U.S. DEPARTMENT OF COMMERCE / National Bureau of Standards

Vibrationally Excited Hydrogen Halides:

A Bibliography on Chemical Kinetics of Chemiexcitation and Energy Transfer Processes (1958 through 1973)

NATIONAL BUREAU OF STANDARDS

The National Bureau of Standards[1] was established by an act of Congress March 3, 1901. The Bureau's overall goal is to strengthen and advance the Nation's science and technology and facilitate their effective application for public benefit. To this end, the Bureau conducts research and provides: (1) a basis for the Nation's physical measurement system, (2) scientific and technological services for industry and government, (3) a technical basis for equity in trade, and (4) technical services to promote public safety. The Bureau consists of the Institute for Basic Standards, the Institute for Materials Research, the Institute for Applied Technology, the Institute for Computer Sciences and Technology, and the Office for Information Programs.

THE INSTITUTE FOR BASIC STANDARDS provides the central basis within the United States of a complete and consistent system of physical measurement; coordinates that system with measurement systems of other nations; and furnishes essential services leading to accurate and uniform physical measurements throughout the Nation's scientific community, industry, and commerce. The Institute consists of a Center for Radiation Research, an Office of Measurement Services and the following divisions:

Applied Mathematics — Electricity — Mechanics — Heat — Optical Physics — Nuclear Sciences[2] — Applied Radiation[2] — Quantum Electronics[3] — Electromagnetics[3] — Time and Frequency[3] — Laboratory Astrophysics[3] — Cryogenics[3].

THE INSTITUTE FOR MATERIALS RESEARCH conducts materials research leading to improved methods of measurement, standards, and data on the properties of well-characterized materials needed by industry, commerce, educational institutions, and Government; provides advisory and research services to other Government agencies; and develops, produces, and distributes standard reference materials. The Institute consists of the Office of Standard Reference Materials and the following divisions:

Analytical Chemistry — Polymers — Metallurgy — Inorganic Materials — Reactor Radiation — Physical Chemistry.

THE INSTITUTE FOR APPLIED TECHNOLOGY provides technical services to promote the use of available technology and to facilitate technological innovation in industry and Government; cooperates with public and private organizations leading to the development of technological standards (including mandatory safety standards), codes and methods of test; and provides technical advice and services to Government agencies upon request. The Institute consists of a Center for Building Technology and the following divisions and offices:

Engineering and Product Standards — Weights and Measures — Invention and Innovation — Product Evaluation Technology — Electronic Technology — Technical Analysis — Measurement Engineering — Structures, Materials, and Life Safety[4] — Building Environment[4] — Technical Evaluation and Application[4] — Fire Technology.

THE INSTITUTE FOR COMPUTER SCIENCES AND TECHNOLOGY conducts research and provides technical services designed to aid Government agencies in improving cost effectiveness in the conduct of their programs through the selection, acquisition, and effective utilization of automatic data processing equipment; and serves as the principal focus within the executive branch for the development of Federal standards for automatic data processing equipment, techniques, and computer languages. The Institute consists of the following divisions:

Computer Services — Systems and Software — Computer Systems Engineering — Information Technology.

THE OFFICE FOR INFORMATION PROGRAMS promotes optimum dissemination and accessibility of scientific information generated within NBS and other agencies of the Federal Government; promotes the development of the National Standard Reference Data System and a system of information analysis centers dealing with the broader aspects of the National Measurement System; provides appropriate services to ensure that the NBS staff has optimum accessibility to the scientific information of the world. The Office consists of the following organizational units:

Office of Standard Reference Data — Office of Information Activities — Office of Technical Publications — Library — Office of International Relations.

Foreword

The National Standard Reference Data System was established in 1963 for the purpose of promoting the critical evaluation and dissemination of numerical data of the physical sciences. The program is coordinated by the Office of Standard Reference Data of the National Bureau of Standards but involves the efforts of many groups in universities, government laboratories, and private industry. The primary aim of the program is to provide compilations of critically evaluated physical and chemical property data. These tables are published in the *Journal of Physical and Chemical Reference Data,* in the NSRDS-NBS series of the National Bureau of Standards, and through other appropriate channels.

The task of critical evaluation is carried out in various data centers, each with a well-defined technical scope. A necessary preliminary step to the critical evaluation process is the retrieval from the world scientific literature of all papers falling within the scope of the center. Each center, therefore, builds up a comprehensive well-indexed bibliographical file which forms the base for the evaluation task. Bibliographies derived from these files are published when they appear to be of value to research workers and others interested in the particular technical area.

Further information on NSRDS and the publications which form the primary output of the program may be obtained by writing to the Office of Standard Reference Data, National Bureau of Standards, Washington, DC 20234.

David R. Lide, Jr., Chief
Office of Standard Reference Data

TABLE OF CONTENTS

VIBRATIONALLY EXCITED HYDROGEN HALIDES:

A Bibliography on Chemical Kinetics of Chemi-xcitation and Energy Transfer Processes*

Francis Westley

A bibliography, a reaction oriented list of references, is provided for published papers and reports containing rate data for reactions of halogen atoms with hydrogen-containing compounds, or of H (D, or T) atoms with halogen-containing compounds to form vibrationally chemiexcited hydrogen halides. The reactions for vibroexcitation of hydrogen halides through unimolecular or photochemical elimination, as well as the processes for vibrational energy transfer between hydrogen halides and various second bodies are also included. In addition, four lists of theoretical papers and a list of critical reviews and bibliographies are provided. Over 300 papers covering 50 types of reactions are listed. The period covered extends from 1958 through 1973.

Key words: Bibliography; chemical kinetics; chemiexcitation; gas phase; halogens; hydrogen; hydrogen halides; laser; quenching; vibrational energy transfer.

Introduction

The bibliography lists papers and reports on the gas phase reaction kinetics of two types of chemical processes: a) formation of vibrationally excited hydrogen halides through abstraction or elimination and b) vibrational energy transfer - including quenching - between hydrogen halides and various second bodies.

---

*This publication is an activity of the Chemical Kinetics Information Center, National Bureau of Standards. The work was supported by the Office of Standard Reference Data, National Bureau of Standards and the Air Force Office of Scientific Research as part of a program to provide information and data on rates of chemical reactions.

The articles have been selected from the files of the Chemical Kinetics Information Center. The criterion for inclusion of an article is that it must contain some new information on the reaction. That is, simple quotations of the results of others and ad hoc guesses have been excluded. There are gray areas, such as the statement of a rate calculated from that of the reverse reaction and the equilibrium constant, or information such as: suggestion of a new mechanism, or a theoretical calculation, or a new theoretical approach derived from kinetic experiments. If the information seemed to be important the reference was included.

The two above mentioned types of reactions (formation of vibrationally excited hydrogen halides and transfer of vibrational energy between hydrogen halides and other bodies) are essential in a fairly new branch of quantum electronics: the chemical laser. Light amplification by stimulated emission of radiation (in short: laser) is a fairly recent development in science dealing with the generation of coherent radiation in the infrared and visible regions of the spectrum. The chemical lasers are based on the new principle of obtaining energy - in the form of coherent radiation - from chemical reactions: the principle of "chemical pumping". In other words, chemical interaction between two gaseous molecules results in the pumping of electronic, vibrational, or rotational energy into the newly formed bond of one to the reaction products. The new bond "stores" for a short time an amount of energy available for other uses. Such a reaction, which is only the first elementary step in the more complex lasing process, is called in short "chemiexcitation". The first observation of an infrared emission from the reaction of atomic hydrogen with molecular chlorine, was reported in 1958 by Cashion and Polanyi[1,2]. They attributed this emission to the vibrationally excited hydrogen chloride, which was one of the products of the reaction:

$$H + Cl_2 \rightarrow HCl^{\ddagger}(v \leq 6) + Cl \qquad (1)$$

In 1961, Polanyi suggested the construction of a HCl laser, dependent on vibrational excitation, which would operate in the infrared region[8]. Polanyi and coworkers have continued their pioneering work in the field of chemical lasers, by following a double path: experimental [infrared spectroscopy[3,4,5], energy distribution among reaction products[6,13,14,17,18,29,21,22,23]] and theoretical [energy distribution[7,9,10,12,15,19,23], potential energy surface[11,12,23], trajectories[12,15,23], chemical kinetics[16]]

However, the first description of an operational HCl pulsed chemical laser was published in 1965 by Kasper and Pimentel[24]. In the following years the research on chemical lasers has been continually expanding. A list of the universities and industrial research laboratories, as well as of their scientists carrying out research in chemical lasers can be found in the introduction of a bibliography published in 1972 by the U.S. Atomic Energy Commission [Chemical Lasers: An Overview of the Literature, (1960 - 1971)[25]].

Since 1965, many chemiexcited molecules have been found suitable in the operation of chemical lasers. However, the hydrogen halides are the most used molecules for that purpose. To date, the highest energy level of a chemiexcited hydrogen halide molecule is vibrational. The search of the literature failed to show the existence of a laser based on an electronically excited hydrogen halide molecule. For these reasons, this bibliography is confined only to two types of reactions involving hydrogen halides: a) vibrational chemiexcitation and b) vibrational energy transfer. No attempt was made to cover the literature dealing with the operation of hydrogen halide lasers. The reader interested in operation of chemical lasers should consult the "Comprehensive Literature Survey of Chemical Lasers" by Arnold and Rojeska[26] or the above mentioned bibliography of Dobratz[25], as well as other reviews and bibliographies listed in part V of this work.

This bibliography is not the result of the effort of a single person, but of the whole staff of Chemical Kinetics Information Center. My thanks to all of them.

In particular, I wish to thank Dr. David Garvin, Director of the Center, and Dr. Robert Hampson for their more than helpful suggestions and constant guidance; Mr. James G. Koch, Supervisor, for tracking down and obtaining papers and reports, otherwise very difficult to obtain; Mrs. Ann C. Robertson, Mrs. Geraldine Zumwalt and Miss Darlene Connelly, for typing a difficult manuscript with particular care.

Arrangement of the report. This bibliography is in six parts:

Part I. Hydrogen fluoride ($HF^{\ddagger}$, or $DF^{\ddagger}$)

Part II. Hydrogen chloride ($HCl^{\ddagger}$, or $DCl^{\ddagger}$)

Part III. Hydrogen bromide ($HBr^{\ddagger}$, or $DBr^{\ddagger}$)

Part IV. Hydrogen iodide ($HI^{\ddagger}$, or $DI^{\ddagger}$)

Part V. Reviews and Bibliographies (Critical reviews, or surveys and general bibliographies dealing with the reactions listed in parts I to IV).

Part VI. The combined bibliography for Parts I to V arranged alphabetically by authors. The complete reference citation for each article mentioned is given here. Occasionally explanatory notes are appended. These establish the "bibliography chain" for closely related papers by the same authors.

Parts I to IV are arranged in the order of their importance: Hydrogen fluoride (Part I) is the most intensively studied chemical laser, while hydrogen iodide (Part IV) is the least studied.

Ordering of chemical reactions. The purpose of this work is to provide the chemical kineticist with a useful list of articles and papers dealing with the vibrationally excited hydrogen halides. For that reason, the arrangement of the bibliography is reaction oriented: parts I to IV are each divided into three large sections:

Section A. Formation of $HX^{\ddagger}$ (X = F, Cl, Br, I)

Section B. $HX^{\ddagger}$ Energy Transfer and Quenching

Section C. $HX^{\ddagger}$ Theoretical Papers

The titles of Sections A and B define very broad categories of reactions. Section C includes only theoretical papers, very closely related to the kinetics of vibrationally excited hydrogen halides. Section A does not include formation of $HX^{\ddagger}$ by energy transfer. This type of reaction may be found in Section B, under 1.a. Each of the Sections A and B is divided into smaller categories of reactions and so on, as indicated in the table of contents.

Display of Chemical Reactions and Formulae. With the exception of subgroups A.1.a and A.1.b, all the other subgroups define a type of chemical reaction. Subgroups A.1.a and A.1.b are each further divided into three types of reactions. For instance, in part I (Hydrogen fluoride) these types are:

A.1.a. Abstraction of H atom by F atom.

$$\text{i.} \quad F + H_2 \rightarrow HF^{\ddagger} + H \qquad (2)$$

$$\text{ii.} \quad F + HX \rightarrow HF^{\ddagger} + X \qquad (3)$$

$$\text{iii.} \quad F + RH \rightarrow HF^{\ddagger} + R \qquad (4)$$

A.1.b. Abstraction of F atom by H atom.

$$\text{i.} \quad H + F_2 \rightarrow HF^{\ddagger} + F \qquad (5)$$

$$\text{ii.} \quad H + FX \rightarrow HF^{\ddagger} + X \qquad (6)$$

$$\text{iii.} \quad H + RF \rightarrow HF^{\ddagger} + R \qquad (7)$$

Throughout the work these different types of reactions are displayed according to a scheme trying to emphasize the direction and nature of the chemical process, rather than to follow a mere alphabetical order. So, the above listed reactions (2) to (7) are all written according to the invariable pattern:

Abstracting atom	+	Molecule	→	Vibrationally excited Product	+	Other Products

In reactions (4) and (7), the terms RH and RF denote in general a hydrogen containing - and, respectively, a halogen containing - organic molecule. However, in some instances, a reference listed under the headings A.1.a.iii. or A.1.b.iii. (Reactions (4) and (7)), might deal with a hydrogen - or halogen - containing inorganic molecule.

The general "third body", whether excited or in ground state, is always last:

$$\text{B.1.a.} \quad HF(v_i=0) + M^{\ddagger} \rightarrow HF^{\ddagger}(v_j>0) + M \quad (M \neq HF) \qquad (8)$$

In general, the first term at the right side of a reaction indicates a vibrationally excited product. The only exception is the reaction type B.2.c (Dissociative quenching).

$$\underline{\text{B.2.c.}}\quad \text{i.}\quad HF^{\ddagger}(v_i=m) + M_2 \rightarrow HF(v_j=0) + M + M \qquad (9)$$

$$\underline{\text{B.2.c.}}\quad \text{ii.}\quad HF^{\ddagger}(v_i=m) + M \rightarrow H + F + M \qquad (10)$$

Excited states of reactants and products. This bibliography deals exclusively with vibrationally excited hydrogen halides. The sign used to indicate the vibronic state of a molecules is the double dagger superscript. If the double dagger appears inside a bracket, it indicates that the molecule might be in its ground state (zero vibrational level):

$$\underline{\text{B.1.b.}}\quad HF^{\ddagger}(v_i=m) + M \rightarrow HF^{\ddagger}(v_j<m) + M^{\ddagger}(v_k>0) \qquad (11)$$

(v_j might be 0)

Only in one instance an asterisk is used to indicate the formation of an intermediate activated complex, which subsequently is dissociated into a vibrationally excited hydrogen halide molecule and another product:

$$\text{A.2.a.}\quad R_1 + R_2 \rightarrow [R_1R_2]^* \rightarrow HX^{\ddagger} + M \quad \text{(Chemical activation)} \qquad (12)$$

Reactions of the type B.1.c. are expressed by a generalized chemical equation including all the HX - HX vibrational energy transfer processes. The multiplicity of vibrational levels (some authors consider 8 vibrational levels in the same paper) would have made it very difficult to arrange this bibliography according to all the possible HX - HX vibronic interactions. Although, in this type of process, four different vibronic levels coexist, the double dagger superscript is entirely omitted and the different vibronic levels are indicated in a bracket following each HX molecule. The reason for omitting the dagger symbol is that only one of the four vibronic levels (v_i, v_j, v_k, v_ℓ) may be zero, provided that the condition $i + j = k + \ell$ is satisfied. (If two, or three of these vibronic levels are zero, then the process becomes a simple quenching, or excitation one.). For the case of the HF - HF vibrational energy transfer, the B.1.c. process is indicated as follows:

$$HF(v_i) + HF(v_j) \rightarrow HF(v_k) + HF(v_\ell) \quad (i + j = k + \ell) \qquad (13)$$

(only one of four levels v_i, v_j, v_k, v_ℓ may be zero)

Reference Citations.

The references under each reaction list the author(s) and the sources, in the following form:

Author(s)	Source-Year-Volume-Page	Number of Author(s)
Airey, J. R.	IJCKBO-1970-2-65	1
Airey and Fried	CHPLBC-1971-8-23	2
Airey, et al.	JCPSA6-1964-41-3255	3 or more

Variations from this format (which we will call "short reference") are usually in the direction of more explicit specification. These variations are never made in the first two fields, source and year. They are fixed and always present.

The sources are indicated by their ASTM CODEN abbreviations*). A guide to these codes follows. As listed in this guide, the codes include an additional sixth cipher, which is a "check character"**). A code prefixed with an asterisk is a code not in the ASTM CODEN set. These are codes we have assigned for reports from industrial laboratories, research institutes and universities. When the CODEN system adopts appropriate codes they will be replaced. The present, temporary codes usually end with Z or U.

Abbreviations

The abbreviations listed below, are used in parts I through IV of this bibliography.

(calc.)	= (calculation)
(cr. sect.)	= (cross section)
(d.r.)	= (detailed rates)
(mech.)	= (mechanism)
(model.)	= (modelling)
(pop. distr.)	= (population distribution)
(pot. surf.)	= (potential energy surface)
(r.p.)	= (related paper)
(rev.)	= (review)
(traj.)	= (trajectories)
(trans. prob.)	= (transition probability)

They are appended inside brackets at the end of the short references. In general, a short reference without appended abbreviations indicates a work including rate constants while a reference followed by appended abbreviations may or may not include rate constants.

The abbreviation r.p. (related paper) indicates a paper which cannot fit in any of the above listed categories. For instance, a work dealing with laser operation will be followed by (r.p.) if it is considered of interest. However, a number of papers with rate constants are included in the r.p. category. For instance, under the heading: $Cl + H_2 \rightarrow HCl^{\ddagger} + H$ a number of papers giving rate constants for the overall reaction $Cl + H_2 \rightarrow HCl + H$ are included. In this reaction, the product HCl indicates all molecules of hydrogen chloride whether in the ground state or in an excited state. Such a paper is therefore a very closely related paper.

Part I. Hydrogen fluoride (HF, DF)

A. Formation of $HF^{\ddagger}$ ($DF^{\ddagger}$)

1. Bimolecular Reactions (Abstraction Lasers)

a. Abstraction of H(D) Atom by F Atom

i. $F + H_2 \rightarrow HF^{\ddagger} + H$

15. SUPPLEMENTARY NOTES

Library of Congress Catalog Card No.: 74-5358.

16. ABSTRACT *(A 200-word or less factual summary of most significant information. If document includes a significant bibliography or literature survey, mention it here.)*

A bibliography, a reaction oriented list of references, is provided for published papers and reports containing rate data for reactions of halogen atoms with hydrogen-containing compounds, or of H (D, or T) atoms with halogen-containing compounds to form vibrationally chemiexcited hydrogen halides. The reactions for vibroexcitation of hydrogen halides through unimolecular or photochemical elimination, as well as the processes for vibrational energy transfer between hydrogen halides and various second bodies are also included. In addition, four lists of theoretical papers and a list of critical reviews and bibliographies are provided. Over 300 papers covering 50 types of reactions are listed. The period covered extends from 1958 through 1973.

17. KEY WORDS *(six to twelve entries; alphabetical order; capitalize only the first letter of the first key word unless a proper name; separated by semicolons)*

Bibliography; chemical kinetics; chemiexcitation; gas phase; halogens; hydrogen; hydrogen halides; laser; quenching; vibrational energy transfer.

NBS TECHNICAL PUBLICATIONS

PERIODICALS

JOURNAL OF RESEARCH reports National Bureau of Standards research and development in physics, mathematics, and chemistry. Comprehensive scientific papers give complete details of the work, including laboratory data, experimental procedures, and theoretical and mathematical analyses. Illustrated with photographs, drawings, and charts. Includes listings of other NBS papers as issued.

Published in two sections, available separately:

- **Physics and Chemistry (Section A)**

Papers of interest primarily to scientists working in these fields. This section covers a broad range of physical and chemical research, with major emphasis on standards of physical measurement, fundamental constants, and properties of matter. Issued six times a year. Annual subscription: Domestic, $17.00; Foreign, $21.25.

- **Mathematical Sciences (Section B)**

Studies and compilations designed mainly for the mathematician and theoretical physicist. Topics in mathematical statistics, theory of experiment design, numerical analysis, theoretical physics and chemistry, logical design and programming of computers and computer systems. Short numerical tables. Issued quarterly. Annual subscription: Domestic, $9.00; Foreign, $11.25.

DIMENSIONS, NBS

The best single source of information concerning the Bureau's measurement, research, developmental, cooperative, and publication activities, this monthly publication is designed for the layman and also for the industry-oriented individual whose daily work involves intimate contact with science and technology —*for engineers, chemists, physicists, research managers, product-development managers, and company executives.* Annual subscription: Domestic, $6.50; Foreign, $8.25.

NONPERIODICALS

Applied Mathematics Series. Mathematical tables, manuals, and studies.

Building Science Series. Research results, test methods, and performance criteria of building materials, components, systems, and structures.

Handbooks. Recommended codes of engineering and industrial practice (including safety codes) developed in cooperation with interested industries, professional organizations, and regulatory bodies.

Special Publications. Proceedings of NBS conferences, bibliographies, annual reports, wall charts, pamphlets, etc.

Monographs. Major contributions to the technical literature on various subjects related to the Bureau's scientific and technical activities.

National Standard Reference Data Series. NSRDS provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated.

Product Standards. Provide requirements for sizes, types, quality, and methods for testing various industrial products. These standards are developed cooperatively with interested Government and industry groups and provide the basis for common understanding of product characteristics for both buyers and sellers. Their use is voluntary.

Technical Notes. This series consists of communications and reports (covering both other-agency and NBS-sponsored work) of limited or transitory interest.

Federal Information Processing Standards Publications. This series is the official publication within the Federal Government for information on standards adopted and promulgated under the Public Law 89–306, and Bureau of the Budget Circular A–86 entitled, Standardization of Data Elements and Codes in Data Systems.

Consumer Information Series. Practical information, based on NBS research and experience, covering areas of interest to the consumer. Easily understandable language and illustrations provide useful background knowledge for shopping in today's technological marketplace.

BIBLIOGRAPHIC SUBSCRIPTION SERVICES

The following current-awareness and literature-survey bibliographies are issued periodically by the Bureau:

Cryogenic Data Center Current Awareness Service (Publications and Reports of Interest in Cryogenics). A literature survey issued weekly. Annual subscription: Domestic, $20.00; foreign, $25.00.

Liquefied Natural Gas. A literature survey issued quarterly. Annual subscription: $20.00.

Superconducting Devices and Materials. A literature survey issued quarterly. Annual subscription: $20.00. Send subscription orders and remittances for the preceding bibliographic services to the U.S. Department of Commerce, National Technical Information Service, Springfield, Va. 22151.

Electromagnetic Metrology Current Awareness Service (Abstracts of Selected Articles on Measurement Techniques and Standards of Electromagnetic Quantities from D-C to Millimeter-Wave Frequencies). Issued monthly. Annual subscription: $100.00 (Special rates for multi-subscriptions). Send subscription order and remittance to the Electromagnetic Metrology Information Center, Electromagnetics Division, National Bureau of Standards, Boulder, Colo. 80302.

Order NBS publications (except Bibliographic Subscription Services) from: Superintendent of Documents, Government Printing Office, Washington, D.C. 20402.
