolinium ions; reorientation processes; anelastic relaxation; calcium fluoride; defect pairs; dielectric relaxation; 15121.

Equation of state; fluid; least squares; parameter estimation; P-V-T; statistical weighting; thermodynamic properties; constraints; 15132.

Equation of state; fluids; methane; orthobaric densities; specific heats; vapor pressures; coexistence boundary; critical point; ethane; J.79A No. 1, 71-79 (1975).

Equation of state; freezing; freezing criteria; melting; molecular correlation functions; phase transitions; 14728.

Equation of state; homogeneity; light scattering; power laws; refractive index; scaling; Schlieren method; specific heat; speed of sound; x-ray scattering; critical region; dielectric constant; 14932.

Equation of state; hydrogen index of refraction PVT; saturation properties; scaling laws; specific heat; critical point; density; enthalpy; NBSIR 75-814.

Equation of state; interaction virial coefficients; moist air; saturated air; second virial coefficients; virial coefficients; enhancement factor; J.79A No. 4, 551-560 (1975).

Equation of state; internal energies; isobars; isochores; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; specific heats; speeds
of sound; vapor pressures; densities; enthalpies, entropies: NBSIR 74-398.

Equation of state: methane; thermal conductivity; thermal conductivity coefficient; viscosity coefficient; correlation; critical point: 15184.

Equations of state: helium; pressure; enthalpy; entropy: 14783.

Equilibrium: gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; testing; building composite; building material; conditioning: NBSIR 75-767.

Equilibrium: loads (forces); masonry; stability; stress distribution; structural engineering; buckling; compression members; concrete; cracking; deflection; eccentricity: 15514.

Equilibrium compositions; heat of isomerization; ideal gas thermodynamic properties; isobutane; n-butane; potential barrier to internal rotation; J. Phys. Chem. Ref. Data 4, No. 4, 859-870 (1975).

Equilibrium constant of formation: free energy of formation; Gibbs energy function; heat capacity; heat of formation; thermochemical tables; critically evaluated data; enthalpy; entropy; J. Phys. Chem. Ref. Data 4, No. 1, 1-176 (1975).

Equilibrium constant of formation; ethylene; Gibbs energy function; Gibbs energy of formation; heat capacity; ideal gas thermodynamic properties; internal rotation; internal rotation barrier height; propylene; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).

Equilibrium cycle; fuel cycle; reactivity swing; sensitivity study; breeding ratio; cross section uncertainties; SP425, pp. 385-388.

Equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; lamella thickness; melting; comonomer concentration; copolymer; crystallization; defect energy: 15561.

Equilibrium measurements; mass spectrometry; measurement system; spectroscopy; state measurements; thermochemistry; calorimetry; chemical energy; chemical thermodynamic data; energy scale (chemical): 15450.

Equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; lamella thickness; melting; comonomer concentration; copolymer; crystallization; defect energy; equilibrium dissolution temperature: 15561.

Equilibrium structure; ground state constants; infrared spectrum; nitrogen dioxide, 2ν band; nitrogen dioxide, ν2 band; upper state constants; vibration-rotation interaction constants: 15694.

Equity; sharing; redistribution of income; water resources; cost sharing; efficiency: 15363.

Equity; salinity control; Colorado River; cost sharing; efficiency: 15477.

Error; line; loss; response; skin effect; step; time; transition; coaxial; cylindrical: 15696.

Error analysis; far-field pattern; near-field measurements; planar scanning; plane-wave spectrum; antennas: TN667.

Error analysis; flux density; ground station; G/T (system gain/system noise temperature); radio star; accuracy; antenna; calibration; Cassiopeia A; NBSIR 75-822.

Error analysis; gloss; photometry; reflectance; scattering; spectrophotometry; specular gloss; accuracy; appearance: TN594-10.

Error analysis; measurements; near-field; antennas: 15664.

Error analysis; ordinary differential equations; turning points; approximation; asymptotics; asymptotic theory: 15414.

Error bounds; Legendre functions; parabolic cylinder functions; turning points; Weber functions; asymptotic approximations: 14947.

Error bounds; ordinary differential equations; parabolic cylinder functions; turning points; wave scattering; Weber functions; asymptotic approximations; connection formulas: 14946.

Error estimates; fission products; loss of coolant accident; sensitivity; afterheat; decay heat; SP425, pp. 29-38.

Error function; Gaussian diffusion; plotting, computer; semiconductors; silicon; BASIC; capacitance-voltage measurements; computer programs; dopant profiles; SP400-11.

Error of sound power; far-field power; near-field power; sound power estimation: 15492.

Error of sound power measurement; noise; noise measurement; sound power level; standard test procedures for sound power measurement; air compressors: NBSIR 75-652.

Errors; goodness of fit; normal distribution; significance tests; standards; statistics; acceptance tests; confidence intervals; criminalistics: 15279.

Errors; soft glass pipets; unwashed soft glass pipets; clinical; contamination: 15295.

Errors in activation analysis; precision; radiation detection; accuracy: 15472.

ESCA; oxygen; physical adsorption; tungsten; xenon; chemisorption: 15347.

ESCA; ruthenium; x-ray photoelectron spectroscopy; chemisorption; CO: 15042.

Escape; high school students; key press; pure tones; second order schedules; aversion for sound; avoidance; differential reinforcement of high rate: 14815.

ESR; fibrils; load elongation curve; microcracks; microfibrils; radicals; bond rupture; chain rupture: 15555.

ESR investigation of radicals; fibrous structure; mechanical breakdown; microfibrillar structure; radical formation; tie molecules; chain rupture; crystalline polymer: 15476.

Esters; heat capacity; heats of vaporization; oligomers; rates; alkanes: 15357.

Estimated uncertainties; evaluations; neutron transport; correlations; covariances; data adequacy; SP425, pp. 842-847.

Eta; fission nuclei; manganese bath nu-bar; 232 Cf; SP425, pp. 262-265.

Eta; fission neutrons per absorption; nuclear reactions; U233, U235; E = 0.25 eV; SP425, pp. 553-556.

Eta; fission neutrons per absorption; nuclear reactions; 232U, 235U; E = 0.0253 eV; SP425, pp. 557-559.

Ethane; equation of state; fluids; methane; orthobaric densities; specific heats; vapor pressures; coexistence boundary; critical point; J. Phys. Ref. 1, 71-79 (1975).

Ethane; gas phase kinetics; ion-molecule reactions; mass spectrometer; product ions: 15111.

Ethane data; facilities; fire research; fire safety; graffiti; product standards; programming language; air conditioners; buses; subway cars; centennial; electric power; environment; DIM/NBS 59, No. 7, 145-168 (1975).

Ethene; kinetics; mass spectrometry; ozone; propene; rate constant; air pollution: 15234.

Ethyl alcohol; interstellar chemistry; molecular cloud; molecular spectroscopy; radio astronomy; Sagittarius B2; 15001.

Ethylamine; pyrolysis reactions; rotational spectrum; structure; vinylamine; dipole moment: 15258.

Ethylene; fabric flammability; glass standards; household fires; jet engines; measurement seminars; metric; protecting nuclear fuels; computers; energy research; DIM/NBS 59, No. 1, 1-24 (1975).

Ethylene; Gibbs energy function; Gibbs energy of formation; heat capacity; ideal gas thermodynamic properties; internal rotation; internal rotation barrier height; propylene; torsional frequency; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).

Ethylene; heavy noble gases; helium; linear model; methane; NBS equation; scaling laws; statistical analysis; steam; universality; air constituents; critical region parameters: 15601.

Ethylene; propylene; thermodynamic properties data; transport properties data; critically evaluated data; NBSIR 75-763.
Ethynyl (HC≡C) ; infrared spectrum; interstellar molecule; matrix isolation; structure; vacuum ultraviolet photolysis; acetylene; discharge; 15003.

ETIP: incentives; innovation; procurement; product improvement; specifications; NBSIR 75-696.

ETIP: incentives; innovation; procurement policy; regulatory policy; small business policy; technology; civilian R&D policy; NBSIR 75-778.

Europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; molybdenum; niobium; plutonium; potassium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Europium; ionization; spectrum; energy; energy levels; 14755.

Europium ions; fluorescence; fluorescence standards; inorganic ion-doped fibers; microspectrofluorimetry; uranyl ions; 15321.

Europium oxides; fast reactors; neutron reactions; tantalum; boron carbides; capture cross sections; CFRMF reactor; control materials; SP425, pp. 908-911.

Evaluated γ-ray intensities; ILRR program; evaluated half-lives; SP425, pp. 324-327.

Evaluated half-lives; evaluated γ-ray intensities; ILRR program; SP425, pp. 324-327.

Evaluation; files; formats; levels; nuclear structure; radiations; reactions; tables; γ-rays; computers; data; decay; ENSDF; SP425, pp. 309-312.

Evaluation; fission product; optical model; resonance cross section; statistical model; total cross section; capture cross section; elastic and inelastic scattering cross sections; SP425, pp. 320-323.

Evaluation; fission products; sensitivity analysis; σ_eff; 101, 102, 103Ru; 127I; adjustment; SP425, pp. 165-168.

Evaluation; fission spectrum; neutron flux; neutrons; cross sections; dosimetry; SP425, pp. 250-253.

Evaluation; graphs; measurements; networks; performance; Petri Nets; probability; SP406, pp. 127-130.

Evaluation; hardware monitors; measurement; performance; software monitors; throughput; computer; SP406, pp. 99-102.

Evaluation; information; processing; radiation; shielding; analysis; cross sections; SP425, pp. 363-366.

Evaluation; integral data; sensitivities; uncertainties; adjustment; critical assemblies; cross sections; SP425, pp. 405-408.

Evaluation; interferences; light sources; precision; accuracy; atomic spectroscopy; atomic vapor; chemical analysis; 14888.

Evaluation; measurement; network; performance; communications; computer; 15693.

Evaluation; measurement; networks; performance; queues; analytical models; SP406, pp. 119-121.

Evaluation; measurement; performance; service; utility; computer; 15093.

Evaluation; measurement; performance; power; work; computer efficiency; SP406, pp. 131-134.

Evaluation; National Bureau of Standards; on-line information retrieval systems; use statistics; 15378.

Evaluation; network; performance; computer; consumer; contract; 15642.

Evaluation; neutron; resonance; capture; chromium; cross section; SP425, pp. 367-370.

Evaluation; nuclear data; plutonium; uranium; SP425, pp. 313-316.

Evaluation; selection; users; acquisition; CODASYL; computer; data base management; designers; 15668.

Evaluation tests; fatigue; high temperature; performance characteristics; bonded resistance strain gage; combined effects; 15096.

Evaluations; neutron transport; correlations; covariances; data adequacy; estimated uncertainties; SP425, pp. 842-847.

Evaporation; kinetic theory; Knudsen number expansion; nucleation; aerosols; condensation; droplets; 15157.

Evaporation; magnetic retention; masks; sputtering; substrates; thin films; 15231.

Excess function; hydrodynamic limit; molecular dynamics; rare gases; velocity autocorrelation function; 11-6-8 potential; Axilrod-Teller correction; dense liquid; 15168.

Excess Gibbs energy; experimental phase equilibria data; heat of mixing; liquid-vapor equilibria; nitrogen-methane system; binary mixture; 14870.

Excess thermal conductivity of N_2; thermal conductivity of Ar; thermal conductivity of He; thermal conductivity of N_2; J. Phys. Chem. Ref. Data No. 2, 407-413 (1975).

Exchange enhancement; Knight shifts; LaNi_5; LaNi_5-Pt; LaPt_5; NMR; ordering; relaxation times; solid solutions; alloys; contact term; core polarization; 14889.

Excimer molecules; fluorescence; lasers; NaK molecule; spectroscopy; diatomic mercury; 15685.

Excimers; excited state kinetics; f-values; mercury molecules; new spectroscopic techniques; optical excitation; potential curves; dissociation laser; Monogr. 143.

Excitation; He; inelastic; Ne; Ar; atoms; autoionizing; cross sections; electron impact; 15586.

Excitation; Hg^2+; crossed beams; cross section; electron impact; 15005.

Excitation; NO_2; electron impact; energy loss; 14808.

Excitation curve; neutron elastic scattering; 101In^m; 0.335-14.7 MeV; SP425, pp. 859-861.

Excitation energy; metal; 5f; electron; activinides; Coulomb term; energy; 15129.

Excitation energy distribution function; 3He; electrodisintegration; 3He excited states; 3He photodisintegration; cross section structure; 15220.

Excitation function; proton; rhenium; cross sections; SP425, pp. 509-511.

Excitation functions; angular distributions; carbon-neutron elastic and inelastic scattering; E_n= 8.0-14.5 MeV; SP425, pp. 889-892.

Excitation functions; fast neutrons; nonelastic interactions; nuclear reactions; sources and spectra; cross-section data and systematics; cross-section measurement; SP425, pp. 664-673.

Excitation transfer; gaseous electronics; lasers; molecules; atoms; electron excitation; 14849.

Excited state; gas phase; nitrogen atom; nitrogen molecule; nitrogen oxides; oxygen atom; oxygen molecule; ozone; bibliography; chemical kinetics; SP371-1.

Excited state; SCF; vibrational transition intensities; σI; CO; dipole moment; 15551.

Excited state kinetics; f-values; mercury molecules; new spectroscopic techniques; optical excitation; potential curves; dissociation laser; excimers; Monogr. 143.

Excited states; experimental methods; fine structure splitting; recommended values; semiempirical calculations; ab initio calculations; atomic negative ions; binding energy; electron affinity; J. Phys. Chem. Ref. Data 4, No. 3, 539-576 (1975).

Excited states; ionization; mass spectrometry; radiation chemistry; rare gases; cross sections; 14832.

Excited states; MC-SCF; molecular geometry; NO_2; spectra; dipole moment; 15336.

E_x = 9 MeV; measured σ(ΔE,θ); nuclear reactions 10B(n,γ); 14C_2(γ,n); deduced Σ^14C_2 (M1) and Σ^14C_2 (E1); SP425, pp. 784-787.

Expansion factors; flow coefficients; flowmeter; fluid meter coefficients; rotameter; variable area meter; coefficients of discharge; 14795.
Experiments; Explosions; Experimental

Experiment: fusion; radioactivity; resonance-levels; afterheat; blanket; cross-section; SP425, pp. 708-711.

Experiment: positive ion; review; Rydberg states; atom; autoionization; collision; cross section; electron; 15556.

Experimental: uranium; distribution; initiation; l-bis(acylamido)-l-deoxypentitols; 24x446.

Experimental: fluorine; gas; graphs; liquid; tables; torsional crystal; viscosity; 14757.

Experimental: lag; unsteady flow; air; analytical; anemometer; dynamic response; NBSIR 75-772.

Experimental: molecule; negative ion; O₂⁻; O₃⁻; O⁻; photodetachment; photodissociation; cross section; drift tube; 15478.

Experimental: oscillator strengths; Ti I; Ti II; Ti III; arc; 15023.

Experimental assessment of system behavior; performance data analysis; performance data presentation; performance monitoring; computer system performance evaluation; SP406, pp. 103-108.

Experimental data; hydrodynamic behavior; methane; molecular dynamics; potential function; self-diffusion coefficient; 11-6-8 potential function; correlation function; 15173.

Experimental methods; fine structure splitting; recommended values; semiempirical calculations; ab initio calculations; atomic negative ions; binding energy; electron affinity; excited states; J. Phys. Chem. Ref. Data, No. 3, 539-576 (1975).

Experimental phase equilibria data; heat of mixing; liquid-vapor equilibria; nitrogen-methane system; binary mixture; excess Gibbs energy; 14870.

Experimental studies; human tolerances; injury; injury thresholds; inspection of edges; laceration; safety; simulation; skin; skin; cutting; synthetic materials; cutting; toys; cut; edges; hazardous; NBSIR 73-262.

Experimental vapor-liquid equilibria; helium-carbon monoxide system; helium-nitrous oxide system; Henry's constants; binary mixture; 15636.

Experimental vapor-liquid equilibria; flow induced desorption; helium-carbon monoxide system; helium-nitrous oxide system; Henry's law constants; two phase chocking; two phase flow; binary mixture; cavitation venturi; enhancement factors; NBSIR 75-806.

Experimenting with; harmony; hues; illumination; light; personal uses; relationships; uses; color; environment; CIS6.

Experiments; flame spread; floorcovering; test methods; theory; corridor fire; 15617.

Experiments; full-scale; gas tracer; interstitial space; penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF₆); Veterans Administration Hospital; NBSIR 75-903.

Explosion; fire; hydrogen; leakage; methane; safety; vents; automobile; detection; dispersion; TN666.

Explosions; fires; fuels; handling; hydrogen; oxidizers; oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; 15154.

Explosives; fabric fires; FFACTS; flammable liquids; gas; gasoline; ignition-causing activities; ignition sources; injury disposition; accidents; burn injuries; burn severity; NBSIR 75-784.

Exponential attenuation; low energy; negative ions; nitric oxide; nitrous oxide; total scattering cross section; electron impact; electron scattering resonances; 14983.

Exponential filtering; Fourier transform; p.m.r. spectroscopy; acylated 1,1-bis(acylamido)-1-deoxypentitols; conformational analysis; conformational nomenclature; 15268.

Exposure; microwave radiation; microwaves; product safety; radiation; radiation effects; resonant cavity; rhesus; suppression; behavior; behavioral suppression; 15194.

Extrapolation; measurements; near-field; antennas; 14784.

Extrapolation method; gain comparison method; microwave antenna; power gain; satellite; calibration accuracy; effective area; effective radiated power; 14970.

Extrapolation techniques; four-pair admittances; permutation techniques; precision admittance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; AC DRRS; coaxial cable effects; coaxial star connectors; 14924.

Extreme value distributions; hurricanes; probability distribution functions; reliability; risk; statistical analysis; storms; structural engineering; wind loads; wind speeds; building codes; TN868.

Extreme values; linear unbiased estimators; statistics; Type I distribution; distribution of largest values; efficient estimators; NBSIR 74-602.

Extreme values; linear unbiased estimators; simplified estimators; statistics; type I distribution; bias; efficiency; NBSIR 75-637.

f value; imprisonment; lifetime; mean life; resonance radiation; transition probability; U 1; uranium; delayed coincidence; 15058.

Fabric; fire modeling; flame spread; flammability; flammability testing; garments; heat transfer; ignition; apparel; burn injury; 14794.

Fabric; fires; FFACTS; flammable liquids; gas; gasoline; ignition-causing activities; ignition sources; injury disposition; accidents; burn injuries; burn severity; explosives; NBSIR 75-784.

Fabric flammability; FFACTS; garments; apparel fires; burn injury severity; 15484.

Fabric flammability; fire hazard; fire investigation; flammability testing; hazard analysis; hazard quantification; clothing flammability; 15635.

Fabric flammability; glass standards; household fires; jet engines; measurement seminars; metric; protecting nuclear fuels; computers; energy research; ethylene; DIMINBS 59, No. 1, 1-24 (1975).

Fabrication of reference blocks; immersion testing; longitudinal waves; metallurgical variables; nondestructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics; aluminum ultrasonic standards; ASTM-type reference blocks; NBSIR 75-685.

Fabrics; flammability; garments; test methods; textiles; upholstered furniture; apparel; carpets; curtains; draperies; 15470.

Fabrics; flammability; heat of combustion; measurement; calorimeter; 15103.

Fabry-Perot interferometer; Lorenz-Lorentz function; methane; rectilinear diameter law; refractive index; refractometric virial coefficients; critical refractive index; 15137.

Face-centered cubic metals; faults; Fourier analysis; review; stacking fault energy; x-ray diffraction; deformation; dislocations; 14750.

Facilities; fire research; fire safety; graffiti; product standards; programming language; air conditioners; buses; subway cars; centennial; electric power; environment; ethane data; DIMINBS 59, No. 7, 145-168 (1975).

Facility; neutron-induced reactions; 14C data; 56 MeV; SP425, pp. 103-105.

Facility location; graph; tree; center; centroid; J.79B Nos. 3 and 4, 107-115 (1975).

Fiberglass reinforced plastic; filament-wound; insulated; molded; morpholine; prefabricated steel conduit; Qualified Products List; tieline; condensate return; epoxy; BSS66, pp. 88-101.

Fiber-reinforced cements; fiber-reinforced concretes; glass fibers; mechanical properties; organic fibers; review; steel fibers; cement; concrete; 15028.

Fiber-reinforced concretes; glass fibers; mechanical properties; organic fibers; review; steel fibers; cement; concrete; fiber-reinforced cements; 15028.

Fiber-reinforced-plastic rod; glass-reinforced-polyester rod; guys, antenna; processing parameters; pultrusion; pultrusion; reinforced plastic rod; stress rupture of FRP rod; test methods; FRP rod; weatherability. FRP rod; composite materials; NBSIR 74-557.

Fibrils; load-elongation curve; microcracks; microfibrils; radii- cals; bond rupture; chain rupture; ESR; 15555.

Fibrous biomaterials; biomaterial properties; biomechanics; composites; fiber orientation; SP415, pp. 63-74.

Fibrous structure; mechanical breakdown; microfibrillar struc- ture; radical formation; tie molecules; chain rupture; crystalline polymer; ESR investigation of radicals; 15476.

Fibrous structure; plastic deformation; polymer solids; 15554.

Field aperture; angular aperture; computer optimization of elec- tron optics; electron beam transport; electron energy analyzers; 15423.

Field emission; field ionization; ion neutralization; surface spectroscopy; tunneling; 15095.
Field emission; ion neutralization; photoemission; surface spectroscopy; chemisorption; 14978.
Field emission; photoemission; single crystals; surface electron spectroscopy; surface state; tungsten; chemisorption; 14982.
Field emission; spin polarization; strongly correlated metals; surface density of states; theory; ferromagnetic transition metals; 15090.
Field emission; tungsten; work function; aluminum; 14780.
Field emission; tungsten; work function; electron energy distribution; 15091.
Field inspection; house trailers; housing; Hurricane Agnes; mobile homes; performance data; standards; enforcement process; NBSIR 75-688.
Field ionization; ion neutralization; surface spectroscopy; tunneling; field emission; 15095.
Field of values; Gersgorin; Hadamard product; Hermitian; positive definite; spectrum; angular field of values; diagonal; diagonally dominant; 15272.
Field of values; Hermitian matrix; normal matrix; positive definite; 15172.
Field strength; impedance; laser parameters noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM metrology; NBSIR 75-818.
Field strength; impedance; noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; NBSIR 74-395.
Field-ion microscopy; semiconductor surface structure; silicon; 15128.
Field-strength measurements; magnetic near-field probe; near-field measurements; r-f hazard measurements; semiconducting transmission line; electric near-field probe; electromagnetic-field hazard; TN658.
Filament-wound; insulated; molded; morpholine; prefabricated steel conduit; Qualified Products List; tieline; condensate return; epoxy; fiberglass reinforced plastic; BSS66, pp. 88-101.
Filareyepeice; flying-spot scanner; hermometer; hydrogen chloride gas; image shearing eyepiece; laser interferometry; measurement methods; microelectronics; micrometry; MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; SP400-17.
File system; laboratory automation; multiprogramming; operating system; real-time; data acquisition; NBSIR 75-713.
Files; formats; levels; nuclear structure; radiations; reactions; tables; y-rays; computers; data; decay; ENSDF; evaluation; SP425, pp. 309-312.
Filled polymers; mechanical properties; particulate composites; shear modulus; theory of elasticity; composite materials; elastic constants; J79A No. 2, 419-423 (1975).
Film boiling; forced convection; heat transfer; helium; nucleate boiling; subcritical; supercritical; critical heat flux; 14930.
Film thickness; film uniformity; fingerprint impressions; fingerprint readers; image quality; ink films; lubricity; film thickness; NBSIR 74-627.
Film uniformity; fingerprint impressions; fingerprint readers; image quality; ink films; lubricity; film thickness; NBSIR 74-627.
Filtered beams; neutrons; capture gamma rays; cross sections; dosimetry; SP425, pp. 89-92.
Filtered beams; neutrons; spectroscopy; dosimetry; SP425, pp. 116-118.
Filters; GM counter; sensitive detector; vacuum ultraviolet; absolute radiation detector; absorption measurements; 14903.
Filters; optical wedge; photodetector; relative spectral output; wavelength; bar code reader; NBSIR 74-580.
Fine particles; laser Raman; micro-Raman; particle analysis; particulates; Raman spectroscopy; 15362.
Fine structure; ionization; multiphoton; sodium; atom; dye laser; electric quadrupole; 15149.
Fine structure constant; volt transfer; gyromagnetic ratio of the proton; 14928.
Fine structure splitting; recommended values; semiempirical calculations; a b initio calculations; atomic negative ions; binding energy; electron affinity; excited states; experimental methods; J. Phys. Chem. Ref. Data 4, No. 3, 539-576 (1975).
Fingerprint; pattern recognition; computerized fingerprint identification; TN878.
Fingerprint impressions; fingerprint readers; image quality; ink films; lubricity; film thickness; NBSIR 74-627.
Fingerprint readers; image quality; ink films; lubricity; film thickness; NBSIR 74-627.
Finished interior; full scale experiments; interaction; measurements; smoke; smoke and flame spread; temperature; with and without forced air; velocity; carpets with and without underlayment; corridor fires; energy models; 15230.
Finite deformation; hyperelasticity; rubbery materials; strain energy function; volume-extension; compressibility; elasticity; 15015.
Finite element analysis; FRP rod; FRP rope; materials testing; nonlinear analysis (shear); potted end fittings; structural engineering; tensile strength; transversely isotropic materials; axisymmetric analysis; cables (ropes); composite materials; contour plotting; 15390.
Finite element analysis; joints; adhesively bonded; reinforcement, composite overlay; reinforcement, cutouts and cracks; adhesively bonded joints; composite materials; composite overlay reinforcement; contour plotting; cracks, reinforcement of; cutouts, reinforcement of; 15508.
Finite fields; genus; modular group; natural homomorphism; parabolic classes; automorphs; elliptic classes; 14972.
Finite system; “flat” loop; fluid-solid phase transition; Lennard-Jones System; Monte Carlo Studies; coexisting densities; 15176.
Finite volumes; Kirkwood Salsburg equation; perturbation expansion; strip operator; thermodynamic limit; distribution functions; 15356.
Finite-difference techniques; impurity redistribution; moving boundary problems; numerical methods; partial differential equations; semiconductor technology; diffusion equations; 15175.
Fire; fire incident system; fire service; incident reports; loss; National Fire Data System; data; 15632.
Fire; flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim’s activity; victim’s reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; 15229.
Fire; flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim’s activity; victim’s reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; TN867.
Fire; flammable fabrics; garment fires; garment parameters; injury severity; reaction patterns; victims; apparel; apparel fires; burn injury; defensive capability; FFACTS; 15438.
Fire; flammable fabrics; garment fires; garment parameters; injury severity; victim’s activity; victim’s reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; NBSIR 73-145.
Fire; hazard assessment; toxicity; bioassay; combustion products; 15628.
Fire; households; injury; loss; National Fire Data System; Na-
buildings; optical density; steel; terminal units; aluminum; ducts; NBSIR 75-673.
Fire tests; gypsum; building codes; construction materials; fire endurance ratings; NBSIR 74-588.
Fishermen: firefighter’s turnout coats; protective clothing; NBSIR 75-702.
Fishermen’s turnout coats; protective clothing: firefighters; NBSIR 75-702.
Fires; fuels; handling; hydrogen; oxidizers; oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; 15154.
Fires; gasoline consumption; glass SRM; hazardous chemicals; leap second; playground equipment safety; scientific data; silicon devices; time; energy conservation; DIM/NBS 59, No. 2, 25-48 (1975).
First-neighbor interactions; ionicity; Lundquist three-body potential; second-neighbor interactions; shell model; alkaline earth oxides; Born-Mayer potential; 15398.
Fish hatchery analysis; fish hatchery management; fish hatchery operation; mathematical model; benefit/cost; NBSIR 74-521.
Fish hatchery management; fish hatchery operation; mathematical model; benefit/cost; fish hatchery analysis; NBSIR 74-521.
Fish hatchery operation; mathematical model; benefit/cost; fish hatchery analysis; NBSIR 74-521.
Fish record system; fishery management model; fishery modeling; modeling; salmon; salmon fishery; salmon information system; Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; fisheries statistics; NBSIR 75-796.
Fisheries; fishery; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; State of Washington; Washington State Fisheries; NBSIR 75-745.
Fisheries management; fisheries regulation; mathematical models; salmon fisheries model; analysis of biological processes; economic performance; NBSIR 74-522.
Fisheries regulation; mathematical models; salmon fisheries model; analysis of biological processes; economic performance; fisheries management; NBSIR 74-522.
Fisheries statistics; fish record system; fishery management model; fishery modeling; modeling; salmon; salmon fishery; salmon information system; Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; NBSIR 75-796.
Fishery; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; State of Washington; Washington State Fisheries; NBSIR 75-745.
Fishery management model; fishery modeling; modeling; salmon; salmon fishery; salmon information system; Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; NBSIR 75-796.
Fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; State of Washington; Washington State Fisheries; NBSIR 75-745.
Fishery modeling; modeling; salmon; salmon fishery; salmon information system; Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; NBSIR 75-796.
Fissile nuclei; manganese bath; nu-bar; 252Cf; eta; SP 425, pp. 262-265.
Fission; actinide; cross sections; SP 425, pp. 202-213.
Fission; fission fragment; fission product; kinetic energy; mass yield; prompt neutron; scission point; statistical theory; actinide nuclide; fast-neutron-induced fission; SP 425, pp. 342-345.
Fission; group 2; 238U(γ,n); delayed neutron; energy spectrum, B = n time-of-flight; SP425, pp. 611-614.
Fission measured; neutrons; ratio; 235U; 238U; 600 keV-22 MeV; cross-sections; SP 425, pp. 568-571.
Fission measured; neutrons; 1 keV-1 MeV; 235U; 238U; cross-sections; SP425, pp. 564-567.
Fission; measurement; ratio; 235U; SP 425, pp. 546-548.
Fission; neptunium-237; neutron reactions; pile neutrons; plutonium-239; uranium-234; uranium-235; uranium-238; cross sections; 15020.
Fission; nuclear reactions; Pu isotopes; U; 238U(n,f); calculated <σf>; dedicated channel spectrum; E = 3-5 MeV; SP425, pp. 129-138.
Fission, absorption; measurement; 239Pu; comparison; cross sections; SP425, pp. 627-630.
Fission barrier shape; fission isomer; photofission; bremsstrahlung beams; cross section; 15313.
Fission barrier shapes; γ-ray strength; isomeric fission; level density; photofission; bremsstrahlung beam; cross section; 15350.
Fission chambers; fission rates; mass assay; MOL-Σ facility; uranium-238 capture rates; fast reactors; SP425, pp. 258-261.
Fission channels; 1; multilevel fits; polarized neutrons; polarized target; 238U(n,γ); SP425, pp. 576-579.
Fission cross section; fission spectrum; 252Cf; 235U; 239U; 238Pu; 239Np; SP425, pp. 270-272.
Fission cross section; manganese bath; NBS II; track-etch detector; S235U; S238U; SP 425, pp. 635-636.
Fission cross section ratios; linear accelerator; time-of-flight technique; uranium isotopes = 235U, 234U, 238U, 237U; 0.001 to 30 MeV; SP425, pp. 591-596.
Fission cross sections; neutron standards; uranium-235 cavity fission spectrum; dosimetry; SP425, pp. 254-257.
Fission fragment; fission product; kinetic energy; mass yield; prompt neutron; scission point; statistical theory; actinide nuclide; fast-neutron-induced fission; fission; SP425, pp. 342-345.
Fission isomer; photofission; bremsstrahlung beams; cross section; fission barrier shape; 15313.
Fission neutrons; inelastic scattering; iron; minima; Monte Carlo; cross sections; SP425, pp. 440-443.
Fission neutrons per absorption; nuclear reactions; U235; U238; E = 0.25 eV; eta; SP425, pp. 553-556.
Fission neutrons per absorption; nuclear reactions; 235U; 238U; E = 0.0253 eV; eta; SP425, pp. 557-559.
Fission product; kinetic energy; mass yield; prompt neutron; scission point; statistical theory; actinide nuclide; fast-neutron-induced fission; fission; fission fragment; SP425, pp. 342-345.
Fission product; optical model; resonance cross section; statistical model; total cross section; capture cross section; elastic and inelastic scattering cross sections; evaluation; SP425, pp. 320-323.
Fission product gamma rays; gamma ray penetration; initial nuclear radiations; neutron penetration; radiation shielding; effects of nuclear weapons; 15056.
Fission products; gamma spectra; photoneutron spectra; reactors; H; Be; SP425, pp. 193-198.
Fission products; half lives; yields; 238U; 239Pu; decay heat; Eβ; Eγ; ENDF/B-IV; SP425, pp. 21-28.
Fission products; half-lives; independent yields; mass spectrometry; cumulative yields; delayed-neutrons; SP425, pp. 401-404.
Fission products; KWO: RSYST; burnup calculation; burnup model; critical boron concentration; \(SP425\), pp. 398-400.

Fission products; loss of coolant accident; sensitivity; afterheat; decay heat; error estimates; \(SP425\), pp. 29-38.

Fission products; sensitivity analysis; \(^{104}_{\text{Rg}},^{104}_{\text{Ru}},^{127}_{\text{I}}\); adjustment; evaluation; \(SP425\), pp. 165-168.

Fission products; shielding; thermal reactor testing; benchmark experiments; dosimetry; fast reader testing; \(SP425\), pp. 834-841.

Fission rates; mass assay; MOL-\(\Sigma\) facility; uranium-238 capture rates; fast reactors; fission chambers; \(SP425\), pp. 258-261.

Fission spectrum; inelastic scattering; sensitivity; \(^{239}_{\text{Pu}}\); critical assemblies; ENDF/B-IV; \(SP425\), pp. 389-391.

Fission spectrum; neutron flux; neutrons; cross sections; dosimetry; evaluation; \(SP425\), pp. 250-253.

Fission spectrum; neutron source; scattering corrections; threshold detectors; activity measurement; cross sections; \(SP425\), pp. 273-276.

Fission spectrum; spectrum averaged cross section; \(^{239}_{\text{U(n,f)}}\); \(^{239}_{\text{Cf}}\); \(SP425\), pp. 266-269.

Fission spectrum; \(^{235}_{\text{Cf}}\); \(^{238}_{\text{U}}\); \(^{239}_{\text{Pu}}\); fission cross section; \(SP425\), pp. 270-272.

Fission track dating; neutron flux; neutron irradiation; plateau annealing; uranium glasses; U-238 fission decay constant 15379.

Fission track technique; fly ash; mica detector; polycarbonate detector; rapid analysis; uranium; coal 15457.

Fission/alpha: spherical electrodes; \(\alpha_i\); \(^{240}_{\text{Cm}}\); fast ionization chamber; \(SP425\), pp. 81-82.

Fission-neutron yields; half-lives of U-233; U-234; Pu-239; mean energy of fission neutron spectrum; neutron cross-sections; neutron data evaluation; U-233; U-235; Pu-239; Pu-241; Westcott g-factors; Cf-252 spontaneous fission neutron yield; \(SP425\), pp. 286-292.

Fixed point pressure scale; high pressure; NaCl pressure scale; pressure measurement; ruby fluorescence; semiconductors; transition pressures; diamond-anvil pressure cell 15224.

Fixed points; lead and indium transition temperatures; low temperature fixed points; low temperature thermometry; superconducting transition temperatures of lead and indium; acoustical thermometry; 15697.

Fixed points; SRM 767; superconductivity; transition temperature 15062.

Fixed surveillance; motion picture surveillance; robbery; sequence cameras; shoplifting; surveillance; surveillance cameras; cameras; demand cameras; employee theft; 14923.

Flame detection; flame detector; false alarms; false alarm simulator; fire detection; fire detector; \(NBSIR 75-956\).

Flame detector; false alarms; false alarm simulator; fire detection; fire detector; flame detection; \(NBSIR 75-956\).

Flame emission spectrometry; interferences; repetitive optical scanning; aluminum 14901.

Flame propagation; Flashover; floor coverings; radiant heat flux; corridor; fire spread; energy release rate; fire induced flow; \(NBSIR 75-691\).

Flame retardancy; mass spectrometry; optical spectroscopy; phosphorus; polyester; \(NBSIR 75-741\).

Flame spray coating; hip prosthesis; segmental bone replacement; bioglass-ceramic; ceramic implants; \(SP415\), pp. 19-36.

Flame spread; flammability; flammability testing; garments; heat transfer; ignition; apparel; burn injury; fabric; fire modeling; 14794.

Flame spread; floor covering material; heat release rate; ignition; 15269.

Flame spread; floor covering materials; ignition; 15440.

Flame spread; floorcovering; test method; theory; corridor fire; experiments; 15617.

Flame spread; furnishings; interior finishes; noncombustible; smoke development; sprinklers; survey; building construction; detectors; \(TN861\).

Flame spread; heat release; interior linings; material ignitability; performance criteria; room fires; smoke; wood crib; buildings; fire growth; \(TN879\).

Flame spread; mass balance; test method; ASTM E 84; carpets; energy balance; \(NBSIR 75-705\).

Flame spread and smoke development; high-rise; human behavior; life safety; plastics; 15069.

Flame spread index; heat release rate; ignition temperature; rigid urethane foam; smoke; dibromotetrafluoroethane; fire tests; 15615.

Flame spread test; flammability tests; flammable fabrics; Operation BREAKTHROUGH; protective clothing; bibliographies; building fires; construction materials; fire departments; fire tests; \(NBSIR 75-736\).

Flame spread tests; floor coverings; interlaboratory evaluation; smoke measurement; tunnel test; ASTM E84; building materials; carpets; fire tests; 15267.

Flames; furnishings; heat release; ignition; smoke; thermal radiation; upholstery; waste receptacle; buildings; combustibility; fire intensity; \(NBSIR 75-679\).

Flames; laser excitation; mass spectrometry; radicals; 15243.

Flammability; building design; consumer protection; fire control; fire detection; fire research; fire spread; \(SP416\).

Flammability; flammability testing; garments; heat transfer; ignition; apparel; burn injury; fabric; fire modeling; flame spread; 14794.

Flammability; flooring radiant panel test; Metro; motor vehicle safety standard 302; urethane; AM General Bus; arson; critical radiant flux; fire retardant; \(NBSIR 75-718\).

Flammability; garments; test methods; textiles; upholstered furniture; apparel; carpets; curtains; draperies; fabrics; 15470.

Flammability; heat of combustion; rate of combustion; calorimeter; fabrics; 15103.

Flammability testing; garments; heat transfer; ignition; apparel; burn injury; fabric; fire modeling; flame spread; flammability; 14794.

Flammability testing; hazard analysis; hazard quantification; clothing flammability; fabric flammability; fire hazard; fire investigation; 15635.

Flammability tests; flammable fabrics; Operation BREAKTHROUGH; protective clothing; bibliographies; building fires; construction materials; fire departments; fire tests; flame spread test; \(NBSIR 75-736\).

Flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; \(FFACTS\); fire; 15229.

Flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; \(FFACTS\); fire; TN867.

Flammable fabrics; garment fires; garment parameters; injury severity; reaction patterns; victims; apparel; apparel fires; burn injury; defensive capability; \(FFACTS\); fire; 15438.

Flammable fabrics; garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; \(FFACTS\); fire; \(NBSIR 75-145\).

Flammable fabrics; Operation BREAKTHROUGH; protective clothing; bibliographies; building fires; construction materials; fire departments; fire tests; flame spread test; flammability tests; \(NBSIR 75-736\).

Flammable liquid containers; gasoline cans; mechanical tests; product standards; safety; consumer products; \(NBSIR 74-614\).

448
Fluid safety; materials; NBS, GSA experiment; optical spectra; plastic pipes; thermal conductivity; computer; cryogenic; cryptography; data; energy labeling; energy needs; DIM/NBS 59, No. 9, 193-216 (1975).

Fluidic logic; gas chromatography; plasma chromatography; sampling; automated systems; 15106.

Fluids; methane; orthobaric densities; specific heats; vapor pressures; coexistence boundary; critical point; ethane; equation of state; J.79A No. 1, 71-79 (1975).

Fluid-solid phase transition; Lennard-Jones model; melting and freezing densities; Monte Carlo simulation; symmetry change; van der Waals isoterm; 14736.

Fluid-solid phase transition; Lennard-Jones System; Monte Carlo Studies; coexisting densities; finite system; “flat” loop; 15176.

Fluorapatite; fluorite; hydroxyapatite; tooth enamel; dicalcium phosphate dihydrite; 14909.

Fluorapatite; fluorite; pit and fissure sealant; tooth enamel; di-calcium phosphate dihydrite; 15565.

Fluorescence; fluorescence quantum yield; fluorescence standards; fluorometry; polarization; spectrofluorimetry; viewing angle; emission anisotropy; J.79A No. 1, 1-15 (1975).

Fluorescence; fluorescence standards; inorganic ion-doped fibers; microspectrofluorimetry; uranyl ions; europium ions; 15321.

Fluorescence; high pressure; hydrostatic pressures; ruby; calibration; diamond cell; 15095.

Fluorescence; lasers; NaK molecule; spectroscopy; diatomic mercury; eximer molecules; 15685.

Fluorescence; Mössbauer spectroscopy; porous glass; 15115.

Fluorescence; nitric oxide; nitrogen; quencher; air; automotive exhaust emission; detection; 14901.

Fluorescence; photodissociation; vacuum ultraviolet; acetylene; bond dissociation energy; bromaacetylene; C2; C2H; 14978.

Fluorescence measurement; instrumentation; luminescence measuring; luminescence measurement; phosphorescence measurement; NBSIR 74-553.

Fluorescence quantum yield; fluorescence standards; fluorometry; polarization; spectrofluorimetry; viewing angle; emission anisotropy; fluorescence; J.79A No. 1, 1-15 (1975).

Fluorescence standards; fluorometry; polarization; spectrofluorimetry; viewing angle; emission anisotropy; fluorescence; fluorescence quantum yield; J.79A No. 1, 1-15 (1975).

Fluorescence standards; inorganic ion-doped fibers; microspectrofluorimetry; uranyl ions; europium ions; fluorescence; 15321.

Fluorescent lamp; fluorescent luminaire; lighting efficiency; power factor; capacitors; energy conservation; TN866.

Fluorescent luminaire; lighting efficiency; power factor; capacitors; energy conservation; fluorescent lamp; TN866.

Fluoride; hydroxyapatite; tooth enamel; dicalcium phosphate dihydrite; fluorapatite; 14909.

Fluoride; pit and fissure sealant; tooth enamel; dicalcium phosphate dihydrite; fluorapatite; 15565.

Fluoride analysis; gas-bonding; HF-air mixtures; ion-specifc electrode; NBSIR 73-261.

Fluorides; heart; heat pump; laser; ozone; radiometer; stabilizer; toy safety; computer security; energy efficiency; electrocatalysis; DIM/NBS 59, No. 11, 241-264 (1975).

Fluorometry; laboratory automation; real-time; analytical chemistry; computers; data acquisition; data processing; TN857.

Fluorometry; polarization; spectrofluorimetry; viewing angle; emission anisotropy; fluorescence; fluorescence quantum yield; fluorescence standards; J.79A No. 1, 1-15 (1975).

Fluorine; gas; graphs; liquid; tables; torsional crystal; viscosity; experimental; 14757.

Fluorine; iron; photon; reaction; tertiary; SP425, pp. 328-331.
crystallization; defect energy; equilibrium dissolution temperature; equilibrium melting temperature; 15561.

Food irradiation; food preservation; gamma rays; accelerators; dose distributions; dosimetry; electron beams; 15435.

Food preservation; gamma rays; accelerators; dose distributions; dosimetry; electron beams; food irradiation; 15435.

Force constants; HBS; infrared; molecular spectra; spectra; thiobarine; absorption spectra; 15000.

Force plate; pavement skid resistance; skid accident reduction; tire-pavement interface forces; calibration procedures; NBSIR 75-738.

Force platforms; impact noise; instrumentation; mechanical impedance; noise; building acoustics; 15462.

Forced convection; heat transfer; helium; nucleate boiling; subcritical; supercritical; critical heat flux; film boiling; 14930.

Forced convection; heat transfer; helium; supercritical; correlation; 14962.

Foreign donor programs; non-donor attitudes; blood banking; donor attitudes; donor eligibility; donor participation rates; donor recruitment; donor retention; 14992.

Foreign relations; industrializing nations; LDC’s; measurement services; OAS; standardization; AID; assistance; economics; NBSIR 75-769.

Foreign visitors; information exchange; international building technology; international organization memberships; professional interaction; cooperative programs; NBSIR 74-514.

Forensic science; law enforcement; methane; metric; police protection; safer streets; security systems; WWV/WWVH; accelerator facilities; computers; court records; fire safety; DIM/NBS 59, No. 3, 49-72 (1975).

Form factors; intermediate coupling; reduced transition probability; 15104.

Form factors; sum rules; transition charge; charge density; Coulomb energy; Coulomb excitation; electron scattering; 14851.

Formation; heat; isomerization; secondary standard; combustion; enthalpy; J.79A No. 3, 481-486 (1975).

Formation; heat; mustard gas; combustion; dichloroethyl sulfide; enthalpy; J.79A No. 5, 634-638 (1975).

Formation; heat; nicotinic acid; calorimetry; combustion; creatinine; enthalpy; J.79A No. 2, 425-430 (1975).

Formation; heat; secondary standard; thermochemical standard; combustion; enthalpy; J.79A No. 3, 487-491 (1975).

Formation; heat; secondary standard; sulfur compound; thianthrene; combustion; enthalpy; J.79A No. 4, 561-564 (1975).

Formation cross sections measurements; isomeric states; clyc activation; SP425, pp. 712-715.

Formation, heat of; reference material; cholesterol; clinical standard; combustion, heat of; enthalpy; J.79A No. 3, 493-496 (1975).

Formats; levels; nuclear structure; radiations; reactions; tables; yoga-rays; computers; data; decay; ENSDF; evaluation; files; SP425, pp. 309-312.

Fornwork removal; nondestructive testing; surface hardness; compressive strength; concrete; flexural strength; NBSIR 75-729.

FORTRAN; Metric System; conversion; 15490.

FORTRAN use; programming aids; syntax analysis; computation and flow analysis; 15348.

Fossil fuels; solar samples; analysis; biological and botanical samples; differential linear sweep voltammetry; environmental samples; 15427.

Four dimensional rotation group; hydrogen; plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering; Balmer lines; 15009.

Four-center reactions; halocarbon ions; ion cyclotron resonance; ion-molecule reaction; rate constants; carbonyl compound; 15384.

Fourier analysis; review; stacking fault energy; x-ray diffraction; deformation; dislocations; face-centered cubic metals; faults; 14750.

Fourier section; Fourier synthesis; least squares; computer programs; contour plotting; constrained refinement; crystallographic calculations; TN854.

Fourier synthesis; least squares; computer programs; contour plotting; constrained refinement; crystallographic calculations; Fourier section; TN854.

Fourier transform; p.m.r. spectroscopy; acetylated 1,1-bis(acylamido)-1-deoxybenolopyranosyl; confornational analysis; conformational nomenclature; exponential filtering; 15268.

Four-pair admittances; permutation techniques; precision admissance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; AC DRRS; coaxial cable effects; coaxial star connectors; extrapolation techniques; 14924.

Four-terminal resistance; high current; operational amplifier; phase angle; resistance; transformer-ratio-arm; audio-frequency; bridge; 14877.

Fractions; homogeneous nucleation; molecular weight; nucleation theory; polyethylene; surface free energies; chain folds; J.79A No. 6, 701-711 (1975).

Fracture; fracture mechanics; glass; impact damage; strength; thermal shock; time to failure; ceramics; 14886.

Fracture; fracture mechanics; porcelain; strength; structural ceramics; crack growth; 15322.

Fracture; glass; static fatigue; strength; crack growth; 15432.

Fracture; glass; zeta potential; crack propagation; 15426.

Fracture; hardness; indentation; residual stress; stress analysis; wear rate; abrasion; brittle solids; brittle surfaces; chipping; NBSIR 75-659.

Fracture; Hertizian; indentation; strength; brittle solids; ceramic surfaces; cracks; degradation; NBSIR 75-664.

Fracture; inclusions; nondestructive inspection; ceramics; failure prediction; 15401.

Fracture; indentation; strength; brittle solids; ceramic surfaces; cracks; degradation; NBSIR 75-661.

Fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity; composites; elastic properties; NBSIR 74-393.

Fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; thermal conductivity; composites; elastic properties; NBSIR 75-810.

Fracture; proof testing; Weibull analysis; ceramics; crack propagation; delayed failure; 15419.

Fracture mechanics; glass; impact damage; strength; thermal shock; time to failure; ceramics; fracture; 14886.

Fracture mechanics; porcelain; strength; structural ceramics; crack growth; fracture; 15322.

Fracture mechanics; sapphire; slow crack growth; thermal activation; ambient temperatures; dislocation mechanisms; 15122.

Fracture probability; slow crack growth; strength degradation; sustained loading; 15125.

Fracture toughness; mechanical properties; nickel steels; crack propagation; cryogenics; 15530.

Francis Galton; frequency curves; method of moments; Karl Pearson; statistics; Tables for Statisticians and Biometricians; W. F. R. Weldon; bibliography; Biometrika; Chi-square tests; correlation; regression; R. A. Fisher; 14822.

Franck-Condon factors; ion-molecule reactions; methane; rare gas ions; rate constants; silane; charge transfer; 14839.

Free energy of formation; Gibbs energy function; heat capacity; heat of formation; thermochemical tables; critically evaluated data; enthalpy; entropy; equilibrium constant of formation; J. Phys. Chem. Ref. Data 4, No. 1, 1-176 (1975).

Free energy surface; geometry of thermodynamic surfaces; ther-
modynamics; critical phenomena; divergences at critical points; 15150.

Frequency; free radical; HCO; HO; laser magnetic resonance; OH; pollution; CH; 15680.
Free radical reactions; G-values; ion-molecule reactions; neopentane; proton transfer; radiolysis; 14890.
Free radical reactions; ion-molecule reactions; photochemistry; primary processes; 1-butene; far ultraviolet; 14773.
Free radicals; scavenging; hydrocarbons; isobutane; neopentane; primary photochemical processes; quantum yields; vacuum ultraviolet photolysis; 14996.
Free radicals; kinetics of reactions; lasers; infrared; photochemistry; apparatus and methods; chemiluminescence; emission spectra; 14969.
Free volume; glasses; glass transition; liquid; polymer; polyvinyl acetate; PVT; relaxation; viscosity; density; entropy; 14777.
Freeze drying; instrumental neutron activation analysis; lyophilization; neutron activation analysis; preconcentration; radioactive tracers; river water; trace elements; tracers; water; 15376.
Freezing; freezing criteria; melting; molecular correlation functions; phase transitions; equation of state; 14728.
Freezing criteria; melting; molecular correlation functions; phase transitions; equation of state; freezing; 14728.
Freezing point; freezing-point cell; platinum resistance thermometer; tin point; zinc point; aluminium point; calibration; 15337.
Freezing points; metastable fluids; nonlinear operator; pair correlation function; single particle probability density; branching; 15178.
Freezing-point cell; platinum resistance thermometer; tin point; zinc point; aluminium point; calibration; freezing point; 15337.
Freons; photochemistry; quantum yields; stratosphere; trichlorofluoromethane; absorption cross section; chlorine atom; dichlorodifluoromethane; 15571.
Frequencies; nondivergent radiation; comment to editor; discrete; 15163.
Frequency; frequency stability; frequency stability analysis; models of frequency stability; picosecond time difference measurements; accurate frequency measurement; accurate time measurement; TN669.
Frequency; high frequency broadcasts; standard; time; dissemination; TN668.
Frequency; questionnaire; standard frequency and time broadcasts; time; TN674.
Frequency; satellite; synchronization; time; broadcasting; dissemination; 14836.
Frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; time standards; application of standards; basic standards; cesium standards; 14830.
Frequency calibration; international frequency comparisons; optimum frequency estimate; primary frequency standards; relativity; SS second; time scale accuracy algorithm; time scale stability; coordinate time scales; 15672.
Frequency calibration; network-originated programs; NBS traceability; phase comparison; television; crystal oscillator; 15682.
Frequency calibrator; frequency offset; NBS traceability; phase comparison; television; crystal oscillator; 15140.
Frequency curves; method of moments; Karl Pearson; statistics; Tables for Statisticians and Biometricians; W. F. R. Weldon; bibliography; Biometrika; Chi-square tests; correlation, regression; R. A. Fisher; Francis Galton; 14822.
Frequency measurements; frequency stability; phase delay; precise time metrology; subpicosecond time difference measurements; time stability; atomic clocks; 15684.
Frequency multiplication; funnel diode oscillator; parametric oscillator; superconducting oscillator; cavity stabilization; 15676.
Frequency multiplication; linewidth; multiplier chain; precision oscillator; rf spectrum; spectral density of phase fluctuations; spectral purity; 15675.
Frequency offset; NBS traceability; phase comparison; television; crystal oscillator; frequency calibrator; 15140.
Frequency source; Josephson radiation; Josephson tunnel junction; junction array; microstripline-coupling; thin-film device; 15599.
Frequency stability; frequency stability analysis; models of frequency stability; picosecond time difference measurements; accurate frequency measurement; accurate time measurement; frequency; TN669.
Frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; time standards; application of standards; basic standards; cesium standards; frequency accuracy; 14830.
Frequency stability; frequency standard; time comparison; clock; 15674.
Frequency stability; interaction length; phase noise; primary frequency standards; Ramsey cavity; accuracy; accuracy evaluations; cavity phase shift; cesium beam tube; 15683.
Frequency stability; noise measurement; oscillator stability; Flicker noise; 14827.
Frequency stability; phase delay; precise time metrology; subpicosecond time difference measurements; time stability; atomic clocks; frequency measurements; 15684.
Frequency stability analysis; models of frequency stability; picosecond time difference measurements; accurate frequency measurement; accurate time measurement; frequency; frequency stability; TN669.
Frequency stabilization; intensity stabilization; cw dye laser; 15160.
Frequency standard; time comparison; clock; frequency stability; 15674.
Frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; time standards; application of standards; basic standards; cesium standards; frequency accuracy; frequency stability; 14830.
Frequency standards; stability; survey of clocks; accuracy; atomic clocks; clocks; crystal oscillator; TN662.
Frequency synthesis; pulse method; Ramsey dual interaction region; second-order doppler; velocity distribution; cavity phase shift; cesium beam tube; 14829.
Fresh water sampling; sampling device; sea water sampling; trace organic analysis; water pollution; baseline studies; 15099.
Frictional tests; slip tests; coefficient of friction; human permability; floor slipperiness; resilient flooring; slipperiness standards; NBSIR 74-613.
FRP rod; FRP rope; materials testing; nonlinear analysis (shear); potted end fittings; structural engineering; tensile strength; transversely isotropic materials; axisymmetric analysis; cables (ropes); composite materials; contour plotting; 15399.
FRP rope; materials testing; nonlinear analysis (shear); potted end fittings; structural engineering; tensile strength; transversely isotropic materials; axisymmetric analysis; cables (ropes); composite materials; contour plotting; end fittings for FRP rod and rope; 15399.
F-sum rule; f-values; lithium sequence; oscillator strength distribution; oscillator strengths; systematic trends; 15474.
Fuel; hydrogen; cryogenic; energy; 14868.
Fuel consumption; building energy use; conservation; energy conservation; electricity saved; 15051.
Fuel control; jet engine; minicomputer; multi-task; performance testing; process control; real-time; RTOS; automation; calibration; 15550.

Fuel cycle; reactivity swing; sensitivity study; breeding ratio; cross section uncertainties; equilibrium cycle; SP425, pp. 385-388.

Fuel from waste; incinicators; organic waste conversion; thermodynamic data for incinicators; waste utilization; 15065.

Fuel utilization; heat recovery; total energy systems; utilities for housing; utility system performance; air conditioning; air pollution; central utility systems; data acquisition system; efficiencies; electrical power; energy conservation; energy costs; NBSIR 75-711.

Fuels; handling; hydrogen; oxidizers; oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; 15154.

Full scale experiments; interaction; measurements; smoke; smoke and flame spread; temperature; with and without forced air; velocity; carpets with and without underlayment; corridor fires; energy models; finished interior; 15230.

Full-scale; gas tracer; interstitial space; penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF6); Veterans Administration Hospital; experiments; NBSIR 75-903.

Full-scale fire; radiative heat transfer; combustion products; NBSIR 74-596.

Functional equations; Hurwitz's theorem; analytic functions; 15563.

Functional evaluation; hardware monitor; measurement tools; performance measurement; computer architecture; SP406, pp. 75-78.

Functional performance of piping; performance characteristics for piping; thermal/structural performance of piping; thermoplastic piping in plumbing; fire performance of piping; BS5668.

Funnel diode oscillator; parametric oscillator; superconducting oscillator; cavity stabilization; frequency multiplication; 15676.

Furnace annealing; glow curve; maximum heating temperature; peak height; reproducibility; sensitivity loss; supraclinearity; dosimetry; fading; 15193.

Furnace pressures; glass fiber; heat ventilating and air conditioning systems; high-rise buildings; optical density; steel; terminal units; aluminum; ducts; fire tests; flexible connectors; NBSIR 75-673.

Furnishings; heat release; ignition; smoke; thermal radiation; upholstery; waste receptacle; buildings; combustibility; fire intensity; flames; NBSIR 75-679.

Furnishings; interior finishes; noncombustible; smoke development; sprinklers; survey; building construction; detectors; flame spread; TN861.

Fusion; medicine; nuclear; power; radiation; reactor; research; utilities; biology; career; ecological; electricity; energy; environment; TN888.

Fusion; radiocactivity; resonance-levels; afterheat; blanket; cross-section; experiment; SP425, pp. 708-711.

Fusion; reaction rates; thick targets; astrophysics; cross sections; SP425, pp. 69-72.

Fusion blanket neutronics; nuclear reactions; 238U; SP425, pp. 680-682.

Fusion cross sections; fusion energy multiplication; fusion reactivities; Two-Component Torus (TCT); advanced fusion fuels; Doppler effect; SP425, pp. 716-721.

Fusion energy multiplication; fusion reactivities; Two-Component Torus (TCT); advanced fusion fuels; Doppler effect; fusion cross sections; SP425, pp. 716-721.

Fusion reactivities; Two-Component Torus (TCT); advanced fusion fuels; Doppler effect; fusion cross sections; fusion energy multiplication; SP425, pp. 716-721.

Fusion reactor design; nuclear data for fusion; SP425, pp. 646-650.

Fusion reactors; niobium; Reference Theta-Pinch Reactor; tritium breeding; Bondarenko; f-factors; SP425, pp. 722-728.

Fusion reactors; perturbation; sensitivity; uncertainties; cross sections; SP425, pp. 674-679.

Fusion-dynamics; 1-layer; reactivity-coefficients; advanced-fuels; DD; DIL; SP425, pp. 683-687.

F-value; imprisonment; lifetime; mean life; resonance radiation; silver; transition probability; Ag; 15120.

F-values; iron and oscillator strengths; arc; 14763.

F-values; lithium sequence; oscillator strength distribution; oscillator strengths; systematic trends; f-sum rule; 15474.

F-values; mercury molecules; new spectroscopic techniques; optical excitation; potential curves; dissociation laser; excimers; excited state kinetics; Monogr. 143.

F₂; hydrides; LiH₂; MC-SCF; O₂; O₃; polarizability; Van der Waals; CO; energy surface; 15275.

G

GaAs; laser; photoconductor; sampling oscilloscope; 15644.

GaAs; photoconductor; picosecond; pulse; detector; dye laser; 15651.

Gadolinium ions; reorientation processes; anelastic relaxation; calcium fluoride; defect pairs; dielectric relaxation; EPR lifetime broadening; fluorine interstitials; 15121.

Gage blocks; interferometry; laser; length; measurement process; uncertainty; calibration; Monogr. 152.

Gage blocks; interferometry; length measurement; parallelism; flatness; 15119.

Gage blocks; measurement assurance; calibration; 15302.

Gage blocks; gage block comparator; linear variable differential transformer; deburring; NBSIR 74-523.

Gain comparison method; microwave antenna; power gain; satellite; calibration accuracy; effective area; effective radiated power; extrapolation method; 14970.

Gain measurement; antenna radiation patterns; 14740.

Galena ores; kohl; lead isotopes; Ptolemaic and Roman Periods; archaeological materials; Egyptian glasses; 14912.

Gallium arsenide; passivity; electrochemistry; ellipsometry; 15480.

Gallium phosphides; high pressure; metallic phase transitions; phonon dispersion; Raman scattering; silicon; 15187.

Galvanomagnetism; quantum transport theory; semiconductors; thermomagnetism; 15525.

Gamma radiation; moments; adjoint; annihilation; buildup factor; concrete; 14940.

Gamma radiation; plastic films; polymethyl methacrylate; polyvinyl chloride; radiation processing; radiochromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; dried cellulose; dried plastics; electron beams; 15278.

Gamma radiation; radiation dosimetry; radiochromic dyes; absorbed dose rate; calorimetry; chemical dosimetry; electron beams; 15482.

Gamma radiography; image enhancement; neutron radiography; nondestructive testing; proton radiography; real-time techniques; three-dimensional radiography; x-radiography; dimensional measurement; 15214.

Gamma ray; mixed radio nuclide; standards; energy efficiency curves; 14820.

Gamma ray; neutron; transport calculations; cross section sensitivity; SP425, pp. 431-435.

Gamma ray; neutron penetration; initial nuclear radiations; neutron penetration; radiation shielding; effects of nuclear weapons; fissile product gamma rays; 15056.

453
Gamman rays; accelerators; dose distributions; dosimetry; electron beams; food irradiation; food preservation; 15435.

Gamma rays; glasses; plastics; radiation chemistry; radiation sterilization; solid-state detectors; spectrophotometry; dose distribution; dosimetry; dyes; electron beams; 14734.

Gamma rays; incoherent scattering function; photons; Rayleigh scattering; tabulations; x rays; atomic form factor; Compton scattering; cross sections; J. Phys. Chem. Ref. Data 4, No. 3, 471-538 (1975).

Gamma rays; Josephson junction; noise thermometer; thermometer; 60Co: 15166.

Gamma rays; muscle; radiochromic dosimeters; x-ray spectra; bone; dosimetry; dyes; electron dosimetry; energy dependence; 15429.

Gamma rays; neutrons; analysis; application; concrete; feasibility; SP425, pp. 496-499.

Gamma spectra; photoneutron spectra; reactors; "H; "Be; fission products; SP425, pp. 193-198.

Gamma-flash; photomultiplier; pulse suppression; scintillator; after-pulse; detector; SP425, pp. 106-107.

Gamma-ray detector; germanium; Ge(Li) detector; infrared response silicon; carrier trapping; SP400-13.

Gamma-ray detector; germanium; Ge(Li) detector; infrared response; silicon; carrier trapping; NBSIR 74-626.

Gamma-ray equipment; radiation installations; radiation safety; x-ray equipment; H114.

Gamma-ray penetration; moments; neutron penetration; secondary gamma rays; adjacent; concrete; 15453.

Gamma-ray production; isotopes; radiation widths; statistical model codes; applications to CTR; cross-section calculations; fast neutron reactions; SP425, pp. 651-658.

Gamma-ray spectrum unfolding; integral measurements; neutron spectrum unfolding; NE-213 detector; nitrogen cross sections; concrete and steel shield; SP425, pp. 161-164.

GaP first dynode; neutron; photoelectron; photomultiplier; resolution; suppression; after-pulse; 14843.

Garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; flammable liquids; 15229.

Garment fires; garment parameters; injury severity; reaction patterns; victims; apparel; apparel fires; burn injury; defensive capability; FFACTS; fire; flammable fabrics; 15438.

Garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; 15229.

Garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; 15229.

Garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; 15229.

Garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; 15229.

Garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; 15229.

Garment fires; garment parameters; injury severity; victim's activity; victim's reactions; accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; 15229.
quantum yield; rate constant; atmospheric chemistry; chemical kinetics; data evaluation; TKN866.

Gas phase kinetics; ion-molecule reactions; mass spectrometer; product ions: ethane; 15111.

Gas proportional counter; neutrons; nuclear physics; T(n,p) neutrons; \(^{10}B(n,a)\) Li reaction; branching ratio; 14813.

Gas scintillation transmission counters; neutron flux determination; \(1 < F_n < 30\) MeV; SP425, pp. 277-280.

Gas standards; industrial hygiene; activated carbon; air sampling; NBSIR 74-530.

Gas standards; nitric oxide; nitrogen dioxide; sulfur dioxide; air pollution; carbon monoxide; gas analysis; 15447.

Gas tracer; interstitial space; penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF\(_6\)); Veterans Administration Hospital; experiments; full-scale; NBSIR 75-903.

Gas-blending; Gutzeit method; spectrophotometry; arsenic; NBSIR 73-260.

Gas-blending; HF-air mixtures; ion-specific electrode; fluoride analysis; NBSIR 73-261.

Gas-blending systems; hydrogen fluoride; phosgene; arsenic; calibration of devices; 15592.

Gas-cooled fast breeder reactor; neutron-coupled gamma-ray cross sections; SP425, pp. 444-446.

Gaseous electronics; lasers; molecules; atoms; electron excitation; excitation transfer; 14849.

Gaseous hydrogen; graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; solid hydrogen; tables; computer programs; 15382.

Gases; hazard; high voltage; sharp edges; sharp points; threshold; consumer products; electrical breakdown; NBSIR 75-908.

Gases; plastic pipe plumbing; PVC; smoke; ABS; DWV; fire endurance; fire spread; fire test; BSS72.

Gasoline; gasoline containers; gasoline incidents; gasoline-related fires; ignition-causing activities; ignition sources; volatile flammable liquids; volatile flammable liquids incidents; accidents; FFACTS; TN850.

Gasoline; ignition-causing activities; ignition sources; injury disposition; accidents; burn injuries; burn severity; explosives; fabric fires; FFACTS; flammable liquids; gas; NBSIR 75-784.

Gasoline cans; mechanical tests; product standards; safety; consumer products; flammable liquid containers; NBSIR 74-614.

Gasoline consumption; glass SRM; hazardous chemicals; leap second; playground equipment safety; scientific data; silicon devices; time; energy conservation; fires; DIM/NBS 89, No. 2, 25-48 (1975).

Gasoline containers; gasoline incidents; gasoline-related fires; ignition-causing activities; ignition sources; volatile flammable liquids; volatile flammable liquids incidents; accidents; FFACTS; gasoline; TN850.

Gasoline flowmeter; automotive fuel flowmeter environment; automotive fuel flowmeters; flowmeter evaluation; flowmeter evaluation test setup; flowmeters; 15415.

Gasoline incidents; gasoline-related fires; ignition-causing activities; ignition sources; volatile flammable liquids; volatile flammable liquids incidents; accidents; FFACTS; gasoline; gasoline containers; TN850.

Gasoline-related fires; ignition-causing activities; ignition sources; volatile flammable liquids; volatile flammable liquids incidents; accidents; FFACTS; gasoline; gasoline containers; gasoline incidents; TN850.

Gauge theories; lepton; muon; M-spin; scattering amplitudes; Weinberg; 14942.

Gaussian diffusion; plotting; computer; semiconductors; silicon; BASIC; capacitance-voltage measurements; computer programs; dopant profiles; error function; SP400-11.

Gaussian distribution; impulsive noise; magnetic field strength; measurement instrumentation; mine noise; spectral density; time-dependent spectral density; amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; NBSIR 74-391.

GCFR; integral measurements; benchmarks; data testing; SP425, pp. 464-468.

Gd(PO\(_4\))\(_3\); glass; magnetic order; polycrystal; vitreous Gd(PO\(_4\))\(_3\); antiferromagnetism; comparison of magnetic properties of glasses and crystals; 14833.

Gel permeation chromatography; hydrogen bonding; liquid chromatography; adsorption; 15088.

Ge(Li) detector; infrared response silicon; carrier trapping; gamma-ray detector; germanium; SP400-13.

Ge(Li) detector; infrared response; silicon; carrier trapping; gamma-ray detector; germanium; NBSIR 74-626.

Ge(Li) detector; measured \(T_{1/2}\); pressured ionization chamber; radioactivity \(^{133}Xe\); \(\nu\) relative intensity; enriched source; 14812.

Ge(Li) detector; solvent extraction; activation analysis; 15459.

General decision problems; Markov algorithms; many-one reducibility; recursive functions; t.e. many-one degrees; t.e. one-one degrees; semi-Thue systems; splinters; combinatorial systems with axiom; degrees of unsolvability; 14998.

General Materials; properties; Research Materials; Standard Reference Materials; analysis; characterization; composition; SP260, 1975-76 Edition.

General Motors Corporation; metric conversion; rounding; test problem; tolerance; Caterpillar Tractor Co.; computer program; documentation; engineering drawing; TKN872.

General relativity; time; clocks; coordinate time; TN659.

Genus; index; level; parabolic class number; classical modular group; congruence groups; elliptic class numbers; 15006.

Genus; modular group; natural homomorphism; parabolic classes; automorphs; elliptic classes; finite fields; 14972.

Geomagnetism; magnetometer; SQUID; superconducting device; 15035.

Geometrical; indexing; patterns; powder diffraction; ambiguities; 15572.

Geometrically total spectral radiant power; gonioradiometer; 15025.

Geometry of thermodynamic surfaces; thermodynamics; critical phenomena; diversifications at critical points; free energy surface; 15150.

Geophysics; laser; lunar distance; moon; selenodesy; astronomy; cartography; 14892.

Geophysics; lasers; lunar cartography; lunar gravity; moon; plate tectonics; crustal movements; earth rotation; 15437.

Germanium; Ge(Li) detector; infrared response silicon; carrier trapping; gamma-ray detector; SP400-13.

Germanium; Ge(Li) detector; infrared response; silicon; carrier trapping; gamma-ray detector; NBSIR 74-626.

Germanium; material structure; optical properties; scattering; electron energy loss; 15387.

Gersgorin; Hadamard product; Hermitian; positive definite; spectrum; angular field of values; diagonal; diagonally dominant; field of values; 15272.

Gersgorin's theorem; Lyapunov's theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal; diagonally dominant; diagonal matrix; D-stability; 14782.

\(E_n, E_n, \langle H_n(x) \rangle, ^{20}Pb(n,f); 500 to 10 000 eV; SP425, pp. 560-563.\)
Glass; transition; hole theory; polymer; poly(vinyl acetate); PVT; thermodynamic; liquid; configurational; 14850.

Glass; glass-ceramic; interferometry; dimensional stability; J. 79A No. 4, 545-550 (1975).

Glass; impact damage; strength; thermal shock; time to failure; ceramics; fracture; fracture mechanics; 14886.

Glass; magnetic order; polycrystal; vitreous Gd(PO₄)₃; antiferromagnetism; comparison of magnetic properties of glasses and crystals; Gd(PO₄)₃; 14833.

Glass; mechanism; silicon carbide; wear; alcohol; 15123.

Glass; piezoelectric; polarization; polyvinyl chloride; pyroelectric; electret; dipole; 15320.

Glass; static fatigue; strength; crack growth; fracture; 15432.

Glass; zeta potential; crack propagation; fracture; 15426.

Glass electrode; pH; pH buffers; pH electrode; pH measurement; pH standards; buffers; buffer solutions; SP260-53.

Glass fiber; heat ventilating and air conditioning systems; high-rise buildings; optical density; steel; terminal units; aluminum; ducts; fire tests; flexible connectors; furnace pressures; NBSIR 75-673.

Glass fiber; thermal conductivity; aramid fiber; composites; cryogenic; epoxy; 15021.

Glass fibers; housing system; laminates; reinforced plastics; shear strength; sustained loading; tensile strength; adhesive bonding; aging tests (materials); composite materials; 15624.

Glass fibers; mechanical properties; organic fibers; review; steel fibers; cement; concrete; fiber-reinforced cements; fiber-reinforced concretes; 15028.

Glass filters; spectral bandpass; spectrophotometry; standard reference materials; stray radiation; testing of spectrophotometers; transmittance (absorbance) accuracy; wavelength accuracy; accuracy in spectrophotometry; SP260-51.

Glass prism; impact tests; light bases; optical cover assembly; photometric measurements; static tests; airport approach and threshold lights; NBSIR 75-647.

Glass SRM; hazardous chemicals; leap second; playground equipment safety; scientific data; silicon devices; time; energy conservation; fires; gasoline consumption; DIM/NBS 59, No. 2, 25-48 (1975).

Glass standards; household fires; jet engines; measurement seminars; metric; protecting nuclear fuels; computers; energy research; ethylene; fabric flammability; DIM/NBS 59, No. 1, 1-24 (1975).

Glass transition; hole theory; polymer; poly(vinyl acetate); PVT; thermodynamic; liquid; configurational; glass; 14850.

Glass transition; liquid; polymer; poly(vinyl acetate); PVT; relaxation; viscosity; density; free volume; glasses; 14777.

Glass transition temperature; hardness; PB; polybutene; polyvinyl chloride; PVC; residual stress; thermoplastic piping; ABS; coefficient of expansion; CPVC; NBSIR 74-629.

Glass-ceramic; interferometry; dimensional stability; glass; J. 79A No. 4, 545-550 (1975).

Glass-ceramic; optics; bolometer; cryogenics; dielectric; 14742.

Glasses; glass transition; liquid; polymer; poly(vinyl acetate); PVT; relaxation; viscosity; density; free volume; 14777.

Glasses; plastics; radiation chemistry; radiation sterilization; solid-state detectors; spectrophotometry; dose distribution; dosimetry; dyes; electron beams; gamma rays; 14734.

Glasses; properties; carbon (graphite); ceramics; composites; data sources; SP396-2.

Glass-fiber composites; literature review; static mechanical properties; thermal properties; cryogenics; dynamic mechanical properties; 15170.

Glass-reinforced-polyester rod; guys; antenna; processing parameters; pultrusion; pultrusion; reinforced plastic rod; stress rupture of FRP rod; test methods. FRP rod; weatherability; FRP rod; composite materials; fiber-reinforced-plastic rod; NBSIR 74-557.

Glauber model; hadronic components of photons; high energy scattering; multiple scattering; neutrino-nucleus interactions; shadowing effects; diffractive production; diffractive scattering; Monogr. 139.

Gloss; optical properties; tolerances; 15583.

Gloss; photometry; reflectance; scattering; spectrophotometry; specular gloss; accuracy; appearance; error analysis; TN594-10.

Glow curve; maximum heating temperature; peak height; reproducibility; sensitivity loss; suprlinearity; dosimetry; fading; furnace annealing; 15193.

Glucose; heat measurements; hexokinase; metabolic processes; microcalorimetry; thermochemistry; thermodynamics; adenosine-5’-triphosphate; biochemistry; enzyme catalyzed reactions; 15174.

Glucose; microcalorimetric; thermochemistry; analysis; clinical chemistry; 15319.

Glucose; microcalorimetry; serum thermochemistry of enzyme processes; analysis; assay in serum; bacterial growth calorimetry; enzyme catalyzed processes; 14898.

GM counter; sensitive detector; vacuum ultraviolet; absolute radiation detector; absorption measurements; filters; 14903.

Gy,; collective motion; correlations; level densities; resonance levels; ²⁶⁰U; ²³⁶U; SP425, pp. 742-743.

Gold decoration; polymer crystals; poly(oxyethylene); surface layer; adsorbed polymer; deformation; fold surface; J. 79A No. 5, 609-611 (1975).

Gold surfaces; van der Waals forces; cesium beam; cesium chloride beam; 15340.

Gold-doped silicon; hermeticity; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; photomasks; photore sist; resistivity; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; silicon; SP400-8.

Gold-doped silicon; hermeticity; incremental sheet resistance; measurement methods; microelectronics; nanometrology; MOS devices; oxide films; resistivity; scanning low energy...
electron probe; semiconductor devices; semiconductor materials; semiconductor process control; SP400-12.

Goniomometer; geometrically total spectral radiant power; 15025.

Goodness of fit; normal distribution; significance tests; standards; statistics; acceptance tests; confidence intervals; criministics; errors; 15279.

GOTO-less programming; language design; precompiler; quality software; structural programming; block structure; control flow; 14916.

\(\gamma\)-production; Cr, Ni, Zr; \(E_n = 3.6\) MeV; (n,n'; \(\gamma\)); nuclear reactions; SP425, pp. 934-937.

Gradient, concentration; gradient, density; gravity, effects of; 3-methylpentane; mixture; liquid; nitroethane; sedimentation; critical point; critical solution point; densimeter, magnetic; diffusion, pressure; 14944.

Gradient, density; gravity, effects of; 3-methylpentane; mixture; liquid; nitroethane; sedimentation; critical point; critical solution point; densimeter, magnetic; diffusion, pressure; gradient, concentration; 14944.

Gradient dependence of normal stress differences; gradient dependence of viscosity; hydrodynamic interaction; intrinsic stress tensor; intrinsic viscosity; elastic dumbbell model; flow instability; flow with longitudinal gradient; flow with transverse gradient; 15143.

Gradient dependence of viscosity; hydrodynamic interaction; intrinsic stress tensor; intrinsic viscosity; elastic dumbbell model; flow instability; flow with longitudinal gradient; flow with transverse gradient; gradient dependence of normal stress differences; 15143.

Grading of diamond powder; powder, diamond; sizes, sub-sieve of diamond powder; diamond powder, grading; PS62-74.

Graffiti; product standards; programming language; air conditioners; buses, subway cars; centennial; electric power; environment; ethane data; facilities; fire research; fire safety; DIM/NBSIR 59, No. 7, 145-168 (1975).

Grafting modification of collagenous surfaces; hard tissue; rat skin; soft tissue; bone; collagen; 15531.

Grafting to tissues; persulfate initiated grafting; surface grafting; tissue modification; ceric ion initiated grafting; chemical attachment to ratskin; 14880.

Grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; molybdenum; niobium; plutonium; potassium; praseodymium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Granular aluminum films; granular films; Type II superconducting films; vortex pinning; critical current densities; critical currents; 15520.

Granular aluminum films; magnetic coupling; superconducting dc transformer; Type II superconducting films; vortex coupling; de transformer; 15361.

Granular films; Type II superconducting films; vortex pinning; critical current densities; critical currents; granular aluminum films; 15520.

Graph; tree; center; centroid; facility location; J. 79B Nos. 3 and 4, 107-115 (1975).

Graph character subsets; graphic subsets; information interchange; information processing; standards; subsets; American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; FIPS PUB 35.

Graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets; American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; FIPS PUB 36.

Graphical subsets; information interchange; information processing; standards; subsets; American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; FIPS PUB 35.

Graphical subsets; information interchange; information processing; standards; subsets; American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; FIPS PUB 36.

Graphs; graphics; minicomputers; computer graphics; cost-benefit analysis; economic analysis; 15488.

Graphs; networks; protocol; standards; computer graphics; computer networks; 15071.

Graphs display terminal; interactive program; least-squares analysis; real-time analyzer; reverberation room; spectrum shaping; digital processing of decay rates; digital sampling; 15082.

Graphite; heat capacity; high-speed measurements; high temperature; thermal emittance; thermodynamics; electrical resistivity; 15108.

Graphite; infrared matrix isolation spectroscopy; melting point; radiance temperature; reaction of Ba(g) and excited ozone; reaction of Fe(g) and oxygen; review of literature on rate of effusion and mass-spectrometric data; NBSIR 74-600.

Graphite; neutron; sodium; water; benchmark; cross sections; SP425, pp. 177-183.

Graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; solid hydrogen; tables; computer programs; gaseous hydrogen; 15382.

Graphs; liquid; tables; torsional crystal; viscosity; experimental; fluorine; gas; 14757.

Gravels; measurements; networks; performance; Petri Nets; probability; evaluation; SP406, pp. 127-130.

Gravel; measurements; microwave; skin depth; attenuation; clay; NBSIR 74-381.

Gravity effects; mixture, binary; mixture, liquid; nitroethane; thermal expansion; 3-methylpentane; consolute point; critical exponent \(\alpha\); critical phenomena; critical solution point; density; 15691.

Gravity; effects of; 3-methylpentane; mixture; liquid; nitroethane; sedimentation; critical point; critical solution point; densimeter, magnetic; diffusion, pressure; gradient, concentration; gradient, density; 14944.

Gravity modes; nonadiabatic; oscillations; resonances; stellar; binary; 15282.

\(\gamma\)-ray anisotropy thermometry; Josephson junctions; noise thermometry; temperature; dilution refrigerators; 15526.

\(\gamma\)-ray strength; isomeric fission; level density; photofission; bremsstrahlung beam; cross section; fission barrier shapes; 15350.

\(\gamma\)-ray thermometer; noise thermometer; superconductive transition temperatures; temperature; copper NMR thermometer; 15527.

\(\gamma\)-rays; computers; data; decay; ENDF; evaluation; files; formats; levels; nuclear structure; radiations; reactions; tables; SP425, pp. 309-312.

Green's function; heat diffusion; weakly absorbing materials; absorption coefficients; barothermal behavior; J. 79A No. 5, 639-648 (1975).

Grid; intermittency; moments; statistical properties; turbulence; velocity-gradients; boundary layer; 15116.

Gross fission products; neutron cross section; time-of-flight; 1-240 eV; SP425, pp. 744-747.

Ground antenna; standard antenna gain; three-antenna extrapolation; calibration; 15641.

Ground state; magnetic; permutation group; quantum
mechanics; antiferromagnetism; cesium magnesium nitrate; dipole-dipole interaction; ferromagnetism; 14911.

Ground state; permutation group; quantum mechanics; spin cluster; spin-Hamiltonian; antiferromagnetism; cesium magnesium nitrate; dipole-dipole coupling; ferromagnetism; 15524.

Ground state constants; infrared spectrum; nitrogen dioxide, $v_1$ band; nitrogen dioxide, $v_2$ band; upper state constants; vibration-rotation interaction constants; equilibrium structure; 15694.

Ground station; G/T (system gain/system noise temperature); radio star; accuracy; antenna; calibration; Cassiopeia A; error analysis; flux density; NBSIR 75-822.

Group constants; iron; neutron spectrum; one-dimensional transport calculation; stainless steel; time-of-flight; activation method; SP425, pp. 184-188.

Group representation; invariant; isotropic tensor; Kneoncker delta; orthogonal group; tensor; algebra; alternating tensor; Capelli’s identity; Cartesian tensor; J.79B Nos. 1 and 2, 49-58 (1975).

Group representations; measurements; near field; non-planar; patterns; scanning; spherical; symmetry; antennas; arrays; coordinate transformations; data processing; NBSIR 75-809.

Group 2; $^{238}$U(y, f); delayed neutron; energy spectrum. $\beta - \eta$ time-of-flight; fission; SP425, pp. 611-614.

Growth; metering; modern; museum; primary; reliability; renovation; secondary; system; variable; anchor; controls; corrosion; BSS66, pp. 102-115.

Growth of cells; heat production; marine eggs; metabolism; microcalorimetry; Arbacia punctulata; calorimetry; cleavage of cells; development of cells; fertilization; 15151.

Growth rate; heat of fusion; lamella thickness; melting; comonomer concentration; copolymer; crystallization; defect energy; equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; 15561.

G/T; radio star; satellite communications; antenna gain; 15660.

G/T (system gain/system noise temperature); radio star; accuracy; antenna; calibration; Cassiopeia A; error analysis; flux density; ground station; NBSIR 75-822.

$\gamma$-transitions in $^{57}$Fe of $^{56}$Fe resonances; $E_\gamma = 7-70$ keV; natural iron target; nuclear reaction $^{56}$Fe (n,y); relative partial radiation widths; SP425, pp. 816-818.

Guide and installation procedures; steel conduit system; design specification; BSS66, pp. 120-121.

Gunfire noise; noise-induced hearing damage; noise of police firearms; damage risk criteria for impulse noise; 14793.

Guns; hearing damage; noise; standard apparatus; toys; children; consumer safety; NBSIR 74-619.

Gust factors; structural engineering; wind engineering; wind loads; accelerations; buffering; building codes; buildings; deflections; dynamic response; BSS74.

Gutzeit method; spectrophotometry; arsine; gas-burning; NBSIR 73-260.

Guys, antenna; processing parameters, pulsation; pultrusion; reinforced plastic rod; stress rupture of FRP rod; test methods, FRP rod; weatherability, FRP rod; composite materials; fiber-reinforced-plastic rod; glass-reinforced-polyester rod; NBSIR 74-557.

G-values; ion-molecule reactions; neopentane; proton transfer; radiolysis; free radical reactions; 14890.

Gypsum; building codes; construction materials; fire endurance ratings; fire tests; NBSIR 74-588.

Gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; testing; building composite; building material; conditioning; equilibration; NBSIR 75-767.

Gyromagnetic ratio; magnetic field; protons; solenoid; automated measurement systems; 14929.

Gyromagnetic ratio of the proton; fine structure constant; volt transfer; 14928.

H

Ho; solar chromosphere; spectral line formation; Ca ii; 15562.

Haag’s theorem; nuclear structure; quantum field theory; relativistic nuclear physics; axiomatic field theory; composite particles; 15695.

Hadamard inequality; positive definite; real part; eigenvalues; 15341.

Hadamard product; Hermitian; positive definite; spectrum; angular field of values; diagonal; diagonally dominant; field of values; Gersgorin; 15272.

Hadronic components of photons; high energy scattering; multiple scattering; neutrino-nucleus interactions; shadowing effects; diffractive production; diffractive scattering; Glauber model; Monogr. 139.

Hadronic structure; melosh transformation; meson spectroscopy; algebra of currents and quarks; constituent quarks; current quarks; 15073.

Hafnium; high-speed measurements; high temperatures; specific heat; thermodynamics; electrical resistivity; emittance; J.79A No. 2, 431-486 (1975).

Hafnium; ionization energies; Slater parameters; energy levels; 14814.

Hafnium; ions; spectra; tungsten; wavelengths; 15257.

Half lives; yields; $^{235}$U; $^{239}$Pu; decay heat; $\mathcal{E}_d$, $\mathcal{E}_y$; ENDF/B-IV; fission products; SP425, pp. 21-28.

Half-chair; melositol; mercuric acetate; phenyllosotriazole; p.m.r.; symmetrical; conformation; 15254.

Half-life measurement; isomeric decay; isotope $^{113}$In$^{m}$; radioactivity; rate of charge measurement; 4r pressure ionization chamber; 15078.

Half-lives; independent yields; mass spectrometry; cumulative yields; delayed-neutrons; fission products; SP425, pp. 401-404.

Half-lives of U-233, U-234, Pu-239; mean energy of fission neutron spectrum; neutron cross-sections; neutron data evaluation; U-233, U-235, Pu-239, Pu-241; Westcott g-factors; Cf-252 spontaneous fission neutron yield; SP425, pp. 286-292.

Halocarbon ions; ion cyclotron resonance; ion-molecule reaction; rate constants; carbonyl compound; four-center reactions; 15384.

Halogens; photoionization; atomic spectra; chlorine; 14753.

Hamiltonian point characteristic; limiting apertures; unit magnification; aberrations; aspheric optics; ellipsoidal reflector; Fermat’s principle; 14840.

Handbook article; liquids; viscosity; 15461.

Handbook; thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; solid hydrogen; tables; computer programs; gaseous hydrogen; graphs; 15382.

Handgun detection; metal detector; performance standard; security; weapon detection; 15306.

Handling; hydrogen; oxidizers; oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; 15154.

Hard particles; wear-resistance; wear-tests; cermet; chromium plating; codeposition, composite coating; dispersion plating; electroplating; 15317.

Hard tissue; rat skin; soft tissue; bone; collagen; grafting modification of collagenous surfaces; 15531.

Hard tooth tissues; metal ions; mordant; adhesive bonding; chelation; comonomers; coupling agents; dental materials; 15161.
Hardness; indentation; residual stress; stress analysis; wear rate; abrasion; brittle solids; brittle surfaces; chipping; fracture; *NBSIR 75-659.*

Hardness; internal stress; polyvinyl chloride; thermal mechanical analysis (TMA); thermal properties; thermogravimetric analysis (TGA); thermoplastic pipe; chlorinated polyvinyl chloride; *NBSIR 74-610.*

Hardness; PB; polybutene; polyvinyl chloride; PVC; residual stress; thermoplastic piping; ABS; coefficient of expansion; CPVC; glass transition temperature; *NBSIR 74-629.*

Hardware monitor; measurement tools; performance measurement; computer architecture; functional evaluation; *SP406,* pp. 75-78.

Hardware monitoring; monitoring register; software monitoring; system reliability; *SP406,* pp. 87-96.

Hardware monitors; measurement; performance; software monitors; throughput; computer; evaluation; *SP406,* pp. 99-102.

Hardware monitors; modeling; computer measurement and evaluation; computer science curriculum; *SP406,* pp. 159-163.

Hardware monitors; performance evaluation of secure computer systems; security; data transmission; security; file access; security; identification (password); security; input and output processing; security software; software monitors; computer performance; *SP406,* pp. 83-86.

Hardware monitors; performance evaluation; performance measurement; software monitors; accounting systems; *SP406,* pp. 113-117.

Harmonic distortion; low frequency; pickup; vibration; vibration exciter; accelerometer; calibration; 15567.

Harmony; hues; illumination; light; personal uses; relationships; uses; color; environment; experimenting with; 15568.

High tables; polynomial search; pseudo-random numbers; scatter storage; collision resolution; 15669.

Hauser-Feshbach; inelastic-scattering; measurements; MeV range 2 to 4.5; neutrons; time-of-flight; 15670.

Hazard; high voltage; sharp edges; sharp points; threshold; consumer products; electrical breakdown; gases; *NBSIR 75-908.*

Hazard; metric conversion; piezoelectric accelerometers; sun; buildings; computer codes; computer networks; computers; copyrights; energy; epoxies; *DIMINBS 59,* No. 4, 73-96 (1975).

Hazard analysis; hazard quantification; clothing flammability; fabric flammability; fire hazard; fire investigation; flammability testing; 15635.

Hazard assessment; toxicity; bioassay; combustion products; fire; 15628.

Hazard level fields; power density meter calibration; TEM transmission cells; *NBSIR 75-804.*

Hazard quantification; clothing flammability; fabric flammability; fire hazard; fire investigation; flammability testing; hazard analysis; 15635.

Hazardous chemicals; leap second; playground equipment safety; scientific data; silicon devices; time; energy conservation; fire; gasoline consumption; glass SRM; *DIMINBS 59,* No. 2, 25-48 (1975).

Hazards; hospital; natural disasters; seismic; structural engineering; building; codes; earthquake damage; earthquakes; 14759.

Hazards; obstruction; riding toys; stairway; static stability; test weight; tilt angle; toy testing; abuse testing; dynamic stability; *NBSIR 74-632.*

HBS; infrared; molecular spectra; spectra; thiobarine; absorption spectra; force constants; 15000.

HCN; HCN; Kohoutek; OH; radio; search; comet; 15626.

HCO; HCO; laser magnetic resonance; OH; pollution; CH; free radical; 15680.

HgCN; Kohoutek; OH; radio; search; comet; HCN; 15626.

He; inelastic; Ne; Ar; atoms; autoionizing; cross sections; electron impact; excitation; 15586.

He emission; photospheres; stellar; chromospheres; stellar; 15487.

Healing; indentations; microcracking; moire patterns; brittle solids; dislocation networks; electron microscopy; 15400.

Healing; indentations; microcracking; moire patterns; brittle solids; dislocation networks; electron microscopy; *NBSIR 75-658.*

Health; product safety; research; science and technology; standards; annual report; computer; energy; environment; *SP418.*

Health care; hospitals; measurement science; meter; metric; pulses; robot; sound; construction; dry weight; ears; energy; *DIMINBS 59,* No. 10, 218-239 (1975).

Hearing damage; noise; standard apparatus; toys; children; consumer safety; guns; *NBSIR 74-619.*

Hearing impairment; hearing survey; noise emission; speech communication interference; consumer products; criteria for safety standards; federal regulations; *NBSIR 74-606.*

Hearing loss; lawn mowers; noise emission; noise pollution; product safety; emergency messages; *NBSIR 74-608.*

Hearing survey; noise emission; speech communication interference; consumer products; criteria for safety standards; federal regulations; hearing impairment; *NBSIR 74-606.*

Heart; heat pump; laser; ozon; radiometer; stabilizer; toy safety; computer security; energy efficiency; electrolytalysis; fluorides; *DIMINBS 59,* No. 11, 241-264 (1975).

Heat; isomerization; secondary standard; combustion; enthalpy; formation; J.79A No. 3, 481-486 (1975).

Heat; mustard gas; combustion; dichloroethyl sulfide; enthalpy; formation; J.79A No. 5, 634-638 (1975).

Heat; nicotinic acid; calorimetry; combustion; creatinine; enthalpy; formation; J.79A No. 2, 425-430 (1975).

Heat; secondary standard; sulfur compound; thionation; combustion; enthalpy; formation; J.79A No. 4, 561-564 (1975).

Heat; secondary standard; thermochemical standard; combustion; enthalpy; formation; J.79A No. 3, 487-490 (1975).

Heat balance; heat transfer; temperature-time curve; fire resistance ratings; fire test furnace; *NBSIR 75-794.*

Heat capacity; heat of formation; thermochemical tables; critically evaluated data; enthalpy; entropy; equilibrium constant of formation; free energy of formation; Gibbs energy function; J. Phys. Chem. Ref. Data 4, No. 1, 1-176 (1975).

Heat capacity; heat of fusion; heat of vaporization; thermodynamic properties; triple point; bromobenzene; calorimetry; enthalpy; entropy; Gibbs energy; J.79A No. 5, 619-628 (1975).

Heat capacity; heats of vaporization; oligomers; rates; alkanes; esters; 15357.

Heat capacity; high-speed measurements; high temperature; thermal emittance; thermodynamics; electrical resistivity; graphite; 15108.

Heat capacity; high-speed measurements; high temperature; thermodynamics; uranium dioxide; capacitor discharges; *NBSIR 75-793.*

Heat capacity; ideal gas thermodynamic properties; internal rotation; internal rotation barrier height; propylene; torsional frequency; critically evaluated data; enthalpy; enthalpy function; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).

Heat capacity; linear polyethylene; polyethylene; thermodynamic properties; adiabatic calorimetry; branched polyethylene; calorimetry; cryogenic temperature; J.79A No. 2, 437-441 (1975).

Heat conduction; human tissue; thermal impact; thermal potential; thermal safety; contact burn; 15050.

Heat detector; optical radiation sensor; poling; polymer; polyvinyl fluoride; polyvinylidene fluoride; pyroelectric effect; relative spectral response; ultraviolet detector; 15183.

Heat diffusion; weakly absorbing materials; absorption coefficients; barothermal behavior; Green’s function; J.79A No. 5, 639-648 (1975).
Heat distribution; heating; high temperature water; hot water; insulation; piping; steam; underground piping; BSS66, pp. 52-59.

Heat exchanger; Kapitza resistance; liquid helium; powder; silver; copper alloy; copper; cryogenics; dilution refrigerator; 15238.

Heat flow analysis; heating and cooling loads; temperature predictions; thermal analysis; thermostat setback; transient heat losses; air leakage measurement; building heat transfer; computer programs; dynamic thermal performance; BSS57.

Heat flux; oxygen depletion; particulate mass; scanning electron microscope; smoke; carbon monoxide; electrostatic precipitation; NBSIR 75-901.

Heat loss from buildings; heat transfer; sound transmission loss; thermal resistance; thermal transmittance; windows; acoustics; air infiltration; air leakage; architectural acoustics; building acoustics; doors; energy conservation; BSS77.

Heat measurements: hexokinase; metabolic processes; microcalorimetry; thermochemistry; thermodynamics; adenosine-5'-triphosphate; biochemical enzyme catalyzed reactions; glucose: 15174.

Heat of combustion; rate of combustion; calorimeter; fabrics; flammability: 15103.

Heat of formation; thermochemical tables; critically evaluated data; enthalpy; entropy; equilibrium constant of formation; free energy of formation; Gibbs energy function; heat capacity; J. Phys. Chem. Ref. Data 4, No. 1, 1-176 (1975).

Heat of fusion; heat of vaporization; thermodynamic properties, triple point; bromobenzene; calorimetry; enthalpy; entropy; Gibbs energy; heat capacity; J. Phys. Chem. Ref. Data 4, No. 5, 619-628 (1975).

Heat of fusion; lamella thickness; melting; comonomer concentration; copolymer; crystallization; defect energy; equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; growth rate: 15561.

Heat of isomerization; ideal gas thermodynamic properties; isobutane; n-butane; potential barrier to internal rotation; equilibrium compositions; J. Phys. Chem. Ref. Data 4, No. 4, 859-870 (1975).

Heat of mixing; liquid-vapor equilibria; nitrogen-methane system; binary mixture; excess Gibbs energy; experimental phase equilibria data; 14870.

Heat of vaporization; thermodynamic properties, triple point; bromobenzene; calorimetry; enthalpy; entropy; Gibbs energy; heat capacity; heat of fusion; J. Phys. Chem. Ref. Data 4, No. 5, 619-628 (1975).

Heat pipe; inner shell excitation; shape resonance; two-electron excitations; absorption spectrum; bariyum; 14989.

Heat production; marine eggs; metabolism; microcalorimetry; Arbacia punctulata; calorimetry; cleavage of cells; development of cells; fertilization; growth of cells; 15151.

Heat pump; laser; ozone; radiometer; stabilizer; toy safety; computer security; energy efficiency; electrocatalysis; fluorides; heart; DIM/NBS 59, No. 11, 241-264 (1975).

Heat pump system; heat recovery and conservation system; nuclear fuel; on-site power generation system; petroleum problems; central plant system; coal gasification; BSS66, pp. 5-8.

Heat recovery; total energy systems; utilities for housing; utility system performance; air conditioning; air pollution; central utility systems; data acquisition system; efficiencies; electrical power; energy conservation; energy costs; fuel utilization; NBSIR 75-711.

Heat recovery and conservation system; nuclear fuel; on-site power generation system; petroleum problems; central plant system; coal gasification; heat pump system; BSS66, pp. 5-8.

Heat release; ignition; smoke; thermal radiation; upholstery; waste receptacle; buildings; combustibility; fire intensity; flames; furnishings; NBSIR 75-679.

Heat release; interior linings; material ignitability; performance criteria; room fires; smoke; wood crib; buildings; fire growth; flame spread; TN879.

Heat release ignition; mattress; smoke; toxic gases; fire retardant; fire test; NBSIR 73-177.

Heat release rate; ignition; flame spread; floor covering material; 15269.

Heat release rate; ignition temperature; rigid urethane foam; smoke; dibromotetrafluoroethane; fire tests; flame spread index; 15615.

Heat switches; polarization; refrigeration; cryogenics; dielectric; electrocaloric: 15491.

Heat transfer; helium; nucleate boiling; subcritical; supercritical; critical heat flux; film boiling; forced convection: 14930.

Heat transfer; helium; supercritical; correlation; forced convection: 14962.

Heat transfer; helium 3; helium 4; Kapitza resistance; liquid helium; powder; silver; cryogenics; dilution refrigerator; 15219.

Heat transfer; helium 3-helix 4; Kapitza resistance; phonon-electron interaction; phonon-quasiparticle interaction; powder; sintering; copper; 14749.

Heat transfer; hemisphere; horizontal cylinder; liquid deuterium, liquid hydrogen, liquid nitrogen; natural convection; sphere; vertical cylinder; cryogenic; NBSIR 75-807.

Heat transfer; ignition; apparel; burn injury; fabric; fire modeling; flame spread; flammability; flammability testing; garments; 14794.

Heat transfer; internal energy measurement; isoperibol calorimeters; measurement theory; calorimetry; energy equivalents; energy measurement; 15102.

Heat transfer; liquid hydrogen; slush hydrogen; boiling heat transfer; convective heat transfer; 14869.

Heat transfer; multiple pipe system; underground pipe; chilled water pipe; earth temperature; BSS66, pp. 18-41.

Heat transfer; sound transmission loss; thermal resistance; thermal transmittance; windows; acoustics; air infiltration; air leakage; architectural acoustics; building acoustics; doors; energy conservation; heat loss from buildings; BSS77.

Heat transfer; temperature-time curve; fire resistance ratings; fire test furnace; heat balance; NBSIR 75-794.

Heat transfer to helium II; interfacial thermal resistance; Kapitza conductance of copper; Kapitza conductance of indium; Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; (100) surface of copper; NBSIR 75-812.

Heat ventilating and air conditioning systems; high-rise buildings; optical density; steel; terminal units; aluminum; ducts; fire tests; flexible connectors; furnace pressures; glass fiber; NBSIR 75-673.

Heat-gun; lead paint; materials evaluation; performance specification; rehabilitation; renovation; abatement; detection; 15591.

Heating; high temperature water; hot water; insulation; piping; steam; underground piping; heat distribution; BSS66, pp. 52-59.

Heating and cooling load calculation; building design; building energy analysis; energy conservation options; energy design optimization; BSS78.

Heating and cooling loads; temperature predictions; thermal analysis; thermostat setback; transient heat flows; air leakage measurement; building heat transfer; computer programs; dynamic thermal performance; heat flow analysis; BSS57.

Heat-pipe ovens; N2O; BaO; chemical reactions; chemiluminescent; electronic spectra; 15666.

Heats of vaporization; oligomers; rates; alkanes; esters; heat capacity; 15357.

Heavy actinide burnup; multigroup cross sections; neutron reactions; heavy actinides; reactor production experiments; SP425, pp. 224-228.
Heavy noble gases; helium; linear model; methane; NBS equation; scaling laws; statistical analysis; steam; universality; air constituents; critical region parameters; ethylene; 15601.

Heavy particles; OER; radiotherapy; absorbed dose; cell survival; SP425, pp. 533-539.

Helical flow; pressure differential during swirling flow; swirling flow; decay of swirling flow; 15080.

Helium; hydrodynamics; one dimensional flow; single phase fluid; thermodynamics; transposed critical line; 15047.

Helium; ionization; theoretical study; electron impact; 14764.

Helium; linear model; methane; NBS equation; scaling laws; statistical analysis; steam; universality; air constituents; critical region parameters; ethylene; heavy noble gases; 15601.

Helium; migration; oxygen; proton; range; scattering; depth; deuteron; diffusion; elastic; SP425, pp. 488-491.

Helium; neutron; benchmark; cross sections; SP425, pp. 375-377.

Helium; nickel; neutron; spectrum; alpha particles; cross section; SP425, pp. 810-812.

Helium; nucleate boiling; subcritical; supercritical; critical heat flux; film boiling; forced convection; heat transfer; 14930.

Helium; power; superconductivity; cryogenics; electricity; energy; 14872.

Helium; pressure; enthalpy; entropy; equations of state; 14783.

Helium; supercritical; correlation; forced convection; heat transfer; 14962.

Helium impurities; microwave cavities; negative differential flow resistance; pressure measurement; system dynamics; thermometers; cooling system; cryogenics; helium-cooled electrical leads; NBSIR 75-823.

Helium pump; power transmission; refrigeration; superconducting cables; cryogenics; 15455.

Helium 3; helium 4; Kapitza resistance; liquid helium; powder; silver; cryogenics; dilution refrigerator; heat transfer; 15219.

Helium 3-helium 4; Kapitza resistance; phonon-electron interaction; phonon-quasiparticle interaction; powder; sintering; copper; heat transfer; 14749.

Helium 4; Kapitza resistance; liquid helium; powder; silver; cryogenics; dilution refrigerator; heat transfer; helium 3; 15219.

Helium-carbon monoxide system; helium-nitrous oxide system; Henry's constants; binary mixture; experimental vapor-liquid equilibria; 15636.

Helium-carbon monoxide system; helium-nitrous oxide system; Henry's law constants; two phase chocking; two phase flow; binary mixture; cavitating venturi; enhancement factors; experimental vapor-liquid equilibria; flow induced desorption; NBSIR 75-806.

Helium-cooled electrical leads; helium impurities; microwave cavities; negative differential flow resistance; pressure measurement; system dynamics; thermometers; cooling system; cryogenics; NBSIR 75-823.

Helium-nitrous oxide system; Henry's constants; binary mixture; experimental vapor-liquid equilibria; helium-carbon monoxide system; 15636.

Helium-nitrous oxide system; Henry's constants; binary mixture; experimental vapor-liquid equilibria; helium-carbon monoxide system; 15636.

Helium-nitrous oxide system; Henry's law constants; two phase chocking; two phase flow; binary mixture; cavitating venturi; enhancement factors; experimental vapor-liquid equilibria; flow induced desorption; helium-carbon monoxide system; NBSIR 75-806.

Helium-3; monopole state; multipole decomposition; zero range approximation; continuum; electron scattering; 15608.

Hematology; microbiology; sampling; chemistry; clinical laboratory capability; critique; 15244.

Hematology; microbiology; sampling; chemistry; clinical laboratory capability; critique; 15273.

Hemisphere; horizontal cylinder; liquid deuterium; liquid hydrogen; liquid nitrogen; natural convection; sphere; vertical cylinder; cryogenic; heat transfer; NBSIR 75-807.

Henry's constants; binary mixture; experimental vapor-liquid equilibria; helium-carbon monoxide system; helium-nitrous oxide system; 15636.

Henry's constants; liquid-vapor phase equilibria; methane; nitrogen; 15519.

Henry's law constants; two phase chocking; two phase flow; binary mixture; cavitating venturi; enhancement factors; experimental vapor-liquid equilibria; flow induced desorption; helium-carbon monoxide system; helium-nitrous oxide system; NBSIR 75-806.

Hermeticity; hydrogen chloride gas; image shearing eyepiece; laser interferometry; measurement methods; microelectronics; micrometrolgy; MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; SP400-17.

Hermeticity; incremental sheet resistance; measurement methods; microelectronics; micrometrolgy; MOS devices; oxide films; resistivity; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; SP400-12.

Hermeticity; measurement methods; microelectronics; micrometrolgy; MOS devices; oxide films; photomasks; photosist; resistivity; scanning electron microscope; semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; SP400-8.

Hermitian; positive definite; spectrum; angular field of values; diagonal; diagonally dominant; field of values; Gersgorin; Hadamard product; 15272.

Hermitian matrix; normal matrix; positive definite; field of values; 15172.

Hertzian; indentation; strength; brittle solids; ceramic surfaces; cracks; degradation; fracture; NBSIR 75-664.

Hertzian cracks; indentation fracture; median vents; penny crack; contact fracture; degradation; NBSIR 75-730.

Hexakis(imidazole)cobalt(t11) nitrate; imidazole, neutron; structure; x ray; cobalt; complexes; 15280.

Hexokinase; metabolic processes; micrometrolgy; thermochecmy; thermodynamics; adenosine-5'-triphosphate; biochemistry; enzyme catalyzed reactions; glucose; heat measurements; 15174.

HF-air mixtures; ion-specific electrode; fluoride analysis; gas blending; NBSIR 73-261.

Hg; crossed beams; cross section; electron impact; excitation; 15005.

Hg; isotropic Knight shift; Knight shift; Korringa product; nuclear magnetic resonance; spin lattice relaxation; anisotropic Knight shift; Cd; 14746.

Hierarchical control; manipulator control; cerebellar model; control theory; data storage; distribution memory; 15287.

High amplitude; internal rotation; PEs; pseudorotation; Raman; vibration; 15370.

High current; operational amplifier; phase angle; resistance; transformer-ratio-arm; audio-frequency; bridge; four-terminal resistance; 14877.

High energy neutron; impurity conduction; reciprocal Hall coefficient; transition regime; 60Co gamma; activation energy; compensation; epitaxial gallium arsenide; 15575.

High energy scattering; multiple scattering; neutrino-nucleus interactions; shadowing effects; diffractive production; diffractive scattering; Glauber model; hadronic components of photons; Monogr. 139.

High frequency broadcasts; standard; time; dissemination; frequency; TN668.

High frequency probe assembly; integrated circuit transistors; parasitic element; S-parameters; TN663.

High plutonium productivity; moderation-jacket in blanket; thermal boosts; SP425, pp. 422-425.

High power laser material; beam splitter; CO2 laser; 14965.
Hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities; conservation; conversion; cost; cryogenics; economics; embrittance; energy; SP419.

Hydrogen; ion dynamics; plasma; Stark broadening; Balmer; 15064.

Hydrogen; leakage; methane; safety; vents; automobile; detection; dispersion; explosion; fire; TN666.

Hydrogen; line strength; oscillator strength; relativistic corrections; spectroscopy; Dirac theory; J.79A No. 5, 629-633 (1975).

Hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; solid hydrogen; tables; computer programs; gaseous hydrogen; graphs; handbook thermophysical properties; 15382.

Hydrogen; monitor; neutron; proportional; counter; flux; SP425. pp. 78-80.

Hydrogen; negative ion; plasma; resonance; vacuum ultraviolet; arc; 15652.

Hydrogen; oxidizers; oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; handling; 15154.

Hydrogen; plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering; Balmer lines; four dimensional rotation group; 15009.

Hydrogen; plasma; radiometry; spectral radiance; vacuum ultraviolet; wall-stabilized; arc; calibrations; 15291.

Hydrogen; properties of fluids; specific heat; velocity of sound; density; enthalpy; entropy; 15022.

Hydrogen; research and development; cryogenic; energy; 14936.

Hydrogen arc; line broadening; Lyman alpha; optically thin; Stark profile; high temperature; 15413.

Hydrogen atom; radiation chemistry; rates; aqueous solution; chemical kinetics; data compilation; NSRDS-NBS5.

Hydrogen bonding; liquid chromatography; adsorption; gel permeation chromatography; 15088.

Hydrogen bonding; monocalcium phosphate; monohydrate; neutron diffraction; phosphate; water molecule; hydrate; 14864.

Hydrogen bonds; hydrogen peroxide; neutron diffraction; structure refinement; thermal motion; crystal structure; deuterium oxide; 15271.

Hydrogen bonds; hydroxylammonium; neutron diffraction; perchlorates; thermal motion; torsional oscillation; constrained refinement; hindered rotation; 14853.

Hydrogen bonds; neutron diffraction; sulfone; alkyl sulfone; crystal structures; dimethyl sulfone dimine; 15383.

Hydrogen chloride gas; image shearing eyepiece; laser interferometry; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; semiconductor devices; SP400-17.

Hydrogen continuum; primary standard; radiometry; vacuum ultraviolet; wall-stabilized arc; blackbody calibrations; 15412.

Hydrogen cyanide; infrared; molecular term values; spectra; spectroscopy; high temperature; 15436.

Hydrogen cyanide; ion selective electrode; occupational safety; gas blending system; NBSIR 73-257.

Hydrogen diffusion; neutron scattering; quasielastic scattering; resonance time; tantalum hydrides; vibrational amplitude; activation energy; 15264.

Hydrogen economy; LNG; superconducting electrical equipment and instrumentation; coal gasification; cryogenics; energy crisis; 15654.

Hydrogen energy systems; hydrogen experts; hydrogen fuel; hydrogen production; hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; hydrogen transportation; accident investigation; 15515.

Hydrogen experts; hydrogen fuel; hydrogen production; hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; hydrogen transportation; accident investigation; hydrogen energy systems; 15515.

Hydrogen fluoride; industrial hygiene; sodium acetate; sorber; solid; work atmosphere; air analysis; air sampling; gas analysis; NBSIR 74-581.

Hydrogen fluoride; phosgene; arsenic; calibration of devices; gas-blending systems; 15592.

Hydrogen fuel; hydrogen production; hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; hydrogen transportation; accident investigation; hydrogen energy systems; hydrogen experts; 15515.

Hydrogen fuel; magnetohydrodynamics; metric changeover; safety; air conditioners; appliance; bone cement; computer; energy; energy labels; fire fatalities; D/M/NBS 59, No. 6, 121-144 (1975).

Hydrogen iodide; n-butane; radical scavenging; vacuum ultraviolet photolysis; alkane; electronically excited molecule; 14762.

Hydrogen peroxide; neutron diffraction; structure refinement; thermal motion; crystal structure; deuterium peroxide; hydrogen bonds; 15271.

Hydrogen plasma; ion motion; line shapes; reduced mass; Stark broadening; Balmer lines; 15463.

Hydrogen production; hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; hydrogen transportation; accident investigation; hydrogen energy systems; hydrogen experts; hydrogen fuel; 15515.

Hydrogen properties; LNG/SNG; production; safety; storage; cryogenic technology; data; energy fuel; hydrogen; TN664.

Hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; hydrogen transportation; accident investigation; hydrogen energy systems; hydrogen experts; hydrogen fuel; 15515.

Hydrogen safety; hydrogen systems; hydrogen technology; hydrogen transportation; accident investigation; hydrogen energy systems; hydrogen experts; hydrogen fuel; 15515.

Hydrogen standards; hydrogen storage device; methane stabilized helium-neon lasers; noise studies; quartz crystal oscillators; quartz crystal resonators; accuracy; atomic clocks; cesium standards; 14846.

Hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; time standards; application of standards; basic standards; cesium standards; frequency accuracy; frequency stability; frequency standards; 14830.

Hydrogen storage device; methane stabilized helium-neon lasers; noise studies; quartz crystal oscillators; quartz crystal resonators; accuracy; atomic clocks; cesium standards; hydrogen standards; 14846.

Hydrogen systems; hydrogen technology; hydrogen transportation; accident investigation; hydrogen energy systems; hydrogen experts; hydrogen fuel; hydrogen production; hydrogen properties experts; hydrogen safety; 15515.

Hydrogen technology; hydrogen transportation; accident investigation; hydrogen energy systems; hydrogen experts; hydrogen fuel; hydrogen production; hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; 15515.

Hydrogen transportation; accident investigation; hydrogen energy systems; hydrogen experts; hydrogen fuel; hydrogen production; hydrogen properties experts; hydrogen safety; hydrogen systems; hydrogen technology; 15515.

Hydrogen utilization; power generation; synthetic fuels; energy storage; 15416.

465
Hydroperoxyl; microwave; HO₂; 15637.
Hydrophone; piezoelectric; polymers; polyvinylidene fluoride; pyroelectric; radiometer; transducers; electrets; NBSIR 75-760.
Hydrostatic pressures; ruby; calibration; diamond cell; fluorescence; high pressure; 15085.
Hydrosulfides; liberation; neutron scattering; phase transition; quasi-elastic scattering; 15506.
Hydroxyapatite; ion activity product; solubility; tooth enamel; dental caries; 15535.
Hydroxyapatite; ion exchange; nucleation; reaction rate; surface; adsorption; 15019.
Hydroxyapatite; nonstoichiometry; solid-to-solution ratio; solubility; surface chemistry; 15195.
Hydroxyapatite; tooth enamel; dicalcium phosphate dihydrate; fluorapatite; fluoride; 14909.
Hydroxyl radical; potential curve; self-consistent-field; dipole moment function; dissociation energy; electronic structure; 14805.
Hydroxylammonium; neutron diffusion; perchlorates; thermal motion; torsional oscillation; constrained refinement; hindered rotation; hydrogen bonds; 14853.
Hygrometer; microwave refractometer; humidity; 15228.
Hyperbolic function; infinite integrals; modified Bessel functions; noise theory; signal statistics; trigonometric functions; Bessel functions; complete elliptic integrals; J. 79B No. 3 and 4, 137-170 (1975).
Hyperelasticity; rubbery materials; strain-energy function; volume-extension; compressibility; elasticity; finite deformation; 15015.
Hyperfine fields; magnetism; Mn; Mössbauer effect; Ni; Sb; Pd; alloys; Cu; 15016.
H₂S; sulfur Kβ emission and K-absorption spectra; sulfur K shell binding energy; x-ray spectra; 14993.

I
Ideal gas thermodynamic functions; reduced and principal moments of inertia; standard heat of formation; structural parameters; torsional mode; vibrational fundamentals; barrier height to internal rotation; J. Phys. Chem. Ref. Data 4, No. 2, 441-456 (1975).
Ideal gas thermodynamic properties; internal rotation; internal rotation barrier height; propylene; torsional frequency; critically evaluated data; enthalpy; enthalpy function; enthalpy of formation; entropy; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).
Ideal gas thermodynamic properties; isobutane; n-butane; potential barrier to internal rotation; equilibrium compositions; heat of isomerization; J. Phys. Chem. Ref. Data 4, No. 4, 859-870 (1975).
Identification; minerals; optical properties; twinning; unit cell dimensions; cleavage; compilation; crystal; crystal habit; crystal space group; crystal structure types; density; determination; 15084.
Identification (faces); image quality; Modulation Transfer Functions; acutance; 15316.
Identification of compounds by refractive index; micro determination of refractive index; microscope for accurate determination of refractive index; multiple prisms; 15098.
Ignition; apparel; burn injury; fabric; fire modeling; flame spread; flammability; flammability testing; garments; heat transfer; 14794.
Ignition; flame spread; floor covering material; heat release rate; 15269.
Ignition; flame spread; floor covering materials; 15440.
Ignition; ignition boundary; solid fuel; 15227.
Ignition; smoke; thermal radiation; upholstery; waste receptacles; buildings; combustibility; fire intensity; flames; furnishings; heat release; NBSIR 75-679.
Ignition boundary; solid fuel; ignition; 15227.
Ignition sources; injury disposition; accidents; burn injuries; burn severity; explosives; fabric fires; FFACS; flammable liquids; gas; gasoline; ignition-causing activities; NBSIR 75-784.
Ignition sources; volatile flammable liquids; volatile flammable liquids incidents; accidents; FFACS; gasoline; gasoline containers; gasoline incidents; gasoline-related fires; ignition-causing activities; TN850.
Ignition temperature; rigid urethane foam; smoke; dibromotetrafluoroethane; fire tests; flame spread index; heat release rate; 15615.
Ignition-causing activities; ignition sources; volatile flammable liquids; volatile flammable liquids incidents; accidents; FFACS; gasoline; gasoline containers; gasoline incidents; gasoline-related fires; TN850.
Ignition-causing activities; ignition sources; injury disposition; accidents; burn injuries; burn severity; explosives; fabric fires; FFACS; flammable liquids; gas; gasoline; NBSIR 75-784.
1-layer; reactivity-coefficients; advanced-fuels; DD; DLI; fusion-dynamics; SP425, pp. 683-687.
Illumination; interdisciplinary approach; physiology; psychology; acoustics; human factors; human occupancy; 15364.
Illumination; light; personal uses; relationships; uses; color; environment; experimenting with; harmony; hues; C156.
Limecrete concrete; Monte Carlo; neutron attenuation; time of flight; SP425, pp. 409-414.
ILRR program; evaluated half-lives; evaluated γ-ray intensities; SP425, pp. 324-327.
Image contrast; monoenergetic x-ray beams; optimum radiographic systems; transmission radiography; x-ray image signals; x-ray scatter; 15276.
Image enhancement; imaging methods; nondestructive evaluation; radiography; serviceability; dimensional measurement; 15148.
Image potential shifts; polarization energy shift; relaxation energies; chemisorption; 14975.
Image quality; ink films; lubricity; film thickness; film uniformity; fingerprint impressions; fingerprint readers; NBSIR 74-627.
Image quality; Modulation Transfer Functions; acutance; identification (faces); 15316.
Image quality; neutron converters; neutron radiography; neutron scintillator; thermal neutron detection; x-radiographic paper; 15549.
Image shearing eyepiece; laser interferometry; measurement methods; microelectronics; micrometry; MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; semiconductor devices; SP400-17.
Imaging methods; nondestructive evaluation; radiography; serviceability; dimensional measurement; image enhancement; 15148.
Imidazole; neutron; structure; x ray; cobalt; complexes; hexakis(imidazole)cobalt(n) nitrate; 15280.
Immersion testing; longitudinal waves; metallurgical variables; nondestructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics; aluminum ultrasonic standards; ASTM-type reference blocks; fabrication of reference blocks; NBSIR 75-685.
Impact; interface; piezoelectric polymer; polymer; pressure; pressure transducer; theory; transducer; calibration; construction; NBSIR 75-740.
Impact; objectives; output; performance measurement; production indices; production measurement; TN890.
Impact collisions; plastic deformation; static crush tests; strain measurements; structural components; test procedures; automobile side impact; crush characteristics; displacement measurements; door structure; drop tests; dynamic crush tests; NBSIR 74-605.

Impact damage; strength; thermal shock; time to failure; ceramics; fracture; fracture mechanics; glass; j14886.

Impact noise; instrumentation; mechanical impedance; noise; building acoustics; force platforms; 15462.

Impact noise; noise emission; reverberation rooms; sound transmission; acoustical measurements; acoustics; 15301.

Impact tests; light bases; optical cover assembly; photometric measurements; static tests; airport approach and threshold lights; glass prism; NBSIR 75-647.

Impedance; laser parameters noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM metrology; field strength; NBSIR 75-818.

Impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; reflection coefficient; reflectometer; self-calibration; six-ports; vector voltmeter; voltage; admittance; automated precision measurements; correlator; current; TN673.

Impedance; noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; NBSIR 74-395.

Impenetrance; intelligence; power; science; technology; artifacts; balance; computer; 15199.

Implant characterization; biocompatibility; ceramic implants; histological evaluation; SP415. pp. 37-44.

Implantable electrodes; metallic implants; nerve prosthesis; synthetic implants; thromboresistance; biocompatibility; biomaterials; blood protein; ceramic implants; SP415.

Implantable hybrid cells; pacemakers; palladium black; platinum black; polarization; porous electrodes; SP415. pp. 55-61.

Implications for fusion-fission blanket calculations; spectra from 10 keV to 15 MeV compared with calculations; 238U pulsed sphere measurements; SP425. pp. 704-707.

Implicit model; least-squares analysis; transformed weights; 14797.

Imprisonment; lifetime; mean life; resonance radiation; transition probability; U 1; uranium; delayed coincidence; f value; 15058.

Imprisonment; lifetime; mean life; resonance radiation; silver; transition probability; Ag t; f-value; 15120.

Improper integrals; integrals; numerical analysis; numerical integration; numerical quadrature; Riemann integral; singularities; 15180.

Improved limits of detection; iodine-129; isotopic separation; neutron activation; 15456.

Improved methodologies; particulates; quartz; self-generated atmosphere; calibration filters; chrysotile; environmental health; 15466.

Impulse; impulse generator calibration; impulse noise; impulse noise generator; NBSIR 73-343.

Impulse generator; picosecond; spectrum; spectrum amplitude; step recovery diode; 15658.

Impulse generator calibration; impulse noise; impulse noise generator; impulse; NBSIR 73-343.

Impulse measurement; Kerr effect; laser systems; calibration; electrical measurement; electro-optics; high voltage measurement; 15059.

Impulse noise; impulse noise generator; impulse; impulse generator calibration; NBSIR 73-343.

Impulse noise generator; impulse; impulse generator calibration; impulse noise; NBSIR 73-343.

Impulse response; lens aberrations; optical transfer function; partial coherence; pupil function; wave-front shearing interferometry; 15396.

Impulse response; linear microdensitometry; microdensitometry; optics; slit imagery; transfer function; 15326.

Impulsive noise; magnetic field strength; measurement instrumentation; mine noise; spectral density; time-dependent spectral density; amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; NBSIR 74-391.

Impurity conduction; reciprocal Hall coefficient; transition regime; 236Co gamma; activation energy; compensation; epitaxial gallium arsenide; high energy neutron; 15575.

Impurity diffusion; interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; molybdenum; niobium; plutonium; potassium; praseodymium; promethium; rhenium; rubidium; sodium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Impurity diffusion; ion drift velocity; nonrandom diffusion; vacancy wind effect; correlation factor; diffusion; divacancy; driving force for diffusion; 15542.

Impurity redistribution; moving boundary problems; numerical methods; partial differential equations; semiconductor technology; diffusion equations; finite-difference techniques; 15175.

in vivo neutron-activation analysis; therapy; activation cross-section; bone mineral; SP425. pp. 520-526.

Incentives; innovation; life cycle costing; procurement; product testing; specifications; unsolicited proposals; certification programs; ETIP; NBSIR 75-716.

Incentives; innovation; procurement; product improvement; specifications; ETIP; NBSIR 75-696.

Incentives; innovation; procurement policy; regulatory policy; small business policy; technology; civilian R&D policy; ETIP; NBSIR 75-778.

Incident reports; loss; National Fire Data System; data; fire; fire incident system; fire service; 15632.

Incinerators; organic waste conversion; thermodynamic data for incinerators; waste utilization; fuel from waste; 15065.

Inclusions; nondestructive inspection; ceramics; failure prediction; fracture; 15401.

Inclusions in glass; Raman scattering; gas analysis; 15704.

Inclusions in glass; Raman spectroscopy of sulfur; sulfur identification; bubble content analysis; gas analysis; 15703.

Incoherent neutron scattering; point defects; diffuse neutron scattering; SP425. pp. 823-824.

Incoherent scattering function; photons; Rayleigh scattering; tabulations; x rays; atomic form factor; Compton scattering; cross sections; gamma rays; J. Phys. Chem. Ref. Data 4, No. 3, 471-538 (1975).

Incoupling mellow alloy; peritectic reaction; Sn-Cd alloys; structure; alloy; directional solidification; 14748.

Incremental costs and revenues; reverse commute bus service; Shirley Highway; transportation planning; bus-on-freeway operations; choice and captive riders; cost allocation formula; NBSIR 74-624.

Incremental sheet resistance; measurement methods; microelectronics; micrometry; MOS devices; oxide films; resistivity; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; SP400-12.

Indentation; residual stress; stress analysis; wear rate; abrasion; brittle solids; brittle surfaces; chipping; fracture; hardness; NBSIR 75-659.

Indentation; strength; brittle solids; ceramic surfaces; degradation; fracture; NBSIR 75-661.

Indentation; strength; brittle solids; ceramic surfaces; cracks; degradation; fracture; Hertzian; NBSIR 75-664.
Insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; TN672.

Insertion loss; masking noise; siren; sound power level; sound pressure level; automobile; destructive interference; directivity; emergency vehicle; 14958.

Insertion loss; microwaves; phase angle; ratio; six-port junction; vector voltmeter; voltage; attenuation; automation; detector; 15649.

In-service inspection; nondestructive testing; nuclear power; reactor components; electric utilities; hot cell inspection; 15118.

Inspection; liquefied petroleum gas; pressure; report form; temperature; temperature compensator; test; vapor meter; volume; bell prover; calibration; H117.

Inspection and testing; safety; architecture; building; building codes; building design; disaster mitigation; earthquakes; engineering; environmental hazards; housing; TN885.

Inspection of edges; laceration; safety; simulation; skin; skin cutting; synthetic materials; cutting; toys; cut; edges; hazardous; experimental studies; human tolerances; injury; injury thresholds; NBSIR 73-262.

Installation management; measurement; modeling; monitoring; operating systems; performance objectives; computer architecture; computer performance evaluation; SP406.

Instrument; measurement; oxides of nitrogen; sulfur dioxide; air pollution; 14939.

Instrumental broadening; line shapes; line shifts; pressure broadening; resonance broadening; Stark broadening; van der Waals broadening; atomic; SP366-2.

Instrumental development; scanning electron microscope; signal processing; contrast; electron beam instrumentation; electron probe microanalyzer; 15249.

Instrumental limitations; supercooling; theoretical model; thermal analysis; thermodynamic properties; differential scanning calorimetry (DSC); electronic and thermal coupling; 14824.

Instrumental neutron activation analysis; lyophilization; neutron activation analysis; preconcentration; radioactive tracers; river water; trace elements; tracers; water; freeze drying; 15376.

Instrumentation; instrumentation standards; standards; CAMAC; computer interfacing; control systems; 15041.

Instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities; conservation; conversion; cost; cryogenics; economics; embrittlement; energy; hydrogen; industrial; SP419.

Instrumentation; measurement methodologies; microphones; psychoacoustics; reverberation room; sound level meters; audiometric standards; building acoustics; community noise; earphones; environmental noise; 15502.

Instrumentation; mechanical impedance; noise; building acoustics; force platforms; impact noise; 15462.

Instrumentation; noise monitoring; outdoor noise; acoustics (sound); environmental acoustics; NBSIR 75-962.

Instrumentation; structural response; wind loads; buildings; deflections; TN873.

Instrumentation; luminescence measuring; luminescence measurement; phosphorescence measurement; fluorescence measurement; NBSIR 74-553.

Instrumentation standards; standards; CAMAC; computer interfacing; control systems; instrumentation; 15041.

Instruments; measurement; statistical surface parameters; surface finish; surface parameters; characterization; 15568.

Instruments; performance standard; specifications; test procedures; breath alcohol; 14778.

Instruments. fluid measurement; open channel flow measurement; pipe flow measurement; standards, flow measurement; flow measurement, water; SP421.

Insulated; molded; morpholine; prefabricated steel conduit; Qualified Products List; tieline; condensate return; epoxy; fiberglass reinforced plastic; filament-wound; BSS66. pp. 88-101.

Insulated underground piping; insulation; limitation of liability; "or equal" specifications; performance specifications; schematic diagrams; specifications; specification writer; cascade heater; BSS66, pp. 78-87.

Insulating fluids; Kerf effect; nitrobenzene; pulse measurements; space charge; automated measurements; dielectrics; dividers; electrical measurement; electric fields; electro-optics; high voltage measurements; NBSIR 75-774.

Insulating joints; nonconducting coating; sacrificial anodes; soil resistivity; cathodic protection; BSS66, pp. 116-119.

Insulation; building economics; consumer information; energy conservation; home economics; home improvements; CIS8.

Insulation; limitation of liability; "or equal" specifications; performance specifications; schematic diagrams; specifications; specification writer; cascade heater; insulated underground piping; BSS66, pp. 78-87.

Insulation; permafrost; seasonal frost; snow drifting; utilidors; ventilation; air leakage; Arctic; central heat distribution systems; construction materials; drainage; BSS66, pp. 122-135.

Insulation; piping; steam; underground piping; heat distribution; heating; high temperature water; hot water; BSS66, pp. 52-59.

Insulation; retrofitting; storm doors; storm windows; tax credit; vapor barriers; weatherstripping; caulks and sealants; clock thermostats; energy conservation; NBSIR 75-795.

Insulation of underground pipes; specifications for underground systems; corrosion of underground pipes; district heating; hot and chilled water systems; BSS66.

Insulator flashover; lightning protection; VLF antenna; voltage breakdown; air gap; electrical breakdown; NBSIR 75-731.

Integral cross section tests; iron; niobium; beryllium; carbon; SP425. pp. 169-172.

Integral data; sensitivities; uncertainties; adjustment; critical assemblies; cross sections; evaluation; SP425. pp. 405-408.

Integral experiments; nuclear data; PHENIX; FBR development; SP425. pp. 51-61.

Integral measurements; benchmarks; data testing; GCGR; SP425. pp. 464-468.

Integral measurements; neutron spectrum unfolding; NE-213 detector; nitrogen cross sections; concrete and steel shield; gamma-ray spectrum unfolding; SP425. pp. 161-164.

Integrals; numerical analysis; numerical integration; numerical quadrature; quadrature; Riemann integral; singularities; improper integrals; 15180.

Integrated circuit; signal processor; computer; detector-ray; discriminator; emitter-coupler; 15511.

Integrated circuit photomasks; photomask inspection; photomasks; photoplate quality; automated inspection of photomasks; critical dimension determination; defects; detection of visual defects; 15039.

Integrated circuit transistors; parasitic element; S-parameters; high frequency probe assembly; TN663.

Integrated circuits; microelectronics; micrometrology; photolithography; photomask; semiconductor technology; SP400-20.

Integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; x-ray diffraction; crystal structure; Monogr. 25. Section 12.

Integrated power Darlington thermal resistance; thermal resistance measurement; Darlington hot spot screen; Darlington thermal resistance; emitter-only switching; hot spot screen for Dalringtons; 15610.

Integrated utilities; utilities; economic incentives; housing development; NBSIR 75-721.
Intelligence; power; science; technology; artifacts; balance; computer; impermanence; 15199.

Intensities of spectral lines; spectral-line intensities; tables of spectral-line intensities; wavelengths of spectral lines; classification of spectral lines; Monogr. 145, Part I.

Intensities of spectral lines; spectral-line intensities; tables of spectral-line intensities; wavelengths of spectral lines; classification of spectral lines; Monogr. 145, Part II.

Intensity stabilization; cw dye laser; frequency stabilization; 15160.

Interacting quantum fields; nuclear structure; particle structure; relativistic bound systems; relativistic nuclear physics; composite particles; Monogr. 147.

Interaction; measurements; smoke; smoke and flame spread; temperature; with and without forced air; velocity; carpets with and without underlayment; corridor fires; energy models; finished interior; full scale experiments; 15230.

Interaction; package quantity standards; voluntary standards; working with government; consumer activism; control proliferation; industry; 15304.

Interaction length; phase noise; primary frequency standards; Ramsey cavity; accuracy; accuracy evaluations; cavity phase shift; cesium beam tube; frequency stability; 15683.

Interaction potential; neutron; charge distribution; Coulomb energy; deuteron; electrostatic; 15469.

Interaction second virial coefficients; review; solid-vapor equilibria; unlike molecule interactions; binary systems; cryogenic fluids; 15188.

Interaction virial coefficients; moist air; saturated air; second virial coefficients; virial coefficients; enhancement factor; equation of state; J.79A No. 4, 551-560 (1975).

Interactive computing; interpretive computer programming language and operating system; medical automation; minicomputer-based systems; MUMPS; MUMPS Development Committee; MUMPS Language Standard; data handling language; H118.

Interactive computing; man-machine interaction; performance measurement; time-sharing; computer networks; TN880.

Interactive program; least-squares analysis; real-time analyzer; reverberation room; spectrum shaping; digital processing of decay rates; digital sampling; graphics display terminal; 15082.

Interactive systems; performance evaluation; cost-benefit analysis; cost-effectiveness; economics; 15633.

Interactive user; language transformation; mental work; association links; command language design; 15371.

Interagency; prequalification; system performance; tri-service; underground heat distribution; ASTM, criteria; Federal Construction Council; BSS66, pp. 73-77.

Interatomic potentials; lattice dynamics; molecular dynamics; shock waves; blast waves; computer simulation; 15434.

Intercalibration; intercomparison; radioactivity; radionuclide; radiointrotron; environment; TN875.

Intercomparison; IPTS-68; platinum resistance thermometers; wire-to-wire calibration; adjustment for trend; calibration; capsule type thermometers; NBSIR 74-586.

Intercomparison; kerma; neutron dosimetry; neutron radiobiology; neutron therapy; absorbed dose; 15540.

Intercomparison; radioactivity; radionuclide; radiointrotron; environment; intercalibration; TN875.

Interdata 70; OS AIDS; RTOS; software; debugging; 15358.

Interdiffusion; lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; molybdenum; niobium; plutonium; potassium; praseodymium; promethium; rhenium; rubidium; sodium; surface diffusion; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Interdisciplinary approach; physiology; psychology; acoustics; human factors; human occupancy; illumination; 15364.

Interface; liquid/solid interface; solid/liquid interface; surfaces; Zeta-potential; electrokinetic potential glass; 14732.

Interface; piezoelectric polymer; polymer; pressure; pressure transducer; theory; transducer; calibration; construction; impact; NBSIR 75-740.

Interface polarization; ionic conduction; mass transport; Ac impedance; calcium apatites; calcium hydroxide; crystal growth; electrolysis; NBSIR 74-628.

Interfacial thermal resistance; Kapitza conductance of copper; Kapitza conductance of indium; Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; (100) surface of copper; heat transfer to helium II; NBSIR 75-812.

Interferences; iron; nickel; separations; atomic absorption; atomic fluorescence; cobalt; 15577.

Interferences; light sources; precision; accuracy; atomic spectroscopy; atomic vapor; chemical analysis; evaluation; 14888.

Interferences; repetitive optical scanning; aluminum; flame emission spectrometry; 14901.

Interferometer; phase locked loop; tracking; ultrasonic; 15040.

Interferometer; radiation chemical kinetics; radiation measurement; refractive index; temperature measurement; calorimeter; dosimetry; electron beam; 15619.

Interferometry; laser; length; measurement process; uncertainty; calibration; gage blocks; Monogr. 152.

Interferometry; dimensional stability; glass; glass-ceramic; J.79A No. 4, 545-550 (1975).

Interferometry; KCl; photelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; ZnSe; birefringence; elastic constants; infrared-laser window materials; NBSIR 75-781.

Interferometry; length measurement; parallelism; flatness; gage blocks; 15119.

Interferometry; light scattering; methane; sound velocity; specific heat ratio; compressibility; 15639.

Interior finishes; noncombustible; smoke development; sprinklers; survey; building construction; detectors; flame spread; furnishings; TN861.

Interior linings; material ignitability; performance criteria; room fires; smoke; wood crib; buildings; fire growth; flame spread; heat release; TN879.

Interlaboratory comparison; scattering parameters; S parameters; transistors; electronics; high-frequency probes; SP400-5.

Interlaboratory evaluation; smoke measurement; tunnel test; ASTM E84; building materials; carpets; fire tests; flame spread tests; floor coverings; 15267.

Interlaboratory standard; measurement; rotary-vane attenuator; attenuation; Monogr. 144.

Interlaboratory test; photodiode detectors; photometry; 15486.

Interlaboratory testing; laboratory performance; paper test methods; collaborative reference program; 15274.

Intermediate coupling; reduced transition probability; 31P; electroexcitation; electron scattering; form factors; 15104.

Intermediate structure; nuclear structure; particle-hole model; quasi-bound states; two-particle two-hole states; giant resonance; 15097.

Intermediate structure; 234U capture cross section; doorway states; SP425. pp. 623-626.

Intermittency, moments; statistical properties; turbulence; velocity-gradients; boundary layer; grid; 15116.

Intermolecular forces; m-6-8 potential quadrupolar gas; second virial coefficient; viscosity coefficient; carbon dioxide; Clausius-Mossotti function; 15521.

Internal combustion engine; noise; sound power level; sound pressure level; acoustics; air compressor; NBSIR 75-653.

Internal control system characterization; nuclear materials safeguards; safeguards; analysis; diversion of nuclear materials; diversion path analysis; 15048.
Internal control system characterization; nuclear materials safeguards; safeguards; analysis; diversion of nuclear materials; diversion path analysis: 15049.
Internal energies; isobars; isochores; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; specific heats; speeds of sound; vapor pressures; densities; enthalpies, entropies; equation of state; NBSIR 74-398.
Internal energy measurement; isoperibol calorimeters; measurement theory; calorimetry; energy equivalents; energy measurement; heat transfer; 15102.
Internal motion; interstellar molecules; Orion; radio astronomy; dimethyl ether; 15265.
Internal rotation; internal rotation barrier height; propylene; torsional frequency; critically evaluated data; enthalpy; enthalpy function; enthalpy of formation; entropy; equilibrium constant of formation; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).
Internal rotation; PF3; pseudorotation; Raman; vibration; high amplitude; 15370.
Internal rotation barrier height; propylene; torsional frequency; critically evaluated data; enthalpy; enthalpy function; enthalpy of formation; entropy; equilibrium constant of formation; ethylene; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).
Internal stress; polyvinyl chloride; thermal mechanical analysis (TMA); thermal properties; thermogravimetric analysis (TGA); thermoplastic pipe; chlorinated polyvinyl chloride; hardness; NBSIR 74-610.
Internal stress; brass; mechanical properties; electrodeposited brass; properties; electrodeposited brass; tensile strength; brass; rate, brass; density, brass; ductility, brass; electrical resistivity, brass; electrodeposited brass; electrolytically plated brass; 15559.
International building technology; international organization memberships; professional interaction; cooperative programs; foreign visitors; information exchange; NBSIR 74-514.
International Bureau of Weights and Measures; International System of Units; measurements; SI; Treaty of the Metre; base units; centennial volume; history of SI; SP420.
International comparison; laboratory intercomparison; permissivity; standard dielectric; cavity method for dielectrics; dielectric constant; dielectric loss; 14999.
International data service; on-line data; reference service data; standard reference data; data files; data network; data on-line; 15266.
International frequency comparisons; optimum frequency estimate; primary frequency standards; reliability; SI second; time scale accuracy algorithm; time scale stability; coordinate time scales; frequency calibration; 15672.
International measurement; measurement system; national economy; national/international measurement system; 15171.
International organization memberships; professional interaction; cooperative programs; foreign visitors; information exchange; international building technology; NBSIR 74-514.
International standards; legislation; measurement language; metrication; metric system; conversion; 148377.
International Standards Organization; International Telecommunications Union; American National Standards Institute; Computer Society of the IEEE; Data Communication Standards; Electronics Industries Association; 15200.
International System of Units; enthalpy of combustion, dry basis; enthalpy of combustion, saturated basis; enthalpy of formation, hydrocarbons, heating value; hydrocarbons; 15094.
International System of Units; measurement units; metric units; SI; systems of units; units of measurement; 15481.
International System of Units; measurements; SI; Treaty of the Metre; base units; centennial volume; history of SI; International Bureau of Weights and Measures; SP420.
International System of Units; measurement systems; Metric system; modernized metric system; SI; weights and measures; SP3044.
International System of Units; kitchen measurement units; metric system; weights and measures; consumer metric information; SP450.
International Telecommunications Union; American National Standards Institute; Computer Society of the IEEE; Data Communication Standards; Electronics Industries Association; International Standards Organization; 15200.
Internuclear distance; laser fluorescence; Na+; transition moment; electronic dipole moment; 14810.
Internucleon-force; parity-violation; 15083.
Interpolation; Monte Carlo; probability; resonance; thinning; unresolved; cross section; SP425, pp. 447-450.
Interpretive computer programming language and operating system; medical automation; minicomputer-based systems; MUMPS; MUMPS Development Committee; MUMPS Language Standard; data handling language; interactive computing; H1118.
Interstellar chemistry; molecular cloud; molecular spectroscopy; radio astronomy; Sagittarius B2; ethyl alcohol; 15001.
Interstellar molecule; matrix isolation; structure; vacuum ultraviolet photolysis; acetylene; discharge; ethynyl (HC3); infrared spectrum; 15003.
Interstellar molecules; Orion; radio astronomy; dimethyl ether; internal motion; 15365.
Interstitial; lattice dynamics; niobium deuteride; phonons; alloy; electronic structure; 15389.
Interstitial hydrogen; lattice dynamics; palladium hydride; phonons; crystal; fermi surface; 14854.
Interstitial space; penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF6); Veterans Administration Hospital; experiments; full-scale; gas tracer; NBSIR 75-903.
Intracavitry absorption; laser; quantitative analysis; high sensitivity; 14857.
Intracavity technique; ion cyclotron resonance; mass spectrometry; negative ions; photodetachment; tunable dye laser; 14770.
Intrinsic stress tensor; intrinsic viscosity; elastic dumbbell model; flow instability; flow with longitudinal gradient; flow with transverse gradient; gradient dependence of normal stress differences; gradient dependence of viscosity; hydrodynamic interaction; 15143.
Intrinsic viscosity; elastic dumbbell model; flow instability; flow with longitudinal gradient; flow with transverse gradient; gradient dependence of normal stress differences; gradient dependence of viscosity; hydrodynamic interaction; intrinsic stress tensor; 15143.
Intrusion alarms; intrusion detection; alarms; burglar alarms; 15494.
Intrusion detection; alarms; burglar alarms; intrusion alarms; 15494.
Invariant; isotropic tensor; Kronecker delta; orthogonal group; tensor; algebra; alternating tensor; Capelli's identity; Cartesian tensor; group representation; J.979 Nos. 1 and 2, 49-58 (1975).
Inventory theory; topological groups; 14788.
Involution; normal; similar; spectrum; unitary; adjoint; Hilbert's Theorem 90; 14891.
Iodine-129; isotopic separation; neutron activation; improved limits of detection; 15446.
Ion: Li+; low energy; Na2+; pseudopotential; Rb+; resonant charge transfer; atom; collision; Cs+; 15075.
Isotope production; La,Mo,V(p,spallation); measured $\sigma$; nuclear medicine; nuclear reactions; $E = 800$ MeV; SP425, pp. 492-495.

Isotope separated sources; measured I/K EC ratio; multiwire proportional counter; radioactivity $^{85}$Kr [from (n,y)]; deduced $Q_{\text{ec}}$, log ft, $J$; enriched $^{18}$Kr target; 15197.

Isotope separation; photochemistry; dye laser; isotope; 14059.

Isotope $^{151}$In$: radioactivity; rate of charge measurement; 4$\pi$ pressure ionization chamber; half-life measurement; isomeric decay; 15078.

Isotopes; mass spectrometry; molybdenum; nickel; normalization; standard reference materials; thermal ionization; isotope dilution; 14094.

Isotopes; molecular dynamics; neutron; nuclear reactor; radiation; radiography; activation analysis; crystal structure; diffraction; TN860.

Isotopes; Monte Carlo calculations; multiple scattering; industrial gauging; SP425, pp. 500-503.

Isotopes; TEA laser; BCl$_3$ (boron trichloride); boron; CO$_2$ (carbon dioxide); enrichment; infrared; 15270.

Isotopic abundance; potassium; reference standard; absolute ratios; atomic weight; J.79A No. 6, 713-725 (1975).

Isotopic abundance; silicon; absolute ratios; atomic weight; J.79A No. 6, 727-735 (1975).

Isotopic abundance; silicon; Avogadro number; crystal repeat distance; density; 15294.

Isotopic ratios; Laurion; lead; mass spectrometry; ores; archaeology; 14918.

Isotopic separation; neutron activation; improved limits of detection; iodine-129; 15456.

Isotopine substitution; matrix isolation; methyl azide; methyleneimine; normal coordinate analysis; photolysis; thermodynamic properties; C=N bond; infrared spectrum; 151110.

Isotropic Knight shift; Knight shift; Korringa product; nuclear magnetic resonance; spin lattice relaxation; anisotropic Knight shift; Cd; Hg; 14746.

Isotropic tensor; Kronecker delta; orthogonal group; tensor; algebra; alternating tensor; Capelli’s identity; Cartesian tensor; group representation; invariant; J.79B Nos. 1 and 2, 49-58 (1975).

J

J; multilevel fits; polarized neutrons; polarized target; $^{233}$U(n,f); fission channels; SP425, pp. 576-579.

JAERI linac; natural U; resonance parameters $\Gamma_{\Delta}$ up to 5 keV; three thicknesses; transmission measurements; 190-m flight path; background; SP425, pp. 738-741.

Jerry-cans; petroleum products, containers for; plastic containers for petroleum products; containers for petroleum products; PS61-74.

Jet engine; minicomputer; multi-task; performance testing; process control; real-time; RTOS; automation; calibration; fuel control; 15550.

Jet engine fuel control testing; minicomputer applications; minicomputer controlled tests; supervisory control; test equipment reliability; automated test equipment; automated tests for jet engine fuel controls; computer interfacing; digital computer controlled tests; 15087.

Jet engines; measurement seminars; metric; protecting nuclear fuels; computers; energy research; ethylene; fabric flammability; glass standards; household fires; DIM/NBS 59, No. 1, 1-24 (1975).

Jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; TN672.

Job enrichment; organizational development; project management; system integration; automation; human relations; 15570.

Jog; kink; multiplication; plasticity; Volterra; crystal; defect; disclination; dislocation; elasticity; 14745.

Johnson noise; linewidth; random walk frequency modulation; spectral density of frequency fluctuations $S_{\Delta f}$; white phase modulation; Allan variance; flicker of frequency modulation; 14828.

Joints; adhesively bonded; reinforcement, composite overlay; reinforcement, cutouts and cracks; adhesively bonded joints; composite materials; composite-overlay reinforcement; contour plotting; cracks, reinforcement of; cutouts, reinforcement of; finite element analysis; 15508.

Josephson device; microstrip; microwave coupling; SQUID; superconducting switch; tunnel junction; voltage standard; cryogenic resistor; current comparator; 15596.

Josephson effect; phase slip; weak superconductivity; 15646.

Josephson effect; precise measurements; superconductivity; electronics; 14971.

Josephson junction; microstrip; quality factor; transmission coefficient; coherent radiation; 14919.

Josephson junction; noise thermometer; thermometer; $^{60}$Co; gamma rays; 15166.

Josephson junction; quantum interference; rf attenuation; superconductivity; 14726.

Josephson junction; quantum interference; rf attenuation; superconductivity; 14838.

Josephson junctions; microstripes; microwave filters; voltage standard; arrays; 14941.

Josephson junctions; noise thermometer; temperature; dilution refrigerators; $\gamma$-ray anisotropy thermometer; 15526.

Josephson radiation; Josephson tunnel junction; junction array; microstrip-line-coupling; thin-film device; frequency source; 15399.

Josephson tunnel junction; junction array; microstrip-line-coupling; thin-film device; frequency source; Josephson radiation; 15399.

Joule-Thomson coefficients; phase equilibria; review; bibliography; calorimetric measurements; fluid mixtures; 15671.

Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; specific heats; speeds of sound; vapor pressures; densities; enthalpies; entropies; equation of state; internal energies; isobars; isochores; isothersms; NBSIR 74-398.

Judder reorientations; quasi-elastic neutron scattering; residence times; activation energy; ammonium ion dynamics; ammonium perchlorate; 15109.

Junction array; microstrip-line-coupling; thin-film device; frequency source; Josephson radiation; Josephson tunnel junction; 15599.

K

Kaon; lepton-asymmetry; momentum-dependence; Weisskopf-Wigner; CP-violation; decays; direct tests; 15211.

Kapitza conductance of copper; Kapitza conductance of indium; Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; (100) surface of copper; heat transfer to helium II; interfacial thermal resistance; NBSIR 75-812.

Kapitza conductance of indium; Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; (100) surface of copper; heat transfer to helium II; interfacial thermal resistance; Kapitza conductance of copper; NBSIR 75-812.
Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; (100) surface of copper; heat transfer to helium II; interfacial thermal resistance; Kapitza conductance of copper; Kapitza conductance of indium; NBSIR 75-812.

Kapitza resistance: liquid helium; powder; silver; cryogenics; dilution refrigerator; heat transfer; helium 3; helium 4; 15219.

Kapitza resistance; liquid helium; powder; silver; copper alloy; copper; cryogenics; dilution refrigerator; heat exchanger; 15238.

Kapitza resistance; phonon-electron interaction; phonon-quasiparticle interaction; powder; sintering; copper; heat transfer; helium 3-helium 4; 14749.

Karl Pearson; statistics; Tables for Statisticians and Biometricians; W. F. R. Weldon; bibliography; Biometrica; Chi-square tests; correlation; regression; R. A. Fisher; Francis Galton; frequency curves; method of moments; 14822.

KCl; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; ZnSe; birefringence; elastic constants; infrared-laser window materials; interferometry; NBSIR 75-781.

Kerma; kerma factors; microdosimetry; neutron dosimetry; neutron energy deposition; fluence; 15407.

Kerma; neutron dosimetry; neutron radiobiology; neutron therapy; absorbed dose; intercomparison; 15540.

Kerma factors; microdosimetry; neutron dosimetry; neutron energy deposition; fluence; kerma; 15407.

Kerr effect; laser systems; calibration; electrical measurement; electro-optics; high voltage measurement; impulse measurement; 15059.

Kerr effect; nitrobenzene; pulse measurements; space charge; automated measurements; dielectrics; dividers; electrical measurement; electric fields; electro-optics; high voltage measurements; insulating fluids; NBSIR 75-774.

KeV energy range; Na, Cr, Mn, Fe, Ni, Rh, Ta, U; absolute radiative capture cross sections; SP425, pp. 953-956.

Key press; pure tones; second order schedules; aversion for sound; avoidance; differential reinforcement of high rate; escape; high school students; 14815.

Key words; publications; abstracts; NBS publications; SP305. Supplement 6.

Key-Word-in-Context index of voluntary standards; KWIC index of standards; standards, voluntary, index of; engineering standards, index of; index of standards, recommended practices, specifications, test methods; SP329. Supplement 2.

Kinetic clotting test; blood coagulation; blood compatibility; blood platelet consumption; SP415, pp. 75-82.

Kinetic diffusion equations; mechanism for diffusion; random walk; vacancies; atom transport; diffusion in crystals; 15421.

Kinetic energy; mass yield; prompt neutron; scission point; statistical theory; actinide nuclide; fast-neutron-induced fission; fission; fission fragment; fission product; SP425, pp. 343-345.

Kinetic energy terms; potential functions; barriers to planarity; cyclobutane; cyclobutane-d; isotope effect; 14855.

Kinetic theory; Knudsen number expansion; nucleation; aerosols; condensation; droplets; evaporation; 15157.

Kinetics; mass spectrometry; nitrogen dioxide; olefin; ozone; rate constant; 14956.

Kinetics; mass spectrometry; ozone; propene; rate constant; air pollution; ethene; 15234.

Kinetics; mass spectrometry; olefin; ozone; photochemical smog; rate constant; air pollution; 15355.

Kinetics; mechanism; organic compounds; rate constants; atomic oxygen; gas phase; 15240.

Kinetics; methyl; nitric oxide; oxygen; rate constants; combination; 15328.

Kinetics; photoelectron spectroscopy; adsorption; Auger spectroscopy; catalysis; infrared spectroscopy; 15318.

Kinetics; pyrolysis; TGA; thermal analysis; thermal degradation; thermogravimetric analysis; differential thermal analysis; DTA; 15292.

Kinetics of reactions; lasers, infrared, photochemistry; apparatus and methods; chemiluminescence; emission spectra; free radicals; 14969.

Kink; multiplication; plasticity; Volterra; crystal; defect; dislocation; elasticity; jog; 14745.

Kirkwood Salsburg equation; perturbation expansion; strip operator; thermodynamic limit; distribution functions; finite volumes; 15356.

Kitchen; ranges; reaction time; safety; warming lights; consumer products; human factors; NBSIR 75-797.

Kitchen measurement units; metric system; weights and measures; consumer metric information; International System of Units; SP430.

Knight shift; Korringa product; nuclear magnetic resonance; spin lattice relaxation; anisotropic Knight shift; Cd; Hg; isotropic Knight shift; 14746.

Knight shifts; LaNi4; LaNi5, Pt; LaPt; NMR; ordering; relaxation times; solid solutions; alloys; contact term; core polarization; exchange enhancement; 14889.

Knight shifts; NMR; rare earth metals and alloys; soft x ray; alloy data; bibliography; index; 14744.

Knudsen number expansion; nucleation; aerosols; condensation; droplets; evaporation; kinetic theory; 15157.

Knudsen radiometer; McLeod gauge; micromanometry; quartz Bourdon gauge; static expansion; thermal transpiration; vapor-stream pumping; visibility gauge; capacitance diaphragm gauge; 14933.

Kohl; lead isotopes; Ptolemaic and Roman Periods; archaeological materials; Egyptian glass; galena ores; 14912.

Kohoutek; OH; radio; search; comet; HCN; HCN, 15262.

Korringa product; nuclear magnetic resonance; spin lattice relaxation; anisotropic Knight shift; Cd; Hg; isotropic Knight shift; Knight shift; 14746.

Kossel; lattice spacing determination; microdiffraction; scanning electron microscopy; strain analysis; x ray; channeling of electrons; crystal orientation; 14913.

Kossel diffraction; lattice expansion; LiF; NBS reactor; radiation damage; thermal neutrons; 15346.

Kovar; sapphire; temperature; thickness; cell; 15618.

Kronecker delta; orthogonal group; tensor; algebra; alternating tensor; Capelli's identity; Cartesian tensor; group representation; invariant; isotropic tensor; J.9B NOS. 1 and 2, 49-58 (1975).

Krypton; measurement technique; methane; self-diffusion coefficient; argon; critical review; 14821.

KWIC index of standards; standards, voluntary, index of; engineering standards, index of; index of standards, recommended practices, specifications, test methods; Key-Word-in-Context index of voluntary standards; SP329. Supplement 2.

KWO; RSYST; burnup calculation; burnup model; critical boron concentration; fission products; SP425, pp. 398-400.

K2SO4-MgO system; K2SO4-MgO system; phase relations; vapor pressure; vaporization equilibria; 15505.

K2SO4-4 system; phase relations; vapor pressure; vaporization equilibria; K2SO4-LaCr2O3 system; 15505.

L

La radiation; crossed beams; cross section; D2+; dissociative recombination; electron scattering; 15076.

Label; refrigerators/freezers; room air conditioning; consumer information; efficiency; energy; 15451.

Label developments; labeling; label specification; monitoring priorities; product classes; test methods; voluntary; education; efficiency comparison; household appliances; household equipment; 15204.
Label specification; monitoring priorities; product classes; test methods; voluntary: education; efficiency comparison; household appliances; household equipment; label developments; labeling; 15204.

Labeling; label specification; monitoring priorities; product classes; test methods; voluntary: education; efficiency comparison; household appliances; household equipment; label developments; 15204.

Labeling; residential; consumer information; consumer products; energy conservation; energy efficiency; energy use; household appliances; household equipment; NBSIR 75-660.

Laboratory accreditation; measurement; national measurement system; technology transfer; voluntary standards; computer science; 14920.

Laboratory automation; multiprogramming; operating system; real-time; data acquisition; file system; NBSIR 75-713.

Laboratory automation; real-time; analytical chemistry; computers; data acquisition; data processing; fluorimetry; TN857.

Laboratory automation operating system; teleprocessor; analytical chemistry; computer; data acquisition; 15136.

Laboratory intercomparison; permittivity; standard dielectric; cavity method for dielectrics; dielectric constant; dielectric loss; international comparison; 14999.

Laboratory performance; paper test methods; collaborative reference program; interlaboratory testing; 15274.

Laceration; safety; simulation; skin; skin; cutting; synthetic materials; cutting; toys; cut; edges; hazardous; experimental studies; human tolerances; injury; injury thresholds; inspection of edges; NBSIR 73-262.

Lag; unsteady flow; air; analytical; anemometer; dynamic response; experimental; NBSIR 75-772.

Lamb's problem; seismic pulses; ultrasonic transducers; acoustic emission; calibration of transducers; electrostatic transducers; 14960.

Lamella thickness; melting; comonomer concentration; copolymer; crystallization; defect energy; equilibrium dissolution temperature; equilibrium melting temperature; fold surface energy; growth rate; heat of fusion; 15561.

Lamella thickness; paraffins; polyethylene; unit cell; x ray; crystal surfaces; density; 14724.

Laminar flow; liquid properties; viscosity sensor; capillary tubes; density sensor; flow nozzle; NBSIR 74-620.

Laminar flow; nozzle; porous plug; sulfur dioxide concentration; carbon dioxide concentration; air pollution; critical flow; NBSIR 74-612.

Laminate; reinforced plastics; shear strength; sustained loading; tensile strength; adhesive bonding; aging tests (materials); composite materials; glass fibers; housing system; 15624.

La, Mo, V (spallation); measured σ; nuclear medicine; nuclear reactions; E = 800 MeV; isotope production; SP425, pp. 492-495.

Land-mobile communications; law enforcement; repeater; vertical antenna; duplexer; fm transceiver; 14990.

Language design; precompiler; quality software; structural programming; block structure; control flow; GOTO-less programming; 14956.

Language transformation; mental work; association links; command language design; interactive user; 15371.

LaNis; LaNis₂₆-Pt₅₂; LaPt₅₂; NMR; ordering; relaxation times; solid solutions; alloys; contact term; core polarization; exchange enhancement; Knight shifts; 14889.

LaNis₂₆-Pt₅₂; LaPt₅₂; NMR; ordering; relaxation times; solid solutions; alloys; contact term; core polarization; exchange enhancement; Knight shifts; LaNis; 14889.

Lanthanides; spectra; rare earths; atomic spectra; ionization energies; 15576.

Lanthanum; liquid metal diffusion; lithium; lutetium; magnesium; manganese; molybdenum; niobium; plutonium; potassium; promethium; rhenium; rubidium; sodium; surface diffusion; tantalum; terbium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Lanthanum; wavelengths; barium; cerium; cesium; ionization energy; 15068.

LaPt₅₂: NMR; ordering; relaxation times; solid solutions; alloys; contact term; core polarization; exchange enhancement; Knight shifts; LaNis, LaNis₂₆-Pt₅₂; 14889.

Large-panel structures; precast concrete construction; progressive collapse; structural design; structural joints; building systems; housing systems; NBSIR 75-715.

Larson-Miller parameter; crack nucleation; elevated temperature; failure prediction; 15638.

Laser; laser calorimetry; laser energy measurements; laser power measurements; 14737.

Laser; length; measurement process; uncertainty; calibration; gage blocks; interferometry; Monogr. 152.

Laser; lunar distance; moon; selenodesy; astronomy; cartography; geophysics; 14892.

Laser; magnetic resonance; oxygen; rotational structure; Zeeman; effect; 15335.

Laser; NO₂; absorption spectroscopy; air pollution; 15101.

Laser; ozone; radiometer; stabilizer; toy safety; computer security; energy efficiency; electrocatalysis; fluorides; heart; heat pump; DIM/ NBS 59, No. 11, 241-264 (1975).

Laser; photoductor; sampling oscilloscope; GaAs; 15644.

Laser; plasma; absorption; bremsstrahlung; electrons; ions; 15532.

Laser; pollution; vinyl chloride; detector; 15027.

Laser; power; pyroelectric; TN665.

Laser; quantitative analysis; high sensitivity; intracavity absorption; 14857.

Laser calorimeter; laser energy; laser power; 14861.

Laser calorimetry; laser energy measurements; laser power measurements; laser; 14737.

Laser energy; laser power; laser calorimeter; 14861.

Laser energy measurements; laser power measurements; laser; laser calorimetry; 14737.

Laser energy measurements; laser power measurements; radiometry; absorbance; calorimeter; cavity; 15033.

Laser excitation; mass spectrometry; radicals; flames; 15243.

Laser fluorescence; Na₂; transition moment; electronic dipole moment; internuclear distance; 14810.

Laser frequency; laser wavelength; length standard; speed of light; 15681.

Laser frequency measurements; speed of light; 15677.

Laser frequency measurements; laser strumeter; saturated absorption spectroscopy; speed of light; the meter; 15688.

Laser frequency synthesis; water vapor laser; absolute frequency measurements; 15534.

Laser frequency synthesis; xenon laser; absolute frequency measurements; 15014.

Laser ignition; oxygen; titanium; combustion; Hilbert transform; 15345.

Laser ignition; spectra (visible); titanium; combustion; 14723.

Laser interferometry; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; semiconductor devices; semiconductor materials; SP400-17.

Laser magnetic resonance; least squares fit; rotational analysis; Zeeman spectrum; asymmetric rotors; doublet states; HO₂; 14910.

Laser magnetic resonance; OH; pollution; CH; free radical; HCO; HO₂; 15680.

Laser magnetic resonance; rotational constants; spectral assignments; spin splitting; Zeeman spectrum; asymmetric rotor levels; HO₂; 15067.
Load surveys; structural engineering; survey techniques; buildings; fire loads; occupancy live loads. 

Load-bearing masonry; load-bearing walls; masonry; masonry research; progressive collapse; abnormal loading; building; gas explosion; NBSIR 74-526.

Load-bearing walls; masonry; masonry research; progressive collapse; abnormal loading; building; gas explosion; load-bearing masonry; NBSIR 74-526.

Load-elongation curve; microcracks; microfibirs; radicals; bond rupture; chain rupture; ESR; fibrils; 15555.

Loads (forces): masonry; moments; slenderness ratio; stability; structural engineering; walls; bricks; buckling; deflection; 1550.

Loads (forces): masonry; stability; stress distribution; structural engineering; buckling; compression members; concrete; cracking; deflection; eccentricity; equilibrium; 15514.

Local building heat/cooling plants, Southeast Federal Area, Washington, D.C.; central heating and cooling plants; cost analysis; cost comparison; economics, future trend; BSS66, pp. 9-17.

Local thermal equilibrium (LTE); mineral analysis; secondary ion mass spectrometry (SIMS); surface analysis; Auger electron spectroscopy; elemental depth profiling; ion microprobe mass analysis; ion optics; 8P427.

Logarithm; neper; radian; angle; dimension; J.79B Nos. 3 and 4, 127-135 (1975).

Loglinear model; minimum discrimination information; statistical analysis; categorical data; contingency tables; 14852.

Lomer-Cottrell locks; sessile dislocations; x-ray topography; anomalous transmission; as-grown copper crystal; crystal perfection; Czochralski growth; 14779.

Longitudinal; reduced widths; transverse; boron; electron scattering; giant resonance; 14964.

Longitudinal waves; metallurgical variables; nondestructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics; aluminum ultrasonic standards; ASTM-type reference blocks; fabrication of reference blocks; immersion testing; NBSIR 75-685.

Lorentz force; magnetic domains; photomicrography; scanning electron microscope; strain effects; iron-silicon alloys; 15037.

Lorentzian; phase sensitive detector; Gaussian; lineshapes; 15702.

Lorentz ratio; low temperature; standard reference material; thermal conductivity; thermopower; electrical resistivity; electrolytic iron; high temperature; iron; 8P260-50.

Lorentz ratio; low temperature; standard reference materials; thermal conductivity; thermopower; tungsten; electrical resistivity; high temperature; 8P260-52.

Lorenz-Lorentz function; methane; rectilinear diameter law; refractive index; refractometric virial coefficients; critical refractive index; Fabry-Perot interferometer; 15137.

Lorks; muon-electron universality; muon number; neutrino quarks; strong interactions; three triplet model; composite model of leptons; electron number; leptonic quarks; 15614.

Loss; National Fire Data System; data; fire; fire incident system; fire service; incident reports; 15632.

Loss; National Fire Data System; National Fire Survey; survey; Census Bureau; Consumer Product Safety Commission; data; fire; households; injury; 15656.

Loss; response; skin effect; step; time; transition; coaxial; cylindrical; error; line; 15696.

Loss measurements; cavity resonators; dielectric constant; 14917.

Loss of coolant accident; sensitivity; afterheat; decay heat; error estimates; fission products; 8P425, pp. 29-38.

Loss tangent; machinable glass-ceramic; specific heat; thermal conductivity; cryogenics; dielectric constant; 15046.

Lossy dielectric; multilayer cylinder; reference values; scattering; cylinder scattering; electromagnetic scattering; 15648.
Low capacity; reliability; shipboard; 77 K refrigerators; cryogenics; infrared detector; NBSIR 74-372.
Low carbon steel; nitrate; nitrite; repassivation; stress corrosion; chloride; ellipsometry; 14882.
Low contrast resolution; night vision; objective lenses; resolution test; variable contrast resolution; contrast curves; 14950.
Low energy; Na\textsuperscript{+}; pseudopotential; Rb\textsuperscript{+}; resonant charge transfer; atom; collision; Cs\textsuperscript{+}; ion; Li\textsuperscript{+}; 15075.
Low energy; negative ions; nitric oxide; nitrous oxide; total scattering cross section; electron impact; electron scattering resonances; exponential attenuation; 14983.
Low energy electron impact; N\textsubscript{2}O; oscillator strengths; electron energy loss; 15467.
Low frequency; pickup; vibration; vibration exciter; accelerometer; calibration; harmonic distortion; 15567.
Low frequency; signal insertion; vibration; accelerometer; calibration; NBSIR 74-597.
Low lying levels; weak coupling; "Sr; "Y; elastic and inelastic electron scattering; 14968.
Low temperature; meta-stable compound; neutron diffraction; NH\textsubscript{4}ClO\textsubscript{4}; thermal motion; crystal structure; 15223.
Low temperature; shielding; SQUID; superconducting shield; superconductivity; cryogenic resisters; current comparators; 15597.
Low temperature; standard reference materials; thermal conductivity; austenitic stainless steel; electrical resistivity; high temperature; SP260-46.
Low temperature; standard reference material; thermal conductivity; thermopower; electrical resistivity; electrolytic iron; high temperature; iron; Lorenz ratio; SP260-50.
Low temperature; standard reference materials; thermal conductivity; thermopower; tungsten; electrical resistivity; high temperature; Lorenz ratio; SP260-52.
Low temperature; thermometry; cryothermometry; 15127.
Low temperature; thermometry; vacuum deposition; calibration; carbon films; NBSIR 74-355.
Low temperature electrical measurement; quantum interference device; ratio transformer; resistive divider; superconductivity; current comparator; 14937.
Low temperature fixed points; low temperature thermometry; superconducting transition temperatures of lead and indium; acoustical thermometry; fixed points; lead and indium transition temperatures; 15697.
Low temperature specific heat; magnetic dipole interaction; paramagnetic salt; CMN; cryomagnetism; 14834.
Low temperature thermometry; superconducting transition temperatures of lead and indium; acoustical thermometry; fixed points; lead and indium transition temperatures; low temperature fixed points; 15697.
Low utilization; overhead; suboptimization; subsystem measurement; variability; distribution; SP406. pp. 45-52.
Low-temperature calibration of thermometers; platinum resistance thermometers; resistance thermometers; two-way structural analysis; calibration of thermometers; 15309.
Lubricity; film thickness; film uniformity; fingerprint impressions; fingerprint readers; image quality; ink films; NBSIR 74-627.
Luminescence; ozone; apparatus and methods; deactivation; energy transfer; infrared laser; 15221.
Luminescence measurement; phosphorescence measurement; fluorescence measurement; instrumentation; luminescence measuring; NBSIR 74-553.
Lunar cartography; lunar gravity; moon; plate tectonics; crustal movements; earth rotation; geophysics; lasers; 15437.
Lunar chemistry; lunar \gamma-rays; neutron capture; nonelastic scattering; cosmic-ray reactions; SP425, pp. 540-545.
Lunar distance; moon; selenodesy; astronomy; cartography; geophysics; laser; 14892.
Lunar gravity; moon; plate tectonics; crustal movements; earth rotation; geophysics; lasers; lunar cartography; 14937.
Lunar \gamma-rays; neutron capture; nonelastic scattering; cosmic-ray reactions; lunar chemistry; SP425, pp. 540-545.
Lunar samples; analysis; biological and botanical samples; differential linear sweep voltammetry; environmental samples; fossil fuels; 15427.
Lundquist three-body potential; second-neighbor interactions; shell model; alkaline earth oxides; Born-Mayer potential; first-neighbor interactions; ionicity; 15398.
Lutetium; magnesium; manganese; molybdenum; niobium; plutonium; potassium; praseodymium; promethium; rhenium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; J. Phys. Chem. Ref. Data, No. 1, 177-250 (1975).
Lyapunov's theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal; diagonally dominant; diagonal matrix; D-stability; Gersgorin's theorem; 14782.
Lyman alpha; optically thin; Stark profile; high temperature; hydrogen arc; line broadening; 15413.
Lyophilization; neutron activation analysis; preconcentration; radioactive tracers; river water; trace elements; tracers; water; freeze drying; instrumental neutron activation analysis; 15376.
Lyotropic liquid crystal; asymptotic diffusion coefficients; diffusion in liquid crystals; 15288.

**M**

Machinable glass-ceramic; specific heat; thermal conductivity; cryogenics; dielectric constant; loss tangent; 15046.
Machinery noise; noise; sound; sound power; acoustics; 15217.
Macro processor; minicomputer-based systems; operating systems; automated computer access; computer networking; 15544.
Macros; minicomputers; protocols; access procedures; command language; computer networks; 15541.
Magnesium; manganese; molybdenum; niobium; plutonium; potassium; praseodymium; promethium; rhenium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; J. Phys. Chem. Ref. Data, No. 1, 177-250 (1975).
Magnetic; perturbation group; quantum mechanics; antiferromagnetism; cerous magnesium nitrate; dipole-dipole interaction; ferromagnetism; ground state; 14911.
Magnetic coupling; superconducting dc transformer; type II superconducting films; vortex coupling; dc transformer; granular aluminum films; 15361.
Magnetic dipole interaction; paramagnetic salt; CMN; cryomagnetism; low temperature specific heat; 14834.
Magnetic disk; Standard Reference Surface; unrecorded disk surface; calibration factor; computer amplitude reference; computer storage media; disk calibration; disk pack; TN884.
Magnetic domain contrast; scanning electron microscope; voltage contrast; cathodoluminescence; electron beam induced conductivity contrast; electron channeling contrast; 15251.
Magnetic domains; photomicrography; scanning electron microscope; strain effects; iron-silicon alloys; Lorentz force; 15037.
Magnetic field; protons; solenoid; automated measurement systems; gyromagnetic ratio; 14929.
Magnetic field strength; measurement instrumentation; mine noise; spectral density; time-dependent spectral density; am-
Man-machine interaction; performance measurement; time-sharing; computer networks; interactive computing; T880.
Man-machine systems; networks; system commands; user protocols; command languages; computers; T877.
Man-machine systems; networks; system commands; user protocols; command languages; computer; NBSIR 75-744.
Manometry; mercury manometer; pressure; 4921.
Many-one reducibility; recursive functions; r.e. many-one degrees; r.e. one-one degrees; semi-Thue systems; splinters; combinatorial systems with axiom; degrees of unsolvability; general decision problems; Markov algorithms; 4998.
Marginal ditching; creep; dental amalgam; 4516.
Marine eggs; metabolism; microcalorimetry; Arctica punctata; calorimetry; size of cells; development of cells; fertilization; growth of cells; heat production; 4515.
Marine sediments; pollution; seawater; baseline studies; gas chromatography; gas chromatography-mass spectrometry; hydrocarbon; liquid chromatography; 45706.
Market pulp; paper; waste; pulp; secondary; recycled paper; secondary pulp; waste paper; 45604.
Marketplace; performance measurement; quality; seller; specifications; validation; buyer; computer software; 4595.
Markov algorithms; many-one reducibility; recursive functions; r.e. many-one degrees; r.e. one-one degrees; semi-Thue systems; splinters; combinatorial systems with axiom; degrees of unsolvability; general decision problems; 4998.
Maser; M-type stars; molecular emission; Orion Nebulae; silicon monoxide; rotational transitions; 45210.
Maser; orion; pumping processes; radio astronomy; silicon monoxide; circular polarization; 45004.
Masking noise; siren; sound power level; sound pressure level; automobile; destructive interference; directivity; emergency vehicle; insertion loss; 4595.
Masks; sputtering; substrates; thin films; evaporation; magnetic retention; 45321.
Masonry; masonry research; progressive collapse; abnormal loading; building; gas explosion; load-bearing masonry; load-bearing walls; NBSIR 74-526.
Masonry; moments; slenderness ratio; stability; structural engineering; walls; bricks; buckling; deflection; loads (forces); 45507.
Masonry; mortars (materials); walls; brick; dolomitic mineral; 45582.
Masonry; performance criteria; waterproofing materials; water repellent materials; accelerated weathering; durability of waterproofing materials; T880.
Masonry; shear strength; shear test; shear walls; stress distribution; stresses; structural engineering; brick; failure; failure theories; NBSIR 75-703.
Masonry; stability; stress distribution; structural engineering; buckling; compression members; concrete; cracking; deflection; eccentricity; equilibrium; loads (forces); 45514.
Masonry; standards; structural design; codes; 45404.
Masonry construction; precast concrete construction; progressive collapse; structural connection; structural design; wind load; design standards; earthquake load; 45369.
Masonry research; progressive collapse; abnormal loading; building; gas explosion; load-bearing masonry; load-bearing walls; masonry; NBSIR 74-526.
Mass; National Bureau of Standards; reference methods; SI units; length; 45678.
Mass assay; MOL-XS facility; uranium-238 capture rates; fast reactors; fission chambers; fission rates; SP425, pp. 258-261.
Mass balance; test method; ASTM E 84; carpets; energy balance; flame spread; NBSIR 75-705.
Mass measurement; density of air; 45568.
Mass spectrometer; product ions; ethane; gas phase kinetics; ion-molecule reactions; 45111.
Mass spectrometry; cumulative yields; delayed-neutrons; fission

Maximum heating temperature; peak height; reproducibility; sensitivity loss; supralinearity; dosimetry; fading; furnace annealing; glow curve; 15193.

McLeod gauge; micromanometry; quartz Bourdon gauge; static expansion; thermal transpiration; vapor-stream pumping; viscosity gauge; capacitance-diaphragm gauge; Knudsen radiometer; 14933.

MC-SCF; molecular geometry; NO2; spectra; dipole moment; excited states; 15336.

MC-SCF; O2; O2; polarizability; Van der Waals; CO; energy surface; F2; hydrides; LiH2; 15275.

Mean; standard deviation; statistics; updating estimates; data analysis; 15460.

Mean energy of fission neutron spectrum; neutron neutron-sections; neutron data evaluation; U-233, U-235, Pu-239, Pu-241; Westcott g-factors; Cf-252 spontaneous fission neutron yield; E = 0.0253 eV and 20 °C Maxwellian; SP425, pp. 286-292.

Mean life; resonance radiation; transition probability; 235U; uranum; delayed coincidence; f value; imprisonment; lifetime; 15058.

Mean life; resonance radiation; silver; transition probability; Ag A; f value; imprisonment; lifetime; 15120.

Meaningful measurement; measurement; measurement system; precision; reference method; specificity; SRM; standard reference material; systematic error; certification; Monogr. 148.

Meaningful measurements; measurement; reference materials; SRM’s; standard materials; standard reference materials; standards; certification; certified reference materials; materials; SP408.

Measured; neutrons; ratio; 238U; 235U; 600 keV-22 MeV; cross-sections; fission; SP425, pp. 568-571.

Measured; neutrons; 1 keV = 1 MeV; 238Pu; 235U; cross-sections; fission; SP425, pp. 564-567.

Measured; positive displacement; cryogenic; flow; flowmeters; liquid nitrogen; 14774.

Measured capture gamma rays resolution approximately 80 keV; nuclear reactions 209Pb(n,y)209Pb Eγ = 11.2 MeV; SP425, pp. 923-925.

Measured capture-to-fission ratio; nuclear reactions 239U(n,f) and 238U(n,y); E = 86 eV - 31.6 keV; enriched target; SP425, pp. 599-602.

Measured (dσ/dE1)(dE2/dθ1) (E2,E0), σ(E0) for 12Be breakup reaction; SP425, pp. 692-696.

Measured dσ/dE1dE2; nuclear reaction (n,n’); Eγ = 14.2 MeV; SP425, pp. 770-773.

Measured form factors; nuclear reactions; 11B; 12B(e, e’); deduced wave functions; electron scattering; 14967.

Measured L/K EC ratio; multiwire proportional counter; radioactivity 81Kr (from [n,y]); deduced Q(Kr). log f1; J1; enriched 88Kr target; isotope separated sources; 15197.

Measured neutron spectra; shielding, 239U(p,n); Eγ = 800 MeV; analysis by Monte Carlo; angular dependence; deep penetration of neutrons in Fe + H shield; SP425, pp. 476-479.

Measured p(E,θ) absolutely for 12C(n,n) reaction then determined A(E,θ) for other reactions; nuclear reactions 4He(n,n); 4Li(n,n); 7Be(n,n); SP425, pp. 875-878.

Measured Δ; nuclear medicine; nuclear reactions; E = 800 MeV; isotope production; La,Mo,V,p,spallation; SP425, pp. 492-495.

Measured σ; nuclear reactions 15C(n,2n); E = 23-34 MeV; statistical model calculations; 238U(n,2n); E = 13-18 MeV; SP425, pp. 819-822.

Measured σ(E, E0) and σ(E, n); 238U deduced resonances, π, gl; nuclear reactions 238U(n,γ); E = 10-1600 eV; enriched targets; SP425, pp. 733-737.

Measured σ(E) for A = 6, 7, 9, 10, 11; nuclear reactions 15C(p,L); astrophysical production of Li, Be and B; E = 45 - 100 MeV; L = Li, Be, B; SP425, pp. 504-508.

Measured σ(En); SP425, pp. 855-858.

Measured σ(Eγ, 90°) for ground, 45, 148 keV states; nuclear reactions 235U(n,n); E = 0.9-2.7 MeV; time-of-flight; compared with calculated excitation functions; SP425, pp. 950-952.

Measured σ(Eγ, θ); nuclear reactions 109Ba(y,γ), 109Ce(y,γ); deduced Σγγ γ(M1) and Σγγ γ(E1); Eγ = 9 MeV; SP425, pp. 784-787.

Measured σ(Eγ, θ); nuclear reactions C(n,n), C(n,p); E = 9-15 MeV; SP425, pp. 866-870.

Measured σγ, γ, σγ, σn; nuclear reactions 230U(n,nγ), 230U(n,γ); E = 30-1800 eV; 237U resonances deduced Γγ γ, Γγ γ; enriched target; SP425, pp. 729-732.

Measured σγ/E; multilevel R-matrix resonance analysis; Fe(n); Eγ = 0.5-30 MeV; SP425, pp. 754-757.

Measured σγ/E; (n,γ); E = 1 eV-few keV; nuclear reactions; summary of deduced, Eγ, Γγ, Γγ, 〈D〉, various statistical tests; SP425, pp. 780-783.

Measured σγ/E; nuclear reactions 209Bi(n,n), nγ, E = 500 eV-75 keV; deduced Eγ, 1, γ, 〈D〉, Si; SP425, pp. 799-801.

Measured σγ/E; Eγ = 1.5-5.5 MeV/α(E), E = 1.8-4.0 MeV; Osγ = 20 to 160; nuclear reaction 146n(nγ)c146C; R-function analysis; SP425, pp. 246-249.

Measured σθ; nuclear reactions; 6Li(p,p); 6Li(p,2H); 6Li(He,p); 6Li(He,α); 6Li(d,p); 8Li(d,α); deduced σαααα(α)n; SP425, pp. 697-700.

Measured σθ; nuclear reactions 71, 70, 90, 60, Se(n,nγ), nγ, E = 6-10 MeV; deduced optical-model parameters; enriched targets; SP425, pp. 897-900.

Measured σθ; nuclear reactions 115Nd(n,nγ), (n,γ), 113,115Sm(n,nγ), (n,γ), 113,115Sm(n,nnγ); Eγ; 7.0 MeV; SP425, pp. 942-945.

Measured σθ/Eγ; σθ/Eγ for 8Li(n,γ)Be reactions; E γ = 0.2-0.9 MeV; SP425, pp. 692-696.

Measured σθ/Eγ for En = 0.847 MeV; nuclear reactions; θ = 90°, 75°, 55°, 35°; Eγ = 8.5, 10.0, 12.2, 14.2 MeV; Fe(n,xy); SP425, pp. 813-815.

Measured Th fission and deduced Γγ γ below 260 eV; measured 115Nd(n,α); measured 209U fission below 35 keV; deduced Γγ γ of 6.7, 21 and 37 eV resonances; SP425, pp. 93-96.

Measured Tn 2; pressured ionization chamber; radioactivity 120Xe; ν relative intensity; enriched source; Ge(Li) detector; 14812.

Measured yield asymmetries; nuclear reactions; 4Li(n,0)He; E = 0.2-1.4 MeV; deduced analyzing powers A(0); SP425, pp. 788-791.

Measured 115Nd(n,α); measured 209U fission below 35 keV; deduced Γγ γ of 6.7, 21 and 37 eV resonances; measured Th fission and deduced Γγ γ below 260 eV; SP425, pp. 93-96.

Measured 209U fission below 35 keV; deduced Γγ γ of 6.7, 21 and 37 eV resonances; measured Th fission and deduced Γγ γ below 260 eV; measured 115Nd(n,α); SP425, pp. 93-96.

Measurement; measurement compatibility; reference methods; Standard Reference Materials; 15265.

Measurement; measurement system; precision; reference method; specificity; SRM; standard reference material; systematic error; certification; meaningful measurement; Monogr. 148.

Measurement; microwave; microwave power; calibration; calibration factor; directional coupler; 15662.

Measurement; modeling; monitoring; operating systems; performance objectives; computer architecture; computer performance evaluation; installation management; SP406.

Measurement; national measurement system; technology transfer; voluntary standards; computer science; laboratory accreditation; 14920.

Measurement; network; performance; communications; computer; evaluation; 15693.

Measurement; networks; performance; queues; analytical models; evaluation; SP406, pp. 119-121.
Measurement; networks; performance; Petri Nets; probability; evaluation; graphs; SP406, pp. 127-130.
Measurement; oxides of nitrogen; sulfur dioxide; air pollution; instrument; 14939.
Measurement; oxygen; performance; pressure; survey; transducer; calibration; compatibility; cryogenic; liquid oxygen; 15155.
Measurement; parameters; performance; performance terminology; predictability; requirements; variables; workload; computer system; factors; SP406, pp. 53-60.
Measurement; performance; power; work; computer efficiency; evaluation; SP406, pp. 131-134.
Measurement; performance; service; utility; computer; evaluation; 15093.
Measurement; performance; software monitors; throughput; computer; evaluation; hardware monitors; SP406, pp. 99-102.
Measurement; performance monitoring; performance variability; computer performance analysis; SP406, pp. 109-112.
Measurement; polarization; antennas; 15659.
Measurement; positive displacement; turbine; vortex shedding; angular momentum; cryogenic; flowmeter; liquid nitrogen; 15043.
Measurement; pressure transducer; transducer calibration; vibration; boundary initial problems; TN856.
Measurement; product safety; research; science; standards; technology; annual report; computer; energy; environment; SP437.
Measurement; ratio; 235U; fission; SP425, pp. 546-548.
Measurement; reference materials; SRM's; standard materials; standard reference materials; standards; certification; certified reference materials; materials; meaningful measurements; SP408.
Measurement; reference methods; standard reference materials; accuracy; clinical chemistry; 15496.
Measurement; research and development; accounting; computer performance evaluation; efficiency; SP406, pp. 155-157.
Measurement; rotary-vane attenuator; attenuation; interlaboratory standard; Monogr. 144.
Measurement; sampling; simulation; wattmeter; analog-to-digital conversion; digital; electricity; electric power; TN870.
Measurement; sampling; wattmeter; analog-to-digital conversion; digital; electricity; electric power; 14878.
Measurement; 209Pu; comparison; cross sections; fission; absorption; SP425, pp. 627-630.
Measurement accuracy; national temperature measurement system; temperature scale; thermometer calibration; thermometer production; thermometry; 15060.
Measurement algorithm; measurement assurance; measurement process; measurement unit; process variability; uncertainty; Monogr. 149.
Measurement assurance; calibration; gage blocks; 15302.
Measurement assurance; measurement process; measurement unit; process variability; uncertainty; measurement algorithm; Monogr. 149.
Measurement compatibility; reference methods; Standard Reference Materials; measurement; 15265.
Measurement education; metrology curriculum; 14845.
Measurement instrumentation; mine noise; spectral density; time-dependent spectral density; amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier transform; NBSIR 74-391.
Measurement language; metrification; metric system; conversion; international standards; legislation; 14837.
Measurement methodologies; microphones; psychoacoustics; reverberation room; sound level meters; audiometric standards; building acoustics; community noise; earphones; environmental noise; instrumentation; 15502.
Measurement methods; microelectronics; micrometry; MOS devices; oxide films; photomasks; photoresist; resistivity; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; test patterns; SP400-8.
Measurement methods; microelectronics; micrometry; MOS devices; oxide films; resistivity; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; SP400-12.
Measurement methods; microelectronics; micrometry; MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; SP400-17.
Measurement of building energy; building retrofit; building systems; energy conservation in buildings; HVAC automatic control; HVAC systems; 15663.
Measurement process; measurement unit; process variability; uncertainty; measurement algorithm; measurement assurance; Monogr. 149.
Measurement process; uncertainty; calibration; gage blocks; interferometry; laser; length; Monogr. 152.
Measurement science; meter; metric; pulses; robot; sound; construction; dry weight; ears; energy; health care; hospitals; DIMINBS 59, No. 10. 218-239 (1975).
Measurement seminars; metric; protecting nuclear fuels; computers; energy research; ethylene; fabric flammability; glass standards; household fires; jet engines; DIMINBS 59, No. 1. 1-24 (1975).
Measurement services; OAS; standardization; AID; assistance; economics; foreign relations; industrializing nations; LCD's; NBSIR 75-769.
Measurement services; review; standardization; survey; AID; development assistance; economics; Ecuador; less developed countries; NBSIR 75-785.
Measurement, statistical surface parameters; surface finish; surface parameters; characterization; instruments; 15368.
Measurement system; national economy; national/international measurement system; international measurement; 15171.
Measurement system; nuclear power plant; productivity; sub-way; calculable capacitor; color; computer simulation; electricity; energy-environment; fire safety; DIMINBS 59, No. 12. 266-291 (1975).
Measurement system; precision; reference method; specificity; SRM; standard reference material; systematic error; certification; meaningful measurement; measurement; Monogr. 148.
Measurement system; spectroscopy; state measurements; thermochemistry; calorimetry; chemical energy; chemical thermodynamic data; energy scale (chemical); equilibrium measurements; mass spectrometry; 15430.
Measurement system identity; technology assessment; flow measurement study; fluid flow measurement system; 15405.
Measurement systems; Metric system; modernized metric system; SI; weights and measures; International system of units; SP3044.
Measurement technique; methane; self-diffusion coefficient; argon; critical review; krypton; 14831.
Measurement theory; calorimetry; energy equivalents; energy measurement; heat transfer; internal energy measurement; isoperibol calorimeters; 15102.
Measurement tools; performance measurement; computer architecture; functional evaluation; hardware monitor; SP406, pp. 75-78.
Measurement unit; process variability; uncertainty; measurement algorithm; measurement assurance; measurement process; Monogr. 149.
Measurements; MeV range 2 to 4.5; neutrons; time-of-flight; Hauser-Feshbach; inelastic-scattering; SP425, pp. 871-874.
chemical analysis; industrial hygiene; 15331.

Mercury; reference samples; trace elements; body fluids; fluorescent; lead; 15408.

Mercury; stabilization; standard reference material; trace element; water standard; 15458.

Mercury in coal; trace analysis; x-ray fluorescence; x-ray spectroscopy; background; NBSIR 75-675.

Mercury manometer; pressure; manometry; 14921.

Mercury molecules; new spectroscopic techniques; optical excitation; potential curves; dissociation laser; excimers; excited state kinetics; f-values; Monogr. 143.

Meson spectroscopy; algebra of currents and quarks; constituent quarks; current quarks; hadronic structure; melosh transformation; 15073.

Message network synthesis; network optimization; satellite; service improvement; communication; cost-benefit; deployment; electronic transmission; facility location; mail; mathematical programming; NBSIR 75-737.

Metabolic processes; microcalorimetry; thermochemistry; thermodynamics; adenosine-5'-triphosphate; biochemistry; enzyme catalyzed reactions; glucose; heat measurements; hexokinase; 15174.

Metabolism; microcalorimetry; Arbacia punctulata; calorimetry; cleavage of cells; development of cells; fertilization; growth of cells; heat production; marine eggs; 15151.

Metal; 5f electron; actinides; Coulomb term; energy; excitation energy; 15129.

Metal coatings; coatings; copper; density; electrodeposited coatings; electrodeposits; 15580.

Metal coatings; properties of electrodeposits; thickness gages; thickness measurement; coating thickness; coating thickness gages; coatings; electrodeposited coatings; electroplated coatings; 15360.

Metal coatings; test methods for metal coatings; testing electrodeposits; coatings; electroplated coatings; 14743.

Metal detector; performance standard; security; weapon detection; handgun detection; 15306.

Metal detector; weapons detection; 14988.

Metal ions; mordant; adhesive bonding; chelation; cemonomers; coupling agents; dental materials; hard tooth tissues; 15161.

Metallic implants; nerve prosthesis; synthetic implants; thromboresistance; biocompatibility; biomaterials; blood protein; ceramic implants; implantable electrodes; 15415.

Metallic implants; systemic effects; corrosion; inflammatory response; 15415.

Metallic phase transitions; phonon dispersion; Raman scattering; silicon; Gallium phosphides; high pressure; 15187.

Metallurgical; reliability (microelectronic); transistors; wire bond; bond pull test (nondestructive); 15430.

Metallurgical failure modes; microelectronic; thermocompression bonds; ultrasonic bonds; bonds (wire); failure modes; 15431.

Metallurgical variables; nondestructive testing; pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics; aluminum ultrasonic standards; ASTM-type reference blocks; fabrication of reference blocks; immersion testing; longitudinal waves; NBSIR 75-685.

Metals; microscopy; surfaces; cracks; flaws; ion beam milling; TN862.

Meta-stable compound; neutron diffraction; NH4ClO4; thermal motion; crystal structure; low temperature; 15223.

Metastable fluids; nonlinear operator; pair correlation function; single particle probability density; branching; freezing points; 15178.

Metastable solvus; microstructural sequence method; nucleation; ordering; precipitation; spinodal decomposition; age hardening; copper-titanium; Dla; 15053.

Meter; metric; pulses; robot; sound; construction; dry weight; ears; energy; health care; hospitals; measurement science; DIM/NBS 59, No. 10, 218-239 (1975).

Metering; modern; museum; primary; reliability; renovation; secondary; system; variable; anchor; controls; corrosion; growth; BSS66, pp. 102-115.

Methacrylate; phthalate; N,N-dimethyl-p-toluamide; ultraviolet spectroscopy; aromatic amine; charge-transfer complexes; color; dental material; 15158.

Methane; metric; police protection; safer streets; security systems; WVW/WWVH; accelerator facilities; computers; court records; fire safety; forensic science; law enforcement; DIM/NBS 59, No. 3, 49-72 (1975).

Methane; molecular dynamics; potential function; self-diffusion coefficient; 11-8 potential function; correlation function; experimental data; hydrodynamic behavior; 15173.

Methane; molecular dynamics; potential function; specific heat; statistical mechanical ensembles; thermodynamic properties; three body forces; 15310.

Methane; NBS equation; scaling laws; statistical analysis; steam; universality; air constituents; critical region parameters; ethylene; heavy noble gases; helium; linear model; 15601.

Methane; n-hexane; oscillator strengths; spectra; electron; energy loss; 15443.

Methane; n-hexane; oscillator strength; electron; electron scattering; energy loss; 15444.

Methane; nitrogen; Henry's constants; liquid-vapor phase equilibria; 15159.

Methane; orthobaric densities; specific heats; vapor pressures; coexistence boundary; critical point; ethane; equation of state; fluids; J.79A No. 1, 71-79 (1975).

Methane; rare gas ions; rate constants; silane; charge transfer; Franck-Condon factors; ion-molecule reactions; 14839.

Methane; rectilinear diameter law; refractive index; refractometric virial coefficients; critical refractive index; Fabry-Perot interferometer; Lorenz-Lorentz function; 15137.

Methane; safety; vents; automobile; detection; dispersion; explosion; fire; hydrogen; leakage; TN666.

Methane; self-diffusion coefficient; argon; critical review; krypton; measurement technique; 14831.

Methane; sound velocity; specific heat ratio; compressibility; interferometry; light scattering; 15639.

Methane; thermal conductivity; thermal conductivity coefficient; viscosity coefficient; correlation; critical point; equation of state; 15184.

Methane spectra; recoil; saturated absorption; laser spectroscopy; 14951.

Methane stabilized helium-neon lasers; noise studies; quartz crystal oscillators; quartz crystal resonators; accuracy; atomic clocks; cesium standards; hydrogen standards; hydrogen storage device; 14846.

Methanol; radiation chemistry; rates; review; chemical kinetics; data compilation; NMRDS-NBS54.

Method of measurement. electrical; semiconductor devices; temperature, peak; thermal properties; transistors, power; safe-operating area; 15493.

Methodology; relative humidity; structural sandwich panel; temperature; testing; building composite; building material; conditioning; equilibration; gypsum wallboard; NBSIR 75-767.

Methyl; methylene; photoionization; radicals; vacuum ultraviolet; enthalpy of formation; ions; mass spectrometry; 15351.

Methyl; methylene; radicals; rate constant; combination; flash photolysis-gas chromatography; 15205.

Methyl; nitric oxide; oxygen; rate constants; combination; kinetics; 15328.

Methyl azide; methylenimine; normal coordinate analysis; photolysis; thermodynamic properties; C=N bond; infrared spectrum; isotopic substitution; matrix isolation; 15110.

Methyl branches; paraffins; polyethylene; potential energy cal-
culations; relaxation strength; two-site model; mechanical relaxation; 14752.
Methyl branches; paraffins; polyethylene; potential energy calculations; relaxation mechanism; relaxation strength; site model; mechanical relaxation; 15329.
Methylcyclopentane; parent ions; charge transfer reactions; cycloalkanes; cyclohexane; gas phase; 14899.
Methylene; photoionization; radicals; vacuum ultraviolet; emissivity of formation; ions; mass spectrometry; methyl; 15351.
Methylene; radicals; rate constant; combination; flash photoly-sis; gas chromatography; methyl; 15205.
Methylenamine; normal coordinate analysis; photolysis; ther-modynamic properties; C=N bond; infrared spectrum; isotopic substitution; matrix isolation; methyl azide; 15110.
Methylthiotetrafluorophosphorane; nuclear magnetic resonance; phosphorus; fluorine; 14798.
Metré; ozone problem; police communications; water pollution; x rays; air pollution; camera guidelines; computerized elections; dental fillings; DIM/NBS 59, No. 5, 97-120 (1975).
Metric; police protection; safer streets; security systems; WWV/WWVH; accelerator facilities; computers; court records; fire safety; forensic science; law enforcement; methane; DIM/NBS 59, No. 3, 49-72 (1975).
Metric; protecting nuclear fuels; computers; energy research; ethylene; fabric flammability; glass standards; household fires; jet engines; measurement seminars; DIM/NBS 59, No. 1, 1-24 (1975).
Metric; pulses; robot; sound; construction; dry weight; ears; energy; health care; hospitals; measurement science; meter; DIM/NBS 59, No. 10, 218-239 (1975).
Metric changeover; safety; air conditioners; appliance; bone cement; computer; energy; energy labels; fire fatalities; hydrogen fuel; magnetohydrodynamics; DIM/NBS 59, No. 6, 121-144 (1975).
Metric chart; metric information; bibliography of metric information; customary units; history of measurement systems; SP410.
Metric conversion; net weight; package control; petroleum products; scales; survey; temperature compensation; uniformity; weights and measures; digital indicators; drained weight; laws and regulations; metrication; SP407.
Metric conversion; piezoelectric accelerometers; sun; buildings; computer codes; computer networks; computers; copyrights; energy; epoxies; hazard; DIM/NBS 59, No. 4, 73-96 (1975).
Metric conversion; round off; computer program; 15406.
Metric conversion; rounding; test problem; tolerance; Caterpillar Tractor Co.; computer program; documentation; engineering drawing; General Motors Corporation; TN872.
Metric conversion; SI units; standards; ADP standards; computers; data processing. Federal Information Processing Standards; FIPS PUB 34.
Metric information; bibliography of metric information; customary units; history of measurement systems; metric chart; SP410.
Metric System; conversion; FORTRAN; 15490.
Metric system; conversion; international standards; legislation; measurement language; metrication; 14837.
Metric system; modernized metric system; SI; weights and measures; international system of units; measurement systems; SJ3044.
Metric system; weights and measures; consumer metric information; International System of Units; kitchen measurement units; SP430.
Metric units; SI; systems of units; units of measurement; International System of Units; measurement units; 15481.
Metrication; metric conversion; net weight; package control; petroleum products; scales; survey; temperature compensation; uniformity; weights and measures; digital indicators; drained weight; laws and regulations; SP407.
Metrical; metric system; conversion; international standards; legislation; measurement language; 14837.
Metrical; product-dimensions; building industry; conversion; engineering; human and modular standards; 15454.
Metro; motor vehicle safety standard 302; urethane; AM General Bus; arsenic; critical radiant flux; fire retardant; flammability; flooring radiant panel test; NBSIR 75-718.
Metrology; standard; unit; watthour meter calibration; watthour meter; calibration; current comparator; electrical energy unit; 14881.
Metrology curriculum; measurement education; 14845.
MeV range 2 to 4.5; neutrons; time-of-flight; Hauser-Feshbach; inelastic-scattering; measurements; SP425, pp. 871-874.
MHD; thermionic emission; vaporization; viscosity; coal slags; 15449.
MHD electrodes; mixed ceria; conductivity; doped ceria; high temperature; 15057.
MHD materials; phase equilibrium; slag; vaporization; viscosity; electrical conductivity; 15510.
Mica detector; polycarbonate detector; rapid analysis; uranium; coal; fission track technique; fly ash; 15457.
Micro determination of refractive index; microscope for accurate determination of refractive index; multiple prisms; identification of compounds by refractive index; 15098.
Macroanalysis; qualitative analysis; quantitative analysis; specimen preparation; x rays; electron probe microanalyzer; 14897.
Microanalysis; specimen preparation; crystal spectrometers; elemental distribution; elemental identification; energy dispersive spectrometers; 15247.
Microbial corrosion; mild steel; oxidizing agent; Schreibersite; sulfate-reducing bacteria; Vivianite; anaerobic corrosion; cathodic depolarization theory; Charles Thom Award; Desulfovibrio desulfuricans; hollow whiskers; mechanism; 15233.
Microbial corrosion; prevention; economics; history; iron mechanisms; 14781.
Microbiological growth; relative humidity; salt solutions; saturated salt; humidity; humidity chamber; NBSIR 75-917.
Microbiology; sampling; chemistry; clinical laboratory capabili-ty; critique; hematology; 15244.
Microbiology; sampling; chemistry; clinical laboratory capabili-ty; critique; hematology; 15273.
Microcalorimetric; thermochromy; analysis; clinical chemistry; glucose; 15319.
Microcalorimetry; Arbacia punctulata; calorimetry; cleavage of cells; development of cells; fertilization; growth of cells; heat production; marine eggs; metabolism; 15041.
Microcalorimetry; serum thermochromy of enzyme processes; analysis; assay in serum; bacterial growth calorimetry; enzyme catalyzed processes; glucose; 14898.
Microcalorimetry; thermochromy; thermodynamics; adenosine-5'-triphosphate; biochemistry; enzyme catalyzed reactions; glucose; heat measurements; hexokinase; metabolic processes; 15174.
Microcalorimetry; tritium standards; gas counting; 14801.
Microcomputers; minicomputers; networks; standards; 15643.
Microracking; moiré patterns; brittle solids; dislocation networks; electron microscopy; heating; indentations; 15400.
Microracking; moiré patterns; brittle solids; dislocation networks; electron microscopy; heating; indentations; NBSIR 75-619.
Microcracks; microfibrils; radicals; bond rupture; chain rupture; ESR; fibrils; load-elongation curve; 15555.
Microdensitometry; microphotometry; optical density; 15377.
Microdensitometry; microscopy resolution charts; National Measurement System; densitometry; lens evaluation; 15394.
Microdensitometry; optical imaging; partial coherence; coherence measurement; 15290.
Microwave power; automation; calibration; directional coupler; microwave: 15650.

Microwave power; calibration; calibration factor; directional coupler; measurement; microwave: 15662.

Microwave radiation; microwaves; product safety; radiation; radiation effects; resonant cavity; rhesus; suppression; behavior; behavioral suppression; exposure: 15194.

Microwave refractometer; humidity; hygrometer: 15228.

Microwave spectra; predicted spectra; radio astronomy; silicon molecules; structures; unidentified molecular lines: 14867.

Microwaves; phase angle; ratio; six-port junction; vector voltage; voltage; attenuation; automation; detector; insertion loss: 15649.

Microwaves; product safety; radiation; radiation effects; resonant cavity; rhesus; suppression; behavior; behavioral suppression; exposure; microwave radiation: 15194.

Migration; oxide; proton; range; scattering; depth; deuterium; diffusion; elastic; helium: SP425. pp. 488-491.

Mild steel; oxidizing agent; Schreibersite; sulfate-reducing bacteria; Vivianite; anaerobic corrosion; cathodic depolarization theory; Charles Thom Award: Desulfovibrio desulfuricans; hollow whiskers; mechanism; microbial corrosion: 15233.

Military vehicles; noise; sound; tire noise; truck tires; acoustics: 14875.

Millikelvin; thermometry; carbon resistors; cryogenics; liquid helium: 15537.

Mine noise; spectral density; time-dependent spectral density; amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier transform; Gaussian distribution; impulsive noise; NBSIR 74-391.

Mineral analysis; secondary ion mass spectrometry (SIMS); surface analysis; Auger electron spectroscopy; elemental depth profiling; ion microprobe mass analysis; ion optics; local thermal equilibrium (LTE): SP427.

Minerals; optical properties; twinning; unit cell dimensions; cleavage; compilation; crystal; crystal habit; crystal space group; crystal structure types; density; determination; identification: 15084.

Minicomputer; modular; multiparameter; on-line; CAMAC; disc; SP425. pp. 97-98.

Minicomputer; multi-task; performance testing; process control; real-time; RTOS; automation; calibration; fuel control; jet engine; 15550.

Minicomputer; shakers; standards; transducers; vibration; vibration exciters; vibration pickups; acceleration; automation; calibration; measurements; NBSIR 74-482.

Minicomputer applications; minicomputer controlled tests; supervisory control; test equipment reliability; automated test equipment; automated tests for jet engine fuel controls; computer interfacing; digital computer controlled tests; jet engine fuel control testing: 15087.

Minicomputer controlled tests; supervisory control; test equipment reliability; automated test equipment; automated tests for jet engine fuel controls; computer interfacing; digital computer controlled tests; jet engine fuel control testing: 15087.

Minicomputer-based systems; MUMPS; MUMPS Development Committee; MUMPS Language Standard; data handling language; interactive computing; interpretive computer programming language and operating system; medical automation: H118.

Minicomputer-based systems; operating systems; automated computer access; computer networking; macro processor: 15544.

Minicomputers; computer graphics; cost-benefit analysis; economic analysis; graphics: 15488.

Minicomputers; networks; standards; microcomputers: 15643.

Minicuters; on-line analysis; quantitative electron probe microanalysis; scanning electron microscopy; SRM-480; empirical methods: 15248.

Minicuters; protocols; access procedures; command language; computer networks; micros: 15541.

Minima; Monte Carlo; cross section; fission neutrons; inelastic scattering; iron; SP425. pp. 440-443.

Minimum discrimination information; statistical analysis; categorical data; contingency tables; loglinear model: 14852.

Mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; TN672.

Mixed ceria; conductivity; doped ceria; high temperature; MHD electrodes: 15057.

Mixed radio nuclide; standards; energy efficiency curves; gamma ray: 14820.

Mixtire; liquid; nitroethane; sedimentation; critical point; critical solution point; densimeter; magnetic; diffusion; pressure; gradient; concentration; gradient; density; gravity; effects of; 3-methylpentane: 14944.

Mixtire; binary; mixture; liquid; nitroethane; thermal expansion; 3-methylpentane; consolute point; critical exponent \( \alpha \); critical phenomena; critical solution point; density; gravity effects; 15691.

Mixtire; liquid; nitroethane; thermal expansion; 3-methylpentane; consolute point; critical exponent \( \alpha \); critical phenomena; critical solution point; density; gravity effects; mixture, binary; 15691.

Mixtures; molecular weight distribution; monodisperse poly-\( \alpha \)-methylstyrene; thermal degradation: 15543.

Mössbauer; NQR; nuclear quadrupole coupling; organotin; organometallic: 14816.

Mössbauer effect; Ni; Sb; Pd; alloys; Cu; hyperfine fields; magnetism; Mn: 15016.

Mössbauer spectrometry; nuclear resonance; materials characterization: 14818.

Mössbauer spectrometry; quantitative analysis; Stannic oxide; tin ores: 15358.

Mössbauer spectroscopy; porous glass; fluorescence: 15115.

Mössbauer spectroscopy; quadrupole splitting; temperature dependence; diffusion; doping; Fe-57; iron-doped; lattice distortion: 15332.

M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal; diagonally dominant; diagonal matrix; D-stability; Gersgorin's theorem; Lyapunov's theorem: 14782.

M; Mössbauer effect; Ni; Sb; Pd; alloys; Cu; hyperfine fields; magnetism; 15016.

\( \text{Mn}(n, \gamma) \); neutron capture gamma-rays; \( ^{6}\text{Li} \); filter; \( ^{154}\text{Gd}(n, \gamma) \); \( ^{156}\text{Gd}(n, \gamma) \); iron filter; SP425. pp. 912-915.

Mobile home parks; mobile homes; performance data; standards; computer techniques; enforcement process; housing: Hurricane Agnes; NBSIR 75-690.

Mobile home parks; performance data; regulatory process; standards; construction; Hurricane Agnes; housing; mobile homes: NBSIR 75-641.

Mobile homes; mobile home parks; performance data; regulatory process; standards; construction; Hurricane Agnes; housing: NBSIR 75-641.

Mobile homes; NCSBCS; ASHRAE 90-P; building codes: SP429.

Mobile homes; performance data; standards; enforcement process; field inspection; house trailers; housing; Hurricane Agnes; NBSIR 75-688.

Mobile homes; performance data; standards; computer techniques; enforcement process; housing; Hurricane Agnes;
Moire patterns; brittle solids; etch networks; electron microscopy; heating; indentations; microcracking; NBSIR 75-658.

Moist air; saturated air; second virial coefficients; virial coefficients; enhancement factor; equation of state; interaction virial coefficients; J.79A No. 4, 551-560 (1975).

Moisture; standard; water vapor; humidity measurement; 14727.

Moisture content; surface area; water content; water vapor adsorption; adsorption; computer application; desorption; dry weight determination; J.79A No. 4, 565-576 (1975).

Molded; morpholine; prefabricated steel conduit; Qualified Products List; tieline; condensate return; epoxy; fiberglass reinforced plastic; filament-wound; insulated; BSS66, pp. 88-101.

Molecular bands; molecular spectra; rotational constants; atomic energy levels; atomic line shapes; atomic spectra; atomic transition probabilities; bands; molecular; energy levels; atomic; line shapes; atomic; 15260.

Molecular cloud; molecular spectroscopy; radio astronomy; Sagitarius B2; ethyl alcohol; interstellar chemistry; 15001.

Molecular constants; perturbations; sodium molecule; spectroscopy; alkali dimer; magnetic rotation; 15516.

Molecular correlation functions; phase transitions; equation of state; freezing; freezing criteria; melting; 14728.

Molecular CO2; molecular oxygen; O and C KA x-ray emission spectra; O K absorption spectra; 15256.

Molecular dynamics; neutron; nuclear reactor; radiation; radiography; activation analysis; crystal structure; diffraction; isotopes; TN680.

Molecular dynamics; potential function; self-diffusion coefficient; 11-6-8 potential function; correlation function; experimental data; hydrodynamic behavior; methane; 15173.

Molecular dynamics; potential function; specific heat; statistical mechanical ensembles; thermodynamic properties; three body forces; methane; 15310.

Molecular dynamics; rare gases; velocity autocorrelation function; 11-6-8 potential; Axilrod-Teller correction; dense liquid; excess function; hydrodynamic limit; 15168.

Molecular dynamics; shock waves; blast waves; computer simulation; interatomic potentials; lattice dynamics; 15434.

Molecular emission; Orion Nebulae; silicon monoxide; rotational transitions; maser; M-type stars; 15210.

Molecular energy levels; ozone; pollution; spectra; absorption spectra; infrared; 15311.

Molecular geometry; NO2; spectra; dipole moment; excited states; MC-SCF; 15336.

Molecular motions; nuclear magnetic resonance absorption; polyoxymethylene crystals; solid state polymerization; trioxane crystals; dielectric loss; dielectric relaxation; 15359.

Molecular oxygen; dissociation; electron; ionization; 14756.

Molecular oxygen; O and C KA x-ray emission spectra; O K absorption spectra; molecular CO2; 15256.

Molecular oxygen; oscillator strengths; spectra; electron; energy loss; 15446.

Molecular oxygen; predissociation; spin-orbit matrix elements; ab initio calculation; level shifts; line broadening; 15055.

Molecular packing; tetraazacyclooctane derivatives; x rays; crystal structure explosives; least-squares refinement; 15574.

Molecular reorientatıon; Raman spectra; vibrational relaxation; chloroform; infrared spectra; 15700.

Molecular spectra; non-LTE; solar model; upper photosphere; carbon abundance; 15044.

Molecular spectra; OH; radiative lifetimes; spin uncoupling; vibration-rotation interaction; vibrational transitions; Einstein coefficients; line strengths; Meinel bands; 14767.

Molecular spectra; rotational constants; atomic energy levels; atomic line shapes; atomic spectra; atomic transition probabilities; bands; molecular; energy levels; atomic; line shapes;
atomic; molecular bands; 15260.
Molecular spectra; solar photosphere; carbon abundance; 15585.
Molecular spectra; spectra; thioborine; absorption spectra; force constants; HBS; infrared; 15000.
Molecular spectroscopy; radio astronomy; Sagittarius B2; ethyl alcohol; interstellar chemistry; molecular cloud; 15001.
Molecular structure; charge transfer; CO$_2$; infrared spectrum; ion-molecule aggregates; matrix isolation; 14722.
Molecular structure; critical evaluation; crystal structure; data analysis; 15483.
Molecular term values; spectra; spectroscopy; high temperature; hydrogen cyanide; infrared; 15436.
Molecular weight; nucleation theory; polyethylene; surface free energies; chain folds; fractions; homogeneous nucleation; J.79A. No. 6, 701-711 (1975).
Molecular weight; nucleation theory; polyethylene; regime I; regime II; spherulite; axialite; chain folds; crystallization rate; J.79A. No. 6, 671-699 (1975).
Molecular weight distribution; monodisperse poly-$\alpha$-methyl-styrene; thermal degradation; mixtures; 15543.
Molecule; negative ion; O$_2$; O$_2$; O$_2$; photodetachment; photodissociation; cross section; drift tube; experimental; 15478.
Molecules; atoms; electron excitation; excitation transfer; gaseous electronics; lasers; 14849.
Molecules; nitrogen; electrons, ions; 15298.
Molecules; noble gases; lithium; 15289.
Molecules; noble gases; radiation; sodium; 15167.
MOL-ΣΣ facility; uranium-238 capture rates; fast reactors; fission chambers; fission rates; mass assay; SP425, pp. 258-261.
Molten salt mixtures; standard reference data; surface tension; viscosity; chlorides; data compilation; density; electrical conduction; J. Phys. Chem. Ref. Data 4, No. 4, 871-1178 (1975).
Molybdenum; nickel; normalization; standard reference materials; thermal ionization; isotope dilution; isotopes; mass spectrometry; 14904.
Molybdenum; niobium; plutonium; potassium; praseodymium; promethium; rehminium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).
Molybdenum; radiation temperature; wavelength; melting point; 15557.
Molybdenum; radiopassivation kinetics; stainless steels; stress corrosion; testing techniques; chloride; crevice corrosion; ellipsometry failure prediction; NBSIR 74-583.
Moments; adjacent; annihilation; buildup factor; concrete; gamma radiation; 14940.
Moments; neutron penetration; secondary gamma rays; adjacent; concrete; gamma-ray penetration; 15453.
Moments; slenderness ratio; stability; structural engineering; walls; bricks; buckling; deflection; loads (forces); masonry; 15507.
Momentum-dependence; Weisskopf-Wigner; CP-violation; decays; direct tests; kaon; lepton-asymmetry; 15211.
Monitor; neutron; proportional; counter; flux; hydrogen; SP425, pp. 78-80.
Monitoring; operating systems; performance objectives; computer architecture; computer performance evaluation; installation management; measurement; modeling; SP406.
Monitoring; priorities; product classes; test methods; voluntary; education; efficiency comparison; household appliances; household equipment; label developments; labeling; label specification; 15204.
Monitoring register; software monitoring; system reliability; hardware monitoring; SP406, pp. 87-96.
Monocalcium phosphate; monohydrate; neutron diffraction; phosphate; water molecule; hydrate; hydrogen bonding; 14864.
Monodisperse poly-$\alpha$-methylstereene; thermal degradation; mixtures; molecular weight distribution; 15543.
Monoeenergetic x-ray beams; optimum radiographic systems; transmission radiography; x-ray image signals; x-ray scatter; image contrast; 15276.
Monohydride; neutron diffraction; phosphate; water molecule; hydrate; hydrogen bonding; monocalcium phosphate; 14864.
Monomers; polymers; primes; sealants; adhesion; bonding; composites; coupling agents; 15374.
Monomers; resins; synthesis; composites, dimethacrylates; 15159.
Monopole excitation; monopole strength; $^3$He; electrode disintegration; electron scattering; inelastic electron scattering; 15105.
Monopole state; multipole decomposition; zero range approximation; continuum; electron scattering; helium-3; 15608.
Monopole strength; $^3$He; electrode disintegration; electron scattering; inelastic electron scattering; monopole excitation; 15105.
Monotonicity; principal submatrix; spectral radius; vector norm; consistency; matrix norm; J.79B. Nos. 3 and 4, 97-102 (1975).
Monte Carlo; cross section; fission neutrons; inelastic scattering; iron; minima; SP425, pp. 440-443.
Monte Carlo; multigroup; reactor; resonance; slowing-down; stochastic; transport; benchmark; cross section; eigenvalue; SP425, pp. 451-454.
Monte Carlo; neutron attenuation; time of flight; ilmenite concrete; SP425, pp. 409-414.
Monte Carlo; neutrons; scintillators; time-of-flight; detector; flux; SP425, pp. 73-74.
Monte Carlo; probability; resonance; thinning; unresolved; cross section; interpolation; SP425, pp. 447-450.
Monte Carlo analysis; ordered spans; self-avoiding polymer chains; shape of polymer chains; spans; unrestricted polymer chains; 15622.
Monte Carlo calculations; multiple scattering; industrial gauging; isotopes; SP425, pp. 500-503.
Monte Carlo calculations for corrections; total energy weighting technique; $^{4}$He detector; absolute values; fluctuations; SP425, pp. 957-960.
Monte Carlo method; 14 MeV neutron shielding; application of nuclear cross section; SP425, pp. 426-430.
Monte Carlo methods; quantitative analysis; scanning electron microscopy; electron probe microanalysis; empirical methods; Fe-Si alloys; 15246.
Monte Carlo simulation; particulate analysis; scanning electron microanalysis; x-ray microanalysis; x-ray source size; backscattered electrons; electron specimen interaction; 15038.
Monte Carlo simulation; symmetry change; van der Waals isotherm; fluid-solid phase transition; Lennard-Jones model; melting and freezing densities; 14736.
Monte Carlo Studies; coexisting densities; finite system; “flat” loop; fluid-solid phase transition; Lennard-Jones System; 15176.
Monte-Carlo computations; chase transition; scattering function; chain correlation; chain statistical parameters; light scattering; 15209.
Moon; plate tectonics; crustal movements; earth rotation; geophysics; lasers; lunar cartography; lunar gravity; 15437.
Moon; selenodesy; astronomy; cartography; geophysics; laser; lunar distance; 14892.
Mordant; adhesive bonding; chelation; comonomers; coupling agents; dental materials; hard tooth tissues; metal ions; 15161.
Morpholine; prefabricated steel conduit; Qualified Products List; tile; condensate return; epoxy; fiberglass reinforced plastic; filament-wound; insulated; molded; BSS66, pp. 88-101.

Morphology; permeation; permeation tubes; polymer structure; sulfur dioxide; density; fluorocarbon copolymer; 15509.

Mortars (materials); walls; brick; dolomitic mineral; masonry; 15582.

MOS devices; oxide films; photomasks; photoresist; resistivity; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; test patterns; thermal resistance; thermal response; SP400-8.

MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; SP400-17.

MOS devices; oxide films; resistivity; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; SP400-12.

Most-probable energy loss; target thickness; energy loss; ionization loss; 15360.

Motion picture surveillance; robbery; sequence cameras; shoplifting; surveillance; surveillance cameras; cameras; demand cameras; employee theft; fixed surveillance; 14923.

Motor efficiency; net positive suction head; pump efficiency; pump performance; cavitation; cryogenic motors; induction motors; liquid helium pumps; NBSIR 75-816.

Motor vehicle safety standard 302; urethane; AM General Bus; arson; critical radiant flux; fire retardant; flammability; floor- ing radiant panel test; Metro; NBSIR 75-718.

Moving boundary problems; numerical methods; partial differential equations; semiconductor technology; diffusion equations; finite-difference techniques; impurity redistribution; 15175.

Moxon-Rae; review; total absorption; activation; capture techniques; high resolution methods; SP425, pp. 139-148.

M-spin; scattering amplitudes; Weinberg; gauge theories; lepton; muon; 14942.

M-type stars; molecular emission; Orion Nebulae; silicon monoxide; rotational transitions; maser; 13210.

Multiaxial; plasticity; thermodynamics; dislocation; 14979.

Mulgird; reactor; resonance; slowing-down; stochastic; transport; benchmark; cross section; eigenvalue; Monte Carlo; SP425, pp. 451-454.

Mulgird capture cross section; Na; self shielding factor; 24 keV; 160 keV; Fe; SP425, pp. 961-963.

Mulgird cross sections; neutron reactions; heavy actinides; reactor production experiments; heavy actinide burnup; SP425, pp. 224-228.

Multi-group data; survey; computer codes; SP425, pp. 848-854.

Multilayer cylinder; reference values; scattering; cylinder scattering; electromagnetic scattering; lossy dielectric; 15648.

Multilevel fits; polarized neutrons; polarized target; 

\[ ^{238}U(n,f) \]

fission channels; J; SP425, pp. 576-579.

Multilevel R-matrix resonance analysis; Fe(n). \( E_n = 0.5-30 \) MeV; measured \( \sigma_{th} \); SP425, pp. 754-757.

Multiparameter; on-line; CAMAC; d:sc; minicomputer; modular; SP425, pp. 97-98.

Multiphoton; sodium; atom; dye laser; electric quadrupole; fine structure; ionization; 15149.

Multiple pipe system; underground pipe; chilled water pipe; earth temperature; heat transfer; BSS66, pp. 18-41.

Multiple prisms; identification of compounds by refractive index; micro determination of refractive index; microscope for accurate determination of refractive index; 15098.

Multiple scattering; industrial gauging; isotopes; Monte Carlo calculations; SP425, pp. 500-503.

Multiple scattering; neutrino-nucleus interactions; shadowing effects; diffractive production; diffractive scattering; Glauber model; hadronic components of photons; high energy scattering; Monogr. 139.

Multiplet tables; N, N II, N III; nitrogen spectra; N I, N II, N III; spectra; N I, N II, N III; NBS-RDS-NBS3, Section 5.

Multiplication; plasticity; Volterra; crystal; defect; disclination; dislocation; elasticity; jog; kink; 14745.

Multiplier chain; precision oscillator; rf spectrum; spectral density of phase fluctuations; spectral purity; frequency multiplication; linewidth; 15675.

Mulpole decomposition; zero range approximation; continuum; electron scattering; helium-3; monopole state; 15608.

Multi-programming; operating system; real-time; data acquisition; file system; laboratory automation; NBSIR 75-713.

Multi-task; performance testing; process control; real-time; R/OS; automation; calibration; fuel control; jet engine; minicomputer; 15550.

Multivariate analysis; order statistics; Princeton University; Rietz, H. L.; Shewhart, W. A.; statistical tolerance limits; Wilks, S. S.; Wishart, John; Annals of Mathematical Statistics; Army Experiment Design Conferences; 15513.

Multwire proportional counter; radioactivity \( ^{85}Kr \) \([\text{from}\ (n, y)]\); deduced \( Q_{dec} \); log \( I/J \); enriched \( ^{85}Kr \) target; isotope separated sources; measured \( I/K \) EC ratio; 15197.

MUMPS; MUMPS Development Committee; MUMPS Language Standard; data handling language; interactive computing; interpretive computer programming language and operating system; medical automation; minicomputer-based systems; H1118.

MUMPS Development Committee; MUMPS Language Standard; data handling language; interactive computing; interpretive computer programming language and operating system; medical automation; minicomputer-based systems; MUMPS; MUMPS Development Committee; H1118.

MUMPS Language Standard; data handling language; interactive computing; interpretive computer programming language and operating system; medical automation; minicomputer-based systems; MUMPS; MUMPS Development Committee; H1118.

Muen; M-spin; scattering amplitudes; Weinberg; gauge theories; lepton; 14942.

Muen number; neutrino quarks; strong interactions; three triplet model; composite model of leptons; electron number; leptonic quarks; loks; muon-electron universality; 15614.

Muen-electron universality; muon number; neutrino quarks; strong interactions; three triplet model; composite model of leptons; electron number; leptonic quarks; loks; 15614.

Muscle; radiochromic dosimeters; x-ray spectra; bone; dosimetry; dyes; electron dosimetry; energy dependence; gamma rays; 15429.

Museum; primary; reliability; renovation; secondary; system; variable; anchor; controls; corrosion; growth; lighting; modern; BSS66, pp. 102-115.

Mustard gas; combustion; dichloroethyl sulfide; enthalpy; formation; heat; J. 79A No. 5, 634-638 (1975).

m-6-8 potential quadrupolar gas; second virial coefficient; viscosity coefficient; carbon dioxide; Clausius-Mossoti function; intermolecular forces; 15521.

\[ ^{v}N \]

\( v \) relative intensity; enriched source; Ge(Li) detector; measured \( T_{1/2} \); pressured ionization chamber; radioactivity \( ^{133}Xe \); 14812.
(n,a) cross sections; fast-neutron reactions; lithium; nuclear reactions; SP245, pp. 240-243.

NaCl pressure scale; pressure measurement; ruby fluorescence; semiconductors; transition pressures; diamond-anvil pressure cell; fixed point pressure scale; high pressure: 15224.

Na-D photonutron sources; radiolysis; spectrum; calibration; construction; SP425, pp. 112-115.

Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences; co-convergent; contra-convergent; J.79B Nos. 1 and 2, 63-69 (1975).

Nagata spaces; open neighborhood assignments; stratifiable spaces; U-linked sequences; co-convergent; contra-convergent; J.79B Nos. 3 and 4, 103-105 (1975).

NaK molecule; spectroscopy; diatomic mercury; excimer molecules; fluorescence; lasers: 15685.

National Bureau of Standards; performance of plumbing systems; plumbing code; principles of hydraulics: 15024.

National Bureau of Standards; on-line information retrieval systems; use statistics; evaluation: 15378.

National Bureau of Standards; programs for architects; research communication; AIA/NBS Architect-in-Residence; architectural research; daylight research: 15606.

National Bureau of Standards; reference methods: SI units; length; mass: 15678.

National economy; national/international measurement system; international measurement; measurement system: 15171.

National Fire Data System; data; fire; fire incident system; fire service; incident reports; loss: 15632.

National Fire Data System; National Fire Survey; survey; Census Bureau; Consumer Product Safety Commission; data; fire; households; injury; loss: 15656.

National Fire Survey; survey; Census Bureau; Consumer Product Safety Commission; data; fire; households; injury; loss; National Fire Data System: 15656.

National Measurement System; densitometry; lens evaluation; microdensitometry; microscopy resolution charts: 15394.

National measurement system; noise; noise control; noise emission; sound; acoustical measurements; acoustics: 15500.

National Measurement System; surface finish; surface roughness; calibration; economic dimensions: 15395.

National measurement system; technology transfer; voluntary standards; computer science; laboratory accreditation; measurement: 14920.

National Science Computer Network; network management; computer networks: 15448.

National Standard Reference Data System; physical sciences; critically evaluated numerical data; 15305.

National Standard Reference Data System; cumulative property index; data compilations; NSRDS-NBS55.

National standards activities; recommended practices; specifications; standardization activities; standards—standardization activities; test methods; codes; consensus system; directory; Federal Government—standardization; industry standards activities; SP417.

National temperature measurement system; temperature scale; thermometer calibration; thermometer production; thermometry; measurement accuracy: 15060.

National/international measurement system; international measurement; measurement system; national economy: 15171.

Natural aging; old paper; paper, aging of; paper, stability of; paper testing; stability of paper; aging of paper; archival materials; NBSIR 74-501.

Natural aging; paper; permanent; paper, stability; permanent papers; record papers; stability of paper; accelerated aging; aging; NBSIR 74-632.

Natural aging; permanence; record materials; record papers; stability; accelerated aging; NBSIR 75-739.

Natural convection; sphere; vertical cylinder; cryogenic; heat transfer; hemisphere; horizontal cylinder; liquid deuterium; liquid hydrogen; liquid nitrogen; NBSIR 75-807.

Natural disasters; seismic; structural engineering; building; codes; earthquake damage; earthquakes; hazards; hospital; 14759.

Natural disasters; structural engineering; wind damage; wind loads; buildings; codes and standards; cyclones: 15609.

Natural hazards; structural engineering; tornados; wind; buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; B5561.

Natural homomorphism; parabolic classes; automorphs; elliptic classes; finite fields; genus; modular group; 14972.

Natural iron target: nuclear reaction; 56Fe (n,y); relative partial radiation widths; y-transitions in 57Fe of 56Fe resonances; Eγ = 7-70 keV: SP425, pp. 816-818.

Natural resources; reclamation; conservation; materials recovery: 15603.

Natural rubber; neoprene; physical constants; polymers; properties; rubbers; styrene-butadiene rubbers; butyl rubber; constants: 14858.

Natural U; resonance parameters τγ up to 5 keV; three thicknesses; transmission measurements; 190-m flight path; background: JAERI linc; SP425, pp. 738-741.

Na2+: pseudopotential; Rb2+: resonant charge transfer; atom; collision; Cs2+: ion; Li2+: low energy; 15075.

Naγ; transition moment; electronic dipole moment; internuclear distance; laser fluorescence: 14810.

Na23: self shielding factor; 24 keV; 160 keV; Fe; multigroup capture cross section; SP425, pp. 961-963.

NBS analyzer; NBS FORTRAN test routines; networking; systematic testing; testing tools; dynamic analysis; TN874.

NBS equation; scaling laws; statistical analysis; steam; universality; air constituents; critical region parameters; ethylene; heavy noble gases; helium; linear model; methane: 15601.

NBS FORTRAN test routines; networking; systematic testing; testing tools; dynamic analysis; NBS analyzer; TN874.

NBS, GSA experiment; optical spectra; plastic pipes; thermal conductivity; computer; cryogenic; cryptography; data; energy labeling; energy needs; fluid safety; materials; DIM/NBS 59, No. 9, 193-216 (1975).

NBS reactor; radiation damage; thermal neutrons; Kossel diffuse fraction; lattice expansion; LiF: 15346.

NBS Standard Reference Material; orchard leaves; trace mercury; agriculture; environment; isolate dilution; mass spectrometry; 14789.

NBS traceability; phase comparison; television; crystal oscillator; frequency calibrator; frequency offset: 15140.

NBS traceability; phase comparison; television; crystal oscillator; frequency calibration; network-originated programs: 15682.

NBS-11; track-etch detector; 229U; 24Na; 9Be(y,n); fission cross section; manganese bath; SP425, pp. 635-636.

n-butane; potential barrier to internal rotation; equilibrium compositions; heat of isomerization; ideal gas thermodynamic properties; isobutane; J. Phys. Chem. Ref. Data 4, No. 4, 859-870 (1975).

N-butane; radical scavenging; vacuum ultraviolet photolysis: alkane; electronically excited molecule; hydrogen iodide: 14762.

NCSBCS; ASHRAE 90-P; building codes; mobile homes; SP429.

Ne; Ar; atoms; autoionizing; cross sections; electron impact; excitation; He; inelastic: 15586.

Near field; non-planar; patterns; scanning; spherical; symmetry; antennas; arrays; coordinate transformations; data processing; group representations; measurements: NBSIR 75-809.

Near field; probe correction; probe design; spherical scan; antenna measurements; data reduction: 14766.
Near-field; antennas; error analysis; measurements; 15664.
Near-field; antennas; extrapolation; measurements; 14784.
Near-field measurements; acoustics; electroacoustic transducers; 14900.
Near-field measurements: phased arrays; antennas; 14994.
Near-field measurements: planar scanning; plane-wave spectrum; antennas; error analysis; far-field pattern; TN667.
Near-field measurements; rf hazard measurements; semiconducting transmission line; electric near-field probe; electromagnetic-field hazard; field-strength measurements; magnetic near-field probe; TN658.
Near-field power; sound power estimation; error of sound power; far-field power; 15492.
Negative differential flow resistance; pressure measurement; system dynamics; thermometers; cooling system; cryogenics; helium-cooled electrical leads; helium impurities; microwave cavities; NBSIR 75-823
Negative ion; O$_2^-$; O$_3^-$; O$_4^-$; photodetachment; photodissociation; cross section; drift tube; experimental; molecule; 15478.
Negative ion; plasma; resonance; vacuum ultraviolet; arc; hydrogen; 15652.
Negative ions; nitric oxide; nitrous oxide; total scattering cross section; electron impact; electron scattering resonances; exponential attenuation; low energy; 14983.
Negative ions; photodetachment; tunable dye laser; intracavity technique; ion cyclotron resonance; mass spectrometry; 14770.
Negative ions; photodetachment; spin-orbit coupling; tunable dye laser; ion cyclotron resonance; mass spectrometry; 14771.
Neodymium 3$^+ $ ions; susceptibility; convergence criterion; crystal field parameters; energy levels; holmium 3$^+$ ions; 14862.
Neon; wavelength standards; hollow cathode; iron; J. 79A No. 1, 17-69 (1975).
Neopentane; primary photochemical processes; quantum yields; vacuum ultraviolet photolysis; free radical scavenging; hydrocarbons; isobutane; 14996.
Neopentane; proton transfer; photolysis; free radical reactions; G-values; ion-molecule reactions; 14890.
Neoprene; physical constants; polymers; properties; rubbers; styrene-butyadiene rubbers; butyl rubber; constants; natural rubber; 14858.
Neper; radian; angle; dimension; logarithm; J. 79B Nos. 3 and 4, 127-135 (1975).
Neptunium-237; neutron reactions; pile neutrons; plutonium; 239; uranium-234; uranium-235; uranium-238; cross sections; fission; 15020.
Nerve prosthesis; synthetic implants; thromboresistance; biocompatibility; biomaterials; blood protein; ceramic implants; implantable electrodes; metallic implants; SP415.
Net positive suction head; pump efficiency; pump performance; cavitation; cryogenic motors; induction motors; liquid helium pumps; motor efficiency; NBSIR 75-816.
Net weight; package control; petroleum products; scales; survey; temperature compensation; uniformity; weights and measures; digital indicators; drained weight; laws and regulations; metrication; metric conversion; SP407.
Network; computer network; management; 15547.
Network; performance; communications; computer; evaluation; measurement; 15693.
Network; performance; computer; consumer; contract; evaluation; 15642.
Network analyzer; adapter; automation; efficiency; microwave; microwave measurement; 14826.
Network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; TN672.
Network analyzer; pulse; S parameters; time domain; attenuation; automated measurement; 15661.
Network flows; independence properties; matroids; maximal flows; J. 79B Nos. 1 and 2, 59-62 (1975).
Network flows; single commodity; transportation; transportation problem; linear programming; 14790.
Network management; computer networks; National Science Computer Network; 15448.
Network optimization; satellite; service improvement; communication; cost-benefit; deployment; electronic transmission; facility location; mail; mathematical programming; message network synthesis; NBSIR 75-737.
Network parameters; reflection coefficient; scattering coefficients; transmission coefficient; waveguide standards; 2-port standards; automatic measurement; coaxial standards; 14739.
Network security; security; communications; computer security; cryptography; data security; encryption; 14557.
Networking; systematic testing; testing tools; dynamic analysis; NBS analyzer; NBS FORTRAN test routines; TN874.
Networking technology; value-added networks; computer networks; computer terminals; 15621.
Network-originated programs; NBS traceability; phase comparison; television; crystal oscillator; frequency calibration; 15682.
Networks; computer networks; 15485.
Networks; optimal locations; concave functions; 14791.
Networks; performance; Petri Nets; probability; evaluation; graphs; measurement; SP406, pp. 127-130.
Networks; performance; queues; analytical models; evaluation; measurement; SP406, pp. 119-121.
Networks; performance requirements; telecommunications; computer communications; computer networking; data communications; TN882.
Networks; protocol; standards; computer graphics; computer networks; graphics; 15071.
Networks; standards; microcomputers; minicomputers; 15643.
Networks; system commands; user protocols; command languages; computers; man-machine systems; TN877.
Networks; system commands; user protocols; command languages; computer; man-machine systems; NBSIR 75-744.
Neurorheological procedures; peripheral nerve repair; tubular prosthesis; SP415, pp. 91-98.
Neutralization mechanisms; pulse radiolysis; charge recombination rate constants; cobalt gamma radiolysis; hydrocarbons; ion-molecule reaction; 15627.
Neutrino quarks; strong interactions; three triplet model; composite model of leptons; electron number; lepton quarks; larks; muon-electron universality; muon number; 15614.
Neutrino-nucleus interactions; shadowing effects; diffractive production; diffractive scattering; Glauber model; hadronic components of photons; high energy scattering; multiple scattering; Monogr. 139.
Neutron; benchmark; cross sections; helium; SP425, pp. 375-377.
Neutron; charge distribution; Coulomb energy; deuterium; electrostatic; interaction potential; 15469.
Neutron; data; flux; LFMBR; SP425, pp. 39-44.
Neutron; nuclear reactor; radiation; radiography; activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; TN860.
Neutron; photoelectron; photomultiplier; resolution; suppression; after-pulse; GaP first dynode; 14643.
Neutron; proportional; counter; flux; hydrogen; monitor; SP425, pp. 78-80.
Neutron; resonance; capture; chromium; cross section; evaluation; SP425, pp. 367-370.
Neutron: resonance; sodium-22; thermal; Westcott; cross section; SP425, pp. 792-794.

Neutron: resonance parameters; total cross section; 241 Am; SP425, pp. 637-641.

Neutron: scattering; cross section; differential; elastic; inelastic; SP425, pp. 883-885.

Neutron: sodium; water; benchmark; cross sections; graphite; SP425, pp. 177-183.

Neutron: spectrum; alpha particles; cross section; helium; nickel; SP425, pp. 810-812.

Neutron: techniques; application; charged particle; cross section; emission; SP425, pp. 156-160.

Neutron: transport calculations; cross section sensitivity; gamma ray; SP425, pp. 431-435.

Neutron activation: improved limits of detection; iodine-129; isotopic separation; 15456.

Neutron activation: radiochemical separation; solvent extraction; tribenzylamine; analysis; biological materials; chloroform; chromium; environmental materials; 15409.

Neutron activation analysis: preconcentration; radioactive tracers; river water; trace elements; tracers; water; freeze drying; instrumental neutron activation analysis; lyophilization; 15376.

Neutron activation analysis: tellurium; uranium; environmental samples; 15385.

Neutron attenuation: time of flight; ilmenite concrete; Monte Carlo; SP425, pp. 409-414.

Neutron capture: nonelastic scattering; cosmic-ray reactions; lunar chemistry; lunar γ-rays; SP425, pp. 540-545.

Neutron capture cross sections; Pu isotopes; 241 Am; actinide management; SP425, pp. 229-231.

Neutron capture gamma-rays: 6 Li filter; 154 Gd(n,γ); 156 Gd(nγ); iron filter; Mn(n,γ); SP425, pp. 912-915.

Neutron capture γ-rays; width correlations; E γ = 24.3 keV; SP425, pp. 926-928.

Neutron converters; neutron radiography; neutron scintillator; thermal neutron detector; x-radiographic paper; image quality; 15349.

Neutron cross section; standard; 10 B; 6 Li; SP425, pp. 232-235.

Neutron cross section; time-of-flight; 1-240 eV; gross fission products; SP425, pp. 744-747.

Neutron cross sections; neutron time-of-flight spectroscopy; angular distributions; differential cross sections; SP425, pp. 938-941.

Neutron cross sections; new results; new techniques; review; SP425, pp. 119-128.

Neutron cross sections; photon-emission sources; surface barrier detectors; 6 Li(n,γ); absolute cross section measurements; manganese bath; SP425, pp. 236-239.

Neutron cross sections; neutron data evaluation; U-233, U-235, Pu-239, Pu-241; Westcott g-factors; Cf-252 spontaneous fission neutron yield; E = 0.0253 eV and 20 °C Maxwellian; fission-neutron yields; SP425, pp. 286-292.

Neutron data evaluation; U-233, U-235, Pu-239, Pu-241; Westcott g-factors; Cf-252 spontaneous fission neutron yield; E = 0.0253 eV and 20 °C Maxwellian; fission-neutron yields; half-lives of U-233, U-234, Pu-239; SP425, pp. 286-292.

Neutron detector; absolute efficiency determination; cross section measurements; SP425, pp. 108-111.

Neutron detector; neutron flux monitor; neutrons; neutron standards; T(p,n)He reaction; associated particle technique; SP425, pp. 75-77.

Neutron diffraction; NH₄ClO₄; thermal motion; crystal structure; low temperature; meta-stable compound; 15223.

Neutron diffraction; perchlorates; thermal motion; torsional oscillation; constrained refinement; hindered rotation; hydrogen bonds; hydroxyxylammonium; 14853.

Neutron diffraction; phosphate; water molecule; hydrate; hydrogen bonding; monocalcium phosphate; monohydrate; 14864.

Neutron diffraction; rare earths; amorphous materials; magnetic materials; 15388.

Neutron diffraction; recrystallization; terbium-iron; amorphous alloys; amorphous magnetism; coercive magnetic force; magnetic structure; 15297.

Neutron diffraction; structure refinement; thermal motion; crystal structure; deuterium peroxide; hydrogen bonds; hydrogen peroxide; 15271.

Neutron diffraction; structure; dichlorotetrapyrazolocopper: 15378.

Neutron diffraction; sulfone; alkyl sulfone; crystal structures; dimethyl sulfone diimine; hydrogen bonds; 15383.

Neutron dosimetry; neutron energy deposition; fluence; kerma; kerma factors; microdosimetry; 15407.

Neutron dosimetry; neutron radiobiology; neutron therapy; absorbed dose; intercomparison; kerma: 15540.

Neutron dosimetry; reactor fuels; reactor materials; absolute fission rates: 15239.

Neutron elastic scattering; 15 In: 0.335-14.7 MeV; excitation curve; SP425, pp. 859-861.

Neutron energy deposition; fluence; kerma; kerma factors; microdosimetry; neutron dosimetry; 15407.

Neutron energy 0.8 to 20 MeV; relative to n-p scattering; U235 fission cross section; linac source; SP425, pp. 615-619.

Neutron flux; neutron irradiation; plateau annealing; uranium glasses; U-238 fission decay constant; fission track dating; 15379.

Neutron flux; neutrons; cross sections; dosimetry; evaluation; fission spectrum; SP425, pp. 250-253.

Neutron flux determination; standard cross sections; 3 H(e,n,p); 6 Li(n,α); 10 B(n,α); 238 U(n,γ); 239 Np(n,γ); Au(n,γ); Cu(n); H(n,n); SP425, pp. 293-301.

Neutron flux determination; 1 ≤ F ≤ 30 MeV; gas scintillation transmission counters; SP425, pp. 277-280.

Neutron flux monitor; neutrons; neutron standards; T(p,n)³He reaction; associated particle technique; neutron detector; SP425, pp. 75-77.

Neutron irradiation; plateau annealing; uranium glasses; U-238 fission decay constant; fission track dating; neutron flux; 15379.

Neutron moisture gauge; pedology; soil; thermal neutron constants; calibration; SP425, pp. 516-519.

Neutron penetration; radiation shielding; effects of nuclear weapons; fission product gamma rays; gamma ray penetration; 15056.

Neutron penetration; secondary gamma rays; adjoint; concrete; gamma-ray penetration; moments; 15453.

Neutron radiobiology; neutron therapy; absorbed dose; intercomparison; kerma; neutron dosimetry; 15540.

Neutron radiography; neutron scintillator; thermal neutron detection; x-radiographic paper; image quality; neutron converters; 15549.

Neutron radiography; nondestructive testing; proton radiography; real-time techniques; three-dimensional radiography; x-radiography; dimensional measurement; gamma radiography; image enhancement; 15214.

Neutron reactions; pile neutrons; plutonium-239; uranium-234; uranium-235; uranium-238; cross sections; fission; neptunium-237; 15020.

Neutron reactions; tantalum; boron carbides; capture cross sections; CFRMF reactor; control materials; europium oxides; fast reactors; SP425, pp. 908-911.

Neutron reactions, heavy actinides; reactor production experi-
Neutron scattering; orientational disorder; reorientation; residence time; single crystal; ammonium bromide; ammonium ion; 15032.

Neutron scattering; perturbation of elementary excitations; quantum liquids; roton minimum; \(^3\)He \(^4\)He solutions; lifetime of excitations; 15263.

Neutron scattering; phase transition; quasi-elastic scattering; hydrosulfides; libration; 15506.

Neutron scattering; propagating modes; scattering function; short wavelength; collective excitations; liquid rubidium; 15207.

Neutron scattering; quasielastic scattering; resonance time; tantalum hydrides; vibrational amplitude; activation energy; hydrogen diffusion; 15264.

Neutron scintillator; thermal neutron detection; x-radiographic paper; image quality; neutron converters; neutron radiography; 15549.

Neutron source; scattering corrections; threshold detectors; activity measurement; cross sections; fission spectrum; SP425, pp. 273-276.

Neutron spectrum; one-dimensional transport calculation; stainless steel; time-of-flight; activation method; group constants; iron; SP425, pp. 184-188.

Neutron spectrum; transplutonium; waste management; yield; actinide burnup; cross section sets; SP425, pp. 214-217.

Neutron spectrum unfolding; NE-213 detector; nitrogen cross sections; concrete and steel shield; gamma-ray spectrum unfolding; integral measurements; SP425, pp. 161-164.

Neutron standards; \(T(n,p)\)\(^3\)He reaction; associated particle technique; neutron detector; neutron flux monitor; neutrons; SP425, pp. 75-77.

Neutron standards; uranium-235 cavity fission spectrum; dosimetry; fission cross sections; SP425, pp. 254-257.

Neutron strength function; doorway states, optical model; SP425, pp. 338-341.

Neutron strength functions; optical potential; quasi-particles; fluctuations; SP425, pp. 806-809.

Neutron testing; pipeline inspection; railroad inspection; transportation; vehicle inspection; airport pavements; bridge inspection; 15213.

Neutron therapy; absorbed dose; intercomparison; kerma; neutron dosimetry; neutron radiobiology; 15540.

Neutron time-of-flight spectroscopy; angular distributions; differential cross sections; neutron cross sections; SP425, pp. 938-941.

Neutron TOF facility; \(C(n,n)\); \(E=9-15\) MeV, measured \(\sigma(E_{\text{nuc}})\); \(D(d,n)\)\(^4\)He and \(C(n,n)\) spectra; SP425, pp. 99-102.

Neutron total cross section; pulsed neutron sources; time-of-flight; carbon; 14809.

Neutron transport; correlations; covariances; data adequacy; estimated uncertainties; evaluations; SP425, pp. 842-847.

Neutron-coupled gamma-ray cross sections; gas-cooled fast breeder reactor; SP425, pp. 444-446.

Neutron-induced low-energy photons; tantalum; cross sections; fluorine; SP425, pp. 762-765.

Neutron-induced reactions; \(^{12}\)C data; 56 MeV facility; SP425, pp. 103-105.

Neutrons; analysis; application; concrete; feasibility; gamma rays; SP425, pp. 496-499.

Neutrons; capture gamma rays; cross sections; dosimetry; filtered beams; SP425, pp. 89-92.

Neutrons; cross sections; dosimetry; evaluation; fission spectrum; neutron flux; SP425, pp. 250-253.

Neutrons; neutron standards; \(T(p,n)\)\(^3\)He reaction; associated particle technique; neutron detector; neutron flux monitor; SP425, pp. 75-77.

Neutrons; nitrogen; sensitivity calculation; air transport; cross sections; SP425, pp. 436-439.

Neutrons; nuclear model; cross section; SP425, pp. 332-334.

Neutrons; nuclear physics; \(T(p,n)\) neutrons; \(^9\)Be \(^{10}\)Li reaction; branching ratio; gas proportional counter; J4813.

Neutrons; nuclear reactions; protons; solar flares; acceleration mechanisms; SP425, pp. 512-515.

Neutrons; phase shifts; tritons; alpha particles; cross sections; deuterons; SP425, pp. 701-703.

Neutrons; ratio; \(^{238}\)U; \(^{235}\)U; 600 keV-22 MeV; cross-sections; fission; measured; SP425, pp. 568-571.

Neutrons; reaction rates; spectra; cross sections; flux; SP425, pp. 189-192.

Neutrons; reactors; resolutions; unresolved; cross sections; ENDF/B; SP425, pp. 371-379.

Neutrons; scintillators; time-of-flight; detector; flux; Monte Carlo; SP425, pp. 73-74.

Neutrons; spectroscopy; dosimetry; filtered beams; SP425, pp. 116-118.

Neutrons; time-of-flight; Hauser-Feshbach; inelastic-scattering; measurements; MeV range 2 to 4.5; SP425, pp. 871-874.

Neutrons; 1 keV - 1 MeV; \(^{239}\)Pu; \(^{235}\)U; cross-sections; fission; measured; SP425, pp. 564-567.

New facility; radiation; storage ring; synchrotron radiation; vacuum ultraviolet; electron accelerator; 15026.

New results; new techniques; review; neutron cross sections; SP425, pp. 119-128.

New spectroscopic techniques; optical excitation; potential curves; dissociation laser; excimers; excited state kinetics; f-values; mercury molecules; Monogr. 143.

New techniques; review; neutron cross sections; new results; SP425, pp. 119-128.

NE-213 detector; nitrogen cross sections; concrete and steel shield; gamma-ray spectrum unfolding; integral measurements; neutron spectrum unfolding; SP425, pp. 161-164.

(n,\(\gamma\)) cross sections; calculations; complex interaction; semi-direct model; volume form; SP425, pp. 346-349.

n-hexane; oscillator strength; electron; electron scattering; energy loss; methane; 15444.

n-hexane; oscillator strengths; spectra; electron; energy loss; methane; 15443.

\(\text{NH}_2^+\); \(\text{OH}^-\); photoionization; threshold energies; water; ammonia; dissociative photoionization; 15352.

\(\text{NH}_2\text{ClO}_4\); thermal motion; crystal structure; low temperature; meta-stable compound; neutron diffraction; 15223.

Ni; Sb; Pb; alloys; Cu; hyperfine fields; magnetism; Mn; Mössbauer effect; 15016.

Nickel; neutron; spectrum; alpha particles; cross section; helium; SP425, pp. 810-812.

Nickel; normalization; standard reference materials; thermal ionization; isotope dilution; isotopes; mass spectrometry; molybdenum; 14904.

Nickel; orchard leaves; aluminum; analysis; business; differential cathode ray polarography; iron; lead; 15344.

Nickel; separations; atomic absorption; atomic fluorescence; cobalt; interferences; iron; 15577.

Nickel alloys; Poisson's ratio; pulse-echo method; sound velocity; Young's modulus; bulk modulus; chromium alloys; compressibility; Debye temperature; Doring effect; elastic constants; iron alloys; magnetic transition; 15343.

Nickel steels; crack propagation; cryogenics; fracture toughness; mechanical properties; 15350.

Nickel steels; Poisson's ratio; shear modulus; sound velocity; Young's modulus; aluminum alloy; bulk modulus; compressibility; Debye temperature; elastic constant; 15522.

Nickel-base alloys; nickel-chromium alloys; nickel-silicon alloys; reference tables; temperature measurements; thermal emf; thermocouples; thermoelctric reference data; thermometry; calibration; 15518.
Nickel-base alloys; Poisson's ratio; shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constants; 15533.

Nickel-cadmium batteries; satellite batteries; separator materials; battery separators; NBSIR 74-541.

Nickel-chromium alloys; nickel-silicon alloys; reference tables; temperature measurements; thermal emf; thermocouples; thermoelctric reference data; thermometry; calibration; nickel-base alloys; 15518.

Nickel-chromium-iron alloys; Poisson's ratio; shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constant; 15225.

Nickel-silicon alloys; reference tables; temperature measurements; thermal emf; thermocouples; thermoelctric reference data; thermometry; calibration; nickel-base alloys; nickel-chromium alloys; 15518.

Nickel-59; resonance integral; resonance parameters; thermal cross section; SP425, pp. 776-779.

Nicotinic acid; calorimetry; combustion; creatinine; enthalpy; formation; heat; J. 79A No. 2, 425-430 (1975).

Nicotinic acid; reference materials; thermostatical; thermostatical standards; thiamine; urea; acetaldehyde; bomb calorimetry; calorimetry; chlorobenzoic acid; combustion; creatinine; fluorobenzoic acid; 15441.

Night vision; objective lenses; resolution test; variable contrast resolution; contrast curves; low contrast resolution; 14950.

Niobium; beryllium; carbon; integral cross section tests; iron; SP425, pp. 169-172.

Niobium; plutonium; potassium; praseodymium; promethium; rhenum; rubidium; sodium; surface diffusion; tantalum; terbi-um; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Niobium; Reference Theta-Pinch Reactor; tritium breeding; Bondarenko; F-factors; fusion reactors; SP425, pp. 722-728.

Niobium deuteride; phonons; alloy; electronic structure; interstitial; lattice dynamics; 15389.

Nitrate; nitrite; repassivation; stress corrosion; chloride; ellipsometry; low carbon steel; 14882.

Nitrate; nitrates; phase transformation; x-ray diffraction data; carbonates; crystal structure transformation; NRSRD-NBS53.

Nitric oxide; nitrogen; quencher; air; automotive exhaust emission; detection; fluorescence; 14991.

Nitric oxide; nitrogen dioxide; sulfur dioxide; air pollution; carbon monoxide; gas analysis; gas standards; 15447.

Nitric oxide; nitrous oxide; total scattering cross section; electron impact; electron scattering resonances; exponential attenuation; low energy; negative ions; 14983.

Nitric oxide; oxygen; rate constants; combination; kinetics; methyl; 15328.

Nitric oxide; tungsten; decomposition; 14887.

Nitrite; repassivation; stress corrosion; chloride; ellipsometry; low carbon steel; nitrate; 14882.

Nitrites; phase transformation; x-ray diffraction data; carbonates; crystal structure transformation; nitrates; NRSRD-NBS53.

Nitrobenzene; pulse measurements; space charge; automated measurements; dielectrics; dividers; electrical measurement; electric fields; electro-optics; high voltage measurements; insulating fluids; Kerr effect; NBSIR 75-774.

Nitroethane; sedimentation; critical point; critical solution point; densimeter; magnetic; diffusion; pressure; gradient; concentration; gradient; density; gravity; effects of; 3-methylpentane; mixture; liquid; 14944.

Nitroethane; thermal expansion; 3-methylpentane; consolute point; critical exponent α; critical phenomena; critical solution point; density; gravity effects; mixture; binary; mixture, liquid; 15691.

Nitrogen; electrons; ions; molecules; 15298.

Nitrogen; Henry's constants; liquid-vapor phase equilibria; methane; 15519.

Nitrogen; quencher; air; automotive exhaust emission; detection; fluorescence; nitric oxide; 14991.

Nitrogen; sensitivity calculation; air transport; cross sections; neutrons; SP425, pp. 436-439.

Nitrogen atom; nitrogen molecule; nitrogen oxides; oxygen atom; carbon dioxide; gas analysis; gas standards; nitric oxide; 15447.

Nitrogen dioxide; sulfur dioxide; air pollution; carbon monoxide; gas analysis; gas standards; nitrogen oxide; 15447.

Nitrogen dioxide; sulfur dioxide; air pollution; carbon monoxide; gas analysis; gas standards; nitric oxide; 15447.

Nitrogen-15 nuclear resonance spectroscopy; nuclear Overhauser effects; amino sugars; chemical shifts; magnitude spectra; 15326.

Nitrous oxide; total scattering cross section; electron impact; electron scattering resonances; exponential attenuation; low energy; negative ions; 14983.

N.r,x; resonance cross section profiles; spectroscopy; vacuum ultraviolet; xenon; 4d absorption; atomic structure; inner shell; 15054.

N.r,x ionization thresholds; photoabsorption; 4d absorption; 4f orbital contraction; barium vapor; configuration interaction; 14907.

NMR; ordering; relaxation times; solid solutions; alloys; contact term; core polarization; exchange enhancement; Knight shifts; LaNi5; LaNi5-Pt; LaPt5; 14889.

NMR; pressure dependence; relaxation; reorientation; temperature dependence; chloroform; deuterium; 15324.

NMR; rare earth metals and alloys; soft x-ray; alloy data; bibliography; index; Knight shifts; 14744.

NMR; switching; ultrasonics; 14980.

(n.n), (n.y); E = 1 eV-few keV; nuclear reactions; summary of deduced EN, GI, 1, Sn, (Dx); various statistical tests; measured α(E); SP425, pp. 780-783.

N,N-dimethyl-p- toluidine; ultraviolet spectroscopy; aromatic amine; charge-transfer complexes; color; dental material; methacrylate, phthalate; 15158.

(n.y); nuclear reactions; γ-production; Cr, Ni, Zr; E= 3-6 MeV; SP425, pp. 934-937.

(n.y) reaction; α(E, y); 76,78,98,10,Se, 76Ge; E<sub>0</sub> = 2.0-4.1 MeV; level schemes; SP425, pp. 893-896.
Noble gas double ionization chamber; synchrotron radiation; transfer standard detectors; calibration of detectors; corrections for second order radiation; far ultraviolet; 14987.

Noble gases: line broadening; lithium; 15584.

Noble gases: line broadening; lithium; molecules; 15289.

Noble gases: radiation; sodium; molecules; 15167.

Noble metal alloys; temperature scale; temperature standards; thermoelements; thermometry; base metals alloys; Monogr. 125. Suppl. 1.

Noble metals; phase diagrams; phase equilibria; platinum group metals; alloy phases; constitution diagrams; NBSIR 73-415.

Noble-metal thermocouples; nonstandardized thermocouples; refractory metal thermocouples; standardization; temperature measurement; thermocouples; thermometry; base-metal thermocouples; cryogenic thermocouples; 15517.

Noise; building acoustics; force platforms; impact noise; instrumentation; mechanical impedance; 15462.

Noise; noise control; noise emission; sound; acoustical measurements; acoustics; national measurement system; 15500.

Noise; noise measurement; sound power level; standard test procedures for sound power measurement; air compressors; error of sound power measurement; NBSIR 75-652.

Noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; NBSIR 74-395.

Noise; precision; repeatability; reproducibility; accuracy; acoustics; 14866.

Noise; psychoacoustics; speech interference; aircraft noise; annoyance; 15536.

Noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; TN672.

Noise; sound; acoustics; 15420.

Noise; sound; sound power; acoustics; machinery noise; 15217.

Noise; sound; tire noise; truck tires; acoustics; military vehicles; 14873.

Noise; sound power level; sound pressure level; acoustics; air compressor; internal combustion engine; NBSIR 75-653.

Noise; standard apparatus; toys; children; consumer safety; guns; hearing damage; NBSIR 74-619.

Noise; toys; bicycle attachments; children; consumer safety; model airplanes; NBSIR 75-693.

Noise control; noise emission; sound; acoustical measurements; acoustics; national measurement system; noise; 15500.

Noise emission; noise pollution; product safety; emergency messages; hearing loss; lawn mowers; NBSIR 74-608.

Noise emission; reverberation rooms; sound transmission; acoustical measurements; acoustics; impact noise; 15501.

Noise emission; sound; acoustical measurements; acoustics; national measurement system; noise; noise control; 15500.

Noise emission; speech communication interference; consumer products; criteria for safety standards; federal regulations; hearing impairment; hearing survey; NBSIR 74-606.

Noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning; acoustics; 14873.

Noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning; acoustics; 14874.

Noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; truck; urban planning; acoustics; 15002.

Noise measurement; noise (sound); railroad yard; trains; acoustics; NBSIR 74-488.

Noise measurement; oscillator stability; Flicker noise; frequency stability; 14827.

Noise measurement; reverberation chambers; sound energy measurement; sound power measurement; acoustical measurements; acoustics; 14786.

Noise measurement; sound power level; standard test procedures for sound power measurement; air compressors; error of sound power measurement; noise; NBSIR 75-652.

Noise monitoring; outdoor noise; acoustics (sound); environmental acoustics; instrumentation; NBSIR 75-962.

Noise of police firearms; damage risk criteria for impulse noise; gunfire noise; noise-induced hearing damage; 14793.

Noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning; acoustics; noise measurement; 14873.

Noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning; acoustics; noise measurement; 14874.

Noise pollution; noise (sound); sound transmission; tire noise; transportation noise; truck; urban planning; acoustics; noise measurement; 15002.

Noise pollution; product safety; emergency messages; hearing loss; lawn mowers; noise emission; NBSIR 74-608.

Noise (sound); railroad yard; trains; acoustics; noise measurement; NBSIR 74-488.

Noise (sound); sound transmission; tire noise; transportation noise; trucks; urban planning; acoustics; noise measurement; 14873.

Noise (sound); sound transmission; tire noise; transportation noise; truck; urban planning; acoustics; noise measurement; 14874.

Noise (sound); sound transmission; tire noise; transportation noise; truck; urban planning; acoustics; noise measurement; 15002.

Noise (sound); sound transmission; tire noise; transportation noise; truck; urban planning; acoustics; noise measurement; 14873.
nuclear materials; diversion path analysis; internal control system characterization: 15048.
Nuclear materials safeguards; safeguards; analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization: 15049.
Nuclear medicine; nuclear reactions; $E=800$ MeV; isotope production; La, Mo, V(p, spallation); measured $\sigma$; SP425, pp. 492-495.
Nuclear model; cross section; neutrons; SP425, pp. 332-334.
Nuclear models; nuclear structure; collective model; giant resonances; isospin purity; nuclear charged density: 15018.
Nuclear moment; spectrum; tantalum; ionization energy: 15381.
Nuclear Overhauser effects; amino sugars; chemical shifts; magnitude spectra; nitrogen-15 nuclear magnetic resonance spectroscopy: 15236.
Nuclear photon scattering; nuclear surface oscillations; plane-polarized photons; giant resonances: 14811.
Nuclear physics; T(p,n) neutrons; $^4$B(n,a) Li reaction; branching ratio; gas proportional counter; neutrons: 14813.
Nuclear power; reactor components; electric utilities; hot cell inspection; in-service inspection; nondestructive testing: 15118.
Nuclear power plant; productivity; subway; calculable capacitor; color; computer simulation; electricity; energy-environment; fire safety; measurement system: DIM/NBS 59, No. 12, 266-291 (1975).
Nuclear quadrupole coupling; organon; organometallic; Mössbauer; NQR: 14816.
Nuclear quadrupole resonance; piezometry; thermometry; applications; material detection: 15475.
Nuclear reaction (n, n 'y): $E_n=14.2$ MeV; measured $d^2\sigma/d\Omega dE$; SP425, pp. 770-773.
Nuclear reaction (n, n 'y): $E_n=14.2$ MeV; measured $d^2\sigma/d\Omega dE$; SP425, pp. 770-773.
Nuclear reaction $^{12}$C(n, n 'y) $^{12}$C; R-function analysis; measured $\sigma(E)$, $E=1.5-5.0$ MeV, $\sigma(E)$, $E=1.8-4.0$ MeV, $\theta_{lab}=20$ to 160$^\circ$, SP425, pp. 246-249.
Nuclear reaction $^{238}$U(n, n 'y) and $^{239}$U(n, n 'y); $\sigma(E)$, $\theta_{lab}=20$ to 160$^\circ$; $E=0.3-3.0$ MeV; SP425, pp. 862-865.
Nuclear reaction $^{56}$Fe(n, y); relative partial radiation widths; y-transitions in $^{56}$Fe of $^{56}$Fe resonances; $E_n=7-70$ keV; natural iron target; SP425, pp. 816-818.
Nuclear reactions; CTR energy production; SP425, pp. 659-663.
Nuclear reactions; $E=800$ MeV; isotope production; La, Mo, V(p, spallation); measured $\sigma$; nuclear medicine; SP425, pp. 492-495.
Nuclear reactions; y-production; Cr, Ni, Zr; $E_n=3-6$ MeV; (n, n 'y); SP425, pp. 934-937.
Nuclear reactions; (n, a) cross sections; cross sections; fast-neutron reactions; lithium; SP425, pp. 240-243.
Nuclear reactions; protons; solar flares; acceleration mechanisms; neutrons; SP425, pp. 512-515.
Nuclear reactions; Pu isotopes; U; $^{235}$U(n, f); calculated $<\gamma>$; deduced channel spectrum; $E=3-5$ MeV; fission; SP425, pp. 129-138.
Nuclear reactions; sources and spectra; cross-section data and systematics; cross-section measurement; excitation functions; fast neutrons; nonelastic interactions; SP425, pp. 664-673.
Nuclear reactions; summary of deduced En, $g_f$, $\Gamma_f$, $S_f$, $(D_o)$; various statistical tests; measured $\sigma(E)$; (n, n), (n, y), $E=1$ eV; few keV; SP425, pp. 780-783.
Nuclear reactions; $\theta=90^\circ$, 75$^\circ$, 55$^\circ$, 35$^\circ$; $E_n=8.5$, 10.0, 12.2, 14.2 MeV; Fe(n,xy); measured $\sigma(\theta)$ for $E_\gamma=0.847$ MeV; SP425, pp. 813-815.
Nuclear reactions; U$^{235}$; U$^{232}$; E=0.25 eV; et; fission neutrons per absorption; SP425, pp. 553-556.
Nuclear reactions; $^{14}$N; $^{18}$B(e,e'); deduced wave functions; electron scattering; measured form factors: 14967.
Nuclear reactions; U$^{233}$; U$^{238}$; $E=0.0253$ eV; et; fission neutrons per absorption; SP425, pp. 557-559.
Nuclear resonance: materials characterization; Mössbauer spectrometry; 14818.

Nuclear structure: collective model; giant resonances; isospin purity; nuclear charged density; nuclear models; 15018.

Nuclear structure: particle structure; relativistic bound systems; relativistic nuclear physics; composite particles; interacting quantum fields; Monogr. 147.

Nuclear structure: particle-hole model; quasi-bound states; two-particle two-hole states; giant resonance; intermediate structure; 15097.

Nuclear structure: quantum field theory; relativistic nuclear physics; axiomatic field theory; composite particles; Haag's theorem; 15695.

Nuclear structure: radiations; reactions; tables; γ-rays; computers; data; decay; ENSDF; evaluation; files; formats; levels; SP425, pp. 309-312.

Nuclear surface oscillations; plane-polarized photons; giant resonances; nuclear photon scattering; 14811.

Nucleate boiling; subcritical; supercritical; critical heat flux; film boiling; forced convection; heat transfer; helium; 14930.

Nucleation; aerosols; condensation; droplets; evaporation; kinetic theory; Knudsen number expansion; 15157.

Nucleation; ordering; precipitation; spinodal decomposition; age hardening; copper-titanium; Dla; metastable solvs; microscopic sequence method; 15053.

Nucleation; reaction rate; surface; adsorption; hydroxyapatite; ion exchange; 15019.

Nucleation; supercooling; carbon dioxide; CO2; critical point; 14915.

Nucleation theory; polyethylene; surface free energies; chain folds; fractions; homogeneous nucleation; molecular weight; J.79A No. 6, 701-711 (1975).

Nucleation theory; polyethylene; regime I: regime II; spherulite; axialite; chain folds; crystallization rate; molecular weight; J.79A No. 6, 671-699 (1975).

Number of prompt fission neutrons; 235U; Eγ = 0.2-1.4 MeV; fast time-of-flight technique; SP425, pp. 549-552.

Numerical analysis; numerical integration; numerical quadrature; Riemann integral; singularities; improper integrals; integrals; 15180.

Numerical analysis; operations research; systems analysis; management science; mathematical models; 15607.

Numerical integration; charge profiles; ionization chambers; J.79B Nos. 1 and 2, 65-78 (1975).

Numerical integration; numerical quadrature; Riemann integral; singularities; improper integrals; integrals; numerical analysis; 15180.

Numerical methods; partial differential equations; semiconductor technology; diffusion equations; finite-difference techniques; impurity redistribution; moving boundary problems; 15175.

Numerical quadrature; Riemann integral; singularities; improper integrals; integrals; numerical analysis; 15180.

(n,α); photon energy; cross sections; SP425, pp. 758-761.

N2O; BaO; chemical reactions; chemiluminescence; electronic spectra; heat-pipe ovens; 15686.

N2O; oscillator strengths; electron energy loss; low energy electron impact; 15467.

Objective lenses; resolution test; variable contrast resolution; contrast curves; low contrast resolution; night vision; 14950.

Objectives, output; performance measurement; production indices; production measurement; impact; TN890.

Obstruction; riding toys; stairway; static stability; test weight; tilt angle; toy testing; abuse testing; dynamic stability; hazards; NBSIR 74-623.

Occupancy live loads; load surveys; structural engineering; survey techniques; buildings; fire loads; TN858.

Occupant behavior; Operation Breakthrough; performance evaluation; architectural psychology; dwelling unit; federal building research; industrialized housing; 15190.

Occupational safety; gas chromatography analysis; gas dilution system, methyl bromide; NBSIR 73-259.

Oceanographic temperature measurements; temperature measurement; temperature sensors; thermometry; time constant; time response; 15074.

Oelfin; ozone; rate constant; kinetics; mass spectrometry; nitrogen dioxide; 14956.

OER; radiotherapy; absorbed dose; cell survival; heavy particles; SP425, pp. 533-539.

OH; pollution; CH; free radical; HCO; HO2; laser magnetic resonance; 15680.

OH; radiative lifetimes; spin uncoupling; vibration-rotation interaction; vibrational transitions; Einstein coefficients; line strengths; Meinel bands; molecular spectra; 14767.

OH; radio; search; comet; HCN; HC3N; Kohoutek; 15262.

Omnidirectional; probe; reflectivity; three-dimensional scanning; anechoic chamber evaluation; 14952.

OMNITAB II: Minutab; statistical computing; text editing; computer applications; NBSIR 75-649.

One dimensional; flow; single phase fluid; thermodynamics; transposed critical line; helium; hydrodynamics; 15047.

One-dimensional transport calculation; stainless steel; time-of-flight; activation method; group constants; iron; neutron spectrum; SP425, pp. 184-188.

On-line; CAMAC; disc; minicomputer; modular; multiparameter; SP425, pp. 97-98.

On-line analysis; quantitative electron probe microanalysis; scanning electron microscopy; SRM-480; empirical methods; minicomputers; 15248.

On-line data; reference data service; standard reference data; data files; data network; data on-line; international data service; 15266.

On-line information retrieval systems; use statistics; evaluation; National Bureau of Standards; 15378.

On-site power generation system; petroleum problems; central plant system; coal gasification; heat pump system; heat recovery and conservation system; nuclear fuel; BSS66, pp. 5-8.

Open channel flow measurement; pipe flow measurement; standards; flow measurement; flow measurement; water; instruments; flow measurement; SP421.

Open neighborhood assignments; stratifiable spaces; U-linked sequences; co-convergent; contra-convergent; Nagata spaces; J.79B Nos. 1 and 2, 63-69 (1975).

Open neighborhood assignments; stratifiable spaces; U-linked
Oxidizers; oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; handling; hydrogen: 15154.

Oxidizing agent; Schreibersite; sulfate-reducing bacteria; Viningite; anaerobic corrosion; cathodic depolarization theory; Charles Thom Award; Desulfovibrio desulfuricans; hollow whiskers; mechanism; microbial corrosion; mild steel: 15233.

Oxygen; electron energy-loss; oscillator strengths: 15152.

Oxygen; oxygen tension; oxygen tension distribution; contact lens; contact lens motion; diffusion; hydrodynamics; mathematical model: 15208.

Oxygen; ozone; triplet states; electron impact; energy loss spectra: 15473.

Oxygen; performance; pressure; survey; transducer; calibration; compatibility; cryogenic; liquid oxygen; measurement: 15155.

Oxygen; physical adsorption; tungsten; xenon; chemisorption; ESCA; 15347.

Oxygen; propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; handling; hydrogen; oxidizers: 15154.

Oxygen; rate constants; combination; kinetics; methyl; nitric oxide; 15328.

Oxygen; rotational structure; Zeeman; effect; laser; magnetic resonance: 15335.

Oxygen; ruthenium; adsorption; carbon monoxide; catalysis; LEED: 15045.

Oxygen; ruthenium; satellite; shake-up; structure; x-ray photoelectron spectroscopy: 15147.

Oxygen; scaling laws; statistical analysis; critical coefficients; critical exponents; critical region; density profile; dielectric constant; linear model: 14772.

Oxygen; statistical analysis; viscosity coefficient; argon; correlated molecular collisions; density expansions; fluorene: 15141.

Oxygen; titanium; combustion; Hilbert transform; laser ignition: 15345.

Oxygen atom; oxygen molecule; ozone; bibliography; chemical kinetics; excited state; gas phase; nitrogen atom; nitrogen molecule; nitrogen oxides; 15291.

Oxygen depletio; particulate mass; scanning electron microscope; smoke; carbon monoxide; electrostatic precipitation; heat flux; NBSIR 75-901.

Oxygen molecule; ozone; bibliography; chemical kinetics; excited state; gas phase; nitrogen atom; nitrogen molecule; nitrogen oxides; oxygen atom: SP371-1.

Oxygen on (100) tungsten; surface bonds; uv photoemission; angular distributions; bond geometry; chemisorption; energy distributions: 15089.

Oxygen tension; oxygen tension distribution; contact lens; contact lens motion; diffusion; hydrodynamics; mathematical model; oxygen: 15208.

Oxygen tension distribution; contact lens; contact lens motion; diffusion; hydrodynamics; mathematical model; oxygen; oxygen tension: 15208.

Ozone; apparatus and methods; deactivation; energy transfer; infrared laser; luminescence: 14527.

Ozone; bibliography; chemical kinetics; excited state; gas phase; nitrogen atom; nitrogen molecule; nitrogen oxides; oxygen atom; oxygen molecule: SP371-1.

Ozone; photochemical smog; rate constant; air pollution; kinetics; mass spectrometry; olefin: 15353.

Ozone; pollution; spectra; absorption spectra; infrared; molecular energy levels: 15311.

Ozone; propene; rate constant; air pollution; ethene; kinetics; mass spectrometry: 15234.

Ozone; radiometer; stabilizer; toy safety; computer security; energy efficiency; electrocatalysis; fluorides; heat; heat pump; laser; DIM/NBS 59, No. 11, 241-264 (1975).

Ozone; rate constant; kinetics; mass spectrometry; nitrogen dioxide; oelfin: 14956.

Ozone; triplet states; electron impact; energy loss spectra; oxygen: 15473.

Ozone problem; police communications; water pollution; x-rays; air pollution; camera guidelines; computerized elections; dental fillings; metre; DIM/NBS 59, No. 5, 97-120 (1975).

O(1D); O(1S); quenching rate; spin-orbit coupling; transition probability; curve crossing: 15566.

O(1S); quenching rate; spin-orbit coupling; transition probability; curve crossing; O(1D): 15566.

O_2^(-); O_3^(-); O_4^(-); photodetachment; photodissociation; cross section; drift tube; experimental; molecule; negative ion: 15478.

O_2^(-); O_3^(-); polarizability; Van der Waals; CO; energy surface; F_2; hydrides; LiH; MC-SCF: 15275.

O; photodissociation; predissociation; Rydberg states; valence states; ion-pair: 15611.

O_2^(-); O_3^(-); photodetachment; photodissociation; cross section; drift tube; experimental; molecule; negative ion; O_2^{-}; 15478.

O_2; polarizability; Van der Waals; CO; energy surface; F_2; hydrides; LiH; MC-SCF; O_2^{-}; 15275.

O_2^{-}; photodetachment; photodissociation; cross section; drift tube; experimental; molecule; negative ion; O_2^{-}; O_3^{-}: 15478.

Pacemakers; palladium black; platinum black; polarization; porous electrodes; implantable hybrid cells; SP415, pp. 55-61.

Pacifiers; product safety; safety requirements; safety testing; consumer products; CPSC proposed regulation; NBSIR 75-733.

Package control; petroleum products; scales; survey; temperature compensation; uniformity; weights and measures; digital indicators; drained weight; laws and regulations; metrication; metric conversion; net weight; SP407.

Package quality standards; voluntary standards; working with government; consumer activism; control proliferation; industry; interaction: 15044.

Packages; proliferation; voluntary standardization; aerosols; Fair Packaging and Labeling Act: 14720.

Pade approximant; power law; slope of the coexistence curve diameter; asymmetry; coexistence curve; compressibility; critical exponents; critical point; decorated lattice gas; hole-particle symmetry; law of corresponding states; liquid: 15293.

Paging; pre-processing; relative error; thinning; cross sections; linearization; SP423, pp. 419-421.

Paint removal; abatement; barrier materials; building materials; housing; lead-based paint; lead poisoning; NBSIR 75-761.

Pair correlation function; single particle probability density; branching; freezing points; metastable fluids; nonlinear operator; 15178.

Palladium black; platinum black; polarization; porous electrodes; implantable hybrid cells; pacemakers; SP415, pp. 55-61.

Palladium deuteride; phonon frequency distribution; single crystal; coherent neutron scattering; dispersion relation; lattice dynamics: 15036.

Palladium hydride; phonons; crystal; fermi surface; interstitial hydrogen; lattice dynamics; 14854.

Paper; aging of; paper; stability of; paper testing; stability of paper; aging of paper; archival materials; natural aging; old paper; NBSIR 74-501.

Paper; permanent; paper; stability; permanent papers; record papers; stability of paper; accelerated aging; aging; natural aging; NBSIR 74-632.

Paper; stability; permanent papers; record papers; stability of paper; accelerated aging; aging; natural aging; 506.
Paper; accelerated aging; aging; natural aging; paper, permanent; NBSIR 74-632.

Paper; stability of; paper testing; stability of paper; aging of paper; archival materials; natural aging; old paper; paper, aging of; NBSIR 74-501.

Paper test methods; collaborative reference program; interlaboratory testing; laboratory performance; 15274.

Paper testing; stability of paper; aging of paper; archival materials; natural aging; old paper; paper, aging of; paper, stability of; NBSIR 74-501.

Paper; waste; pulp, secondary; recycled paper; secondary pulp; waste paper; market pulp; 15604.

Parabolic class number; classical modular group; congruence groups; elliptic class numbers; genus; index; level; 15006.

Parabolic classes; automorphs; elliptic classes; finite fields; genus; modular group; natural homomorphism; 14972.

Parabolic cylinder functions; turning points; wave scattering; Weber functions; asymptotic approximations; connection formulas; error bounds; ordinary differential equations; 14946.

Parabolic cylinder functions; turning points; Weber functions; asymptotic approximations; error bounds; Legendre functions; 14947.

Paraffin crystals; plastic deformation; polymer crystals; radiation damage; X-ray topography; microstructure; 15433.

Paraffins; polyethylene; potential energy calculations; relaxation strength; two-site model; mechanical relaxation; methylene branches; 14752.

Paraffins; polyethylene; potential energy calculations; relaxation mechanism; relaxation strength; site model; mechanical relaxation; methylene branches; 15329.

Paraffins; polyethylene; unit cell; X-ray; crystal surfaces; density; lamella thickness; 14724.

Paraholography; reverberation chambers; sound propagation; acoustics; acoustical holography; acoustical measurement; 14796.

Parallelism; flatness; gage blocks; interferometry; length measurement; 15119.

Paramagnetic salt; CMN; cryomagnetism; low temperature specific heat; magnetic dipole interaction; 14834.

Parameter; reactivity; lattices; nuclear data; SP425; pp. 7-13.

Parameter estimation; p-V-T; statistical weighting; thermodynamic properties; constraints; equation of state; fluid; least squares; 15132.

Parameters; performance; performance terminology; predictability; requirements; variables; workload; computer system; factors; measurement; SP406; pp. 53-60.

Parameters of bound level of Ar-36; SP425, pp. 774-775.

Parametric oscillator; superconducting oscillator; cavity stabilization; frequency multiplication; funnel diode oscillator; 15676.

Parametric programming; post-optimality analysis; algorithms; linear programming; NBSIR 75-666.

Pararosaniline method; quality control; reference materials; sulfur dioxide; air pollution; chemical analysis; NBSIR 75-662.

Parasitic element; S-parameters; high frequency probe assembly; integrated circuit transistors; TN663.

Parent ions; charge transfer reactions; cycloalkanes; cyclohexanes; gas phase; methylcyclopentane; 14899.

Parity-violation; internucleon-force; 15083.

Park-and-ride; Shirley Highway; transportation planning; bus-on-freeway operations; commuter surveys; mode choice decisions; NBSIR 75-689.

Partial coherence; coherence measurement; microdensitometry; optical imaging; 15290.

Partial coherence; pupil function; wave-front shearing interferometry; impulse response; lens aberrations; optical transfer function; 15396.

Partial differential equations; semiconductor technology; diffusion equations; finite-difference techniques; impurity redistribution; moving boundary problems; numerical methods; 15175.

Particle analysis; particulates; Raman spectroscopy; fine particles; laser Raman; micro-Raman; 15362.

Particle structure; relativistic bound systems; relativistic nuclear physics; composite particles; interacting quantum fields; nuclear structure; Monogr. 147.

Particle-hole model; quasi-bound states; two-particle two-hole states; giant resonance; intermediate structure; nuclear structure; 15097.

Particle-hole model; resonance energy; 14C; analog states; electron scattering; inelastic electron scattering; 14729.

Particulate analysis; scanning electron microanalysis; x-ray microanalysis; X-ray source size; backscattered electrons; electron specimen interaction; Monte Carlo simulation; 15038.

Particulate composites; shear modulus; theory of elasticity; composite materials; elastic constants; filled polymers; mechanical properties; J79A No. 2, 419-423 (1975).

Particulate mass; scanning electron microscope; smoke; carbon monoxide; electrostatic precipitation; heat flux; oxygen depletion; NBSIR 75-901.

Particulate matter; air pollution; light scattering; 15602.

Particulates; quartz; self-generated atmosphere; calibration filters; chrysotile; environmental health; improved methodologies; 15466.

Particulates; Raman spectroscopy; fine particles; laser Raman; micro-Raman; particle analysis; 15362.

Partition coefficient; sea water; stripping cell; aromatic hydrocarbons; gas chromatography; hydrocarbon analysis; 14955.

Partitioned matrix; diagonalizable matrix; J79B Nos. 1 and 2, 45-48 (1975).

Partitioned matrix; rational canonical form; similarity; matrix equation; J79B Nos. 3 and 4, 117-125 (1975).

Passivation; single crystals; sulfuric acid; titanium; corrosion; 14747.

Passivity; electrochemistry; ellipsometry; gallium arsenide; 15480.

Passivity; pitting; breakdown passivity; chloride; ellipsometry; iron; 15081.

Patrol car definitions; patrol car functions; patrol car systems; patrol car terms; 14761.

Patrol car functions; patrol car systems; patrol car terms; patrol car definitions; 14761.

Patrol car systems; patrol car terms; patrol car definitions; patrol car definitions; 14761.

Patrol car terms; patrol car definitions; patrol car functions; patrol car systems; 14761.

Pattern recognition; computerized fingerprint identification; fingerprint; TN878.

Pattern recognition; reading machines; character recognition; context research; data bases; optical character recognition; NBSIR 75-746.

Patterns; powder diffraction; ambiguities; geometrical; indexing; 15572.

Patterns; scanning; spherical; symmetry; antennas; arrays; coordinate transformations; data processing; group representations; measurements; near field; non-planar; NBSIR 75-809.

Pavement skid resistance; skid accident reduction; tire-pavement interface forces; calibration procedures; force plate; NBSIR 75-738.

PB; polybutene; polyvinyl chloride; PVC; residual stress; thermoplastic piping; ABS; coefficient of expansion; CPVC; glass transition temperature; hardness; NBSIR 74-629.

Pb; scattering; small angles; U; fast neutrons; SP425, pp. 948-949.
Pd; alloys; Cu; hyperfine fields; magnetism; Mn; Mössbauer effect; Ni; Nb; 150.16.
Peak height; reproducibility; sensitivity loss; suprainlinearity; dosimetry; fading; furnace annealing; glow curve; maximum heating temperature; 15193.
Peak intensities; powder patterns; reference intensities; standard; x-ray diffraction; crystal structure; integrated intensities; lattice constants; Monogr. 25. Section 12.
Penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF₆); Veterans Administration Hospital; experiments; full-scale; gas tracer; interstitial space; NBSIR 75-903.
Penny crack; contact fracture; degradation; Hertzian cracks; indentation fracture; median vents; NBSIR 75-730.
Pentafluorostyrene; polymerization; pressure radiation; reactivity ratios; tetrafluoroethylene; copolymerization; 15281.
Perceptron; adaptive control; cerebellium model; control theory; manipulator control; 15428.
Perchlorates; phase transformations; phosphates; sulfates; thermodynamic data; x-ray diffraction data; chromates; crystal structure; crystal structure transformations; NSRDS-NBS56.
Perchlorates; thermal motion; torsional oscillation; constrained refinement; hindered rotation; hydrogen bonds; hydroxylammonium; neutron diffraction; 14853.
Performance; analytical; computer systems modeling; end users; SP406, pp. 123-126.
Performance; communications; computer; evaluation; measurement; network; 15693.
Performance; computer; consumer; contract; evaluation; network; 15642.
Performance; performance terminology; predictability; requirements; variables; workload; computer system; factors; measurement; parameters; SP406, pp. 53-60.
Performance; Petri Nets; probability; evaluation; graphs; measurement; networks; SP406, pp. 127-130.
Performance; planning; present value analysis; analysis; construction; cost; design; economics; flexibility; law enforcement facilities; 14961.
Performance; power; work; computer efficiency; evaluation; measurement; SP406, pp. 131-134.
Performance; pressure; survey; transducer; calibration; compatibility; cryogenic; liquid oxygen; measurement; oxygen; 15,153.
Performance; queues; analytical models; evaluation; measurement; networks; SP406, pp. 119-121.
Performance; service; utility; computer; evaluation; measurement; 15093.
Performance; software monitors; throughput; computer; evaluation; hardware monitors; measurement; SP406, pp. 99-102.
Performance attributes; performance criteria; physical and engineering properties; test methods; bituminous roof membranes; 15629.
Performance characteristics; bonded resistance strain gage; combined effects; evaluation tests; fatigue; high temperature; 15096.
Performance characteristics; piezoelectric; test method; thermal radiation; thermal transient; zero shift; accelerometer; TN853.
Performance characteristics for piping; thermal/structural performance of piping; thermoplastic piping in plumbing; fire performance of piping; functional performance of piping; BSS68.
Performance criteria; application procedures; built-up roofing systems; composite membrane; composition; 15620.
Performance criteria; building codes; building standards; housing; 15372.
Performance criteria; physical and engineering properties; test methods; bituminous roof membranes; performance attributes; 15629.
Performance criteria; bonding; temperature effectiveness; tensile fatigue; test methods; bituminous roof membranes; fatigue testing; flexural fatigue; TN863.
Performance criteria; room fires; smoke; wood crib; buildings; fire growth; flame spread; heat release; interior linings; material ignitability; TN879.
Performance criteria; waterproofing materials; water repellent materials; accelerated weathering; durability of waterproofing materials; masonry; TN883.
Performance data; regulatory process; standards; construction; Hurricane Agnes; housing; mobile homes; mobile home parks; NBSIR 75-641.
Performance data; standards; computer techniques; enforcement process; housing; Hurricane Agnes; mobile home parks; mobile homes; NBSIR 75-690.
Performance data; standards; enforcement process; field inspection; house trailers; housing; Hurricane Agnes; mobile homes; NBSIR 75-688.
Performance data analysis; performance data presentation; performance monitoring; computer system performance evaluation; experimental assessment of system behavior; SP406, pp. 103-108.
Performance data presentation; performance monitoring; computer system performance evaluation; experimental assessment of system behavior; SP406, pp. 103-108.
Performance evaluation; architectural psychology; dwelling unit; federal building research; industrialized housing; occupant behavior; Operation Breakthrough; 15190.
Performance evaluation; computer graphics; cost-benefit analysis; cost-effectiveness; economics; 15072.
Performance evaluation; cost-benefit analysis; cost-effectiveness; economics; interactive systems; 15633.
Performance evaluation; performance factors; resource utilization; user competence; end-user satisfaction; SP406, pp. 39-42.
Performance evaluation; performance measurement; software monitors; accounting systems; hardware monitors; SP406, pp. 113-117.
Performance evaluation; user control of computing; users' performance evaluation; users' performance measures; computer performance evaluation; computer resource allocation; computer service parameters; computer system performance; cost/effectiveness; SP406, pp. 65-71.
Performance evaluation of secure computer systems; security, data transmission; security; file access; security; identification (password); security, input and output processing; security software; software monitors; computer performance; computer security; SP406, pp. 83-86.
Performance factors; resource utilization; user competence; end-user satisfaction; performance evaluation; SP406, pp. 39-42.
Performance measurement; computer architecture; functional evaluation; hardware monitor; measurement tools; SP406, pp. 75-78.
Performance measurement; production indices; production measurement; impact; objectives, output; TN890.
Performance measurement; quality; seller; specifications; validation; buyer; computer software; marketplace; 15495.
Performance measurement; software monitors; accounting systems; hardware monitors; performance evaluation; SP406, pp. 113-117.
Performance measurement; test data bases; test transactions; benchmark testing; data base management; 15670.
Performance measurement; time-sharing; computer networks; interactive computing; man-machine interaction; TN880.
Performance monitoring; computer system performance evaluation; experimental assessment of system behavior; performance data analysis; performance data presentation; SP406, pp. 103-108.

Performance monitoring; performance variability; computer performance analysis; measurement; SP406, pp. 109-112.

Performance objectives; computer architecture; computer performance evaluation; installation management; measurement; modeling; monitoring; operating systems; SP406.

Performance of plumbing systems; plumbing code; principles of hydraulics; National Bureau of Standards; 15024.

Performance prediction; simulation; software validation; tools; actual system performance; computer performance evaluation; SP406, pp. 79-82.

Performance requirements; telecommunications; computer communications; computer networking; data communications; networks; TN88.

Performance specification; rehabilitation; renovation; abatement; detection; heat-gun; lead paint; materials evaluation; 15591.

Performance specifications; schematic diagrams; specifications; specification writer; cascade heater; insulated underground piping; insulation; limitation of liability; "or equal" specifications; BSS66, pp. 78-87.

Performance standard; security; weapon detection; handgun detection; metal detector; 15306.

Performance standard; specifications; test procedures; breath alcohol; instruments; 14778.

Performance standard; transceiver; transmitter; communications; law enforcement; mobile transceiver; 14922.

Performance standards; photoelectric detector; detection; detectors; fire fatalities; gas detectors; ionization chamber detectors; 15218.

Performance standards; reference ethanol solutions; breath alcohol analyzers; dichromate oxidimetry; 15203.

Performance terminology; predictability; requirements; variables; workload; computer system; factors; measurement; parameters; performance; SP406, pp. 53-60.

Performance testing; branch circuits; contact resistance; electrical codes; electrical connections; fire safety; housewiring; NBSIR 75-672.

Performance testing; contact resistance; electrical codes; electrical connections; fire safety; house wiring; materials properties; BSS63.

Performance testing; process control; real-time; RTOS; automation; calibration; fuel control; jet engine; minicomputer; multitask; 15550.

Performance testing; reduced-size vents; trap-seal retention; venting; venting criteria; vents; reduced-size; DWV; BSS60.

Performance variability; computer performance analysis; measurement; performance monitoring; SP406, pp. 109-112.

Peripheral nerve repair; tubular prosthesis; neurorraphical procedures; SP415, pp. 91-98.

Peritectic reaction; Sn-Cd alloys; structure; alloy; directional solidification; incongruent melting alloy; 14748.

Permafrost; seasonal frost; snow drifting; utilidors; ventilation; air leakage; Arctic; central heat distribution systems; construction materials; drainage; insulation; BSS66, pp. 122-135.

Permanence; record materials; record papers; stability; accelerated aging; natural aging; NBSIR 75-739.

Permanents papers; record papers; stability of paper; accelerated aging; aging; natural aging; paper; permanent; paper; stability; NBSIR 74-632.

Permanental adjoint; positive semidefinite hermitian matrix; symmetry class of tensors; 15314.

Permeability; plastic deformation; sorption; crazing; crystalline polymer solid; diffusion; elastic deformation; 15237.

Permeability; ripple; sand transport; oscillatory flows; 15145.

Permeation; permeation tubes; polymer structure; sulfur dioxide; density; fluorocarbon copolymer; morphology; 15009.

Permeation tubes; polymer structure; sulfur dioxide; density; fluorocarbon copolymer; morphology; permeation; 15009.

Permeation tubes; propane; sulfur dioxide; air pollution; carbon monoxide; gas analysis; 15552.

Permittivity; standard dielectric; cavity method for dielectrics; dielectric constant; dielectric loss; international comparison; laboratory intercomparison; 14999.

Permutation group; quantum mechanics; antiferromagnetism; cerous magnesium nitrate; dipole-dipole interaction; ferromagnetism; ground state; magnetic; 14911.

Permutation group; quantum mechanics; spin cluster; spin-Hamiltonian; antiferromagnetism; cerous magnesium nitrate; dipole-dipole coupling; ferromagnetism; ground state; 15524.

Permutation techniques; precision admittance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; AC DRRS; coaxial cable effects; coaxial star connectors; extrapolation techniques; four-pair admittances; 14924.

Personal data; physical security; privacy risk assessment; access controls; ADP security; computer security; Federal Information Processing Standards; information management; FIPS PUB 41.

Personal identification; access; access control; authentication; computer networks; computer security; computer terminals; 15077.

Personal uses; relationships; uses; color; environment; experimenting with; harmony; hues; illumination; light; C156.

Personnel monitor; piezoelectric sensor; trace analysis; air pollution; chemical analysis; dosimeter; industrial hygiene analysis; mercury; 15581.

Persulfate initiated grafting; surface grafting; tissue modification; ceric ion initiated grafting; chemical attachment to rat skin; grafting to tissues; 14880.

Perturbation; Rydberg state; absorption spectrum; accidental predissociation; carbon monoxide; emission spectrum; 15386.

Perturbation; sensitivity; uncertainties; cross sections; fusion reactors; SP425, pp. 674-679.

Perturbation expansion; strip operator; thermodynamic limit; distribution functions; finite volumes; Kirkwood-Salsburg equation; 15356.

Perturbation of elementary excitations; quantum liquids; roton minimum; 3He 4He solutions; lifetime of excitations; neutron scattering; 15263.

Perturbation-allowed transitions; resonances; secular determinants; spectra; structure; arsine; infrared high resolution; 14953.

Perturbations; sodium molecule; spectroscopy; alkali dimer; magnetic rotation; molecular constants; 15516.

Petri Nets; probability; evaluation; graphs; measurement; networks; performance; SP406, pp. 127-130.

Petrography; pinal; apatite; calciospherulites; calcii; 14835.

Petroleum problems; central plant system; coal gasification; heat pump system; heat recovery and conservation system; nuclear fuel; on-site power generation system; BSS66, pp. 5-8.

Petroleum products; scales; survey; temperature compensation; uniformity; weights and measures; digital indicators; drained weight; laws and regulations; metrization; metric conversion; net weight; package control; SP407.

Petroleum products; containers for; plastic containers for petroleum products; containers for petroleum products; jerry cans; PS61-74.

P.F.; pseudorotation; Raman; vibration; high amplitude; internal rotation; 15370.

PH; pH buffers; pH electrode; pH measurement; pH standards; buffers; buffer solutions; glass electrode; SP260-53.
Phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; NBSIR 74-395.

Phase; power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM metrology; field strength; impedance; laser parameters noise; optical electronics; NBSIR 73-818.

Phase angle; power; ratio; reflection coefficient; reflectometer; self-calibration; six-ports; vector voltmeter; voltage; admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; TN673.

Phase angle; ratio; self-calibration; six-port; vector voltmeter; voltage; attenuation; microwave; 15665.

Phase angle; ratio; six-port junction; vector voltmeter; voltage; attenuation; automation; detector; insertion loss; microwaves; 15649.

Phase angle; resistance; transformer-ratio-arm; audio-frequency; bridge; four-terminal resistance; high current; operational amplifier; 14877.

Phase comparison; television; crystal oscillator; frequency calibrator; frequency offset; NBS traceability; 15140.

Phase comparison; television; crystal oscillator; frequency calibration; network-originated programs; NBS traceability; 15682.

Phase delay; precise time metrology; subpicosecond time difference measurements; time stability; atomic clocks; frequency measurements; frequency stability; 15684.

Phase diagrams; phase equilibria; platinum group metals; alloy phases; constitution diagrams; noble metals; NBSIR 73-415.

Phase equilibria; platinum group metals; alloy phases; constitution diagrams; noble metals; phase diagrams; NBSIR 73-415.

Phase equilibria; review; bibliography; calorimetric measurements; fluid mixtures; Joule-Thomson coefficients; 15671.

Phase equilibria; slag; vaporization; viscosity; electrical conductivity; MHD materials; 15510.

Phase locked loop; tracking; ultrasonic; interferometer; 15040.

Phase noise; primary frequency standards; Ramsey cavity; accuracy; accuracy evaluations; cavity phase shift; cesium beam tube; frequency stability; interaction length; 15683.

Phase noise; squarewave servo; indirect synthesis; 15689.

Phase relations; vapor pressure; vaporization equilibria; K$_2$SO$_4$-LaCrO$_3$ system; K$_2$SO$_4$-MgO system; 15305.

Phase sensitive detector; Gaussian; lineshapes; Lorentzian; 15702.

Phase separation; borosilicate glass; chemical durability; 15212.

Phase shifts; tritons; alpha particles; cross sections; deuterons; neutrons; SP425, pp. 701-703.

Phase slip; weak superconductivity; Josephson effect; 15646.

Phase transformation; thermodynamics; high-speed measurement; high temperature; iron; 15623.

Phase transformation; x-ray diffraction data; carbonates; crystal structure transformation; nitrates; nitrates; NSRDS-NBS53.

Phase transformations; phosphates; sulfates; thermodynamic data; x-ray diffraction data; chromatics; crystal structure; crystal structure transformations; perchlorates; NSRDS-NBS53.
Photoconductor: picosecond; pulse; detector; dye laser; GaAs; 15651.

Photoconductor: sampling oscilloscope; GaAs; laser; 15644.

Photodetachment; photodissociation; cross section; drift tube; experimental; molecule; negative ion; O₂⁻; O₃⁻; O₄⁻; 15478.

Photodetachment; spin-orbit coupling; tunable dye laser; ion cyclotron resonance; mass spectrometry; negative ions; 14771.

Photodetachment; tunable dye laser; intracavity technique; ion cyclotron resonance; mass spectrometry; negative ions; 14770.

Photodetector; photodetector spectral response; photomultiplier tubes; phototubes; 14804.

Photodetector; relative spectral output; wavelength; bar code reader; filters; optical wedge; NBSIR 74-580.

Photodetector spectral response; photomultiplier tubes; phototubes; photodetector; 14804.

Photodiode detectors; photometry; interlaboratory test; 15486.

Photodissociation; cross section; drift tube; experimental; molecule; negative ion; O₂⁻; O₃⁻; O₄⁻; photodetachment; 15478.

Photodissociation; predissociation; Rydberg states; valence states; ion-pair; O₂; 15611.

Photodissociation; vacuum ultraviolet; acetylene; bond dissociation energy; bromoacetylene; C₂H₄; fluorescence; 14896.

Photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; coefficient of thermal expansion; elastic constants; infrared laser window materials; NBSIR 75-639.

Photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; ZnSe; birefringence; elastic constants; infrared-laser window materials; interferometry; KCl; NBSIR 75-781.

Photoelectric absorption; photons; Rayleigh scattering; x rays; attenuation coefficient; compilation; Compton scattering; cross section; crystallography; 14847.

Photoelectric detector; detection; detectors; fire fatalities; gas detectors; ionization chamber detectors; performance standards; 15218.

Photoelectric smoke detector; smoke control; smoke movement simulation; smokeproof tower; high-rise buildings; NBSIR 75-701.

Photoelectric smoke detectors; smoke detectors; Taguchi gas sensors; fire detectors; ionization chamber smoke detectors; NBSIR 75-700.

Photoelectric triestim colorimeters; photometry of retroreflective materials; retroreflective sign materials; colorimetry; highway signs; 15117.

Photofilm; photomultiplier; resolution; suppression; afterpulse; GaP first dynode; neutron; 14843.

Photofilm spectra; tungsten; work function; C₂H₄; decomposition; chemisorption bonds; LEED; 14807.

Photofilm spectroscopy; adsorption; Auger spectroscopy; catalysis; infrared spectroscopy; kinetics; 15318.

Photofilm spectroscopy; photoemission; x-ray edge singularities; asymmetric lineshapes; 15133.

Photoemission; photoionization; angular distributions; chemisorption; 14806.

Photoemission; photoionization; surfaces; angular distributions; chemisorption; 14981.

Photoemission; single crystals; surface electron spectroscopy; surface state; tungsten; chemisorption; field emission; 14982.

Photoemission; surface spectroscopy; chemisorption; field emission; ion neutralization; 14978.

Photoemission; x-ray edge singularities; asymmetric lineshapes; photofilm spectroscopy; 15133.

Photofissision; bremsstrahlung beam; cross section; fission barrier shape; fission isomer; 15313.

Photoflash bulb; pressure; pressure transducer response; thermal transient; transducer; calibration; dynamic; electronic flash; NBSIR 75-732.

Photographic edges; transfer function; acutance; calibration; computer programs; microdensitometry; NBSIR 75-699.

Photomultiplier; angular distributions; chemisorption; photoemission; 14806.

Photoionization; atomic spectra; chlorine; halogens; 14753.

Photoionization; cyclohexane; cyclopropanes; ion-molecule reactions; olefins; 15010.

Photoionization; quantum-mechanical; atomic; inner shell; 15079.

Photoionization; radials; vacuum ultraviolet; enthalpy of formation; ions; mass spectrometry; methyl; methylene; 15351.

Photoionization; rare gases; angular distribution; asymmetry; 15299.

Photoionization; rate constants; reaction mechanisms; vinyl halides; ion-molecule reactions; mass spectrometry; 14844.

Photoionization; surfaces; angular distributions; chemisorption; photoemission; 14981.

Photoionization; threshold energies; water; ammonia; dissociative photoionization; NH₄⁺; OH⁺; 15352.

Photolithography; photomask; semiconductor technology; integrated circuits; microelectronics; micrometrology; SP4000-20.

Photolysis; thermodynamic properties; C=N bond; infrared spectrum; isotopic substitution; matrix isolation; methyl azide; methyleneamine; normal coordinate analysis; 15110.

Photomask; semiconductor technology; integrated circuits; microelectronics; micrometrology; photolithography; SP4000-20.

Photomask inspection; photomasks; photoplate quality; automated inspection of photomasks; critical dimension determination; defects; detection of visual defects; integrated circuit photomasks; 15039.

Photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; SP4000-17.

Photomasks; photoplate quality; automated inspection of photomasks; critical dimension determination; defects; detection of visual defects; integrated circuit photomasks; photomask inspection; 15039.

Photomasks; photoresist; resistivity; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; test patterns; thermal resistance; thermal response; thermally stimulated capacitance; SP4000-8.

Photometric measurements; static tests; airport approach and threshold lights; glass prism; impact tests; light bases; optical cover assembly; NBSIR 75-647.

Photometry; interlaboratory test; photodiode detectors; 15486.

Photometry; reflectance; scattering; spectrophotometry; specular gloss; accuracy; appearance; error analysis; gloss; TN594-10.

Photometry; spectrophotometry; averaging spheres; diffusing effectiveness; efficiency; flux averaging; 15126.

Photometry of retroreflective materials; retroreflective sign materials; colorimetry; highway signs; photoelectric tristimulus colorimeters; 15117.

Photomicrography; scanning electron microscope; strain effects; iron-silicon alloys; Lorentz force; magnetic domains; 15037.

Photomultiplier; pulse suppression; scintillator; after-pulse; detector; gamma-flash; SP425, pp. 106-107.
Pitting; breakdown passivity; chlorine; ellipsometry; iron; passivity; 15081.

Planar scanning; plane-wave spectrum; antennas; error analysis; far-field pattern; near-field measurements; T N667.

Plane-polarized photons; giant resonances; nuclear photon scattering; nuclear surface oscillations; 14811.

Plane-wave spectrum; antennas; error analysis; far-field pattern; near-field measurements; plane scanning; T N667.

Planning; present value analysis; analysis; construction; cost; design; economics; flexibility; law enforcement facilities; performance; 14961.

Plasma; absorption; bremsstrahlung; electrons; ions; laser; 15532.

Plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering; Balmer lines; four dimensional rotation group; hydrogen; 15009.

Plasma; radiometry; spectral radiance; vacuum ultraviolet; wall-stabilized; arc; calibrations; hydrogen; 15291.

Plasma; resonance; vacuum ultraviolet; arc; hydrogen; negative ion; 15652.

Plasma; Stark broadening; Balmer; hydrogen; ion dynamics; 15664.

Plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering; Balmer lines; four dimensional rotation group; hydrogen; plasma; 15009.

Plasma chromatography; sampling; automated systems; fluidic logic; gas chromatography; 15106.

Plasma polymers; tissue reaction; biocompatibility; inflammatory response; SP415, pp. 13-17.

Plasma-formed polymers; polymer films; polymerization; polymer permeability; SP415, pp. 1-12.

Plastic containers for petroleum products; containers for petroleum products; jerry-cans; petroleum products; containers for; PS61-74.

Plastic deformation; polymer crystals; radiation damage; x-ray topography; microstructure; paraffin crystals; 15433.

Plastic deformation; polymer solids; fibrous structure; 15554.

Plastic deformation; sorption; crazing; crystalline polymer solid; diffusion; elastic deformation; permeability; 15237.

Plastic deformation; static crush tests; strain measurements; structural components; test procedures; automobile side impact; crush characteristics; displacement measurements; door structure; drop tests; dynamic crush tests; impact collisions; NBSIR 74-605.

Plastic films; polymethyl methacrylate; polyvinyl chloride; radiation processing; radiocromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; dried cellulose; dried plastics; electron beams; gamma radiation; 15278.

Plastic pipe; PVC; smoke; toxic gases; vent; waste; ABS; cast iron; copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; NBSIR 74-449.

Plastic pipe plumbing; PVC; smoke; ABS; DWV; fire endurance; fire spread; fire test; gases; BSS72.

Plastic pipes; thermal conductivity; computer; cryogenic; crytography; data; energy labeling; energy needs; fluid safety; materials; NBS, GSA experiment; optical spectra; DIM/NBS 59, No. 9, 193-216 (1975).

Plasticity; thermodynamics; dislocation; multiaxial; 14979.

Plasticity; Volterra; crystal; defect; disclination; dislocation; elasticity; jog; kink; multiplication; 14475.

Plastics; flame spread and smoke development; high-rise; human behavior; life safety; 15069.

Plastics; radiation chemistry; radiation sterilization; solid-state detectors; spectrophotometry; dose distribution; dosimetry; dyes; electron beams; gamma rays; glasses; 14734.

Plate tectonics; crustal movements; earth rotation; geophysics; lasers; lunar cartography; lunar gravity; moon; 15437.

Plateau annealing; uranium glasses; U-238 fission decay constant; fission track dating; neutron flux; neutron irradiation; 15379.

Platinum; soft x-ray appearance potential; tungsten; tungsten carbide; x-ray photoemission; catalysis; electronic structure; 15011.

Platinum black; polarization; porous electrodes; implantable hybrid cells; pacemakers; palladium black; SP415, pp. 55-61.

Platinum group metals; alloy phases; constitution diagrams; noble metals; phase diagrams; phase equilibria; NBSIR 73-415.

Platinum resistance thermometer; standard cell enclosure; standard cells; AC transformer-ratio bridge; 14925.

Platinum resistance thermometers; resistance thermometers; two-way structural analysis; calibration of thermometers; low-temperature calibration of thermometers; 15309.

Platinum resistance thermometer; tin point; zinc point; aluminium point; calibration; freezing point; freezing-point cell; 15337.

Platinum resistance thermometers; wire-to-wire calibration; adjustment for trend; calibration; capsule type thermometers; intercomparison; IPTS-68; NBSIR 74-586.

Playground equipment safety; scientific data; silicon devices; time; energy conservation; fires; gasoline consumption; glass SRM; hazardous chemicals; leap second; DIM/NBS 59, No. 2. 25-48 (1975).

Plotting, computer; semiconductors; silicon; BASIC; capacitance-voltage measurements; computer programs; dopant profiles; error function; Gaussian diffusion; SP400-11.

Plumbing code; principles of hydraulics; National Bureau of Standards; performance of plumbing systems; 15024.

Plutonium; potassium; praseodymium; promethium; rhenium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Plutonium; safeguard; uranium; nuclear enterprises; nuclear materials; SP425, pp. 199-201.

Plutonium; uranium; evaluation; nuclear data; SP425, pp. 313-316.

Plutonium-238; safeguards data; spontaneous fission; track recorders; coincidence counting; decay constant; SP425, pp. 587-590.

Plutonium-239; uranium-234; uranium-235; uranium-238; cross sections; fission; neptunium-237; neutron reactions; pile neutrons; 15020.

Plywood, construction, and industrial; construction and industrial plywood; industrial plywood; PS1-74.

P.m.r.; symmetrical; conformation; half-chair; inositol; mercuric acetate, phenylsotriazole; 15254.

P.m.r. spectroscopy; acylated 1,1-bis(acylamido)-1-deoxygentitols; conformational analysis; conformational nomenclature; exponential filtering; Fourier transform; 15268.

Poincaré series; polynomial approximation; automorphic functions; 15366.

Point defects; diffuse neutron scattering; incoherent neutron scattering; SP425, pp. 823-824.

Poison ratio; pulse-echo method; sound velocity; Young's modulus; aluminium; aluminium alloys; bulk modulus; compressibility; Debye temperature; elastic constants; elasticity; 15528.

Poison ratio polycrystals; shear modulus; single crystals; Young's modulus; bulk modulus; compressibility; elastic constants; elasticity Lamé constant; 14871.

Poison's ratio; pulse-echo method; sound velocity; Young's modulus; bulk modulus; chromium alloys; compressibility;
Debye temperature; Doring effect; elastic constants; iron alloys; magnetic transition; nickel alloys; 15343.

Poison's ratio; shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constant; nickel-chromium-iron alloys; 15225.

Poison's ratio; shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constant; nickel steels; 15522.

Poison's ratio; shear modulus; Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constants; nickel-base alloys; 15533.

Polarizability; Van der Waals; CO; energy surface; F₂; hydrides; LiH₂; MC-SCF; O₂; O₃; 15275.

Polarization; antennas; measurement; 15659.

Polarization; polymers; polyvinyl chloride; polyvinylfluoride; polyvinylidenefluoride; electrets; piezoelectricity; NBSIR 75-787.

Polarization; polyvinyl chloride; pyroelectric; electret; dipole; glass; piezoelectric; 15320.

Polarization; porous electrodes; implantable hybrid cells; pacemakers; palladium black; platinum black; SP415; pp. 55-61.

Polarization; refrigeration; cryogenics; dielectrics; electrocaloric; heat switches; 15491.

Polarization; spectrofluorimetry; viewing angle; emission anisotropy; fluorescence; fluorescence quantum yield; fluorescence standards; fluorimetry; J.79A No. 1, 1-15 (1975).

Polarization energy shift; relaxation energies; chemisorption; image potential shifts; 14975.

Polarized neutrons; polarized target; ²³⁵U(n,f); fission channels; J; multilevel fits; SP425; pp. 576-579.

Polarized target; ²³⁵U(n,f); fission channels; J; multilevel fits; polarized neutrons; SP425; pp. 576-579.

Polarography; chemical analysis; coulometry; electrochemical analysis; ion-selective electrodes; 15479.

Polarography; spectrochemical analysis; thermal analysis; wet chemistry; x-ray fluorescence; activation analysis; characterization; chemical composition; chromatographic analysis; coulometry; electron probe microanalysis; ion-selective electrodes; mass spectrometry; 15165.

Police communications; water pollution; x rays; air pollution; camera guidelines; computerized elections; dental fillings; metre; ozone problem; DIM/NBS 59, No. 5, 97-120 (1975).

Police protection; safer streets; security systems; WWV/WWVH; accelerator facilities; computers; court records; fire safety; forensic science; law enforcement; methane; metric; DIM/NBS 59, No. 3, 49-72 (1975).

Poling; polymer; polyvinyl fluoride; polyvinylidene fluoride; pyroelectric effect; relative spectral response; ultraviolet detector; heat detector; optical radiation sensor; 15183.

Pollution; CH; free radical; HCO; HO₂; laser magnetic resonance; OH; 15680.

Pollution; seawater; baseline studies; gas chromatography; gas chromatography-mass spectrometry; hydrocarbon; liquid chromatography; marine sediments; 15706.

Pollution; spectra; absorption spectra; infrared; molecular energy levels; ozone; 15311.

Pollution; vinyl chloride; detector; 15027.

Poly(acrylic-itaconic acid); polycarboxylate; potassium titanate; base; dental; cement; polyacrylate; base; cement; reinforced; 15013.

Polybutene; polyvinyl chloride; PVC; residual stress; thermostatic piping; ABS; coefficient of expansion; CPVC; glass transition temperature; hardness; PB; NBSIR 74-629.

Poly carbonate detector; rapid analysis; uranium; coal; fission track technique; fly ash; mica detector; 15457.

Poly carboxylate; potassium titanate; base, dental; cement; polycarboxylate; cement; reinforced; fiber reinforcement; poly(acrylic-itaconic acid); 15013.

Poly crystal; vireous GdPO₄; antiferromagnetism; comparison of magnetic properties of glasses and crystals; GdPO₄; glass; magnetic order; 14833.

Poly crystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; coefficient of thermal expansion; elastic constants; infrared laser window materials; photoelasticity; NBSIR 75-639.

Poly crystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; ZnSe; birefringence; elastic constants; infrared-laser window materials; interferometry; KCl; photoelasticity; NBSIR 75-781.

Polyester; flame retardancy; mass spectrometry; optical spectroscopy; phosphorus; NBSIR 75-741.

Polyethylene; potential energy calculations; relaxation strength; two-site model; mechanical relaxation; methyl branches; paraffins; 14752.

Polyethylene; potential energy calculations; relaxation mechanism; relaxation strength; site model; mechanical relaxation; methyl branches; paraffins; 15329.

Polyethylene; regime I; regime II; spherulite; axialite; chain folds; crystalization rate; molecular weight; nucleation theory; J.79A No. 6, 671-699 (1975).

Polyethylene; surface free energies; chain folds; fractions; homogeneous nucleation; molecular weight; nucleation theory; J.79A No. 6, 701-711 (1975).

Polyethylene; thermodynamic properties; adiabatic calorimetry; branched polyethylene; calorimetry; cryogenic temperature; heat capacity; linear polyethylene; J.79A No. 2. 437-441 (1975).

Polyethylene; unit cell; x ray; crystal surfaces; density; lamella thickness; paraffins; 14724.

Polymer; poly(vinyl acetate); PVT; relaxation; viscosity; density; entropy; free volume; glasses; glass transition; liquid; 14777.

Polymer; poly(vinyl acetate); PVT; thermodynamic; liquid; configurational; glass; glass transition; hole theory; 14850.

Polymer; polyvinyl fluoride; polyvinylidene fluoride; pyroelectric effect; relative spectral response; ultraviolet detector; heat detector; optical radiation sensor; poling; 15183.

Polymer; pressure; pressure transducer; theory; transducer; calibration; construction; impact; interface; piezoelectric polymer; NBSIR 75-740.

Polymer crystals; polyoxymethylene; surface layer; adsorbed polymer; deformation; fold surface; gold decoration; J.79A No. 5, 609-611 (1975).

Polymer crystals; radiation damage; x-ray topography; microstructure; paraffin crystals; plastic deformation; 15433.

Polymer crystals; regular folds; adsorbed layer; amorphous component; fold surface; J.79A No. 5, 613-617 (1975).

Polymer films; polymerization; polymer permeability; plasma-formed polymers; SP415, pp. 1-12.

Polymer grafting; resins; restorative materials; sealants; wear resistance; adhesive materials; composites; dental materials; NBSIR 75-766.

Polymer permeability; plasma-formed polymers; polymer films; polymerization; SP415, pp. 1-12.

Polymer solids; fibrous structure; plastic deformation; 15554.

Polymer structure; sulfur dioxide; density; fluorocarbon copolymer; morphology; permeation; permeation tubes; 15309.

Polymeric bond failure; scanning electron microscopy (SEM); x-ray photoelectron spectroscopy (ESCA); adhesion failure; cohesive failure; 15283.

Polymerization; polymer permeability; plasma-formed polymers; polymer films; SP415, pp. 1-12.
Polymerization; pressure radiation; reactivity ratios; tetrafluoroethylene; copolymerization; pentafluorotyrene; 15281.

Polymers: polypeptides; protein structure; relaxation times; C-13 magnetic resonance; collagen; 15330.

Polymers: polyvinyl chloride; polyvinyl fluoride; polyvinylidene fluoride; electrets; piezoelectricity; polarization; NBSIR 75-787.

Polymers: polyvinylidene fluoride; pyroelectric; radiometer; transducers; electrets; hydphone; piezoelectric; NBSIR 75-760.

Polymers: primers; sealants; adhesion; bonding; composites; coupling agents; monomers; 15374.

Polymers: properties; rubbers; styrene-butadiene rubbers; butyl rubber; constants; natural rubber; neoprene; physical constants; 14838.

Poly(methyl methacrylate): polyvinyl chloride; radiation processing; radiochromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; dyed cellophane; dyed plastics; electron beams; gamma radiation; plastic films; 15278.

Poly(methyl methacrylate); self-curing; surgical bone cement; biomaterial; bone cement; orthopaedic material; 15191.

Poly(methyl methacrylate); self-curing; surgical bone cement; total hip replacement; cement; acrylic resin; cement; medical materials; orthopedic materials; 15164.

Polyominal approximation; automorphic functions; Poincaré series; 15366.

Polyominal search; pseudo-random numbers; scatter storage; collision resolution; hash tables; 15669.

Poly(oxyethylene): surface layer; adsorbed polymer; deformation; fold surface; gold decoration; polymer crystals; J.79 A No. 5, 609-611 (1975).

Poly(oxyethylene) crystals; solid state polymerization; trioxane crystals; dielectric loss; dielectric relaxation; molecular motions; nuclear magnetic resonance absorption; 15359.

Polypeptides: protein structure; relaxation times; C-13 magnetic resonance; collagen; polymers; 15330.

Polylysine: viscoelasticity; Zimm theory; head-spring model; chain molecules; chain stiffness; deoxyribonucleic acid; dilute solutions; hydrodynamic interaction; 1514.

Poly(vinyl acetate); PVT; relaxation; viscosity; density; entropy; free volume; glasses; glass transition; liquid; polymer; 14777.

Poly(vinyl acetate); PVT; thermodynamic; liquid; configurational; glass; glass transition; hole theory; polymer; 14850.

Poly(vinyl chloride): PVC; residual stress; thermoplastic piping; ABS; coefficient of expansion; CPVC; glass transition temperature; hardness; PB; polybutene; NBSIR 74-629.

Poly(vinyl chloride); pyroelectric; electret; dipoles; glass; piezoelectric; polarization; 15320.

Poly(vinyl chloride); radiation processing; radiochromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; dyed cellophane; dyed plastics; electron beams; gamma radiation; plastic films; poly(methyl methacrylate); 15278.

Poly(vinyl chloride); thermal mechanical analysis (TMA); thermal properties; thermogravimetric analysis (TGA); thermoplastic pipe; chlorinated poly(vinyl chloride); hardness; internal stress; NBSIR 74-610.

Poly(vinyl chloride) coatings; steel reinforcing bars; bridge decks; chloride ions; concrete; corrosion; deicing salts; epoxy coatings; organic coatings; BSS65.

Poly(vinyl fluoride): polyvinylidene fluoride; pyroelectric effect; relative spectral response; ultraviolet detector; heat detector; optical radiation sensor; poling; polymer; 15183.

Poly(vinyl fluoride); pyroelectric detectors; reflectance; directional-hemispherical; 14721.

Poly(vinylidene chloride): polyvinylfluoride; polyvinylidenefluoride; electrets; piezoelectricity; polarization; polymers; NBSIR 75-787.
Potential barrier to internal rotation; equilibrium compositions; heat of isomerization; ideal gas thermodynamic properties; isobutane; n-butane; J. Phys. Chem. Ref. Data 4, No. 4, 859-870 (1975).

Potential curve; self-consistent-field, dipole moment function; dissociation energy; electronic structure; hydroxyl radical; 14805.

Potential curves; dissociation laser; excimers; excited state kinetics; 14806.

Potential energy calculations; relaxation strength; two-site model; mechanical relaxation; methyl branches; paraffins; polyethylene; 14752.

Potential energy calculations; relaxation mechanism; relaxation strength; site model; mechanical relaxation; methyl branches; paraffins; polyethylene; 15329.

Potential factor; self-diffusion coefficient; 11-6-8 potential function; correlation function; experimental data; hydrodynamic behavior; methane; molecular dynamics; 15173.

Potential function; specific heat; statistical mechanical ensembles; thermodynamic properties; three body forces; methane; molecular dynamics; 15310.

Potential functions; barriers to planarity; cyclobutane; cyclobutane-d4; isotope effect; kinetic energy terms; 14855.

Potentiometry; electrode review; ion-selective electrodes; membrane electrodes; 14785.

Potted end fittings; structural engineering; tensile strength; transversely isotropic materials; axisymmetric analysis; cables (ropes); composite materials; contour plotting; end fittings for FRP rod and rope; finite element analysis; FRP rod; FRP rope; 15399.

Powder; silver; copper alloy; copper; cryogenics; dilution refrigerator; heat exchanger; Kapitza resistance; liquid helium; 15238.

Powder; silver; cryogenics; dilution refrigerator; heat transfer; helium 3; helium 4; Kapitza resistance; liquid helium; 15219.

Powder; sintering; copper; heat transfer; helium 3-helium 4; Kapitza resistance; phonon-electron interaction; phonon-quasiparticle interaction; 14749.

Powder, diamond; sizes, sub-sieve of diamond powder; diamond powder, grading; grading of diamond powder; P562-74.

Powder diffraction; ambiguities; geometrical; indexing; patterns; 15572.

Powder diffraction standard, silicon; silicon powder diffraction standard; standard, powder diffraction; standard reference material, silicon; 14905.

Powder patterns; reference intensities; standard; x-ray diffraction; crystal structure; integrated intensities; lattice constants; peak intensities; Monogr. 25, Section 12.

Powders; thermal conductivity; thermal diffusivity; cryogenic insulation; 15177.

Power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; NBSIR 74-395.

Power; pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; laser parameters noise; optical electronics; phase; NBSIR 75-818.

Power; pyroelectric; laser; TN665.

Power; radiation; reactor; research; utilities; biology; career; ecological; electricity; energy; environment; fusion; medicine; nuclear; TN888.

Power; ratio; reflection coefficient; reflectometer; self-calibration; six-ports; vector voltmeter; voltage; admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; TN673.

Power; science; technology; artifacts; balance; computer; impermanence; intelligence; 15199.

Power; superconductivity; cryogenics; electricity; energy; helium; 14872.

Power; work; computer efficiency; evaluation; measurement; performance; SF406, pp. 131-134.

Power density meter calibration; TEM transmission cells; hazard level fields; NBSIR 75-804.

Power equation concept; automated measurements; bolometer unit calibration; 14823.

Power equation concept; automation techniques; bolometer units; calibration; 14959.

Power factor; capacitors; energy conservation; fluorescent lamp; fluorescent luminaire; lighting efficiency; TN886.

Power gain; satellite; calibration accuracy; effective area; effective radiated power; extrapolation method; gain comparison method; microwave antenna; 14970.

Power generation; synthetic fuels; energy storage; hydrogen utilization; 15416.

Power law; slope of the coexistence curve diameter; asymmetry; coexistence curve; compressibility; critical exponents; critical point; decorated lattice gas; hole-particle symmetry; law of corresponding states; liquid; Padé approximant; 15293.

Power laws; refractive index; scaling; Schlieren method; specific heat; speed of sound; x-ray scattering; critical region; dielectric constant; equation of state; homogeneity; light scattering; 14932.

Power measurement; pulse circuit; pyroelectricity; detector circuits; 14733.

Power saws; radial arm saws; safety; table saws; accident research; consumer products; injury data; opinion survey; portable circular saws; NBSIR 75-748.

Power transistors; thermal impedance measurements; thermal response measurements; transistors (thermal measurements); computer simulation (transient thermal); current crowding (transistors); 14963.

Power transmission; refrigeration; superconducting cables; cryogenics; helium pump; 15455.

Praseodymium; promethium; rhodium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium; alloy diffusion; beryllium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Precast concrete construction; progressive collapse; structural connection; structural design; wind load; design standards; earthquake load; masonry construction; 15369.

Precast concrete construction; progressive collapse; structural design; structural joints; building systems; housing systems; large-panel structures; NBSIR 75-715.

Precipitation; spinodal decomposition; age hardening; copper-titanium; Dla; metastable solus; microstructural sequence method; nucleation; ordering; 15053.

Precise measurements; superconductivity; electronics; Josephson effect; 14971.

Precise time metrology; subpicosecond time difference measurements; time stability; atomic clocks; frequency measurements; frequency stability; phase delay; 15684.

Precision; accuracy; atomic spectroscopy; atomic vapor; chemical analysis; evaluation; interferences; light sources; 14888.

Precision; production of atomic vapor; zinc; accuracy; atomic fluorescence; automatic scatter correction; cadmium; chemical interferences; data evaluation; 15012.

Precision; radiation detection; accuracy; errors in activation analysis; 15472.
Precision; reference method; specificity; SRM; standard reference material; systematic error; certification; meaningful measurement; measurement; measurement system; Monogr. 148.

Precision; repeatability; reproducibility; accuracy; acoustics; noise; 14866.

Precision; run statistics; security; terminology; validation; warranty; accuracy; audit; certification; code-independent; documentation; optimization; SP406, pp. 141-144.

Precision admittance standards; precision capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; Ac DRRS; coaxial cable effects; coaxial star connectors; extrapolation techniques; four-pair admittances; permutation techniques; 14924.

Pressure attenuation; sensor; waveguide-below-cutoff; absolute (unambiguous) readout; piston; NBSIR 74-394.

Pressure capacitance measurements; transformer bridges; transformer ratio measurements; two-pair admittances; Ac DRRS; coaxial cable effects; coaxial star connectors; extrapolation techniques; four-pair admittances; permutation techniques; precision admittance standards; 14924.

Pressure oscillator; rf spectrum; spectral density of phase fluctuations; spectral purity; frequency multiplication; linewidth; multiplier chain; 15675.

Precompiler; quality software; structural programming; block structure; control flow; GOTO-less programming; language design; 14916.

Preconcentration; radioactive tracers; river water; trace elements; tracers; water; freeze drying; instrumental neutron activation analysis; lyophilization; neutron activation analysis; 15376.

Predictability; requirements; variables; workload; computer system; factors; measurement; parameters; performance; performance terminology; SP406, pp. 53-60.

Predicted indoor adaptability index; air conditioning criteria; building thermal response; comfort indices; human comfort; 15371.

Predicted spectra; radio astronomy; silicon molecules; structures; unidentified molecular lines; microwave spectra; 14867.

Predissociation; Rydberg states; valence states; ion-pair; O2; photodissociation; 15611.

Predissociation; spin-orbit matrix elements; ab initio calculation; level shifts; line broadening; molecular oxygen; 15055.

Prefabricated manholes; restrained piping; accesses; bell joints; concrete manholes; expansion joints; expansion loops; o-ring gaskets; BSS66, pp. 60-72.

Prefabricated steel conduit; Qualified Products List; tieline; condensate return; epoxy; fiberglass reinforced plastic; filament wound; insulated; molded; morphology; BSS66, pp. 88-101.

Preference; pure tones; acoustic navigation aids; applied psychoacoustics; applied psychology; aversiveness; foghorns; 14821.

Pre-processing; relative error; thinning; cross sections; linearization; paging; SP425, pp. 419-421.

Prequalification; system performance; tri-service; underground heat distribution; ASTM, criteria; Federal Construction Council; interagency; BSS66, pp. 73-77.

Present value analysis; analysis; construction; cost; design; economics; flexibility; law enforcement facilities; performance; planning; 14961.

Pressure; enthalpy; entropy; equations of state; helium; 14783.

Pressure; manometry; mercury manometer; 14921.

Pressure; pressure measurement; pressure transducer; thermal transient; transducer; calibration; dynamic; photo flashbulb; NBSIR 75-654.

Pressure; pressure transducer; theory; transducer; calibration; construction; impact; interface; piezoelectric polymer; polymer; NBSIR 75-740.

Pressure; pressure transducer response; thermal transient; transducer; calibration; dynamic, electronic flash; photoflash bulb; NBSIR 75-732.

Pressure; report form; temperature; temperature compensator; test; vapor meter; volume; bell prover; calibration; inspection; liquefied petroleum gas; HI117.

Pressure; sinusoidal pressure; transducer; calibration; dynamic; liquid column; NBSIR 75-708.

Pressure; survey; transducer; calibration; compatibility; cryogenic; liquid oxygen; measurement; oxygen; performance; 15155.

Pressure broadening; resonance broadening; Stark broadening; van der Waals broadening; atomic; instrumental broadening; line shapes; line shifts; SP366-2.

Pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering; Balmer lines; four dimensional rotation group; hydrogen; plasma; plasma broadening; 15009.

Pressure dependence; relaxation; reorientation; temperature dependence; chloroform; deuterium; NMR: 15324.

Pressure differential during swirling flow; swirling flow; decay of swirling flow; helical flow; 15080.

Pressure measurement; calibration; piston gages; 14931.

Pressure measurement; pressure transducer; thermal transient; transducer; calibration; dynamic; photo flashbulb; pressure; NBSIR 75-654.

Pressure measurement; primary pressure standards; calibration; 15460.

Pressure measurement; ruby fluorescence; semiconductors; transition pressures; diamond-anvil pressure cell; fixed point pressure scale; high pressure; NaCl pressure scale; 15224.

Pressure measurement; system dynamics; thermometers; cooling system; cryogenics; helium-cooled electrical leads; helium impurities; microwave cavities; negative differential flow resistance; NBSIR 75-823.

Pressure radiation; reactivity ratios; tetrafluoroethylene; copolymerization; pentafluoro styrene; polymerization; 15281.

Pressure transducer; railway safety; silicon devices; water heaters; windowless buildings; auto fuels; energy; highway safety; lead; DIM/NBS 59, No. 8, 169-192 (1975).

Pressure transducer; theory; transducer; calibration; construction; impact; interface; piezoelectric polymer; polymer; pressure; NBSIR 75-740.

Pressure transducer; thermal transient; transducer; calibration; dynamic; photo flashbulb; pressure; pressure measurement; NBSIR 75-654.

Pressure transducer; transducer calibration; vibration; boundary initial problems; measurement; TN856.

Pressure transducer response; thermal transient; transducer; calibration; dynamic; electronic flash; photoflash bulb; pressure; NBSIR 75-732.

Pressurized ionization chamber; radioactivity 149XE; v relative intensity; enriched source; Ge(Li) detector; measured T1/2; 14812.

Prevention; economics; history; iron mechanisms; microbial corrosion; 14781.

Pricing; administration of computing; computer services; management; microeconomics; 15131.

Primary; reliability; renovation; secondary; system; variable; anchor; controls; corrosion; growth; metering; modern; museum; BSS66, pp. 102-115.

Primary frequency standards; relativity; SI second; time scale accuracy algorithm; time scale stability; coordinate time scales; frequency calibration; international frequency comparisons; optimum frequency estimate; 15672.

Primary frequency standards; Ramsey cavity; accuracy; accuracy evaluations; cavity phase shift; cesium beam tube; frequency stability; interaction length; phase noise; 15683.
Primary photochemical processes; quantum yields; vacuum ultraviolet photolysis; free radical scavenging; hydrocarbons; isobutane; neopentane; 14996.

Primary pressure standards; calibration; pressure measurement; 15460.

Primary processes: 1-butene; far ultraviolet; free radical reactions; ion-molecule reactions; photochemistry; 14773.

Primary standard: radiometry; vacuum ultraviolet; wall-stabilized arc; blackbody calibrations; hydrogen continuum; 15412.

Primers; sealants; adhesion; bonding; composites; coupling agents; monomers; polymers; 15374.

Princeton University; Rietz, H. L.; Shewhart, W. A.; statistical tolerance limits; Wilks, S. S.; Wishart, John; Annals of Mathematical Statistics; Army Experiment Design Conferences; Dodd, E. L.; educational testing; 15513.

Principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; stability; triagonal; diagonally dominant; diagonal matrix; D-stability; Gersgorin's theorem; Lyapunov's theorem; M-matrix; oscillatory; positive definite; 14782.

Principal submatrix; spectral radius; vector norm; consistency; matrix norm; monotonicity; J. 79B Nos. 3 and 4, 97-102 (1975).

Principles of hydraulics; National Bureau of Standards; performance of plumbing systems; plumbing code; 15024.

Privacy; privacy costs; security costs; computer security; data security; TN876.

Privacy; privacy legislation; privacy planning; 15631.

Privacy; requirements definition; security; systems design; computer; data processing; index; information processing; NBSIR 75-909.

Privacy costs; security costs; computer security; data security; privacy; TN876.

Privacy legislation; privacy planning; 15631.

Privacy planning; privacy; privacy legislation; 15631.

Privacy risk assessment; access controls; ADP security; computer security; Federal Information Processing Standards; information management; personal data; physical security; FIPS PUB 41.

Probability; evaluation; graphs; measurement; networks; performance; Petri Nets; SP406, pp. 127-130.

Probability; resonance; thinning; unresolved; cross section; interpolation; Monte Carlo; SP425, pp. 447-450.

Probability distribution function; reliability; risk; statistical analysis; storms; structural engineering; wind loads; wind speeds; building codes; 15558.

Probability distribution functions; reliability; risk; statistical analysis; storms; structural engineering; wind loads; wind speeds; building codes; extreme value distributions; hurricanes; TN868.

Probability plot; statistical methods; statistics; tests of distributional hypotheses; correlation coefficient; medians; normal distribution; order statistics; 14856.

Probe correction; probe design; spherical scan; antenna measurements; data reduction; near field; 14766.

Probe design; spherical scan; antenna measurements; data reduction; near field; probe correction; 14766.

Procedure of ICTA Standards Committee and NBS; standard in thermal analysis; transition from I - III; potassium nitrate; 14906.

Process control; real-time; RTOS; automation; calibration; fuel control; jet engine; minicomputer; multi-task; performance testing; 15550.

Process variability; uncertainty; measurement algorithm; measurement assurance; measurement process; measurement unit; Monogr. 149.

Processing; radiation; shielding; analysis; cross sections; evaluation; information; SP425, pp. 363-366.

Processing parameters, pultrusion; pultrusion; reinforced plastic rod; stress rupture of FRP rod; test methods; FRP rod; weatherability; FRP rod; composite materials; fiber-reinforced-plastic rod; glass-reinforced-polyester rod; guys; antenna; NBSIR 74-557.

Procurement; product improvement; specifications; ETIP; incentives; innovation; NBSIR 75-696.

Procurement; product testing; specifications; unsolicited proposals; certification programs; ETIP; incentives; innovation; life cycle costing; NBSIR 75-716.

Procurement; specifications; standards; technology; transfer; innovation; 15595.

Procurement guidelines; protective equipment; security systems vehicles; voluntary standards: weapons; building systems; communications equipment; concealed objects detectors; emergency equipment; Law Enforcement Standards Laboratory; 15325.

Procurement policy; regulatory policy; small business policy; technology; civilian R&D policy; ETIP; incentives; innovation; NBSIR 75-778.

Product classes; test methods; voluntary; education; efficiency; comparison; household appliances; household equipment; label developments; labeling; label specification; monitoring priorities; 15204.

Product D* (n = 4); cross sections; D*+; dissociative recombination; 14865.

Product improvement; specifications; ETIP; incentives; innovation; procurement; NBSIR 75-696.

Product ions; ethane; gas phase kinetics; ion-molecule reactions; mass spectrometer; 15111.

Product safety; emergency messages; hearing loss; lawn mowers; noise emission; noise pollution; NBSIR 74-608.

Product safety; environmental tests; NBSIR 74-590.

Product safety; product testing; safety regulations; standard development; baby cribs; children's furniture; NBSIR 75-714.

Product safety; radiation; radiation effects; resonant cavity; rhesus; suppression; behavior; behavioral suppression; exposure; microwave radiation; microwaves; 15194.

Product safety; regulation; standards; consumer; 15497.

Product safety; research; science and technology; standards; annual report; computer; energy; environment; health; SP418.

Product safety; research; science; standards; technology; annual report; computer; energy; environment; measurement; SP437.

Product safety; residence-related products; residential safety; safety implementation approaches; safety standards; building codes; Consumer Product Safety Act; NBSIR 75-651.

Product safety; safety requirements; safety testing; consumer products; CPSC proposed regulation; pacifiers; NBSIR 75-733.

Product standards; programming language; air conditioners; buses; subway cars; centennial; electric power; environment; ethane data; facilities; fire research; fire safety; graffiti; DIM/NBS 59, No. 7, 145-168 (1975).

Product standards; safety; consumer products; flammable liquid containers; gasoline cans; mechanical tests; NBSIR 74-614.

Product testing; safety regulations; standard development; baby cribs; children's furniture; product safety; NBSIR 75-714.

Product testing; specifications; unsolicited proposals; certification programs; ETIP; incentives; innovation; life cycle costing; procurement; NBSIR 75-716.

Product-dimensions; building industry; conversion; engineering; human and modular standards; metrication; 15454.

Production; safety; storage; cryogenic technology; data; energy fuel; hydrogen; hydrogen properties; LNG/SNG; TN664.

Production; solar; storage; transmission; transportation; utilities; conservation; conversion; cost; cryogenics; economics; embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; SP419.
Production indices; production measurement; impact; objectives, output; performance measurement; T/N890.

Production measurement; impact; objectives, output; performance measurement; production indices; T/N890.

Production of atomic vapor; zinc; accuracy; atomic fluorescence; automatic scatter correction; cadmium; chemical interferences; data evaluation; precision; I5012.

Productivity; subway; calculable capacitor; color; computer simulation; electricity; energy-environment; fire safety; measurement system; nuclear power plant; DIMINBS 59, No. 12, 266-291 (1975).

Professional interaction: cooperative programs; foreign visitors; information exchange; international building technology; international organization memberships; NBSIR 74-514.

Profiles: sensitivity; uncertainties; air transport; benchmark; SP425, pp. 825-833.

Program conversion; programming aids; programming languages; COBOL; Federal Standard COBOL; FIPS PUB 43.

Programming aids; programming languages; COBOL; Federal Standard COBOL; program conversion; FIPS PUB 43.

Programming aids; syntax analysis; computation and flow analysis; FORTAN use; I5348.

Programming language; air conditioners; buses, subway cars; centennial; electric power; environment; ethane data; facilities; fire research; fire safety; graffiti; product standards; DIMINBS 59, No. 7, 145-168 (1975).

Programming language; software; standards conformance; COBOL; data processing; Federal Information Processing Standard; information interchange; information processing; FIPS PUB 21-1.

Programm ing languages; COBOL; Federal Standard COBOL; program conversion; programming aids; FIPS PUB 43.

Programs for architects; research communication; AIA/NBS Architect-in-Residence; architectural research; daylight research; National Bureau of Standards; 15606.

Progress report; standards; temperature scale; thermometry; annual report; calibrations; T/N869.

Progressive collapse; abnormal loading; building; gas explosion; load-bearing masonry; load-bearing walls; masonry; masonry research; NBSIR 74-526.

Progressive collapse; standards; benefit-cost analysis; building safety; economics; NBSIR 74-542.

Progressive collapse; structural connection; structural design; wind load; design standards; earthquake load; masonry construction; precast concrete construction; I5369.

Progressive collapse; structural design; structural joints; building systems; housing systems; large-panel structures; precast concrete construction; NBSIR 75-715.

Project management; system integration; automation; human relations; job enrichment; organizational development; I5570.

Proliferation; voluntary standardization; aerosols; Fair Packaging and Labeling Act; packages; I4720.

Promethium; rhenium; rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium; alloy diffusion; beryllium; cerium; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Prompt fission neutron spectrum; T-O-F technique; U-235; fast neutron fission; SP425, pp. 631-634.

Prompt neutron; scission point; statistical theory; actinide nuclide; fast-neutron-induced fission; fission; fission fragment; fission product; kinetic energy; mass yield; SP425, pp. 342-345.

Proof testing; Weibull analysis; ceramics; crack propagation; delayed failure; fracture; I5419.

Propagance; reflectance; reflectance factor; symbols; transmittance; transmittance factor; modulation; notation; optical density; I5564.

Propagating modes; scattering function; short wavelength; collective excitations; liquid rubidium; neutron scattering; I5207.

Propane; sulfur dioxide; air pollution; carbon monoxide; gas analysis; permeation tubes; I5552.

Propellants; safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; handling; hydrogen; oxidizers; oxygen; I5154.

Propene; rate constant; air pollution; ethene; kinetics; mass spectrometry; ozone; I5234.

Properties; additive; deformation; dental; porcelain; I4977.

Properties; carbon (graphite); ceramics; composites; data sources; glasses; SP396-2.

Properties; Research Materials; Standard Reference Materials; analysis; characterization; composition; General Materials; SP260, 1975-76 Edition.

Properties; rubbers; styrene-butadiene rubbers; butyl rubber; constants; natural rubber; neoprene; physical constants; polymers; I4858.

Properties; electrodeposited brass; tensile strength; brass; wear rate; brass; density; brass; ductility; brass; electrical resistivity; brass; electrodeposited brass; electroplated brass; internal stress; brass; mechanical properties; electrodeposited brass; I5559.

Properties of electrodeposits; thickness gages; thickness measurement; coating thickness; coating thickness gages; coatings; electrodeposited coatings; electroplated coatings; metal coatings; I5560.

Properties of fluids; specific heat; velocity of sound; density; enthalpy; entropy; hydrogen; I5022.

Property value uncertainties; solid; solid hydrogen; tables; computer programs; gaseous hydrogen; graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; I5382.

Proportional; counter; flux; hydrogen; monitor; neutron; SP425, pp. 78-80.

Proportional limit; stiffness of testing machines; I4949.

Propositional calculus; recursion theory; undecidability; degrees of unsolvability; I5161.

Propyl ion; butyl ion; carbonium ion; ion fragmentation; isomerization; I4908.

Propylene; thermodynamic properties data; transport properties data; critically evaluated data; ethylene; NBSIR 75-763.

Propylene; torsional frequency; critically evaluated data; enthalpy; enthalpy function; enthalpy of formation; entropy; equilibrium constant of formation; ethylene; Gibbs energy function; J. Phys. Chem. Ref. Data 4, No. 1, 251-261 (1975).

Protecting nuclear fuels; computers; energy research; ethylene; fabric flammability; glass standards; household fires; jet engines; measurement seminars; metric; DIMINBS 59, No. 1, 1-24 (1975).

Protective clothing; bibliographies; building fires; construction materials; fire departments; fire tests; flame spread test; flammability tests; flammable fabrics; Operation BREAKTHROUGH; NBSIR 75-736.

Protective clothing; firefighters; firefighter's turnout coats; NBSIR 75-702.

Protective equipment; security systems vehicles; voluntary standards; weapons; building systems; communications equipment; concealed objects detectors; emergency equipment; Law Enforcement Standards Laboratory; procurement guidelines; I5325.

Protein conformation; adsorbed protein conformation; blood protein; SP415, pp. 83-90.

Protein structure; relaxation times; C-13 magnetic resonance; collagen; polymers; polypeptides; I5330.

Protocol; standards; computer graphics; computer networks; graphics; networks; I5071.

Protocols; access procedures; command language; computer networks; macros; minicomputers; I5541.
Proton; range; scattering; depth; deuterium; diffusion; elastic; helium; migration; oxide; SP425, pp. 488-491.
Proton; relaxation; spin; 65-335 K; cerous magnesium nitrate hydrate; lattice; 14860.
Proton; rhenium; cross sections; excitation function; SP425, pp. 509-511.
Proton emission; scattered neutron; angular distribution; inelastic scattering; SP425, pp. 350-353.
Proton radiography; real-time techniques; three-dimensional radiography; x-radiography; dimensional measurement; gamma radiography; image enhancement; neutron radiography; nondestructive testing; 15214.
Proton scattering; quantitative analysis; air particulate matter; SP425, pp. 484-487.
Proton transfer; radiolysis; free radical reactions; G-values; ion-molecule reactions; neopentane; 14890.
Proton-recoil spectrometry; Pu-Be and 235Cf neutron spectra; spectra unfolding; SP425, pp. 62-65.
Protons; solar flares; acceleration mechanisms; neutrons; nuclear reactions; SP425, pp. 512-515.
Protons; solenoid; automated measurement systems; gyromagnetic ratio; magnetic field; 14929.
Pseudopotential; Rb2+; resonant charge transfer; atom; collision; Cs2+; ion; Li+; low energy; Na2+; 15075.
Pseudo-random numbers; scatter formation; collision resolution; hash tables; polynomial search; 15669.
Pseudorotation; Raman; vibration; high amplitude; internal rotation; PF3; 15370.
Psychoacoustics; reverberation room; sound level meters; audiometric standards; building acoustics; community noise; earphones; environmental noise; instrumentation; measurement methodologies; microphones; 15502.
Psychoacoustics; speech interference; aircraft noise; annoyance; noise; 15536.
Psychological; solar glass; spaciousness; sunshine; view; windowless; windows; daylight; fenestration; BS770.
Psychology; acoustics; human factors; human occupancy; illumination; interdisciplinary approach; physiology; 15364.
Ptolemaic and Roman Periods; archaeological materials; Egyptian glasses; galena ores; kohl; lead isotopes; 14912.
ρ-type GaN; Schottky barrier diode; single crystal GaN; 14N+ implantation; 14938.
Pu isotopes; U; 238U(n, f); calculated <α>; deduced channel spectrum; E = 3-5 MeV; fission; nuclear reactions; SP425, pp. 129-138.
Pu isotopes; 238Am; actinide mixture; neutron capture cross sections; SP425, pp. 229-231.
Pu-Be and 235Cf neutron spectra; spectra unfolding; proton-recoil spectrometry; SP425, pp. 62-65.
Public administration; state and local government; systems analysis; technology utilization; vote-tallying; computer security; computing technology; election administration; NBSIR 75-687.
Public good; scientific and technical information; semi-public good; subsidization; total cost recovery; user charges; automated information retrieval; cost benefit; TN864.
Publications; abstracts; NBS publications; key words; SP305, Supplement 6.
Publications; Samuel Stanley Wilks; S. S. Wilks; bibliographic citations; 15017.
Pulp. secondary; recycled paper; secondary pulp; waste paper; market pulp; paper; waste; 15604.
Pulse; detector; dye laser; GaAs; photoconductor; picosecond; 15651.
Pulse; pulse generators; pulse measurement; transmission lines; oscilloscopes; 15304.
Pulse; pyroelectric; autocorrelation; detector; 14741.
Pulse; S parameters; time domain; attenuation; automated measurement; network analyzer; 15661.
Pulse calorimetry; thermodynamics; thermophysical properties; high-speed measurements; high temperature; 15146.
Pulse circuit; pyroelectricity; detector circuits; power measurement; 14733.
Pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; TN672.
Pulse generator; risetime; trigger; tunnel diode; directional coupler; picosecond; 15653.
Pulse generators; pulse measurement; transmission lines; oscilloscopes; pulse; 15304.
Pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; TN672.
Pulse measurement; superconductivity; delay line; picosecond; 14776.
Pulse measurement; superconductivity; delay line; picosecond; 14825.
Pulse measurement; transmission lines; oscilloscopes; pulse; pulse generators; 15304.
Pulse measurements; space charge; automated measurements; dielectrics; dividers; electrical measurement; electric fields; electro-optics; high voltage measurements; insulating fluids; Kerr effect; nitrobenzene; NBSIR 75-774.
Pulse method; Ramsey dual interaction region; second-order doppler; velocity distribution; cavity phase shift; cesium beam tube; frequency synthesis; 14829.
Pulse radiolysis; charge recombination rate constants; cobalt gamma radiolysis; hydrocarbons; ion-molecule reaction; neutralization mechanisms; 15627.
Pulse radiolysis; radiation dosimetry; radiographic dyes; absorbed dose rate; depth dose; distribution; dye films; electron beams; optical cell; 15277.
Pulse suppression; scintillator; after-pulse; detector; gamma-flash; photomultiplier; SP425, pp. 106-107.
Pulsed neutron sources; time-of-flight; carbon; neutron total cross section; 14809.
Pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; power; NBSIR 74-395.
Pulsed quantities; squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; laser parameters; noise; optical electronics; phase; power; NBSIR 75-818.
Pulsed wavemeter timing; oscilloscopes; 15647.
Pulse-echo; steel ultrasonic standards; titanium ultrasonic standards; ultrasonics; aluminum ultrasonic standards; ASTM-type reference blocks; fabrication of reference blocks; immersion testing; longitudinal waves; metallurgical variables; nondestructive testing; NBSIR 75-685.
Pulse-echo method; sound velocity; Young’s modulus; bulk modulus; chromium alloys; compressibility; Debye temperature; Dearing effect; elastic constants; iron alloys; magnetic transition; nickel alloys; Poisson’s ratio; 15343.
Pulse-echo method; sound velocity; Young’s modulus; aluminum; aluminum alloys; bulk modulus; compressibility; Debye temperature; elastic constants; Poisson ratio; 15528.
Pulse-height weighting; time-of-flight method; 90Nb, Ag, 127I, 160Ho, 197Au and 238U; CeF6 detector; Fe-filtered beam; neutron capture cross section; SP425, pp. 802-805.
Pulses; robot; sound; construction; dry weight; cars; energy;
Quantum mechanics; antiferromagnetism; cerous magnesium nitrate; dipole-dipole interaction; ferromagnetism; ground state; magnetic; permutation group; 14911.
Quantum mechanics; spin cluster; spin-Hamiltonian; antiferromagnetism; cerous magnesium nitrate; dipole-dipole coupling; ferromagnetism; ground state; permutation group; 15524.
Quantum transport theory; semiconductors; thermomagnetism; galvanomagnetism; 15525.
Quantum yield; rate constant; atmospheric chemistry; chemical kinetics; data evaluation; gas phase; photoabsorption cross section; photochemistry; TN866.
Quantum yields; stratosphere; trichlorofluoromethane; absorption cross section; chlorine atom; dichlorodifluoromethane; freons; photochemistry; 15571.
Quantum yields; vacuum ultraviolet photolysis; free radical scavenging; hydrocarbons; isobutane; neopentane; primary photochemical processes; 14996.
Quantum-mechanical; atomic; inner shell; photoionization; 15079.
Quartz; self-generated atmosphere; calibration filters; chrysotile; environmental health; improved methodologies; particulates; 15466.
Quartz Bourdon gauge; static expansion; thermal transpiration; vapor-stream pumping; viscosity gauge; capacitance-diaphragm gauge; Knudsen radiometer; McLeod gauge; micromanometry; 14933.
Quartz crystal oscillators; quartz crystal resonators; accuracy; atomic clocks; cesium standards; hydrogen standards; hydrogen storage device; methane stabilized helium-neon lasers; noise studies; 14846.
Quartz crystal resonators; accuracy; atomic clocks; cesium standards; hydrogen standards; hydrogen storage device; methane stabilized helium-neon lasers; noise studies; quartz crystal oscillators; 14846.
Quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; time domain stability; crystal controlled oscillator; fast linewidth; 15673.
Quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; time domain stability; crystal controlled oscillator; fast linewidth; 15687.
Quasi-bound states; two-particle-two-hole states; giant resonance; intermediate structure; nuclear structure; particle-hole model; 15097.
Quasi-elastic neutron scattering; residence times; activation energy; ammonium-ion dynamics; ammonium perchlorate; jump reorientations; 15109.
Quasi-elastic scattering; hydrosulfides; liberation; neutron scattering; phase transition; 15506.
Quasielastic scattering; resonance time; talantal hydrides; vibrational amplitude; activation energy; hydrogen diffusion; neutron scattering; 15204.
Quasi-particles; fluctuations; neutron strength functions; optical potential; SP425, pp. 806-809.
Quencher; air; automotive exhaust emission; detection; fluorescence; nitric oxide; nitrogen; 14991.
Quenching rate; spin-orbit coupling; transition probability; curve crossing; O(1D); O(S); 15566.
Questionnaire; standard frequency and time broadcasts; time; frequency; TNE674.
Queues; analytical models; evaluation; measurement; networks; performance; SP406, pp. 119-121.

R

R. A. Fisher; Francis Galton; frequency curves; method of moments; Karl Pearson; statistics; Tables for Statisticians and Biometricians; W. F. R. Weldon; bibliography; Biometrika; Chi-square tests; correlation; regression; 14822.
Radial arm saws; safety; table saws; accident research; con-
sumer products; injury data; opinion survey; portable circular saws; power saws; NBSIR 75-748.
Radial tire failures; certification of steel belted radial tires; high speed radial tire hazard; NBSIR 75-734.
Radian; angle; dimension; logarithm; neper; J. 79B Nos. 3 and 4, 127-135 (1975).
Radiance temperature; high-speed measurements; high temperature; iron; melting; normal spectral emittance; J. 79A No. 4, 541-544 (1975).
Radiance temperature; reaction of Ba(g) and excited ozone; reacation of Fe(g) and oxygen; review of literature on rate of effusion and mass-spectrometric data; scandium group and rare-earth gaseous monoxides; specific heat; total emittance; vanadium; zirconium; NBSIR 74-600.
Radiance temperature; wavelength; melting point; molybdenum; 15557.
Radiance temperature; zirconium; electrical resistivity; high-speed measurements; high temperature; melting point; normal spectral emittance; 15612.
Radiant heat flux; corridor fire spread; energy release rate; fire induced flow; flame propagation; flashover; floor coverings; NBSIR 75-691.
Radiation; radiation effects; resonant cavity; rhesus; suppression; behavior; behavioral suppression; exposure; microwave radiation; microwaves; product safety; 15194.
Radiation; radiography; activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; TN860.
Radiation; reactor; research; utilities; biology; career; ecological; electricity; energy; environment; fusion; medicine; nuclear; power; TN888.
Radiation; shielding; analysis; cross sections; evaluation; information; processing; SP425, pp. 363-366.
Radiation; sodium; molecules; noble gases; 15167.
Radiation; storage ring; synchrotron radiation; vacuum ultraviolet; electron accelerator; new facility; 15026.
Radiation; chemical kinetics; radiation measurement; refractive index; temperature measurement; calorimeter; dosimetry; electron beam; interferometer; 15619.
Radiation chemistry; radiation sterilization; solid-state detectors; spectrophotometry; dose distribution; dosimetry; dyes; electron beams; gamma rays; glasses; plastics; 14734.
Radiation chemistry; rare gases; cross sections; excited states; ionization; mass spectrometry; 14832.
Radiation chemistry; rate constants; ion-molecule reaction; ion structure; ionic fragmentation; 14884.
Radiation chemistry; rates; aqueous solution; chemical kinetics; data compilation; hydrated electron; NSRDS-NBS43. Supplement.
Radiation chemistry; rates; aqueous solution; chemical kinetics; data compilation; hydrogen atom; NSRDS-NBS51.
Radiation chemistry; rates; review; chemical kinetics; data compilation; methanol; NSRDS-NBS54.
Radiation curing; radiation processing; radiocromic dyes; thin films; dose distributions; dosimetry; dye dosimeters; electron beams; 14957.
Radiation damage; thermal neutrons; Kossel diffraction; lattice expansion; LiF; NBS reactor; 15346.
Radiation damage; x-ray topography; microstructure; paraffin crystals; plastic deformation; polymer crystals; 15433.
Radiation detection; accuracy; errors in analysis activation; precision; 15472.
Radiation dosimetry; radiocromic dyes; absorbed dose rate; depth dose; dose distribution; dye films; electron beams; optical cell; pulse radiolysis; 15277.
Radiation dosimetry; radiocromic dyes; absorbed dose rate; calorimetry; chemical dosimetry; electron beams; gamma radiation; 15482.
Radiation effects; resonant cavity; rhesus; suppression;
behavior; behavioral suppression; exposure; microwave radiation; microwaves; product safety; radiation; 15194.

Radiation imaging; radiation measurements; calorimetry; depth dose; dose distributions; dosimetry; electron beams; holographic interferometry; holography; isodose; 15529.

Radiation installations; radiation safety; x-ray equipment; gamma-ray equipment; H114.

Radiation measurement; radiation transport; cavity theory; dosimetry; Fano theorem; ionization chambers; 15169.

Radiation measurement; refractive index; temperature measurement; calorimeter; dosimetry; electron beam; interferometer; radiation chemical kinetics; 15619.

Radiation measurements; calorimetry; depth dose; dose distributions; dosimetry; electron beams; holographic interferometry; holography; isodose; radiation imaging; 15529.

Radiation processing; radiocromic dyes; thin films; dose distributions; dosimetry; dye dosimeters; electron beams; radiation curing; 14957.

Radiation processing; radiocromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; dyed cellophane; dyed plastics; electron beams; gamma radiation; plastic films; polymethyl methacrylate; polyvinyl chloride; 15278.

Radiation safety; x-ray equipment; gamma-ray equipment; radiation installations; H114.

Radiation shield; temperature gradient; x-ray; attachment; low-temperature; 15242.

Radiation shielding; effects of nuclear weapons; fission product gamma rays; gamma ray penetration; initial nuclear radiations; neutron penetration; 15056.

Radiation standard; absorbed dose; calorimeter; dosimetry; electrons; ionization chamber; 15471.

Radiation sterilization; solid-state detectors; spectrophotometry; dose distribution; dosimetry; dyes; electron beams; gamma rays; glasses; plastics; radiation chemistry; 14734.

Radiation transport; cavity theory; dosimetry; Fano theorem; ionization chambers; radiation measurement; 15169.

Radiation widths; statistical model codes; applications to CTR; cross-section calculations; fast neutron reactions; gamma-ray production; isomers; SP425, pp. 651-658.

Radiations; reactions; tables; y-rays; computers; data; decay; ENSDF; evaluation; files; formats; levels; nuclear structure; SP425, pp. 309-312.

Radiative transfer; combustion products; full-scale fire; NBSIR 74-596.

Radiative heat transfer; corridor; fire spread; flashover; floor covering; 15410.

Radiative lifetimes; spin uncoupling; vibration-rotation interaction; vibrational transitions; Einstein coefficients; line strengths; Meinel bands; molecular spectra; OH; 14767.

Radiative transfer; atomic abundances; CN spectra; non-LTE molecular spectra; photospheres; stellar; 15418.

Radiative transfer; solar active regions; solar chromosphere; spectral line formation; 14863.

Radiative transfer; solar flares; chromosphere, sun; photosphere, sun; 15286.

Radiative transfer; spectral line formation; stellar atmospheres; astrophysics; early-type stars; 14751.

Radiative transfer; spectral line formation; stellar atmospheres; astrophysics; energy loss; 15489.

Radiative transition probabilities; spectra; atomic physics; atomic structure; oscillator strengths; 14768.

Radiatively controlled lines; contrasts in emergent intensity; 14948.

Radical formation; tie molecules; chain rupture; crystalline polymer; ESR investigation of radicals; fibrous structure; mechanical breakdown; microfibrillar structure; 15476.

Radical scavenging; vacuum ultraviolet photolysis; alkane; electronically excited molecule; hydrogen iodide; n-butane; 14762.

Radicals; bond rupture; chain rupture; ESR; fibrils; load-elongation curve; microcracks; microfibrils; 15555.

Radicals; flames; laser excitation; mass spectrometry; 15243.

Radicals; rate constant; combination; flash photolysis-gas chromatography; methyl; methylene; 15205.

Radicals; vacuum ultraviolet; enthalpy of formation; ions; mass spectrometry; methyl; methylene; photoionization; 15351.

Radio; search; comet; HCN; HCN, Kohoutek; OH; 15262.

Radio astronomy; dimethyl ether; internal motion; interstellar molecules; Orion; 15365.

Radio astronomy; Sagittarius B2; ethyl alcohol; interstellar chemistry; molecular cloud; molecular spectroscopy; J5001.

Radio astronomy; silicon molecules; structures; unidentified molecular lines; microwave spectra; predicted spectra; 14867.

Radio astronomy; silicon monoxide; circular polarization; maser; orion; pumping processes; 15004.

Radio star; accuracy; antenna; calibration; Cassiopeia A; error analysis; flux density; ground station; G/T (system gain/system noise temperature); NBSIR 75-822.

Radio star; satellite communications; antenna gain; G/T; 15660.

Radioactive tracers; Anger positron camera; lung function; SP425, pp. 469-471.

Radioactive tracers; river water; trace elements; tracers; water; freeze drying; instrumental neutron activation analysis; lyophilization; neutron activation analysis; preconcentration; 15376.

Radioactivity; radionuclide; radiotrntum; environment; intercalibration; intercomparison; TN875.

Radioactivity; rate of charge measurement; 4πγ pressure ionization chamber; half-life measurement; isomeric decay; isotope 1511In; 15078.

Radioactivity; resonance-levels; afterheat; blanket; cross-section; experiment; fusion; SP425, pp. 708-711.

Radioactivity 133Xe; ν relative intensity; enriched source; Ge(Li) detector; measured T1/2; pressured ionization chamber; 14812.

Radioactivity 99Kr [from (n,γ)]; deduced Qec, log ft, J; enriched 99Kr target; isotopes; separated sources; measured L/K EC ratio; multiwire proportional counter; 15197.

Radiochemical separation; solvent extraction; triphenylamine; analysis; biological materials; chloroform; chromium; environmental materials; neutron activation; 15409.

Radiochromic dosimeters; x-ray spectra; bone; dosimetry; dyes; electron dosimetry; energy dependence; gamma rays; muscle; 15429.

Radiochromic dyes; absorbed dose rate; depth dose; dose distribution; dye films; electron beams; optical cell; pulse radiolysis; radiation dosimetry; 15277.

Radiochromic dyes; absorbed dose rate; cellulose triacetate; dosimetry; dyed cellophane; dyed plastics; electron beams; gamma radiation; plastic films; polymethyl methacrylate; polyvinyl chloride; radiation processing; 15278.

Radiochromic dyes; absorbed dose rate; calorimetry; chemical dosimetry; electron beams; gamma radiation; radiation dosimetry; 15482.

Radiochromic dyes; thin films; dose distributions; dosimetry; dye dosimeters; electron beams; radiation curing; radiation processing; 14957.

Radiochromic dyes; thin films; cavity theory; depth dose; dose distributions; dosimetry; dyes; electron beams; 15424.

Radiography; activation analysis; crystal structure; diffraction; isotopes; molecular dynamics; neutron; nuclear reactor; radiation; TN860.

Radiography; radiotherapy; tissue; dosimeter; SP425, pp. 527-532.

Radiography; serviceability; dimensional measurement; image
Recommended practices; specifications; standardization activities; standards; states—standardization activities; test methods; codes; consensus system; directory; Federal Government—standardization; industry standards activities; national standards activities; SP417.

Recommended values; semiempirical calculations; ab initio calculations; atomic negative ions; binding energy; electron affinity; excited states; experimental methods; fine structure splitting; J. Phys. Chem. Ref. Data 4, No. 3, 539-576 (1975).

Record materials; record papers; stability; accelerated aging; natural aging; permanence; NBSIR 75-739.

Record papers; stability; accelerated aging; natural aging; permanence; record materials; NBSIR 75-739.

Record papers; stability of paper; accelerated aging; aging; natural aging; paper; permanent; paper; stability; permanent papers; NBSIR 74-632.

Recrystallization; terbium-iron; amorphous alloys; amorphous magnetism; coercive magnetic force; magnetic structure; neutron diffraction; 15297.

Rectifiers; water treatment; anodes; cathodic protection; coatings; corrosion; deterioration; inhibitors; materials selection; nonmetals; BSS566, pp. 42-51.

Rectilinear diameter law: refractive index; refractometric viral coefficients; critical refractive index; Fabry-Perot interferometer; Lorenz-Lorentz function; methane; 15137.

Recursion theory; undecidability; degrees of unsolvability; propositional calculus; 15616.

Recursive functions; r.e. many-one degrees; r.e. one-one degrees; semi-Thue systems; splinters; combinatorial systems with axiom; degrees of unsolvability; general decision problems; Markov algorithms; many-one reducibility; 14998.

Recycle concept; transuranium element production; waste recycling in a 233U-237Th reactor; actinide fuel, fertile material, and wastes; SP425, pp. 222-223.

Recycled paper; secondary pulp; waste paper; market pulp; paper, waste; pulp, secondary; 15604.

 Redistribution of income; water resources; cost sharing; efficiency; equity; recreation; 15363.

 Reduced and principal moments of inertia; standard heat of formation; structural parameters; torsional mode; vibrational fundamentals; barrier height to internal rotation; fluoroethanes with a symmetric top; J. Phys. Chem. Ref. Data 4, No. 2, 441-456 (1975).

 Reduced mass; Stark broadening; Balmer lines; hydrogen plasma; ion motion; line shapes; 15463.

 Reduced transition probability; 31P; photoexcitation; electron scattering; form factors; intermediate coupling; 15104.

 Reduced widths; transverse; boron; electron scattering; giant resonance; longitudinal; 14964.

 Reduced-size vents; trap-seal retention; venting; venting criteria; vents, reduced-size; DWV; performance testing; BSS560.

 Reduction of measurement data; software measurement tools; total computing capacity; user satisfaction measurement; SP406, pp. 27-31.

 Reference data service; standard reference data; data files; data network; data on-line; international data service; on-line data; 15266.

 Reference ethanol solutions; breath alcohol analyzers; dichromate oxidation; performance standards; 15203.

 Reference intensities; standard; x-ray diffraction; crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; Monogr. 25, Section 12.

 Reference material; cholesterol; clinical standard; combustion, heat of; enthalpy; formation; heat of; J.79A No. 3, 493-496 (1975).

 Reference materials; analysis of toxic materials; atmospheric analysis; industrial hygiene; NBSIR 73-256.

 Reference materials; SRM's; standard materials; standard reference materials; standards; certification; certified reference materials; materials; meaningful measurements; measurement; SP408.

 Reference materials; sulfur dioxide; air pollution; chemical analysis; pararosaniline method; quality control; NBSIR 75-662.

 Reference materials; thermochemical; thermochemical standards; thianthren; urea; acetanilide; bomb calormetry; calorimetry; chlorobenzoic acid; combustion; creatinine; fluorobenzoic acid; nicotinic acid; 15441.

 Reference method; specificity; SRM; standard reference material; systematic error; certification; meaningful measurement; measurement; measurement system; precision; Monogr. 148.

 Reference methods; SI units; length; mass; National Bureau of Standards; 15678.

 Reference methods; Standard Reference Materials; measurement; measurement compatibility; 15265.

 Reference methods; standard reference materials; accuracy; clinical chemistry; measurement; 15496.

 Reference samples; trace elements; body fluids; fluorine; lead; mercury; 15408.

 Reference standard; absolute ratios; atomic weight; isotopic abundance; potassium; J.79A No. 6, 713-725 (1975).

 Reference tables; temperature measurements; thermal emf; thermocouples; thermoelectric reference data; thermometry; calibration; nickel-base alloys; nickel-chromium alloys; nickel-silicon alloys; 15518.

 Reference Theta-Pinch Reactor; tritium breeding; Bondarenko; f-factors; fusion reactors; niobium; SP425, pp. 722-728.

 Reference values; scattering; cylinder scattering; electromagnetic scattering; lossy dielectric; multilayer cylinder; 15648.

 Reflectance; directional-hemispherical; polyvinyl fluoride; pyroelectric detectors; 14721.

 Reflectance; reflectance factor; symbols; transmittance; transmittance factor; modulation; notation; optical density; propagance; 15564.

 Reflectance; scattering; spectrophotometry; specular gloss; accuracy; appearance; error analysis; gloss; photometry; TN594-10.

 Reflectance factor; symbols; transmittance; transmittance factor; modulation; notation; optical density; propagance; reflectance; 15564.

 Reflecting objective; spectrometers; spherical aberration; third-order theory; unit magnification; Cassegrain; 14802.

 Reflection coefficient; reflectometer; self-calibration; six-ports; vector voltmeter; voltage; admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; TN673.

 Reflection coefficient; scattering coefficients; transmission coefficient; waveguide standards; 2-port standards; automatic measurement; coaxial standards; network parameters; 14739.

 Reflectivity; three-dimensional scanning; anechoic chamber evaluation; omni-directional probe; 14952.

 Reflectometer; self-calibration; six-ports; vector voltmeter; voltage; admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; reflection coefficient; TN673.

 Reflector, cat's-eye; retroreflector, cat's eye; optical devices; optics; precision; 15202.

 Refractive index; refractometric viral coefficients; critical refractive index; Fabry-Perot interferometer; Lorenz-Lorentz function; methane; rectilinear diameter law; 15137.
Review; stacking fault energy; x-ray diffraction; deformation; dislocations; face-centered cubic metals; faults; Fourier analysis; 14750.

Review; standardization; survey; AID; development assistance; economics; Ecuador; less developed countries; measurement services; NBSIR 75-785.

Review; steel fibers; cement; concrete; fiber-reinforced cements; fiber-reinforced concretes; glass fibers; mechanical properties; organic fibers; 15028.

Review; total absorption; activation; capture techniques; high resolution methods; Moxon-Ray; SP425, pp. 139-148.

Review article; thermodynamic diffusion equations; vacancy diffusion mechanisms; atomic diffusion mechanisms; diffusion; random walk; 15539.

Review of literature on rate of effusion and mass-spectrometric data; scandium group and rare-earth gaseous monoxides; specific heat; total emittance; vanadium; zirconium; bibliography on spectroscopy of fluorides and oxides of the lanthanide series; NBSIR 74-600.

R-function; R-function; R-f

Rietz, Ripple; Risetime; R-matrix; standards; Sp; 104.

Ripple; sequence cameras; shoplifting; surveillance; surveillance cameras; cameras; demand cameras; employee theft; fixed surveillance; motion picture surveillance; 14923.

Robot; sound; construction; dry weight; ears; energy; health care; hospitals; measurement science; meter; metric; pulses; DIM/NBS 59, No. 10, 218-239 (1975).

Roisin; roofing; temperature effects; tensile fatigue; test methods; bimetallic roof membranes; fatigue testing; flexural fatigue; performance criteria; TN863.

Room air conditioning; consumer information; efficiency; energy; label; refrigerator/freezers; 15451.

Room fires; scale models; thermal radiation; fire growth; fire tests; flashover; NBSIR 75-710.

Room fires; smoke; wood crib; buildings; fire growth; flame spread; heat release; interior linings; material ignitability; performance criteria; TN879.

Rotometer; variable area meter; coefficients of discharge; expansion factor; flow coefficients; flowmeter; fluid meter coefficients; 14795.

Rotary-vane attenuator; attenuation; interlaboratory standard; measurement; Monogr. 144.

Rotational analysis; Zeeman spectrum; asymmetric rotors; doublet states; HO2; laser magnetic resonance; least squares fit; 14910.

Rotational constants; atomic energy levels; atomic line shapes; atomic spectra; atomic transition probabilities; bands, molecular; energy levels; atomic; line shapes; atomic; molecular bands; molecular spectra; 15260.

Rotational constants; spectral assignments; spin splitting; Zeeman spectrum; asymmetric rotor levels; HO2; laser magnetic resonance; 15067.

Rotational disorder; single crystal; alkali cyanides; crystal dynamics; dispersion curves; orientation; phonons; 15124.

Rotational spectra; applications; chemical analysis; microwave; qualitative analysis; quantitative analysis; 15261.

Rotational spectra; applications; chemical analysis; microwave; qualitative analysis; quantitative analysis; 15625.

Rotational spectrum; structure; vinylamine; dipole moment; ethylamine; pyrolysis reactions; 15258.

Rotational structure; Zeeman; effect; laser; magnetic resonance; oxygen; 15335.

Rotational transitions; laser; M-type stars; molecular emission; Orion Nebula; silicon monoxide; 15210.

Rotonic minimum; 3He; He solutions; lifetime of excitations; neutron scattering; perturbation of elementary excitations; quantum liquids; 15263.

Roughness; surfaces; computer simulation; crystal growth; fcc crystals; 15144.

Round off; computer program; metric conversion; 15406.

Rounding; test problem; tolerance; Caterpillar Tractor Co.; computer program; documentation; engineering drawing; General Motors Corporation; metric conversion; TN782.

Rousse theory; solution properties; viscoelasticity; head-spring model; block copolymers; concentrated solutions; dynamics; 15390.
Routh-Hurwitz conditions; sign stable; sign symmetric; stability; tridiagonal; diagonally dominant; diagonal matrix; D-stability; Gersgorin's theorem; Lyapunov's theorem; M-matrix; oscillatory; positive definite; principal minor; 14782.

RSYST; burnup calculation; burnup model; critical boron concentration; fission products; KWO; SP425, pp. 398-400.

RTOS; automation; calibration; fuel control; jet engine; minicomputer; multi-task; performance testing; process control; real-time; 15550.

RTOS; software: debugging; Interdata 70; OS AIDs; 15538.

Rubbers; styrene-butadiene rubbers; butyl rubber; constants; natural rubber; neoprene; physical constants; polymers; properties; 14858.

Rubbery materials; strain-energy function; volume-extension; compressibility; elasticity; finite deformation; hyperelasticity; 15015.

Rubidium; line broadening; 15070.

Rubidium; satellite; line-broadening; 14731.

Rubidium; sodium; line broadening; 15349.

Rubidium; sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium; alloy diffusion; beryllium; cerium; cesium; chromium; copper; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Rubidium; spectra; ultraviolet; wavelengths; 14893.

Rubidium; spectra; ultraviolet; wavelengths; 15255.

Rubidium nitrate; rubidium tantalate; sodium antimonate; sodium antimonate fluoride; ionic conductivity; nonstoichiometry; potassium antimonate; 15439.

Rubidium standards; saturated absorption; time standards; application of standards; basic standards; cesium standards; frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; 14830.

Rubidium tantalate; sodium antimonate; sodium antimonate fluoride; ionic conductivity; nonstoichiometry; potassium antimonate; rubidium nitrate; 15439.

Ruby; calibration; diamond cell; fluorescence; high pressure; hydrostatic pressures; 15085.

Ruby fluorescence; semiconductors; transition pressures; diamond-anvil pressure cell; fixed point pressure scale; high pressure; NaCl pressure scale; pressure measurement; 15224.

Run statistics; security; terminology; validation; warranty; accuracy; audit; certification; code-independent; documentation; optimization; precision; SP406, pp. 141-144.

Runway capacity; simulation; airport; airport capacity; airport simulation; models; model validation; 15029.

Runway capacity; simulation; validation; airport; airport capacity; airport simulation; models; model validation; NBSIR 75-783.

Ruthenium; adsorption; carbon monoxide; catalysis; LEED; oxygen; 15045.

Ruthenium; satellite; shake-up; structure; x-ray photoelectron spectroscopy; oxygen; 15147.

Ruthenium; work function Auger spectroscopy; carbon monoxide; chemisorption; defraction low energy electron; 14945.

Ruthenium; x-ray photoelectron spectroscopy; chemisorption; CO; ESCA; 15042.

Rydberg state; absorption spectrum; accidental predissociation; carbon monoxide; emission spectrum; perturbation; 15386.

Rydberg states; atom; autoionizing; collision; cross section; electron; experiment; positive ion; review; 15556.

Rydberg states; valence states; ion-pair; O2; photodissociation; predissociation; 15611.

S parameters; time domain; attenuation; automated measurement; network analyzer; pulse; 15661.

S parameters; transistors; electronics; high-frequency probes; interlaboratory comparison; scattering parameters; SP400-5.

S. S. Wilks; bibliographic citations; publications; Samuel Stanley Wilks; 15017.

Sacrificial anodes; soil resistivity; cathodic protection; insulating joints; nonconducting coating; BS566, pp. 116-119.

Safeguard; uranium; nuclear enterprises; nuclear materials; plutonium; SP425, pp. 199-201.

Safeguards; analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization; nuclear materials safeguards; 15048.

Safeguards; analysis; diversion of nuclear materials; diversion path analysis; internal control system characterization; nuclear materials safeguards; 15049.

Safeguards; surveillance; tamper-resistant; television; NBSIR 75-707.

Safeguards data; spontaneous fission; track recorders; coincidence counting; decay constant; plutonium-238; SP425, pp. 587-590.

Safer streets; security systems; WWV/WWVH; accelerator facilities; computers; court records; fire safety; forensic science; law enforcement; methane; metric; police protection; DIM/ NBS 59, No. 3, 49-72 (1975).

Safety; accidents; breeders; fast reactors; LMFBR; recriticality; SP425, pp. 45-50.

Safety; air conditioners; appliance; bone cement; computer; energy; energy labels; fire fatalities; hydrogen fuel; magnetohydrodynamics; metric changeover; DIM/NBS 59, No. 6, 121-144 (1975).

Safety; architecture; building; building codes; building design; disaster mitigation; earthquakes; engineering; environmental hazards; housing; inspection and testing; TN885.

Safety; consumer products; flammable liquid containers; gasoline cans; mechanical tests; product standards; NBSIR 74-614.

Safety; simulation; skin; skin, cutting; synthetic materials; cutting; toys; cut; edges; hazardous; experimental studies; human tolerances; injury; injury thresholds; inspection of edges; laceration; NBSIR 73-262.

Safety; standards; structural loading; buildings; codes; design criteria; regulatory system; 15503.

Safety; storage; cryogenic technology; data; energy fuel; hydrogen; hydrogen properties; LNG/SNG; production; TN664.

Safety; table saws; accident research; consumer products; injury data; opinion survey; portable circular saws; power saws; radial arm saws; NBSIR 75-748.

Safety; vents; automobile; detection; dispersion; explosion; fire; hydrogen; leakage; methane; TN666.

Safety; warning lights; consumer products; human factors; kitchen; ranges; reaction time; NBSIR 75-797.

Safety implementation approaches; safety standards; building codes; Consumer Product Safety Act; product safety; residence-related products; residential safety; NBSIR 75-651.

Safety information; thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; handling; hydrogen; oxidizers; oxygen; propellants; 15154.

Safety regulations; standard development; baby cribs; children's furniture; product safety; product testing; NBSIR 75-714.

Safety requirements; safety testing; consumer products; CPSC proposed regulation; pacifiers; product safety; NBSIR 75-733.

Safety standards; building codes; Consumer Product Safety Act; product safety; residence-related products; residential safety; safety implementation approaches; NBSIR 75-651.

Safety standards; sampling plan; sampling scheme; quality assurance; regulation; NBSIR 75-697.

Safety testing; consumer products, CPSC proposed regulation;
pacificers; product safety; safety requirements; \textit{NBSIR} 75-733.

Sagittarius B2; ethyl alcohol; interstellar chemistry; molecular cloud; molecular spectroscopy; radio astronomy; \textit{15001}.

Salinity control; Colorado River; cost sharing; efficiency; equity; 15477.

Salmon; salmon fishery; salmon information system; Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; fishery modeling; modeling: \textit{NBSIR} 75-796.

Salmon fisheries; salmon fishery modeling; simulation; State of Washington; Washington State; Washington State Fisheries; fisheries; fishery modeling; mathematical modeling; regulatory analysis; resource management; \textit{NBSIR} 75-745.

Salmon fisheries model; analysis of biological processes; economic performance; fisheries management; fisheries regulation; mathematical models; \textit{NBSIR} 74-522.

Salmon fishery; salmon information system; Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; fishery modeling; modeling: salmon; \textit{NBSIR} 75-796.

Salmon fishery modeling; simulation; State of Washington; Washington State; Washington State Fisheries; fisheries; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; \textit{NBSIR} 75-745.

Salmon information system; Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; fishery modeling; modeling; salmon; \textit{NBSIR} 75-796.

Salt solutions; saturated salt; humidity; humidity chamber; microbiological growth; relative humidity; \textit{NBSIR} 75-917.

Salt spray corrosion resistance; warded lock; ace type pin tumbler lock; cheek plate tamper resistance; 14959.

Sampling; automated systems; fluidic logic; gas chromatography; plasma chromatography; 15106.

Sampling; chemistry; clinical laboratory capability; critique; hematology; microbiology; 15244.

Sampling; chemistry; clinical laboratory capability; critique; hematology; microbiology; 15273.

Sampling; simulation; wattmeter; analog-to-digital conversion; digital; electricity; electric power; measurement; TN870.

Sampling; wattmeter; analog-to-digital conversion; digital; electricity; electric power; measurement; 14878.

Sampling device; sea water sampling; trace organic analysis; water pollution; baseline studies; fresh water sampling; 15099.

Sampling oscilloscopes; GaAs; laser; photocoherent; 15644.

Sampling oscilloscopes; scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; TN672.

Sampling plan; sampling scheme; quality assurance; regulation; safety standards; \textit{NBSIR} 75-697.

Sampling scheme; quality assurance; regulation; safety standards; sampling plan; \textit{NBSIR} 75-697.

Samuel Stanley Wilks; S. S. Wilks; bibliographic citations; publications; 15017.

Sand transport; oscillatory flows; permeability; ripple; 15145.

Sapphire; slow crack growth; thermal activation; ambient temperatures; dislocation mechanisms; fracture mechanics; 15122.

Sapphire; temperature; thickness; cell; Kvar; 15618.

Satellite; calibration accuracy; effective area; effective radiated power; extrapolation method; gain comparison method; microwave antenna; power gain; 14970.

Satellite; line-broadening; rubidium; 14731.

Satellite; service improvement; communication; cost-benefit; deployment; electronic transmission; facility location; mail; mathematical programming; message network synthesis; network optimization; \textit{NBSIR} 75-737.

Satellite; shake-up; structure; x-ray photoelectron spectroscopy; oxygen; ruthenium; 15147.

Satellite; synchronization; time; broadcasting; dissemination; frequency; 14836.

Satellite batteries; separator materials; battery separators; nickel-cadmium batteries; \textit{NBSIR} 74-541.

Satellite communications; antenna gain; G/T; radio star; 15660.

Satellite ephemesis; variation of parameters; celestial mechanics; orbit perturbation; \textit{J.79B} Nos. 1 and 2, 1-15 (1975).

Satellites; spinodal decomposition; composition modulations; contrast mechanism; electron diffraction; electron microscopy; lattice images; modulation images; 15063.

Saturated absorption; laser spectroscopy; methane spectra; recoil; 14951.

Saturated absorption; time standards; application of standards; basic standards; cesium standards; frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; 14830.

Saturated absorption spectroscopy; speed of light; the meter; laser frequency measurements; laser straingage; 15688.

Saturated air; second virial coefficients; virial coefficients; enhancement factor; equation of state; interaction virial coefficients; moist air; \textit{J.79A} No. 4, 551-560 (1975).

Saturated salt; humidity; humidity chamber; microbiological growth; relative humidity; salt solutions; \textit{NBSIR} 75-917.

Saturation properties; scaling laws; specific heat; critical point; density; enthalpy; equation of state; hydrogen; index of refraction PV T; \textit{NBSIR} 75-814.

Sb; Ph; alloys; Cu; hyperfine fields; magnetism; Mn; Mössbauer effect; Ni; 15016.

\( \sigma_s: \) 1.0, 1.0, 1.0, 1.0; Ru: 271; adjustment; evaluation; fission products; sensitivity analysis; \textit{SP425}, pp. 165-168.

Scale models; thermal radiation; fire growth; fire tests; flashover; room fires; \textit{NBSIR} 75-710.

Scale-model; smoke movement; stratified flow; theory; corridors; fire induced flow; recirculating flow; 15630.

Scales; survey; temperature compensation; uniformity; weights and measures; digital indicators; drained weight; laws and regulations; metrification; metric conversion; net weight; package control; petroleum products; \textit{SP407}.

Scaling; Schlieren method; specific heat; speed of sound; x-ray scattering; critical region; dielectric constant; equation of state; homogeneity; light scattering; power laws; refractive index; 14932.

Scaling; W-value; charged particle penetration; dosimetry; electron slowing down; electron transport; 15156.

Scaling laws; specific heat; critical point; density; enthalpy; equation of state; hydrogen; index of refraction PV T; saturation properties; \textit{NBSIR} 75-814.

Scaling laws; statistical analysis; critical coefficients; critical exponents; critical region; density profile; dielectric constant; linear model; oxygen; 14772.

Scaling laws; statistical analysis; steam; universality; air constituents; critical region parameters; ethylene; heavy noble gases; helium; linear model; methane; NBS equation; 15601.

Scandium; titanium; transition probabilities; allowed transitions; line strengths; oscillator strengths; \textit{J. Phys. Chem. Ref. Data} 4, No. 2, 263-332 (1975).

Scandium; group and rare-earth gaseous monoxides; specific heat; total emittance; vanadium; zirconium; bibliography on spectroscopy of fluorides and oxides of the lanthanide series; calculation of dissociation energies; electrical resistivity; enthalpy of transition; \textit{NBSIR} 74-600.

Scanning; spherical; symmetry; antennas; arrays; coordinate transformations; data processing; group representations; measurements; near field; non-planar; patterns; \textit{NBSIR} 75-809.
Scanning electron microscopy; strain effects; iron-silicon alloys; Lorentz force; magnetic domains; photomicrography; 15037.

Scanning electron microscopy; SEM applications; SEM dynamic experiments; SEM specimen preparation; SEM stroboscopy; stereomicroscopy; 15245.

Scanning electron microscope; signal processing; contrast; electron beam instrumentation; electron probe microanalyzer; instrumental development; 15249.

Scanning electron microscope; SEM contrast formation; SEM image defects; SEM image formation; SEM image quality; signal processing; 15250.

Scanning electron microscope; voltage contrast; cathodoluminescence; electron beam induced conductivity contrast; electron channeling contrast; magnetic domain contrast; 15251.

Scanning electron microscope; signal differentiation; signal processing; Y-modulation; black level suppression; nonlinear amplification; 15425.

Scanning electron microscope; bend contours; contrast formation; crystalline materials; electron channeling contrast; electron channeling patterns; 15548.

Scanning electron microscope; semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; test patterns; thermal resistance; thermal response; thermally stimulated capacitance; thermally stimulated current; ultrasonic bonding; SP400-8.

Scanning electron microscope; strain analysis; x-ray; channeling of electrons; crystal orientation; Kossel; lattice spacing determination; microdiffraction; 14913.

Scanning electron microscopy; scanning transmission electron microscopy; Auger electron spectrometry; electron probe x-ray microanalysis; energy loss spectrometry; 15030.

Scanning electron microscopy; surface analysis; contrast; electron probe microanalysis; electron spectroscopy for chemical analysis (ESCA); ion microprobe analysis; 15142.

Scanning electron microscope; electron probe microanalysis; empirical methods; Fe-Si alloys; Monte Carlo methods; quantitative analysis; 15246.

Scanning electron microscopy; SRM-480; empirical methods; minicomputers; on-line analysis; quantitative electron probe microanalysis; 15248.

Scanning electron microscopy (SEM); x-ray photoelectron spectroscopy (ESCA); adhesion failure; cohesive failure; polymer-ic bond failure; 15283.

Scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; SP400-12.

Scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; SP400-17.

Scanning transmission electron microscopy; Auger electron spectrometry; electron probe x-ray microanalysis; energy loss spectrometry; scanning electron microscopy; 15030.

Scatter storage; collision resolution; hash tables; polynomial search; pseudo-random numbers; 15669.

Scattered neutron; angular distribution; inelastic scattering; proton emission; SP425, pp. 350-353.

Scattering; cross section; differential; elastic; inelastic; neutron; SP425, pp. 885-885.

Scattering; cylinder scattering; electromagnetic scattering; lossy dielectric; multilayer cylinder; reference values; 15648.

Scattering; depth; deuterium; diffusion; elastic; helium; migration; oxide; proton; range; SP425, pp. 489-491.

Scattering; electron energy loss; germanium; material structure; optical properties; 15387.

Scattering; small angles; U; fast neutrons; Pb; SP425, pp. 948-949.

Scattering; spectrophotometry; specular gloss; accuracy; appearance; error analysis; gloss; photometry; reflectance; TN594-10.

Scattering amplitudes; Weinberg; gauge theories; lepton; muon; M-spin; J4942.

Scattering angle; solid angle; spectrometer; absolute cross section; beam profile; electron scattering; TN871.

Scattering coefficients; transmission coefficient; waveguide standards; 2-port standards; automatic measurement; coaxial standards; network parameters; reflection coefficient; 14739.

Scattering corrections; threshold detectors; activity measurement; cross sections; fission spectrum; neutron source; SP425, pp. 273-276.

Scattering function; chain correlation; chain statistical parameters; light scattering; Monte-Carlo computations; chase transition; 15209.

Scattering function; short wavelength; collective excitations; liquid rubidium; neutron scattering; propagating modes; 15207.

Scattering geometry; uniform sensitivity neutron counter; differential elastic scattering cross section; fast neutrons; SP425, pp. 886-888.

Scattering matrix; spectral line broadening; Stark broadening; symmetry group; time ordering; Balmer lines; four dimensional rotation group; hydrogen; plasma; plasma broadening; pressure broadening; 15009.

Scattering matrix; transducers; linear differential operators; reciprocity relations; J.99B Nos. 1 and 2, 17-39 (1975).

Scattering parameters; S parameters; transistors; electronics; high-frequency probes; interlaboratory comparison; SP400-5.

Scattering parameters; spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; TN672.

SCF; vibrational transition intensities; a\u00b2II; CO; dipole moment; excited state; 15551.

Schematic diagrams; specifications; specification writer; cascade heater; insulated underground piping; insulation; limitation of liability, "or equal" specifications; performance specifications; BSS66, pp. 78-87.

Schlieren method; specific heat; speed of sound; x-ray scattering; critical region; dielectric constant; equation of state; homogeneity; light scattering; power laws; refractive index; scaling; J4932.

Schottky barrier diode; single crystal GaN; 14N\textsuperscript{+} implantation; p-type GaN; J4938.

Schreibersite; sulfate-reducing bacteria; Vivianite; anaerobic corrosion; cathodic depolarization theory; Charles Thom Award; Desulfovibrio desulfuricans; hollow whiskers; mechanism; microbial corrosion; mild steel; oxidizing agent; 15233.

Science; standards; technology; annual report; computer; energy; environment; measurement; product safety; research; SP437.
Science; technology; artifacts; balance; computer; impermanence; intelligence; power; 15199.

Science and technology; standards; annual report; computer; energy; environment; health; product safety; research; SP418.

Scientific and technical information; semi-public good; subsidization; total cost recovery; user charges; automated information retrieval; cost benefit; public good; TN864.

Scientific data; silicon devices; time; energy conservation; fires; gasoline consumption; glass SRM; hazardous chemicals; leap second; playground equipment safety; DIM/NBS 59, No. 2, 25-48 (1975).

Scintillator; after-pulse; detector; gamma-flash; photomultiplier; pulse suppression; SP425, pp. 106-107.

Scintillators; spacecraft, gamma-rays; spallation; activation; Apollo; background; computation, decay-schemes; cross-sections; SP425, pp. 480-483.

Scintillators; time-of-flight; detector; flux; Monte Carlo; neutrions; SP425, pp. 73-74.

Scission point; statistical theory; actinide nuclide; fast-neutron-induced fission; fission; fission fragment; fission product; kinetic energy; mass yield; prompt neutron; SP425, pp. 342-345.

Sea water; stripping cell; aromatic hydrocarbons; gas chromatography; hydrocarbon analysis; partition coefficient; 14955.

Sea water sampling; trace organic analysis; water pollution; baseline studies; fresh water sampling; sampling device; 15099.

Sealants; adhesion; bonding; composites; coupling agents; monomers; polymers; primers; 15374.

Sealants; wear resistance; adhesive materials; composites; dental materials; polymer grafting; resins; restorative materials; NBSIR 75-766.

Search; comet; HCN; HC5N; Kohoutek; OH; radio; 15262.

Seasonal efficiency; boiler oversizing; efficiency vs. heating load; modular boilers; modular concept; BSS79.

Seasonal frost; snow drifting; utilidors; ventilation; air leakage; Arctic; central heat distribution systems; construction materials; drainage; insulation; permastuff; BSS66, pp. 122-135.

Seawater; baseline studies; gas chromatography; gas chromatography-mass spectrometry; hydrocarbon; liquid chromatography; marine sediments; pollution; 15706.

Second order diffraction radiation; synchrotron radiation; XUV grating monochromators; calibrated XUV detectors; irradiance; radiometry; 15107.

Second order Doppler shift; accuracy evaluation; atomic beam frequency standards; cavity phase shift; 14765.

Second order schedules; aversion for sound; avoidance; differential reinforcement of high rate; escape; high school students; key press; pure tones; 14815.

Second virial coefficient; viscosity coefficient; carbon dioxide; Clausius-Mossotti function; intermolecular forces; m-6-8 potential quadrupolar gas; 15521.

Second virial coefficients; virial coefficients; enhancement factor; equation of state; interaction virial coefficients; moist air; saturated air; J.79A No. 4, 551-560 (1975).

Secondary; system; variable; anchor; controls; corrosion; growth; metering; modern; museum; primary; reliability; renovation; BSS66, pp. 102-115.

Secondary gamma rays; adjoint; concrete; gamma-ray penetration; moments; neutron penetration; 15453.

Secondary ion mass spectrometry (SIMS); surface analysis; Auger electron spectroscopy; elemental depth profiling; ion microprobe mass analysis; ion optics; local thermal equilibrium (LTE); mineral analysis; SP427.

Secondary pulp; waste paper; market pulp; paper; waste; pulp; secondary; recycled paper; 15604.

Secondary standard; combustion; enthalpy; formation; heat; isomerization; J.79A No. 3, 481-486 (1975).

Secondary standard; sulfur compound; thiophene; combustion; enthalpy; formation; heat; J.79A No. 3, 561-564 (1975).

Secondary standard; thermochemical standard; combustion; enthalpy; formation; heat; J.79A No. 3, 487-491 (1975).

Secondary temperature standards; temperature scales; Y2O3; IPTS-68; melting point; 14735.

Second-order interaction; shell model; alkaline earth oxides; Born-Mayer potential; first-neighbor interactions; ionicity; Lundquist three-body potential; 15398.

Second-order doppler; velocity distribution; cavity phase shift; cesium beam tube; frequency synthesis; pulse method; Ramsey dual interaction region; 14829.

Secular determinants; spectra; structure; arson; infrared high resolution; perturbation-allowed transitions; resonances; 14953.

Security; communications; computer security; cryptography; data security; encryption; network security; 15657.

Security; systems design; computer; data processing; index; information processing; privacy; requirements definition; NBSIR 75-909.

Security; terminology; validation; warranty; accuracy; audit; certification; code-independent; documentation; optimization; precision; run statistics; SP406, pp. 141-144.

Security; weapon detection; handgun detection; metal detector; performance standard; 15306.

Security costs; computer security; data security; privacy; privacy costs; TN876.

Security; data transmission; security; file access; security, identification (password); security, input and output processing; security software; software monitors; computer performance; computer security; hardware monitors; SP406, pp. 83-86.

Security, identification (password); security, input and output processing; security software; software monitors; computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; SP406, pp. 83-86.

Security, identification (password); security, input and output processing; security software; software monitors; computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; SP406, pp. 83-86.

Security, input and output processing; security software; software monitors; computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; security, file access; SP406, pp. 83-86.

Security software; software monitors; computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; security, file access; security, identification (password); SP406, pp. 83-86.

Security systems; WWV/WWVH; accelerator facilities; computers; court records; fire safety; forensic science; law enforcement; methane; metric; police protection; safer streets; DIM/NBS 59, No. 3, 49-72 (1975).

Security systems vehicles; voluntary standards; weapons; building systems; communications equipment; concealed objects detectors; emergency equipment; Law Enforcement Standards Laboratory; procurement guidelines; protective equipment; 15325.

Sedimentation; critical point; critical solution point; densimeter; magnetic; diffusion; pressure; gradient; concentration; gradient; density; gravity; effects of; 3-methylpentane; mixture; liquid; nitroethane; 14944.

Segmental bone replacement; bioglass-ceramic; ceramic implants; flame spray coating; hip prosthesis; SP415, pp. 19-36.

\[ \sigma(E, \theta) = \text{const} \cdot E^{-0.4} \]

Segmental bone replacement; bioglass-ceramic; ceramic implants; flame spray coating; hip prosthesis; SP415, pp. 19-36.

\[ \sigma(E, \theta) = \text{const} \cdot E^{-0.4} \]

Segmental bone replacement; bioglass-ceramic; ceramic implants; flame spray coating; hip prosthesis; SP415, pp. 19-36.

\[ \sigma(E, \theta) = \text{const} \cdot E^{-0.4} \]

Segmental bone replacement; bioglass-ceramic; ceramic implants; flame spray coating; hip prosthesis; SP415, pp. 19-36.

\[ \sigma(E, \theta) = \text{const} \cdot E^{-0.4} \]

Segmental bone replacement; bioglass-ceramic; ceramic implants; flame spray coating; hip prosthesis; SP415, pp. 19-36.
Seismic: structural engineering; building; codes; earthquake damage; earthquakes; hazards; hospital; natural disasters; 14759.

Seismic pulses; ultrasonic transducers; acoustic emission; calibration of transducers; electrostatic transducers; Lamb's problem; 14960.

Selection: users; acquisition; CODASYL; computer; data base management; designers; evaluation; 15668.

Selection criteria: software features; system evaluation; system features; user experiences; data base applications; data base management systems; TN887.

Selenoey; atmospheric; cartography; geophysics; laser; lunar distance; moon; 14992.

Self shielding factor; 24 keV; 160 keV; Fe; multigroup capture cross section; Na; SP425, pp. 961-963.

Self-avoiding polymer chains; shape of polymer chains; spans; unrestricted polymer chains; Monte Carlo analysis; ordered spans; 15622.

Self-calibration; six-port; vector voltmeter; voltage; attenuation; microwave; phase angle; ratio; 15665.

Self-calibration; six ports; vector voltmeter; voltage; admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; reflection coefficient; reflectometer; TN673.

Self-consistent-field; dipole moment function; dissociation energy; electronic structure; hydroxyl radical; potential curve; 14805.

Self-diffusion coefficient; argon; critical review; krypton; measurement technique; methane; 14831.

Self-diffusion coefficient; 11-6-8 potential function; correlation function; experimental data; hydrodynamic behavior; methane; molecular dynamics; potential function; 15173.

Self-generated atmosphere; calibration filters; chrysotile; environmental health; improved methodologies; particulates; quartz; 15466.

Seller; specifications; validation; buyer; computer software; marketplace; performance measurement; quality; 15493.

SEM applications; SEM dynamic experiments; SEM specimen preparation; SEM stroboscopy; stereomicroscopy; scanning electron microscope; 15245.

SEM contrast formation; SEM image defects; SEM image formation; SEM image quality; signal processing; scanning electron microscope; 15250.

SEM dynamic experiments; SEM specimen preparation; SEM stroboscopy; stereomicroscopy; scanning electron microscope; SEM applications; 15245.

SEM image defects; SEM image formation; SEM image quality; signal processing; scanning electron microscope; SEM contrast formation; 15250.

SEM image formation; SEM image quality; signal processing; scanning electron microscope; SEM contrast formation; SEM image defects; 15250.

SEM image quality; signal processing; scanning electron microscope; SEM contrast formation; SEM image defects; SEM image formation; 15250.

SEM specimen preparation; SEM stroboscopy; stereomicroscopy; scanning electron microscope; SEM applications; SEM dynamic experiments; 15245.

SEM stroboscopy; stereomicroscopy; scanning electron microscope; SEM applications; SEM dynamic experiments; SEM specimen preparation; 15245.

Semiconducting transmission line; electric near-field probe; electromagnetic-field hazard; field-strength measurements; magnetic near-field probe; near-field measurements; rf hazard measurements; TN658.

Semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; test patterns; thermal resistance; thermal response; thermally stimulated capacitance; thermally stimulated current; ultrasonic bonding; voltage contrast mode; SP400-8.

Semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; acoustic emission; beam-lead bonds; SP400-12.

Semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; boron nitride; SP400-17.

Semiconductor devices; temperature; peak; thermal properties; transistors; power; safe operating area; method of measurement; electrical; 15493.

Semiconductor diodes; carrier lifetime; reverse recovery; 15259.

Semiconductor gas sensor; sensor contamination; false alarm; fire detector; fire test; residential smoke detector; NBSIR 74-591.

Semiconductor materials; semiconductor process control; silicon; spreading resistance; test patterns; thermal resistance; thermal response; thermally stimulated capacitance; thermally stimulated current; ultrasonic bonding; voltage contrast mode; wire bonds; SP400-8.

Semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; acoustic emission; beam-lead bonds; boron redistribution; SP400-12.

Semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; boron nitride; boron redistribution; SP400-17.

Semiconductor process control; silicon; spreading resistance; test patterns; thermal resistance; thermal response; thermally stimulated capacitance; thermally stimulated current; ultrasonic bonding; voltage contrast mode; wire bonds; Boron redistribution; SP400-8.

Semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; acoustic emission; beam-lead bonds; boron redistribution; SP400-17.

Semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; boron nitride; boron redistribution; SP400-17.

Semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; boron nitride; Boron redistribution; SP400-12.

Semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy; boron nitride; Boron redistribution; SP400-17.

Semiconductor surface structure; silicon; field-ion microscopy; 15128.

Semiconductor technology; diffusion equations; finite-difference techniques; impurity redistribution; moving boundary problems; numerical methods; partial differential equations; 15175.

Semiconductor technology; integrated circuits; microelectronics; micrometrolgy; photolithography; photomask; SP400-20.

Semiconductors; silicon; BASIC; capacitance-voltage measurements; computer programs; dopant profiles; error function; Gaussian diffusion; plotting; computer; SP400-11.

Semiconductors; thermomagnetism; galvanomagnetism; quantum transport theory; 15525.

Semiconductors; transition pressures; diamond-anvil pressure cell; fixed point pressure scale; high pressure; NaCl pressure scale; pressure measurement; ruby fluorescence; 15224.

Semi-direct model; volume form; (n,γ) cross sections; calculations; complex interaction; SP425, pp. 346-349.
Semiempirical calculations; ab initio calculations; atomic negative ions; binding energy; electron affinity; excited states; experimental methods; fine structure splitting; recommended values; J. Phys. Chem. Ref. Data 4, No. 3, 539-576 (1975).

Semi-public good; subsidization; total cost recovery; user charges; automated information retrieval; cost benefit; public good; scientific and technical information; TN864.

Semi-Thue systems; splitters; combinatorial systems with axioms; degrees of unsolvability; general decision problems; Markov algorithms; many-one reducibility; recursive functions; r.e. many-one degrees; r.e. one-one degrees; I4998.

Sensitive detector; vacuum ultraviolet; absolute radiation detector; absorption measurements; filters; GM counter; I4903.

Sensitivities; uncertainties; adjustment; critical assemblies; cross sections; evaluation; integral data; SP425, pp. 405-408.

Sensitivity; afterheat; decay heat; error estimates; fission products; loss of coolant accident; SP425, pp. 29-38.

Sensitivity; shield; two dimensional; cross section; SP425, pp. 459-463.

Sensitivity; uncertainties; air transport; benchmark; profiles; SP425, pp. 825-833.

Sensitivity; uncertainties; cross sections; fusion reactors; perturbation; SP425, pp. 674-679.

Sensitivity; $^{295}$Pu; critical assemblies; ENDF/B-IV; fission spectrum; inelastic scattering; SP425, pp. 389-391.

Sensitivity analysis; $\sigma$, $\alpha$, $\alpha_1$, $\alpha_2$, $\alpha_3$; adjustment; evaluation; fission products; SP425, pp. 165-168.

Sensitivity calculation; air transport; cross sections; neutrons; nitrogen; SP425, pp. 436-439.

Sensitivity loss; supralinearity; dosimetry; fading; furnace annealing; glow curve; maximum heating temperature; peak height; reproducibility; I5193.

Sensitivity study; breeding ratio; cross section uncertainties; equilibrium cycle; fuel cycle; reactivity swing; SP425, pp. 385-388.

Sensor; waveguide-below-cutoff; absolute (unambiguous) readout; piston; precision attenuator; NBSIR 74-394.

Sensor contamination; false alarm; fire detector; fire test; residential smoke detector; semiconductor gas sensor; NBSIR 74-591.

Separations; atomic absorption; atomic fluorescence; cobalt; interferences; iron; nickel; I5577.

Separator materials; battery separators; nickel-cadmium batteries; satellite batteries; NBSIR 74-541.

Sequence cameras; shoplifting; surveillance; surveillance cameras; cameras; demand cameras; employee theft; fixed surveillance; motion picture surveillance; robbery; I4923.

Serum thermochemistry of enzyme processes; analysis; assay in serum; bacterial growth calorimetry; enzyme catalyzed processes; glucose; microcalorimetry; I4898.

Service; utility; computer; evaluation; measurement; performance; I5093.

Service improvement; communication; cost-benefit; deployment; electronic transmission; facility location; mail; mathematical programming; message network synthesis; network optimization; satellite; NBSIR 75-737.

Serviceability; dimensional measurement; image enhancement; imaging methods; nondestructive evaluation; radiography; I5148.

Sesse dislocations; x-ray topography; anomalous transmission; as-grown copper crystal; crystal perfection; Czochralski growth; Lomer-Cottrell locks; I4779.

$\sigma_1$, $\sigma_2$, $\sigma_3$; fast ionization chamber; fission/alpha; spherical electrodes; SP425, pp. 81-82.

$\sigma_{U}(^{238}U)$ shape; $E_0 = 20-550$ keV; SP425, pp. 620-622.

Shaking effects; diffusive production; diffusive scattering; Glauber model; hadronic components of photons; high energy scattering; multiple scattering; neutrino-nucleus interactions; Monogr. 139.

Shakers; standards; transducers; vibration; vibration exciters; vibration pickups; acceleration; automation; calibration; measurements; I5569.

Shakers; standards; transducers; vibration; vibration exciters; vibration pickups; acceleration; automation; calibration; measurements; minicomputer; NBSIR 74-482.

Shake-up; structure; x-ray photoelectron spectroscopy; oxygen; ruthenium; satellite; I5147.

Shape analysis; nuclear reactions $^{59}$Fe, $^{59.61.63}$Ni(n,$\gamma$), $E = 6-150$ keV, deduced $\Gamma$, width correlations; SP425, pp. 929-933.

Shape of polymer chains; spans; unrestricted polymer chains; Monte Carlo analysis; ordered spans; self-avoiding polymer chains; I5622.

Shape resonance; two-electron excitations; absorption spectrum; barium; heat pipe; inner shell excitation; I4989.

Sharp edges; sharp points; threshold; consumer products; electrical breakdown; gases; hazard; high voltage; NBSIR 75-908.

Sharps; threshold; consumer products; electrical breakdown; gases; hazard; high voltage; sharp edges; NBSIR 75-908.

Shear modulus; single crystals; Young's modulus; bulk modulus; compressibility; elastic constants; elasticity Lamé constant; Poisson ratio polyacrylates; I4871.

Shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constant; nickel-chromium-iron alloys; Poisson's ratio; I5225.

Shear modulus; sound velocity; Young's modulus; aluminum alloy; bulk modulus; compressibility; Debye temperature; elastic constant; nickel steels; Poisson's ratio; I5522.

Shear modulus; sound velocity; Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constant; nickel-base alloys; Poisson's ratio; I5533.

Shear modulus; theory of elasticity; composite materials; elastic constants; filled polymers; mechanical properties; particulate composites; I79A No. 2, 419-423 (1975).

Shear modulus; Young's modulus; bulk modulus; composite; compressibility; elastic compliance; elastic stiffness; piezoelectric oscillator; Poisson's ratio; I5523.

Shear strength; shear test; shear walls; stress distribution; stresses; structural engineering; brick; failure; failure theories; masonry; NBSIR 75-703.

Shear strength; sustained loading; tensile strength; adhesive bonding; aging tests (materials); composite materials; glass fibers; housing system; laminates; reinforced plastics; I5624.

Shear test; shear walls; stress distribution; stresses; structural engineering; brick; failure; failure theories; masonry; shear strength; NBSIR 75-703.

Shear walls; stress distribution; stresses; structural engineering; brick; failure; failure theories; masonry; shear strength; shear test; NBSIR 75-703.

Shell model; alkaline earth; oxides; Born-Mayer potential; first-neighbor interactions; ionicity; Lundquist three-body potential; second-neighbor interactions; I5398.

Shewhart, W. A.; statistical tolerance limits; Wilks, S. S.; Wishart, J.; Annals of Mathematical Statistics; Army Experiment Design Conferences; Dodd, E. L.; educational testing; history of mathematical statistics in the U.S.A.; I5513.

Shield; two dimensional; cross section; sensitivity; SP425, pp. 459-463.

Shielding; analysis; cross sections; evaluation; information; processing; radiation; SP425, pp. 363-366.

Shielding; SQUID; superconducting shield; superconductivity; cryogenic resistors; current comparators; low temperature; I5597.

Shielding; thermal reactor testing; benchmark experiments; dosimetry; fast reader testing; fission products; SP425, pp. 834-841.

Shielding, $^{238}$U(p,xn), $E_x = 800$ MeV; analysis by Monte Carlo;
angular dependence; deep penetration of neutrons in Fe + H shield; measured neutron spectra; SP425, pp. 476-479.
Shipboard; 77 K refrigerator; cryogenics; infrared detector; low capacity; reliability; NBSIR 74-372.
Shirley Highway; transportation planning; bus-on-freeway operations; choice and captive riders; cost allocation formula; incremental costs and revenues; reverse commute bus service; NBSIR 74-624.
Shirley Highway; transportation planning; bus-on-freeway operations; commuter surveys; mode choice decisions; park-and-ride; NBSIR 75-689.
Shock waves; blast waves; computer simulation; interatomic potentials; lattice dynamics; molecular dynamics; 15434.
Shoplifting; surveillance; surveillance cameras; cameras; demand cameras; employee theft; fixed surveillance; motion picture surveillance; robbery; sequence cameras; 14923.
Short wavelength; collective excitations; liquid rubidium; neutron scattering; propagating modes; scattering function; 15207.
Short-term stability; spectral density of frequency fluctuations; time domain stability; crystal controlled oscillator; fast linewidth; quartz crystal resonators; 15673.
Short-term stability; spectral density of frequency fluctuations; time domain stability; crystal controlled oscillator; fast linewidth; quartz crystal resonators; 15687.
SI; systems of units; units of measurement; International System of Units; measurement units; metric units; 15481.
SI; Treaty of the Metre; base units; centennial volume; history of SI; International Bureau of Weights and Measures; International System of Units; measurements; SP420.
SI second; time scale accuracy algorithm; time scale stability; coordinate time scales; frequency calibration; international frequency comparisons; optimum frequency estimate; primary frequency standards; relativity; 15672.
SI units; length; mass; National Bureau of Standards; reference methods; 15678.
SI units; standards; ADP standards; computers; data processing; Federal Information Processing Standards; metric conversion; FIPS PUB 34.
SI; weights and measures; international system of units; measurement systems; Metric system; modernized metric system; SP3044.
Sign; sign; sign symmetric; stability; tridiagonal; diagonally dominant; diagonal matrix; D-stability; Gersgorin's theorem; Lyapunov's theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; 14782.
Sign symmetric; stability; tridiagonal; diagonally dominant; diagonal matrix; D-stability; Gersgorin's theorem; Lyapunov's theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; 14782.
Signal conditioning; systems; time domain; data conversion; dynamic measurements; electrical measurements; electronic instrumentation; TN865.
Signal differentiation; signal processing; Y-modulation; black level suppression; nonlinear amplification; scanning electron microscope; 15425.
Signal insertion; vibration; accelerometer; calibration; low frequency; NBSIR 74-597.
Signal processing; contrast; electron beam instrumentation; electron probe microanalyzer; instrumental development; scanning electron microscope; 15429.
Signal processing; scanning electron microscope; SEM contrast formation; SEM image defects; SEM image formation; SEM image quality; 15250.
Signal processing; Y-modulation; black level suppression; nonlinear amplification; scanning electron microscope; signal differentiation; 15425.
Signal processor; computer; detector-ray; discriminator; emitter-couple; integrated circuit; 15511.
Signal statistics; trigonometric functions; Bessel functions; complete elliptic integrals; hyperbolic function; infinite integrals; modified Bessel functions; noise theory; J79B Nos. 3 and 4, 137-170 (1975).
Significance tests; standards; statistics; acceptance tests; confidence intervals; criminalistics; errors; goodness of fit; normal distribution; 15279.
Silane; charge transfer; Franck-Condon factors; ion-molecule reactions; methane; rare gas ions; rate constants; 14839.
Silicon; absolute atomic; atom weight; isotopic abundance; J79A No. 6, 727-730 (1975).
Silicon; Avogadro number; crystal repeat distance; density; isotopic abundance; 15294.
Silicon; band gap; band structure; electronic structure; energy bands; optical properties; 15705.
Silicon; BASIC; capacitance-voltage measurements; computer programs; dopant profiles; error function; Gaussian diffusion; plotting; computer; semiconductors; SP400-11.
Silicon; carrier trapping; gamma-ray detector; germanium; Ge(Li) detector; infrared response; NBSIR 74-626.
Silicon; field-ion microscopy; semiconductor surface structure; 15128.
Similar; spectrum; unitary; adjoint; Hilbert's Theorem 90; in- 
volution; normal; 14891.

Simplicity; matric equation; partitioned matrix; rational canoni- 

Simplified statistics; type I distribution; bias; efficiency; extreme values; linear unbiased estimators; NBSIR 75-637.

Simulation; airport; airport capacity; airport simulation; models; model validation; runway capacity; 15029.

Simulation; skin; skin; cutting; synthetic materials; cutting; toys; cut; edges; hazardous; experimental studies; human tolerances; injury; injury thresholds; inspection of edges; laceration; safety; NBSIR 73-262.

Simulation; software validation; tools; actual system performance; computer performance evaluation; performance prediction; SP406, pp. 79-82.

Simulation; State of Washington; Washington State; Washington State Fisheries; fisheries; fishery; fishery modeling; mathe- 
atical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; NBSIR 75-745.

Simulation; validation; airport; airport capacity; airport simulation; models; model validation; runway capacity; NBSIR 75-783.

Simulation; wattmeter; analog-to-digital conversion; digital; electricity; electric power; measurement; sampling; TN870.

Single commodity; transportation; transportation problem; line- 
ar programming; network flows; 14790.

Single crystal; alkali cyanides; crystal dynamics; dispersion cur- 
vices; orientation; phonons; rotational disorder; 15124.

Single crystal; ammonium bromide; ammonium ion; neutron scattering; orientational disorder; reorientation; residence time; 15632.

Single crystal; tetrahedral anion; x-ray diffraction; calcium fluoroborate; calcium salts; crystal structure; 14976.

Single crystal; x-ray diffraction; compressibility; 14895.

Single crystal GaN; 14N' implantation; p-type GaN; Schottky barrier diode; 14938.

Single crystals; sulfuric acid; titanium; corrosion; passivation; 14747.

Single crystals; surface electron spectroscopy; surface state; 
tungsten; chemisorption; field emission; photoemission; 14982.

Single crystals; Young's modulus; bulk modulus; compressibility; 
elastic constants; elasticity Lamé constant; Poisson ratio poly- 
crystals; shear modulus; 14871.

Single crystal; coherent neutron scattering; dispersion relation; 
lattice dynamics; palladium deuteride; phonon frequency dis- 
tribution; 15036.

Single particle probability density; branching; freezing points; 
metastable fluids; nonlinear operator; pair correlation func- 
tion; 15179.

Single phase fluid; thermodynamics; transposed critical line; 
helium; hydrodynamics; one dimensional flow; 15047.

Singularity; improper integrals; integrals; numerical analysis; 
umerical integration; numerical quadrature; quadrature; 
Riemann integral; 15180.

Sintering; copper; heat transfer; helium 3-helium 4; Kapitza re- 
sistance; phonon-electron interaction; phonon-quasiparticle in- 
teraction; powder; 14749.

Sinusoidal pressure; transducer; calibration; dynamic; liquid 
column; pressure; NBSIR 75-708.

Siren; sound power level; sound pressure level; automobile; 
destructive interference; directivity; emergency vehicle; inser- 
tion loss; masking noise; 14958.

Site model; mechanical relaxation; methyl branches; paraffins; 
polyethylene; potential energy calculations; relaxation mechanism; relaxation strength; 15329.

Six-port; vector voltmeter; voltage; attenuation; microwave; 
phase angle; ratio; self-calibration; 15665.

Six-port junction; vector voltmeter; voltage; attenuation; auto- 
mation; detector; insertion loss; microwaves; phase angle; 
ratio; 15649.

Six-ports; vector voltmeter; voltage; admittance; automated 
precision measurements; correlator; current; impedance; mi- 
crowave circuit parameters; microwave measurements; 
phase angle; power; ratio; reflection coefficient; reflectome- 
ter; self-calibration; TN673.

Sizes; sub-sieve of diamond powder; diamond powder; grading; 
grading of diamond powder; powder; diamond; PS62-74.

Slit material; reduction; tire-pavement interface forces; calibration; 
procedures; force plate; pavement skin resistance; NBSIR 75-738.

Skin; skin; cutting; synthetic materials; cutting; toys; cut; edges; 
hazardous; experimental studies; human tolerances; injury; in-
jury thresholds; inspection of edges; laceration; safety; simul-
ation; NBSIR 73-262.

Skin; cutting; synthetic materials; cutting; toys; cut; edges; 
hazardous; experimental studies; human tolerances; injury; in-
jury thresholds; inspection of edges; laceration; safety; simul-
ation; skin; NBSIR 73-262.

Skin depth; attenuation; clay; gravel; measurements; 
microwave; NBSIR 74-381.

Skin effect; step; time; transition; coaxial; cylindrical; error; 
line; loss; response; 15696.

Slag; vaporization; viscosity; electrical conductivity; MHD 
materials; phase equilibrium; 15510.

Slater parameters; energy levels; hafnium; ionization energies; 
14814.

Slenderness ratio; stability; structural engineering; walls; bricks; 
buckling; deflection; loads (forces); masonry; moments; 15507.

Sliding termination; standards; calibration; 14883.

Slip tests; coefficient of friction; human perambulation; floor 
slipperiness; resilient flooring; slipperiness standards; fric- 
tional tests; NBSIR 74-613.

Slipperiness standards; frictional tests; slip tests; coefficient of 
friction; human perambulation; floor slipperiness; resilient 
flooring; NBSIR 74-613.

Slit imagery; transfer function; impulse response; linear micro 
densitometry; microdensitometry; optics; 15326.

Slope of the coexistence curve diameter; asymmetry; coex- 
istence curve; compressibility; critical exponents; critical 
point; decorated lattice gas; hole-particle symmetry; law of 
corresponding states; liquid; Padé approximant; power law; 15293.

Slow crack growth; strength degradation; sustained loading; 
fraction probability; 15125.

Slow crack growth; thermal activation; ambient temperatures; 
dislocation mechanisms; fracture mechanics; sapphire; 15122.

Slowdowning; stochastic; transport; benchmark; cross section; 
eigenvalue; Monte Carlo; multigroup; reactor; resonance; 
SP425, pp. 451-454.

Slush hydrogen; boiling heat transfer; convective heat transfer; 
heat transfer; liquid hydrogen; 14869.

Small angles; U; fast neutrons; Pb; scattering; SP425, pp. 948- 
949.

Small business policy; technology; civilian R&D policy; ETIP; 
incentives; innovation; procurement policy; regulatory policy; 
NBSIR 75-778.

Smoke; ABS; DWV; fire endurance; fire spread; fire test; gases; 
plastic pipe plumbing; PVC; BSS72.

Smoke; carbon monoxide; electrostatic precipitation; heat flux; 
oxygen depletion; particulate mass; scanning electron micro 
scope; NBSIR 75-901.

Smoke; dibromotetrafluoroethane; fire tests; flame spread index; 
heat release rate; ignition temperature; rigid urethane foam; 15615.
Smoke; smoke and flame spread; temperature; with and without forced air; velocity; carpets with and without underlayment; corridor fires; energy models; finished interior; full scale experiments; interaction; measurements: 15230.

Smoke; thermal radiation; upholstery; waste receptacle; buildings; combustibility; fire intensity; flames; furnishings; heat release; ignition: NBSIR 75-679.

Smoke; toxic gases; fire retardant; fire test; heat release ignition; mattress: NBSIR 73-177.

Smoke; toxic gases; vent; waste; ABS; cast iron; copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC: NBSIR 74-449.

Smoke; wood crib; buildings; fire growth; flame spread; heat release; interior linings; material ignitability; performance criteria; room fires; TN879.

Smoke and flame spread; temperature; with and without forced air; velocity; carpets with and without underlayment; corridor fires; energy models; finished interior; full scale experiments; interaction; measurements; smoke: 15230.

Smoke control; smoke movement simulation; smokeproof tower; high-rise buildings; photoelectric smoke detector: NBSIR 75-701.

Smoke detectors; Taguchi gas sensors; fire detectors; ionization chamber smoke detectors; photoelectric smoke detectors: NBSIR 75-700.

Smoke development; sprinklers; survey; building construction; detectors; flame spread; furnishings; interior finishes; non-combustible; TN861.

Smoke measurement; tunnel test; ASTM E84; building materials; carpets; fire tests; flame spread tests; floor coverings; interlaboratory evaluation; 15267.

Smoke movement; smoke simulation; sulfur hexa-fluoride (SF₆); Veterans Administration Hospital; experiments; full-scale; gas tracer; interstitial space; penetration through ceiling: NBSIR 75-903.

Smoke movement; stratified flow; theory; corridors; fire induced flow; recirculating flow; scale-model: 15630.

Smoke movement simulation; smokeproof tower; high-rise buildings; photoelectric smoke detector; smoke control: NBSIR 75-701.

Smoke simulation; sulfur hexa-fluoride (SF₆); Veterans Administration Hospital; experiments; full-scale; gas tracer; interstitial space; penetration through ceiling; smoke movement: NBSIR 75-903.

Smokeproof tower; high-rise buildings; photoelectric smoke detector; smoke control; smoke movement simulation: NBSIR 75-701.

Sn-Cd alloys; structure; alloy; directional solidification; incongruent melting alloy; peritectic reaction: 14748.

Snow drifting; utilidors; ventilation; air leakage; Arctic; central heat distribution systems; construction materials; drainage; insulation; permastorm; seasonal frost: BSS66, pp. 122-135.

\(\sigma_{\text{in},xy}\) measurements: \(Eₐ\) to 21 MeV; \(Eₐ\) to 10 MeV: SP425, pp. 766-769.

Sodium; atom; dye laser; electric quadrupole; fine structure; ionization; multiphoton: 15149.

Sodium; line broadening; rubidium: 15349.

Sodium; molecules; noble gases; radiation: 15167.

Sodium; surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zincirconium; alloy diffusion; beryllium; cerium; cesium; chromium; copper; diffusion: J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Sodium; water; benchmark; cross sections; graphite; neutron: SP425, pp. 177-183.

Sodium acetate; sorbet; solid; work atmosphere; air analysis; air sampling; gas analysis; hydrogen fluoride; industrial hygiene: NBSIR 74-581.

Sodium antimonate; sodium antimonate fluoride; ionic conductivity; nonstoichiometry; potassium antimonate; rubidium niobate; rubidium tantalate: 15439.

Sodium; antimonate fluoride; ionic conductivity; nonstoichiometry; potassium antimonate; rubidium niobate; rubidium tantalate; sodium antimonate: 15439.

Sodium molecule; spectroscopy; alkali dimer; magnetic rotation; molecular constants; perturbations: 15516.

Sodium-22; thermal; Westcott; cross section; neutron resonance: SP425, pp. 792-794.

Soft glass pipets; unwashed soft glass pipets; clinical; contamination; errors: 15295.

Soft tissue; bone; collagen; grafting modification of collagenous surfaces; hard tissue; rat skin: 15531.

Soft x-ray; alloy data; bibliography; index; Knight shifts; NMR; rare earth metals and alloys: 14744.

Soft x-ray appearance potential; tungsten; tungsten carbide; x-ray photoemission; catalysis; electronic structure; platinum: 15011.

Software; debugging; Interdata 70; OS AIDS; RTOS: 15538.

Software; standards; CAMAC; computer systems; control systems; industrial control: 14885.

Software; standards conformance; COBOL; data processing; Federal Information Processing Standard; information interchange; information processing; programming language: FIPS PUB 21-1.

Software features; system evaluation; system features; user experiences; data base applications; data base management systems; selection criteria: TN887.

Software measurement tools; total computing capacity; user satisfaction measurement; reduction of measurement data: SP406, pp. 27-31.

Software monitoring; system reliability; hardware monitoring; monitoring register: SP406, pp. 87-96.

Software monitors; accounting systems; hardware monitors; performance evaluation; performance measurement: SP406, pp. 113-117.

Software monitors; computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; security, file access; security, identification (password); security, input and output processing: SP406, pp. 83-86.

Software monitors; throughput; computer; evaluation; hardware monitors; measurement; performance: SP406, pp. 99-102.

Software physics; software units; software work; computer performance measurement: SP406, pp. 135-137.

Software units; software work; computer performance measurement; software physics; SP406, pp. 135-137.

Software validation; tools; actual system performance; computer performance evaluation; performance prediction; simulation: SP406, pp. 79-82.

Software work; computer performance measurement; software physics; software units; SP406, pp. 135-137.

Soil; thermal neutron constants; calibration; neutron moisture gauge; pedology: SP425, pp. 516-519.

Soil resistivity; cathodic protection; insulating joints; nonconducting coating; sacrificial anodes: BSS66, pp. 116-119.

Solar; storage; transmission; transportation; utilities; conservation; conversion; cost; cryogenics; economics; embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production: SP419.

Solar active regions; solar chromosphere; spectral line formation; radiative transfer: 14863.

Solar chromosphere; spectral line formation; radiative transfer; solar active regions: 14863.

Solar chromosphere; spectral line formation; radiative transfer; solar active regions: 14863.

Solar collector; solar energy; solar radiation; standard; standard test; thermal performance: NBSIR 74-635.
Solar collector; solar heating and cooling system; solar-powered absorption refrigeration; retrofitted solar residence; TN892.

Solar conversion; atmospheric physics; radiometric physics; radiometry; 14842.

Solar energy; solar heating and cooling; economic optimization; HVAC systems; life-cycle cost analysis; NBSIR 75-712.

Solar energy; solar radiation; standard; standard test; thermal performance; solar collector; NBSIR 74-635.

Solar energy; standard; standard test; thermal performance; solar storage; thermal test; NBSIR 74-634.

Solar flares; acceleration mechanisms; neutrals; nuclear reactions; protons; SP425, pp. 512-515.

Solar flares; chromosphere, sun; photosphere, sun; radiative transfer; 15286.

Solar glass; spaciousness; sunshine; view; windowless; windows; daylight; fenestration; psychological; BSS70.

Solar heating and cooling; economic optimization; HVAC systems; life-cycle cost analysis; solar energy; NBSIR 75-712.

Solar heating and cooling system; solar-powered absorption refrigeration; retrofitted solar residence; solar collector; TN892.

Solar model; upper photosphere; carbon abundance; molecular spectra; non-LTE: 15044.

Solar photosphere; carbon abundance; molecular spectra; 15585.

Solar radiation; standard; standard test; thermal performance; solar collector; solar energy; NBSIR 74-635.

Solar-powered absorption refrigeration; retrofitted solar residence; solar collector; solar heating and cooling system; TN892.

Solenoid; automated measurement systems; gyromagnetic ratio; magnetic field; protons; 14929.

Solid; solid hydrogen; tables; computer programs; gaseous hydrogen; graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; 15382.

Solid; work atmosphere; air analysis; air sampling; gas analysis; hydrogen fluoride; industrial hygiene; sodium acetate; sorber; NBSIR 74-581.

Solid angle; spectrometer; absolute cross section; beam profile; electron scattering; scattering angle; TN871.

Solid fuel; ignition; ignition boundary; 15227.

Solid hydrogen; tables; computer programs; gaseous hydrogen; graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; 15382.

Solid solubility silicates; x-ray powder analysis; crystal chemistry; flux growth; garnet; hydrogarnet; indium silicates; inorganic synthesis; 15235.

Solid solutions; alloys; contact term; core polarization; exchange enhancement; Knight shifts; LaNi₅; LaNi₅₋ₓPtₓ; LaPt₅; NMR; ordering; relaxation times; 14889.

Solid state data; standard reference data; thermodynamic data, transport properties; atomic and molecular data; chemical kinetics; colloid and surface properties; mechanical properties; nuclear data; TN881.

Solid state noise source; stability measure; Allan variance; argon gas noise source; cross correlation; 15666.

Solid state polymerization; trioxane crystals; dielectric loss; dielectric relaxation; molecular motions; nuclear magnetic resonance absorption; polyoxymethylene crystals; 15359.

Solid/liquid interface; surfaces; Zeta-potential; electrokinetic potential glass; interface; liquid/solid interface; 14732.

Solid-solid phase transformation; thermodynamics; zirconium; electrical resistivity; high-speed measurements; high temperature; J.79A No. 1, 81-84 (1975).

Solid-state detectors; spectrophotometry; dose distribution; dosimetry; dyes; electron beams; gamma rays; glasses; plastics; radiation chemistry; radiation sterilization; 14734.

Solid-state transitions; superconducting temperature calibration; thermometric fixed points; antiferromagnetism; ferroelectricity; 15353.

Solid-solution ratio; solubility; surface chemistry; hydroxyapatite; nonstoichiometry; 15195.

Solid-vapor equilibria; unlike molecule interactions; binary systems; cryogenic fluids; interaction second virial coefficients; review; 15188.

Solubility; bone mineral; dental caries; electric currents; mechanism; 14985.

Solubility; surface chemistry; hydroxyapatite; nonstoichiometry; solid-to-solution ratio; 15195.

Solubility; tooth enamel; dental caries; hydroxyapatite; ion activity product; 15535.

Solution properties; viscoelasticity; Zimm theory; head-spring model; block-copolymers; dilute solutions; dynamics; limiting viscosity number; 15373.

Solution properties; viscoelasticity; head-spring model; block copolymers; concentrated solutions; dynamics; Rouse theory; 15590.

Solvent extraction; activation analysis; Ge(Li) detector; 15459.

Solvent extraction; tribenzylamine; analysis; biological materials; chloroform; chromium; environmental materials; neutron activation; radiochemical separation; 15409.

Sorber; solid; work atmosphere; air analysis; air sampling; gas analysis; hydrogen fluoride; industrial hygiene; sodium acetate; NBSIR 74-581.

Sorption; crazing; crystalline polymer solid; diffusion; elastic deformation; permeability; plastic deformation; 15237.

Sound; acoustical measurements; acoustics; national measurement system; noise; noise control; noise emission; 15500.

Sound; acoustics; noise; 15420.

Sound; construction; dry weight; ears; energy; health care; hospitals; measurement science; meter; metric; pulses; robot; DIM/NBS 59, No. 10, 218-239 (1975).

Sound; sound power; acoustics; machinery noise; noise; 15217.

Sound; tire noise; truck tires; acoustics; military vehicles; noise; 14875.

Sound absorption; acoustic centers; attenuation of sound; 15222.

Sound energy measurement; sound power measurement; acoustical measurements; acoustics; noise measurement; reverberation chambers; 14786.

Sound level meters; audiometric standards; building acoustics; community noise; earphones; environmental noise; instrumentation; measurement methodologies; microphones; psychoacoustics; reverberation room; 15502.

Sound power; acoustics; machinery noise; noise; sound; 15217.

Sound power estimation; error of sound power; far-field power; near-field power; 15492.

Sound power level; sound pressure level; automobile;destructive interference; directivity; emergency vehicle; insertion loss; masking noise; siren; 14958.

Sound power level; sound pressure level; acoustics; air compressor; internal combustion engine; noise; NBSIR 75-653.

Sound power level; standard test procedures for sound power measurement; air compressors; error of sound power measurement; noise; noise measurement; NBSIR 75-652.

Sound power measurement; acoustical measurements; acoustics; noise measurement; reverberation chambers; sound energy measurement; 14786.

Sound pressure level; acoustics; air compressor; internal combustion engine; noise; sound power level; NBSIR 75-653.

Sound pressure level; automobile; destructive interference; directivity; emergency vehicle; insertion loss; masking noise; siren; sound power level; 14958.

Sound propagation; acoustics; acoustical holography; acoustical measurement; paraholography; reverberation chambers; 14796.

Sound transmission; acoustical measurements; acoustics; impact noise; noise emission; reverberation rooms; 15501.
Spectra; rare earths; atomic spectra; ionization energies; lanthanides; 15576.
Spectra; spectroscopy; high temperature; hydrogen cyanide; infrared; molecular term values; 15436.
Spectra; structure; arsenic; infrared high resolution; perturbation-allowed transitions; resonances; secular determinants; 14953.
Spectra; tantalum; 14894.
Spectra; thio borone; absorption spectra; force constants; HBS; infrared; molecular spectra; 15000.
Spectra; tungsten; wavelengths; hafnium; levels; 15257.
Spectra; ultraviolet; wavelengths; rubidium; 14893.
Spectra; ultraviolet; wavelengths; iron; 15007.
Spectra; ultraviolet; wavelengths; rubidium; 15255.
Spectra; wavelengths; aluminum; 15008.
Spectra from 10 keV to 15 MeV compared with calculations; 
Spectral line; spectral-line spectrophotometers; N N spectrophotometers; Spectra; Spectra, Spectra; Spectra; Spectra; Spectra; Spectra, Spectra; Spectra; Spectra; Spectra; Spectra.
Spectra; N H N; N H; N H; wavelengths; nitrogen spectra N H, N H, N H; atomic energy levels; N H, N H, N H; NSRDS-NBS3, Section 5.
Spectra unfolding; proton-recoil spectrometry; Pu-Be and 238Cf neutron spectra; SP425, pp. 62-65.
Spectra (visible); titanium; combustion; laser ignition; 14723.
Spectral analysis; time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; TN672.
Spectral assignments; spin splitting; Zeeman spectrum; asymmetric rotor levels; HO; laser magnetic resonance; rotational constants; 15067.
Spectral bandpass; spectrophotometry; standard reference materials; stray radiation; testing of spectrophotometers; transmittance (absorbance) accuracy; wavelength accuracy; accuracy in spectrophotometry; glass filters; SP260-51.
Spectral density; time-dependent spectral density; amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier transform; Gaussian distribution; impulsive noise; NBSIR 74-391.
Spectral density of frequency fluctuations S(f); white phase modulation; Allan variance; flicker of frequency modulation; Johnson noise; linewidth; random walk frequency modulation; 14828.
Spectral density of frequency fluctuations; time domain stability; crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; 15673.
Spectral density of frequency fluctuations; time domain stability; crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; 15687.
Spectral density of phase fluctuations; spectral purity; frequency multiplication; linewidth; multiplier chain; precision oscillator; rf spectrum; 15675.
Spectral irradiance; spectral radiant power density; cw dye laser; detector spectral response; electrically calibrated pyroelectric detector; radiometry; 15338.
Spectral line; stellar chromospheres; Ca II; 14841.
Spectral line broadening; Stark broadening; symmetry group; time ordering; Balmer lines; four dimensional rotation group; hydrogen; plasma broadening; pressure broadening; scattering matrix; 15009.
Spectral line formation; Ca II; Hg; solar chromosphere; 15562.
Spectral line formation; radiative transfer; solar active regions; solar chromosphere; 14863.
Spectral line formation; stellar atmospheres; astrophysics; early-type stars; radiative transfer; 14751.
Spectral line formation; stellar atmospheres; astrophysics; energy loss; radiative transfer; 15489.
Spectral purity; frequency multiplication; linewidth; multiplier chain; precision oscillator; rf spectrum; spectral density of phase fluctuations; 15675.
Spectral radiant; vacuum ultraviolet; wall-stabilized; arc; calibrations; hydrogen; plasma; radiometry; 15291.
Spectral radiant power density; cw dye laser; detector spectral response; electrically calibrated pyroelectric detector; radiometry; spectral irradiance; 15138.
Spectral radius; vector norm; consistency; matrix norm; monotonicity; principal submatrix; J79B Nos. 3 and 4, 97-102 (1975).
Spectra-line intensities; tables of spectral-line intensities; wavelengths of spectral lines; classification of spectral lines; intensities of spectral lines; Monogr. 145, Part I.
Spectra-line intensities; tables of spectral-line intensities; wavelengths of spectral lines; classification of spectral lines; intensities of spectral lines; Monogr. 145, Part II.
Spectrochemical analysis; thermal analysis; wet chemistry; x-ray fluorescence; activation analysis; characterization; chemical composition; chromatographic analysis; coulometry; electron probe microanalysis; ion-selective electrodes; mass spectrometry; polarography; 15165.
Spectrofluorimetry; viewing angle; emission anisotropy; fluorescence; fluorescence quantum yield; fluorescence standards; fluorimetry; polarization; J79A No. 1, 1-15 (1975).
Spectrometer; absolute cross section; beam profile; electron scattering; scattering angle; solid angle; TN871.
Spectrometer calibration; standard source; synchrotron radiation; vacuum ultraviolet; irradiances; radiometry; J79A No. 6, 761-774 (1975).
Spectrometers; spherical aberration; third-order theory; unit magnification; Cassgrain; reflecting objective; 14802.
Spectrophotometry; arsenic; gas-bending; Gutzeit method; NBSIR 73-260.
Spectrophotometry; averaging spheres; diffusing effectiveness; efficiency; flux averaging; photometry; 15126.
Spectrophotometry; dose distribution; dosimetry; dyes; electron beams; gamma rays; glasses; plastics; radiation chemistry; radiation sterilization; solid-state detectors; 14734.
Spectrophotometry; specular gloss; accuracy; appearance; error analysis; gloss; photometry; reflectance; scattering; TN594-10.
Spectrophotometry; standard reference materials; stray radiation; testing of spectrophotometers; transmittance (absorbance) accuracy; wavelength accuracy; accuracy in spectrophotometry; glass filters; SP260-51.
Spectroscopy; alkali dimer; magnetic rotation; molecular constants; perturbations; sodium molecule; 15516.
Spectroscopy; diatomic mercury; excimer molecules; fluorescence; lasers; NaK molecule; 15685.
Spectroscopy; Dirac theory; hydrogen; line strength; oscillator strength; relativistic corrections; J79A No. 5, 629-633 (1975).
Spectroscopy; dosimetry; filtered beams; neutrons; SP425, pp. 116-118.
Spectroscopy; high temperature; hydrogen cyanide; infrared; molecular term values; spectra; 15436.
Spectroscopy; state measurements; thermochemistry; calorimetry; chemical energy; chemical thermodynamic data; energy scale (chemical); equilibrium measurements; mass spectrometry; measurement systems; 15450.
Spectroscopy; vacuum ultraviolet; xenon; 4d absorption; atomic structure; inner shell; N w x; resonance cross section profiles; 15054.
Spectroscopy facilities; acoustic facilities; accelerators; calorimeters; electrical measurements facilities; high pressure facilities; high temperature facilities; SP413.
Spectrum; alpha particles; cross section; helium; nickel; neutron; SP425, pp. 810-812.
ircular field of values; diagonal; diagonally dominant; field of values; Gersgorin; Hadamard product; Hermiteian; positive definite; 15272.

Spectrum: calibration; construction; Na-D photonuclear sources; radiolysis; SP425, pp. 112-115.

Spectrum: D-stable matrix; positive diagonal matrix; quadratic forms; 15252.

Spectrum: energy; energy levels; europium; ionization; 14755.

Spectrum: energy levels; rhenum; 15380.

Spectrum: spectrum amplitude; step recovery diode; impulse generator; picosecond; 15658.

Spectrum: spectrum amplitude; step recovery diode; impulse generator; picosecond; spectrum; 15658.

Spectrum averaged cross section: \( ^{235}U(\gamma,f) \); \( ^{255}CF \); fission spectrum; SP425, pp. 266-269.

Spectrum shaping; digital processing of decay rates; digital sampling; graphics display terminal; interactive program; least-squares analysis; real-time analyzer; reverberation room; 15082.

Specular gloss; accuracy; appearance; error analysis; gloss; photometry; reflectance; scattering; spectrophotometry; TN594-10.

Speech communication interference; consumer products; criteria for safety standards; federal regulations; hearing impairment; hearing survey; noise emission; NBSIR 74-606.

Speech interference; aircraft noise; annoyance; noise; psychoacoustics; 15336.

Speed of light; laser frequency measurements; 15677.

Speed of light; laser frequency; laser wavelength; length standard; 15681.

Speed of light; the meter; laser frequency measurements; laser strainmeter; saturated absorption spectroscopy; 15688.

Speed of sound; x-ray scattering; critical region; dielectric constant; equation of state; homogeneity; light scattering; power laws; refractive index; scaling; Schlieren method; specific heat; 14932.

Speeds of sound; vapor pressures; densities; enthalpies, entropies; equation of state; internal energies; isobars; isochores; isotherms; Joule-Thomson inversion; latent heats of vaporization; melting line; orthobaric densities; specific heats; NBSIR 74-398.

Sphere; vertical cylinder; cryogenic; heat transfer; hemisphere; horizontal cylinder; liquid deuterium; liquid hydrogen; liquid nitrogen; natural convection; NBSIR 75-807.

Spherical; symmetry; antennas; arrays; coordinate transformations; data processing; group representations; measurements; near field; non-planar; patterns; scanning; NBSIR 75-809.

Spherical aberration; third-order theory; unit magnification; Cassegrain; reflecting objective; spectrometers; 14802.

Spherical electrodes; \( \eta \); \( ^{255}CM \); fast ionization chamber; fission/alpha; SP425, pp. 81-82.

Spherical scan; antenna measurements; data reduction; near field; probe correction; probe design; 14766.

Spherelite; axiolite; chain folds; crystalization rate; molecular weight; nucleation theory; polyethylene; regime I; regime II; J.79A No. 6, 671-699 (1975).

Spin; 65-335 K; cerous magnesium nitrate hydrate; lattice; proton; relaxation; 14860.

Spin assignments; thermal cross sections; bound level parameters; SP425, pp. 357-359.

Spin cluster; spin-Hamiltonian; antiferromagnetism; cerous magnesium nitrate; dipole-dipole coupling; ferromagnetism; ground state; permutation group; quantum mechanics; 15524.

Spin lattice relaxation; anisotropic Knight shift; Cd; Hg; isotropic Knight shift; Knight shift; Korringa product; nuclear magnetic resonance; 14746.

Spin polarization; strongly correlated metals; surface density of states; theory; ferromagnetic transition metals; field emission; 15090.

Spin splitting; anharmonic constant; Coriolis resonance; high resolution; infrared spectrum; nitrogen dioxide; 15523.

Spin splitting; Zeeman spectrum; asymmetric rotor levels; \( \text{HO}_2 \); laser magnetic resonance; rotational constants; spectral assignments; 15067.

Spin splitting; 2\( \text{D} \); Coriolis resonance; high resolution; infrared; \( \text{NO}_2 \); 14769.

Spin uncoupling; vibration-rotation interaction; vibrational transitions; Einstein coefficients; line strengths; Meinel bands; molecular spectra; OH; radiative lifetimes; 14767.

Spin-Hamiltonian; antiferromagnetism; cerous magnesium nitrate; dipole-dipole coupling; ferromagnetism; ground state; permutation group; quantum mechanics; spin cluster; 15524.

Spinodal decomposition; age hardening; copper-titanium; Dla; metastable solvs; microstructural sequence method; nucleation; ordering; precipitation; 15053.

Spinodal decomposition; composition modulations; contrast mechanism; electron diffraction; electron microscopy; lattice images; modulation images; satellites; 15063.

Spin-orbit coupling; transition probability; curve crossing; \( \text{O}(1D); \text{O}(1S) \); quenching rate; 15566.

Spin-orbit coupling; tunable dye laser; ion cyclotron resonance; mass spectrometry; negative ions; photodetachment; 14771.

Spin-orbit matrix elements; ab inioto calculation; level shifts; line broadening; molecular oxygen; predissociation; 15055.

Spins of \( ^{255}U \) resonances; SP425, pp. 580-583.

Splitters; combinatorial systems with axiom; degrees of unsolvability; general decision problems; Markov algorithms; many-one reducibility; recursive functions; r.e. many-one degrees; r.e. one-one degrees; semi-Thue systems; 14998.

Spontaneous fission; track recorders; coincidence counting; decay constant; plutonium-238; safeguards data; SP425, pp. 587-590.

Spreading resistance; test patterns; thermal resistance; thermal response; thermally stimulated capacitance; thermally stimulated current; ultrasonic bonding; voltage contrast mode; wire bonds; Boron redistribution; Darlington pairs; dopant profiles; electrical properties; SP400-8.

Sprinklers; survey; building construction; detectors; flame spread; furnishings; interior finishes; noncombustible; smoke development; TN861.

Sputtering; substrates; thin films; evaporation; magnetic retention; masks; 15231.

Squarewave servo; indirect synthesis; phase noise; 15689.

SQUID; superconducting device; geomagnetism; magnetometer; 15035.

SQUID; superconducting shield; superconductivity; cryogenic; resistors; current comparators; low temperature; shielding; 15597.

SQUID; superconducting switch; tunnel junction; voltage standard; cryogenic; resistor; current comparator; Josephson device; microstrip line; microwave coupling; 15596.

Squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; power; pulsed quantities; NBSIR 74-395.

Squids; transmission lines; waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM metrology; field strength; impedance; laser parameters noise; optical electronics; phase; power; pulsed quantities; NBSIR 75-818.

SRM; standard reference material; systematic error; certification; meaningful measurement; measurement; measurement system; precision; reference method; specificity; Monogr. 148.
SRM 767: superconductivity; transition temperatures; fixed points; 15602.
SRM's; standard materials; standard reference materials; standards; certification; certified reference materials; materials; meaningful measurements; measurement; reference materials; SP408.
SRM-480; empirical methods; minicomputers; on-line analysis; quantitative electron probe microanalysis; scanning electron microscopy; 15248.
Stability; accelerated aging; natural aging; permanence; record materials; record papers; NBSIR 75-739.
Stability; strength; test; testing; tipping; home playground equipment; NBSIR 74-621.
Stability; stress distribution; structural engineering; buckling; compression members; concrete; cracking; deflection; eccentricity; equilibrium; loads (forces); masonry; 15514.
Stability; structural engineering; walls; bricks; buckling; deflection; loads (forces); masonry; moments; slenderness ratio; 15507.
Stability; survey of clocks; accuracy; atomic clocks; clocks; crystal oscillator; frequency standards; TN662.
Stability; tridiagonal; diagonally dominant; diagonal matrix; D-stability; Gersgorin's theorem; Lyapunov's theorem; M-matrix; oscillatory; positive definite; principal minor; Routh-Hurwitz conditions; sign stable; sign symmetric; 14782.
Stability measure; Allan variance; argon gas noise source; cross correlation; solid state noise source; 15666.
Stability of paper; accelerated aging; aging; natural aging; paper; permanent; paper; stability; permanent papers; record papers; NBSIR 74-632.
Stability of paper; aging of paper; archival materials; natural aging; old paper; paper; aging of; paper; stability of; paper testing; NBSIR 74-501.
Stabilization; standard reference material; trace element; water standard; mercury; 15458.
Stabilizer; toy safety; computer security; energy efficiency; electrolysis; fluorides; heat; heat pump; laser; ozone; radiometer; DIF/NBS 59, No. 11, 241-264 (1975).
Stacking fault energy; x-ray diffraction; deformation; dislocation; face-centered cubic metals; faults; Fourier analysis; review; 14750.
Stacking fault energy, stainless steel; x-ray diffraction; austenite; iron alloys; 15139.
Stainless steel; time-of-flight; activation method; group constants; iron; neutron spectrum; one-dimensional transport calculation; SP425, pp. 184-188.
Stainless steels; stress corrosion; testing techniques; chloride; crevice corrosion; ellipsometry failure prediction; molybdenum; repassivation kinetics; NBSIR 74-583.
Stairway; static stability; test weight; tilt angle; toy testing; abuse testing; dynamic stability; hazards; obstruction; riding toys; NBSIR 74-623.
Standard; standard test; thermal performance; thermal storage; thermal test; solar energy; NBSIR 74-634.
Standard; standard test; thermal performance; solar collector; solar energy; solar radiation; NBSIR 74-635.
Standard; time; dissemination; frequency; high frequency broadcasts; TN668.
Standard; unit; watthour meter calibration; watthour meter; calibration; current comparator; electrical energy unit; metrology; 14881.
Standard; water vapor; humidity measurement; moisture; 14727.
Standard; x-ray diffraction; crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; Monogr. 25, Section 12.
Standard; ^9B; ^4Li; neutron cross section; SP425, pp. 232-235.
Standard antenna gain; three-antenna extrapolation; calibration; ground antenna; 15641.

Standard apparatus; toys; children; consumer safety; guns; hearing damage; noise; NBSIR 74-619.
Standard cell enclosure; standard cells; A/C transformer-ratio bridge; platinum resistance thermometer; 14925.
Standard cells; A/C transformer-ratio bridge; platinum resistance thermometer; standard cell enclosure; 14925.
Standard cells; surveillance of local units of voltage; voltage standards; voltage transport standards; unit of voltage; regional maintenance of the volt; 14935.
Standard cross section; uncertainty file; correlation; covariance; ENDF/B; SP425, pp. 173-176.
Standard cross sections; ^2He(n,p); ^7Li(n,α), ^10B(n,α), ^235U(n,f); ^237Np(n,α); Au(n,γ); C(n,n); H(n,n); neutron flux determination; SP425, pp. 293-301.
Standard development; baby cribs; children's furniture; product safety; product testing; safety regulations; NBSIR 75-714.
Standard deviation; statistics; updating estimates; data analysis; mean; 15640.
Standard dielectric; cavity method for dielectrics; dielectric constant; dielectric loss; international comparison; laboratory intercomparison; permittivity; 14999.
Standard fields; susceptibility; testing; transverse electromagnetic; compatibility; 14725.
Standard frequency and time broadcasts; time; frequency; questionnaire; TN674.
Standard in thermal analysis; transition from I → III; potassium nitrate; procedure of ICTA Standards Committee and NBS; 14906.
Standard materials; standard reference materials; standards; certification; certified reference materials; materials; meaningful measurements; measurement; reference materials; SRM's; SP408.
Standard, powder diffraction; standard reference material, silicon; powder diffraction standard, silicon; silicon powder diffraction standard; 14905.
Standard reference data; data file; data network; data on-line; international data service; on-line data; reference data service; 15266.
Standard reference data; surface tension; viscosity; chlorides; data compilation; density; electrical conductance; molten salt mixtures; J. Phys. Chem. Ref. Data 4, No. 4, 871-1178 (1975).
Standard reference data; thermodynamic data, transport properties; atomic and molecular data; chemical kinetics; colloid and surface properties; mechanical properties; nuclear data; solid state data; TN881.
Standard Reference Data Program; well-defined, measurable properties; data; 15301.
Standard reference material; systematic error; certification; meaningful measurement; measurement; measurement system; precision; reference method; specificity; SRM: Monogr. 148.
Standard reference material; thermal conductivity; thermopower; electrical resistivity; electrolytic iron; high temperature; iron; Lorenz ratio; low temperature; SP260-50.
Standard reference material; trace element; water standard; mercury; stabilization; 15458.
Standard reference material; silicon; powder diffraction standard; silicon; silicon powder diffraction standard; standard, powder diffraction; 14905.
Standard Reference Materials; analysis; characterization; composition; General Materials; properties; Research Materials; SP260, 1975-76 Edition.
Standard reference materials; thermal ionization; isotope dilution; isotopes; mass spectrometry; molybdenum; nickel; normalization; 14904.
Standard reference materials; aircraft; air pollution; automobile; 14926.

Standard Reference Materials; measurement; measurement compatibility; reference methods; 15265.

Standard reference materials; clinical chemistry; 15375.

Standard reference materials; accuracy; clinical chemistry; measurement; reference methods; 15496.

Standard reference materials; thermal conductivity; austenitic stainless steel; electrical resistivity; high temperature; low temperature; SP260-46.

Standard reference materials; stray radiation; testing of spectrophotometers; transmittance (absorbance); accuracy; wavelength accuracy; accuracy in spectrophotometry; glass filters; spectral bandwidth; spectrophotometry; SP260-51.

Standard reference materials; thermal conductivity; thermopower; tungsten; electrical resistivity; high temperature; Lorenz ratio; low temperature; SP260-52.

Standard reference materials; standards; certification; certified reference materials; materials; meaningful measurements; measurement; reference materials; SRM's; standard materials; standard reference materials; SP408.

Standard Reference Surface: unrecorded disk surface; calibration factor; computer amplitude reference; computer storage media; disk calibration; disk pack; magnetic disk; TN884.

Standard source; synchrotron radiation; vacuum ultraviolet; ir-radiances; radiometry; spectrometer calibration; J.79A No. 6, 761-774 (1975).

Standard test; thermal performance; thermal storage; thermal test; solar energy; standard; NBSIR 74-634.

Standard test; thermal performance; solar collector; solar energy; solar radiation; standard; NBSIR 74-635.

Standard test procedures for sound power measurement; air compressors; error of sound power measurement; noise; noise measurement; sound power level; NBSIR 75-652.

Standardization; accuracy; accurate measurement in clinical chemistry; clinical chemistry; clinical reference materials; 15753.

Standardization; AID; assistance; economics; foreign relations; industrializing nations; LDC's; measurement services; OAS; NBSIR 75-769.

Standardization; survey; AID; development assistance; economics; Ecuador; less developed countries; measurement services; review; NBSIR 75-785.

Standardization; temperature measurement; thermocouples; thermometry; base-metal thermocouples; cryogenic thermocouples; noble-metal thermocouples; non-standardized thermocouples; refractory metal thermocouples; 15517.

Standardization; activities; standards; states—standardization activities; test methods; codes; consensus system; directory; Federal Government—standardization; industry standards activities; national standards activities; recommended practices; specifications; SP417.

Standards; ADP standards; computers; data processing; Federal Information Processing Standards; metric conversion; SI units; FIPS PUB 34.

Standards; annual report; computer; energy; environment; health; product safety; research; science and technology; SP418.

Standards; benefit-cost analysis; building safety; economics; progressive collapse; NBSIR 74-542.

Standards; building codes; buildings; energy conservation; TN789-1.

Standards; calibration; sliding termination; 14883.

Standards; CAMAC; computer interfacing; control systems; instrumentation; instrumentation standards; 15041.

Standards; CAMAC; computer systems; control systems; industrial control; software; 14885.

Standards; certification; certified reference materials; materials; meaningful measurements; measurement; reference materials; SRM's; standard materials; standard reference materials; SP408.

Standards; computer graphics; computer networks; graphics; networks; protocol; 15071.

Standards; computer techniques; enforcement process; housing; Hurricane Agnes; mobile home parks; mobile homes; performance data; NBSIR 75-690.

Standards; construction; Hurricane Agnes; housing; mobile homes; mobile home parks; performance data; regulatory process; NBSIR 75-641.

Standards; consumer; product safety; regulation; 15497.

Standards; driver information; highway; highway signing; human factors; information displays; 15699.

Standards; energy efficiency curves; gamma ray; mixed radio nuclides; 14820.

Standards; enforcement process; field inspection; house trailers; housing; Hurricane Agnes; mobile homes; performance data; NBSIR 75-688.

Standards; microcomputers; minicomputers; networks; 15643.

Standards; state-of-the-art study; enforcement; legislation; mobile homes; regulation; NBSIR 75-680.

Standards; states—standardization activities; test methods; codes; consensus system; directory; Federal Government—standardization; industry standards activities; national standards activities; recommended practices; specifications; standardization activities; SP417.

Standards; statistics; acceptance tests; confidence intervals; criminalistics; errors; goodness of fit; normal distribution; significance tests; 15279.

Standards; stopping power ratio; absorbed dose; dosimetry; electrons; ionization chambers; 15579.

Standards; structural design; codes; masonry; 15404.

Standards; structural loading; buildings; codes; design criteria; regulatory system; safety; 15503.

Standards; subsets; American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication; data interchange; data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; FIPS PUB 35.

Standards; subsets; American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication; data interchange; data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; FIPS PUB 36.

Standards; technology; annual report; computer; energy; environment; measurement; product safety; research; science; 15378.

Standards; technology; biomedical; conference; cross section; nuclear; SP425, Volumes I and II.

Standards; technology; transfer; innovation; procurement; specifications; 15595.

Standards; temperature scale; thermometry; annual report; calibrations; progress report; TN869.

Standards; transducers; vibration; vibration excitors; vibration pickups; acceleration; automation; calibration; measurements; shakers; 15569.

Standards; transducers; vibration; vibration excitors; vibration pickups; acceleration; automation; calibration; measurements; minicomputer; shakers; NBSIR 74-482.

Standards; user identification; Brooks Bill; computer security; congressional concern; controlled accessibility; data sensitivity; measures of risk; 15498.

Standards; 6Li; 3Pb; cross sections; light elements; R-matrix; SP425, pp. 302-308.

Standards conformance; COBOL; data processing; Federal Information Processing Standard; information interchange; information processing; programming language; software; FIPS PUB 21-1.

Standards; flow measurement; flow measurement, water; instru
mments, flow measurement; open channel flow measurement; pipe flow measurement; SP421.

Standards of ultrasonic power; ultrasonic power; ultrasonic transducers; piezoelectric transducers; 14819.

Standards, voluntary index of; engineering standards, index of; index of standards, recommended practices, specifications, test methods; Key-Word-In-Context index of voluntary standards; KWIC index of standards; SP329. Supplement 2.

Stannic oxide; tin ores; Mössbauer spectrometry; quantitative analysis; 15358.

Star formation; cross sections; pion; SP425, pp. 472-475.

Stark broadening; Balmer; hydrogen; ion dynamics; plasma; 15064.

Stark broadening; Balmer lines; hydrogen plasma; ion motion; line shapes; reduced mass; 15463.

Stark broadening; symmetry group; time ordering; Balmer lines; four dimensional rotation group; hydrogen; plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; 15009.

Stark broadening; van der Waals broadening; atomic; instrumenta- 

tional broadening; line shapes; line shifts; pressure broadening; 

resonance broadening; SP366-2.

Stark profile; high temperature; hydrogen arc; line broadening; 

Lyman alpha; optically thin; 15413.

State; authority; building; energy; legislation; regulations; NBSIR 75-747.

State and local government; systems analysis; technology utilization; vote-tallying; computer security; computing technology; election administration; public administration; NBSIR 75-687.

State measurements; thermochemistry; calorimetry; chemical energy; chemical thermodynamic data; energy scale (chemical); equilibrium measurements; mass spectrometry; measurement system; spectroscopy; 15450.

State of Washington; Washington State; Washington State Fisheries; fisheries; fishery; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; NBSIR 75-745.

State-of-the-art; survey; automated measurements; computer; concepts; reliability; 14728.

State-of-the-art study; enforcement; legislation; mobile homes; regulation; standards; NBSIR 75-680.

States—standardization activities; test methods; codes; consensus system; directory; Federal Government—standardization; industry standards activities; national standards activities; recommended practices; specifications; standardization activities; standards; SP417.

Static crash tests; strain measurements; structural components; test procedures; automobile side impact; crush characteristics; displacement measurements; door structure; drop tests; dynamic crush tests; impact collisions; plastic deformation; NBSIR 74-605.

Static expansion; thermal transpiration; vapor-stream pumping; viscosity gauge; capacitance-diaphragm gauge; Knudsen radiometer; McLeod gauge; micromanometry; quartz Bourdon gauge; 14933.

Static fatigue; ceramics; crack healing; crack propagation; cyclic fatigue; failure prediction; high temperature; 15422.

Static fatigue; strength; crack growth; fracture; glass; 15432.

Static mechanical properties; thermal properties; cryogenics; dynamic mechanical properties; glass-fiber composites; literature review; 15170.

Static mechanical properties; thermal properties; advanced fiber composites; cryogenics; dynamic mechanical properties; literature review; 15667.

Static stability; test weight; tilt angle; toy testing; abuse testing; dynamic stability; hazards; obstruction; riding toys; stairway; NBSIR 74-623.

Static tests; airport approach and threshold lights; glass prism; impact tests; light bases; optical cover assembly; photometric measurements; NBSIR 75-647.

Statistical analysis; categorical data; contingency tables; loglinear model; minimum discrimination information; 14852.

Statistical analysis; critical coefficients; critical exponents; critical region; density profile; dielectric constant; linear model; oxygen; scaling laws; 14772.

Statistical analysis; steam; universality; air constituents; critical region parameters; ethylene; heavy noble gases; helium; linear model; methane; NBSIR equation; scaling laws; 15601.

Statistical analysis; storms; structural engineering; wind loads; wind speeds; building codes; probability distribution function; reliability; risk; 15558.

Statistical analysis; storms; structural engineering; wind loads; wind speeds; building codes; extreme value distributions; hurricanes; probability distribution functions; reliability; risk; TN868.

Statistical analysis; viscosity coefficient; argon; correlated molecular collisions; density expansions; fluorine; oxygen; 15141.

Statistical computing; test editing; computer applications; OM- 

NITAB II; Minitab; NBSIR 75-649.

Statistical mechanical ensembles; thermodynamic properties; three body forces; methane; molecular dynamics; potential function; specific heat; 15310.

Statistical methods; statistics; tests of distributional hypotheses; correlation coefficient; medians; normal distribution; order statistics; probability plot; 14856.

Statistical model; total cross section; capture cross section; elastic and inelastic scattering cross sections; evaluation; fission product; optical model; resonance cross section; SP425, pp. 320-323.

Statistical model calculations; 238U(n,2n). E = 13-18 MeV; measured σ(E); nuclear reactions 12C(n,2n). E = 23-34 MeV; SP425, pp. 819-822.

Statistical model codes; applications to CTR; cross-section calcu-

lations; fast neutron reactions; gamma-ray production; isomers; radiation widths; SP425, pp. 651-658.

Statistical properties; turbulence; velocity-gradients; boundary layer; grid; intermittency; moments; 15116.

Statistical theory; actinide nuclide; fast-neutron-induced fission; fission; fission fragment; fission product; kinetic energy; mass yield; prompt neutron; scission point; SP425, pp. 342-345.

Statistical tolerance limits; Wilks, S. S.; Wishart, John; Annals of Mathematical Statistics; Army Experiment Design Conferences; Dodd, E. L.; educational testing; history of mathematical statistics in the U.S.A.; Hotelling, Harold; 15513.

Statistical weighting; thermodynamic properties; constraints; equation of state; fluid; least squares; parameter estimation; p-

V-T; 15132.

Statistics; acceptance tests; confidence intervals; criminalistics; error; goodness of fit; normal distribution; significance tests; standards; 15279.

Statistics; Tables for Statisticians and Biometricians; W. F. R. Weldon; bibliography; Biometrika; Chi-square tests; correlation; regression; R. A. Fisher; Francis Galton; frequency curves; method of moments; Karl Pearson; 14822.

Statistics; temperature coefficient; auto headlamp glass; popula-

tion; refractive index; RI variance; 15086.

Statistics; tests of distributional hypotheses; correlation coefficient; medians; normal distribution; order statistics; probability plot; statistical methods; 14856.

Statistics; Type I distribution; distribution of largest values; effici-

te estimators; extreme values; linear unbiased estimators; NBSIR 74-602.

Statistics; type I distribution; bias; efficiency; extreme values; linear unbiased estimators; simplified estimators; NBSIR 75-637.
Superconducting transition temperatures of lead and indium; acoustical thermometry; fixed points; lead and indium transition temperatures; low temperature fixed points; low temperature thermometry; 15697.

Superconducting transition temperatures; superconductivity; temperature; thermometric fixed points; 15052.

Superconducting transition temperature; superconducting transition width; thermometric fixed point; OSRM; pure cadmium; 15342.

Superconducting transition width; temperature; copper NMR thermometer; γ-ray thermometer; noise thermometer; 15527.

Superconducting transition width; thermometric fixed point; OSRM; pure cadmium; superconducting transition temperature; 15342.

Superconductivity; cryogenic resistors; current comparators; low temperature; shielding; SQUID; superconducting shield; 15597.

Superconductivity; cryogenics; electricity; energy; helium; power; 14872.

Superconductivity; current comparator; low temperature electrical measurement; quantum interference device; ratio transformer; resistive divider; 14937.

Superconductivity; delay line; picosecond; pulse measurement; 14776.

Superconductivity; delay line; picosecond; pulse measurement; 14825.

Superconductivity; electronics; Josephson effect; precise measurements; 14971.

Superconductivity; Josephson junction; quantum interference; rf attenuation; 14726.

Superconductivity; Josephson junction; quantum interference; rf attenuation; 14838.

Superconductivity; temperature; thermometric fixed points; superconducting transition temperatures; 15052.

Superconductivity; transition temperatures; fixed points; SRM 767; 15062.

Superconductivity; vanadium alloys; A15 phases; iridium alloys; 15192.

Supercooling; carbon dioxide; CO₂; critical point; nucleation; 14915.

Supercooling; theoretical model; thermal analysis; thermodynamic properties; differential scanning calorimetry (DSC); electronic and thermal coupling; instrumental limitations; 14824.

Supercritical; correlation; forced convection; heat transfer; helium; 14962.

Supercritical; critical heat flux; film boiling; forced convection; heat transfer; helium; nucleate boiling; subcritical; 14930.

Supervisory control; test equipment reliability; automated test equipment; automated tests for jet engine fuel controls; computer interfacing; digital computer controlled tests; jet engine fuel control testing; minicomputer applications; minicomputer controlled tests; 15087.

Suppression; after-pulse; GaP first dynode; neutron; photomultiplier; resolution; 14842.

Suppression; behavior; behavioral suppression; exposure; microwave radiation; microwaves; product safety; radiation; radiation effects; resonant cavity; rhenium; 15194.

Supralinearity; dosimetry; fading; furnace annealing; glow curve; maximum heating temperature; peak height; reproducibility; sensitivity loss; 15193.

Surface; adsorption; hydroxyapatite; ion exchange; nucleation; reaction rate; 15019.

Surface; surface finish; surface integrity; surface questionnaire; surface survey; CIRP; 15464.

Surface analysis; Auger electron spectroscopy; elemental depth profiling; ion microprobe mass analysis; ion optics; local thermal equilibrium (LTE); mineral analysis; secondary ion mass spectrometry (SIMS); SP427.

Surface analysis; contrast; electron probe microanalysis; electron spectroscopy for chemical analysis (ESCA); ion microprobe analysis; scanning electron microscopy; 15142.

Surface area; teeth; water vapor adsorption; adsorption theory; aggregate; adsorption by; collagen; dental materials; dentin; enamel; 14966.

Surface area; water content; water vapor adsorption; adsorption; computer application; desorption; dry weight determination; moisture content; J.79A No. 4. 565-576 (1975).

Surface barrier detectors; Li(n,α); absolute cross section measurements; manganese bath; neutron cross sections; photoneutron sources; 5425, pp. 236-239.

Surface bonds; uv photoemission; angular distributions; bond geometry; chemisorption; energy distributions; oxygen on (100) tungsten; 15089.

Surface chemistry; hydroxyapatite; nonstoichiometry; solid-solution ratio; solubility; 15195.

Surface density of states; theory; ferromagnetic transition metals; field emission; spin polarization; strongly correlated metals; 15090.

Surface diffusion; tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium; alloy diffusion; beryllium; cerium; cesium; chromium; copper; diffusion; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Surface electron spectroscopy; surface state; tungsten; chemisorption; field emission; photoemission; single crystals; 14982.

Surface finish; surface integrity; surface questionnaire; surface survey; CIRP; surface; 15464.

Surface finish; surface parameters; characterization; instrument; measurements; statistical surface parameters; 15368.

Surface free energies; chain folds; fractions; homogeneous nucleation; molecular weight; nucleation theory; polyethylene; J.79A No. 6. 701-711 (1975).

Surface grafting; tissue modification; ceric ion initiated grafting; chemical attachment to ratskin; grafting to tissues; persulfate initiated grafting; 14880.

Surface hardness; compressive strength; concrete; flexural strength; formwork removal; nondestructive testing; NBSIR 75-729.

Surface integrity; surface questionnaire; surface survey; CIRP; surface; surface finish; 15464.

Surface layer; adsorbed polymer; deformation; fold surface; gold decoration; polymer crystals; poly(oxymethylene); J.79A No. 5. 609-611 (1975).

Surface modification; tissue surfaces; bone; chemical grafting; collagen; ratskin; 15185.

Surface parameters; characterization; instruments; measurements; statistical surface parameters; surface finish; 15368.

Surface plasmons; attenuation length; inelastic electron scattering; 14984.

Surface questionnaire; surface survey; CIRP; surface; surface finish; 15464.

Surface roughness; calibration; economic dimensions; National Measurement System; surface finish; 15395.

Surface spectroscopy; chemisorption; field emission; ion neutralization; photoemission; 14978.

Surface spectroscopy; tunneling; field emission; field ionization; ion neutralization; 15095.

Surface state; tungsten; chemisorption; field emission; photoemission; single crystals; surface electron spectroscopy; 14982.

Surface survey; CIRP; surface; surface finish; surface integrity; surface questionnaire; 15464.

Surface tension; viscosity; chlorides; data compilation; density; electrical conductance; molten salt mixtures; standard

Surface texture measurement; surface texture parameters; vertical resolution; electron microscopes; horizontal resolution; optical instruments; stylus instruments; 15613.

Surface texture parameters; vertical resolution; electron microscopes; horizontal resolution; optical instruments; stylus instruments; surface texture measurement; 15613.

Surfaces: angular distributions; chemisorption; photoemission; photoionization; 14981.

Surfaces; computer simulation; crystal growth; fcc crystals; roughness; 15144.

Surfaces; cracks; flaws; ion beam milling; metals; microscopy; TN862.

Surfaces; Zeta-potential; electrokinetic potential glass; interface; liquid/solid interface; solid/liquid interface; 14732.

Surgical bone cement; biomaterial; bone cement; orthopaedic material; poly(methyl methacrylate); specification; 15191.

Surgical bone cement; total hip replacement, cement; acrylic resin; cement; medical materials; orthopedic materials; polymethylmethacrylate, self-curing; 15164.

Surveillance; surveillance cameras; cameras; demand cameras; employee theft; fixed surveillance; motion picture surveillance; robbery; sequence cameras; shoplifting surveillance; 14923.

Surveillance; tamper-resistant; television; safeguards; NBSIR 75-707.

Surveillance cameras; cameras; demand cameras; employee theft; fixed surveillance; motion picture surveillance; robbery; sequence cameras; shoplifting surveillance; 14923.

Surveillance of local units of voltage; voltage standards; voltage transport standards; unit of voltage; regional maintenance of the volt; standard cells; 14935.

Survey; AID; development assistance; economics; Ecuador; less developed countries; measurement services; review; standardization; NBSIR 75-785.

Survey; automated measurements; computer; concepts; reliability; state-of-the-art; 14738.

Survey; building construction; detectors; flame spread; furnishings; interior finishes; noncombustible; smoke development; sprinklers; TN861.

Survey; Census Bureau; Consumer Product Safety Commission; data; fire; households; injury; loss; National Fire Data System; National Fire Survey; 15656.

Survey; computer codes; multi-group data; SP425. pp. 848-854.

Survey; technology; cryogenic; gas industry; liquefied natural gas; research; 15468.

Survey; temperature compensation; uniformity; weights and measures; digital indicators; drained weight; laws and regulations; metrification; metric conversion; net weight; package control; petroleum products; scales; SP407.

Survey; transducer; calibration; compatibility; cryogenic; liquid oxygen; measurement; oxygen; performance; pressure; 15153.

Survey of clocks; accuracy; atomic clocks; clocks; crystal oscillator; frequency standards; stability; TN662.

Survey techniques; buildings; fire loads; occupancy live loads; load surveys; structural engineering; TN858.

Susceptibility; convergence criterion; crystal field parameters; energy levels; holmium 3+ ions; neodymium 3+ ions; 14862.

Susceptibility; testing; transverse electromagnetic; compatibility; standard fields; 14723.

Sustained loading; fracture probability; slow crack growth; strength degradation; 15125.

Sustained loading; tensile strength; adhesive bonding; aging tests (materials); composite materials; glass fibers; housing system; laminates; reinforced plastics; shear strength; 15624.

Swirling flow; decay of swirling flow; helical flow; pressure differential during swirling flow; 15080.

Switching; ultrasonics; NMR; 14980.

Symbols; transmittance; transmittance factor; modulation; rotation; optical density; propagation; reflectance; reflectance factor; 15664.

Symmetrical; conformation; half-chair; inositol; mercuric acetate, phenylsotriazole; p.m.r.; 15254.

Symmetry; antennas; arrays; coordinate transformations; data processing; group representations; measurements; near field; non-planar; patterns; scanning; spherical; NBSIR 75-809.

Symmetry change; van der Waals isotherm; fluid-solid phase transition; Lennard-Jones model; melting and freezing densities; Monte Carlo simulation; 14736.

Symmetry class of tensors; elementary divisors; irreducible character; 15338.

Symmetry class of tensors; permanent adjoint; positive semidefinite hermitian matrix; 15314.

Symmetry group; time ordering; Balmer lines; four dimensional rotation group; hydrogen; plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; 15009.

Symmetry plane; vacancy; correlation factor; diffusion; drift mobility; electric field; random walk; 15367.

Synchronization; time; broadcasting; dissemination; frequency; satellite; 14836.

Synchronous signaling rates; teleprocessing; wide band; data communication equipment; data processing terminal equipment; data transmission (high speed); Federal Information Processing Standards; FIPS PUB 37.

Synchrotron radiation; transfer standard detectors; calibration of detectors; corrections for second order radiation; far ultraviolet; noble gas double ionization chamber; 14987.

Synchrotron radiation; transfer standard detectors; vacuum ultraviolet radiation standards; continuum radiation; diodes; irradiance standard; 14997.

Synchrotron radiation; vacuum ultraviolet; electron accelerator; new facility; radiation; storage ring; 15026.

Synchrotron radiation; vacuum ultraviolet; irradiances; radiometry; spectrometer calibration; standard source; J.79A No. 6, 761-774 (1975).

Synchrotron radiation; XUV grating monochromators; calibrated XUV detectors; irradiance; radiometry; second order diffracted radiation; 15107.

Syntax analysis; computation and flow analysis; FORTRAN use; programming aids; 15348.

Synthesis; composites; dimethacrylates; monomers; resins; 15159.

Synthetic fuels; energy storage; hydrogen utilization; power generation; 15416.

Synthetic implants; thromboresistance; biocompatibility; biomaterials; blood protein; ceramic implants; implantable electrodes; metallic implants; nerve prosthesis; SP415.

Synthetic materials; cutting; toys; cut; edges; hazardous; experimental studies; human tolerances; injury; injury thresholds; inspection of edges; laceration; safety; simulation; skin; skin cutting; NBSIR 73-262.

System; variable; anchor; controls; corrosion; growth; metering; modern; museum; primary; reliability; renovation; secondary; BSS56. pp. 102-115.

System commands; user protocols; command languages; computers; man-machine systems; networks; TN877.

System commands; user protocols; command languages; computers; man-machine systems; networks; NBSIR 75-744.

System dynamics; thermometers; cooling system; cryogenics; helium-cooled electrical leads; helium impurities; microwave cavities; negative differential flow resistance; pressure measurement; NBSIR 75-623.

System effectiveness; computer performance evaluation; efficiency measurement data; measures of computer performance; SP406. pp. 61-64.
System evaluation; system features; user experiences; data base applications; data base management systems; selection criteria; software features; TN887.

System features; user experiences; data base applications; data base management systems; selection criteria; software features; system evaluation; TN887.

System integration; automation; human relations; job enrichment; organizational development; project management; 15570.

System performance; tri-service; underground heat distribution; (ASTM) criteria; Federal Construction Council; interagency; prequalification; BS666, pp. 73-77.

System reliability; hardware monitoring; monitoring register; software monitoring; SP406, pp. 87-96.

Systematic error; certification; meaningful measurement; measurement; measurement system; precision; reference method; specificity; SRM; standard reference material; Monogr. 148.

Systematic testing; testing tools; dynamic analysis; NBS analyzer; NBS FORTRAN test routines; networking; TN874.

Systematic trends; f-sum rule; f-values; lithium sequence; oscillator strength distribution; oscillator strengths; 15474.

Systemic effects; corrosion; inflammatory response; metallic implants; SP415, pp. 45-54.

Systems; time domain; data conversion; dynamic measurements; electrical measurements; electronic instrumentation; signal conditioning; TN865.

Systems analysis; management science; mathematical models; numerical analysis; operations research; 15607.

Systems analysis; technology utilization; vote-tallying; computer security; computing technology; election administration; public administration; state and local government; NBSIR 75-667.

Systems design; computer; data processing; index; information processing; privacy; requirements definition; security; NBSIR 75-909.

Systems of units; units of measurement; International System of Units; measurement units; metric units; SI; 15481.

Table saws; accident research; consumer products; injury data; opinion survey; portable circular saws; power saws; radial arm saws; safety; NBSIR 75-748.

Tables; computer programs; gaseous hydrogen; graphs; handbook thermophysical properties; hydrogen; liquid hydrogen; ortho-para modifications; property value uncertainties; solid; solid hydrogen; 15382.

Tables; y-rays; computers; data; decay; ENSDF; evaluation; files; formats; levels; nuclear structure; radiations; reactions; SP425, pp. 309-312.

Tables; torsional crystal; viscosity; experimental; fluorine; gas; graphs; liquid; 14757.

Tables for Statisticians and Biometricians; W. F. R. Weldon; bibliography; Biometrika; Chi-square tests; correlation, regression; R. A. Fisher; Francis Galton; frequency curves; method of moments; Karl Pearson; statistics; 14822.

Tables of spectral-line intensities; wavelengths of spectral lines; classification of spectral lines; intensities of spectral lines; spectral-line intensities; Monogr. 145, Part 1.

Tables of spectral-line intensities; wavelengths of spectral lines; classification of spectral lines; intensities of spectral lines; spectral-line intensities; Monogr. 145, Part 11.

Tabulations; x rays; atomic form factor; Compton scattering; cross sections; gamma rays; incoherent scattering function; photons; Rayleigh scattering; J. Phys. Chem. Ref. Data 4, No. 3, 471-538 (1975).

Taguchi gas sensors; fire detectors; ionization chamber smoke detectors; photoelectric smoke detectors; smoke detectors; NBSIR 75-700.

Tamper-resistant; television; safeguards; surveillance; NBSIR 75-707.

Tantalum; boron carbides; capture cross sections; CFMRF reactor; control materials; europium oxides; fast reactors; neutron reactions; SP425, pp. 908-911.

Tantalum; cross sections; fluorene; neutron-induced low-energy photons; SP425, pp. 762-765.

Tantalum; ionization energy; nuclear moment; spectrum; 15381.

Tantalum; spectra; 14894.

Tantalum; terbium; ternary diffusion; thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium; alloy diffusion; beryllium; cerium; cesium; chromium; copper; diffusion; electromigration; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Tantalum hydrides; vibrational amplitude; activation energy; hydrogen diffusion; neutron scattering; quasistatic scattering; resonance time; 15264.

Target thickness; energy loss; ionization loss; most-probable energy loss; 15360.

Tax credit; vapor barriers; weatherstripping; caulks and sealants; clock thermostats; energy conservation; insulation; retrofitting; storm doors; storm windows; NBSIR 75-795.

TEA laser; BCl3; (boron trichloride); boron; CO2; (carbon dioxide); enrichment; infrared; isotopes; 15270.

Technical societies; computer measurement; SP406, pp. 151-153.

Techniques; application; charged particle; cross section; emision; neutron; SP425, pp. 156-160.

Technologies; dehumanization; deterrent; 15198.

Technology; annual report; computer; energy; environment; measurement; product safety; research; science; standards; SP437.

Technology; artifacts; balance; computer; impermanence; intelligence; power; science; 15199.

Technology; biomedical; conference; cross section; nuclear; standards; SP425, Volumes I and II.

Technology; civilian R&D policy; ETIP; incentives; innovation; procurement policy; regulatory policy; small business policy; NBSIR 75-779.

Technology; cryogenic; gas industry; liquefied natural gas; research; survey; 15468.

Technology; transfer; innovation; procurement; specifications; standards; 15595.

Technology assessment; flow measurement study; fluid flow measurement system; measurement system identity; 15405.

Technology transfer; voluntary standards; computer science; laboratory accreditation; measurement; national measurement system; 14920.

Technology utilization; vote-tallying; computer security; computing technology; election administration; public administration; state and local government; systems analysis; NBSIR 75-667.

Teeth; water vapor adsorption; adsorption theory; aggregate; adsorption by; collagen; dental materials; dentin; enamel; surface area; 14966.

Telecommunications; computer communications; computer networking; data communications; networks; performance requirements; TN882.

Telephone systems; computers; information systems; mass transportation; NBSIR 75-665.

Teleprocessing; wide band; data communication equipment; data processing terminal equipment; data transmission (high speed); Federal Information Processing Standards; synchronous signaling rates; FIPS PUB 37.
Testing; building composite; building material; conditioning; equilibration; gypsum wallboard; methodology; relative humidity; structural sandwich panel; temperature; NBSIR 75-767.

Testing; tipping; home playground equipment; stability; strength; test; NBSIR 74-621.

Testing; transverse electromagnetic; compatibility; standard fields; susceptibility; 14725.

Testing; electrodeposits; coatings; electroplated coatings; metal coatings; test methods for metal coatings; 14743.

Testing; of spectrophotometers; transmittance (absorbance) accuracy; wavelength accuracy; accuracy in spectrophotometry; glass filters; spectral bandpass; spectrophotometry; standard reference materials; stray radiation; SP260-51.

Testing; of vehicles; wind effects on structures; air leakage; cooling load measurement; refrigerated enclosures; 14799.

Testing techniques; chloride; crevice corrosion, ellipsometry failure prediction; molybdenum; repassivation kinetics; stainless steels; stress corrosion; NBSIR 74-583.

Testing tools; dynamic analysis; NBS analyzer; NBS FORTRAN test routines; networking; systematic testing; TN874.

Tests; of distributional hypotheses; correlation coefficient; medians; normal distribution; order statistics; probability plot; statistical methods; statistics; 14856.

Tetraazacyclooctane derivatives; x rays; crystal structure explosives; least-squares refinement; molecular packing; 15574.

Tetrafluoroethylene; copolymerization; pentfluorostyrene; polymerization; pressure reaction; reactivity ratios; 15281.

Tetrahedral anion; x-ray diffraction; calcium fluoroborate; calcium salts; crystal structure; single crystal; 14976.

Text editing; computer applications; OMNITAB II; Minitab; statistical computing; NBSIR 75-649.

Textiles; upholstered furniture; apparel; carpets; curtains; draperies; fabrics; flammability; garments; test methods; 15470.

TGA; thermal analysis; thermal degradation; thermogravimetric analysis; differential thermal analysis; DTA; kinetics; pyrolysis; 15292.

The meter; laser frequency measurements; laser strainer; saturated absorption spectroscopy; speed of light; 15688.

Theoretical; cross sections; energy distributions; photon; tertia- ry; SP425, pp. 317-319.

Theoretical model; thermal analysis; thermodynamic properties; differential scanning calorimetry (DSC); electronic and thermal coupling; instrumental limitations; supercooling; 14824.

Theoretical study; electron impact; helium; ionization; 14764.

Theory; corridor fire; experiments; flame spread; floorcovering; test method; 15617.

Theory; corridors; fire induced flow; recirculating flow; scale-model; smoke movement; stratified flow; 15630.

Theory; ferromagnetic transition metals; field emission; spin polarization; strongly correlated metals; surface density of states; 15090.

Theory; transducer; calibration; construction; impact; interface; piezoelectric polymer; polymer; pressure; pressure transducer; NBSIR 75-740.

Theory; x-ray inelastic scattering; differential cross section; real metals; J.79A No. 2, 415-417 (1975).

Theory and experiment; fast neutron capture; Co, Ni, Cu, Zn, Nb, Ho, Ta, Au; SP425, pp. 901-904.

Theory of elasticity; composite materials; elastic constants; filled polymers; mechanical properties; particulate composites; shear modulus; J.79A No. 2, 419-423 (1975).

Therapy; activation cross-section; bone mineral; in vivo neutron-activation analysis; SP425, pp. 520-526.

Thermal; Westcott; cross section; neutron; resonance; sodium-22; SP425, pp. 792-794.

Thermal activation; ambient temperatures; dislocation
mechanisms; fracture mechanics; sapphire; slow crack growth; 15122.

Thermal analysis; thermal degradation; thermogravimetric analysis; differential thermal analysis; DTA; kinetics; pyrolysis; TGA; 15292.

Thermal analysis; thermodynamic properties; differential scanning calorimetry (DSC); electronic and thermal coupling; instrumental limitations; supercooling; theoretical model; 14824.

Thermal analysis; thermostat setback; transient heat flows; air leakage measurement; building heat transfer; computer programs; dynamic thermal performance; heat flow analysis; heating and cooling loads; temperature predictions; BSS57.

Thermal analysis; wet chemistry; x-ray fluorescence; activation analysis; characterization; chemical composition; chromatographic analysis; coulometry; electron probe microanalysis; ion-selective electrodes; mass spectrometry; polarography; spectrochemical analysis; 15165.

Thermal boosts; high plutonium productivity; modulation-jacket in blanket; SP425, pp. 422-425.

Thermal capture spectra; valence capture in $^{36}$Ar and $^{56}$Fe; SP425, pp. 795-798.

Thermal coefficient of refractive index; coefficient of thermal expansion; elastic constants; infrared laser window materials; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; NBSIR 75-639.

Thermal coefficient of refractive index; ZnSe; birefringence; elastic constants; infrared-laser window materials; interferometry; KC1; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; NBSIR 75-781.

Thermal conductivity; aramid fiber; composites; cryogenic; epoxy; glass fiber; 15021.

Thermal conductivity; austenitic stainless steel; electrical resistivity; high temperature; low temperature; standard reference materials; SP260-46.

Thermal conductivity; composite; cryogenics; superconducting coil; 15031.

Thermal conductivity; composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; NBSIR 74-393.

Thermal conductivity; composites; elastic properties; fracture; liquid helium; mechanical properties; structural materials; superconducting machinery; NBSIR 75-810.

Thermal conductivity; computer; cryogenic; cryptography; data; energy labeling; energy needs; fluid safety; materials; NBS, GSA experiment; optical spectra; plastic pipes; DIM/NBS 59, No. 9, 193-216 (1975).

Thermal conductivity; cryogenics; dielectric constant; loss tangent; machinable glass-ceramic; specific heat; 15046.

Thermal conductivity; thermal diffusivity; cryogenic insulation; powders; 15177.

Thermal conductivity; thermal conductivity coefficient; viscosity coefficient; correlation; critical point; equation of state; methane; 15184.

Thermal conductivity; thermopower; electrical resistivity; electrolytic iron; high temperature; iron; Lorenz ratio; low temperature; standard reference material; SP260-50.

Thermal conductivity; thermopower; tungsten; electrical resistivity; high temperature; Lorenz ratio; low temperature; standard reference materials; SP260-52.

Thermal conductivity; transport properties; viscosity; argon; Barker-Henderson perturbation theory; modified Enskog theory; 14775.

Thermal conductivity coefficient; viscosity coefficient; correlation; critical point; equation of state; methane; thermal conductivity; 15184.

Thermal conductivity of Ar; thermal conductivity of He; thermal conductivity of N$_2$; excess thermal conductivity of N$_2$; J.79A No. 2. 407-413 (1975).

Thermal conductivity of N$_2$; excess thermal conductivity of N$_2$; thermal conductivity of Ar; thermal conductivity of He; J.79A No. 2. 407-413 (1975).

Thermal cross section; nickel-59; resonance integral; resonance parameters; SP425, pp. 776-779.

Thermal cross sections; bound level parameters; spin assignments; SP425, pp. 357-359.

Thermal degradation; mixtures; molecular weight distribution; monodisperse poly-$\alpha$-methylstyrene; 15543.

Thermal degradation; thermogravimetric analysis; differential thermal analysis; DTA; kinetics; pyrolysis; TGA; thermal analysis; 15292.

Thermal diffusivity; cryogenic insulation; powders; thermal conductivity; 15177.

Thermal emf; thermocouples; thermoelectric reference data; thermometry; calibration; nickel-base alloys; eickel-chromium alloys; nickel-silicon alloys; reference tables; temperature measurements; 15518.

Thermal emittance; thermodynamics; electrical resistivity; graphite; heat capacity; high-speed measurements; high temperature; 15108.

Thermal expansion; 3-methylpentane; consolute point; critical exponent $\alpha$; critical phenomena; critical solution point; density; gravity effects; mixture, binary; mixture, liquid; nitroethane; 15691.

Thermal impact; thermal potential; thermal safety; contact burn; heat conduction; human tissue; 15050.

Thermal impedance measurements; thermal response measurements; transistors (thermal measurements); computer simulation (transient thermal); current crowding (transistors); power transistors; 14963.

Thermal ionization; isotope dilution; isotopes; mass spectrometry; molybdenum; nickel; normalization; standard reference materials; 14904.

Thermal mechanical analysis (TMA); thermal properties; thermogravimetric analysis (TGA); thermoplastic pipe; chlorinated polyvinyl chloride; hardness; internal stress; polyvinyl chloride; NBSIR 74-610.

Thermal motion; crystal structure; low temperature; meta-stable compound; neutron diffraction; NH$_3$ClO$_4$; 15223.

Thermal motion; crystal structure; deuterium peroxide; hydrogen bonds; hydrogen peroxide; neutron diffraction; structure refinement; 15271.

Thermal motion; torsional oscillation; constrained refinement; hindered rotation; hydrogen bonds; hydroxyalummonium; neutron diffraction; perchlorates; 14853.

Thermal neutron constants; calibration; neutron moisture gauge; pedology; soil; SP425, pp. 516-519.

Thermal neutron detection; x-radiographic paper; image quality; neutron converters; neutron radiography; neutron scintillator; 15549.

Thermal neutrons; Kossel diffraction; lattice expansion; LiF; NBS reactor; radiation damage; 15346.

Thermal performance; solar collector; solar energy; solar radiation; standard; standard test; NBSIR 74-635.

Thermal performance; thermal storage; thermal test; solar energy; standard; standard test; NBSIR 74-634.

Thermal potential; thermal safety; contact burn; heat conduction; human tissue; thermal impact; 15050.

Thermal properties; advanced fiber composites; cryogenics; dynamic mechanical properties; literature review; static mechanical properties; 15667.

Thermal properties; cryogenics; dynamic mechanical properties; glass-fiber composites; literature review; static mechanical properties; 15170.

Thermal properties; thermogravimetric analysis (TGA); ther-
Thermocompression bonds; ultrasonic bonds; bonds (wire); failure modes; metallurgical failure modes; microelectronics; 15431.

Thermocouples; thermoelectric reference data; thermometry; calibration; nickel-base alloys; nickel-chromium alloys; nickel-silicon alloys; reference tables; temperature measurements; thermal emf; 15518.

Thermocouples; thermometry; base-metal thermocouples; cryogenic thermocouples; noble-metal thermocouples; non-standardized thermocouples; refractory metal thermocouples; standardization; temperature measurement; 15517.

Thermodynamic; liquid; configurational; glass; glass transition; hole theory; polymer; poly(vinyl acetate); PVTr; 14850.

Thermodynamic data; x-ray diffraction data; chromatography; crystal structure; crystal structure transformations; percolations; phase transformations; phosphates; sulfates; NSRDS-NBS56.

Thermodynamic data for incinerators; waste utilization; fuel from waste; incinerators; organic waste conversion; 15065.

Thermodynamic data, transport properties; atomic and molecular data; chemical kinetics; colloid and surface properties; mechanical properties; nuclear data; solid state data; standard reference data; TN881.

Thermodynamic diffusion equations; vacancy diffusion mechanisms; atomic diffusion mechanisms; diffusion; random walk; review article; 15539.

Thermodynamic effects; vapor pressure; cavitation; cavity pressure; steam; steam vapor pressure; 14879.

Thermodynamic limit; distribution functions; finite volumes; Kirkwood Salsburg equation; perturbation expansion; strip operator; 15336.

Thermodynamic properties; adiabatic calorimetry; branched polyethylene; calorimetry; cryogenic temperature; heat capacity; linear polyethylene; polyethylene; J.79A No. 2, 437-441 (1975).

Thermodynamic properties; C = N bond; infrared spectrum; isotopic substitution; matrix isolation; methyl azide; methyleneimine; normal coordinate analysis; photolysis; 15110.

Thermodynamic properties; chemical reactions; combustion; cryogenic fluid safety; explosions; fires; fuels; handling; hydrogen; oxidizers; oxygen; propellants; safety information; 15154.

Thermodynamic properties; constraints; equation of state; fluid; least squares; parameter estimation; $p-V-T$; statistical weighting; 15132.

Thermodynamic properties; differential scanning calorimetry (DSC); electronic and thermal coupling; instrumental limitations; supercooling; theoretical model; thermal analysis; 14824.

Thermodynamic properties; thermodynamic surface; ammonia; correlation; gas; liquid; NBSIR 75-770.

Thermodynamic properties; three body forces; methane; molecular dynamics; potential function; specific heat; statistical mechanical ensembles; 15310.

Thermodynamic properties data; transport properties data; critically evaluated data; ethylene; propylene; NBSIR 75-783.

Thermodynamic properties; triple point; bromobenzene; calorimetry; enthalpy; entropy; Gibbs energy; heat capacity; heat of fusion; heat of vaporization; J.79A No. 5, 619-628 (1975).

Thermodynamic surface; ammonia; correlation; gas; liquid; thermodynamic properties; NBSIR 75-770.

Thermodynamic temperature; CMN; entropy; magnetic susceptibility; magnetic temperature; 15654.

Thermodynamics; adenosine-5'-triphosphate; biochemistry; enzyme catalyzed reactions; glucose; heat measurements; hexokinase; metabolic processes; microcalorimetry; thermochemistry; 15174.

Thermodynamics; critical phenomena; divergences at critical points; free energy surface; geometry of thermodynamic surfaces; 15150.

Thermodynamics; dislocation; multiaxial; plasticity; 14979.

Thermodynamics; electrical resistivity; graphite; heat capacity; high-speed measurements; high temperature; thermal emf; 15108.

Thermodynamics; electrical resistivity; emittance; hafnium; high-speed measurements; high temperatures; specific heat; J.79A No. 2, 431-436 (1975).

Thermodynamics; high-speed measurement; high temperature; iron; phase transformation; 15623.

Thermodynamics; thermophysical properties; high-speed measurements; high temperature; pulse calorimetry; 15146.

Thermodynamics; thermophysics; capacitor discharges; high-speed measurements; high temperatures; 14934.

Thermodynamics; transposed critical line; helium; hydrodynamics; one dimensional flow; single phase fluid; 15047.

Thermodynamics; uranium dioxide; capacitor discharges; heat capacity; high-speed measurements; high temperature; NBSIR 75-793.

Thermodynamics; zirconium; electrical resistivity; high-speed measurements; high temperature; solid-solid phase transformation; J.79A No. 1, 81-84 (1975).

Thermogravimetric analysis; differential thermal analysis; DT A; kinetics; pyrolysis; TGA; thermal analysis; thermal degradation; 15292.

Thermogravimetric analysis (TGA); thermoplastic pipe; chlorinated polyvinyl chloride; hardness; internal stress; polyvinyl chloride; thermal mechanical analysis (TMA); thermal properties; NBSIR 74-610.

Thermomagnetism; galvanomagnetism; quantum transport theory; semiconductors; 15525.

Thermometer; $^{60}$Co; gamma rays; Josephson junction; noise thermometer; 15166.

Thermometer calibration; thermometer production; thermometry; measurement accuracy; national temperature measurement system; temperature scale; 15060.

Thermometer production; thermometry; measurement accuracy; national temperature measurement system; temperature scale; thermometer calibration; 15060.

Thermometers; cooling system; cryogenics; helium-cooled electrical leads; helium impurities; microwave cavities; negative differential flow resistance; pressure measurement; system dynamics; NBSIR 75-823.

Thermometric fixed point; OSMR; pure cadmium; superconductive transition temperature; superconductive transition width; 15342.

Thermometric fixed points; antiferromagnetism; ferroelectricity; solid-state transitions; superconducting temperature calibration; 15353.

Thermometric fixed points; superconductive transition temperatures; superconductivity; temperature; 15052.

Thermometry; annual report; calibrations; progress report; standards; temperature scale; TN869.

Thermometry; applications; material detection; nuclear quadrupole resonance; piezometry; 15475.
Thermometry; base metals alloys; noble metal alloys; temperature scale; temperature standards; thermoelements; *Monogr. 125.* Suppl. 1.

Thermometry; base-metal thermocouples; cryogenic thermocouples; noble-metal thermocouples; nonstandardized thermocouples; refractory metal thermocouples; standardization; temperature measurement; thermocouples; 15517.

Thermometry; burn hazard; consumer products; contact temperature; thermesthesiometer; 15285.

Thermometry; calibration; nickel-base alloys; nickel-chromium alloys; nickel-silicon alloys; reference tables; temperature measurements; thermal emf; thermocouples; thermoelectric reference data; 15518.

Thermometry; carbon resistors; cryogenics; liquid helium; millikelvin; 15537.

Thermometry; conference; temperature; 15179.

Thermometry; consumer products; contact temperature; thermesthesiometer; 15303.

Thermometry; cryothermometry; low temperature; 15127.

Thermometry; measurement accuracy; national temperature measurement system; temperature scale; thermometer calibration; thermometer production; 15060.

Thermometry; time constant; time response; oceanographic temperature measurements; temperature measurement; temperature sensors; 15074.

Thermometry; vacuum deposition; calibration; carbon films; low temperature; *NBSIR 74-355.*

Thermomigration; thulium; titanium; tungsten; uranium; vanadium; zirconium; alloy diffusion; beryllium; cerium; cesium; chromium; copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; *J. Phys. Chem. Ref. Data* 4, No. 1, 177-250 (1975).

Thermophysical properties; high-speed measurements; high temperature; pulse calorimetry; thermodynamics; 15146.

Thermophysics; capacitor discharges; high-speed measurements; high temperatures; thermodynamics; 14934.

Thermoplastic pipe; chlorinated polyvinyl chloride; hardness; internal stress; polyvinyl chloride; thermal mechanical analysis (TMA); thermal properties; thermogravimetric analysis (TGA); *NBSIR 74-610.*

Thermoplastic piping; ABS; coefficient of expansion; CPVC; glass transition temperature; hardness; PB; polybutene; polyvinyl chloride; PVC; residual stress; *NBSIR 74-629.*

Thermoplastic piping in plumbing; fire performance of piping; functional performance of piping; performance characteristics for piping; thermal/structural performance of piping; 15568.

Thermopower; tungsten; electrical resistivity; high temperature; Lorenz ratio; temperature; standard reference material; thermal conductivity; SP260-50.

Thermopower; tungsten; electrical resistivity; high temperature; Lorenz ratio; low temperature; standard reference materials; thermal conductivity; SP260-52.

Thermostat setback; transient heat flows; air leakage measurement; building heat transfer; computer programs; dynamic thermal performance; heat flow analysis; heating and cooling loads; temperature predictions; thermal analysis; BSS57.

Thianthrene; combustion; enthalpy; formation; heat; secondary standard; sulfur compound; *J. AERI* No. 4, 561-564 (1975).

Thianthrene; urea; acetaldehyde; bomb calorimetry; calorimetry; chlorobenzoic acid; combustion; creatinine; fluorobenzoic acid; nicotinic acid; reference materials; thermochemical; thermochemical standards; 15441.

Thick targets; astrophysics; cross sections; fusion; reaction rates; *SP245,* pp. 69-72.

Thickening; volume change; annealing; crystalline polymers; material transport; 14754.

Thickness; cell; Kovar; sapphire; temperature; 15618.

Thickness gages; thickness measurement; coating thickness; coating thickness gages; coatings; electrodoped coatings; 15560.

Thickening; coating thickness; coating thickness gages; coatings; electrodoped coatings; electrodoped coatings; metal coatings; properties of electrodoped coatings; 15560.

Thin films; cavity theory; depth dose; dose distributions; dosimetry; dye; electron beams; radiodynamic dyes; 15424.

Thin films; dose distributions; dosimetry; dye dosimeters; electron beams; radiation curing; radiation processing; radiodynamic dyes; 14957.

Thin films; ellipsometry; optics; 15061.

Thin films; evaporation; magnetic retention; masks; sputtering; substrates; 15231.

Thin-film device; frequency source; Josephson junction; Josephson tunnel junction; junction array; microstrip-line-coupling; 15599.

Thinning; cross sections; linearization; paging; pre-processing; relative error; *SP245,* pp. 419-421.

Thinning; unresolved; cross section; interpolation; Monte Carlo; probability; *SP245,* pp. 447-450.

Thioborine; absorption spectra; force constants; HBS; infrared; molecular spectra; spectra; 15000.

Thioformaldehyde; ultraviolet photolysis; vacuum ultraviolet photolysis; CH3S; CH3SH; dimethylsulfide; infrared spectrum; matrix isolation; pyrolysis; s-trithane; 15334.

Third interaction virial coefficients; virial coefficients; water vapor-air mixtures; chemical association; Lennard-Jones potential parameters; *J. AERI* No. 6, 777-779 (1975).

Third-order aberration coefficients; two-tube electrostatic lens; weak lenses; aberration integrals; asymptotic aberration coefficients; electron lenses; strong lenses; 14817.

Third-order aberration coefficients; two-tube lens; aberration integrals; asymptotic aberration coefficients; electron optics; electrostatic lenses; 14974.

Third-order theory; unit magnification; Cassegrain; reflecting objective; spectrometers; spherical aberration; 15402.

Two body forces; methane; molecular dynamics; potential function; specific heat; statistical mechanical ensembles; thermodynamic properties; 15310.

Three thicknesses; transmission measurements; 190-m flight path; background; *J. AERI*; natural U; resonance parameters f* up to 5 keV; *SP245,* pp. 738-741.

Three triplet model; composite model of leptons; electron number; leptonic quarks; larks; muon-electron universality; muon number; neutrino quarks; strong interactions; 15614.

Three-antenna extrapolation; calibration; ground antenna; standard antenna gain; 15641.

Three-dimensional radiography; x-radiography; dimensional measurement; gamma radiography; image enhancement; neutron radiography; nondestructive testing; proton radiography; real-time techniques; 15214.

Three-dimensional scanning; anechoic chamber evaluation; omni-directional probe; reflectivity; 14952.

Threshold; CO; electron excitation; energy loss spectra; resonance decay; resonant structure; 15134.

Threshold; consumer products; electrical breakdown; gases; hazard; high voltage; sharp edges; sharp points; *NBSIR 75-908.*

Threshold; xenon; autoionizing states; electron excitation; energy loss; resonances; 15442.

Threshold detectors; activity measurement; cross sections; fission spectrum; neutron source; scattering corrections; *SP245,* pp. 273-276.

Threshold energies; water; ammonia; dissociative photoionization; NH3*, OH*; photoionization; 15352.

Thrombrosis; biocompatibility; biomaterials; blood
phys.; 15023. 177-250 estimate; 88. 36
Time, Time, Time, Time, Tieline; Tie
Ti, Ti: arc; experimental; oscillator strengths; 15023. Ti
Ti; arc: experimental; oscillator strengths; 15023. Tie
Tie molecules: chain rupture; crystalline polymer; ESR investigation of; radicals; fibrous structure; mechanical breakdown; microfibrillar structure; radical formation; 15476.
Tielle: condensate return; epoxy; fiberglass reinforced plastic; filament-wound; insulated; molded; morpholine; prefabricated steel conduit; Qualified Products List; BSS66, pp. 88-101.
Tilt angle; toy testing; abuse testing; dynamic stability; hazards; obstruction; riding toys; stairway; static stability; test weight; NBS1R 74-623.
Time: broadcasting; dissemination; frequency; satellite; synchronization; 14836.
Time: clocks; coordinate time; general relativity; TN659.
Time: dissemination; frequency; high frequency broadcasts; standard; TN668.
Time: energy conservation; fires; gasoline consumption; glass SRM; hazardous chemicals; leap second; playground equipment; safety; scientific data; silicon devices; DIMINBS 59, No. 2, 25-48 (1975).
Time: frequency; questionnaire; standard frequency and time broadcasts; TN674.
Time: transition; coaxial; cylindrical; error; line; loss; response; skin effect; step; 15696.
Time comparison; clock; frequency stability; frequency standard; 15674.
Time constant; time response; oceanographic temperature measurements; temperature measurement; temperature sensors; thermometry; 15074.
Time delay; CO laser; electrical discharge; gas mixture; 15594.
Time domain: attenuation; automated measurement; network analyzer; pulse; S parameters; 15661.
Time domain; data conversion; dynamic measurements; electrical measurements; electronic instrumentation; signal conditioning; systems; TN865.
Time domain analysis; attenuation; discrete Fourier transform; fast Fourier transform; insertion loss; jitter; microwave measurement; mismatch; network analyzer; noise; pulse generator; pulse measurement; sampling oscilloscope; scattering parameters; spectral analysis; TN672.
Time domain stability; crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; 15673.
Time domain stability; crystal controlled oscillator; fast linewidth; quartz crystal resonators; short-term stability; spectral density of frequency fluctuations; 15673.
Time of flight; ilmenite concrete; Monte Carlo; neutron attenuation; SP425, pp. 409-414.
Time ordering; Balmer lines; four dimensional rotation group; hydrogen; plasma; plasma broadening; pressure broadening; scattering matrix; spectral line broadening; Stark broadening; symmetry group; 15009.
Time response: oceanographic temperature measurements; temperature measurement; temperature sensors; thermometry; time constant; 15074.
Time reversal symmetry; counting independent parameters; phonon dynamical matrix; 15216.
Time scale accuracy algorithm; time scale stability; coordinate time scales; frequency calibration; international frequency comparisons; optimum frequency estimate; primary frequency standards; relativity; SI second; 15672.
Time scale stability; coordinate time scales; frequency calibration; international frequency comparisons; optimum frequency estimate; primary frequency standards; relativity; SI second; time scale accuracy algorithm; 15672.
Time stability; atomic clocks; frequency measurements; frequency stability; phase delay; precise time metrology; subpicosecond time difference measurements; 15684.
Time standards; application of standards; basic standards; cesium standards; frequency accuracy; frequency stability; frequency standards; hydrogen standards; ion storage; laser stabilization; rubidium standards; saturated absorption; 14830.
Time to failure; ceramics; fracture; fracture mechanics; glass; impact damage; strength; thermal shock; 14886.
Time-dependent spectral density; amplitude probability distribution; digital data; electromagnetic interference; electromagnetic noise; emergency communications; Fast Fourier transform; Gaussian distribution; impulse noise; magnetic field strength; NBS1R 74-391.
Time-of-flight; activation method; group constants; iron; neutron spectrum; one-dimensional transport calculation; stainless steel; SP425, pp. 184-188.
Time-of-flight; carbon; neutron total cross section; pulsed neutron sources; 14809.
Time-of-flight; compared with calculated excitation functions; measured a(Ea, 90o) for ground; 45, 148 keV states; nuclear reactions 238U(n,n'), E = 0.9-2.7 MeV; SP425, pp. 950-952.
Time-of-flight; detector; flux; Monte Carlo; neutrons; scintillators; SP425, pp. 73-74.
Time-of-flight; Hauser-Feshbach; inelastic-scattering; measurements; MeV range 2 to 4.5; neutrons; SP425, pp. 871-874.
Time-of-flight; 1-240 eV; gross fission products; neutron cross section; SP425, pp. 744-747.
Time-of-flight method; 99Nb, Ag, 137Cs, 141Pr, 197Au and 235U; CaFe detector; Fe-filtered beam; neutron capture cross section; pulse-height weighting; SP425, pp. 802-805.
Time-of-flight technique; uranium isotopes—234U, 238U, 235U, 236U; 1.001 to 30 MeV; fission cross section ratios; linear accelerator; SP425, pp. 591-596.
Time-sharing; computer networks; interactive computing; man-machine interaction; performance measurement; TN880.
Tin ores; Mössbauer spectrometry; quantitative analysis; Stan-nic oxide; 15358.
Tin point; zinc point; aluminium point; calibration; freezing point; freezing-point cell; platinum resistance thermometer; 15337.
Tipping; home playground equipment; stability; strength; test; testing; NBS1R 74-621.
Tire noise; transportation noise; trucks; urban planning; acoustics; noise measurement; noise pollution; noise (sound); sound transmission; 14873.
Tire noise; transportation noise; trucks; urban planning; acoustics; noise measurement; noise pollution; noise (sound); sound transmission; 14874.
Tire noise; transportation noise; truck; urban planning; acoustics; noise measurement; noise pollution; noise (sound); sound transmission; 15002.
Tire noise; transportation noise; acoustics; noise (sound); 15206.
Tire noise; transportation noise; acoustics; automobile; noise (sound); 15312.
Tire noise; truck tires; acoustics; military vehicles; noise; sound; 14875.
The page contains a list of technical terms and abbreviations related to various scientific fields, including ultrasonic testing, nuclear reactions, and semiconductor properties. The text includes various sections on measurement methods, interferometers, ultrasonic bonding, and electronic testing devices.

Some key terms and concepts include:
- Ultrasonic interferometer
- Ultrasonic bonding
- Voltage contrast mode
- Boron redistribution
- Darlington pairs
- Optoelectronics
- Spectroscopy
- Ultraviolet light
- Nuclear reactions
- Uncertainty
- Metrology
- Calibration

The page also references specific standards and algorithms, such as ASTM, Monogr., and ENDF/B.
Unsolicited proposals; certification programs; ETIP; incentives; innovation; life cycle costing; procurement; product testing; specifications; NBSIR 75-716.

Unsteady flow; air; analytical; anemometer; dynamic response; experimental; lag; NBSIR 75-772.

Unwashed soft glass pipets; clinical; contamination; errors; soft glass pipets; 15295.

Updating estimates; data analysis; mean; standard deviation; statistics; 15640.

Upholstered furniture; apparel; carpets; curtains; draperies; fabrics; flammability; garments; test methods; textiles; 15470.

Upholstery; waste receptacles; buildings; combustibility; fire intensity; flames; furnishings; heat release; ignition; smoke; thermal radiation; NBSIR 75-679.

Upper photosphere; carbon abundance; molecular spectra; non-LTE; solar model; 15044.

Upper state constants; vibration-rotation interaction constants; equilibrium structure; ground state constants; infrared spectrum; nitrogen dioxide; $2\nu$; band; nitrogen dioxide; $\nu_2$; band; 15564.

Uranium; coal; fission track technique; fly ash; mica detector; polycarbonate detector; rapid analysis; 15457.

Uranium; delayed coincidence; $f$; value; imprisonment; lifetime; mean life; resonance radiation; transition probability; U 1; 15058.

Uranium; environmental samples; neutron activation analysis; tellurium; 15385.

Uranium; evaluation; nuclear data; plutonium; SP425, pp. 313-316.

Uranium; nuclear enterprises; nuclear materials; plutonium; safeguard; SP425, pp. 199-201.

Uranium; vanadium; zirconium; alloy diffusion; beryllium; cerium; cesium; chromium; copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Uranium dioxide; capacitor discharges; heat capacity; high-speed measurements; high temperature; thermodynamics; NBSIR 75-793.

Uranium glasses; U-238 fission decay constant; fission track dating; neutron flux; neutron irradiation; plateau annealing; 15379.

Uranium isotopes $^{233}\text{U, } ^{234}\text{U, } ^{235}\text{U, } ^{236}\text{U}$; 0.001 to 30 MeV; fission cross section ratios; linear accelerator; time-of-flight technique; SP425, pp. 591-596.

Uranium-234; uranium-235; uranium-238; cross sections; fission; neptunium-237; neutron reactions; pile neutrons; plutonium-239; 15020.

Uranium-235; uranium-238; cross sections; fission; neptunium-237; neutron reactions; pile neutrons; plutonium-239; uranium-234; 15020.

Uranium-235 cavity fission spectrum; dosimetry; fission cross sections; neutron standards; SP425, pp. 254-257.

Uranium-238; cross sections; fission; neptunium-237; neutron reactions; pile neutrons; plutonium-239; uranium-234; uranium-235; 15020.

Uranium-238 capture rates; fast reactors; fission chambers; fission rates; mass assay; MOL-ΣΣ facility; SP425, pp. 258-261.

Uranium ions; europium ions; fluorescence; fluorescence standards; inorganic ion-doped fibers; microspectrofluorimetry; 15321.

Urban planning; acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; 14873.

Urban planning; acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; trucks; 14874.

Urban planning; acoustics; noise measurement; noise pollution; noise (sound); sound transmission; tire noise; transportation noise; truck; 15002.

Urban transportation; carpool matching; carpools; computer programs; transportation; NBSIR 74-633.

Urea; acetaldehyde; bomb calorimetry; calorimetry; chlorobenzonic acid; combustion; creatinine; fluorobenzonic acid; nicotinic acid; reference materials; thermochemical; thermochemical standards; thianthren; 15441.

Urethane; AM General Bus; arson; critical radiant flux; fire retardant; flammability; flooring radiant panel test; Metro; motor vehicle safety standard 302; NBSIR 75-718.

Use statistics; evaluation; National Bureau of Standards; on-line information retrieval systems; 15378.

User charges; automated information retrieval; cost benefit; public good; scientific and technical information; semi-public good; subsidization; total cost recovery; TN864.

User competence; end-user satisfaction; performance evaluation; performance factors; resource utilization; SP406, pp. 39-42.

User control of computing; users' performance evaluation; users' performance measures; computer performance evaluation; computer resource allocation; computer service parameters; computer system performance; cost/effectiveness; cost/performance; SP406, pp. 65-71.

User experiences; data base applications; data base management systems; selection criteria; software features; system evaluation; system features; TN887.

User identification; Brooks Bill; computer security; congressional concern; controlled accessibility; data sensitivity; measures of risk; standards; 15498.

User protocols; command languages; computers; man-machine systems; networks; system commands; TN877.

User protocols; command languages; computer; man-machine systems; networks; system commands; NBSIR 75-744.

User satisfaction measurement; reduction of measurement data; software measurement tools; total computing capacity; SP406, pp. 27-31.

Users; acquisition; CODASYL; computer; data base management; designers; evaluation; selection; 15668.

Users' performance evaluation; users' performance measures; computer performance evaluation; computer resource allocation; computer service parameters; computer system performance; cost/effectiveness; cost/performance; performance evaluation; SP406, pp. 65-71.

Users' performance measures; computer performance evaluation; computer resource allocation; computer service parameters; computer system performance; cost/effectiveness; cost/performance; performance evaluation; user control of computing; SP406, pp. 65-71.

Uses; color; environment; experimenting with; harmony; hues; illumination; light; personal uses; relationships; CIS6.

Utilitoids; ventilation; air leakage; Arctic; central heat distribution systems; construction materials; drainage; insulation; permafrost; seasonal frost; snow drifting; BS566, pp. 122-135.

Utilities; biology; career; ecological; electricity; energy; environment; fusion; medicine; nuclear; power; radiation; reactor; research; TN888.

Utilities; conversion; cost; cryogenics; economics; embrittlement; energy; hydrogen; industrial instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; SP419.

Utilities; economic incentives; housing development; integrated utilities; NBSIR 75-721.

Utilities for housing; utility system performance; air conditioning; air pollution; central utility systems; data acquisition system; efficiencies; electrical power; energy conservation; energy costs; fuel utilization; heat recovery; total energy systems; NBSIR 75-711.
Vacancies; atom transport; diffusion in crystals; kinetic diffusion equations; mechanism for diffusion; random walk; 15421.

Vacancy; correlation factor; diffusion; drift mobility; electric field; random walk; symmetry plane; 15367.

Vacancy diffusion mechanisms; atomic diffusion mechanisms; diffusion; random walk; review article; thermodynamic diffusion equations; 15359.

Vacancy wind effect; correlation factor; diffusion; divacancy; driving force for diffusion; impurity diffusion; ion drift velocity; nonrandom diffusion; 15452.

Vacuum deposition; calibration; carbon films; low temperature; thermometry; NBSIR 74-355.

Vacuum ultraviolet; absolute radiation detector; absorption measurements; filters; GM counter; sensitive detector; 14903.

Vacuum ultraviolet; acetylene; bond dissociation energy; bromoaecetyle; C₂; C₂H₃; fluorescence; photodissociation; 14986.

Vacuum ultraviolet; arc; hydrogen; negative ion; plasma; resonance; 15652.

Vacuum ultraviolet; electron accelerator; new facility; radiation; storage ring; synchrotron radiation; 15026.

Vacuum ultraviolet; enthalpy of formation; ions; mass spectrometry; methyl; methane; photoionization; radicals; 15351.

Vacuum ultraviolet; iradiances; radiometry; spectrometer calibration; standard source; synchrotron radiation; J. 79A No. 6. 761-774 (1975).

Vacuum ultraviolet; wall-stabilized; arc; calibrations; hydrogen; plasma; radiometry; spectral radiant; 15291.

Vacuum ultraviolet; wall-stabilized arc; blackbody calibrations; hydrogen continuum; primary standard; radiometry; 15412.

Vacuum ultraviolet; xenon; 4d absorption; atomic structure; inner shell; Nₓₓ; resonance cross section profiles; spectroscopy; 15054.

Vacuum ultraviolet photolysis; alkane; electronically excited molecule; hydrogen iodide; n-butane; radical scavenging; M1202.

Vacuum ultraviolet photolysis; free radical scavenging; hydrocarbons; isobutane; neopentane; primary photochemical processes; quantum yields; 14996.
orthobaric densities; specific heats; speeds of sound; NBSIR 74-398.

Vaporization; viscosity; coal slags; MHD; thermionic emission; 15449.

Vaporization; viscosity; electrical conductivity; MHD materials; phase equilibrium; slag; 15510.

Vaporization equilibrium: K$_2$SO$_4$-La$_2$Cr$_2$O$_7$ system; K$_2$SO$_4$-MgO system; phase relations; vapor pressure; 15505.

Vapor-stream pumping; viscosity gauge; capacitance-diaphragm gauge; Knudsen radiometer; McLeod gauge; micromanometer; quartz Bourdon gauge; static expansion; thermal transpiration; 14933.

Variability; distribution; low utilization; overhead; suboptimization; subsystem measurement; SP406, pp. 45-52.

Variable; anchor; controls; corrosion; growth; metering; modern; museum; primary; reliability; renovation; secondary; system; BSS66, pp. 102-115.

Variable area meter; coefficients of discharge; expansion factor; flow coefficients; flowmeter; fluid meter coefficients; rotameter; 14795.

Variable contrast resolution; contrast curves; low contrast resolution; night vision; objective lenses; resolution test; 14950.

Variables; workload; computer system; factors; measurement; parameters; performance; performance terminology; predictability; requirements; SP406, pp. 53-60.

Variation of parameters; celestial mechanics; orbit perturbation; satellite ephemeris; J.79B Nos. 1 and 2, 1-15 (1975).

Various statistical tests; measured $\sigma(E)$; (n,n); (n,y); $E = 1$ eV-few keV; nuclear reactions; summary of deduced $E_o$, $gT_o$, $F_Y$, $S_o$, $D_o$; SP425, pp. 780-783.

Vector norm; consistency; matrix norm; monotonicity; principal submatrix; spectral radius; J.79B Nos. 3 and 4, 97-102 (1975).

Vector voltmeter; voltage; admittance; automated precision measurements; correlator; current; impedance; microwave circuit parameters; microwave measurements; phase angle; power; ratio; reflection coefficient; reflectometer; self-calibration; six-ports; TN673.

Vector voltmeter; voltage; attenuation; automation; detector; insertion loss; microwaves; phase angle; ratio; six-port junction; 15649.

Vector voltmeter; voltage; attenuation; microwave; phase angle; ratio; self-calibration; six-port; 15665.

Vehicle inspection; airport pavements; bridge inspection; neutron testing; pipeline inspection; railroad inspection; transportation; 15213.

Velocity; carpets with and without underlayment; corridor fires; energy models; finished interior; full scale experiments; interaction; measurements; smoke; smoke and flame spread; temperature; with and without forced air; 15230.

Velocity autocorrelation function; 11-6-8 potential; Axilrod-Teller correction; dense liquid; excess function; hydrodynamic limit; molecular dynamics; rare gases; 15168.

Velocity distribution; cavity phase shift; cesium beam tube; frequency synthesis; pulse method; Ramsey dual interaction region; second-order doppler; 14829.

Velocity of sound; density; enthalpy; entropy; hydrogen; properties of fluids; specific heat; 15022.

Velocity-gradientes; boundary layer; grid; intermittency; moments; statistical properties; turbulence; 15116.

Vent; waste; ABS; cast iron; copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC; smoke; toxic gases; NBSIR 74-449.

Ventilation; air leakage; Arctic; central heat distribution systems; construction materials; drainage; insulation; permastone; seasonal frost; snow drifting; utilidors; BSS66, pp. 122-135.

Vents; automobile; detection; dispersion; explosion; fire; hydrogen; leakage; methane; safety; TN666.

Vents, reduced-size; DVW; performance testing; reduced-size vents; trap-seal retention; venting; BSS660.

Vents, automobile; detection; dispersion; explosion; fire; hydrogen; leakage; methane; safety; TN666.

Vertical antenna; duplexer; fm transceiver; land-mobile communications; law enforcement; repeater; 14990.

Vertical cylinder; cryogenic; heat transfer; hemisphere; horizontal cylinder; liquid deuterium; liquid hydrogen; liquid nitrogen; natural convection; sphere; NBSIR 75-807.

Vertical resolution; electron microscopes; horizontal resolution; optical instruments; stylus instruments; surface texture measurement; surface texture parameters; 15613.

Veterans Administration Hospital; experiments; full-scale; gas tracer; interstitial space; penetration through ceiling; smoke movement; smoke simulation; sulfur hexa-fluoride (SF$_6$); NBSIR 75-903.

Vibration; accelerometer; calibration; low frequency; signal insertion; NBSIR 74-597.

Vibration; boundary initial problems; measurement; pressure transducer; transducer calibration; TN856.

Vibration; high amplitude; internal rotation; PF$_5$; pseudorotation; Raman; 15370.

Vibration; vibration exciter; accelerometer; calibration; harmonic distortion; low frequency; pickup; 15567.

Vibration; vibration exciters; vibration pickups; acceleration; automation; calibration; measurements; shakers; standards; transducers; 15569.

Vibration exciters; vibration pickups; acceleration; automation; calibration; measurements; minicomputer; shakers; standards; transducers; NBSIR 74-482.

Vibration exciter; accelerometer; calibration; harmonic distortion; low frequency; pickup; vibration; 15567.

Vibration exciters; vibration pickups; acceleration; automation; calibration; measurements; shakers; standards; transducers; vibration; 15569.

Vibration exciters; vibration pickups; acceleration; automation; calibration; measurements; minicomputer; shakers; standards; transducers; vibration; 15569.

Vibration pickups; acceleration; automation; calibration; measurements; shakers; standards; transducers; vibration; 15569.

Vibration pickups; acceleration; automation; calibration; measurements; minicomputer; shakers; standards; transducers; vibration; excitors; BSS660.

Vibrational fundamentals; barrier height to internal rotation; fluoroethanes with a symmetric top; ideal gas thermodynamic functions; reduced and principal moments of inertia; standard heat of formation; J. Phys. Chem. Ref. Data 4, No. 2, 441-456 (1975).

Vibrational relaxation; chloroform; infrared spectra; molecular reorientation; Raman spectra; 15700.

Vibrational transition intensities; aH; CO; dipole moment; excited state; SCF; 15551.

Vibrational transitions; Einstein coefficients; line strengths; Meinel bands; molecular spectra; OH; radiative lifetimes; spin uncoupling; vibration-rotation interaction; 14767.

Vibration-rotation interaction; vibrational transitions; Einstein coefficients; line strengths; Meinel bands; molecular spectra; OH; radiative lifetimes; spin uncoupling; 14767.

Vibration-rotation interaction constants; equilibrium structure;
Volterra; crystal; defect; disclination; dislocation; elasticity; jog; kink; multiplication; plasticity; 14745.

Volume; bell prover; calibration; inspection; liquefied petroleum gas; pressure; report form; temperature; temperature compensator; test; vapor meter; H117.

Volume change; annealing; crystalline polymers; material transport; thickening; 14754.

Volume form; (n,y) cross sections; calculations; complex interaction; semi-direct model; SP425, pp. 346-349.

Volume standard; density; density calibration; density measurement; density standard; 15215.

Volume-extension; compressibility; elasticity; finite deformation; hyperelasticity; rubbery materials; strain-energy function; 15015.

Volumetric calibration; burets; capacity; flasks; meniscus; pipets; NBSIR 74-461.

Voluntary; education; efficiency comparison; household appliances; household equipment; label developments; labeling; label specification; monitoring priorities; product classes; test methods; 15204.

Voluntary standardization; aerosols; Fair Packaging and Labeling Act; packages; proliferation; 14720.

Voluntary standards; computer science; laboratory accreditation; measurement; national measurement system; technology transfer; 14920.

Voluntary standards; weapons; building systems; communications equipment; concealed objects detectors; emergency equipment; Law Enforcement Standards Laboratory; procurement guidelines; protective equipment; security systems vehicles; 15325.

Voluntary standards; working with government; consumer activism; control proliferation; industry; interaction; package quantity standards; 15504.

Vortex coupling; dc transformer; granular aluminum films; magnetic coupling; superconducting dc transformer; type II superconducting films; 15361.

Vortex pinning; critical current densities; critical currents; granular aluminum films; granular films; Type II superconducting films; 15520.

Vortex shedding; angular momentum; cryogenic; flowmeter; liquid nitrogen; measurement; positive displacement; turbine; 15043.

Vote-tallying; computer security; computing technology; election administration; public administration; state and local government; systems analysis; technology utilization; NBSIR 75-687.

Walls; brick; dolomitic mineral; masonry; mortars (materials); 15582.

Walls; bricks; buckling; deflection; loads (forces); masonry; moments; slenderness ratio; stability; structural engineering; 15507.

Wall-stabilized; arc; calibrations; hydrogen; plasma; radiometry; spectral radiance; vacuum ultraviolet; 15291.

Wall-stabilized arc; arc plasma; iron; lifetimes; oscillator strength; transition probabilities; 15411.

Wall-stabilized arc; blackbody calibrations; hydrogen continuum; primary standard; radiometry; vacuum ultraviolet; 15412.

Wall-stabilized arc; flow-stabilized arc; oscillator strength; U I; U II; 15066.

Warded lock; ace type pin tumbler lock; check plate tamper resistance; salt spray corrosion resistance; 14959.

Warning lights; consumer products; human factors; kitchen; ranges; reaction time; safety; NBSIR 75-797.

Warranty; accuracy; audit; certification; code-independent; documentation; optimization; precision; run statistics; security; terminology; validation; SP406, pp. 141-144.

Washington State; Washington State Fisheries; fisheries; fishery; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; State of Washington; NBSIR 75-745.

Washington State Fisheries; Anadromous Fish Catch Record System; catch record system; fisheries statistics; fish record system; fishery management model; fishery modeling; modeling; salmon; salmon fishery; salmon information system; NBSIR 75-796.

Washington State Fisheries; fisheries; fishery; fishery modeling; mathematical modeling; regulatory analysis; resource management; salmon fisheries; salmon fishery modeling; simulation; State of Washington; Washington State; NBSIR 75-745.

Waste; ABS; cast iron; copper; drain; fire endurance; fire spread; fire test; Operation BREAKTHROUGH; plastic pipe; PVC; smoke; toxic gases; vent; NBSIR 74-449.

Waste management; yield; actinide burnup; cross section sets; neutron spectrum; transplutonium; SP425, pp. 214-217.

Waste paper; market pulp; paper; waste; pulp; secondary; recycled paper; secondary pulp; 15604.

Waste receptacle; buildings; combustibility; fire intensity; flames; furnishing; heat release; ignition; smoke; thermal radiation; upholstery; NBSIR 75-679.

Waste recycling in a 231U; 238Th reactor; actinide fuel, fertile material; and wastes; recycle concept; transuranium element production; SP425, pp. 222-223.

Waste utilization; fuel from waste; incinerators; organic waste conversion; thermodynamic data for incinerators; 15065.

Water; ammonia; dissociative photoionization; NH2++; OH++; photoionization; threshold energies; 15352.

Water; benchmark; cross sections; graphite; neutron; sodium; SP425, pp. 177-183.

Water; freeze drying; instrumental neutron activation analysis; lyophilization; neutron activation analysis; preconcentration; radioactive tracers; river water; trace elements; tracers; 15376.

Water content; water vapor adsorption; adsorption; computer application; desorption; dry weight determination; moisture content; surface area; J.99A No. 4, 565-576 (1975).

Water heaters; windowless buildings; auto fuels; energy; highway safety; lead; pressure transducer; railway safety; silicon devices; DIM/NBS 59, No. 8, 169-192 (1975).

Water molecule; hydrate; hydrogen bonding; monocalcium phosphate; monohydrate; neutron diffraction; phosphate; 14864.

Water pollution; baseline studies; fresh water sampling; sampling device; sea water sampling; trace organic analysis; 15099.

Water pollution; x rays; air pollution; camera guidelines; computerized elections; dental fillings; metre; ozone problem; police communications; DIM/NBS 59, No. 5, 97-120 (1975).

Water repellent materials; accelerated weathering; durability of waterproofing materials; masonry; performance criteria; waterproofing materials; TN883.

Water resources; cost sharing; efficiency; equity; recreation; redistribution of income; 15363.

Water standard; mercury; stabilization; standard reference material; trace element; 15458.

Water treatment; anodes; cathodic protection; coatings; corrosion; deterioration; inhibitors; materials selection; nonmetals; rectifiers; BSS66, pp. 42-51.

Water vapor; absorption; drying; phosphorous pentoxide; NBSIR 74-631.
Water vapor; humidity measurement; moisture; standard: 14727.
Water vapor adsorption; adsorption; computer application; desorption; dry weight determination; moisture content; surface area; water content; J.79A No. 4, 565-576 (1975).
Water vapor adsorption; adsorption theory; aggregate; adsorption by; collagen; dental materials; dentin; enamel; surface area; teeth: 14966.
Water vapor laser; absolute frequency measurements; laser frequency synthesis: 15534.
Water vapor-air mixtures; chemical association; Lennard-Jones potential parameters; third interaction virial coefficients; virial coefficients: J.79A No. 6, 775-776 (1975).
Waterproofing materials; water repellent materials; accelerated weathering; durability of waterproofing materials; masonry; performance criteria; TN883.
Wattmeter; calibration; current comparator; electrical energy unit; metrology; standard; unit; wattmeter calibration: 14881.
Wattmeter calibration; wattmeter; calibration; current comparator; electrical energy unit; metrology; standard; unit: 14881.
Wattmeter; analog-to-digital conversion; digital; electricity; electric power; measurement; sampling: 14878.
Wattmeter; analog-to-digital conversion; digital; electricity; electric power; measurement; sampling; simulation; T870.
Wave scattering; Weber functions; asymptotic approximations; connection formulas; error bounds; ordinary differential equations; parabolic cylinder functions; turning points: 14946.
Waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; power; pulsed quantities; squids; transmission lines; NBSIR 74-395.
Waveform analysis; waveguides; antenna parameters; attenuation; automated measurements; EM metrology; field strength; impedance; laser parameters; noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; NBSIR 75-818.
Wave-front shearing interferometry; impulse response; lens aberrations; optical transfer function; partial coherence; pupil function; 15396.
Waveguide cavity; IR; laser; optically pumped; 15196.
Waveguide standards; 2-port standards; automatic measurement; coaxial standards; network parameters; reflection coefficient; scattering coefficients; transmission coefficient: 14739.
Waveguide-below-cutoff; absolute (unambiguous) readout; piston; precision attenuator; sensor: NBSIR 74-394.
Waveguides; antenna parameters; attenuation; automated measurements; EM Metrology; field strength; impedance; noise; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; NBSIR 74-395.
Waveguides; antenna parameters; attenuation; automated measurements; EM metrology; field strength; impedance; laser parameters; noise; optical electronics; phase; power; pulsed quantities; squids; transmission lines; waveform analysis; NBSIR 75-818.
Wavelength; bar code reader; filters; optical wedge; photodetector; relative spectral output; NBSIR 74-580.
Wavelength; melting point; molybdenum; radianc temperature: 15557.
Wavelength accuracy; accuracy in spectrophotometry; glass filters; spectral bandpass; spectrophotometry; standard reference materials; stray radiation; testing of spectrophotometers; transmittance (absorbance) accuracy: SP260-51.
Wavelength standards; hollow cathode; iron; neon; J.79A No. 1, 17-69 (1975).
Wavelengths; aluminum; spectra: 15008.
Weights and measures; consumer metric information; International System of Units; kitchen measurement units; metric system: SP430.

Weights and measures; digital indicators; drained weight; laws and regulations; metrication; metric conversion; net weight; package control; petroleum products; scales; survey; temperature compensation; uniformity; SP407.

Weights and measures; international system of units; measurement systems: Metric system; modernized metric system; SI; SP304A.

Weinberg; gauge theories; lepton; muon; M-spin; scattering amplitudes; 14942.

Weisskopf-Wigner; CP-violation; decays; direct tests; kaon; lepton-asymmetry; momentum-dependence; 15211.

Well-defined, measurable properties; data; Standard Reference Data Program; 15301.

Westcott; cross section; neutron; resonance; sodium-22; thermal; SP425, pp. 792-794.

Westcott g-factors; CF-252 spontaneous fission neutron yield; E = 0.0253 eV and 20 °C Maxwellian; fission-neutron yields; half-lives of U-233, U-234, Pu-239; mean energy of fission neutron spectrum; neutron cross-sections; SP425, pp. 286-292.

Westcott g-factor; 241Pu fission cross-section; normalization; SP425, pp. 603-606.

Wet chemistry; x-ray fluorescence; activation analysis; characterization; chemical composition; chromatographic analysis; coulometry; electron probe microanalysis; ion-selective electrodes; mass spectrometry; polargraphy; spectrochemical analysis; thermal analysis; 15165.

Weyl; bounded representations; Burnside; irreducibility; unitary groups; 15308.

White phase modulation; Allan variance; flicker of frequency modulation; Johnson noise; linewidth; random walk frequency modulation; spectral density of frequency fluctuations S(4); 14828.

Wide band; data communication equipment; data processing terminal equipment; data transmission (high speed); Federal Information Processing Standards; synchronous signaling rates; teleprocessing; FIPS PUB 37.

Width correlations; E0 = 24.3 keV; neutron capture γ-rays; SP425, pp. 926-928.

Wilks, S. S.; Wishart, John; Annals of Mathematical Statistics; Army Experiment Design Conferences; Dodd, E. L.; educational testing; history of mathematical statistics in the U.S.A.; Hotelling, Harold; likelihood-ratio tests; 15513.

Wind; buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornadoes; BSS61.

Wind damage; wind loads; buildings; codes and standards; cyclones; natural disasters; structural engineering; 15609.

Wind effects on structures; air leakage; cooling load measurement; refrigerated enclosures; testing of vehicles; 14799.

Wind engineering; wind loads; accelerations; buffeting; building codes; buildings; deflections; dynamic response; gust factors; structural engineering; BSS74.

Wind load; design standards; earthquake load; masonry construction; precast concrete construction; progressive collapse; structural connection; structural design; 15639.

Wind loads; accelerations; buffeting; building codes; buildings; deflections; dynamic response; gust factors; structural engineering; wind engineering; BSS74.

Wind loads; building technology; cooperation; fire safety; hydraulics; NBSIR 74-618.

Wind loads; buildings; codes and standards; cyclones; natural disasters; structural engineering; wind damage; 15609.

Wind loads; buildings; deflections; instrumentation; structural response; TN873.

Wind loads; wind speeds; building codes; probability distribution function; reliability; risk; statistical analysis; storms; structural engineering; 15558.

Wind loads; wind speeds; building codes; extreme value distributions; hurricanes; probability distribution functions; reliability; risk; statistical analysis; storms; structural engineering; TNP868.

Wind speeds; building codes; extreme value distributions; hurricanes; probability distribution functions; reliability; risk; statistical analysis; storms; structural engineering; wind loads; TNP868.

Wind speeds; building codes; probability distribution function; reliability; risk; statistical analysis; storms; structural engineering; wind loads; 15558.

Wind velocity; air infiltration; dynamic pressure differential; 15403.

Windowless; windows; daylight; fenestration; psychological; solar glass; spaciousness; sunshine; view; BSS70.

Windows; acoustics; air infiltration; air leakage; architectural acoustics; building acoustics; doors; energy conservation; heat loss from buildings; heat transfer; sound transmission loss; thermal resistance; thermal transmittance; BSS77.

Windows; daylight; fenestration; psychological; solar glass; spaciousness; sunshine; view; windowless; BSS70.

Wire bond; bond pull test (nondestructive); metallurgical; reliability (microelectronic); transistors; 15430.

Wire bonds; Boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; SP400-8.

Wire bonds; x-ray photoelectron spectroscopy; acoustic emission; beam-lead bonds; boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; SP400-12.

Wire bonds; x-ray photoelectron spectroscopy; boron nitride; boron redistribution; capacitance-voltage methods; Darlington pairs; deep depletion; dopant profiles; electrical properties; electron beam evaporator; electron beam induced damage; electronics; SP400-17.

Wire-to-wire calibration; adjustment for trend; calibration; capsule type thermometers; intercomparison; IPTS-68; platinum resistance thermometers; NBSIR 74-586.

Wishart, John; Annals of Mathematical Statistics; Army Experiment Design Conferences; Dodd, E. L.; educational testing; history of mathematical statistics in the U.S.A.; Hotelling, Harold; likelihood-ratio tests; 15513.

With and without forced air; velocity; carpets with and without underlayment; corridor fires; energy models; finished interior; full scale experiments; interaction; measurements; smoke; smoke and flame spread; temperature; 15230.

Wood crib; buildings; fire growth; flame spread; heat release; interior linings; material ignitability; performance criteria; room fires; smoke; TN879.

Work; computer efficiency; evaluation; measurement; performance; power; SP406, pp. 131-134.

Work atmosphere; air analysis; air sampling; gas analysis; hydrogen fluoride; industrial hygiene; sodium acetate; sorber; solid; NBSIR 74-581.

Work function; aluminum; field emission; tungsten; 14780.

Work function; C2H4 decomposition; chemisorption bonds; LEED; photoelectron spectra; tungsten; 14807.

Work function; electron energy distribution; field emission; tungsten; 15091.

Work function; xenon; desorption energy; desorption kinetics; physical adsorption; tungsten (111); 15201.

Work function Auger spectroscopy; carbon monoxide; chemis-
X

X-ray; channelling of electrons; crystal orientation; Kossel; lattice spacing determination; microdiffraction; scanning electron microscopy; strain analysis; 14913.

X-ray; cobalt; complexes; hexakis(imidazole)cobalt(II) nitrate; imidazole; neutron; structure; 15280.

X-ray; crystal surfaces; density; lamella thickness; paraffins; polyethylene; unit cell; 14724.

X-rays; air pollution; camera guidelines; computerized elections; dental filings; metre; ozone problem; police communications; water pollution; DIMINBS 59, No. 5, 97-120 (1975).

X-rays; attenuation coefficient; compilation; Compton scattering; cross section; crystallography; photoelectric absorption; photons; Rayleigh scattering; 14847.

X-rays; crystal structure explosives; least-squares refinement; molecular packing; tetraazacyclodecane derivatives; 15574.

X-rays; electron probe microanalyzer; microanalysis; qualitative analysis; quantitative analysis; specimen preparation; 14897.

Xenon; autoionizing states; electron excitation; energy loss; resonances; threshold; 15442.

Xenon; chemisorption; ESCA; oxygen; physical adsorption; tungsten; 15347.

Xenon; desorption energy; desorption kinetics; physical adsorption; tungsten (111); work function; 15201.

Xenon; 4d absorption; atomic structure; inner shell; N\textsubscript{IV}; resonance cross section profiles; spectroscopy; vacuum ultraviolet; 15054.

Xenon laser; absolute frequency measurements; laser frequency synthesis; 15014.

X-radiographic paper; image quality; neutron converters; neutron radiography; neutron scintillator; thermal neutron detection; 15549.

X-radiography; dimensional measurement; gamma radiography; image enhancement; neutron radiography; nondestructive testing; proton radiography; real-time techniques; three-dimensional radiography; 15214.

X-ray; attachment; low-temperature; radiation shield; temperature gradient; 15242.

X-ray diffraction; austenite; iron alloys; stacking fault energy; stainless steel; 15139.

X-ray diffraction; calcium fluoroborate; calcium salts; crystal structure; single crystal; tetrahedral anion; 14976.

X-ray diffraction; compressibility; single crystal; 14895.

X-ray diffraction; crystal structure; organic crystal; 15284.

X-ray diffraction; crystal structure; integrated intensities; lattice constants; peak intensities; powder patterns; reference intensities; standard; Monogr. 25, Section 12.

X-ray diffraction; deformation; dislocations; face-centered cubic metals; faults; Fourier analysis; review; stacking fault energy; 14750.

X-ray diffraction data; carbonates; crystal structure transformation; nitrites; nitrites; phase transformation; NBS5-65.

X-ray diffraction data; chromates; crystal structure; crystal structure transformations; perchlorates; phase transformations; phosphates; sulfates; thermodynamic data; NBS5-65.

X-ray diffraction examination of single crystal lattice damage; (100) surface of copper; heat transfer to helium II; interfacial thermal resistance; Kapitza conductance of copper; Kapitza conductance of indium; Kapitza conductance of niobium; NBSIR 75-812.

X-ray edge singularities; asymmetric lineshapes; photoelectron spectroscopy; photoemission; 15133.

X-ray equipment; gamma-ray equipment; radiation installations; radiation safety; 1114.

X-ray fluorescence; characterization; chemical composition; chromatographic analysis; Coulometry; electron probe microanalysis; ion-selective electrodes; mass spectrometry; polargraphy; spectrochemical analysis; thermal analysis; wet chemistry; 15165.

X-ray fluorescence; x-ray spectrography; background; mercury in coal; trace analysis; NBSIR 75-675.

X-ray image signals; x-ray scatter; image contrast; monoenergetic x-ray beams; optimum radiographic systems; transmission radiography; 15276.

X-ray inelastic scattering; differential cross section; real metals; theory; J. 79A No. 2, 415-417 (1975).

X-ray microanalysis; x-ray source size; backscattered electrons; electron specimen interaction; Monte Carlo simulation; particulate analysis; scanning electron microscopy; 15038.

X-ray photoelectron spectroscopy; acoustic emission; beam-lead bonds; boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; incremental sheet resistance; 3400-12.

X-ray photoelectron spectroscopy; boron nitride; boron redistribution; capacitance-voltage methods; Darlington pairs; deep depletion; dopant profiles; electrical properties; electron beam evaporator; electron beam induced damage; electronics; epitaxial layer thickness; 3400-17.

X-ray photoelectron spectroscopy; chemisorption; CO; ESCA; ruthenium; 15042.

X-ray photoelectron spectroscopy; oxygen; ruthenium; satellite; shake-up; structure; 15147.

X-ray photoelectron spectroscopy (ESCA); adhesion failure; cohesive failure; polymeric bond failure; scanning electron microscopy (SEM); 15283.

X-ray photoemission; catalysis; electronic structure; platinum; soft x-ray appearance potential; tungsten; tungsten carbide; 15011.

X-ray powder analysis; crystal chemistry; fluo growth; garnet; hydrogarnet; indium silicates; inorganic synthesis; solid solubility silicates; 15235.

X-ray scatter; image contrast; monoenergetic x-ray beams; optimum radiographic systems; transmission radiography; x-ray image signals; 15276.

X-ray scattering; critical region; dielectric constant; equation of state; homogeneity; light scattering; power laws; refractive index; scaling; Schlieren method; specific heat; speed of sound; 14932.

X-ray source size; backscattered electrons; electron specimen interaction; Monte Carlo simulation; particulate analysis; scanning electron microscopy; x-ray microanalysis; 15038.

X-ray spectra; bone; dosimetry; dyes; electron dosimetry; energy dependence; gamma rays; muscle; radiochromic dosimeters; 15429.

X-ray spectra; H\textsubscript{2}S; sulfur K\textsubscript{a} emission and K-absorption spectra; sulfur K shell binding energy; 14993.

X-ray spectrography; background; mercury in coal; trace analysis; x-ray fluorescence; NBSIR 75-675.
Y

Yield; actinide burnup; cross section sets; neutron spectrum; transplutonium; waste management; \textit{SP425}, pp. 214-217.

Yields; \textsuperscript{235}U; \textsuperscript{239}Pu; decay heat; \textit{E}_\gamma; \textit{E}_\text{f}; ENDF/B-IV; fission products; half lives; \textit{SP425}, pp. 21-28.

Yields vs. energy; \textsuperscript{235}U, \textsuperscript{239}U, \textsuperscript{238}U, \textsuperscript{239}Pu; burnup monitors; capture-to-fission; dilution mass spectrometry; fast fission yields; \textit{SP425}, pp. 378-384.

Y-modulation; black level suppression; nonlinear amplification; scanning electron microscope; signal differentiation; signal processing; 15425.

Young's modulus; aluminium; aluminium alloys; bulk modulus; compressibility; Debye temperature; elastic constants; elasticity; Poisson ratio; pulse-echo method; sound velocity; 15528.

Young's modulus; aluminium alloy; bulk modulus; compressibility; Debye temperature; elastic constant; nickel steels; Poisson's ratio; shear modulus; sound velocity; 15522.

Young's modulus; bulk modulus; compressibility; elastic constants; elasticity Lamé constant; Poisson ratio polycrystals; shear modulus; single crystals; 14871.

Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constant; nickel-chromium-iron alloys; Poisson's ratio; shear modulus; sound velocity; 15225.

Young's modulus; bulk modulus; chromium alloys; compressibility; Debye temperature; Doping effect; elastic constants; iron alloys; magnetic transition; nickel alloys; Poisson's ratio; pulse-echo method; sound velocity; 15342.

Young's modulus; bulk modulus; composite; compressibility; elastic compliance; elastic stiffness; piezoelectric oscillator; Poisson's ratio; shear modulus; 15523.

Young's modulus; bulk modulus; compressibility; Debye temperature; elastic constants; nickel-base alloys; Poisson's ratio; shear modulus; sound velocity; 15533.

\textit{Y}_2\textit{O}_3; IPTS-68; melting point; secondary temperature standards; temperature scales; 14735.

Z

Zeeman: effect; laser; magnetic resonance; oxygen; rotational structure; 15335.

Zeeman spectrum; asymmetric rotors; doublet states; \textit{H}_2O; laser magnetic resonance; least squares fit; rotational analysis; 14910.

Zeeman spectrum; asymmetric rotor levels; \textit{H}_2O; laser magnetic resonance; rotational constants; spectral assignments; spin splitting; 15067.

Zero range approximation; continuum; electron scattering; helium-3; monopole state; multiple decomposition; 15608.

Zero shift; accelerometer; performance characteristics; piezoelectric; test method; thermal radiation; thermal transient; \textit{TN855}.

Zeta potential; crack propagation; fracture; glass; 15426.

Zimm theory; bead-spring model; chain molecules; chain stiffness; deoxyribonucleic acid; dilute solutions; hydrodynamic interaction; polystyrene; viscoelasticity; 15114.

Zimm theory; bead-spring model; block-copolymers; dilute solutions; dynamics; limiting viscosity number; solution properties; viscoelasticity; 15373.

Zinc: accuracy; atomic fluorescence; automatic scatter correction; cadmium; chemical interferences; data evaluation; precision; production of atomic vapor; 15012.

Zinc atomic weight; atomic weight; coulometry; electrochemical equivalent; \textsuperscript{179}Zn No. 6, 737-745 (1975).

Zinc atomic weight; atomic weight; coulometry; electrochemical equivalent; \textsuperscript{179}Zn No. 6, 747-759 (1975).

Zinc point; aluminium point; calibration; freezing point; freezing-point cell; platinum resistance thermometer; tin point; 15337.

Zirconium: alloy diffusion; beryllium; cerium; cesium; chromium; copper; diffusion; electromigration; europium; grain boundary diffusion; hydrogen; impurity diffusion; interdiffusion; lanthanum; J. Phys. Chem. Ref. Data 4, No. 1, 177-250 (1975).

Zirconium; bibliography on spectroscopy of fluorides and oxides of the lanthanide series; calculation of dissociation energies; electrical resistivity; enthalpy of transition; graphit; infrared matrix isolation spectroscopy; melting point; radiation temperature; \textit{NBSIR} 74-600.

Zirconium; electrical resistivity; high-speed measurements; high temperature; melting point; normal spectral emittance; radiation temperature; 15612.

Zirconium; electrical resistivity; high-speed measurements; high temperature; solid-solid phase transformation; thermodynamics; \textit{J.79A} No. 1, 81-84 (1975).

ZnSe; bifrerenance; elastic constants; infrared-laser window materials; interferometry; KCl; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index; \textit{NBSIR} 75-781.

0.001 to 30 MeV; fission cross section ratios; linear accelerator; time-of-flight technique; uranium isotopes \textsuperscript{233}U, \textsuperscript{234}U, \textsuperscript{235}U, \textsuperscript{236}U, \textsuperscript{238}U; \textit{SP425}, pp. 591-596.

0.335-14.7 MeV; excitation curve; neutron elastic scattering; 152In; \textit{SP425}, pp. 859-861.

1 keV = 1 MeV; \textsuperscript{239}Pu; \textsuperscript{235}U; cross-sections; fission; measured; neutrons; \textit{SP425}, pp. 564-567.

1-butenes; far ultraviolet; free radical reactions; ion-molecule reactions; photochemistry; primary processes; 14773.

1 \leq F_\alpha < 30 MeV; gas scillination transmission counters; neutron flux determination; \textit{SP425}, pp. 277-280.

10B; cross sections; light elements; R-matrix; standards; \textit{4Li; SP425}, pp. 302-308.

10B; \textit{4Li}; neutron cross section; standard; \textit{SP425}, pp. 232-235.

\textit{B}(n,a); \textsuperscript{235}U(n,p); \textsuperscript{237}Np(n,d); \textit{Au}(n,y); \textit{C}(n,n); \textit{H}(n,n); neutron flux determination; standard cross sections; \textit{3He}(n,p); \textit{4Li}(a,a); \textit{SP425}, pp. 293-301.

\textit{B}(n,\alpha)\textit{Li} reaction; branching ratio; gas proportional counter; neutrons; nuclear physics; \textit{T}(p,n) neutrons; 14813.

(100) surface of copper; heat transfer to helium II; interfacial thermal resistance; Kapitza conductance of copper; Kapitza conductance of indium; Kapitza conductance of niobium; x-ray diffraction examination of single crystal lattice damage; \textit{NBSIR} 75-812.

\textit{101,106,109Ru}; \textit{107I}; adjustment; evaluation; fission products; sensitivity analysis; \alpha; \textit{SP425}, pp. 165-168.

\textit{11In}; 0.335-14.7 MeV; excitation curve; neutron elastic scattering; \textit{SP425}, pp. 859-861.

11-6-8 potential; Axilrod-Teller correction; dense liquid; excess function; hydrodynamic limit; molecular dynamics; rare gases; velocity autocorrelation function; 15168.

11-6-8 potential function; correlation function; experimental data; hydrodynamic behavior; methane; molecular dynamics; potential function; self-diffusion coefficient; 15173.

12C data; 56 MeV; facility; neutron-induced reactions; \textit{SP425}, pp. 103-105.
APPENDIX A. LIST OF DEPOSITORY LIBRARIES IN THE UNITED STATES

ALABAMA

Auburn: Auburn University, Ralph Brown Draughon Library (1907).
Birmingham:
  Birmingham Public Library (1895).
  Birmingham-Southern College Library (1932).
Samford University, Harwell G. Davis Library (1884).
Enterprise: Enterprise State Junior College Library (1967).
Florence: Florence State University, Collier Library (1932).
Huntsville: University of Alabama, Huntsville Campus Library (1964).
Jacksonville: Jacksonville State University, Ramona Wood Library (1929).
Mobile: Mobile Public Library (1963).
  Spring Hill College, Thomas Byrne Memorial Library (1937).
University of South Alabama Library (1968).
Montgomery:
  Alabama State Department of Archives and History Library (1884).
  Alabama Supreme Court Library (1884).
Auburn University at Montgomery Library (1971).
Tuskegee Institute: Tuskegee Institute, Hollis Burke Frissell Library (1907).
University:
  University of Alabama, School of Law Library (1967).
  University of Alabama Library (1960) – REGIONAL.

ALASKA

Anchorage:
  Alaska Methodist University Library (1963).
  Supreme Court of Alaska Library (1973).
College: University of Alaska, Elmer E. Rasmuson Library (1922).
Ketchikan: Ketchikan Community College Library (1970).

ARIZONA

Flagstaff: Northern Arizona University Library (1937).
Phoenix:
  Department of Library and Archives (unknown) – REGIONAL.
  Phoenix Public Library (1917).
Prescott: Prescott College Library (1968).
Tucson:
  Tucson Public Library (1970).
  University of Arizona Library (1907) – REGIONAL.
  Yuma: Yuma City-County Library (1963).

ARKANSAS

Arkadelphia: Quachita Baptist University, Riley Library (1963).
Batesville: Arkansas College Library (1963).
Clarksville: College of the Ozarks Library (1925).
Conway: Hendrix College, O. C. Bailey Library (1903) 3.
Fayetteville: University of Arkansas Library (1907).
Little Rock:
  Arkansas Supreme Court Library (1962).
  Little Rock Public Library (1953).
  University of Arkansas at Little Rock Library (1973).
Monticello: University of Arkansas at Monticello Library (1956).
Pine Bluff: Arkansas Agricultural, Mechanical and Normal College Library (pending).
Russellville: Arkansas Polytechnic College, Tomlinson Library (1925).
State College: Arkansas State University, Dean B. Ellis Library (1913).
Walnut Ridge: Southern Baptist College, Felix Goodson Library (1967).

CALIFORNIA

Arcadia: Arcadia Public Library.
Arcata: Humboldt State College Library (1963).
Bakersfield:
  California State College, Bakersfield Library (1974).
  Kern County Library System (1943).
Berkeley:
  University of California, General Library (1907).
Chico: Chico State University Library (1962).
Claremont: Pomona College Documents Collection, Honnold Library (1913).
Compton: Compton Library (1972).
Culver City: Culver City Library (1966).
Davis:
  University of California at Davis Library (1953).
  University of California at Davis, School of Law Library (1972).
Downey: Downey City Library (1963).
Fresno:
  Fresno County Free Library (1920).
  Fresno State University Library (1962).
Fullerton: California State College at Fullerton Library (1963).
  Garden Grove: Garden Grove Regional Library (1963).
Hayward: California State College at Hayward Library (1963).
La Jolla: University of California, San Diego, University Library (1963).
Lancaster: Lancaster Regional Library (1967).
Long Beach:
  California State College at Long Beach Library (1962).
  Long Beach Public Library (1933).
Los Angeles:
  California State College at Los Angeles, John F. Kennedy Memorial Library (1956).

Publications of the National Bureau of Standards 1975 Catalog

Betty L. Hurdle, Editor

NATIONAL BUREAU OF STANDARDS
DEPARTMENT OF COMMERCE
WASHINGTON, D.C. 20234

Same as Item 9

This supplement to Special Publication 305 Supplements 1 through 6 of the National Bureau of Standards lists the publications of the Bureau issued between January 1, 1975 and December 31, 1975. It includes an abstract of each publication (plus some earlier papers omitted from Special Publication 305 Supplement 6), key-word and author indexes; and general information and instructions about NBS publications.

Miscellaneous Publication 240 (covering the period July 1, 1957 through June 30, 1960) and its supplement (covering the period July 1, 1960 through June 30, 1966), Special Publication 305 (covering the period July 1966 through December 1967), and Special Publication 305 Supplement 1 (covering the period 1968-1969), Special Publication 305 Supplement 2 (covering the period 1970), Special Publication 305 Supplement 3 (covering the period 1971), Special Publication 305 Supplement 4 (covering the period 1972), Special Publication 305 Supplement 5 (covering the period 1973), Special Publication 305 Supplement 6 (covering the period 1974), remain in effect. Two earlier lists, Circular 460 (Publications of the National Bureau of Standards, 1901 to June 1947) and its supplement (Supplementary List of Publications of the National Bureau of Standards, July 1, 1947 to June 30, 1957) are also still in effect.

Abstracts, NBS publications; key words; publications.
