An Author and Permuted Title Index to Selected Statistical Journals

Brian L. Joiner, N. F. Laubscher, Eleanor S. Brown, and Bert Levy

Over 5,000 articles appearing in the indicated issues of the following journals are indexed: *Annals of Mathematical Statistics* (1961–1969), *Biometrics* (1965–1969 #3), *Biometrika* (1951–1969), *Journal of the American Statistical Association* (1956–1969), *Journal of the Royal Statistical Society, Series B* (1954–1969 #2), *South African Statistical Journal* (1967–1969 #2), *Technometrics* (1959–1969). The articles indexed correspond to those appearing since the most recent cumulative subject index was published for the first six named journals, while for *Technometrics* all articles have been included even though a subject index exists for the first seven volumes. The index consists of three sections, an author index, a permuted title index and a bibliographic listing. In the permuted title index each article is listed under every important word appearing in its title. This index should consequently serve many of the functions of a conventional subject index. The author index is similar to a conventional author index.

Key words: Bibliography; computer indexing; index; key word in context; KWIC; permuted title index; statistics.

Introduction

How to Use the Index

The index consists of three sections, a permuted title index, an author index, and a bibliographic listing. In the **permuted title**, or **title word** (key word in context) index, every article appearing in any of the seven journals during the included years, is listed in alphabetical order under all important words in its title. Each title reads from left to right except when the word being indexed occurs near the end or beginning of a long title, in which case it was sometimes necessary to "wrap" the title around to the other side of the page. When a title is too long to fit on one line a portion at the beginning and/or end may be chopped off.

This index may be used to retrieve an article if any part of its title is known or to find all articles whose titles include a particular word or phrase. It should consequently serve many of the same functions as a subject index. Some entries in the permuted title index corresponding to words considered of no indexing value have been omitted but no attempt has been made to eliminate all such nonsense entries. Entries corresponding to words that are sometimes hyphenated and sometimes not (e.g. non-linear versus nonlinear) may be slightly separated in the permuted title index. Numeral entries are given last after the letter Z.

The **location** of each article is specified by an abbreviation of the journal name, the last two digits of the year in which the article was published, and the page on which the article begins. For example, BIOKA65 365 means that the article begins on page 365 of the 1965 issue of *Biometrika*. For some pre-publication entries page numbers were not available and the issue number has been used instead.

In the **author index** every article is listed under each of its authors' names. Each author's name is followed by as much of the title as will fit on one computer line and by the "location" of the article. Authors will be found under the prefix when their last name is preceded by any of the following prefixes: DE, DEL, DEN, DER, DES, DI, LA, LE, ST, VAN, and VON. Authors may be listed with their given names in full and with one or more of their given names shortened to initials. This, plus the fact that authors whose names are followed by suffixes, such as JR, SR, II, and III, sometimes publish with the suffix dropped, means that occasionally several listings for the same author may become slightly separated.

The **bibliography** consists of a chronological listing of the table of contents of the seven journals for the included years and may be used to obtain any information that has had to be chopped from a long entry in either the title word or author sections.

In some cases it has been necessary to translate titles that were originally hand set using special fonts into the all-capital format required by the computer. For example "2ⁿ" factorial experiments are given as "2-TO-THE-N." A few titles have been annotated to improve their informativeness. Such annotations are always enclosed in parentheses and preceded by a + sign. "Notes" and "queries" are indexed with the main articles in this index, queries being identified as such. Book reviews are not covered. **Corrigenda locations** are given in two different ways, sometimes as part of the "title" of the article and sometimes as a completely separate entry. In either event, corrigenda should be readily locatable in one or more of the three sections. The indexes have been checked for obvious errors but

no exhaustive proofreading has been attempted. It may also be noted that this index was prepared for the most part from the tables of contents appearing

on the covers of the journals, which in some cases do not agree exactly with the titles and authors appearing inside the journal.

Coverage and Related Indexes

All articles, notes, queries, corrigenda, and obituaries appearing in the following journals during the indicated years are indexed. For all seven journals the years correspond one-for-one with volume years.

Abbreviation	Journal Name	Years	Volumes
AMS	Annals of Mathematical Statistics.....	1961-1969	32-40
BIOCS	Biometrics.....	1965-1969 #3*	21-25 #3*
BIOKA	Biometrika.....	1951-1969	38-56
JASA	Journal of the American Statistical Association.....	1956-1969	51-64
JRSSB	Journal of the Royal Statistical Society, Series B.....	1954-1969 #2	16-31 #2
SASJ	South African Statistical Journal.....	1967-1969 #2	1-3 #2
TECH	Technometrics.....	1959-1969	1-11

*A portion of the contents of the fourth issue for volume 25, 1969, is also included.

Existing indexes to these journals include the following: A comprehensive index to AMS covering volumes 1-31 (1930-1960) including sections on authors, subject matter, tables, citations, and news items; an author and subject index to BIOCS covering volumes 1-20 (1945-1964), (each volume of BIOCS since 1964 includes annual author and subject indexes); a subject index to BIOKA covering volumes 1-37 (1901-1950) and an author index covering volumes 1-48 (1901-1961); two author and subject indexes to JASA, the first covering volumes 1-34 (1888-1939) and the second covering volumes 35-50 (1940-1955), and an author index to JASA covering volumes 51-60 (1956-1965); combined author and subject indexes for JRSSB which are included in two general indexes to the *Journal of the Royal Statistical Society* covering JRSSB volumes 1-6 (1934-1939) and volume 7-15 (1940-1941 and 1946 thru 1953) respectively, (volumes 16-22 (1954-1960) of JRSSB contain annual combined author and subject indexes); and author and subject indexes to TECH covering volumes 1-7 (1959-1965).

The computer program used to prepare this index has been used previously in the preparation of volumes 1 and 2 of *Computer Literature Bibliography*, NBS Miscellaneous Publication 266 and Special Publication 309 respectively, by W. W. Youden. After this index was well under way we learned that John W. Tukey and coworkers at Princeton University and the Bell Telephone Laboratories have done extensive research on methods for improving the format and sorting order of permuted title indexes and have a working draft of an index to virtually all of the statistical literature appearing up to and including 1966.

The basic input to the computer program is a set of approximately 16,000 punched cards quite closely resembling the bibliographic listing. Most of the punched cards for AMS, BIOCS, JASA, JRSSB,

and SASJ were provided by N. F. Laubscher, who wishes to acknowledge several of his assistants for their help. All of the cards for BIOKA and TECH and some of the cards for the other five journals were prepared by Eleanor S. Brown. Computer time was provided by Bert Levy and B. M. Kurkjian (then at Harry Diamond Laboratories and now at Headquarters, Army Materiel Command). Rubin Wagner of NBS arranged to have the index electronically phototypeset thereby improving readability considerably. The editors of the seven journals contributed to the currentness of this index by supplying prepublication copies of the tables of contents of their journals. Other helpful assistance was provided by Sam Bonnanno of Harry Diamond Laboratories, R. L. Chamberlain of Iowa State University, and James J. Filliben and Miss Bonnie Connor of the National Bureau of Standards. Brian L. Joiner served as initiator and coordinator.

This index was initiated for internal use at the National Bureau of Standards and evolved into a cooperative effort of the National Bureau of Standards, the National Research Institute for Mathematical Sciences of the South African Council for Scientific and Industrial Research, and the Harry Diamond Laboratories. Copies in the computer listing form were distributed to a limited number of individuals many of whom indicated that they found it quite useful and asked how copies could be obtained. Since it was prohibitively expensive to distribute more copies in the computer listing form, the decision was made to make it available for distribution as an NBS Special Publication.

The computer program used to prepare this index was written by the late W. W. Youden of the National Bureau of Standards to whom we wish to acknowledge our indebtedness. Without his program this index would not have been undertaken.

NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards¹ was established by an act of Congress March 3, 1901. Today, in addition to serving as the Nation's central measurement laboratory, the Bureau is a principal focal point in the Federal Government for assuring maximum application of the physical and engineering sciences to the advancement of technology in industry and commerce. To this end the Bureau conducts research and provides central national services in four broad program areas. These are: (1) basic measurements and standards, (2) materials measurements and standards, (3) technological measurements and standards, and (4) transfer of technology.

The Bureau comprises the Institute for Basic Standards, the Institute for Materials Research, the Institute for Applied Technology, the Center for Radiation Research, the Center for Computer Sciences and Technology, and the Office for Information Programs.

THE INSTITUTE FOR BASIC STANDARDS provides the central basis within the United States of a complete and consistent system of physical measurement; coordinates that system with measurement systems of other nations; and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. The Institute consists of an Office of Measurement Services and the following technical divisions:

Applied Mathematics—Electricity—Metrology—Mechanics—Heat—Atomic and Molecular Physics—Radio Physics²—Radio Engineering²—Time and Frequency²—Astrophysics²—Cryogenics.²

THE INSTITUTE FOR MATERIALS RESEARCH conducts materials research leading to improved methods of measurement standards, and data on the properties of well-characterized materials needed by industry, commerce, educational institutions, and Government; develops, produces, and distributes standard reference materials; relates the physical and chemical properties of materials to their behavior and their interaction with their environments; and provides advisory and research services to other Government agencies. The Institute consists of an Office of Standard Reference Materials and the following divisions:

Analytical Chemistry—Polymers—Metallurgy—Inorganic Materials—Physical Chemistry.

THE INSTITUTE FOR APPLIED TECHNOLOGY provides technical services to promote the use of available technology and to facilitate technological innovation in industry and Government; cooperates with public and private organizations in the development of technological standards, and test methodologies; and provides advisory and research services for Federal, state, and local government agencies. The Institute consists of the following technical divisions and offices:

Engineering Standards—Weights and Measures—Invention and Innovation—Vehicle Systems Research—Product Evaluation—Building Research—Instrument Shops—Measurement Engineering—Electronic Technology—Technical Analysis.

THE CENTER FOR RADIATION RESEARCH engages in research, measurement, and application of radiation to the solution of Bureau mission problems and the problems of other agencies and institutions. The Center consists of the following divisions:

Reactor Radiation—Linac Radiation—Nuclear Radiation—Applied Radiation.

THE CENTER FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides technical services designed to aid Government agencies in the selection, acquisition, and effective use of automatic data processing equipment; and serves as the principal focus for the development of Federal standards for automatic data processing equipment, techniques, and computer languages. The Center consists of the following offices and divisions:

Information Processing Standards—Computer Information—Computer Services—Systems Development—Information Processing Technology.

THE OFFICE FOR INFORMATION PROGRAMS promotes optimum dissemination and accessibility of scientific information generated within NBS and other agencies of the Federal Government; promotes the development of the National Standard Reference Data System and a system of information analysis centers dealing with the broader aspects of the National Measurement System, and provides appropriate services to ensure that the NBS staff has optimum accessibility to the scientific information of the world. The Office consists of the following organizational units:

Office of Standard Reference Data—Clearinghouse for Federal Scientific and Technical Information³—Office of Technical Information and Publications—Library—Office of Public Information—Office of International Relations.

¹ Headquarters and Laboratories at Gaithersburg, Maryland, unless otherwise noted; mailing address Washington, D.C. 20234.

² Located at Boulder, Colorado 80302.

³ Located at 5285 Port Royal Road, Springfield, Virginia 22151.

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH reports National Bureau of Standards research and development in physics, mathematics, chemistry, and engineering. Comprehensive scientific papers give complete details of the work, including laboratory data, experimental procedures, and theoretical and mathematical analyses. Illustrated with photographs, drawings, and charts.

Published in three sections, available separately:

● Physics and Chemistry

Papers of interest primarily to scientists working in these fields. This section covers a broad range of physical and chemical research, with major emphasis on standards of physical measurement, fundamental constants, and properties of matter. Issued six times a year. Annual subscription: Domestic, \$9.50; foreign, \$11.75*.

● Mathematical Sciences

Studies and compilations designed mainly for the mathematician and theoretical physicist. Topics in mathematical statistics, theory of experiment design, numerical analysis, theoretical physics and chemistry, logical design and programming of computers and computer systems. Short numerical tables. Issued quarterly. Annual subscription: Domestic, \$5.00; foreign, \$6.25*.

● Engineering and Instrumentation

Reporting results of interest chiefly to the engineer and the applied scientist. This section includes many of the new developments in instrumentation resulting from the Bureau's work in physical measurement, data processing, and development of test methods. It will also cover some of the work in acoustics, applied mechanics, building research, and cryogenic engineering. Issued quarterly. Annual subscription: Domestic, \$5.00; foreign, \$6.25*.

TECHNICAL NEWS BULLETIN

The best single source of information concerning the Bureau's research, developmental, cooperative and publication activities, this monthly publication is designed for the industry-oriented individual whose daily work involves intimate contact with science and technology—for *engineers, chemists, physicists, research managers, product-development managers, and company executives*. Annual subscription: Domestic, \$3.00; foreign, \$4.00*.

* Difference in price is due to extra cost of foreign mailing.

NONPERIODICALS

Applied Mathematics Series. Mathematical tables, manuals, and studies.

Building Science Series. Research results, test methods, and performance criteria of building materials, components, systems, and structures.

Handbooks. Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications. Proceedings of NBS conferences, bibliographies, annual reports, wall charts, pamphlets, etc.

Monographs. Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

National Standard Reference Data Series. NSRDS provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated.

Product Standards. Provide requirements for sizes, types, quality and methods for testing various industrial products. These standards are developed cooperatively with interested Government and industry groups and provide the basis for common understanding of product characteristics for both buyers and sellers. Their use is voluntary.

Technical Notes. This series consists of communications and reports (covering both other agency and NBS-sponsored work) of limited or transitory interest.

Federal Information Processing Standards Publications. This series is the official publication within the Federal Government for information on standards adopted and promulgated under the Public Law 89-306, and Bureau of the Budget Circular A-86 entitled, Standardization of Data Elements and Codes in Data Systems.

CLEARINGHOUSE

The Clearinghouse for Federal Scientific and Technical Information, operated by NBS, supplies unclassified information related to Government-generated science and technology in defense, space, atomic energy, and other national programs. For further information on Clearinghouse services, write:
