The performance of buildings is commonly measured in economic terms such as return on investment, or in otherwise readily quantifiable terms, such as amount of time required for maintenance, heat transfer, acoustic properties, or durability of materials. "Behavioral cost," which might be defined as dysfunctional aspects in the human organism caused by elements in the social and the designed environment, traditionally has escaped rigorous measurement and quantification. It became evident only through indirect indices such as statistics on pathologies, absenteeism, job turnover, etc. It is suggested that in addition to the commonly used performance measures, building performance be based on normative user behavior that is explicitly stated in building program specifications. Several approaches to this problem area are outlined.

A performance evaluation study in a public plaza using observational techniques is reported. The findings indicate that a strong relationship exists between informal stationary activity and space defining elements in the plaza, such as benches and columns. Certain conclusions for the programming of a plaza are drawn.

Verbalized user response and the building performance concept: a case study in university residence hall evaluation, W. F. E. Preiser, *SP361, Vol. 1,* pp. 111-119 (Feb. 1972).

Key words: Attitude scale; building performance; comparative user response; user behavior; user satisfaction; verbalized response.

Building performance appraisal focused upon user behavior is a recognized need. Theoretical frameworks exist for the analysis, programming, and design of buildings with human behavior as the basic unit of analysis, particularly with reference to normative states of equilibrium within a given cultural and environmental context. These states may be expressed in terms of user satisfaction through verbalization. Based upon Thurstone's scale of equal-appearing intervals, an evaluative tool for the qualitative assessment of building performance has been developed. The method attempts to measure the subjective importance and acceptance of features of the built environment by the users. The data thus derived may complement traditional "hardware" criteria in the appraisal of buildings. The evaluation procedure, consisting of six steps, was applied to students living in residence halls at Virginia Polytechnic Institute and State University.

1. Construction of Attitude Statements.
2. Selection of Statements.
3. Scaling of Attitude Statements.
4. Statistical Evaluation.
5. Selection of "Best" Scoring Statements.

6. Validation Procedure and Construction of Comparative Response Profiles of 3 Residence Halls.

Some conclusions resulting from the building evaluation are outlined for consideration in future programming of residence halls.

Identification of performance criteria using multidimensional scaling of user evaluations, H. G. Blasdel, *SP361, Vol. 1,* pp. 121-129 (Feb. 1972).

Key words: Color schemes; field studies; glare; illuminance; matrix analysis; multidimensional scaling; performance criteria; preference scaling; scaling; user evaluations; visual environment.

The relative significance, accuracy and completeness of performance criteria for environmental control systems in buildings require testing through user evaluations in addition to customary laboratory research. Because of the inherent variability in human judgment, and the difficulty of interpreting direct quality estimations, such evaluations have not been widely used. Multidimensional scaling allows the reduction of comparative evaluations into a quantitative system of perceived environmental attributes. A questionnaire was used in evaluation of luminous environments as an example of the technique. Results provide for identification of perceived attributes and the scaling of the observed environments with respect to those subjective parameters so that physical measures may be related to human responses.

These methods differentially weight the salience of each attribute for each individual's judgment matrix, allowing access to data on individual differences that can assess the need for variety in a building system. The attribute structures may be applied to setting quality criteria across a wide range of environmental variables so that cost-benefit analysis may be done against overall performance rather than separate criteria.

Performance: the new language of design, D. J. Parsons, *SP361, Vol. 1,* pp. 131-139 (Feb. 1972).

Key words: Cost; design; industrialization; performance; user needs; value system.

With the scattered development of tools for user needs analysis, the measurement and specification of performance, product analysis, and building evaluation, there is a growing need for unification of these concepts into a single framework. A definition of the performance concept is presented which mediates between the measurement of benefit and the costs of design solutions. With performance as a mediating concept, we are able to formulate user needs as the correlation between performance and benefit, and to analyze products in terms of the relationship between their cost and their performance. The Performance/Benefit correlation (user need) is a user characteristic *independent* of product Cost; while the Cost/Performance relationship is a product characteristic *independent* of Benefit to the user. This paper clarifies the relationship between this definition of the performance concept and various forms of analysis, design, and evaluation common to the design of buildings. It further explores possible shifts in the practice of design as skills become more specialized in the building industry.

Consideration of externalities to the basic performance/cost evaluation of buildings in the design process, G. S. Birrell, *SP361, Vol. 1,* pp. 141-148 (Feb. 1972).

Key words: Building; competitive market; construction; cost; evaluation; materials; performance; price; user; value.

Starting from (1) an adequate analysis of buildings into subsystems and their functional elements; (2) the statement of required technological performance for each element of a proposed building; and (3) the budget cost for each element of a proposed building, the question arises – what else should the designer include in his evaluation of each building element to maximize overall User Satisfaction?

These externalities to the basic technological performance and cost of each element are described and discussed and their relationship to each other exposed on a Value Axis. They comprise a range of factors from Hypothetical Minimum Cost to User Values. They are interrelated and influenced by the Project Roles which are responsible for each section of the Value Axis on each Project. Such externalities play an important part in the integration of the elements to create a desirable overall project and the designer should direct his attention to them to achieve optimum overall balance between Performance and Cost.

The conclusion reached is that while the above ratio of technological performance to cost of each element is a desirable starting point for building evaluation, the externalities on the Value Axis also play a considerable part in selecting the building materials which can provide maximum building User Satisfaction.

Architectural economics related to comfort, productivity and glass, J. T. Malarky, *SP361, Vol. 1,* pp. 149-159 (Feb. 1972).

Key words: Building economics; capital costs; human comfort; human performance; insulated glass; operating costs; people costs; single glass.

For many years, the most sophisticated and objective professionals have believed that thermal and visual "environmental factors" can exert a profound influence on the physical comfort and productivity of building occupants. Some experienced owners, such as the General Service Administration, believe that 90 percent of the owners' total cost in an office building can be charged properly against people and only about 10 percent against land, building and debt service. Experienced tenants regularly pay more money for carefully controlled and selected environments.

Glass "environmental factors" such as glass surface temperature, influence productivity and can be evaluated in a practical way. For exploratory use and for professional evaluation and criticism, an empirical people-productivity/glass-performance evaluation system is proposed. This evaluation system illustrates a practical relationship between glass "environmental factors," comfort and productivity. A comfort-productivity relationship equation is developed. A practical example illustrates the effect architectural glass could have on productivity and profits.

The notion of performance in building: building requirements, G. Blachère, *SP361, Vol. 1,* pp. 161-164 (Feb. 1972).

Key words: Assembly; compatibility of components; physical properties of a building, of a product; users' requirements.

A building is built for a given purpose, i.e., to meet the requirements of the man for whom the building is built, the user's requirements. These are related to the whole building and can be expressed in terms related to man by numerical figures for the best known requirements such as physiological and economic ones, and by words in other cases, i.e., for psychological or sociological needs, roughly speaking.

To meet the users' requirements, a building has to present a set of physical (including chemical, geometrical, and mechanical) properties. Various sets of physical properties may be suitable to meet the same set of requirements.

Generally speaking a building is built of elements, and elements are made of products (raw materials, semifinished products, sections, components).

It is possible to relate the properties of a built element to the properties of the constituent products, by considering the various physical characteristics and also the compatibility of adjacent parts.

Some details will be given on the users' physiological, psycho-sociological and economic requirements at the level of the whole building; on absolute needs and relative requirements; on the variation of requirements in space and time.

What are the natures of performance and evaluation for the three levels: building, components, materials, G. Blachère, *SP361, Vol. 1*, pp. 165-170 (Feb. 1972).

Key words: Agrément; building components; durability; materials; performance; tests.

For a whole building what is required is the satisfaction of the users' requirements. For example for a dwelling the requirements are temperature, noise level, illumination level, air purity level, convenience of internal space, convenient relationship between the various rooms and an adequate view from the inside, etc.

The means of evaluation are the sciences which relate the physical properties of the building to the effect on the inhabitants, or reference to a long and satisfactory use of some techniques or direct proof by the real occupation of the building by users and the observations of the latter.

What is needed for components is that they possess the physical properties which enable the built elements to play their correct part in the building as a whole.

These properties are expressed in scientific terms, i.e., by reference to physical characteristics measured by any methods, in terms of technological indexes based on long experience or on tradition, or in terms of physical requirements. There is also the important problem of durability (cf. the paper on Agrément).

As for raw materials, it is not possible to have requirements of any sort by performance or otherwise, because there is no defined link between materials and a building. We can only judge a material plus its shape, i.e., roughly speaking, a component.

Techniques for developing performance specifications for buildings, M. Brill, *SP361, Vol. 1*, pp. 171-180 (Feb. 1972).

Key words: Environmental characteristics; performance; performance specifications.

A tested technique is offered, which can serve as a generating model for performance specifications for any building type. The technique recognizes the primacy of the user's needs as the generator of information, while acknowledging that manufacturer's information requirements must be formatted in different terms. A matrix is used as a display device to show the set of all possible environmental characteristics for all possible subsystems.

The environmental characteristic headings are: Conditioned air, Illumination, Acoustics, Stability, Durability, Reliability, Safety, Activity support, Maintainability, Esthetics, Waste management, Potable water, Food handling, Communication, Accessibility.

The Building subsystems whose performances must satisfy these requirements are: Structure, HVAC, Finished floor, Finished ceiling, Luminaires, Space dividers, Exterior walls, Plumbing Utilities, Sanitary fixtures, Food services, Cleaning systems, Energy source, Energy systems, Transportation systems, Roofs, Windows, Doors, Security systems, Sealant systems, Communication systems, Materials handling, Waste removal.

Each intercept is examined for interaction between demand (the user's needs) and supply (the capability of the subsystem to respond to, or alter the demand). Where an intercept is seen as interactive, three kinds of information are generated—a *Requirement* which is a prose statement of the specific need; *Criteria*, some measure of the acceptable range of solution; and *Test Method*, the mechanism whereby surety of performance is guaranteed. A method of correlating Requirements, Criteria, and Test Methods into performance specifications by subsystem is described.

This technique attempts to deal with physiological requirements only and some discussion is presented for its applicability to psychological and sociological requirements.

A consistent basis for functional and ultimate criteria, R. N. Wright and A. H.-S. Ang, *SP361, Vol. 1*, pp. 181-190 (Feb. 1972).

Key words: Building criteria; design; optimization; reliability; safety; serviceability; structures.

Objectives in the process of building include minimization of cost as well as performance in meeting functional requirements and safety with respect to property loss or personal injury. The performance concept contributes to these objectives by expressing performance requirements in a manner allowing fair competition among available solution schemes. This paper discusses the formulation of functional and ultimate criteria for structural performance using rational consideration of uncertainties in the information available for decision making.

Functional requirements define limit states of serviceability which are independent of solution scheme. Requirements for safety, however, relate to ultimate limit states which differ in mechanisms and consequences for different structural schemes. This paper shows that performance requirements for safety can be expressed in a scheme-independent manner by accounting for the scheme-dependence of ultimate limit states with reliability-based criteria.

Total performance is described by the expected loss which includes expected initial costs and probable costs of occurrence of functional and ultimate limit states. This formulation guides the expression of performance requirements in ultimate limit states as scheme-independent prescriptions of required reliability. Both statistically defined and statistically undefined uncertainties are accounted for. The fail-safe concept provides very high reliability against catastrophic ultimate limit states.

Performance concept and the system approach—some comments, I. Karlén, *SP361, Vol. 1*, pp. 191-200 (Feb. 1972).

Key words: Building; design process; ER-system; performance; performance concept; quality description; system approach.

This paper will comment on two main approaches for use of the performance concept: behaviour in use and output of a process. The system approach, applying inter alia the performance concept, can be used in different stages of the building process, particularly for description of the wanted result, the final system. The author tries to give examples of applications on different product levels. The ER Quality description system is one example. The author comments on the help given by classification in the applications and the relations between classification categories, levels and classification.

The performance concept in building: the working application of the systems approach to building, R. G. Robbie, *SP361, Vol. 1*, pp. 201-206 (Feb. 1972).

Key words: Buildings; design process; performance; performance concept; performance-judgement approach; proposed international generic building classifications; proposed international subsystem classification models; systems approach; user needs.

The paper reviews the meaning of the systems approach to building in its practical context. Attention is drawn to the local factor in building when consideration is given to performance requirements. A characteristic which separates theory from accomplished practice in building. It is suggested that the local factor in building could make the notation of the pure performance approach to building something of a hoax, or at least common and current misconception in the industry. The realities of building performance assessment on major systems programmes are noted and a suggestion is made that the concept of the (pure) Performance Approach or Concept of Building should be discarded. It is recommended that the Performance Judgement Approach or Concept be adopted as a more accurate representation of the daily realities of performance-based building practice.

The paper proposes the establishment of an international Generic Building Classification for the bulk of common building uses. It reviews the apparent divergent meaning of performance specifications as they appear to be finding application in Europe and North America. A proposal is made for the establishment of international sub-system classification models and two examples are given for schools and housing.

The paper concludes with an appeal for a major increase in user requirements research and the development of science-based skill in the building industry. It appeals also for a major rationalization of all skills in the industry in the expectation that with building code rationalization the building industry would then have the comprehensive resources necessary to make the performance concept in building a reality.

The relationship between the performance concept and the systems concept, J. Vilett, *SP361, Vol. 1*, pp. 207-212 (Feb. 1972).

Key words: Building industry; building production process; building systems; innovation; performance approach; semantics; systems approach.

There is considerable confusion in current architectural, engineering and construction literature concerning the distinction and relationship between the performance and systems concepts. It would be useful to maintain a clear theoretical separation of these ideas. Although there is value in their simultaneous application to many types of project, each also has the capability for independent application to certain aspects of the building process. The rationale for this proposition is based on a comparative analysis of the two concepts in terms of definitions, objectives, origins, scope of applicability, and advantages and disadvantages.

Computer based code systems and the performance concept, J. P. Eberhard, *SP361, Vol. 1*, pp. 213-218 (Feb. 1972).

Key words: Building codes; building systems; computer systems; performance standards; simulation of building requirements; systems design.

Building codes are part of a building code system which is intended to provide an organized process by which such codes are: communicated, updated, enforced, administrated and evaluated. Historically this code system has been manually operated by the use of printed documents. There is some evidence to indicate that it would be economically and technically possible to convert most of this system to one which was computer based. A computer based code system could be self-improving, resource conserving, provide an information based to the design process, raise the level of sophistication of evaluation methods, and make the code requirements more nearly responsive to the performance requirements of building users.

Performance analysis, Tenho Sneck, J. Saarimaa, and Timo Sneck, *SP361, Vol. 1*, pp. 219-226 (Feb 1972).

Key words: Application of performance concept; building levels; external factors; internal factors; performance analysis; performance evaluation; stages of building.

A performance analysis technique for building elements, products and materials is described. In order to be able to evaluate the total performance of an object all influencing factors must be known. The technique is based upon the listing of the external factors affecting the object. The internal factors of the object have to withstand the effects of the external factors. By juxtaposition of the external and internal factors, requirements concerning the desired properties can be written. The analysis can be made by the aid of check lists for external and internal factors.

Building performance appraisal, T. A. Markus, *SP361, Vol. 1*, pp. 227-235 (Feb. 1972).

Key words: Appraisal; building performance; constraints; environmental system; evaluation; resources.

This paper outlines a model of an interactive system with five main components:

1. the goals and objectives of an organization;
2. the activity and behaviour appropriate to the achievement of these objectives;
3. the environment suitable for the activity;
4. the hardware required for the creation of a suitable environment; and
5. the resources required as inputs into the system and the values achieved as outputs.

It sets out the main stages in appraisal – modeling, measurement and evaluation, and then discusses the role of performance criteria under three categories: the "ideal," norms and constraints. The paper concludes with a brief reference to a published appraisal of a school and some of the findings resulting from it.

A systems approach for the evaluation of performance of buildings in design process, S. G. Haider and N. Khachaturian, *SP361, Vol. 1*, pp. 237-248 (Feb. 1972).

Key words: Building design; design process; evaluation; performance; systems approach; user requirements; value system.

Buildings are man-made physical systems which are essential, in one way or another, for almost all activities in the society. The worth of a building is some combined measure of its performance in the functional, technological economic, perceptual-aesthetic and sociological contexts. However, most of the work done in the evaluation of performance of buildings has been directed to specialised aspects within isolated contexts and is often limited to particular types of buildings. There is a need for considering the evaluation of overall performance of a building within the design process framework of a building as a system. This

paper is intended to be a step towards the fulfillment of this need.

In the design process, the concept of value system that forms the basis of performance specifications and criteria; synthesis of building scheme which specifies the form, materials and construction methods; and operations on information are briefly discussed. The value system is systematically analysed into criteria and constituent measures which in turn are shown to be functions of design parameters and performance variables of building scheme. The evaluation process starts with the performance ratings at the level of constituent measures and successively integrates them into a single measure of the overall worth of the building design.

An innovative approach for building system analysis and esign, M. J. Macalik, *SP361, Vol. 1,* pp. 249-253 (Feb. 1972).

Key words: Building system analysis; design; innovation; mathematical model; predictive technique.

The intent of this paper is to introduce a new computer program formulated to aid in the evaluation of performance of building systems and components. The new program is designed to define, within a range of possibilities, the scope of future innovation in building systems and components necessary to improve their performance for the user and their profitability to the manufacturer.

A general overview of operation BREAKTHROUGH, E. V. eyendecker, *SP361, Vol. 1,* pp. 255-260 (Feb. 1972).

Key words: Department of Housing and Urban Development; housing; industrialized housing; innovative housing; National Academies of Sciences and Engineering; National Bureau of Standards; Operation BREAKTHROUGH; performance; performance criteria.

Operation BREAKTHROUGH was initiated with the overall objective of increasing housing production by breaking through the barriers which constrain the use of innovative materials and systems in producing housing. Twenty-two housing systems were selected by the Department of Housing and Urban Development (HUD) to participate in the program by erecting housing on selected prototype sites. The Building Research Division of the National Bureau of Standards (NBS) was selected to write performance based criteria and evaluate the housing for HUD. A technical panel formed by the National Academies of Sciences and Engineering is providing HUD with independent advice on the results of the NBS evaluations.

Philosophy and scope of structural performance criteria, F. Y. Yokel and N. F. Somes, *SP361, Vol. 1,* pp. 261-266 (Feb. 972).

Key words: Deflection; load capacity; performance criteria; performance evaluation; stiffness; strength; structural engineering; structures; user requirements; vibration.

In the program entiled "Operation BREAKTHROUGH," the U.S. Department of Housing and Urban Development is supporting and guiding the development of industrial housing systems and encouraging innovation in housing technology. Evaluation criteria that were developed by the Building Research Division of the National Bureau of Standards' Institute of Applied Technology will be applied to all "Operation BREAKTHROUGH" housing systems. This paper presents the philosophy for the development of Structural Performance Criteria, which are derived from the user requirements of safety, activity support, low maintenance cost, absence of stress and anxiety and visual acceptability. One example is quoted to illustrate the form of these criteria, which comprise three groups: strength, stiffness and rigidity, and resistance to local damage.

Philosophy for physical simulation using performance criteria, N. F. Somes and F. Y. Yokel, *SP361, Vol. 1,* pp. 267-274 (Feb. 1972).

Key words: Accelerated aging; building systems; extreme loads; performance criteria; performance evaluation; service loads; stiffness; strength; testing; variability.

Physical simulation may be defined as a testing procedure designed to closely simulate the actual structure in order to determine the response of the prototype structure to the loads it is likely to receive during its service life. Criteria for physical simulation include the selection of critical assembly, the consideration of critical load conditions, the allowance, the allowance for the effects of the service life environment and taking account of variability in structural elements and subsystems. The paper discusses each of these criteria in detail, and presents a philosophy.

Field testing of conventional buildings for static and dynamic deflections, G. C. Hsi, H. S. Lew, F. Y. Yokel, and N. F. Somes, *SP361, Vol. 1,* pp. 275-288 (Feb. 1972).

Key words: Building; design criteria; drift; field test; floor vibration; wood frame.

In order to evaluate innovative materials and systems it is necessary to develop performance criteria for aspects of structural behavior which hitherto have not been considered for traditional materials and solutions. It is reasonable to set levels of performance required by these new criteria so as to achieve a performance which has been acceptable to society over a long period of time. Unfortunately, there is a lack of data on the performance of traditional buildings. This paper describes recent field testing of several conventional buildings in order to confirm the suitability of performance criteria established for static and dynamic deflections within the "Operation BREAKTHROUGH" program.

Performance of components: a procedure for the preparation of specifications for building components, H. W. Harrison, *SP361, Vol. 1,* pp. 289-296 (Feb. 1972).

Key words: Building components design; building procedures; contracting procedures; performance specifications; properties of building materials; standardization.

The United Kingdom Building Research Station has been assisting a number of public bodies – central government departments, or consortia of local authorities – in the preparation of performance specifications, and monitoring their use in the purchase of components for educational, housing and other building programmes. The procedure used is described. Reference is made to the problems involved in obtaining alternative proposals from manufacturers and in assessing their suitability, also to the use of the CIB master list of properties.

User requirements and performance design, J. King, *SP361, Vol. 1,* pp. 297-301 (Feb. 1972).

Key words: ABS (Academic Building Systems); EFL (Educational Facilities Laboratories, Inc.); environmental criteria; evaluate; performance criteria; performance design; RAS (Recherches en Amenagements Scolaires); SCSD (School Construction System Development); SEF (Study of Educational Facilities); SSP (Schoolhouse Systems Program); URBS (University Residential Building System); user requirements.

To establish performance goals for buildings based on extensive user requirement studies has been the basic underlying goal behind the building systems which have been developed for educational buildings in North America. Evaluating the quality of buildings has generally been a subjective question. Establishing performance criteria begins to tie quality to measurable objectives rather than more ephemeral issues. Finding those performance objectives which can be described, which are relevant to the building, which are relevant to education, and which protect the economic interests of the owning institution is neither simple nor direct. Conflicts between immediate economic advantage and long range flexibility, between comfort and economy, between low first cost and long-range operational economy make for difficult decision making.

Weighing the comparative importance of the conflicting interests of the user-client (student/teacher/dormitory resident) and the owner-client (school system/college/university) is the most subtle area of decision making and the toughest. The evaluation of whether the resulting buildings meet the performance criteria is a comparatively simple matter. Reexamining whether the performance criteria adopted was appropriate and consistent with the direction the institution has taken since the building has been built, occupied and used is a more significant and of course a more difficult question to get at.

Paths to performance—some recent projects employing the performance concept, W. Meyer, R. Bender, and C. Arnold, *SP361, Vol. 1,* pp. 303-315 (Feb. 1972).

Key words: ABS; building systems; college buildings; dormitories; HVC; laboratories; lighting/ceiling; performance specifications; procurement process; SCSD; structure; subsystem; URBS.

Two building research, and development programs, organized and directed by our firm (BSD), have utilized the performance concept, each with a different approach and end result. Both projects were based on earlier experience coordinating the School Construction Systems Development (SCSD) program.

Based on an analysis of user requirements, performance specifications and/or requirements were developed on the URBS (University Residential Building System) program for University of California student housing, and on the ABS (Academic Building Systems) program for Indiana University and University of California academic buildings.

The URBS project involved performance specifications to guide the development by manufacturers of five *new* subsystems for student housing. Specifications for the subsystems were written to accommodate cooperation between bidders and to assure an integrated design proposal. Product development to meet the URBS performance specifications was based upon a large, guaranteed market. The ABS program on the other hand, could not guarantee a future market and therefore assumed the selection of *existing*, already developed, products for its five subsystems.

Based on the experience gained from the URBS and ABS projects, the paper calls for the encouragement of public agencies to collect and develop, as necessary:

- methods expressing man's environmental needs in performance terms;
- scales for displaying various *levels* of performance;
- methods for relating *levels* of performance to various activities or spaces as they occur in buildings; and
- models for using performance-oriented requirements in building and building systems procurement processes.

The "Recherches en Aménagements Scolaires" (R.A.S.) project— a case study—strategy implemented for the development of a building system for educational facilities through the Performance Concept, M. Bezman, *SP361, Vol. 1,* pp. 317-330 (Feb. 1972).

Key words: Bid evaluation; building systems; criteria and tests; educational facilities; life cost; performance specifications; prototypes; S.C.S.D., R.A.S.; strategy; systems approach; technology and feasibility; user needs.

The R.A.S. Project (Research in School Facilities), was conducted by the author for the Montreal Catholic School Commission. Both the recognition of a basic problem common to all school districts, and the acceptance of a problem solving direction experimented with in California through the S.C.S.D. Project, are at the origin of the R.A.S. Project. The problem is the inadequacy of traditionally accepted methods to provide educators with appropriate and adaptable facilities within limited financial boundaries and the direction is the adoption of the "Systems Approach" for viewing and solving the problem, and the "Performance Concept" as a means for achieving the objectives subsequently defined.

The Performance Concept approach was instrumental in harnessing Canada's industrial resources and potential for the development of a building system (presently under implementation) integrating the following sub-systems:

1. Structural
2. Heating-Ventilation-Cooling
3. Ceiling-Lighting
4. Internal Space Subdivision
5. Electric-Electronic Distribution

The strategy enforced and the means implemented through the various stages of the project, as well as the subsequent results are discussed throughout.

The paper covers:

- the project's specific context,
- the main surveys conducted to establish a basis for Performance Specifications, from user requirements to evaluation of resources,
- the major Performance Requirements developed to identify the problems for which a solution was sought,
- the Performance Criteria defined to qualify and quantify the required levels of performance,
- the evaluative methods implemented during the pre-bid, bidding and development phases of the project (scientific measurement, empirical evaluation and economic evaluation) to test and evaluate the building systems "as a whole" and at the level of their individual sub-systems.

The development of performance criteria for university facilities, R. F. Hallenbeck, *SP361, Vol. 1,* pp. 331-337 (Feb. 1972).

Key words: Acoustical environment; administrative procedures; communication; environmental criteria; functional criteria; interior finishes criteria; luminous environment; measurement; outdoor lighting criteria; performance criteria; process description; university facilities.

Since its inception in 1962, the State University Construction Fund has been responsible for the planning, design and construction of campus facilities for the State University of New York. It is estimated that as of September 1971, the Fund has completed, or placed under design or construction, facilities costing 2.31 billion dollars. In concert with this large-scale effort, the Fund has undertaken the development of performance criteria for its physical facilities in two

groupings – Environmental Performance Criteria and Functional Performance Criteria. It is contemplated that criteria in these two areas will be synthesized into a third area of criteria for Construction System Performance upon completion of research in progress. Difficulties in generating industry wide acceptance of measurable performance criteria has lead to the exploration and development of a variety of means of communicating Fund requirements to the design professionals who prepare plans and specifications for university facilities. These interim approaches to communication of performance requirements include: State-of-the-Art documents, specification statements, administrative procedures, design development process descriptions, space planning and design criteria and check lists. Much remains to be done in the direction of more precise and comprehensive communications within the construction industry with measurable performance criteria a mainstay of this goal.

Experience and lessons from an innovative housing project sing the performance concept, W. Allen and P. Rich, *SP361, ol. 1,* pp. 339-344 (Feb. 1972).

Key words: Building systems; education; government sponsored research, need for; housing – industrial, innovated, prototype, low-rise high-density industrialization; performance requirements.

A large low-income project of low-rise construction has been completed in an industrialised building system selected by competitive bidding based upon performance criteria written by the architects. Provisional building designs were prepared in advance as part of an innovative community plan and formed part of the guidance in formulating the criteria. Initial screening reduced the number of bidders to three, all of whom had then to be assisted to develop conformity to the criteria. This part of the project demonstrated the need for whole-dwelling performance requirements established nationally.

Examples are given of the ways in which the design requirements of low-rise high-density development influenced the performance criteria. They are the need to park cars beneath 3- and 4-storey construction, the assembly constraints due to narrow pedestrian passages, a need for stepback balconies and terracing, and party floors which meet fire and sound requirements.

Unconventional performance-based specification items were also exemplified. Concrete finishes were prescribed by Munsell classification, and were also required to deter scribbling. Weather-tightness of joints, thermal performance (in some detail), sound insulation and fire were covered.

The bidding procedure required a new sequence and form for contract documents and this is described.

Prototype dwelling had to be built for agreement on quality of finish and to remove difficulties from the assembly process. Some criticisms are made of the inadequacy of preliminary trials which is unavoidable at this stage as present conventions operate, and this is noted as a cause of some defects which later became evident.

Other lessons are identified. The performance approach requires equivalent development of evaluation and testing procedures, and changes in legal and contractual matters. The vital role of building research organisations for monitoring and feed-back is emphasised for the collective learning process of the professions and industry. The relation between responsibility and deficiencies in the absolute state of knowledge for innovational situations is noted. The educational unpreparedness of the industry is emphasised as a barrier and cause of enhanced risk.

Finally, five major factors of building education and administration which need review by governments promoting innovation are identified.

Evaluation process of performance and cost as applied to existing housing prior to rehabilitation, C. Forsberg and G. S. Birrell, *SP361, Vol. 1,* pp. 345-356 (Feb. 1972).

Key words: Analysis; cost; evaluation financing; housing; improvements; individual; inspection; minority groups; performance; real world; rehabilitation; synthesis; system; user needs; user values.

This paper presents a process for evaluating the performance of existing homes and planning suitable changes for users who would like to improve this performance. The process was evolved as a result of field research work in aiding minority group families evaluate their homes. The process is intended to enable a housing advisory group assist families in satisfying their individual User Needs. Given that family's home and their priorities for its improvement, income, and available financing, the process derives realistic rehabilitation choices available. Topics discussed include technical/human housing user interface problems, presentation of information, housing requirement analysis process, individual housing user value rating analysis, housing user financial analysis and the organization of the advisory service. This paper maintains a simple level of description and discussion to keep the system uncomplicated enough to operate in the harshness of real-world field work of aiding minority groups rehabilitate their homes.

Performance specifications for office space interiors, T. E. Ware, *SP361, Vol. 1,* pp. 357-374 (Feb. 1972).

Key words: Building process; building systems; "closed" systems; management; office buildings; "open" systems; performance specifications.

The Public Buildings Service of the General Services Administration, which creates a $200 million annual market for Federal office buildings, commissioned the Building Systems Section of the Building Research Division of the Institute for Applied Technology, National Bureau of Standards, to conduct an experiment demonstrating the feasibility of the Systems Approach to designing, specifying and constructing complex buildings. Thus, the Government is using its building program for its own benefit while making a public experiment intended to replace prescriptive specifications with Performance Specifications based upon a specific definition of user's needs. This approach will modify – perhaps drastically in some instances – the products, rules, people, resources and energy involved in the building process. It is not intended to supplant the traditional design process or construction process, but rather, it is intended to combine all the elements in the design and construction process to more precisely and efficiently produce a desired result. The principles of this project are examined in such terms that their application to other projects may be expedited.

Performance requirements for windows, E. Paulsen, *SP361, Vol. 1,* pp. 375-384 (Feb. 1972).

Key words: Air-tightness; performance characteristics; performance parameters; rain-tightness; sealed glazing units; wind loading; window.

A window is defined as any part of a vertical external wall which is predominantly filled by transparent or translucent material and where the primary function of a window is to furnish the adjacent room with sufficient daylight and provide a clear and undistorted view to the outside.

Statements of performance requirements are given under the following headings: Transparency and vision, light transmission, glare, control of solar radiation, thermal insulation and condensation, sound insulation, airing (ventilation), airtightness, rain-tightness, strength and stiffness, control of opening light, security against illegal entry, fire resistance, escape from fire, appearance, dimensions, durability of operating parts and durability of materials.

Evaluation of window performance, A. G. Wilson and J. R. Sasaki, *SP361, Vol. 1,* pp. 385-394 (Feb. 1972).

Key words: Performance criteria; performance evaluation; window characteristics; window evaluation; window functions; window requirements; window standards.

Windows are used in the enclosure of buildings to permit entry of natural light, a view of the outdoors, and ventilation. In addition, windows must perform the same function of separating interior and exterior environments as the remainder of the enclosure. Functions related to transparency may be in conflict with those relating to other desired attributes of the building space; this creates the need for considering cost versus benefit on a system basis in establishing performance criteria. This paper deals with the current status of evaluation of windows as environmental separators.

Many aspects of performance cannot be adequately predicted from basic principles, hence a number of standard tests are evolving for evaluation of some of the primary ones. The tests are widely used in product standards, along with relevant criteria, to classify windows and to define certain minimum requirements. Standard test methods, however, have some important limitations in relation to predicting and specifying performance in-use. Some performance characteristics, particularly those involving heat and mass flow, are interdependent although they are usually evaluated independently or are influenced by factors that are excluded or fixed in standard test methods. Where in-use performance of windows is critical, it may be necessary to resort to more complex tests that attempt to take account of all the major factors influencing the final result. This is economically practical only on major construction projects. The development of information to assist the designer in predicting window performance for the majority of situations, utilizing data obtained from standard tests, is, therefore, a desirable goal. The designer will, however, always need to exercise judgment in relating the limited information provided by tests, or other methods of prediction, to the real situation.

Effect of envelope design on cost performance of office buildings, M. Anson, W. B. Kennedy, and J. W. Spencer, *SP361, Vol. 1,* pp. 395-406 (Feb. 1972).

Key words: Cost analysis; design criteria; external envelope; office building; performance evaluation.

Building design ideally should cover a sufficient range of design alternatives to enable selection of a combination of the performance variables which is as near optimum as can be obtained with the money available. In practice most design variables do not relate simply to the performance variables, and the best that can be done is to check the various performance levels of a design selected on the basis of past experience, amending those features found to be unsatisfactory. This conventional procedure can be improved as much by the development of suitable computational routines as by further refinement of direct measurement of performance.

This paper reports substantial progress with the computation of air-conditioning costs, which when both initial operating costs are taken into account is the biggest cost item in an office building. The peak air-conditioning load, the sum of the initial costs of the plant, and the envelope plus plant operating, maintenance, and replacement costs over the life of the building have been calculated for 122 variations of a hypothetical building situated in Melbourne (38 °S, 145 °E).

The study showed that the return on investment could be increased from 10 to over 11% for a hypothetical building with 150,000 sq. ft. of rentable space depending on envelope design. For smaller buildings this increase could be even higher because the ratio of the envelope area to volume of the building increases as volume decreases.

Tables and graphs are presented which give some consideration to the relative economic effectiveness of building envelope materials and fenestration.

Use of modern computer programs to evaluate dynamic heat transfer and energy use processes in buildings, T. Kusuda and F. J. Powell, *SP361, Vol. 1,* pp. 407-418 (Feb. 1972).

Key words: ASHRAE Task Group Energy Requirements; computer application; heating/cooling load; room temperature; thermal environment.

Salient features of the ASHRAE (American Society of Heating, Refrigerating and Air-Conditioning Engineers) Task Group procedures for calculating heating and cooling load are described. It is stressed that the significance of the thermal storage effect is to be found in the conversion of the heat gain process into the cooling load, even in commercial buildings.

An NBS computer program (NBSLD) was used to augment the ASHRAE methodology. This program was designed to predict the indoor temperature of buildings with limited air conditioning or none at all. Various calculation results obtained by NBSLD are illustrated, some of which are compared with the experimental results.

A simple cooling load calculation illustrated in Chapter 28 of the 1967 ASHRAE Handbook of Fundamentals is used to compare the results obtained by the NBSLD program and the program developed by the U.S. Post Office Department (USPOD), which is an adaptation of the ASHRAE Task Group Procedure.

The application of total energy systems to housing development, P. R. Achenbach and J. B. Coble, *SP361, Vol. 1,* pp. 419-430 (Feb. 1972).

Key words: Energy conservation in housing; energy systems for housing; environmental quality in housing; field study of energy systems; total energy systems; utility system performance.

A pilot investigation of the performance of a total energy system was undertaken by the National Bureau of Standards to evaluate the potential for decreasing the amount of fuel required to provide the utility services to an apartment complex of 500 units and for better control of noise and air pollution. This installation is being made at a site in Jersey City as a part of the BREAKTHROUGH program of the Department of Housing and Urban Development. The selection of the site followed a feasibility study of eleven sites distributed over the United States and the preparation of a performance specification which set forth the design conditions, the requirements for reliability, stability and safety of the system and the environmental quality that must be attained.

The pilot total energy plant is being extensively instrumented to determine its thermal efficiency; the daily and seasonal load patterns; the reliability of the utility services;

the level of noise and pollution control; the maintenance and repair requirements; the owning and operating costs; and the occupant response to his environment.

A morphological performance evaluation technique for moisture problems in buildings, J. Saarimaa, *SP361, Vol. 1,* pp. 431-449 (Feb. 1972).

Key words: Building moisture problems; effects; evaluation; morphological research; movement; sources.

The paper gives a picture of an evaluation technique which may be suitable in solving moisture problems of buildings. The final goal of the procedure is the setting up of the performance requirements which are needed for building elements and products in order to ensure the expected performance of constructions. The evaluation is done with the help of a matrix which is built up as follows: The problem may be divided in the following main factors:

1. Moisture sources
2. Moisture movement and fixation
3. Effects of moisture
4. Performance requirements

Each factor will then be given all the possible values it can get in reality. The main factors form the first vertical column of the matrix, and the possible values of these factors are put on the horizontal lines. The principles and the procedure of the evaluation technique will be discussed. The values of the various "factors" will be introduced, and examples given on the results obtained.

Sizing of water heating equipment, L. G. Spielvogel, *SP361, Vol. 1,* pp. 451-463 (Feb. 1972).

Key words: Domestic hot water systems; hot water heating; hot water system design; hot water usage; survey of hot water use.

This paper contains the results of studies made on 162 buildings throughout the U.S.A. to determine the nature of hot water use in order to establish design criteria for sizing water heating equipment in various types of buildings.

An extensive search of the literature was conducted and analysed, and there is an extensive bibliography and list of references on this subject available.

Meters were installed in the cold water inlet to water heating systems and hourly readings were taken for periods of up to 1 1/2 years. Data was collected and organized in 10 categories of buildings, men's college dormitories, women's college dormitories, motels, nursing homes, office buildings, food service facilities, apartment houses, elementary schools, junior high schools, and high schools. Test data was analyzed with respect to peak hourly, daily and average flow rates in order to compare with previously available information. Further analysis was done on multiple-hours use of hot water, and curves were drawn representing an infinite number of relationships between storage capacity and recovery capacity, any of which will adequately meet the requirements for hot water in each type of building.

Some of the factors that influence hot water consumption are discussed. The influence that hot water temperature has on demand and consumption is analyzed. New definitions are developed for efficiencies in connection with water heating systems. Limited information on energy consumption of water heating systems is discussed. Safety factors are recommended. There is some discussion on instantaneous flow rates based on data extrapolation.

Typical profiles for each category of building are shown with hour-by-hour flows for the day in which the peak hourly demand occurred, the day in which the peak daily demand occurred and the hour-by-hour average of all test data for the particular building selected.

With this information it is now possible to make an economical selection of water heating equipment, based on both first cost and operating cost. Comparing the recommended sizing methods with those methods previously used shows a significant reduction in both storage capacity and recovery capacity for most types of buildings.

The development of performance criteria and test procedures for the piping of sanitary drain, waste and vent systems in residential service, R. T. Holtz, *SP361, Vol. 1,* pp. 465-476 (Feb. 1972).

Key words: Criteria for DWV pipe; drain, waste, and vent systems; environmental factors; evaluative methods for DWV pipe; thermoplastic pipe.

The development and use of new plastic materials for drain, waste and vent piping emphasized the need for the identification and definition of service requirements to be used as a basis for minimum performance criteria for these products. Such criteria would have to take account of all of the pertinent application and service factors to which a typical DWV product might be exposed, and to provide for safe and satisfactory performance under these conditions for the projected life of the building. The availability of such criteria would enable the development of materials and the design and engineering of DWV products to more accurately meet the needs of this plumbing service. It would also facilitate the design and evaluation of systems fabricated from various materials.

Several years ago, a task force was established under the auspices of Standards Committee A112 of the American Standards Association (now American National Standards Institute—ANSI) to:

1. Determine the service criteria for residential drain, waste and vent systems;
2. Establish the design criteria and test conditions for plastic DWV materials to meet the service requirements.

The task force, composed of experienced sanitary engineers and others knowledgeable in plumbing engineering identified the following general categories of service criteria: Chemical, Mechanical, Thermal and Environmental. Objective minimum or maximum conditions for each of these criteria in these categories were determined, and test conditions were recommended, based on an assumed fifty year usage.

Following completion of the service criteria, the group determined test procedures, simulating end use conditions and established design criteria consistent with the minimum service criteria for DWV systems. This paper emphasizes the methods used in the study, the service conditions identified as pertinent to DWV exposures, and the criteria established. It then discusses how these criteria were adapted to facilitate adequate performance through appropriate design of plastic DWV piping.

Simplified acoustical measurement procedures for building code enforcement, M. J. Kodaras, *SP361, Vol. 1,* pp. 477-481 (Feb. 1972).

Key words: Acoustical field measurements; building code enforcement; noise control enforcement; noise control in dwellings.

New and revised building codes now contain specific requirements for acoustical privacy in multifamily dwellings. These performance specifications for sound transmission loss, impact sound insulation, maximum per-

missible sound power radiated by mechanical equipment and isolation of structural vibration sources must be subject to field measurements to assure compliance with the building code provisions. In most cases the results of these field measurements need only indicate a "pass" or "fail" result.

This paper reviews some of the simplified field test procedures now in use and in process of development.

The effect of illumination systems upon visual performance, I. Lewin and J. W. Griffith, *SP361, Vol. 1,* pp. 483-490 (Feb. 1972).

Key words: Illumination systems; lighting; performance concept; task contrast; veiling reflections; visual performance; visual task.

One of the critical human factors in building design is the provision for an adequate level of visual performance, in relation to the speed and accuracy of vision. It has only recently been recognized fully that the amount of illumination on a visual task may be of secondary importance to that of another variable, the "task contrast." The concept of "Contrast Rendition Factor" will be developed, where the amount of contrast produced on a written task by any given illumination system may be evaluated in relation to a reference standard. Recent researches will be reported which indicate the ineffectiveness of present conventional illumination systems.

Further research undertaken in the development of unconventional systems of illumination will be reported, and it will be shown that a unique distribution of light within a working area can produce very substantial visual performance increases, without increasing the electrical input to the system.

Whereas the paper will include some theoretical concepts in relation to visual performance, its chief purpose will be to provide practical guidelines for the improvement of this factor.

The performance concept in the service of technical evaluations of building innovations, D. E. Dobson, *SP361, Vol. 1,* pp. 491-502 (Feb. 1972).

Key words: Agrément; durability prediction; economic aspects; evaluative judgement; need for clarity of purpose; performance concept; plastics in fire; rain penetration; robustness of construction; technical evaluation; uniformity of assessment; weathering.

The introduction gives a broad picture of the increasing effort of the National Building Research Institute (NBRI) in the field of technical evaluation and performance requirements. Terminology is also defined. This is followed by a section in which work on certain selected aspects of performance is discussed. The concluding sections deal generally with the performance concept and its cardinal position in the evaluation of innovations in building, and bring out some of the practical limitations of the concept and the continuing need for the exercise of evaluative judgement.

Technical evaluation of components: agrément, G. Blachère, *SP361, Vol. 1,* pp. 503-506 (Feb. 1972).

Key words: Agrément; assessment; durability; new materials; new processes.

It is a problem for a builder to know whether a component presents the physical properties which are needed for it to play its part correctly in the finished whole.

Various means are available to give this proof:

– the use of science and exact physical measurements,
– the use of traditional knowledge recorded in codes of practice and standards,
– the direct proof by performance tests.

Unfortunately among the properties required is durability and often it may not be possible to test it by one of the preceding methods, because scientific knowledge may be lacking, experience does not exist for new components, and performance testing takes too long where durability is concerned. Nevertheless it is necessary to have, if not a proof, at least a judgement about the durability of new materials, components, and building systems, and if a completely logical proof is not possible, the advice of the best experts based on a broad examination and various tests is the best that can be found. Such is the agrément procedure. People such as manufacturers, builders, and administrative authorities needing the best advice on the durability of new things, can ask for an agrément issued by a group of experts drawn from all parts of the building field, utilizing the results of measurements of natural or semi-natural tests on a full or reduced scale, and experience with short term use.

It is possible to draw up a check list of the various properties that may be required of an element in service and of the means of testing them. Some examples of such properties and tests will be given.

For convenience of the users of agrément a control of the manufacture of approved products is possible and may be indicated by a mark.

An agrément procedure is used in all the Western European countries which belong to the UEAtc, and which cooperate in writing common directives for agrément and in recognizing each other's agrément certificates.

Performance requirements in a systematic method for selecting building materials, K. Shirayama, K. Imaizumi, K. Kamimura, K. Kondo, F. Saito, T. Nireki, K. Ito, F. Tomosawa, S. Sugawara, H. Suzuki, K. Kawase, Y. Takahashi, S. Oka, Y. Mimura, M. Ito, *SP361, Vol. 1,* pp. 507-518 (Feb. 1972).

Key words: Building; classification; comparison; elements; materials; performance requirements; selection.

The purpose of the study on "Systematic Method for Selecting Building Materials" is to establish a system or rational method for solving the problem of how to select and how to use building elements or materials. This selection system is composed of the following steps:

1. Identify the conditions concerned with the use of building elements or materials and put them in order. These conditions are named "Given Conditions."
2. Select necessary performance requirements for the buildings or components according to the "Given Conditions."
3. Transform performance requirements of the building to those of building elements or materials.
4. Evaluate performance or properties of existing building elements or materials based on the results obtained by suitable proposed methods of tests, calculation, and so on.
5. Select building elements or materials by means of comparing their evaluated performance or properties with those required.

The outline of this systematic selecting method is presented putting stress on the following points.

a. Classification and arrangement of the performance requirements.

b. Selection of necessary performance requirements according to the "Given Conditions."

c. Relation and transformation between the performance requirements of different levels.

Proposed method of test for evaluating performance of buildings, building elements, and materials, K. Shirayama, K. Imaizumi, K. Kamimura, K. Kondo, F. Saito, T. Nireki, K. Ito, F. Tomosawa, S. Sugawara, H. Suzuki, K. Kawase, Y. Takahashi, S. Oka, Y. Mimura, M. Ito, *SP361, Vol. 1,* pp. 519-529 (Feb. 1972).

Key words: Building elements; building materials; evaluation; performance; performance requirements.

In order to select suitable building elements or materials rationally, it is essential to make clear their performance corresponding to the requirements. To achieve this, fifty standard testing methods, with evaluating methods of test results, were prepared.

These testing methods are classified into the following three groups:

a. Tests for materials (Materials-related tests)
b. Tests for building elements (Building element-related tests)
c. Tests for space or building (Space or building-related tests)

In each testing method, the following items are included.

1. Designation of testing method with its classification symbol.
2. Relevant performance requirements.
3. Scope
4. Test specimen description
5. Procedure
   5-1 Outline
   5-2 Apparatus
   5-3 Conditioning prior to test
   5-4 Details
6. Evaluation method and grade determination
7. Report
8. Notice, other relevant testing methods.

Titles of all proposed methods are tabled and some of them are referred to in detail.

Performance of components with special attention paid to the practical implementation, G. Christensen, *SP361, Vol. 1,* pp. 529-534 (Feb. 1972).

Key words: Components; dirt repelling; evaluation; feedback; open system; performance requirement; scratch resistance; testing; water-spray repelling.

It is explained how the use of the Performance concept on the level of components has an open building system as a prerequisite and further that a number of compatibility problems thus must be solved.

Manufacturers and designers have a common need in describing the attributes offered or required by a component on a Performance base. An example of the basic principle for such a common Performance language is shown.

The principle is used for describing the Performance attributes for bathroom walls regarding scratching resistance, ability to repel dirt, and ability to reject water spray. The background for the use of these tests is also discussed.

It is finally underlined how important it is to explain to the building industry that the Performance concept is created as an invitation to new technical solutions within building and it is not meant as a new set of restrictions to be used instead of traditional building regulations.

Increasing the application efficiency of performance tests with analytic procedures, S. K. Suddarth and D. H. Percival, *SP361, Vol. 1,* pp. 535-543 (Feb. 1972).

Key words: Analysis and performance tests combined; computerized analysis; plane frame structures; test results; use of structural analogs.

A method is illustrated for combining more advanced analytical procedures with performance tests of plane frame structures. A fundamental part of the method is the development of an analog, or mathematical model, of the real structure. This analog, which may be as simple or as complex as the situation warrants, is processed by a computerized system to produce a complete structural analysis. In use, performance tests of parts of the frame, particularly joints, can be used to evaluate needed parameters in the analog of the entire structure.

Three quite different examples are given showing how the analog reproduces the deformation patterns corresponding to the full-scale test structures. Acceptance of internal stresses in the analog as sufficient estimates of internal stresses in the prototype is based primarily on the deflection correspondence.

The possession of a suitable analog permits examination of a wide variety of structural variations and load cases that require verification with only a relatively small number of prototype tests.

Evaluation of structural concrete members penetrated by service systems, J. M. Hanson, W. G. Corley, and E. Hognestad, *SP361, Vol. 1,* pp. 545-556 (Feb. 1972).

Key words: Analysis; concrete beams; concrete plates; ducts; openings; serviceability; strength; structural performance; tests.

Performance requirements for structural concrete members containing openings are defined. Both strength and serviceability are considered. Results of tests carried out by the Portland Cement Association to evaluate performance of flat plate and beam and slab floors containing embedded metal ducts and of concrete joists with holes in their webs are described.

A performance approach to the design of fire-resistive buildings, L. G. Seigel, *SP361, Vol. 1,* pp. 557-566 (Feb. 1972).

Key words: Building design; fire protection; fire resistance; fire-resistive buildings; structural design.

For many years, fire-endurance requirements for building structures and fire-insurance rate schedules for buildings have been based on performance demonstrated in standard fire tests. However, many conditions that may be encountered in an actual building, such as structural restraint, and partial or nonuniform fire exposure are in no way covered by standard fire test procedures. Therefore, the results of standard fire tests (as presently defined) may not represent the performance to be anticipated in a building. The structural performance of a building during a fire depends on the temperatures reached by the structural members of the building independent of how such temperatures are attained. Therefore, an analytical approach to the determination of fire resistance should be considered based on appropriate temperature limits for the structural materials of the building. Fire-resistive design may then be accomplished by providing adequate thermal protection to the structure so that the temperature limits of the structural materials will not be exceeded.

The resistance of brick walls to lateral loading, H. W. H. West and H. R. Hodgkinson, *SP361, Vol. 1,* pp. 567-576 (Feb. 1972).

Key words: Brickwork; experimental; lateral loading; performance; research; residential structures; safety; structural masonry.

The Building (Fifth Amendment) Regulations 1970 lay down performance requirements to prevent progressive collapse, following and incident, in buildings of 5 storeys or more. Essentially either the building must be so designed as to provide alternative paths of support in the event of the removal of a main structural member, or the members must be designed to withstand a lateral load of 5 lbf/in². Laboratory tests to determine the lateral strength of various types of brick wall are briefly described and the application of the results to the evaluation of the performance of real buildings discussed. It is concluded that solid brick walls more than 7 in. thick may be "deemed to satisfy" the requirements of the Fifth Amendment.

Experimental gas explosions in load-bearing brick structures, N. F. Astbury, H. W. H. West, and H. R. Hodgkinson, *SP361, Vol. 1*, pp. 577-592 (Feb. 1972).

Key words: Building structures; damage; gas explosions; limiting pressures; load-bearing brickwork; venting.

The resistance of normal types of fenestration and cladding, masonry walls, and a full-size load-bearing brickwork structure to explosions of town gas/air and natural gas/air mixtures was determined. The explosions were generated by igniting stoichiometric gas-air mixtures in balloons, or layered mixtures in the explosion space. Peak pressures were recorded by transducers. Explosion damage to the structure is discussed. Normal windows and cladding failed at pressures below 1 lbf/in² and in so doing provided venting relief limiting the maximum pressure developed, in accord with a simple formula. Under a precompression of about 30 lbf/in² a cavity wall will crack at about 3.3 lbf/in². A 4 1/2 in. wall fully restrained by returns failed at about 5 lbf/in² and a 9 in. wall fully restrained cracked but did not fail at 15 lbf/in². In a normally vented simulation of a full-scale real domestic situation, it was not possible to raise an explosion pressure greater than just over 3 lbf/in². Possible amplification of explosion effects due to cascade or turbulence in interconnected rooms is briefly discussed and will be studied further.

Performance characteristics for timber frame joist floors, H. Hansen, *SP361, Vol. 1*, pp. 593-600 (Feb. 1972).

Key words: Deflection (floors); dwelling; floor (wood); joists; loads; performance criteria; strength (floors); vibration (floors).

Different loads which act on a floor are discussed and a factor of safety based on economic criteria is used. The paper also discusses vibration and deflection criteria for timber frame joist floors.

It is pointed out that the deflection under a single point load may be used as a performance criterion for human perception to initial vibration.

An acceptable strength and deflection performance of a wood-joist floor system is given.

Performance requirements for floors, C. Bring, *SP361, Vol. 1*, pp. 601-612 (Feb. 1972).

Key words: Colour fastness; flatness; flooring; indentation; performance requirements; properties; quality classes; rolling load; surface evenness; test methods; warmth to touch.

Several properties of floors and floorings have been studied. Test methods have been used which allow comparisons between different types of floor materials and floor constructions. On the basis of tests on actual floors and in the laboratory, classified performance requirements are proposed.

The validity of the properties for different floorings and subfloors is considered. Typical quality classes of actual floors are surveyed. Suggestions for performance requirements for the discussed properties of floors in dwelling-rooms are made by way of an example.

With the users' requirements and the future conditions in mind, relevant performance requirements can be chosen for different projects with the help of the paper. The intended quality of a floor can generally be obtained in more than one way. However, none of the alternatives fulfills all requirements. Extremely high requirements on certain properties often must be combined with low requirements on other properties for the same floor. Already extremely high requirements on two antagonistic properties—like resistance to indentation and warmth to touch—might result in the elimination of almost all floors or floorings.

Performance analysis of floors, J. Saarimaa, Tenho Sneck, and M. Wäänänen, *SP361, Vol. 1*, pp. 613-623 (Feb. 1972).

Key words: Classification of floors; evaluation of floors; external factors; floorings; floors; performance analysis; properties of floors.

The paper discusses the main principles, which may be used in setting up performance requirements for floors. Performance requirements, which define the performance of a floor may be derived from an analysis of the external factors, which affect a floor in use by juxtaposition of the external factors and the properties of the floor. The following levels of building are considered in the analysis: space, building element, product combination, product, material. The analysis of external and internal factors as well as the relation between external and internal factors has been carried out on these levels. An evaluation technique, which could be used for selection and development of floors and floorings has been developed. The method is based on the identification and classification of the external factors, classification of rooms, listing of requirements and classification of rooms according to the requirements. The main purpose of the paper is to give an example of how the ideas of performance analysis could be applied to floors.

Strength criteria of glued-laminated timber, B. Bohannan, *SP361, Vol. 1*, pp. 625-632 (Feb. 1972).

Key words: Defective material; design criteria; design stresses; glued-laminated timber; knots; lamination; lumber grades; prestressed wood; slope of grain; strength criteria; strength ratio; strength-reducing characteristics; structural

Accurate knowledge of the properties of any engineering material is essential to its proper uses. Recognizing this fact the U.S. Forest Products Laboratory has had a continuing research program to better define the strength characteristics of glued-laminated construction, a versatile engineering material. Early research in the 1930's was the foundation for the glued-laminated industry in the United States. Design and manufacturing criteria were developed based on glued members which were relatively small by today's standards. With industry growth, manufacturing techniques and architectural design developed to the extent that timbers of almost unlimited size and shape were possible, but engineering technology did not keep pace. However, an extensive research effort during the 1960's has developed related engineering technology for the large timbers. This research established the effect of several facto

involving strength and design of large timbers—a principal one being the effect of tension lamination quality on beam strength. Such research has resulted in revised specifications for glued-laminated timbers which will insure a more reliable engineering material.

Performance requirements for mechanical fasteners used in building, E. G. Stern, *SP361, Vol. 1,* pp. 633-642 (Feb. 1972).

Key words: Bolts; building assemblies; building components; building constructions; framing wood; improved nails; mechanical fasteners; mechanical fastenings; nails; screws; staples.

The selection of mechanical fasteners used for joining and fastening of materials, assemblies, and components is influenced by a variety of criteria, all of which are related directly to the anticipated performance of the assembled items. The mechanical fasteners need to be selected on the basis of their actual and economic availability, versatility, applicability, physical and mechanical properties, rigidity and damping capacity, compatibility, thermal properties, fire resistivity, reliability including their resistance to creep, maintenance and repair of the finished product, and feasibility of testing for performance evaluation and performance predictability. These performance criteria are given detailed consideration in order to facilitate the writing of performance specifications covering mechanical fasteners as well as mechanical fastening in building constructions. Whereas the subject matter is approached from the overall viewpoint, reference is made to a few selected specific applications in order to draw attention to the importance of the performance concept under given conditions.

Performance criteria for composites in building, A. G. H. Dietz, *SP361, Vol. 1,* pp. 643-651 (Feb. 1972).

Key words: Classes of composites; composites for building; evaluation; performance criteria; performance statement.

Composite materials for building are mainly particulate, fibrous, or laminar. Examples are to be found in buildings in various parts of the world. Performance criteria are especially pertinent because composites are frequently put together to meet specific situations. Great care is needed to make sure that the criteria accurately reflect requirements. A statement of performance criteria is of little value, unless the actual performance of a composite building component can be tested. Some tests are equally applicable to composites and to other materials, but others are specific for composites. They include, for example, the character of the bonds among constituents; the fire behavior of a composite, especially penetration, flamespread, and smoke evolution; the combined mechanical behavior; and durability. New types of tests, such as ultrasonic evaluation of bond, are needed in many instances. Standard tests may require adaptation for evaluation of composites.

Basic problems and conditions of long term performance of materials and structures, O. Valenta, *SP361, Vol. 1,* pp. 653-658 (Feb. 1972).

Key words: Capillary elevation (head); coefficient of permeability; kinetics of deterioration; open pores; steady and unsteady flow; tests of absorption, permeability and capillary elevation.

Appropriate choice of materials for structures of all sorts must be based on their properties and long term performance in specified conditions of their application. Besides the main mechanical physical factors, factors concerned with the pore system in relation to the possibility of water or gas penetration must be considered as basic properties in the study of long term behavior of any material in natural weathering or other conditions. Actual state of standards concerned with humidity and water permeability of materials is analysed. Absorption, permeability and capillary elevation are considered as the main characteristics of materials.

Absorption test—its purpose and methods are discussed in the light of the mechanics and kinetics of water penetrating into a porous body. Some standards British, Russian, American and Czechoslovak are then quoted and analysed as to their interpretation and compliance with the need to describe the pore system effectively. The need of scientific base of such tests is stressed.

Permeability test—its purpose and methods are given with special emphasis to the need of providing us with the coefficient of permeability. British, Russian, German and Czechoslovak standards for testing are then surveyed from this point of view.

Capillary elevation test in relation to the importance of the capillary elevation head is analysed and Czechoslovak standards are quoted.

Mechanics and kinetics of water permeation into materials, its factors and their determination are considered as to their effect and importance for their performance in structures. Both steady and unsteady flow of water are considered in relation to the determination of the coefficient of permeability. Capillary properties of the pore system should be provided by test. The importance of these characteristics for the analyses of tests as well as of practical cases is then stressed by cases of practical application.

Pore properties in the evaluation of materials, J. M. Haynes and Tenho Sneck, *SP361, Vol. 1,* pp. 669-675 (Feb. 1972).

Key words: Materials; performance evaluation; pore size distribution; porosity; specific surface.

Many technologically-important materials are porous, and can be characterised by such pore parameters as porosity, specific surface and pore size distribution. The pore structure of such materials often plays a dominant role in controlling their useful properties. Attention is therefore drawn to some of the difficulties to be encountered in performance evaluation of such materials, when measured pore parameters have to be taken into account.

The definition of a low intensity fire, D. Gross and J. B. Fang, *SP361, Vol. 1,* pp. 677-686 (Feb. 1972).

Key words: Buildings; calorimetry; combustibility; fire intensity; flame spread; furnishings; heat release; thermal radiation; wastebaskets.

A reproducible fire of low intensity may be used for the realistic performance evaluation of interior finish materials and of structural building elements. The burning behavior of furniture and the contents of wastebaskets are defined in terms of the rates of heat release, heat transfer to the surrounding walls, and heat losses by radiation and convection. Experimental measurements of temperature and radiation levels within a room are summarized for a variety of combustible contents and mass loadings. Selected low intensity fires have been examined for repeatability and for potential use in evaluating fire safe requirements for interior finish materials in terms of the spread of flame, generation of smoke and overall fire growth pattern.

The interaction between mortar and masonry units as a basis for standards for masonry mortars, Tenho Sneck, *SP361, Vol. 1,* pp. 687-692 (Feb. 1972).

Key words: Fresh mortar; interaction between masonry mortars and units; masonry mortar; mortar evaluation; mortar standard; suction of masonry unit; winter masonry.

The paper describes a draft standard for masonry mortars which is based on the application of the performance concept on the "product" (material) level. The approach is based upon a statement that the solutions have to give optimal service, under the action of the external factors. In this case, the object of the analysis is fresh mortar. The most important external factor affecting the mortar is the suction exerted by the masonry units. The removal or non-removal of water has deciding effects on the mortar joint as a whole. Therefore, the properties of the mortar have to be matched to the properties of the unit. The evaluation of the mortar is based on the interaction of the mortar and the masonry unit. Testing methods and the general background of the evaluation are described. The final evaluation lies in the hands of an expert panel.

A performance evaluation of thin bed adhesive mortar in concrete masonry construction, L. A. Kuhlmann, *SP361, Vol. 1,* pp. 693-709 (Feb. 1972).

Key words: Adhesives; concrete masonry; cost performance; ground concrete block; mortar.

The rising cost of labor in recent years has prompted the concrete block industry to develop new methods of building walls. Of the many techniques created, the concept of gluing together dimensionally accurate concrete units has been the most successful. For the past 10 years, projects have been built with an adhesive mortar and block, providing an arena for demonstrating the performance characteristics of this concept. Both physical properties from ASTM test methods and economics from case histories prove that this concept is acceptable and practical.

Performance requisites for concrete building components and their achievement with gap-graded concrete, S. Li, D. A. Stewart, and V. Ramakrishnan, *SP361, Vol. 1,* pp. 711-718 (Feb. 1972).

Key words: Aggregate grading; cement content; concrete construction; creep; durability; economy; gap-grading; shrinkage; strength; structural concrete.

Performance requirements for all reinforced and prestressed concrete building components are established and criteria for evaluating such performance requirements are given. Their achievement with gap-graded concrete is substantiated with experimental results and field observations.

Relating materials quality to materials performance to structural performance of concrete, B. Mather, *SP361, Vol. 1,* pp. 719-724 (Feb. 1972).

Key words: Aggregates; cement; concrete; concrete quality; materials; performance; portland cement; structural performance.

Portland cement, aggregates for portland-cement concrete, admixtures for concrete, and curing materials for concrete are usually procured for use in construction under specifications that stipulate levels of quality as indicated by the results of standardized tests of samples. The information obtained from these tests is believed to be related directly or indirectly to levels of performance of the material itself, the composite of which it is a constituent, the structural element of which it is a component, and the structural system of which it is an element. The testing is limited to determinations that can be completed in the time available for testing and at an appropriate cost. The levels of quality are selected to be few for simplicity and are frequently higher than needed to insure adequacy of performance in the specific situation; rarely lower. Attention has primarily been directed to those few cases where less than adequate performance has resulted. Greater economies and more prudent utilization of natural resources will result if attention were directed to those much more numerous cases where stipulated levels of quality are higher than needed.

Proposed method for prediction of corrosion of reinforcement in concrete, J. Saarimaa, *SP361, Vol. 1,* pp. 725-732 (Feb. 1972).

Key words: Concrete; corrosion; durability; material properties; morphological research; performance analysis; reinforced concrete; reinforcement.

A performance evaluation technique suitable for the evaluation of corrosion of reinforcement in concrete is explained. The durability of the reinforcement is a consequence of the combined effects of the environment, the properties of the concrete and the reinforcement, and of the processes caused by the external factors which affect steel concrete. In order to be able to solve the complicated problem a systematical method of evaluation is needed. The prediction could be made with the help of a matrix which consists of a list of all the important factors affecting the corrosion of reinforcement. The evaluation can give both qualitative and quantitative information on corrosion. The evaluation technique is feasible for evaluation of the probability of corrosion of reinforcement in a defined construction. It can also give information on how a construction should be dimensioned in order to avoid corrosion of reinforcement.

The performance concept applied to building materials—an unattainable ideal, F. A. Blakey and K. G. Martin, *SP361, Vol. 1,* pp. 733-740 (Feb. 1972).

Key words: Building materials; concrete; functions in building; material prescriptions; performance concept; plastics; property tests.

The performance concept is the only logical basis for building regulations for the selection of building systems and for the whole design process, which does not implicitly restrict the designer on his choice of materials and form. Nevertheless, experience has shown that it remains an impractical ideal when one attempts to apply the concept to specification and control of materials. This is probably most evident for concrete and for plastics, two materials which are discussed in this paper.

There is no dearth of tests for concrete which may be used to assess the performance of the material in various ways, but there remain many important properties for which it is impossible to specify rational limits for the properties measured. There are also many tests which produce results, but these measures are of little value because they are obtained in conditions which are too far removed from the practical conditions in which the material will be used. Shrinkage and standard crushing tests for concrete are considered as examples of these viewpoints and yet might appear to be successful and valid applications of the performance approach.

Plastics may also be characterized by a variety of tests relating to many chemical and physical properties, and being manufactured to meet certain of these properties would also appear to offer opportunity for control by specification based upon performance tests. However, the functions most frequently required of plastics in building application include aesthetics, weathering, and fire resistance; and the

development of performance specifications to encompass such properties is shown to encounter problems at every step.

In view of these and other examples to be cited, it is proposed that there should be a widespread return to prescription specifications to complement quality and valid performance property testing. The tests needed to police a prescription specification are usually simpler and quicker to carry out than performance tests and are equally satisfactory for control of uniformity.

Evaluation of performance of materials performance and dimensional stability of resin binders, K. Gamski, *SP361, Vol. 1*, pp. 741-750 (Feb. 1972).

Key words: Adhesion; composites; dimensional stability test; fillers; performance; resin binders.

Although there are standard methods for evaluating the performance of composites based upon traditional binders such as hydraulic or bituminous binders, we have no methods for evaluating binders and composites made of resin.

The author describes some tests capable of being used and possibly standardized, among which is the dimensional stability measurement test. This test could be adapted to resin binders and composites on one hand, and on the other hand, adapted to large dimensional elements both prefabricated and constructed on site.

Natural and artificial weathering performance of rigid polyvinyl chloride (PVC) and other plastic materials, H. F. Stedman, *SP361, Vol. 1*, pp. 751-760 (Feb. 1972).

Key words: Atmospheric pollutants; color—difference and representation; impact resistance; plastics; rigid polyvinyl chloride (PVC); test methods; ultraviolet (UV) radiation; water vapor; weathering—artificial and natural; yellowing.

Rigid polyvinyl chloride and other synthetic plastics as exterior building materials are relatively new, but their use, fabrication and distribution are well-documented. Weathering performance of these materials is taking time to evaluate because of the wide range of variables involved, the general inertness of the substances and the lack of knowledge of the proper test parameters to use. An artificial weathering test method has been developed which takes into account the vital role of moisture in the degradation of plastics. Dual consideration is given to the deleterious effects of ultraviolet radiation alone. Many of the results of this combined method of evaluation have correlated well on an accelerated basis with outdoor performance. The efficacy of outdoor weathering emphasizes the need for a closer examination of UV radiation sources and test atmospheres. Color and surface changes are followed during weathering, and measures of stability are expressed as color difference units and gloss variations. Color acceptability may be evaluated by means of color triangulation. Changes in impact resistance in rigid PVC are as important as the influence of atmospheric pollutants during the natural weathering process. Both phenomena require duplication artificially with the hope of determining time equivalence between the two media.

Evaluation of structural adhesives for use in housing systems, W. W. Reichard, L. W. Masters, and J. H. Pielert, *SP361, Vol. 1*, pp. 761-775 (Feb. 1972).

Key words: Accelerated aging; adhesives; bonded structures; durability; glass fiber reinforced plastics; housing systems; Operation BREAKTHROUGH; paper honeycomb; performance criteria; structural sandwich.

As a result of the structural evaluation procedures developed for the "Operation BREAKTHROUGH" program, critical factors occurring in adhesive bonded structural assemblies were identified. The effects of aging, sustained-loading and adverse environmental conditions on these bonded areas were evaluated using small test specimens.

Typical results from this evaluation on two BREAKTHROUGH systems are presented. The results indicate that the accelerated aging procedure used here has a deteriorative effect on the strength of these systems. However, the magnitude of this effect was not judged to be great enough to reduce the strength of the final design below that required by the application. The results presented also show that the effects of adhesive thickness, temperature and sustained loading can be very significant and must be fully considered in design and structural evaluation.

Performance requirements for bituminous roofings, A. J. Hoiberg, *SP361, Vol. 1*, pp. 777-787 (Feb. 1972).

Key words: Bituminous; cost; durability; performance; roof behavior; roofing.

Factors related to performance of the shingle and the built-up membrane bituminous roofings are discussed under the general headings of durability, roof traffic considerations, appearance and economic evaluation. Durability relates to resistance to weather including wind and hail, and ability to withstand stresses within the membrane such as caused by thermal and moisture changes and by differential membrane and deck movements. Additional testing of roofing systems for ability to withstand movements is suggested and research methods which seem adequate are cited. Testing and requirements for fire resistance and hazard are described. Model analysis and testing are suggested to determine parameters and properties of materials required to be able to design properly performing traffic decks. Appearance is a primary design consideration for strip and individual shingles, whereas membrane systems mostly are applied for protection only. If a non-black appearance is desired, surfacing of the membrane with aggregate or a coating is feasible and additionally can improve durability. A method of economic analysis to determine the annual cost of a roof over its projected life is proposed. This includes in addition to first cost and annual capital charge, terms for maintenance, and the cost of surface renewal modified by a present worth factor. Quality control of the component parts and in application are key factors, once an adequate design of a roof system has been determined. Bituminous roofs can be varied greatly in design, and with proper care in construction will provide long time satisfactory performance at minimum cost in comparison with other systems.

Abrasion test and wear resistance of concrete terrazzo flooring tiles, I. Soroka, *SP361, Vol. 1*, pp. 789-797 (Feb. 1972).

Key words: Abrasion test; Böhme machine; concrete terrazzo flooring tiles; DIN 52108; wear resistance.

The paper summarizes a series of tests, in which the reliability of the Böhme abrasion machine (DIN 52108) in evaluating the wear properties of terrazzo concrete tiles was investigated. In view of the performance of such tiles under service conditions it was concluded that this procedure is not always reliable. It was therefore suggested that the acceptance procedure of such tiles should not be limited to an abrasion test but should also specify a minimum cement content in the terrazzo course. This minimum cement content should be 450 kg. per cu.m while the maximum amount of abrasion should not exceed 1.8 mm.

Performance tests for finish floors state-of-the-art, W. C. Wolfe, *SP361, Vol. 1,* pp. 799-806 (Feb. 1972).

Key words: Carpets; cleanability; conducting; durability; flooring; identation; resilience; slip resistance; static charge; test methods; water resistance; wear.

The need for performance standards in buildings and in finish flooring is recognized but performance requirements and criteria need to be established. Requirements for finish flooring, based on user needs, were divided into three categories in a symposium at the 72d Annual ASTM meeting. These were Health and Safety; Comfort, Convenience and Efficiency; and Economics. Criteria are dependent on the art and science of testing.

Sanitation factors, such as *cleanability and air pollution* are difficult to define. Statistics show a number of deaths and injuries from falls but the number of accidents due to *slippery floors* is unknown. *Fire safety* is not discussed as this is outside the scope of our work.

In the second category, *resistance to the movement of wheeled vehicles* is a problem with carpet but not with other types of finish floors. One question about *resilience as related to foot comfort* is whether this is related to fatigue or to foot problems. *Water and solvent resistance* is a problem in certain areas, such as bathrooms, kitchens, and industrial locations. The question of *noise or acoustics* is outside our scope.

Wear and durability is related to economics as it is a determining factor in life-cost. Since finish flooring is judged on appearance as well as function, it is important to consider change of appearance in wear testing as well as actual loss of material or wearing through.

The state of the art in test development is reviewed and exploratory work at NBS is presented in the areas of cleanability and stain resistance; slip resistance; indentation and resilience; static charge and conductivity; water resistance; and durability or wear.

SP361. Volume 2. **Performance concept in buildings.** Opening addresses, rapporteur reviews, and discussions. Proceedings of a symposium jointly sponsored by the International Union of Testing and Research Laboratories for Materials and Structures (RILEM), the American Society for Testing and Materials (ASTM), and the International Council for Building Research Studies and Documentation (CIB), Philadelphia, Pa., May 2-5, 1972, B. E. Foster, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 361, Vol. 2, 169 pages (Sept. 1972).

Key words: Buildings; components; design procedures; experience in use; materials; performance evaluation; performance requirements; user requirements.

Volume 2 records the proceedings of the Joint RILEM-ASTM-CIB Symposium on the Performance Concept in Buildings which was held in Philadelphia on May 2-5, 1972. Volume 1 contains the 82 papers accepted for the Symposium and was published prior to the meetings. This second volume contains the opening addresses; the reports of the rapporteurs, which include a review of the papers and a general discussion in each of six areas; such discussion as was submitted in writing; a general summary of the Symposium with conclusions drawn by the closing rapporteur; and statements by representatives of the three sponsoring organizations outlining the present and probable future activity of these organizations in furthering the performance concept in buildings. The subject matter covered in the papers includes physiological, anthropometrical, psychological, sociological, and economic human requirements and methods of evaluation; physical requirements and methods of evaluation in mechanical, acoustical, thermal, dimensional stability, compatibility, fire properties, and geometry areas; operation and maintenance requirements and methods of evaluation in such areas as maintenance, repair, replacement, and versatility; techniques and problems in applying the performance concept to design; and experience gained in application of the performance concept in design, building, and building use.

SP362. **Chemical kinetics in the C-O-S and H-N-O-S systems: A bibliography—1899 through June 1971,** F. Westley, Nat. Bur. Stand. (U.S.), Spec. Publ. 362, 68 pages (Apr. 1972).

Key words: Bibliography; carbon oxysulfides: carbon sulfides; chemical kinetics; gas phase; hydrogen; nitrogen; nitrogen oxides; oxygen; sulfur; sulfur hydrides; sulfur oxides.

A bibliography, a reaction oriented list of references, is provided for published papers and reports containing rate data for reactions of COS, COS_2, CS, CS_2, CS_3, D_2S, H_2S, H_2S_2, HSO_2, S, SH, SO, SO_2, SO_3, SO_4, S_2, S_2O_2, S_4, S_6 and S_8 with each other and with CO, CO_2, D, D_2, H, H_2, H_2O, N, N_2, N_2O, N_2O_5, NO, NO_2, NO_3, NOS, O, OH, O_2, O_3, R and RH. Three lists of critical reviews dealing with the above reactions are included. 317 papers covering 240 reactions are listed. The period covered extends from 1899 through June 1971.

SP363. **Bibliography on atomic energy levels and spectra, July 1968 through June 1971,** L. Hagan and W. C. Martin, Nat. Bur. Stand. (U.S.), Spec. Publ. 363, 103 pages (June 1972).

Key words: Atomic energy levels; atomic spectra; bibliography; energy levels, atomic; spectra, atomic; wavelengths, atoms and ions.

The bibliography contains approximately 1100 references classified by subject for individual atoms and atomic ions. A number index identifies the references. An author index is included. References included contain data on energy levels, classified lines, wavelengths, Zeeman effect, Stark effect, hyperfine structure, isotope shift, ionization potentials, or theory which gives results for specific atoms or atomic ions.

SP364. **Solid state chemistry.** Proceedings of the 5th Material Research Symposium sponsored by the Institute for Material Research, National Bureau of Standards, Oct. 18-21, 1971 held at Gaithersburg, Md., R. S. Roth and S. J. Schneider, Jr. Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 364, 799 page (July 1972).

Key words: Chalcogenides; crystallographic shear; electro optical lattice images; lone pair geometry; non stoichiometry; oxides; refractory hard metals; Solid Stat Chemistry.

This book presents the Proceedings of the 5th Material Research Symposium on "Solid State Chemistry" held at th National Bureau of Standards, Gaithersburg, Md., on Oct. 18 21, 1971. The symposium was sponsored by the Institute fo Materials Research, NBS. The purpose of the conference was t explore the realm of new inorganic crystalline materia emphasizing crystal chemical and structural aspects, providin a forum for discussion of new research problems and technique A total of 56 invited and contributed papers were presented. I addition, the symposium included three unscheduled talks and a open discussion period consisting of four impromptu lectures o very current subjects dealing with nonstoichiometry. Th Proceedings are divided into four main groupings, I Oxides, Borides, Carbides, Silicides, and Related Materials, III Cha cogenides, and IV Open Discussion on Nonstoichiometry. A edited version is given of the floor discussion following each p per. *These proceedings include the following papers (indented*

The stereochemistry of the inert pair in some solid oxides oxide fluorides of Sb^{3+}, Bi^{3+} and Pb^{2+}, S. Andersson and Åström, *SP364,* pp. 3-14 (July 1972).

Key words: Antimony oxide fluorides; antimony oxides; bismuth oxide fluorides; lead oxides; lone pairs.

Geometrically it is shown that the inert electron pair in some solid oxides or oxide fluorides requires space comparable with that of an anion. If the lone pairs are located on certain sites in a lattice, nets consisting of lone pairs and anions are obtained which correspond to hexagonal, or cubic closest packing of atoms. Other more complex nets, comparable with those in alloy structures, are also found. The lone pairs are thus found in positions which are normally occupied by anions. Using this observation, direct structural relationships with the transition metal compounds can be shown to exist.

The single crystal x-ray structure determination of some alkali metal molybdates and niobates, B. M. Gatehouse, D. J. Lloyd, and B. K. Miskin, *SP364*, pp. 15-27 (July 1972).

Key words: Alkali metal; bronze; heptagonal holes; hexagonal tungsten bronze; lattice image; molybdate; molybdenum; niobate; niobium; oxide; single crystal; tetramolybdate; x-ray structure determination.

Crystal structures have been determined for the compounds "$Rb_3Nb_{54}O_{146}$," "$RbNb_3O_9$" $Na_xMo_6O_{17}$, $K_xMo_6O_{17}$ (x approximately 0.8 and 1.0 respectively) and $Li_2Mo_4O_{13}$ (low temperature form). Preliminary results are communicated for the compounds $Li_xMo_6O_{17}$ ($x \leq 1.0$) and $Li_2Mo_4O_{13}$ (high temperature form).

For "$Rb_3Nb_{54}O_{146}$" an unusual structure occurs where niobium-oxygen octahedra are grouped forming four, five, six and seven-sided tunnels through the structure, with the hexagonal tunnels partly filled with rubidium atoms. The unbalanced electrostatic charge is discussed in terms of the possible presence of fluoride, or fractional occupancy of oxygen sites.

Unusual features are discussed for the $M_x^IMo_6O_{17}$ structures (M^I= Li, Na, K) in terms of the presence or absence of Mo-O_6 octahedra or Mo-O_4 tetrahedra in the structure. It appears that the lithium analogue will have a somewhat different structure in spite of similarity in unit cell dimensions.

The ordering of lithium-oxygen octahedra in planes in $Li_2Mo_4O_{13}$ is pointed out in an accurate structure determination of this compound, which is basically a cubic close-packed oxygen lattice with Li and Mo occupying octahedral sites. Systematically absent oxygen atoms result in the presence of pairs of strings of cube octahedral holes in the structure.

The crystal chemistry of some new mixed oxides of tellurium IV, J. Galy, *SP364*, pp. 29-39 (July 1972).

Key words: Crystal structure; "lone pair" structures; tellurites; tellurium dioxide; tellurium hypovanadate; titanium tellurite.

The structural chemistry of some new mixed oxides between TeO_2 and some transition metal oxides is discussed.

A new structural type MTe_3O_8 has been found in the TeO_2-MO_2 systems (M = Ti, Zr, Hf and Sn). The structure of $TiTe_3O_8$ determined by x-ray single crystal analysis is cubic, space group Ia3 with a = 10.956 Å. The relationships with the fluorite structure type have been established. $ZrTe_3O_8$ as well as fourteen new compounds with the general formula $A_{1/2}B_{1/2}Te_3O_8$ (A = Sc, Cr, Fe, Ga, Rh, In, Bi and B = Nb, Ta) are isostructural with $TiTe_3O_8$.

In the system TeO_2-VO_2 the phase $TeVO_4$ has been prepared in two different crystalline forms, which we designate α and β here. A reversible polymorphic transformation occurs at 650 °C $\alpha \rightleftarrows \beta$. Both phases crystallize in the monoclinic system. The α-$TeVO_4$ crystals are black and the β-$TeVO_4$ crystals green; a melt of $TeVO_4$ gives a black glass by quenching. In α-$TeVO_4$ the coordination number of vanadium and tellurium is 6 and 3, in β-$TeVO_4$ the C.N. is 5 and 4.

The crystal structure of $NaVTeO_5$ ($KVTeO_5$, $RbVTeO_5$ and $AgVTeO_5$ are isostructural) exhibits isolated chains with $(VTeO_5)_n^{n-}$ formula surrounded by sodium atoms.

Finally, relationship between the structure of α- and β-$TeVO_4$ and other "lone pair" structures such as α-Sb_2O_4 or $SbNbO_4$, β-Sb_2O_4 and Pb_3O_4 is discussed, and comparison with such simple structures as α-PbO_2, ReO_3, PdF_3 and TiO_2 rutile also made.

Crystal structure and physical properties of a triclinic sodium tungsten oxide, H. F. Franzen, H. R. Shanks, and B. H. W. S. deJong, *SP364*, pp. 41-50 (July 1972).

Key words: Resistivity; Seebeck coefficient; sodium tungstate; structure.

A triclinic sodium tungstate was prepared by the method of electrolysis of molten mixtures of Na_2WO_4 and WO_3 which has been used extensively in the preparation of sodium tungsten bronzes. The electrical resistivities and Seebeck coefficients of several samples were measured and are reported. A single crystal x-ray diffraction study yielded the tungsten atom positions. A structure is suggested which is consistent with the tungsten positions and the electrical properties. The suggested stoichiometry is $Na_6W_{14}O_{45}$. In the suggested structure the tungsten atoms are coordinated by distorted octahedra of oxygen atoms in all cases but one, in which case the tungsten is coordinated by a trigonal-bipyramid of oxygen atoms. The octahedra share corners in planes in a fashion similar to that found in the hexagonal bronze, and the sodium atoms are located in the resulting hexagonal holes.

Electrochemical preparation and characterization of alkali metal tungsten bronzes, M_xWO_3, M. S. Whittingham and R. A. Huggins, *SP364*, pp. 51-62 (July 1972).

Key words: Crystal growth; electrolysis; non-stoichiometry; reaction mechanisms; thermodynamics; tungsten bronze.

When a current is passed through two inert electrodes immersed in a molten solution (~ 750 °C) of alkali metal tungstate, M_2WO_4, and tungsten oxide, WO_3, oxygen is liberated at the anode and a crystal of tungsten bronze, M_xWO_3, where $O < x < 1$, formed at the cathode. The potential difference between the electrodes is related to the oxygen concentration gradient across the cell. Thus, if the electrical potential difference across the cell, rather than the current or current density, is kept constant, crystals with a fixed oxygen activity and hence composition (stoichiometry) will be grown. Measurements of the decomposition potential of melts of M_2WO_4 and WO_3 of different composition, and of the oxygen activity in tungsten bronzes allows a type of phase diagram relating oxygen activity to the alkali metal/tungsten ratio in both liquid and solid phases to be constructed. Using this thermodynamic approach, it is possible to rule out certain suggested reaction intermediates in the electrolytic process and to explain both the overlapping stoichiometric ranges of some phases and the effects of reacting electrodes on the decomposition potential.

Some aspects of the investigation of intergrowth phases in Nb_2O_5-rich systems, R. Gruehn, *SP364*, pp. 63-86 (July 1972).

Key words: Analysis; hybrid phase; intergrowth phase;

niobium pentoxide; preparation; ranges of homogeneity; stability; systems.

Numerous Nb_2O_5-rich compounds with complicated compositions could be prepared as monophasic samples. The preparative and analytical work in this field was supplemented by x-ray investigations using the Guinier technique. In addition to 5 phases ($Nb_{11}O_{27}$, $Nb_{25}O_{62}$, $Nb_{28}O_{70}$, $Nb_{31}O_{77}F$, $Nb_{34}O_{84}F_2$) whose structures are known from investigations by Wadsley, Andersson, and Norin, we found 4 "hybrid" phases also called intergrowth-phases. The building principle of the hybrid phases $NbO_{2.464}$, $NbO_{2.483}$, $Nb(O,F)_{2.510}$, and $Nb(O,F)_{2.523}$ is a combination of building elements of both neighbor phases, e.g., $NbO_{2.483}$ combines component rows of the $Nb_{25}O_{62}$-structure and the $Nb_{28}O_{70}$-structure in a ratio 1:1.

It is of special interest that the phases $Nb_{25}O_{62}$, $Nb_{28}O_{70}$, $Nb_{31}O_{77}F$, and $Nb_{34}O_{84}F_2$ have small but exactly reproducible ranges of homogeneity. The fundamental reason for this deviation from the ideal composition is still unknown. It may be that the deviation from the ideal composition is due to the special properties of the building elements. According to this the non-ideal composition of a hybrid phase may be derived from the non-ideal composition of both neighbor phases, e.g., the actual composition $NbO_{2.483\pm0.001}$ of the hybrid phase may be calculated from the actual limits of the phases $Nb_{25}O_{62}$ (2.478 O/Nb) and $Nb_{28}O_{70}$ (2.489 O/Nb). A hybrid phase with the ideal composition 2.491 O/Nb ($Nb_{25}O_{62} + Nb_{28}O_{70}$) is nonexisting.

In addition to the combination of compositions of neighbor phases there may be relationship between the stabilities of the basic structures and the resulting hybrid phases.

The application of electron optical techniques to high temperature materials, J. G. Allpress, *SP364,* pp. 87-111 (July 1972).

Key words: Crystallographic shear planes; crystal structure; electron diffraction; electron microscopy; lattice images; lithium ferrites; lithium lutetium titanate; niobium-titanium oxides; niobium-tungsten oxides; tungsten oxides; Wadsley defects.

Careful studies of phase equilibria in many high temperature systems have revealed unexpectedly complex structural relationships, which are frequently very difficult to unravel by means of conventional x-ray techniques. The purpose of this contribution is to indicate how and why the electron microscope can be used to advantage in these circumstances. The value of the technique will be demonstrated by referring to the following recent applications in the field of the structural chemistry of oxides: (1) The determination of unit cell data for microcrystalline samples of alkali metal rare earth titanates, using electron diffraction. These materials have orthorhombic superlattices of the perovskite structure; (2) The use of dark field microscopy to study the precipitation of the ferrimagnetic spinel $LiFe_5O_8$ from a nonstoichiometric matrix of α-$LiFeO_2$. The morphology of the precipitate depends critically upon prior thermal treatment; (3) The direct observation of crystallographic shear planes in WO_{3-x} ($x < 0.05$) and $WO_3 \cdot yNb_2O_5$ ($y = 0.03$-0.09). The results show how changes of composition are accommodated in these systems, and provide clues as to the mode of formation and diffusion of crystallographic shear defects; (4) The study of regions of "solid solution" in the system TiO_2-Nb_2O_5 (> 50 mol % Nb_2O_5), by lattice imaging. Variations in composition are accommodated by coherent intergrowth, at the unit cell level, of thin slabs of several parent phases; and (5) The study of phases in the system WO_3-Nb_2O_5 which have structures related to that of tetragonal tungsten bronze. Several different superlattices are possible, and lattice images provide direct evidence for order-disorder, microdomain formation, and intergrowth with material having a much simpler cubic structure.

Application of infrared and Raman spectroscopy to the characterization of order-disorder in high temperature oxides, W. B. White and V. G. Keramidas, *SP364,* pp. 113-126 (July 1972).

Key words: Corundum structure; order-disorder; Raman spectra; rocksalt structure; rutile structure; spinel structure.

The vibrational spectra of oxides are remarkably sensitive to ordering effects and are a useful characterization tool. Cation ordering can be classified into: (a) preferential distribution of nonequivalent cations onto nonequivalent sites with no change in space group symmetry or unit cell size, (b) preferential distribution onto equivalent sites with decrease in space group symmetry only, (c) building of superstructures with same symmetry as parent structure, (d) both (b) and (c) combined. Experimental Raman spectra of various structures are compared with these schemes. Ordering of type (a) produces only frequency shifts with no change in spectral pattern and is exemplified by normal-inverse ordering in spinels. Ordering of type (b) produces additional bands due to selection rule relaxation and is exemplified by ilmenite, $LiNbO_3$, and Ni_3TeO_6 orderings on corundum and by spinels with 1:1 ordering on tetrahedral sites. Ordering of type (c) produces a multiplicity of bands as is illustrated by the trirutile structure. Ordering of type (d) produces very complex spectra. Examples include: P3c1 ordering on corundum, 1:1 ordering on rocksalt and the Ruddlesden-Popper superstructures. Raman spectra are sharp but intensities are highly variable. Simple ordering schemes are easy to discern, but complex schemes produce spectra difficult to interpret.

A study of V_2O_3 by photoelectron spectroscopy, J. M. Honig, H. E. Weaver, and R. D. Board, *SP364,* p. 127 (July 1972).

Key words: Metallic-insulator transition; photoelectron spectroscopy; V_2O_3.

The occupied energy states of single crystal and polycrystalline V_2O_3 have been studied by x-ray photoelectron spectroscopy both above and below the metallic-antiferromagnetic insulator (M-AFI) transition. All of the elemental vanadium and oxygen states in the range 20 to 640 eV below the Fermi level were also encountered in V_2O_3. In addition, a valence band with structure was observed in the range 0 to 10 eV. In the metallic phase this band was intersected by the Fermi level; below the transition temperature the topmost portion of the band was no longer observable and may have disappeared under increased noise. Under the experimental conditions involving a resolution of 0.3 to 0.5 eV, a search was made for the presence of localized states in the energy spectrum of the insulating phase at 77 K. No such states were encountered; unless they were masked by the residual valence band approximately 4 eV in width it must be concluded that the transition does not involve a change from a localized to an itinerant electron regime.

Observations in the electron microscope of lattice planes and migration of silver in beta alumina, W. L. Roth, *SP364,* pp. 129-137 (July 1972).

Key words: Beta alumina; electron microscope; lattice images; migration of silver; silver whiskers.

Beta alumina is the commonly accepted name for a sodium aluminate of variable composition and structure with

"ideal" formula $NaAl_{11}O_{17}$. There is considerable interest in beta alumina and its isomorphs because the monovalent ions diffuse rapidly at temperatures of 300 °C and below. Crystal structure and density studies of the sodium and silver isomorphs have shown the compound is nonstoichiometric and contains approximately 25 percent excess sodium or silver. All of the monovalent ions lie in basal planes at z = 1/4 and 3/4. The planes are separated by 11 Å and ion conduction takes place by two dimensional diffusion in these planes.

The conducting planes have been resolved in the electron microscope and their identity established by electron diffraction. High resolution photographs show lattice bending and rotation.

When relatively thick crystals of silver beta alumina are observed in the electron microscope, worm-like filaments or whiskers about 50 Å in diameter exude from the edge of the crystal. The filaments were shown by electron diffraction to be silver. The filaments are produced by diffusion of Ag^+ ions down channels in the conducting planes to neutralize the negative charge of absorbed electrons.

Beta alumina—prelude to a revolution in solid state electrochemistry, M. S. Whittingham and R. A. Huggins, *SP364*, pp. 139-154 (July 1972).

Key words: Beta alumina; diffusion; electrochemical cell; electrochemical transducer; ionic conductivity; mass transport; solid electrolyte.

For almost two decades solid state electrochemical techniques have been used to study the thermodynamic and transport properties of a number of materials. However, these studies have been restricted essentially to systems utilizing electrolytes containing mobile silver or copper ions at low temperatures, and oxygen ions at high temperatures.

Transport measurements have been made on single crystals of beta alumina, which has the nominal formula $MAl_{11}O_{17}$ where M is usually a monovalent cation, to test its suitability as a solid electrolyte. In this and related structures, the monovalent cation can be extremely mobile. By use of a group of novel nonpolarizing solid electrodes, which are fully reversible to the monovalent cation, it has been possible to study the ionic conductivity of a series of beta aluminas containing alkali metals as well as thallium over a wide temperature range. The electronic conductivity of silver beta alumina has also been determined by use of the Wagner asymmetric polarization technique over wide ranges of temperature and oxygen partial pressure.

The results of these studies clearly indicate that the beta alumina family shows excellent promise for use as solid electrolytes, exhibiting high values of ionic conductivity and a very low electronic transference number. These properties were exhibited over extremely wide ranges of temperature, − 150 to + 820 °C, and oxygen partial pressure, 10^{-24} to 1 atm. The use of beta alumina opens up many new opportunities in solid state electrochemistry, particularly in the study of materials containing monovalent cations.

Experimental study on the ionicity in the TiO phase. An application of the new method of determining the structure factor by high voltage electron diffraction, D. Watanabe and O. Terasaki, *SP364*, pp. 155-164 (July 1972).

Key words: Critical voltage for the 400 of TiO; critical voltage for the 110 of TiO_2 (rutile); determination of structure factor by high voltage electron diffraction; disappearing effect of the second order reflection in electron diffraction; ionicity in TiO crystal; many-beam dynamical interaction in electron diffraction; structure factors for electrons of TiO.

It was reported recently that the second order reflection in electron diffraction vanishes at a certain accelerating voltage E_c, owing to the many-beam dynamical interaction combined with the relativistic change of electron mass [Watanabe, Uyeda and Kogiso, Acta Cryst. **A24**, 249 (1968)]. A measured value of E_c makes it possible to determine very accurately the Fourier coefficient of the potential for the first order, and thus the corresponding value of the x-ray scattering factor [Watanabe, Uyeda and Fukuhara, Acta Cryst. **A24**, 580 (1968), **A25**, 138 (1969)].

In the present study, the method has been applied to the disordered TiO phase. The accelerating voltages E_c, for which Kikuchi lines of the 400 reflection vanish, have been measured using a 500 kV electron microscope. The measured values are 340, 354, 389 and 425 kV, respectively, for $TiO_{0.82}$, $TiO_{0.96}$, $TiO_{1.16}$, and $TiO_{1.25}$. To compare the experimental values with calculation, the values of E_c have been calculated for $TiO_{0.82}$ and $TiO_{1.25}$, using theoretical scattering factors of titanium and oxygen atoms of various atomic states. The calculations have been made for free neutral atoms Ti^0, O^0, monovalent ions Ti^{1+}, O^{1-} and divalent ions Ti^{2+}, O^{2-}. The structure factors of the first order have been determined using the measured values of E_c.

Comparison of the experimental values of E_c and the first order structure factors with theoretical ones enables us to discuss the ionicity in a TiO crystal. The result shows that the ionicity depends on the oxygen concentration in the crystal, i.e., titanium and oxygen atoms in the oxygen-deficient TiO crystal are considered to be almost neutral, while the elements in the titanium-deficient crystal appear to be in the ionic states.

The possibility of applying the present method to a TiO_2 crystal of the rutile type is discussed as well.

The structure and intergrowth of the polymorphic forms of $ZrO_2 \cdot 16Nb_2O_5$, N. C. Stephenson, J. P. Beale, and D. C. Craig, *SP364*, pp. 165-182 (July 1972).

Key words: Crystal structure; intergrowth; lattice-image; polymorphism; zirconium-niobium oxide.

The compound $ZrO_2 \cdot 12Nb_2O_5$ has been reported to exist in three polymorphic forms, one of which is isostructual with $TiNb_{24}O_{62}$.

The crystal structures of the remaining two polymorphs have been determined by examining x-ray data collected from a single crystal of the β-monoclinic form. The unit-cell dimensions are a = 39.693, b = 3.830, c = 35.488 Å, β = 116.53°. 2948 data were collected using a single crystal diffractometer and Cu$K\alpha$ radiation.

No assumptions were made about the structural features and the basic subcell unit was deduced from the Patterson function. Modifications of this subcell give rise to the remaining two polymorphs, which contain blocks of 3 x 3, 4 x 4, and 3 x 4 corner sharing octahedra. The 3 x 4 blocks are all at the one level and form sheets running parallel to (100). The 3 x 3 and 4 x 4 blocks form sheets which alternate with those just described. The manner in which the sheets fit together determines which polymorph is formed.

Although the structures were solved using standard x-ray procedures, the solutions were facilitated by using features of electron transmission micrographs. These consisted of a regular array of dots and streaks (plane group p2) arranged in lines parallel to c. The spacial distribution and contrast of these dots and streaks, together with their arrangements at antiphase boundaries and fault areas, impose certain restrictions upon structures that can be derived by modifications of the basic subcell.

In terms of structure, the areas of contrast on transmission micrographs can be identified with the different types of block junctions.

Superstructure of the orthorhombic $Nb_2O_5 \cdot 6ZrO_2$ type phase(s) in the Nb_2O_5-ZrO_2 and Ta_2O_5-ZrO_2 systems, R. S. Roth, J. L. Waring, W. S. Brower, and H. S. Parker, *SP364*, pp. 183-195 (July 1972).

Key words: Equilibrium; Nb_2O_5-ZrO_2; ordered defects; α-PbO_2-type phase(s); single crystals; superstructure; Ta_2O_5-ZrO_2.

The phase previously described as $Nb_2O_5 \cdot 6ZrO_2$ has been found to have a composition varying from a Nb_2O_5:ZrO_2 ratio of about 2:9 to 2:15. The solidus temperatures of the intermediate compositions studied seem to follow a smooth curve from 1435 to 1640 °C rather than a stepwise function expected from a series of compounds. The x-ray diffraction powder patterns indicate a series of phases with subcells similar to α-PbO_2 and orthorhombic symmetry. Superstructure lines indicate that these phases have a multiple *b* axis. The composition 2:9 corresponds approximately to a structure with a *b*-axis multiplicity of seven. The 2:11 composition appears to have a multiplicity of eight, 2:13 a multiplicity of nine and the last composition 2:15, a multiplicity of ten. The intermediate compositions 1:5, 1:6 and 1:7 show superstructure lines halfway between those of the simpler phases on either side, corresponding to multiplicities of 15, 17 and 19 respectively. These multiplicities and compositions thus appear to belong to a homologous series $M_{n-1}O_{2n}$ where *n* varies from 14-20. However the phase equilibria data do not rule out the possibility of a homologous series M_nO_{2n+1}. Compositions in the Ta_2O_5-ZrO_2 system apparently have the same composition *vs* multiplicity arrangement, however, their melting points are considerably higher.

Single crystals of these phases, prepared by both direct cooling of a melt and utilization of a barium vanadium oxide eutectic flux, have enabled the multiplicities to be completely verified and are now being used for crystal structure determinations. This stabilization of the high pressure form of ZrO_2 (the orthorhombic structure type) by means of higher valence cations provides an alternate process to the anion deficient stabilization of the cubic fluorite phase.

Physical and geometrical principles of crystallographic shear in rutile, L. A. Bursill, B. G. Hyde, and M. O'Keeffe, *SP364*, pp. 197-204 (July 1972).

Key words: Crystallographic shear; rutile; swinging shear planes; TiO_2; TiO_2-Cr_2O_3 system.

Recent studies by electron microscopy and diffraction have elucidated many of the structural patterns of formation of homologous series of oxides derived from the rutile structure by crystallographic shear. In this paper, the physical and geometrical principles underlying the formation of planar defects are considered. It is shown that the only crystallographic shear planes expected in systems derived from rutile are those containing $< 111 >$ as observed, e.g., in TiO_{2-x} and TiO_2–Cr_2O_3. These results enable us to establish likely criteria for the development of homologous series in oxide systems. The kinetic consequences of the existence of disordered shear planes (Wadsley defects) are further examined in the light of these developments.

Structures and chemical bond problems in vanadium oxides, P. Hagenmuller, *SP364*, pp. 205-218 (July 1972).

Key words: Covalence parameters; insulator-metal transitions; perovskite like structures; relations between structures and physical properties; vanadium oxides.

In the transition metal oxides the d-electrons may be either in a localized or a collective state depending essentially on the structure, the transition element and its oxidation state. Some significant examples will be given resulting from recent investigations in the field of the vanadium oxy compounds:

1. A study of the magnetic and electrical properties of the phase $K_{2-x}V_{3+2x}O_{8+2x\pm\kappa}$ ϕ in the system V_2O_5-VO_2-K_2O shows that it can be written formally as

$$K_{2-x}V^{4+}V^{5+}_{2-3x\pm2\kappa}\,(V^{4+}_{3x\pm2\kappa})_{subst.}\,(V^{4+}_{2x})_{ins.}\,O_8(O_{2x\pm\kappa})_{ins.}$$

$K_2V_3O_8$ is actually an insulator in which the V^{5+} and V^{4+} ions occupy well defined sites ($K_2V^{4+}(V^{5+})_2O_8$). It does not become a conductor until the progressive appearance of d-electrons in the V^{5+} sites as a result of a hopping mechanism. The variation with x of the Curie constant shows that the vanadium, inserted in the form of chain links (O)-V-O-V-(O) in the tunnels emptied by the potassium, also occupies a particular site. These properties were confirmed by the determination of the structure: the phase ϕ, which is isostructural with $Ba_2TiSi_2O_8$, is actually made up of three types of cationic sites.

2. VO_2 has an allotropic transformation at 340 K of the type homopolar bonding ⇆ metal. This transformation is characterized by a change of symmetry from monoclinic to tetragonal of the rutile type. The replacement of vanadium 4+ by cationic substitution of the type $2V^{4+} = M^{5+}$ (Nb^{5+} f.e.) + V^{3+} or by anionic substitution $V^{4+} + O^{2-} = V^{3+} + F^-$ results in the lowering of the transition temperature. It seems to be the result of the progressive occupancy of a π band. On the other hand the transformation temperature is raised by a substitution of the type $2V^{4+} = M^{3+}$(Cr^{3+} f.e.) = V^{5+}, and there appears an intermediate semi-conducting phase of orthorhombic symmetry. The existence of this phase can be explained by the ferroelectric distortions due to vanadium 5+. The change of the physical properties with the substitution rate is analyzed on the basis of the obtained structures.

3. The phase $La_{1-x}Sr_xVO_3$ ($0 \leq x \leq 0.40$) with a structure derived from $GdFeO_3$ is characterized by an evolution from semi-conductor to metal with increasing x. This latter results from the strengthening of the π (B–0) bond which is a consequence of the weakening of the σ (A–0) bond and the partial replacement of vanadium 3+ by vanadium 4+. This change is less sensitive for the phase $Gd_{1-x}Sr_xVO_3$, Gd^{3+} being more acidic than La^{3+} and hence σ (A–0) stronger and π (B–0) weaker.

These results are compared with those obtained for the homologous $LnTO_3$ phases, Ln being a lanthanide and T a 3d-transition element, on the basis of Goodenough's covalent mixing parameters λ_π and λ_σ. The influence of various factors on the physical properties is discussed.

Preparation and structure of a pyrochlore and perovskite in the $BiRhO_{3+x}$ system, J. M. Longo, P. M. Raccah, J. A. Kafalas, and J. W. Pierce, *SP364*, pp. 219–226 (July 1972).

Key words: $BiRhO_3$; defect structures; perovskite; pressure-synthesis; pyrochlore.

The pyrochlore structure with general formula $A_2B_2O_7$ is formed with a wide variety of ions and tolerates a high degree of nonstoichiometry on the anion and A cation sites, e.g., $Pb_{1.5}Nb_2O_{6.5}$. We have found that the reaction of Bi_2O_3 with either Rh metal or Rh_2O_3 (Bi/Rh = 1:1) at 600-1000 °C in air or oxygen forms a compound with a face-centered cubic unit cell ($a = 10.238 \pm .008$ Å) and the pyrochlore structure. X-ray fluorescence for the Bi/Rh ratio and

thermogravimetric analysis for the oxygen content gave $Bi_{2.0}Rh_{2.0}O_{6.8}$.

In the pyrochlore structure the cations are in fixed positions, and there are two types of oxygen. Six oxygen atoms are of one type (O_1) with one position parameter and form the octahedra around the B cations. The last oxygen (O_2) is fixed and coordinated only to the A cations. It is not essential to the B_2O_6-octahedra network. Taking the origin at the B cation, we have refined the position parameter for O_1, the occupancy factor (OF) for O_2 and atomic temperature factors (B) by R-factor minimization of integrated powder diffraction intensity data. The results are as follows:

$B_{Bi} = 0.7$, $B_{Rh} = 0.1$, $B_{O_1} = 0.1$,

$B_{O_2} = 0.0$, $x_{O_1} = 0.326$, $OF_{O_2} = 0.7$.

The position parameter for O_1 is in agreement with those found in other pyrochlores, and the occupancy factor (OF) is consistent with the chemical analysis. Resistivity measurements on sintered samples at room temperature gave $\rho = 3.2 \times 10^{-3}$ Ω-cm. We will discuss the stability of the defect structure in terms of the availability of the "inert pair" of electrons of the A cation.

When Bi_2O_3 and Rh_2O_3 were reacted in sealed, evacuated quartz tubes at 750-1100 °C, the product could not be identified. When the same reactants were placed in platinum capsules and subjected to over 65 kbar pressure at 1000-1300 °C for 1/2 hour, the perovskite $BiRhO_3$ was formed. Its unit cell is orthorhombic ($a = 5.354 \pm .005$ Å, $b = 5.813 \pm .005$ Å, $c = 7.776 \pm .005$ Å) as in $GdFeO_3$ or the series of $LnRhO_3$. The relationship between the defect pyrochlore and perovskite structures will be discussed.

Precious metal pyrochlores, A. W. Sleight and R. J. Bouchard, *SP364*, pp. 227-232 (July 1972).

Key words: Metallic conductivity; oxides; pyrochlore structure; semiconductivity.

Rare earth pyrochlores of the type $A_2M_2O_7$ where A is a rare earth and M is Ru, Ir, Pd, or Pt have been reported, but little is known of their physical properties. We have grown crystals of the rare earth ruthenate and iridate pyrochlores. Four-probe electrical resistivity measurements on single crystals show that both rare earth ruthenates and iridates are semiconducting with an activation energy of about 0.1 eV for the ruthenates and about 0.08 eV for the iridates. Very different behavior is found for the iridate and ruthenate pyrochlores when the A cation is a post-transition metal. Although $Tl_2Ru_2O_7$ is also semiconducting, it has an activation energy of only about 0.01 eV. Metallic conduction is found for $Tl_2Ir_2O_7$, $Tl_2Os_2O_7$, $Bi_2Ru_2O_7$, and $Bi_2Ir_2O_7$. Magnetic susceptibility measurements confirm the localized electron behavior for the semiconductors and delocalized electron behavior for the metallic compounds. Structural refinements have been carried out for $Nd_2Ru_2O_7$, $Yb_2Ru_2O_7$, and $Bi_2Ru_2O_7$. The Ru-O distance is $2.00 \pm .01$ Å for all three compounds; however, an anomalously high temperature coefficient was found for Bi.

Phases in the systems BaO-NiO-O-CO_2 and BaO-CoO-O-CO_2, T. Negas and R. S. Roth, *SP364*, pp. 233-263 (July 1972).

Key words: Ba/Co-oxide phases; Ba/Ni-oxide phases; crystal structure; phase equilibria; transition-metal oxides.

Several new materials apparently related to the aragonite form of $BaCO_3$ and to the 2H form of "$BaNiO_3$" were prepared at elevated temperature *in air*. The phases $Ba_3NiC_xO_{9-y}$ and $Ba_3Ni_2C_xO_{9-y}$ ($[Ni + C] \leq 3$) were prepared in powder and single crystal form. Both phases are hexagonal with *a*-axes related to the 2H "$BaNiO_3$" by $a \approx a_{2H}\sqrt{3}$. Single crystal x-ray and electron diffraction patterns of the Ba:Ni = 3:1 phase reveal $c \approx 2c_{2H}$. The structure was refined in space group P6 to R = 5.9% using 639 x-ray reflections. $BaCO_3$ - 3:2 (Ba:Ni) phase composite crystals were prepared by decomposition of 3:1 phase crystals in air at 800 °C. The structure for these composites is discussed. A similar 3:2 compound, $Ba_3Co_2C_xO_{9-y}$, containing low-spin octahedral Co^{4+}, was prepared in powder form.

Although 2H "$BaNiO_3$" is not stable in air, single crystals of two phases near Ba:Ni = 1:1 were obtained. Both are rhombohedral with hexagonal $a \approx a_{2H}\sqrt{3}$ and large *c*-axis multiplicities but exact stoichiometries are unknown. Two-layer-like forms of $BaCoO_{3-x}$ can be prepared in air, however, below 890 °C. Similar phases exist at compositions slightly deficient in cobalt. A 12-layer form of $BaCoO_{3-x}$ exists from 890 to 925 °C. It transforms to a phase of unknown structure above 925 °C. The compound Ba_2CoO_4, related to Ba_2TiO_4, can be prepared above 825 °C. Ba_2CoO_4 has a reversible, nonquenchable, monoclinic ⇄ orthorhombic inversion at 145 °C. The Co^{4+} is in a high-spin, tetrahedral, configuration.

Preparation of $SrFe_xMn_{1-x}O_{3-y}$ and $CaFe_xMn_{1-x}O_{3-y}$ crystals and some of their properties, E. Banks, O. Berkooz, and T. Nakagawa, *SP364*, pp. 265-273 (July 1972).

Key words: Antiferromagnetism; $CaFe_xMn_{1-x}O_{3-y}$; defect structure; mixed metal oxides; Mössbauer effect; oxygen vacancies; perovskite; semiconductivity; $SrFe_xMn_{1-x}O_{3-y}$.

Single crystals of $SrFe_xMn_{1-x}O_{3-y}$ and $CaFe_xMn_{1-x}O_{3-y}$ were grown by the usual technique from fluxes of excess $SrCl_2$ and $CaCl_2$, respectively. Apparently cubic perovskites were obtained in the $SrFe_xMn_{1-x}O_{3-y}$ system where x is in the range $0.4 \leq x \leq 0.7$ and in the $CaFe_xMn_{1-x}O_{3-y}$ where x is $0.2 \leq x \leq 0.4$. Hexagonal crystals, isostructural with the reported high temperature phase of $BaMnO_3$, were obtained in the $SrFe_xMn_{1-x}O_{3-y}$ where x is 0.1 and 0. Chemical analysis showed that the values of Fe:Mn ratio in these crystals were very close to the expected ones. From the density and x-ray measurements the existence of substantial amounts of oxygen vacancies ($0.26 \leq y \leq 0.44$) in the perovskite crystals was observed. For the hexagonal crystals, lower concentrations of oxygen vacancies ($y \sim 0.11$) were observed. The Mössbauer spectra of crystals having $x = 0.4 - 0.7$ in the $SrFe_xMn_{1-x}O_{3-y}$ system were found to consist of two kinds of quadrupole-split lines of Fe^{3+} ions, Fe^{3+} (I) which are present in regular oxygen octahedra and Fe^{3+} (II) which are associated with oxygen vacancies. From the magnetic measurements, Neél temperatures in the $SrFe_xMn_{1-x}O_{3-y}$ were found to be $T_N = 130$, 35 and 20 K for x - 0.7, 0.5 and 0.4, respectively. Using the experimental data of the densities, the Mössbauer effect and effective magnetic moments, discussions concerning the amount of oxygen vacancies in the perovskite compounds are given.

The perovskite-like phases exhibited semiconducting behavior with activation energies of about 0.16 eV, which was almost independent of composition.

$La_xSr_{1-x}RuO_3$: A new perovskite series, R. J. Bouchard and J. F. Weiher, *SP364*, pp. 275-284 (July 1972).

Key words: Antiferromagnetism; Curie-Weiss paramagnetism; ferromagnetism; metallic conductivity; oxide; perovskite; solid solution.

The compound $LaRuO_3$ was prepared for the first time. It appears to be metallic and antiferromagnetic. Solid solutions with ferromagnetic $SrRuO_3$ of the type $La_xSr_{1-x}RuO_3$ exist for all values of x. All compounds have the orthorhombic $GdFeO_3$-type perovskite structure. The ferromagnetism ob-

served for $SrRuO_3$ ($x = 0$) diminishes rapidly with increasing La content, and antiferromagnetism or parasitic ferromagnetism sets in at approximately 35% La. All compounds show Curie-Weiss behavior at fairly low temperatures. The properties of $LaRhO_3$ are also discussed.

High pressure synthesis and crystal structure of cobalt sesquioxide and its low-spin → high-spin transition, M. Marezio, P. D. Dernier, J. Chenavas, and J.-C. Joubert, *SP364*, pp. 285-286 (July 1972).

Key words: Cobalt sesquioxide; crystal structure; high pressure synthesis; low-spin → high-spin transition.

Influence of madelung energy and covalency on the structure of $A^+B^{5+}O_3$ compounds, J. A. Kafalas, *SP364*, pp. 287-293 (July 1972).

Key words: $A^+B^{5+}O_3$ compounds; ferroelectricity; perovskites; phase stability.

The large Goldschmidt tolerance factor $t = 1.06$ in $BaTiO_3$ appears to be related to its ferroelectric properties and also suggests that relatively large effective charge at a Ti^{4+} ion inhibits formation of the hexagonal-perovskite polytypes generally associated with $t > 1.0$. In order to test these ideas, $RbNbO_3$ and $RbTaO_3$ ($t = 1.08$) were prepared under very high pressures. $RbNbO_3$ is an orthorhombic perovskite isostructural with ferroelectric $BaTiO_3$, and it decomposes on heating without formation of an hexagonal-perovskite polytype. Only at 90 kbar and 900 °C did $RbTaO_3$ form a cubic, or nearly cubic, perovskite. Unlike the transition-metal ions, Sb^{5+} and Bi^{5+} have never been stabilized in a cubic perovskite structure. $AgSbO_3$ forms a defect pyrochlore, $NaSbO_3$ and $KSbO_3$ have ilmenite structures, although a cubic (Pn3) form of $KSbO_3$ is stabilized by prolonged annealing above 1000 °C. A body-centered-cubic, disordered form of the cubic $KSbO_3$ having space group I23 was prepared in five minutes at 20 kbar and 800 °C. Preparation of $RbSbO_3$ at 20 kbar and 1000 °C yielded a phase with the same structure. These results are interpreted to mean that strong covalent bonding inhibits the formation of 180° Sb^{5+}-O^{2-}-Sb^{5+} linkages.

Defects in oxides, J. S. Anderson, *SP364*, pp. 295-317 (July 1972).

Key words: Block structures; crystallographic shear; defect clusters; defect models; high resolution electron microscopy; oxide defects; rutile structure; Wadsley defects.

Defects in ionic crystals, such as the metallic oxides, are so intimately involved in diffusion, reactivity and electronic properties, that an understanding of defect structure is a necessary background for a variety of problems in the chemistry, physics and technology of materials. In the present context consideration will be restricted primarily to thermodynamic defects: the inner equilibrium of oxide structures, stoichiometric changes that displace that equilibrium, and solid solutions in which replacement of one cation by another of different valence involves an analogous change in the ratio of cations to anions in the crystal structure. This paper is largely concerned with structural matters and has two purposes: the first is to draw together what is known about highly defective oxide structures (stoichiometrically variable and solid solution phases); the second is to consider, in more detail, one or two systems that exhibit a remarkable capacity for organizing their defect structures.

It has been customary to treat these problems within the framework of point defect theory. This viewpoint, well rooted in statistical thermodynamics, is certainly applicable to highly ionic uni-univalent crystals (alkali halides) and, perhaps generally to highly dilute defect systems, e.g., 10^{19} cm^{-3} or less. We are concerned with concentrations two orders of magnitude greater, with ions of greater formal charge, and (in the important transition metal oxides) with a considerable measure of orbital overlap between cations and anions and, in some cases, direct cation-cation bonding. These last considerations raise questions about the effects exerted by defects, such as anion vacancies, on charge screening and cation repulsions, and about the preservation of cation coordination so as to maximize charge screening and optimize the covalent component of the bonding.

We shall try to trace a progression in our classification of defect structures, and in doing so we shall find effects both of chemical specificity— the electronic configuration, as well as the size of cations—and of influences exerted non-specifically, by crystal structure type.

Oxygen dissociation pressures and phase behavior in the transplutonium oxides, T. D. Chikalla and R. P. Turcotte, *SP364*, pp. 319-330 (July 1972).

Key words: Actinide oxides; actinide sesquioxides; americium oxides; berkelium oxides; curium oxides; melting points of actinide oxides; nonstoichiometry; oxides; thermodynamics.

The results of recent oxygen vapor pressure measurements over nonstoichiometric AmO_x, CmO_x, and BkO_x are presented. These include derived information concerning the phase relations and partial thermodynamics of oxygen solution over the range $1.5 < x < 2.0$ and $300 < T < 1200$ °C.

The americium-oxygen system has been examined by thermogravimetric techniques in the single phase α region for $1.80 < x < 2.00$ to yield relative partial molar heat and entropy data. Supporting information obtained by quench methods and x-ray diffraction analysis extend the results to lower compositions and, additionally, demonstrate the existence of a bcc σ phase over a wide composition range. Phase relations in the curium-oxygen system have been defined by a series of isobars in the pressure range $2 < p_{O_2}$ (mm) < 730. In addition to α and σ phase, compounds of more narrow compositional width are seen at $CmO_{1.72}$ and $CmO_{1.82}$, and a plausible phase diagram is constructed. Differences obtained on two curium isotopes of greatly different radioactivity are discussed. The berkelium-oxygen system has been examined using a novel capacitance manometer system and a 1.2 mg sample. A set of five isotherms was obtained over the range $852 < T$ (°C) < 1150. The isotherms show a regular variation across α and σ regions separated by a diphasic field at $x \sim 1.79$. In addition, a narrow two-phase region exists between $BkO_{1.91}$ and $BkO_{1.93}$. Certain similarities are shown to exist between this and certain other fluorite related ternary oxide systems.

In addition, melting behavior of the di- and sesquioxides and polymorphism in the sesquioxide is described over the entire actinide series.

Binary solid solutions of PaO_2 and other actinide dioxides and their exchange equilibria with molten salt reactor fluorides, C. E. Bamberger, R. G. Ross, and C. F. Baes, Jr., *SP364*, pp. 331-341 (July 1972).

Key words: Activity coefficients in solid solutions; equilibria with molten fluorides; equilibrium of actinide oxides and molten fluorides; heat of mixing in solid solutions; ion exchange between solid oxides and molten fluorides; lattice parameter of actinide oxides; molten fluorides; molten salt reactor; oxide solid solutions; plutonium dioxide; protactinium dioxide; thorium dioxide; uranium dioxide.

The dioxides of thorium, protactinium, uranium and plutonium all are relatively insoluble in molten mixtures—containing LiF, BeF_2, ThF_4, PaF_4, and UF_4 or UF_3—which serve as the fuel of the molten salt nuclear power reactors (MSR's). Since these dioxides can form substitutional solid solutions, exchange reactions of the type

$$ThO_2(ss) + MF_4(d) \rightleftarrows ThF_4(d) + MO_2(ss);\ Q_{Th}^{M} = \frac{X_{MO_2}}{X_{ThO_2}} \frac{X_{ThF_4}}{X_{MF_4}}$$

involving the solid solution (ss) and the molten fluoride phase (d) become possible. It is of interest to study such exchange equilibria not only because the inadvertent precipitation of fissile oxide solids from an MSR fuel should be avoided, but also because such reactions might provide a means of separating and recycling the fissile and fertile elements.

A study of the exchange reaction involving Pa^{4+} and Th^{4+} has been carried out in which PaO_2-ThO_2 solid solutions ($X_{PaO_2} \leq 0.33$) were formed by equilibration of ThO_2 with molten LiF-BeF_2-ThF_4-PaF_4 (72-16-12-0.05 mol %) in the temperature range 570-730 °C. The resulting values of the distribution quotient Q_{Th}^{Pa}, along with previously measured values of Q_{Th}^{U} and a value of Q_{Th}^{Pu} derived indirectly from other previous measurements, are consistent with the following expressions

$$\ln \gamma_{MO_2} = 10^6 \left(\frac{1.228 \pm .15}{T}\right)\left(\frac{\Delta a}{a_{ThO_2}}\right)^2 X_{ThO_2}^2;$$

$$\ln \gamma_{ThO_2} = 10^6 \left(\frac{1.228 \pm .15}{T}\right)\left(\frac{\Delta a}{a_{ThO_2}}\right)^2 X_{MO_2}^2$$

$$\ln Q_{Th}^{M} = 10^6 \left(\frac{1.318 \pm .03}{T}\right)\left(\frac{\Delta a}{a_{MO_2} a_{ThO_2}}\right)$$

$$+ 10^6 \left(\frac{1.228 \pm .15}{T}\right)\left(\frac{\Delta a}{a_{ThO_2}}\right)^2 (2X_{MO_2} - 1)$$

wherein the activity coefficients in the solid solution are related to the difference in the lattice parameters ($\Delta a = a_{ThO_2} - a_{MO_2}$) as suggested by Hietala's model.

Growth and x-ray studies of single crystals of higher oxides of praseodymium and terbium, M. Z. Lowenstein, L. Kihlborg, K. H. Lau, J. M. Haschke, and L. Eyring, *SP364*, pp. 343-351 (July 1972).

Key words: Higher oxides; hydrothermal crystal growth; oxide structures; praseodymium oxide; single crystal; terbium oxide.

Single crystals of higher oxides of praseodymium and terbium have been grown successfully using hydrothermal techniques. Cold seal reactors were utilized to study the crystallization process over a temperature range of 600-900 °C and at pressures up to 3.1 kilobar. Crystal growth conditions were optimized using controlled pressure and temperature cycling. Any oxide of praseodymium may be used as starting material. Nitric acid served both as a mineralizer to promote solubility and as a source of oxygen. Two predominant crystal habits are observed; octahedra and trigonal prisms. Faces are smooth and well defined.

Single crystals of praseodymium dioxide have been reduced to $PrO_{1.833}$ in the homologous series Pr_nO_{2n-2} with crystal integrity maintained. X-ray data have been obtained on these crystals using Weissenberg and Hägg-Guinier cameras. The phase has a fluorite-type sublattice with a superstructure of monoclinic symmetry (space group $P2_1/n, C_2^5h$) and a unit cell having $a = 6.6874$ Å, $b = 11.602$ Å, $c = 15.470$ Å, $\beta = 125.257°$ and $V = 979.6$ Å^3. Indexing of the powder pattern of this phase has been completed on the basis of this cell. The relationship to the fluorite subcell is shown.

Defects and mass transport in reduced CeO_2 single crystals, Y. Ban and A. S. Nowick, *SP364*, pp. 353-365 (July 1972).

Key words: Ceria; crystal defects; diffusion; mass transport; nonstoichiometry; oxides.

A study is made of reduced CeO_2 in the form of large single crystals grown by arc fusion. It is shown that, so long as $y \geq 1.67$ in the formula CeO_y, all structural changes on reducing CeO_2 occur without loss of coherency of the original fluorite lattice. Comparison of length and lattice parameter changes shows that only oxygen vacancies (and no detectable Ce interstitials) are present in the reduced state. For $y > 1.67$, it is shown that oxidation (in air or in O_2) takes place at reasonable rates just above room temperature. The kinetics of this anomalously rapid mass transport are studied in some detail, including the effects of sample thickness and of oxygen partial pressure. The results show that the kinetics are neither diffusion nor surface controlled. A model of the process is developed which explains the major results. The low temperature oxidation process does not terminate in the pure α (CeO_2) phase, but in a metastable structure, here called α', for which y is very close to 2.0. The properties of α' are discussed.

Anion centered coordination polyhedra and related physical properties in rare earth oxides and oxysalts, P. E. Caro, *SP364*, pp. 367-383 (July 1972).

Key words: Complex ions; coordination polyhedra; nonstoichiometry; polymolecular frameworks; rare earth optical spectra; rare earth oxide; refractory materials; thin films; 4 f^n configurations.

The structures of rare earth oxides and oxysalts can be conveniently described in terms of linkages of anion centered coordination polyhedra, namely tetrahedra, yielding two-dimensional or three-dimensional frameworks. A complex "lanthanyl" cation $(LnO)_n^{n+}$ can be recognized. It has two different arrangements of tetrahedra, one of them being identical with the well known "bismuthyl" cation $(BiO)_n^{n+}$. The structural elements are similar to the classical SiO_2 and Si_xO_y ones; SiO_4 tetrahedra frameworks, used for silicates structures classification. Other anions than oxygen (sulfur and halides) yield isomorphous networks.

Such types of structures imply some sort of covalent bonding. The covalence of the bond can be shown from optical measurements on solids. For (OLn_4) compounds the absorption spectrum is displaced to the red (nephelauxetic effect), a phenomenon which corresponds to the lowering of the Racah's parameters of the 4 f^n configuration. The mixing of the $|\,4\,f^n>$ wave functions with ligand wave functions also yields larger transition probabilities and the $(LnO)_n^{n+}$ materials are very effective phosphors.

The layered oxide structures also yield textured thin films which exhibit epitaxial continuity and intergrowth between the rare earth oxides phases.

The layered polymolecular complex cation concept can be applied to rare earth extended non-stoichiometric systems. It can be shown that the chemical composition of all the known phases of those systems can be accounted for in terms of the succession along a main crystallographic axis of four planar chemical units ABCD. Non-stoichiometry occurs because a layered structure AB is able to be interleaved

through another layered structure ADCD. A general chemical formula for the ordered phases was derived, for the bastnaesite family of compound (AB = bastnaesite, ADCD = synchisite), the Ln_2O_3-LnF_3 systems (AB = tysonite, ADCD = trigonal EuOF), the LnO_x systems (AB = Ln_6O_{10}, ADCD = $Ln_{12}O_{22}$) and the $LnCl_3$-$LnCl_2$ system (AB = $LnCl_3$, ADCD = $LnCl_2$). All of the compounds contain layered polymolecular complex cations.

Plasma-synthesized substoichiometric scandium oxide, J. E. Young, Jr., and M. J. Sienko, *SP364*, pp. 385-395 (July 1972).

Key words: Crystal growth; F centers; flame fusion; magnetic susceptibility; nonstoichiometry; scandium oxide.

Crystals of substoichiometric scandium oxide have been grown in high frequency, induction-coupled, argon plasmas. The composition of the crystals could be varied by addition of small percentages of hydrogen or oxygen to the argon stream. Chemical analysis by reoxidation indicated an oxygen deficiency that could attain 4% before metallic films appeared, concentrated at grain boundaries. The chemical composition of the films could not be established. X-ray studies of the bulk crystals indicated retention of the C-type rare earth structure of Sc_2O_3 with but slight shrinkage of the cubic cell parameter. Transmission electron microscopy showed no evidence for shear plane formation. Attempts to measure Hall voltage and conductivity by a van der Pauw technique gave conductivity values, both a.c. and d.c., too small to measure. Faraday susceptibility measurements from 1.6 to 300 K indicated a very small effective magnetic moment, which decreased below 10 K. Possible models are F and F′ centers in thermal equilibrium or Sc^{+1} ions with thermal equilibrium between ^3D and ^1D or ^3D and ^1S states.

Crystal chemistry and compound formation in the systems rare earth sesquioxide-WO_3, G. J. McCarthy, R. D. Fischer, G. G. Johnson, Jr., and C. E. Gooden, *SP364*, pp. 397-411 (July 1972).

Key words: Fluorite-related structures; rare earth tungstates; rare earth tungsten oxides; RE_2O_3-WO_3 compounds; RE-W-O systems.

Compounds with the following stoichiometries have been prepared in the rare earth sesquioxide-tungsten trioxide systems: RE_6WO_{12}, $RE_{10}W_2O_{21}$, $RE_{14}W_4O_{33}$, RE_2WO_6, $RE_2W_2O_9$. Compounds of the first three stoichiometries prepared at 1400 °C have structures apparently related to that of fluorite. RE_6WO_{12} has three structural classes whose symmetries are dependent on the rare earth ionic radius: La-Pr, cubic or pseudocubic; Nd-Gd, pseudotetragonal; Tb-Lu, Y, rhombohedral. $RE_{10}W_2O_{21}$ is stable only for RE = Gd-Ho, Y and has the same pseudotetragonal symmetry as the intermediate RE_6WO_{12} compounds. $RE_{14}W_4O_{33}$ has a pseudorhombohedral structure related to the third RE_6WO_{12} structure. The rhombohedral RE_6WO_{12} compounds are known to be isostructural with RE_7O_{12} oxides and it is suggested that $RE_{10}W_2O_{21}$ and $RE_{14}W_4O_{33}$ may be structurally related to RE_4O_7 and RE_6O_{11} respectively. RE_2WO_6 compounds with RE = Pr-Dy have a monoclinic scheelite-related structure. The $RE_2W_2O_9$ compounds, also with a complex monoclinic structure, are stable only for RE = Ce-Gd (or Tb). Compounds of the stoichiometries $RE_4W_3O_{12}$ and $RE_2W_3O_{12}$ were not studied, but the literature information on them is noted. A discussion of the probable subsolidus phase relations in RE-W-O systems is also included.

Preparation of oxides and related compounds by chemical transport, H. Schäfer, *SP364*, pp. 413-436 (July 1972).

Key words: Chemical Vapor Transport; crystal growth; oxides; synthesis.

In a temperature gradient it is possible for solids to migrate by sublimation, by catalytic sublimation (P_{red}/I_2), dissociative sublimation and by chemical transport.

Reversible heterogeneous reactions are utilized in chemical transport. The phenomenon is complex but can normally be treated as gaseous diffusion between spaces in which thermodynamic equilibrium has been established between solid and gaseous phases. The partial pressure drop between these spaces is the quantity which determines the suitability of a chemical reaction for transport processes.

Information is given regarding working techniques and transport agents which have been employed hitherto.

In further chapters there is an account of the binary oxides which have been chemically transported up to now and there is also an account of the types of reaction used for transport.

Using zinc oxide transport as an example, a demonstration is given of the selection of transport reactions on the basis of thermodynamic considerations.

There is a discussion of syntheses in a temperature gradient and of "solid/solid reactions," with regard to the preparative employment of chemical transport processes. This discussion is illustrated with several examples. There is in addition a review of the transport of ternary compounds and of the decomposition of ternary compounds which can occur under the influence of the transport agent.

Examples are given of the crystallization of metastable modifications out of the gas phase.

Precision parameters of the ferroelectric rare earth molybdates $Ln_2(MoO_4)_3$, L. H. Brixner, P. E. Bierstedt, A. W. Sleight, and M. S. Licis, *SP364*, pp. 437-443 (July 1972).

Key words: Ferroelectric molybdates of rare earths; lattice parameters; phase transitions.

Lattice parameters to an accuracy of better than ±0.001 Å have been determined for the ferroelectric $Ln_2(MoO_4)_3$ compounds with Ln = Pr, Nd, Sm, Eu, Gd, Tb, Dy and Ho. X-ray patterns were obtained with a Hägg-Guinier camera and the data was refined by a least-squares method using selected reflections. Parameters obtained this way exhibited a systematic trend of the *b-a* dimension as a function of the cation size for the orthorhombic Pba2 room temperature structure. A linear relationship between the cell volume and the cube of the ionic radius of the rare earths has been observed. The first seven compounds are metastable at room temperature and transform from the ferroelectric/ferroelastic Pba2 structure to the parent $P42_1m$ structure between 140 and 235 °C. Only $Ho_2(MoO_4)_3$ is stable in the Pba2 phase at room temperature and transforms into the tetragonal structure at 121 °C. The high temperature structure for this compound is orthorhombic, space group Pnca. The transition temperatures have been accurately determined by differential scanning calorimetry, differential thermal analysis, dielectric measurements and hot-stage optical techniques and are discussed in relationship with the degree of *b-a* distortion. Lattice parameters have also been determined for the stable monoclinic modification of Sm, Eu, Gd, Tb and Dy-molybdate and their transition temperatures ranging from 800 to 1000 °C, as reported.

Structural and phase relationships among trivalent tungstates and molybdates, K. Nassau and J. W. Shiever, *SP364*, pp. 445-456 (July 1972).

Key words: Crystal structure; lanthanide compounds; molybdates; tungstates.

The trivalent tungstates $L_2(WO_4)_3$, molybdates $L_2(MoO_4)_3$, and mixed systems, $L_2(W_{1-x}Mo_xO_4)_3$ have been studied between room temperature and the melting points (up to 1650 °C). Single crystal and powder x-ray diffraction at room and elevated temperatures, differential thermal analysis, and crystal growth were among the techniques used to characterize phases and determine relationships.

Among the molybdates of the lanthanides, In, Sc, Fe, Cr, and Al, at least five structures were observed: the tungstates show at least three. Particular attention was devoted to $Tb_2(MoO_4)_3$, which, like $Gd_2(MoO_4)_3$, shows transitions at 800, 1040 and melting at 1155 °C and a ferroelectric transition at 163 °C in the metastable phase region; not all of these transitions are easily reversible.

Pseudo-binary tungstate-molybdate phase diagrams and structural parameters were determined for the La, Nd, Sm, Gd, Ho, and In systems. Based on structural determinations together with phase diagram interpretations and crystal growth evidence of the nature of various transitions (destructive or nondestructive), structural relationships were used to organize the many structures into three groupings and relate the results to the radii of the trivalent atoms:

(i) The small size tungstates and molybdates, the $Sc_2(WO_4)_3$ type family, with at least two members, form 6-coordinated structures with unit cell or subcell based on *Pnca*; with rising temperature this family extends to larger size atoms.

(ii) The large size tungstates and molybdates form 8-coordination structures with scheelite related subcells; this α-$Eu_2(WO_4)_3$ type family includes at least 4 structures.

(iii) The β-$Gd_2(MoO_4)_3$ type family of structures, occurring only in the intermediate size molybdates, have 7-coordinated trivalent atoms; except for $Y_2(MoO_4)_3$ they are stable only above 800 °C, although extensive metastability does occur with ferroelectric transitions in the metastable form near room temperature.

Crystal chemistry of tetrahedrally-coordinated oxides: Li_3PO_4 derivatives, A. R. West and F. P. Glasser, *SP364*, pp. 457-469 (July 1972).

Key words: Crystal chemistry; kinetics; lithium arsenate; lithium phosphates; lithium vanadate; phase transformation; polymorphism.

The high and low polymorphs of Li_3PO_4 are type structures for a large family of tetrahedrally-coordinated oxides. These are readily synthesized by direct solid state reaction of the constituent oxides or by hydrothermal reaction. The simplest substances which are Li_3PO_4-type include Li_3VO_4 and Li_3AsO_4, although the high-low inversion in the latter two proceeds reversibly through one or more intermediate phases which are thermodynamically stable over a short range of temperatures.

The intermediate phases often undergo further structural distortion during quenching to ambient. Li_3PO_4 itself forms an intermediate phase in the conversion low → high Li_3PO_4. This intermediate phase is readily retained to ambient but is believed to be metastable at all temperatures. More complex Li_3PO_4 derivatives include substances of the general formula Li_2MXO_4, where M = Mg, Zn, Co^{2+} and X = Si, Ge^{4+}. Each compound usually has at least two polymorphs. These fall into three classes: one which is either high or low Li_3PO_4 type, one which includes the distortional derivatives of both high and low Li_3PO_4, and lastly, phases of related but unknown structures. A full explanation of the polymorphism of an individual phase is only possible if effects due to solid solution are taken into account. For example, the stoichiometry of "Li_2ZnSiO_4" varies within the system Li_4SiO_4-Zn_2SiO_4; the solubilities of excess Li^+ and Zn^{2+} have been measured as a function of temperature. Inversion temperatures, and especially, the occurrence and stability of many of the distortional derivative structures, are closely related to the stoichiometry.

The possibilities of making other substitutions, such as replacing $(Li^+ + M^{2+})$ by A^{3+}, where A = Al, Ga^{3+}, etc., are discussed.

This family of phases is probably of widespread occurrence. We have encountered these phases in glass-ceramic systems, such as Li_2O-MgO-ZnO-SiO_2, where they are an important crystallization product of *all* glass composition.

On the solidification temperature and the nonstoichiometry of cobaltous oxide in an oxidizing atmosphere, J. P. Coutures and M. Foex, *SP364*, pp. 471-481 (July 1972).

Key words: CoO-O_2 system; melting point depression; nonstoichiometry in liquid CoO; solar furnace; thermal analysis.

Liquid cobaltous oxide can dissolve a large amount of oxygen depending on temperature oxygen partial pressure and time. Therefore, the solidification temperature decreases when the amount of oxygen in the liquid phases increases. During solidification, a "spitting" phenomena occurs. The behavior (spitting phenomena for example) and the properties of this oxide (solidification temperature, melt composition, solid composition) are studied by high temperature techniques.

The system FeO-SiO_2-TiO_2 at high temperatures and high pressures, E. Woermann and A. Lamprecht, *SP364*, p. 483 (July 1972).

Key words: FeO-SiO_2-TiO_2 system; high pressure; high temperature; ternary system.

The investigations of liquidus and solidus relationships in the system FeO-SiO_2-TiO_2 in equilibrium with metallic iron at one atmosphere total pressure revealed four ternary invariant points:

(1) L = wüstite + fayalite + ulvöspinel (1169° C); (2) L = fayalite + tridymite + ulvöspinel (1145 °C); (3) L + ilmenite = tridymite + ulvöspinel (1180 °C); and (4) L + ferropseudobrookite = tridymite + ilmenite (1254 °C).

In the system ferropseudobrookite-tridymite-*rutile* in equilibrium with metallic iron considerable amounts of trivalent titanium are observed at solidus and liquidus temperatures. The titanium bearing phases thus are located outside of the ternary system FeO-SiO_2-TiO_2 toward the oxygen deficient side.

At elevated pressures the following reactions occur:

(1) Ferropseudobrookite = rutile + ilmenite; (2) ulvöspinel + quartz = fayalite + ilmenite; (3) fayalite + quartz = ferrosilite; and (4) ulvöspinel = wüstite + ilmenite.

Depending on temperature and pressure the iron titanium phases form limited solid solutions in the system FeO-SiO_2, due to the occurrence of defect structures.

Carbides and silicides, H. Nowotny, H. Boller, and G. Zwilling, *SP364*, pp. 487-504 (July 1972).

Key words: Carbides; chemical bonding; defect structures; interstitial compounds; ordering; silicides.

A brief survey of the structural chemistry of transition element carbides will be presented with emphasis on the problem of carbon-void ordering. The scandium carbides including $Sc_{15}C_{19}$ are to be discussed. Complex carbides which derive from octahedral and trigonal prismatic building

elements will be classified. Metal-metal carbides such as VCr_2C_2 and metal-nonmetal carbides such as Ti_3SiC_2, V_4P_2C, Nb_2SC or Ta_2S_2C will be interrelated. The role of nitrogen and hydrogen on the stabilization of complex carbides such as $Cr_3(C,N)_2$ or $Zr_2CH_{0.5}$ will also be treated. Besides the class of typical interstitial carbides, some examples of metal boro-carbides displaying a two-dimensional boron-carbon network will be given (YB_2C). In compounds such as $Cr_2(P,C)$ carbon plays an intermediate role. The present state of the problem of chemical bonding in carbides will be discussed.

Binary metal silicides are numerous and occur almost at any composition. They are commonly classified as valence compounds (electronegative), metal-like silicides (electropositive) and clathrate silicides (mainly electroneutral). Disilicides and related compounds exhibit a particularly wide occurrence. The continuous change of structural elements and properties of this group will be discussed. So-called defect disilicides of formula T_nSi_{2n-m} (T = transition element) which are derived from the $TiSi_2$ type structure belong to a uniform building principle, where n presents the number of subcells and m the deviation from the disilicide composition. In many cases a relation of the electronic concentration with m can be observed. In general, lowering of the overall electron concentration diminishes the defect m. Single crystal work on $Mn_{27}Si_{47}$ will be described. This phase, a fifth variety having a composition in the vicinity of $MnSi_{\sim 1.7}$, presents the problem of pseudo-homogenous domains. Some ternary silicides such as E-phases will be discussed from the viewpoint of ordered structures.

Investigations in the ternary system—boron-carbon-silicon, E. Gugel, R. Kieffer, G. Leimer, and P. Ettmayer, *SP364*, pp. 505-513 (July 1972).

Key words: Binary system; boron; carbon; chemical analysis; melting-point determination; metallography; phase-field division; silicon; solubilities; ternary system; x-ray investigations.

Viewing the literature one will notice that the available knowledge about the nonmetallic inorganic systems are rather insufficient and sometimes do not agree with each other. These systems yield a number of attractive high temperature materials and therefore it is essential to improve available information.

The Institut für chemische Technologie anorganischer Stoffe (Institute for Chemical Technology of Inorganic Materials), Technical University of Vienna, and the Research Institute of the Cremer-Group, Rödental-Germany, have systematically worked in this area for several years. This paper will deal with the system Boron-Carbon-Silicon.

In contradiction, some publications confirmed the existence of B_4C only in the enclosing system Boron-Carbon. However, Boron Carbide is able to incorporate excess Boron up to the composition $B_{6.5}$ (in solid solution) clearly showing a lattice expansion. Within the enclosing system Silicon-Boron there are the chemical compounds SiB_{4-x} ($x \leq 1$) and SiB_{12+x} ($x \geq 8$). According to our investigations the ternary system itself, in contrast to some other scientists, does not contain ternary phases as well as no solid solution between enclosing binary systems. Limited solid solutions exist around B_4C (+ Si) and around SiB_{4-x} (+ C). The x-ray investigations permit the presentation of phase distributions. By means of a new method for determination the melting temperatures of high temperature materials the liquidus areas (melting isotherms) of this system were investigated.

Valence bonding in some refractory transition metal compounds with high coordination, F. L. Carter, *SP364*, pp. 515-559 (July 1972).

Key words: Aluminum diboride—cadmium diiodide structure; bidirectional orbitals; effective charge; ESCA; Fermi surface distortion; Madelung constant; Madelung potential; metallic single bond radii; refractory transition metal compounds; tungsten carbide; valence bonding; Voronoi polyhedra.

Bond formation in transition metal compounds isomorphous with WC and AlB_2 is formulated using the bidirectional orbital approximation (BOA) to establish orbital hybridization and a simple but self-consistent application of Pauling's metallic radii with charge transfer to obtain the bond orders. For tungsten carbide seven mutually orthogonal bidirectional bonding orbitals for the negative W atom permit it to simultaneously bond its fourteen neighbors with up to 6.5 electrons. However, bond polarization results in an effective negative charge for carbon of 0.0 to $-0.3e$. For the diborides the metallic radii results indicate that the group IV diborides have a slightly positive boron which becomes negative with increasing group number but remains below a charge of $-1e$. Four arguments are given for the pleating of the boron layer were it to be heavily charged as has been proposed earlier in the isoelectronic analogy to graphite. One of these involves a new definition of atomic volume based on the Voronoi polyhedron. Bond formation by the boron and carbon atoms in these compounds is discussed using the nonpaired spin-orbital [NPSO] approach of Linnett.

Madelung constant and Madelung potentials calculations via the method of Bertaut have been made for both the tungsten carbide and the $AlB_2(CdI_2)$ structure. These were computed in order to both estimate the magnitude of the electrostatic stability as a function of atomic parameters and to provide a basis for the comparison of ESCA chemical shift data with the calculated effective charge.

The effect of bond formation in distorting the surfaces of constant energy in k space is also considered in these compounds with the aid of a simple square well potential model. The principle directions of these distortions of the unreduced Fermi surface are indicated for the WC structure and as a function of the boron position parameter for the AlB_2 structures.

Finally, we note that in both of these structures almost all the electrons outside the rare gas cores are involved in bond formation; this is in contrast to the refractory chalcogenides.

Crystal chemistry of refractory carbides, A. L. Bowman, *SP364*, pp. 561-566 (July 1972).

Key words: Carbide; crystal structure; molybdenum carbide; niobium carbide; reaction mechanism; solid state; tantalum carbide; tungsten carbide; vanadium carbide.

The crystal structures of most of the refractory metal carbides may be described generally on the basis of a close-packed metal sublattice, with the carbon atoms occupying all or part of the octahedral sites. Close-packed carbide structures have been observed with composition MC and packing type c, M_4C_3 and hhcc, M_3C_2 and hcc or hhc, and M_2C and h or c. All of these structures have one octahedral site per metal atom, and thus an apparent possible composition MC. This is reached however, only with the c-type packing, and it has been suggested that only one half of the sites adjacent to an h layer can be filled. This is found to be an upper limit that is not always reached. These carbide structures thus have carbon vacancy concentrations ranging from ~ 0 up to $\sim 70\%$, with a possibility of vacancy order-

ing. Neutron and electron diffraction studies have shown ordering to exist in the M_2C compounds and in carbon-deficient VC.

The order-disorder transformation of the carbon vacancies in Mo_2C has been studied in detail with high-temperature neutron diffraction. The kinetics data are consistent with a nucleation-growth mechanism involving nucleation on grain boundaries and linear growth across the interface. The reaction between Mo_2C and Mo_3C_2, involving the transformation of the close-packed metal lattice ($h \rightleftharpoons hcc$) has been studied less thoroughly, but the kinetics data also appear to be consistent with a nucleation-growth mechanism.

A simple model for the stability of transition metal carbides, R. G. Lye, *SP364*, pp. 567-582 (July 1972).

Key words: Bonding; carbides; cohesive energy; density of states; electronic structure; heat of formation; $L_{II,III}$ spectra; refractory hardmetals; Ti; TiC; transition metal compounds.

The origins of the unusual and complex combination of physical properties exhibited by the transition metal carbides remain somewhat obscure despite extensive studies of the problem in recent years. Even the qualitative nature of the bonding has not yet been described in a manner that accounts satisfactorily for the diverse and sometimes apparently contradictory experimental observations made on these compounds.

One theme, however, recurring through the years of study, draws attention to the similarity of these compounds to the parent transition metals. This characteristic of the carbides is considered briefly in the present study in an attempt to provide a qualitative explanation for the manner in which the stability of the carbide phases varies with the position of the parent metal in the periodic chart of the elements. A simple model for the d band bonding in the transition metals, discussed by Cyrot-Lackmann, is modified for this purpose. In particular, it is assumed that a major component of the bonding in the carbides arises from crystalline electronic energy bands derived for the d states of the metal atoms. Because of changes in crystal structure, these bands are modified somewhat from the shape of the corresponding bands in the parent metal. Of greater importance for the stability of the carbides, however, is the increase in the width of the band, discussed by Costa and Conte, that results from the presence of the carbon atoms within the interstitial positions in the metal sublattice.

As for the parent metals, the cohesion of the carbides is determined by the number of electrons in the d band. In the carbides, however, it is assumed that some of these electrons are provided by transfer from the 2p states of the carbon atoms. Thus, the stability, as measured by the heat of formation, results from the combined effects of the increase in the width of the d band and in the number of electrons it contains.

Despite the considerable simplifications employed, an analytical formulation of this model yields estimates for the heats of formation of the carbides that agree remarkably well with the experimental data presently available.

Ordering effects in NbC and TaC, J. D. Venables and M. H. Meyerhoff, *SP364*, pp. 583-590 (July 1972).

Key words: Carbides; electron diffraction; interpretation of ordering effects; niobium carbide; ordering effects; superlattice; tantalum carbide; transition metal compounds; vanadium carbide.

Studies of the phase equilibria in the MC transition metal carbides have shown that they retain their nominal NaCl structure over a relatively wide phase field. Although it is well known that this wide latitude in composition is accomplished through the incorporation of carbon vacancies in the carbon sublattice, there is considerable uncertainty regarding the degree of order exhibited in most of the carbides by the remaining carbon atoms. In this investigation, an attempt has been made to resolve this question for NbC and TaC using some of the techniques applied previously in a study of ordering in the vanadium-carbon system.

By means of transmission electron microscopy and electron diffraction, evidence has been obtained for the existence of long range carbon atom ordering in single-crystal niobium carbide that has a carbon-to-metal ratio close to the integral composition Nb_6C_5. The ordering, which gives rise to superlattice and domain structures similar to those observed in V_6C_5, appears, however, only in samples that have been cooled slowly (~ 8 °C/h) through the order-disorder temperature of 1025 C. In TaC of similar composition, the ordering, although present, remains very imperfect even after the crystals are subjected to the same thermal treatment.

The results are interpreted in terms of the electronic structure of the transition metal carbides as it is currently understood, and their relevance to the mechanical properties of NbC and TaC are discussed.

The CdP_2-Ge system and the growth of crystals of $CdGeP_2$, E. Buehler and J. H. Wernick, *SP364*, pp. 591-595 (July 1972).

Key words: $CdGeP_2$; CdP_2-Ge system; Ge; phase diagram; single crystals.

The macroscopic features of the phase relationships in the CdP_2-Ge system have been determined. The tetragonal $CdGeP_2$ phase melts congruently at 790 ± 5 °C. Two eutectics are present: one between CdP_2 and $CdGeP_2$ at ~ 700 °C and 20 mol % Ge, and the other, between $CdGeP_2$ and Ge at ~ 750 °C and 65 mol % Ge. Techniques and results for the growth of crystals from stoichiometric melts, by chemical transport, and from liquid Cd and Sn are presented.

High boron content rare-earth borides, K. E. Spear and G. I. Solovyev, *SP364*, pp. 597-604 (July 1972).

Key words: Borides; lattice constants; LnB_{66} compounds; melting temperatures; microhardness; rare-earth borides.

Investigations were performed to determine which rare-earth metals form LnB_{66} phases, and to measure some of the properties of these compounds. Similar rare-earth borides have been recently reported with B:Ln ratios of 50 to 100 for metals Y, Gd, Tb, Ho, and Yb. A single crystal structure analysis published on the yttrium compound shows the structure to be face-centered cubic with an ideal stoichiometry YB_{66}. In the present studies, ten representative metals were used: Y, La, Ce, Pr, Nd, Sm, Gd, Dy, Er, and Yb. Boron-rich compositions were prepared by arc-melting mixtures of the elements. Identification of the phases in each sample was performed with the use of x-ray and metallographic techniques. All of the investigated systems except La, Ce, and Pr formed the LnB_{66} phase, and it is predicted that all rare-earth metals from Nd through Lu will form this phase. Lattice parameters were measured and show a general, but not regular decrease with atomic number. The LnB_{66} phases are extremely hard, with Vickers microhardness values ranging from about 3600 to 4000 kp/mm^2. Melting temperatures for the LnB_{66} phases were essentially the same for all metals, and equal to approximately 2150 °C.

Preparation and characterization of boron suboxide, D. R. Petrak, R. Ruh, and B. F. Goosey, *SP364*, pp. 605-611 (July 1972).

Key words: Amorphous boron; anhydrous boric acid; boric oxide; boron carbide structure type; boron suboxide; crystal structure; decompose; electron microbeam probe; infrared spectrum; lattice parameters; pycnometer; reaction-hot pressing; rhombohedral boron; x-ray diffraction.

Fabrication techniques have been developed to produce specimens of near theoretical density by reaction hot pressing of boron and boric acid in vacuum at temperatures of 1900-2000 °C and pressures of 0.41 kbars. The composition range 80 to 89 atomic % boron was investigated by chemical analysis, lattice parameter studies, pycnometric density determinations, electron probe analysis and infrared analysis. Results support the $B_{12}O_2$ chemical formula and the R3m space group with twelve boron atoms in the 18h positions and two oxygen atoms in the 6c positions. Thus, on the basis of the experimentally determined hexagonal lattice parameters of $a = 5.386 \pm 0.003$ Å and $c = 12.326 \pm 0.004$ Å, the calculated density is 2.602 $g \cdot cm^{-3}$ and this is in good agreement with the experimentally determined value of 2.600 ± 0.007 $g \cdot cm^{-3}$. The occupancy of the 3b position by either boron or oxygen (to allow the B_4O or $B_{13}O_2$ stoichiometry) is ruled out since this would require increases in density and/or lattice parameters and none were observed. Also these configurations do not satisfy the Longuet-Higgins and Roberts counting rule. The boron suboxide phase has been studied by electron probe and infrared analyses. The oxygen K emission spectra as well as the infrared reflection spectra are presented. Boron suboxide has been studied by mass spectrometric analysis and found to decompose to rhombohedral boron and B_2O_2.

Ternary transition metal silicides and germanides: Ordering and metal-metal bonding in Ni_2In-related phases, V. Johnson and W. Jeitschko, *SP364*, pp. 613-622 (July 1972).

Key words: Fe_2P and Mn_5Si_3; metal-metal bonding; metal-site occupancies; Ni_2In; ordered ternary silicides and germanides; silicides and germanides; ternary Ni_2In-related phases; TiNiSi.

Ternary transition metal silicides and germanides with structures related to Ni_2In ("filled" NiAs) are reviewed. For compositions TT'Si and TT'Ge, where T is a transition metal from groups IV, V and VII and T' is from the iron group, the structures adopted are TiNiSi (ordered anti-$PbCl_2$), ordered Fe_2P, TiFeSi or Ni_2In. We describe and illustrate how these as well as the hexagonal Mn_5Si_3 structure are related.

Metal site occupancies in ternary TiNiSi and Fe_2P-type silicides and germanides and pseudobinaries with Ni_2In and Mn_5Si_3 structures are also reviewed. We discuss the importance of the relative size and electronegativity of the transition metal atoms and their d-electron configurations in determining site preferences.

Bonding in these Ni_2In-related phases, $(TT')_{2-x}Si(Ge)$, is discussed. The structures differ principally in the strengths of the respective T-T, T-T', and T'-T' metal-metal interactions. Questions as to how these are determined by electronegativities, size and d-electron configuration, and how they in turn affect phase stability and metal-site occupancies are raised.

Structural transitions of some transition-metal chalcogenides, F. Jellinek, *SP364*, pp. 625-635 (July 1972).

Key words: Dichalcogenides; intercalation compounds; layer structures; modulated structures; occupation waves; selenides; semiconductor-to-metal transitions; structure transitions; sulfides; tellurides; transition-metal chalcogenides; trigonal-prismatic coordination.

A survey is given of some recent investigations on transition-metal chalcogenides (sulfides, selenides, tellurides) carried out in the author's laboratory; particular attention is paid to compounds undergoing structural transitions at elevated temperatures. Examples are given of transitions involving a change of the coordination of the metal ($NbSe_2$, TaS_2, $TaSe_2$, $MoTe_2$, Ni_3Se_2), of order-disorder transitions ($AgCrSe_2$ and related compounds; chromium sulfides, $Ni_{3\pm x}Te_2$), and of transitions involving distortions of the structure (CrS, VS, $Nb_{1-x}S$). The occurrence of trigonal-prismatic coordination in several transition-metal chalcogenides is ascribed to d-covalency which stabilizes trigonal-prismatic with respect to octahedral coordination for ions with a d^0, d^1 or spin-paired d^2 configuration. The effect of the metal coordination on the physical properties of the compound is also described. The distributions of occupied and vacant metal sites in transition-metal chalcogenides $M_{1+p}X_2$ are discussed (chromium sulfides, zirconium selenides), as is the concept of "occupation waves" (titanium sulfides). In $Ni_{3\pm x}Te_2$ occupation waves lead to a phase lacking three-dimensional periodicity; the intervention of this phase allows smooth transitions from the disordered high-temperature form to the ordered low-temperature forms (two-step second-order transition).

Solid solubility in the face centered cubic Gd_xSe_{1-x} system, F. Holtzberg, D. C. Cronemeyer, T. R. McGuire, and S. von Molnar, *SP364*, pp. 637-644 (July 1972).

Key words: Color-concentration dependence; gadolinium monoselenide; Hall effect; homogeneity range; magnetic ordering; reflectivity; resistivity; single crystal growth.

The range of homogeneity has been studied in the face-centered cubic Gd_xSe_{1-x} system. The solid solution field is bounded by the composition $x = 0.443$ for excess Se and extends through the stoichiometric composition to at least 0.512 for excess Gd. The lattice constant decreases linearly with decreasing Gd concentration except at lowest values of x. The materials have been characterized by resistivity, reflectivity and magnetic measurements. The results of the transport and reflectivity measurements are explained on the basis of a simple single rigid band model. Magnetization measurements show that all compositions order antiferromagnetically with the Neél temperature, T_N, varying from ~ 20 to ~ 60 K and θ from -25 to -135 K with increasing Gd or electron concentration.

Ternary chalcogenides of light rare earth elements with transition elements, G. Collin, H. D. Nguyen, O. Gorochov, M. Guittard, P. Laruelle, and J. Flahaut, *SP364*, pp. 645-65(
(July 1972).

Key words: Crystal structure; magnetic properties; rare earth; ternary chalcogenides; transition metals.

Description of three new crystal families. Crystal structures. Magnetic properties. (1) $La_2Fe_2S_5$-type – orthorhombic $A2_1am$; (2) $La_8Fe_3S_{15}$-type – monoclinic Bm. These two structures have similarities. The rare earth atoms are 7-8 coordinated. The Fe atoms have two kinds of environments: 4-coordinated in a distorted tetrahedron of S atoms, 6-coordinated in a distorted octahedron of S atoms. In both cases 2 neighboring Fe atoms are associated by 2 intermediate S atoms. These 4 atoms form a distorted quadrilateral with Fe-S-Fe angles not far from 90°; (3) $CeCrSe_2$ type – orthorhombic Pnam. The rare earth atoms are 9-coordinated, and the Cr atoms are 6-coordinated, inside nearly regular octahedron of selenium. As in the preceding structures, 2 neighboring Cr atoms form with 2 intermediate Se atoms a nearly regular square.

These compounds are antiferromagnetic at low temperature (Neél temperature for $LaCrSe_3$: 165 K). Weak ferromagnetism appears at lower temperature.

Crystal chemistry of metal-rich refractory sulfides, H. Chen and H. F. Franzen, *SP364*, pp. 651-662 (July 1972).

Key words: Crystal structure; intermetallic; phosphides; refractory; sulfides; transition metal; coordination polyhedra.

Systematization of the crystal structures of metal-rich chalcogenides was attempted with emphasis on the coordinations of a few key metal atoms. This approach gave a more complete interpretation of many chalcogenide structures, notably those of Ta_2S, Ta_6S and Nb_2Se, than did the conventional descriptions using the packing of the coordinations of the chalcogen atoms. The pursuit of this approach led to the recognition of a polyhedron, which, owing to its repeated presence in many metal-rich compounds, appeared to be of great importance in crystal chemistry. It is a two-centered polyhedron formed by the interpenetration of two C. N. 14 Kasper polyhedra in such a way that the center of one of the Kasper polyhedra is the apex of another. The presence of a very short interatomic distance between the two centers is one of the important features of this polyhedron. With the help of this polyhedron as the building block, the structures of Zr_9S_2, α-V_3S and β-V_3S were satisfactorily described and correlated; the short interatomic distances in the structures could be explained semi-quantitatively; and the structural differences expressed by the different packing schemes of the polyhedra and the different positions the sulfur atoms occupied in the polyhedra. The description using the two-centered polyhedra as the basic units was extended to the structures in phosphide systems and provided new structural evidences to the similarities and distinctions among the Zr_9S_2-, α-V_3S-, β-V_3S-, Fe_3P- and Ti_3P-type structures, and to the correlation that the Fe_3P structure is the high temperature form of the Ti_3P structure. The smooth correlation between the sulfides, Zr_9S_2, α-V_3S and β-V_3S, and the phosphides and related compounds renders further support to the speculation that these sulfides possess the nature of intermetallic compounds.

Mixed cation disulfides of titanium, vanadium, and chromium, L. E. Conroy and K. R. Pisharody, *SP364*, pp. 663-671 (July 1972).

Key words: Disulfides; electrical conductivity; magnetic properties; sulfides; titanium disulfide; titanium-vanadium disulfides; vanadium disulfide.

Mixed cation disulfides of the types $Ti_{1-x}V_xS_2$ and $Ti_{1-x}Cr_xS_2$ have been prepared with compositions in the range $0 < x < 1$ in the Ti-V system and $0 < x < 0.4$ in the Ti-Cr system. Polycrystalline materials were prepared by direct reaction of the elements in vacuo at 950°. Single crystals of the Ti-V compounds were prepared by chemical transport reactions, employing iodine as the transport agent. The Ti-Cr disulfides failed to transport by this technique. The chemical properties of the mixed cation materials were found to be very similar to those of TiS_2. X-ray diffraction data indicated a random substitution of V or Cr for Ti in the normal Ti sites in the TiS_2 structure. A regular variation of lattice parameter with the vanadium content was observed in the Ti-V system. The magnetic properties of both the Ti-V and Ti-Cr compounds were characteristic of ferrimagnetic materials, with magnetic susceptibilities in the range of 3×10^{-11} m³/g to 12×10^{-11} m³/g (corrected) at room temperature. All of the mixed cation materials exhibited metallic electrical conductivity in contrast with the degenerate semiconductor behavior of TiS_2, with resistivities of the order of 10^{-5} ohm-m at room temperature. No superconductivity was observed at temperatures above 1.3 K. A band model for the description of the electronic properties of these materials is discussed.

Crystal growth and properties of some I-III-VI_2 compounds, H. M. Kasper, *SP364*, pp. 671-679 (July 1972).

Key words: $AgGaS_2$; chalcogenides; chalcopyrite; I-III-VI_2 compounds; crystal growth; $CuGaS_2$; $CuInS_2$; d-bands; direct bandgap semiconductors; nonlinear optical materials; semiconductor materials.

The I-III-VI_2 compounds are ternary analogues to the II-VI semiconductors and are interesting both as possible nonlinear optical materials and as semiconductors. They usually crystallize in the chalcopyrite structure which belongs to the uniaxial acentric crystal class 42m. In order to study their optical and semiconductor properties, single crystals of $AgGaS_2$, $CuGaS_2$ and $CuInS_2$ have been grown by slowly cooling melts of stoichiometric composition, and the conditions of growth by directional freezing are reported. $AgGaS_2$ crystallizes as yellow and green crystals. The yellow crystals seem to be gallium rich. $CuGaS_2$ does not melt congruently. Stoichiometric melts first crystallize a composition near $Cu_{0.88}Ga_{1.04}S_2$ as light orange crystals. Later darker, nearly stoichiometric crystals are obtained. $CuInS_2$ crystallizes between 1050 and 1000 °C with all crystals transparent to beyond 10 μ. There is a strong absorption in $CuGaS_2$ near 1.8 μ, which extends toward the visible and causes the darker color. The bandgaps are 2.72 eV for $AgGaS_2$, 2.53 eV for $CuGaS_2$ and 1.55 eV for $CuInS_2$ at 2 K. Both the light and dark crystals of $CuGaS_2$ as well as $CuInS_2$ and $AgCuS_2$ show sharp line luminescence. The linear and nonlinear optical properties of $AgGaS_2$, $Cu_{0.88}Ga_{1.04}S_2$ and $CuInS_2$ have been investigated. Unfortunately in both $Cu_{0.88}Ga_{1.04}S_2$ and $CuInS_2$ the birefringence is not large enough to permit three frequency phase matching, but $AgGaS_2$ can be phase matched in the infrared for both parametric oscillation and second harmonic generation. With both $CuGaS_2$ and $CuInS_2$ a pronounced structure has been observed in electroreflectance near the bandgap and at higher energies. From this structure is concluded that the crystal field splitting of the d bands is about 0.7 eV and that the d bands lie about 2 eV below the valence band edge in both compounds. Stimulated emission has been observed in $AgGaS_2$, $CuGaS_2$ and $CuInS_2$. $AgGaS_2$ is usually of high resistivity, whereas $CuGaS_2$ is p-type and $CuInS_2$ can be made both p- and n-type.

Crystal chemistry and magnetic properties of phases in the Ba-Fe-S(Se) systems, H. Steinfink, H. Hong, and I. Grey, *SP364*, pp. 681-694 (July 1972).

Key words: Crystal structures of Ba_2FeS_3, Ba_2FeSe_3, $BaFe_2S_3$, $BaFe_2Se_3$, $Ba_7Fe_6S_{14}$, $Ba_6Fe_8S_{15}$, $Ba_3Fe_3Se_7$; magnetic characteristics of Ba_2FeS_3, $Ba_7Fe_6S_{14}$ and $Ba_6Fe_8S_{15}$.

The crystal structures of a number of new phases synthesized in the Ba-Fe-S and Se systems were investigated by x-ray diffraction techniques. Ba_2FeS_3 is orthorhombic, Pnma, $a = 12.087(5)$ A, $b = 4.246(2)$ A, $c = 12.359(5)$ A, $\rho_{meas} = 4.0$ g/cc, $\rho_{calc} = 4.47$ g/cc, $Z = 4$, m.p. > 1300 °C. The compound is isostructural with Ba_2ZnS_3 and the structure consists of FeS_4 tetrahedra sharing corners to form an infinite linear chain. Ba_2FeSe_3 is isostructural with the sulfide and its parameters are $a = 12.350(7)$ A, $b = 4.439(2)$ A, $c = 12.921(5)$ A. $BaFe_2S_3$ is orthorhombic, Cmcm, $a = 8.7835(9)$ A, $b = 11.219(1)$ A, $c = 5.2860(5)$ A, $\rho_{meas} = 4.0$

g/cc, ρ_{calc} = 4.40 g/cc, Z = 4, m.p. = 765 ± 10 °C. Three dimensional x-ray diffraction data was used to refine the structure which consists of two FeS_4 tetrahedra sharing edges and this binuclear unit in turn shares edges with others to form an infinite chain. The structure of $BaFe_2Se_3$ is essentially the same as that of the sulfide but they are not isostructural. The selenide is orthorhombic, Pnma, a = 11.878(3) A, b = 5.447(2) A, c = 9.160(2) A, ρ_{calc} = 5.44 g/cc, Z = 4; decomposes above 750 °C. $Ba_6Fe_8S_{15}$ is tetragonal, I4/m, a = 11.408(2) A, c = 10.256(2) A, ρ_{meas} = 4.30 g/cc, ρ_{calc} = 4.36 g/cc, Z = 2, m.p. 880 ± 10 °C. The structure was determined from three dimensional x-ray diffraction data and consists of a tetranuclear unit formed by 4 FeS_4 tetrahedra sharing corners and these units then share edges to form an infinite column. $Ba_3Fe_3Se_7$ is hexagonal, $P6_3mc$, a = 10.843(3) A, c = 7.384(2) A, ρ_{calc} = 5.00 g/cc, Z = 2. The structure was determined using three dimensional single crystal x-ray diffraction data and consists of isolated trinuclear units formed by edge sharing of three FeS_4 tetrahedra. The Fe-Fe distances between chains are 6 A, and vary from 2.6 A to 4.2 A within the chains. The Fe-S distances are 2.3—2.4 A, the S-Fe-S angles are tetrahedral and the Ba-S distances are essentially equal to the sum of the ionic radii. The corresponding distances in the selenides reflect the larger size of the anion.

The magnetic characteristics of Ba_2FeS_3, $Ba_7Fe_6S_{14}$ and $Ba_6Fe_8S_{15}$ were investigated; all three compounds are antiferromagnets. The values of the exchange forces, J/k, correlate with the observed Fe-Fe distances.

Study of sulfospinels, R. E. Tressler and V. S. Stubican, *SP364*, pp. 695-702 (July 1972).

Key words: Flash evaporation; high pressure phases; sulfospinels; thin films.

Several new compounds with the formula AB_2S_4 were synthesized. Pressure-induced polymorphism of the sulfospinels was investigated. Sulfospinels which produced new high-pressure phases were $NiRh_2S_4$, $FeYb_2S_4$, In_2S_3, $CrIn_2S_4$, $NiIn_2S_4$, $CoIn_2S_4$ and $MnIn_2S_4$. The only sulfospinels which transformed to the NiAs derivatives were those in which A and B atoms had unfilled d-orbitals. P-T phase relations were investigated for a series of sulfochromites.

Thin films of several ACr_2S_4 (A = Mn, Fe, Co, Cu and Zn) sulfospinels were prepared by a flash evaporization technique on the (111) and (100) planes of NaCl and on the (100) plane of MgO.

Phase changes in Cu_2S as a function of temperature, W. R. Cook, Jr., *SP364*, pp. 703-712 (July 1972).

Key words: Chalcocite; Cu_2S; digenite; djurleite; nonstoichiometry; phase relations.

The high-copper phase boundary of Cu_2S deviates from stoichiometry above 300 °C, first becoming copper deficient, then above ~ 1075 °C becoming copper rich. The maximum copper content occurs at the monotectic temperature of 1104 °C. The strong effect of oxygen on the hexagonal-cubic transition in Cu_2S was confirmed; the transition was also found to be sensitive to the type of pretreatment of the material. The high temperature tetragonal "$Cu_{1.96}S$" phase is stable between $Cu_{1.95}S$ and Cu_2S, at temperatures of ~ 90 to ~ 140 °C. The transition to the tetragonal phase is extremely sluggish. The true composition of djurleite has been shown to be approximately $Cu_{1.93}S$.

The phases near the chalcocite-digenite region of the diagram may be grouped into those with hexagonal close packing of sulfur atoms and those with cubic close packing of sulfurs. This is important in understanding rates of transformation among the various phases that occur in this area of the diagram.

Preparation and properties of the systems $CuFeS_{2-x}$ and $Cu_{1-x}Fe_{1+x}S_{2-y}$, R. L. Adams, P. Russo, R. J. Arnott, and A. Wold, *SP 364*, pp. 713-719 (July 1972).

Key words: Chalcopyrite; $CuFeS_2$, $CuFeS_{2-x}$, $Cu_{1-x}Fe_{1+x}S_{2-y}$; Cu-Fe-S system; $CuFeS_2$ crystal growth.

Stoichiometric samples of $CuFeS_2$ were prepared by direct combination of the elements in sealed evacuated silica tubes. The products were characterized by x-ray diffraction, density determination, magnetic susceptibility and Mössbauer spectroscopy. Homogeneous single phase products gave a density of 4.18 ± 1 g/cc and cell parameters of a_o = 5.292 ± (5) Å and c_o = 10.407 ± (5) Å. In addition, all of the iron was found to be trivalent and located on tetrahedral sites. The plot of inverse susceptibility versus temperature was nearly temperature independent from 77 to 300 K, and the magnetic susceptibility measurements gave a $\chi_M = 9.8 \times 10^{-4}$ emu/mole. Single crystals of $CuFeS_2$ were grown from the melt by means of a modified Bridgman technique.

Samples having the composition $CuFeS_{2-x}$ were also prepared by the direct combination of the elements. X-ray diffraction studies indicated that existence of a single phase, tetragonal γ-form, when x was varied from 0.17 to 0.24. The compound $CuFeS_{1.8}$ had cell dimensions of a_o = 10.598 ± (5) Å and c_o = 5.380 ± (5) Å. Contrary to previous reports, this phase was found to be stable from room temperature to 800 °C. In addition, this phase was stable at room temperature for a period of time in excess of 250 days. It was concluded from density measurements that the structure is best represented as a close packing of sulfur with excess metal ions occupying additional lattice sites.

Compounds having the composition $Cu_{1-x}Fe_{1+x}S_{1.80}$ ($0.25 > x > 0.08$) were prepared and found to be cubic with an average cell size of a_o = 5.32 Å. However, attempts to prepare single phase products with a composition of $Cu_{1+x}Fe_{1-x}S_{2-y}$ were unsuccessful.

Laser Raman spectra of polycrystalline ZnS and $Zn_xCd_{1-x}S$ solid solutions, J. Shamir and S. Larach, *SP364*, p. 721 (July 1972).

Key words: Laser Raman spectra; polycrystalline; ZnS; $Zn_xCd_{1-x}S$.

Raman spectra of polycrystalline ZnS and of CdS have been recorded. The instrument consisted mainly of a He-Ne laser, Spectra-Physics, model 125 and a 1400 Spex double monochromator. The lines observed were in good agreement with those observed before in a single crystal. Some of these lines are not as sharp and intense as in a single crystal; however, the LO frequency of ZnS at 351 cm^{-1} is a very sharp and intense line.

In addition we studied the spectra of $Zn_xCd_{1-x}S$ solid solutions. These materials have been prepared by firing mixtures of pure ZnS and CdS, in the proper compositions, at 1100 °C, in an atmosphere of purified Argon. It has been observed that the LO frequency of CdS at 306 cm^{-1} shifts toward higher frequencies as the concentration of zinc increases. This behavior indicates a type I change as discussed by Pershan and Lacina, namely a linear shift of the frequency as the concentration varies from zero to one in the $Zn_xCd_{1-x}S$. These results resemble the ones obtained in a Vegard plot of lattice constants as determined by x rays.

Novel method for the synthesis of rare earth chalcogenides, C. Paparoditis and R. Suryanarayanan, *SP364,* p. 723 (July 1972).

Key words: Coevaporation of elements; rare earth chalcogenides; synthesis.

A description is given of an all-metal vacuum system for the synthesis of rare earth tellurides and selenides by the coevaporation of the elements. The evaporation chamber is provided with three crucibles so that ternary compounds can also be prepared. Forty or more deposits can be obtained in a single operation. A wide range of compositions can thus be obtained if desired. The substrates, amorphous or crystalline, can be heated up to 600 °C. The following compounds have been obtained as polycrystalline, highly textured or single crystal films: EuTe, EuSe, YbTe, YbSe, $YbSe_{1+\delta}$, SmTe, SmSe, $SmSe_{1+\delta}$ (Th_3P_4 structure), $Eu_{1-x}Pb_xTe$, $Eu_{1-x}Gd_xSe$, $Eu_{1-x}Yb_xTe$. Evidence of high quality is given by x-ray, electron microscopy, electron diffraction and electron microprobe analysis. Optical absorption spectra up to 6 eV, reflection spectra up to 10 eV, magnetic circular dichroism spectra in the visible have been obtained. Transition assignments have been proposed for the first time in the case of Yb and Sm monochalcogenides.

Results of optical and magneto optical investigations have been presented for the ferromagnetic EuS obtained by coevaporation and for EuO obtained by reactive evaporation. Finally, electrical and other transport properties of stoichiometric EuO have also been presented.

P365. **Metric conversion card,** J. V. Odom, Nat. Bur. Stand. (U.S.), Spec. Publ. 355, 2 pages (Revised Nov. 1972).

Key words: Metric units, conversion customary to metric; metric units, conversion metric to customary.

A pocket card for convenient appropriate conversion of the ustomary units of physical measurement to metric units and ietric units to customary units.

P366. **Bibliography on atomic line shapes and shifts (1889 through March 1972),** J. R. Fuhr, W. L. Wiese, and L. J. Roszman, Nat. Bur. Stand. (U.S.), Spec. Publ. 366, 165 pages (Sept. 1972).

Key words: Atomic; instrumental broadening; line shapes; line shifts; pressure broadening; resonance broadening; Stark broadening; Van der Waals broadening.

This is the first general, annotated bibliography on atomic line hapes and shifts. It covers exhaustively the atomic spectral line roadening literature in about 1400 separate references extend- ng from 1889 through March 1972. The bibliography contains our major parts: (1) All general interest papers are catalogued ccording to the broadening mechanisms (and, further, according o special topics under several of the mechanisms), and as to hether the work is a general theory, a general review, a table of rofiles or parameters, a comment on existing work, a study of eneral experimental measurement techniques, or an experimen- al effort of general importance. Also included are selected apers on important applications of line broadening and on iscellaneous topics relating to atomic spectral line shapes and hifts. (2) In Part 2, all papers containing numerical data are or- ered as to element, ionization stage, broadening mechanism (in he case of foreign gas broadening the perturbing species are sted), and it is indicated whether the data are experimentally or eoretically derived. (3) While in the two preceding parts of the ibliography the references are listed for brevity by identification umbers only, in Part 3 all references are listed completely by ournal, authors, and title and are arranged chronologically and lphabetically within each year according to the principal

SP366. Supplement 1. **Bibliography on atomic line shapes and shifts (April 1972 through June 1973),** J. R. Fuhr, L. J. Roszman, and W. L. Wiese, Nat. Bur. Stand. (U.S.), Spec. Publ. 366 Suppl. 1, 73 pages (Jan. 1974) SD Catalog No. C13.10:366, Suppl. 1.

Key words: atomic; instrumental broadening; line shapes; line shifts; pressure broadening; resonance broadening; Stark broadening; Van der Waals broadening.

This is the first supplement to the NBS Special Publication 366, "Bibliography on Atomic Line Shapes and Shifts (1889 through March 1972)." It contains about 350 references and covers the literature from April 1972 through June 1973. The bibliography contains five major parts: (1) All general interest papers are cataloged according to the broadening mechanisms (and, further, according to special topics under several of the mechanisms) and as to whether the work is a general theory, a general review, a table of profiles or parameters, a comment on existing work, a study of general experimental measurement techniques, or an experimental effort of general importance. Also included are selected papers on important applications of line broadening and on miscellaneous topics relating to atomic spectral line shapes and shifts. (2) In Part 2, all papers containing numerical data are ordered as to element, ionization stage, broadening mechanism (in the case of foreign gas broadening the perturbing species are listed), and it is indicated whether the data are experimentally or theoretically derived. (3) While in the two preceding parts of the bibliography the references are listed for brevity by identification numbers only, in Part 3 all references are listed completely by journal, authors, and title and are arranged chronologically and alphabetically within each year according to the principal author. (4) This section contains a list of all authors and their papers. (5) A final section provides corrections or additions to our first bibliography.

SP366-2. **Bibliography on atomic line shapes and shifts (July 1973 through May 1975),** J. R. Fuhr, G. A. Martin, and B. J. Specht, Nat. Bur. Stand. (U.S.), Spec. Publ. 366 Suppl. 2, 75 pages (Nov. 1975) SD Catalog No. C13.10:366/Suppl. 2.

Key words: atomic; instrumental broadening; line shapes; line shifts; pressure broadening; resonance broadening; Stark broadening; van der Waals broadening.

This is the second supplement to the NBS Special Publication 366, "Bibliography on Atomic Line Shapes and Shifts (1889 through March 1972)." It contains about 400 references and covers the literature from July 1973 through May 1975. As before, the bibliography contains five major parts: (1) All general interest papers are catalogued according to the broadening mechanisms (and, further, according to special topics under several of the mechanisms) and as to whether the work is a general theory, a general review, a table of profiles or parameters, a comment on existing work, a study of general experimental measurement techniques, or an experimental effort of general importance. Also included are selected papers on important applications of line broadening and on miscellaneous topics relating to atomic spectral line shapes and shifts. (2) In Part 2, all papers containing numerical data are ordered as to element, ionization stage, and broadening mechanism (in the case of foreign gas broadening the perturbing species are listed), and it is indicated whether the data are experimentally or theoretically derived. (3) While in the two preceding parts of the bibliography the references are listed for brevity by identification numbers only, in Part 3 all references are listed completely by journal, authors, and title and are generally arranged chronologically and alphabetically within each year according to the principal author. (4) This section contains a list of all authors and their papers. (5) A final section provides corrections or additions to the first bibliography and supplement.

SP367. **National Bureau of Standards Brochure, 1972,** W. E. Small, Editor, Nat. Bur. Stand. (U.S.), SP367, 66 pages (Dec. 1972).

Key words: National Bureau of Standards; organization; overview; program descriptions.

This publication presents an in-depth look at the National Bureau of Standards. An overview of the Bureau's history, programs, and major contributions precedes individual chapters detailing the programs of each of the four NBS Institutes: Institute for Basic Standards; Institute for Materials Research; Institute for Applied Technology; and Institute for Computer Sciences and Technology. Supersedes NBS Miscellaneous Publication 282 and Special Publication 360.

SP-368, Superseded by Special Publication 368, 1976 Edition.

SP369. **Soft x-ray emission spectra of metallic solids: Critical review of selected systems and annotated spectral index,** A. J. McAlister, R. C. Dobbyn, J. R. Cuthill, and M. L. Williams, Nat. Bur. Stand. (U.S.), Spec. Publ. 369, 176 pages (Jan. 1974) SD Catalog No. C13.10:369.

Key words: alloys; critical review; emission spectra; intermetallic compounds; metals; soft x ray; spectra.

Theory and experimental practice in the field of soft x-ray emission from metallic solids are briefly reviewed, and measurements on a number of systems are critically evaluated and compared with the results of other techniques and theory, with a view to establishing the pertinence of the soft x-ray measurements and indicating specific guidelines for further enhancing their value. In addition, an exhaustive annotated index of measured spectra is provided. Supersedes NBS Monograph 52 in part, for emission spectra only.

SP370. **Research and testing facilities of the Engineering Mechanics Section, National Bureau of Standards, Washington,** D.C., by the Staff of the NBS Engineering Mechanics Section, D. J. Chwirut, Coordinator, Nat. Bur. Stand. (U.S.), Spec. Publ. 370, 23 pages (Jan. 1973) 55 cents, SD Catalog No. C13.10:370.

Key words: Engineering Mechanics Section; force generating equipment; research facilities; testing machines.

The principal characteristics of the force measuring and generating equipment and related research facilities available in the Engineering Mechanics Section of the National Bureau of Standards are described.

SP371. **A supplementary bibliography of kinetic data on gas phase reactions of nitrogen, oxygen, and nitrogen oxides,** F. Westley, Nat. Bur. Stand. (U.S.), Spec. Publ. 371, 92 pages (Feb. 1973) $1.25, SD Catalog No. C13.10:371.

Key words: Bibliography; chemical kinetics; excited state; gas phase; nitrogen atom; nitrogen molecule; nitrogen oxides; oxygen atom; oxygen molecule; ozone.

A bibliography, a reaction-oriented list of references supplementing NBS publication COM-71-00841 (NBS-OSRDB-71-2, August 1971), is provided for published papers and reports containing rate data for reactions of N, N_2, N_3, N_2O, N_2O_2, N_2O_3, N_2O_4, N_2O_5, NO, NO_2, NO_3, NO_4, O, O_2 and O_3 with each other. It includes an extensive list of papers dealing with production and reactions of molecular oxygen in excited singlet state ($a^1\Delta_g$, $b^1\Sigma_g^+$, $c^1\Sigma_u$). In addition, two lists of critical reviews dealing with the above reactions are included. About 500 papers are listed. The period covered extends from 1900 through January 1972.

SP371-1. **Supplementary bibliography of kinetic data on gas phase reactions of nitrogen, oxygen, and nitrogen oxides (1972-1973),** F. Westley, Nat. Bur. Stand. (U.S.), Spec. Publ. 371-1, 88 pages (June 1975) SD Catalog No. C13.10:371-1.

Key words: bibliography; chemical kinetics; excited state; gas phase; nitrogen atom; nitrogen molecule; nitrogen oxides; oxygen atom; oxygen molecule; ozone.

A reaction-oriented list of references is provided for papers and reports published in 1972 and 1973, containing rate data for reactions of N, N_2, N_2O, N_2O_2, N_2O_3, N_2O_4, N_2O_5, NO, NO_2, NO_3, NO_4, O, O_2 and O_3 with each other. Some reactions of species in excited states are included. This bibliography, covering about 500 papers, extends the coverage of two previous bibliographies on the same subject, COM-71-00941, NBS-OSRDB-71-2, August 1971 and NBS Special Publication 371, February 1973. Some work published prior to 1972 omitted in the previous publications has been included here.

SP372. **Laser induced damage in optical materials: 1972.** Proceedings of a Symposium Sponsored by the American Society for Testing and Materials and by the National Bureau of Standards, June 14-15, 1972, NBS, Boulder, Colo., A. J. Glass and A. H. Guenther, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 372, 215 pages (Oct. 1972).

Key words: IR windows and mirrors; laser damage; laser materials; self-focusing; thin films.

The fourth ASTM Symposium on Laser Induced Damage in Optical Materials was held at the National Bureau of Standards in Boulder, Colo., on June 14-15, 1972. This symposium is held as part of the activity of Subcommittee II on Lasers and Laser Materials, of the ASTM. Subcommittee II is charged with the responsibility of formulating standards for laser materials, components, and devices. The chairman of Subcommittee II is Haynes Lee of Owen-Illinois, Inc. Co-chairmen for the damage symposia are Dr. Arthur H. Guenther of the Air Force Weapons Laboratory, and Professor Alexander J. Glass, Chairman of the Department of Electrical Engineering at Wayne State University.

Approximately 125 attendees at the symposium heard 21 papers on topics relating to laser induced damage in glass, crystalline materials, nonlinear optical materials, thin film dielectric coatings, and infrared components. Particular attention was given to the process of plasma formation at dielectric surfaces, the role played by self-focusing in bulk damage in solids, damage morphology of thin film coatings, and the role of absorption in IR component failure.

The proceedings of these Symposia represent the major source of information in the field of laser induced damage in optical materials. The Symposia themselves, along with the periodic meetings of Subcommittee II, provide a unique forum for the exchange of information regarding laser materials specifications among the manufacturers and users of laser devices, components, and systems. The Symposium also serves as a mechanism of information gathering, to enable the Subcommittee to write informed and realistic specifications. *These proceedings include the following papers* (*indented*):

Laser damage of HOYA Laser Glass, LCG-11, T. Izumitani, K. Hosaka, and C. Yamanaka, *SP372,* pp. 3-10 (Oct. 1972).

Key words: HF treatment; inclusion damage; passive and active testing; platinum inclusion; surface damage; thin film coating.

In HOYA Glass Works we have developed a Barium Crown Laser Glass, LCG-11. It has a stimulated emission cross section (σ) of 2.0×10^{-20} cm^2 and a loss coefficient (γ) of 0.001 cm^{-1}.

In this report we show that, while platinum lowers the damage threshold of laser glass, by controlling the number and size of the platinum inclusion, the damage threshold of platinum crucible melts of LCG-11 laser glass does not go below 400 J/cm² in the passive test, nor below 28 J/cm² in the active test. This compares favorably with the damage threshold of melts in SiO_2 and ceramic crucibles. The ceramic melted glass showed a higher lasing threshold, a lower slope efficiency in normal oscillation and an output saturation tendency in Q-switched oscillation.

We find that surface damage is independent of glass strength, glass thermal expansion, and adsorption of water in glass surface. We find that LCG-11 glass, upon treatment with hydrofluoric acid, was improved from 28 J/cm² to 40 J/cm², a higher damage threshold in passive test, yet we were unable to find a change in glass surface composition due to hydrofluoric acid treatment by using electron microprobe. We assume that surface damage is dependent upon the multi-photon ionization tendency of a glass surface. This assumption is based upon our observation of silica glass which has no single-bond oxygen and a high damage threshold.

Interaction gradients, concurrent light scattering experiments and bulk laser damage in solids, C. Y. She and D. F. Edwards, *SP372*, pp. 11-14 (Oct. 1972).

Key words: Bulk; crystalline quartz; fused quartz; interaction gradient; laser glass; laser induced damage; light scattering; stimulated Brillouin scattering.

The concept of interaction gradient and its role on bulk laser damage is discussed. Results of light scattering experiments concurrent with damaging laser pulses on crystalline quartz, fused quartz and laser glass samples are compared to substantiate the role of interaction gradient and stimulated Brillouin scattering on bulk laser damage in solids.

Optical index damage in electrooptic crystals, A. M. Glass, G. E. Peterson, and T. J. Negran, *SP372*, pp. 15-26 (Oct. 1972).

Key words: Holographic measurements; laser induced index change; optical memories; reversible low power damage.

Optically induced refractive index changes which occur at low incident power densities (< 1 KW/cm²) in many electrooptic crystals have severely limited the application of these materials in the visible spectrum. Following a brief historical review of the subject, we discuss the recent advances in the understanding of the physical mechanisms involved, progress in reducing the damage susceptibility, and in enhancing the effect for holographic applications.

Particular attention is paid to $LiNbO_3$ and $LiTaO_3$ crystals. Optical and EPR studies of these materials have demonstrated that Fe^{2+} impurity ions present in nominally pure material are responsible for the index damage. The effects of stoichiometry variation, heat treatment, impurity and color center content, X-irradiation of crystals and the kinetics of the index damage process are accounted for by Fe^{2+}-Fe^{3+} reactions.

By careful control of crystal growth and stabilization of the Fe^{3+} impurity ion state, $LiNbO_3$ and $LiTaO_3$ crystals with greatly improved damage resistance have been prepared.

Comparison of laser induced bulk damage in alkali-halides at 0.6, 1.06, and 0.69 microns, D. W. Fradin, E. Yablonovitch, and M. Bass, *SP372*, pp. 27-39 (Oct. 1972).

Key words: Alkali halides; avalanche breakdown; bulk damage; self-focusing; surface damage.

It has long been recognized that catastrophic self-focusing cannot occur below a critical power P_c and that perturbations from self-focusing become progressively less important as the power of a probe optical beam is lowered below P_c. Using this fact, we have designed and conducted a number of experiments to study bulk damage in alkali-halides in which self-focusing was eliminated and unequivocal measurements of damaging fields obtained. Strongly focusing optical systems were used so that damage could be achieved while probe powers could be restricted to between one and two orders-of-magnitude below theoretical critical powers for electrostrictive self-focusing. Experimental evidence confirms the absence of self-focusing.

By observing the absolute magnitude of breakdown strengths and relative values among the alkali-halides, striking similarities between 10.6, 1.06, and 0.69 μm and d.c. avalanche breakdown were found. The results also showed no frequency dispersion over the wavelength range of 10.6 to 0.69 microns. The implications of this work for surface damage studies are explored and, in addition, the effects of inclusions on bulk optical strength are considered.

Laser induced damage to glass surfaces, N. L. Boling and G. Dube', *SP372*, pp. 40-45 (Oct. 1972).

Key words: Chemically strengthened glass; glass damage; glass lasers; laser damage; Q-switched; surface damage.

Entrance and exit surface damage thresholds for Owens-Illinois ED-2 laser glass are measured at Brewster's angle and near normal incidence. A theory that accounts for the observed asymmetry in exit/entrance face damage thresholds is presented. The nature of the damage at both surfaces is described for both untreated and chemically strengthened ED-2 laser glass.

The relation between surface damage and surface plasma formation, C. R. Giuliano, *SP372*, pp. 46-54 (Oct. 1972).

Key words: Entrance and exit surface damage; sapphire; spatial and temporal plasma resolution; streak camera experiments; surface plasmas.

A number of experiments are described in which entrance and exit surface laser-induced damage on sapphire samples are studied. Damage thresholds are measured as a function of beam size and divergence at the surfaces. Temporal evolution of surface plasmas is studied using a streaking camera, and spatial differentiation of surface plasmas is accomplished by allowing the light to strike the surfaces away from normal incidence. It is found that the entrance surface has two plasma components, an air plasma which is directed along the light beam and an "explosion" plasma which is directed normal to the surface. The exit surface has only the explosion plasma. It is concluded that surface plasmas are a result of rather than a cause of surface damage.

Ion beam polishing as a means of increasing surface damage thresholds in sapphire, C. R. Giuliano, *SP372*, pp. 55-57 (Oct. 1972).

Key words: Ion beam polishing; sapphire; surface damage; threshold increase; threshold measurement.

Polishing of sapphire surfaces with energetic Ar^+ ion beams is shown to result in a substantial increase in laser damage threshold over that for conventionally polished surfaces. Data for both entrance and exit damage are presented. The results are interpreted in terms of an increase in surface strength with ion beam polishing.

Laser-induced damage probability at 1.06 and 0.69 μm, M. Bass and H. H. Barrett, *SP372*, pp. 58-69 (Oct. 1972).

Key words: Breakdown starting time; electron avalanche; probabilistic nature of damage; surface damage; wavelength dependence of damage.

Measurements of the laser-induced surface damage process at both ruby and Nd:YAG laser wavelengths are reported in which the laser pulse and beam parameters were carefully held constant for both sources. This resulted in the first directly comparable measurements of laser damage at two different wavelengths. The most striking feature of the data is that all the materials studied are harder to damage at 0.69 μm than at 1.06 μm. In addition, the relationship between the damage probability and the optical electric field strength at 0.69 μm, though similar to that at 1.06 μm, suggests that more than one damage mechanism may be operative.

The probabilistic nature of the laser-induced damage process at 1.06 μm was explored further by measuring the distribution of breakdown starting times with the image-converter streak camera. For a particular laser pulse a threshold-like damage process would result in a very sharp distribution of breakdown starting times. Instead, a large spread is found, with the most likely starting time occurring before the laser intensity reaches its maximum. The observed distribution is described by the compound probability that breakdown occurs at a particular time, given that it has not occurred before that time.

In addition, several possible connections between the probabilistic and threshold-like interpretations of laser-induced damage are discussed. It is shown that these points of view are not totally incompatible.

Damage to GaAs surfaces from ruby- and Nd-glass laser illumination, J. L. Smith, *SP372*, pp. 70-74 (Oct. 1972).

Key words: Doping; GaAs; laser induced damage; photoconductivity; surface; surface finish.

Surface damage of GaAs due to 0.694- and 1.06-micron beams from ruby and Nd-glass lasers has been investigated. The wavelengths employed represent photon energies above and below the bandgap of GaAs. For laser operation in the conventional mode, Ga-rich material developed on the surface to a greater extent than for Q-switched operation. Surface damage from Q-switched beams did not appear to depend on the absence, presence, or type of doping, although the nature of the surface preparation was important. The damage threshold for Nd-glass laser illumination was approximately 10^7 W/cm^2, only a little higher than that for ruby laser illumination. For Q-switched, Nd-glass laser beam exposure, the damage occurred in highly localized regions and appears to be connected with material flaws near the surface.

Surface science and surface damage, J. M. Khan, *SP372*, pp. 75-83 (Oct. 1972).

Key words: Laser damage; surface science; thin films.

The relatively new field of Surface Science is concerned with the measurement of physical and chemical properties of well characterized surfaces. The ability to characterize these surfaces has been steadily increasing due to the development of new tools, or the application of older techniques to surface interrogation. The overwhelming result of surface investigation is to draw attention to the difficulty of obtaining such well-characterized surfaces. With this realization in mind, it is highly instructive to review the conventional methods of creating surface conditions. The assumptions involving the conditions at prepared surfaces or interfaces must be reexamined. New procedures may have to be evolved to control conditions to even assure reproducibility. Only when this has been accomplished can measurements of surface damage thresholds be taken as intrinsic characteristics of prepared surfaces.

Self-focusing with elliptical beams, J. Marburger, *SP372*, pp. 84-91 (Oct. 1972).

Key words: Bulk damage; damage threshold; elliptical beams; enhancement; self-focusing.

The time independent self-focusing of beams whose constant intensity contours are ellipses has been studied in the paraxial ray-constant shape approximation. This approximation leads to equations for the principal $1/e$ intensity diameters versus axial distance which have been analysed previously by Vorob'yev by a different method. Our method allows the treatment of non-gaussian intensity profiles. The solutions are employed to find expressions for the critical powers and self-focal lengths of nonaxially symmetric beams under a variety of initial conditions. The critical power can be greatly enhanced by astigmatic focusing, even if the beam shape is initially axially symmetric. This theory implies that bulk damage thresholds arising from self-focusing depend strongly on beam shape, in agreement with experimental results of Giuliano.

Relative contribution of Kerr effect and electrostriction to self-focusing, A. Feldman, D. Horowitz, and R. M. Waxler, *SP372*, pp. 92-99 (Oct. 1972).

Key words: Damage threshold; electrostriction; Kerr-effect; laser damage in glasses; optical glasses; self-focusing.

The ratio of damage thresholds for circularly polarized radiation to linearly polarized radiation was found to be > 1 in borosilicate crown glass, fused silica, and dense flint glass. A Q-switched Nd:glass laser operating in the TEM_{00} mode was used. The damage was assumed to result from self-focusing. The fractional contributions of electrostriction and the Kerr effect to the nonlinear index n_2 are estimated from the threshold ratios calculated for each mechanism in the absence of the other and assuming no other self-focusing mechanism. The high damage threshold of fused silica is attributed to its relatively small Kerr effect. Measurements of self-focusing lengths as a function of peak power give qualitatively good agreement with theory.

Damage measurements with subnanosecond pulses, J. M. McMahon, *SP372*, pp. 100-103 (Oct. 1972).

Key words: Damage mechanisms in laser systems; disc amplifiers; Nd: YAG laser; self-focusing; subnanosecond pulses.

The realization of high energy subnanosecond pulse lasers has been limited by self-focusing damage in laser rods. In this paper measurements on n_2 for laser glasses with subnanosecond pulses are described. The system aspects of using such glasses are also discussed since in practice this can have a dominant effect on the performance of a high energy short pulse device.

Time resolved damage studies of thin films and substrate surfaces, J. H. Parks and N. Alyassini, *SP372*, pp. 104-107 (Oct. 1972).

Key words: Damage induced reflectivity change; laser induced damage; laser induced surface acoustic waves; surface; surface breakdown plasma; thin film; time resolved damage.

The time evolution of damage to thin films and substrate surfaces was observed by monitoring the intensity variation of a He-Ne beam reflected from the film or surface during irradiation by a Q-switched ruby laser. Monolayered films including ZnS, CaF_2 and NaCl on fused silica substrates were studied, as well as uncoated fused silica and LiF substrates. When the probe beam is reflected from the exit surface of a substrate sample, the reflected intensity was observed to decrease within the time-scale range of 20-200 nanoseconds to a final value significantly less than that prior to damage. When the probe is spatially offset from the damage region, the reflected intensity decreases and then returns to approximately the predamage value within 0.2-0.3μ sec. This reversible effect was observed to be associated with a propagating disturbance on the substrate surface moving with approximately the speed characteristic of a Rayleigh surface wave. The risetime and duration of the plasma which accompanies surface damage was also measured.

The reflected intensity from thin films was observed to increase or decrease depending on the film index of refraction. The monolayer film samples exhibited reflectance changes on the timescale of the ruby pulse, however an offset probe position indicates this change can occur after a time delay of $\sim$ 0.1-0.2μ sec.

Laser induced damage to mirrors at two pulse durations, E. . Bliss and D. Milam, *SP372*, pp. 108-122 (Oct. 1972).

Key words: Dielectric mirror; electron avalanche; laser damage mechanisms; laser induced damage; laser monitoring; plasma production; scattering sites.

The damage thresholds of eight, multiple layer dielectric, 95% reflecting mirrors have been measured for single pulses of 20 nanoseconds and 20 picoseconds duration. In both sets of measurements the pulse energy, an oscilloscope trace of the pulse, and the beam's transverse energy density profile at the surface being damaged are recorded for each shot. The variation of the threshold from mirror to mirror and as a function of pulse duration, beam radius, and appearance under microscopic examination is discussed in the context of possible damage mechanisms.

Study of laser-irradiated thin films, B. E. Newnam and L. G. DeShazer, *SP372*, pp. 123-134 (Oct. 1972).

Key words: Damage morphology; damage thresholds; laser-induced scatter; ruby; spark thresholds; thin films; truncated Gaussian optics.

Laser damage to thin-film coatings was studied using a TEM_{oo} Q-switched ruby laser. Our study included mono-, bi- and multi-layered coatings of the materials TiO_2, SiO_2, ZrO_2, MgF_2 and ZnS on substrates of glass, rocksalt and spinel. The samples included coatings for antireflection and reflection at the ruby wavelength, and were produced either at USC or by a commercial vendor. Damage threshold energy and power densities were measured with attention paid to dependences on laser beam spot-size, film material and thickness, substrate condition and incipient scattering of the film. Particular attention was given to the establishment of a threshold criterion for laser damage to thin films. Several effects attendant to damage were investigated, with the conclusion that film scattering induced by the laser was the most sensitive detector of film breakup. The laser induced scatter was observed prior to or at the threshold of spark formation at the film, depending on the film material.

Influence of structural effects on laser damage thresholds of discrete and inhomogeneous thin films and multilayers, R. R. Austin, R. C. Michaud, A. H. Guenther, J. M. Putman, and R. Harniman, *SP372*, pp. 135-164 (Oct. 1972).

Key words: Laser damage; inhomogeneous films; microscopy; optical coatings; thin film stress.

The dependence of single shot damage threshold on certain film properties is discussed. Variable stress films are produced by mixing components with approximately equal damage thresholds but opposite stress characteristics a definite stress dependence is shown. Films formed from mixtures of high and low threshold components are investigated and found to have damage thresholds between the high and low component values. The damage threshold and damage mode of multilayer and periodic inhomogeneous film systems is compared. The results confirm that the damage threshold is almost entirely material dependent.

Fundamental absorption mechanisms in high-power laser window materials, R. Hellwarth, *SP372*, pp. 165-171 (Oct. 1972).

Key words: Absorption limit; extrinsic absorption; high-power laser window materials; intrinsic absorption; optical absorption mechanisms; thermal damage.

The thermal deformation and damage to windows and lenses caused by their optical absorption poses serious limitations on the operation of high-power CW and long-pulse lasers. For example, no known materials have both low enough absorption coefficients and good enough mechanical and chemical properties to perform satisfactorily as windows in the large 10.6 μm lasers being developed today. However, very many crystals and glasses would be good candidates for high-power IR windows, if their linear absorption coefficients could be made lower by at least an order of magnitude. Here we review what is known of the physical mechanisms that are responsible for, or may limit, the small residual absorption in the "transparent" wavelength regions of the best candidate window materials. From the primitive state of present knowledge, it seems likely that uncontrolled impurity effects are presently limiting performance in the best window materials, and that therefore their high-power performance can be improved further. We identify theoretical gaps whose filling would greatly improve our understanding of the mechanisms and limits of laser-window absorption.

Recent developments in high-power infrared-window research, M. Sparks, *SP372*, pp. 172–175 (Oct. 1972).

Key words: Infrared absorption; infrared laser systems; thermal fracture; window materials.

The problem of failure of high-power infrared laser-system windows involves low intensities (a few hundred to a few thousand W/cm^2). Thermally induced distortion of the optical beam by a heated window and thermal fracture have been considered previously. Pressure-induced optical distortion is discussed. For large-diameter windows of weak materials, the minimum window thickness is determined by pressure-induced optical distortion, rather than by pressure-induced fracture. Previous figures of merit for rating candidate window materials assumed a constant thickness of 1 cm for all materials. New figures of merit, based on the minimum thickness required to withstand a given pressure, indicate a different preference for materials than that of the previous figures of merit.

It is not known if the measured values of the optical absorption coefficient β for candidate materials are extrinsic or intrinsic. The intrinsic value of β is needed in order to determine if material-improvement programs could produce materials with sufficiently low values of β. Information on extrinsic processes is needed in order to identify the sources of the extrinsic contributions to β so that they may be

removed. Measurements of β over ranges of frequency and temperature should be invaluable in obtaining this information. Feasibility studies indicate that emissivity measurements should yield the required values of β, which cannot be obtained by current transmission or calorimetric measurements.

Low emittance and absorption measurements of windows and mirrors, G. Wijntjes, N. J. E. Johnson, and J. M. Weinberg, *SP372,* pp. 176-182 (Oct. 1972).

Key words: Absorptance measurement; bulk scattering; coating measurement; emittance measurement; infrared absorptance; laser damage.

A cryogenic interferometric spectrometer has been developed which can achieve a noise equivalent spectral radiance (NESR) of 1.2×10^{-11} watts/cm^2-ster-cm^{-1} at 10 μm in 10 seconds of integration, with spectral resolution of 1 cm^{-1}.

The application of this instrument to the measurement of low level emittance or absorptance in optical elements is described. In such measurements, the specimen is kept at 300 K and its surroundings at 77 K. The measurement is limited by the sensitivity of the instrument, the accuracy of the specimen temperature measurement, and the dynamic range of the measurement. The first limitation is expressed by the noise equivalent spectral emittance.

$$(NE\Delta\epsilon)_\nu = \frac{NESR}{R^o_\nu(T)}$$

where $R\nu^o$ (T) is the blackbody radiance at temperature T. With reasonable integration times the determination of emittance is feasible to a precision approaching a part in 10^7, which represents the fundamental limitation to such measurement. The other limitations are proportional to the average emittance over the spectral range considered, and for average emittances below 0.01, permit absolute emittance measurements to a few parts in 10^6. The high spectral resolution of this instrument permits examination of absorption band structure in substrate and coating materials, and the identification of contaminant organic materials. The measurement of bulk scattering in transmissive materials is also possible.

Investigation of pulsed CO_2 laser damage of metal and dielectric-coated mirrors, V. Wang, A. I. Braunstein, M. Braunstein, and J. Y. Wada, *SP372,* pp. 183-193 (Oct. 1972).

Key words: Damage mechanisms; inclusions in dielectrics; multilayer dielectric mirrors; pulsed CO_2 laser damage; thin film coated metal; uncoated metal mirrors.

Recent progress made in pulsed high power CO_2 lasers has increased the power handling capabilities of mirrors and mirror coatings. Discussed in this paper are surface damage mechanisms based upon simple physical models (i.e., surface heating, thermally induced stress, absorption centers, etc.) and the experimental results obtained using a pulsed CO_2 laser. Various substrates (Mo, Cu, Ni, quartz, graphite, etc.), metal films (Au, Ag, and Cu), and dielectric coatings (Ge, ThF_4, CdTe) were exposed to 10.6 μm pulses of 1 to 10 μsec duration with energy fluxes of up to 200 J/cm^2. The measured threshold values (> 140 J/cm^2 for 10 μsec pulses) of polished metal mirrors were generally in agreement with the predicted values based on the simple model. Thin film coated mirrors exhibited slightly lower threshold values (≃ 75 to 140 J/cm^2 for 10 μsec pulses) than that of simple metal metals. The thresholds for those limited numbers of dielectric mirrors tested were even lower (≃ 10 J/cm^2 for pulses of 1 to 10 μsec lengths); this low performance is attributed to inclusions which act as local absorption centers within the dielectric.

SP373. **Bibliography of temperature measurement, January 1953 to December 1969,** P. D. Freeze and L. P. Parker, Nat. Bur. Stand. (U.S.), Spec. Publ. 373, 140 pages (Nov. 1972).

Key words: Fluidic thermometers; pyrometry; radiation pyrometry; temperature measurement; thermistors; thermocouple; thermometry.

This bibliography consolidates into a single publication National Bureau of Standards Monograph 27 (January 1953 to June 1960) and its two supplements (September 13, 1963 and April 28, 1967, respectively) together with 1800 new references covering essentially the period from January 1966 to December 1969, but including some earlier citations previously omitted. The consolidated publication, which supersedes the earlier bibliographies, thus covers literature of temperature measurement published between January 1953 and December 1969.

In general, the arrangement of material in this new edition is the same as in Monograph 27, and the journal abbreviations are those employed in Chemical Abstracts. However, starting with 1963, and in the new material, scope of coverage in Part 1 was broadened to include theory, calibration, and temperature scales in addition to the previous categories of thermoelectric theory and calibration.

SP374. **Method for determining the resolving power of photographic lenses,** F. E. Washer and I. C. Gardner. Appendix added by C. E. Kuyatt, Nat. Bur. Stand. (U.S.), Spec. Publ. 374, 32 pages (June 1973) $3.00. SD Catalog No. C13.10:374.

Key words: Photographic lenses; resolution test charts; resolving power.

This publication supersedes NBS Circular 533, issued May 20, 1953. It contains the original data and a new appendix describing the NBS Microcopy Resolution Test Charts No. 1010a. It provides the photographer with two sets of charts by which the resolving power of a photographic lens may be numerically measured with respect to a definite scale of values. A detailed description is given of the procedure and technique to be followed in order that comparable values may be obtained by different observers. The test provides an objective method of testing a photographic lens. The six charts of one set are printed in black on a white background to form a high-contrast chart. The six charts of the other set are printed with gray ink on a gray background to form a low-contrast chart. Additional uses of these charts are also described. These uses include the testing of goggle lenses for definition and prismatic power and the testing of telescopes and binoculars for definition. Supersedes NBS Circular 533, issued May 1953.

SP375. **An index of State specifications and standards, covering those standards and specifications issued by State Purchasing Offices of the United States,** L. L. Grossnickle, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 375, 394 pages (Sept. 1972). $3.70, SD Catalog No. C13.10:375.

Key words: Index of State specifications and standards; Key-Word-In-Context index of State specifications and standards; purchase specifications and standards, State specifications, State; standards, State; State specifications and standards.

This computer-produced Index contains the permuted titles of more than 6,000 State purchasing specifications and standards issued by 37 State Purchasing Offices thru 1971. The title of each specification and standard can be found under all the signifi-

nt key words which it contains. These key words are arranged phabetically down the center of each page together with their rrounding context. The date of publication or latest revision, e specification or standard number, and an abbreviation for ch State appear as part of each entry. A list of these abbrevia- ns and the names and addresses of the State Purchasing Offi- als are found at the beginning of the Index.

P376. **Ruler: 15 cm/6 in, with metric-customary units and equivalents,** Nat. Bur. Stand. (U.S.), SP367, Both Sides (Dec. 1972).

Key words: Centimeter; conversion; customary units; inch; metric units.

This ruler provides metric linear measure (15 cm) and custo- ary-unit linear equivalents (approximately 6 inches) plus con- rsion formula for effecting changes from customary to metric its.

P377. **Index to the reports of the National Conference on Weights and Measures. From the First to the Fifty-sixth 1905 to 1971,** F. C. Bell, Nat. Bur. Stand. (U.S.), Spec. Publ. 377, 46 pages (Feb. 1973) 75 cents, SD Catalog No. C13.10:377.

Key words: Index; measures; National Conference; reports; weights.

This publication comprises a subject index and a speaker dex for the Reports of the National Conference on Weights d Measures from the First (1905) through the Fifty-Sixth 971). Supersedes Miscellaneous Publication 243.

P378. **Accuracy in spectrophotometry and luminescence measurements,** Proc. Conf. held at the National Bureau of Standards, Gaithersburg, Md., Mar. 22-24, 1972, R. Mavrodineanu, J. I. Shultz, and O. Menis, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 378, 268 pages (May 1973) $4.85, SD Catalog No. C13.10:378.

Key words: Accuracy; critical parameters; instrumentation; linearity; quantum efficiency; spectrofluorometry; spectrophotometry; standards.

This volume contains the 18 papers presented at the Con- rence on Accuracy in Spectrophotometry and Luminescence easurements organized by the Analytical Chemistry Division the National Bureau of Standards and held from March 22 to 4, 1972.

These papers discuss the problems encountered in accurate pectrophotometry and luminescence measurements of materi- s. They also define the status of these competences from the andpoint of basic principles, critical factors involved in the easurements, and the instrumental conditions which must be lfilled to assure accurate measurements. Particular attention is ven to the selection, production and use of Standard Reference laterials in spectrophotometry and spectrofluorometry. roblems related to health are also covered in six of the papers, vo of which include original contributions to the application of minescence techniques to specific biochemical problems.

Reprinted from the National Bureau of Standards Journal of esearch, Section A. Physics and Chemistry, Vol. 76A, Nos. 5 nd 6, Sept.-Oct., and Nov.-Dec. 1972. *These proceedings in- lude the following papers (indented):*

High accuracy spectrophotometry at the National Physical Laboratory, F. J. J. Clarke, *SP378,* pp. 1-29 (May 1973).

Key words: High accuracy spectrophotometry; photoelectronic linearity; reflectance; transmittance.

The techniques and equipment used at the National Physical Laboratory (NPL) to achieve high accuracy spectrophotometric measurements are described and discussed. The emphasis at NPL has always been on the determination of systematic components of error and their elimination or correction rather than on the attainment of mere precision, which is largely a matter of variance and resolution. The scales of regular transmittance, diffuse transmittance, total transmittance of scattering samples, regular reflectance, diffuse reflectance, total reflectance and radiance factor are determined, maintained, and made available in practical form to industry by combined use of a reference NPL manual spectrophotometer and commercial recording spectrophotometers.

The presentation will concentrate on transmittance measurements made with the reference instrument, which is designed specifically to allow separate investigation of the various possible sources of systematic error, processes that are not practicable with commercial spectrophotometers. The investigation of the linearity of the complete photoelectronic system has always been a key factor, and double-aperture devices have been used consistently at NPL for over 40 years to monitor the performance of this instrument and its predecessors. Besides instrumentation, the procurement of material standards of suitable quality is a major limitation of the art, and the types in use at NPL are described, including the recently developed Ceramic Colour Standards.

An accurate spectrophotometer for measuring the transmittance of solid and liquid materials, R. Mavrodineanu, *SP378,* pp. 31-51 (May 1973).

Key words: Absorbance; automation of accurate spectrophotometer; instrumentation, spectrophotometric; spectrophotometry, high accuracy; standard reference material in spectrophotometry; transmittance.

The optical transmittance of solids and liquids as well as the molar absorptivity of various chemical species are parameters of fundamental significance in characterizing these materials. Meaningful transmittance data can be obtained only when the measurements are performed with well-known accuracy and precision. To perform such measurements, a high accuracy spectrophotometer was designed and assembled at NBS, Analytical Chemistry Division, and will be described in this paper. This single-beam instrument is composed of a constant radiation source, a monochromator, a sample carriage, an integrating sphere-photomultiplier assembly followed by appropriate electronics, and a read out system consisting of a digital voltmeter and a computer data acquisition and handling provision. The accuracy of transmittance measurements is determined by the light-addition principle used in conjunction with a two-aperture arrangement. The spectrophotometer can be used in manual or automatic modes of operation. A detailed discussion of the data obtained with this instrument, used in both modes, will be presented together with its application to the certification of solid and liquid Standard Reference Materials for checking the photometric scales of conventional spectrophotometers.

Absolute spectroradiometric measurements, G. A. W. Rutgers, *SP378,* pp. 53-62 (May 1973).

Key words: Absolute spectroradiometry; absolute standard source of radiation; calibrated photodetector.

There are two general methods for measuring a quantity of radiation emitted by a source. One can compare it with the radiation emitted by a standard source or one can measure the radiation with a detector calibrated in absolute units. When using the latter method, one must know the

spectral transmittance factor of the optical components between source and detector.

In the present paper, a survey will be given of the standard sources available for spectroradiometry: cavity radiator, tungsten strip lamp, anode of the carbon arc, xenon arc and cascade arc. Several types of detectors such as the absolute bolometer and thermopile, with their properties, will be discussed.

Accurate measurements of and corrections for nonlinearities in radiometers, C. L. Sanders, *SP378,* pp. 63-79 (May 1973).

Key words: Nonlinearity; photocell linearity; photometric accuracy; radiation addition method.

The methods described in the literature for accurately measuring photocell linearity are surveyed and assessed. The effect of not measuring photocell linearity under the conditions used in the final apparatus are considered. Some of the conditions necessary for accurate assessment of the nonlinearity under working conditions are specified. The use of the NRC "Photocell Linearity Tester" to measure and correct for the nonlinearity of various receivers is described.

Physical parameters in high-accuracy spectrophotometry, K. D. Mielenz, *SP378,* pp. 81-93 (May 1973).

Key words: High accuracy spectrophotometry, physical parameters; linearity test of photodetector; spectrophotometry, high accuracy.

The measured apparent transmittance T_A of a filter or liquid sample depends on the beam geometry in the spectrophotometer. For focused light incident upon the sample, T_A is different for systems having different f-numbers, and also depends on the state of polarization of the light. These effects are eliminated when the incident light is collimated; in this case T_A approaches the "true" transmittance τ of the sample. Both modes of operation suffer from stray light and interference effects. The former may be reduced significantly by using mirror rather than lens optics, and the latter by suitable choice of the monochromator slit width. A new spectrophotometer based upon the above-mentioned design principles is described. The photometric precision of this instrument is shot-noise limited, permitting measurements to better than 10^{-4} transmittance units.

The double-aperture method of testing detector linearity to this level of precision is discussed. The conventional method of finding the nonlinearity correction can be replaced by a curve-fitting procedure giving better precision. Data on detector nonlinearity, and its dependence on wavelength, are presented.

Liquid absorbance standards, R. W. Burke, E. R. Deardorff, and O. Menis, *SP378,* pp. 95-108 (May 1973).

Key words: Absorptivity data; accuracy; liquid absorbance standards; Standard Reference Materials.

Errors in the measurement of the absorbances of liquid filters result from instrumental and chemical uncertainties. This paper presents a systematic study of these variables on the absorbances of selected filters. Three types of liquid filters are discussed. These are (1) individual solutions of high purity compounds, (2) composite mixtures, and (3) aqueous solutions of organic dyes. The accuracy of the absorptivity data is established using NBS-calibrated glass filters. The magnitude of the errors arising from spectral bandpass, beam geometry, stray light, internal multiple reflections, and refractive index are delineated. Finally, as a practical outgrowth of this study, the development and issuance of NBS Standard Reference Material 931, Liquid Absorbance Star dards for Ultraviolet and Visible Spectrophotometry, i described.

Accurate measurement of molar absorptivities, R. W. Bu nett, *SP378,* pp. 109-115 (May 1973).

Key words: Molar absorptivity in clinical chemistry; ran dom errors in molar absorptivity; systematic errors in mol absorptivity.

The key to accurate measurement of molar absorptivitie is a thorough understanding of the sources of error whic appear throughout the measurement procedure. Sources determinant error will be listed with comments on estima ing their magnitude and eliminating them where possibl Sources of random error will be discussed as well as th propagation of both random and determinant errors. The is discussion of the need for accurate values of molar ab sorptivities using examples from clinical chemistry. Finall the proper use of accurate absorptivity values in the clinic chemistry laboratory will be considered. Here, emphasis on the need for a quality assurance system which includ routine checks on such things as wavelength calibration ar photometric accuracy of spectrophotometers, calibration analytical balances, and quality of incoming reagents.

Problems associated with the need for standardization in clin cal spectrophotometric and fluorometeric measurements, J. Penton, G. M. Widdowson, and G. Z. Williams, *SP378,* p 117-124 (May 1973).

Key words: Clinical standards; standard reference mate als; standardization, spectrofluorometric; standardizatio spectrophotometric.

There is a growing demand in clinical chemistry f analyses to be performed in a manner allowing compariso of results among laboratories and, from time to time, in t same laboratory. Reliable comparability requires adequa procedures of standardization for spectrophotometric a fluorometric instruments and methods. Problems wi chemical and instrumental standardization are discussed.

For assays where the substance to be measured is avai ble in suitable form, primary chemical standardization justifiably popular. Relatively unsophisticated instrumen tion can be used to compare measurements of unkno samples with such standards. Because primary standar meeting all necessary criteria are not available for many says of clinical significance, standardization must depend precision and accuracy of the instrumentation used, and accurately compiled values of chemical-optical propert for the materials of interest. The task of compilation is o side the capability of the routine laboratory and should provided by a reliable central agency. If an individ laboratory is to use the agency's compiled values, t laboratory must have available precise, accurate a reasonably inexpensive instrumentation along with relia absorbance, fluorescence, and wavelength calibration st dards.

The role of spectrophotometric standards in the clini chemistry laboratory, R. N. Rand, *SP378,* pp. 125-134 (M 1973).

Key words: Clinical spectrophotometry, accuracy, pre sion; optical cuvettes; spectrophotometric standards, cl cal.

It is obvious that erroneous data reported to a physic may adversely affect patient welfare. Currently, accepta limits of accuracy and precision are poorly defined.

should be recognized, however, that the spectrophotometric measurement step in an appropriate analytical procedure is critical and inapparent error may occur. Spectrophotometric measurements, both manual and automated, are extensively used in the clinical chemistry laboratory. At least 1,000,000 such measurements per day on rather diverse equipment are made in this country; yet, few standards exist. Results of intra-lab surveys suggests that performance could be improved. The various ways in which spectrophotometry is used will be illustrated and a discussion of possible errors resulting from nonstandardized instrumentation will follow. There is pressing need for well defined and easily usable standards for wavelength, photometric accuracy, photometric linearity, stray light, as well as NBS specifications for optical cuvettes.

Spectrophotometric standards, W. H. Venable, Jr., *SP378,* p. 135-136 (May 1973).

Key words: Photometric accuracy; standards, spectrophotometric.

To be useful, spectrophotometric measurements must be believable and practical. The basic standard for any believable spectrophotometric measurement is the ability to accurately compare fluxes of radiation within the framework of a well-defined geometry. The emphasis in the program proposed for the Institute for Basic Standards is to develop such ability over the broadest range of spectrophotometric measurements. Establishing such a basis will enable the National Bureau of Standards to render real assistance to those who deal with the problem of making practical measurements.

Absolute spectrofluorometry, W. H. Melhuish, *SP378,* pp. 137-150 (May 1973).

Key words: Actinometers; calibration of spectrofluorometers; detectors, absolute; fluorescence spectra, corrected; quantum counters; spectrofluorometers, design; spectrofluorometry, absolute; standard lamps; standards, fluorescence; thermopiles.

The last 10 years has seen the increasing publication of the emission spectra of organic, inorganic and metal-chelate compounds, but there is no agreed method of presentation of such spectra. In the few cases where corrected emission spectra have been published, there is often no mention of the units used for the intensity coordinate or the method used for correcting spectra. A method of reporting absolute fluorescence spectra originally put forward in 1962 will be reexamined and improved. The two best known methods for calibrating spectrometers for absolute spectrofluorometry: (a) standard tungsten lamp, (b) quantum counter method, will be critically examined, and the limitations and possible improvements in accuracy will be proposed. The criteria for an emission standard will be examined and the use of emission standards for calibrating spectrofluorometers discussed. It is suggested that the distribution of emission standards to laboratories measuring corrected fluorescence spectra and the analysis and publication of the results should be done in the near future.

Absolute quantum efficiencies, G. A. Crosby, J. N. Demas, and J. B. Callis, *SP378,* pp. 151-167 (May 1973).

Key words: Calorimetry in quantum yields; laser, use in quantum yields; photodetectors in quantum yields; quantum efficiencies.

Recent developments in several areas of chemistry, laser technology, photodetector instrumentation, and calorimetry are surveyed, and their probable impact on the measurement of quantum yields is assessed. Chemical developments include: (a) synthesis and design of new luminescent molecules that could possibly serve as standards, (b) application of improved separation techniques to provide samples of extreme purity, and (c) advances in photochemistry that portend the development of wide-range chemical actinometers. The potential use of lasers in quantum-yield measurements and their advantages over conventional sources for application in both optical and calorimetric techniques are pointed out. New methods of quantum-yield measurements, based on the novel characteristics of laser pump sources, are suggested, including the feasibility of measuring yields under time-resolved conditions and of employing internal standards. The possible lifting of wavelength restrictions on both laser sources and detector devices and the implications of these developments for extending the spectral range of quantum-yield measurements are discussed. The current status of calorimetry for determining yields is surveyed, and the impact of recent technology on the feasibility of developing calorimetric methods competitive with optical methods is assessed.

Phosphorimetry, J. D. Winefordner, *SP378,* pp. 169-182 (May 1973).

Key words: Aqueous solvents in phosphorimetry; phosphorimetry; rotating capillary cell; solvents for phosphorimetry.

Phosphorimetry in the past has received limited use because the precision of reproducibility was inadequate, there were solvent limitations, and preparation of test specimens was difficult and time consuming. Detection limits have now been lowered by more than two orders of magnitude by using a rotating capillary sample cell, a more stable excitation-source power supply, and aqueous solvents. These steps have also increased precision by more than an order of magnitude. Considerable reduction in time and effort of sampling and measurement has been effected compared to phosphorimetric measurements made with standard procedures and commercial equipment. Twenty microliters of aqueous solution is all that is required to fill a quartz capillary cell by capillary action. Capillary cells filled with aqueous solutions do not crack when cooled to 77 K or when returned to room temperature. Rotation of the sample cell minimizes effects due to cell orientation and thus improves precision. Reduction of background phosphorescence results in improved accuracy of analysis. A study was made of the influence of methanol-water mixtures and of sodium-halide aqueous solutions on the magnitude of phosphorescence signals from several substances and of the effect on signal-to-noise ratios. The optimum solvent system for many phosphorimetric measurements is discussed. Analytical results are given for several organic substances measured by phosphorimetry at 77 K. These results are compared with those from previous studies by older methods.

Measurements of absolute values in biochemical fluorescence spectroscopy, R. F. Chen, *SP378,* pp. 183-196 (May 1973).

Key words: Absolute fluorometry; absolute fluorometry in biochemistry; standard reference materials in fluorometry.

Fluorescence spectroscopy is an important tool of the biochemist studying the structure and interactions of proteins and nucleic acids. The four basic quantities to measure accurately are: 1. spectra (corrected excitation and emission), 2. quantum yields (Q), 3. fluorescence decay

characteristics, and 4. polarization. Commercially available instruments, with little modification, can be used to obtain these measurements, but the biochemist in this field is very dependent on the accuracy of measurements of substances he uses as standards. Confusion arises from disagreement between reported values for standards which may be used to calibrate a detector system to obtain quantum yields, or to set up lifetime and polarization photometers. For instance, the protein chemist is fond of using tryptophan and quinine as quantum yield standards, but Q for tryptophan has been variously reported as 0.13 and 0.20, and Q values for quinine bisulfate range from 0.4 to 0.7. The biochemist should also be aware of the problems inherent in the use of commercially available instruments in absolute measurements, as well as the special complications arising in complex biochemical systems where the fluorescence is heterogeneous.

Newer fluorometric methods for the analysis of biologically important compounds, G. G. Guilbault, *SP378*, pp. 197-202 (May 1973).

Key words: Enzymes, fluorometric analysis; fluorometry of enzymes; fluorometry of substrates; silicone pad; solid surface fluorometry.

Newer fluorometric methods for the analysis of biologically important compounds will be discussed: enzymes such as LDH, alkaline phosphatase, lipase and cholinesterase, and substrates such as glucose, urea and uric acid. These methods are based on the production of fluorescence initiated by an enzymic reaction.

New reagentless fluorescence methods will be described for enzymes and substrates. These methods are highly precise (1%), fast (less than 1 minute) and involve no preparation of reagents. These methods, as adapted to clinical laboratory procedures, will be discussed.

Inorganic ions in glasses and polycrystalline pellets as fluorescence standard reference materials, R. Reisfeld, *SP378*, pp. 203-225 (May 1973).

Key words: Fluorescence standards, inorganic ions; glass standards in fluorescence; rare-earth-doped glasses.

The absorption and fluorescence of inorganic ions; glass polycrystalline disks doped by heavy metal ions is discussed, and their use as fluorescence standards is evaluated. The advantages of the glass standards over other media is summarized.

The glass standards are divided into two groups (1) glasses doped by trivalent earths such as Gd^{3+}, Tb^{3+}, Eu^{3+}, Sm^{3+}, and Tm^{3+} which have narrow band optical spectra as a result of intraconfigurational transitions, and (2) glasses and polycrystalline disks doped by ions such as Tl^{+}, Pb^{2+}, Ce^{3+}, and Cu^{+} which have broad spectral bands since the optical spectra originate from interconfigurationally allowed transitions. Optical and physical parameters, including matrix effects, quantum efficiencies, decay characteristics, Stokes' shifts and spin-orbit versus orbit-lattice interactions due to the different transitions will be discussed.

Group (1) glasses are suitable for use as standards where a narrow well-defined fluorescence range is required, and group (2) glasses are suitable for use as standards whenever a substance with a wide range of fluorescence is measured. Special emphasis will be placed on energy transfer between donor and acceptor ions.

Development of a new fluorescent reagent and its application to the automated assay of amino acids and peptides at the picomole level, S. Udenfriend, *SP378*, pp. 227-230 (M 1973).

Key words: Fluorometry, amino acids; fluorometry, pe tides; picomole fluorometry.

Methods for the assay of amino acids and peptides a most important in elucidating the structure of proteins a peptides. In many important areas of research such as in e docrinology, neurobiology, and genetics, methods a needed with sensitivity higher than is available with t widely used colorimetric ninhydrin procedure. A short wh ago, we noted that all primary amines react with ninhydi and phenylacetaldehyde to give a ternary product which highly fluorescent. The chemistry of that reaction has n been elucidated and the conditions have been modified a improved so that essentially quantitative yields fluorescent products are formed with all primary amin The reaction has been automated and is being used as t detecting system for chromatography of amino acids, pe tides and amines in the 10 to 100 picomole range. Proble concerning the fluorescence instrumentation and the iso tion and chromatography of these compounds in t picomole range will be discussed.

Considerations on organic compounds in solution and in ganic ions in glasses as fluorescent standard reference materi R. A. Velapoldi, *SP378*, pp. 231-244 (May 1973).

Key words: Emission spectra; excitation spect fluorescence; fluorescence standards; glass standards; qu ine derivatives; rare earths; relative quantum efficienci solution standards.

The use of various organic compounds in solution and organic ions in glasses has been investigated as possi fluorescence Standard Reference Materials. Emphasis placed on measuring physical and chemical parameters s as stability, reproducibilities of absorbance and fluoresce measurements, relative quantum efficiencies as a funct of excitation wavelength, etc., for quinine derivatives selected organic compounds. A brief discussion is inclu on the use of rare earth and non-rare earth inorganic ion glasses as standards.

SP379. **Report of the 57th National Conference on Weights Measures 1972,** F. C. Bell and H. F. Wollin, Report Edit Nat. Bur. Stand. (U.S.), Spec. Publ. 379, 216 pages (M 1973) $1.85, SD Catalog No. C13.6/3:379.

Key words: Administration; Conference; laws; procedu regulations; requirements; technology; weights and n sures.

This is a report of the proceedings (edited) of the 57th tional Conference on Weights and Measures, sponsored by National Bureau of Standards, held in Washington, D.C., 10-14, 1972, and attended by state, county, and city weights measures officials, the Federal Government, business, indus and consumer organizations.

SP380. **Photonuclear reaction data, 1973,** E. G. Fuller, H. Gerstenberg, H. Vander Molen, and T. C. Dunn, Nat. Stand. (U.S.), Spec. Publ. 380, 131 pages (Mar. 1973) $2 SD Catalog No. C13.10:380.

Key words: Bibliography; data index; data summary; ments; isotopes; nuclear physics; photonuclear g resonance; photonuclear reaction.

A brief summary is given of the available data on the gross tures of the photonuclear giant resonance. Data are presente tabular form for all nuclei where measurements have been m

In addition, a comprehensive, annotated data index and bibliography are given which cover experimental data for the field of photonuclear reactions published in scientific and technical journals in the period from 1955 through 1972. Organized by element and isotope, each entry in the index is for a specific reaction reported in a given reference. Information is given on the type of measurement, excitation energies studied, source type and energies, detector type and angular ranges covered for each reaction entry. This publication supersedes NBS Miscellaneous Publication 277 and NBS Special Publication 322 which also embraced Supplement 1 to Misc. Publ. 277. All information contained in these publications has been combined and merged with new data to form the Photonuclear Data Index and Bibliography contained in this publication.

SP381. **Bibliography of ion-molecule reaction rate data (January 1950-October 1971),** G. A. Sinnott, Nat. Bur. Stand. (U.S.), Spec. Publ. 381, 73 pages (Oct. 1973) $1.00, SD Catalog No. C13.10:381.

Key words: Atoms; bibliography; cross-sections; ions; molecules; rate coefficients; reactions.

A bibliography is presented of papers in the open literature that contain original experimental data on ion-molecule reaction rates or cross sections. Positive and negative ion-molecule and ion-ion reactions are included but not electron impact processes. For papers to be included, the reactants must have been identified and data for kinetic energies below 10 electron volts must have been presented.

SP382. **Hydraulic research in the United States and Canada, 1972,** G. Kulin and P. H. Gurewitz, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 382, 340 pages (Jan. 1974) SD Catalog No. C13.10:382.

Key words: fluid mechanics; hydraulic engineering; hydraulic research; hydraulics; hydrodynamics; model studies; research summaries.

Current and recently concluded research projects in hydraulics and hydrodynamics for the years 1971-1972 are summarized. Projects from more than 250 university, industrial, state and federal government laboratories in the United States and Canada are reported.

SP383. **The creative partnership: Government and the professional services,** Proceedings of the Fourth Users-Producers Conference Sponsored by the Technical Analysis Division, Institute for Applied Technology, National Bureau of Standards, in Cooperation with the Center for the Study of Private Enterprise, The American University, held at the National Bureau of Standards, Gaithersburg, Md., January 23, 1973, J. D. Johnson, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 383, 142 pages (Aug. 1973) $2.10, SD Catalog No. C13.10:383.

Key words: Creative-partnership; management; operating; procurement; services; Users-Producers.

These proceedings are written for the 4th Users-Producers Conference held at the National Bureau of Standards on January 23, 1973. The Conference was designed to highlight the problems and advantages in our present procurement system when Government utilizes the services of professional and professions Service firms.

The speakers addressed themselves to the many facets of the procurement process. They represent both the private and Government side and bring their views forward in a clear and concise manner. Speakers are grouped into three panels. The first panel describes the development of the problem, the second panel considers the procurement process, and the third panel discusses managing the project. At the end of each group of panel speeches, there is a general discussion with comments and questions by all attendees.

There is also a separate presentation given by the Honorable James C. Corman, United States Congressman (Calif.), Chairman, Sub-Committee on Government Procurement of Professional Services. *These proceedings include the following papers (indented):*

Management information and computer systems, R. M. Davis, *SP383,* pp. 21-28 (Aug. 1973).

Management consulting, W. P. Sommers, *SP383,* pp. 29-41 (Aug. 1973).

Architecture and engineering, J. R. Dunn, *SP383,* pp. 42-45 (Aug. 1973).

Operating level problems in procurement, W. E. Cushen, *SP383,* pp. 46-56 (Aug. 1973).

Government procurement policy, P. Waterman, *SP383,* pp. 69-73 (Aug. 1973).

The relationship of private enterprise to Government procurement, R. W. Kreuger, *SP383,* pp. 74-78 (Aug. 1973).

Legal aspects of Government procurement, G. P. Bond, *SP383,* pp. 79-86 (Aug. 1973).

A proposed Government system for professional services, J. E. Moriarty, *SP383,* pp. 87-93 (Aug. 1973).

Government project management, T. F. Noble, *SP383,* pp. 107-109 (Aug. 1973).

Managing the private contractor, R. A. Walbrecker, *SP383,* pp. 110-114 (Aug. 1973).

Managing the university research team, R. P. Boynton, *SP383,* pp. 115-122 (Aug. 1973).

SP384. **Annotated bibliography of the literature on resource sharing computer networks. Revised 1976,** H. M. Wood, S. W. Watkins, and I. W. Cotton, *Nat. Bur. Stand. (U.S.), Spec. Publ. 384 (revised),* 179 pages (Sept. 1976) SD Catalog No. C13.10:384/rev..

Key words: bibliography; computer network; data communications; resource sharing.

This bibliography consists of over 1,000 references with critical annotations to the literature on computer networks. A classification scheme has been developed to make each citation more accessible by general topic. Five indexes to the bibliography are included: author index, corporate author index, network index, title word index, and report number index.

SP385. **Transfer of radiation in spectral lines,** V. V. Ivanov, English language edition of *Radiative Transfer and the Spectra of Celestial Bodies.* Prepared in collaboration with D. G. Hummer from a draft translation by Eileen Weppner, Nat. Bur. Stand. (U.S.), Spec. Publ. 385, 480 pages (Nov. 1973) $7.45, SD Catalog No. C13.10:385.

Key words: Astrophysics; energy loss; photons; radiative transfer; spectral line profiles; stellar atmospheres.

This book is a revised and somewhat extended version of V. V. Ivanov's *Radiative Transfer and the Spectra of Celestial Bodies,* published in Moscow in 1969. The principal subject is

the transfer of radiant energy through gas composed of atoms with two discrete levels. Although the emphasis of the book is on analytical methods, extensive numerical and graphical results are presented.

SP386, 1976 Edition. **Standards on noise measurements, rating schemes, and definitions: A compilation,** T. L. Quindry, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 386, 1976 Edition,* 84 pages (Apr. 1976) SD Catalog No. C13.10:386.

Key words: acoustics; noise; rating scheme; sound; standards organization.

This compilation deals with material assembled from the various standards, industrial and trade organizations, or technical and scientific societies concerned with acoustics. There has been no attempt to review or evaluate the standards, but rather just to list documents covering measurement techniques, calibration methods, definitions, rating schemes, and equipment and product specifications concerned with noise. Those standards dealing solely with ultrasonics, audio equipment, or shock and vibration have not generally been included. The paragraphs describing the standards give a brief summary of intent and/or scope of the standard. In some cases the paragraph is the official description of the standard as issued by the organization or society promulgating the standard, while in others the paragraph merely describes the intent of the standard. Proposed standards are also listed where available. Not listed are proposed revisions of current standards and those which must be reapproved to remain in effect. For the convenience of those readers wishing to purchase copies of standards, names and addresses for the various organizations and/or societies are provided. Federal Regulations directly involving noise measurements are given in Appendix A. Appendix B lists active committees for each organization and names and addresses of appropriate committee chairmen or technical contacts. This compilation includes all information available as of January 1, 1976.

SP387. **Laser induced damage in optical materials: 1973.** Proceedings of a symposium sponsored by Office of Naval Research, The American Society for Testing and Materials and by the National Bureau of Standards, Boulder, Colo. May 15-16, 1973, A. J. Glass and A. H. Guenther, Editors, Nat. Bur. Stand. (U.S.), Spec. Publ. 387, 285 pages (Dec. 1973) $2.85, SD Catalog No. C13.10:387.

Key words: IR windows and mirrors; laser damage; laser materials; self-focusing; thin films.

The Fifth ASTM-ONR-NBS Symposium on Laser Induced Damage in Optical Materials was held at the National Bureau of Standards in Boulder, Colo. on May 15 and 16 of this year. These Symposia are held as part of the activities of Subcommittee II on Lasers and Laser Materials, of the ASTM. Subcommittee II is charged with the responsibilities of formulating standards and test procedures for laser materials, components, and devices. The chairman of Subcommittee II is Haynes Lee, of Owens-Illinois, Inc. Co-chairmen for the Damage Symposia are Dr. Arthur H. Guenther, Scientific Director, Technology Division of the Air Force Weapons Laboratory, and Dr. Alexander J. Glass, Head, Basic Studies, Y Division, Lawrence Livermore Laboratory.

Approximately 135 attendees at the Symposium heard 25 papers on topics relating to laser induced damage in crystalline and nonlinear optical materials, at dielectric surfaces, and in thin film coatings as well as discussions of damage problems in the infrared region due both to cw and pulsed irradiation. In addition, several reports on the theoretical analysis of laser-materials interaction, relative to the damage process were given, along with tabulations of fundamental materials properties of importance in evaluation of optical material response to high power laser radiation. Several papers presented by title only are included within the proceedings for completeness.

The proceedings of these Symposia represent the major sources of information in the field of laser induced damage in optical materials. The Symposia themselves, along with the periodic meetings of Subcommittee II, provide a unique forum for the exchange of information regarding laser materials specifications among the manufacturers and users of laser devices, components, and systems. The Symposia also serve as a mechanism of information gathering to enable the Subcommittee to write informed and realistic specifications. *These proceedings include the following papers (indented):*

The ARPA program on optical surface and coating science, C. M. Stickley, *SP387,* pp. 3-10 (Dec. 1973).

Nonlinear refractive index measurements in laser media, A. Owyoung, *SP387,* pp. 11-24 (Dec. 1973).

Key words: Ellipse rotation; glass; nonlinear index; nonlinear susceptibility; self focusing; yttrium aluminum garnet.

The ellipse rotation technique has been employed to measure nonlinear refractive index changes in YAG and several laser glasses using a Q-switched TEM_{00q} mode ruby oscillator-amplifier. By time resolving the 9 ns ellipse rotation signal, we obtain all of the information necessary to plot ellipse rotation vs. input power in a single shot, thereby also introducing the capability to detect transient contributions which would interfere with the measurement.

A small anisotropy is found in the third order nonlinear susceptibility of YAG and values for n_2 are inferred assuming electronic distortion to be the primary mechanism.

Self-focusing in yttrium aluminum garnet and optical glasses A. Feldman, D. Horowitz, and R. M. Waxler, *SP387,* pp. 26-35 (Dec. 1973).

Key words: Absorption coefficient; electrostriction; Kerr effect; laser damage; nonlinear refractive index; optical glasses; self-focusing; thermal self-focusing; yttrium aluminum garnet.

An analysis of damage threshold data in borosilicate crown glass, fused silica, and dense flint glass for linearly and circularly polarized radiation indicates that the Kerr effect is the dominant self-focusing measurement for 1.06 μm laser pulses with a 25 ns temporal width. The calculated thermal effect is found to be larger than the electrostrictive effect, which is small. Self-focusing length measurements in yttrium aluminum garnet (YAG) are found to agree with theory. In YAG, the Kerr effect also dominates.

A rational definition of index nonlinearity in self-focusing media, A. J. Glass, *SP387,* pp. 36-41 (Dec. 1973).

Key words: Critical power; laser damage; nonlinear index; self focusing.

It is proposed that the index nonlinearity in self-focusing media be reported in terms of a critical power for the medium, P_1, rather than in terms of n_2. The principal results of self-focusing theory are expressed in terms of the ratio (P/P_1), where P is the total power in a Gaussian beam. Using P_1 not only simplifies the expressions for quantities of physical interest, but also will remove some of the confusion now existing in the literature of self-focusing and laser damage.

Self focusing of very powerful laser beams, B. R. Suydam, *SP387,* pp. 42-48 (Dec. 1973).

Key words: Laser damage; nonlinear; self focusing.

Self focusing has heretofore been studied by assuming something equivalent to total collapse of the beam. Computer simulations at high power level show, however, that it is rather some small portion of the beam (e.g., a diffraction spike) which first collapses. We have therefore examined self focusing as a problem in stability theory. The method can be applied to divergent beams and to any medium in which gain is a known function of field strength. The theory agrees well with computer experiments. We find an absolute limit to the intensity available from a glass laser of order 10^{10} watts/cm^2.

Homogeneity requirements for minimizing self-focusing damage, J. Marburger, R. Jokipii, A. Glass, and J. Trenholme, *SP387*, pp. 49-56 (Dec. 1973).

Key words: Laser damage; nonlinear index; random index variation; self focusing.

The theory of wave propagation in random media is generalized in a straightforward way to include the effects of self focusing. Simple solutions are obtained which show how the intensity fluctuations which are induced by random inhomogeneities grow catastrophically. These solutions can be used to obtain conditions on the homogeneity of the medium, and on the fluctuations in the incident beam, for elimination or reduction of catastrophic self focusing in the medium.

Self focusing and saturation in disk amplifiers, K. A. Brueckner and J. E. Howard, *SP387*, pp. 57-62 (Dec. 1973).

Key words: Damage threshold; disk amplifiers; eikonal; saturation; self-focusing.

The methods of geometrical optics are used to investigate self focusing in arbitrarily spaced Nd glass disk amplifiers. Difference equations describing the growth of a localized ring or spot beam inhomogeneity are derived and solved numerically. The corresponding differential equations are solved in closed form for the case of equally spaced disks, yielding explicit constraints on the allowable amplitude and width of spikes in terms of the thickness and spacing of the disks. In a more refined calculation, the decrease in gain at large flux densities is taken into account. The analytic and numerical results are applied to a typical laser system, wherein a chain of slab amplifiers is used to produce a high energy pulse for CTR experiments.

Damage control in a 100 GW high power laser system, J. Tillson, B. Guscott, and K. Moncur, *SP387*, p. 63 (Dec. 1973).

Key words: Disc laser; laser damage; laser fusion; Nd-glass lasers.

With the development of high power Nd^{+++} lasers for CTR research, severe damage in laser glass and optical components can be expected from both the output energy and from reflected plasma energy. At KMS, laser operating procedures, system diagnostics, and several isolation devices have been developed in an effort to reduce damage effects and to maximize laser lifetime. Since December 1972, the KMS laser system has operated in the 50-100 GW power range (up to 300 J at 3 nsec pulse width) for a total of 310 shots on target. An additional 2,379 laser shots have been fired for purposes of laser beam diagnostics. Plasma experiments with f/1 and f/1.5 focusing lenses have been performed with plane targets of CD_2, CH_2 and aluminum. This paper will discuss the KMS laser system, with particular emphasis on damage control procedures and equipment necessary for conducting high energy plasma experiments.

Low scatter finishing of optical elements, W. P. Barnes, *SP387*, pp. 64-68 (Dec. 1973).

Key words: Low scatter; mirror; optical surfacing.

The adaptation of bowl-feed polishing techniques to the low-scatter finishing of large optical elements is described. Electron micrographs of the surface of a 27 inch diameter fused silica spherical mirror indicate promise for the successful superpolishing of large, high-precision, optical elements.

Laser surface damage studies on several glasses, N. L. Boling, G. Dubé, M. D. Crisp, *SP387*, pp. 69-79 (Dec. 1973).

Key words: Absorption; electron avalanche; laser damage; plasma formation; polishing compound.

Q-switched laser induced surface damage studies on several glasses and sapphire are reported. By measuring thresholds on these various glasses, investigating the effect of various polishing compounds on damage of laser glass, studying damage morphologies, and taking care to detect damage in its initial stages, several conclusions are reached. Initial damage in practical situations is probably due to absorption by isolated submicron inclusions, and not electron avalanche. Inclusion type damage is found to occur without formation of the bright plasma associated with electron avalanche. The damage threshold is found to depend strongly on polishing compound in some cases. It is found that increased smoothness of a surface does not necessarily lead to an increased threshold.

Some aspects of surface damage that can be explained with linear optics, M. D. Crisp, *SP387*, pp. 80-83 (Dec. 1973).

Key words: Laser damage; surface damage.

Quantitative predictions of the relative values of surface damage thresholds for various geometries are found to follow from linear optics and simple assumptions concerning the damage mechanism. It is assumed that, for a fixed pulse shape, a surface will damage when it experiences an oscillating field of amplitude greater than a threshold value. This assumption is consistent with both absorption by inclusions and avalanche breakdown as a damage mechanism. The ratios of damage thresholds for entrance and exit surfaces at normal incidence, surfaces at Brewsters angle and a total internal reflection surface are found to depend only on the index of refraction of the material. It follows from the analysis that the different threshold values obtained from measurements made with various geometries are simply related and contain information about only one intrinsic surface parameter.

Damage in lithium iodate with and without second harmonic generation, C. R. Giuliano and D. Y. Tseng, *SP387*, pp. 84-90 (Dec. 1973).

Key words: Bulk damage; lithium iodate; phase matching; second harmonic generation.

The purpose of this study has been to determine whether a significant difference exists between bulk damage thresholds under conditions of phase matching (PM) for second harmonic generation (SHG) compared with the condition where phase matching is absent. Bulk damage in lithium iodate was studied both at 1.06 μm and 0.694 μm using single mode Q-switched lasers. Under the conditions of the experiment no significant difference was observed in damage thresholds between PM and non-PM conditions for single shot damage at 0.694 μm and for both single pulse and 10 pps at 1.06 μm.

Laser surface damage studies at Bendix, P. Bräunlich, J. Carrico, B. Rosenblum, and A. Schmid, *SP387,* pp. 91-102 (Dec. 1973).

Key words: Exoelectron emission; laser surface damage.

A status report will be presented which describes the application of the exoelectron imaging technique as a nondestructive test method for laser surface damage. The mechanism of exoelectron emission from dielectrics will be discussed and an outline of a theory of laser induced exoelectron emission will be given. It will be shown that thermally or optically stimulated electron emission images represent a record of physical phenomena that are precursors of laser surface damage. Experimental techniques used to obtain exoelectron images after laser exposure of the sample will be described and recent results presented.

Effects of laser flux on GaAs, J. L. Smith, *SP387,* pp. 103-106 (Dec. 1973).

Key words: GaAs; laser-induced acoustical pulse; laser-induced damage; stimulated Brillouin scattering; threshold dependence on wavelength and doping.

Pulsed laser damage thresholds for surface damage of GaAs have previously been measured for 0.694 and 1.06 μm laser beams. Measurements have recently been made for a 10.6 μm laser beam. These wavelengths were obtained with ruby, Nd^{3+}-glass, and TEA CO_2 lasers with pulse half-widths of 20 nsec, 60 nsec, and 100 nsec, respectively. The first two lasers utilized dye Q-switched cells. Later work with the Nd^{3+}-glass laser incorporated a Pockels cell for Q-switching. Surface damage thresholds ranged from about 8 MW cm^{-2} for 0.694 μm radiation to 30 MW cm^{-2} for 10.6 μm radiation, and except for 10.6 μm radiation did not depend significantly on whether the GaAs was p-type, n-type, or undoped. For 10.6 μm radiation, the p-type GaAs was damaged at one third the value for the n-type GaAs and mostly exhibited bulk cracking rather than surface damage. The damage threshold of GaAs shows some dependence on the 1.06 μm laser pulse time, becoming lower as the pulse duration increases. Highly localized damage sites occurring at 1.06 μm cannot be accounted for by laser beam inhomogeneities. A study of the effects of surface trash on this localization revealed that, although visible trash does play a role, it need not be present for surface pits of approximately 2 μ size to occur. An arrangement utilizing a Pockels-switched Nd^{3+}-glass laser and quartz transducer was devised to determine whether the leading acoustical pulse induced in undoped GaAs bulk by the laser beam was rarefaction or compression. Rarefaction could result if the material were strongly electrostrictive, and this would bring out the question of the possibility of stimulated Brillouin scattering which depends on the effect. On the other hand, compression would result, for example, from thermal expansion. The study confirmed that the main effect of the 1.06 μm laser beam is to produce a compression in the leading pulse. The compression pulse amplitude was found to be proportional to the laser power up to the damage threshold.

Carrier effects observed in laser-induced damage in a silicon junction photodetector, J. F. Giuliani, *SP387,* pp 107-113 (Dec. 1973).

Key words: Laser damage; silicon photodetector; surface damage; surface recombination lifetimes.

Damage induced by a pulsed 1.06 μm laser was studied in a n-p-n silicon photodiode on the basis of measured surface changes using a technique of He-Ne beam probing of the photoconductive gain and excess minority carrier diffusion lengths as functions of increasing cumulative pulsed-laser energy.

These preliminary studies suggest that the pulsed laser produces significant changes in the surface recombination rates for the charge carriers and this in turn can be related to the measured changes in detector gain and dark current also as functions of increasing laser energy.

The role of coating defects in laser-induced damage to thin films, L. G. DeShazer, B. E. Newnam, and K. M. Leung, *SP387,* pp. 114-123 (Dec. 1973).

Key words: Coating defects; damage morphology; damage thresholds; laser-induced scatter; mean distance between defects; rutile crystal damage; thin-film damage.

Laser damage to dielectric thin-film coatings was investigated using a TEM_{00} Q-switched ruby laser. The laser-induced damage thresholds of several thin-film coatings increased with decreasing laser beam spot-size and were invariant for spot-sizes greater than 150 μm. A simple model has been suggested that the distribution and nature of coating defects have played an important role in this spot-size dependence, e.g., the probability of the laser beam striking a defect site will be greater for larger spot-sizes and that damage in materials can be distinguished as defect damage and intrinsic damage. This model can be also applied to surface damage.

The role of inclusions and linear absorption in laser damage to dielectric mirrors, D. Milam, R. A. Bradbury, and M. Bass, *SP387,* pp. 124-132 (Dec. 1973).

Key words: Dielectric mirror; inclusions; laser-induced damage; linear absorption.

By studying the morphology of threshold damage and observing the predicted "pulse duration-inclusion size" relationship we have found that laser damage to dielectric coatings is primarily determined by the presence of metallic or highly absorbing nonmetallic inclusions. It is also shown that linear absorption does not determine the damage resistance of coatings when they are properly prepared from materials which do not show bulk absorption.

Time resolution of laser-induced damage to thin films, N. Alyassini, J. H. Parks, and L. G. DeShazer, *SP387,* pp. 133-137 (Dec. 1973).

Key words: Laser induced film damage; optical probe; surface plasma; time resolved laser damage.

The time evolution of laser-induced damage to ZnS film was measured by monitoring the intensity of a He-Ne probe beam internally reflected from the films at the critical angle. The time behavior of the damage was measured with a resolution of 2 nsec, and was correlated to the ruby laser pulse and the spark emission, when present. This technique was used to compare the damage time evolution with the related damage site morphology observed in SEM photographs.

Investigation of pulsed CO laser damage in coated metal mirrors and dielectric-coated windows, S. Holmes and P. Kraatz, *SP387,* pp. 138-150 (Dec. 1973).

Key words: CaF_2 windows; CO laser damage; damage threshold; dielectric antireflection coatings; metal coatings; metal mirrors; protective overcoatings.

Results of some pulsed high power CO laser damage tests

of metal-coated metal mirrors and AR-coated CaF_2 windows are reported. The laser employed in these tests is an E-beam pumped, CO gas laser which produces a multimode output pulse of ~ 100 μsec duration at a wavelength of 5 μm. It was focused to a spot size of ~ 2-3mm, yielding maximum energy densities in excess of 700J/cm^2. The mirrors tested were polished beryllium copper substrates coated with either silver or gold; the windows were polished CaF_2 having multilayer AR-coatings comprising combinations of ThF_4, PbF_2, MgF_2, and MgO. Damage threshold measurements and effects of fabrication parameters on performance are discussed.

Pulsed CO_2 laser damage studies of windows and window coatings, A. I. Braunstein, V. Wang, M. Braunstein, J. E. Rudisill, and J. Wada, *SP387*, pp 151-156 (Dec. 1973).

Key words: CO_2 laser damage; damage thresholds; laser windows; window coatings; KCl; ZnSe; CdTe.

A study was made of damage thresholds and damage morphology for KCl, ZnSe, and CdTe windows subjected to a pulsed CO_2 TEA laser. Damage to KCl and CdTe was initiated at the surfaces while ZnSe windows were found to fail due to explosion of inclusions in the bulk. For As_2S_3 passivated KCl or ThF_4/As_2S_3 antireflection coated KCl, or BaF_2/ZnS antireflection coated ZnSe the damage morphology was the same as for uncoated windows—failure was not initiated by the coatings. For the two antireflection coating designs studied electric field distributions are shown, and their use in choosing between alternate designs is explained.

Pulsed CO_2 laser damage studies of metal and dielectric coated mirrors, V. Wang, A. Braunstein, M. Braunstein, J. E. Rudisill, J. Y. Wada, *SP387*, pp. 157-169 (Dec. 1973).

Key words: As_2S_3; CdTe; dielectric reflector; inclusions in dielectrics; KCl; pulsed CO_2 laser damage; thin film damage; ZnTe.

Damage thresholds measured using single transverse mode 10.6 μm radiation are reported for several metal and dielectric enhanced multilayer mirrors ($CdTe/ThF_4$, ZnTe/ZnS, As_2S_3/KCl). Typical values are in the range of several J/cm^2 for semiconductor thin films to over 30 J/cm^2 for wide bandgap dielectric thin films (pulse length 0.6 μsec). These single mode values are considerably lower than the corresponding multimode results. Scanning electron microscope, x-ray microprobe, and power dependent absorption measurements were performed in order to examine the nature of mirror surfaces before and after laser damage. Several models for potential damage mechanism (thermal, inclusion, dielectric, etc.) have been investigated. A comparison of the experimental and theoretical results has provided the basis for a possible damage model.

Damage threshold in 10.6 μm laser materials, J. Davit, *SP387*, pp. 170-174 (Dec. 1973).

Key words: Alkali halides; infrared windows; laser damage; TEA laser.

Q-switched laser damage thresholds have been determined for three materials: germanium (Ge), potassium chloride (KCl), and sodium chloride (NaCl). A TEM_{oo} mode CO_2 laser with output at 10.6 μm wavelength and a 75 nsec pulse length was employed. For the three materials, the damage observed was surface damage. In the case of potassium chloride and sodium chloride, while the surface damage threshold was about the same as with germanium, the surface breakdown threshold was much lower. Results on antireflection coated materials are also reported.

Radiation induced damage to NaCl by 10.6 μm fractional joule, nanosecond pulses, W. H. Reichelt and E. E. Stark, Jr., *SP387*, pp. 175-180 (Dec. 1973).

Key words: Damage threshold; exit damage; NaCl; surface damage.

Fractional joule nanosecond pulses from the Los Alamos pulsed CO_2 laser system have been used to obtain preliminary breakdown data for optical quality NaCl. Both surface and bulk damage have been observed. Surface damage in some samples takes the form of a rectangular craze pattern. This pattern is at the surface and similar to that observed by Bastow, et al., in TiC irradiated with light pulses from a Q-switched ruby laser. Estimated thresholds for breakdown and damage patterns are given.

A study of 10.6 μm laser induced damage in alkali halide crystals, H. Posen, J. Bruce, J. Comer, A. Armington, *SP387*, pp. 181-188 (Dec. 1973).

Key words: Alkali halides; ALQLOY; damage threshold; IR coatings; IR materials; laser damage.

Laser induced damage at 10.6 micrometers is observed in alloy alkali halide single crystals of the ALQLOY composition ($KCl_{0.33} - KBr_{0.67}$) and pure KCl, as a function of crystalline orientation. The effect of the stepwise increase in laser irradiation power is monitored by x-ray topographic techniques, Nomarski microscopy and electron microscopy of the replicated damage surface.

The relationship of the damage threshold to the crystalline orientation is explained by invoking the critical resolved shear stress law for the rock salt crystal structure of the alkali halides.

Surface and coating absorption measurement with an Alphaphone, E. L. Kerr, *SP387*, pp. 189-193 (Dec. 1973).

Key words: Absorption; coatings; high-power laser; measurements; surface; testing.

Optical elements and coatings for high power laser applications require low surface absorption. The Alphaphone provides an instrument for rapidly measuring surface absorption at laser wavelengths. Sensitivity is 10^{-5} absorption with 10 W input and a noise bandwith of 15 Hz. The total measuring time is a few minutes. Sensitivity down to 1.5×10^{-7} is achievable by decreasing the chopping frequency. In addition, sensitivity may be improved by signal averaging or by increasing the input power. Two surfaces of a window may be measured independently. Scattering has no significant effect.

The sample to be tested forms one wall of a thin cell filled with air. The air is heated by a small fraction of the energy absorbed at the sample surface when it is illuminated by the laser beam. The resulting pressure rise is measured by a capacitance microphone. In a demonstration we have recorded the absorption signals from two KRS-5 windows coated with antireflection coatings for 10.6 μm. The absorption was 1 percent, measured with a signal-to-noise ratio of 1000.

Photoelastic constants of infrared transmitting materials, B. Bendow and P. D. Gianino, *SP387*, pp. 194-201 (Dec. 1973).

Key words: IR transmitting materials; photoelasticity; stress-optics.

Stress-induced birefringence may severely degrade or limit the optical performance of IR transmitting materials, especially in high power laser applications. The birefringence in a given material is predictable once the photoelastic tensor has been determined. In this work we carry out a

first-principles calculation of the photoelastic constants p_{ij}, employing a recent theory of Humphreys and Maradudin. For ionic crystals, a Born-Mayer interatomic potential is employed, while for semiconductors a Morse potential is employed. The p_{ij} are calculated for a wide variety of rocksalt- and zinc blende-type crystals, including alkali-halides, II-VI's and III-V's. The electronic contribution to the p_{ij}'s is found to dominate in most semiconducting crystals, so that dispersion in the transparent frequency regime is generally negligible. For ionic materials, however, dispersion can be important; values at 10.6 μm, for example, may differ from those in the visible by as much as 25 to 50 percent, even for the better potential laser window materials.

Checks of multiphonon absorption theory, R. Hellwarth, *SP387*, pp. 202-207 (Dec. 1973).

Key words: Crystal absorption theory; frequency moments; infrared absorption; infrared susceptibility; infrared window materials; multiphonon absorption.

There is considerable uncertainty as to the accuracy of calcuations to date of multiphonon absorption in infrared window materials. Here we show that such uncertainties can be checked by calculating various weighted integrals over frequency ("frequency moments") of the imaginary part $\chi''(\omega)$ of the electrical susceptibility, to which the absorption coefficient $\beta(\omega)$ cm^{-1} is related. We obtain expressions for six moments, evaluating a moment of the 2-phonon contribution explicitly for an anharmonic pair-interaction model. This exact result reveals inaccuracies in the dependence of absorption on ion masses and temperature predicted by approximate theories.

Theory of material failure in crystals containing infrared absorbing inclusions, C. J. Duthler and M. Sparks, *SP387*, pp. 208-216 (Dec. 1973).

Key words: Dielectric particles; inclusions; laser damage; thermal damage.

Small amounts of macroscopic inclusions in or on the surface of infrared-transmitting materials (in some cases a fractional volume of 10^{-7} to 10^{-8}) increase the average value of the optical absorption coefficient β and cause localized heating that could lead to material failure at high-power levels. The frequency dependence of β ranges from increasing as ω^2, to independent of ω, to exponentially decreasing with ω. Temperature dependence ranges from independent of T, to increasing as T^p in the high-temperature limit, where $p \cong 1 - 4$ typically. Simple expressions for the absorption cross section are used to derive expressions for β for large inclusions of strong and weak absorbers and small inclusions of dielectric and metallic particles. Material failure resulting from local heating of inclusions is a far greater problem in high-intensity short-pulse systems than in low-intensity long-pulse or cw systems having the same average intensity. Microsecond pulses with energy densities as low as a few joules per square centimeter can cause material failure.

Surface damage by laser induced collective electron oscillations, R. A. Shatas, L. M. Narducci, J. L. Smith, H. C. Meyer, and S. S. Mitra, *SP387*, pp. 217-224 (Dec. 1973).

Key words: Electron avalanche; electron tunneling in alternating fields; laser damage of GaAs; laser damage processes; laser-induced surface damage; parametric plasma instability; resonant plasmon-photon interaction; solid state plasma.

Recent experiments with high pressure infrared molecular lasers demonstrate that the surface damage of ancillary optical components is the performance limiting factor. Intensities of a few tens of MW cm^{-2} in the pulse regime of fractional μsec are sufficient to damage the optical components; this performance is considerably less than what one would expect from the analysis of the intrinsic dielectric strength. It is proposed that the principal damage mechanism is associated with the damping of collective electron oscillations which have been driven beyond the linear regime by resonant photon-plasmon interaction. If the mobility of the carriers in a typical optical component is sufficiently high (such as for example in GaAs), one can adequately model the collective behavior of the carriers by a collisionless plasma. Thus the threshold for instabilities can be calculated on the basis of the Vlasov equation. In particular, the threshold for parametric instabilities in GaAs illuminated by 10.6 μm radiation is shown to be of the order of 10^5 V cm^{-1} which is in close agreement with recent experimental results. The mechanism responsible for producing the critical electron density is proposed to be field-assisted electron tunneling. The required tunneling probability for electric fields of the order of the instability threshold is attained if the energy separation of bound to free state is less than the crystalline bandgap. Adsorbed impurities and bending of the crystal bands at the surface account for the lowered value of the effective pseudo gap; hence the damage is seen first at the surface of the material.

Studies of intrinsic optical breakdown, D. W. Fradin and M. Bass, *SP387*, pp. 225-238 (Dec. 1973).

Key words: Alkali halides; avalanche breakdown; intrinsic breakdown.

Previous work demonstrated that intrinsic optical damage is caused by electron avalanche breakdown. We have conducted a number of recent studies of intrinsic damage which have reinforced the original identification of the damage process and which have probed various characteristics of avalanche breakdown.

By using a ruby laser to induce damage in the alkali halides, we have observed frequency dispersion in the relative breakdown fields. This dispersion, which was not apparent at 1.06 μm, provides insight into the development of the avalanche. A mode-locked Nd:YAG laser with output pulses of 300 to 15 ps duration was used to induce damage in NaCl, and the results were compared to Q-switched studies. It was found that the rms breakdown field increased by almost an order of magnitude to over 10^7 volts/cm as the pulse duration was reduced from 10 ns to 15 ps. This result agrees at least qualitatively with published dc breakdown measurements. A statistical character to bulk optical damage was observed in a number of materials including sapphire and fused quartz and found to be indistinguishable from statistics observed in surface damage. This observation and measurements of the ratio of surface to bulk breakdown fields show that the intrinsic mechanisms for surface and bulk breakdown are identical. Finally, the effect of crystalline disorder on the breakdown strength of solids was studied by measuring the intrinsic damage fields for a polycrystal, an alloy, and an amorphous insulator and comparing the results to the damage fields for the respective single crystals.

Laser-induced surface damage in proustite (Ag_3AsS_3) at 1. μm and 0.694 μm, G. R. Giuliano and D. Y. Tseng, *SP3* pp. 239-249 (Dec. 1973).

Key words: Ag_3AsS_3; proustite; pulse duration dep dence; repetition rate dependence; surface damage; 1. μm; 0.694 μm.

The results of a number of experiments on laser-induced entrance surface damage in proustite (Ag_3AsS_3) are presented. Morphology for pulsed and cw surface damage is discussed and illustrated. Damage at 1.06 μm where most of the work was done was studied with single pulse, repetitively pulsed, and continuous radiation; damage at 0.694 μm was studied with single pulses. It was found that the surface damage threshold at 1.06 μm is independent of pulse repetition rate from single pulse to 500 pps. Results of measurements taken for pulses of different duration are interpreted in terms of a thermal mechanism.

Spectral emittance measurements on several crystalline samples, D. L. Stierwalt, *SP387*, pp. 250-253 (Dec. 1973).

Key words: Absorption coefficient; emittance spectra; KBr; CdTe; ZnSe; $ZnSe_xTe_{1-x}$.

Emittance spectra were obtained at 273 and 373 K from 3 to 15 microns on several samples supplied by AFCRL. The specimens included KBr, CdTe, $ZnSe_xTe_{1-x}$, ZnSe, and four samples of Pb-doped KCl. Values of absorption coefficient were derived from the emittance data. Curves of absorption coefficient versus wavelength will be presented.

A sensitive interferometric null method for measuring stress-induced birefringence, G. Birnbaum and E. Cory, *SP387*, pp. 254-258 (Dec. 1973).

Key words: Birefringence; fused silica; optical spectrum analyzer; photoelastic effect; sapphire; scanning Fabry-Perot interferometer; YAG.

A sensitive apparatus for measuring induced birefringence utilizing a scanning Fabry-Perot interferometer excited by circularly polarized laser radiation has been developed. Because of birefringence in the sample located within the interferometer, its resonance wavelengths for radiation polarized parallel and perpendicular to the direction of applied stress are different. The voltage on a Kerr cell properly oriented within the interferometer is adjusted to cancel the sample birefringence. The wavelength difference is observed by using the scanning interferometer as a spectrum analyzer and comparing the resonance curves associated with each polarization. The stress-induced birefringence in YAG, sapphire and fused silica at 0.633 μ in the temperature range 26 to 75 °C has been measured.

P388. **The public need and the role of the inventor.** Proceedings of a Conference held in Monterey, Calif., June 11-14, 1973, F. Essers and J. Rabinow, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 388, 215 pages (May 1974) SD Catalog No. C13.10:388.

Key words: antitrust doctrine; employed inventors; entrepreneurship; innovation; invention; needs of society; new enterprises; Patent Office; patent system; technological policy making; technology.

This book presents the proceedings of the Conference on the ublic Need and the Role of the Inventor, held at Monterey, alif., on June 11-14, 1973. The conference, based on a recomendation of the National Inventors Council, was sponsored by e Office of Invention and Innovation, Institute for Applied echnology, under a grant from the Experimental Technology ıcentives Program, NBS. The purpose of the conference was to udy the climate for invention and how to make it one in which merica's inventors can flourish for the common good. Eighteen vited papers were presented. In addition, the proceedings inudes statements from the chairmen of the three sessions: harles S. Draper, Jacob Rabinow, and Myron Coler. The oceedings are divided into three sessions with an edited version of the floor discussions following the papers. Following the presentation of papers, the participants of the conference separated into six workshop panels. Their recommendations are presented at the end of this volume. *These proceedings include the following papers (indented):*

Inventions, innovations, and incentives, Betsy Ancker-Johnson, *SP388*, pp. 5-6 (May 1974).

Key words: government patent policy; government R. & D.; technology enhancement efforts; technological innovation; technology transfer programs.

The Government has a responsibility to transfer the results of its research and development activities to wider use in the private sector. Last year, in the President's Science and Technology Message, and this year, in his budget, a strategic approach to technology was adopted as a national policy. The strategy includes increased funding, new emphasis on critical problems of special, national concern, and an effort to provide incentives to inventors, entrepreneurs, and research managers. The Department of Commerce is taking steps to promote actively the licensing of Government-owned patents, and the Experimental Technology Incentives Program in the National Bureau of Standards is asking such questions as "What cost-effective Federal actions can be taken to facilitate the commercialization of the technical inventions of the individual and small R. & D. firms?"

An economist looks at the patent system, R. D. Tollison, *SP388*, pp. 11-14 (May 1974).

Key words: economic tradeoffs; monopolies; new information; patent reform; patent system.

This talk sketches the way an economist might view the tradeoffs involved in the social institution of a patent system. If the output that a patent is designed to protect can be loosely labeled as "information," then there will always be a tension between the need for patents to stimulate the production of new information and placing a short-run monopoly price on goods that, once produced, are inherently non-rival in consumption. A patent system is probably a socially efficient way to make this tradeoff, although the fact that societies impose different standards and procedures in the patent process suggests that study and discussion of patent reform may be worthwhile.

Trends in technological policy making, D. V. De Simone, *SP388*, pp. 17-20 (May 1974).

Key words: experimental incentives programs; Federal incentives; technological policy making; technology assessment program.

Federal programs and policies contribute to technological advances in numerous ways. Many Federal incentives for technological innovation have been proposed over the years, but none has been put into effect. We need to develop a better basis for choosing courses of action.

Three Federal programs recently begun are aimed at this deficiency: the systematic assessment of the state of industrial technology by the Department of Commerce, a study on the barriers to technological innovation by NSF, and the experimental incentives programs being conducted by NSF and NBS. These are small-scale pilot projects, but the experiments and studies will help us understand more about the factors influencing technological advance. As a result, decision makers will be better equipped to determine what should be the nature and extent of Federal encouragement of private investment in technological innovation.

New enterprise generation, R. S. Morse, *SP388*, pp. 23-28 (May 1974).

Key words: entrepreneurship; environment for innovation; government policy for innovation; industry R. & D.; new enterprises; university R. & D.

The national environment for innovations is examined: in government, industry, the university, and the public.

The administration is concerned for the environment of science and technology, but centralized leadership and responsibility for long-range analysis and planning are absent. New rules and policies, or new legislation by Congress are needed.

Industry has been trying new methods in the management of R. & D., both in establishing centers for entrepreneurship within the company, and providing venture capital to acquire new technology outside the company. The key to success in these enterprises is the entrepreneur who can judge the market and bring a new product into public use.

Universities should study the mechanisms that industry is using; there is need for research in these areas, and a need for a coupling of effort between the university and the industrial community. The university can also play an important role in teaching entrepreneurship.

The President should delegate authority either in the Executive Office or in the Department of Commerce to review the problems of invention, innovation, and entrepreneurship for the generation of new enterprises. New approaches should be tried to expedite the public use of technology and a closer relationship among government, industry, and the university.

Inventor-entrepreneurship and national priorities, N. S. Kapany, *SP388,* pp. 31-36 (May 1974).

Key words: business management; inventor-entrepreneur; national priorities; national problems; technological innovation.

Because he is capable in science, invention, management and business, the inventor-entrepreneur has a high potential for solving some of the urgent problems of mankind today.

The attributes of the inventor and of the entrepreneur are briefly examined: the inventor-entrepreneur combines these talents in a bold, imaginative way.

Although some national problems are of such a nature that they must be solved by massive, large-scale interdisciplinary effort, there are still many high-priority areas that can be attacked by the inventor-entrepreneur.

The optimum climate for nurturing his efforts must include: a strong technological and industrial base; a free-enterprise economic system; a healthy reception by the financial community and a sympathetic public attitude; and, a cooperative, benevolent government attitude.

The inventor-entrepreneur is a pioneer—a champion of innovation—and as such, he deserves attention, support, and a chance to share the responsibility for solving the problems of society today.

Invention and innovation in the university, J. Adams, *SP388,* pp. 37-43 (May 1974).

Key words: academic risk; business-Government-university relationship; faculty risk; time constraints; university entrepreneurial activities.

Universities are not fulfilling their potential as a source of public need-oriented invention and innovation. Their potential is inhibited by three constraints: risk, time, and business.

There is an academic risk to the student in undertaking projects where the outcome must be uncertain. The risk to the faculty lies in the fact that the academic rating procedure treats entrepreneurial activities as unusual and academic publication as usual.

Time is another constraint: there is insufficient time in the academic year to develop a product and market it.

The business constraint is a lack of knowledge as to how ideas could be carried to reality with a just division of the compensation among the students, faculty, university, Government, and commercial business interests involved.

Government funding might help to solve the risk and time constraints by forming peer groups and allowing employment of long-term professional support.

People in the educational community would appreciate help on solving the business-Government-university relationship problems. Frameworks must be found and publicized in which universities can put their intellectual resources to work in a more applied way and gain reasonable financial and intellectual rewards.

The invention of the transistor—"an example of creative-failure methodology," W. Shockley, SP388, pp. 47-88 (May 1974).

Key words: creative-failure methodology; invention of transistor; junction transistor; patents; semiconductor amplifiers; will-to-think.

Presents a general historical perspective on the invention of the transistor, from the standpoint of the patents issued and the men involved in the inventions.

Five applications for patents on transistor devices were filed prior to the first public announcement of the transistor on June 30, 1948. The development of the essential inventive ideas for these five patents is described.

Several attempts to make semiconductor amplifiers failed. These failures were used creatively by the team involved—an example of effective research, of which one of the principal elements is the "will to think." The day-to-day development of important ideas and the interaction between them are presented.

The story is continued through the invention and realization of the junction transistor.

Antitrust doctrine v. the individual inventor: Friend or foe? J. C. Stedman, *SP388,* pp. 93-98 (May 1974).

Key words: antitrust; Hart proposal; inventors; patent licenses; patents; Scott proposal.

The perennial conflict between antitrust and patents is currently reflected in the Scott (Patent Bar) and Hart proposals pending before the Senate. The Scott proposal would apply a "rule of reason," giving a patentee considerable freedom in imposing various restrictions upon licensees. The Hart proposal would apply a "reasonably ancillary" test, narrowly circumscribing the patentee's freedom in this respect. The question is: which is more advantageous to the inventor, independent or employed? Restrictions in patent licenses, while they may enable the patentee to maximize his return from the invention, may at the same time provide protection from competition and thus lessen the competitive fears and hopes of competitive advantage that provide the main economic force underlying inventive activity. Thus paradoxically, the short-range advantages of restrictive licensing may operate long-range to the detriment of the inventor. Deeper research into the subject is urgently needed, but tentatively one may suggest that enactment of a law enlarging a patentee's freedom to impose licensing restrictions may prove, in the long run, advantageous to institutions that seek to minimize the forces of competition (including competition in research and innovation), but disadvantageous to small concerns and individual inventors, independent or employed, whose welfare depends upon competitive achievement and innovative activity.

The inventor in a changing world of patents, A. R. Whal *SP388,* pp. 103-110 (May 1974).

Key words: adversary proceedings; antitrust; deferred examination; independent Patent Office; innovation; inventor patent system; useful arts.

It's time we overcome our collective hardening of the attitudes about changes in the patent system. The simple choice is whether the design of change will pass by default to those in the courts or Congress who march to different drummers, or whether those who use and understand the system will meet the challenge of change.

The patent system faces an identity crisis. Three positive approaches would help set thinking straight:

1. Emphasize the patent system's effectiveness in areas of its intended operation in the useful arts.

2. Foster understanding of the interdependence of invention and innovation in making the patent system work in the public interest.

3. Work for a no-fault divorce between patents and antitrust to rectify the subservient status now assigned to patents.

At the same time, we should move to reconstruct the patent system rather than repair it. Recognizing that the concept of patents remains sound, we should give consideration to carefully circumscribed adversary proceedings made practicable by deferred examination and maintenance fees and administered by an independent Patent Office. Thorough discussion of the possibilities and pitfalls of these approaches should lead to a patent system of increased vigor and the restoration of confidence in the patenting process without distress to the substantive aspects we seek to preserve.

The role of the patent office in the process of invention and innovation, E. J. Brenner, *SP388*, pp. 111-115 (May 1974).

Key words: advisers to inventors; deferred examinations; innovation; invention; mechanized searching; patent litigation; Patent Office; patent system reform; petty patents; satellite research centers.

Examines how well the U.S. Patent Office is doing its job now, and presents some suggestions that might enable it to do a better job in the future.

Within the financial limitations under which it must operate, the Patent Office performs an efficient screening operation, rather than a validity proceeding, which would take far more time and money.

Two general suggestions are given for future improvement: first, that an Assistant Secretary for Invention, Innovation, and Intellectual Property be appointed in the Department of Commerce, to serve as a focal point for these activities; and secondly, that a systems analysis approach be taken to weigh the merits of various ideas for reforming the patent system.

Specific suggestions are also made for consideration: adoption of deferred or selective examination; a system of petty patents; a greater role for the Patent Office in litigation; continued efforts to improve mechanized searching; the institution of satellite search centers and a system of advisers to inventors; and a review of the patent system to eliminate some of the technicalities that may invalidate patents.

United States patent system: Fraud on the inventor and the public (and what can be done about it), I. Kayton, *SP388*, pp. 119-126 (May 1974).

Key words: inventor; monopoly; patent system; property rights; validity of patents.

The inventor is the creator of progress, and our main hope to solve most of society's problems. In order for him to be motivated to continue inventing, he needs to have his property rights protected. By and large, the United States patent system no longer affords the protection.

There are some Federal circuits where, because of the rules of law enunciated by the United States Court of Appeals, a patent cannot be held valid, irrespective of the merit of the invention.

The law of expected return dictates which patents get litigated—there's no such thing as a *per se* good patent. The reason is the legally outrageous proposition which has been imposed on the public, the bar, and the bench, either fraudulently, through arrant ignorance or simple misconception, that all patents are monopolies. Monopolies are bad—therefore, patents are bad.

The truth is that practically no patents are monopolies. Patents are property—and where there is competition, either by product alternatives or by licensing, you cannot control price and you do not control a relevant market and you do not have a monopoly.

A revision of the patent statute is suggested which would reverse the alienation of the small inventor from the patent system and restore the system to its earlier effectiveness in promoting the useful arts.

NBS and the inventive process, R. W. Roberts, *SP388*, pp. 131-135 (May 1974).

Key words: Experimental Technology Incentives Program; inventors; National Bureau of Standards; Office of Invention and Innovation; technological innovation.

If we are to compete for international markets, we need more and better science, and we need a continuing supply of marketable inventions. The role of the inventor at the National Bureau of Standards, and the services offered to the outside inventor by the Bureau, are described. The aims of a major new NBS effort—the Experimental Technology Incentives Program—are explained, and suggestions are requested for additional experiments that ETIP could perform.

The inventive process—where does it need stimulation?, W. B. McLean, *SP388*, pp. 139-142 (May 1974).

Key words: government help to innovation; government ownership of patents; innovation; inventor; patent system.

The patent system is crucial for the development of our national economy. Its influence is exerted by providing a period in which risk capital needed for development can realize a return through production. The inventor and his returns are only incidental to this process.

Many areas of new development exist where the returns to the economy would be great but the Government is the only organization capable of starting the development. These include: (1) Satellite communications; (2) Two-way cable TV; (3) Floating cities; (4) Undersea cities and oil and mining operations; (5) Submarine tankers. Government ownership of patents is inconsistent with the purpose for which the patent system was created because it has no reasonable means to grant exclusive licenses.

The employed inventor and the corporation, C. E. Anagnostopoulos, *SP388*, pp. 145-149 (May 1974).

Key words: corporation; employed inventor; innovation; invention; research director; technological entrepreneur.

The idea that the goals of the employed inventor conflict with those of the corporation is an outmoded fallacy. The creative challenges of the modern corporation are totally compatible with the creative drives of the employed inventor. Through invention, he discovers new and useful solutions to problems. Through innovation, the corporation commercializes such technical advances. Corporate growth and profitability today depend upon planned and systematic innovation.

Such innovation requires not only the technical certainty of a useful invention, but also an evaluation and reduction of its commercial risks by such criteria as corporate fit, market timing and potential business volume. The presumed conflict between the employed inventor and the corporation is

at this interface between his empirical proof that his invention works and the corporation's pragmatic assessment of it as a business risk.

Actually, this point of stress is a constructive interfacial tension that can be most productive if kept in dynamic equilibrium. This is a task for a middleman who, more than a research director, is a technological entrepreneur; technically well-grounded and with a full grasp of corporate objectives. His role: motivating interpreter to both the employed inventor and the corporation, having the respect and confidence of each.

The institutions and environment for inventors in IBM, D. DeWitt, *SP388*, pp. 153-156 (May 1974).

Key words: environment for innovation; IBM Fellow; institutions for inventors; inventors; rewards for inventors.

IBM seeks to create and maintain in its laboratories an environment conducive to innovation. Inventors are aided by instruction in patent practice, prompt and competent evaluation of submissions, and the help of experienced patent attorneys. Innovation is encouraged by a system of recognition and rewards for patents issued and outstanding technical contributions.

The IBM Fellow appointment is an attractive long-range objective for inventive people: it is a lifetime appointment which gives the Fellow freedom to do innovative work of his own choosing, with appropriate support.

The IBM institutions for encouragement of innovations were introduced about 10 years ago, and have been modified from time to time. They are still being evaluated, but the results have been largely favorable.

The role of the inventor in an industrial laboratory, J. A. Rajchman, *SP388*, pp. 159-164 (May 1974).

Key words: antitechnical crisis; industrial laboratory; industrial research; scientist-inventor; technical innovations.

The industrial research laboratories of large corporations have been a great success; as one of the main mechanisms for harnessing the process of innovation they have benefited their sponsors, society and the scientist-inventor. To the imaginatively inclined technical man they have provided a living and a place in society. Furthermore, a seasoned laboratory provides broad options to the individual to pursue his ambitions according to his talents, as it exploits with subtlety the fact that it is at the crossroads between science, production and the market place and therefore finds good value in individual genius, cooperative work as well as managerial initiative. To a great many technical men the industrial laboratory offers the proper arena for undertaking technical innovations. The personal experiences of the author, at RCA Laboratories, as individual contributor as well as manager, illustrate the point.

The present antitechnical crisis has various symptoms. In the industrial laboratory, budgets are no longer lush, there are problems with non-growing staff, and there is a shift from science to engineering that is accompanied by short range expectations. More alarming are symptoms of disillusionment elsewhere, mostly with the young, among whom many fewer aspire to science and technology. As one possible remedy a plea is made for society to show far greater appreciation and respect toward technical innovators in addition to bestowing them with essential material awards.

Systems to stimulate employee-inventions in Europe, F. Neumeyer, *SP388*, pp. 167-174 (May 1974).

Key words: awards to inventors; employee-inventors; European incentive systems for inventors; Japanese incentive systems for inventors; legal employee-inventor incentive systems; Soviet Union incentive systems for inventors.

An analysis is made of systems, in Europe and elsewhere, to stimulate employee-inventions by legal and voluntary incentive systems, which are part of the overall pattern of the economic and political regime prevailing in a country. The following countries are examined: the Soviet Union, Sweden, Denmark, Norway, Finland, Austria, Holland, Germany, Japan, Great Britain, and Canada. The legal incentive systems in these countries include tangible and intangible rewards. Tangible rewards are: extra compensation, tax relief, standard cash payment, or release of the rights of invention. Intangible rewards include the right to be mentioned in the patent, and honorary titles conferred on the inventor. The objects of these measures are human beings; we need their imagination; and generosity and justice to them will be repaid by them manifold.

European perspective of the inventor ecology, H. Romanus, *SP388*, pp. 175-182 (May 1974).

Key words: European efforts to aid inventors; inventor; inventor ecology; Swedish Board for Technical Development.

Examines the hazards and impediments to inventors, and the methods that some states—in particular, Sweden—are taking to remove these impediments.

Inventors need technical help to develop their ideas, financial help, advice on patenting, and aid in selling their ideas to industry. Having grown from a small beginning in the 1930's, the Swedish Board for Technical Development now has the know-how and resources to perform these services for inventors who they consider are worthy of help. The Board also evaluates proposed legislation affecting inventors, and studies the climate of invention activities.

The practices of the Swedish Board for Technical Development are being followed in other European countries in an effort to support the first link in the innovation chain—invention.

The inventor—his motivations and society, S. Ruben, *SP388*, pp. 195-197 (May 1974).

SP-389, Superseded by Letter Circular 1070.

SP390. **Index of international standards,** S. J. Chumas, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 390, 222 pages (Mar. 1974) SD Catalog No. C13.10:390.

Key words: analyses; International Commission on Rules for the Approval of Electrical Equipment; International Electrotechnical Commission; International Organization for Standardization; International Organization of Legal Metrology; International Special Committee on Radio Interference; recommendations; specifications; standards; test methods.

This computer-produced Index, based on the Key-Word-In-Context (KWIC) system, contains over 2,700 standards titles of the International Organization for Standardization (ISO), the International Electrotechnical Commission (IEC), the International Commission on Rules for the Approval of Electrical Equipment (CEE), the International Special Committee on Radio Interference (CISPR), and the International Organization of Legal Metrology (OIML).

SP391. **Report of the 58th National Conference on Weights and Measures 1973,** S. J. Wilson and R. N. Smith, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 391, 208 pages (May 1974) SD Catalog No. C13.10:391.

Key words: administration; automated checkstand systems; Conference; consumers; laws and regulations; metrication; open dating; procedures; technical requirements; technology; universal product coding; weights and measures.

This is a report of the proceedings (edited) of the Fifty-Eighth National Conference of Weights and Measures, sponsored by the National Bureau of Standards, held in Minneapolis, Minn., July 22-27, 1973, and attended by state, county, and city weights and measures officials, the Federal Government, business, industry, and consumer organizations. *These proceedings include the following papers (indented):*

Measures for progress, G. L. Johnson, *SP391*, pp. 1-3 (May 1974).

Universal product code in the grocery industry:

Effect of UPC on supermarket operations and equipment, R. H. Sloat, *SP391*, pp. 27-31 (May 1974).

Computerized checkstand weighing system, W. N. Shannon, *SP391*, pp. 32-36 (May 1974).

Digital designs in weighing systems:

Applications in retail trade, R. O. Bradley, *SP391*, pp. 36-40 (May 1974).

Large capacity scale designs, T. G. Soper, *SP391*, pp. 41-48 (May 1974).

Dynamic weighing in the railroad industry, E. W. Hodgkins, *SP391*, pp. 49-53 (May 1974).

Gasoline measurement and marketing:

Changing systems and designs, W. F. Gerdom, *SP391*, pp. 55-57 (May 1974).

Electronic components and applications, R. J. McCrory, *SP391*, pp. 58-64 (May 1974).

Weighting on the mail, A. Smith, *SP391*, pp. 64-75 (May 1974).

Net quantity—directions and determinations:

Viewpoint on net weight variations, G. M. Burditt, *SP391*, pp. 75-82 (May 1974).

Status of Handbook 67 revision, E. A. Vadelund, *SP391*, pp. 83-90 (May 1974).

Management assistance for weights and measures progress:

MIS analyses and concept development, E. G. Neigut, *SP391*, pp. 91-97 (May 1974).

Measuring inaccuracy's economic distortion, S. W. Stiefel, *SP391*, pp. 97-107 (May 1974).

New approach in weights and measures operations:

Pilot program, W. H. Korth, *SP391*, pp. 108-114 (May 1974).

Development of Dallas Department of Consumer Affairs, C. H. Vincent, *SP391*, pp. 115-121 (May 1974).

Consumer protection in Minnesota, S. Keefe, *SP391*, pp. 122-132 (May 1974).

SP392. **Vibrationally excited hydrogen halides: A bibliography on chemical kinetics of chemiexcitation and energy transfer processes (1958 through 1973),** F. Westley, Nat. Bur. Stand. (U.S.), Spec. Publ. 392, 81 pages (Apr. 1974) SD Catalog No. C13.10:392.

Key words: bibliography; chemical kinetics; chemiexcitation; gas phase; halogens; hydrogen; hydrogen halides; laser; quenching; vibrational energy transfer.

A bibliography, a reaction oriented list of references, is provided for published papers and reports containing rate data for reactions of halogen atoms with hydrogen-containing compounds, or of H (D, or T) atoms with halogen-containing compounds to form vibrationally chemiexcited hydrogen halides. The reactions for vibroexcitation of hydrogen halides through unimolecular or photochemical elimination, as well as the processes for vibrational energy transfer between hydrogen halides and various second bodies are also included. In addition, four lists of theoretical papers and a list of critical reviews and bibliographies are provided. Over 300 papers covering 50 types of reactions are listed. The period covered extends from 1958 through 1973.

SP393. **Colorimetry and spectrophotometry: A bibliography of NBS publications January 1906 through January 1973,** K. L. Kelly, Nat. Bur. Stand. (U.S.), Spec. Publ. 393, 54 pages (Apr. 1974) SD Catalog No. C13.10:393.

Key words: bibliography; color; color codes; colorimetry; color measurement; spectrophotometry; vision.

This bibiliography of publications will serve as the key to the large amount of research into color measurement and specification, and color vision carried out by the staff of the National Bureau of Standards (NBS) in colorimetry and spectrophotometry. These 623 publications appeared in NBS publications and outside scientific and technical journals between January 1906 and January 1973. This material has been in constant demand by Bureau members as well as by outside individuals and organizations. The practical value of this wealth of information lies in its ready accessibility to the scientific and technical fraternity by title, by key words or by author, in the Library of Congress and in depository libraries such as large public and university libraries. A short organizational chronology of the colorimetry and spectrophotometry program is included.

SP394. **MFPG. The role of cavitation in mechanical failures,** Proceedings of the 19th Meeting of the Mechanical Failures Prevention Group, held at the National Bureau of Standards, Oct. 31, Nov. 1 and 2, 1973, Boulder, Colo. 80302, T. R. Shives and W. A. Willard, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 394, 183 pages (Apr. 1974) SD Catalog No. C13.10:394.

Key words: bubble collapse; cavitation; cavitation damage; cavitation erosion prevention; erosion; surface roughness.

These proceedings consist of a group of 16 submitted papers and discussions from the 19th meeting of the Mechanical Failures Prevention Group which was held at the National Bureau of Standards on October 31 and November 1 and 2, 1973. The central theme of the proceedings is the role of cavitation in mechanical failures. *These proceedings include the following papers (indented):*

Physics associated with cavitation induced material damage, F. B. Peterson, *SP394*, pp. 3-12 (Apr. 1974).

Role of physical properties of liquids in cavitation erosion, A. Thiruvengadam, *SP394*, pp. 13-22 (Apr. 1974).

The role of mechanical properties in cavitation erosion resistance, G. C. Gould, *SP394*, pp. 23-30 (Apr. 1974).

Recent theories of cavitation damage including nonsymmetrical bubble collapse effects, F. G. Hammitt, *SP394*, pp. 31-35 (Apr. 1974).

Some practical examples of cavitation erosion and their prevention, A. F. Conn, *SP394*, pp. 39-47 (Apr. 1974).

Examples of oil cavitation erosion in positive displacement pumps, J. A. Halat and G. O. Ellis, *SP394*, pp. 48-53 (Apr. 1974).

Microscopic investigation of cavitation erosion damage in metals, J. V. Hackworth and W. F. Adler, *SP394*, pp. 54-61 (Apr. 1974).

Lubricant pressure rippling in dynamic Hertzian contacts induced by surface roughness, T. E. Tallian and J. I. McCool, *SP394*, pp. 62-73 (Apr. 1974).

Asperity lubrication and cavitation in face seals, J. A. Walowit, *SP394*, pp. 77-87 (Apr. 1974).

Effect of cavitation on fluid stability in polymer thickened fluids and lubricants, J. L. Duda and E. E. Klaus, *SP394*, pp. 88-99 (Apr. 1974).

Effects of viscoelasticity on cavitation in drag reducing fluids, R. Y. Ting, *SP394*, pp. 100-106 (Apr. 1974).

Progress and problems in erosion prediction, F. J. Heymann, *SP394*, pp. 107-114 (Apr. 1974).

Potential of thin, sputtered films as erosion resistant protective coatings. Part 1. Sputter-coating and film characteristics, K. Gentner, *SP394*, pp. 117-128 (Apr. 1974).

Potential of thin, sputtered films as erosion resistant protective coatings. Part 2. Erosion and the gas turbine engine, J. E. Newhart, *SP394*, pp. 129-144 (Apr. 1974).

Rain droplet erosion mechanisms in transparent plastic materials, G. F. Schmitt, Jr., *SP394*, 145-159 (Apr. 1974).

Analysis of Navy radome failure problems, G. J. Tatnall and K. Foulke, *SP394*, pp. 160-165 (Apr. 1974).

Government-industry data exchange program (GIDEP), E. T. Richards, *SP394*, pp. 166-170 (Apr. 1974).

SP395. **Simulation and gaming.** Proceedings of the 12th Annual Symposium National Gaming Council and the 4th Annual Conference International Simulation and Gaming Association, held at the National Bureau of Standards, Gaithersburg, Md., September 17-19, 1973, J. E. Moriarty, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 395, 458 pages (June 1974) SD Catalog No. C13.10:395.

Key words: computer; decision-making; games; learning; manual games; simulation.

This document contains the proceedings of a Gaming Conference along with many formal papers assembled to provide a comprehensive collection of up-to-date gaming information. The proceedings are divided into three major sections, namely, Theory and Evaluation, Design, and Applications. Each section contains the text of informal workshops held during the Conference and a selection of formal papers. There is a significant amount of reference material cited in the formal papers along with timely questions and challenges explored and amplified in the workshops. *These proceedings include the following papers (indented):*

THEORY AND EVALUATION TASK GROUP

Facilitator's Statements:

Theory and evaluation, R. A. Schusler, *SP395*, p. 21 (June 1974).

Evaluation: Classroom uses: Training planning and research uses, J. C. Thompson, Jr., and C. H. Postma, *SP395*, pp. 22-23 (June 1974).

Evaluation sub-group facilitator's statement, S. Thiagarajan, *SP395*, pp. 24-25 (June 1974).

Evaluation facilitator's statement, P. Y. Martin, *SP395*, pp. 26-27 (June 1974).

Sub-group title: Theory and evaluation facilitator's statement, S. H. Woolard, *SP395*, pp. 28-29 (June 1974).

Formal Papers:

Simulating a model of perception to shape problem recognition behavior, S. H. Woolard, *SP395*, pp. 30-39 (June 1974).

The what and why of gaming: A taxonomy of experimental learning systems, B. D. Ruben, *SP395*, pp. 40-55 (June 1974).

Conflict resolution: From power to peer relations in the helping professions, P. Y. Martin and M. W. Osmond, *SP395*, pp. 56-73 (June 1974).

A preliminary investigation of the use of Prince—a man-computer simulation of international relations—in high school courses, S. J. Kidder, R. E. Horowicz, and G. M. Kiselewich, *SP395*, pp. 74-81 (June 1974).

Obstacle course, T. Foster, Jr., *SP395*, pp. 82-90 (June 1974).

Simulation: An analysis of student cognitive retention and student teacher effective perceptions, C. H. Postma and J. C. Thompson, Jr., *SP395*, pp. 91-102 (June 1974).

Simulating an urban school and community for use in teacher education, F. P. Diulus, *SP395*, pp. 103-112 (June 1974).

Design, development, and validation of anticipation games, M. I. Semmel and S. Thiagarajan, *SP395*, pp. 113-127 (June 1974).

Using simulation to implement TABA's cognitive theory, R. A. Schusler, *SP395*, pp. 128-134 (June 1974).

The effect of instructional gaming upon absenteeism: The first step, L. E. Allen and D. B. Main, *SP395*, pp. 135-158 (June 1974).

Simulation/gaming: An autotelic inquiry technique, R. Stadsklev, *SP395*, pp. 159-164 (June 1974).

DESIGN TASK GROUP

Facilitator's Statements:

Developing computer-based simulations, facilitator's statement, R. I. Miller, *SP395*, pp. 165-166 (June 1974).

Designing computer-based simulations, facilitator's statement, M. H. Whithed, *SP395*, pp. 167-168 (June 1974).

Frame games: Design and redesign, R. H. Armstrong and M. Hobson, *SP395*, pp. 169-172 (June 1974).

Frame games: Design and redesign, E. S. Mulley, *SP395*, pp. 173-174 (June 1974).

Decision: Futures modeling, D. L. Little, *SP395*, pp. 175-177 (June 1974).

Designing interactive social simulations, facilitator's statement, G. Wilcoxson, *SP395*, p. 177 (June 1974).

Sub-group: Selecting and developing media in simulation design, C. H. Adair, *SP395*, pp. 178-179 (June 1974).

Student designed games, facilitator's statement, H. Tamminga, *SP395*, p. 180 (June 1974).

Computer-based gaming models, P. D. Patterson, *SP395*, p. 181 (June 1974).

Unstructured and game-generating games, facilitator's statement, K. F. Dette, *SP395*, pp. 183-184 (June 1974).

Formal Papers:

A process for designing, developing, and evaluating social simulation, C. H. Adair, *SP395*, pp. 185-196 (June 1974).

A model for selecting optimum media as part of the simulation design process, C. H. Adair, *SP395*, pp. 197-203 (June 1974).

Where all else fails – an approach to defining the possible uses of gaming-simulation in the decision-making process, R. H. R. Armstrong and M. Hobson, *SP395*, pp. 203-217 (June 1974).

Simulated universities, H. A. Becker, *SP395*, pp. 218-238 (June 1974).

The data behind simulation models, H. A. Becker, *SP395*, pp. 239-249 (June 1974).

Simulating alternative futures for American education, J. Debenham, *SP395*, pp. 250-274 (June 1974).

A guide for simulation design, C. H. Adair and J. T. Foster, Jr., *SP395*, p. 275 (June 1974).

APPLICATIONS TASK GROUP

Facilitator's Statements:

Applications: Research, facilitator's statement, R. L. Dukes, *SP395*, p. 303 (June 1974).

Medicine and social welfare, facilitator's statement, J. T. Foster, Jr., *SP395*, pp. 304-305 (June 1974).

Teaching-training: Urban planning, D. E. LaHart, *SP395*, p. 306 (June 1974).

Teaching-training: Elementary-secondary education, H. E. Arnold, *SP395*, p. 307 (June 1974).

Community and public policy applications of gaming simulation, J. R. Hanson, *SP395*, p. 308 (June 1974).

Community and public policy applications, G. M. McFarland, *SP395*, p. 308 (June 1974).

Issues in game use: What values are conveyed by game designers and users, G. M. McFarland, *SP395*, pp. 309-311 (June 1974).

Formal papers:

Simulations and games as growth group experiences, J. F. Karshmer, *SP395*, pp. 312-315 (June 1974).

The disorganized health clinic as a simulation, J. T. Foster, Jr., *SP395*, pp. 316-323 (June 1974).

Simulation and gaming as aids in regional and intercommunity problem solving, H. Sievering and J. Sinopoli, *SP395*, pp. 324-334 (June 1974).

Paying the piper or pay us again, Sam, S. Cipinko, *SP395*, pp. 335-340 (June 1974).

Public policy applications, G. McFarland, *SP395*, pp. 341-342 (June 1974).

Massive management gaming, R. F. Barton, *SP395*, pp. 343-351 (June 1974).

Simulating sexism: Unintentional (?) replication of reality, N. D. Glandon, *SP395*, pp. 352-357 (June 1974).

Advocacy – a community planning game for the ranking of school system goals and training needs, J. R. Hanson, *SP395*, pp. 358-364 (June 1974).

Learning tools to research instruments: A research package for starpower, R. L. Dukes, *SP395*, pp. 365-373 (June 1974).

A pedagogical schema for the development and use of computer simulation technology, D. B. Main, R. Stout, D. W. Rajecki, H. Eichenbaum, and T. Villars, *SP395*, pp. 374-381 (June 1974).

Education and training for contemporary urban planning systems: The impact of interactive simulation, R. M. Sarly, *SP395*, pp. 382-396 (June 1974).

The publication and distribution of simulation games, I. B. Naiburg, Jr., *SP395*, pp. 397 (June 1974).

TASK GROUP SUMMARIES

Design sub-group summary: Computer-based gaming simulations, P. D. Patterson, *SP395*, pp. 398-399 (June 1974).

Urban planning sub-group: Summary paper, D. E. LaHart, *SP395*, pp. 405-406 (June 1974).

Teaching and training sub-group: Business summary state of the art, M. Uretsky and R. F. Barton, *SP395*, pp. 407-408 (June 1974).

Research applications of simulation games: Summary paper, R. L. Dukes, *SP395*, pp. 409-412 (June 1974).

SP396-1. **Critical surveys of data sources: Mechanical properties of metals,** R. B. Gavert, R. L. Moore, and J. H. Westbrook, Nat. Bur. Stand. (U.S.), Spec. Publ. 396-1, 90 pages (Sept. 1974) SD Catalog No. C13.10:396-1.

Key words: commercial alloys; data sources; mechanical properties; metals.

This study was undertaken with the objective of providing a detailed critical survey of the existent sources of mechanical property data for commercially available metals and alloys. This survey was intended to assess the scope, assets and deficiencies of about forty of the most prominent sources of such information. There were included: handbooks and technical compilations, information centers, foreign information sources, technical societies, and trade associations. The initial listing of sources to be examined was prepared by the authors with the advice and the assistance of a subcommittee of the Metals Properties Council. The aim was to restrict the survey to sources which actually had compilations of mechanical property data in some form. Thus sources which offered only generalized guides to the literature, monographs, textbooks, or periodicals publishing original research or engineering articles were not to be included. Those sources from the original listing which were found upon detailed examination to fall into the latter categories are therefore treated in a separate appendix.

SP396-2. **Critical surveys of data sources: Ceramics,** D. M. Johnson and J. F. Lynch, Nat. Bur. Stand. (U.S.), Spec. Publ. 396-2, 52 pages (Dec. 1975) SD Catalog No. C13.10:396-2.

Key words: carbon (graphite); ceramics; composites; data sources; glasses; properties.

A directory was compiled for selected sources of property data of ceramics, glasses, carbon/graphite and composite materials containing a ceramic component. Included is an assessment of the scope, assets and deficiencies of the most prominent sources. These include handbooks, technical compilations, information/data centers, technical societies, and trade associations or institutes. The directory is indexed by materials and properties.

SP396-3. **Critical survey of data sources: Corrosion of metals,** R. B. Diegle and W. K. Boyd, *Nat. Bur. Stand. (U.S.), Spec. Publ. 396-3,* 38 pages (Jan. 1976) SD Catalog No. C13.10:396-3.

Key words: commercial alloys; corrosion; data sources; metals.

This survey was undertaken to provide a directory of authoritative sources of information on corrosion of metals. It assesses the scope, assets, and deficiencies of about thirty-eight of the most important sources. These include handbooks and technical compilations, information centers, technical societies, and trade associations and institutes. The initial listing of sources to be included was drafted by the authors and submitted to members of the Publications Committee of the National Association of Corrosion Engineers. This Committee thus served as an ad hoc review group for the sources which appear herein. The Directory is indexed by materials and types of corrosion.

SP396-4. **Critical surveys of data sources: Electrical and magnetic properties of metals,** M. J. Carr, R. B. Gavert, R. L. Moore, H. W. Wawrousek, and J. H. Westbrook, *Nat. Bur. Stand. (U.S.), Spec. Publ. 396-4,* 92 pages (July 1976) SD Catalog No. C13.10:396-4.

Key words: commercial alloys; data sources; electrical properties; magnetic properties; metals.

This survey is intended to provide a directory of authoritative sources of numerical data on the electrical and magnetic properties of metals, with emphasis on commercial alloys. Fifty-nine sources, including handbooks and other publications, information centers, trade associations, and technical societies are described in detail, including information on the properties and materials covered and the criteria used in the selection of data. A few additional related publications are listed with brief descriptions.

SP-397, Superseded by Special Publication 418.

SP398. **Fundamental physical constants,** B. N. Taylor, Nat. Bur. Stand. (U.S.), Spec. Publ. 398, card (Aug. 1974) SD Catalog No. C13.10:398.

Key words: fundamental constants.

This card gives values of the fundamental constants resulting from the "1973 Least-Squares Adjustment of the Fundamental Physical Constants" carried out by E. R. Cohen and B. N. Taylor under the auspices of the CODATA Task Group on Fundamental Constants and adopted for international use by CODATA. These constants have been previously given in J. Phys. Chem. Ref. Data 2, 663 (1973) and CODATA Bulletin No. 11 (Dec. 1973). Supersedes NBS SP344.

SP399. Volume 1. **NBS FORTRAN test programs. Volume 1—documentation for versions 1 and 3,** F. E. Holberton and E. G. Parker, Nat. Bur. Stand. (U.S.), Spec. Publ. 399, 171 pages (Oct. 1974) SD Catalog No. C13.10:399/V.1.

Key words: computer programming language; FORTRAN; FORTRAN validation; language validation; standard FORTRAN; test program design.

The NBS FORTRAN test programs, written in Standard FORTRAN, are designed to test whether a FORTRAN compiler accepts the forms and interpretations of the FORTRAN language as described in the American National Standard FORTRAN document X3.9-1966. The test programs, comprised of 116 test units, are structured into two versions, each containing approximately 14,500 punch card images. The test units may be used as separate executable FORTRAN programs, or may be linked end to end with other test units, with a minimum of user effort, to improve operating efficiency. Version 1 is structured into 116 executable FORTRAN programs, and Version 3, containing the same 116 test units, is structured into 14 executable FORTRAN programs for use on large FORTRAN processors.

The test program design criteria was to: Constrain all test programs to the FORTRAN Standard X3.9-1966; Reduce the effect of those areas in which the FORTRAN Standard does not prescribe a method or sulution, e.g., range, precision, size of computer, etc.; Simplify the use of the FORTRAN test programs; Test FORTRAN language elements before they are used in support of other tests; Maintain an open ended system so that tests may be changed or added.

The test programs require the use of a card reader, printer and one intermediate tape unit.

SP399. Volume 2. **NBS FORTRAN test programs. Volume 2—listings for version 1,** F. E. Holberton and E. G. Parker, Nat. Bur. Stand. (U.S.), Spec. Publ. 399, 221 pages (Oct. 1974) SD Catalog No. C13.10:399/V.2.

Key words: computer programming language; FORTRAN; FORTRAN validation; language validation; standard FORTRAN; test program design.

THE NBS FORTRAN test programs, written in Standard FORTRAN, are designed to test whether a FORTRAN compiler accepts the forms and interpretations of the FORTRAN language as described in the American National Standard FORTRAN document X3.9-1966. The test programs, comprised of 116 test units, are structured into two versions, each containing approximately 14,500 punch card images. The test units may be used as separate executable FORTRAN programs, or may be linked end to end with other test units, with a minimum of user effort, to improve operating efficiency. taining the same 116 test units, is structured into 14 executable FORTRAN programs for use on large FORTRAN processors.

The test program design criteria was to: Constrain all test programs to the FORTRAN Standard X3.9-1966; Reduce the effect of those areas in which the FORTRAN Standard does not prescribe a method or solution, e.g., range, precision, size of computer, etc.; Simplify the use of the FORTRAN test programs; Test FORTRAN language elements before they are used in support of other tests; Maintain an open ended system so that tests may be changed or added.

The test programs require the use of a card reader, printer and one intermediate tape unit.

SP400-1. **Semiconductor measurement technology. Quarterly report, July 1 to September 30, 1973,** W. M. Bullis, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 400-1, 68 pages (Mar. 1974) SD Catalog No. C13.10:400-1.

Key words: contact resistance; die attachment; dopant profiles; electrical properties; electronics; gold-doped silicon; hermeticity; metallization; methods of measurement; microelectronics; microwave diodes; mobility; MOS devices; oxide films; photomasks; photoresist; resistivity; resistivity standards; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; sheet resistance; silicon; S-parameters; spreading resistance; test patterns; thermal resistance; thermally stimulated capacitance; thermally stimulated current; wire bonds.

This quarterly progress report, twenty-first of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal accomplishments during this reporting period include (1) extension of the technique for measuring thermally stimulated current and capacitance to include measurements on MOS capacitors, (2) completion of the development of the thermal response method for evaluation of transistor die attachment, (3) analysis of the interlaboratory comparison of transistor scattering parameter measurements, (4) preliminary review of measurement problems in the photolithographic aspects of semiconductor device processing, of problems associated with certain hermeticity testing procedures, and of methods for evaluating metallization step coverage, and (5) initiation of new activity on characterization of oxide films in MOS structures and analysis of diffusion profiles. Results are also reported on spreading resistance, capacitance-voltage, and sheet resistance measurements; the activation energy of the gold acceptor in silicon; evaluation of the base-to-metal contact resistor test structure; metallurgical systems for ultrasonic bonding; burn-out characteristics of fine gold and aluminum bonding wire; transistor thermal resistance measurements; and microwave diode conversion loss measurements. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices.

SP400-2. **Semiconductor measurement technology: Microelectronic ultrasonic bonding,** G. G. Harman, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 400-2, 109 pages (Jan. 1974) SD Catalog No. C13.10:400-2.

Key words: bonding; degradation (wire bond); discrete devices; electrical interconnection; fabrication (wire bond); failure (wire bond); hybrid circuits; integrated circuits; microelectronics; reliability; semiconductor devices; testing (wire bond); ultrasonic bonding; wire bond.

This report primarily comprises excerpts of the work done under the NBS ultrasonic wire bonding program that was previously published in 17 quarterly and other reports. The material is organized into subject groupings with the intention of presenting in convenient form sufficient information for making high quality ultrasonic wire bonds as well as imparting a basic understanding of the ultrasonic systems used. The work emphasizes problems and methods of solving them. To accomplish this, the required measurement equipment is first introduced. This is followed by procedures and techniques used in setting up a bonding machine, and then various machine- or operator-induced reliability problems are discussed. The characterization of the ultrasonic system and its problems are followed by in-process bonding studies and work on the ultrasonic bonding (welding) mechanism. The report concludes with a discussion of various effects of bond geometry and wire matallurgical characteristics. Where appropriate, the latest, most accurate value of a particular measurement has been substituted for an earlier reported one. Thus all of the included material is up to date.

SP400-3. **Semiconductor measurement technology: ARPA/NBS workshop I. Measurement problems in integrated circuit processing and assembly,** H. A. Schafft, Nat. Bur. Stand. (U.S.), Spec. Publ. 400-3, 24 pages (Feb. 1974) SD Catalog No. C13.10:400-3.

Key words: die bonding; hermeticity; integrated circuits; measurement methods; microelectronics; oxides; photolithography; process control; reliability; semiconductor devices; silicon; wire bonding.

The dual purpose of the workshop was (1) to announce and describe the new effort, "Advancement of Reliability, Processing, and Automation for Integrated Circuits with the National Bureau of Standards," sponsored by the Defense Advanced Research Projects Agency (ARPA), and (2) to obtain additional input on critical measurement problems in integrated circuit processing and assembly to assist in planning future work in the effort. More than 130 engineers representing 61 organizations from the electronics industry and government participated in the workshop. The measurement problems in silicon, oxides, photolithography, and assembly and the problems in information dissemination that were identified by the participants are summarized. Included as appendices are summaries of two talks given: one which described the results of earlier direct contacts with a cross section of industrial representatives on major measurement problems in integrated circuit processing and assembly and the other which described the initial plans for work in the new effort.

SP400-4. **Semiconductor measurement technology. Combined quarterly report, October 1, 1973 to March 31, 1974,** W. Bullis, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 400-4, 101 pages (Nov. 1974) SD Catalog No. C13.10:400-4.

Key words: boron redistribution; collector resistor; doping profiles; effective masses; electrical properties; electron beam induced current mode electronics; epitaxial layer thickness; flying spot scanner; gold-doped silicon; hermeticity; ion microprobe mass analysis; methods of measurement; microelectronics; microwave diodes; mobility; MOS devices; oxide films; photomasks; photoresist; platinum wire resistivity; resistivity standards; ribbon wire scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; sheet resistance; silicon; spreading resistance; test patterns; thermal response; thermally stimulated capacitance; thermally stimulated current; thick film copper; voltage contrast mode; wire bonds; x-ray photoelectron spectroscopy.

This combined quarterly progress report describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal accomplishments during this reporting period include

(1) identification of major problem areas in connection with measuring and inspecting photomasks, (2) development of a mathematical model suitable for interpreting thermally stimulated current and capacitance measurements on junction diodes and metal-oxide-semiconductor (MOS) capacitors, (3) completion of a preliminary evaluation of a method, based on the transient capacitance-voltage characteristic of an MOS capacitor, for measuring thickness of epitaxial layers up to 2 μm, and (4) development of criteria for use in nondestructive wire bond pull tests. Results are also reported on spreading resistance, capacitance-voltage, and carrier mobility measurements; polynomial fits for energy band gap and hole and electron effective masses in silicon; methods for characterizing oxide films; evaluation of sheet resistance and collector resistor test structures; evaluation of a photoresist spinner test; scanning electron microscopy; bonding of aluminum ribbon wire to thick film copper; bonding of platinum wire to thin film aluminum; leak rate calculations in the transition flow regime; transistor thermal response measurements; and radiation response of microwave mixer diodes. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices.

SP400-5. **Semiconductor measurement technology: Measurement of transistor scattering parameters,** G. J. Rogers, D. E. Sawyer, and R. L. Jesch, Nat. Bur. Stand. (U.S.), Spec. Publ. 400-5, 53 pages (Jan. 1975) SD Catalog No. C13.10:400-5.

Key words: electronics; high-frequency probes; interlaboratory comparison; scattering parameters; S parameters; transistors.

Results of an interlaboratory comparison of transistor scattering-parameter measurements are reported for transistor types 2N709, 2N918 and 2N3960. From these results it is estimated that, for such devices, between-laboratory variability of transistor S-parameter measurements in the frequency range between 200 and 2000 MHz could be held to a maximum relative sample standard deviation of 7.5 percent in the measurement of magnitude and a maximum sample standard deviation of 8 degrees in the measurement of phase of s_{11} and 3.5 degrees in the measurement of phase of other S parameters. This could be done if all participants were required to use the same calibration procedure and to limit their test signal to a level that would assure small-signal operation. In a separate study, the equivalent circuit of high-frequency probes used in characterizing the parameters of integrated circuits was evaluated by measuring S parameters at the input connectors with the probe tips in contact with known loads. These measurements revealed a resonance which would limit the usefulness of the probes for measurements in the vicinity of 1.2 GHz. Work is underway to determine design changes needed to eliminate this resonance.

SP400-6. **Semiconductor measurement technology: Microelectronic test patterns: An overview,** M. G. Buehler, Nat. Bur. Stand. (U.S.), Spec. Publ. 400-6, 24 pages (Aug. 1974) SD Catalog No. C13.10:400-6.

Key words: integrated circuits; microelectronic test patterns.

The test patterns considered are those designed by the physical electronics engineer to evaluate fabrication processes rather than those designed by the microcircuit designer. The evaluation of fabrication processes can reveal if a process is under control and can indicate the stability and reliability of the resulting microcircuit. This evaluation is in essence an evaluation of a microcircuit's material characteristics, for process control and reliability depend ultimately on the right atoms being in the right places.

Various material analysis test structures are described, such as resistors, MOS capacitors, and gated *p-n* junctions along with the material parameters that can be derived from each. These test structures are illustrated by the NBS-2 test pattern, and its use in process control is described. Examples are given which span the range from those structures which are amenable to production testing to those which require an advanced measurement capability. In addition test structures are discussed with regard to their usability; this encompasses their size, sensitivity, correlation, contacting schemes, testability, and packaging. Test structures must be properly designed so that desired parameters are measured. In this regard various design aspects such as metal taps and diffused taps are mentioned. Finally the role of NBS in evaluating and designing test patterns is discussed.

SP400-7. **Semiconductor measurement technology: Permanent damage effects of nuclear radiation on the x-band performance of silicon Schottky-barrier microwave mixer diodes,** J. M. Kenney, *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-7,* 30 pages (Apr. 1976) SD Catalog No. C13.10:400-7.

Key words: diodes; gamma rays; hardness assurance; microwave mixer diodes; mixers; neutrons; radiation hardness; receivers; Schottky-barrier diodes; semiconductors; solid-state devices; x-band measurements.

The permanent damage induced by nuclear radiation in silicon Schottky-barrier x-band microwave mixer diodes was assessed by subjecting separate groups of diodes to ^{60}Co gamma rays and fast neutrons (E>10 keV) of progressively higher levels, reaching a total gamma dose of 1.7×10^{8} rads (Si) and a cumulative neutron fluence of 5.5×10^{15} cm^{-2}. Measurements were made at a local oscillator frequency of 9375 MHz to determine changes in conversion insertion loss, local oscillator return loss and SWR, i-f output conductance, self-bias, and forward current at one dc bias voltage.

No changes due to the gamma irradiation were observed. At a neutron fluence of 1.0×10^{15} cm^{-2}, changes in conversion insertion loss and forward current were just discernible. At 5.5×10^{15} cm^{-2}, the conversion insertion loss of most diodes was degraded by up to 0.7 dB, although some diodes were unchanged and the average change was only 0.2 dB. The return loss, SWR, and self-bias voltage of most diodes were distinctly altered at this level, and the forward current of all diodes was decreased. The i-f output conductance was not significantly altered.

A group of unirradiated diodes, intermixed with the gamma and neutron groups during measurements, served as a control. Since diode stability was recognized as an important factor, the three groups were matched on the basis of pre-irradiation conversion insertion loss stability. The three-sigma repeatability of the conversion insertion loss measurement was estimated from the control group measurements to be about 0.05 dB, with a systematic drift over the course of these measurements of about the same amount.

SP400-8. **Semiconductor measurement technology. Quarterly report, April 1 to June 30, 1974,** W. M. Bullis, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 400-8, 70 pages (Feb. 1975) SD Catalog No. C13.10:400-8.

Key words: Boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; heterogeneity; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; photomasks; photoresist; resistivity; scanning electron microscopy; semiconductor devices; semiconductor materials; semiconductor process control; silicon; spreading resistance; tes

patterns; thermal resistance; thermal response; thermally stimulated capacitance; thermally stimulated current; ultrasonic bonding; voltage contrast mode; wire bonds.

This quarterly progress report describes NBS activities rected toward the development of methods of measurement for miconductor materials, process control, and devices. The nphasis is on silicon device technologies. Principal accomplishents during this reporting period include (1) identification of rface preparation procedures which improve the quality of preading resistance measurements, (2) preparation of a deotaped tutorial discussion of thermally stimulated current id capacitance measurements, (3) completion of an analysis of e apparent position of an opaque edge when viewed with inoherent and coherent illumination, and (4) completion of the onstruction of a flying-spot scanner. Results are also reported n capacitance-voltage and two-probe resistivity measurements; nalyses of thermally stimulated current and capacitance meaurements on metal-oxide-semiconductor (MOS) capacitors; a view of methods for characterizing interface states associated ith thin oxide films on silicon; fabrication of a test pattern ased on the charge-coupled device; a preliminary comparison f filar and image shearing eyepieces for line-width measurent; a review of technologies in use for photomask inspection id measurements; procedures for determination of correct phoesist exposure; epitaxial layer thickness; scanning electron icroscopy; mathematical modeling of ultrasonic bonding; leak st procedures; thermal resistance measurements on transistors id Darlington pairs, and transistor thermal response measurents. Supplementary data concerning staff, publications, orkshops and symposia, standards committee activities, and chnical services are also included as appendices.

iP400-9. **Semiconductor measurement technology: ARPA/NBS Workshop II. Hermeticity testing for integrated circuits,** H. A. Schafft, Nat. Bur. Stand. (U.S.), Spec. Publ. 400-9, 43 pages (Dec. 1974) SD Catalog No. C13.10:400-9.

Key words: bubble test; gas analysis; helium leak test; hermeticity; integrated circuits; measurement methods; microelectronics; radioisotope test; seals; semiconductor devices; weight test.

Synopses are presented of the six invited talks and two discusion periods of a meeting in which 65 engineers and scientists, epresenting 36 organizations from private industry and governent, participated. Topics ranged from failure analysis and the ature of leaks to evaluations and intercomparisons of bubble, eight, helium, and radioisotope tests. Underlying many of the roblems discussed is the lack of a technical basis for specifications on maximum allowable leak rates and contaminant levels; o data is available to relate leak rate to component life. Of conern is the proliferation of test conditions which has complicated esting and test intercomparison efforts, and has resulted, unittingly, in testing devices to significantly different actual leak ate criteria. Water vapor, sealed-in and that which penetrates ne package, is a contaminant of major concern, and the difficules of making sufficiently accurate measurements of water vapor ere detailed. The control required in the materials and assembly process to avoid hermeticity failure and false leak indications in ceramic, dual in-line packages were discussed. Finally, ne importance of performing some hermeticity tests at elevated emperatures was cited.

iP400-10. **Semiconductor Measurement Technology: Spreading Resistance Symposium.** Proceedings of a Symposium held at the National Bureau of Standards, Gaithersburg, Md., June 13-14, 1974, J. R. Ehrstein, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 400-10, 293 pages (Dec. 1974) SD Catalog No. C13.10:400-10.

Key words: dopant concentration; dopant profiles; metal-semiconductor contacts; resistivity; semiconductor surface preparation; silicon; spreading resistance.

This Proceedings contains the information presented at the Spreading Resistance Symposium held at the National Bureau of Standards on June 13-14, 1974.

This Symposium covered the state of the art of the theory, practice and applications of the electrical spreading resistance measurement technique as applied to characterization of dopant density in semiconductor starting materials and semiconductor device structures. In addition to the presented papers, the transcripts of the discussion sessions which were held directly after the Theory, Practice and Applications sessions are also included. These transcripts, which were reviewed by the respective respondents for clarity, are essentially as presented at the Symposium. *These proceedings include the following papers (indented):*

The physics of spreading resistance measurements, S. J. Fonash, *SP400-10,* pp. 17-26 (June 1974).

Key words: correction factor; crystallographic orientations; effective contact radius; interfaces; metal-semiconductor contacts; multilayered structure; piezoresistivity; resistivity; spreading resistance; stress; zero bias resistance.

The spreading resistance method is uniquely suitable for the determination of electrical resistivities in a number of situations. However the technique does not simply measure the resistivity beneath the contacts. Considering the two probe configuration, what is actually measured is the ratio $\Delta V/I$. Here ΔV is the difference between the Fermi levels of the probes necessary to maintain the sampling current I. This difference in the Fermi levels of the probes depends on the zero bias resistance of the probe–semiconductor contacts, the effective resistivity of the layers in a multilayer structure, and the configuration of the structure. The zero bias resistance depends on temperature and details of the metal-semiconductor contact including surface history. Effective resistivities enter into the measurement–and not the actual resistivities–because of the fact that the use of pressure probes creates a stress field under the contacts. This field falls off with a characteristic length of the order of the contact radius. Thus piezoresistivity effects–well known for Si–can be operative under the contacts. As a consequence of these various effects the interpretation of what $\Delta V/I$ is actually measuring is not straightforward. Practical application of the spreading resistance technique necessitates making certain simplifying assumptions. In light of the various phenomena involved in a spreading resistance measurement it is imperative that the implications of these assumptions to the accuracy of the measurement be understood.

Formal comparison of correction formulae for spreading resistance measurements on layered structures, P. J. Severin, *SP400-10,* pp. 27-44 (June 1974).

Key words: contact resistance; correction formulae; sheet resistance; silicon; spreading resistance.

The spreading resistance of a metal contact on a semiconductor sample is analysed for infinite geometry, with three different boundary conditions: a specified potential of the contact, a uniform contact current density and a current density dependent on contact resistance. The cases of a thin layer on a perfectly conducting substrate and on a non-conducting substrate are analysed each for the boundary conditions of uniform current density and of the current density distribution valid for the infinite geometry. With a perfectly conducting substrate the two boundary conditions yield

about 10 percent difference. With a non-conducting substrate calculations based on both current density distributions produce in the thin layer approximation the same ln r dependence required. The constant terms in both approaches are different by 5 percent and the constant current density result in addition agrees with the result obtained with a totally different transmission-line approach. The actual three-point-probe measurement situation is discussed. The danger of correcting the precise spreading resistance measurement results with an error of 1 percent, with formulae derived on the basis of a formal model which is sensitive to the choice of the boundary conditions by up to 10 percent, is stressed. The effects of undefined thickness, bevel edge and transition layer curving upwards are mentioned as further complications.

Two-point probe correction factors, D. H. Dickey, *SP400-10*, pp. 45-50 (June 1974).

Key words: boundary correction; calculations; electrostatic analogue; resistivity; semiconductor; spreading resistance.

The effects of sample boundaries on resistivity measurements made with a two-point spreading resistance probe are calculated for various boundary conditions. The results are presented in the form of dimensionless correction factors. The problem of depth-dependent resistivity in a thin layer is considered, and a method for correcting measurements on such layers is described.

On the validity of correction factors applied to spreading resistance measurements on bevelled structures, P. M. Pinchon, *SP400-10*, pp. 51-61 (June 1974).

Key words: accuracy; bevelled structures; correction application; correction factors; edge effect; profiles; resistivity profiling; small spacing; spreading resistance.

The correction factors in spreading resistance measurements are generally determined by using a plan-parallel model of a single or multi-layer structure. This paper will discuss the applicability of these factors to the profiling measurements on a bevel, and call attention to possible systematic errors which can appear in the case of an insulated layer or a low/high type of structure.

After a short discussion on the spacial resolution of the spreading resistance probe, the case of a homogeneous isolated layer is examined in more detail. A simplified expression for the value of spreading resistance was calibrated against published data using fitting coefficients.

It is then easy to show that the use of a correction derived for parallel structures is not correct for the case of a thin, isolated layer, when the measurement is made on a bevel.

Indications are also given on the parameters which could minimise the problem.

The experimental part of this paper shows a series of profiles made with P-type epitaxial layers.

After the application of the usual corrections, the various electrical boundaries or geometrical conditions are seen to affect the results in accordance with the discussion. An edge effect which is significant even at great distance from the edge, is also described.

In the absence of a three dimensional theory for correction, the use of small spacing is recommended in conjunction with a small radius of contact and a shallow bevelling angle.

SRPROF, a fast and simple program for analyzing spreading resistance profile data, B. L. Morris and P. H. Langer, *SP400-10*, pp. 63-74 (June 1974).

Key words: resistivity profiles; spreading resistance; thin film correction factors.

The spreading resistance technique is an excellent method of measuring epitaxial resistivity profiles. In many cases it is the only method by which the complete profile may be measured. However, thin film correction factors must be used to convert the spreading resistance into a corrected resistivity. Previous calculations of these correction factors have emphasized a mathematically complex solution which necessitates the use of a large computer. The correction factors used here are calculated from a relatively simple algorithm which allows the use of a minicomputer. A documented program is presented which uses these algorithms. This program, written in FOCAL for use on the PDP8 series of minicomputers, is fast, accurate, easy to use, and provides a complete data reduction system. Examples of corrected spreading resistance profiles are presented, and compared with independent results such as diode C-V and four point probe measurements.

Multilayer analysis of spreading resistance measurements, G. A. Lee, *SP400-10*, pp. 75-94 (June 1974).

Key words: computer modeling; correction factors; dopant profiles; multilayer spreading resistance model; resistivity; semiconductor dopant concentration; spreading resistance.

Spreading resistance measurements provide a highly flexible technique for the determination of dopant profiles in semiconductors. However, because each measurement samples a greater depth into the sample than the depth difference between successive measurements, the direct conversion of resistivity readings to dopant concentration values will not yield a correct profile.

The technique discussed in this report analyzes direct spreading resistance readings to deduce a "true" dopant profile. The model used is that of circular contacts to a laterally infinite medium which is partitioned vertically into layers of homogeneous resistivity, each layer corresponding to one spreading resistance measurement point. The analysis is performed by a computer program. Some detail in the development of the program is discussed.

The results of this analysis technique compare favorably to profile results of other profiling techniques such as capacitance voltage and incremental sheet resistance on profile types to which they can be applied. The program execution time is usually fast enough that the computer charge is less than the direct charge billed for making the spreading resistance measurements.

An automated spreading resistance test facility, J. C. White, Jr., *SP400-10*, pp. 95-98 (June 1974).

Key words: automated testing; epitaxial silicon; impurity concentration; resistivity; semiconductor materials; silicon; spreading resistance.

An automated spreading resistance test facility has been designed and constructed at the Allentown Works of the Western Electric Co. This system has been shown to provide a rapid, semi-nondestructive, and reproducible measurement of epitaxial layer resistivity which can be used in a production environment. The system has the advantages of operator independence, well protected probes, and four-inch capability. Surface or in-depth measurements can be performed with on-line calculations of resistivity and impurity concentration. Cycle time is less than five seconds per measurement and system reproducibility is ± 1.3 percent (IS).

Angle-bevelling silicon epitaxial layers, technique and evaluation, P. J. Severin, *SP400-10*, pp. 99-108 (June 1974).

Key words: bevel; interferometer; jig; microcontacts; silicon; spreading resistance; steel probe; topography.

The properties of a steel probe for a spreading-resistance system are discussed stressing the effect of micro- and macrocontacts. The need is explained for producing small-angle bevels and a lapping jig for making such bevels is described. With small-angle bevels the slice topography cannot be neglected and a simple instrument is described by which the surface topography of the whole slice can be recorded. By recording the slice topography before and after bevelling the local reduction of thickness by the bevelling process is determined. This method can be used for angles between 1/500 and 1/2000. It is indispensable for the proper interpretation of spreading resistance measurements on bevelled N on N^+ junctions.

Spreading resistance measurements on silicon with non-blocking aluminum-silicon contacts, J. Krausse, *SP400-10,* pp. 109-122 (June 1974).

Key words: absolute measurements; aluminum-silicon contact; four-point probe measurements; local resolution; *n*-type silicon; resistivity inhomogeneities; spreading resistance; striations.

The paper concerns the measurement of resistivity fluctuations in *n*-type silicon starting material in the resistivity range from 1 to 1000 Ω cm. The microscopic resistivity fluctuations that are associated with the well-known striations require a measurement technique of high accuracy and high local resolution. We chose the spreading resistance method. However, in contrast to the conventional method, in which the metal probe is pressed directly onto the silicon surface, we supply the silicon slice with non-blocking aluminum-silicon contacts. The radius of the contact area is exactly defined. Any contact radius can be realized according to the resolution desired in lateral direction and in depth. When the metal probe is applied to the aluminum-silicon contact, the contact is not destroyed. Thus it is possible to perform spreading resistance measurements and four-point probe measurements along one and the same measuring track and in this manner at the same time to vary the local resolution. A comparison of both measurement results will in particular yield information on the conditions of the resistivity in axial direction of the slice. Essential prerequisites for an absolute measurement are fulfilled with the aluminum-silicon contact. However, the investigations made up to now show that the resistivity calculated from the spreading resistance is smaller than the one obtained with the four-point probe measurement by approximately a factor of 0.8.

The preparation of bevelled surfaces for spreading resistance probing by diamond grinding and laser measurement of bevel angles, A. Mayer and S. Shwartzman, *SP400-10,* pp. 123-136 (June 1974).

Key words: bevelling; diamond grinding; laser bevel angle measurement; layer thickness determination; materials; resistivity measurement; silicon doping profiles; spreading resistance measurement; surface damage.

A rapid and reproducible method for preparing bevelled surfaces on silicon has been developed as a preliminary to spreading resistance probe measurement of doping profiles or junction depth determination by staining. Several chips can be bevelled simultaneously. The sample is mounted on a carrier which is clamped on the tilting table of a microtome. The tilt is adjusted until a laser beam reflected from the surface to a calibrated wall chart is deflected to the desired angle. The bevel is then ground with a high-speed diamond wheel mounted on the microtome, taking cuts of several micrometers at a time. The bevel edge is clearly defined even for very shallow angles. The angle is accurately measured with the same laser.

Because the ground surface is highly reflective, in contrast to a lapped surface, a good reading of very small angles of less than 30 minutes can be obtained. Up to a 6 meter base line is used with a lmw He-Ne laser and the reflection is visible in normal room light.

Factors entering into spreading resistance are discussed, such as mechanical damage incurred in bevelling, probe impact damage, and surface cleanliness. Judged by spreading resistance, the amount of damage incurred during grinding is small and reproducible, provided care is taken to maintain the spindle so that it runs without vibrating.

Spreading resistance correction factors for (111) and (100) surfaces, H. Murrmann and F. Sedlak, *SP400-10,* pp. 137-144 (June 1974).

Key words: contact radius; correction factors; silicon; spreading resistance; surface orientation.

The effective contact radius for spreading resistance measurements on Si has been evaluated by comparison of S.R. for epitaxial layers limited by a *pn*-junction or by a well conducting buried layer for different crystal orientation. The contact radius on (100) surfaces showed to be greater by a factor of 1.26 than for a (111) plane. Furthermore measurements were made on samples for both (100) and (111) orientation in the resistivity range of 0.01 to 80Ω cm with *n* and *p*-type doping. Data for spreading resistance and resulting from the predetermined contact radius for the resistivity dependent correction factor are given.

On the calibration and performance of a spreading resistance probe, H. J. Ruiz and F. W. Voltmer, *SP400-10,* pp. 145-154 (June 1974).

Key words: automated resistivity measurements; calibration; germanium characterization; sample preparation; silicon characterization; spreading resistance; surface effects.

In this paper, techniques are presented for material standards selection for calibration purposes, materials and calibration block preparation, and techniques for data collection and processing for the spreading resistance probe. A description of the variation with time of the calibration of a spreading resistance probe is presented. Problems encountered with characterization of high resistivity *p*-type silicon are discussed, and examples of the probe performance in the characterization of germanium are also presented.

Comparison of the spreading resistance probe with other silicon characterization techniques, W. H. Schroen, G. A. Lee, and F. W. Voltmer, *SP400-10,* pp. 155-168 (June 1974).

Key words: automation; bevelling; comparison; four-point probe; incremental MOS capacitance-voltage; incremental sheet resistance; infrared spectrometer; ion microprobe; junction capacitance-voltage; lap and stain; mercury probe; scanning Michelson interferometer; Schottky capacitance-voltage; spreading resistance.

Range and precision of doping concentration data in silicon materials gained by the spreading resistance technique are compared to values obtained by other characterization methods. They include junction and MOS capacitance-voltage techniques, mercury probe, four-point probe, incremental sheet resistance technique, ion microprobe, and optical methods. The comparison considers precision and resolution of each technique, range of silicon resistivities and layer thicknesses, experimental effort, analytical interpretation, and time and cost of data acquisition and evaluation. Examples are presented which demonstrate the range of applicability of each technique and how they can supplement each other so that they cover the total doping range of silicon devices.

Preparation of a lightly loaded, close-spaced spreading resistance probe and its application to the measurement of doping profiles in silicon, J. L. Deines, E. F. Gorey, A. E. Michel, and M. R. Poponiak, *SP400-10,* pp. 169-178 (June 1974).

Key words: bevel angle measurement; correction factor; epitaxial layer; impurity concentration; ion-implanted layer; neutron activation; probe loading; probe spacing; spreading resistance.

A commercially available spreading resistance probe, the ASR-100, was modified to operate with lighter probe loading and smaller probe spacing. The advantages of device structure profiling, increased resolution, and reduction in the "correction factor" in the converted impurity concentration profile are realizable with smaller probe spacing. The effect of the probe modifications on sample profiles and profile quality is discussed for thin epitaxial layers, bipolar transistor structures, and ion-implanted layers. Sample preparation, as influenced by the beveling technique, is also shown to have an effect on profile quality. A novel method for precise measurement of very small bevel angles is described.

A direct comparison of spreading resistance and MOS-CV measurements of radial resistivity inhomogeneities on PICTUREPHONE® wafers, J. R. Edwards and H. E. Nigh, *SP400-10,* pp. 179-184 (June 1974).

Key words: dark field coring; MOS-CV techniques; PICTUREPHONE®; radial resistivity inhomogeneities; silicon resistivity; spreading resistance techniques.

Small scale (~ 50 μm) radial impurity concentration inhomogeneities in silicon wafers have been measured using both the MOS-CV method and the spreading resistance technique. The MOS-CV measurements were made using photolithographically defined 50 μm square capacitors placed on 75 μm centers and the spreading resistance measurements were made using a model 100 ASR probe on the same wafers after removal of the MOS capacitors.

A direct comparison between these methods is presented for three specific types of ⟨111⟩ oriented silicon wafers with an impurity concentration range between 5 and 10×10^{14}/cm^3. In addition, a photograph showing the direct effect of radial resistivity variations on the dark field coring of a PICTUREPHONE® target is included.

Investigations on local oxygen distribution in silicon single crystals by means of spreading resistance technique, F. G. Vieweg-Gutberlet, *SP400-10,* pp. 185-190 (June 1974).

Key words: oxygen in silicon; silicon single crystals; spreading resistance measurements; swirls.

By means of spreading resistance measurements subsequent to heat-treatments at approx. 450 °C and 1100 °C alternatively the local distribution of oxygen in the donor state in silicon single crystals was examined. Oxygen striations have not been found which are in correspondence to a distribution coefficient of $k_o = 1.25 \pm 0.17$ for oxygen in silicon. The radial distribution of oxygen in the donor state is more or less uniform except for an edge area of about 1.5 mm where the oxygen content seems to be considerably lower. A very strong relationship between electrically activated oxygen (donor state) and swirls was found: in regions containing swirls a smaller amount of oxygen was activated to the donor state. This result fits De Kock's model describing swirls as consisting of vacancy-OXYGEN-clusters.

Use of the spreading resistance probe for the characterization of microsegregation in silicon crystals, F. W. Voltmer and H. J. Ruiz, *SP400-10,* pp. 191-199 (June 1974).

Key words: crystal growth; Czochralski; Fourier transform; microsegregation; resistivity characterization; silicon; spreading resistance.

A technique for using the spreading resistance probe to quantitatively characterize microsegregation in single crystal silicon is presented. For the first time, the use of Fourier transformations of the resistivity is developed to provide accurate quantitative information as to the periodicity and amplitude of the various components giving rise to the resistivity variations. It is demonstrated that the probe is reproducible and is capable of measuring fluctuations in resistivity to ± 1 percent, which is well below the normally observed microsegregation. Examples of the use of the technique are given by characterizing microsegregation in two Czochralski grown crystals and one modified float zone crystal. The periodicity of the principle resistivity fluctuation of the Czochralski grown crystals is evaluated by Fourier transform analysis and agrees well with the anticipated fluctuations in impurity incorporation based on growth parameters.

Effects of oxygen and gold on silicon power devices, J. Assour, *SP400-10,* pp. 201-208 (June 1974).

Key words: gold in silicon; oxygen in silicon.

Several important features that make the two-probes spreading resistance technique a unique process control tool for designing and manufacturing silicon power devices are elucidated in terms of the effects of electrically active oxygen and gold centers on the characteristics of transistors, thyristors, and rectifiers. The effectiveness of the spreading resistance technique is compared to other commonly practiced techniques for the investigation of diffusion mechanisms of oxygen in homotaxial NPN transistors and of gold in fast switching rectifiers and thyristors.

The evaluation of thin silicon layers by spreading resistance measurements, G. A. Gruber, *SP400-10,* pp. 209-216 (June 1974).

Key words: diffusion; epitaxy; ion implantation; microwave devices; profiling; spreading resistance; thin silicon layers.

The spreading resistance measurement technique is the only one capable of providing precise thickness measurements and detailed concentration profiles on any type of active device layer or structure formed in silicon on a routine basis. The methods employed in the evaluation of thin layer structures of the type used for microwave devices is discussed and the application of these methods to thin NN^+, P^+NN^+ and P^+N silicon structures formed by combinations of diffusion, epitaxy and ion implantation is illustrated.

Evaluation of the effective epilayer thickness by spreading resistance measurement, H. Murrmann and F. Sedlak, *SP400-10,* pp. 217-221 (June 1974).

Key words: epilayer thickness; silicon; spreading resistance; test pattern.

Two types of double layer structure which are dealt with in the multilayer theory have been examined: 1) a top layer is insulated against a bottom layer (i.e. *pn*-junction, $R(\infty)$); 2) a top layer is shorted by a bottom layer (i.e. n^+-buried layer, R(0)). In both arrangements the Spreading Resistance depends strongly on layer thickness d and on the radius a of contact area. Knowing the effective radius the epilayer thickness can easily be evaluated from Spreading Resistance Measurement and making use of the function $R(\infty)/R(O) = f(d/a)$. This method is nondestructive and less time consuming than other common methods. A simple test pattern is proposed for evaluating the thickness on wafers in process. A comparison between this method and an IR-reflexion method (Digilab FTG 12) showed that both are in very good agreement in thickness range of 2.....6/μm.

The experimental investigation of two-point spreading resistance correction factors for diffused layers, N. Goldsmith, R. V. D'Aiello, and R. A. Sunshine, *SP400-10,* pp. 223-234 (June 1974).

Key words: correction factors; diffused layers; spreading resistance.

Spreading resistance measurements have been made on a series of erfc and Gaussian phosphorus diffusions into *n* and *p*-type silicon. Conventional four point probe methods were used to obtain values of sheet resistance and surface concentration. Comparison between the two methods shows increasingly large disagreements as the diffusion depth is decreased. The Dickey formula for accounting for the presence of a junction is shown to work well for uniform (nondiffused) samples but to fail to correct fully and properly for diffusions less than 20 μm deep. Empiric curves for estimating errors on lapped surfaces used in this study are given for a wide variety of samples.

Application of the spreading resistance technique to silicon characterization for process and device modeling, W. H. Schroen, *SP400-10,* pp. 235-248 (June 1974).

Key words: arsenic; boron; design; device modeling; doping distribution; phosphorus; process control; process modeling; spreading resistance.

In recent years the interest in modeling of semiconductor processes and silicon device parameters has intensified considerably. Precise knowledge of the doping distribution in the semiconductor emerged as a key requirement for input and starting condition of many of these models and for their verification. It turned out that the spreading resistance technique, after careful probe calibration and multilayer data analysis, is able to supply some of the required data better than any other characterization technique available. This paper discusses these successful applications. On the other hand, this paper points out inherent limitations of the spreading resistance technique with regard to resolution and precision, and how this affects the verification of process and device models. Finally, the paper describes ways to supplement the spreading resistance technique by other material characterization or electrical techniques so that the combination of these methods is capable of generating the required experimental data for the analytical models.

Improved surface preparation for spreading resistance measurements on *p*-type silicon, J. R. Ehrstein, *SP400-10,* pp. 249-256 (June 1974).

Key words: bevel polishing; *p*-type silicon; resistivity depth profiling; resistivity radial profiling; semiconductors; spreading resistance measurements; surface effects; surface preparation.

The interpretation and the precision of spreading resistance measurements have been seen to be strongly dependent on specimen surface preparation. A bakeout at 150 °C for 15 min following specimen surface preparation with any aqueous polishing solution is considered here. It is shown both to improve the precision of the basic calibration curve for spreading resistance measurements and to significantly improve the correlation between resistivity values derived from spreading resistance measurements on a variety of specimens, and resistivity values derived from other measurement techniques. No bakeout appears to be necessary if specimen surface preparation is done with a nonaqueous polishing process.

SP400-11. **Semiconductor measurement technology: A BASIC program for calculating dopant density profiles from capacitance-voltage data,** R. L. Mattis and M. G. Buehler, Nat. Bur. Stand. (U.S.), Spec. Publ. 400-11, 39 pages (June 1975) SD Catalog No. C13.10:400-11.

Key words: BASIC; capacitance-voltage measurements; computer programs; dopant profiles; error function; Gaussian diffusion; plotting, computer; semiconductors; silicon.

A computer program is presented which is suitable for calculating dopant density vs. depth profiles from capacitance-voltage data for the case of a Gaussian-diffused *p-n* junction diode. The program includes corrections for peripheral capacitance of round or rectangular diodes and back depletion of the space charge region into the diffused layer. Inputs to the program consist of the surface dopant density, the junction depth, the background dopant density in the diffused layer, the junction diameter, three scaling parameters, and the capacitance-voltage data pairs. Output from the program is ~~in the form~~ of a plot and an optional listing of dopant density as a function of depth. The equations underlying the program are given and are related to the program whose operation is described in detail. A second program, for generating idealized capacitance-voltage data for a Gaussian-diffused diode on material with a constant dopant density is also included.

SP400-12. **Semiconductor measurement technology: Quarterly report, July 1 to September 30, 1974,** W. M. Bullis, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 400-12, 59 pages (May 1975) SD Catalog No. C13.10:400-12.

Key words: acoustic emission; beam-lead bonds; boron redistribution; Darlington pairs; dopant profiles; electrical properties; electronics; epitaxial layer thickness; flying-spot scanner; gold-doped silicon; hermeticity; incremental sheet resistance; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; resistivity; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy.

This quarterly progress report describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period include (1) completion of Hall effect measurements to determine activation energies of the gold donor and acceptor levels in silicon; (2) successful direct measurement of fast interface state density with the circular CCD test structure; and (3) demonstration of the feasibility of the use of acoustic emission as a non-destructive means for testing individual beam-lead bonds. Results are also reported on a holder for semi-automated sheet resistance measurements, progress on development of mathematical models of dopant profiles, analysis of thermally stimulated current and capacitance measurements on junction diodes, x-ray photoelectron spectroscopy, a comparative study of surface analysis techniques, design and fabrication of a test pattern for resistivity-dopant density evaluation, epitaxial layer thickness measurement, use of the flying-spot scanner, initial work on the scanning low energy electron probe, mathematical modeling of ultrasonic bonding, an improved method for force adjustment and measurement on beam lead bonders, helium mass spectrometery for leak testing, thermal resistance measurements on Darlington pairs, and transistor thermal response measurements. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices.

SP400-13. **Semiconductor measurement technology: Improved infrared response technique for detecting defects and impurities in**

germanium and silicon *p-i-n* diodes, A. H. Sher, Nat. Bur. Stand. (U.S.), Spec. Publ. 400-13, 26 pages (Feb. 1975) SD Catalog No. C13.10:400-13.

Key words: carrier trapping; gamma-ray detector; germanium; Ge(Li) detector; infrared response silicon.

An infrared response (IRR) technique was evaluated for its utility in qualifying germanium for radiation detector use. Because of several improvements in the sensitivity and interpretation of the technique made during the evaluation, it was possible to observe a number of discrete energy levels lying within the forbidden energy gap of germanium which had passed unobserved in previous studies. These levels correlate with the type of defects and vacancies introduced by radiation damage into germanium as measured using such techniques as photoconductivity and Hall effect measurements after irradiation. Furthermore, the improved infrared response measurement method was used to identify impurities, such as copper, gold, and iron, and dislocations resulting from heat treatments in germanium. A major advance was made when it was determined that the IRR spectra could be grouped into five distinct types on the basis of spectral features observed in the energy range from 0.6 to 0.7 eV. One of the spectrum types represented crystals from which good quality detectors could be fabricated; the other four represented crystals that yielded poorer quality detectors due to carrier trapping, or crystals that presented problems such as low lithium drift mobility in detector fabrication. Three of the four spectrum types representative of poor crystal quality could be duplicated by suitably degrading specimens of a good quality crystal. The material and detector characteristics of crystals within each spectrum type were found to be similar.

SP400-15. **Semiconductor measurement technology: ARPA/NBS workshop III. Test patterns for integrated circuits,** H. A. Schafft, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-15,* 52 pages (Jan. 1976) SD Catalog No. C13.10:400-15.

Key words: data acquisition; data display; integrated circuits; measurement technology; microelectronics; process control; reliability; semiconductors; silicon; test patterns.

Synopses are presented of talks and discussion periods at a meeting on the use and development of MOS and bipolar test patterns and associated data acquisition systems. The discussions revealed that device manufacturers and users are making increased use of test patterns as powerful new measurement tools that can electrically monitor various process parameters to aid in the control of materials, wafer processes, circuit performance, and reliability. However, the large volume of data generated from these test patterns and the requirement for rapid diagnostic feedback present severe challenges in data management and display. In this report several data acquisition systems are described, as are approaches for presenting data in more easily interpretable graphic displays. The need for improvements in the design of test patterns is emphasized. In particular, problems with measuring contact resistance and the properties of oxides, surfaces, and defects, are identified. Numerous test structures are described including charge coupled device structures which can measure some characteristics not easily measured by other means. Also described are NBS's efforts and plans to identify, analyze, and intercompare selected test structures of value to the industry and its customers, and to develop measurement methods for use with these structures.

SP400-17. **Semiconductor measurement technology: Progress report, October 1 to December 31, 1974,** W. M. Bullis, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 400-17, 79 pages (Nov. 1975) SD Catalog No. C13.10:400-17.

Key words: boron nitride; boron redistribution; capacitance-voltage methods; Darlington pairs; deep depletion; dopant profiles; electrical properties; electron beam evaporator; electron beam induced damage; electronics; epitaxial layer thickness; filar eyepiece; flying-spot scanner; hermeticity; hydrogen chloride gas; image shearing eyepiece; laser interferometry; measurement methods; microelectronics; micrometrology; MOS devices; oxide films; photomask inspection; resistivity; scanning electron microscope; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; test patterns; thermally stimulated current; thermal resistance; thermal response; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy.

This progress report describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period include (1) initiation of development of measurement technology for characterizing boron nitride diffusion sources and hydrogen chloride purging gas, (2) application of dc electrical methods with a sensitivity of about 0.1 μm to the measurement of critical dimensions such as the width of diffusion windows, (3) completion of an initial comparison of line-width measurements made with an image shearing eyepiece and a filar eyepiece, and (4) development of procedures for measuring electrically the thermal resistance of the output transistor of integrated Darlington pairs. Also reported are the intermediate results of an interlaboratory evaluation of standard reference wafers for resistivity, evaluation of the deep-depletion method for measuring dopant density with an MOS capacitor, progress on development of mathematical models of dopant profiles, initial results of the reevaluation of Irvin's curve for *n*-type silicon, analysis of thermally stimulated current and capacitance measurements on MOS capacitors, study of surface carbon contamination which occurs during measurement of silicon by x-ray photoelectron spectroscopy, preliminary measurements of absorbed dose from electron-beam evaporation of aluminum films, initial evaluation of the CCD test structure operating as an MOS capacitor and an MOS transistor, analysis of a TV-microscope system for photomask inspection, initial study of calibration procedures and artifacts for photomask metrology, analysis of the range of applicability of MOS C-V methods for epitaxial layer thickness measurement, use of an optical flying-spot scanner, assessment of damage to selected integrated circuits caused by inspection with a scanning electron microscope, mathematical modeling of ultrasonic bonding, a dry gas method for gross leak testing, and measurements of transistor thermal response. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices.

SP400-18. **Semiconductor measurement technology: The destructive bond pull test,** J. Albers, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-18,* 52 pages (Feb. 1976) SD Catalog No. C13.10:400-18.

Key words: bond angle; bonding; bond pull test; bond-to-bond spacing; large wire; loop height; microelectronics; nondestructive bond pull test; position of hook; pull rate; pull strength; resolution-of-forces; semiconductor devices; ultrasonic bonding; wire bond.

This report summarizes the work done at NBS on the destructive bond pull test as applied to small-diameter (approximately 1 mil or 25 μm) ultrasonically bonded aluminum wire. This work was performed during the period from 1969 to 1974. The report begins with a brief summary of the calculation of the resolution-of-forces operative in the bond system during the application of

the pulling force. Next, comparisons of the theoretical and experimental dependencies of the pull strength on the variables involved in the resolution-of-forces calculation are given. Some of the variables which are not directly involved in this calculation are then considered and their effects on the measured pull strength are presented. The report ends with a sensitivity calculation as to how well the variables must be controlled to maintain the variability of the pull strength to within given limits. Bond pull specifications for large-diameter wire as well as recommended force levels to be used in the application of the nondestructive bond pull test, both of which have resulted from the pull test work, are considered in the appendices.

SP400-19. **Semiconductor measurement technology: Progress report, January 1 to June 30, 1975,** W. M. Bullis, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-19,* 95 pages (Apr. 1976) SD Catalog No. 13.10:400-19.

Key words: acoustic emission; beam-lead bonds; bias-temperature stress test; boron redistribution; capacitance-voltage methods; charge-coupled device structures; Darlington pairs; deep depletion; dopant profiles; electrical properties; electron beam induced current; electron beam induced damage; electronics; epitaxial layer thickness; four-probe method; hermeticity; leak tests; measurement methods; microelectronics; moisture infusion; optical flying-spot scanner; oxide films; passivation overcoats; photomask metrology; pull test; resistivity; Rutherford backscattering; scanning electron microscope; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; shear test; sheet resistors; silicon; silicon on sapphire; spreading resistance; test patterns; thermal resistance; thermal response; transistors; ultrasonic bonding; wire bonds; x-ray photoelectron spectroscopy.

This progress report describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Both in-house and contract efforts are included. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period included (1) completion and analysis of an interlaboratory evaluation of standard reference wafers for resistivity measurement by the four-probe method, (2) analysis of the effect of finite contact size on sheet resistance as measured with a van der Pauw structure, (3) calculation of errors introduced in measuring line width with typical microscope systems, (4) development of procedures for predicting the magnitude of electron beam induced current in silicon device structures, (5) application of the optical flying-spot scanner to observation of hot spots and nonlinearities in rf power transistors and of logic patterns in an MOS shift register, and (6) determination of a more accurate electrical method, based on peak junction temperature measurement, for establishing safe operating area curves for medium power transistors. Also reported are the results of work on spreading resistance measurements, ionization of dopant impurities in silicon, Rutherford backscattering measurements, x-ray photoelectron spectroscopy, ion microprobe mass analysis, tests for determining the surface quality of sapphire substrates, reevaluation of Irvin's curves, mathematical models of dopant profiles, deep depletion measurements of resistivity profiles, measurement of epitaxial layer thickness by the deep depletion method, bias-temperature stress test measurements on MOS capacitors, a high voltage capacitance-voltage method for measuring characteristics of thick insulator films, ion implantation parameters, methods for determining integrity of passivation overcoats, optical imaging and calibration standards for photomask metrology, line-width measurements, charge-coupled device test structures, test pattern design and analysis for silicon on sapphire MOS device technologies, nondestructive acoustic emission test for beam-lead bonds, pull and shear tests for wire bonds, a rapid cycle dry gas gross leak test, leak detection by helium mass spectrometry, correlation of moisture infusion in semiconductor packages with leak size and device reliability, an automated scanning low-energy electron probe, electron beam induced damage in silicon device structures, and thermal resistance measurements on Darlington transistors. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices. A sixth appendix is included to summarize the results of a study which was carried out to assess the impact of automation of integrated circuit processing and assembly on future measurement requirements in the industry.

SP400-20. **Semiconductor measurement technology: Optical and dimensional-measurement problems with photomasking in microelectronics,** J. M. Jerke, Nat. Bur. Stand. (U.S.), Spec. Publ. 400-20, 42 pages (Oct. 1975) SD Catalog No. C13.10:400-20.

Key words: integrated circuits; microelectronics; micrometrology; photolithography; photomask; semiconductor technology.

Photomasks are the basic artifacts for transferring design geometry to the semiconductor wafer in integrated circuit (IC) production. Currently, photolithographic techniques using optical equipment are the primary means for both fabricating masks and using masks to print patterns on wafers. The present study was to identify the major optical and dimensional-measurement problems related to the fabrication and use of masks.

The results show that the primary optical problems are those related directly to the use of optical instruments for dimensional measurements of IC pattern geometry. Furthermore, most suppliers and users of optical equipment for mask fabrication do not conduct sufficient optical testing to determine imaging performance. The basic limitations derived from light diffraction and coherence continue to limit the quality of masks and IC devices with sub-micrometre geometry, and acceptable units are produced generally on a best-effort basis. The primary dimensional-measurement problems are (1) accurate measurements below about 10 μm, (2) edge definition or location of a physical edge for a line, and (3) mask registration. Recommendations to improve the accuracy of dimensional measurements are given.

A bibliography of publications related to the optical and micrometrological aspects of photomasking is included.

SP400-21. **Semiconductor measurement technology: Planar test structures for characterizing impurities in silicon,** M. G. Buehler, J. M. David, R. L. Mattis, W. E. Phillips, and W. R. Thurber, *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-21,* 32 pages (Jan. 1976) SD Catalog No. C13.10:400-21.

Key words: MOS capacitors; *p-n* junctions; resistivity of silicon; semiconductor devices; semiconductor process control; sheet resistors; test patterns; thermally stimulated currents.

Various test structures such as sheet resistors, *p-n* junctions, and MOS capacitors and their associated physical models have been developed to characterize dopants and defects in silicon. These structures address various needs within the semiconductor industry for (a) well-designed and miniaturized test structures such as an orthogonal van der Pauw sheet resistor, (b) simple and economical measurements such as the oxide window width of a diffused layer, (c) updated values for the resistivity versus dopant density relation, and (d) improved detection methods for identifying defect centers which control the lifetime and leakage currents of devices.

SP400-22. **Semiconductor measurement technology: Microelectronic test pattern NBS-3 for evaluating the resistivity-dopant density relationship of silicon,** M. G. Buehler, *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-22,* 57 pages (June 1976) SD Catalog No. C13.10:400-22.

Key words: dopant density; microelectronics; MOS capacitors; *n-p-n* transistor fabrication; *p-n* junctions; resistivity; semiconductor electronics; sheet resistors; silicon; test pattern; test structures.

Test pattern NBS-3 is a microelectronic test vehicle designed by the National Bureau of Standards to evaluate the electronic materials used in discrete semiconductor devices and integrated circuits. Designed for fabrication on silicon wafers, the test pattern is an aid in better understanding integrated circuit fabrication technologies. The main pattern consists of four masks designated BASE, EMITTER, CONTACT, and METAL and contains 33 test structures such as sheet resistors, MOS capacitors, *p-n* junctions, bipolar and MOS transistors, and etch control and resolution structures.

The pattern was designed primarily to aid in the evaluation of the relationship between resistivity and dopant density in both *n*- and *p*-type silicon. This relation is needed in the design of silicon solid-state devices and in the analysis of various physical measurements. Other test structures are included for use as diagnostic tools to verify that proper fabrication procedures were followed. The remaining structures allow the exploration of new designs and measurement methods.

The structures are arranged in a square pattern 200 mil (5.08 mm) on a side. A detailed layout of each test structure is presented including both a top view and a cross sectional view. A description of each structure is given and where applicable the formulas for evaluating such quantities as resistivity, dopant density, and sheet resistance are given. The fabrication of the test pattern is illustrated by an *n-p-n* transistor process and values obtained from various test structures are presented.

SP400-23. **Semiconductor measurement technology: ARPA/NBS Workshop IV. Surface analysis for silicon devices,** A. G. Lieberman, *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-23,* 238 pages (Mar. 1976) SD Catalog No. C13.10:400-23.

Key words: Auger spectroscopy; depth profiles; electron beam induced imaging; ESCA; insulator films; interface characteristics; internal photoemission; ion scattering spectroscopy; nuclear resonance profiling; photodepopulation; photovoltaic imaging; Rutherford backscattering; SCANIIR; secondary ion mass spectroscopy; semiconductor devices; silicon; surface analysis; x-ray photoelectron spectroscopy.

This report contains the proceedings of the ARPA/NBS Workshop IV, *Surface Analysis for Silicon Devices,* held at the National Bureau of Standards on April 23-24, 1975.

The Workshop, as part of an NBS program to develop measurement technology for the field of semiconductor devices, was held to discuss the present capabilities and future prospects of modern analytical beam techniques as applied to silicon, and associated insulator films and device structures. Of particular interest were the determination of impurity profiles, surface contamination, and interface characteristics. Techniques utilizing impinging electron, ion, neutral or photon beams were considered. The Workshop was directed at the analysts, the semiconductor manufacturers who use the analysts' results, and the instrument people who design and manufacture the analytical equipment. Transcripts of the discussions following each paper are also included within these proceedings. *These proceedings include the following papers (indented):*

Introductory concepts for silicon surface analysis, A. G. Lieberman, *SP400-23,* pp. 3-6 (Mar. 1976).

Identification of integrated circuit process areas amenable to diagnosis and control by analytical beam techniques, B. E. Deal, *SP400-23,* pp. 7-20 (Mar. 1976).

Key words: acoustic emission; Auger electron spectroscopy; beam-lead bonds; bias-temperature stress test; boron redistribution; capacitance-voltage methods; dopant profiles; electrical properties; electronics; four-probe method; hermeticity; interface states; ion implantation; ion microprobe mass analysis; leak tests; measurement methods; microelectronics; moisture infusion; optical flying-spot scanner; passivation overcoats; photoresist; pull test; resistivity; scanning acoustic microscope; scanning electron microscope; scanning low energy electron probe; semiconductor devices; semiconductor materials; semiconductor process control; silicon; silicon dioxide; silicon on sapphire; spreading resistance; test patterns; thermally stimulated current; thermal resistance; ultrasonic wire bonding; voltage contrast mode; x-ray photoelectron spectroscopy.

This progress report describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Both in-house and contract efforts are included. The emphasis is on silicon device technologies. Principal accomplishments during this reporting period included (1) preliminary results of a systematic study of the effects of surface preparation on spreading resistance measurements; (2) development of an optical test for surface quality of sapphire; (3) development of a basis for an exposure sensitivity specification for photoresists; and (4) development of a modular cell concept for test structure design and layout. Also reported are the results of work on four-probe resistivity measurements, comparison of techniques for surface analysis, ion microprobe mass analysis, analysis of process chemicals with flame emission spectrometry, redistribution profiles, thermally stimulated current response of interface states, bias-temperature stress test measurements on MOS capacitors, a high voltage capacitance-voltage method for measuring characteristics of thick insulator films, hydrogen chloride oxidation, ion implantation parameters, methods for determining integrity of passivation overcoats, measurement of free sodium in an oxidation furnace by resonance fluorescence, a square array collector resistor test structure, an electrical alignment test structure, two dimensional wafer maps, test pattern design and analysis for silicon-on-sapphire MOS device technologies, a nondestructive acoustic emission test for beam-lead bonds, wire bond pull test, bondability of doped aluminum metallizations, leakage into double hermetic enclosures, a static expansion dry gas gross leak test, correlation of moisture infusion in semiconductor packages with leak size and device reliability, an automated scanning low-energy electron probe, an optical flying-spot scanner, scanning electron microscopy, scanning acoustic microscopy, and thermal resistance measurements on power transistors and simple integrated circuits. Supplementary data concerning staff, publications, workshops and symposia, standards committee activities, and technical services are also included as appendices.

SP400-26. **Semiconductor measurement technology: Defects in PN junctions and MOS capacitors observed using thermally stimulated current and capacitance measurements—videotape script,** M. G. Buehler, *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-26,* 20 pages (Apr. 1976) SD Catalog No. C13.10:400-26.

Key words: cryostat; defects; gold-doped silicon; measurement methods; microelectronics; MOS capacitor; *p-n* junctions; semiconductors; silicon; thermally stimulated capacitance; thermally stimulated current.

Two measurement methods are described which detect and characterize defects which can control such device characteristics as lifetime and junction leakage. The methods can be used as diagnostic tools in the fabrication of bipolar and MOS devices. The number of different kinds of defects and their densities may be obtained with little effort and simple apparatus. Positive identification of these defects may be obtained with more effort and more sophisticated apparatus. Of more importance, the measurements characterize defects in an environment which is identical to that of the finished product. Thus, the answers derived are directly applicable to process control and device design.

These methods involve thermally stimulated capacitance and current measurements which utilize the ability of defects in the vicinity of a *p-n* junction or in a MOS capacitor to trap holes or electrons and emit them after receiving sufficient thermal energy. Values for defect densities, energy levels, and emission rates can be derived from these measurements. The limit of detectability can be as low as 10^{10} defects/cm^3. These values provide sufficient information to positively identify the defects.

Three vehicles are used to illustrate the methods: a gold doped n^+-p diode, a p^+-n diode with a process-induced defect center, and a gold doped n-type MOS capacitor. Two cryostats are described which have a maximum heating rate of 10 K/s.

SP400-27. **Semiconductor measurement technology: Laser scanning of active semiconductor devices—Videotape script,** D. E. Sawyer and D. W. Berning, *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-27,* 26 pages (Feb. 1976) SD Catalog No. C13.10:400-27.

Key words: failure analysis; hot spots; integrated circuits; laser scanner; measurement method; nondestructive test; nonlinear operation; optical scanner; reliability; transistors.

This is the script of a videotape presentation which describes new and powerful applications for laser scanning in semiconductor device design and reliability work. The design of the scanner is described in detail and many of its applications are displayed and discussed. The optical scanner can, in a completely nondestructive way, reveal the inner workings of semiconductor devices. For example, it is shown that the scanner can (1) map dc and high-frequency gains in transistors, (2) reveal areas of the device operating in a nonlinear manner, (3) electronically map temperature in the transistor, and (4) detect the location of hot spots that can develop for certain operating conditions. The vehicle used to show these capabilities of the scanner is a bipolar interdigitated UHF transistor. A dual input NAND gate is used to demonstrate the use of the scanner to determine internal logic states and otherwise observe internal operation of the circuit. To show the ability of the scanner to examine MOS devices without detectable degradation, a MOS shift register is used. The location and progress of internal logic in the register is clearly shown by the scanner. Not only can internal logic be mapped and marginally-operating logic cells detected, but individual logic states can be changed by the scanner without affecting other elements.

SP400-28. **Semiconductor measurement technology: NBS/FDA workshop. Reliability technology for cardiac pacemakers,** H. A. Schafft, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-28,* 49 pages (June 1976) SD Catalog No. C13.10:400-28.

Key words: cardiac pacemaker; data banks; failure analysis; failure modes; hermeticity; hybrid devices; leak testing; measurement technology; microelectronics; MOS devices;

process control; reliability; semiconductor devices; surgical implants.

Brief summaries are presented of 20 invited talks on the following topics: procurement and assurance of reliable, long lived semiconductor electronic parts; leak testing of device packages and pacemaker systems; activities of standardization organizations; and availability and use of resources for information and expertise. The purpose of the workshop was to address technical questions relevant to the enhancement and assurance of cardiac pacemaker reliability, and to bring together representatives from the pacemaker, military, aerospace, and other communities to discuss areas of mutual concern. The technical sessions highlighted the problems of pacemaker manufacturers associated with obtaining high reliability electronic components – problems shared with the most demanding users in the military and space communities. It was also noted that no government agency has the authority or responsibility for the development of methods to permit assured procurement of high quality electronic components for critical applications by organizations in the civilian sector. These organizations must rely on spin-off from military and space programs even when parts of this civilian sector have reliability requirements which are more severe than all but the most stringent military and space requirements. Included in appendices are measurement technology areas of concern identified by the pacemaker community; information about utilizing reliability data banks and facilities for searching literature and data; and organizations offering services in the microelectronics field.

SP400-34. **Semiconductor measurement technology: Safe operation of capacitance meters using high applied-bias voltage,** A. M. Goodman, *Nat. Bur. Stand. (U.S.), Spec. Publ. 400-34,* 57 pages (Dec. 1976) SD Catalog No. C13.10:400-34.

Key words: bias-isolation unit; capacitance measurements at high applied-bias voltage; capacitance-meter; extended-range capacitance measurement; high-voltage C(V) measurements; modified MIS C(V) measurements.

The use of capacitance meters (C-meters) to determine small-signal (differential) capacitance at 1 MHz as a function of applied-bias voltage is widespread. The maximum value of the bias voltage which may be applied to a sample under test with any commercially available C-meter is 600 V or less. A larger bias-voltage capability is required for certain applications.

This report describes a technique for using a commercial C-meter with a Bias-Isolation Unit (BIU) for capacitance measurements at bias-voltage magnitudes up to 10 kV without damage to the measurement equipment. The basic principles of operation and the details of the electrical design of a BIU are discussed.

The use of the BIU imposes certain limitations on the range of sample capacitance which may be measured without introducing excessive error. The theory of these limitations is presented and compared with experimental results obtained from the use of the BIU with each of three commercially available C-meters. The measurement capability demonstrated by these results appears to be adequate for all current and future applications. For less than ± 1 percent error in the indicated (measured) capacitance, the measurable range of the sample capacitance is found to be from 0 to at least 400 pF. In some applications, it is important to be able to accurately measure small changes in the sample capacitance; for less than ± 1 percent error in the indicated (measured) value of a small change in the sample capacitance, the measurable range of the sample capacitance is found to be from 0 to at least 130 pF.

Construction details of the BIU are appended.

SP401. **Computer performance evaluation.** Proceedings of the Eighth Meeting of Computer Performance Evaluation Users Group [CPEUG], held at NBS, Gaithersburg, Md., December 4-7, 1973, H. J. Highland, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 401, 155 pages (Sept. 1974) SD Catalog No. C13.10:401.

Key words: computer evaluation; computer performance; computer scheduling; hardware monitors; simulation of computer systems; software monitors; systems design and evaluation; time-sharing systems evaluation.

The Eighth Meeting of the Computer Performance Evaluation Users Group [CPEUG], sponsored by the United States Army Computer Systems Command and the National Bureau of Standards, was held December 4-7, 1973 at NBS, Gaithersburg. The program chairman for this meeting was Merton J. Batchelder of the U.S. Army Computer Systems Command at Fort Belvoir, Va. 22060 [CSCS-ATA Stop H-14].

About 150 attendees at this meeting heard the 17 papers presented on computer performance, evaluation and measurement. Among the papers presented were those dealing with hardware and software monitors, workload definition and benchmarking, a report of FIPS Task Force 13, computer scheduling and evaluation in time-sharing as well as MVT environment, human factors in performance analysis, dollar effectiveness in evaluation, simulation techniques in hardware allocation, a FEDSIM status report as well as other related topics.

These proceedings represent a major source in the limited literature on computer performance, evaluation and measurement. *These proceedings include the following papers (indented):*

Getting started in computer performance evaluation, P. J. Kiviat and M. F. Morris, *SP401,* pp. 5-13 (Sept. 1974).

A methodology for performance measurement, D. M. Venese, *SP401,* pp. 15-22 (Sept. 1974).

Use of SMF data for performance analysis and resource accounting on IBM large-scale computers, R. E. Betz, *SP401,* pp. 23-32 (Sept. 1974).

Using SMF and TFLOW for performance enhancement, J. M. Graves, *SP401,* pp. 33-36 (Sept. 1974).

USACSC software computer system performance monitor: SHERLOC, P. Balcom and G. Cranson, *SP401,* pp. 37-43 (Sept. 1974).

Benchmark evaluation of operating system software: Experiments on IBM's VS/2 system, B. A. Ketchledge, *SP401,* pp. 45-48 (Sept. 1974).

Report on FIPS Task Group 13 workload definition and benchmarking, D. W. Lambert, *SP401,* pp. 49-53 (Sept. 1974).

A simulation model of an AUTODIN automatic switching center communications data processor, R. B. McManus, *SP401*, pp. 127-136 (Sept. 1974).

SP403. **Energy conservation through effective energy utilization.** 1973 Engineering Foundation Conference, New England College, Henniker, NH, Aug. 19-24, 1973, J. C. Denton, S. Webber, and J. Moriarty, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 403,* 251 pages (June 1976) SD Catalog No. C13.10:403.

Key words: automobile; break-even analysis; conservation; cooling; economics; energy; environment; fuel; heating; imports; industry; management; manufacturing; paper; petroleum; resources; standards; steel; thermal; thermodynamics.

These proceedings of the 1973 Engineering Foundation Conference focus on effective utilization of thermal energy as a means of energy conservation. It is hoped publication will help stimulate the national dialogue toward a balanced national program for more energy conservation.

The varied professional backgrounds of the participants provided an interdisciplinary approach for action steps to be taken in areas where research is needed and will provide a significant impact. For example, the development of better stack controls was recommended as a specific research task, and the improvement of energy accounting systems and energy use norms was recommended as a useful research area. Broad agreement was reached that there is much left to be accomplished in thermal process technology as used in industrial processes, in industrial equipment, and in heating, ventilating, and air conditioning (HVAC) equipment for buildings.

A clear conclusion of the conference is that while new technology is important the introduction of much technology that is already available is equally, if not more, important. Institutional barriers relating to economics, management, finance, and national policy keep available technology standing in the wings. The conference papers and discussions show that engineering design, when it can be rigorously applied, does result in striking reductions in energy use in the thermal process technologies. *These proceedings include the following papers (indented):*

Effective utilization of energy and other natural resources, C. A. Berg, *SP403*, pp. 3-12 (June 1976).

Key words: costs; economics; energy; fuel; imports.

An overview of the Nation's energy problems is presented to provide a basis of definition for the term "energy crisis." The term does not represent a crisis of depletion of energy resources but rather refers to energy cost. The dependency of the United States on fuel imports illustrates the problems that questionable reliability and increasing costs of fuel imports pose for American industry. Improving energy use efficiency would reduce energy consumption and, considering rising energy costs, may prove to be economically attractive to industry. A policy of national life-term costing of equipment, which includes energy cost of that equipment, should be promoted rather than the present criterion of justification which is based primarily on first costs. Further, a rational economic method for achieving effective and balanced use of all natural resources, based on total life-term costing, is advocated.

Energy conservation goals and methods, R. E. Shepherd, *SP403*, pp. 13-18 (June 1976).

Key words: conservation; energy; organization.

The goals of the President's energy message of early 1973 and the feasibility of the 1974 goal of a 5 percent energy use reduction nationally are discussed. An overview of the Federal government's organizational structure is presented and discussed with reference to attaining these goals. Voluntary energy conservation measures and a major educational program directed at energy users are urged to help solve the Nation's energy problems.

National benefits of energy conservation, L. R. Glicksman and D. C. White, *SP403*, pp. 21-41 (June 1976).

Key words: correlation; economic; energy; imports; international; petroleum.

Starting from the correlation between a nation's gross national product and its energy consumption per capita, the consequences of economic growth on the world's estimated energy resources is discussed. In the absence of new energy technologies or a reduction of energy consumption in relationship to GNP, sustained high economic growth will be difficult and costly to achieve as our own resource base diminishes. The developing nations of the world will be competing for resources as their own GNP's increase, further exacerbating the resource depletion problem. As the nations of the world compete for scarce resources, there are potential international complications beyond those presently apparent in the effect of petroleum imports on America's transportation sector.

Options for energy conservation, B. Hannon, *SP403*, pp. 43-56 (June 1976).

Key words: economic; energy; input-output model.

An input-output model useful in measuring energy use, efficiency of production processes, and product uses is presented. The model provides estimates of total energy and employment shifts in a variety of processes and products. Several of these demand shifts and their potential impacts are discussed. United States industry, in general, becomes more energy-intensive as it grows. The impacts of demand shifts and changing character of industry as it evolves on consumer cost, employment, and pollution should be thoroughly understood before policy recommendations should be initiated.

Measures of thermal energy utilization, B. B. Hamel and H. L. Brown, *SP403*, pp. 57-64 (June 1976).

Key words: energy; heating systems; model; thermodynamics.

It is necessary to quantify, or structure, the ideas of thermal energy utilization in order to develop an efficiency of energy utilization. Such a quantitative analysis is useful in assessing any modification or change in design of an energy system. A method of analysis useful in assessing modifications in an energy system is presented. The concept of thermodynamic availability is used to determine maximum energy utilization efficiency. The method is illustrated by evaluating the efficiencies of several water heating systems.

Economic and environmental implications of effective utilization of energy, J. C. Denton, *SP403*, pp. 65-74 (June 1976).

Key words: automobile; economic; energy; model; transform analysis.

Technology uses energy, materials, money, people, etc. to produce products and services for society. The resultant products and their impacts on resources, society and the environment exist in a dynamic interrelationship. Technology transform analysis is an analytical model which is proposed to identify and elucidate the interrelationships between these elements and to assess the consequences of their modification. The technology transform analysis is prerequisite to the application of input-output analysis if the interrelationships between energy, environmental, economic, and human factors is to be displayed in a compatible fashion. An abbreviated example analysis of the automobile industry is presented to demonstrate the complexities which must be included and the subtleties which appear. Possible pitfalls of an incomplete analysis are discussed.

Industrial energy analysis and forecasting, D. R. Limaye, J. R. Sharko, and J. H. Kayser, *SP403*, pp. 77-93 (June 1976).

Key words: break-even analysis; economics; energy; industrial.

Although the industrial sector is one of the largest consumers of energy (over 33% of total energy consumption), relatively little is known in detail about the end use characteristics in this sector because of the diversity of processes and practices. Two approaches are discussed: a detailed engineering process analysis, involving an in-depth look at each major product in each industry; and a survey approach employing interviews and questionnaires. Studies are presented on the Chemical and Allied Products industry (SIC 28). A break-even analysis is employed to determine the prices at which two fuels are economically equivalent. An overall methodology is presented for integrating all of the different aspects of industrial energy analysis. The initial steps are the identification of end use characteristics, energy requirements per unit of output, process economics, and qualitative factors affecting energy use. Based on these and on estimates of total industrial output, the total energy requirements can be determined.

Management's role in industrial thermal energy utilization, A. S. Cook, *SP403*, pp. 95-101 (June 1976).

Key words: conservation; costs; economics; energy; thermal.

The industrial sector has a vital role and stake in decisions with respect to utilization of the country's thermal energy resources. Energy management responsibility requires a significant reorientation of the management job toward energy conservation. Industrial management's present dedication is to competitive free enterprise and energy substitution for human toil. The reorientation is toward acceptance of higher energy costs and toward security of energy supply. Discussions are presented on what industrial manufacturing can do and some factors external to industrial process thermal energy utilization. In the former category a new process technology, ultraviolet curing, is presented to exemplify conservation results from application of a new technology. In the latter category, it is emphasized that a given company cannot operate in isolation in its energy conservation efforts without running the risk that the total energy required by the society may increase.

Development of industrial energy management policies, M. C. Noland, *SP403*, pp. 103-111 (June 1976).

Key words: conservation; economic; energy; management; manufacturing.

A systematic approach to energy management at the operational level must be custom-fitted to specific industrial facilities. Preliminary results of attempts to (1) determine the steps being taken by industry in response to changing energy supply conditions and the potential for conservation inherent in that response and (2) develop guidelines for the establishment of plant energy management policies in the manufacturing and process industries are presented. The major incentive for future conservation of energy by industry is cost. The only alternative is regulation and enforcement. The economic incentive involves both direct energy cost and the indirect costs of energy security. The approach to energy problems taken by different firms follows no discernibly systematic pattern, varying from little concern to progressive programs. An outline of steps in the development of industrial energy management policies is presented.

Case histories of effective energy utilization in industry, W. Rudoy, *SP403*, pp. 113-117 (June 1976).

Key words: attitudes; conservation; energy; industrial; systems.

Energy conservation through effective energy utilization falls into three classes: better "housekeeping" or energy management of present systems; application of present off-the-shelf technology to existing systems; and revision of existing systems to provide the same objective with less energy. Three general components enter into any implementation of energy conservation—technology, economics, and people. There is a great deal of off-the-shelf technology that could be employed and case studies are presented showing significant gains in energy conservation in the area of comfort conditioning of the industrial environment. In most cases, the rule-of-thumb economic payback period of two years for revising a system is not met. The decision to move toward more efficient utilization, even when the other two components are favorable, is often influenced by the attitudes of key personnel.

A projection of energy demand by the iron and steel industry, D. Larson, *SP403*, pp. 121-152 (June 1976).

Key words: energy; forecast; industry; iron; steel.

The iron and steel industry is not only one of the larger consumers of energy (7.5% of the total U.S. energy use in 1968), but is also a very complex industry. The interrelationships between projected demand for products and the amounts of fuels needed for manufacturing the products are discussed as well as the trends that could change the amounts of fuels needed per unit of product. Conclusions drawn are that there should be a 65 percent increase in production and a 28 percent increase in energy consumption in the industry between 1971 and 1985. The growth rate of energy consumption decreases with time and should almost level off by 1985. The change in energy requirements per ton of finished product is primarily the result of technological changes. Therefore, trends that phase out obsolete inefficient equipment can accelerate this energy utilization efficiency. Most of the improved efficiency is expected in the iron-making and steel-making processes and very little change is forecast in the reheating and finishing portion of the industry.

Potential energy savings in the forming of paper, T. Speidel and D. Kallmes, *SP403,* pp. 153-161 (June 1976).

Key words: energy; industrial; paper.

The United States produced 59 million tons of paper and paper products in 1972 requiring 320×10^{12} BTU exclusive of the energy required to produce the necessary wood pulp. The conventional paper forming process is described in brief. A new method of forming paper is described having the potential of saving 40 percent of the energy conventionally required to form paper. The new method can make high quality paper utilizing up to 2 percent suspended wood pulp. A helical mixer with a high shear component in the jet permits a 35 percent decrease in the heat required during the process. This process is particularly attractive where fuel oil or fuel gas is used to supply the heat rather than waste bark and black liquor.

Potential for energy conservation in heating, ventilating, and air-conditioning equipment for buildings, G. Kelly, T. Kusuda, and J. Hill, *SP403,* pp. 163-191 (June 1976).

Key words: conservation; cooling; cost; energy; heating.

Approximately one-third of the Nation's energy use is presently used in residential and commercial buildings. Over seventy percent of the energy is being used for heating, cooling, and providing hot water. The potential for energy conservation through proper design and use of heating, ventilating, and air conditioning equipment within or in the proximity of buildings is discussed. The topics presented include a discussion of the positive and negative features of both unitary and central HVAC equipment, a description of typical all-air and air-water HVAC systems, the heat pump and how it can be combined with other equipment to conserve energy, and the recovery of energy from the building exhaust air. A brief description is given of total energy systems, modular integrated utility systems, and the utilization of waste heat from incineration plants. Considerable savings could be obtained from judicious choice of standard equipment based on energy conservation considerations. The use of life cycle costing rather than lowest possible first cost would vastly upgrade the present standards of practice.

ASHRAE and energy conservation, P. E. McNall, Jr., *SP403,* pp. 193-195 (June 1976).

Key words: energy; environment; food.

ASHRAE is concerned with all aspects of environmental control for people, as well as for plants and animals as the latter relate to food production and processing. The ASHRAE Guide is discussed and its excellent treatment on thermal comfort in buildings is emphasized. The need for better energy management and the importance of first cost to the building industry in speculative type investments is discussed. The utility of reheat HVAC systems is emphasized since they are easy to maintain and have low initial costs. ASHRAE has considerable know-how which is not optimally used at present because of inadequate incentive. Labor is no substitute for energy since a man is worth only 10 per day in energy expended.

Factors controlling the manufacture and marketing of energy conserving products, J. B. Comly and C. M. Huggins, *SP403,* pp. 199-213 (June 1976).

Key words: costs; energy; heating; manufacturing; marketing.

The complex of factors relating to decisions to manufacture and market new or improved products is discussed, with examples taken from consumer equipment of importance in conservation of energy at the point of utilization. The heat pump and the incandescent light bulb are used as specific examples. Premature marketing of the heat pump as a heating system impaired its degree of acceptance. The tradeoff between energy efficiency and replacement cost of the incandescent light bulb illustrates the optimization of these two factors in a product. Technological development alone does not assure immediate implementation of energy efficient systems. The prospect of commercial success of a product should be evaluated well before that product is brought to market.

Economic, energy, environment trade-offs, P. Swatek, *SP403,* pp. 215-223 (June 1976).

Key words: costs; economics; energy; environment.

The individual is a member of a community of interdependent parts. His instincts prompt him to compete for his place in the community but his ethics prompt him also to cooperate. Believing that pecuniary motivation is high on the list of human priorities, freer market mechanisms than presently exist are urged. The market should be unshackled, both removing subsidies to the energy industry (oil depletion allowance) and having the producers internalize the now externalized social and environmental cost of their operations. Such measures are projected to be effective in all energy consuming sectors, await the development of no new technologies, require no legislation of rigid criteria and technical standards, require no bureaucracy, rely on the normal operation of the free market, do not depend on changes in basic motivation of consumers, and will work and produce an efficient allocation of resources.

Regulatory, legal, and tax constraints on energy conservation—Polemic or fact?, C. Warren, *SP403,* pp. 225-235 (June 1976).

Key words: energy; legal; regulatory; standards.

Recognizing the vital role of power in society, an education and voluntary basis for balancing the different mechanisms in the market (such as the adjustment of electric rate structures) is urged. In the last analysis, if this approach is unsuccessful, regulation will be required drawing upon the power of the State. Regulatory enactments should be directed toward behavioral norms in the every day activities of people rather than adjudicating conflicts. The State would set standards for the building industry, controlling lighting and insulation, be prepared to establish allocations of energy, and prescribe levels of operating efficiency. Since the standards proposed are essentially performance criteria rather than product quality criteria, one could enforce conformity at the point of end use.

Financial feasibility of energy conservation, S. Sixfin, *SP403,* pp. 237-241 (June 1976).

Key words: costs; energy; financial; resources; risk.

Energy availability is approached from a purely economic point of view. The technology to be used is determined by the rate of return on the investment. A sample cost feasibility analysis for a 100,000 square foot industrial plant is presented as an example. Besides price, the ultimate criterion for choosing an energy source is its availability. Where critical energy shortages are foreseen, incentives must be provided to encourage the flow of capital in the

directions necessary to alleviate the shortages. Private investors should be compensated for the risk that they undertake in the location and development of energy resources.

National context for energy conservation, J. C. Denton, *SP403*, pp. 245-246 (June 1976).

Energy management in industry, R. G. Gatts, *SP403*, pp. 247-250 (June 1976).

Institutional considerations respecting energy conservation, S. Z. Klausner, *SP403*, pp. 253-254 (June 1976).

SP404. **Approaches to privacy and security in computer systems.** Proceedings of a Conference held at the National Bureau of Standards, Gaithersburg, Md., March 4-5, 1974, Clark R. Renninger, Editor, Nat. Bur. Stand. (U.S.), Spec. Publ. 404, 84 pages (Sept. 1974) SD Catalog No. C13.10:404.

Key words: Computer systems; confidentiality; privacy; privacy and security; security.

This publication summarizes and contains the proceedings of a conference held at the National Bureau of Standards on March 4-5, 1974 to continue the dialog in search of ways to protect confidential information in computer systems.

Proposals are presented for meeting governmental needs in safeguarding individual privacy and data confidentiality that were identified at a conference held in November 1973. Among the proposals are the enactment of privacy legislation, improved computer system architecture and access controls, information and security management guidelines and the development of a systematic, balanced approach to system security.

The proposals were presented by legislators, citizens, computer industry associations and companies, professional societies, and public interest groups. *These proceedings include the following papers (indented):*

The privacy issue, A. R. Miller, *SP404*, pp. 2-3 (Sept. 1974).

The administrative burdens of privacy legislation, E. I. Golding, *SP404*, p. 66 (Sept. 1974)

SP405. **Benchmarking and workload definition: A selected bibliography with abstracts,** J. L. Walkowicz, Nat. Bur. Stand. (U.S.), Spec. Publ. 405, 46 pages (Nov. 1974) SD Catalog No. C13.10:405.

Key words: benchmarking; bibliography; computer performance measurement; computer procurement; workload definition.

These 85 citations to the literature of benchmarking and workload definition were selected from a longer list of documents encompassing a somewhat broader scope, that was submitted to Federal Information Processing Standards (FIPS) Task Group 13 in response to a request made to attendees of the Task Group's Planning Session held on July 12, 1973, at the National Bureau of Standards. One of the topics discussed at the Planning Session was the collection of a selected bibliography on workload definition and benchmarking. The bibliographic effort was to be directed not so much toward exhaustiveness as toward the development of a bibliography that the attendees had found useful and would, therefore, recommend to other workers in the

field. Of the approximately 250 citations submitted to the Task Group, these 85 were selected on the basis of two criteria: (1) the item dealt primarily with benchmarking or workload definition; and (2) hard copy was available at the Institute for Computer Sciences and Technology. The citations are arranged alphabetically by last names of the first authors. Each citation has an abstract, a classification category assignment, and a list of keywords. The category assignments are made from a classification scheme that was developed for the collection and that is used here as a Category Index to the Bibliography. A Keyword Index is also provided.

P406. **Computer performance evaluation: Report of the 1973 NBS/ACM Workshop**, T. E. Bell, B. W. Boehm, and S. Jeffery, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 406, 180 pages (Aug. 1975) SD Catalog No. C13.10:406.

Key words: computer architecture; computer performance evaluation; installation management; measurement; modeling; monitoring; operating systems; performance objectives.

An ACM/NBS Workshop on Computer Performance Evaluation (CPE) was held in San Diego, Calif., in March 1973. The papers, workshop discussions, conclusions, and recommendations presented in this volume address specific problems in making computer performance evaluation a commonplace and productive practice.

While several of the conclusions indicate that improvements are needed in performance analysis tools, another suggests that improved application of CPE could be achieved by better documentation of analysis field to develop its full potential. Participants noted that the common emphasis on data collection or modeling, to the exclusion of considering objectives, often seriously degrades the value of performance analysis. *These proceedings include the following papers (indented):*

Computer system performance factors at Mellon Bank, G. P. DiNardo, *SP406*, pp. 27-31 (Aug. 1975).

Key words: reduction of measurement data; software measurement tools; total computing capacity; user satisfaction measurement.

Mellon Bank has acquired or developed a series of software measurement tools which gather statistics related to job production and system utilization. No one software tool meets all the bank's needs and, on occasion, resort is made to a hardware probe. Of particular benefit have been data reduction schemes, file managers, and query languages that facilitate rapid reduction, summarization, search, and calculation of the raw measurement data. A continuing aim has been to use the same body of basic measurement data for job production statistics, system tuning data, and user costing schemes. In spite of the use of benchmarks, etc., there is concern about a basic inability to access accurately total third generation computing capacity in a rapidly changing hardware and software environment. The increasing need and the capability to make more accurate, timely, usable, and meaningful data immediately available to the final user requires use of teleprocessing, file management, and query systems that in a narrow and traditional sense are "wasteful" of system resources on a massive scale.

Computer performance analysis: Industry needs, E. Seals, *SP406*, pp. 33-38 (Aug. 1975).

Key words: Computer Performance Evaluation (CPE); CPE education; CPE imagination; CPE instrumentation; CPE policy; EDP productivity.

The computer has grown in its ability to provide information processing support to the automobile industry. The budget for computers and related items has also grown, both in magnitude and as a percentage of the expense of sales. Computer Performance Evaluation (CPE) has begun to offer help in increasing the productivity of EDP equipment. The auto industry has recognized the need for CPE and engages in CPE programs with vigor. The general CPE consciousness taking hold within the EDP community promises benefits to the auto industry, which currently is involved with generating its own CPE talent and techniques.

This paper discusses the CPE needs of the automobile industry with specific references to General Motors where the author was previously involved in CPE activities.

Performance factors for university computer facilities, J. C. Browne, *SP406*, pp. 39-42 (Aug. 1975).

Key words: end-user satisfaction; performance evaluation; performance factors; resource utilization; user competence.

The unique problems of performance evaluation in a university computer facility arise because of the diversity of usage patterns and resource demand patterns with which a single facility must cope. In such an environment, one key element of performance evaluation is the characterization of the workload; another is that a high premium must be placed upon adaptability and flexibility of the management algorithm. Subsystem performance can normally be subdivided into the service given the different classes of users. It is a balanced and adequate performance in these subsystems which is basically the most important criterion in universities.

Certain performance factors are discussed, such as end-user satisfaction, resource utilization, and usage of system subcomponents. The skewed competence of users, peculiar to a university environment, is also discussed as a factor affecting performance.

Computer sub-system performance, G. Carlson, *SP406*, pp. 45-52 (Aug. 1975).

Key words: distribution; low utilization; overhead; suboptimization; subsystem measurement; variability.

The goal of performance measurement is to improve the performance of the system and reduce the cost. The present measurement tools start at the computer subsystem level. A thorough understanding of these tools seems to be necessary before we can move beyond the subsystem level into the overall system, then the computer operations, then the computer management, and hopefully beyond. Subsystem measurements have a direct impact on equipment configurations in terms of reduction of presently installed equipment, postponement of planned equipment, selection of new equipment, and comparison between different vendors. How to detect and interpret low and high device utilization and uneven distributions of activities is covered.

Overhead is explored in several contexts and an attempt to generalize the concept of overhead is made. Performance comparisons are made between theoretical and practical maximums. Suboptimization is discussed, pointing out that some suboptimization can have no bad side effects and should be achieved.

Variability in present measurement techniques is bothersome and is discussed briefly. A need for better reporting techniques is indicated.

Computer system performance factors—Their changing requirements, R. L. Morrison, *SP406*, pp. 53-60 (Aug. 1975).

Key words: computer system; factors; measurement; parameters; performance; performance terminology; predictability; requirements; variables; workload.

Advances in programming and computer system architecture are causing additional performance factors to be

identified faster than the relationships among them are being understood. This must necessitate changes in the technology, terminology, and methodology, used to measure and describe computer system performance in the future. Problems and limitations resulting from using several measures of performance popular today, and suggestions for meeting tomorrow's needs, are noted in this paper. Insights gained from evaluating IBM's recently delivered storage systems during their development and early release stages provide the basis for discussing these changing requirements.

End-user subsystem performance, P. J. Kiviat, *SP406*, pp. 61-64 (Aug. 1975).

Key words: computer performance evaluation; efficiency measurement data; measures of computer performance; system effectiveness.

Subsystem end-users should be concerned primarily with measures of system effectiveness that are cost or value based. Only through these measures can they relate the operations of their subsystem to the goals of the larger system. Individual subsystem effectiveness measures should be related through a total systems effectiveness model to permit tradeoff and marginal allocation decisions to be made.

Subsystem end-users are usually not concerned with measures of system efficiency, which are the traditional computer performance measurements, but they are responsible for seeing that their effectiveness is achieved at minimum cost, which is determined and achieved by analysis of computer performance measurement data. Subsystem end-users therefore should see that their operating units receive system efficiency measurement data and that they understand how resource efficiency is related to system effectiveness.

End-user system performance, N. R. Nielsen, *SP406*, pp. 65-71 (Aug. 1975).

Key words: computer performance evaluation; computer resource allocation; computer service parameters; computer system performance; cost/effectiveness; cost/performance; performance evaluation; user control of computing; users' performance evaluation; users' performance measures.

The end-user's view of a computer system's performance is generally quite different from that of the computer professional or of the service provider. He is unconcerned about such traditional system performance measures as CPU utilization, channel balance, memory fragmentation, and I/O queues. He is concerned only with the indirect effects of these measures as manifested in the cost he incurs or in the performance he receives. Factors reflected in these measures encompass items in the areas of accounting cost, control, system service, reliability, user interface, output, programming, and user (rather than system) performance.

In addition to the usual perceptual differences that exist between server and user, there are also significant disparities in the items taken to define performance, in the measures used to reflect that performance, and in the criteria employed to evaluate the measured performance. The paper explores some of these differences as well as discussing certain aspects of system performance which are of particular concern to the end-users of computer systems.

Complementary pursuits—Computer design, W. T. Wilner, *SP406*, pp. 75-78 (Aug. 1975).

Key words: computer architecture; functional evaluation; hardware monitor; measurement tools; performance measurement.

The relationship between computer design and performance analysis is argumentatively claimed to be an information-producing symbiosis. Performance analysis can add precision to the conceptual models which designers use to generate new systems. Most of the major aspects of good models, however, are unquantifiable. Computer design can help or hinder performance analysis, mainly by adding or omitting those few components which allow hardware monitors to recognize significant system events.

Validation aspects of performance evaluation, R. J. Rubey *SP406*, pp. 79-82 (Aug. 1975).

Key words: actual system performance; computer performance evaluation; performance prediction; simulation; software validation; tools.

This paper describes the relationship between software validation and computer performance evaluation. A brief review of validation objectives and methods is presented. With this background, three principal aspects of the relationship between validation and evaluation are explored.

The first aspect to be explored is the activity undertaken during validation to compare the actual system performance with performance predicted earlier. The second aspect, with which the paper is concerned, is the difficulty of validation. This should be an important consideration in the evaluation of a particular software or hardware system. The third aspect of the relationship is the similarity of the tools used in validation and performance evaluation.

Security vs. performance, D. R. Chastain, *SP406*, pp. 83-86 (Aug. 1975).

Key words: computer performance; computer security; hardware monitors; performance evaluation of secure computer systems; security, data transmission; security, file access; security, identification (password); security, input and output processing; security software; software monitors.

The necessity for security often overrides the concern for optimum performance of a computer system. However, it is important that the relationships between security and performance be recognized. In this paper three major areas concerning these relationships are discussed.

The first concern is with some of the types of hardware and software that are required in order to maintain security internally in an ADP system, and the effect of this hardware and software on the performance of the system.

The second area discusses some of the complex problems of evaluating the impact of security software on the performance of computer systems.

The final area discusses a number of other technical and human problems often associated with evaluating performance in a secure environment.

Performance evaluation techniques and system reliability—A practical approach, J. Hughes, *SP406*, pp. 87-96 (Aug. 1975).

Key words: hardware monitoring; monitoring register; software monitoring; system reliability.

A literature search discloses very few papers devoted to the improvement of system reliability through the use of performance evaluation techniques. A brief description is provided of an existing hardware monitor of advanced design which is capable of discerning both software and hardware events. In terms of such a tool, methods are discussed by which an attack may be launched on a number of the root causes of system unreliability. In order that new forms of packaging technology may not jeopardize the continuing use of such techniques, a proposal is made for the inclusion of a monitoring register in future computer systems.

On the power and efficiency of a computer, L. Hellerman, *SP406*, pp. 131-134 (Aug. 1975).

Key words: computer efficiency; evaluation; measurement; performance; power; work.

The concept of power is defined and proposed as a new performance measurement tool for computer systems. Several examples are given that illustrate the calculation of power for small devices. The efficiency of a system is then discussed in terms of power. Finally, the new methods are compared with other methods of system evaluation.

The Weltansicht of software physics, K. W. Kolence, *SP406*, pp. 135-137 (Aug. 1975).

Key words: computer performance measurement; software physics; software units; software work.

This paper is a brief exposition of the idea that a "software physics" exists, and furthermore that it is based on the same concepts as used in the natural sciences. The idea of a software unit is introduced to name the entities embodying the basic observable properties of software physics. These properties are identified as work and time. (Another property, existence, is not referenced in this paper.) The relation of these properties, in a general sense, to the variables of performance monitors and modeling is commented on.

Standards in performance evaluation and measurement, R. W. Bemer, *SP406*, pp. 141-144 (Aug. 1975).

Key words: accuracy; audit; certification; code-independent; documentation; optimization; precision; run statistics; security; terminology; validation; warranty.

Giving "evaluation" equal billing with "measurement" opens the door to discussion of performance that is good or bad, as oppposed to fast or slow. Through this opening come considerations of security and confidentiality, validation of software and hardware means for performing arithmetic operations and evaluating mathematical functions (to varying degrees of precision and accuracy), code independency, auditing and warranty, optional optimization in compilation of running programs in high-level languages, and retention of statistics of every aspect of operation—for later analysis and reduction of duplicate work.

The role of the technical societies in the field of computer measurement, R. W. Hamming, *SP406*, pp. 151-153 (Aug. 1975).

Key words: computer measurement; technical societies.

It is comparatively easy to make measurements of computer performance, but this does not mean that there is, or can be, any single set of "right" measurements of performance—much as we may wish otherwise! This being the situation, the technical societies should not get themselves involved in trying to set standards of measurement (in the sense of what to measure), though they should encourage high quality measurement and subsequent data processing, publication, and oral presentation of results.

Computer performance evaluation—R&D, J. H. Burrows, *SP406*, pp. 155-157 (Aug. 1975).

Key words: accounting; computer performance evaluation; efficiency; measurement; research and development.

Computer performance evaluation has moved to the forefront of a long list of tools to help the field practitioner. However, as long as R&D is applied only to large installations pushing the margin of feasibility (a noble and rewarding effort) that R&D will not contribute to the majority of data processing installations. Something useful is needed for the more normal installation.

In addition, it is becoming increasingly clear that CPE leads one to discuss and evaluate procedures and goals set for and acting upon the whole "user" community and not just the hardware monitor. More needs to be done in the external environment.

University education in computer measurement and evaluation, J. D. Noe, *SP406*, pp. 159-163 (Aug. 1975).

Key words: computer measurement and evaluation; computer science curriculum; hardware monitors; modeling.

The paper presents the view that computer measurement and evaluation should be taught in universities to stimulate research activity and to establish in the minds of students the importance of the measurement and evaluation viewpoint. It is recommended that measurement and evaluation initially be taught as a separate course, but the ultimate aim should be for the viewpoint to pervade all course work on hardware and software systems, at which time the need for the specific course should vanish. A list of suggested concepts is included.

SP407. **59th National conference on weights and measures 1974,** S. J. Edgerly, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 407, 284 pages (June 1975) SD Catalog No. C13.10:407.

Key words: digital indicators; drained weight; laws and regulations; metrication; metric conversion; net weight; package control; petroleum products; scales; survey; temperature compensation; uniformity; weights and measures.

This is a report of the proceedings (edited) of the Fifty-Ninth National Conference on Weights and Measures, sponsored by the National Bureau of Standards, held in Washington, D.C., July 7-12, 1974, and attended by state, county, and city weights and measures officials, the Federal Government, business, industry, and consumer organizations. *These proceedings include the following papers (indented):*

SP408. **Standard reference materials and meaningful measurements**, R. W. Seward, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 408, 820 pages (Mar. 1975) SD Catalog No. C13.10:408.

Key words: certification; certified reference materials; materials; meaningful measurements; measurement; reference materials; SRM's; standard materials; standard reference materials; standards.

This book presents the proceedings of the 6th Materials Research Symposium on "Standard Reference Materials and Meaningful Measurement" held at the National Bureau of Standards, Gaithersburg, Maryland, on October 29 through November 2, 1973. The symposium was sponsored by the NBS Institute for Materials Research. The purpose of the symposium was to explore ways that Standard Reference Materials (SRM's) could be used more effectively to bring about meaningful measurements both on a national and international scale, to explore the meaning of meaningful measurements, and to review the major paths now used to reach these measurements.

Starting with the relationship of SRM's to a national measurement system, the symposium reviewed SRM activities at the international level, various national programs, and industrial needs. The use of statistics, selection criteria, and steps for certifying SRM's were reviewed. Fifteen panel sessions reviewed the current status of SRM's and outlined future needs. *These proceedings include the following papers (indented):*

Standard reference materials and meaningful measurements—An overview, R. D. Huntoon, *SP408*, pp. 4-56 (Mar. 1975).

Possibilities for international cooperative efforts in standard reference materials, J. P. Cali, *SP408*, pp. 57-67 (Mar. 1975).

Activity by the International Organization for Standardization with respect to standard reference materials, F. L. LaQue, *SP408*, pp. 68-73 (Mar. 1975).

The analytical quality control programme of the International Atomic Energy Agency, O. Suschny and D. M. Richman, *SP408*, pp. 74-102 (Mar. 1975).

The activities of the European economic community in the field of reference materials and methods, K. F. Lauer and H. Laurent, *SP408*, pp. 103-117 (Mar. 1975).

Calibration and test materials for physicochemical measurements, H. Kienitz, *SP408*, pp. 118-126 (Mar. 1975).

Selection criteria of a material as standard reference material and steps for certification, G. Milazzo, *SP408*, pp. 127-145 (Mar. 1975).

Statistics and standard reference materials, J. Mandel, *SP408*, pp. 146-160 (Mar. 1975).

National SRM program in France, G. Denegre and A. Marschal, *SP408*, pp. 161-166 (Mar. 1975).

National RM program in Germany (FRG), R. J. A. Neider, *SP408*, pp. 167-188 (Mar. 1975).

The current status of SRM activities in Japan, T. Tsuchiya, *SP408*, pp. 189-200 (Mar. 1975).

National SRM programs in Poland, T. Plebanski, *SP408*, pp. 201-223 (Mar. 1975).

Reference materials in the United Kingdom, J. D. Cox, *SP408*, pp. 224-236 (Mar. 1975).

The national standard reference materials program in the U.S.A., H. T. Yolken, *SP408*, pp. 237-245 (Mar. 1975).

The SRM story at NBS, R. E. Michaelis, *SP408*, pp. 246-257 (Mar. 1975).

The role of the American National Standards Institute in national and international consensus standards programs, R. P. Trowbridge, *SP408*, pp. 258-266 (Mar. 1975).

ASTM in the U.S. measurement system, W. T. Cavanaugh, *SP408*, pp. 267-274 (Mar. 1975).

Chemical composition control problems and solutions related to metals and alloys, R. S. Cremisio, *SP408*, pp. 275-297 (Mar. 1975).

Measurement problems in physical and mechanical properties of industrial metals and the use of SRM's, J. Convey, *SP408*, pp. 298-319 (Mar. 1975).

Sampling of oil spills and fingerprinting by infrared spectroscopy, C. W. Brown, M. Ahmadjian, and P. Lynch, *SP409*, pp. 91-92 (Dec. 1974).

A new infrared instrument for monitoring oil films on water, D. E. Wright and J. A. Wright, *SP409*, pp. 93-94 (Dec. 1974).

Mapping and identification of oil on water by the use of an airborne laser system, G. K. Schwemmer and H. H. Kim, *SP409*, pp. 95-96 (Dec. 1974).

Movement of spilled oil in San Francisco Bay as predicted by estuarine nontidal drift, T. J. Conomos, *SP409*, pp. 97-100 (Dec. 1974).

Oil pollution along the Indian coastline, S. N. Dwivedi and A. H. Parulekar, *SP409*, pp. 101-105 (Dec. 1974).

Sampling errors in the quantitation of petroleum in Boston Harbor water, A. M. Ahmed, M. D. Beasley, A. C. Efromson, and R. A. Hites, *SP409*, pp. 109-111 (Dec. 1974).

Hydrocarbon concentrations in seawater along the Halifax-Bermuda section: Lessons learned regarding sampling and some results, D. C. Gordon, Jr., and P. D. Keizer, *SP409*, pp. 113-115 (Dec. 1974).

Determination of aromatic hydrocarbons in sea water using an electrolytic stripping cell, S. P. Wasik and R. N. Boyd, *SP409*, pp. 117-118 (Dec. 1974).

Determination of aromatic and total hydrocarbon content in submicrogram and microgram quantities in aqueous systems by means of high performance liquid chromatography, A. Zsolnay, *SP409*, pp. 119-120 (Dec. 1974).

Determination of $C_1 - C_{10}$ hydrocarbons in water, C. D. McAucliffe, *SP409*, pp. 121-125 (Dec. 1974).

Suspensions of crude oils in sea water: Rapid methods of characterizing light hydrocarbon solutes, R. M. Bean, *SP409*, pp. 127-130 (Dec. 1974).

Measurement and characterization of nonvolatile hydrocarbons in ocean water, R. A. Brown, J. J. Elliott, and T. D. Searl, *SP409*, pp. 131-133 (Dec. 1974).

Identification, estimation and monitoring of petroleum in marine waters by luminescence methods, A. W. Hornig, *SP409*, pp. 135-144 (Dec. 1974).

Recent developments in the identification of asphalts and other petroleum products, F. K. Kawahara, *SP409*, pp. 145-148 (Dec. 1974).

Identification of hydrocarbons in an extract from estuarine water accommodated No. 2 fuel oil, R. H. Bieri, A. L. Walker, B. W. Lewis, G. Losser, and R. J. Huggett, *SP409*, pp. 149-153 (Dec. 1974).

The role of standard reference materials in environmental monitoring, H. T. Yolken, *SP409*, pp. 157-160 (Dec. 1974).

Standard and intercomparison criteria: Tar balls and particulate matter, R. W. Traxler and R. H. Pierce, Jr., *SP409*, pp. 161-162 (Dec. 1974).

Analyses of hydrocarbons in marine organisms: Results of IDOE intercalibration exercises, J. W. Farrington, J. M. Teal, J. G. Quinn, P. L. Parker, J. K. Winters, T. L. Wade, and K. Burns, *SP409*, pp. 163-166 (Dec. 1974).

IDOE-5 intercalibration sample: Results of analysis after sixteen months storage, G. C. Medeiros and J. W. Farrington, *SP409*, pp. 167-169 (Dec. 1974).

Use of low molecular-weight-hydrocarbon concentrations as indicators of marine pollution, W. M. Sackett and J. M. Brooks, *SP409*, pp. 171-173 (Dec. 1974).

Fluorescence monitoring study at ocean weather station "P", W. J. Cretney and C. S. Wong, *SP409*, pp. 175-177 (Dec. 1974).

Sampling marine organisms and sediments for high precision gas chromatographic analysis of aromatic hydrocarbons, H. E. Bruce and S. P. Cram, *SP409*, pp. 181-182 (Dec. 1974).

Field sampling methods and techniques for marine organisms and sediments, D. Straughan, *SP409*, pp. 183-187 (Dec. 1974).

Methods for establishing levels of petroleum contamination in organisms and sediment as related to marine pollution monitoring, R. C. Clark, Jr., *SP409*, pp. 189-194 (Dec. 1974).

Quantitative determination of hydrocarbons in marine organisms, J. S. Warner, *SP409*, pp. 195-196 (Dec. 1974).

Methods for trace organic analysis in sediments and marine organisms, H. S. Hertz, S. N. Chesler, W. E. May, B. H. Gump, D. P. Enagonio, and S. P. Cram, *SP409*, pp. 197-199 (Dec. 1974).

Long term weathering characteristics of Iranian crude oil: The wreck of the "Northern Gulf", D. W. Mayo, D. J. Donovan, L. Jiang, R. L. Dow, and J. W. Hurst, Jr., *SP409*, pp. 201-208 (Dec. 1974).

Analytical techniques for isolating and quantifying petroleum paraffin hydrocarbons in marine organisms, R. C. Clark, Jr., and J. S. Finley, *SP409*, pp. 209-212 (Dec. 1974).

Determination of hydrocarbons in marine organisms and sediments by thin layer chromatography, L. Hunter, H. E. Guard, and L. H. DiSalvo, *SP409*, pp. 213-216 (Dec. 1974).

Determination of extractable organic material and analysis of hydrocarbon types in lake and coastal sediments, J. W. Blaylock, R. M. Bean, and R. E. Wildung, *SP409*, pp. 217-219 (Dec. 1974).

Hydrocarbons in blue mussels from the Kiel Bight, M. Ehrhardt and J. Heinemann, *SP409*, pp. 221-225 (Dec. 1974).

Identification of mineral oils by field ionization mass spectrometry, M. Anbar, M. E. Scolnick, and A. C. Scott, *SP409*, pp. 229-232 (Dec. 1974).

Pelagic tar in the Gulf of Mexico and Caribbean Sea, L. M. Jeffrey, W. E. Pequegnat, E. A. Kennedy, A. Vos, and B. M. James, *SP409*, pp. 233-235 (Dec. 1974).

Marine environmental monitoring: Trace elements in persistent tar ball oil residues, M. H. Feldman and D. E. Cawlfield, *SP409*, pp. 237-241 (Dec. 1974).

Distribution of tar balls and Neuston sampling in the Gulf Stream system, K. Sherman, J. B. Colton, R. L. Dryfoos, K. D. Knapp, and B. S. Kinnear, *SP409*, pp. 243-244 (Dec. 1974).

Estimation of the modern oil pollution of the North Atlantic Waters, A. I. Simonov, S. G. Oradovski, and A. A. Justchak, *SP409*, p. 245 (Dec. 1974).

Value of oil pollution monitoring in marine organisms, G. La Roche, *SP409*, pp. 249-250 (Dec. 1974).

Effects of oils on Baltic Littoral Community, as studied in an outdoor model test system, M. Notini and Å. Hagström, *SP409*, pp. 251-254 (Dec. 1974).

Hydrocarbon content and chlorophyll correlation in the waters between Nova Scotia and the Gulf Stream, A. Zsolnay, *SP409*, pp. 255-256 (Dec. 1974).

Effect of an oil spill on benthic animals in the lower York River, Virginia, M. E. Bender, J. L. Hyland, and T. K. Duncan, *SP409*, pp. 257-259 (Dec. 1974).

Marine pollution by carcinogenic hydrocarbons, J. B. Sullivan, *SP409*, pp. 261-263 (Dec. 1974).

SP-410, Superseded by Special Publication 410 1977 Edition.

SP411. **Fire safety research.** Proceedings of a Symposium held at the National Bureau of Standards, Gaithersburg, Md., August 22, 1973, M. J. Butler and J. A. Slater, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 411, 251 pages (Nov. 1974).

Key words: children; flammable fabrics; sleepwear; standards development; statistics.

The general methodology used in the development of a mandatory flammability Standard is presented. An illustrative summary is given of the hazard analysis of the accident data and the subsequent test development and laboratory investigations conducted in the development of the children's sleepwear flammability standards (DOC FF-3-71 and DOC PFF 5-73). Some of the problems encountered in the development of a mandatory standard and the resolution of those problems are discussed.

A comparison between potential hazard reduction from fabric flammability standards, ignition source improvement and public education, B. Buchbinder and A. Vickers, *SP411*, pp. 1-4 (Nov. 1974).

Key words: cigarettes; education; fabric; fire; flammability; hazard; ignition source; kitchen ranges; matches; mattresses; sleepwear; standards; upholstered furniture.

Mandatory standards have been and are being promulgated for flammable fabric item types (e.g., children's sleepwear, mattresses, upholstered furniture) to reduce the fire hazard inherent in the use of common ignition sources (e.g. matches, cigarettes, kitchen ranges). Trade-offs should be made between potential hazard reduction from fabric item standards and from design changes or improved quality control in ignition source fabrication. Public education is a third approach to the reduction of certain hazards.

Development of the standards for the flammability of children's sleepwear, E. Braun, J. H. Winger, and J. A. Slater, *SP411*, pp. 5-16 (Nov. 1974).

Key words: children; flammable fabrics; sleepwear; standards development; statistics.

The general methodology used in the development of a mandatory flammability Standard is presented. An illustrative summary is given of the hazard analysis of the accident data and the subsequent test development and laboratory investigations conducted in the development of the children's sleepwear flammability standards (DOC FF-3-71 and DOC PFF-5-73). Some of the problems encountered in the development of a mandatory standard and the resolution of those problems are discussed.

Sampling plans in mandatory standards, P. Gottfried, *SP411*, pp. 16-19 (Nov. 1974).

Key words: flammable fabrics; product safety; sampling; standards.

The Children's Sleepwear Standard for sizes 0-6X provides an example of the necessary interplay between sampling theory, industry capabilities and consumer safety assurance. The sampling plan imposes requirements for the fabric, for garment design and for garment production. These requirements address the differences between hazards due to design and those due to production error. The requirements also interact to provide improved assurance of safety by limiting the potential for severe injury.

Human activity patterns and injury severity in fire incidents involving apparel, L. B. Buchbinder, *SP411*, pp. 20-29 (Nov. 1974).

Measurement tools, C. D. Warner, *SP406*, pp. 99-102 (Aug. 1975).

Key words: computer; evaluation; hardware monitors; measurement; performance; software monitors; throughput.

First generation computers were designed to operate in a serial fashion—performing one operation at a time (e.g., input, output, process). Performance evaluation was simply a matter of determining, with a watch or calendar, the time from the start of a job to the end. After several generations of computers, we now have systems with an enormous degree of complexity and parallelism.

In an effort to keep pace in the performance evaluation area, several computer manufacturers, as well as companies not directly involved in the manufacture of computers, have built a number of performance measurement tools. These tools cover the whole spectrum, from a simple device using electromechanical counters, to a system larger than most computers it would measure.

Future measurement systems will involve both hardware and software. Special software sometimes will communicate with the hardware monitor over a special I/O interface. These new measurement systems will then not only provide information about system performance, but will provide much more accurate job accounting information than is currently available, as well as doing a better job of scheduling.

State of the art: Experiment design and data analysis, H. D. Schwetman, *SP406*, pp. 103-108 (Aug. 1975).

Key words: computer system performance evaluation; experimental assessment of system behavior; performance data analysis; performance data presentation; performance monitoring.

Experimental observations form an important part of computer system performance evaluation. It is through experimentation that models are validated, simulations parameterized and systems tuned. This paper surveys several approaches to designing experiments to aid in the assessment of systems behavior. Data gathering tools and techniques are discussed, as are the important topics of data presentation and data analysis. The paper concludes with a critical examination of the state of the art of experimentation. The key problems are found to include: (1) a lack of generally applicable guidelines, (2) a missing link between low-level data and high-level questions, and (3) a lack of means for dealing with variations in behavior attributable to variations in the workload.

Computer performance variability, T. E. Bell, *SP406*, pp. 109-112 (Aug. 1975).

Key words: computer performance analysis; measurement; performance monitoring; performance variability.

The performance of a computer varies significantly, even when it is subjected to the same load. Analysts who are performing between-machine comparisons, predicting performance, or merely trying to understand performance can be led to incorrect decisions if random variability is interpreted as representing real differences. Tightly controlled tests employing a flexible synthetic job indicated that elapsed time, processor time, and response time vary enough to deceive analysts. Several trends seem to indicate that variability will increase with time, so the effect will increase in importance. Both computer manufacturers and performance analysts should take specific actions to preclude problems due to computer performance variability.

Domains for performance measurement, S. Jeffery, *SP406*, pp. 113-117 (Aug. 1975).

Key words: accounting systems; hardware monitors; performance evaluation; performance measurement; software monitors.

In lieu of an integrated approach to performance, it may be helpful to propose a structure for consideration of the entities of Performance Measurement: systems, applications, and measurement techniques. It is proposed that these entities can be compartmentalized into "domains," for the categorization of performance measurement. It is likely that definite domains will be uncovered indicating the use of performance measurement, or more important and less widely recognized, where it is not cost-effective to perform system measurement.

The tools for measuring performance—hardware monitors, software monitors, and accounting systems—are discussed in terms of system level or application level management programs.

Several tasks are suggested that need to be addressed: (1) the gathering of currently available information on the use of accounting systems, and the development and publication of guidelines for the employment of accounting data; (2) the development and postulation of a set of Computer Performance Evaluation domains; (3) a Performance Measurement Handbook comprising guidelines for utilization of computer performance evaluation over all domains.

Queueing theoretic models, P. J. Denning and R. R. Muntz, *SP406*, pp. 119-121 (Aug. 1975).

Key words: analytical models; evaluation; measurement; networks; performance; queues.

Tradeoffs between methods of solving analytical queueing models are discussed. It is suggested that representing the multiple (simply defined) resources of a computer system and the sequencing of tasks among these resources gives models which are simple enough to yield to analysis and yet are applicable to systems of interest. Theoretical results from the study of such networks are summarized and directions of future research are briefly discussed.

An analytic framework for computer system sizing and tuning, S. R. Kimbleton, *SP406*, pp. 123-126 (Aug. 1975).

Key words: analytical; computer systems modeling; end users; performance.

Performance analysis, as practiced by end users, appears to be dominated by the trial and error approach. Computer systems modeling techniques have received relatively little usage by such users except for the sporadic application of commercially available computer system simulators. Vendors, by contrast (cf. the various ACM and IEEE publications) have been extensive users of both analytical and simulation based techniques for performance analysis. This paper discusses some of the reasons underlying the lack of extensive usage of such techniques by end users, identifies an area of performance analysis appropriate to the usage of modeling techniques and discusses an approach to its investigation through their usage.

Relating time and probability in computer graphs, R. R. Johnson, *SP406*, pp. 127-130 (Aug. 1975).

Key words: evaluation; graphs; measurement; networks; performance; Petri Nets; probability.

Program behavior is discussed in terms of Petri Nets. Using probabilistic information, an experimental method is given to determine the time spent in each state. To illustrate the method, two examples are given for program graphs.

Key words: accident patterns; apparel; apparel fires; burn injury; FFACTS; fire; flammable fabrics; flammable liquids; garment fires; garment parameters; injury severity; victim's activity; victim's reactions.

Activities immediately preceding an apparel fire are identified, classified and related to the age/sex groups involved. The level of severity of burn injuries resulting from apparel fire accidents is discussed and is related to the type of activity causing the accident. The relationships defined in the study indicate the importance of the human behavioral aspects of a fire accident and aid in defining types of remedial action likely to be effective in reducing human loss due to fabric fires.

Chemical aspects of flame inhibition, J. W. Hastie, *SP411*, pp. 30-36 (Nov. 1974).

Key words: fire retardants; flames; inhibition.

The role played by inorganic chemical additives in fire retardancy and flame inhibition is considered. Particular attention is given to the molecular level aspects of commercially important systems containing compounds of antimony and halogens.

Mechanism of flame retardant action in textiles, R. H. Barker, *SP411*, pp. 37-49 (Nov. 1974).

Key words: calorimetry; cellulose; flames; flammable gases; nylon; oxidation reactions; oxygen index; phosphorus; polyester; polymer substrates; pyrolysis-gas chromatography; textiles; thermal analysis.

Flame retardants may exert their effect on textile materials by either modifying the pyrolysis reactions of the polymer substrates so that smaller quantities of flammable gases are produced or by interfering with the oxidation reactions in the flame. The modes of action for several common types of retardants on cellulose, nylon, and polyester have been determined by use of thermal analysis, pyrolysis-gas chromatography, oxygen index, and calorimetric techniques.

Additional studies of the transfer of flame retardant effects with cellulosic fabrics, B. Miller, *SP411*, pp. 50-58 (Nov. 1974).

Key words: cellulosics; cotton; DAP; fabric flammability; flame retardants; flammability; rayon; thermogravimetric analysis.

Burning rate measurements on double layers of the same fabric when one layer has been treated with a flame retardant have indicated that certain effects of the retardant can be transferred to the untreated layer. To learn more about the mode and chemistry of this phenomenon, a study of nonflaming combustion of cellulosics has been carried out on mixed systems using thermogravimetric analysis. By arranging to have untreated cotton physically separated from the flame retardant material during heating it was possible to determine that the transfer depends on a chemical process and is most likely the effect of a volatile product generated during heating. Data are presented also showing that rayon containing an alkoxy-phosphazene flame retardant does not transfer its flammability properties to untreated rayon.

An evaluation of flame spread test methods for floor covering materials, J. Quintiere and C. Huggett, *SP411*, pp. 59-89 (Nov. 1974).

Key words: corridor fires; fire test methods; flame spread; flammability tests; floor covering flammability; floor coverings.

Flammability properties of materials have traditionally been measured by small scale laboratory tests. The relationships between test results and performance in real fires have been largely inferred by intuition or subjective judgement. Flame spread test methods for floor covering materials are examined. Through full-scale fire experiments and laboratory studies the nature of the potential flame spread hazard of flooring materials is presented. The factors promoting flame spread in each test method are identified. Test method results are compared with relevant full-scale fire experiments involving floor covering materials in a corridor. An effort is made to relate test results, where possible, to the potential flame spread hazard of floor covering materials in building corridors and exitways.

Mathematical modeling of radiant panel test methods, J. A. Rockett, *SP411*, pp. 90-96 (Nov. 1974).

Key words: fire modeling; fire test methods; flame spread test method.

Standard flame spread tests characterize complex physical phenomena by a relatively simple experiment. Analytic modeling of the standard test identifies the sample geometry and material properties controlling the test outcome. Systematic variation of the model parameters verifies the analytic model for many broad classes of test samples provided parameter values appropriate to each test are determined by independent measurements. In most cases the standard test is not a satisfactory way to quantify the important sample parameters. The standard test is a suitable way to verify the applicability of a particular model or set of analytic models for a particular sample. If sample parameters are independently determined, the applicable models may then be used for hazard determination.

Flame spread over a porous surface under an external radiation field, T. Kashiwagi, *SP411*, pp. 97-104 (Nov. 1974).

Key words: carpet flammability; flame spread; ignition.

Flame spread over carpet surfaces was studied under various constant external radiant fluxes from 0.4 to 1.1 W/cm². Characteristics of ignition and flame spread including speed of spread and net heat release rate were measured. The results indicate that these values increase rapidly with increasing external radiant flux. It was also observed that there exists a minimum radiant flux necessary to sustain steady flame spread for each carpet. The underlayment of a carpet has a significant effect on ignition and flame spread speed for nylon carpets due to melting of fibers before flameover. However, this effect is negligible for low pile density acrylic carpets.

Physiological and toxicological effects of the products of thermal decomposition from polymeric materials, M. M. Birky, *SP411*, pp. 105-124 (Nov. 1974).

Key words: combustion; polymer; pyrolysis; smoke; specific optical density; toxic gases; toxicity.

A program that combines the capabilities of the College of Medicine and the College of Engineering of The University of Utah has been instituted to evaluate the physiological and toxicological effects of the products of thermal degradation and combustion of cellulose, a polyvinyl chloride, a flexible polyurethane, and wood (Douglas fir). The products produced from these materials are being identified and quantified with a gas chromatograph-mass spectrometer-computer system. In addition, a National Bureau of Standards smoke chamber has been modified with a weight loss transducer to correlate, on a continuous basis, the quantities of smoke produced with sample weight loss. Extensive studies on the effects of these degradation products on rats is in

progress. The results of exposure of the rats to carbon monoxide are reported. All of the laboratory results are being correlated with full-scale fire studies at the National Bureau of Standards.

Contribution of interior finish materials to fire growth in a room, J. B. Fang and D. Gross, *SP411*, 125-138 (Nov. 1974).

Key words: buildings; fire intensity; flame spread; flames; furnishings; heat release; interior linings; material ignitability; room fires; smoke; upholstery; waste receptacle; wood crib.

Characterization of the fire environment from the burning of the combustible contents of wastebaskets, upholstered furniture and interior finish materials is important for developing rational tests and establishing design criteria for reduction of fire hazard in buildings. Some experimental results on the burning characteristics of an upholstered chair, contents of waste receptacles and wood crib arrays in a well-ventilated room are presented. A procedure has been developed for evaluating the contribution to fire growth of wall and ceiling panels in a full-scale room corner with a standardized wood crib duplicating the conditions produced by an incidental fire. Results of full-scale and laboratory tests with selected interior finish materials on ease of ignition, surface flammability, flame penetration and smoke and heat generation measurements are presented and compared.

Fire build-up in reduced size enclosures, W. J. Parker and B. T. Lee, *SP411*, pp. 139-153 (Nov. 1974).

Key words: fire tests; flashover; heat release rate; scale models; thermal radiation.

A $30 \times 30 \times 32$ inch enclosure was constructed to study the fire build-up process in a room. Conductive and radiative heat flux, temperature, air velocity, fuel supply rate, and oxygen concentration were measured. In order to relate the phenomena observed in the small enclosure to that in a full size room, the possibility of small-scale modeling with combustible walls was examined. This was done on a preliminary basis by comparing the results of some corner fire tests conducted both in the model and in a full size room. A preliminary examination was also made of the effect of the fuel flow rate and the location of the burner on the temperature and oxygen profiles in the enclosure. Since the ceiling temperature closely follows the upper air temperature the latter is a suitable measure of the degree of fire build-up in the room. Any analysis of the fire build-up process must account for this temperature.

An analytic model for calculating the fire resistance of simply supported prestressed and reinforced concrete beams, L. A. Issen, *SP411*, pp. 154-164 (Nov. 1964).

Key words: analytic methods; concrete; creep; elevated temperature; finite differences; finite elements; fire endurance; fire tests; isotherms; prestressed concrete; reinforced concrete; steel.

At present the fire resistance of concrete beams is determined either by running a fire test or by interpolation from existing fire test data. The second method can only be used if the data are for beams that are closely similar to the object beam. Other ad hoc empirical methods are equally limited. To overcome these difficulties an analytic model was developed for the rational analysis of prestressed and reinforced concrete beams. This model will be checked against available test data. A computer program based on the analytic model is being tested and will be used for developing graphical tools (graphs, nomograms, tables) for estimating the fire endurance of simply supported prestressed and reinforced concrete beams.

Smoke and carbon monoxide generation from burning selected plastics and red oak, T. Y. King, *SP411*, pp. 165-177 (Nov. 1974).

Key words: carbon monoxide; electrostatic precipitation; particulate mass; scanning electron microscope; smoke.

This paper presents preliminary results of simultaneous smoke and carbon monoxide measurements from burning selected plastics and red oak in the smoke density chamber. An attempt was made to correlate smoke optical density with mass concentration of smoke. Particulate shape and approximate size range of the smokes were obtained using a scanning electron microscope.

A field study of non fire-resistive multiple dwelling fires, F. L. Brannigan, *SP411*, pp. 178-194 (Nov. 1974).

Key words: apartments; building codes; fire; fire walls; garden apartments; gypsum board; insurance; livability; multiple dwellings.

A field study was made of structural and building design factors contributing to the spread of fire in more than 40 non fire-resistive, multiple occupancy dwellings, typically "Garden Apartments." Most deficiencies could be corrected by preserving the integrity of a gypsum board sheath serving as a fire barrier. Examples are given of penetrations and openings in fire barriers which permitted substantial fire spread.

The current status of fire detection, G. Sinnott, *SP411*, pp. 195-200 (Nov. 1974).

Key words: alarm communications; false alarms; fire alarms; fire detectors; risk benefit; smoke detectors; standards.

The status of residential fire detection systems is presented in terms of the major problems encountered in their use. This includes a discussion of risk benefit considerations, false alarms, and the effectiveness of alarms. The impact of these considerations on acceptance standards for residential fire detection systems is pointed out.

Sequencing the purchase and retirement of fire engines, P. B. Saunders and R. Ku, *SP411*, pp. 201-214 (Nov. 1974).

Key words: dynamic programming; equipment replacement; fire engines.

A mathematical model and solution method are presented for the problem of determining an "optimum" manner of sequencing the purchase and retirement of fire engines. The method calculates that stream of "buy and retire" decisions which, subject to certain natural constraints (such as limits on annual acquisitions), minimizes the operating cost of the fleet of engines over a prescribed planning period. Implemented as an efficient computer program, the model has been applied to illustrative data from the Washington, D.C. Fire Department. The approach carries over to problems dealing with the replacement of other types of items (e.g., ambulances, small fleets of aircraft, typewriters) whose reliability-maintenance becomes increasingly expensive with age.

FIFI—Fire information field investigation, F. J. Kauffman and M. E. Grimes, *SP411*, pp. 215-229 (Nov. 1974).

Key words: field investigation; fire information; fire investigations; fire training; programmed instruction.

The Research Phase of FIFI defined and evaluated those state-of-the-art investigation techniques used at the scene of fires to report on the cause and circumstances of those fires. The two most significant conclusions reached during the research phase were (a) that very little literature is available to an officer interested in studying methods of general fire

cause determination, since most existing literature is arson oriented, and (b) that standardized training programs in systematic investigative practices do not exist. The Development Phase of the project isolated the most valid of the investigative techniques evaluated in the research phase, and synthesized them into a new, simplified, logical, process-of-elimination investigation sequence known as HEP (Hexagonal Elimination Process) based on the NFPA Standard 901, *Coding System for Fire Reporting*. Two prototype training packages were developed; designed to aid firefighters in carrying out the systematic HEP investigation sequence in their initial, on-scene, routine fire investigations. The prototype training packages were field tested in six fire departments of varying sizes and types.

National Science Foundation RANN Program, R. H. Long, Jr., *SP411*, pp. 230-238 (Nov. 1974).

Key words: fire programs; fire research; National Science Foundation; RANN; research grants.

The fire research effort at NSF is part of the Research Applied to National Needs (RANN) Program of NSF, which provides funds for problem-oriented research on selected problems of national importance. The current effort is funded at $2 million and about 20 projects are under way. An outline of the thrust of the total program will be given. Also, several projects which are closely related to interests of the National Bureau of Standards will be indicated. Related activities within NSF will be mentioned.

SP412. **Aerosol measurements.** The Proceedings of a Seminar on Aerosol Measurements, May 7, 1974, W. A. Cassatt and R. S. Maddock, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 412, 193 pages (Oct. 1974) SD Catalog No. C13.10:412.

Key words: aerosol instrument performance; aerosol measuring instruments; beta-ray absorption; Doppler shift; electromobility; laser light scattering; optical imaging; piezoelectric effect.

Papers followed by discussions were given in a closed seminar and workshop sponsored by the National Bureau of Standards and the Food and Drug Administration to define the state of development of aerosol measuring instruments. The instruments discussed were based upon a variety of operating principles including laser light scattering, optical imaging, Doppler shift, electromobility, piezoelectric effect, and beta-ray absorption. Two review papers were given which described other phenomena upon which aerosol measurements are based. The general summary includes a table which lists the specifications of the instruments discussed to illustrate the range of capabilities available in this field. Discussion among seminar attendees revealed that many questions remain to be answered before the more difficult aerosol measurements problems can be solved. For example, in the analysis of very dense aerosols questions arise concerning coincidence losses or agglomeration effects that may result from collisions between particles as they are drawn into the measuring volume. Volatilization or condensation effects may alter the size distribution if the measurements are made late in time. Finally, variations in particle shape or index of refraction can alter the instrument response and cause difficulties in interpretation. *These proceedings include the following papers (indented):*

A review of the methods for the particle size analysis of aerosol spray can droplets, R. Davies and J. D. Stockham, *SP412*, pp. 1-12 (Oct. 1974).

Key words: aerosol instrumentation; aerosol measurements; aerosol review; aerosols; aerosol scattering; aerosol sizing; droplet imaging; droplet sizing; electrical mobility; impaction; momentum methods; particle imaging; particle measurements; particle scattering; particle size determinations; particulates; sprays.

This paper reviews the methods that have been used for sizing droplets, sprays, and mists, but places particular emphasis on the methods that are applicable to the sizing of aerosol spray can droplets.

The methods reviewed include photographic imaging, collection, deposition and size reconstruction, momentum transfer, pulse counting, hot wire anemometry, electrical mobility, optical scattering, and interference.

From the various techniques discussed in each class, laser holographic imaging is considered the best approach, but the method has an extremely high capital cost. Light scattering methods are the second choice, but these, too, have a relatively high capital cost. If capital cost is an important factor, then methods such as photographic imaging and impaction can be usefully employed.

Light scattering by single aerosol particles, M. Kerker, *SP412*, pp. 13-20 (Oct. 1974).

Key words: aerosol fibers; light scattering; particle size measurements; particulates; refractive index.

Although angular light scattering is a sensitive measure of particle size, sensitivity is rapidly lost when a mixture of particulates covers a range of particle sizes. However, instrumentation for studying scattering by single particles can overcome this limitation. This will be illustrated with reference to scattering by single fibers and spheres.

Light scattering methods for the characterization of particulate matter in real time, C. C. Gravatt, *SP412*, pp. 21-32 (Oct. 1974).

Key words: aerosol sizing; aerosol spectrometer; chemical characterization of particles; fire produced particles; laser light scattering by aerosols; particle size measurements; particulates; refractive index; smoke detector.

This paper presents a brief overview of new light scattering methods for the rapid characterization of particulate matter in air. An instrument has been developed which determines the size distribution of particulate matter in air in essentially real time by a forward lobe light scattering method. The basic concept involves the simultaneous measurement of the intensity of light scattered by a single particle at two small scattering angles. The ratio of the two intensities is a direct measure of the size and is fairly independent of the index of refraction of the particle. Numerical solutions of the Mie equations for spheres have indicated that the sizing error by this method is not greater than ± 15 percent for the range of particle sizes from 0.2 to 4 μm for essentially all possible indices of refraction. In addition, it appears feasible to extend the lower limit of size determination to 0.05 μm by the measurement of a single forward lobe intensity. Also, a technique has been developed which permits some degree of chemical characterization of particles, and which has been employed in a smoke detector capable of distinguishing between fire-produced and nonfire-produced aerosols.

Flow apparatus for the characterization of aerosols, M. B. Ranade, *SP412*, pp. 33-40 (Oct. 1974).

Key words: aerosol size measurements; aerosol spectrometer; aerosol sprays; condensation on aerosol droplets; evaporation of aerosol droplets; laser light scattering by aerosols; therapeutic aerosols.

A flow apparatus has been developed to enable the size measurement of liquid aerosols to be measured under defined conditions with the help of a light scattering technique. This apparatus was used to study the evaporative behavior of submicron aqueous aerosols during transportation in air. The apparatus is currently being used to characterize large (~ 50 μm) aerosol particles under sedimentation. Portable versions of the flow apparatus are presently

under development to characterize acid mist droplets, and to investigate the characteristics of therapeutic aerosols.

360° scattering diagrams from individual aerosols in a flowing stream, T. R. Marshall, C. S. Parmenter, and M. Seaver, *SP412*, pp. 41-56 (Oct. 1974).

Key words: aerosol light scattering; aerosol size measurements; aerosol spectrometer; aerosol sprays; laser light scattering by aerosols; refractive index; scattering diagrams; 360° scattering by particles.

Nearly complete 360° scattering diagrams have been obtained from each of a large number of individual aerosols which stream in an air sheath through a laser beam. A computer analysis of diagrams from a "monodisperse" aerosol (polystyrene spheres with mean diameter near 1.2 μm) shows that *both* diameter and refractive index can be determined from each scattering diagram to compile a statistical characterization of the aerosol. Diameter precision is about 0.4 percent and the refractive index can be determined to within 0.7 percent.

The method is clearly a practical approach to routine characterization of aerosol sprays containing spherical particles whose diameters range from about 0.3 μm to at least 20 μm. The refractive index determination will reveal differences between particle composition and bulk composition of the parent material as well as composition changes during aging of aerosol sprays.

Active scattering aerosol spectrometry, R. G. Knollenberg, *SP412*, pp. 57-64 (Oct. 1974).

Key words: aerosol light scattering; aerosol sizing; aerosol spectrometer; cloud droplet measurements; interferometer; laser imaging of particles; laser light scattering by aerosols; particle size measurements.

An active scattering aerosol spectrometer is one that uses the active open cavity of a laser as the source of particle illumination. The interferometric aspects of the oscillating radiation illuminating the particles produces both forward and backward scattered radiation at all collecting angles. This, coupled with the fact that the collecting optics solid angle can be considerably greater than one steradian, and an extremely intense source, results in a system with an extremely high sensitivity, fully capable of sizing particles several hundred Angstroms diameter using solid state silicon detectors.

Rapid measurement of droplet size distributions by optical heterodyne spectroscopy, I. Chabay, *SP412*, pp. 65-72 (Oct. 1974).

Key words: aerosol cloud chamber; aerosol light scattering; aerosol size measurements; aerosol spectrometer; cloud droplet measurements; Doppler measurements of particle size; laser heterodyne; laser scattering by aerosol particles; particle sizing.

A new technique which allows rapid, direct determination of particle size distributions by measurement of the Doppler shift of laser light scattered by falling particles will be discussed. The technique has been successfully applied to the measurement of parameters associated with cloud droplet growth (from 1 to 10 micrometer radius) in a diffusion cloud chamber. Applications to other types of particles in the size range 0.5-50 micrometers radius will be pointed out.

Measurements of aerosol size distributions with a laser Doppler velocimeter (LDV), W. J. Yanta, *SP412*, pp. 73-88 (Oct. 1974).

Key words: aerosol sizing; aerosol spectrometer; aerosol sprays; Doppler measurements of particle size; droplet sizing; interferometer; laser light scattering by aerosols; particle size measurements; particle velocity measurements.

A miniature wind tunnel has been built which together with the Laser Doppler Velocimeter (LDV) has been used to determine aerosol size distributions. In principle the LDV was used to measure the particle lag of individual aerosol particles as they were accelerated through a small supersonic nozzle. The measured velocity lag was then used in conjunction with numerical predictions to determine the particle size. An optical owl was used to determine the mean of the size distributions. The LDV measurements were in good agreement with the owl measurements.

An optical transform technique for measuring the size distribution of particles in fluids, A. McSweeney, *SP412*, pp. 89-96 (Oct. 1974).

Key words: aerosol light scattering; aerosol sizing; aerosol spectrometer; laser light scattering by aerosols; optical transform; particle size measurements.

Real-time inversion of the data obtained from the total diffraction pattern due to particles in a relatively large volume yields a measure of the size distribution of the particles. A significant advantage of this technique is that the sample volume may be large, removing the requirement for piping the sample through small tubes. This technique may be applied to particles in gases, in liquids, or on microscope slides.

Sizing aerosols in real time by pulsing UV laser machine, G. A. Hotham, *SP412*, pp. 97-126 (Oct. 1974).

Key words: aerosol impact studies; aerosol sizing; aerosol spectrometer; aerosol sprays; laser holography; laser imaging of particles.

A new laser machine will be described which utilizes a pulsing UV laser to produce "instantaneous" images of aerosol droplets on a TV screen in real time. With this instrument it is possible to measure from 0.3 to 1000 micrometers.

Rapid respirable mass measurement, L. Doemeny, G. Carson, and B. Almich, *SP412*, pp. 127-136 (Oct. 1974).

Key words: aerosol size measurements; beta absorption; cascade impactor; coal dust monitor; dust inhalation hazards; environmental sampler; respirable dust sampler.

The respirable mass concept of dust sampling will be used to introduce the GCA Corporation, beta absorption particulate aerosol sampler. NIOSH has extensively evaluated the GCA instrument as a coal dust monitor and is beginning to apply it to the sampling of other aerosols. The evaluation included mass loading, accuracy and environmental simulations. Other sampling methods which look promising will be discussed.

Particulate mass measurement by piezoelectric crystal, R. L. Chuan, *SP412*, pp. 137-148 (Oct. 1974).

Key words: aerosol sizing; cascade impactor; particle detection by impaction; particle size measurements; piezoelectric crystal; quartz crystal microscope.

An adhesive-coated quartz crystal working as the impaction surface capturing particulates from decelerating jets measures mass by frequency change, to a sensitivity of 10^9 Hz gm^{-1}. The scheme is applied to a number of working instruments which measure continuously and directly particulate mass concentration, and particulate mass distribution (by using the devices in a cascade).

Development, calibration and application of size distribution instruments at the University of Minnesota, V. A. Marple, *SP412*, pp. 149-173 (Oct. 1974).

Key words: aerosol electrical analyzer; aerosol generators; aerosol instrument calibration; aerosol size measurements; aerosol spectrometer; aerosol sprays; nuclei counters; particle generators; particle size measurements; particle size measurements by electromobility; particle standards.

Work with size distribution instruments has been in the areas of development, calibration, and application. Instruments have been developed in the area of particle size determination, such as the electrical aerosol analyzer, and in the area of monodisperse particle generation, such as the vibrating orifice generator and the differential mobility analyzer. These aerosol generators, along with new techniques, have been used to calibrate a variety of aerosol measuring instruments such as optical particle counters, nuclei counters, and the electrical aerosol analyzer. These instruments have then been used to study a range of particle types, from fairly ideal particles such as atmospheric aerosols to very nonideal particles such as coal dust.

SP413, 1976 Edition. **Special technical facilities at the National Bureau of Standards,** H. L. Mason and I. M. Lloyd, Eds., (Supersedes NBS Special Publication 413, 1975 Edition), *Nat. Bur. Stand. (U.S.), Spec. Publ. 413, 1976 Edition,* 50 pages (Mar. 1976) SD Catalog No. C13.10:413/1976 Ed..

Key words: accelerators; acoustic facilities; calorimeters; electrical measurements facilities; high pressure facilities; high temperature facilities; spectroscopy facilities.

Among the major technical facilities of the NBS laboratories in Gaithersburg, Md., and Boulder, Colo., are some which are unique and many which feature equipment that is relatively uncommon. These important resources deserve to be more widely known and used by the scientific and engineering community, including the Bureau's own staff, other Government agencies, industrial research associates, academic researchers, and postdoctoral fellows. Those facilities which are available for shared use, either occasional or extended, are briefly described in the pages of this publication.

SP414. **Laser induced damage in optical materials: 1974.** Proceedings of a Symposium Sponsored by Office of Naval Research, The American Society for Testing and Materials, and by the National Bureau of Standards, May 22-23, 1974, NBS, Boulder, Colo., 80302, A. J. Glass and A. H. Guenther, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 414, 256 pages (Dec. 1974) SD Catalog No. C13.10:414.

Key words: IR windows and mirrors; laser damage; laser materials; self-focusing; thin films.

The Sixth ASTM-ONR-NBS Symposium on Laser Induced Damage in Optical Materials was held at the National Bureau of Standards in Boulder, Colo., on May 22-23, of this year. These Symposia are held as part of the activities in Subcommittee II on Lasers and Laser Materials, of the ASTM. Subcommittee II is charged with the responsibilities of formulating standards and test procedures for laser materials, components, and devices. The Chairman of Subcommittee II is Haynes Lee, of Owens-Illinois, Inc. Co-chairmen for the Damage Symposia are Dr. Arthur Guenther, Chief Scientist of the Air Force Weapons Laboratory, and Dr. Alexander J. Glass, Head, Theoretical Studies, Y Division, Lawrence Livermore Laboratory.

Over 150 attendees at the Symposium heard 31 papers on topics relating to laser induced damage in crystalline and non-linear optical materials, at dielectric surfaces, and in thin film coatings as well as discussions of damage problems in the infrared region due both to cw and pulsed irradiation. In addition, several reports on the theoretical analysis of laser-materials interaction relative to the damage process were given, along with tabulations of fundamental materials properties of importance in evaluation of optical material response to high power laser radiation. Attention was given to high power laser system design considerations which relate to improved system performance and reliability when various damage mechanisms are operable in such systems.

Because of the growing importance and acceptance of machined components in high power laser systems, a workshop on the machining of optics was held, under the coordination of Captain T. T. Saito of the Air Force Weapons Laboratory. Nine papers on various facets of the topic were presented dealing with machining procedures, surface characterization of machined elements, coating of machined components, and the polishing and damage resistance of polished, coated, and bare metal reflectors. Abstracts on these papers are included in the Symposium Proceedings proper.

The proceedings of these Symposia represent the major sources of information in the field of laser induced damage in optical materials. The Symposia themselves, along with the periodic meetings of Subcommittee II, provide a unique forum for the exchange of information regarding laser materials specifications among the manufacturers and users of laser devices, components, and systems. The Symposia also serve as a mechanism of information gathering to enable the Subcommittee to write informed and realistic specifications. *These proceedings include the following papers (indented):*

Laser beam divergence and damage in glass amplifiers, K. A. Brueckner, B. Guscott, S. Jorna, K. Moncur, and L. Siebert, *SP414,* pp. 2-6 (Dec. 1974).

Key words: apodizers; glass lasers; self-focusing.

The power limit in glass amplifiers is determined by the onset of nonacceptable beam distortion of self-focusing leading to glass damage, which results from the power-dependent index in the glass. Self-phase modulation due to the variation of index with power also can at very high power result in pulse distortion and gain loss. These effects can be analyzed quantitatively by integration of Maxwell's equations together with the equation for gain variation of the lasing medium. Under conditions of rapid intensity change, diffraction effects can be ignored and the eikonal equation used to determine beam propagation.

To study these problems for small amplitude disturbances we have analyzed the equations using dispersion theory. For larger amplitudes we have developed several computer codes which allow exact simulation of the laser system and of selected components which are essential for control of the beam intensity.

The intensity of the laser beam must be carefully controlled to avoid both large scale and small scale effects. The large scale effects which increase beam divergence result from the initial beam radial intensity variation combined with nonuniform gain in the laser amplifiers. The small scale effects usually result from diffraction and interference and can be minimized by reducing interference effects as far as possible. This can best be done by the use of graduated or "soft" apertures placed at critical points in the beam. The beam intensity profile can also be controlled by the use of attenuators with graduated transmission.

These techniques offer highly flexible and effective control of the laser beam and allow operation well above 5 GW/cm^2.

Nonlinear propagation studies, E. S. Bliss, *SP414,* pp. 7-16 (Dec. 1974).

Key words: apodization; beam breakup; instability theory; nonlinear propagation; propagation codes; self-focusing.

The desire to avoid damaging the components of high-power solid-state laser-systems being built for laser fusion experiments has led to increased interest in all aspects of in-

tense pulse propagation. This paper describes a variety of observations of nonlinear propagation phenomena and the instrumentation used for measuring them, presents comparisons with theoretical predictions, and outlines some approaches to minimization of the resulting problems in large systems. The intent of the paper is to present an up-to-date summary of the progress being made in characterizing and controlling nonlinear propagation effects.

Suppression of parasitic oscillation in laser rod amplifiers, J. M. McMahon, R. P. Burns, and T. H. DeRieux, *SP414*, pp. 17-22 (Dec. 1974).

Key words: disc lasers; laser amplifiers; laser design; parasitic suppression.

The most common glass laser rod amplifier geometry is one in which the laser rod is centered in glass water jacket and pumped by Xenon flashlamps surrounding the water jacket. By suppressing parasitic modes in the amplifier much higher gains can be realized than previously achieved with a consequent increase in the short pulse damage threshold. 30-50 percent improvements have been attained in the NRL system and factor of two improvements are possible.

Optical requirements for laser mirrors, H. E. Bennett and P. C. Archibald, *SP414*, pp. 23-30 (Dec. 1974).

Key words: infrared absorption; laser damage; laser mirror; laser optical train; laser window; microroughness; optical figure; scattered light.

The surface and coating requirements for mirrors used in laser systems are very severe. They may be summarized as follows: (1) excellent figure under thermal load, (2) high catastrophic damage threshold and an absence of localized sites where damage is likely to occur, and (3) low scattering levels. Backscattering is particularly important since it can easily damage the laser itself. The figure requirements for components increase rapidly when multicomponent "real world" optical trains are used. For example, to satisfy Maréchal's criterion for a 10 component system used at a wavelength of 3.8 μm, each component must have an initial figure of approximately 1/8th wave in the visible region and thermal distortion over the surface of less than 1000 Å. Very high reflectance coatings with excellent uniformity are thus required. Light scattering at short wavelengths provides a powerful, nondestructive tool for measuring microroughness (which reduces the infrared reflectance of metal coatings), and for identifying potential sites where damage is likely to occur. The damage threshold of a metal mirror is not necessarily determined by its absorption, and our understanding of the laser mirror problem is still incomplete.

Diffraction theory of absorbing windows, M. Flannery and J. Marburger, *SP414*, pp. 31-38 (Dec. 1974).

Key words: birefringence; laser windows; thermal distortion.

The diffraction-optical theory of coherent polarized beams incident on realistic absorbing windows is developed here with emphasis on tracing the origin of qualitative features of the diffraction field. The influence of incident polarization, stress induced birefringence, and other parameters, on the transmitted beam is described, and both analytical and numerical solutions for the transmitted diffraction field are presented. Our development of the theory allows the influence of the window material to be characterized by two parameters in the transient regime rather than the three previously believed to be necessary. Implications for IR window design are summarized.

Damage resistance of dielectric reflectors for picosecond pulses, B. E. Newnam, *SP414*, pp. 39-47 (Dec. 1974).

Key words: damage thresholds; dielectric reflector; laser-induced scatter; picosecond pulses; spark thresholds; thin films; weak-signal scatter.

A state-of-the-art survey has been conducted to determine the range of damage thresholds of electron-gun-produced dielectric reflectors irradiated by 30-ps laser pulses at 1.06 μm. Seven commercial coating companies, experienced in producing refractory-oxide coatings, supplied total reflectors of a specified TiO_2/SiO_2 design deposited on low-scatter glass substrates provided by LASL. Optional reflectors of ZrO_2/SiO_2 were also evaluated. Single-shot thresholds were determined by laser-induced scatter and photoelectric detection of spark radiation. Thresholds of TiO_2/SiO_2 reflectors ranged from 1 to 4 J/cm^2; those for ZrO_2/SiO_2 reflectors ranged from 0.5 to 2 J/cm^2. Reflectors which exhibited a large amount of diffuse, weak-signal scatter generally had low thresholds.

Damage studies at 1.06 μm with 100-200 ps pulses, G. W. Leppelmeier and M. Finkelstein, *SP414*, pp. 48-52 (Dec. 1974).

Key words: laser damage; mirror damage; thin films.

Studies have been conducted of the damage threshold at 1.06 μm of multilayer dielectric films used as polarizing beamsplitters, mirrors, and anti-reflection coatings, $K(H_xD_{2-x})PO_4$, several high Verdet constant glasses, and micromachined silver. The laser pulse used had less than 4 percent spatial and temporal ripple. Pulse energy of up to 1 joule permitted using a collimated beam. Damage thresholds in the range 1-5 J/cm^2 were obtained.

Damage thresholds in ZnSe, A/R coated NaCl and micromachined mirrors by 10.6 μm multijoule, nanosecond pulses, E. E. Stark, Jr., and W. H. Reichelt, *SP414*, pp. 53-58 (Dec. 1974).

Key words: A/R coatings; damage thresholds; machined mirrors; ZnSe.

Multijoule, nanosecond pulses at 10.6 μm were used to determine the damage thresholds of uncoated and antireflection (A/R) coated ZnSe, A/R coated NaCl and micromachined mirrors. The ZnSe results indicate that the A/R coatings have a higher damage threshold than the bulk material. Antireflection coatings on NaCl were found to have a damage threshold slightly lower than uncoated NaCl. Damage thresholds for micromachined copper and gold are greater than 4 joules/cm^2.

Pulsed CO_2 laser damage in windows, reflectors, and coatings, V. Wang, J. E. Rudisill, C. R. Giuliano, M. Braunstein, and A. Braunstein, *SP414*, pp. 59-65 (Dec. 1974).

Key words: As_2S_3; laser coatings; laser reflectors; laser windows; pulsed CO_2 laser damage, ThF_4; ZnSe.

Recent 10.6 μm damage measurements using a TEM_{oo} laser of 0.6 μsec pulse length are reported for a variety of windows, reflectors, and coatings. Reduction of the density of inclusions in ZnSe was found to have a large effect upon scatter but a smaller effect upon damage resistance. Absorptions and damage thresholds of thin films of ZnSe, As_2S_3 and ThF_4 were measured upon relatively defect-free KCl substrates, and then tested in antireflection and multilayer reflector configurations. Also reported is a five-fold increase in damage resistance of simple polished copper reflectors by surface etching.

Pulsed CO_2 laser damage studies of RAP grown KCl, S. D. Allen, M. Braunstein, C. Giuliano, and V. Wang, *SP414*, pp. 66-75 (Dec. 1974).

Key words: etch-polishing; KCl; laser damage; laser windows; RAP; 10.6 μm.

Laser damage thresholds in high purity RAP (Reactive Atmosphere Processing) KCl were measured as a function of surface and bulk processing techniques. Single crystal and press forged material was prepared in a "conventionally" polished and HCl etch-polished manner and the bulk and surface damage thresholds measured and correlated with absorption (cw CO_2 laser calorimeter), Auger, LEED and SEM data. The damage measurements were made with a TEM_{oo} CO_2 TEA laser with a 0.6 μsec pulse length.

A comparison of 10.6 μm pulsed laser damage in sputtered vs electron beam deposited Ge-coated KCl, A. Golubovic, W. Ewing, J. Bruce, J. Comer, and D. Milan, *SP414*, pp. 76-84 (Dec. 1974).

Key words: characterization of laser damage; e-beam deposition of germanium; germanium coating; laser damage mechanism; laser induced damage; multiple beam damage apparatus; potassium chloride; sputtering of germanium.

Germanium films deposited on KCl substrates by electron beam and sputter techniques have been irradiated at 10.6 μm. A comparative damage study of germanium films prepared by these techniques under pulsed irradiation is reported. A novel mulitple beam pulsed laser damage apparatus was used for this study. Well characterized RAP Bridgeman and Czochralski grown KCl substrates with (100) and (111) orientation were used.

10.6 μm pulsed laser damage in ZnSe, H. Posen, J. Bruce, and D. Milam, *SP414*, pp. 85-92 (Dec. 1974).

Key words: CO_2 pulsed laser damage; damage threshold; laser windows; twin structure; zinc selenide.

The effect of 10.6 μm pulsed laser radiation on large grain ZnSe is examined with respect to the local crystallography of the material. In particular, the presence of twin boundaries, a common defect in II-VI materials, is shown to have very little effect on the damage threshold. Damage effects were monitored by Nomarski interference contrast microscopy, electron microscopy and x-ray topography.

Evaluation of single crystal $LaCl_3$ AS CO_2 laser window material, F. Varsanyi and L. G. DeShazer, *SP414*, p. 93 (Dec. 1974).

Key words: absorption coefficient; infrared materials; $LaCl_3$. thin film material.

We report calorimetric measurements of the $LaCl_3$ absorption coefficient at 10.6 μm. Single crystal $LaCl_3$ of substantial size (one inch diameter, two or more inches long) were grown repeatedly in our laboratories in the past years, mostly for spectroscopic purposes. $LaCl_3$ is transparent in the visible extending up to 25 μm and, if pure, is only slightly hygroscopic. Its phonon spectrum has been well investigated and terminates around 260 cm^{-1}. A rather elaborate program of mechanical and optical property evaluation was initiated. In the preliminary experiments reported here, we studied a $LaCl_3$ single crystal ($2 \times 11 \times 12$ mm) with a CO_2 laser. We feel $LaCl_3$ compares favorably with KCl as a laser window material, but without some of its problems.

Laser window damage from CW 10.6-μm radiation, J. S. Loomis and C. A. Huguley, *SP414*, pp. 94-102 (Dec. 1974).

Key words: CO_2 laser radiation; CW laser damage; infrared windows; KCl; NaCl; optical distortion; ZnSe.

Damage studies have been conducted using a CW, one-kilowatt CO_2 laser. Some analytic calculation of local temperature rise as a function of laser power, spot size, and irradiation time will be discussed. Results of optical distortion and stress-field observations on uncoated and coated samples of KCl, NaCl, and ZnSe are reported.

10.6 micrometer CW laser damage studies of metal substrate mirrors, T. T. Saito, G. B. Charlton, and J. S. Loomis, *SP414*, pp. 103-112 (Dec. 1974).

Key words: CW laser damage; diamond turned optics; dielectric enhanced metal mirrors; laser beam characterization; metal mirrors.

The CW damage properties of metal substrate mirrors were studied by focusing a 1 KW CW CO_2 laser onto the mirrors. Mirrors studies included polished and diamond machined bare metals, noble metal evaporated coatings, electroplated and then machined metals, and dielectric coated. Experimentally determined damage thresholds and damage statistics are discussed. Extensive efforts to characterize beam area of focused kilowatt beam is included. Evidence of a self-cleaning of mirrors by slowly raising laser power is described. Dust on mirrors reduces the damage threshold below 100 W/cm^2.

High absorption damage in infrared filters, W. S. Otaguro, *SP414*, pp. 113-118 (Dec. 1974).

Key words: high absorption damage; infrared filters; laser-induced damage.

The damage morphology, degradation of filter transmission, and thresholds for damage of infrared filters subjected to a hostile environment where the radiation incident on the filters includes high power densities in a wavelength region of high absorption have been examined. Infrared filters cooled to 10 kelvin exhibited damage thresholds at 5 megawatts per square centimeter when illuminated with a Q-switched ruby laser. A thermodynamic model based on intrinsic absorption of the material composing the multilayer coatings is compared to the measured damage thresholds.

Q-switched laser induced surface damage at 1.06 microns, N. L. Boling, J. A. Ringlien, and G. Dubé, *SP414*, pp. 119-130 (Dec. 1974).

Key words: electron avalanche; laser; laser induced damage.

Our studies of the effect of "superpolishing" on the surface damage threshold indicate that such polishing does not increase the practical threshold on ED-2 glass. Impurities introduced in the polishing process often outweigh any advantages that might be gained in longer polishing to reduce geometrical defects.

On commercially available, "conventionally" polished laser glass, the surface threshold is about 150 J/cm^2 (5 GW/cm^2). This is at least an order of magnitude below the intrinsic bulk threshold. Some problems encountered in using small beams to measure the surface-to-bulk ratio are discussedd.

The effect of treating ED-2 laser glass with boiling nitric acid is also briefly described. This treatment can permanently raise the threshold by as much as a factor of three, while leaving the surface in good optical condition. The efficacy of the treatment is highly dependent on the polishing history of the sample.

Damage in nonlinear optical materials at 1.06 μm: Surface treatment of $LiNbO_3$ in Ar-O_2 plasmas and high pressure O_2 environment, J. C. Potosky and C. R. Giuliano, *SP414*, pp. 131-134 (Dec. 1974).

Key words: $LiNbO_3$; 1.06 μm; oxygen deficiency; surface damage; surface treatment.

Surface damage in $LiNbO_3$ has been studied at 1.06 μm as a function of different surface treatments. While the use of ion beam polishing on $LiNbO_3$ has resulted in general degradation of surface finish and decrease in damage resistance, a different type of plasma treatment shows a distinct improvement. This method of surface treatment is one in which the sample is bombarded in a low energy rf-excited plasma of argon and oxygen. Under this type of plasma treatment, the damage resistance is substantially improved ($\sim 50\%$) over that of the conventionally polished surface of the same sample. To avoid complications of possible cumulative effects in the damage experiments, each point on the surface is laser irradiated only once at any given power. The results are presented in terms of the fraction of surface which resists damage for a given incident energy.

That this improvement in threshold involves a surface-oxygen effect is supported by another series of preliminary measurements in which damage tests were performed on $LiNbO_3$ at 10 to 15 atm O_2 pressure. Under these conditions, the surface was usually seen to completely resist damage at levels of irradiation at least twice that at which damage occurred at ambient conditions or in a high pressure nitrogen environment.

Surface characteristics related to laser damage of lithium niobate and potassium chloride surfaces, J. O. Porteus, E. A. Teppo, and J. H. Dancy, *SP414*, pp. 135-140 (Dec. 1974).

Key words: Auger electron spectroscopy; ion beam profiling; laser-induced damage; lithium niobate; potassium chloride; surface acoustic waves; surface characterization; transmission electron microscopy.

Laser damage of transparent materials is promoted by irregularities in topography and surface composition. Changes in these characteristics following laser irradiation can provide insight on damage mechanisms. Transmission electron micrographs of replicated $LiNbO_3$ surfaces which have been chemically etched show submicroscopic pitting similar to that previously observed following laser irradiation. Experiments designed to explore a possible role of surface-acoustic waves in the laser-induced pitting are in progress. Auger analysis of coated $LiNbO_3$ surfaces following visible laser damage have helped to identify redistributed surface material. Profiling of the coating shows evidence of C contamination layers near the substrate surface. Preliminary Auger spectra of KCl surfaces show promise for similar studies on this material.

Characterization of infrared laser window materials at the National Bureau of Standards, A. Feldman, I. Malitson, D. Horowitz, R. M. Waxler, and M. Dodge, *SP414*, pp. 141-148 (Dec. 1974).

Key words: As_2S_3; chalcogenide glass; coefficient of thermal expansion; elastic constants; infrared laser window materials; KCl; photoelasticity; polycrystalline ZnSe; refractive index; stress-optical constants; thermal coefficient of refractive index.

A program has been established for measuring refractive index, n, stress-optical constants, q_{ij}, change of index with temperature, dn/dT, thermal expansion coefficient, α, and elastic compliances, s_{ij}, of infrared laser window materials. These parameters are necessary for determining the optical distortion that occurs in windows due to heating by the absorption of high power laser radiation. n and dn/dT are measured over a spectral range 0.2 to 50 μm by the method of minimum deviation on precision spectrometers. Twyman-Green and Fizeau interferometers, which operate at 0.6328 μm, 1.15 μm, and 10.6 μm, are used for measuring q_{ij}, α, dn/dT and s_{ij}. Materials currently under study are polycrystalline ZnSe, As_2S_3 glass, chalcogenide glass (Ge 33%, As 12%, Se 55%), and KCl. Results are given for n and dn/dT in KCl, and q_{ij} and s_{12} in ZnSe, As_2S_3 glass, and chalcogenide glass.

Testing the surface quality of laser materials, M. J. Soileau and H. E. Bennett, *SP414*, pp. 149-156 (Dec. 1974).

Key words: laser damage; light scattering; optical surface quality; scratch detection.

Research presented at the 1973 Laser Damage Symposium clearly showed that surface microcracks and pits influence laser damage thresholds for optical materials. In addition, backscatter from laser amplifiers can result in damage to oscillator optics in high power oscillator-amplifier systems. The scratch and dig specifications presently used to specify optical surface quality are inadequate since (1) they address only the problem of surface irregularities larger than 2 μm (Bloembergen has shown theoretically that pits or scratches as small as 100 Å can significantly reduce damage thresholds), and (2) compliance is determined in a subjective manner. The relationship between surface quality and light scattering from transparent optical components is discussed, and an instrument for measuring bulk scattering and surface quality described. Quantitative measurements on a set of standard scratches and digs are presented, as well as measurements of surface imperfections and bulk scattering in optical materials used in infrared laser systems.

Statistical characterization of mirror and window surfaces, J. M. Bennett, *SP414*, pp. 157-162 (Dec. 1974).

Key words: autocovariance laser damage statistical characterization of surface; FECO interferometry; scattered light; surface roughness.

In order to evaluate the contribution of surface structure to laser damage and to calculate the magnitude and angular distribution of scattered light from laser mirrors, windows, and other optical surfaces, the autocovariance function, rms roughness and height distribution functions are required. These and other statistical parameters for optical surfaces can now be determined with a FECO Scanning Interferometer, which consists of a FECO interferometer, slow scan television camera, signal averager, minicomputer, and teletype. Wavelengths are measured at 512 equally spaced points along the length of an interference fringe (which contours irregularities on the optical surface under investigation). The fringe length corresponds to a total length of 1 mm on the interferometer surface. The statistics for the surface are obtained from the wavelength data. The system has the advantages that it does not depend on visual estimates of fringe width to yield a value of the rms roughness, and additional statistical information such as the autocovariance function and height distribution function can be obtained which cannot be determined visually.

Roughness measurement by light scattering, J. C. Stover, *SP414*, pp. 163-168 (Dec. 1974).

Key words: light scattering; sinusoidal grating diffraction; spatial spectral density function; surface roughness.

Theoretical and experimental descriptions of how light scatters from sinusoidal gratings lead to the relationship between light scattered from an arbitrary surface and the spatial power spectral density function of that surface. With an appropriate measurement system, this relationship lends

itself to studying the correlation between damage threshold and surface topography for surfaces in the 10 to 500 Å (rms) range. Experimental results are given for various types of sinusoidal gratings (variation in magnitude, frequency and material) and several arbitrary surfaces. Measurements of samples submitted by outside laboratories have been taken.

Laser-damage-mechanism identification by the measurement of survival times, D. Milam, R. A. Bradbury, R. H. Picard, and M. Bass, *SP414*, pp. 169-178 (Dec. 1974).

Key words: absorbing inclusions; absorption; bulk dielectrics; dielectric films; dielectric surfaces; electric field enhancement; electron-avalanche breakdown; laser-damage statistics.

The mechanism responsible for laser-induced damage can be determined from the statistical fluctuation in the times required to produce damage at many sites which were sequentially irradiated by equally-intense, square-waveform pulses. Damage mechanisms are readily separated into three general categories: (1) Homogeneous absorption, (2) damage due to material defects or inclusions, and (3) intrinsic damage due to electron-avalanche breakdown or other fast intrinsic mechanisms.

The dynamics of transmitted, reflected, and scattered laser pulses above and below damage threshold: The search for precatastrophic damage, C. R. Giuliano, *SP414*, pp. 179-189 (Dec. 1974).

Key words: back-scattering; precatastrophic damage; pulse dynamics; reflection; ruby laser; surface damage; temporal pulse monitoring; transmission; 0.694 μm.

This paper deals with a detailed study of the temporal shapes on a nanosecond time scale of laser pulses that are transmitted, back reflected, Brewster reflected, and backscattered at small angles for different powers below and above surface damage threshold. The sharp cutoff in transmitted light above damage threshold is accompanied by a corresponding cutoff in reflected light while the small angle backscattered light shows a sharp increase at the same time. The shapes of the transmitted and reflected pulses are essentially the same over a wide range of powers from below damage threshold to ~ 10x above threshold. The small angle backscattered intensity is the most sensitive measure of the very onset of surface damage in that while the transmitted pulse shows essentially no change in shape for powers slightly above damage threshold, the backscattered component shows a marked increase in intensity. These results, along with the intensity dependence of Brewster reflected pulses, are discussed in terms of possible precatastrophic damage effects.

Rutherford backscattering diagnostics of laser-irradiated GaAs, R. R. Hart, C. R. Giuliano, and H. L. Dunlap, *SP414*, pp. 190-192 (Dec. 1974).

Key words: ion channeling; laser-damaged GaAs; Rutherford backscattering; scattering centers.

The Rutherford backscattering of 280 keV He^{++} has been used to study the amount and depth distribution of lattice disorder introduced in GaAs by intense laser irradiation. The lattice remains largely intact after irradiation at a laser power level of three times the damage threshold (optical) except within a 175 Å surface layer. In this surface layer the number of scattering centers increases to about 2.5 times the number of Ga and As atoms present in the surface oxide on undamaged GaAs.

Surface defects on crystals of TiO_2 and YVO_4 studied by laser-induced damage effects, K. M. Leung and L. G. DeShazer, *SP414*, pp. 193-199 (Dec. 1974).

Key words: damage morphology; polishing compounds; spot-size dependence; surface defects; rutile crystal damage; yttrium orthovanadate crystal damage.

The nature of surface defects on single crystals of rutile (TiO_2) and yttrium orthovanadate (YVO_4) was investigated by laser-induced damage effects using a TEM_{00} Q-switched ruby laser. It was demonstrated that damage to these crystal surfaces can be distinguished as defect damage and intrinsic damage, where the damage thresholds decreased with increasing focal spot-size of the laser beam. The dependence on the directions of crystallographic axes and electric field was studied. The morphology of the surface damage sites was examined by the scanning electron microscope revealing that polishing imperfections were the cause of damage on TiO_2 surface and inclusions were the cause of damage in the case of YVO_4.

Pulsed CO_2 laser window damage processes, R. A. Shatas, J. D. Stettler, L. M. Narducci, S. S. Mitra, and H. C. Meyer, *SP414*, pp. 200-206 (Dec. 1974).

Key words: damage threshold of GaAs; extended Shockley avalanche; pulsed laser damage; semiconductor infrared windows; solid state plasma; two-stream instability threshold.

We examine the applicability of the extended avalanche breakdown process to describe the semiconductor window surface damage by pulsed high pressure CO_2 lasers. In the extension to optical frequencies of Shockley's avalanche theory construed originally for a dc electric field, a hard momentum-reversing collision of the free carrier is required to occur at the instant of optical field reversal. In contrast to alkali halides, the mobility is very high in semiconductors, and the probability of a momentum-reversing collision is too small to account for experimental observations of damage thresholds. Alternate models of damage processes are discussed. They are based on quantum mechanical photon assisted tunneling probability calculations between the bound and the quasi-free states and resonant collective excitations of carriers in the quasi-free state. Theoretical predictions for maximum pulsed CO_2 laser fluxes are made for some typical semiconducting window materials.

Frequency dependence of the nonlinear optical susceptibility of five glasses, R. Hellwarth, J. Cherlow, and T-T. Yang, *SP414*, pp. 207-213 (Dec. 1974).

Key words: ac Kerr effect; glasses; nonlinear optical effects; nonlinear optical susceptibility; self-focusing; three-wave mixing.

The frequency dependence of the nonlinear susceptibility throughout the optical region of fused quartz, ED-4, LSO, SF-7, and LaSF-7 glasses is derived in a novel and useful form from Raman-scattering and intensity-induced polarization change measurements.

The refractive index dependence of pulsed laser induced damage, J. R. Bettis, A. H. Guenther, and A. J. Glass, *SP414* pp. 214-218 (Dec. 1974).

Key words: bulk; electro-absorption; electron avalanche laser damage; local field corrections; refractive index; surfaces; thin films.

The dependence of the laser induced damage threshold on refractive index has been investigated. A simple theoretical

expression, based upon several factors such as the local electric field and avalanche mechanisms, has been derived. Comparison is made with several series of previously published results to verify the proposed dependence. Strikingly good agreement is obtained between theory and experiment for materials with refractive indices ranging from 1.38 to 2.36. The available experimental data used for comparison were obtained (1) on the surface of uncoated dielectrics, (2) in the bulk of alkali halides, (3) with $\lambda/4$ dielectric coatings and (4) with vapor phase mixture thin films. Extrapolations of these results to conditions for air at STP give remarkable agreement with reported values of pulsed laser induced air breakdown.

Extrinsic absorption in laser window materials, C. J. Duthler and M. Sparks, *SP414,* pp. 219-226 (Dec. 1974).

Key words: absorbing inclusions; alkali halides; impurity absorption; laser damage.

Two types of extrinsic absorption are discussed. First, our calculations on absorbing inclusions, presented at the 1973 symposium, have been extended to explain the cone-shaped surface pits observed by Boling. For a spherical inclusion of radius a located a distance d below the surface, the cone half-angle is $\theta_m = \cos^{-1}(a/d)$. The second type of absorption is that due to polyatomic molecular-ion impurities in alkali halides. A literature survey indicates that concentrations of less than 0.1 ppm of NO_2^-, HCO_3^-, SO_4^{2-}, or CrO_4^{2-} will result in a bulk absorption coefficient $\beta(10.6\ \mu m) > 10^{-4\ cm-1}$.

SP415. **Biomaterials.** Proceedings of a Symposium held in conjunction with the Ninth Annual Meeting of the Association for the Advancement of Medical Instrumentation, New Orleans, April 19-20, 1974, E. Horowitz and J. L. Torgesen, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 415, 109 pages (May 1975) SD Catalog No. C13.10:415.

Key words: biocompatibility; biomaterials; blood protein; ceramic implants; implantable electrodes; metallic implants; nerve prosthesis; synthetic implants; thromboresistance.

This volume is based on papers presented at the Symposium on Biomaterials, held in conjunction with the Ninth Annual Meeting of the Association for the Advancement of Medical Instrumentation, New Orleans, LA, April 19-20, 1974. It provides a review of special topics in biomaterials research selected to focus attention on some noteworthy achievements. The topics covered include plasma-polymerized polymers and their application in biomedicine; biocompatibility of ceramic materials and their application both as inert coatings for synthetic implants and as porous materials for bone repair; the selection of metallic implant materials through engineering and medical considerations; in vitro testing of thromboresistance; adsorption of blood proteins on synthetic substrates; a prosthesis for nerve regeneration; and properties of fibrous biomaterials. *These proceedings include the following papers (indented):*

Plasma formed polymers for biomedical application. Part I. Synthesis and fundamental studies, K. G. Mayhan, A. W. Hahn, M. R. Havens, and B. W. Peace, *SP415,* pp. 1-12 (May 1975).

Key words: plasma-formed polymers; polymer films; polymerization; polymer permeability.

The deposition of polymeric coatings through Rf plasma techniques is a unique process from several points of view. By introducing monomeric gases into an inert gas Rf plasma, the monomers are converted to ultrathin continuous polymer films. These films can be made to vary in thickness from less than 1 μm to 10 μm or more. These materials are insoluble to common organic solvents and are not attacked by strong mineral acids. In addition, the monomeric materials in the reactor are distilled gases and are therefore quite pure in comparison to monomers used for ordinary linear polymerizations. As a result, the polymer coatings which are formed do not contain residual catalysts or activists and are in a highly purified state. We have utilized the plasma polymerization process to produce polymer films intended for biomedical application. Plasma coatings have been formed from a wide variety of monomers. These coatings have been applied to various nonmetallic, metallic and organic substrates. In each instance it was found that continuous adherent films could be deposited after suitable substrate preparation and reactor operation parameters were established. It has been our experience that a general cleaning procedure for all substrates cannot be dictated and that the preparative steps involved are dictated by the environment to which the final product will be subjected.

Plasma-formed polymers for biomedical applications. Part II. Biocompatibility and applications, A. W. Hahn, K. G. Mayhan, J. R. Easley, and C. W. Sanders, *SP415,* pp. 13-17 (May 1975).

Key words: biocompatibility; inflammatory response; plasma polymers; tissue reaction.

Different polymer films generated by rf plasma techniques and deposited on glasses of varying chemical composition, on implant alloys, and on formed prosthetic polymers have been implanted in New Zealand white rabbits and various canine species and have shown minimum tissue reactions after periods of time up to six months. It has further been found that the substrates upon which the plasma polymers are formed are more detrimental to cell cultures than the polymers themselves. These findings, along with other implant work, indicate that plasma-formed polymers will play a definite role as biocompatible materials in the future.

Interfacial behavior of ceramic implants, L. L. Hench, H. A. Paschall, W. C. Allen, and G. Piotrowski, *SP415,* pp. 19-36 (May 1975).

Key words: bioglass-ceramic; ceramic implants; flame spray coating; hip prosthesis; segmental bone replacement.

Recent studies of bioglass, bioglass-ceramic, and alumina implants have produced an understanding of the chemical nature of interfacial tissue reactions to bioceramics. Significant differences between hard and soft tissue reactions are due to the influence of surface chemical reactivity on the ultrastructural histology as revealed by transmission electron microscopy. Modern surface characterization of the implants correlates with the histological reactions. Applications of the results to a variety of orthopaedic prostheses show promise in animal experiments. Biomechanical analyses of interfacial bonding between bioceramic prostheses and tissues are presented.

Soft tissue response to a series of dense ceramic materials and two clinically used biomaterials, W. C. Richardson, Jr., S. F. Hulbert, J. J. Klawitter, and B. W. Sauer, *SP415,* pp. 37-44 (May 1975).

Key words: biocompatibility; ceramic implants; histological evaluation; implant characterization.

Disc-shaped implants of spinel, alumina, mullite, zircon, a cast Co-Cr-Mo alloy, and ultra-high molecular weight polyethylene (UHMWPE) were implanted in the paraspinalis muscle of twelve adult, male, White New Zealand rabbits. Prior to implantation the implants were charac-

terized with respect to size and shape, weight and surface roughness. After periods of 1 month, 2 months, and 4 months the rabbits were sacrificed and the tissue specimens were retrieved with the implants still intact. Histological examination of the tissues surrounding the implants along with changes in the size and shape, weight, and surface roughness of the implants were used as criteria for evaluating these materials for implant purposes.

No surface degradation of any of the materials was detected using scanning electron microscopy. Fibrous tissue seems to adhere to the UHMWPE implants more than any other material used in this study. Large amounts of fibrous tissue were also found to adhere to the cast Co-Cr-Mo alloy implants.

The histological results indicated that within the limits of this investigation, the biocompatibility of the ceramic materials used in this study compares favorably with the clinically used cast Co-Cr-Mo alloy implants and the UHMWPE implants.

Engineering and biological studies of metallic implant materials, N. D. Greene, C. Onkelinx, L. J. Richelle, and P. A. Ward, *SP415*, pp. 45-54 (May 1975).

Key words: corrosion; inflammatory response; metallic implants; systemic effects.

The aim of this investigation is the development of improved alloys for short term (0.5 to 5 years) orthopaedic implants. The program is interdisciplinary in nature—simultaneous studies of corrosion, inflammatory response, and systemic effects of iron, nickel, cobalt, titanium, and tantalum base alloys are being determined. Corrosion tests under *in vitro* and *in vivo* conditions have been performed via linear polarization and other electrochemical methods.

The inflammatory responses of various implant alloys are being determined by both *in vivo* and *in vitro* experiments. *In vitro* chemotactic assays on rabbit neutrophilic granulocytes and mononuclear cells are performed in the presence and absence of appropriate metal ion concentrations. Corrosion rate data described above are employed to select the proper concentrations.

Systemic effects of metallic corrosion products have been determined via radioisotope and analytical techniques. Radioactive metallic salts at appropriate concentrations are injected intravenously in rats of known age and sex. Following this, the concentration of metallic products is determined as a function of time in various biological samples (plasma, urine, feces, etc.). These data permit the establishment of models which can predict the distribution of individual elements released from continuously corroding metal implants.

Materials characterization of implantable porous electrodes, R. B. Beard, J. F. DeRosa, S. F. Dubin, L. Sturm, R. M. Koerner, and A. Miller, *SP415*, pp. 55-61 (May 1975).

Key words: implantable hybrid cells; pacemakers; palladium black; platinum black; polarization; porous electrodes.

Porous platinum and palladium black electrodes have been used as cathodes for reducing body oxygen in implantable hybrid cells supplying energy to pacemakers. The power-generating capabilities of a cell are greatly decreased under load, i.e., increased current density, due to polarization at the electrode interface. A greatly increased surface area of the porous electrodes, i.e., number of sites for the electrode reaction, permits a greater current density with lower overpotential or polarization. Similarly, at the pacemaker stimulating electrode and at electrodes used in making electrical impedance measurements there is polarization and a consequent loss of energy in a charge transfer at the electrode interface. Porous electrodes in these cases have also greatly reduced the overpotential. The physical electrochemical properties of the porous electrodes have been characterized by specific adsorption, i.e., BET measurements; scanning electromicrographs; galvanostatic and potentiostatic measurements; and electrical impedance measurements. Histopathological studies have been made in order to determine the biocompatibility of the tissue-electrode interface.

Properties of fibrous biomaterials with statistically dispersed orientation, E. Y. Robinson, *SP415*, pp. 63-74 (May 1975).

Key words: biomaterial properties; biomechanics; composites; fiber orientation; fibrous biomaterials.

Many factors influence the interaction between bone or soft tissue and implanted synthetic biomaterials, e.g., biocompatibility, implant configuration, functional requirements, bone and tissue structure, and relative mechanical properties. Of the many active factors, one aspect is considered here: the theoretical consequences of the fibrous-lamellar structure of bone, and of the degree of fibrous orientation present in the individual lamellae. This orientation is known to be statistically dispersed about certain preferred directions in each layer, with possible large orientation changes from layer to layer. Analysis of this type of structure is presented with graphical illustration of the effects of orientation and of statistical dispersion of orientation on conventional engineering material parameters.

New biomaterials are being evolved which combine fiber reinforcement with polymer resin matrices (e.g., graphite fibers/polyethylene matrix). Such materials may be tailored to yield certain specific properties by controlling fiber orientation and quantity. Materials of this type are of interest in implants which may be required to behave in a similar fashion to adjacent bone tissue (as in bone splints, hip prostheses, etc.). The analysis presented here provides a rapid and convenient basis for calculating the effect of controlled and dispersed fibrous orientation on material properties.

The methods described lay a base for first approximations and show certain directions which should be followed in further investigation. Graphical results include examples for both fibrous bone tissue models and synthetic types of fiber-reinforced biomaterials.

A simple *in vitro* test for screening the blood compatibility of materials, H. Kambic, T. Komai, R. J. Kiraly, and Y. Nosé, *SP415*, pp. 75-82 (May 1975).

Key words: blood coagulation; blood compatibility; blood platelet consumption; kinetic clotting test.

An *in vitro* blood compatibility test was developed to evaluate thromboresistant properties of materials. This method is called the closed-cell kinetic blood coagulation test. A closed cell system eliminates any air-blood interface. The blood is withdrawn directly from the animal into the cell, minimizing the exposure to foreign surfaces other than the one being studied and eliminating the use of anticoagulants through the process.

The technique includes the simultaneous blood filling of eight cells with the test materials, and eight cells lined with a control material. As a control material we have selected silicone rubber, which has reasonably good thromboresistant properties, is widely accepted, and commercially available. The cells are opened at different predetermined times, and the clot formation is then measured by two complimentary methods: weighing the clot and colorimetry of the unclotted blood. The two methods correlate and can differentiate between red and white thrombus.

The results are presented as clot formation curves versus

time for the material under test and for the control. The variability of blood properties makes this control curve essential.

Detailed analyses of the curves will offer a new approach to the understanding of the mechanism of thrombus formation on various types of materials. Results will be presented for tests conducted on Hydron®, segmented polyurethane, purified natural rubber, as well as chemically treated tissue.

Conformation of adsorbed blood proteins. B. W. Morrissey, L. E. Smith, C. A. Fenstermaker, R. R. Stromberg, and W. H. Grant, *SP415*, pp. 83-90 (May 1975).

Key words: adsorbed protein conformation; blood protein; protein conformation.

The likelihood that surface-induced blood coagulation results from specific interactions between proteins and materials has led to a study of the conformation of adsorbed blood proteins. Infrared difference spectroscopy was used to determine the bound fraction, i.e., the fraction of carbonyl groups of an adsorbed molecule directly interacting with a silica surface, and ellipsometry was used to measure the average extension (thickness) of adsorbed protein films. *In situ* measurements were made on serum albumin, fibrinogen, and prothrombin as a function of the amount adsorbed, time of adsorption, and surface energy.

The bound fraction results obtained for serum albumin and prothrombin indicate that the internal bonding of these globular proteins is sufficient to prevent changes in conformation while adsorbed, even at low surface population. The bound fraction of fibrinogen increases with increasing adsorbance, suggesting possible interfacial aggregation. The conformation of all three proteins was found by both I.R. difference spectroscopy and ellipsometry to be independent of the time of adsorption. In addition, the ellipsometric studies show that while the adsorbance of fibrinogen and prothrombin does not vary for a number of surfaces, their extensions increase with decreasing surface energy.

Studies of cross-linked and denatured serum albumin have shown that changes in conformation concomitant with adsorption of the native protein, if they occur, are small.

A nerve implant prosthesis for facilitating peripheral nerve regeneration. Part I. Development of the prosthetic device and system of repair, W. E. Kuhn and J. L. Hall, *SP415*, pp. 91-98 (May 1975).

Key words: neurorrhaphical procedures; peripheral nerve repair; tubular prosthesis.

The design rationale and requirements of a system of sutureless nerve repair employing a special thin walled porous stainless steel tube and a vacuum technique for applying the tube and approximating the nerve ends will be outlined. A description of the tubular prosthesis, its fabrication, the surgical instruments and neurorrhaphical procedures will be presented.

A slurry dipping process has been developed for the production of uniform "green" tubes in quantity. These are sintered in a hydrogen atmosphere to impart the strength required to retain their tubular configuration under the forces imposed by the surgical procedures and the vacuum pressure. Placing the porous tube on the nerve and drawing the nerve ends into approximation is both simple and rapid.

A nerve implant prosthesis for facilitating peripheral nerve regeneration. Part II. Development of the prosthetic device and system of repair neuroanatomical aspects. J. L. Hall and W. E. Kuhn, *SP415*, pp. 99-101 (May 1975).

Key words: histological evaluation; nerve axons; surgical procedure.

The principal neuroanatomical aspects of peripheral nerve repair are the approximation of the severed ends and the minimizing of trauma during the approximation. The method of using vacuum to draw the severed ends down a porous tube seems to take these two factors into consideration. The porous tube provides a shielded environment for the regenerating nerve to grow into the approximated distal end. The porosity allows for the escape of edematous fluids, prevents the invasion of scar tissue and provides for the flow of nutritional fluids.

Histological and statistical results of the procedures are presented. In most instances the axons of the regenerating nerve grow across the gap and occupy the intact neurilema sheaths of the degenerating distal segments.

SP416, 1976 Edition. **Attacking the fire problem: A plan for action—1976 Edition,** F. B. Clarke and D. W. Raisher, Eds., (Supersedes NBS Special Publication 416, 1975 Edition) *Nat. Bur. Stand. (U.S.), Spec. Publ. 416, 1976 Edition,* 41 pages (Jan. 1976) SD Catalog No. C13.10:416, 1976 Ed., $1.00.

Key words: building design; consumer protection; fire control; fire detection; fire research; fire spread; flammability.

The mission of the Center for Fire Research is to insure the development of the technical base for the standards and specifications needed in support of the National goal to reduce fire losses by 50 percent over the next generation. A systems approach to accomplish this mission is described. The Center consists of four basic programs in the area of Fire Science and five applied research programs in the area of Fire Safety Engineering. Each applied program addresses an aspect of the Fire Problem, using fundamental information supplied by the basic research function. Active participation by staff members in voluntary standards organizations is the principal means of making this technology available for codes and standards needed to reduce the Nation's fire loss.

SP417. **Directory of United States standardization activities,** S. J. Chumas, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 417, 228 pages (Nov. 1975) SD Catalog No. C13.10:417.

Key words: codes; consensus system; directory; Federal Government—standardization; industry standards activities; national standards activities; recommended practices; specifications; standardization activities; standards; states—standardization activities; test methods.

This Directory serves as a guide to standardization activities in the United States. It supersedes a Directory of the same title, issued in 1967, as National Bureau of Standards Miscellaneous Publication 288. Included in the Directory are summaries of the standardization activities of trade associations, technical and other professional societies representing industry and commerce, and state and Federal governments. For the first time this Directory covers nonengineering and nonindustry organizations. SP417 contains current descriptive summaries of more than 580 organizations.

Criteria for inclusion are that the organizations have standardization activities such as standards-writing groups, that they assist in the development of standards, or that they issue standards or disseminate standards information.

The standardization activities summaries are grouped into three sections: associations, states, and agencies of the Federal Government. In each section, the summaries are arranged alphabetically by organization. Two types of indexes are included in SP417 to assist the reader in identifying an activity: (1) a subject of index key words taken from the summaries; and (2) a listing of organizations classified into 24 subject areas. Supersedes NBS Misc. Publ. 288.

SP418. **National Bureau of Standards. Annual Report**, E. P. McGehan, M. King, and R. S. Franzen, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 418, 32 pages (Apr. 1975) SD Catalog No. C13.10:418.

Key words: annual report; computer; energy; environment; health; product safety; research; science and technology; standards.

This document describes how resources were utilized during fiscal year 1974 and highlights major achievements as a result of work performed at the National Bureau of Standards. Using the theme, "Standards for daily living," the book presents brief discussions of accomplishments within major program areas. The report serves as 1) an annual account of NBS activities and 2) promotional information about NBS. The Table of Contents includes: From the Director: Standards for Daily Living: Historical Pioneer, Catalyst for Change, Information Programs; The Year in Review: Expanding Measurement Capabilities, Toward Solving the Energy Problem, Improving Man's Environment, Striving for Safer Products, Aiding Health Care, Advancing Computer Technology; Interaction is the Key: Public Interest, Government Projects, Industry Cooperation, Information Services; Funds and Facilities; Organization; People.

SP419. **Selected topics on hydrogen fuel**, W. R. Parrish, R. O. Voth, J. G. Hust, T. M. Flynn, C. F. Sindt, N. A. Olien, and J. Hord, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 419, 212 pages (May 1975) SD Catalog No. C13.10:419.

Key words: conservation; conversion; cost; cryogenics; economics; embrittlement; energy; hydrogen; industrial; instrumentation; liquefaction; literature; materials; production; solar; storage; transmission; transportation; utilities.

The National Bureau of Standards played a vital role in developing hydrogen technology for the space age and is now engaged in efforts to adapt and improve this technology for the commercial use of hydrogen fuel. This document is a summary report on selected hydrogen-fuel topics and was prepared to identify cost and technical barriers to the commercial use of hydrogen fuel and to generate reference data for policy-planning, decision-making and design. Cryogenic hydrogen fuel technology is emphasized in the economic and systems analyses reported herein. Using the best available technical and economic data, hydrogen fuel is not currently cost competitive with alternate fuels; however, we must not reject hydrogen on the basis of current economic comparisons. Increased efficiencies of production, liquefaction, and energy conversion may drastically change these comparisons-of-today as will increased fossil fuel prices and more stringent environmental and pollution constraints. Hydrogen appears currently marketable in certain integrated utility systems, in transoceanic transport of energy produced far at sea, and is a necessary element in a wide variety of growing industrial processes and in the liquefaction of coal. This publication identifies research and development needs within selected areas of NBS competence and future research plans are outlined.

SP420. **International Bureau of Weights and Measures 1875-1975**, C. H. Page and P. Vigoureux, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 420, 257 pages (May 1975) SD Catalog No. C13.10:420.

Key words: base units; centennial volume; history of SI; International Bureau of Weights and Measures; International System of Units; measurements; SI; Treaty of the Metre.

This is the English version of the Centennial volume of the International Bureau of Weights and Measures (BIPM) translated from the French. Metrology—the science of measurement—is traced from man's earlier efforts to the world's most modern, uniform, and coherent measurement system, the International System of Units (SI). Detailed accounts are given of the 1875 Treaty of the Metre—to which 18 nations, including the United States, were signators—and the work of the International Bureau of Weights and Measures which was created by the Treaty and now the international province of 44 nations. Historical reviews are given of the development of the base and derived units of the SI, specifically mass, length, gravimetry, manobarometry, thermometry, electricity, photometry, radioactivity, x and gamma rays, and neutron measurements.

SP421. **A guide to methods and standards for the measurement of water flow**, G. Kulin and P. R. Compton, Nat. Bur. Stand. (U.S.), Spec. Publ. 421, 97 pages (May 1975) SD Catalog No. C13.10:421.

Key words: flow measurement, water; instruments, flow measurement; open channel flow measurement; pipe flow measurement; standards, flow measurement.

Selected information sources on methods and standards for making measurements of water and wastewater flow in the field are listed and described. Both closed conduit and free surface flows are treated, but emphasis is on open channel flow measurements needed in water resource engineering and in water pollution control. Instruments and methods covered include weirs, flumes, current meters (and velocity traverse methods), dilution techniques, pipe flow instruments, acoustic meters and others. In addition to summarizing the basic properties of each instrument or method and referring users to the best available sources of detailed information on performance and field application, potential sources of error are described and quantified where possible.

SP422. Volume I and II. **Accuracy in trace analysis: Sampling, sample handling, analysis.** Proceedings of the 7th Materials Research Symposium held at the National Bureau of Standards, Gaithersburg, MD, Oct. 7-11, 1974, P. D. LaFleur, Ed., *Nat. Bur. Stand. (U.S.), Spec. Pub. 422, Vol. I,* 645 pages, *Vol. II,* 636 pages, (Aug. 1976) SD Catalog No. C13.10:422/vol. I and II, $20 per 2-part set.

Key words: accuracy; analysis; analytical chemistry; sample handling; sampling; trace analysis.

This book is the formal report of the proceedings of the 7th Materials Research Symposium: Accuracy in Trace Analysis. This volume contains the invited and contributed papers presented at the Symposium, and which treat problems of sampling and sample handling as well as the usually-discussed analytical methodology. Many important techniques and methods are described, and extensive references are presented.

o give deeper insight into the problems of obtaining accurate esults in trace analytical chemistry. Accordingly, this volume hould not only stimulate greater interest in research in these reas but should provide a valuable guide for everyday analytical roblems. *These proceedings include the following papers (in-dented):*

The need for accuracy in a regulatory agency, A. C. Kolbye, Jr., *SP422*, pp. 3-8 (Aug. 1976).

Key words: accuracy; drugs; foods; regulation; regulatory agency.

A discussion of the need for accuracy in the food and drug industries is presented. Problems involved in sampling, sample handling, and methods of analysis are discussed as well as the establishing of permissible limits of contaminants and additives.

Accuracy and trace organic analyses, R. G. Lewis, *SP422*, pp. 9-34 (Aug. 1976).

Key words: concentration; detectors; extraction; gas chromatography; isolation and clean-up; mass spectrometry; organic trace analysis; qualitative accuracy; quality control; quantitative accuracy; reference materials; sampling.

Accuracy in trace organic analysis presents a formidable problem to the residue chemist. He is confronted with the analysis of a large number and variety of compounds present in a multiplicity of substrates at levels as low as parts-per-trillion. At these levels, collection, isolation, identification and quantification are all very difficult. Sample contamination and substrate interferences can also lead to large errors. Obtaining accurate qualitative data is often more of a problem than accuracy of quantitative data. Retention times and peak height measurements from gas chromatography coupled with highly sensitive, but nonspecific, detectors are most commonly used in residue analysis. Although dual column and/or dual detector determination, partition values and chemical derivatization are often employed, lack of good reference standards, interferences and poor detector specificity frequently cast doubt on the qualitative and quantitative accuracy of data upon which regulatory decisions may be made. Mass spectrometry and Fourier transform spectrophotometry offer partial solutions to qualitative accuracy where this instrumentation is available. However, less expensive and more sensitive specific detectors for gas chromatography are most needed. Means of quantitating residues from such complex industrial mixtures as polychlorobiphenyls and toxaphenes are far from adequate. Finally, collection systems for environmental media often lack efficiency, especially for volatile organic compounds in air.

Accuracy and quality control in trace element analysis, J. H. Boutwell, *SP422*, pp. 35-40 (Aug. 1976).

Key words: accuracy and precision; clinical chemistry; quality control; surrogate specimens; trace elements.

Trace element analysis, not uniquely, but to a unique degree, is affected by the problems associated with contamination of the specimen during the process of collection, as well as by the contamination of reagents and the environment during the process of analysis, which will be discussed in other presentations.

The quality control of accuracy in trace element analysis must therefore cover all phases of the analytical process, including collection. Such an extension makes it necessary to use surrogate specimen material with defined trace element(s) content beyond the laboratory, that is, in the sphere of specimen collection in the field, on a regular, protocol-directed basis. The protocol for using such surrogate specimens for accuracy control should be directed to the exposure and display of any variations in systematic bias which may occur. Such bias, or error, may be either positive or negative and may arise from defects or alterations in collection materials or in procedural errors in the collection process.

The nature of the surrogate specimens required for accuracy control depends upon both the type of specimens to be collected and analyzed and the details of the analytical process itself.

The role of the National Bureau of Standards Standard Reference Materials in accurate trace analysis, J. P. Cali and W. P. Reed, *SP422*, pp. 41-63 (Aug. 1976).

Key words: accuracy; accurate measurement system; precision; reference methods; standard reference material; systematic errors.

A meaningful measurement process is capable of producing numerical values of the property(ies) under test or measurement that are compatible throughout the measurement infrastructure. By this we mean that all the measurement laboratories within a given industry or technological or scientific area are capable of and, in practice do, produce measurement values for a given property on a given material that are identical and immediately comparable within some agreed on uncertainty. Such measurement compatibility results when accurate measurements are the basis upon which the work is founded. When a measurement system is accurate, then the numerical values produced are free of systematic errors and are also precise. We will show that, in practice, a certain degree of precision must be obtained before assertions of accuracy can be realistically tested experimentally.

One mode by which accuracy may be transferred to all laboratories within a measurement infrastructure is through the use of reference materials used in conjunction with reference methods. At NBS reference materials are called Standard Reference Materials (SRM's). They are well-characterized materials (in terms of accurately determined properties) useful for the calibration and/or assessment of a measurement system. When SRM's are used in conjunction with a reference method, i.e., one of demonstrated accuracy, then it becomes possible to transfer accuracy throughout an entire measurement infrastructure. How this is accomplished will be discussed.

Obviously the assurance of the "built-in" accuracy of the SRM is critical. How this is done at NBS will be discussed. Finally, currently available SRM's useful in trace analysis will be considered, as well as work now in process and future plans for additional trace SRM's.

Interpretation of accuracy of trace element results in biological materials, G. H. Morrison, *SP422*, pp. 65-77 (Aug. 1976).

Key words: accuracy; biological materials; data interpretation; standard materials; trace elements.

With the recent realization that trace elements have a very important role, either beneficial or harmful, in man, trace element analysis has become an increasingly important field of research in clinical medicine, biology, nutrition, and environmental studies. Many researchers have investigated the amounts of various elements in man, animals, plants, and types of tissues.

The interpretation of trace analytical results for biological

materials is discussed from the viewpoint of their accuracy. Interpretation of results of an analysis of an unknown sample depends to a great extent on prior evaluation of the analytical method employed. The accuracy of the method is best determined by the analysis of standard samples. In the absence of standard samples of a similar nature to the unknown samples, the results of the method are compared with those obtained by other methods of analysis. Both of these approaches are discussed. An evaluation of published results for the determination of the 15 trace constituents in the standard reference material Orchard Leaves is presented from the viewpoint of accuracy.

A case history is presented to illustrate the problems associated in the development of a method for a biological sample and the evaluation of the accuracy of the method.

Precision and accuracy in silicate analysis, S. S. Goldich, *SP422*, pp. 79-89 (Aug. 1976).

Key words: accuracy; analytical bias; reference samples; silicate analysis.

The precision and accuracy of analytical results in geological publications range widely. High-quality analyses are typical of the research in geochronology and in other areas of isotopic investigations, and this work has resulted in substantial improvement in the data that are now evolving in more routine geological investigations. The trace elements Rb, Sr, Ba, and the rare earth elements are widely used in petrological investigations, and accurate results are obtained routinely by isotope-dilution techniques and mass spectrometric measurements. It is now commonplace for the results from different laboratories to agree within 1 to 2 percent of the amount present. In contrast, the results from atomic absorption, x-ray fluorescence, neutron activation, and optical spectrographic methods are much more variable and are less reliable. The increasing availability of reference samples is easing some of the problems of the instrumental analyst, but the reference samples have some problems of their own. The lack of well-characterized reference samples is a major barrier to better quality instrumental analyses.

Use and interpretation of water quality data, W. T. Sayers and W. R. Ott, *SP422*, pp. 91-107 (Aug. 1976).

Key words: accuracy; data interpretation; monitoring; water; water quality.

Water quality data are collected by State and Federal pollution control agencies to characterize baseline quality, identify trends, detect and document violations in quality standards and discharge permit conditions, develop mathematical models for determining present and future pollution control requirements, and characterize the movement, fate, and effects of specific pollutants entering the water environment. This information is used in formulating and implementing water quality management goals, strategies, and plans and in evaluating the effectiveness of resulting local, State, and Federal pollution abatement efforts. The kinds of interpretations to be made from water quality data, the interpretive methods to be used, and the level of reliability desired of the results must all be decided before an effective sampling program can be designed. These considerations dictate the number and spatial arrangement of stations, the parameters to be evaluated, sampling frequencies, and the duration of the sampling program. Because of supportive relationships among parameters, data on a given parameter are seldom evaluated independently of the data on the other parameters measured. Results are grouped in various combinations and displayed in any of a number of ways for interpretation, depending on the objectives in mind. Statistical procedures are an important tool in the interpretive process, but should never be used as a substitute for judgment. The economic and other impacts of management/legal decisions based on the data require that proper consideration be given to data reliability measures and the confidence levels of the results obtained, in addition to the results themselves.

Interpretation of clinical laboratory data, D. S. Young, *SP422*, pp. 109-122 (Aug. 1976).

Key words: accuracy, precision and specificity of analytical methods; biological and genetic variability; clinical laboratory data; specimen collection; specimen handling.

The central role of the clinical laboratory in the diagnosis of some diseases is discussed as well as some of the potential consequences of misinterpretation. Examples of the influence of both *in-vivo* and *in-vitro* factors on the interpretation of results are presented.

The genetic background and biological variability of the individual influences the data, even when he is healthy. The disease process may have a greater or lesser effect on laboratory data. In general, physicians usually request those tests to be performed that they anticipate being abnormal, so that the influence of disease on the test performed in the clinical laboratory is usually quite large. Other *in-vivo* influences include the mode of collection of specimens for analysis. Outside the patient the preparation of the specimen for analysis may affect the analytical results. Finally, the accuracy, precision and specificity of the analytical procedures in the clinical laboratory affect the data. It is only this group of factors that the clinical chemist is able to control and yet knowledge of both laboratory and patient factors is essential for the correct interpretation of data.

The analyst and accuracy, F. P. Byrne, *SP422*, pp. 123-126 (Aug. 1976).

Key words: accuracy; analytical chemistry; standard reference material; statistics; syndrome.

It sometimes happens that an analytical chemist, in evaluating the accuracy of his analysis, subconsciously obtains highly precise and accurate analyses, when in fact, the method and techniques he uses cannot possibly yield such results. This can happen even when he uses standard reference materials or carries out a series of repetitive analyses. Examples of these are discussed along with examples of other human foibles that may leave the analyst with a false impression of his accuracy and precision.

Detection of systematic errors by the analysis of precision, K. Heydorn, *SP422*, pp. 127-139 (Aug. 1976).

Key words: accuracy; analysis of precision; *a priori* error; *a priori* precision; *a posteriori* precision; chi-square test; precision; precision of analytical method; ultratrace level.

The extension of accuracy in trace element analysis to the ppb level cannot be based directly on the study of Standard Reference Materials because most of these are certified only at the ppm levels. Control of accuracy at such low levels may be achieved by an analysis of precision which serves to detect unknown sources of variation in replicate measurements. This approach was used to locate errors in connection with the determination of arsenic in human serum by neutron activation analysis. Successive applications of the analysis of precision led to the detection of two unknown sources of variation. In addition, the analysis of precision indicated that the current evaluation of

small photopeak areas was not entirely unbiased. The apprehension of these errors led to changes in the methodology which in turn yielded both better precision and improved accuracy at the ppb level of concentration.

Detection of systematic error in routine trace analysis, D. E. ing, *SP422,* pp. 141-150 (Aug. 1976).

Key words: analytical performance; between-run; calibration; precision; quality control; systematic error; Youden plot.

The Youden technique has been modified in order to monitor systematic error between runs. When a laboratory appears to have systematic error problems, it is important to know whether or not this is typical of the routine operation. The procedure to be described examines the sum and difference of the results obtained on each of two control samples. Simple statistics permit long-term analysis of the results of such control analyses to separate within-run, or random effects, from the systematic effects occurring between runs. This simple sum/difference approach has been applied in a wide variety of water and wastewater analytical procedures. The blank determination in trace analysis has been implicated, in many cases, as the most significant source of systematic error.

The application of cluster analysis to trace elemental concentrations in geological and biological matrices, E. W. Stromberg nd J. L. Fasching, *SP422,* pp. 151-162 (Aug. 1976).

Key words: air particulates; blood; chemistry; computer graphics; geochemistry; medicine; pattern recognition; trace elements.

In the past it has been difficult to accurately interpret the information provided by trace elemental analysis, especially when concerned with biological and geological studies where there may be many variables involved other than simple elemental distributions. Utilizing a combination of hierarchical cluster analysis, factor analysis, and canonical correlation, data is presented showing how these three statistical methods may be combined to study the relationships of trace elemental concentrations in geological and biological matrices. Clusters of elements are found which are not readily apparent from examination of either raw data or simple correlation matrices.

Individual variation of trace metal content in fish, J. R. Montgomery, S. E. Kolehmainen, M. D. Banus, B. J. Bendien, J. L. Donaldson, and J. A. Ramìrez, *SP422,* pp. 163-172 (Aug. 1976).

Key words: atomic absorption spectroscopy; fish analysis; sample size variations; trace analysis; trace metals.

Fifty herring *Opisthonema oglinum* (Le Sueur) were collected from Boquerón Bay, Puerto Rico in one gill net haul. Each whole fish was wet-digested and analyzed as a separate sample in triplicate for Fe, Zn, Pb, Cd, Cu, and Mn using atomic absorption spectrophotometry. Results were correlated to the size of the fish. The concentration of Fe, Zn, Cd, and Cu was significantly higher in the pooled small fish as compared to the pooled large fish. The Pb concentration showed no detectable difference between the size classes. However, the Mn concentration was significantly higher in the pooled large fish as compared to the pooled small fish. The mean concentrations of these metals were statistically compared to the results of a pooled sample of fish collected and analyzed identically and to a pooled sample of thread herring collected in another location at a different time. No significant difference was found between these two pooled samples of medium size fish or between the trace metal values for the individual medium size fish. A determination of the sample size necessary to detect a 15, 20, and 25 percent difference between two significantly different means showed that a minimum sample size to detect that magnitude of difference would be 124, 70, or 50 fish respectively.

Accuracy of chemical analysis of airborne particulates—results of an intercomparison exercise, F. Girardi, *SP422,* pp. 173-188 (Aug. 1976).

Key words: accuracy; activation analysis; airborne particulates; air filter analysis; atomic absorption; emission spectroscopy; environmental pollutants; intercomparisons; multi-element analysis; trace element analysis; x-ray fluorescence.

Since suitable standard reference materials for chemical analysis of airborne particulates are not available, an intercomparison exercise was carried out among 40 interested laboratories in order to evaluate the accuracy of various trace analysis techniques for this specific application. Six hundred grams of airborne particulates were collected from the inlet filters of the air conditioning installation of a hotel in the center of Milan. The sample was sieved to remove coarser particles, thoroughly mixed, and distributed in 1 to 5 gram aliquots. The homogeneity was checked by relative measurements carried out by three independent techniques. For 40 elements no inhomogeneity was found to exceed the analytical error, which was estimated to be approximately 10 percent. The data of the analytical exercise are being collected and evaluated. Results are available for 56 elements, but to date only 33 have been determined by more than one technique. Activation analysis, emission spectroscopy, atomic absorption, x-ray fluorescence and various wet chemical methods contributed to the intercomparison. No result was received from mass spectroscopic methods and, although analyses were specifically encouraged, very few results were received on the organic components. From a first approximate evaluation a good agreement was found for Al, Fe, Zn, Mn, Ca, Pb, Cl, S, Si, Ti, Mn, while for the other elements no definite conclusion can yet be drawn. An attempt will be made to interpret important cases of systematic errors, a few of which are already evident.

The estimation of accuracy in trace analysis. Results obtained from intercomparisons organized by the I.A.E.A., L. Górski, J. Heinonen, and O. Suschny, *SP422,* pp. 189-197 (Aug. 1976).

Key words: accuracy; activation analysis; air filter analysis; analytical quality control; atomic absorption spectrometry; environmental analysis; fresh water analysis; intercomparisons; precision; round-robin experiments; trace element analysis.

The 1972 and 1973 I.A.E.A. round-robin exercises concerning trace analysis in environmental problems are reported. Paper filters simulating air filters were spiked with known amounts of salts of: As, Ba, Cd, Cr, Cu, Fe, Hg, Mn, Ni, Pb, Se, V, and Zn, in the order of micrograms of an element per one filter. Only Fe and Pb were present in the order of 200 μg. Twenty-two laboratories returned 922 analytical results obtained by 6 different methods—mostly neutron activation analysis and atomic absorption spectrometry. Tables summarizing the results for each element are presented with special emphasis on the difference between the true value and the reported results. The need and the utility of the Analytical Quality Control programme

of the Agency is also discussed.

Accuracy assurance in the analysis of environmental samples, R. K. Skogerboe and S. R. Koirtyohann, *SP422,* pp. 199-210 (Aug. 1976).

Key words: accuracy; anodic stripping voltammetry; arc emission spectroscopy; atomic absorption; environmental analyses; interlaboratory tests; neutron activation analysis; plasma emission; round robin; x-ray fluorescence.

Three soils, two freeze dried blood pools, two (NBS) plant leaf samples, and one (NBS) freeze dried liver sample were analyzed in an interlaboratory program undertaken by NSF(RANN). Three independent methods produced agreement within ± 20 percent for the soils and pooled blood. The values for the plant leaves were within the experimental error as estimated by the standard deviations given for the round robin results. The liver results showed excessive scatter.

Subsequent tests included the use of NBS reference samples, the preparation of secondary reference materials, resubmission of previously analyzed samples, and the use of several methods for the same determination. Methods used for cross checking included atomic absorption with and without chemical separation, nonflame atomic absorption, arc emission spectroscopy, plasma emission, anodic stripping voltammetry, neutron activation analysis and x-ray fluorescence. In most cases the agreement between methods was good, but enough problems were identified and subsequently corrected to establish the value of the program.

The steps taken in the two laboratories represent an adequate, yet practically attainable program to assure accurate results in a centralized analytical support laboratory for a university or other large research organization.

Four-laboratory comparative instrumental nuclear analysis of the NBS Coal and Fly Ash Standard Reference Materials, J. M. Ondov, W. H. Zoller, I. Olmez, N. K. Aras, G. E. Gordon, L. A. Rancitelli, K. H. Abel, R. H. Filby, K. R. Shah, and R. C. Ragaini, *SP422,* pp. 211-223 (Aug. 1976).

Key words: analytical methods; coal; environmental samples; environmental standards; fly ash; instrumental neutron activation analysis (INAA); instrumental photon activation analysis (IPAA); natural radioactivity; standard reference materials; trace elements.

The NBS coal and fly ash Standard Reference Materials (SRM 1632 and 1633) were analyzed for 37 elements in coal and 41 elements in fly ash mainly by the use of instrumental neutron activation analysis (INAA), augmented by instrumental photon activation analysis (IPAA) and direct counting of natural γ-ray activity. For most elements measured, there was excellent interlaboratory agreement between the four participating laboratories and with the National Bureau of Standards values for elements measured by them and in this work. In cases of most elements for which comparisons can be made, instrumental nuclear methods used in a round-robin study of the standards provided more accurate average concentrations and smaller interlaboratory dispersions of values than the other major techniques used, atomic absorption spectrometry and optical emission spectroscopy.

Trace element studies of a selected portion of the Mahoning River system, I. Mahadeviah, E. Mooney, and R. Munteau, *SP422,* pp. 225-230 (Aug. 1976).

Key words: atomic absorption analysis; Californium-252; Mahoning River: neutron activation analysis; pollution; sediment; trace elements; water; wet chemical analysis.

The Mahoning River flows through a highly industrial ized section of eastern Ohio. It is used as a dumping ground for both solid and liquid wastes by both industry and mu nicipalities along its banks.

Both water and sediment samples were collected a predetermined sites on a section of the Mahoning River running from its headwaters into and beyond one of the in dustrialized areas. The water samples were analysed fo trace elements by neutron activation analysis (NAA) em ploying Youngstown State University's 10 mg Californium 252 neutron source, wet chemical techniques, and atomi absorption (AA). Certain trace elements, Ca and Mg, in th water samples were detected by all three methods. Com parison of results showed good agreement between NA and wet chemical analysis for most samples. AA data, fo the most part differed considerably from both NAA an wet chemical analysis. Subsequent tests have shown tha organics, which are plentiful in the Mahoning River, ar responsible for erroneous results in AA analysis.

Neutron activation analysis was shown to be the simples of the three methods for trace element analysis and the loca tion of possible sources of pollution.

Analysis of 11 elements in biological material. Comparison o neutron activation analysis and atomic absorption analysis, H Wesch and A. Bindl, *SP422,* pp. 231-238 (Aug. 1976).

Key words: atomic absorption spectroscopy (AAS); com parison between NAA and AAS; neutron activation analy sis (NAA); time of analysis in NAA and AAS; trace ele ment content in liver biopsies; trace element content i tumor bearing animals; Wilson's disease.

Seven trace elements (Co, Cu, Fe, Mn, Mo, Se, Zn) an four bulk elements (Ca, K, Mg, Na) were analyzed by mean of neutron activation analysis and flame or flameless atomi absorption analysis.

The organic material was destroyed by wet or low tem perature ashing. Four different possibilities of analysi result from this arrangement. Time of analysis, accuracy reproducibility and real, not theoretical, detection limit wi be reported for each arrangement. The analyses were ca ried out with the 1577 NBS liver standard and our own live standard. The techniques will be discussed in reference t clinical and research applications. The reported results wi be based on analysis of liver biopsies and animal exper ments.

Determination of zinc in environmental matrices: A com parison of results obtained by independent methods, M. Ga lorini and E. Orvini, *SP422,* pp. 239-245 (Aug. 1976).

Key words: accuracy; atomic absorption; environmen neutron activation analysis; precision; x-ray fluorescenc

Zinc determination results in environmental matrices a reported by different laboratories in some recent inte laboratory comparisons, seems to have large biases. I order to achieve a better solution of the problem, an evalua tion of four different methods for the determination of zin content in environmental matrices is underway in ou laboratory.

The suggested methods are: a) XRF x-ray fluorescenc b) NAA(I) instrumental neutron activation analysis, c NAA(RC) neutron activation analysis, via radiochemica separation, and d) AAS atomic absorption spectrometry Each of these techniques give information on some critica step typical of each different method. SRF and NAA(require no sample treatment or dissolution or chemic procedures, and insure no loss of any component and n danger of contamination. Unfortunately some interferenc

due to some matrix content may occur, affecting in both ways the accuracy of the results. NAA(RC) techniques give results free from interferences from contamination, but require wet dissolution of samples or high temperature treatment which may affect the analytical results. AAS analysis may be affected by contamination from reagents and by the difficulties related to the sample dissolution. A critical evaluation of results acquired through these different methodologies on a dust sample is discussed.

Reliability of trace metal determination in freshwater by ameless atomic absorption (graphite tube atomization) in comarison with other chemical and physical methods, R. Vagemann, *SP422*, pp. 247-265 (Aug. 1976).

Key words: accuracy; flameless atomic absorption; freshwater; interlaboratory comparison; method evaluation; trace metal analysis.

An interlaboratory study of trace metal analyses involving seven different laboratories has been carried out, using river water samples and "synthetic" standards. The analytical precision for the flameless atomic absorption with graphite tube atomization was also established for eight different metals at various trace concentrations. The flameless atomic absorption method with graphite tube atomization is compared with 16 other techniques and methods used in the interlaboratory study, and the conclusion is reached that for a number of commonly determined metals the flameless atomic absorption method of measuring trace concentrations in dilute fresh water is as accurate a method as other more established methods. The relative standard deviation for interlaboratory determination of traces of zinc is consistently large, which indicates that this metal is relatively more difficult to measure accurately than most other metals that were investigated. The available analytical data for arsenic is small but sufficiently discrepant to indicate that arsenic is a most difficult metal to measure accurately at trace levels by most of the methods tried.

The accuracy of determination for most of the metals investigated would appear to lie within 20 to 45 percent, at the concentration levels prevalent in unpolluted fresh water.

The preparation and certification of trace mercury in water standard reference materials, J. R. Moody, P. J. Paulsen, T. C. Rains, and H. L. Rook, *SP422*, pp. 267-273 (Aug. 1976).

Key words: atomic absorption spectrometry; isotope dilution analysis; mercury in water, trace analysis; mercury in water, stabilization of; neutron activation analysis; spark source mass spectrometry.

The study of mercury in natural water supplies requires a Standard Reference Material (SRM) with a certified concentration at the 1 ng/g level. NBS SRM's have been prepared with nominal mercury concentrations of 1.5 μg/g and 1.2 ng/g. Confirmation of these values was obtained by neutron activation, atomic absorption, and isotope dilution-spark source mass spectrometry (IDSSMS). Nitric acid and trace amounts of gold were added to achieve a stable mercury concentration. The precautions observed for cleaning the glass and Teflon containers, preparation of mercury solutions, and the packaging of the SRM's are given. As an example of the care needed in the analysis of mercury at these levels, specific details are presented for the chemistry required to prepare samples for the spark source mass spectrometer (SSMS).

The influence of limits of laboratory accuracy and precision on the interpretation of blood lead analyses for industrial lead hygiene control, A. C. Eckert, Jr., *SP422*, pp. 275-282 (Aug. 1976).

Key words: accuracy; blood lead analyses; clinical chemistry; industrial lead hygiene; interlaboratory correlations; lead hygiene control; occupational exposure standard criteria; occupational health control; precision; trace element analyses.

Good laboratory accuracy in blood lead analyses can be obtained under some conditions but evaluation of the consistency of analyses of blood samples feasibly obtained from workers in industrial lead plants continues to present significant problems. The need for accuracy in blood lead analyses for industrial lead hygiene control is misunderstood because more than 45 years ago, long before there was any knowledge of blood lead levels, control of clinical lead cases had been achieved, and by 1949, 20 years of successful maintenance of such control was reported. The desirability of having an objective criterion, such as a maximum allowable blood lead level, for protection of the health of industrial lead workers is evident. However, adequate consistency of trace element analyses, even in relatively simple inorganic materials, is often not experienced even under some of the best conditions. Therefore, those who are concerned with reducing the lead hygiene control process to a routine, that can be administered in part by paramedical or nonmedical personnel, and those who are concerned with attempts to establish and enforce maximum allowable blood lead levels urgently need a clear statement that specifies the limits of the capability of the present technology to demonstrate the accuracy that would be essential to meet these objectives.

Sampling and sample preparation at the Geological Survey of Canada—The what, why, and how, J. A. Maxwell, *SP422*, pp. 285-297 (Aug. 1976).

Key words: contamination; geological sample; rocks and minerals; sample preparation; sampling; trace analysis; water sampling.

The landmass of Canada, with half of its 4 million square miles underlain by the Precambrian Canadian Shield, encompasses most of the main geological regions of North America, and presents the geoscientist with a wide diversity of geological terrains of varying degrees of complexity, economic interest and inaccessibility.

Among the chief concerns of the Geological Survey of Canada is that of providing a comprehensive inventory and understanding of the geological framework through its extensive field and laboratory studies, with emphasis upon those regions having high potential for the occurrence of additional economic mineral deposits.

Many factors influence the nature of a sampling program, which may vary from the taking of single "grab" specimens to the collection of large numbers of samples on the basis of a sampling pattern laid out according to a statistically devised plan, but the primary consideration is always to obtain a sample that will yield the best answer to the question being asked. Rocks, minerals, stream and lake sediments, soils, glacial deposits, water samples from lakes, streams, springs, muskeg and other sources, all of these have their use as a source of compositional, petrographic, isotopic, mineralogical, textural and other information.

Because of the often unique nature of a sample, the difficulty of obtaining additional samples, the succeeding extensive and frequently costly work to be done on the prepared material, and the conclusions that will be derived from the resulting data, it is of paramount importance that the sample be correctly prepared. Again, various factors

must be considered in the choice of method to be used, but the overriding concern must be to ensure that the sample prepared for study is truly representative of the sample submitted.

Sampling of biological materials, A. Speecke, J. Hoste, and J. Versieck, *SP422,* pp. 299-310 (Aug. 1976).

Key words: biological materials; chromium; cobalt; contamination; manganese; sampling; serum.

As many so-called essential elements are present in biological fluids and tissues in the subnanogram/gram range, contamination-free sampling and storage prior to the actual analysis is primordial. This is particularly the case when an essentially blank-free method like activation analysis is applied.

The used surgical equipment and storage vessels must be checked for their content of elements to be determined and adequate cleaning procedures must be adopted. As the tendency of liquid (or wet) samples to pick up contaminants from the vessel walls is much greater than that of dry samples, a drying (lyophilization) step should be enforced as early as possible after collection. (This will also prevent to a great extent the loss of traces to the vessel.) All samples should also be protected from dust as in an urban, industrial or laboratory environment airborne particles are important pollutants. All sample treatment and storage must be done in a dust-free room.

A typical example (the collection of human blood) will be discussed *in extenso,* together with the design of a dust-free room of simple conception and reasonable cost.

The adequacy and success of these procedures with continuous discipline is illustrated by the very low concentrations in serum obtained for Cr, Mn, and Co, respectively 0.15, 0.5 and 0.1 ng/ml. Furthermore as these elements are essential and the samples practically uncontaminated, the results present a Gaussian frequency distribution with a small standard deviation.

Accuracy in air sampling, J. P. Lodge, Jr., *SP422,* pp. 311-320 (Aug. 1976).

Key words: accuracy and precision; air; air particulates; air pollution; analysis of air; atmosphere; gaseous pollutants; sampling air.

The physical act of sampling the atmosphere for the subsequent determination of its trace composition is complicated by the fact that the atmosphere is not an equilibrium system. It contains numerous species that are mutually incompatible with one another, but that survive to be measured because of their extreme dilution. These arise from many point sources, many of them sporadic in nature, and hence the atmosphere is poorly mixed, even on a relatively small scale. This leads to serious problems in attempting to isolate a small portion of atmosphere in a form that may be carried back to the laboratory for subsequent analysis—or even analyzed *in situ.*

The planning of atmospheric sampling is further complicated by the statistical properties of the system. Simultaneous or sequential measurements, for example, within a city are not independent numbers, but tend to be highly autocorrelated. As a result, statistical judgments as to the number of necessary measurements to define mean levels within acceptable limits of accuracy have generally been misleading. In point of fact, most measurement networks have been designed around an available budget rather than around statistical ideality, and frequently without a clear notion of the purpose of the resulting data.

The reduction of orders of magnitude errors in lead analys of biological materials and natural waters by evaluating and co trolling the extent and sources of industrial lead contaminatio introduced during sample collecting, handling, and analysis, C. C. Patterson and D. M. Settle, *SP422,* pp. 321-351 (Au 1976).

Key words: accuracy of atomic absorption analytic techniques; accuracy of isotope dilution analytic techniques; errors in lead analyses; lead; lead contaminatio evaluation and control; lead in animals and plants; pollutio lead; sampling techniques; trace analysis of lead; water lead in.

Most present analytical practices for lead cannot reliab determine lead concentrations at the 1 ng/g level because a universal lack of familiarity with lead contamination du ing sample collecting, handling and analysis. Consequentl the great mass of published data on lead in plant and anim tissue and in water is associated with gross positive erro which obscure the meaning of most work dealing with lea at the few μg/g level.

It can be stated unequivocally that for lead concentratio in the μg/g range or less the investigator must know wi certainty the magnitude of the contribution of lead fro each individual reagent, from air exposure, and from co tainer walls; furthermore he must know the yields for ea step in the chemical separation procedure so that he c modify the contamination contribution at any given st caused by yields of less than 100 percent in the precedi step.

Techniques for the collection of uncontaminated sampl of fresh water, snow, sea water, and animal tissue a described. A clean laboratory for low level lead analyses also described and other sources of lead contamination a discussed and means of control evaluated.

Sampling for clinical chemistry, F. A. Ibbott, *SP422,* p 353-361 (Aug. 1976).

Key words: accuracy and precision; analysis of body fluid clinical analysis; clinical chemistry; clinical sampling; e zyme analysis; storage of clinical samples.

Three requisites must be satisfied for a physiological sa ple to be acceptable for analysis in the clinical chemist laboratory. If any of these three requisites is not met, t acquisition of a reliable and meaningful result is jeopardize

To begin with, at the time the sample is collected, the p tient must be in a physical state appropriate for the conte plated assay. Some of these physical requirements a reasonably apparent such as observance of being fasting, supine, and avoidance of hyperventilation. An example th is less obvious concerns the interference by radioacti material already present in the patient's blood upon radioimmunoassay.

The second requirement is for the blood drawn from t patient to be truly representative of that in the circulatio This implies circumvention of trauma to body tissu avoidance of damage to the blood cells and alertness to t possible introduction of contaminants.

Finally, the specimen must be maintained in a manner th preserves its composition with regard to the parameter to measured. While certain analytes remain stable for lo periods, others require the use of chemical preservatives that the sample be frozen. In some instances, no practi method of preservation has been developed.

High-purity reagents for trace analysis, M. Zief and J. H vath, *SP422,* pp. 363-375 (Aug. 1976).

Key words: analytical blanks; analytical reagents; contamination control; high-purity reagents; membrane filtration; mercury cathode electrolysis; prepurification; purity definition; reagent contamination; ultrapurification.

Determination of ultratrace (<1 μg/g) metal content in diverse matrices requires high-purity reagents for dissolution, preconcentration and supporting electrolytes. Trace impurities in these reagents fluctuate not only with the degree of contamination during purification and containment by the manufacturer but also with the care exercised by the analyst.

Particulates are a prime source of ultratrace impurities in inorganic salts. Most of the Fe, Pb and Cu in water soluble sodium and potassium reagents can be removed by submicrometer filtration under pressure. These impurities can be further reduced by mercury cathode electrolysis.

Although liquids are more easily purified, they are not stored as easily as solids. Accelerated aging studies for liquids, particularly the mineral acids, in leached glass or plastic containers are necessary to insure the integrity of the product. After the chemical has been purified and stored, it must be equilibrated with its container and analyzed under contamination-free conditions. Until full, accurate disclosure of procedural details for ultratrace measurements are published by suppliers and the laboratory analyst, inaccuracies attributed to systematic errors can be expected. Improper handling of high-purity reagents is frequently observed. For example, there is no point to use an expensive reagent when the container is allowed to collect dust on an open shelf or in the fume hood of a heavily contaminated laboratory.

Contamination of atmospheric particulate matter collected at mote shipboard and island locations, E. J. Hoffman, G. L. offman, and R. A. Duce, *SP422,* pp. 377-388 (Aug. 1976).

Key words: analytical blanks; atmospheric sampling; coastal sampling; contamination of atmospheric particulate samples; sample handling; shipboard atmospheric sampling.

As part of a study of the chemistry of marine aerosols, atmospheric particulate samples have been collected simultaneously on the bow and on the stern of the University of Rhode Island oceanographic vessel TRIDENT to determine the degree to which particulates generated or modified by the ship itself can influence the chemistry of ambient air particulates. Samples have been analyzed for a variety of trace elements, including Na, Mg, Ca, K, Fe, Cu, Mn, Al, and Pb. The results indicate that certain elements are most subject to this form of contamination.

It is possible to use meteorological parameters to determine whether or not samples are contaminated by local sources. Atmospheric particulate samples have been collected from coastal towers in Hawaii and Bermuda. The composition of the particulates at the Hawaii tower is dependent not only on meteorological conditions at the time of collection, but also on conditions *(e.g.,* wind direction, rainfall, *etc.)* 24 hours previous to sample collection. Detailed meteorological information is thus critical in remote locations to determine whether or not the sample collected is representative of the ambient atmosphere.

Sampling and analysis for sulfur compounds in automobile exaust, E. R. Blosser, L. J. Hillenbrand, J. Lathouse, W. R. ierson, and J. W. Butler, *SP422,* pp. 389-400 (Aug. 1976).

Key words: automobile exhaust; catalytic oxidation converter; dilution tunnel; isopropanol; particulate filtration; sulfate; sulfur dioxide; sulfur trioxide; sulfur trioxide condensation.

Fuel sulfur is oxidized to the dioxide and trioxide in automobile engines. Adding an oxidation catalyst for emission control may alter the SO_3/SO_2 ratio in the exhaust.

An engine, a current production V-8 equipped with 1975 emission controls including an oxidizing catalytic converter (but without exhaust-gas recirculation), was run at steady operating conditions on an engine dynamometer. The exhaust was passed through a conventional exhaust system to a 23-in-diameter, 36-ft-long dilution tunnel.

Samples were withdrawn from before and after the catalytic converter, from the tailpipe, and from before and after filters sampling the diluted exhaust in the tunnel. Material balances for the fuel sulfur were carefully checked to ensure that valid data were being obtained.

Experiments were conducted with several catalysts, at two levels of fuel sulfur content. The results indicate less than 1 percent conversion to sulfate when the catalyst is not used, but substantial conversion to sulfate with the catalyst in use at the operating conditions of the experiments. A large increase in particulate mass is observed with the catalyst; the increase has been shown to be largely sulfuric acid and associated water.

Considerable care must be exercised in the sampling and analysis of exhaust sample if errors are to be avoided. Details of the overall method, and reasons for the precautions taken will be presented, with data supporting the conclusions.

Preparation, analysis, and sampling constants for a biotite, C. O. Ingamells and J. C. Engels, *SP422,* pp. 401-419 (Aug. 1976).

Key words: biotite stoichiometry; geochemical standards; geochronological standards; K-Ar dating; sampling a biotite; sampling constants; standard biotite.

A 99.9+ percent pure 40-60 mesh biotite, intended primarily as a K-Ar dating standard, but useful in other applications, has been exhaustively analyzed. About 8 kilograms have been prepared for distribution.

Sampling constants K_s (*i.e.*, the weights of samples necessary for 1% sampling error) have been determined for potassium (0.005 g), for sodium (1 g), for total iron (0.005 g), for calcium (2 g), for aluminum (0.001 g), and for some other elements. Nonuniformity with respect to potassium, sodium, and calcium may be partly due to diadochic substitution: nonuniformity with respect to calcium may be caused in part by 0.02 percent of apatite impurity. There is evidence that the biotite is geochronologically inhomogeneous; it behaves as a mixture of two biotites of different K-Ar ages. The sampling constant for radiogenic argon is about 0.05.

Possibly the greatest value of this standard material will lie in its demonstration of the principles which ought to be observed during the preparation and distribution of geochemical standards. We hope that may be the first in a series of International Standard rocks and minerals which may be used with confidence to calibrate and control geochemical analysis.

An approximate method of computing errors in trace analysis due to sampling heterogeneous solids, F. J. Flanagan, *SP422,* pp. 421-427 (Aug. 1976).

Key words: analytical error; geochemical variance; particle size distribution; particle size errors; sampling errors; trace analysis.

An approximate method of computing errors in the determination of trace elements in silicate rocks, errors that may be attributable to the size distribution at the sample grains,

has been derived using the Poisson distribution and assuming no covariance between minerals and grain sizes. Standard deviations of trace-element analyses decrease as particle size decreases and as number of particles increases. Before a crushed rock is sampled, the analyst should ensure that the number of particles is so large that the relative error due to the number of grains in the portion for analysis will always be a magnitude or two less than other errors he may make in the analytical procedure.

Sampling and analysis of carbon contained in the primary coolant of pressurized water reactors, S. A. Meacham, *SP422*, pp. 429-438 (Aug. 1976).

Key words: analysis; carbon; crud; filtration; pressurized water reactors; primary coolant; sampling; water.

A portable high pressure in-line filtration device, developed by the Westinghouse Analytical Laboratories, was installed in a pressurized water reactor (PWR) primary coolant sample line and the suspended solids removed by filtration.

The filtration medium was a 47 mm diameter silver filter having a porosity of 0.45 μm. Collection times of 8 hours with an average flow rate of 2.66 liters per minute (42.1 gal h^{-1}) were made. Total volume of primary coolant processed per run was 1,275 liters and resulted in the collection of 3.3 milligrams of suspended solids; more commonly known as crud. This corresponded to a concentration of 2.6 $\mu g\,\ell^{-1}$ or 2.6 ppb in the coolant.

After sufficient crud has been collected, the pre-tared silver filter is removed from the high pressure housing, dried, and reweighed. Eleven millimeter diameter discs are cut from the filter and placed in a preconditioned quartz combustion system and heated to 1150 °C within 30 minutes. An additional hour at 1150 °C is required to ensure complete reaction of the crud sample with the oxidizing atmosphere. The quantitative liberation of carbon dioxide is collected in a trap cooled with liquid nitrogen and subsequently released and measured by gas chromatography. Provisions are made for blank determinations on an unused silver filter with appropriate corrections and aliquot size determined by gamma spectroscopy.

The method developed for this analysis is applicable in the range of 1 to 200 micrograms of carbon. The accuracy and precision of the sampling method and the analytical procedure are discussed.

Sampling and sample handling for activation analysis of river water, S. H. Harrison, P. D. LaFleur, and W. Zoller, *SP422*, pp. 439-455 (Aug. 1976).

Key words: filtering water; river water; sampling water for trace elements; suspended particulates in water; Teflon water sampler; trace elements; trace elements in water; water.

A complete preanalysis scheme for determining trace elements in river and estuarine water by instrumental neutron activation analysis is described. The design, operation and evaluation of a new Teflon water sampler is included in the presentation of the preanalysis scheme. The evaluation of this water sampler consists of replicate sampling experiments and a comparison with a commercial sampling bottle (Van Dorn). The water sampler described allows for filtration of the sample as it is transferred from the sampler to a storage container. Lyophilization (freeze drying) is used as the preconcentration technique for the dissolved species, *i.e.*, liquid portion of the sample. Normalization of suspended particulate data to the element scandium is presented as a useful technique for locating man-made heavy metal input sources.

Homogeneity considerations in trace analyses using the nuclear track technique, B. S. Carpenter and G. M. Reimer, *SP422*, pp. 457-459 (Aug. 1976).

Key words: detector techniques; nuclear track analysis; sample homogeneity.

Nuclear track results are compared to those obtained by other analytical methods using different quantities of homogeneous material.

Two different approaches are used to make the nuclear trace analysis of a sample more representative of the larger sample. Sample homogenization methods and detector manipulation are discussed.

Problems in sample treatment in trace analysis, C. W. Sill, *SP422*, pp. 463-490 (Aug. 1976).

Key words: ashing (wet and dry); chemical errors; contamination; dissolution techniques; fusion dissolution; radiochemical analyses.

One of the most important—and most neglected—parts of any analytical procedure is the initial decomposition of the sample. Not only must the sample matrix be dissolved but the element sought must be converted reliably to the proper ionic form before chemical reactions characteristic of that element can be obtained. Complete dissolution is especially difficult with the quadrivalent and pentavalent elements which form very refractory oxides, carbides, *etc.*, particularly after having been heated. For example, the plutonium in the ash remaining from dry ashing large samples of soft tissue requires much more powerful treatment for its complete conversion to the ionic state than merely boiling with nitric acid. Fusion with molten potassium fluoride is one of the simplest and most effective methods for dissolving metallic as well as siliceous refractories because of the stability of the fluoride complexes and the high reaction rates available at its melting point of 846 °C. Inclusion of a small quantity of potassium nitrate even permits rapid and complete dissolution of refractory carbides such as Carborundum. The cake can then be transposed either with sulfuric acid to a pyrosulfate fusion with simultaneous volatilization of both hydrogen fluoride and silicon tetrafluoride, or with nitric and boric acids to give a solution free of sulfate. Color slides of the entire process will be shown to demonstrate that the procedure is neither difficult nor time-consuming as is generally supposed.

Extremely serious problems can be introduced by evaporating solutions of quadrivalent elements to dryness or by neutralizing them to too high a pH. Powerful sequestering agents can be produced from orthophosphates in the sample that will completely change the course of the analysis unless recognized and provided for. Standardizations are frequently carried out in a careless and inaccurate manner. Contamination is one of the greatest problems in trace analysis and needs to be avoided by good management and understanding of the causes. Preservation of both samples and standards can be vastly improved by application of a little more fundamental chemistry. Many other important "details" will be discussed which are frequently ignored or overlooked because of preoccupation with the more glamorous facets of the procedure, such as elegant separations or measurement techniques employed.

Dissolution of organic materials, T. T. Gorsuch, *SP422*, pp. 491-507 (Aug. 1976).

Key words: ashing techniques; dissolution; dry ashing; organic materials analysis; trace element analysis; wet ashing.

The initial stage in the determination of trace elements, the destruction of the organic matter, is likely to introduce more errors than all the other stages put together.

There are two main families of decomposition methods, those involving air or oxygen and carried out at relatively high temperatures and those involving relatively large quantities of liquid reagents and carried out at temperatures limited by the boiling points of the liquids. Each of them has its advantages and disadvantages. The dry methods generally being characterized by high and relatively less controlled temperatures and with little or no separation of the required elements and the other solid components of the system, while with regard to the wet methods, the temperature is generally lower and there is separation at all times between the required elements and the solid components of the system. The technique using activated oxygen falls into a separate class of its own.

The problems during the decomposition stage are of two kinds, losses of the required elements, or contamination of the sample with extraneous material. The losses can be due to volatilization or to fixation on the solid components of the system and such losses are generally less serious with wet methods than with dry. Contamination on the other hand is often related to the quantities of reagents added and in this instance the dry methods are probably superior to the wet.

The problems encountered, particularly with regard to losses, will vary greatly with the element to be determined and the nature of the sample in which it is to be determined. Elements such as mercury and selenium are always difficult and samples containing chlorine in any form generally pose problems.

The role of the analytical blank in accurate trace analysis, T. J. Murphy, *SP422*, pp. 509-539 (Aug. 1976).

Key words: accuracy; analysts; apparatus; blank; contamination; environment; purity; reagents.

The inability to control the analytical blank, *i.e.*, contamination from all sources external to the sample, has seriously affected the accuracy of low level trace determinations. Most of the sources of the blank are variable and it is this variability that determines the uncertainty of the blank correction and, therefore, the lower limit of trace element concentration that can be determined with reliability. To improve both the accuracy and lower limit of trace determinations, it is imperative to control the variability of the analytical blank. The only practical way to accomplish this is to reduce the size of the blank itself by controlling the sources of the blank.

The analytical blank is composed of contamination from four principal sources, namely: the environment the analysis is performed in, the reagents used in the analysis, the apparatus used, and the analyst performing the analysis.

Environmental contamination is caused by particulates and gaseous compounds in the ambient air. Methods for reducing the blank from this source by the use of isolation chambers or "absolute" filters are described.

While commercially available high-purity reagents have helped the analyst to control the blank from reagents, they are frequently not low enough in trace element concentration and must be purified before use. Methods for the preparation of high-purity reagents, especially water and the mineral acids, are reviewed.

Contamination from beakers, containers, mortars and other apparatus can seriously affect the blank. Techniques for controlling this type of contamination are described with emphasis on the purity of materials.

The last source of contamination is that caused by the analyst during the analysis due to carelessness or poor technique. Suggestions are given to aid the analyst in this regard.

The analysis of surfaces and microstructural detail, F. Bacon and E. Lifshin, *SP422*, pp. 541-573 (Aug. 1976).

Key words: Auger spectrometry; electron microprobe analysis; ESCA; ion scattering; secondary ion mass spectrometry; surface analysis.

The spatial distribution of trace elements detected by bulk chemical analysis can be as important a factor in determining the properties of any material as its overall composition. In structural materials such as steel, for example, the presence of certain impurities below the 100 parts per million level, segregated to grain boundaries, can cause intergranular failure while a uniform distribution of the same concentration might have a negligible effect on mechanical properties. Similar examples can readily be cited regarding the influence of minor or trace constituents on electrical properties, corrosion, oxidation, adhesion and catalysis behavior.

New instruments for chemical analysis of fine structure and surfaces include electron and ion microanalyzers, as well as Auger, photoelectron and ion scattering spectrometers. It will be the purpose of this paper to review the present status and limitations of these techniques for local chemical analysis and discuss how they complement each other and more traditional methods of bulk chemical analysis.

The effects of container composition, storage duration, and temperature on serum mineral levels, G. L. Fisher, L. G. Davies, and L. S. Rosenblatt, *SP422*, pp. 575-591 (Aug. 1976).

Key words: atomic absorption spectrophotometry; calcium; container effects; copper; magnesium; potassium; serum minerals; serum storage effects; sodium; temperature effects; trace elements; zinc.

To evaluate the effects of various storage parameters on serum mineral levels, blood-bank pooled, human serum was stored in Erlenmeyer flasks of five different compositions at three temperatures. The samples were analyzed by atomic absorption techniques for calcium, magnesium, copper, zinc, sodium, and potassium at 0, 1, 2, 4, 8, 16, 32, and 50 days of storage. Container effects were highly significant for Zn, K, and Na, but were small with maximal container differences of 2 to 3 percent. To 16 days of storage, temperature effects were not significant, and at later times temperature was highly significant at room temperature for Ca, Mg, and Zn. The effect of storage time was highly significant for all elements: Zn showed a 20 percent decrease after 2 days; Ca, Mg, and Cu had 10 percent decreases at 2, 4, and 8 days, respectively; K and Na showed maximal decreases of 2 percent and 3.5 percent with storage time. For the elements Zn, Ca, Mg, and Na, decreases were observed after 4 days of storage with near return to the original values on day 8. The patterns of mineral change in serum suggested at least two mechanisms: (1) pH change and (2) at later times, bacterial growth. To test these hypotheses, two subsequent studies were initiated. In one study, pH of f shly pooled human serum was measured, and streak plates were counted for bacteria at the time of each elemental analysis under various storage conditions. In another study, serum pH changes were accelerated by physical techniques that accelerated the loss of CO_2. The data indicate that factors that influence serum pH levels appear to affect elemental concentrations.

Biological sample contamination due to quartz container in neutron activation analysis, B. Maziere, A. Gaudry, J. Gros, and D. Comar, *SP422*, pp. 593-604 (Aug. 1976).

Key words: biological analysis; container blank; neutron activation analysis; wet-ashing blank.

Activation analysis is not dependent on the purity of chemical reagents because these are used only after irradiation. However, in the analysis of biological samples a new source of "contamination" appears, due to the container in which the sample is irradiated. For this reason it is often necessary to separate the irradiated sample from its irradiation container before recording the activity. Since the quartz of the container is partly dissolved, it is necessary to eliminate contamination due to impurities adsorbed on the surface of the quartz ampoule. The values of the so-called "analytical blank" are given for some 15 elements, certain of which have a recognized importance in biology.

Preparation of biological materials for chromium analysis, W. R. Wolf and F. E. Greene, *SP422*, pp. 605-610 (Aug. 1976).

Key words: biological materials; biological standards; chromium; flameless atomic absorption; volatile chromium compounds.

In flameless atomic absorption spectrometry, introducing biological materials directly into a graphite furnace leads to a lower response than if the samples are pre-ashed. The decrease is due to organically bound chromium. Since few biological standards are available with reliable data as to chromium content, it is necessary to use inorganic standards of known chromium content and prepare the biological materials in such a way as to destroy the chemical history of the chromium. Studies were carried out on the NBS Standard Reference Material SRM-1577 (Bovine liver), looking at a variety of sample digestion and ashing procedures. An order of magnitude variation in chromium content was seen depending upon the type of sample preparation procedure used. The existence of volatile compounds of chromium that are lost during ashing or digestion steps has been postulated for an explanation of these different results.

Stability of chromium ions at low concentrations in aqueous and biological matrices stored in glass, polyethylene, and polycarbonate containers, V. D. Anand and D. M. Ducharme, *SP422*, pp. 611-619 (Aug. 1976).

Key words: adsorption losses; biological systems; chromium; stability; storage containers.

Low-concentration solutions of chromium (< 50 μg/dl), in either aqueous or biological matrices, frequently need to be stored for short or long term studies. Storage at low temperatures is usually considered the best available precaution against changes in concentration through adsorption or leaching or evaporation of water. Polyethylene containers are not appropriate for storage of aqueous chromium standards of low concentration. Borosilicate glass containers are preferred for the storage of low-concentration aqueous standards for up to 6 months. The stability of serum and plasma chromium concentration ($< 0.2 - 0.5$ μg/dl) is maintained in polyethylene vessels, if stored frozen at below -10 °C. Polycarbonate tubes were found adequate for storage of serum and plasma for up to 2 weeks, under refrigeration at 4 °C.

A possibility of state analysis of plasma spectrometry, S. Hanamura, *SP422*, pp. 621-625 (Aug. 1976).

Key words: plasma spectrometry; preliminary analysis; specimen decomposition; specimen evaporation.

This report describes a new method of state analysis b plasma spectrometry which is found to be very useful fo preliminary analysis of natural samples. An induction fur nace or an electric heater is used for the vaporization of thi solid sample and the resulting gas is introduced into th plasma torch. The vaporized sample enters the plasma flam in the order of height of boiling point and depends upon th temperature gradient of the furnace.

Preparation and analysis of aquatic-related samples, N. M Ferguson, J. R. Lund, R. R. Rickard, and L. T. Corbin *SP422*, pp. 627-632 (Aug. 1976).

Key words: aquatic insects; atomic absorption; clean room fish; mini-computer; sample preparation; toxic metals trace determination.

The use of a special room in which to prepare sample and high-purity reagents has become standard now. How ever, without adopting and judiciously following specia operating procedures to cope with those factors which af fect the accuracy of trace analyses, the analyst may en counter serious problems.

Special operating procedures have been followed withi the sample preparation laboratory to provide representativ aliquots of aquatic-related samples (fish, aquatic insects water, and water sediments) to other analysts for multipl element determinations. Procedures or preparatio techniques employed for aquatic-related samples have bee directed toward the final use of NAA, SSMS and AA fo the desired determinations. Criteria have been establishe to aid in the selection of applicable analytical methods Consideration is given to determining what degree of accu racy is adequate and to the expense necessary to achiev this accuracy. By following sound sample preparatio procedures in the sample preparation laboratory and by tak ing great care in making the final determination or measure ment, significant reductions in analytical costs can be real ized without compromising the accuracy of the analysis.

Stability of metal ions in aqueous environmental samples, A Rattonetti, *SP422*, pp. 633-648 (Aug. 1976).

Key words: filtration losses; metallic ions; pollution moni toring; rainwater analysis; sample stability; surface wate analysis.

The time lapse between the collection of aqueous en vironmental samples and the analysis affects the origina ionic concentration. Studies have proven the nonionic spe cies in a water sample have more of an effect on the veracity of an analysis than the "container wall" effect, and that ad justment to a pH of 2 at sample collection time is a "Pyrrhic victory." Lead, for example, will commonly increase a order of magnitude when unfiltered samples are adjusted t a pH of 2 upon collection. This effect is greatest when ele mental ions are present in the ng ml^{-1} range and lessens a the original ionic concentration increases.

Data is presented that behooves filtration of stream wate and rainwater samples prior to any acidification step. Th need to acidify the resulting filtrate is also discussed. Lithi um, sodium, potassium, cesium, magnesium, calcium, stron tium, manganese, iron, copper, silver, zinc, cadmium, alu minum, indium, and lead are examined. The insoluble phas retained on the filter can be digested with acid and also analyzed. The separate analysis of the filtrate and filter wil give a true representation of the occurrence of these metal in nature. Flame and flameless atomic absorption and emis sion are used to perform the trace analyses.

Resin-loaded papers—sampling and trace analysis using neutron activation and x-ray spectrography, S. L. Law and W. J. Campbell, *SP422*, pp. 649-658 (Aug. 1976).

Key words: ion exchange; sampling; x-ray fluorescence.

Resin-loaded papers, composed of approximately 50 weight percent cellulose and 50 weight percent resin, provide an ideal medium for sampling large volumes of solution, then determining the concentrated elements by either fluorescent x-ray spectrography or neutron activation. This combination of chemistry and spectrography offers a versatile quantitative approach to the determination of trace elements in the ppm-ppb range. Standards and unknowns are prepared by either multiple filtration of solutions through two or more papers to measure the collection efficiency or a radiotracer is added to the solution to serve as a collection monitor. Reagent and paper blanks are incorporated into the analytical procedure. Papers containing strong acid or base resins collect a wide range of ions. Specific ions are collected by either chemical processing of the solution prior to filtration through the resin-loaded paper or by the use of papers loaded with chelating resins having high specificity.

Advantages of the resin-loaded paper approach prior to spectrography are: Improved analytical accuracy as the standards and unknowns are present in similar matrices; sampling errors are reduced and sensitivity significantly increased by concentration of the elements from a large volume of solution; and x-ray and gamma-ray spectral interferences are greatly reduced compared to bulk analysis. Also standard papers can be reused and stored indefinitely for x-ray applications.

Examples of published applications to a wide range of industrial, environmental, and health problems are summarized together with applications by the Bureau of Mines to metallurgical and mining problems. Potential applications of new ion exchange resins and reagent-loaded papers are also considered.

Losses, interferences, and contamination in trace metal analysis—some examples, F. Amore, *SP422*, pp. 661-668 (Aug. 1976).

Key words: analysis; ashing; blood lead; contamination; dairy products; digestion; interferences; losses; mercury; trace metal.

The three main problems confronting the analysts in trace metal determinations are losses, interferences, and contamination. These problems occur at all stages of the analysis. Procedures requiring a minimum amount of sample manipulation are, therefore, desirable. Examples such as losses of copper, cadmium, lead and chromium in dairy samples routinely surveyed fr these elements in both a dry ashing and wet digestion procedure are discussed. Examples and discussion of interference problems and sources of contamination are also given. The use of blanks and spiking and continuous monitoring practices are emphasized.

Sampling problems and the determination of mercury in surface water, seawater, and air, H. A. Das and H. A. van der Sloot, *SP422*, pp. 669-699 (Aug. 1976).

Key words: activation analysis; adsorption isotherm; environmental samples; mercury; preconcentration; trace elements.

Analysis of surface water for mercury comprises the determination of both ionic and organically bound mercury in solution and that of the total mercury content of the suspended matter. Eventually, metallic mercury has to be determined too. These determinations require a sampling procedure which meets the following requirements: a) the concentration of suspended matter is not affected, b) the separation of the solid fraction from the sample is performed immediately after sampling without losses from the aqueous phase due to absorption and losses from the solid phase due to desorption at a too low pH, and c) the aqueous phase is processed immediately to prevent losses due to absorption on the wall of the container. A method for the routine determination of mercury in surface water and seawater was developed and applied to Dutch surface waters. The total sample volume is 2500 ml. About 500 ml is used for the determination of the content of suspended matter and the total amount of mercury in the water. The sample is filtered through a bed of previously purified active charcoal at a low flow-rate. The main portion ($\simeq$ 2000 ml) passes a flow-through centrifuge to separate the solid fraction. One liter is used to separate "inorganic" mercury by reduction, volatilization in an airstream and adsorption on active charcoal. The other liter is led through a column of active charcoal to collect all mercury. The procedures were checked with ^{197}Hg radiotracer both as an ion an uncorporated in organic compounds. The mercury is determined by thermal neutron activation, followed by volatilization in a tube furnace and adsorption on a fresh carbon bed. The limit of determination is $\simeq$ 1 ng l^{-1}. The rate of desorption from and adsorption on suspended material has been measured as a function of the pH of the solution for Hg^{+2} and various other ions. It can be concluded that only the procedure mentioned above does not disturb the equilibrium. The separation of mercury from air is obtained by suction of 1 m^3 through a 0.22 μm filter and a charcoal bed. The determination is then performed as in the case of the water samples.

Control of blanks in the analysis of phthalates in air and ocean biota samples, C. S. Giam and H. S. Chan, *SP422*, pp. 701-708 (Aug. 1976).

Key words: air analysis; analytical blank; gas chromatography; ocean biota analysis; phthalate trace analysis.

For the trace characterization of phthalates, gas chromatographs equipped with electron-capture detectors have been found to be more sensitive than those with flame-ionization detectors in the order of about 10^2. But the response (measured by peak height) of phthalates to electron-capture detectors are in the order of 10^2 less sensitive than that of chlorinated hydrocarbons (DDT, DDE, PCBs, *etc.*). The response of phthalates to electron-capture detectors is not constant and normally as little as 0.5 nanogram of di-2-ethylhexyl phthalate (DEHP) can be detected.

The following factors limit the detection of phthalates at ultra-low levels (parts per billion to parts per trillion in biota samples) with acceptable accuracy: 1) contamination from solvents, reagents and materials used in the analysis; 2) limitation from the size of the samples; and 3) polychlorinated biphenyls (PCBs) and DEHP contamination in the laboratory and their strong adsorption to glass surfaces.

This paper will describe the problem of background contamination from various sources—reagents, solvents and materials used in the laboratory—the procedure for the removal of these contaminants and the methods for the isolation and separation of phthalates in air and open-ocean biota samples.

Mass spectrometric analysis for fractional ppb atomic content of boron in trichlorosilane, J. A. Baker, *SP422*, pp. 709-714 (Aug. 1976).

Key words: boron measurements; mass spectrometry; semiconductor grade silicon; trichlorosilane.

$HSiCl_3$ is used to make semiconductor grade silicon. This silicon must have a boron content in the low ppb atomic range as measured by resistivity analysis; thus, purity of the raw material $HSiCl_3$ must be known in advance. A mass spectrometric technique was developed to analyze quantitatively the boron content in the $HSiCl_3$ relative to the observed boron deposited in the silicon.

A fixed volume of $HSiCl_3$ was evaporated and hydrolyzed onto a cleaned silicon electrode; the electrode surface area was approximately 20 square mm. A point silicon counter electrode was scanned over the surface of the coated large area electrode to spark the "deposited" residue. To obtain a limit of detection of 3 ppb atomic in the bulk analysis of a solid it is necessary to spark and produce a 300 nanocoulomb exposure on the analyzing photoplate. The evaporation and hydrolysis of $HSiCl_3$ produces a concentration factor as later determined of approximately 1000; thus, a surface exposure of 3 nanocoulomb will give a limit of detection of 0.3 ppb atomic. Experiments were performed on 8 samples covering a wide range of boron content and 16 samples at or near the limit of detection. Mass spectrometric analysis of each $HSiCl_3$ sample was performed and silicon poly rods were grown from each $HSiCl_3$ sample. The poly rods were float zoned 1 and 10 pass to determine by resistivity the boron and donor concentrations in the poly. A calibration curve was then constructed comparing the mass spectrometric boron concentration and the boron as determined by resistivity. The concentration factor of approximately 1000 was thus obtained for the mass spectrometric analysis of boron in $HSiCl_3$. The observed boron content thus refers to the boron deposited in polycrystalline silicon by the $HSiCl_3$ and not the boron content in $HSiCl_3$. This distinction is necessary; to demonstrate that one analytical technique is producing correct results it is necessary to calibrate it against a known standard technique. The measurement of boron in silicon by resistivity is an accurate technique is producing correct results it is necessary to validated. Thus, an analytical technique has been developed to measure impurity concentrations (in this case boron in $HSiCl_3$) in the fractional ppb atomic range in liquids with great accuracy.

The challenge of getting the lead out, E. Berman, *SP422*, pp. 715-719 (Aug. 1976).

Key words: atomic absorption spectrometry; blood analyses; contaminations; flameless methods; lead; lead blood analyses; methodology; trace element analyses.

Developments in spectroscopic instrumentation over the last decade have enabled determinations of the lead content in blood, other biological fluids, and tissues to become routine analyses in clinical laboratories serving metropolitan centers. Though not a technically difficult procedure in itself, maintaining the quality of lead analyses presents a few challenges. One must be cognizant of the pitfalls of a specific method and of the limits of its accuracy and precision. Instrumental limits, the matter of possible extraneous lead contaminants on the subject of analysis, the labware, the in-the-laboratory environment, the reagents, *etc.* must all be considered.

Factors influencing the integrity of lead determinations in the clinical laboratory, from sample collection to interpretations of analytical results with confidence, will be discussed.

Rapid homogenization and drying of biological material, I. Y. Donev, *SP422*, pp. 721-726 (Aug. 1976).

Key words: biological materials; homogenization; lyophilization; noncontaminating; sample preparation.

The determination of chemical trace elements in biological material presents many methodological difficulties. The most important difficulties of the sample's homogenization and enrichment are connected with the elimination of contamination with other elements or losses of the latter. Another problem is tissue lyophilization.

The paper describes the procedure for a relatively rapid drying and fine homogenization of biological materials for trace element research by means of nondestructive neutron activation analysis. Data are given on a double homogenizer and vacuum drying installation at liquid nitrogen temperatures. Wet homogenization of tissues is carried out in the inner homogenizer. This homogenizer is put into a second one, the lower part of which is utilized for fine mincing.

Each homogenizer has a capacity of up to 15 cm^3. The humidity taken away during the drying is approximately 75 to 90 percent, and depends especially on the tissue state.

The procedure was applied with success on serum, blood plasma and other biological materials.

The total installation allows the simultaneous drying of 13 homogenates. The total time for the drying and homogenization of 13 samples carried out by one trained laboratory assistant, is about 6 to 7 hours.

Problems in trace analysis of nitrosamines in foodstuffs, E. A. Walker and M. Castegnaro, *SP422*, pp. 727-736 (Aug. 1976).

Key words: carcinogens; food; nitrosamines; trace analysis.

Methods in general use are briefly reviewed. Epidemiological research in the region of the Caspian Littoral has demonstrated certain trends in the distribution of incidence of oesophageal cancer. Samples of typical foodstuffs from both high and low incidence areas have been analyzed for traces of N-nitrosamines. After extraction from the food, the nitrosamines were analyzed by oxidation to nitramines which were then separated by adsorption chromatography and determined by gas chromatography using an electron capture detector. Initial results suggested a correlation between levels of nitrosodimethylamine and oesophageal cancer incidence. However, the presence of nitrosamines could not be confirmed by mass spectrometry. As a result, the clean-up procedure was modified by inclusion of a further adsorption chromatography stage where some interfering material was eliminated and all levels of nitrosamine were reduced below the 1 $\mu g/kg$ level. The work demonstrates that even for screening analysis, clean-up procedures must be rigorous when carrying out trace analysis to avoid misleading results.

Effects of storage conditions on residues of 2,4-D and 2,4-DCP in potatoes, D. Bristol, *SP422*, pp. 737-745 (Aug. 1976).

Key words: gas chromatography; potatoes; residues, dissipation of; residues, in potatoes; residues, metabolic; residues, total; residues, volatilization; storage effects; 2,4-dichlorophenol; 2,4-dichlorophenoxyacetic acid.

Red potatoes grown in North Dakota are treated with low dosage rates of 2,4-D (2,4-dichlorophenoxyacetic acid) at tuber set to improve market quality and yield. Tuber residues of 2,4-D and 2,4-DCP (2,4-dichlorophenol) in potatoes treated at a total rate of 2 ounces of active ingredients per acre were found to range from 0.068 to 0.15 and from less than 0.002 to 0.012 ppm, respectively. Samples were analyzed both with and without an acidic tissue hydrolysis step which preceded solvent extraction to deter-

mine total and free residue levels, respectively. Conjugated residues of 2,4-D could not be detected in significant quantities.

The stabilities of 2,4-D and 2,4-DCP in stored samples were found to be very dependent upon both the manner in which field samples were processed and the temperatures used for storage. Residue levels of metabolically incorporated 2,4-D in treated potato samples stored whole at 4 °C decreased over a period of 15 months to less than 0.005 ppm but those of 2,4-DCP remained constant. The observed dissipation rate of 2,4-D was approximately first order with a half-life of about 10-14 weeks. In contrast to these results, obtained under conditions used for commercial storage, the stabilities of 2,4-DCP were reversed in tuber samples which were sliced, fortified and processed immediately after harvest and stored at − 20 °C. Recoveries of 2,4-D from frozen samples were constant over a 15-month period, but those of 2,4-DCP decreased slowly from 88 to 47 percent. These contrasting results point out the utility and necessity of incorporating dissipation experiments into residue studies conducted on samples stored for significant periods of time.

Sampling problems in the investigation of high purity metals, I. Radwan, L. Walis, and H. Jaskólska, *SP422*, pp. 747-755 (Aug. 1976).

Key words: high purity metals; inhomogeneity; microsegregation; sampling; surface contamination.

One of the vital problems in the determination of trace elements in metals is their inhomogeneous distribution in the matrix. Elements which dissolve in the metal matrix at elevated temperatures often concentrate during the crystallization process at the grain boundaries, or inside the grain. Elements which do not dissolve occur in the form of nonmetallic inclusions. The distribution of such inclusions is generally irregular, and obtaining results which are representative for the whole ingot is practically impossible. The error involved can be reduced, if the type and range of segregation of the element to be determined in the alloy is known and taken into account on sampling. Several examples are given.

Analytical methodology for accurate determination of trace constituents in highly pure materials, P. Albert, *SP422*, pp. 759-772 (Aug. 1976).

Key words: contamination; gas analysis; high purity; materials analysis; neutron activation analysis.

High purity materials analysis is a difficult problem and different analytical methods are used. This paper is devoted to the discussion of the principles of analytical methodology in two ways: 1. the accurate determination of one or a few trace elements in a high purity material, and 2. the accurate determination of the "complete analysis" in a high purity material with the purpose of defining the true number of "nines," at the level of six or seven "nines," in the conventional definition in percent purity. In the first case the ultimate goal of analytical measurement is a numerical result of known accuracy. The necessary conditions for the accurate and precise analytical determination of an element in a high purity material are discussed and the calibration, the "blank" and the "clean rooms," surface contamination, chemical recovery, and finally the need of certified purity reference materials are debated. In the second case the main problem is to make a selection of some complementary multielement trace analysis methods.

Discussion includes identifying and resolving the problems and identifying what areas require further research. Conclusions are made on general philosophy and attitude concerning the necessity of a general approach to guarantee the accuracy of trace analysis.

Analytical methodology—rocks and ores, H. Onishi, *SP422*, pp. 773-790 (Aug. 1976).

Key words: accuracy and precision; comparison of trace analytical methods; contamination; rocks and ores; sample preparation; trace element analysis.

To Goldschmidt we owe early knowledge of trace element geochemistry. He analyzed a variety of geomaterials by emission spectrochemical analysis during 1930-37. Colorimetric (spectrophotometric) procedures have been developed beginning with Sandell since 1936. Studies in trace element geochemistry have been greatly advanced by means of neutron activation analysis since approximately 1950. Isotope dilution mass spectrometry is gaining a central position as a reliable trace element analysis method; this has become possible through scrupulous control of blanks.

The blank can be related to the constituent in question and the interfering (positively or negatively) substances. Correction for contamination during sample preparation is usually very difficult. The blank is affected by reagents, vessels, and atmosphere or environment, all of which require the close attention of the analyst. Ways for reducing blank values are briefly mentioned.

Methods recently described for determination of trace elements in geomaterials are: spectrophotometric and fluorimetric, emission spectrochemical, atomic absorption and flame emission, x-ray fluorescence, nuclear (activation, nuclear track, *etc.*), electrochemical, mass spectrometry, and gas chromatography. Examples of comparison of methods are given. The following are to be considered in choosing the proper analytical technique: objective of analysis, sensitivity and detection limit, accuracy, precision or reproducibility, determination of single element or multielements, time and cost, and analyst.

The past, present, and future of the analysis of atmospheric particulates, R. K. Skogerboe, *SP422*, pp. 791-803 (Aug. 1976).

Key words: atmospheric particulates; direct analysis techniques; emission spectroscopy; particulate analysis; particulate characterization; sampling methods; X-ray fluorescence.

The determination of the composition of airborne particulate matter is a major task of escalating importance. The general requirements imposed on the analytical methods are typical: The multielement composition must be determined accurately and precisely over a wide concentration range. These accurate results are to be generated by the analytical method even though there may be major variations in the general composition of the particulate samples or in their "preparative" histories. Other emerging requirements include the determination of composition on a continuous basis in the field even at exceedingly low concentrations and/or the specification of composition as a function of particle size.

A comparative evaluation of the various analytical methods used for characterization of particulates is presented from the perspective of these requirements. The state of the art for several competitive analytical methods is summarized and their advantages and limitations defined. A synopsis of ongoing research is presented and potentially fruitful directions for analytical development are indicated.

Analytical chemistry of natural waters, D. E. Robertson, *SP422*, pp. 805-836 (Aug. 1976).

Key words: accuracy; analytical chemistry; contamination; errors; natural water; sample storage; sampling.

Analysts who have had more than a casual experience in trace element analysis of natural waters will unanimously agree that achieving accurate and precise results is indeed a difficult task. The reasons for these difficulties are numerous and begin with the collection of the sample. Many of the factors which govern the accuracy and precision attainable by present techniques and instrumentation for the measurement of trace element analysis of waters, from the sampling through the actual analysis, are discussed. Several case studies are presented which illustrate the parameters which must be carefully evaluated to ensure sufficient accuracy and precision in water analysis.

Analytical methodology for accurate analysis in clinical chemistry, S. S. Brown and F. L. Mitchell, *SP422*, pp. 837-850 (Aug. 1976).

Key words: accuracy; clinical analysis; clinical chemistry; health; precision.

Methods of measurement in clinical chemistry need to be continuously assessed to determine the degree of accuracy and precision required to ensure their optimum value for clinical purposes. Constant review is necessary since improvements in technology often show that much of what was once thought to be biological variation within and between individuals can be laboratory error. When biological variation is clearly known, it is pointless to provide measurements which may be costly when done beyond the required degree of accuracy and precision. In many cases however, that degree is not yet attainable in routine work.

Once determined, these levels of efficiency must be maintained and comparability of results ensured between laboratories and nations. Only comparatively recently have the principles which are required to achieve this, been formulated and understood. The first stage was the elimination, as far as possible, of human error by the large-scale introduction of automation and electronic data processing, then when precision was thus brought under control, it became possible to investigate accuracy.

Work in this direction using special reference technology, is proving that many of the well established techniques are far from satisfactory. New substances are required to be measured increasingly, and often, a technique may be accurate and not precise or *vice versa*, only an ability to monitor and maintain accuracy and precision with confidence in the clinical chemistry laboratory, will ensure continued progress in the use of clinical measurement in medicine. Ways of doing this will be discussed.

Trace level determination of triclosan by gas chromatography, F. H. Marquardt, J. Schulze, and D. Smith, *SP422*, pp. 851-859 (Aug. 1976).

Key words: bacteriostats; blood analysis; gas chromatography; trace analysis; triclosan; 2-hydroxy-2′,4′,4-trichlorodiphenyl ether.

The triclosan (2-hydroxy-2′,4′,4-trichlorodiphenyl ether) content in various substrates, for example, blood, can be determined by extraction into hexane, formation of the acetyl derivative, and gas chromatography over OV-17 with an electron capture detector, either with or without aldrin as internal standard. The precision and accuracy of this method is discussed.

Electrochemical trace analyses based on Faraday's Law, D. J Curran, *SP422*, pp. 861-869 (Aug. 1976).

Key words: automatic titrations; coulometric titration current integration; digital timing; epinephrine; linea sweep voltammetry; manganese; micrometer cell; thin laye electrochemistry; vanadium.

Thin layer electrochemical measurements and constan current coulometry can provide useful absolute methods fo trace analysis.

The difficulty to distinguish the coulombs consumed b the Faradaic process from the total coulombs consumed i the experiment can be minimized by the use of a null co cept with constant current coulometry. After adjustment the system to the null point, for example potentiometric, th sample is added and the system returned to the null by cou lometric titration. The electrochemical potential of th system is the same before and after passage of the electroly sis current, no charge can be lost or gained from charging o discharging of the double layer. Several examples of deter minations based on this concept are presented.

The coulometric method involves the use of an elec trogenerated titrant in almost all cases. A more direct ap proach to the use of Faraday's Law is provided by thi layer methods, where direct electrochemical conversion o the species of interest is carried out stoichiometrically Corrections for background coulombs must be made wit these techniques. Very small volumes of solutions as dilut as $10^{-5}M$ can be handled and several examples ar presented. In addition, it is possible to combine thin laye methods with electrochemical preconcentration technique to yield a versatile tool for trace analysis.

The non-faradaic background in pulse polarography, R. A Osteryoung and J. H. Christie, *SP422*, pp. 871-879 (Aug 1976).

Key words: background correction; differential puls polarography; dropping mercury electrode; electroanalysis pulse polarography; trace analysis.

The dropping mercury electrode, with its continuall renewed fresh surface, offers advantages for real sampl analysis. However, continuous expansion of the electrod drop requires a continuous non-faradaic current to maintai the charge density on the electrode surface. The technique of pulse polarography attempt to minimize this non-faradai component by differencing currents flowing before and afte application of a potential step to the drop. Nevertheless since these currents are measured neither at the same poten tial nor at the same time in drop life, the difference curren will contain a non-faradaic contribution, which is *nonlinear* function of a potential.

Extensive computer simulations of the effect of the non faradaic background on the analytical utility of puls polarography at trace concentrations indicate that inaccu rate results may be obtained if the true baseline is not know (as is likely for a real matrix). The magnitude of th background limits the amount of analyte that may be de tected and the nonlinearity of the background determine the accuracy with which the superimposed faradaic signa may be measured.

Recognizing that the double layer charging current is de pendent only on the potential and the time in drop life a which the current is measured while the faradaic current de pends on the history of the entire drop, we have devise three variants of pulse polarography which compensate fo the non-faradaic background current. These variants c pulse polarography are: 1. alternate drop pulse polarog

raphy. The output current is the difference in current for a drop whose potential is changed late in drop life and a drop maintained at the step-to potential throughout its life. 2. Twin electrode pulse polarography. The current output is the difference in current between two matched drops, both in the test solution, one of which is pulsed while the other is maintained at the step-to potential.

Improved anodic stripping voltammetry for accurate trace analysis, M. Ariel and J. Wang, *SP422*, pp. 881-897 (Aug. 1976).

Key words: anodic stripping voltammetry; background current compensation; differential anodic stripping voltammetry; electrochemical analysis; twin electrode balancing.

The unfavorable "signal to noise" ratio obtained during measurements carried out in very dilute metal ion solutions sets the lower concentration limit in anodic stripping voltammetry (ASV) determinations. The noise, deriving largely from the background current during the stripping step, is composed of a capacity current and a faradaic current contribution. DASV (differential ASV) and ASWC (anodic stripping with collection), carried out with *in situ* mercury film formation at rotating glassy carbon disc or ring-disc electrodes respectively, efficiently reduce residual current interference and significantly improve the reliability of ASV methods, as applied to real sample analyses.

DASV is carried out at identical twin working electrodes balanced against each other and immersed in the sample solution, to which Hg^{+2} ions have been added. Preelectrolysis, carried out at both electrodes at the same potential but for different deposition periods, is followed by a stripping step during which the oxidation currents are substracted.

In ASWC, a rotating ring disc electrode is employed; conventional ASV at the disc is supplemented, during the stripping step, by simultaneous redeposition at the ring, kept at a suitably cathodic constant throughout the stripping scan, allowing unequivocal quantitative evaluation of collection current peaks. Very rapid scan rates may be employed during the disc stripping steps, resulting in improved sensitivity without any loss in accuracy.

The method, combined with thin film ASV, with the mercury film co-deposited *in situ* with the trace metals present on a glassy carbon ring disc electrode, yields excellent results in the analysis of trace metal solutions in the ppb (and lower) range.

Monitoring dissolved copper in seawater by means of ion-elective electrodes, G. K. Rice and R. J. Jasinski, *SP422*, pp. 99-915 (Aug. 1976).

Key words: adsorption; copper; cupric ion; flow cell; ion-selective electrode; seawater analysis.

The application of an ion-selective electrode method for continuously monitoring Cu^{++} in seawater, without sample pretreatment, is described.

The necessary sensitivity of the Cu^{++} selective electrodes was achieved by preconditioning the electrodes and by use of a flow cell configuration. Response times, even at trace concentrations, were found to be adequate for monitoring small changes in the Cu^{++} concentration of seawater.

Evaluating the effects of solid materials on the chemistry of Cu^{++} in seawater was simplified by the speed and convenience of the ion-selective electrode technique. In addition to the adsorption of metal ions on solid surfaced, Cu^{++} electrode analysis indicated that contaminants from some solid materials form complexes with Cu^{++} in solution. Other materials apparently introduce cations such as Fe^{+++} which can liberate Cu^{++} from some complexes. It was also found that changes in chemical properties such as pH measurably affect the distribution of Cu^{++} in seawater.

Operation of a trace sampling and analysis system aboard a ship is complicated by chemical and electrical effects of the ship's hull on the continuous seawater flow stream. A method was found for minimizing electrical "noise" in the flow stream and to distinguish the Cu^{++} potential of chemical contamination due to the ship from the ambient background of natural seawater.

The results indicate that it should be practical to develop trace analytical methods which require little or no sample pretreatment for true *in situ* analysis thus avoiding many of the problems of sampling and sample handling.

Electroanalytical determination and characterization of some heavy metals in seawater, M. Branica, L. Sipos, S. Bubic, and S. Kozar, *SP422*, pp. 917-928 (Aug. 1976).

Key words: Adriatic Sea; cadmium; copper; electrochemical analysis; heavy metals; lead; seawater analysis; speciation; stability of water samples; zinc.

Anodic stripping methods have been widely applied during the last 10 years for determination of some heavy metals in natural water systems. However, relatively little has been done on the physicochemical characterization and determination of species actually present in aquatic systems, which is of special importance for elucidation of respective biogeochemical cycle and fate of radioactive or industrial waste.

The experience on application of electroanalytical techniques is presented and discussed with regard to: 1) direct determination of concentrations of some metal ions; 2) characterization of the species actually present; 3) study of chelation, hydrolyzation and other interactions between metallic ions and organic ligands in natural aquatic system.

Anodic stripping voltammetry (ASV) with rotating glassy carbon electrode was used for determination of Cd, Pb, and Cu and slowly dropping mercury electrode was used for determination of Zn in the North Adriatic. The reproducibility of measurements, behavior of electrodes, the role of cell and storage bottle materials and sampling procedures are discussed.

A new method for characterization of the ionic state of metals at very low concentrations (10^{-9} to $10^{-8}M$), based on voltammetric measurements with accumulation at various constant potentials, is proposed.

The accurate determination of lead in biological and environmental samples by isotope dilution mass spectrometry, L. A. Machlan, J. W. Gramlich, T. J. Murphy, and I. L. Barnes, *SP422*, pp. 929-935 (Aug. 1976).

Key words: accurate and precise analysis; biological and environmental samples; blanks; homogeneity of lead content; isotope dilution mass spectrometry; lead analysis.

The accurate determination of lead in biological and environmental samples has become of great interest due to health considerations. Isotope dilution mass spectrometry (IDMS) has proven to be precise and accurate to within 0.15 percent. The IDMS method has permitted the accurate determination of trace quantities of lead in samples of biological and environmental interest as well as determining the inhomogeneity of the lead content.

IDMS has been utilized to provide certified lead values in Standard Reference Materials used by the fuel industry (coal, fuel oil and fly ash). These materials are to be used for comparison standards, quality assurance and developing or

verifying analytical methods. The lead content of a series of blood samples has also been determined by IDMS to provide accurate values in the development of a clinical reference method.

The method consists of taking a weighed aliquot of the sample, adding a known amount of separated isotope, decomposing the material with suitable acids, separating the lead by anion exchange, purifying the lead by electrodeposition, determining the lead isotope ratios by thermal ionization mass spectrometry and calculating the lead content of the sample.

Rare earth element analysis by isotope dilution, G. N. Hanson, *SP422*, pp. 937-949 (Aug. 1976).

Key words: analytical techniques; fractional crystallization; geochemistry; isotope dilution; partial melting; rare earth elements; trace element models; volcanic rocks.

At Stony Brook we have been analyzing igneous rocks, granites through gabbros, basalts, and ultramafic rocks for rare earth elements (REE) as well as the other major, minor, and trace elements in order to determine the origin of these rocks utilizing quantitative trace element models. For rare earths we are using the analytical procedure of J. G. Arth, USGS, Reston, Virginia, which utilizes two Dowex 50Wx8 cation columns, one for nitric acid to get a group separation of the REE and the other for hydrochloric acid to separate the specific REE. The rare earth elements La, Ce, Nd, Sm, Eu, Gd, Dy, Er, Yb, and Lu can usually be analyzed in three to four mass spectrometric runs with a total time for analysis of about 8 hours. The number of REE analyzed should not be reduced or the great advantage of the REE, the regular but not consistent variation from element to element, cannot be fully utilized in an interpretation. Precision is about 1 percent for all elements except for Lu and Gd. The uncertainty in the accuracy is somewhat greater.

Much of the REE data in the literature has uncertainties of about 5 percent or greater, and for gross comparison of rock types this data is adequate. REE data, however, with uncertainties much greater than 10 percent are no longer acceptable, as they are not useful even for gross comparisons of rock types.

In a detailed study of a magmatic sequence in order to distinguish differentiated fractions *versus* different original parents and to determine which residual or fractionating minerals are involved, then high precision on the order of 1 percent is absolutely necessary. In such a sequence, since it is only necessary to compare samples with each other, high precision is adequate as one can normalize all samples to a sample in the sequence. In order to compare data with other laboratories, however, high accuracy is also necessary. The uncertainty in the accuracy is mainly in not having adequate rare earth standards.

An accurate determination of electrolyte concentrations in blood serum by isotope dilution mass spectrometry, E. L. Garner, L. A. Machlan, J. W. Gramlich, L. J. Moore, T. J. Murphy, and I. L. Barnes, *SP422*, pp. 951-960 (Aug. 1976).

Key words: accurate; blood; concentrations; determination; dilution; electrolyte; isotope; mass spectrometry; serum.

Concentrations of the electrolytes Li, Mg, Cl, K and Ca were determined in three different lots of blood sera by isotope dilution mass spectrometry. Descriptions of the chemistry, mass spectrometry, and some of the precautions necessary to obtain an accurate measurement are given. An internal normalization technique which eliminates a systematic bias component due to variable isotopic fractionation between different analyses, was used to significantly improve the accuracy of the magnesium measurement. The experimental values for the three lots of sera followed a pattern of low, intermediate and high concentration levels for each electrolyte. The magnesium values in $\mu g/g$, for example were 8.546 ± 0.064, 24.52 ± 0.08, and 41.27 ± 0.10. The estimated limit of error for a single analysis, based on the 95 percent confidence limit and the effect of sample impurities ranged from 0.75 percent for magnesium in one lot of serum to 0.2 percent for the potassium concentrations.

Spiking isotope dilution and its application to fluorine determinations, H. A. Das and T. Wals, *SP422*, pp. 961-982 (Aug. 1976).

Key words: absorption isotherm; environmental samples; fluorine; isotope dilution; radionuclides; substoichiometry.

Isotope dilution is based on the isolation of a constant substoichiometric amount. This method can be completed by a group of techniques in which this amount is a function of the concentration to be determined. This approach enables the routine analysis of aqueous samples. The practical difference with normal isotope dilution is twofold: a) the activity is added as a spike to both the standard and the sample solution and b) the count rates obtained for the fractions isolated from the standard solutions, are plotted against the concentration in such a way that a linear calibration curve is obtained. Some methods which can be used in the application of this principle are discussed and compared to "classical" isotope dilution. Expressions are derived for the relative statistical error and the limit of detection. As a practical example of these techniques, the determination of fluorine is discussed. The radionuclide used is ^{18}F ($T\ 1/2 = 110$ min) which is prepared carrier free by irradiation of Li_2CO_3. The substoichiometric amount is taken by either absorption on glass beads or by imperfect liquid-liquid extraction with $(CH_3)_3SiCl$ dissolved in benzene. The glass beads or the organic extract are counted integrally. The reciprocal of the count-rate is a linear function of the concentration to be determined. The limit of detection is usually 0.01 $\mu g/ml$ while the limit of determination is $\simeq 0.05$ $\mu g/ml$. The method is applicable to both F^- and $SiF_6^=$ and is not sensitive to appreciable NaCl concentrations. The error is depending on counting statistics and on the ratio reagent amount to be determined. The method can be extended to dried plant material by ashing and dissolving the sample using ^{18}F-tracer for chemical yield determination.

The determination of small amounts of nitrogen (0 to 20 ppm) in plain carbon steels, H. F. Pronk, J. de Boer, and N. Butter Bijwaard, *SP422*, pp. 983-1003 (Aug. 1976).

Key words: atmospheric contamination; blank value; indophenol blue reaction; Kjeldahl digestion technique; limit of detection; nitrogen in steel.

The paper describes the results of a thorough experimental investigation into the original and reduction of the blank during sample handling and sample analysis in the determination of the total nitrogen content in plain carbon steel at levels of 0.002 percent and less. Attention is paid to atmospheric contributions to the blank and to their prevention. The possible harmful effect of nitrite or nitrate compounds on the analytical result is pointed out. Finally a method is recommended which is especially adapted for the determination of very low levels of nitrogen.

Trace element analysis of nickel and nickel-base alloys—review of current methods, C. M. Davis, *SP422*, pp. 1005-101 (Aug. 1976).

Key words: atomic absorption spectrophotometry; emission spectroscopy; nickel; nickel-base alloys; polarography; spectrophotometry; x-ray fluorescence spectroscopy.

Trace element analysis has been a frontier in the field of analytical chemistry for many years. Twenty years ago 0.01 percent was considered a "trace." Today, specifications require certain nickel-base alloys to have no more than 0.00003 percent (0.3 ppm) of some elements. The everchanging definition of the word "trace" has made trace element analysis a continuing challenge to the analytical chemist. This paper reviews the various approaches to this elusive problem and outlines potential solutions. The emphasis is on elements categorized as being detrimental to the mechanical properties of nickel-base alloys since these are of the greatest concern.

Among the methods reviewed are spark source mass spectrometry, emission spectroscopy, x-ray fluorescence spectroscopy, spectrophotometry, polarography, and atomic absorption spectrophotometry.

Nonuniform distribution (both micro and macro) of trace elements in high-temperature alloys, O. H. Kriege and J. Y. Marks, *SP422*, pp. 1017-1022 (Aug. 1976).

Key words: high-temperature alloys; intergranular segregation; macro-segregation; sampling problems; trace elements.

Because low melting metals such as bismuth, lead, selenium, tellurium and thallium can have a harmful influence on the mechanical properties of high-temperature alloys, the accurate determination of 0.3 to 10 ppm of these metals is of considerable importance. In developing reliable methods for the determination of trace elements in complex, high-temperature alloys, major sampling problems were encountered. Significant variations in trace metal concentrations were frequently noted in different parts of the same casting. For example, marked variations were sometimes observed between the top and bottom of small cast parts, other specimens had significantly different amounts of trace metals at the surface than at the center of the coating, while the concentration of certain trace metals was a function of wall thickness in some hollow parts. The common practice of sample selection by removal of material from noncritical regions of a casting to preserve the part can evidently lead to serious errors in cases when macro-segregation of trace elements exists. Various production practices which have produced analytically important macro-segregation are summarized in detail.

In addition to macro-segregation, significant intergranular segregation has been observed in high-temperature alloys. There is a pronounced tendency for certain trace elements to concentrate at grain boundaries rather than at the center of grains. With the increased commercial importance of directionally solidified and other large grain cast materials, the importance of this micro-segregation is increased, particularly when methods are used which involve the analysis of very small amounts of sample. Techniques for proper sampling of nonuniform, high-temperature alloys are reviewed.

In addition, those methods which are currently used to determine low concentrations of trace metals in high-temperature alloys are reviewed.

Monitoring of an atomic absorption spectrophotometer using umulative sum statistical control charts, J. R. Montgomery, *P422*, pp. 1023-1033 (Aug. 1976).

Key words: atomic absorption; cadmium; copper; lead; manganese; sensitivity; spectrophotometry; statistical methods; zinc.

A method has been devised to monitor the reproducibility of an atomic absorption spectrophotometer utilizing statistical control charts. Standard curves for five elements, Cu, Pb, Zn, Mn, and Cd have been monitored to determine if the cumulative sum type control charts with "V" mask can detect incipient changes in sensitivity of the atomic absorption spectrophotometer caused by alteration in lamp output, fuel, air mixtures and electronic gear. The cumulative sum chart is easily computed and allows the operator to quickly detect significant changes in the sensitivity of the machine.

Signal characterization and measurement in microsample atomic absorption spectrometry, R. S. Vogel and A. M. Hartley, *SP422*, pp. 1035-1043 (Aug. 1976).

Key words: atomic absorption; background correction; Delves Cup; lead; spectrophotometry.

Some of the errors encountered in atomic absorption spectrometry are broadband absorption due to light scattering by particles and absorption by molecular species originating from the sample matrix. Instrumentation for microsample techniques have been developed for typical volumes of 50 μl or less. The resultant transient absorbance signals are from one to several orders of magnitude greater than the same concentration in the 1-ml or more sample volume typically required by conventional solution aspiration methods. Background signals associated with the microsample methods are sometimes a major fraction of the total absorption signal. Literature dealing with these methods has emphasized the ubiquitous nature of background absorption and so-called "smoke" peaks. Specific absorption by atomic species might be mistaken for nonspecific background absorption resulting in significant errors. An example is given of this potential problem and how mistakes can be avoided.

Absorption signals characteristic of those from nebulizer-burner systems, as well as those from microsample systems are discussed. The conclusion drawn on the basis of the experimental evidence is not that the "smoke" peak attributed by others to nonspecific absorption is actually due to atomic absorption, but rather, when in the use of the microsample atomic absorption techniques, sequential absorption peaks are observed. Each of these peaks must be studied objectively or serious analytical errors may occur.

An intercomparison of flame and nonflame systems in atomic absorption spectrometry, T. C. Rains and O. Menis, *SP422*, pp. 1045-1051 (Aug. 1976).

Key words: atomic absorption spectrometry; nonflame graphite furnace; sensitivity *vs.* precision and accuracy; Standard Reference Materials.

In atomic absorption spectrometry (AAS) the nonflame devices for producing atomic vapor have recently received wide attention. In comparison to the traditional flame technique they offer increased sensitivity for many elements. On the other hand they seemed to suffer from poorer precision. In this study several of the parameters affecting the precision of the carbon furnace were evaluated and data were compared with NBS Standard Reference Materials (Fly Ash, Coal, and Orchard Leaves). Operating conditions, such as the sample volume, and the temperatures of the drying, ashing and atomization controlled the precision and accuracy of the measurement. The main advantage of the graphite furnace was the elimination of the preconcentration step and its inherent problem of larger blanks.

Atomic absorption spectrophotometry of air filter paper tape samples, F. J. Muñoz-Ribadeneira, M. L. Nazario, and A. Vega, *SP422*, pp. 1053-1061 (Aug. 1976).

Key words: air sampling; atomic absorption spectrophotometry; high temperature ashing; trace elements.

Several techniques for the preparation of air paper tape samples for trace metal analysis by Atomic Absorption Spectrophotometry (AAS) have been investigated. Known amounts of Cr, Mn, Co, Ni, Cu, Zn, Cd, and Pb were used to study the recovery of each under the effects of several preparative and digestion procedures. Conclusions obtained by means of a statistical analysis of the results are given. Statistical analysis of data obtained from the application of the most successful techniques when applied to natural air particulate samples are also presented.

Analysis of cadmium in fish tissue by flameless atomic absorption with a tantalum ribbon, E. R. Blood and G. C. Grant, *SP422,* pp. 1063-1072 (Aug. 1976).

Key words: atomic absorption; bluegills; cadmium; fish; heavy metal; tissue; trace element analysis; water pollution.

Bluegills *(Lepomis machrochirus)* of the same age and approximately the same size after acclimation were exposed to known amounts of cadmium (ppm level), sacrificed at selected time intervals and frozen whole in plastic bags until dissection and analysis. The heart, liver and kidney were removed entirely and portions of skin, muscle, gill, gut and bone were taken at the same time. Analyses were made by atomic absorption, following wet digestion in concentrated acid. All results are expressed as micrograms cadmium per gram of wet tissue. Typical values reported are in the range of 0.2 to 20 μg Cd per gram of wet tissue with a typical precision of 10-15 percent rsd for repetitive aliquots from the same organ. Corresponding organs from different fish, however, gave mean values differing from one another by as much as a factor of five.

Methodological considerations in western Lake Superior water-sediment exchange studies of some trace elements, J. E. Poldoski and G. E. Glass, *SP422,* pp. 1073-1088 (Aug. 1976).

Key words: anodic stripping voltammetry; flameless atomic absorption; interstitial water; Lake Superior chemical analysis; trace element water analysis; water filtration; water sampling apparatus.

Trace element measurements on western Lake Superior water were taken as a function of geographical area and distance above and below the water-sediment interface. The objective of detecting gradients of certain constituents in the system, however, required an extensive examination of required methodology. Investigations of this methodology indicate that the values obtained from a particular sample type are constrained by a number of uncertainties and operational definitions. Data were taken using different methods and experiments were conducted at various points in the analytical scheme to determine the influence of sample collection, handling and analysis steps. Results were of aid in determining where emphasis should be placed to improve the end result.

Accuracy in determining trace element concentrations in marine sediments, E. D. Wood and N. A. Cintron, *SP422,* pp. 1089-1102 (Aug. 1976).

Key words: accuracy; Atomic Absorption Spectrometry; Caribbean; precision; Puerto Rico; replicates; sediments; standard; trace elements.

When sampling the environment, one desires not only an accurate analysis of a particular sample, but also an analysis which is representative of the region sampled and one that can be repeated within reasonable limits. Replicate sediment samples were collected in the course of mapping a portion of the sea floor on the west coast of Puerto Rico. The location is in the discharge region of the Guanajibo River. Ten replicate grab samples were taken by independent positioning of the ship. The samples were stripped with hydrochloric acid and the resulting solutions analyzed by atomic absorption spectrometry (AAS) for Ca, Cd, Co, Cr, Cu, Fe, Mg, Ni, Pb, Sr and Zn. The standard deviations of replicate analysis of individual samples were generally less than for the individual samples themselves. Chemical standards prepared in our laboratory were used to determine the value of the samples. Particle size and homogeneity are factors considered with respect to the number of replicates required and sample size. The average concentrations for several elements in a set of 10 samples with confidence limits for 95 percent level as determined by AAS are as follows: Cd, 0.840 ± 0.011; Co, 56.5 ± 0.2; Cr, 696 ± 8; Cu, 30.7 ± 0.4; Fe, 60000 ± 1010; Mn, 827 ± 5; Ni, 487 ± 5; Pb, 17.2 ± 0.2; and Zn, 70.3 ± 0.8 μg/g dry sediment. A composite sample from this location was prepared for use as a standard in future sediment analysis.

Significant improvement of accuracy and precision in the determination of trace rare earths by fluorescence analysis, L. Ozawa and H. N. Hersh, *SP422,* pp. 1103-1107 (Aug. 1976).

Key words: fluorescence method analysis; rare earths, as an internal reference; rare earths, determination of trace amounts.

Most of the rare earths in yttrium, gadolinium and lanthanum oxides emit characteristic fluorescent line spectra under irradiation with photons, electrons and x rays. The sensitivity and selectivity of the rare earth fluorescences are high enough to determine the trace amounts (0.01 to 100 ppm) of rare earths. The absolute fluorescent intensities of solids, however, are markedly affected by the synthesis procedure, level of contamination and crystal perfection, resulting in poor accuracy and low precision for the method (larger than 50% error). Special care in preparation of the samples is required to obtain good accuracy and precision.

It is found that the accuracy and precision for the determination of trace (less than 10 ppm) rare earths by fluorescence analysis is improved significantly, while still maintaining the sensitivity, when the determination is made by comparing the ratio of the fluorescent intensities of the trace rare earths to that of a deliberately added rare earth as reference. The variation in the absolute fluorescent intensity remains, but is compensated for by measuring the fluorescent line intensity ratio. Consequently, the determination of trace rare earths (with less than 3% error) is easily made by a photoluminescence technique in which the rare earths are excited directly by photons. Accuracy is still maintained when the absolute fluorescent intensity is reduced by 50 percent through contamination by Ni, Fe, Mn or Pb (about 100 ppm). Determination accuracy is also improved for fluorescence analysis by electron excitation and x-ray excitation. For some rare earths, however, accuracy by these techniques is reduced because indirect excitation mechanisms are involved. The excitation mechanisms and the interferences between rare earths are also reported.

The advantages of x-ray fluorescence analysis for trace elements in silicate rocks, B. M. Gunn, *SP422,* pp. 1109-1118 (Aug. 1976).

Key words: mineral analysis; trace analysis; x-ray

fluorescence.

X-ray fluorescence (XRF) analysis has been successfully used to analyze over 1000 rock, cement and ore samples per year for elements including F, Na, Mg, Al, Si, P, S, Cl, V, K, Ca, Ti, Mn, Fe, Cr, Co, Ni, Cu, Zn, Ga, Rb, Sr, Y, Zr, Ba, Cs, Ce, La, Pb, Th, and U. Detection limits are never greater than 10 ppm and optimally are as low as 1 ppm for 60 second counting times. Accuracy is mainly limited by the accuracy of available standards which for major and minor elements are not known to better than 0.1 to 0.01 percent. Data reduction and matrix corrections are made by computer and programs have been developed in both FORTRAN IV and FOCAL-11 language.

Monitoring of smog aerosols with elemental analysis by accelerator beams, T. A. Cahill, R. G. Flocchini, R. A. Eldred, P. J. Feeney, S. Lange, D. Shadoan, and G. Wolfe, *SP422*, pp. 1119-1136 (Aug. 1976).

Key words: aerosol; California aerosol monitoring program; elemental analysis; ion beam analysis; monitoring; particle sizing; time resolution.

The California Air Resources Board has operated an aerosol monitoring network of up to 15 stations since January 1973, using impactors to collect size segregated samples and ion-excited x-ray emission to perform the subsequent elemental analyses. Two-stage Lundgren-type rotary drum impactors with afterfilters collect particles in the 0.1 to 0.6 μm, 0.6 to 5 μm, and 5 to 20 μm size ranges. Alpha beams from an isochronous cyclotron, possessing energies of 18 MeV, are used to excite x-rays in the aerosol samples, which are then detected by a Si(Li) x-ray detector. On-line data collection and reduction codes generate aereal densities for elements between sodium and uranium, with sensitivities in the nanogram per cubic meter range for most elements. During the first year of operation, about 12,000 analyses were performed as part of this program. Each analysis normally included between 15 and 25 elements. In order to insure that all results were accurate, extensive programs were undertaken in quality assurance. The first concern involved proper operation of the aerosol collection systems. Uranene dye studies were able to generate information on the particle size cuts induced by the impactor slits, as well as indicate the importance of nonoptimum collection effects such as bounce-off from the drum surfaces. However, extensive studies with real aerosols were required before the problem of bounce-off for dry, silicious aerosols was solved by coating the drums with 530 $\mu g/cm^2$ mylar upon which was deposited about 50 $\mu g/cm^2$ paraffin. Penetration of the Nuclepore final filter contributed important corrections to the smallest size range, based upon the work of Spurney and Lodge. Operation of the collection system was verified through extensive comparisons on an element by element basis with high-volume filter samplers, and a nominal collection error of $\pm$ 15 percent was assigned from these causes. Absolute accuracy of the analysis system was established through the use of 28 gravimetric thin film standards, and confirmed by numerous interlaboratory and inter-method comparisons, all of which showed that the nominal analytical accuracy of $\pm$ 10 percent was quite conservative. Major corrections for light elements, loading effects, which limited accuracy to $\pm$ 30 percent for sodium in the worst case.

Characteristics of environmental airborne fissionable materi-
l, B. M. Center, K. E. Jackson, and F. H. Ruddy, *SP422*, pp. 132-1142 (Aug. 1976).

Key words: alpha particle tracks; fission radiography; solid dielectric track recorders; ^{239}Pu track.

Methods are reported for performing a quantitative assay of environmental air samples for fissionable material. Determination of size characteristics using the nuclear track technique is given and a comparison is made with size characteristics obtained from an aerodynamic (cascade impactor) separation. Special emphasis is placed on the important problem of detection of plutonium in the environment.

Analytical design in activation analysis: The role of accuracy and precision, D. A. Becker, *SP422*, pp. 1143-1155 (Aug. 1976).

Key words: accuracy and precision; activation analysis; analytical design; irradiation procedures; radioactivity detection systems; radiochemical separations; sampling and sample handling.

In order to obtain maximum utilization of the technique of activation analysis, a logical and systematic method for the evaluation of alternate analytical procedures is required, especially for analyses requiring a high degree of accuracy and precision. The activation analysis procedure can be separated into the four basic areas: A) sampling and sample handling; B) irradiation procedures; C) radiochemical separations; and D) detection systems. Each of these areas can then be divided into a number of individual options, each option with its own characteristics, including an uncertainty value.

The resulting analytical design results when these options are fused to form a procedure which will adequately meet the requirements. This paper outlines many of the options available in each area and discusses some of their inherent limitations and uncertainties.

A search for accuracy in activation analysis of trace elements in different matrices, S. Meloni, M. T. Ganzerli-Valentini, V. Caramella-Crespi, V. Maxia, L. Maggi, U. Pisani, R. Soma, and P. Borroni, *SP422*, pp. 1157-1164 (Aug. 1976).

Key words: accuracy; activation analysis; copper; gold; hafnium; palladium; platinum; precision; radiochemical separations; silver.

Different factors may affect accuracy in activation analysis of trace elements. The evaluation of these factors often requires a number of time consuming experiments, but the statement of accuracy in activation analysis is of great value to cast some light on the overall reliability of the method itself. It can be pointed out that accuracy is often inversely proportional to the number of steps of the whole analytical procedure, from sampling to calculation of results. Several techniques of activation analysis were developed and applied to the determination of trace element content in standard reference materials and in samples chosen for intercomparison among laboratories. Emphasis was put on limiting the number of steps to improve the accuracy and on achieving the best of precision. Results are presented and discussed, together with the criteria for the choice of the most appropriate separation technique. Other sources of systematic errors, such as the reliability of the content of the reference standards and dead-time corrections when short-lived isotopes are involved, were taken into account and discussed.

Surface effects on accuracy in activation analysis, G. Revel and M. Federoff, *SP422*, pp. 1165-1171 (Aug. 1976).

Key words: accuracy; activation analysis; charged particle irradiation; diffusion; etching; metals; neutron irradiation; recoil; surface effect.

One of the main advantages of trace activation analysis is the possibility of eliminating surface contamination by

post-irradiation removal of the superficial layers of the sample. In some cases this advantage is lost by noneffective removal, leading to inaccurate results. We discuss the main causes of ineffective removal of surface contamination. In neutron activation analysis the surface contamination takes place during sampling and irradiation. The main causes of ineffective removal of this contamination are redeposition during chemical etching and large diffusion during irradiation. For the determination of light elements (O,C,N) performed by charged particle or photon irradiation, the surface contamination is increased through the diffusion of impurities by recoil and channeling. Chemical etching, used as the only method, is not convenient for a number of metallic samples—often the thickness of the dissolved layer varies along the surface due to heterogeneities in purity, crystalline structure and localized oxidation made by nonhomogeneous incident beam. Several examples investigated by tracer and metallographic methods are given. A procedure for accurate surface contamination removal is suggested.

A study into the accuracy of a remote-controlled system for multielement determination in foodstuffs using NAA, R. Schelenz and J. F. Diehl, *SP422*, pp. 1173-1180 (Aug. 1976).

Key words: biological material; biological standards; data evaluation; distillation; food composition; gamma spectrometry; inorganic separators; isotopic exchange; multielement determination; neutron activation; radiochemical separation; trace elements.

More accurate information on the trace element composition of foodstuffs is important in the field of nutrition. An appropriate approach to this problem is the application of neutron activation analysis for simultaneous multielement determination using high resolution gamma spectrometry.

A system has been developed permitting determination of at least 28 elements, utilizing remote controlled radiochemical processing of irradiated biological samples. The reliability of the method has been ascertained by participation in inter-laboratory comparisons organized by the International Atomic Energy Agency (IAEA). Results for multielement determinations are given for potatoes (peeled), milk powder, fish solubles and algae.

Neutron activation analysis of elements extracted into organic media, R. Stella and N. Genova, *SP422*, pp. 1181-1187 (Aug. 1976).

Key words: chlorine effect; counting corrections; gamma intensity attenuation; neutron flux depression; organic liquid sample irradiation; palladium distribution ratios; platinum distribution ratios.

It is sometimes worthwhile, especially in solvent extraction studies by radiochemical techniques, to neutron irradiate the organic phase after extraction and directly count the same. Problems arise in comparing gamma activities in the corresponding aqueous phases, eventually irradiated after extraction, and in aqueous standards. Many factors may affect, though in a different way, both the neutron activation and counting steps: the former being a function of neutron absorption in the organic medium that may be especially relevant in the case of chlorine containing solvents and of the different neutron thermalizing properties of the same.

To test these effects, tributyl phosphate in various diluents as an extractant for the chlorocomplexes of some noble metals, namely Pd, Pt, Ir, Os and Au, was used.

The effect of different thermalizing power of the media by comparing the activities of irradiated aqueous and organic obtained on identical samples by other analytical methods like colorimetry, atomic absorption and mass spectrometry.

Estimation of primary reaction interferences in fast particle activation analysis by calculations using cross section data, V. Krivan, *SP422*, pp. 1189-1214 (Aug. 1976).

Key words: accuracy; activation analysis; analytical chemistry; charged particle activation analysis; cross sections; excitation functions; fast neutron activation analysis; fast particle activation analysis; interferences; primary interference reactions; systematic errors; trace analysis.

Since the primary interference reactions may be a considerable source of systematic errors in fast particle activation analysis, their evaluation is of principal importance. These interferences can often be avoided or at least reduced to a negligible degree by the choice of the optimum projectile energy. In certain cases the interfering nuclear reactions cannot be avoided; then their extent must be evaluated quantitatively and corresponding corrections applied.

For the evaluation of the primary interference reactions by calculation, in addition to the appropriate projectile flux parameters, the cross section data must be known. A critical picture is provided of the present state of the cross section data required for this purpose with regard to their accuracy and completeness. Compilations from which the cross section data can be obtained are surveyed and discussed. A survey of systematics enabling the possibility to estimate unknown cross section data is given. The consequences of the uncertainty in nuclear data for the evaluation of primary reaction interferences are discussed and demonstrated by using practical examples. Handling of nuclear interferences in activation with 14 MeV neutrons, with fast neutrons of intermediate energy and with charged particles is considered.

In most cases, the cross section data needed for these calculations are, at present, already available. Generally, the accuracy suffices to make calculations for assessing the significance of the interferences and to choose the optimum projectile energy. The application of calculations to obtain the actual correction factors is possible only in cases where the cross section data have been critically evaluated and their accuracy is well known.

Activation analysis with charged particles of intermediate energy: Performances and applications, J. N. Barrandon and J. L. Debrun, *SP422*, pp. 1215-1232 (Aug. 1976).

Key words: activation analysis; charged particle; cyclotron; method evaluation; multielemental analysis.

The subject of this communication is activation analysis with intermediate energy protons (10 to 15 MeV) and $_2{}^3$He(10 to 20 MeV) with an emphasis on nondestructive multielemental analysis, but results obtained for single element determination after radiochemical separations are also reported.

Precision, accuracy, selectivity and sensitivity of the methods are discussed, as well as the possibilities of application in various areas including mainly metallurgy, geology, solid state physics and archeology.

In the case of nondestructive analysis with 10 MeV protons, we will present experimental activation yields for over 130 radioisotopes corresponding to more than 50 elements. Calculated sensitivities for the determination of these elements will be compared with experimental sensitivities obtained in actual analysis of various matrixes like Ag, Al, Au, Co, Ir, Nb, Rh, Ta, rocks and graphite.

For destructive analysis with higher energy protons and $_2{}^3$He, our experimental results will be compared with results obtained on identical samples by other analytical methods like colorimetry, atomic absorption and mass spectrometry.

Organomercury and total mercury content of environmental matrices as determined by neutron activation analysis, E. Orvini and M. Gallorini, *SP422*, pp. 1233-1240 (Aug. 1976).

Key words: environmental matrices; extraction yields; mercury; neutron activation analysis; organomercury; solvent extraction.

Neutron activation analysis and the gas-chromatographic techniques are used in the determination of organomercury compounds and of total mercury in environmental matrices. In this work the benzene-cysteine separation procedure of Westôô was coupled to neutron activation analysis. In this way both the total mercury content and the organomercury fraction can be evaluated in one sample and during one radiochemical separation process. The activity of ^{197}Hg from the inorganic mercury content of the samples has been evaluated with a well-known combustion separation technique, carried out on the residual sample after benzene extraction. The activity of ^{197}Hg from organomercury compounds of the samples has been evaluated after extraction and purification with cysteine acetate from benzene fraction. The total mercury content was checked on an untreated portion of the same sample. Szilard-Chalmers reaction on the chemical bond between mercury and the organic radical seems to have a very low yield, down to 3 to 4 percent.

Determination of elements in standard material (Bovine Liver SRM 1577), I. Y. Donev and L. M. Marichkova, *SP422*, pp. 1293-1304 (Aug. 1976).

Key words: errors of analysis; homogenization; neutron activation analysis; sample preparation; standard materials; trace element analysis.

Investigations for quantitative determination of the elements: bromine, chromium, copper, iron, calcium, sodium, manganese and zinc in standard material Bovine Liver SRM 1577 have been carried out. Nondestructive neutron activation analysis was utilized. Gamma spectrometry was carried out with a 10 cm^3 Ge(Li) detector connected to a 4000 channel pulse height analyzer. In addition, some methodological procedures concerning the preparation of the standards are communicated, especially on the manipulation and origin of individual or systematic errors. Quantitative evaluations of these errors are given. Analytical results of trace element determinations, before and after cleaning, of Bulgarian polyethylene film, used as packaging material, are given.

A short description is also given of the procedure for rapid homogenization and drying of biological material at liquid nitrogen temperature for about 6 hours, where the water removed is about 85 percent. This enrichment is sufficient for investigations with the neutron activation analysis method. It is also important that the drying is carried out at 30 °C, so the danger for losses of different elements such as arsenic, selenium, silver, *etc.*, is reduced.

Evaluation of error in the instrumental activation analysis of rocks, R. J. Rosenberg, *SP422*, pp. 1241-1256 (Aug. 1976).

Key words: comparative analyses; error evaluation; geological materials; instrumental-neutron activation analysis.

In this paper, the overall error in instrumental activation analysis of rocks with a TRIGA Mark II reactor and the magnitude of its components, are evaluated. The analysis of lanthanides in the USGS standard rocks G-1 and W-1 is used as an example. In view of these results the possibility to decrease the error is discussed.

The average precision of the individual results obtained in this work is 11.6 percent and the average deviation of the mean is 4.6 percent. According to a comparison of values found in the literature the average error of results obtained in different laboratories is 11.8 percent and the average deviation of the results obtained in this work from the average of all results is 7.3 percent evenly distributed on both sides of zero.

The possible components of the error have been investigated partly experimentally and partly theoretically and the following was found to give noticeable contributions when 200 mg samples were used: The flux gradient causes an average error of 5.2 percent and thermalization in aquatic standards causes a negative error of 2.2 percent. Differences in counting geometry in measurements with the sample on the detector cause an error of 2.5 percent and differences in gamma-ray absorption cause an error that varies between 2.5 percent and below 1 percent. This error is negative when aquatic standards are used. Counting statistics causes an error that varies between 1 percent and 38 percent. The mean errors calculated from these data give a total error that varies between 9.0 and 42 percent with an average of 10.8 percent. A comparison between 10.8 percent and the average precision 12.8 percent of all results obtained in this work indicates that all errors of any importance are considered here. The mean error without counting statistics is 8.9 percent.

By rotating the samples during irradiation, counting with a few cm distance between sample and detector and by using rock-standards the total error can be decreased to the level of counting statistics. The same results can be obtained by decreasing the dimensions of the samples.

Neutron activation analysis for some nonstoichiometric constituents in a large number of natural and synthetic beryl samples, S. M. Ristic, *SP422*, pp. 1257-1274 (Aug. 1976).

Key words: cesium and scandium content; natural and synthetic beryls; neutron activation analysis.

About 100 natural beryls from very different locations were analyzed. An appreciable content of all five alkali metals was present, so that determination with a good precision was an important crystalochemical as well as geochemical problem. The trace amounts of Cr, As, Sc, Mn, Eu, and Dy in some natural samples, as well as Co, Ni, Fe, Mo, Sc, Cs and Na were measured in a gamma-spectrometric arrangement with a 500-channel pulse height analyzer, without chemical treatment (*i.e.*, in a nondestructive NAA procedure). The results obtained were partly controlled and compared by emission spectrography, flame spectrometry, and atomic absorption spectrometry, in order to determine the general reliability, as well as precision and accuracy in various analytical procedures and different samples.

Control of sample configuration as an aid to accuracy in instrumental neutron activation analysis, R. E. Heft, *SP422*, pp. 1275-1281 (Aug. 1976).

Key words: gamma counting efficiency; germanium detectors; instrumental neutron activation analysis; particulate sample geometry; trace elements in polyethylene powder.

Errors associated with the basic calculation common to all instrumental neutron activation analyses are discussed. The sample thickness of particulate or powdered samples contained in vials or cups is likely to be nonuniform and difficult to measure. To improve the accuracy of the counting efficiency determination, a procedure was developed for potting the samples in polyethylene to form cylindrical

disks of polyethylene completely containing the sample material, uniformly distributed throughout the volume of the disk. Typically, 100 milligrams of sample is intimately mixed with 1 gram of polyethylene powder by gentle grinding in an agate mortar. The mixture is placed in a 2.54 cm diameter polycarbonate cylindrical cup and heated to 150 °C in a vacuum oven with a 3.81 cm long polycarbonate cylindrical rod of just under 2.54 cm diameter, in place, on top of the sample. At 150 °C the polyethylene melts and forms a highly viscous fluid which upon cooling forms a disk of fixed diameter with parallel faces and whose thickness is measurable to 0.05 millimeter. Blank corrections for the polyethylene are found to be small, and the disks serve as secure containers for the particulates during and after irradiation; and as counting samples of precise configuration for which counting efficiency can be accurately determined.

Observations on the quantitative electron probe microanalysis of particles, C. E. Fiori, K. F. J. Heinrich, R. L. Myklebust, and M. M. Darr, *SP422*, pp. 1283-1291 (Aug. 1976).

Key words: continuous radiation; electron probe microanalyzer; glass standard; lithium drifted silicon detector; Monte Carlo; particle analysis.

Elemental analysis of high accuracy with the electron probe microanalyzer is possible for flat specimens which are thicker than the depth of penetration of the electron beam. Existing data reduction procedures convert x-ray intensities to mass fractions of elements with typical accuracies of 1 to 2 percent (relative). These procedures will not work for specimens which are irregularly shaped and smaller than the range of the electron beam, such as dust particles. A Monte Carlo method is being developed to predict the expected x-ray intensity from particles of various shapes, sizes and compositions. We are also developing a method to measure the mass of a particle through the emitted continuous radiation. The expected end result of this work is an algorithm for quantitative microprobe analysis of particles. Experimental parts of this work include the manufacture and analysis of glass fibers and spheres of various diameters and widely varying composition.

SP423. **MFPG—Mechanical failure: Definition of the problem.** Proceedings of the 20th Meeting of the Mechanical Failures Prevention Group, held at the National Bureau of Standards, Washington, DC, May 8-10, 1974, T. R. Shives and W. A. Willard, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 423*, 228 pages (Apr. 1976) SD Catalog No. C13.10:423.

Key words: brittle fracture; economics of failure prevention; fatigue failure; mechanical failure; mechanical reliability; stress corrosion cracking.

These Proceedings consist of 20 submitted papers and discussions from the 20th Meeting of the Mechanical Failures Prevention Group held at the National Bureau of Standards, May 8-10, 1974. The central theme of the proceedings is the definition of the problem of mechanical failure, with emphasis on modes of failure, consequences of mechanical failure, and implications of mechanical failure. *These proceedings include the following papers (indented):*

What we can learn from the examination of service failures, J. A. Bennett, *SP423*, pp. 3-11 (Apr. 1976).

Key words: crack propagation; failure analysis; failure prevention; fracture; fractography; mechanical failure.

The study of metal components that have fractured in service provides information that can be of major importance in preventing future failures. The metallurgical and fractographic techniques used in such studies are described so as to permit an evaluation of the reliability of the results. Examples are given of some case histories in which the fracture studies were highly effective, and of others in which the information was ignored and further failures occurred.

Failure by fatigue, A. J. McEvily, *SP423*, pp. 13-24 (Apr. 1976).

Key words: crack initiation; crack propagation; fatigue crack growth; fatigue failure; metal fatigue.

The lifetime of manufactured items under intended service conditions is often limited by the processes of corrosion, wear and fatigue. Since such processes represent economic loss and perhaps a safety hazard to the consumer, much effort has gone into the understanding of these phenomena as well as into improved design procedures to guard against their occurrence. In the field of fatigue in particular a considerable advance in recent years has been made in the quantitative treatment of the fatigue process, especially with respect to the matter of fatigue crack growth. Improved understanding of the fatigue crack growth process is timely as in certain circumstances, as for example in the case of welded structures, it is not the initiation of cracks but rather the growth of cracks from preexisting defects which is the critical aspect in determining service lifetime. Other advances have been made in improving the resistance of materials to fatigue either through the control of chemistry or by control of processing variables. Such procedures are generally more important in affecting the crack initiation rather than the crack propagation stages. In this presentation a review of the current status of fatigue will be given from the mechanistic as well as the design viewpoints. Areas in need of further understanding such as corrosion fatigue, creep-fatigue, and fatigue under variable amplitude loading will also be considered.

Failure by stress corrosion cracking—Current approaches toward failure prediction, J. Kruger, *SP423*, pp. 27-40 (Apr. 1976).

Key words: corrosion; failure prediction; film rupture-metal dissolution; hydrogen embrittlement; stress corrosion cracking; stress-sorption.

Stress corrosion cracking (SCC) produces failures in a material when it is subjected to the combined effects of mechanical stress and reaction with an environment. All proposed mechanisms of SCC seek to explain how the combination of a given level of stress, a particular material, and a given environment can lead to the initiation and propagation of cracks. The three major categories of mechanisms that are generally proposed are (1) active path dissolution, (2) stress-sorption, and (3) embrittlement.

In recent years attempts to determine the mechanisms have been enhanced by new concepts and techniques that flow from the three major scientific disciplines that underlie the complex problem of SCC—chemistry, metallurgy, and mechanics. From chemistry have come two main currents: (a) increased awareness of the importance of characterizing the altered environment inside a growing crack, and (b) a recognition of the importance of the regrowth rate of a protective film on a bare surface exposed when that film is broken by stress. The main emphasis in the metallurgy of SCC has been on the crucial role played by structure in general, and particularly at the tip of a crack. Aiding this objective has been the use of the high voltage electron microscope which can directly look at the interaction of the

environment with structural defects, e.g., dislocations. Finally, the major thrust in the mechanics of SCC has been the application of the concepts and techniques of fracture mechanics.

The impact of these new concepts and measurement techniques on predicting and preventing SCC failure will be discussed.

Elastohydrodynamics in concentrated contacts, H. S. Cheng, *SP423,* pp. 41-54 (Apr. 1976).

Key words: contact lubrication; elastohydrodynamic contacts; fatigue; lubricant film thickness; scuffing; wear.

Typical geometrical features of elastohydrodynamic (EHD) contacts and major operating, lubricant, and material parameters governing lubrication in these contacts are described. Operating regimes for various machine components, such as gears, rolling element bearings, cams, and compliant bearings, are identified. A state-of-the-art survey is given to the predictability of major EHD characteristics based on existing analytical and experimental EHD research. The significance of film thickness, pressure fluctuations, friction, and temperature in affecting failures of concentrated contacts by fatigue, scuffing, and wear is discussed. Finally, suggestions are made to incorporate the EHD effects in predicting fatigue life, scuffing load, and wear rate.

Failure in gears and related machine components, R. A. Wilde, *SP423,* pp. 55-66 (Apr. 1976).

Key words: abrasive wear; adhesive wear; gear failure; machine component failure; mechanical failure; surface pitting.

Tooth breakage and abrasive wear are gear failure mechanisms that are well understood. Adhesive wear (scuffing and scouring) and surface pitting are more complex failure mechanisms.

When sliding is introduced into the rolling condition the rubbing between partially lubricated surfaces introduce high surface tensile stresses which result in adhesive wear and surface pitting. Neither of these failures will occur if a continuous oil film separates the metal surfaces.

Because these failures are the result of the interaction of many variables, a systems approach is required to understand the nature of the failure. The following variables have a direct effect on the thickness of the oil film and therefore on the amount of metal to metal contact: Surface roughness, direction of scratches relative to the sliding direction, oil viscosity, conjunction temperature, rolling speed, relative sliding speed, oil composition and load (Hertz stress). These variables will have significantly different effects when sliding is introduced to the rolling condition as occurs in gear applications.

Bearing damage analysis, R. L. Widner and W. E. Littmann, *SP423,* pp. 67-84 (Apr. 1976).

Key words: bearing failure; bearing loading; bearing lubrication; bearing misalignment; bearing temperature; mechanical failure.

Failure analysis of machine components is described with the major emphasis on tapered roller bearings and their interactions with other components of a system. Included in the discussion are the effects of loading, deflections, misalignment, lubrication, temperature, debris, water and electrical current on the type of damage and life of tapered roller bearings.

Anti-friction bearing design, inspection and recycling, K. M. Glaesner, *SP423,* pp. 87-91 (Apr. 1976).

Key words: aircraft engine bearings; antifriction bearings; bearing failure; bearing failure modes; bearing inspection; bearing reclamation; bearing recycling.

The paper will describe the ramification of failures of antifriction bearings related to aircraft applications, including engine bearings. The paper will endeavor to describe the problems of antifriction bearings in four categories:

I. Design of application. Here, the paper will describe the inherent design failures as noted in applications. The paper will also include parameters of bearing design which will best provide operational success and life expectancy.

II. Failure modes in bearing applications will be described and an outline of the most popular types of failure as detected in bearings, will be discussed.

III. A recovery process for the reclamation of bearings will be outlined and again limits for the acceptability of defects on bearings will be presented.

IV. New inspection techniques now under study will be outlined and the method of inspection will detail failure prevention once the bearing is mounted in the application.

Holographic NDI of P-3 wing plank splices, A. J. Koury, M. J. Devine, J. F. Erthal, and P. D. Bhuta, *SP423,* pp. 93-103 (Apr. 1976).

Key words: aircraft component failure; continuous wave holograms; crack detection; holographic techniques; pulsed laser holograms; stress corrosion cracking; ultrasonic inspection.

Continuous wave and pulsed laser holographic techniques were applied to inspect stress corrosion cracking in P-3 wing plank splices. Holographic results were compared with those of currently used ultrasonic inspection techniques. Holographic techniques successfully detected all the stress corrosion cracking areas that were identified by the ultrasonic inspection technique and, in addition, several other crack areas were located whose presence was later verified by dye penetrant inspection after careful disassembly of the panel joints. It was also shown that the holographic technique can locate areas of stress corrosion cracking without removal of paint and sealant materials. The currently used ultrasonic technique requires a paint and sealant stripping operation prior to inspection. Considerable savings in cost will be realized when inspection using holographic techniques is implemented. The holographic technique was demonstrated to Navy personnel at the Naval Air Rework Facility, Alameda, California, in an air rework environment. The concept of "structural signature" to verify structural integrity of complex aircraft structures is briefly described.

Economic considerations in failure prevention, H. E. Morgan, *SP423,* pp. 107-116 (Apr. 1976).

Key words: economic cost of failure prevention; frequency of failure; government action; life-cycle costing; marginal analysis; quality control; safety standards.

Economic considerations normally determine if product failure prevention is justified by a producing firm. Some failures are not worth preventing, even if prevention is technically feasible. Since the risk of failure is inherent in all products, the expected benefits of failure prevention should be compared with expected costs, both discounted to present value in a life-cycle context and compared with alternatives.

Producers and users of a product may evaluate the risk of failure and its economic cost differently. This may lead to in-

efficient and inequitable production decisions affecting the public interest. Consequently, externalities (third-party effects) may require that regulatory or other agencies of Government intervene to protect the public and to insure socially efficient and equitable allocation of resources to failure prevention.

Failures represent a gap between expectations and performance. Both involve measurement and standards technology which the NBS can provide. However, economic analysis should be used to determine the conditions under which failure prevention is desirable. Examples of economically desirable conditions for failure prevention are provided.

Economic impact of tribology, H. P. Jost, *SP423*, pp. 117-139 (Apr. 1976).

Key words: economic savings of failure prevention; friction; lubrication; mechanical failure; tribology; wear.

The emergence of tribology as a subject in its own right arose out of industrial need. In the early 1960's there was a large increase in reported failures of plant and machinery due to wear and associated causes. At the same time, technology was increasing the capital intensity of plant and the use of more continuous processes; thus breakdowns of such plant and machinery were becoming more costly.

In 1966 a U.K. Government investigation came to the conclusion that by application of tribological principles, very large savings were obtainable, in most cases without appreciable capital investment.

Tribology was defined as "the science and technology of interacting surfaces in relative motion and of subjects and practices related thereto." In other words, it deals with all aspects of rubbing, sliding and rolling surfaces and included the subjects of wear, friction and lubrication. Application of tribological principles would lead not only to greater operational reliability, efficiency and productivity, but also to conservation of materials and energy.

To gain the advantages outlined in the above Report, estimated at the time to be in the region of £515 million per annum (p.a.) ($1285 million approximately), the British Government set up the Committee on Tribology, to implement the recommendations in the education, research and industrial fields.

Actual savings already resulting to British industry are conservatively estimated to be in excess of £100 million p.a. ($230 million), and potential savings (allowing for inflation since the 1966 estimate) to over £1,000 million p.a. ($2,300 million).

In less than seven years, the new concept of tribology has been accepted by the majority of the industrial countries as part of their scientific and technological background in the field of obtaining greater plant efficiency, better performance, fewer breakdowns and significant savings in other directions.

Nuclear power plant safety, P. A. Morris, *SP423*, pp. 143-151 (Apr. 1976).

Key words: failure prevention; mechanical failure; mechanical malfunction; quality assurance; reactor systems and components; safety standards.

Protection against the potential radiological consequences of malfunction or mechanical failure of reactor systems and components in nuclear power plants is achieved by a combination of procedural and technical constraints. For routine operation, plants are to be designed and operated so that radioactive effluents are maintained as low as practicable. To assure that the probability of serious accidents is acceptably low requires conservative design, construction and operation using redundant and diverse systems and components and a rigorous program for quality assurance at all times.

Mechanical failures and public expectations of safe transportation, H. H. Wakeland, *SP423*, pp. 153-163 (Apr. 1976).

Key words: effects of mechanical failure on environment; failure prevention; government action; mechanical failure; safety standards; transportation safety.

Although, in the interaction between society and technology, it is desired to minimize the incidence of mechanical failure under all conditions, the practical ability to circumscribe and control failures in transportation (for example) varies widely. Depending upon identifiable variables in circumstances, society may effectively require a range of performance between complete freedom from failure and general acceptance of repeated failures of a life-threatening nature. An attempt is made to classify the variables of circumstance which seem to govern public expectation and to create a structure in which the degree of freedom from mechanical failure which will be tolerated by the public can be reviewed. The possibility of using this structure for estimating public reaction to failures is discussed.

Public safety and construction surety, J. Feld, *SP423*, pp. 165-170 (Apr. 1976).

Key words: construction safety; construction surety; degradation of safety with age and use; maintenance of safety; public safety; safety responsibility.

Structures are conceived, designed and constructed for use by man and located in proximity to other structures and open spaces occupied by man. How safe are these structures when first occupied, and what degree of safety can be expected of them with age?

Who is responsible for the original condition of safety of the structures, and for the degradation of safety with age and use?

Who is responsible for the maintenance of sufficient safety to permit continued use and occupancy?

In addition to the broad aspects of the problem, the paper will describe avoidable use of incompatible materials that caused local distress or failure of the structure.

Public safety and construction surety depend on proper control of each factor involved in the design, construction, maintenance, and use of a structure. Any deviation on the part of any one factor makes the structure vulnerable to damage or even collapse. Absolute safety is not obtainable. The historical record of structure behaviour indicates the high reliability of present techniques and procedures.

Responsibility for defects and for the small percent of structures that do not perform properly is a deterrent to proper control, but considerable pressure is needed to further reduce the number of failures to insignificant numbers. It is the duty of the professions involved to provide that pressure, since legal and political action has not been successful, and to control the proper performance of the work in every factor and so provide public safety and surety in the construction industry.

The people considerations of automotive service, F. J. Uhlig, *SP423*, pp. 171-178 (Apr. 1976).

Key words: automotive repair; automotive repair effectiveness; automotive service; customer-mechanic relationship; human factor considerations; universal symbol diagram approach.

The presentation will cover some of the human factor considerations in servicing automobiles at GM dealerships. Emphasis will be placed on the communication channel between customer and mechanic and possible attendant breakdown that can limit the effectiveness of repairs. Specifically, the repair challenge will be described relative to: (1) Vehicle relation and consumer expectations; (2) The customer item-service writer interface; (3) Technical service information for internal service shop communications.

In addition, the presentation will cover some recent developments of GM service research which address themselves to the above problems for example: (1) Service writer check sheet—a vehicle simulator oriented approach to customer order write up; (2) "STAR"—A computerized reading comprehension method for use in improving the readability of service manuals used by mechanics; (3) "USDA"—Universal Symbol Diagnosis Approach—that uses graphic symbols in a logic tree format to aid in vehicle system problem diagnosis; (4) Shop operation management system.

Mechanical failures: Implications for science; J. P. Hirth, *SP423*, pp. 181-191 (Apr. 1976).

Key words: continuum cracks; continuum mechanics; failure mechanisms; mechanical failure; microstructural effects on mechanical failure.

The early scientific advances by Griffith for continuum cracks and by Orowan, Taylor, Hall and Petch, and Hirsch and coworkers for effects of microstructure have contributed to our current understanding of mechanical failure. However, this understanding remains incomplete. Here, a brief historical account and survey of the present status of various fundamental aspects of the failure problem are presented. Specific unsolved problems and areas for needed research are suggested.

Implications for action for engineering, H. W. Paxton, *SP423*, pp. 193-197 (Apr. 1976).

Key words: environmental extremes; fail-safe operation; high strength materials; mechanical failure; potential service conditions; proliferation of specifications.

The demands on materials for fail-safe operation have increased enormously since the days of "Galloping Gertie" and Liberty Ships. The necessity to use higher strengths has increased demands on selection, design, acceptance testing, nondestructive evaluation of structures, and manufacturing methods. Extremes of temperatures, thicker sections, and environmental effects have all accentuated the tendency for mechanical failure. This paper will discuss the current status of selected problems, and by assessing our fundamental understanding of certain important engineering parameters, will examine prospects for improved materials and techniques.

Mechanical reliability—Implications for engineering, manufacturing and design, W. D. Compton, *SP423*, pp. 199-208 (Apr. 1976).

Key words: design engineering; material deterioration; mechanical failure; mechanical integrity; mechanical reliability; performance envelope; predicting product reliability.

The automobile is a complex assembly of some 15 000 different components in a network of functional subsystems and systems. The definition of the problem of mechanical performance is complicated by the absence of a fixed vehicle performance envelope. Control over use of the vehicle is in the hands of the individual driver. This is substantially different from military and aerospace hardware for which there are specified performance envelopes, and from many consumer products in which the performance follows a fixed pattern, almost independent of consumer preference. This situation imposes special implications for engineering and design, and for testing.

Improved methodologies for predicting component durability and lifetime under real-life conditions, when combined with information on material and structure properties derived under realistic test conditions, can be of great value in developing designs with improved mechanical properties. Likewise, the high volume production rates associated with automotive components involve consideration of material processing and manufacturing factors if the proper levels of mechanical performance are to be achieved.

Implications for action—Industry, J. E. Ryan, *SP423*, pp. 209-212 (Apr. 1976).

Key words: consumer products; marketing; mechanical failure; product performance; product reliability; product testing.

This paper will review product trends for industrial and consumer durables; the foreseeable environment of production and use of these products and systems; and the implications for preventive action in this industrial area based upon the growing body of knowledge of mechanical failure mechanisms and the increasing concern for economic and social consequences of mechanical failures.

The implications of mechanical failures for consumer product safety—Vice versa, L. M. Kushner, *SP423*, pp. 215-219 (Apr. 1976).

Key words: consumer product safety; failure prevention; government action; government responsibility; mechanical failure; safety standards.

In years past, manufacturing a safe product (rather than one that is simply marketable) for the consumer was regarded as a nice, but not necessarily imperative, thing for a manufacturer to do. Recent legislation, however, mandates consumer product safety, thereby putting additional responsibilities on product designers and engineers and the research scientists who support them. Experience in operating a regulatory product safety program discloses that materials failures, many of which are mechanical in nature, are an important factor in consumer product safety. A discussion will be presented of the implications of the Consumer Product Safety Act for materials engineers. Some specific examples of mechanical failures in consumer products that have created serious safety problems will be given.

Mechanical failure—A material matter, R. W. Roberts, *SP423*, pp. 221-225 (Apr. 1976).

Key words: conservation of material resources; failure prevention; government action; mechanical failure; mechanical reliability; safety standards.

The Federal Government has long been concerned with minimizing mechanical failures. This concern has come about for two reasons. First, the Federal Government purchases and operates a great deal of equipment, much of it, as in the space program and in the DOD, equipment of extreme technological sophistication. The Government, in purchasing, using, and maintaining this equipment, has often led the way in devising new approaches to mechanical reliability. The second reason involves areas of broad public

concern, such as safety. Here, Congress has granted Government agencies the authority to set mandatory standards that are designed to prevent mechanical failures in the private sector. It is clear that in the future both these activities will be continued.

In addition, several current national trends call for enhanced concern with mechanical reliability. These trends are related to the conservation of natural resources, the continuing need for new methods of improving product quality and maintainability in the face of rising labor costs, and the growth of new technologies, such as nuclear energy, requiring a new plateau of operating reliability.

These trends are analyzed in terms of future government policy and future modes of interaction between the government and the private sector.

SP424. **A contribution to computer typesetting techniques: Tables of coordinates for Hershey's repertory of occidental type fonts and graphic symbols,** N. M. Wolcott and J. Hilsenrath, *Nat. Bur. Stand. (U.S.), Spec. Publ. 424,* 173 pages (Apr. 1976) SD Catalog No. C13.10:424.

Key words: alphabets; COM; computerized typesetting; digital plotting; graphics; Hershey character set; plotting; type fonts; typesetting; vectorized characters.

These tables present coordinates from which it is possible to generate 1377 different alphabetic and graphic characters on either COM devices or on digital plotters. The tables, originally developed by Dr. A. V. Hershey of the Naval Weapons Laboratory, are augmented here by corresponding figures which show for each character the location of the tabulated points and the manner in which they are connected. The tables can be used with existing typographic systems to compose pages for scientific and mathematical publications of graphic arts quality either on COM devices or flat-bed plotters. Numerous applications are discussed and illustrated. The tables are also available on a magnetic tape in either BCD or ASCII format from the National Technical Information Service.

SP425, Volumes I and II. **Nuclear cross sections and technology.** Proceedings of a Conference held in Washington, D.C., March 3-7, 1975, R. A. Schrack and C. D. Bowman, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 425, Vol. 1, 487 pages, Vol. II, 553 pages (Oct. 1975) SD Catalog No. C13.10:425.

Key words: biomedical; conference; cross section; nuclear; standards; technology.

These proceedings are the compilation of 221 papers presented at the Conference on Nuclear Cross Sections and Technology held in Washington, D.C. on March 3-7, 1975. The Conference summarized the present status of nuclear cross sections and technology and discussed future cross section needs. Special emphasis is placed on reactor technology and biomedical applications of nuclear science and the measurement of standard cross sections. *These proceedings include the following papers (indented):*

The light water reactor industry-nuclear data needs, V. O. Uotinen, J. D. Robertson, and J. S. Tulenko, *SP425,* pp. 7-13 (Oct. 1975).

Key words: lattices; nuclear data; parameter; reactivity.

Radioactive-nuclide decay data in science and technology, C. W. Reich and R. G. Helmer, *SP425,* pp. 14-20 (Oct. 1975).

Key words: applications of decay data; ENDF/B-IV decay-data file.

The scope of ENDF/B has recently been expanded to include radioactive-nuclide decay data. In this paper, the content and organization of the decay data which are included in ENDF/B are presented and discussed. The application of decay data in a wide variety of nuclear-related activities is illustrated by a number of examples. Two items pointed up by the ENDF/B decay-data compilation effort are treated: the identification of deficiencies in the data; and the importance of a radioactive-nuclide metrology effort oriented toward supplying these needs in a systematic fashion.

Radioactive decay heat analyses, R. E. Schenter and F. Schmittroth, *SP425,* pp. 21-28 (Oct. 1975).

Key words: decay heat; $\bar{E}_\beta$; $\bar{E}_\gamma$; ENDF/B-IV; fission products; half lives; yields; ^{235}U; ^{239}Pu.

Calculations of decay heat from fission products have been made using the summation method for fast and thermal reactor systems. Results of these calculations for both "burst" and long exposure times are presented and compared with previous experimental results and summation calculations. In addition, uncertainty estimate calculations are given which used both exact and approximate summation method formulas. The above calculations require as input libraries containing data for each individual fission product nuclide. Our source of data has been ENDF/B-IV, where fission yield, cross section and decay data (half lives, β and γ energies, branching, etc.) for 824 fission product nuclides are contained in the fission product and fissionable isotope files.

Sensitivity of the afterheat from ^{235}U and ^{239}Pu thermal fission to errors in fission product nuclear data, C. Devillers, B. Nimal, C. Fiche, J. P. Noël, J. Blachot, and R. de Tourreil, *SP425,* pp. 29-38 (Oct. 1975).

Key words: afterheat; decay heat; error estimates; fission products; loss of coolant accident; sensitivity.

This paper presents calculational results on the decay heat associated with the thermal fission of ^{235}U and ^{239}Pu. Calculations are based on the summation of the energies which are released by individual fission products. Two cases have been considered: the first corresponds to one instantaneous fission, the other to a 900 days irradiation time. In both cases the sensitivities of the afterheat to respectively independent yields, half-lives, average beta plus gamma energies of 512 instable fission products have been derived. This information has been used to calculate the afterheat uncertainties from experimental and evaluated nuclear data errors, when available. Results relating to the instantaneous fission of ^{235}U and ^{239}Pu are compared to calorimetric measurements between 100 and 10^5 second cooling time. Errors in the afterheat corresponding to a 900 days irradiation time have been estimated for cooling times ranging from 1 to 1000 seconds which are appropriate for Loss of Coolant Accident analyses in light water reactors. The computer programmes which have been developed can be applied to any irradiation and cooling time condition.

Significance of nuclear data on the development of the LMFBR industry, N. C. Paik, *SP425,* pp. 39-44 (Oct. 1975).

Key words: data; flux; LMFBR; neutron.

The overall interaction of nuclear data, methods and nuclear performance predictions of an LMFBR is described. Areas of successful applications of the recent Evaluated Neutron Data File (ENDF/B) to an LMFBR design are shown to be numerous. Design areas where improvements in the Evaluated Neutron Data File would have significant impact on the development of the LMFBR industry are listed. Specific cross sections where improvements in the neutron data would be beneficial to the LMFBR industry are enumerated. In order to provide insight into why

these developments are required, an application of nuclear data to the determination of the intrinsic neutron source strength in an LMFBR are described in relation to the Ex-Vessel Low Level Flux Monitor system design.

Fast reactor safety, R. Avery, *SP425*, pp. 45-50 (Oct. 1975).

Key words: accidents; breeders; fast reactors; LMFBR; recriticality; safety.

The current state of knowledge with respect to the analysis of potential accident sequences in fast breeder reactors and the understanding of associated accident phenomena, as well as implications to reactor design, are reviewed.

After PHENIX, what is the importance of nuclear data programs for the FBR development?, J. Y. Barré, J. Bouchard, and J. P. Chaudat, *SP425*, pp. 51-61 (Oct. 1975).

Key words: FBR development; integral experiments; nuclear data; PHENIX.

In the fast reactor physics approach chosen in France, the integral experiments serve as a reference. The significance of differential nuclear measurements, in this philosophy, is presented.

The programs carried out on critical facilities and operating fast power reactors up to the end of this year will solve the last major problems arising from nuclear data inaccuracies for commercial plants. Results obtained on PHENIX during start-up and operation validate this approach. After the end of 1975, the nuclear data needs concern mainly safety, plant operation and fuel cycle analysis. Nonnuclear uncertainties largely dominate the effects of nuclear data uncertainties for these problems. Evaluations must be sufficient to reach the requested accuracies.

NE-213 neutron spectrometry system for measurements to 15 MeV, R. H. Johnson, B. W. Wehring, and J. J. Dorning, *SP425*, pp. 62-65 (Oct. 1975).

Key words: proton-recoil spectrometry; Pu-Be and ^{252}Cf neutron spectra; spectra unfolding.

A 5-cm by 5-cm NE-213 scintillator mounted on a 56AVP PM tube is used with a bridge utilizing two high voltage supplies and giving good linearity and good pulse shape discrimination. The cross-over timing method is used to discriminate against gamma-ray events. Measurements of a ^{252}Cf and a D-T source were used to test the linearity of the system. The ^{252}Cf measurement is in good agreement with earlier results and is fit by a Maxwellian distribution with a temperature of 1.43 MeV. A modified version of the COOLC unfolding code was used to obtain neutron spectra. This code, FORIST, optimizes the neutron energy resolution through an iterative process. A measured Pu-Be spectrum is used to demonstrate the benefits of the modified unfolding procedure. The Pu-Be spectrum is also in good agreement with earlier results. The 9.7 MeV peak of the Pu-Be neutron spectrum is resolved when the FORIST code is used, but not when the COOLC code is used with the window width data distributed with the COOLC and FERDOR code package.

Absolute calibration of neutron detectors in the 10-30 MeV energy range, J. A. Cookson, M. Hussian, C. A. Uttley, J. L. Fowler, and R. B. Schwartz, *SP425*, pp. 66-68 (Oct. 1975).

Key words: absolute efficiency of fast neutron detectors.

A central problem in fast neutron research is that of finding the absolute efficiency of neutron detectors. Using the associated particle method for this purpose, we have designed a chamber to count He particles from the D(d,n)^{3}He or the T(d,n)^{4}He reaction in coincidence with neutron events. The reactions take place in deuterium o tritium gas and a ΔE solid state counter at 80, 65, or 43° t the 2-10 MeV deuteron beam direction detects the He parti cles with 100 percent efficiency. To reduce background w allow the deuterons to pass out of the gas chamber throug a Ni window and stop the beam ~ 150 cm from the coun ters. With the D(d,n)^{3}He reaction we have obtained ~ 2 per cent efficiency calibration of the central portion of a liqui scintillator in the 9-10 MeV energy range. With the T(d,n reaction this calibration can be extended to ~ 27 MeV an the efficiency can be mapped out as a function of position i the scintillator.

A thick target measurement technique for determining nuclear reaction rates, N. A. Roughton, M. J. Fritts, R. J Peterson, C. J. Hansen, and C. S. Zaidins, *SP425*, pp. 69-72 (Oct. 1975).

Key words: astrophysics; cross sections; fusion; reactior rates; thick targets.

A technique for measuring nuclear cross sections using thick targets and an empirical approximation for energy loss has been developed by our group at the Nuclear Physics Laboratory of the University of Colorado. Over the past two years we have measured thick target yields of over thirty nuclear reactions of interest in astrophysics and CTR applications. From these yields we can derive average cross sections and thermonuclear reaction rates, $N_1 \langle \sigma v \rangle$. We will describe the technique and data analysis methods and give some examples of our results.

A black detector for 250 keV—1000 keV neutrons, G. P. Lamaze, M. M. Meier, and O. A. Wasson, *SP425*, pp. 73-74 (Oct. 1975).

Key words: detector; flux; Monte Carlo; neutrons; scintillators; time-of-flight.

A detector has been designed to have a greater than 95 percent efficiency in the range of 250—1000 keV neutron energy. The detector is modeled from a similar but larger detector by Poenitz. The efficiency calculations were made with a modified version of Carlo Black, which is a Monte Carlo calculation of multiple neutron scattering in a scintillator. The detector is a 12.6 cm × 17.78 cm cylinder of NE 110 with a 5.08 cm × 2.54 cm reentrant hole. The scintillator is mounted on an RCA 8854 photomultiplier tube which has been selected for low noise. Calculated efficiencies are presented as well as comparisons with experimental measurements.

Detector calibration with an associated particle apparatus, M. M. Meier, A. D. Carlson, and G. P. Lamaze, *SP425*, pp. 75-77 (Oct. 1975).

Key words: associated particle technique; neutron detector; neutron flux monitor; neutrons; neutron standards; T(p,n)^{3}He reaction.

An associated particle apparatus employing the T(p,n)^{3}He reaction is now in routine use at the NBS. The apparatus consists of two target chambers with ports at 10 and 25° which give a useful neutron energy range of 100 keV to 1 MeV for protons from the 3 MV Van de Graaff. Electrostatic deflection, fast energy discrimination and pulsed beam time of flight techniques are used to reduce background in the neutron-associated $^3He^{++}$ pulse height spectrum to less than 1 percent. Neutron fluxes in the associated cone range between 30 and 100 n/sec at the lowest and highest bombarding energies. The spatial profile of the neutron cone is broadened by coulomb scattering of the $^3He^{++}$ in the tritiated titanium target and has a width less than 12° (full

width at one-tenth maximum) for neutron energies above 300 keV. The apparatus has been used to calibrate a "black" detector described by Lamaze. The results of this calibration will be compared to a Monte Carlo calculation of the efficiency.

Use of gas proportional counters for neutron flux monitors at the NBS Linac, O. A. Wasson, *SP425*, pp. 78-80 (Oct. 1975).

Key words: counter; flux; hydrogen; monitor; neutron; proportional.

The use of a hydrogen filled proportional counter as a neutron flux monitor for standard neutron reaction cross section measurements at the 200 m flight path of the NBS Linac is described. Efficiency uncertainties approaching 1 percent are obtainable.

Fission cross section measurements on short-lived alpha emitters, J. W. T. Dabbs, N. W. Hill, C. E. Bemis, and S. Raman, *SP425*, pp. 81-82 (Oct. 1975).

Key words: fast ionization chamber; fission/alpha; spherical electrodes; σ_f; ^{245}Cm.

The large difference in initial ionization can be used to limit the size of alpha pulses relative to fission pulses in an ionization chamber, if the track lengths are both short. In parallel plate chambers this condition is not well met. We have developed a spherical plate chamber in which the ratio of maximum/minimum track length is 3. In the present (small sample) version, the maximum track is 6 mm, with deposit and neutron beam diameters of 1 cm. At optimum, with pure CH_4 gas, an electron collection time of ~ 22 ns is expected across the 2 mm gap. It is expected that the worst alpha/fission current pulse ratio will not exceed 1/14. Thus fissile isotopes with alpha half lives of 30 years or more (e.g., ^{243}Cm) may be studied with 1-2 nanosecond risetime current amplifiers; in addition, very small spontaneous fission branching ratios may be better determined. Comparisons of this new chamber with a parallel plate chamber and initial results on ^{245}Cm (~ 16 μg sample) will be presented. The ORELA pulsed neutron source permits measurements below 20 eV which are inaccessible to underground explosion experiments.

Systematic discrepancy in photoneutron cross sections for medium and heavy nuclei, T. Tomimasu and S. Sugiyama, *SP425*, pp. 83-88 (Oct. 1975).

Key words: calibrations of the NBS P2 chamber; comparison of shape and magnitude of photoneutron cross sections; nuclear reactions Cu, ^{63}Cu, Pr, Pb, ^{208}Pb, Bi(γ,n).

The shape and magnitude of the photoneutron cross sections for Cu, Pr, Pb, and Bi are compared to find out a systematic discrepancy between the cross sections obtained using the NBS P2 chamber as a bremsstrahlung beam monitor and those obtained by other experimental techniques such as the positron annihilation-in-flight. The former cross sections in general are observed to be systematically larger than the latter. The discrepancy of about 10 percent is demonstrated in the peak cross section values for medium nuclei. This may be explained in the good direction by a systematic discrepancy of 6 percent in the calibration constants of the NBS P2 chamber given at several laboratories, because the lowest values in these calibrations have been widely used to determine the photoneutron cross sections from measured neutron yield curves. The highest values can almost eliminate the 10 percent discrepancy. The definite discrepancy cannot be demonstrated for heavy nuclei because of the large discrepancies of 20 percent or more found in the cross sections obtained with γ-rays from positron annihilation-in-flight.

The 2-keV filtered beam facility at the NBS reactor, I. G. Schroder, R. B. Schwartz, and E. D. McGarry, *SP425*, pp. 89-92 (Oct. 1975).

Key words: capture gamma rays; cross sections; dosimetry; filtered beams; neutrons.

A scandium filter that views a manganese scatterer has been installed in a through tube of the National Bureau of Standards Reactor (NBSR). The use of a resonant scatterer eliminates unwanted core neutrons and core gamma rays. This produces a pure 2-keV neutron beam with only 3 percent higher energy neutron contamination and a 1 mR·hr^{-1} gamma-ray background. This should be compared with previously reported results in which the high energy contaminant was approximately 50 percent, thus severely limiting the utility of such a filter. Details of the filter construction, the use of titanium with the scandium to reduce background, the optimization of the beam for different types of experiments, and the application of 2-keV neutrons to neutron dosimetry, cross-section measurements and capture gamma-ray studies are discussed.

The Rensselaer Intense Neutron Spectrometer, R. C. Block, R. W. Hockenbury, D. S. Cramer, E. Bean, and R. E. Slovacek, *SP425*, pp. 93-96 (Oct. 1975).

Key words: measured Th fission and deduced $\bar{\Gamma}_f$ below 260 eV; measured ^{145}Nd(n,α); measured ^{238}U fission below 35 keV, deduced $\bar{\Gamma}_f$ of 6.7, 21 and 37 eV resonances.

The Rensselaer Intense Neutron Spectrometer (RINS) is obtained by driving a 75-ton lead slowing down spectrometer with the intense pulsed neutron source from the RPI 100-MeV electron linac. For the same linac beam power, RINS produces a useable neutron flux which is $10^3 \sim 10^4$ greater than that obtained with a conventional time-of-flight spectrometer. Fission measurements upon ^{238}U have shown strong subthreshold fission above 700 eV and have determined the fission widths of the 6.7, 21 and 37 eV resonances to be (10 ± 5), (70 ± 30) and (8 ± 6) neV respectively. No strong subthreshold fission was observed in ^{232}Th, and an upper limit of (15 ± 10) neV is obtained for $\bar{\Gamma}_f$ for the Th resonances below 260 eV. Measurements of ^{145}Nd (n,α) have shown that the RINS system is readily capable of measuring ~ μ eV partial widths with only several mg of sample.

A modular minicomputer multiparameter data gathering and virtual memory operating system for the NBS neutron standards program, R. A. Schrack, H. T. Heaton II, and D. Green, *SP425*, pp. 97-98 (Oct. 1975).

Key words: CAMAC; disc; minicomputer; modular; multiparameter; on-line.

The new aboveground neutron time-of-flight system has recently been completed at the National Bureau of Standards linear accelerator facility. A computer system has been developed that will permit the accumulation of multiparameter data simultaneously from several experiments, using an inexpensive minicomputer and a small moving head disc storage unit. The operating system is modular in form, allowing different experimenters to rapidly construct a software system to their requirements. Data gathering and analysis programs are interchanged between core and disc as required. Interfacing hardware has been modularized using the CAMAC system.

TUNL fast neutron cross section facility, D. W. Glasgow, F. O. Purser, J. C. Clement, G. Mack, K. Stelzer, J. R. Boyce, D. H. Epperson, H. H. Hogue, E. G. Bilpuch, H. W. Newson, and C. R. Gould, *SP425*, pp. 99-102 (Oct. 1975).

Key words: C(n,n), E=9-15 MeV, measured $\sigma(E_n,\theta)$; D(d,n)^{3}He and C(n,n) spectra; neutron TOF facility.

A fast neutron time-of-flight (TOF) facility has been constructed in order to measure neutron differential cross sections required for the CTR program. The facility combines the outstanding capabilities of the Cyclo-Graaff accelerator with those of a good energy resolution, high mechanical precision, very low background TOF spectrometer-goniometer. The facility provides the capability for measurements of scattering cross sections with magnitudes of a few mb/sr to ≈ 5 percent absolute accuracy in the energy range 6-15 MeV. The D(d,n)^{3}He source spectra at 0° are practically devoid of extraneous neutrons produced by deuteron reactions with the all-metal, ultraclean beam transport system.

A facility for studying neutron-induced charged particle reactions, F. P. Brady, N. S. P. King, M. W. McNaughton, J. F. Harrison, and B. E. Bonner, *SP425*, pp. 103-105 (Oct. 1975).

Key words: facility; neutron-induced reactions; ^{12}C data; 56 MeV.

Nearly monoenergetic beams of neutrons, variable in energy from below 10 to above 60 MeV are produced via intense beams of protons and deuterons from the sector focusing isochronous cyclotron at Crocker Nuclear Laboratory. The neutron production target and collimation system are connected to a scattering chamber containing detector telescopes, all in vacuum. ΔE, E and time-of-flight signals from each telescope are interfaced to a PDP15/40 computer via CAMAC and sophisticated on-line and off-line data processing can be carried out. There are a number of examples of the use of these cross sections: Neutron induced reactions on carbon have provided us with a better understanding of energy dependence of neutron detection efficiencies in plastic scintillators. Data from carbon and other tissue-resident elements are necessary for an understanding of microscopic dose distributions produced by neutrons.

After-pulse suppression for 8850 and 8854 photomultipliers, J. P. Lamaze, J. K. Whittaker, R. A. Schrack, and O. A. Wasson, *SP425*, pp. 106-107 (Oct. 1975).

Key words: after-pulse; detector; gamma-flash; photomultiplier; pulse suppression; scintillator.

Spurious pulses occurring after large light output events in a scintillator (after pulsing) have been observed in semiconducting first dynode photomultipliers (RCA 8850 series). The after-pulsing apparently has two components, an isochronous component occurring at a fixed time interval after the initial light pulse and an asynchronous component with a long duration lasting at least 40 μsec. The time interval between the isochronous bursts is related to the types of residual gases in the photomultiplier. In the RCA 8850 series tubes, the asynchronous after-pulsing consists of very low amplitude pulses and appears to be primarily due to single electron events, the number of these events being related to the main pulse amplitude. To obtain after pulse suppression, a fine stainless steel mesh was stretched tightly over the glass window of the photocathode. The mesh was then pulsed (FWHM = 250 ns) during the light flash to +300 volts relative to the photocathode potential. The isochronous and asynchronous after-pulsing was completely suppressed. Further details are presented.

A secondary standard neutron detector for measuring total action cross sections, K. K. Sekharan, H. Laumer, and F. Gabbard, *SP425*, pp. 108-111 (Oct. 1975).

Key words: absolute efficiency determination; cross section measurements; neutron detector.

A neutron detector has been constructed and calibrated for the accurate measurement of total neutron-production cross sections. The detector consists of a polyethylene sphere of 24 in diameter in which 8-$^{10}BF_3$ counters have been installed radially. The relative efficiency of this detector has been determined for average neutron energies, from 30 keV to 1.5 MeV by counting neutrons from ^{7}Li(p,n)^{7}Be. By adjusting the radial positions of the BF_3 counters in the polyethylene sphere the efficiency for neutron detection was made nearly constant for this energy range. Measurement of absolute efficiency for the same neutron energy range has been done by counting the neutrons from ^{51}V(p,n)^{51}Cr and ^{57}Fe(p,n)^{57}Co reactions and determining the absolute number of residual nuclei produced during the measurement of neutron yield. Details of absolute efficiency measurements and the use of the detector for measurement of total neutron yields from neutron producing reactions such as ^{23}Na(p,n)^{23}Mg are given.

Facilities for cross section measurements using Na-D photoneutron sources, J. C. Robertson, M. C. Davis, and J. C. Engdahl, *SP425*, pp. 112-115 (Oct. 1975).

Key words: calibration; construction; Na-D photoneutron sources; radiolysis; spectrum.

Photoneutron sources are a convenient source of neutrons in the intermediate energy range, and because of this they are often used to make absolute cross section measurements. In this paper, the construction of two sodium-deuterium sources is described. One of the sources uses deuterated polyethylene shells and the other utilizes heavy water. The methods used in the manipulation of the sources are outlined. The effects of radiolysis on the yields from the sources is discussed together with the unique features of the Michigan manganese bath system used in their calibration. The results of Monte Carlo calculations of the neutron spectra are given.

A 25-keV neutron beam facility at NBS, E. D. McGarry and I. G. Schroder, *SP425*, pp. 116-118 (Oct. 1975).

Key words: dosimetry; filtered beams; neutrons; spectroscopy.

An iron-filtered, neutron-beam facility that provides a well collimated source of 25-keV neutrons has been developed at the National Bureau of Standards (NBS) Reactor. For selected physics experiments and monoenergetic calibration of neutron dosimeters, the beam flux may be tailored to provide $5 \times 10^5 n \cdot cm^{-2} \cdot s^{-1}$ with 99 percent 25-keV neutrons. For other experiments, such as calibration of fast-neutron spectrometers, fluxes of $10^6 n \cdot cm^{-2} \cdot s^{-1}$ may be obtained with as many as 13 identifiable peaks in the energy range 25 keV to 1.5 MeV.

New experimental techniques and results in neutron spectroscopy, C. D. Bowman, *SP425*, pp. 119-128 (Oct. 1975).

Key words: neutron cross sections; new results; new techniques; review.

During the past several years there has been very little funding available for construction of new facilities for neutron measurements. The most important changes in the field have come through the development of new experimental techniques at existing facilities. These techniques and resulting measurements in the area of programmatic neutron data and neutron physics research will be discussed.

Measurement, analysis, and implications of the fission cross section of the important fissionable isotopes, M. S. Moore, *SP425*, pp. 129-138 (Oct. 1975).

Key words: calculated $<\sigma_f>$; deduced channel spectrum; E = 3-5 MeV; fission; nuclear reactions; Pu isotopes; U; $^{235}U(n,f)$.

Recent measurements on the resonance cross sections of isotopes of uranium and plutonium are reviewed, with the objective of determining average parameters suitable for calculations at higher energies. The average parameters obtained are useful in two ways: they provide the necessary input for statistical calculations of resonance cross sections in the unresolved region, and they provide a normalization point for the calculation of smooth cross sections above the unresolved region. The particular problem we address is the systematic trend of average fission cross sections from 3-5 MeV, which have been found to follow the equation $\sigma_f = -39.031 + 17.231\ Z^2/A^{3/2}$. We find that a very simple statistical model calculation, based on R-matrix parameters which adequately describe the total cross section from 20 keV to 20 MeV, can provide a qualitative understanding of this systematic behavior.

Neutron capture cross section measurement techniques, R. E. Chrien, *SP425*, pp. 139-148 (Oct. 1975).

Key words: activation; capture techniques; high resolution methods; Moxon-Rae; review; total absorption.

A review of currently-used techniques to measure neutron capture cross sections is presented. Measurements involving use of total absorption and Moxon-Rae detectors are based on low-resolution detection of the prompt γ-ray cascades following neutron captures. In certain energy ranges activation methods are convenient and useful. High resolution γ-ray measurements with germanium detectors can give information on the parameters of resonance capture states. The use of these techniques is described.

Nuclear models and data for gamma-ray production, P. G. Young, *SP425*, pp. 149-155 (Oct. 1975).

Key words: nuclear reactions ^{14}N, ^{27}Al, ^{56}Fe, Mo, ^{93}Nb, ^{181}Ta, W, ^{238}U, review selected (n,xγ) measurements, evaluations, $\sigma(E_n)$, $\sigma(E_\gamma)$; $^{93}Nb(n,x\gamma)$, E = 14.2 MeV, calculated $\sigma(E_\gamma)$; $^{181}Ta(n,x\gamma)$, E = thermal, calculated $\sigma(E_\gamma)$.

The current Evaluated Nuclear Data File (ENDF/B, Version IV) contains information on prompt gamma-ray production from neutron-induced reactions for some 38 nuclides. In addition, there is a mass of fission product yield, capture, and radioactive decay data from which certain time-dependent gamma-ray results can be calculated. These data are needed in such applications as gamma-ray heating calculations for reactors, estimates of radiation levels near nuclear facilities and weapons, shielding design calculations, and materials damage estimates. The prompt results are comprised of production cross sections, multiplicities, angular distributions, and energy spectra for secondary gamma-rays from a variety of reactions up to an incident neutron energy of 20 MeV. These data are based in many instances on experimental measurements, but nuclear model calculations, generally of a statistical nature, are also frequently used to smooth data, to interpolate between measurements, and to calculate data in unmeasured regions. The techniques and data used in determining the ENDF/B evaluations will be reviewed in this paper, and comparisons of model-code calculations and ENDF data with recent experimental results will be given.

Techniques for the determination of neutron induced charged particle reactions, H. Liskien, *SP425*, pp. 156-160 (Oct. 1975).

Key words: application; charged particle; cross section; emission; neutron; techniques.

Several fields of practical importance are existing for neutron induced charged particle reactions despite their low position within the cross section hierarchy. A survey is given on the experimental techniques employed to obtain information on cross sections, energy and angular distribution for this class of reactions. The obtainable accuracies are discussed and compared with the accuracies requested for the practical applications. The main areas of work, presently neglected, requiring future attention can be identified: (1) Reactions on medium mass nuclei not accessible by the activation method and (2) the neutron energy region between 6 and 12 MeV where suited neutron sources are not easily available.

Integral measurements to test shielding cross sections, L. Harris, Jr., J. C. Young, N. A. Lurie, D. K. Steinman, S. J. Friesenhahn, D. E. Bryan, W. E. Gober, and L. Schänzler, *SP425*, pp. 161-164 (Oct. 1975).

Key words: concrete and steel shield; gamma-ray spectrum unfolding; integral measurements; neutron spectrum unfolding; NE-213 detector; nitrogen cross sections.

The pulsed-white-neutron-source, time-of-flight method and an NE-213 detector have been used for two integral shielding measurements. Incident-neutron-energy-dependent measurements of scattered neutrons and secondary gamma rays from small samples of Be, C, N, H_2O and Fe have been performed. Results for N, including unfolded energy spectra of scattered neutrons and secondary gamma rays at 125°, are presented. Time-dependent measurements of leakage neutrons and secondary gamma rays from a thick concrete and steel shield are described, and some data are presented.

Evaluation, uncertainty estimation and adjustment of capture cross sections for fission product nuclei, H. Gruppelaar, J. B. Dragt, A. J. Janssen, and J. W. M. Dekker, *SP425*, pp. 165-168 (Oct. 1975).

Key words: adjustment; evaluation; fission products; sensitivity analysis; σ_c; $^{101,102,104}Ru$; ^{127}I.

Part of the results of integral measurements, which have been performed in the STEK-facility for about 60 fission product nuclei, have been analysed and used for adjustment of capture cross sections needed for fast breeders. This paper gives an outline of the method used to obtain these adjusted cross sections as well as some conclusions for σ_c of $^{101,102,104}Ru$, ^{127}I.

Integral test of cross sections using neutron leakage spectra from spheres of iron, niobium, beryllium, and polyethylene, R. H. Johnson, J. J. Dorning, and B. W. Wehring, *SP425*, pp. 169-172 (Oct. 1975).

Key words: beryllium; carbon; integral cross section tests; iron; niobium.

Measurements of neutron leakage spectra in the energy range 1 to 15 MeV from homogeneous spherical assemblies have been made using an NE-213 spectrometry system. These benchmark-type measured spectra will be compared with detailed computed spectra as an integral test of evaluated nuclear data. Preliminary ANISN calculations using cross section sets based on ENDF/B-III are presented and compared with the measurements. Measurements on a 22 cm diam beryllium sphere, a 25-cm diam niobium sphere and a 46-cm diam polyethylene (CH_2) sphere, each with a ^{252}Cf source at the sphere center, have been made. The niobium calculation slightly underpredicts the leakage spectrum below 9 MeV. The beryllium and polyethylene calculations are in general agreement with the measurements

though discrepancies are seen for small energy ranges. Measurements have also been made for a 76-cm diam iron sphere with a 14-MeV source at the sphere center. The preliminary iron calculation (ENDF/B-III) greatly underpredicts the leakage spectrum from 1 to 8 MeV.

Uncertainties and correlations in evaluated data sets induced by use of standard cross sections. R. W. Peelle, *SP425*, pp. 173-176 (Oct. 1975).

Key words: correlation; covariance; ENDF/B; standard cross section; uncertainty file.

A file of cross-section uncertainty information for use in reactor performance uncertainty analysis should take into account the propagated effects of uncertainties in the standard cross sections used. This problem has been analyzed using first-order error theory in terms of the uncertainties in the standard cross sections and the energy-dependent weight given to each underlying experimental result in obtaining an evaluated cross section. Three cases occur depending on whether the energy dependence of the standard was utilized, and if so whether the absolute magnitude or only the shape of the standard cross section was used in an underlying experiment. The analysis yields the uncertainties in and correlations among the evaluated cross sections. The resulting uncertainty files need not refer explicitly to the uncertainties in standards and can use the same set of formats employed for other uncertainty data.

Shielding benchmark experiments and sensitivity studies in progress at some European laboratories. G. Hehn, M. Mattes, W. Matthes, R. Nicks, and H. Rief, *SP425*, pp. 177-183 (Oct. 1975).

Key words: benchmark; cross sections; graphite; neutron; sodium; water.

A 100 group standard library based on ENDF/B3 has been prepared by IKE and JRC. This library is used for the analysis of the current European and Japanese iron benchmark experiments. Further measurements are planned for checking the data sets for graphite, sodium, and water.

In a cooperation between the IKE and JRC groups coupled neutron-photon cross section sets will be produced.

Point data are processed at IKE by the modular program system RSYST (CDC 6600) for elaborating the ENDFB data, whereas the JRC group, apart from using standard codes such as SUPERTOG 3, GAMLEG, etc., has developed a series of auxiliary programs (IBM 360) for handling the DLC 2D and POPOP libraries and for producing the combined neutron-plus gamma library EL4 (119 groups). Sensitivity studies (in progress at IKE) make possible improvements in methods and optimization of calculation efforts for establishing group data. A tentative sensitivity study for a 3-dimensional MC approach is in progress at Ispra. As for nuclear data evaluation, the JRC group is calculating barium cross sections and their associated gamma spectra.

Assessment of neutron group constants for iron and stainless steel through measurements and analyses of energy and space distributions of neutrons in test assemblies. I. Kimura, K. Kobayashi, S. A. Hayashi, S. Yamamoto, H. Nishihara, M. Ando, S. Kanazawa, and M. Nakagawa, *SP425*, pp. 184-188 (Oct. 1975).

Key words: activation method; group constants; iron; neutron spectrum; one-dimensional transport calculation; stainless steel; time-of-flight.

In order to assess group constants (JAERI-FAST, ABBN, DLC-2D, etc.) for iron and stainless steel, neutron energy spectra from 1 keV to a few MeV in iron and stainless steel assemblies were measured by the linac-time-of-flight method. Neutron spatial distributions measured by the activation method ($^{58}Ni(n,p)^{58}Co$ and $^{197}Au(n,\gamma)^{198}Au$) showed a spherical symmetry around the photoneutron source, and enabled us to use one-dimensional transport codes (ANISN, DTF-IV, etc.). The measured neutron spectra agree with the predicted by ANISN code with DLC-2D for both materials. However, C/E agreement is poorer below the 25 keV resonance when JAERI-FAST constants for iron are used in calculation. This disagreement was considerably reduced by using a modified set of constants. General shape of fast-neutron spatial distributions agrees with the theoretically predicted for all cases.

ENDF/B dosimetry cross section file benchmark neutron flux-spectral uncertainties. W. N. McElroy, *SP425*, pp. 189-192 (Oct. 1975).

Key words: cross sections; flux; neutrons; reaction rates; spectra.

An ENDF/B file of evaluated energy dependent cross sections for dosimetry applications has been established. The fission and most reliable nonfission reaction cross sections on this file are used with current recommended sets of evaluated measured reaction rates for several benchmark spectra to establish multiple foil derived flux-spectra with Monte Carlo uncertainties for comparison with spectrometry and calculated spectra. It is concluded that integral data testing of cross sections on the ENDF/B-IV file is presently limited to the ± 5 to 10 percent (1σ) range because of uncertainties in the benchmark flux-spectra.

Fission-product gamma-ray and photoneutron spectra. M. G. Stamatelatos and T. R. England, *SP425*, pp. 193-198 (Oct. 1975).

Key words: fission products; gamma spectra; photoneutron spectra; reactors; ^{2}H; ^{9}Be.

Fission-product gamma-ray and photoneutron spectra from thermal and fast fission of ^{233}U, ^{235}U, ^{238}U, and ^{239}Pu have been calculated at 27 time intervals between 1 and 1000 hours following reactor shutdown. The gamma spectral calculations were made using CINDER, a depletion and fission-product code, which has been revised, extended, and variably dimensioned for applications to many problems involving irradiated materials. ENDF/B-IV yield and decay data for all fission products with half-lives ≥ 15 minutes and gamma energies above $^{9}Be(\gamma,n)^{8}Be$ threshold were used. An interesting general feature of the spectra is that they harden with time. The photoneutron spectra were calculated with PHONEX, a program general enough to operate on arbitrary gamma spectra incident on specific materials, e.g., ^{9}Be and ^{2}H. Time-dependent distributions of photons and photoneutrons/fission were calculated in 66 energy groups (50 keV grids). The constancy of these source strengths between ~ 10 and 200 hours following reactor shutdown indicates the possibility of sourceless start-ups.

Safeguards against theft or diversion of nuclear materials. T. B. Taylor, *SP425*, pp. 199-201 (Oct. 1975).

Key words: nuclear enterprises; nuclear materials; plutonium; safeguard; uranium.

An overview of the risks and safeguards relevant to the possible theft or national diversion of special nuclear materials from peaceful nuclear enterprises is presented.

Fission theory and actinide fission data. A. Michaudon, *SP425*, pp. 202-213 (Oct. 1975).

Key words: actinide; cross sections; fission.

The understanding of the fission process has made great progress recently, as a result of the calculation of fission barriers, using the Strutinsky prescription. Double-humped shapes were obtained for nuclei in the actinide region. Such shapes could explain, in a coherent manner, many different phenomena: fission isomers, structure in near-threshold fission cross sections, intermediate structure in subthreshold fission cross sections and anisotropy in the emission of the fission fragments. A brief review of fission barrier calculations and relevant experimental data is presented. Calculations of fission cross sections, using double-humped barrier shapes and fission channel properties, as obtained from the data discussed previously, are given for some U and Pu isotopes.

The fission channel theory of A. Bohr has greatly influenced the study of low-energy fission. However, recent investigation of the yields of prompt neutrons and γ-rays emitted in the resonances of ^{235}U and ^{239}Pu, together with the spin determination for many resonances of these two nuclei cannot be explained purely in terms of the Bohr theory. Variation in the prompt neutron and γ-ray yields from resonance to resonance does not seem to be due to such fission channels, as was thought previously, but to the effect of the (n,γ f) reaction.

The number of prompt fission neutrons and the kinetic energy of the fission fragments are affected by the energy balance and damping or viscosity effects in the last stage of the fission process, from saddle point to scission. These effects are discussed for some nuclei, especially for ^{240}Pu.

Nuclear data for actinide recycle, E. J. Hennelly, *SP425*, pp. 214-217 (Oct. 1975).

Key words: actinide burnup; cross section sets; neutron spectrum; transplutonium; waste management; yield.

Large quantities of heavy actinides will be byproducts of burning plutonium and uranium fuel in nuclear power reactors. Chemical recovery and subsequent recycle in reactors will be for the production of ^{238}Pu and ^{244}Cm as heat sources and ^{252}Cf as a unique source of neutrons or for the ultimate conversion of heavy actinides to shorter-lived fission products to reduce long-term waste storage problems. Test measurements and production yields have provided data for developing a consistent set of multigroup cross sections which give excellent predictions of actinide concentrations in a variety of reactor environments and exposures. These multigroup cross sections are compatible with advanced reactor theory calculational codes.

(n,f) cross sections for exotic actinides, J. B. Wilhelmy, H. C. Britt, A. Gavron, E. Konecny, and J. Weber, *SP425*, pp. 218-221 (Oct. 1975).

Key words: deduced σ_{nf}; nuclear reactions measured P_f $^{230-233}$Pa, ^{231,232}U, $^{233-239}$Np, ^{237,238}Pu, $^{239-243}$Am, $^{241-244}$Cm, ^{248,249}Bk using (^{3}He,df), (^{3}He,tf), E = threshold $-\sim$ 12 MeV.

Neutron induced fission cross sections have been obtained for 26 actinide nuclei using (^{3}He,df) and (^{3}He,tf) reactions to determine fission probabilities and then multiplying these values by calculated compound nuclear neutron reaction cross sections. Comparison with existing (n,f) data shows this to be a feasible approach for obtaining reliable estimates for (n,f) cross sections where direct measurements are not possible. Theoretical developments in interpreting fission probability measurements are discussed.

A study of the ^{233}U-^{232}Th reactor as a burner for actinide wastes, S. Raman, C. W. Nestor, Jr., and J. W. T. Dabbs, *SP425*, pp. 222-223 (Oct. 1975).

Key words: actinide fuel, fertile material, and wastes; recycle concept; transuranium element production; waste recycling in a ^{233}U-^{232}Th reactor.

A plausible method for reducing the storage problems and hazards now associated with long-lived actinide wastes might be to recycle and convert these to fission products. Several reactor types can be envisaged for this purpose. We note that in a ^{233}U-^{232}Th reactor, the production of ^{237}Np, Pu and transplutonium isotopes is greatly reduced compared to a ^{235}U-^{238}U reactor because several additional neutron captures are required to reach the same mass. Hence, the ^{233}U-^{232}Th reactor can be employed to effectively reduce Np, Pu, Am, and Cm wastes to fission-product wastes which entail shorter ($\approx$ 1000 yr) storage times.

A consistent set of transplutonium multigroup cross sections, R. W. Benjamin, V. D. Vandervelde, T. C. Gorrell, and F. J. McCrosson, *SP425*, pp. 224-228 (Oct. 1975).

Key words: heavy actinide burnup; multigroup cross sections; neutron reactions, heavy actinides; reactor production experiments.

A consistent set of multigroup neutron cross sections was developed for nuclides in the chain from ^{242}Pu to ^{253}Es. Evaluated multigroup cross section data were combined with experimental test measurements and production yields from long-term reactor irradiations in flux spectra of varying hardness. Thus 37- and 84-group data were derived in part from ENDF/B and existing Savannah River Laboratory evaluated libraries. Where differential data were lacking, resonance-region model calculations and integral cross section values were combined to form the multigroup data. The data were tested with the JOSHUA system to calculate the reactor environment as a function of time and to predict the concentration of actinide nuclides in the chain. Cross section data were modified within experimental uncertainties until predicted nuclide concentrations matched experimental results within reasonable limits over the range of neutron flux spectra.

Measurement of the neutron capture cross sections of the actinides, L. W. Weston and J. H. Todd, *SP425*, pp. 229-231 (Oct. 1975).

Key words: actinide management; neutron capture cross sections; Pu isotopes, ^{241}Am.

The capture cross sections of the isotopes heavier than ^{239}Pu are of great importance for the core physics, fuel recycle, and waste management for power reactors. Since total cross sections are not sufficient, a program for the measurement of these needed capture cross sections is being carried out at ORNL. Measurements have been almost completed on ^{240}Pu, ^{241}Pu, and ^{241}Am and have been planned for ^{242}Pu and possible ^{237}Np and ^{243}Am. The capture gamma-ray detector used is the "total energy detector" which is a modification of the Moxon-Rae detector. Fission, when present, is detected with fast neutron counters. Results obtained on ^{240}Pu, ^{241}Pu, and ^{241}Am will extend continuously from thermal neutron energies to 350 keV. The cross sections are normalized at thermal neutron energies and the neutron flux is measured relative to the ^{10}B(n,α) cross section up to 2 keV and ^{6}Li(n,α) at higher neutron energies. The accuracy of the techniques used varies with the sample but is about 8 percent. With such cross sections the long range management of the actinides produced in power reactors can be planned on a more systematic basis.

Measurements of the ^{6}Li and ^{10}B partial cross sections from 1 to 1500 keV, S. J. Friesenhahn, V. J. Orphan, A. D. Carlson,

M. P. Fricke, and W. M. Lopez, *SP425*, pp. 232-235 (Oct. 1975).

Key words: neutron cross section; standard; ^{10}B; ^{6}Li.

The $^{10}B(n,\alpha_0+\alpha_1)^7Li$, $^{10}B(n,\alpha_1)^7Li^*$ and $^{6}Li(n,\alpha)T$ cross sections have been measured between 1- and 1500-keV neutron energy. The neutron spectrum was measured using proton scattering as observed in a methane-filled proportional counter. Gamma rays from the $^{10}B(n,\alpha_1)^7Li^*$ reaction were observed with a high-resolution Ge(Li) spectrometer, and the reaction products from the $^{10}B(n,\alpha_0+\alpha_1)^7Li$ and $^{6}Li(n,\alpha)T$ reactions were observed in a large ion chamber. In an auxiliary measurement, the ratio of the $^{10}B(n,\alpha_0+\alpha_1)^7Li$ cross section to the hydrogen scattering cross section was obtained between 200 and 1000 keV by observation of interactions in a specially constructed $^{10}BF_3$ proportional counter containing a methane additive.

An absolute measurement of the $^{6}Li(n,\alpha)$ cross section at 964 keV, W. P. Stephany and G. F. Knoll, *SP425*, pp. 236-239 (Oct. 1975).

Key words: absolute cross section measurements; manganese bath; neutron cross sections; photoneutron sources; surface barrier detectors; $^{6}Li(n,\alpha)$.

A value of 356 mb ±12 percent was obtained for the $^{6}Li(n,\alpha)$ cross section at 964 keV. Neutrons were produced using a spherical Na-Be photoneutron source, calibrated relative to NBS-II using The University of Michigan manganese bath. Thin ^{6}LiF targets enriched to 95 atom percent ^{6}Li were vapor deposited onto the electrode surfaces of a 42 micron thick, fully depleted Si surface barrier detector. A summary of the data, corrections, and error analysis is presented.

Angular anisotropy in the $^{6}Li(n,\alpha)^3H$ reaction at 25 keV, I. G. Schroder, E. D. McGarry, G. de Leeuw-Gierts, and S. de Leeuw, *SP245*, pp. 240-243 (Oct. 1975).

Key words: cross sections; fast-neutron reactions; lithium; nuclear reactions; (n,α) cross sections.

The angular anisotropy in the $^{6}Li(n,\alpha)^3H$ reaction at 25 keV has been measured in two sets of experiments performed at an iron-filtered beam facility (99% of the flux at 25 keV) at the NBS Reactor. First, a surface-barrier detector coated with 80 $\mu g \cdot cm^{-2}$ of ^{6}LiF (front face) was used as a 2π detector. This detector was placed in four different angular positions with respect to the neutron beam: front face at 90 and 45° to the beam; back face at 90 and 45° to the beam. The pulse-height distributions of both the ^3H and ^4He were recorded for these four positions yielding a forward-to-backward asymmetry of 1.59 ± 0.11 in the center-of-mass system. A second detector was placed coaxially with the first (at 90° to the beam) and in such a way as to substend a 45° cone. Coincidence measurements, that simultaneously recorded the distributions in both detectors, yielded an asymmetry in the back-to-forward 45° cone of 1.80 ± 0.06 in the center-of-mass system. The existence of such a large anisotropy at this low energy and the possibility of similar behavior at still lower energies (i.e., 1 – 2 keV) should result from s-p wave interference. This would give rise to a constant anisotropy that is experimentally masked by the 1/v behavior of the isotropic s-s interference terms at lower energies.

Neutron total cross section of ^{6}Li from 10 eV to 10 MeV, J. A. Harvey and N. W. Hill, *SP425*, pp. 244-245 (Oct. 1975).

Key words: nuclear reactions; ^{6}Li, σ_{nT}, En = 10 eV to 10 MeV.

Transmission measurements have been made at ORELA upon two metal samples of ^{6}Li(98.72%) with inverse sample thicknesses of ^{6}Li of 11.99 and 2.987 b/atom. The measurements at low energies (from 10 eV to 300 keV) were made using a ^{6}Li glass scintillation detector at 17.878 m and 78.203 m and at high energies (from 50 keV to ~ 10 MeV) using an NE-110 scintillation detector at 78.203 m. The total cross section data from both samples and detectors are in good agreement and are believed to be accurate to 1 to 2 percent below 1 MeV. Total cross section data obtained from both samples at ~ 25 discrete energies up to 1 MeV using an iron-filtered beam are in good agreement with the continuous spectra data.

Observation and analysis of elastic neutron scattering from ^{12}C, R. J. Holt, A. B. Smith, and J. F. Whalen, *SP425*, pp. 246-249 (Oct. 1975).

Key words: measured $\sigma_t(E)$, E = 1.5-5.0 MeV, $\sigma(\theta,E)$, E = 1.8-4.0 MeV, θ_{lab} = 20 to 160°; nuclear reaction $^{12}C(n,n)^{12}C$; R-function analysis.

Angular distributions of neutrons elastically scattered from ^{12}C were measured from 1.8-4.0 MeV at intervals of ≥ 20 scattering angles distributed between 20-160 deg. Incident neutron energy resolutions were 20-50 keV. All differential cross sections were determined relative to those of the H(n,n) reaction. In addition, total neutron cross sections were deduced from monoenergetic (ΔE ≈ 2 keV) neutron transmissions in the energy range 1.5-5.0 MeV. The experimental results were interpreted in terms of a multilevel R-matrix analysis including considerations of previously reported cross sections and polarizations. The resulting R-matrix parameters are compared with the Yale values deduced from observed scattered neutron polarizations. The measured values and analysis suggest physically consistent standard carbon total and scattering cross sections readily referenced in measurement applications.

Fission spectrum neutrons for cross section validation and neutron flux transfer, J. A. Grundl and C. M. Eisenhauer, *SP425*, pp. 250-253 (Oct. 1975).

Key words: cross sections; dosimetry; evaluation; fission spectrum; neutron flux; neutrons.

A variety of measurement methods over more than two decades provides a base for proper evaluation of the fission spectrum shape. The evaluation presented recommends a Maxwellian reference description for ^{252}Cf (spontaneous fission) and ^{235}U (thermal-neutron-induced fission) with average energy parameters of 2.13 MeV and 1.97 MeV respectively over the energy range 0.25 to 8 MeV. A further multigroup summary of the experimental data presents the final evaluation as an empirical adjustment of Maxwellian segments and includes an estimate of credible departures from the true spectrum shape. The reference Maxwellian shapes differ from the final evaluated shape by < 2 percent over the above energy range. A few basic integral quantities, fission neutron age in water and the fission-spectrum-averaged fission cross section for ^{238}U, ^{235}U, and ^{237}Np, are reviewed briefly, based on the results of the evaluation. Two features of fission neutrons make them a useful reference for certain measurement problems in nuclear technology: the fission spectrum shape is preserved above ~ 1 MeV in important reactor-associated neutron environments, and small, intense sources of pure ^{252}Cf fission neutrons are now available. A restricted class of related applications using fission neutron sources is discussed.

Fundamental integral cross section ratio measurements in the thermal-neutron-induced uranium-235 fission neutron spec-

trum, A. Fabry, J. A. Grundl, and C. Eisenhauer, *SP425*, pp. 254-257 (Oct. 1975).

Key words: dosimetry; fission cross sections; neutron standards; uranium-235 cavity fission spectrum.

High-accuracy integral cross section ratio measurements have been performed in the thermal-neutron-induced uranium-235 fission neutron spectrum. This involves the basic fission reactions ^{235}U(n,f), ^{239}Pu(n,f), ^{238}U(n,f) and ^{237}Np(n,f); and the gold capture and ^{115}In(n,n')^{115m}In dosimetry reactions. The uranium-235 fission neutron spectrum is generated at the center of a one meter diameter spherical cavity within a graphite thermal column. Simple and variable geometrical arrangements were used and evaluated for neutron field purity. The fission rates were determined with the NBS double fission chamber as well as with others of different size and design. All fission detectors were validated within a parallel program of interlaboratory comparisons in the MOL-ΣΣ Standard Neutron Field. The activation rates have been measured with calibrated gamma-ray spectrometers. The resulting integral cross section ratios relative to the ^{238}U(n,f) reaction are, for ^{235}U(n,f): 3.94 ± 0.08; ^{239}Pu(n,f): 5.93 ± 0.13; ^{237}Np(n,f): 4.35 ± 0.13; ^{115}In(n,n')^{115m}In: 0.620 ± 0.019; and ^{197}Au(n,γ)^{198}Au: 0.287 ± 0.014.

Interlaboratory comparison of absolute fission rate and uranium-238 capture rate measurements in the Mol-ΣΣ secondary intermediate-energy standard neutron field, M. Pinter, W. Scholtyssek, P. Fehsenfeld, H. A. J. van der Kamp, W. H. J. Quaadvliet, A. Fabry, G. De Leeuw, S. De Leeuw, F. Cops, J. A. Grundl, D. Gilliam, and C. Eisenhauer, *SP425*, pp. 258-261 (Oct. 1975).

Key words: fast reactors; fission chambers; fission rates; mass assay; MOL-ΣΣ facility; uranium-238 capture rates.

Interlaboratory comparisons have been made during the past two years, of techniques that are currently applied for the measurement of fission rates and uranium-238 capture rates in a number of zero-power fast assemblies related to the LMFBR program. This effort has involved the exposure of absolute fission chambers and of activation foils, to the Mol-ΣΣ central neutron field. Long term flux level monitoring accuracy of better than ±0.5 percent in Mol-ΣΣ has been achieved. The perturbation of the neutron field by the access hole has been studied extensively. Uncertainties in measured reaction rates estimated by each laboratory relative to flux monitors are between ±1.5 percent and ±3.5 percent. Interlaboratory agreement for ^{235}U, ^{238}U, and ^{239}Pu fission rates is in the range ±0.5 to ±1.3 percent. Poor agreement is obtained for the ^{238}U capture rate measurements and further interlaboratory efforts are recommended including complementary experimental techniques. A set of ΣΣ preferred values of central fission rate ratios and uncertainties is presented.

Manganese bath systematic effects in measurements of nu-bar and eta, J. R. Smith, *SP425*, pp. 262-265 (Oct. 1975).

Key words: eta; fissile nuclei; manganese bath; nu-bar; ^{252}Cf.

Measurements using the manganese bath technique are central to the discrepancy that has existed between measured values of $\bar{\nu}$ for ^{252}Cf. Manganese bath measurements of $\bar{\nu}$ belong to the lower group of values, while the η measurements are consistent with the higher ν values. A three-part study was performed to see if the discrepancy could be explained by differences in manganese bath techniques: (1) A ^{252}Cf source previously calibrated by De Volpi was calibrated in the MTR manganese bath; (2) The recommendations made by De Volpi for altering the MTR eta values were carefully considered; and (3) The results of the Monte Carlo calculations of the MTR experiment, carried out at Bettis Atomic Power Laboratory, were examined in detail. The study produced insignificant changes in the η values.

Absolute ^{235}U fission cross section for ^{252}Cf spontaneous fission neutrons, H. T. Heaton II, J. A. Grundl, V. Spiegel, Jr., D. M. Gilliam, and C. Eisenhauer, *SP425*, pp. 266-269 (Oct. 1975).

Key words: fission spectrum; spectrum averaged cross section; ^{235}U(n,f); ^{252}Cf.

A measurement of the absolute ^{235}U fission cross section for ^{252}Cf spontaneous fission neutrons has been performed with two double fission chambers in compensated beam geometry. The fission chambers are mounted 10 cm apart on opposite sides of a small volume, single encapsulated ^{252}Cf source (4×10^9 n/sec, 0.34 cm^3 capsule vol; ~ 2 g steel and aluminum). In this geometry the effect of source position errors is small. The ^{252}Cf neutron source strength was determined with a Manganous Sulfate Bath relative to the internationally compared Ra-Be photoneutron standard neutron source, NBS-I, presently known to ±1.1 percent. Uncertainty in the Manganous Bath comparison of NBS-I and the Cf source was ±0.4 percent; the ^{235}U fissionable deposit masses have been ascertained to ±1.3 percent. Five scattering corrections were applied to the data: source capsule (0.6 ±0.8) percent, fission chamber (1.1 ±0.4) percent, support structure (0.6 ±0.5) percent, platinum deposit backing (1.3 ±0.8) percent and total room return (0.5 ±0.2) percent. The observed ^{235}U fission cross section is 1204 ± 29 mb. A computed value of 1245 mb is obtained using an evaluated ^{252}Cf fission neutron spectrum and ENDF/B-IV for the ^{235}U(n,f) cross section.

Fission cross section ratios in the ^{252}Cf neutron spectrum (^{235}U; ^{238}U; ^{239}Pu; ^{237}Np), D. M. Gilliam, C. Eisenhauer, H. T. Heaton II, and J. A. Grundl, *SP425*, pp. 270-272 (Oct. 1975).

Key words: fission cross section; fission spectrum; ^{252}Cf; ^{235}U; ^{238}U; ^{239}Pu; ^{237}Np.

In a ^{252}Cf neutron field, ratios of spectrum-averaged fission cross sections have been measured by back-to-back counting in a double fission ionization chamber with interchangeable deposits of ^{235}U, ^{238}U, ^{239}Pu, and ^{237}Np. These ratio measurements provide integral tests for evaluated cross section data. The dominant error in the ratio measurements was the ±1.4 percent to ±2.1 percent uncertainty in the fissionable deposit masses. Redundant mass assay methods were employed for all deposit nuclides. Corrections of up to (1.4 ± 7) percent were necessary for inelastic scattering effects on the neutron energy distribution in the cases of ^{238}U and ^{237}Np. For ^{235}U and ^{239}Pu fission rates, a correction of (0.45 ± 0.20) percent was made for the contribution of neutrons moderated and back-scattered by laboratory structures. The cross section ratios observed in the present measurements were as follows: 1.000: 0.266 ± 1.7 percent: 1.500 ± 1.6 percent: 1.105 ± 2.2 percent for ^{235}U: ^{238}U: ^{239}Pu: ^{237}Np, respectively. In comparison to the observed integral cross section ratios, the corresponding values derived from ENDF/B-IV data were 2.3 to 6.0 percent lower.

Measurement of cross sections for threshold reactions induced by californium-252 spontaneous fission neutrons, W. G. Alberts, J. Bortfeldt, E. Günther, K. Knauf, M. Matzke, G. Rassl, V. Siegel, and K. F. Walz, *SP425*, pp. 273-276 (Oct. 1975).

Key words: activity measurement; cross sections; fission

spectrum; neutron source; scattering corrections; threshold detectors.

An open-air experiment for measuring cross sections averaged over the californium-252 spontaneous fission neutron spectrum is described. In a low-scattering arrangement the ^{252}Cf source was enclosed by the sample materials for irradiation. From the source strength (3×10^{9} s^{-1} as of Jan. 1973) and the activities of the generated nuclides, average cross sections for the reactions $^{27}Al(n,\alpha)^{24}Na$, $^{54}Fe(n,p)^{54}Mn$, $^{56}Fe(n,p)^{56}Mn$, and $^{46}Ti(n,p)^{46}Sc$ were derived. The influence of neutron scattering in the source and samples has been taken into account by means of Monte Carlo calculations; in addition this influence in the samples was studied experimentally by activating samples of various thicknesses.

Absolute neutron flux determination in fast neutron spectra, . Schouky, S. Cierjacks, P. Brotz, D. Gröschel, and B. Leuers, *SP425*, pp. 277-280 (Oct. 1975).

Key words: gas scintillation transmission counters; neutron flux determination; $1 \leq E_n \leq 30$ MeV.

A flux detector system was developed in order to determine the fast neutron flux between 1-30 MeV obtained with the Karlsruhe isochronous cyclotron. The counter system represents a telescope-like proton recoil device using solid radiators and gas scintillation transmission counters. Flux determination is accomplished separately between about 1-6 MeV and ~ 5-30 MeV, with a small energy interval of overlap. Below 6 MeV, recoil protons are detected in a single gas scintillation chamber viewed by three photomultipliers requiring a fast coincidence. Above this range, high energy recoil protons are identified by coincidences in three adjacent chambers and by their specific energy losses. Since the transmission of the entire flux counter system is better than 99 percent, it can be used for simultaneous flux measurements in partial cross section determination. The accuracy for the determination of the neutron flux is about 5 percent.

Thermal parameters of the fissile isotopes, B. R. Leonard, Jr., *SP425*, pp. 281-285 (Oct. 1975).

Key words: evaluation; nuclear reactions ^{233}U, ^{235}U, ^{239}Pu, $^{241}Pu(n,F)$ (n,γ) (n,n) ν, E = 0-1 eV.

Evaluations have continued to better define the 2200 m/s nuclear data for the fissile isotopes. The author has been participating in such evaluations with both the International Atomic Energy Agency (IAEA) and the USAEC National Neutron Cross Section Center (NNCSC). Each study is faced with the same dilemma: the measured values of a given parameter form a set which is reasonably self-consistent, yet the average values of the interrelated parameters constitute a set which is significantly inconsistent. The obvious discrepancy is between the values of alpha deduced with high accuracy from irradiation experiments with the values which result from the ensemble of values of the other parameters which by themselves form a reasonably self-consistent set. However, the inconsistency could result from error assignments which are too small for two or more parameters, e.g., fission and eta. In order to expedite ENDF/B-IV, the NNCSC evaluation fixed certain input parameters including the thermal shapes which are in good agreement with differential data. As a result the least-squares-compromise adjusted absorption, fission, and nubar values by several tenths percent. In the IAEA evaluation, the primary adjustments of the LSQ fit were in nubar and g_γ values which implicitly infer significant systematic errors in the directly measured capture shapes. The Electric Power Research Institute has initiated studies to attempt to resolve this dilemma which is crucial to analyses of fission power reactors. These are: (1) A simultaneous LSQ fit to energy-dependent differential partial and total data; (2) A reevaluation of the accuracy assignment of absolute fission cross section values; and (3) A reexamination of irradiation alpha experiments with sophisticated analytical methods. Further experiments which would improve the knowledge of the thermal parameters include: (1) Confirmatory measurements of capture shapes extended to lower neutron energies; (2) Confirmatory measurements relative to the monoenergetic eta experiments; (3) Accurate coherent scattering amplitude measurements in the thermal region for all isotopes; (4) Measurement of the total cross section of ^{233}U from thermal to several tenths eV; (5) Improved thermal fission critical experiments and analysis for ^{239}Pu; and (6) Confirmatory high accuracy absolute fission cross-section experiments.

The third IAEA evaluation of the 2200 m/s and 20 °C Maxwellian neutron data for U-233, U-235, Pu-239, and Pu-241, H. D. Lemmel, *SP425*, pp. 286-292 (Oct. 1975).

Key words: Cf-252 spontaneous fission neutron yield; E = 0.0253 eV and 20 °C Maxwellian; fission-neutron yields; half-lives of U-233, U-234, Pu-239; mean energy of fission neutron spectrum; neutron cross-sections; neutron data evaluation; U-233, U-235, Pu-239, Pu-241; Westcott g-factors.

The paper presents a new consistent set of best values of 2200 m/s and 20 °C Maxwellian neutron cross-sections, fission-neutron yields, and Westcott g-factors for U-233, U-235, Pu-239, and Pu-241, and of related reference values such as the spontaneous fission-neutron yield of Cf-252, the mean fission-neutron spectrum energies of the five nuclides named, the α-decay half-lives of U-233, U-234, and Pu-239 and others.

This consistent set of values is derived from a multiparameter least-squares fit of all available experimental data, after reviewing and, where feasible, reassessing the authors' quoted values and errors usually after consultation with the authors.

The new best set of values is significantly different from that of the Second IAEA Review of 1969. The major changes are due to new lower experimental values of $\overline{\nu}$ (Cf-252) and of half-lives. Also discussed are some disturbing unresolved discrepancies among experimental data, which leave the accuracies of some parameters, for example the uranium fission cross-sections, still unsatisfactory.

Neutron cross section standards and flux determinations above thermal energies, A. D. Carlson, *SP425*, pp. 293-301 (Oct. 1975).

Key words: Au(n,γ); C(n,n); H(n,n); neutron flux determination; standard cross sections; $^{3}He(n,p)$; $^{6}Li(n,\alpha)$; $^{10}B(n,\alpha)$; $^{235}U(n,f)$; $^{237}Np(n,f)$.

The recent worldwide advances in nuclear technology, particularly fast fission and fusion reactors, have revealed the need for accurate neutron reaction cross sections for the design of these systems. The accuracies of these cross sections are generally limited by the standard cross sections relative to which they are measured. With the exception of the hydrogen scattering cross section, there have been serious problems with each of the standards in the energy region where it is being used as a standard. New measurements of many of these standards have been recently completed which will have a strong impact on the quality of these cross sections. A review will be presented of the status of the neutron cross section standards presently employed for

measurements of neutron cross sections. Light element, capture and fission standards will be included. Special emphasis will be placed on the techniques which have been used to obtain the neutron flux for measurements of neutron cross section standards.

R-matrix analysis of the light element standards, G. M. Hale, *SP425*, pp. 302-308 (Oct. 1975).

Key words: cross sections; light elements; R-matrix; standards; ^{6}Li; ^{10}B.

The application of multilevel, multichannel R-matrix theory to the analysis of reactions in light nuclear systems is outlined. The discussion then specializes to describe analyses of reactions in the ^{7}Li and ^{11}B systems, which contain (n,α) cross sections widely used as neutron standards. Comprehensive R-matrix analyses which were incorporated in Version IV of the Evaluated Nuclear Data File (ENDF/B-IV) for neutron reactions from ^{6}Li and ^{10}B are described, giving the reactions and data analyzed, the resulting parameters, and predicted cross sections. The effects of new experimental information on the ENDF/B-IV results are discussed for both lithium and boron. Particular attention is given to the perplexing question of determining the ^{6}Li(n,α) cross section in the region of the 240 keV resonance. Suggestions for further experimental work are given.

Computer-readable "Nuclear Data Sheets," W. B. Ewbank, *SP425*, pp. 309-312 (Oct. 1975).

Key words: computers; data; decay; ENSDF; evaluation; files; formats; levels; nuclear structure; radiations; reactions; tables; γ-rays.

The evaluated nuclear structure data contained in "Nuclear Data Sheets" are available in computer-readable form. Experimentally established properties of nuclear levels are included as well as radiations from nuclear reactions and radioactive decay. Portions of the data can be selected for distribution in several formats on magnetic tape or computer cards. A variety of different listing and drawing formats are also available.

Recent evaluation for the German nuclear data library KEDAK-3. B. Goel, H. Küsters, and F. Weller, *SP425*, pp. 313-316 (Oct. 1975).

Key words: evaluation; nuclear data; plutonium; uranium.

For the design and optimization of reactors a precise knowledge of the microscopic neutron data is needed. For this purpose new evaluations for a number of important fast reactor materials have been performed at this laboratory. In the paper we discuss reevaluations of U^{238} and Pu^{239}. To check the quality of the presently evaluated data in reactor physics calculations, their effect on k_{eff} for a large variety of critical assemblies is studied. Calculation shows that with the evaluated data for U^{235}, U^{238}, Pu^{239}, Pu^{240}, Pu^{241}, and Pu^{242} the value of k_{eff} for a large number of critical assemblies can be reasonably well reproduced without any adjustment of the data.

Description of the ENDF/B-IV silicon evaluation energy distributions of outgoing particles, D. Larson, *SP425*, pp. 317-319 (Oct. 1975).

Key words: cross sections; energy distributions; photon; tertiary; theoretical.

Calculations are presented for the energy distributions of secondary particles resulting from neutron-induced binary and tertiary reactions on ^{28}Si.

Evaluation of fission product nuclear data for 28 important nuclides, S. Igarasi, S. Iijima, M. Kawai, T. Nakagawa, Y. Kikuchi, K. Maki, and H. Matsunobu, *SP425*, pp.320-323 (Oct. 1975).

Key words: capture cross section; elastic and inelastic scattering cross sections; evaluation; fission product; optical model; resonance cross section; statistical model; total cross section.

Evaluation of 28 fission product nuclear data for fast reactors is performed for total, capture, elastic scattering and inelastic scattering cross sections up to 15.0 MeV. Resonance parameters as well as the data of resonance integrals are surveyed. The cross sections reproduced with these parameters are adjusted so as to fit the thermal values and are connected smoothly with the cross sections obtained by the statistical model calculations. For some nuclides whose resonance parameters are not experimentally obtained yet, the statistical model calculations are carried out down to fairly low energy point. The cross section values thus obtained are used as the expectation values of averaged cross sections in the resonance region. Numerical data obtained are stored on the magnetic tape in the ENDF/B format.

Evaluated decay-scheme data for the ILRR program, R. G. Helmer and R. C. Greenwood, *SP425*, pp. 324-327 (Oct. 1975).

Key words: evaluated half-lives; evaluated γ-ray intensities; ILRR program.

The half-lives and γ-ray intensities associated with radioactive decay have been evaluated for nuclides of interest to the Interlaboratory LMFBR Reaction Rate program. The results indicate that for most of the isotopes the decay parameters are known sufficiently well to meet the ILRR goals of 2 1/2 or 5 percent accuracy in reaction rate measurements.

Development of a two-step Hauser-Feshbach code with precompound decays and gamma-ray cascades—a theoretical tool for cross section evaluations, C. Y. Fu, *SP425*, pp. 328-331 (Oct. 1975).

Key words: fluorine; iron; photon; reaction; tertiary.

The code is used to calculate neutron-induced binary reaction, tertiary reaction and associated gamma-ray-production cross sections of ^{19}F, ^{40}Ca and ^{56}Fe. Comparisons with experimental data show much improved agreements over those previously possible.

Neutron cross sections and their uncertainties obtained from nuclear systematics, S. Pearlstein, *SP425*, pp. 332-334 (Oct. 1975).

Key words: cross section; neutrons; nuclear model.

Previously, neutron cross sections in the MeV range for nuclei ranging in Z from 21 through 41 were calculated using a hybrid empirical-statistical model code THRESH. The formalism includes level density, Coulomb barrier, and competing reaction effects and has been useful in the prediction of unmeasured cross sections or normalized to point measurements to generate complete excitation curves. Reaction data up to 20 MeV in the Z range 21 through 83 are used to refine the model and extend its range of validity. A least squares fitting technique optimizes the choice of parameters with the resulting matrix used to determine parameter uncertainties and correlations. Fitted cross sections and their calculated uncertainties are compared with measurements and quoted errors. A range of uncertainty is assigned to predicted cross sections.

Level density calculation for deformed nuclei, J. P. Felvinci, . Cacuci, and E. Melkonian, *SP425*, pp. 335-337 (Oct. 975).

Key words: level densities and positions of K-bands in rare earth and actinide nuclei.

Level densities for the rare earth and actinide nuclei have been calculated using a modified version of the Ericson formalism. The assumption was made, that K (the projection of J on the symmetry axis of the nucleus) is a good quantum number in the compound nucleus. Individual level densities for the different (K,J) values of the compound nucleus formed by low energy neutron interactions were calculated. The results show good agreement with the interpretation of recent results obtained on U-235 in this laboratory. Using the above calculations it is also possible to infer from the measured level densities the locations of the band heads of different K bands in the compound nucleus. The results also indicate that the K bands responsible for the level densities exclude the ground state rotational band. Levels built on the higher lying β and γ vibrational bands and their composites are sufficient in number to explain the observed level densities.

Odd-even fluctuations in neutron strength functions, G. J. rouac, *SP425*, pp. 338-341 (Oct. 1975).

Key words: doorway states, optical model; neutron strength function.

Systematic fluctuations are reported for the s-wave neutron strength functions of adjacent mass target nuclei with odd and even neutron number. Within the 3S and 4S single-particle resonances, the fluctuations appear to be related to odd-even variations in the doorway state density which are correlated with the excitation energy. A simple model calculation successfully reproduces the strength function fluctuations in the first peak of the split 4S resonance ($143 \leq A \leq 160$). An examination of all available even-Z strength function data suggests a general trend; S-odd > S-even near single-particle resonances and S-even > S-odd between resonances. This result is discussed in terms of the optical model spreading width W and other fundamental nuclear properties.

Statistical estimation of physical quantities in thermal- and t-neutron-induced fission, T. Yamamoto and K. Sugiyama, *425*, pp. 342-345 (Oct. 1975).

Key words: actinide nuclide; fast-neutron-induced fission; ission; fission fragment; fission product; kinetic energy; mass yield; prompt neutron; scission point; statistical heory.

Making use of a model based on the statistical theory in which the scission-point distance is treated as an adjustable parameter, calculations were performed to obtain the mass yields of fission products, the kinetic energies of fission fragments and the numbers of prompt neutrons from neutron-induced fission of ^{232}Th, ^{231}Pa, ^{233}U, ^{235}U, ^{238}U, ^{237}Np, ^{239}Pu, and ^{241}Pu for incident-neutron energies ranging from thermal o 14.7 MeV. Calculated results reproduced experimental values well. The proposed method could be used in the estimation of unknown physical quantities in fission.

Theoretical estimates of (n,γ) cross sections for 6-15 MeV utrons, G. Longo and F. Saporetti, *SP425*, pp. 346-349 ct. 1975).

Key words: calculations; complex interaction; semi-direct nodel; volume form; (n,γ) cross sections.

The knowledge of the correct values of (n,γ) cross sections for high energy neutrons is of great interest for studies into nuclear reaction mechanism as well as for reactor shielding purposes and in particular fusion-reactor design. The use of theoretical estimates is therefore required to fill the gaps in the available experimental data. For this purpose the semi-direct capture model has been refined (a) by replacing the previous surface form factors of the interaction by volume form factors, (b) by including quadrupole terms in addition to the dipole ones. Calculations, based on the refined model, agree satisfactorily with experimental data.

Reaction mechanism in the high energy tail of the 14 MeV ^{56}Fe(n,n′)-process, H. Jahn, C. H. M. Broeders, and I. Broeders, *SP425*, pp. 350-353 (Oct. 1975).

Key words: angular distribution; inelastic scattering; proton emission; scattered neutron.

Measured cross-sections of 14 MeV-neutrons scattered inelastically on ^{56}Fe are analyzed to carry out investigations about the reaction mechanism. It is shown that a considerable part of direct inelastic scattering has to be added to the evaporation and pre-equilibrium processes in order to reproduce the data, especially the angular distribution, for energies of the scattered neutron above 7 MeV.

Calculations of (n,α) rates for iron-group materials, F. M. Mann and Z. E. Switkowski, *SP425*, pp. 354-356 (Oct. 1975).

Key words: calculated σ(E), (α,n), (n,α), Hauser-Feshbach; nuclear reactions Fe group.

The Hauser-Feshbach statistical model is used to calculate (α,n) and (n,α) cross sections for Fe-group elements to provide information on helium production within fusion reactors. A parametrization of the cross sections is discussed.

Parametric fit of the total cross section of ^{45}Sc, B. A. Magurno and S. F. Mughabghab, *SP425*, pp. 357-359 (Oct. 1975).

Key words: bound level parameters; spin assignments; thermal cross sections.

A parametric fit to the total cross section of Sc-45 based on the Breit-Wigner multilevel formalism was carried out. To reproduce the minimum in the total cross section at 2.0 keV and to get an acceptable fit for the low energy resonances, the spins of the bound level, the 3.24, and 4.27 keV resonances are 4,3,4 respectively. At higher energies the spins adopted for the resonances at 6.5, 7.9, 8.9, and 11.7 keV were 3,4,3,4. The parameters of the bound level are $E_o = -270$ eV, $\Gamma_n^o = 2.05$ eV (J=4) and $\Gamma_\gamma = 0.38$ eV.

Neutron capture mechanism in light and closed shell nuclides, B. J. Allen, J. W. Boldeman, M. J. Kenny, A. R. deL. Musgrove, H. Pe, and R. L. Macklin, *SP425*, pp. 360-362 (Oct. 1975).

Key words: nuclear reactions: Al, Si, ^{40}Ca, ^{52}Cr, ^{90}Zr, ^{138}Ba(n,γ), $E_n > 2.5$ keV, measured σ(n,γ), ^{6}Li monitor, enriched targets, deduced resonance parameters, correlation coefficient, valence component.

High resolution neutron capture cross section measurements have been made at the Oak Ridge Electron Linear Accelerator on Al, Si, ^{40}Ca, ^{52}Cr, ^{90}Zr, and ^{138}Ba for the energy range above 2.5 keV. These data have been analysed at Lucas Heights where capture measurements with Ge(Li) and Moxon-Rae detectors have provided complementary information. While valence model calculations are important for these nuclides in explaining the shape of the γ-ray spectra and the observed correlation between reduced neutron and radiative widths, the valence component cannot adequately account for the observed radiative widths and a

substantial single particle component, uncorrelated with neutron widths, is required.

Radiation Shielding Information Center data activities, R. W. Roussin, B. F. Maskewitz, and D. K. Trubey, *SP425*, pp. 363-366 (Oct. 1975).

Key words: analysis; cross sections; evaluation; information; processing; radiation; shielding.

Activities developed at the Radiation Shielding Information Center (RSIC) play an important role in the utilization of nuclear cross sections in various radiation transport applications and help improve the general utility of the national ENDF/B effort. The activities involving processed and evaluated data libraries on behalf of RSIC's various sponsoring agencies are described.

Evaluation of the resonance parameters and capture cross section for chromium up to 600 keV, D. Abramson, J. C. Bluet, and P. Fardeau, *SP425*, pp. 367-370 (Oct. 1975).

Key words: capture; chromium; cross section; evaluation; neutron; resonance.

Experimental results are examined. An extensive comparison of recent sets of results allows a point-wise evaluation of the capture cross section versus energy. Moreover a set of resonance parameters has been chosen. The curve calculated with these parameters and a smoothly varying background agrees pretty well with the point-wise evaluation.

Representation of the neutron cross sections in the unresolved resonance region, G. de Saussure and R. B. Perez, *SP425*, pp. 371-379 (Oct. 1975).

Key words: cross sections; ENDF/B; neutrons; reactors; resonances; unresolved.

We discuss some limitations of the statistical approach to the representation of cross sections in the unresolved region and suggest that the actual Doppler-broadened cross sections should be used instead.

Helium production in reactor materials, E. P. Lippincott, W. N. McElroy, and H. Farrar, *SP425*, pp. 375-377 (Oct. 1975).

Key words: benchmark; cross sections; helium; neutron.

Comparisons of integral helium production measurements with predictions based on ENDF/B Version IV cross sections have been made. It is concluded that an ENDF/B helium production cross section file should be established in order to ensure a complete and consistent cross section evaluation to meet accuracies required for LMFBR, CTR, and LWR applications.

Fast reactor fission yields for ^{233}U, ^{235}U, ^{238}U, ^{239}Pu, and recommendations for the determination of burnup on FBR mixed oxide fuels, W. J. Maeck, *SP425*, pp. 378-384 (Oct. 1975).

Key words: burnup monitors; capture-to-fission; dilution mass spectrometry; fast fission yields; yields vs. energy; ^{233}U, ^{235}U, ^{238}U, ^{239}Pu.

Absolute fast reactor fission yields are presented for over 40 stable and long-lived isotopes of Kr, Rb, Sr, Zr, Mo, Ru, Sb, Xe, Cs, Ba, La, Ce, Nd, and Sm for ^{233}U, ^{235}U, ^{238}U, and ^{239}Pu irradiated in EBR-II. A method for ordering fission yields as a function of neutron energy is given. Recommendations for the determination of burnup on mixed-oxide fuels irradiated in a fast reactor are given.

Effects of nuclear data uncertainties upon LMFBR fuel cycle characteristics, R. D. McKnight, L. G. LeSage, and J. M Christenson, *SP425*, pp. 385-388 (Oct. 1975).

Key words: breeding ratio; cross section uncertainties equilibrium cycle; fuel cycle; reactivity swing; sensitivit study.

Fuel cycle sensitivity calculations have been performe to determine the effect which nuclear data uncertaintie have upon the long term properties of a typical LMFBF These effects are assessed by direct comparison of a serie of fuel cycle calculations which evaluate the approach t equilibrium conditions. The effects of uniform cross sectio adjustments (for the fission and capture cross sections fo ^{238}U, ^{238}Pu, ^{240}Pu, and ^{241}Pu) upon the fuel cycle chara teristics, including breeding ratio, doubling time, power di tribution, fissile loading, fissile mass discharge rates, contr requirements and reactivity swing are presented for the in tial burn cycle and the equilibrium cycle. ENDF/B-3 da are used for a data reference. Several of the cross sectio modifications produced significant uncertainties in LMFB design parameters. The effects of these changes upon th fuel cycle characteristics propagate from cycle to cycle bu in general, do not increase with time. The most significa effects were produced by uncertainties in σ_f for ^{239}Pu ar ^{241}Pu, and σ_c for ^{238}U. Uncertainties in these cross sectio produce large changes in control requirements, breedi potential, and reactivity swing.

The sensitivity of k_{eff} of metallic assemblies to the parametr representation of the fission and the inelastic scattering spectr H. Nissimov and J. J. Wagschal, *SP425*, pp. 389-391 (Oc 1975).

Key words: critical assemblies; ENDF/B-IV; fission spe trum; inelastic scattering; sensitivity; ^{239}Pu.

The fission spectrum and the inelastic scattering spectru of ENDF/B-IV ^{239}Pu data were modified. The variations k_{eff} and of the leakage spectrum induced by these modific tions were calculated for a bare ^{239}Pu critical sphere, as typical metallic assembly. In certain cases these modific tions lead to substantial variations in k_{eff}. Guides f reasonable changes in the representation of the spectra we obtained. The variations in k_{eff} and in the leakage spectru caused by these reasonable changes were found to be with their experimental errors.

Comparison of Doppler broadening methods, D. E. Culle C. R. Weisbin, R. Q. Wright, and J. E. White, *SP425*, pp. 39 397 (Oct. 1975).

Key words: calculation; comparison; Doppler broadenin line shape.

Burnup calculations for the KWO reactor, D. C. Lut *SP425*, pp. 398-400 (Oct. 1975).

Key words: burnup calculation; burnup model; critic boron concentration; fission products; KWO; RSYST.

An effort was made to reproduce the measured shape the critical boron concentration for the KWO react (PWR) during the first cycle starting from basic nuclear da (ENDF/BII). The overall results are quite satisfactory b there are some local differences up to 80 ppm.

Fission product nuclear data obtained by use of on-line ma spectrometer, P. L. Reeder, J. F. Wright, and R. A. Ande *SP425*, pp. 401-404 (Oct. 1975).

Key words: cumulative yields; delayed-neutrons; fissi products; half-lives; independent yields; mass spectrometr

A Spectrometer for On-Line Analysis of Radionuclid

(SOLAR) has been installed at a 1 MW TRIGA reactor at Washington State University. Fission product ions from a combination target/ion source located within the thermal column are brought out to a 60° magnetic sector mass spectrometer. Surface ionization provides copious beams of Rb^+ and Cs^+ ions and less intense beams of Br^- and I^- ions with negligible contamination by other elements. About 40 fission product nuclides can thus be chemically and physically separated in times of less than 1 second. Past results on independent and cumulative fission yields along with measurements of half-lives of some very neutron-rich nuclides will be presented. Current work on delayed-neutron emission probabilities and energy spectra of delayed neutrons from individual nuclides will be described.

Differential cross sections and integral data: The ENDF/B-4 ɔrary and "clean" criticals, J. J. Wagschal, A. Ya'ari, and Y. eivin, *SP425*, pp. 405-408 (Oct. 1975).

Key words: adjustment; critical assemblies; cross sections; evaluation; integral data; sensitivities; uncertainties.

The ENDF/B-4 cross sections of the principal isotopes of U and Pu are adjusted by critical-mass data on 15 metallic assemblies. Only very minor cross-section modifications are needed in order for neutronic calculations to reproduce the integral data well within their experimental errors. The nature of the adjustments and the quality of the input integral data are discussed.

Neutron attenuation in normal and ilmenite concretes, R. J. dams and K. H. Lokan, *SP425*, pp. 409-414 (Oct. 1975).

Key words: ilmenite concrete; Monte Carlo; neutron attenuation; time of flight.

Energy distributions of neutrons transmitted through slabs of normal (density = 147 lb/ft³) and ilmenite loaded (240 lb/ft³) concretes have been obtained using time of flight methods, for concrete thicknesses increasing in 3 inch steps from 0 to 18 inches. The incident spectrum was a photoneutron continuum from aluminium irradiated with 35 MeV bremsstrahling, and was generally similar to a fission neutron spectrum.

The measured distributions are compared with the results of a Monte Carlo calculation, and agree well within the experimental errors. Results from the calculations are used to extrapolate to greater thicknesses and other ilmenite concrete densities.

Analysis of the BNL ThO_2-^{233}U exponential experiments, D. ibby, *SP425*, pp. 415-418 (Oct. 1975).

Key words: cross sections; ThO_2 resonance integral; ^{232}Th; ^{233}U.

The BNL ThO_2-3 w/o ^{233}U light-water-moderated exponential experiments were analyzed to evaluate (1) cross section library sets for ^{233}U and ^{232}Th, and (2) correlations with measured ThO_2 resonance integral data. A total of six cross section library sets were evaluated, including ENDF/B-2 and ENDF/B-3 libraries for ^{232}Th, ENDF/B-2 library for ^{233}U, and ThO_2 resonance integral correlations based on data by Weitman and Pettus, Hardy and Palowitch, and corrections to the latter data by Steen. A modified version of the LEOPARD code was used throughout this analysis. The principal results of this work are as follows: (1) The library set containing ENDF/B-2 data for ^{233}U and ENDF/B-3 data for ^{232}Th, together with ThO_2 resonance integral correlation based on Steen's corrections to the Hardy and Palowitch data, yields the best agreement with measurements, giving an average k_{eff} of 0.9975 with a standard deviation of 0.0067 for the 21 analyzed configurations. (2) With respect to this "best" set, the ENDF/B-2 ^{232}Th data is less reactive than the corresponding ENDF/B-3 data by $\sim 0.1\%\Delta k$. (3) The ThO_2 resonance integral correlation based on data by Weitman and Pettus yields resonance integrals that are consistently higher than those produced by the correlation with Steen's values, even though the latter is normalized to an infinitely dilute resonance integral of 85.9 barns (0.5 eV cutoff), while the former is normalized to a corresponding value of 80 barns. Thus, with respect to the "best" set, the ThO_2 resonance integral correlation based on the Weitman and Pettus data is less reactive by $\sim 0.75\%\Delta k$.

Tabular cross section file generation and utilization techniques, D. E. Cullen, O. Ozer, and C. R. Weisbin, *SP425*, pp. 419-421 (Oct. 1975).

Key words: cross sections; linearization; paging; preprocessing; relative error; thinning.

Criteria of importance to the generation of linear cross section tabulations are presented. Algorithms for reducing or thinning such tables within a desired accuracy criterion and the implementation of paging techniques for efficient utilization of large data tables are reviewed.

Neutron energy spectrum controlled blanket for fast breeder reactor, L. H. Tang, *SP425*, pp. 422-425 (Oct. 1975).

Key words: high plutonium productivity; moderation-jacket in blanket; thermal boosts.

It is shown that the productivity of a blanket can be substantially improved by introducing a "moderation-jacket" around the inner blanket facing the fast core. The operational procedure and the expected significance of the jacket are investigated. For a flux level similar to that of EBR-II, it is shown that one can shorten the plutonium production time by 34.5 percent for 0.7 percent plutonium density buildup and 15.4 percent for 1.5 percent plutonium density buildup. The overall time saving is about 100 days per recycling from density buildup of 0.7 to 2.0 percent.

Use of Monte Carlo method in the estimation of fast neutrons leaked through a concrete-paraffin shielding, L. S. Chuang and K. C. Wong, *SP425*, pp. 426-430 (Oct. 1975).

Key words: application of nuclear cross section; Monte Carlo method; 14 MeV neutron shielding.

A neutron generator shielding house, in which a 14 MeV neutron generator with a 4π yield of 1×10^{11} neutron per second is installed, was built with labyrinth geometry and made of ordinary concrete and paraffin block. Rough estimation for fast neutron flux in a location directly above the neutron generator target, but outside the shielding layers, is 7.7×10^{-3} n/cm²-s which was resulted from the approximation that for 14 MeV neutron, the flux is reduced by a factor of 10 for each 15 inches of solid concrete, or for each 8.2 inches of paraffin wax, disregarding the effect of scattering from the surrounding shielding materials. In order to take the geometrical effect of the shielding into consideration, a computer program, FORTRAN IV, was devised for calculating the neutron flux at the same location, using the Monte Carlo technique in a simplified 1-dimensional diffusion of neutron through the shielding layers. The result of this calculation was about 10^{-1} n/cm²-s; in good agreement with the result of measurement using a BF_3 counter.

A comparison of air-over-ground transport calculations using different cross sections, J. C. Saccenti and W. A. Woolson, *SP425*, pp. 431-435 (Oct. 1975).

Key words: cross section sensitivity; gamma ray; neutron; transport calculations.

Time dependent neutron and secondary gamma-ray transport calculations for 14 MeV and fission sources were performed in air-over-ground geometry utilizing cross sections from the DNA working cross section library. These calculations were compared with earlier calculations which have been widely used in weapon effects studies. Several significant differences were found attributed to the different cross sections used in the calculations.

The sensitivity of neutron air transport to nitrogen cross section uncertainties, A. Niiler, W. B. Beverly, and N. E. Banks, *SP425*, pp. 436-439 (Oct. 1975).

Key words: air transport; cross sections; neutrons; nitrogen; sensitivity calculation.

The sensitivity of the transport of 14-MeV neutrons in sea level air to uncertainties in the ENDF/B-III values of the various nitrogen cross sections has been calculated using the correlated sampling Monte Carlo neutron transport code SAMCEP. The source consisted of a 14.0- to 14.9-MeV band of isotropic neutrons and the fluences (0.5-15.0 MeV) were calculated at radii from 50 to 1500 metres. The maximum perturbations, assigned to the ENDF/B-III or base cross section set in the 6.0- to 14.5-MeV energy range were; (1) 2 percent to the total, (2) 10 percent to the total elastic, (3) 40 percent to the inelastic and absorption and (4) 20 percent to the first Legendre coefficient and 10 percent to the second Legendre coefficient of the elastic angular distributions. Transport calculations were carried out using various physically realistic sets of perturbed cross sections, bounded by evaluator-assigned uncertainties, as well as the base set. Results show that in some energy intervals at 1500 metres, the differential fluence level with a perturbed set differed by almost a factor of two from the differential fluence level with the base set.

Monte Carlo studies of the effect of cross section characteristics on fast neutron penetration in iron, L. P. Ku and H. Goldstein, *SP425*, pp. 440-443 (Oct. 1975).

Key words: cross section; fission neutrons; inelastic scattering; iron; minima; Monte Carlo.

Using Monte Carlo Method, we are able to study the mechanisms of neutron transport in natural iron and their relations to the cross section properties. Fission neutrons in 15 MeV to 10 keV range are discussed. It is concluded that the low energy spectrum exiting from a small bare sphere is particularly sensitive to inelastic cross sections near the threshold. For larger, and for reflected spheres, inelastic scattering plays a much less important role. At distances of practical significance ($\gtrsim$ 1 meter) it is found that transport in the regions of cross section minima, while significant, does not provide dominant channels in determining the penetrating neutron spectra.

Neutron-coupled gamma-ray cross-section requirements for gas-cooled fast breeder reactors, M. Nagel and R. J. Cerbone, *SP425*, pp. 444-446 (Oct. 1975).

Key words: gas-cooled fast breeder reactor; neutron-coupled gamma-ray cross sections.

The generation, application, and testing of neutron-coupled gamma-ray cross sections required for Gas-Cooled Fast Breeder Reactor shield analysis are described.

Cross section preparation for the continuous-energy Monte Carlo code VIM, R. E. Prael, *SP425*, pp. 447-450 (Oct. 1975).

Key words: cross section; interpolation; Monte Carl probability; resonance; thinning; unresolved.

Improvements in the methods used to represent cross se tions in the data library for the Monte Carlo code VIM a discussed. The degree to which observed difficulties ha been eliminated and the reliability of the current VIM lib ry based on ENDF/B Version 3 data are illustrated by co parison of broad-group cross section calculations made VIM and by ETOE-2/MC^2-2.

A comparison of VIM and MC^2-2—Two detailed solutions the neutron slowing-down problem, R. E. Prael and H. He ryson II, *SP425*, pp. 451-454 (Oct. 1975).

Key words: benchmark; cross section; eigenvalue; Mor Carlo; multigroup; reactor; resonance; slowing-dow stochastic; transport.

A comparison of solutions by the Monte Carlo code VI and by ETOE-2/MC^2-2 of a zero-dimensional slowing-do problem in the homogeneous ZPR-6 Assembly 7 core co position demonstrates the ability of either code to provid reliable computational benchmark capability for such cal lations.

Decay heat analysis for an LMFBR fuel assembly usi ENDF/B-IV data, G. W. Morrison, C. R. Weisbin, and C. Kee, *SP425*, pp. 455-458 (Oct. 1975).

Key words: CRBR; decay heat; ENDF/B-IV fissi product; LMFBR; ORIGEN.

Recently evaluated ENDF/B-IV fission product da have been used in decay heat calculations for typi LMFBR fuel assemblies exposed to 100,000 MWd/M burnup. The decay heat and radioactivity of the fuel asse blies have been calculated as a function of time fr discharge. Important contributors to the decay have be identified.

A two dimensional cross section sensitivity analysis of iron a concrete shield, T. E. Albert and G. L. Simmons, *SP425*, 459-463 (Oct. 1975).

Key words: cross section; sensitivity; shield; two dim sional.

A cross section sensitivity analysis of iron in a family concrete shields is performed to illustrate the dependence the cross section sensitivity to the spatial distributio reinforcing steel. The results of this study demonstrate t one dimensional sensitivity methods can be inadequate multidimensional problems.

GCFR benchmarks: Experiments and analysis, S. Seth, Heer, M. Jermann, C. McCombie, E. Ottewitte, R. Richmo and P. Wydler, *SP425*, pp. 464-468 (Oct. 1975).

Key words: benchmarks; data testing; GCFR; integral m surements.

Measurements of reaction rate ratios and neutron spec in GCFR benchmark lattices are described. An import feature of the lattices is that rod fuel elements are us Several data sets have been tested against the experime and deficiencies indicated.

Biomedical application of shortlived positron emitt isotopes, P. Meyer, E. Behrin, R. Frank, R. Holub, and C. McJilton, *SP425*, pp. 469-471 (Oct. 1975).

Key words: Anger positron camera, lung function; radio tive tracers.

Radioactive nitrogen, oxygen and ozone have been u

for dynamic lung-function studies on live dogs with an Anger positron camera. In particular an attempt was made to determine the feasibility of this method to study early functional changes caused by ozone.

Energy-dependent pion mean free path length for star formation, C. Werntz and C. W. Lucas, Jr., *SP425*, pp. 472-475 (Oct. 1975).

Key words: cross sections; pion; star formation.

Through the use of a simple model in which true absorption of a pion in flight by a nucleus is treated analogously to collisional broadening in optics, the energy dependent mean free path for star formation in water is calculated. Besides the absorption cross section, the cross sections for elastic and inelastic scattering are presented.

Spectrum and shielding measurements and calculations of neutrons produced by 800 MeV protons, L. R. Veeser, G. J. Russell, E. D. Arthur, P. A. Seeger, W. F. Sommer, D. M. Drake, R. G. Fluharty, and R. F. Bentley, *SP425*, pp. 476-479 (Oct. 1975).

Key words: analysis by Monte Carlo; angular dependence; deep penetration of neutrons in Fe + H shield; measured neutron spectra; shielding, $^{238}U(p,xn)$, $E_p = 800$ MeV.

Measurements were made to check: (a) calculation of the neutron flux produced by 800-MeV protons on a cylinder of depleted uranium, and (b) computations of the energy-dependent neutron flux as a function of thickness for a rectangular shield surrounding the target. A proton recoil spectrometer was used to measure neutron fluxes from the shield between 300 keV and 7 MeV. Agreement has been obtained between the proton recoil data and Monte Carlo calculations for shields composed of steel and gypsum for thicknesses between 0.48 and 1.37 m. Agreement is good at most angles for energies above 1 MeV.

Nuclear data for assessment of activation of scintillator materials during spaceflight, C. S. Dyer, J. I. Trombka, and S. M. Seltzer, *SP425*, pp. 480-483 (Oct. 1975).

Key words: activation; Apollo; background; computation, decay-schemes; cross-sections; scintillators; spacecraft, gamma-rays; spallation.

A calculation is outlined which predicts energy-loss spectra observed in detector materials due to the decay of radioactive nuclides which are produced by particle irradiation in spaceflight. The input decay schemes and cross-section requirements are described. Examples are given from the Apollo gamma-ray spectrometer experiments.

Proton scattering for analysis of atmospheric particulate matter, K. R. Akselsson, J. W. Nelson, and J. W. Winchester, *SP425*, pp. 484-487 (Oct. 1975).

Key words: air particulate matter; proton scattering; quantitative analysis.

Proton scattering has been applied to the problem of elemental quantitative analysis of air particulate matter. Elements up through chlorine may be resolved using 16 MeV protons incident upon targets up to about 1 mg/cm² in thickness. Using the FSU Super FN Tandem Accelerator and a large area solid state proton detector, an analysis can be performed in several minutes. Combination of this technique with proton induced x-ray emission analysis provides a means of quantitative analysis for all elements. These accelerator based methods are being applied to studies of the composition of air particulate matter in diverse locations such as St. Louis, Mo.; Los Angeles, Ca.; several cities in Florida; and Bermuda.

Use of elastic scattering cross section anomalies for depth profiling helium and hydrogen isotopes in solids, R. S. Blewer, *SP425*, pp. 488-491 (Oct. 1975).

Key words: depth; deuterium; diffusion; elastic; helium; migration; oxide; proton; range; scattering.

A proton elastic scattering technique is described which makes possible direct accurate depth profile measurements of light element isotopes (deuterium, tritium, helium, etc.) in metal or insulator hosts. Several examples of the application of this technique to current problems are given in the fields of energy research and neutron generator target evaluation.

Spallation cross sections and the LAMPF medical radioisotope program, B. R. Erdal, P. M. Grant, V. R. Casella, A. E. Ogard, and H. A. O'Brien, Jr., *SP425*, pp. 492-495 (Oct. 1975).

Key words: E = 800 MeV; isotope production; La,Mo,V(p,spallation); measured σ; nuclear medicine; nuclear reactions.

The intense beam of medium-energy protons (600 to 800 MeV) from the LAMPF accelerator will be used to prepare multi-curie quantities of radioisotopes of value in diagnostic and therapeutic nuclear medicine. Thin-target cross section measurements of spallation-induced reactions represent a significant segment of the LASL Medical Radioisotope Research Program, as these data provide a basis for calculating specific radioisotope yields in thick targets, evaluating potential isotopic interferences, and monitoring hot-cell operations. Recent measurements include the cross sections (cumulative yields) of ^{123}I, ^{127}Xe, ^{82}Sr, and ^{43}K formed in the interaction of 800-MeV protons with La, Mo, and V targets; they are reported to be 51 ± 3 mb, 51 ± 7 mb, 24.5 ± 0.8 mb, and 5.4 ± 0.3 mb, respectively. Comparison with previous results at 590 MeV are made, and quantity and product quality estimates are presented for biomedical isotopes under the irradiation conditions expected to prevail at LAMPF.

Feasibility of neutron-gamma techniques for field analysis of fresh concrete, M. C. Taylor, J. R. Rhodes, and D. L. Bernard, *SP425*, pp. 496-499 (Oct. 1975).

Key words: analysis; application; concrete; feasibility; gamma rays; neutrons.

A technique has been developed which employs two neutron sources (^{252}Cf and ^{238}Pu-Be) and three NaI(Tl) detectors to determine the H, Ca, Si and C content of calcareous aggregate concrete in its plastic state. These elements are indicative of the water, cement, fine aggregate and coarse aggregate components which along with air entrainment are key factors in strength determination. Results are presented which demonstrate the feasibility of the technique for analysis of typical samples in a total time of the order of 10 minutes.

Cross section requirements for industrial gauging applications, B. Y. Cho and T. P. Sheahen, *SP425*, pp. 500-503 (Oct. 1975).

Key words: industrial gauging; isotopes; Monte Carlo calculations; multiple scattering.

We use nuclear isotopes for gauging and control of industrial products. The use of recycled materials have made paper, steel, plastic, etc., into ever-changing composite media, forcing us to update calibrations empirically. This paper lists those areas of research that would benefit our work. Specifically, we need: differential cross sections for electrons scattered from most common elements, as a func-

tion of energy below 3.6 MeV; Monte Carlo calculations that simulate isotopic sources (Kr-85, Sr-90/Y-90) interacting with common materials; phenomenological models or empirical expressions that coalesce scattering formulas and Monte Carlo results into forms usable for gauge design.

Li, Be and B production in proton-induced reactions: Implications for astrophysics and space radiation effects, C. T. Roche, R. G. Clark, G. J. Methews, and V. E. Viola, Jr., *SP425*, pp. 504-508 (Oct. 1975).

Key words: astrophysical production of Li, Be and B; E = 45 – 100 MeV; L = Li, Be, B; measured $\sigma(E)$ for A = 6, 7, 9, 10, 11; nuclear reactions $^{12}C(p,L)$.

Cross sections for the production of mass 6 to 11 isobars from proton spallation of carbon targets have been measured at bombarding energies of 45, 55, 60, 65, 75 and 100 MeV. The results of these measurements and similar studies by other groups are used to test theories of Li, Be and B nucleosynthesis. The measured abundance ratios for $^7Li/^6Li$, $^{11}B/^{10}B$, Li/Be and B/Li can be reproduced using measured cross sections and models which propose interstellar proton fluxes $\phi(E)$ of the form $(m_pC^2+E)^{-2.6}$, $E^{-\gamma}$ ($\gamma \approx 1.5 - 2.0$) or E^{-3} for $E > 30$ MeV, if a substantial amount of ^7Li is synthesized via some other source. The cross sections for formation of Li, Be and B are also of importance because of possible high LET effects in biological material exposed to cosmic radiation. Our measurements are compared with calculated cross sections that have been used to estimate LET effects.

Long lived isotope production cross sections from proton bombardment of rhenium, A. J. Armini and S. N. Bunker, *SP425*, pp. 509-511 (Oct. 1975).

Key words: cross sections; excitation function; proton; rhenium.

The production cross reaction of long lived isotopes produced by proton bombardment of rhenium has been measured between 15 and 160 MeV. A set of stacked graphite disks impregnated with rhenium was used as a target. The data have been used to calibrate a high temperature graphite thickness gauge.

A need for (p,n) cross sections for selected targets at lower energies, H. S. Ahluwalia, *SP425*, pp. 512-515 (Oct. 1975).

Key words: acceleration mechanisms; neutrons; nuclear reactions; protons; solar flares.

We have argued elsewhere that protons of energy $\lesssim 10$ MeV are probably accelerated, in the active regions on the sun, for several days, following a solar flare. These protons must undergo nuclear interactions with the constituents of the solar atmosphere producing, among other things, neutrons. Being electrically neutral the neutrons are not affected by the solar or interplanetary magnetic fields. So they should be observable when the active regions lie on the earth-sun line. No solar neutrons have been detected so far. We think that the reason for this null-result is that the energy response of most of the detectors used, peaks at too high an energy (~ 100 MeV). Recent discovery of solar deuterons indicates that the solar neutrons probably have lower energies. They are probably produced in (p,n) reactions involving C,N,O,Ne,Mg,Si,S,Ca,Fe, etc. The available cross sections, in the energy range 3.4 MeV to 30 MeV, certainly bear out this expectation for Fe. The cross sections for some other elements are as yet unknown. Our conclusions are presented and the urgent need for the determination of the (p,n) cross sections for other elements is discussed.

The measurement of thermal neutron constants of the soil; application to the calibration of neutron moisture gauges and to the pedological study of soil, P. Couchat, C. Carre, J. Marcesse and J. Le Ho, *SP425*, pp. 516-519 (Oct. 1975).

Key words: calibration; neutron moisture gauge; pedology; soil; thermal neutron constants.

The neutronic method for measuring the water content of soils is more and more used by agronomists, hydrogeologists and pedologists. On the other hand the studies on the phenomena of slowing down and diffusion process have shown a narrow relation between the thermal absorption (Σ_a) and diffusion (Σ_d) constants and the thermal flux developed in the soil around a fast neutron source like Am-Be. Then, the authors present two original applications of the direct measurement of Σ_a and Σ_d.

The method described consists in the measurement, in a cube of graphite with an Am-Be source in the middle, on one side of the perturbation of the thermal flux, obtained by the introduction of 300 g of soil, and on the other side of the transmitted thermal flux measured through the same sample of soil, on a side of the cube.

After calibrating the device, these two parameters give Σ_a and Σ_d which are easily introduced in the calibration equation of neutron moisture gauge. Also these two values are useful for the pedologists because Σ_d is connected to clay content in the soil and Σ_a is connected to the type of clay by the way of rare earth contents.

Medical uses of nuclear data, R. S. Tilbury, R. E. Bigler, L. Zeitz, and J. S. Laughlin, *SP425*, pp. 520-526 (Oct. 1975).

Key words: activation cross-section; bone mineral; *in vivo* neutron-activation analysis; therapy.

Nuclear data is used in modern medicine in a myriad of ways. Activation cross sections are used in the calculation of radioisotope production rates for both neutron and charged particle activation. The radioisotopes so produced are used in diagnostic nuclear medicine for the early detection of disease and for therapy either by external radiation or by internal radiation. The calculation of radiation dose from internally administered radioisotopes involves a knowledge of the decay scheme, mode and energy of decay, internal conversion coefficients, x-ray fluorescent and Auger electron yields. The decay scheme of radioisotopes including parent-daughter equilibria is essential knowledge for their accurate assay and for the understanding of radioisotope generators. Range-energy relationships for neutrons of various energies, charged particles, gamma-rays and electrons are also necessary for therapy and dose considerations. Applications to *in vivo* neutron activation analysis and photon absorptiometry for bone mineral measurement are also considered. An attempt is made to briefly describe these applications and to point out where more basic nuclear data measurements would be helpful.

Medical use of fast neutrons in radiotherapy and radiograph D. K. Bewley, *SP425*, pp. 527-532 (Oct. 1975).

Key words: dosemeter; radiography; radiotherapy; tissue.

Over 400 patients have been treated with fast neutrons from a cyclotron at Hammersmith Hospital, London, using 16 MeV deuterons on beryllium. A large variety of malignant disease is included in this trial. A randomized trial of fast neutron therapy for cancer of the mouth and throat is in progress and preliminary results will be given. Fast neutron radiographs are often taken to check the position of the fields used on the patients. These show no contrast from bone, but demonstrate only the presence of gas-filled

cavities. As a diagnostic method, fast neutron radiography suffers from a number of disadvantages, the main ones being lack of sensitivity of the image-forming system and the hazard to the patient due to a large Quality Factor. Estimation of the absorbed dose given to different types of tissue is an important factor in the medical use of fast neutrons. More data are needed on the processes whereby fast neutrons impart energy to matter, particularly for neutrons above 15 MeV.

Biomedical radiation transport calculations as an application f nuclear data, R. G. Alsmiller, Jr., *SP425*, pp. 533-539 (Oct. 975).

Key words: absorbed dose; cell survival; heavy particles; OER; radiotherapy.

The extent to which transport calculations of biomedical interest for negatively charged pions, neutrons, protons, alpha particles, and heavier ions can presently be performed is reviewed.

Geochemical mapping of the moon by orbital gamma-ray pectroscopy, R. C. Reedy, *SP425*, pp. 540-545 (Oct. 1975).

Key words: cosmic-ray reactions; lunar chemistry; lunar γ-rays; neutron capture; nonelastic scattering.

Chemical compositions of the surfaces of the moon and certain planetary bodies can be determined by orbital γ-ray spectroscopy. The major sources of γ-ray lines (and of radionuclides) in the moon are the decay of the primordial radioelements (U, Th, and ^{40}K) and nuclear reactions induced by the bombardment of the moon by cosmic-ray particles. The major cosmogenic γ-ray lines are produced by neutron nonelastic scattering and neutron capture reactions. The fluxes of γ-ray lines expected from the moon for each major source have been calculated. Gamma-rays from the moon were measured by γ-ray spectrometers during the Apollo 15 and 16 missions. The preliminary analysis of the data show that O and Si vary little over the moon's surface, that Mg, Fe, and Ti have higher concentrations in the maria than in the lunar highlands, and that the radioelements are significantly more abundant in and near the western near-side maria than in the rest of the moon.

A measurement of the fission cross section of ^{235}U from 1 keV 1 MeV, J. B. Czirr and G. S. Sidhu, *SP425*, pp. 546-548 Oct. 1975).

Key words: fission; measurement; ratio; ^{235}U.

We have measured the ratio of the ^{235}U fission cross section to the ^{6}Li (n,α) reaction for neutron energies from thermal to 1 MeV. This experiment is the third in a series which is designed to measure the relative fission cross section of ^{235}U from thermal to 20 MeV. The first two experiments covered the energy range from 0.8- to 20-MeV, and used the n,p scattering reaction to measure the energy dependence of incident flux.

The average number of prompt neutrons, $\bar{\nu}_p$, from neutron induced fission of ^{235}U between 0.2 and 1.4 MeV, F. Käppeler and . E. Bandl, *SP425*, pp. 549-552 (Oct. 1975).

Key words: $E_n = 0.2$-1.4 MeV; fast time-of-flight technique; number of prompt fission neutrons; ^{235}U.

For the clarification of existing discrepancies in the energy dependence of $\bar{\nu}_p$ for ^{235}U an experiment was performed which was based on a method independent of current techniques. A considerable reduction of background and correction problems was achieved by renouncing on an absolute measurement. Thus the resulting systematic uncertainty was 0.6 percent. In the energy range between 0.2 and 1.4 MeV the shape of $\bar{\nu}_p$ was measured at 22 points in steps of 50 keV with an average energy resolution of 3.3 percent. Repetition of several runs with modified experimental conditions ensured the consistent reproduction of the results. It was found that $\bar{\nu}_p$ of ^{235}U shows distinct deviations of up to 2 percent from a linear energy dependence.

Monte Carlo analysis of direct measurements of the thermal eta (0.025 eV) for U^{233} and U^{235}, J. J. Ullo and M. Goldsmith, *SP425*, pp. 553-556 (Oct. 1975).

Key words: E = 0.25 eV; eta; fission neutrons per absorption; nuclear reactions; U^{233}; U^{235}.

In support of the LWBR program, the manganese bath measurements of eta of U^{233} and U^{235} at 0.025 eV were analyzed using Monte Carlo methods. The calculated values of eta, including statistical, cross section, and experimental uncertainties, are $\eta^{233} = 2.2993 \pm 0.0082$ and $\eta^{235} = 2.0777 \pm 0.0064$. The systematic corrections to the experiments were also studied in detail.

Monte Carlo analysis of manganese bath measurement of eta of ^{233}U and ^{235}U using thermalized neutrons, M. Goldsmith and J. J. Ullo, *SP425*, pp. 557-559 (Oct. 1975).

Key words: E = 0.0253 eV; eta; fission neutrons per absorption; nuclear reactions; ^{233}U; ^{235}U.

Monte Carlo analysis of the ORNL manganese bath measurements of eta of ^{233}U and ^{235}U at 2200 m/sec yields: $\eta_{2200}{}^{233} = 2.3019 \pm 0.0086$, and $\eta_{2200}{}^{235} = 2.0746 \pm 0.0078$. The analysis was confirmed by calculating measured quantities used by the experimentalists in their determinations of η_{2200}.

Parameters of the subthreshold fission structure in ^{240}Pu, G. F. Auchampaugh and L. W. Weston, *SP425*, pp. 560-563 (Oct. 1975).

Key words: $\Gamma_{f\lambda^c}$, $\Gamma_{f\lambda^{c,II}}$, $\langle H_{\lambda^c\lambda^{c2}} \rangle$; ^{240}Pu(n,f); 500 to 10 000 eV.

The neutron subthreshold fission cross section of ^{240}Pu has been measured from 500 eV to 10 000 eV using the Oak Ridge Electron Linear Accelerator neutron facility. A total of 82 fission widths were obtained from area and shape analysis of those resonances which define the class II states at $\cong$ 782 eV, $\cong$ 1406 eV, $\cong$ 1936 eV, and $\cong$ 2700 eV. The average square of the coupling matrix element for the first three class II states is 4.08 ± 1.63 eV^2. The average class II fission width is 2.47 ± 0.96 eV. Approximately 22 clusters of class I resonances were observed below 10 keV, which results in a value of 450 ± 50 eV for the average class II level spacing. Assuming parabolic inner and outer barriers, the following barrier parameters were obtained: $V_A - B_{II}/\hbar\omega_A = 0.59 \pm 0.06$ and $V_B - B_{II}/\hbar\omega_B = 0.54 \pm 0.006$.

Measurement of the ^{239}Pu fission cross-section and its ratio to the ^{235}U fission cross-section in the energy range from 1 keV to 1 MeV, D. B. Gayther, *SP425*, pp. 564-567 (Oct. 1975).

Key words: cross-sections; fission; measured; neutrons; 1 keV – 1 MeV; ^{239}Pu; ^{235}U.

The cross-section for the ^{239}Pu(n,f) reaction has been measured on the Harwell 45 MeV linac using the time-of-flight method. Fission events were recorded by detecting the prompt neutrons and the incident neutron flux spectrum was measured with a detector which was calibrated against two standard detectors. The cross-section was normalized in the 10 to 30 keV energy interval to agree with the recent evaluation of Sowerby et al. Comparison with this evaluation shows agreement to within 5 percent at energies above a few

keV. The agreement with the ENDF/B-IV evaluation is generally within 4 percent throughout the complete energy range. A similar comparison is made for the ratio of the ^{239}Pu and ^{235}U fission cross-sections, obtained from the present measurement, and a previously published measurement of the $^{235}U(n,f)$ cross-section made with the same equipment.

A measurement of the $^{238}U/^{235}U$ fission cross-section ratio, M. S. Coates, D. B. Gayther, and N. J. Pattenden, *SP425*, pp. 568-571 (Oct. 1975).

Key words: cross-sections; fission; measured; neutrons; ratio; ^{238}U; ^{235}U; 600 keV-22 MeV.

The ratio of the neutron induced fission cross-sections of ^{238}U and ^{235}U have been measured in the energy range from 600 keV to 22 MeV using the time-of-flight method on the Harwell synchrocyclotron, at a nominal resolution of 0.5 ns/m. Fission fragments were detected in a gas scintillation chamber containing foils of each material mounted back-to-back and perpendicular to the incident beam. The measured cross-section ratio was normalized at 14 MeV to the ratio evaluated by Sowerby et al. The estimated standard deviation error in the ratio measurements is ± 2 1/2 percent. Comparison with other recent data shows reasonable agreement throughout most of the energy range.

Precision measurement of prompt fission neutron spectra of ^{235}U, ^{238}U and ^{239}Pu, P. I. Johansson, B. Holmqvist, T. Wiedling, and L. Jéki, *SP425*, pp. 572-575 (Oct. 1975).

Key words: fast fission neutron spectra; TOF-technique; ^{235}U; ^{238}U; ^{239}Pu.

Prompt neutron spectra from fission of ^{235}U, and ^{239}Pu have been measured at incident neutron energies of 0.10, 0.18, 0.53 and 2.07 MeV. A major effort was made to obtain an accurate experimental determination of the efficiency and energy response function of the time-of-flight neutron detector in the energy range 0.15 to 15 MeV. The spectra have been analytically described by the so called Watt distribution, as well as with a Maxwell distribution. It is shown that the Watt relation gives a somewhat better description of the spectra than the Maxwell formula. The angular correlation between incident-neutrons and fission-neutrons was measured for ^{235}U and ^{238}U at an incident neutron energy of 2.07 MeV. The data indicate some slight anisotropies, being rather small or even negligible for ^{235}U and somewhat more pronounced for ^{238}U. The results show that the shape of the neutron energy distribution is independent of the angle of observation.

Spin determination of resonances in ^{235}U, G. A. Keyworth, C. E. Olsen, J. D. Moses, J. W. T. Dabbs, and N. W. Hill, *SP425*, pp. 576-579 (Oct. 1975).

Key words: fission channels; J; multilevel fits; polarized neutrons; polarized target; $^{235}U(n,f)$.

A polarized beam of neutrons and a polarized ^{235}U target have been used to determine the spins of resonances below 150 eV. Most spins are assigned by inspection of the data; others by comparison with multilevel or single-level fits. Previously published data on fission fragment angular distributions, in conjunction with our spin assignments, indicate that two or more fission channels are available to each spin state. The ratio of symmetric to asymmetric fission appears to be uncorrelated with the resonance spin.

Quantum numbers of low lying neutron resonances in U-235, J. P. Felvinci, E. Melkonian, and W. W. Havens, Jr., *SP425*, pp. 580-583 (Oct. 1975).

Key words: spins of ^{235}U resonances.

Experiments were performed at ORELA to measure t low energy fission cross section of U-235. Times of flight the neutrons causing fission and the fission fragment ener detected by a solid state detector were recorded event-b event. Analysis of the data showed marked pulse heig variation among resonances. Several of the large resonanc were shown to be composites and the level density obtain is much higher than previously determined. The results we interpreted by the hypothesis that K is a good quantu number in the compound nucleus. This assumption and t systematic variation of the fission fragment energies amo resonances enabled us to assign J and K quantum numbe to many levels. Three families of fission resonances we seen, $J=4^-$; $K=2$, $J=4^-$; $K=1$, and $J=3^-$; $K=1$. O results have implications as to the accuracy of fission cro section measurements and to the calculation of cross se tions in the unresolved energy region.

keV capture cross section of ^{242}Pu, R. W. Hockenbury, A. Sanislo, and N. N. Kaushal, *SP425*, pp. 584-586 (Oct. 197

Key words: capture; normalization; strength functions.

The neutron capture cross section of ^{242}Pu has been me sured from 5 to 70 keV. The high-low bias method was us to distinguish between capture and fission events. Transm sion experiments were also made in the resonance region. normalization method was developed using the absorpti and transmission data from six resonances. Using average s-wave radiation width of 22 MeV, an s-wa strength function of 1.16×10^{-4} and our measured captu cross section, we have determined p-wave contributio to the ^{242}Pu capture cross section below 70 keV.

Spontaneous fission decay constant of plutonium-238, R. G and R. Sher, *SP425*, pp. 587-590 (Oct. 1975).

Key words: coincidence counting; decay constant; pluto um-238; safeguards data; spontaneous fission; track rec ders.

The spontaneous fission decay constant of plutonium-2 was measured by two methods: fission-track counting mica and coincidence counting of the fission fragments solid-state detectors. The efficiency of the mica track dete tor was determined by thermal column irradiation of the pl tonium source-mica detector assembly and subseque counting of tracks arising from plutonium-239 fission. T coincidence counting result was combined with a determir tion of the Pu^{238} alpha emission rate of the sample to obta the spontaneous fission decay constant. The results of t two methods were $\lambda_{sf} = (4.75 \pm 0.12) \times 10^{-19}$ sec^{-1} and (4 $\pm 0.4) \times 10^{-19}$ sec^{-1}, respectively.

Neutron-induced fission cross sections of ^{233}U, ^{234}U, ^{236}U, a ^{238}U with respect to ^{235}U, J. W. Behrens, G. W. Carlson, and W. Bauer, *SP425*, pp. 591-596 (Oct. 1975).

Key words: fission cross section ratios; linear accelerat time-of-flight technique; uranium isotopes—^{233}U, ^{234}U, ^{235} ^{236}U, ^{238}U; 0.001 to 30 MeV.

Ratios of the neutron-induced fission cross sections ^{233}U, ^{234}U, ^{236}U, and ^{238}U relative to ^{235}U and of ^{238}U relati to ^{233}U were measured with fission ionization chambers the LLL 100-MeV electron linear accelerator. The time-f flight technique was used to measure the cross section rati as a function of neutron energy from 0.1 to 30 MeV, exce for the ^{233}U:^{235}U and ^{238}U:^{233}U ratios, which were measur from 0.001 to 30 MeV, and 1 to 30 MeV, respectively. T continuous energy spectrum of the neutron source allow us to cover the entire energy range of each ratio in one me surement. The threshold cross section method was used

normalize the ratios independent of other cross section measurements. Typical energy resolutions of the data are 5 percent at 20 MeV and 1.5 percent at 1 MeV. Most of the data have counting uncertainties smaller than 4 percent. Systematic errors are discussed, and current results are compared with previous measurements.

On sub-barrier fission in ^{238}U, J. A. Wartena, H. Weigmann, and E. Migneco, *SP425*, pp. 597-598 (Oct. 1975).

Sub-barrier fission in ^{238}U has first been observed by R. Block et al., using ionization chambers for fission fragment detection. In the present measurements a liquid scintillator was used to detect prompt fission neutrons. Thereby, with a sample of 250 g of ^{238}U, neutron time-of-flight measurements could be performed at a 30 m flightpath with a nominal resolution of 1.3 nsec/m. The result of the present investigation is a full confirmation of the findings of Block et al. This includes a confirmation, by high resolution data, of the fact that the resonance at 721.0 eV and 1210.7 eV contribute most strongly to the observed fission in the two sub-barrier structures at low neutron energies. Their fission widths are found to be (0.85 ± 0.13) MeV and (0.25 ± 0.05) MeV, respectively (assuming $\Gamma_\gamma = 23$ MeV). For most of the other resonances in these two structures only upper limits for the fission widths are obtained.

Capture-to-fission ratio of ^{235}U from the measurement of low-energy γ-rays, F. Corvi and P. Giacobbe, *SP425*, pp. 599-602 (Oct. 1975).

Key words: E = 86 eV – 31.6 keV; enriched target; measured capture-to-fission ratio; nuclear reactions ^{235}U(n,f) and ^{235}U(n,γ).

A new technique of α-determination is presented, consisting of measuring with a Ge(Li)-detector low-energy γ-ray spectra following neutron absorption in ^{235}U, as a function of neutron energy. A relative value of α can then be deduced assuming that the intensity of a given capture (fission) γ-ray is proportional to the average capture (fission) cross-section. Such an assumption is thoroughly discussed in the text. More specifically, α was taken proportional to the ratio between the intensity of the 642 keV capture transition and those of the fission γ-rays at 352 keV and 1280 keV. Average α-values with statistical errors less or equal to ± 5 percent were determined for 20 intervals in the range 86 eV – 31.6 keV.

Intermediate structure in the keV fission cross section of ^{235}U, E. Migneco, P. Bonsignore, G. Lanzanò, J. A. Wartena, and H. Weigmann, *SP425*, pp. 607-610 (Oct. 1975).

The relative fission cross section of ^{235}U has been measured up to 200 keV with a nominal resolution of 1.0 ns/m, using a thin foil plastic scintillator detector. The data have been analyzed in order to detect nonstatistical effects due to intermediate structure. Statistical tests which have been applied to this fission and similar total cross section data include calculations of the auto-correlation function and Wald-Wolfowitz tests on the cross-section and on the autocorrelograms. The comparison of the results indicates the presence of intermediate structure effects in fission cross-section which may be interpreted on the basis of the double-humped deformation potential.

The ^{241}Pu neutron induced fission cross section from 0.01 eV to 50 eV and its normalization, C. Wagemans and A. J. Deruytter, *SP425*, pp. 603-606 (Oct. 1975).

Key words: normalization; Westcott g_f-factor; ^{241}Pu fission cross-section.

The neutron induced fission cross-section of ^{241}Pu has been measured at an 8 m flightpath of the CBNM Linac (from 50 eV to below thermal energy) with respect to the ^{10}B(n,α)^{7}Li cross-section. Several fission integrals were calculated as well as the 20.44 °C Westcott factor $g_f = 1.046 \pm 0.006$. Special attention is given to normalization problems.

Energy spectrum of delayed neutrons from photo-fission of ^{238}U, S. Iwasaki, K. Yana, S. Sato, K. Sano, M. Hagiwara, and K. Sugiyama, *SP425*, pp. 611-614 (Oct. 1975).

Key words: delayed neutron; energy spectrum, β – n time-of-flight; fission; group 2; ^{238}U(γ,f).

Energy spectrum of the second group delayed neutrons ($T_{1/2} = 22$ sec.) from photo-fissions of ^{238}U has been obtained using a time-of-flight technique between beta-particles and neutrons. Experimental results show a fine structure in the spectrum. The six prominent peaks of energies; 200-, 240-, 280-, 380-, 540- and 750-keV are observed.

^{235}U fission cross section measurements relative to neutron-proton scattering, G. S. Sidhu and J. B. Czirr, *SP425*, pp. 615-619 (Oct. 1975).

Key words: linac source; neutron energy 0.8 to 20 MeV; relative to n-p scattering; U235 fission cross section.

Energy dependence of the fission cross section of ^{235}U with respect to the n-p scattering reaction was measured for neutron energies from 0.8 to 20 MeV. The LLL linac target was used as the pulsed neutron source; neutron energies were measured by time-of-flight technique. A ^{235}U ion chamber was designed and operated to make the fission detection efficiency independent of the angular distribution of fission fragments. The neutron flux monitor consisted of an annular polyethylene radiator with a shielded proton recoil detector. Data in the energy range from 3 to 20 MeV were obtained with a 3.3 mg/cm^2 radiator; a 0.31 mg/cm^2 radiator was used for the range from 0.8 to 4 MeV. Both sets of data were normalized to yield the average fission cross section value of 1.198 b in the overlapping region from 3 to 4 MeV. Total error in the relative ^{235}U(n,f) cross section is ± 1 percent below 7 MeV, ± 2 percent at 14 MeV, and ± 6 percent at 20 MeV.

Measurement of the ^{238}U capture cross section shape in the neutron energy region 20 to 550 keV, R. R. Spencer and F. Käppeler, *SP425*, pp. 620-622 (Oct. 1975).

Key words: E_n = 20-550 keV; $\sigma_\gamma(^{238}U)$ shape.

The Karlsruhe 800 l liquid scintillator detector and 3 MV pulsed Van de Graaff were used to measure the shape vs. neutron energy of the ^{238}U capture yield relative to a gold capture sample and relative to ^{235}U fission. The resulting cross section shape computed from the gold capture cross section is consistent with that computed from a recent evaluation of the ^{235}U fission cross section. Below 100 keV a significant intermediate structure is observed which corresponds to that in recent ORNL data.

Intermediate structure in the ^{238}U neutron capture cross section, R. B. Perez and G. de Saussure, *SP425*, pp. 623-626 (Oct. 1975).

Key words: doorway states; intermediate structure; ^{238}U capture cross section.

Recent measurements of the ^{238}U neutron capture cross section show large fluctuations in the unresolved resonance region. To test whether or not the observed long-range fluctuations of the neutron capture represent departures from the compound nuclear model, the Wald-Wolfowitz runs and correlation tests were applied to the ^{238}U neutron capture

data obtained at ORELA. The Wald-Wolfowitz runs test deals with the statistic, R, which is the number of unbroken sequences of data points above or below a given reference line. This statistic is to be compared with the expected value of runs $E(R) \pm \sigma(R)$ arising from randomly distributed data. In the correlation test we have computed the first serial correlation coefficient of the data as well as its expected value and variance for a set of random data. In both tests one computes the probability, P, for the given statistical entity to depart from its expected value by more than ϵ standard deviations. Both tests confirm the presence of intermediate structure between 5 and 100 keV. The range of the structure far exceeds the width of the experimental resolution and level widths.

A direct comparison of different experimental techniques for measuring neutron capture and fission cross sections for ^{239}Pu, R. Gwin, L. W. Weston, J. H. Todd, R. W. Ingle, and H. Weaver, *SP425*, pp. 627-630 (Oct. 1975).

Key words: comparison; cross sections; fission, absorption; measurement; ^{239}Pu.

A comparison of the results of two different experimental methods of measuring the neutron absorption and fission cross sections for ^{239}Pu is made. These measurements were normalized at thermal energy and extend to 200 keV. The ratio of the neutron capture to fission cross section for ^{239}Pu derived in these two experiments is shown to be in good agreement.

Fast neutron fission spectrum measurement of ^{235}U at 0.52 MeV incident neutron energy, P. I. Johansson and J. M. Adams, *SP425*, pp. 631-634 (Oct. 1975).

Key words: fast neutron fission; prompt fission neutron spectrum; T-O-F technique; U-235.

There exists a large number of measurements of the prompt fission neutron spectrum of ^{235}U. The discrepancies in the results, however, indicate systematic errors which might be attributable to the different experimental equipment and facilities used at the various laboratories. This measurement is a collaboration between the Harwell Nuclear Physics Division and the Neutron Physics Laboratory in Studsvik. The purpose was to repeat measurements on ^{235}U at Studsvik and Harwell. The experiments were performed on 1BIS, the Harwell neutron time-of-flight facility and the experimental parameters of importance were chosen to be identical, viz the same incident neutron energy, detector angle, sample size and composition etc., and also the highly critical parameters, viz the neutron detector response function and the energy calibration of the neutron time-of-flight spectrometer, were obtained by using the same experimental technique and nuclear reactions.

The fission cross section of ^{235}U for Na-Be photoneutrons, D. M. Gilliam and G. F. Knoll, *SP425*, pp. 635-636 (Oct. 1975).

Key words: fission cross section; manganese bath; NBS-II; track-etch detector; ^{235}U; ^{24}Na; ^{9}Be(γ,n).

The fission cross section of ^{235}U for Na-Be photoneutrons has been measured with absolute flux determination. The neutron flux was determined absolutely (i.e., without significant dependence on other cross section data) by using a manganese bath to compare the photoneutron source with the standard source NBS-II. Fission counts were accumulated with the source positioned symmetrically between two identical detectors, all suspended in a low-albedo laboratory. Fission fragments passing through limited solid angle apertures were recorded on polyester track-etch films. Use of a projection microscope counting system allowed rapid measurement of track diameters, so that the smallest track could be distinguished reliably from background pits th were not much smaller in diameter. The masses of the U_3O deposits (7 mg each) were determined by microbalanc weighings. After making a small correction for the calc lated energy distribution of the source neutrons, a value f the fission cross section at 964 keV of 1.21 barns $\pm$ 2.1 pe cent (1.8% systematic and 1.0% random) is derived from th present measurement.

The total cross section and the fission cross section of ^{241}Am the resonance region, resonance parameters, H. Derrien and L Lucas, *SP425*, pp. 637-641 (Oct. 1975).

Key words: neutron; resonance parameters; total cross se tion; ^{241}Am.

The ^{241}Am total and fission cross sections have been me sured in the resonance region, using the 60 MeV Sacl linac as a pulsed neutron source. The resonance paramete obtained by a single level shape analysis of the transmissi data are given for 189 levels up to 150 eV neutron energ The mean level spacing, corrected for 18 percent of miss resonances in the 0 to 50 eV energy range, is $(0.55 \pm 0.0$ eV. The s-wave neutron strength function value, in the 0 150 eV energy range, is equal to $(0.94 \pm 0.09)10^{-4}$. Th average radiation width obtained from 43 resonances (43.77 ± 0.72) meV. Only preliminary results of the fissi experiment are available now; 38 fission widths are given u to 32 eV neutron energy, with the average value $\langle \Gamma_f \rangle \approx 0.2$ meV; the statistical distribution of these fission widths co responds to a X^2 law with 4 degrees of freedom. An ar analysis of the Los Alamos fission data has also been don from which we obtain 36 Γ_f values in the 20 to 50 eV energ range; the corresponding average value is: $\langle \Gamma_f \rangle$ 0.52 me the statistical distribution obeys to a X^2 law with 15 degre of freedom, in disagreement with the Saclay results.

Structures in ^{232}Th(n,f) and ^{238}U(n,f) cross sections, J. Blon C. Mazur, and D. Paya, *SP425*, pp. 642-645 (Oct. 1975).

Key words: cross sections; structures; ^{232}Th(n,f); ^{238}U(n,f

The ^{232}Th(n,f) and ^{238}U(n,f) cross sections have been me sured relative to that of ^{235}U up to 6 MeV. The best energ resolution was 3 keV at 1.6 MeV. Below the fissi threshold of ^{238}U, intermediate structures are observed. I the ^{232}Th(n,f) cross section, the broad vibrational resonanc located above 1 MeV are resolved into sharp structur which are interpreted as rotational states. The angul anisotropy of fission fragments has been also measured i the same energy range. Thereby, values of K and J hav been determined for each structure. The moment of inerti of ^{233}Th in shape isomeric deformation has been deduced.

Nuclear data needs for fusion reactor design, D. Steine *SP425*, pp. 646-650 (Oct. 1975).

Key words: fusion reactor design; nuclear data for fusion.

The nuclear data needs associated with the developme of fusion as an energy source will be discussed in terms seven areas of design application including: fusion fuel c cles, tritium breeding performance (for concepts based o the D-T fuel cycle), nuclear heating, radiation damage e fects, induced activity, radiation shielding, and hybrid co cepts. Dosimetry applications will also be considered. Th areas of application described above will be related t specific types of nuclear data and to the programmati requirements of the Controlled Thermonuclear Research e fort. The paper concludes with a summary of recent activ ties relevant to CTR nuclear data needs.

Model calculations as one means of satisfying the neutron cross section requirements of the CTR program, D. G. Gardner, *SP425*, pp. 651-658 (Oct. 1975).

Key words: applications to CTR; cross-section calculations; fast neutron reactions; gamma-ray production; isomers; radiation widths; statistical model codes.

A large amount of cross-section and spectral information for neutron-induced reactions will be required for the CTR design program. To undertake to provide the required data through a purely experimental measurement program alone may not be the most efficient way of attacking the problem. It is suggested that a preliminary theoretical calculation be made of all relevant reactions on the dozen or so elements that now seem to comprise the inventory of possible construction materials to find out which are actually important, and over what energy ranges they are important. A number of computer codes for calculating cross sections for neutron induced reactions have been evaluated and extended. These will be described and examples will be given of various types of calculations of interest to the CTR program.

Energy from charged particle reactions among light nuclei, T. A. Tombrello, *SP425*, pp. 659-663 (Oct. 1975).

Key words: CTR energy production; nuclear reactions.

The copious production of neutrons in the "standard" CTR fuels has led to a renewed interest in proposals that various "exotic" fusion fuels be investigated. These fuels invariably involve reactions on lithium, beryllium, or boron isotopes in which most of the energy is liberated in the form of charged particles. Obtaining reaction cross sections at the appropriate energies or extrapolating the yield into inaccessible energy regions is, however, not always a straightforward procedure; and each reaction may require the development of new techniques. By means of selections from among such "exotic" fuel reactions, I shall show examples of experimental techniques for charged particle cross-section measurements at low energies and some techniques for extrapolation to still lower energies.

A survey of fast-neutron induced reaction cross-section data, M. Qaim, *SP425*, pp. 664-673 (Oct. 1975).

Key words: cross-section data and systematics; cross-section measurement; excitation functions; fast neutrons; nonelastic interactions; nuclear reactions; sources and spectra.

Sources of fast-neutrons and their spectra are discussed briefly. A critical survey of experimental techniques employed in studies of nuclear reactions (excluding fission) at $E_n \geq 14$ MeV is presented. The recent experimental cross-section data are described concisely. Special attention is paid to the case of low-yield reactions, such as processes with trinucleon emission. A review of recently discussed cross-section systematics together with an outline of some of the theoretical implications is given.

A quantitative assessment of CTR cross section needs, S. A. W. Gerstl, D. J. Dudziak, and D. W. Muir, *SP425*, pp. 674-679 (Oct. 1975).

Key words: cross sections; fusion reactors; perturbation; sensitivity; uncertainties.

A computational method to quantitatively determine cross section requirements is described and applied to a particular CTR design project. In order to provide a rational basis for the priorities assigned to new cross section measurements or evaluations, this method includes a quantitative assessment of the uncertainty of currently available data, the sensitivity of important nuclear design parameters to selected cross sections, and the accuracy desired in predicting nuclear design parameters. Perturbation theory is used to combine estimated cross section uncertainties with calculated sensitivities to determine the variance of any nuclear design parameter of interest. Selected computational results are presented for a model of the Tokamak Fusion Test Reactor.

A sensitivity study of data deficiencies weighting functions, and 14 MeV neutron source spectrum effects in a ^{238}U fueled fusion-fission hybrid blanket, B. R. Leonard, Jr., U. P. Jenquin, D. L. Lessor, D. F. Newman, and K. B. Stewart, *SP425*, pp. 680-682 (Oct. 1975).

Key words: fusion blanket neutronics; nuclear reactions; ^{238}U.

Neutronic calculations have been made for a hybrid DT fusion reactor blanket in which the initial region is fueled with depleted uranium followed by lithium and graphite. The important parameters of the blanket are the tritium production, fissions, ^{238}U captures, and thermal flux in the graphite. The sensitivity of these integral parameters was studied as a function of ^{238}U region thickness and the ^{238}U microscopic data used. In particular the effect of modifying some improbable secondary neutron energy distributions of ^{238}U on both versions III and IV of ENDF/B was calculated. Calculations were made for multigroup data obtained by collapsing over constant and E^{-1} weighting functions below the fusion peak. Results were also obtained for a narrow DT fusion neutron peak and for neutron source distribution resulting from an essentially exact calculation of a mirror plasma driven by 100 keV neutral ^{2}H and ^{3}H.

Advanced fuels for nuclear fusion reactors, J. R. McNally, Jr., *SP425*, pp. 683-687 (Oct. 1975).

Key words: advanced-fuels; DD; D^{6}Li; fusion-dynamics; 1-layer; reactivity-coefficients.

Should magnetic confinement of hot plasma prove satisfactory at high beta ($\Sigma 8\pi nkT/B^2 > 0.2$), nuclear fusion fuels other than DT will be important in future fusion reactors. The prospect of the advanced fusion fuels DD and ^{6}LiD in such fusion reactors appears very promising provided the system is large, well reflected and has a sufficiently high density and temperature (high beta). Steady state burning of DD can ensue in a 60 kG field, 5m radius reactor for $\beta \gtrsim 0.1$ and wall reflectivity $R_\mu = 0.9$. The first generation thermonuclear reactions between D and D or ^{6}Li produce the very active, energy-rich fuels t and ^{3}He which exhibit a high burnup probability in very hot plasmas. Steady state burning of ^{6}LiD has also been demonstrated theoretically for low concentrations of ^{6}Li; however, important features of the ^{6}Lid system still need to be incorporated in the calculation. In particular, there is a need for new and improved nuclear cross section data on over 80 reaction possibilities.

A study of the ^{6}Li(n,α)t reaction between 2-10 MeV, C. M. Bartle, *SP425*, pp. 688-691 (Oct. 1975).

Key words: angular distribution; 2-10 MeV; ^{6}Li(n,α)t.

Absolute ^{6}Li(n,α)t cross section measurements are reported between 2.16 and 9.66 MeV. The results agree with the Pendlebury evaluation. The possibility of unfolding angular distributions from the pulse-height distributions in ^{6}LiI(Eu) is investigated.

Absolute cross sections for neutrons from ^{6}Li + d reactions at energies between 0.2 and 0.9 MeV, A. J. Elwyn, R. E. Holland,

F. J. Lynch, J. E. Monahan, and F. P. Mooring, *SP425*, pp. 692-696 (Oct. 1975).

Key words: $E_d = 0.2$-0.9 MeV; measured $(d^2\sigma)/(dE_d d\Omega)$ $(\theta; E_d)$, $\sigma_t(E_d)$ for ^{7}Be breakup reaction; measured $\sigma(\theta; E_d)$, $\sigma_t(E_d)$ for ^{6}Li(d,n)^{7}Be reactions.

Absolute differential and total cross sections in reactions of deuterons with ^{6}Li have been measured for neutrons corresponding to the formation of ^{7}Be in both its ground and its first excited state, and for the continuum neutrons involved in the breakup of ^{7}Be at deuteron energies between 0.2 and 0.9 MeV. Discussion of the experimental procedure is presented. The results indicate that the breakup neutrons are a substantial portion of the total neutron production cross section in this reaction. The reaction rates of the various neutron production reactions are presented.

Cross section measurements for charged particle induced reactions on ^{6}Li, C. R. Gould, J. M. Joyce, and J. R. Boyce, *SP425*, pp. 697-700 (Oct. 1975).

Key words: deduced σ $\alpha\nu\delta$ $\langle\sigma v\rangle$; measured $\sigma(\theta)$; nuclear reactions; ^{6}Li(p,p); ^{6}Li(p,^{3}He); ^{6}Li(^{3}He,p); ^{6}Li(d,p); ^{6}Li(d,α).

Investigations of proton, deuteron and helium induced reactions on ^{6}Li are of importance in connection with the advantages of fusion reactor cycles involving only charged particles. The cross section data for many of these reactions are incomplete and poorly known. We report measurements of the absolute cross sections of the reactions ^{6}Li(p,p), ^{6}Li(p,^{3}He) at $E_p = 3$-12 MeV, ^{6}Li(d,p), ^{6}Li(d,α) at $E_d = 2.25$-6 MeV and ^{6}Li(^{3}He,p) at $E = 3$-6 MeV. Our data are combined with available information in the literature to determine reaction rate parameters as a function of the temperature of the reacting nuclei.

Phase shift analysis of nD, nT, DD, DT, TT, αD and αT cross sections, C. Abulaffio and A. Peres, *SP425*, pp. 701-703 (Oct. 1975).

Key words: alpha particles; cross sections; deuterons; neutrons; phase shifts; tritons.

Explicit formulas are given for the elastic and inelastic cross sections of neutrons, deuterons, tritons and alpha particles. These formulas, obtained by a phase shift analysis, are the best fit to currently available experimental data, for all angles and energies up to 14 MeV.

^{238}U pulsed sphere measurements and CTR fusion-fission blanket calculations, C. Wong, J. D. Anderson, R. C. Haight, L. F. Hansen, and T. Komoto, *SP425*, pp. 704-707 (Oct. 1975).

Key words: implications for fusion-fission blanket calculations; spectra from 10 keV to 15 MeV compared with calculations; ^{238}U pulsed sphere measurements.

The neutron emission spectra from ^{238}U spheres pulsed with 14-MeV neutrons have been measured from the source energy down to 10 keV and have been compared with calculations employing ENDF/B-IV and ENDL cross sections. The low energy spectra (10 keV to 1 MeV) are best described using ENDF/B-IV cross sections while the high energy spectra (2 MeV to 15 MeV) are best described using ENDL cross sections. It is concluded that use of ENDL cross sections should yield the best estimate of tritium breeding and ENDF/B-IV that of Pu breeding in a CTR fusion-fission blanket.

The ^{94}Nb(n,γ)^{95}Nb, ^{95m}Nb reaction for the CTR reactor technology program, P. J. Persiani, E. M. Pennington, Y. D. Harker, and R. L. Heath, *SP425*, pp. 708-711 (Oct. 1975).

Key words: afterheat; blanket; cross-section; experimen fusion; radioactivity; resonance-levels.

Depending on the assumptions made of the neutron cro section behavior in the high-energy region, the captures ^{94}Nb have been found to be the major components influen ing the afterheat and radioactivity in fusion reactor desi problems. Preliminary blanket designs indicate that abo 60 percent of the capture rates in ^{94}Nb occur above 1 ke and 90 percent occur above 100 eV. Therefore an importa and timely cross section need is an estimate and measu ment of the ^{94}Nb(n,γ)^{95}Nb, ^{95m}Nb reaction in the keV-Me energy region. Nuclear level systematic studies using t two known positive energy resonances, the thermal cro section, the resonance integral and the apparent high-den ty of the low-lying levels in niobium, have suggested post lating the existence of negative energy levels or level. The considerations involved the postulated negative ener resonances, and assumptions about positive ener resonances above 50 eV and average unresolved paramete based on nuclear systematics. The experimental techniq to obtain a measured integrated cross-section in the fast f sion spectrum of the Coupled Fast Reactivity Measu ments Facility (CFRMF) and the Argonne Fast Sour Reactor (AFSR) is investigated with foils of ^{93}Nb containi 4.1 percent ^{94}Nb utilizing Ge(Li) spectrometry.

Production cross sections of some micro and milliseco isomers with 14.8 MeV neutrons, G. N. Salaita and P. Eapen, *SP425*, pp. 712-715 (Oct. 1975).

Key words: cylic activation; formation cross sections me surements; isomeric states.

The formation cross sections for the isomeric states Mg, Al, Y, In, Hf, Tl, Pb, and Bi by the (n,p), (n,α), a (n,2n) reactions have been measured using the cyclic activ tion technique and a Ge(Li) detector. The half-lives of t induced isomeric activities were determined using a wi range time-to-pulse height converter and a multichan analyzer.

Reactivities for two-component fusion calculations, G. Miley and H. H. Towner, *SP425*, pp. 716-721 (Oct. 1975).

Key words: advanced fusion fuels; Doppler effect; fusi cross sections; fusion energy multiplication; fusion reacti ties; Two-Component Torus (TCT).

Tables and graphs of fusion reactivities ($\langle\sigma v\rangle$) are read available for fusion in thermalized (Maxwellian) plasr using common fuels. However, plans to construct the Tw Component Torus (TCT) have created a need for reacti ties to characterize fusion via high-energy beams interacti with low-temperature target plasmas. Such reactivities a derived in the present paper for a variety of fuels includi $D \rightarrow T$, $D \rightarrow {}^3He$, $D \rightarrow D$, $T \rightarrow T$, $T \rightarrow {}^3He$, and $p \rightarrow {}^{11}$ Some examples of the use of these reactivities in two-co ponent calculations are also described.

Application of Bondarenko formalism to fusion reactors, D. Soran and D. J. Dudziak, *SP425*, pp. 722-728 (Oct. 197

Key words: Bondarenko; f-factors; fusion reactors; nio um; Reference Theta-Pinch Reactor; tritium breeding.

The Bondarenko formalism used to account for resonan self-shielding effects (temperature and composition) in Reference Theta-Pinch Reactor is reviewed. A material interest in the RTPR blanket is ^{93}Nb, which exhibits a lar number of capture resonances in the energy region bel 800 keV. Although Nb constitutes a small volume fracti of the blanket, its presence significantly affects t

nucleonic properties of the RTPR blanket. The effects of self-shielding in ^{93}Nb on blanket parameters such as breeding ratio, total afterheat, radioactivity magnet-coil heating and total energy depositions have been studied. Resonance selfshielding of 93Nb, as compared to unshielded cross sections, will increase tritium breeding by ~ 7 percent in the RTPR blanket, and will decrease blanket radioactivity, total recoverable energy, and magnet-coil heating. Temperature effects change these parameters by less than 2 percent. The method is not restricted to the RTPR, as a single set of Bondarenko f-factors is suitable for application to a variety of fusion reactor designs.

Neutron cross-section measurements on ^{236}U, L. Mewissen, . Poortmans, G. Rohr, J. Theobald, H. Weigmann, and G. anpraet, *SP425*, pp. 729-732 (Oct. 1975).

Key words: enriched target; measured $\sigma_{n,T}$, $\sigma_{n,\gamma}$, $\sigma_{n,n'}$; nuclear reactions ^{236}U(n,n), ^{236}U(n,γ), E = 30-1800 eV; ^{237}U resonances deduced Γ_n, Γ_γ.

Capture, scattering and total cross-section measurements have been performed on ^{236}U, over an energy range from 30 eV up to 1.8 keV. The neutron width Γ_n could be determined for 97 levels and the capture width Γ_γ for 57 among them. The average radiative width is: $\Gamma_\gamma = [23.0 \pm 0.3$ (stat.) ± 1.5(syst.)] meV. For the s-wave strength function we find: $S_n = (1.05 \pm 0.14)10^{-4}$.

p-wave assignment of ^{238}U neutron resonances, F. Corvi, G. ohr, and H. Weigmann, *SP425*, pp. 733-737 (Oct. 1975).

Key words: enriched targets; measured σ(E, Eγ) and $\sigma_{n\gamma}$ ^{238}U deduced resonances, π, gΓ_n; nuclear reactions ^{238}U(n, γ), E = 10-1600 eV.

A method of p-wave assignment of ^{238}U resonances is presented, consisting of measuring the fraction of capture γ-rays above 4.3 MeV for neutron resonances in the range 10-1600 eV. In this way, 57 resonances showing an enhancement of the high energy γ-ray yield, were identified as p-waves. In addition, a capture cross-section measurement was performed on a $6.32 \cdot 10^{-3}$ at/barn thick sample in order to obtain the gΓ_γ values of such small resonances. The derived final estimates of the p-wave strength functions S_1 and of the s-wave level spacing D_o are: $S_1 = (2.3^{+0.5}_{-0.4}) \cdot 10^{-4}$; $D_o = (22.4 \pm 1.0)$eV.

Neutron resonance parameters of ^{238}U, Y. Nakajima, A. sami, M. Mizumoto, T. Fuketa, and H. Takekoshi, *SP425*, . 738-741 (Oct. 1975).

Key words: background; JAERI linac; natural U; resonance parameters Γ_n^o up to 5 keV; three thicknesses; transmission measurements; 190-m flight path.

Neutron transmission measurements on natural U samples were performed in the energy region from 20 eV up to 30 keV on a 190-m flight path of the JAERI 120-MeV linac neutron time-of-flight spectrometer. Samples were all metallic slabs with three thicknesses of 0.00725, 0.0144 and 0.0236 atoms/barn, respectively. One of them was cooled down to 77 K to reduce Doppler broadening. The best nominal resolution of the measurements was 0.3 nsec/m. A special attention has been paid to determine the background, because the shape of the background was found to depend on the thickness of the sample in the beam. Resonance parameters Γ_n^o are obtained in the energy region up to about 5 keV with the Atta-Harvey area-analysis program. Results are compared with currently available experimental data.

Evidence for structure in the sequence of s-wave levels in ^{238}U, E. Melkonian, J. P. Felvinci, and W. W. Havens, Jr., *SP425*, pp. 742-743 (Oct. 1975).

Key words: collective motion; correlations; level densities; resonance levels; ^{238}U; Γ_n^o; Γ_γ^o.

The levels in ^{238}U show unusual clusterings of large and small levels as evidenced by runs statistics and sequential correlation of values of Γ_n^o. Also, Γ_n^o is found to show significant correlation with Γ_γ. These effects are interpreted in terms of a model which assumes that excitation states are built upon persistent states of collective vibration and that an entering neutron seeks to form those states involving minimum change of particle motion.

Total neutron cross section measurements on gross fission products, H. G. Priesmeyer and U. Harz, *SP425*, pp. 744-747 (Oct. 1975).

Key words: gross fission products; neutron cross section; time-of-flight; 1-240 eV.

Fast-chopper time-of-flight transmission measurements have been made using gross fission product samples of different irradiation and cooling histories, in order to find isotopic identifications and parameters of fission product resonances. The covered energy range was from 1 eV to 240 eV with resolutions of 47 ns/m and 94 ns/m. Some prominent fission product resonances have been found and can partly be identified. From the transmission analysis the U 235 content and burnup can be calculated within ≤ 5 percent.

High resolution total neutron cross-section in ^{54}Fe and ^{56}Fe, M. S. Pandey, J. B. Garg, J. A. Harvey, and W. M. Good, *SP425*, pp. 748-753 (Oct. 1975).

Key words: high resolution; total neutron cross section; ^{54}Fe; ^{56}Fe.

High resolution neutron total cross-section measurements on ^{54}Fe and ^{56}Fe have been made using the ORELA facility and resonance parameters are reported up to an energy of 500 keV. The total cross-section data were analyzed by R-matrix multi-level code for broad, interfering s-wave resonances. For narrow and noninterfering s-wave resonances and $l > 0$-wave resonances transmission data were analyzed using Harvey-Atta code of area analysis. From these values of resonance parameters, the values of level density $\langle D \rangle$ and strength function for s- and p-wave neutron scattering have been determined. Statistical distributions of spacing and reduced neutron widths are presented. A large number of p-wave resonances are observed which have not been reported before.

Thick sample transmission measurement and resonance analysis of the total neutron cross section of iron, S. Cierjacks, G. Schmalz, R. Töpke, R. R. Spencer, and F. Voss, *SP425*, pp. 754-757 (Oct. 1975).

Key words: Fe(n), $E_n = 0.5$-30 MeV; measured σ_{nT}(E); multilevel R-matrix resonance analysis.

New transmission measurements on natural iron samples were performed at the 190 m flight path of the Karlsruhe fast neutron time-of-flight spectrometer, allowing for an improved resolution of 0.015 ns/m. The measurements were carried out in the energy range from 0.5-30 MeV using two largely different sample thicknesses. The thick sample results indicate, that the deep s-wave minima are now fully explored in the energy range below the inelastic scattering threshold at about 850 keV. From the highly resolved transmission data resonance parameters were determined by multilevel R-matrix analysis. The results of the thick sample

measurements between 0.5-30 MeV and the resonance parameters determined in the range between 500-800 keV are presented.

Gamma-ray production measurements due to interactions of neutrons with elements required for nuclear power applications and design, G. T. Chapman, J. K. Dickens, T. A. Love, G. L. Morgan, and E. Newman, *SP425*, pp. 758-761 (Oct. 1975).

Key words: cross sections; (n,xγ); photon energy.

For the past three years neutron-induced gamma-ray production cross sections have been made for a variety of elements at the Oak Ridge Electron Linear Accelerator. A large, well shielded, NaI spectrometer was used as the gamma-ray detector and ORELA as the neutron source. The facility provides a consistent data set for neutron energies from 0.7 to 20 MeV and photon energies from 0.3 to 10.5 MeV. Typically the samples are flat plates of the element of ≈ 0.02 atoms/barn thickness, although several elements studied required samples in compound form. The data are accumulated in a two-parameter array, gamma-ray pulse height versus neutron time-of-flight. Data reduction was accomplished by binning in desired neutron-energy groups and in fixed photon-energy groups. For each neutron-energy group the data were unfolded using FERD unfolding routine, and the results are in the form of absolute differential cross sections, $d^2\sigma/d\omega dE$, for each photon-energy bin. So far data have been obtained for 20 elements (Li, C, N, O, F, Mg, Al, Si, Ca, Fe, Ni, Cu, Zn, Nb, Ag, Sn, Ta, W, Au, and Pb).

Cross sections for the production of low energy photons by neutron interactions with fluorine and tantalum, J. K. Dickens, G. L. Morgan, and F. G. Perey, *SP425*, pp. 762-765 (Oct. 1975).

Key words: cross sections; fluorine; neutron-induced low-energy photons; tantalum.

Differential cross sections for the production of low energy photons (< 240 keV) by neutron interactions in fluorine and tantalum have been measured for neutron energies between 0.1 and 20 MeV. Photons were detected at 92° using an intrinsic germanium detector. Incident neutron energies were determined by time-of-flight techniques for a white source spectrum.

Spectral gamma-ray production cross-section measurements from threshold to 20 MeV, V. C. Rogers, V. J. Orphan, C. G. Hoot, V. V. Verbinski, D. G. Costello, and S. J. Friesenhahn, *SP425*, pp. 766-769 (Oct. 1975).

Key words: E_n to 21 MeV; E_γ to 10 MeV; σ(n,xγ) measurements.

The gamma-ray production cross-section measurement program at IRT is described. Neutrons from epithermal energies to 21 MeV were produced with the IRT Linac, and gamma rays resulting from neutron interactions were detected with a Ge(Li) spectrometer system. Representative results are presented for C, N, Al, Si, and Fe.

Fourteen-MeV, neutron-induced gamma-ray production cross sections for several elements, E. D. Arthur, D. M. Drake, M. G. Silbert, and P. G. Young, *SP425*, pp. 770-773 (Oct. 1975).

Key words: $E_n = 14.2$ MeV; measured $d^2\sigma/d\Omega dE$; nuclear reaction (n,n′γ).

A pulsed 14.2 MeV neutron source and a NaI(Tl) gamma-ray spectrometer were used to measure gamma-ray production cross sections for several elements in the range A = 12 to 239. Angular distributions for some of the more prominent gamma ray groups were obtained. Complete gamma-ray production cross sections were measured for all the sample materials, including those in which no clearly separable gamma ray groups appeared.

The low energy total cross section of ^{36}Ar, S. F. Mughabghab and B. A. Magurno, *SP425*, pp. 774-775 (Oct. 1975).

Key words: parameters of bound level of Ar-36.

To compare the predictions of the valence model with measured partial radiative widths of Ar-36 an accurate knowledge of the bound-level parameters is required. This is achieved by carrying out a Breti-Wigner parameter fit to the total cross section of Ar-36 measured by Chrien et al. and renormalized to the recommended values of the thermal capture and scattering cross sections. The result is as follows:

$$E_n = -10 \text{ keV}, \Gamma_n^o = 92.3 \text{ eV}, \Gamma_\gamma = 1.26 \text{ eV}.$$

Neutron cross sections of Ni-59, G. J. Kirouac and H. M. Eiland, *SP425*, pp. 776-779 (Oct. 1975).

Key words: nickel-59; resonance integral; resonance parameters; thermal cross section.

The thermal cross section and resonance integral for Ni-59 have been measured in integral measurements using the pile oscillator technique. The results are σ_n (2200 m/sec) = 92 ± 4 barns and RI = 125 ± 8 barns. Separate differential measurements of the neutron total cross section from 0.5 eV to above 2 keV were performed at the RPI linear accelerator. A resonance was observed at 203 eV and analyzed by shape and area methods. Parameters for the resonance have been determined. The integral and differential results were compared and found to be in reasonable agreement.

Neutron resonance spectroscopy at Nevis laboratories, G. Hacken, H. I. Liou, J. Rainwater, and U. N. Singh, *SP425*, pp. 780-783 (Oct. 1975).

Key words: measured $\sigma_t(E)$; (n,n), (n,γ), E = 1 eV-few keV; nuclear reactions; summary of deduced E_n, $g\Gamma_n$, Γ_γ, S_o, $\langle D_o \rangle$; various statistical tests.

A review of the results of high resolution, high intensity neutron time of flight spectroscopy with the Columbia University Nevis Synchrocyclotron is presented. The review includes a brief description of the experimental facilities and a summary of resonance parameter results.

Threshold photoneutron spectroscopy of nuclei near A = 140, R. J. Holt and H. E. Jackson, *SP425*, pp. 784-787 (Oct. 1975).

Key words: deduced $\Sigma\Gamma_{\gamma 0}$ (M1) and $\Sigma\Gamma_{\gamma 0}$ (E1); $E_x \approx 9$ MeV; measured $\sigma(E_n,\theta)$; nuclear reactions ^{138}Ba(γ,n), ^{140}Ce(γ,n).

The E1 and M1 radiative strength functions have been measured for nuclei with atomic mass number near A = 140 and at an excitation energy of approximately 9 MeV using the threshold photoneutron technique. A method was developed for extracting the dipole strength even though the first excited state of the daughter nucleus is near the ground state. The photoneutron spectra were measured at laboratory angles of 90° and 135° and with high resolution (0.5 ns/m) using the time-of-flight spectrometer associated with the Argonne high-current linac. In particular the dipole strengths found in ^{138}Ba and ^{140}Ce are discussed. These results are compared with theoretical estimates and with the radiative strengths of nuclei in the mass range 50 < A < 250.

Analyzing powers of the ^{6}Li($\vec{n}$, t)^{4}He reaction, M. Karim and J. C. Overley, *SP425*, pp. 788-791 (Oct. 1975).

Key words: deduced analyzing powers A(0); measured yield asymmetries; nuclear reactions: ^{6}Li($\vec{n}$, t)^{4}He, E = 0.2-1.4 MeV.

We have measured analyzing powers for the ^{6}Li($\vec{n}$, t)^{4}He reaction for neutron energies between 0.2 and 1.4 MeV. An energy continuum of neutrons was produced by bombarding a thick lithium metal target with a 3.5-MeV, nanosecond-pulsed proton beam. The partially polarized neutrons emitted at 50° were incident on an evaporated ^{6}Li metal target. A silicon surface barrier detector was used to measure triton and α-particle yields as a function of particle energy. Tritons were distinguished from α particles with time-of-flight techniques. Yield asymmetries were determined at laboratory angles of 35, 60 and 80° with angular resolutions of ±5°. The α-particle yield asymmetries were converted to backward angle triton asymmetries, providing data at six angles. Analyzing powers as a function of angle were deduced. Although results are tentative, analyzing powers near 90° and 250 keV are negative (~ −0.3) while above 700 keV they are large and positive (~ −+0.9) and vary slowly with neutron energy.

Neutron-absorption cross section of sodium-22, R. Rundberg, M. F. Elgart, H. L. Finston, E. T. Williams, and A. H. Bond, Jr., *SP425*, pp. 792-794 (Oct. 1975).

Key words: cross section; neutron; resonance; sodium-22; thermal; Westcott.

We describe a simple method for determining the neutron-absorption cross sections for radionuclides produced and consumed in a reactor-neutron flux. Data were obtained for ^{22}Na which through application of Westcott's procedure, yielded the following: σ_{n} = 51.1 ± 3.1 Kbarns, s_{n} = 2.3 ± 0.1, and Σ' = 100 ± 10 Kbarns.

Evidence for valence neutron capture in s-wave neutron capture in ^{36}Ar and ^{54}Fe, S. F. Mughabghab, *SP425*, pp. 795-798 (Oct. 1975).

Key words: thermal capture spectra; valence capture in ^{36}Ar and ^{54}Fe.

The valence and channel neutron model of Lane and Lynn remarkably account for partial radiative widths of neutron resonances in the 3p-giant resonance. In this investigation, evidence is presented for valence neutron capture at and in the neighborhood of the 3s- giant resonance in target nuclei Ar-36 and Fe-54. In addition, the variation of the correlation coefficient $\rho(\Gamma_{\gamma ij}\, E_{\gamma}^{-n}, (2J+1)\, S_{nlp})$ with the reduction power factor n of the γ ray energy is studied.

Neutron resonance spectroscopy. ^{209}Bi, U. N. Singh, J. Rainwater, H. I. Liou, G. Hacken, and J. B. Garg, *SP425*, pp. 799-801 (Oct. 1975).

Key words: deduced E_{n}, l, J, $g\Gamma_{n}$, S_{n}, S_{l}; measured $\sigma_{t}(E)$; nuclear reactions ^{209}Bi (n,n), (n,γ), E = 500 eV-75 keV.

Neutron time of flight transmission measurements were made on several samples of ^{209}Bi using the Nevis Synchrocyclotron of Columbia University. The resonance parameters are given for 29 levels to 75 keV. Out of the 29 observed levels 10 were l = 0 and 19 were l = 1 levels. The implied s and p-strength functions are $10^{4}S_{n} = (0.60\ ^{+0.39}_{-0.21})$ and $10^{4}S_{1} = (0.19^{+0.08}_{-0.05})$.

Measurement of neutron capture cross section near 24 keV, . Yamamuro, T. Doi, T. Hayase, Y. Fujita, K. Kobayashi, id R. C. Block, *SP425*, pp. 802-805 (Oct. 1975).

Key words: $C_{6}F_{6}$ detector; Fe-filtered beam; neutron capture cross section; pulse-height weighting; time-of-flight method; ^{93}Nb, Ag, ^{127}I, ^{165}Ho, ^{197}Au and ^{238}U.

Neutron capture cross sections of ^{93}Nb, Ag, ^{127}I, ^{165}Ho, ^{197}Au and ^{238}U were measured near 24 keV using the Fe-filtered-beam method. A 15-cm thick Fe filter was placed in the neutron time-of-flight beam produced by the KUR 46-MeV electron Linac. Capture γ-rays were detected by two $C_{6}F_{6}$ total energy detectors located on a 12-m flight path. Pulse-height weighting was used to determine the relative capture efficiency. The neutron flux was determined with the detector via the ^{10}B (n;$\alpha_{1}\gamma$) reaction and saturated resonance capture in Ag at 5.2 eV. Multiple scattering corrections were applied to the data, resulting in 24 keV capture cross sections of 0.33, 1.10, 0.76, 1.26, 0.68 and 0.50 barns for ^{93}Nb, Ag, ^{127}I, ^{165}Ho, ^{197}Au and ^{238}U, respectively. Total errors are 5 to 7 percent, with an estimated systematic error of 4 percent.

Fluctuations in the neutron strength function, C. M. Newstead, *SP425*, pp. 806-809 (Oct. 1975).

Key words: fluctuations; neutron strength functions; optical potential; quasi-particles.

Strength function fluctuations are interpreted in terms of variation of the quasi-particle state density. The anomalous behaviour of the neodymium isotopes is described and an account of the fluctuations of S_{n} in the 3S and 4S size resonances is given. Fluctuations of the local strength fluctuations with energy are discussed.

Measurements of thermal neutron cross sections for helium production in ^{59}Ni, J. McDonald and N. G. Sjöstrand, *SP425*, pp. 810-812 (Oct. 1975).

Key words: alpha particles; cross section; helium; nickel; neutron; spectrum.

The cross section for the reaction ^{59}Ni (n,α)^{56}Fe was measured at three neutron energies from 0.029 to 0.042 eV. The alpha particles were recorded using a Si surface barrier detector. The measurements were made relative to Li-6. Within experimental errors the cross section ratio remained constant for the three energies. Assuming that the 1/v law applies the ^{59}Ni (n,α) cross section at 0.0253 eV is found to be 22.2 ± 1.7 barn.

Differential cross sections for the 0.847-MeV gamma ray from iron for incident neutrons of 8.5, 10.0, 12.2, and 14.2 MeV, D. M. Drake, L. R. Veeser, M. Drosg, and G. Jensen, *SP425*, pp. 813-815 (Oct. 1975).

Key words: E_{n} = 8.5, 10.0, 12.2, 14.2 MeV; Fe(n,xγ); measured $\sigma(\theta)$ for E_{γ} = 0.847 MeV; nuclear reactions; θ = 90°, 75°, 55°, 35°.

Neutron-induced differential gamma-ray production cross sections for the 0.847-MeV gamma ray from iron have been measured using a pulsed ^{3}H(p,n)^{3}He neutron source and a NaI spectrometer. Background caused by break-up neutrons and Compton-scattered gamma rays was suppressed by placing the sample about one meter from the neutron source and using time-of-flight to select only pulses caused by the monoenergetic ^{3}H(p,n)^{3}He neutrons.

High energy γ-ray transitions of ^{56}Fe resonances in the energy range 7-70 keV, H. Beer, R. R. Spencer, and F. Käppeler, *SP425*, pp. 816-818 (Oct. 1975).

Key words: E_{n} = 7-70 keV; natural iron target; nuclear reaction ^{56}Fe (n,γ); relative partial radiation widths; γ-transitions in ^{57}Fe of ^{56}Fe resonances.

High energy γ-ray transitions to low lying states in ^{57}Fe following neutron capture in ^{56}Fe were investigated for individual resonances in the energy region 7-70 keV at the Karlsruhe 3 MV pulsed Van-de-Graaff-accelerator by means of a 50 cc Ge(Li)-detector. As a result relative partial radiation widths for 5 transitions of 4 resonances were determined.

Excitation functions of the (n,2n) reactions on ^{12}C and ^{238}U, A. Ackermann, B. Anders, M. Bormann, and W. Scobel, *SP425*, pp. 819-822 (Oct. 1975).

Key words: measured σ(E); nuclear reactions $^{12}C(n,2n)$, E= 23-34 MeV; statistical model calculations; $^{238}U(n,2n)$, E= 13-18 MeV.

The excitation functions of the reaction $^{12}C(n,2n)^{11}C$ for incident neutron energies from 23 to 34 MeV and of $^{238}U(n,2n)^{237}U$ from 13 to 18 MeV have been measured with activation techniques. The results are compared with existing data and interpreted with the statistical model approach. The calculations performed for ^{238}U include fission competition and preequilibrium contributions to account for an enhanced (n,2n) yield at projectile energies above 15 MeV.

Incoherent neutron scattering cross-sections as determined by diffuse neutron scattering techniques, W. Schmatz, G. Bauer, and M. Löwenhaupt, *SP425*, pp. 823-824 (Oct. 1975).

Key words: diffuse neutron scattering; incoherent neutron scattering; point defects.

A discussion is given of the way in which small incoherent scattering cross-sections can be obtained as a by-product of point defect scattering studies. A table with σ_{inc}-values for ten elements is given.

Cross section and method uncertainties: The application of sensitivity analysis to study their relationship in calculational benchmark problems, C. R. Weisbin, E. M. Oblow, J. Ching, J. E. White, R. Q. Wright, and J. Drischler, *SP425*, pp. 825-833 (Oct. 1975).

Key words: air transport; benchmark; profiles; sensitivity; uncertainties.

Sensitivity analysis is applied to the study of an air transport benchmark calculation to quantify and distinguish between cross-section and method uncertainties. The boundary detector response was converged with respect to spatial and angular mesh size, P_l expansion of the scattering kernel, and the number and location of energy grid boundaries. The uncertainty in the detector response due to uncertainties in nuclear data is 17.0 percent (one standard deviation, not including uncertainties in energy and angular distribution) based upon the ENDF/B-IV "error files" including correlations in energy and reaction type. Differences of approximately 6 percent can be attributed exclusively to differences in processing multigroup transfer matrices.

Benchmark experiments for nuclear data, E. M. Bohn, R. J. LaBauve, R. E. Maerker, B. A. Magurno, F. J. McCrosson, and R. E. Schenter, *SP425*, pp. 834-841 (Oct. 1975).

Key words: benchmark experiments; dosimetry; fast reader testing; fission products; shielding; thermal reactor testing.

Benchmark experiments offer the most direct method for validation of nuclear data. Benchmark experiments for several areas of application of nuclear data have been specified by CSEWG. These experiments are surveyed and tests of recent versions of ENDF/B are presented.

Estimated uncertainties in nuclear data—An approach, F. G. Perey, *SP425*, pp. 842-847 (Oct. 1975).

Key words: correlations; covariances; data adequacy; estimated uncertainties; evaluations; neutron transport.

The need to communicate estimated uncertainties in evaluated nuclear data to be used in the assessment of their adequacy in applications has been recognized in the ENDF/B system. Starting with ENDF/B-IV, the data files contain formatted data describing the estimated covariances of some of the microscopic cross sections in such a form that they can be processed by computer codes to generate covariance matrices of quantities used in solving neutron transport problems such as group cross sections. The basic concepts behind the representation of such quantities will be described and the work done so far in the representation and manipulation of such quantities will be discussed. Problem areas not yet addressed in ENDF/B-IV but under study will be discussed.

A survey of computer codes which produce multigroup data from ENDF/B-IV, N. M. Greene, *SP425*, pp. 848-854 (Oct. 1975).

Key words: computer codes; multi-group data; survey.

The features of three code systems that produce multigroup neutron data are contrasted. This includes the ETOE-2/MC²-2/SDX, MINX/SPHINX and AMPX code packages. These systems all contain a fairly extensive set of processing capabilities with the current evaluated nuclear data files—ENDF/B. They were designed with different goals and applications in mind. This paper discusses some of their differences and the implications for particular situations.

Measurement of (n,2n) and (n,3n) cross-sections for incident energies between 6 and 15 MeV, J. Fréhaut and G. Mosinski, *SP425*, pp. 855-858 (Oct. 1975).

Key words: E_n = 8-15 MeV; measured σ(En); nuclear reactions ^{56}Fe, ^{59}Co, $^{76,78,80,82}Se$, ^{89}Y, ^{93}Nb, ^{103}Rh, ^{169}Tm, ^{175}Lu, ^{181}Ta, W, Pt, ^{197}Au, ^{209}Bi, $^{238}U(n,2n)$; $^{238}U(n,3n)$.

Cross sections for the (n,2n) and (n,3n) reactions have been measured for several nuclides between 6 and 15 MeV using a large liquid scintillator to count the neutrons directly. Measurements were made relative to fission cross section of ^{238}U for ^{56}Fe, ^{59}Co, ^{76}Se, ^{78}Se, ^{80}Se, ^{82}Se, ^{89}Y, ^{93}Nb, ^{103}Rh, ^{169}Tm, ^{175}Lu, ^{181}Ta, ^{197}Au, ^{209}Bi, ^{238}U, and for the natural elements Pt and W. The relative accuracy was generally in the range 5 to 10 percent. The present results are compared with previous measurements.

Excitation curve for the production of $^{115}In^m$ by neutron inelastic scattering, D. C. Santry and J. P. Butler, *SP425*, pp. 859-861 (Oct. 1975).

Key words: excitation curve; neutron elastic scattering; $^{115}In^m$; 0.335-14.7 MeV.

Cross sections for the reaction $^{115}In(n,n')^{115}In^m$ have been measured by the activation method from a threshold energy of 0.335 MeV to 14.74 MeV. Cross sections at energies below 5.3 MeV were based on neutron flux measurements determined with a calibrated neutron long counter, while at higher energies measurements were made relative to the known cross section for the $^{32}S(n,p)^{32}P$ reaction. An effective cross section for a ^{235}U fission neutron spectrum calculated from the measured excitation curve is 173 ± 9 mb.

Inelastic neutron excitation of the ground state rotational band of ^{238}U, P. Guenther and A. Smith, *SP425*, pp. 862-865 (Oct. 1975).

Key words: E=0.3-3.0 MeV; nuclear reaction ^{238}U(n,n) and ^{238}U(n,n'); $\sigma(\Theta,E)$; Θ_{lab}=20 to 160°.

Cross sections for the neutron excitation of the 2+(45 keV), 4+(148 keV) and 6+(308 keV) states in ^{238}U were measured to incident energies of ≈3.0 MeV. The experimental resolution was sufficient to resolve these components throughout the measured energy range. Particular attention was given to energies near threshold and in the few MeV range where direct reaction contributions were appreciable. The experimental results were compared with theoretical estimates based upon statistical and coupled-channel models deduced from comprehensive studies of neutron scattering from heavy-rotational-deformed nuclei. An evaluated inelastic scattering data set was derived from the present experimental and calculational results and previously reported experimental values and compared with respective values from the ENDF-IV file.

Differential elastic and inelastic scattering of 9-15 MeV neutrons from carbon, F. O. Purser, D. W. Glasgow, H. H. Hogue, J. C. Clement, G. Mack, K. Stelzer, J. R. Boyce, D. H. Epperson, S. G. Buccino, P. W. Lisowski, S. G. Glendinning, E. G. Bilpuch, H. W. Newson, and C. R. Gould, *SP425*, pp. 866-870 (Oct. 1975).

Key words: measured $\sigma(E)_{n},\theta)$; nuclear reactions C(n,n), C(n,n'), E=9-15 MeV.

Measurements have been made of the differential elastic and inelastic scattering cross sections, at 28 angles each, for 9, 9.21, 9.6, 10, 10.25, 10.74, 11, 11.22, 11.79, 12, 13, 14, 14.5, and 15 MeV neutrons incident upon natural carbon. The measurements were made with the TUNL FN tandem accelerator and a high-precision goniometer time-of-flight spectrometer. Monte Carlo simulation has been used to correct the differential cross sections for multiple scattering. Absolute uncertainties are typically 5 percent. These data partially fill the 9-15 MeV gap in the C elastic and inelastic scattering data set required for the CTR program.

Neutron inelastic scattering cross sections in the energy range 2 to 4.5 MeV, M. A. Etemad, *SP425*, pp. 871-874 (Oct. 1975).

Key words: Hauser-Feshbach; inelastic-scattering; measurements; MeV range 2 to 4.5; neutrons; time-of-flight.

Fast neutron inelastic scattering cross sections have been measured for the elements Al, Ti, V, Mn, Fe, Ni, Nb, Pb and Bi by the time-of-flight technique. The measurements were made in the energy range of 2 to 4.5 MeV in steps of 0.25 MeV and at a scattering angle of 125°. The experimental results are compared to the excitation functions calculated on the basis of the Hauser-Feshbach formalism and corrected for the effects of the level width fluctuations.

The absolute polarization of fast neutrons elastically scattered from light nuclei, F. W. K. Firk, J. E. Bond, G. T. Hickey, R. J. Holt, R. Nath, and H. L. Schultz, *SP425*, pp. 875-878 (Oct. 1975).

Key words: E=2 to 5 MeV; measured $\vec{p}(E,\theta)$ absolutely for ^{12}C(n,$\vec{n}$) reaction then determined $\vec{A}(E,\theta)$ for other reactions; nuclear reactions ^{4}He($\vec{n}$,n); ^{6}Li($\vec{n}$,n); ^{9}Be($\vec{n}$,n); ^{12}C($\vec{n}$,n) and ^{16}O($\vec{n}$,n); R-function and phase-shift analyses; θ_{lab}=20 to 150°.

Photoneutrons from the target of the Yale LINAC were polarized by elastic scattering from a cylinder of graphite. The polarized neutrons were observed at angles of 50 and 130° and their energies determined with a time-of-flight resolution of 0.75 ns·m^{-1}. The *absolute* polarization of the neutrons was measured in a true double-scattering experiment; this polarized source then was used to measure the analyzing powers of the reactions $\vec{n}$-^{4}He, $\vec{n}$-^{6}Li, $\vec{n}$-^{9}Be, and $\vec{n}$-^{16}O over wide ranges of energy and angle. These reactions are of interest from three viewpoints i) the design of fission and fusion power reactors ii) absolute neutron standards and iii) fundamental theory. General, multi-level R-function analyses and phase-shift analyses of the observed analyzing powers were made in all cases. Differential and total cross sections were predicted and compared with currently available measurements.

Inelastic scattering of fast neutrons from ^{103}Rh, D. Reitmann, E. Barnard, D. T. L. Jones, and J. G. Malan, *SP425*, pp. 879-882 (Oct. 1975).

Key words: fast neutrons; inelastic scattering; isomeric state; level scheme; optical model; rhodium-103.

Cross sections for elastic and inelastic scattering of fast neutrons from ^{103}Rh were measured at energies up to 1500 keV. Additional information about the level scheme followed from (n,n'γ) measurements. The effective cross section for excitation of the isomeric state at 40 keV was derived from these results and compared with activation measurements and theoretical results.

ORNL neutron scattering cross section measurements from 4 to 8.5 MeV: A summary, W. E. Kinney and F. G. Perey, *SP425*, pp. 883-885 (Oct. 1975).

Key words: cross section; differential; elastic; inelastic; neutron; scattering.

The ORNL program to measure neutron elastic and inelastic scattering cross sections for 26 nuclides from C to ^{238}U in the 4-8.5 MeV energy range is summarized. Data acquisition and reduction techniques are reviewed and typical results given. The nuclides investigated are tabulated.

Differential elastic scattering cross sections of sulphur for 14.8 MeV neutrons by surface of revolution technique, A. M. Ghose, A. Chatterjee, and S. Nath, *SP425*, pp. 886-888 (Oct. 1975).

Key words: differential elastic scattering cross section; fast neutrons; scattering geometry; uniform sensitivity neutron counter.

A new technique has been developed for the absolute measurements of differential elastic scattering cross sections of nuclei for fast neutrons. The method is based on constant angle scatterers shaped in the form of a surface of revolution around the source to detector line as axis. Inelastically scattered neutrons have been discriminated by the multiple bias technique applied to recoil proton plastic detectors. The results obtained for sulphur for 14.8 MeV neutrons will be presented.

Differential cross sections for carbon neutron elastic and inelastic scattering from 8.0 to 14.5 MeV, G. Haouat, J. Lachkar, Y. Patin, J. Sigaud, and F. Coçu, *SP425*, pp. 889-892 (Oct. 1975).

Key words: angular distributions; carbon-neutron elastic and inelastic scattering; E_{n}=8.0-14.5 MeV; excitation functions.

Differential elastic and inelastic cross sections for fast neutrons scattered by carbon have been measured between 8.0 and 14.5 MeV. No other results on ^{12}C seem to have been reported, at this time, between 9 and 14 MeV. A

complete and consistent set of data for carbon, including total, elastic and inelastic, (n,α) and (n,n'3α) cross sections, is now available for energies below 14.5 MeV.

Level and decay schemes of even-A Se and Ge isotopes from (n,n'γ) reaction studies, J. Sigaud, Y. Patin, M. T. McEllistrem, G. Haouat, and J. Lachkar, *SP425*, pp. 893-896 (Oct. 1975).

Key words: E_γ; $E_n = 2.0$-4.1 MeV; level schemes; (n,n'γ) reaction; $\sigma(E_\gamma,\Theta)$; ^{76,78,80,82}Se, ^{76}Ge.

The energy levels and the decay schemes of ^{76}Se, ^{78}Se, ^{80}Se and ^{76}Ge have been studied through the measurements of (n,n'γ) differential cross sections. Gamma-ray excitation functions have been measured between 2.0- and 4.1-MeV incident neutron energy, and angular distributions have been observed for all of these isotopes.

Symmetry effects in neutron scattering from isotopically enriched Se isotopes, J. Lachkar, G. Haouat, M. T. McEllistrem, Y. Patin, J. Sigaud, F. Coçu, *SP425*, pp. 897-900 (Oct. 1975).

Key words: deduced optical-model parameters; enriched targets; measured $\sigma(\theta)$; nuclear reactions ^{76,78,80,82}Se(n,n), (n,n'), E = 6-10 MeV.

Differential cross sections for neutron elastic and inelastic scattering from ^{76}Se, ^{78}Se, ^{80}Se and ^{82}Se, have been measured at 8-MeV incident neutron energy and from ^{76}Se and ^{82}Se at 6- and 10-MeV incident energies. The differences observed in the elastic scattering cross sections are interpretable as the effects of isospin term in the scattering potentials. A full analysis of the elastic scattering data are presented.

Fast neutron capture and activation cross sections, W. P. Poenitz, *SP425*, pp. 901-904 (Oct. 1975).

Key words: fast neutron capture; Co, Ni, Cu, Zn, Nb, Ho, Ta, Au, ^{238}U; theory and experiment.

Fast neutron capture cross sections were measured in the energy interval from 0.02 to 0.7 MeV using white source neutron time-of-flight techniques and from 0.3 to 3.0 MeV using monoenergetic neutrons. Target materials were Co, Ni, Zn, Cu, Nb, Ho, Ta, Au and ^{238}U. A 1300 l liquid scintillator was used as a capture γ-ray detector. Flat efficiency neutron detectors and/or the standard capture cross section of Au were used for the neutron flux determination. Fast neutron capture and activation cross sections were calculated in terms of the statistical model. The Hauser-Feshbach formalism and a gamma cascade model previously described were used.

Fission product capture cross sections in the keV region, R. W. Hockenbury, H. R. Knox, and N. N. Kaushal, *SP425*, pp. 905-907 (Oct. 1975).

Key words: average Γ_γ, D, S^0 and S^1; capture cross sections.

Capture cross section measurements have been made on ^{105}Pd, ^{151,153}Eu and ^{103}Rh from 20 eV to 200 keV. Capture data in the resolved resonance region are combined with our own transmission data to obtain a consistent capture normalization. For these experiments, the statistical uncertainty of the normalization is ± 4 percent for ^{151}Eu, ^{153}Eu and ^{105}Pd, and ± 8 percent for ^{103}Rh. The statistical uncertainty of the keV capture cross section point data is about ± 4 percent. The information derived from these measurements is the measured keV capture cross section and the average s and p wave parameters $\bar{\Gamma}_\gamma$, S^0 and S^1.

Integral capture cross-section measurements in the CFRMF for LMFBR control materials, R. A. Anderl, Y. D. Harker, E. H. Turk, R. G. Nisle, and J. R. Berreth, *SP425*, pp. 908-911 (Oct. 1975).

Key words: boron carbides; capture cross sections; CFRMF reactor; control materials; europium oxides; fast reactors; neutron reactions; tantalum.

Integral capture-cross sections for separated isotopes of Eu and Ta are reported for measurements in the Coupled Fast Reactivity Measurements Facility (CFRMF). These cross sections along with that measured in the CFRMF for ^{10}B(n,α) provide an absolute standard for evaluating the relative reactivity worth of Eu_2O_3, B_4C and Ta in neutron fields typical of an LMFBR core. Based on these measurements and for neutron fields characterized by the ^{235}U:^{238}U reaction rate spectral index ranging from 23 to 50, the infinitely dilute relative worth of Eu_2O_3 has been estimated to be 25 to 40 percent higher than that for B_4C and 80 to 100 percent higher than that for Ta.

Radiative capture of neutrons in the keV region, R. C. Greenwood, R. E. Chrien, and K. Rimawi, *SP425*, pp. 912-915 (Oct. 1975).

Key words: iron filter; Mn(n,γ); neutron capture gamma-rays; ^{6}Li filter; ^{154}Gd(n,γ); ^{156}Gd(n,γ).

Essentially monoenergetic neutrons with keV energies can be obtained from a reactor by using suitable filters. To date, prompt γ-ray spectra have been measured using 24-, 2-, and 1-keV neutrons, obtained through Fe + Al + S, Sc + Ti and ^{6}Li filters, respectively. Two features of these data are of note to reactor shielding. First, the radiative capture spectra from higher Z nuclei usually result from an average over many resonance states. Hence statistical fluctuations in the primary γ-ray intensities, to which the corresponding thermal neutron capture spectra are subject, are averaged out. Second, such data provide information on the dependence of radiative capture spectra on neutron energy. The data shows that at 24 keV there is a significant p-wave contribution to these spectra, even for those mass regions where the ratio of the p-to-s wave strength function is close to a minima. This occurs because the smallness of the relative penetrability at 24 keV, $0.04 < (kR)^2 < 0.08$ for $100 < A < 240$, is compensated for by the branching ratio Γ_γ/Γ which is now much larger for p-wave than for s-wave resonances.

Measurement of the γ-ray production cross sections from inelastic neutron scattering in some chromium and nickel isotopes between 0.5 and 10 MeV, F. Voss, S. Cierjacks, D. Erbe, and G. Schmalz, *SP425*, pp. 916-919 (Oct. 1975).

Key words: $E_n = 0.5$-10 MeV; ^{52}Cr, ^{58}Ni, ^{60}Ni (n,n',γ) experimental results of γ-ray production cross sections.

At the Karlsruhe fast neutron time-of-flight spectrometer the investigation of γ-ray production cross sections of technologically important materials has been continued with the elements Cr and Ni. The excitation functions for the γ-ray production cross sections in inelastic neutron scattering have been measured at 125° from threshold to 10 MeV. The Karlsruhe cyclotron was used to produce a pulsed beam of neutrons having a continuous energy spectrum between ~ 0.5 and 30 MeV. The incident neutron energy was determined by the time of flight technique. The energy resolution ranged from 2.2 keV at 1 MeV to 70 keV at 10 MeV. Neutron flux determination was accomplished by use of a calibrated proton recoil detector. Preliminary results are shown for the γ-ray energies 1434 keV in ^{52}Cr, 1454 keV in ^{58}Ni and 1333 keV in ^{60}Ni and compared with the results of other authors.

Measurement of 24.3 keV activation cross sections with the

iron filter technique, K. Rimawi and R. E. Chrien, *SP425*, pp. 920-922 (Oct. 1975).

Key words: relative ^{10}B standard; 24.3 keV neutron activation cross sections.

Using high-resolution detection techniques, intensities of specific activation lines from $^{197}Au(n,\gamma)^{238}U(n,\gamma)$,$^{127}I(n,\gamma)$, and $^{115}In(n,\gamma)$ {54 min + 2.2 sec} were recorded, using the BNL HFBR iron-filtered neutron beam. From a comparison with the reaction $^{10}B(n,\alpha\gamma)$, cross sections at 24.3 keV were determined.

Radiative capture gamma rays from the reaction $^{208}Pb(n,\gamma)^{209}Pb$ for 11-MeV incident neutrons, D. M. Drake, E. D. Arthur, I. Bergqvist, D. K. McDaniels, and P. Varghese, *SP425*, pp. 923-925 (Oct. 1975).

Key words: measured capture gamma rays resolution approximately 80 keV; nuclear reactions $^{208}Pb(n,\gamma)^{209}Pb$ $E_n = 11.2$ MeV.

The spectrum of gamma rays emitted by ^{209}Pb from 11-MeV neutron capture has been measured with a Ge(Li) detector. Although the statistical quality of the data is poor it seems apparent that two-particle, one-hole states, as well as single-particle states, play a prominent role in fast neutron capture in ^{208}Pb.

γ-ray spectra from $l = 1$ neutron capture near 24 keV, K. Rimawi and R. E. Chrien, *SP425*, pp. 926-928 (Oct. 1975).

Key words: $E_n = 24.3$ keV; neutron capture γ-rays; width correlations.

The characteristics of neutron capture γ-ray spectra near $E_n = 24.3$ keV are discussed. The E-1 transitions following the capture of p-wave neutrons show a marked preference for populating low-lying states with and s or d single-particle character. This preference introduces a significant correlation between partial (n,γ) cross sections and the neutron reduced widths for final states as measured in the (d,p) reaction.

Shape analysis and width correlation studies based on neutron capture data for ^{56}Fe, ^{58}Ni, ^{60}Ni and ^{61}Ni, F. H. Fröhner, *SP425*, pp. 929-933 (Oct. 1975).

Key words: nuclear reactions ^{56}Fe, $^{58,60,61}Ni(n,\gamma)$, E = 6-150 keV, deduced Γ_γ, width correlations; shape analysis.

Previously reported neutron capture data were analyzed up to 150 keV for ^{56}Fe, ^{58}Ni and ^{60}Ni, and up to 30 keV for ^{61}Ni with a newly developed multilevel shape analysis code with the aim to improve and extend older area analysis results, to check whether the reported correlations between neutron and radiation widths are not produced e.g. by neglect of multilevel effects in the older self-shielding and multiple-scattering calculations and to search for channel effects such as asymmetric peak shapes.

γ-ray production cross sections for neutron inelastic scattering from Cr, Ni, ^{92}Zr, and ^{94}Zr from 3 to 6 MeV, G. Tessler and S. S. Glickstein, *SP425*, pp. 934-937 (Oct. 1975).

Key words: Cr, Ni, Zr; $E_n = 3$-6 MeV; $(n,n'\gamma)$; nuclear reactions; γ-production.

Cross sections for γ-ray production by neutron inelastic scattering from Cr, Ni, ^{92}Zr, and ^{94}Zr have been measured for incident neutrons in the energy range 3-6 MeV. The γ rays were detected with a 55 cm^3 coaxial Ge(Li) anti-Compton spectrometer located at 55° to the incident neutron direction. Background associated with neutrons scattering from the samples into the Ge(Li) detector was suppressed by the pulsed beam time-of-flight technique. Assignment of γ rays to transitions from specific energy levels of the isotopes of Cr, Ni, and Zr has been made using γ-ray energies determined from this work and energies and level schemes reported in the literature. Many of the observed γ rays could not be assigned to known levels.

Scattering of neutrons by nitrogen and oxygen from 5.0 to 9.3 MeV, D. L. Bernard and M. C. Taylor, *SP425*, pp. 938-941 (Oct. 1975).

Key words: angular distributions; differential cross sections; neutron cross sections; neutron time-of-flight spectroscopy.

Angular distributions of neutrons scattered elastically and inelastically from nitrogen-14 and oxygen-16 have been measured at neutron energies of 5.04, 6.25 and 9.29 MeV. Neutron flux attenuation and multiple scattering corrections were made using a modified version of an existing computer code. Special consideration was given in the modification of the code to developing an angular resolution function to treat the effects on multiple scattering corrections due to the solid angle subtended by the scattering sample at the neutron producing target. Graphs and tabulated results are presented as center of mass differential scattering cross sections versus the cosine of the center of mass scattering angle.

Deformation effects in neutron scattering from the Sm isotopes, M. T. McEllistrem, J. Lachkar, G. Haouat, C. Lagrange, Y. Patin, R. E. Shamu, J. Sigaud, and F. Coçu, *SP425*, pp. 942-945 (Oct. 1975).

Key words: calculated $\sigma(\theta)$; measured $\sigma(\theta)$; nuclear reactions $^{146}Nd(n,n)$, (n,n'), $^{148,150}Sm(n,n)$, (n,n'), $^{152,154}Sm(n,n+n')$, E = 7.0 MeV.

Deformation effects in neutron scattering from isotopically enriched Sm_2O_3 samples have been studied at an incident neutron energy of 7 MeV where a maximum of the deformation effects was observed in total cross section measurements on the same isotopes.

Differential cross sections for elastic scattering and inelastic scattering (first 2^+ state) were measured for ^{148}Sm and ^{150}Sm and for ^{146}Nd, which was included in this study to aid in separating isospin effects from deformation effects. Cross sections for the sum of elastic and inelastic scattering (first 2^+ state) were determined for ^{152}Sm and ^{154}Sm.

Experimental cross sections are compared to the results of nonspherical optical-potential coupled-channel calculations.

Small-angle scattering of fast neutrons, W. Bucher, C. E. Hollandsworth, and J. E. Youngblood, *SP425*, pp. 946-949 (Oct. 1975).

Key words: fast neutrons; Pb; scattering; small angles; U.

By the application of a new technique, absolute cross sections for the small-angle elastic scattering of neutrons by U have been accurately determined at various energies in the range 7-14-MeV. The data show less strong forward-peaking at small angles than previously reported results. In addition, measurements of the small-angle scattering by Pb were also carried out over the same energy range; and the results, while in conflict with some previous reported measurements, are, apart from normalization, in excellent agreement with optical model calculations based on the energy independent, nonlocal potential of Perey and Buck.

Elastic and inelastic differential neutron scattering cross sections for ^{238}U from 0.9-2.7 MeV, J. J. Egan, G. H. R. Kegel, G.

P. Couchell, A. Mittler, B. K. Barnes, W. A. Schier, D. J. Pullen, P. Harihar, T. V. Marcella, N. B. Sullivan, E. Sheldon, and A. Prince, *SP425*, pp. 950-952 (Oct. 1975).

Key words: compared with calculated excitation functions; measured $\sigma(E_n, 90°)$ for ground, 45, 148 keV states; nuclear reactions $^{238}U(n,n)$, (n,n'), E = 0.9-2.7 MeV; time-of-flight.

Differential cross sections have been measured via the time-of-flight method for neutrons scattered at 90° from the ground and first two excited states, at 45 and 148 keV, of ^{238}U in the bombarding energy range 0.9 to 2.7 MeV. The $^{7}Li(p,n)^{7}Be$ reaction was the neutron source. The LTI 5.5 MeV Van de Graaff accelerator in conjunction with a Mobley bunching system generated proton pulses with durations as short as 320 picoseconds (fwhm). The excellent timing characteristics of this system enabled the three states in ^{238}U to be resolved up to 2.7 MeV. Above 1.5 MeV the present results for the 2^+ state at 45 keV are 2 to 2.5 times larger than the ENDF/IV cross sections. However, the present results are in good agreement with theoretical calculations which incorporate both direct interaction and compound nucleus contributions to the cross sections.

Absolute measurements of neutron radiative capture cross sections for Na^{23}, Cr, Mn^{55}, Fe, Ni, Rh^{103}, Ta, U^{238} in the keV energy range, C. Le Rigoleur, A. Arnaud, and J. Taste, *SP425*, pp. 953-956 (Oct. 1975).

Key words: absolute radiative capture cross sections; keV energy range – Na^{23}, Cr, Mn^{55}, Fe, Ni, Rh^{103}, Ta, U^{238}.

The absolute measurements of several neutron radiative capture cross sections in the keV energy range are presented. The total energy weighting technique was used. Absolute neutron flux were done. Special care was given to the correction arising from the neutron sensitivity of the gamma detector.

Capture cross section of ^{197}Au between 10 keV and 500 keV, E. Fort and C. Le Rigoleur, *SP425*, pp. 957-960 (Oct. 1975).

Key words: absolute values; fluctuations; Monte Carlo calculations for corrections; total energy weighting technique; $4\pi\beta\gamma$ detector.

This reference capture cross-section has been measured by two different absolute methods; prompts γ measurements, activation method. The results obtained are in good agreement between themselves and with Poenitz's recommendation.

Self shielding factor measurements for natural iron and Na^{23} between 24 keV and 160 keV at 300 K, A. Arnaud, C. Le Rigoleur, and J. P. Marquette, *SP425*, pp. 961-963 (Oct. 1975).

Key words: Fe; multigroup capture cross section; Na^{23}; self shielding factor; 24 keV; 160 keV.

We present experimental values of the multigroup capture cross section and self shielding factor for natural iron and Na^{23} between 24 keV and 160 keV. The capture rate is measured with a shielded neutron flux $\phi = \phi_n \exp(-n\sigma_t X)$ after transmission through a sample of iron or Na^{23}, at room temperature. The self shielding factors at the non zero dilution are obtained by analytical calculation.

SP426. **Bibliography of low energy electron and photon cross section data (through December 1974)**, L. J. Kieffer, *Nat. Bur. Stand. (U.S.), Spec. Publ. 426*, 219 pages (Mar. 1976) SD Catalog No. C13.10:426.

Key words: atom; collision cross section; detachment; dissociation; elastic scattering; electron; excitation; fluorescence; ion; ionization; molecule; photon; positron.

A bibliography of original reports of measurements or calculations of electron, positron and photon cross sections and their ions is presented. A detailed index to the bibliography allows retrieval of cross section data for specific processes and atomic or molecular species. A comprehensive author index is included. The bibliography covers the period 1921 through calendar year 1974 but some references late in 1974 may not have been found and included. No references were found prior to 1921.

SP427. **Secondary ion mass spectrometry.** Proceedings of a Workshop on Secondary Ion Mass Spectrometry and Ion Microprobe Mass Analysis, held at the National Bureau of Standards, Gaithersburg, Md., September 16-18, 1974, K. F. J. Heinrich and D. E. Newbury, Eds., Nat. Bur. Stand. (U.S.),

Key words: Auger electron spectroscopy; elemental depth profiling; ion microprobe mass analysis; ion optics; local thermal equilibrium (LTE); mineral analysis; secondary ion mass spectrometry (SIMS); surface analysis.

This book is the formal report of the Workshop on Secondary Ion Mass Spectrometry (SIMS) and Ion Microprobe Mass Analysis held at the National Bureau of Standards in September 1974. Invited and contributed papers cover a range of topics in the SIMS field: design of SIMS instrumentation; factors affecting secondary ion collection; techniques of reducing secondary ion mass spectra to yield quantitative compositional information; comparisons of SIMS with Auger electron spectroscopy (AES); techniques of obtaining elemental depth profiles and the instrumental and physical factors affecting such profiles; and applications of SIMS to the study of geological samples. The papers include both tutorial reviews and detailed reports on current research in SIMS. The volume should be of interest to all workers in the SIMS and surface analysis fields. *These proceedings include the following papers (indented):*

The ion microprobe—Instrumentation and techniques, H. Liebl, *SP427*, pp. 1-31 (Oct. 1975).

Looking at the collection efficiency problem through the ion microscope optics, G. Slodzian, *SP427*, pp. 33-61 (Oct. 1975).

High mass resolution secondary ion mass spectrometry, P. Williams and C. A. Evans, Jr., *SP427*, pp. 63-68 (Oct. 1975).

A comparison of mass spectra from three ion probes, J. G. Bradley, D. Y. Jerome, and C. A. Evans, Jr., *SP427*, pp. 69-77 (Oct. 1975).

A critical discussion of the local thermal equilibrium model for the quantitative correction of sputtered ion intensities, C. A. Andersen, *SP427*, pp. 79-119 (Oct. 1975).

An outline of secondary ion emission models, J. M. Schroeer, *SP427*, pp. 121-127 (Oct. 1975).

Empirical quantitation procedures in SIMS, J. A. McHugh, *SP427*, pp. 129-134 (Oct. 1975).

Application of SIMS microanalysis techniques to trace element and isotopic studies in geochemistry and cosmochemistry, J. F. Lovering, *SP427*, pp. 135-178 (Oct. 1975).

Factors that influence an elemental depth concentration profile, J. A. McHugh, *SP427*, pp. 179-189 (Oct. 1975).

A comparison of Auger electron spectroscopy (AES) and secondary ion mass spectrometry (SIMS), J. M. Morabito, *SP427*, pp. 191-224 (Oct. 1975).

SP428. Parts 1, 2, and 3. **Bibliography of infrared spectroscopy through 1960,** C. N. R. Rao, S. K. Dikshit, S. A. Kudchadker, D. S. Gupta, V. A. Narayan, and J. J. Comeford, *Nat. Bur. Stand. (U.S.), Spec. Publ. 428/1-3,* 2399 pages (Jan. 1976) SD Catalog No. C13.10:428/1-3.

Key words: bibliography; data; infrared; inorganic; minerals; ores; organic; polymers; spectroscopy.

This bibliography is based on a systematic search of the literature on infrared spectroscopy up to the end of 1960. It covers, directly or through abstract journals, 121 periodicals. As a general rule, any paper of interest in the field of infrared spectroscopy is included. Substance coverage is provided in four sections: organic compounds, inorganic compounds, polymeric compounds, and minerals and ores. Information provided includes: empirical formula, compound name, range of wavelengths reported, state of material, type of data presented in paper, and literature reference. Issued in three parts.

SP429. **Proceedings of the 7th Annual Conference of the National Conference of States on Building Codes and Standards,** S. A. Berry, Ed., Nat. Bur. Stand. (U.S.), Spec. Publ. 429, 129 pages (Sept. 1975) SD Catalog No. C13.10:429.

Key words: ASHRAE 90-P; building codes; mobile homes; NCSBCS.

The National Conference of States on Building Codes and Standards had its formal beginning in Wisconsin in 1967. Its formation represented a response by the States to recommendations for intergovernmental reforms in the area of building codes, prepared by the Advisory Commission on Intergovernmental Relations. The formative meeting held in Wisconsin was a direct outgrowth of an earlier exploratory meeting, involving several States, called by the National Bureau of Standards. At this meeting, the States represented discussed the idea of a national organization of the States similar to the National Conference of Weights and Measures, assisted by the National Bureau of Standards, leading to a cooperative solution regarding the multiple problems in the entire building regulatory system.

The Governor of Wisconsin issued an invitation to the States to gather in Wisconsin to address the problem, to develop an organization which could effectively respond to this national need, and to consider the offer of assistance of the National Bureau of Standards. Sixteen States attended this meeting and unanimously agreed to the formation of the NCSBCS and to accept the secretariat role of the National Bureau of Standards.

The Conference is structured to develop many technical and general recommendations in the field of comprehensive building code administration and its programs explore the entire system of this important segment of governmental regulatory service.

The secretariat of the National Conference of States on Building Codes and Standards located in the Office of Building Standards and Codes Services, Center for Building Technology, National Bureau of Standards, Washington, D.C. 20234.

SP430. **Household weights and measures,** Nat. Bur. Stand. (U.S.), Spec. Publ. 430, 2 pages (Sept. 1975) SD Catalog No. C13.10:430.

Key words: consumer metric information; International System of Units; kitchen measurement units; metric system; weights and measures.

This card presents weights and measures tables most useful for household (kitchen) purposes. It also introduces metric information for consumer use.

SP431. **Fourth international congress for stereology.** Proceedings of the Fourth International Congress for Stereology held at the National Bureau of Standards, Gaithersburg, MD, Sept. 4-9, 1975, E. E. Underwood, R. de Wit, and G. A. Moore, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 431,* 547 pages (Jan. 1976) SD Catalog No. C13.10:431.

Key words: stereology; stereometry; stereoscopy; stochastic models; structures; three-dimensional reconstruction.

These proceedings contain most of the papers presented at the technical sessions and workshops of the Fourth International Congress for Stereology, held at the National Bureau of Standards, Gaithersburg, Maryland, from 4-9 September 1975. Of the 113 papers recorded here, 10 are invited lectures, 66 are submitted papers, and 37 come from the six workshops. Three of these workshops containing 17 papers were integrated into the technical sections for these proceedings. Topics covered in the Technical Sections are Principles and Mathematical Developments, Pattern Recognition, Instrumentation, Three-dimensional Reconstruction, and Stereological Applications in Materials and Biology. Additional topics covered in the Workshops are Mathematical Foundations of Stereology, Particle Science, and Size Distributions. *These proceedings include the following papers (indented):*

On estimating aggregate and overall characteristics from thick sections by transmission microscopy, R. E. Miles, *SP431,* pp. 3-12 (Jan. 1976).

Computational methods in stereology, R. S. Anderssen and A. J. Jakeman, *SP431,* pp. 13-18 (Jan. 1976).

Estimation of linear functionals by maximum likelihood, W. L. Nicholson, *SP431,* pp. 19-24 (Jan. 1976).

The geometry and stereology of "Cubo-Spherical" particles, R. Warren, *SP431,* pp. 25-28 (Jan. 1976).

Quantitative microscopy of lineal features in three dimensions, R. T. DeHoff and S. M. Gehl, *SP431,* pp. 29-40 (Jan. 1976).

Connectivity of "Dispersed" particles: A probabilistic computation, G. A. Moore, *SP431,* pp. 41-44 (Jan. 1976).

Analytic results for the connectivity of dispersed particles, R. de Wit, *SP431,* pp. 45-48 (Jan. 1976).

Topological analysis of dendritic trees, M. Berry, *SP431,* pp. 49-54 (Jan. 1976).

Theoretical and experimental studies of the stereological properties of porosity, specific surface, and connectivity, R. B. Martin, *SP431,* pp. 55-58 (Jan. 1976).

Assessment of sampling errors in stereological analysis, J. E. Hilliard, *SP431,* pp. 59-67 (Jan. 1976).

On optimal forms for stereological data, A. J. Jakeman and R. S. Anderssen, *SP431,* pp. 69-74 (Jan. 1976).

Multivariate data analysis to describe intra- and intergranular relations in thin sections, W. Good, *SP431,* pp. 75-78 (Jan. 1976).

Correction of stereological parameters from biased samples on nucleated particle phases, L. M. Cruz-Orive, *SP431,* pp. 79-82 (Jan. 1976).

Stochastic models in stereology: Strength and weaknesses, J. P. Serra, *SP431,* pp. 83-86 (Jan. 1976).

A stereological view of data analysis, G. A. Moore and G. T. Eden, *SP431,* pp. 87-90 (Jan. 1976).

Three-dimensional shape parameters from planar sections, E. E. Underwood, *SP431,* pp. 91-92 (Jan. 1976).

Interpretation of some of the basic features of field-ion image projections from a hemispherical to a planar surface using Moire patterns, P. D. Ownby, R. M. Doerr, and W. Bollmann, *SP431,* pp. 93-98 (Jan. 1976).

Network simulation of connectivity and aggregate size in two-phase mixtures, W. D. Leahy and J. H. Steele, Jr., *SP431,* pp. 99-105 (Jan. 1976).

What can pattern recognition do for stereology?, G. C. Cheng, *SP431,* pp. 107-112 (Jan. 1976).

Theory and applications of imagery pattern recognition, C. H. Chen, *SP431,* pp. 113-116 (Jan. 1976).

A new, fast and storage-saving image analysis procedure for investigating individuals by a digital computer, M. Rink, *SP431,* pp. 117-120 (Jan. 1976).

System for computer input and processing of two-dimensional pictures, I. Krekule and M. Indra, *SP431,* pp. 121-122 (Jan. 1976).

Pattern recognition on the quantimet 720 image analyzing computer, K. E. Lawson, *SP431,* pp. 123-126 (Jan. 1976).

Recognition and classification of structure by means of stereological methods in neurobiology, G. Bernroider, *SP431,* pp. 127-132 (Jan. 1976).

Projectors in pattern recognition categories, M. Pavel, *SP431,* pp. 133-139 (Jan. 1976).

Automatic image analyzing instruments today, H. P. Hougardy, *SP431,* pp. 141-148 (Jan. 1976).

Texture analysis of stereological specimens, W. Hunn, *SP431,* pp. 149-154 (Jan. 1976).

A computerized image process for isolating individuals in an originally netted pattern, M. Rink, *SP431,* pp. 155-158 (Jan. 1976).

An image analysis system based on feature descriptors, R. R. A. Morton, *SP431,* pp. 159-162 (Jan. 1976).

Implications of recent advances in image analysis for stereological theory, H. Schmeisser, *SP431,* pp. 163-166 (Jan. 1976).

Experiences with optomanual automated evaluation-systems in biological research, especially in neuromorphology, H. Haug, *SP431,* pp. 167-172 (Jan. 1976).

A user-oriented automatic scanning optical microscope, J. E. Hilliard, *SP431,* pp. 173-176 (Jan. 1976).

The determination of particle shape and size distributions using automatic image analysis techniques, J. Slater and B. Ralph, *SP431,* pp. 177-180 (Jan. 1976).

Some shape functions for use in automatic image analysers for the classification of particulate materials, A. C. Terrell and R. J. Willes, *SP431,* pp. 181-184 (Jan. 1976).

Determination of particle size and shape distribution by automatic feature analysis, J. R. Schopper, *SP431,* pp. 185-188 (Jan. 1976).

Stereology and the automatic linear analysis of mineralogical materials, M. P. Jones and G. Barbery, *SP431,* pp. 189-19[illegible] (Jan. 1976).

A new opto-manual semi-automatic evaluation system, H. P[illegible] Rohr, *SP431,* pp. 193-195 (Jan. 1976).

Automated measurements for determination of the statistical nature of the distribution of inclusions in steel, G. A. Moore, *SP431,* pp. 197-198 (Jan. 1976).

Reconstruction from projections: A survey of applications, R. Gordon, *SP431,* pp. 201-202 (Jan. 1976).

Morphometric analysis of neurons in different depths of the cat's brain cortex after hypoxia, O. Hunziker, U. Schulz, C. Walliser, and J. Serra, *SP431,* pp. 203-206 (Jan. 1976).

Three-dimensional reconstruction from serial high voltage electron micrographs, L. D. Peachey, C. H. Damsky, and A. Veen, *SP431,* pp. 207-210 (Jan. 1976).

Determining three-dimensional intracellular structure data from scanning proton microscopy luminescence data, D. G. Oldfield, *SP431,* pp. 211-214 (Jan. 1976).

Artifacts in three-dimensional reconstruction from medical radiographic data, E. L. Hall, G. C. Huth, R. A. Gans, and I. S. Reed, *SP431,* pp. 215-218 (Jan. 1976).

Artificial stereo: A generalized computer algorithm for combining multi-channel image data, W. G. Pichel, R. L. Brower, D. R. Brandman, and R. J. Moy, *SP431,* pp. 219-220 (Jan. 1976).

Stereoscopic photomacrography and stereoscopic projection, Y. Fujimoto and Y. Ohta, *SP431,* pp. 221-222 (Jan. 1976).

Holographic methods for in-depth viewing of microscopic subjects, R. J. Schaefer and J. A. Blodgett, *SP431,* pp. 223-224 (Jan. 1976).

Evaluation of a new technique for determining the volume of the human left ventricle from one-plane radiographic measurements, R. Moore, I. Beranek, S. Kim, and K. Amplatz, *SP431,* pp. 225-228 (Jan. 1976).

Movie: Prim-9. Viewing high dimensional point clouds, J. W. Tukey, *SP431,* p. 229 (Jan. 1976).

Applications of quantitative microscopy in metal science, F. N. Rhines, *SP431,* pp. 233-244 (Jan. 1976).

Applications of stereological techniques to the quantitative characterization of wood microstructure, J. H. Steele, Jr., G. Ifju, and J. A. Johnson, *SP431,* pp. 245-256 (Jan. 1976).

Texture analyzer measurements and physical anisotropy of tropical woods, A. Mariaux, O. Peray, and J. Serra, *SP431,* pp. 257-260 (Jan. 1976).

Decision criteria in quality control of steel with respect to nonmetallic inclusions, S. Johansson, *SP431,* pp. 261-264 (Jan. 1976).

Automatic recognition of nonmetallic stringers in steel, D. Jeulin and J. Serra, *SP431,* pp. 265-268 (Jan. 1976).

Metallographic characterization of fracture surface profiles on sectioning planes, J. R. Pickens and J. Gurland, *SP431,* pp. 269-272 (Jan. 1976).

The equivalent foil thickness principle, S. M. El-Soudani, *SP431*, pp. 273-276 (Jan. 1976).

Stereological method for estimating relative membrane surfaces in freeze-fracture preparations, E. R. Weibel, G. A. Losa, and R. P. Bolender, *SP431*, pp. 277-280 (Jan. 1976).

Application of various stereological methods to the study of the grain and the crack structure of concrete, P. Stroeven, *SP431*, pp. 281-286 (Jan. 1976).

The use of quantitative metallography and stereological methods to describe composite materials, J. L. Chermant and M. Coster, *SP431*, pp. 287-290 (Jan. 1976).

A definition of the two-dimensional size of irregular bodies, G. M. Timčák, *SP431*, pp. 291-294 (Jan. 1976).

Stereometric microstructure and properties of two-phase materials, G. Ondracek, *SP431*, pp. 295-298 (Jan. 1976).

Use of mathematical morphology to estimate comminution efficiency, P. Cauwe, *SP431*, pp. 299-303 (Jan. 1976).

Microscopy, radial distribution analysis, and sortability, R. M. Doerr, *SP431*, pp. 305-308 (Jan. 1976).

Size distribution analysis in situ on individual or interconnected phases by image analyses, C. Gateau and J. M. Prévosteau, *SP431*, pp. 309-314 (Jan. 1976).

Stereological determination of the proportional volume of dendrites in cast iron by measuring plan micrographs, R. Wlodawer, *SP431*, pp. 315-318 (Jan. 1976).

Morphometry, stereometry and stereology applied to cancer development in the large intestine of man, H. Elias, D. Bokelmann, and R. Vögtle, *SP431*, pp. 321-326 (Jan. 1976).

Analysis of the heterogeneous composition of central nervous tissue, S. Eins and J. R. Wolff, *SP431*, pp. 327-330 (Jan. 1976).

Stereological analysis of the heterogeneous composition of central nervous tissue: Synapses of the cerebral cortex, J. R. Wolff, *SP431*, pp. 331-334 (Jan. 1976).

The development of myelinated fibers in the visual cortex of cats, H. Haug, *SP431*, pp. 335-336 (Jan. 1976).

The volumes of elastic tissue and smooth muscle cells in the arterial wall, V. Levický, *SP431*, pp. 337-340 (Jan. 1976).

Progress, success and problems in applying stereology in biological research, E. R. Weibel, *SP431*, pp. 341-350 (Jan. 1976).

Hexachlorobenzene-induced smooth endoplastic reticulum in rat liver: A correlated stereologic and biochemical study, T. Kuiper-Goodman, D. Kreweski, H. Combley, M. Doran, and D. L. Grant, *SP431*, pp. 351-354 (Jan. 1976).

Automated measurement of airspaces in lungs from dogs chronically exposed to air pollutants, D. Hyde, A. Wiggins, D. Dungworth, W. Tyler, and J. Orthoefer, *SP431*, pp. 355-358 (Jan. 1976).

Volumetric determinations of cells and cell organelles from two-dimensional transsections, L. G. Lindberg, *SP431*, pp. 359-362 (Jan. 1976).

Morphometric analysis of thymic cells during murine radioleukemogenesis, J. Boniver, R. Courtoy, and L. J. Simar, *SP431*, pp. 363-366 (Jan. 1976).

Studies on the partially-oriented surfaces of skeletal muscle mitochondria, N. T. James and G. A. Meek, *SP431*, pp. 367-370 (Jan. 1976).

Determination of the number of cells with multiple nucleoli in histological sections, A. Schleicher, H. J. Kretschmann, F. Wingert, and K. Zilles, *SP431*, pp. 371-374 (Jan. 1976).

Combined light and electron microscopy of serially sectioned cells and tissues, Y. Collan, *SP431*, pp. 375-378 (Jan. 1976).

Morphometric "organelle profiles" as metabolic indicators, S. Malamed and L. C. Zoller, *SP431*, pp. 379-384 (Jan. 1976).

A quantitative analysis of some ultrastructural aspects of seed development, C. E. Hughes and L. G. Briarty, *SP431*, pp. 385-388 (Jan. 1976).

The brain as a "stereological device," T. Radil-Weiss and J. Radilová, *SP431*, pp. 389-391 (Jan. 1976).

Stereological analysis of neural organogenesis in the chick embryo, O. Mathieu and P. E. Messier, *SP431*, pp. 393-396 (Jan. 1976).

Application of stereological methods to the study of preimplantation embryogenesis in mice, R. L. Deter, *SP431*, pp. 397-400 (Jan. 1976).

The determination of size distribution on lymphoblasts in acute leukemia, E. Feinermann and G. A. Langlet, *SP431*, pp. 401-404 (Jan. 1976).

A morphometric study of human placentae of different gestational ages from normal and triplet pregnancies, I. Bhargava, K. Kamashki, and Y. Dodge, *SP431*, pp. 405-408 (Jan. 1976).

The effects of optical resolution on the estimation of stereological parameters, H. J. Keller, H. P. Friedli, P. Gehr, M. Bachofen, and E. R. Weibel, *SP431*, pp. 409-410 (Jan. 1976).

Quantification of rarely occurring structures in electron microscopy, U. Pfeifer, *SP431*, pp. 411-414 (Jan. 1976).

The morphometry and stereology of cerebral arterial bifurcations, P. B. Canham, J. G. Walmsley, and J. F. H. Smith, *SP431*, pp. 415-418 (Jan. 1976).

Karyo-interkaryometry as a periodic control for clinical prognosis, E. C. Craciun and C. Tasca, *SP431*, pp. 419-422 (Jan. 1976).

Nucleic acids content-nuclear volume correlation as a quantitative parameter in cellular malignancy, C. Tasca and E. C. Craciun, *SP431*, pp. 423-426 (Jan. 1976).

Is there an unrecognized systematic error in the estimation of surface density of biomembranes?, A. Reith and T. Barnard, *SP431*, pp. 427-428 (Jan. 1976).

Quantitative studies with the optical and electronic microscope of the pathological cells of the acute leukemia and chronic lymphocytic leukemia, J. L. Binet, P. Debré, P. d'Athis, D. Dighiero, and F. de Montaut, *SP431*, p. 429 (Jan. 1976).

Simple devices for stereology and morphometry, H. Elias and E. Botz, *SP431*, pp. 431-434 (Jan. 1976).

The edema syndrome in motion pictures, O. C. Jaffee, *SP431*, p. 435 (Jan. 1976).

Overview, R. T. DeHoff, *SP431*, pp. 439-443 (Jan. 1976).

Probabilistic foundations of stereology, R. E. Miles and P. Davy, *SP431*, pp. 443-445 (Jan. 1976).

Volume fraction analysis, H. E. Exner, *SP431*, pp. 446-448 (Jan. 1976).

Surface area, E. R. Weibel, *SP431*, pp. 448-455 (Jan. 1976).

Length of lineal features in space, R. T. DeHoff, *SP431*, pp. 455-457 (Jan. 1976).

The area tangent count and the total curvature, R. T. DeHoff, *SP431*, pp. 457-459 (Jan. 1976).

Granulometry for isolated particles or connected media, J. Serra, *SP431*, pp. 460-461 (Jan. 1976).

Statistics of measurement, W. L. Nicholson, *SP431*, pp. 461-464 (Jan. 1976).

Introduction remarks, B. H. Kaye, *SP431*, pp. 467-468 (Jan. 1976).

Stereology and particle technology, H. E. Exner, *SP431*, pp. 469-470 (Jan. 1976).

Representation of particle size and shape, B. Scarlett, *SP431*, pp. 471-47 6(Jan. 1976).

The application of stereology to particle technology, B. Scarlett and P. J. Lloyd, *SP431*, pp. 477-482 (Jan. 1976).

Techniques for particle measurement using image analysis, R. R. A. Morton, *SP431*, pp. 483-486 (Jan. 1976).

Microscopic characterization of fine powders, P. Ramakrishnan, *SP431*, pp. 487-490 (Jan. 1976).

Stereology of paint films, B. H. Kaye and I. Robb, *SP431*, pp. 491-492 (Jan. 1976).

Concluding remarks, B. H. Kaye, *SP431*, p. 493 (Jan. 1976).

Estimation of linear properties of spherical bodies in thin foils from their projections, F. Piefke, *SP431*, pp. 497-498 (Jan. 1976).

On size distribution methods, F. A. L. Dullien and K. S. Chang, *SP431*, pp. 499-502 (Jan. 1976).

Size distribution of retained austenite phase in a quenched stainless steel, A. V. Samudra and O. Johari, *SP431*, pp. 503-506 (Jan. 1976).

Analysis of a set of spherical cells relative to their volume, P. d'Athis, *SP431*, pp. 507-508 (Jan. 1976).

Appendix—Basic stereology, E. E. Underwood, *SP431*, pp. 509-512 (Jan. 1976).

SP432. **NBS time and frequency dissemination services,** S. L. Howe, Ed., (Supersedes NBS Special Publication 236, 1974 and previous editions), *Nat. Bur. Stand. (U.S.), Spec. Publ. 432*, 32 pages (Jan. 1976) SD Catalog No. C13.10:432.

Key words: broadcast of standard frequencies; frequency calibration; high frequency; low frequency; standard frequencies; television color subcarrier; time calibration; time signals.

Detailed descriptions are given of the time and frequency dissemination services of the National Bureau of Standards. These services include the broadcasts from radio stations WWV, WWVH, WWVB, and WWVL, and new time and frequency calibration services using television. This publication shows the services available on January 1, 1976. It will be updated only when the services are revised or when new services are added. A list of other publications available about the Time and Frequency Division is also included.

SP433. **MFPG—Success by design: Progress through failure analysis.** Proceedings of the 21st Meeting of the Mechanical Failures Prevention Group, held at the National Bureau of Standards, Gaithersburg, MD, Nov. 7-8, 1974, T. R. Shives and W. A. Willard, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 433*, 229 pages (July 1976) SD Catalog No. C13.10:433.

Key words: design; engineering education; failure analysis; failure analysis case histories; failure prevention; reliability; safety.

These Proceedings consist of a group of twenty-two submitted papers and discussions from the 21st meeting of the Mechanical Failures Prevention Group which was held at the National Bureau of Standards in Gaithersburg, Maryland on November 7-8, 1974. The central theme of the Proceedings was improvement in design through failure analysis. Emphasis was on design philosophy, the use of failure analysis case studies as an educational tool, successful redesign through failure analysis, and design oversights. *These proceedings include the following papers (indented):*

Creative student engineering design, P. S. De Jong, *SP433*, pp. 3-5 (July 1976).

The designer's contribution in the development of new products, J. J. Lesko, *SP433*, pp. 7-14 (July 1976).

Successful redesign and launch performance of the ERTS/Nimbus adapter after an acceleration test failure, V. T. Sweet and W. B. Keegan, *SP433*, pp. 19-72 (July 1976).

Agricultural equipment for underdeveloped countries, C. W. Suggs, *SP433*, pp. 74-81 (July 1976).

Safety success through design, D. W. Logan, *SP433*, pp. 83-87 (July 1976).

Reliability, pollutants and aluminum raw material, V. D. Matney, *SP433*, pp. 89-101 (July 1976).

Rotor burst protection program, G. J. Mangano, *SP433*, pp. 103-119 (July 1976).

Airframe "crashworthiness" experiments, N. N. Shapter, *SP433*, pp. 122-128 (July 1976).

Redesign and assembly of anti-friction bearing housings for improved life, G. D. Xistris and D. C. Watson, *SP433*, pp. 131-142 (July 1976).

Case history of failures in a hammer mill, J. K. L. Baja, *SP433*, pp. 144-158 (July 1976).

Solution of an art restoration problem, E. Passaglia, *SP433*, pp. 159-161 (July 1976).

Elimination of failures of U-bolts in farm tractor dual wheel, B. P. Bardes, *SP433*, pp. 164-165 (July 1976).

Structural in-flight wing failures, M. L. Marx, *SP433*, pp. 166-177 (July 1976).

Use of cases in engineering education—Their special value, F. O. Fuchs, *SP433*, pp. 180-182 (July 1976).

What can be learned from cases, G. Kardos, *SP433*, pp. 183-187 (July 1976).

Student written design case studies, C. O. Smith, *SP433,* pp. 188-190 (July 1976).

Teacher feedback on the use of engineering case studies, B. J. Pelan, *SP433,* pp. 192-198 (July 1976).

Some thermal problems in the design of fluid film bearings, D. D. Fuller, *SP433,* pp. 205-211 (July 1976).

Never overlook notches, C. O. Smith, *SP433,* pp. 212-213 (July 1976).

Innovation or reliability, H. O. Fuchs, *SP433,* pp. 214-215 (July 1976).

The "model" designer, R. E. Maringer, *SP433,* pp. 216-217 (July 1976).

The misuse of tensile strength as a design parameter, T. J. Dolan, *SP433,* pp. 218-219 (July 1976).

Inspection consideration at the design stage, J. F. Erthal, *SP433,* p. 222 (July 1976).

SP434. **Hydrocarbons for fuel—75 years of materials research at NBS,** G. T. Armstrong, *Nat. Bur. Stand. (U.S.), Spec. Publ. 434,* 20 pages (May 1976) SD Catalog No. C13.10:434.

Key words: coal; energy; fuel; graphite; hydrocarbons; metering; methane; natural gas; petroleum; physical properties; standard reference materials.

In this historical review the NBS work on hydrocarbons is discussed in terms of the three major classes of natural hydrocarbonaceous fuels: natural gas, petroleum, and coal. The work done on the measurement of properties of the pure components has included measurement of the values of the properties themselves and development of practical and accurate measurement procedures and instruments. In addition, combustion energies, densities, viscosities, vapor pressures, refractive indices, elemental compositions and other parameters have been determined for complex fuel mixtures and correlated to find methods of estimating properties. Extensive standard reference data tables have been compiled and a number of standard reference materials have been developed.

SP435. **Laser induced damage in optical materials: 1975.** Proceedings of a Symposium sponsored by: National Bureau of Standards, American Society for Testing and Materials, Office of Naval Research, Energy Research and Development Administration, NBS Boulder, CO, July 29-31, 1975, A. J. Glass and A. H. Guenther, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 435,* 437 pages (Apr. 1976) SD Catalog No. C13.10:435.

Key words: avalanche ionization; IR windows and mirrors; laser damage; laser materials; multiphoton processes; self-focusing; thin films.

The Seventh ERDA-ASTM-ONR-NBS Symposium on Laser Induced Damage in Optical Materials was held at the National Bureau of Standards in Boulder, Colorado, on July 29-31 of this year. These Symposia are held as part of the activities in Subcommittee II on Lasers and Laser Materials, of the ASTM. Subcommittee II is charged with the responsibilities of formulating standards and test procedures for laser materials, components, and devices. The Chairman of Subcommittee II is Haynes Lee, of Owens-Illinois, Inc. Co-chairmen for the Damage Symposia are Dr. Arthur Guenther, Chief Scientist of the Air Force Weapons Laboratory, and Dr. Alexander J. Glass, Head, Theoretical Studies, Y Division, Lawrence Livermore Laboratory.

Over 150 attendees at the Symposium heard 42 papers on topics relating fabrication procedures to laser induced damage in optical materials; on metal mirrors; in infrared window materials; the multipulse, wavelength and pulse length dependence of damage thresholds; damage in dielectric films and at exposed surfaces; as well as theoretical discussions on avalanche ionization and multiphoton processes of importance at shorter wavelengths. Of particular importance was the sealing relations developed from several parametric studies relating fundamental properties (refractive index, surface roughness, etc.) to the damage threshold. This year many of the extrinsic influences tending to reduce a material damage resistance were isolated such that a measure of its egregious nature could be quantified. Unfortunately, it was evident that much still needs to be accomplished to improve processing and fabrication procedures to allow a measurable approach to a materials intrinsic strength to be demonstrated. *These proceedings include the following papers (indented):*

Fabrication of laser optics at Lawrence Livermore laboratory, N. J. Brown, *SP435,* pp. 3-9 (Apr. 1976).

Key words: chamfering; continuous polishing; grinding; metal polishing; optical fabrication.

This paper summarizes fabrication techniques in use at Lawrence Livermore Laboratory for laser discs, windows, and mirrors, and polishing techniques used with metal surfaces.

Standard industrial polishing of high energy laser optics, W. J. Spawr, *SP435,* pp. 10-13 (Apr. 1976).

Key words: copper; molybdenum; optician; polishing; surfaces; zinc selenide.

The polishing and figuring of optical materials to produce state-of-the-art surface quality is truly an art, a scientific art, but an art nonetheless.

To attain success, the optician must have a clear mental model of the processes and associated techniques, and use this model as his most important tool. Second only to that is the combination of discipline and determination that no harmful or deleterious influences are allowed to effect the processes. New sophisticated polishing machines used in "Metrology Laboratory" environments are of little or no assistance. Polishing machines built 50 years ago work as well as the latest designs.

Today, moderately skilled technicians routinely produce 30 Å RMS surfaces on copper, molybdenum, and zinc selenide. These surfaces are free of orange peel, scratches, and digs; and are produced on conventional polishing machinery. Such surfaces are shown to exhibit exceedingly high laser damage thresholds from 1.06 to 10 μm. This is accomplished on a daily basis in a time frame comparable to the commercial polishing of ordinary optical glasses.

Ion planing and coating of sodium chloride, R. A. Hoffman, W. J. Lange, and W. J. Choyke, *SP435,* pp. 14-19 (Apr. 1976).

Key words: arsenic trisulphide; ion planing; protective films; moisture resistance; sodium chloride.

Ion planing of single crystal sodium chloride, using low energy Xe ions at grazing incidence, is effective in removing scratches from surfaces when the sample is rotated. Surface features which develop, probably due to defects such as polishing grit and dislocations, can be minimized and the scratches eliminated by optimizing the amount of material removed. Ion planing and depositing overcoating films "in situ" greatly improves film adherence and protection of sodium chloride substrates against moisture attack.

Polishing studies and backscatter measurements on alkali-halide windows, M. J. Soileau, H. E. Bennett, J. M. Bethke, and J. Shaffer, *SP435*, pp. 20-28 (Apr. 1976).

Key words: alkali-halide; KCl; laser windows; optical figure; polishing; scattered light; surface absorption.

Surface absorption, optical figure, and optical scatter from windows are particularly important in high energy lasers. Surface absorption can result in window failure due to thermal distortion and in some cases catastrophic failure. Excellent optical figure is required for each component in the laser system optical train in order to maintain maximum on axis intensity of the focused laser beam. Backscatter from windows and other optical components can cause depumping of the active medium, and in the case of amplified chains, catastrophic damage to the laser amplifiers. A technique for polishing alkali-halide and quantitative measurements of backscatter for alkali-halide windows from the visible to 10.6 μm will be presented. This polishing procedure produces alkali-halide surfaces which have less than 1×10^{-4} surface absorption, are parallel to less than 3 seconds of arc and are flat to better than a quarter wave in the visible. Scattering levels below 10^{-4} at 10.6 μm have been achieved.

1.06 μm 150 psec laser damage study of diamond turned, diamond turned/polished and polished metal mirrors, T. T. Saito, D. Milam, P. Baker, and G. Murphy, *SP435*, pp. 29-40 (Apr. 1976).

Key words: copper mirror; damage threshold; dark field photography; diamond turned optics; 1.06 μm polishing.

Using a well characterized 1.06 μm 150 psec glass laser pulse we have studied the damage characteristics for diamond turned, diamond turned/polished, and polished copper and silver mirrors less than 5 cm diameter. Although most samples were tested with a normal angle of incidence, some were tested at 45° with different linear polarization showing an increase in damage threshold for S polarization. Different damage mechanisms observed will be discussed. Laser damage is related to residual surface influence of the fabrication process. Our first attempts to polish diamond turned surfaces resulted in a significant decrease in laser damage threshold. The importance of including the heat of fusion in the one dimensional heat analysis of the theoretical damage threshold and how close our samples came to the theoretical damage threshold will be discussed.

Pulsed laser damage to uncoated metallic reflectors, I. Goldstein, D. Bua, and F. A. Horrigan, *SP435*, pp. 41-48 (Apr. 1976).

Key words: angle of incidence; polarization; pulsed laser damage; thermal model.

Threshold damage measurements were made on a variety of polished bulk copper and thin gold film reflectors using a TEM_{00} mode Q-switched Nd:YAG laser. Results correlate well with a simple thermal model based on the assumed existence of a critical surface temperature. Direct confirmation of this thermal model was obtained through systematic variations of the polarization and angle of incidence of the incident laser beam and calorimetric measurements of the surface optical absorption coefficients. The "Damage Threshold" was defined through a careful procedure of attenuating the incident beam and varying all parameters (e.g., focus, position on the surface) until the sample no longer could be "damaged" as assessed visually with a microscope. In one striking case the damage threshold of two "identical" samples was shown to correlate with the measured surface absorption and not with the visual surface quality.

The implications of these results to the design of high power optical systems which use large angles of incidence (e.g., axicon or toric optical elements) are discussed. In particular, for the polarization associated with Brewster's phenomenon the damage threshold was found to remain constant over wide variations of the angle of incidence, e.g., from 0 to 70° or 80°.

Diamond-turned mirrors, H. E. Bennett, M. J. Soileau, and P. C. Archibald, *SP435*, pp. 49-56 (Apr. 1976).

Key words: diamond turning; laser damage; metal mirrors; micromachining; optical figure; scattered light.

Diamond-turned, micromachined metal mirrors offer a new approach to optical fabrication and may have significant advantages for use as laser components. A laser mirror must have (1) excellent optical figure, (2) low scattered light, (3) high reflectance, (4) high damage threshold, and (5) good environmental resistance. We have measured optical figures as good as 1/20th wave over a 3.86-cm diameter sample and better than a wave over a 10.2-cm diameter sample on micromachined mirrors produced by Oak Ridge National Laboratories. Scattered light levels in the infrared can be as low or lower than those obtained on conventional mirrors and values as low as 2×10^{-5} have been observed at a wavelength of 10.6 μm. Infrared reflectance values as high or higher than those of conventional evaporated or sputtered coatings have been achieved and one mirror had an absorption at 10.6 μm of 0.006. The laser damage threshold of micromachined mirrors may well be higher than that obtainable by other techniques, but this question and the environmental resistance and "coatability" of a micromachined surface require further investigation.

Results of optical measurements of surface quality and figure of diamond-turned mirrors, R. E. Sladky and R. H. Dean, *SP435*, pp. 57-65 (Apr. 1976).

Key words: blur circle; circular diffraction grating; diamond-turned mirrors; diffraction pattern; machine cusp; scattered light; surface figure.

During the past year, the Oak Ridge Y-12 Plant has diamond turned mirrors for the LASL High-Energy Laser and for other projects. The largest of these mirrors are flat, elliptical in shape, and 654 mm (25.5 in) on the major axis and 394 mm (15.5 in) on the minor axis. The concave mirrors are 394 mm OD. These mirrors were inspected for surface finish and figure. Results of this work will be summarized. In addition, blur circle was measured. Measurements of scattered light have also been made. In some cases, the diffraction pattern was related to the waves formed in the surface by the machining process. This information has been useful to the engineers doing research on the diamond turning of laser materials.

Dielectric coated diamond turned mirrors, J. R. Buckmelter, T. T. Saito, R. Esposito, L. P. Mott, and R. Standlund, *SP435*, pp. 66-74 (Apr. 1976).

Key words: adherence; diamond machining; dielectric mirror; electroplating; laser damage resistance; stress relief.

Adherence of multilayer dielectric enhanced mirror coatings to diamond turned metallic surfaces was discovered to be a problem. Initial coating results demonstrated peeling and erratic optical properties for a variety of coating designs deposited on ERDA diamond turned copper, silver, and gold. The same coating designs deposited on polished molybdenum had excellent adherence and consistent optical properties. The adherence problem was determined to derive from two factors intimately connected

with the diamond turning process, namely, oil adsorption and stress in the electroplated metal surface. These factors can be eliminated by stress relief in a heated oil bath followed by thorough clening in freon or trichloroethylene prior to coating. Procedures used to investigate dielectric coated diamond turned mirrors included absorption calorimetry, damage measurements with a 10 kW laser and Auger Spectroscopy.

Slide-position errors degrade machined optical component uality, J. B. Arnold, P. J. Steger, and R. R. Burleson, *SP435*, p. 75-89 (Apr. 1976).

Key words: controlled environment; diamond machining; machined optics; nondistortion part support; position errors; quality and compatible part material; quality diamond tools.

An ultraprecision lathe is being developed at the Oak Ridge Y-12 Plant to fabricate optical components for use in high-energy laser sytems. The lathe has the capability to produce virtually any shape mirror which is symmetrical about an axis of revolution. Two basic types of mirrors are fabricated on the lathe; namely, (1) the mirrors which are machined using a single slide motion (such as flats and cylinders), and (2) the mirrors which are produced by two-coordinated slide motions (such as hyperbolic reflectors; large, true-radius reflectors, and other contoured-surface reflectors). The surface-finish quality of typical mirrors machined by a single axis of motion is better than 13 nm, peak to valley, which is an order of magnitude better than the surface finishes of mirrors produced by two axes of motion. Surface finish refers to short-wavelength-figure errors that are visibly detectable. The primary cause of the inability to produce significantly better surface finishes on contoured mirrors has been determined as positional errors which exist in the slide positioning systems. The correction of these errors must be accomplished before contoured surface finishes comparable to the flat and cylinder can be machined on the lathe.

Ultrasonic cleaning of optical surfaces, W. E. K. Gibbs and A. D. McLachlan, *SP435*, pp. 90-97 (Apr. 1976).

Key words: laser damage; metal mirrors; subsurface structure; ultrasonic cleaning.

During the formal proceedings of the 1975 Symposium on Laser Induced Damage in Optical Materials, Dr. A. H. Guenther presented some recent results on the degradation of polished optical surfaces by ultrasonic cleaning procedures. This information was supplied to him by Dr's. W. E. K. Gibbs and A. D. McLachlan of the Materials Research Laboratories of the Department of Defense, Commonwealth of Australia. Materials studied included OFHC copper, beryllium copper, zirconium copper, stainless steel, kanigen and fused quartz. Results indicate that ultrasonic cleaning degrades polished surfaces, and if the cleaning process is vigorous enough for a sufficient duration of time, subsurface fracture introduced in the grinding process is made quite evident. At the conclusion of the transmission of this correspondence, a discussion on the subject of ultrasonic cleaning ensued.

Thermal diffusivity of germanium gallium arsenide and cadnium telluride over the temperature range 80 K-900 K, R. Doussain, H. P. le Bodo, *SP435*, pp. 98-106 (Apr. 1976).

Key words: cadmium telluride; gallium arsenide; germanium; laser flash method; laser windows; thermal diffusivity.

The laser flash technique was used to determine the thermal diffusivity of germanium, gallium arsenide and cad um telluride over the temperature range 80 K-1000 K. The main features of the experimental equipment are described. Values of thermal diffusivity (80-900 K) are reported.

Damage to 10.6 μm window materials due to CO_2 TEA laser pulses, K. M. Leung, M. Bass, and A. G. J. Balbin-Villaverde, *SP435*, pp. 107-117 (Apr. 1976).

Key words: KCl; NaCl; pulsed CO_2 TEA laser damage; transmitted pulse; waveform distortion; ZnSe.

Laser irradiation induced damage to several materials of interest for use as 10.6 μm laser system windows was studied. A pulsed CO_2 TEA laser, operating in the TEM_{00} mode was the irradiation source in these experiments. The light was focused onto the surfaces or into the bulk of the samples and the waveform of the transmitted pulse was monitored. Comparison of the incident and transmitted laser pulse waveforms shows the onset of laser induced damage as a distortion of the latter. Damage threshold data and a discussion of possible damage mechanisms for improved ZnSe, commercial and RAP grown KCl, and commercial NaCl are presented.

Improvements in the breakdown threshold in alkali halides at 10.6 μm, V. Wang, C. R., Giuliano, S. D. Allen, and R. C. Pastor, *SP435*, pp. 118-125 (Apr. 1976).

Key words: alkali halides; bulk damage; longitudinal mode control; pulsed 10.6 μm laser damage; RAP materials; transmitted pulse cutoff; variable pulse duration.

Evidence has been found that the threshold for laser-induced breakdown in the bulk of single crystals is strongly dependent upon processing. Potassium bromide, KCl, and NaCl have been examined over a range of pulse widths (from 0.2 μs to 6 μs) in selected cases and for a variety of pulse shapes using both single longitudinal mode and partially mode-locked multilongitudinal mode pulses. A breakdown threshold of over 12 GW/cm^2 (2.5 MV/cm) for KCl far exceeds the best values obtained in previously available commercial material at these pulse lengths. A comparison of breakdown threshold for conventional and reactive atmosphere processed (RAP) halides is made with comment upon the present ambiguities in breakdown mechanism. In addition to the measurement of damage thresholds of materials from different sources, the temporal profile of transmitted pulses at the time of damage was monitored.

Optical distortion by laser heated windows, J. S. Loomis and E. G. Bernal, *SP435*, pp. 126-141 (Apr. 1976).

Key words: infrared lasers; interferometry; stress birefringence; thermal distortion; windows.

The optical distortion introduced in a collimated He-Ne beam by windows irradiated with a CO_2 laser has been measured interferometrically. Materials measured included ZnSe, KCl, NaCl, CaF_2, SrF_2, and BaF_2. Flux densities from the CO_2 laser were in the range 10-60 KW/cm^2 with total powers from 250 to 1000 watts for the ZnSe and the halides. The changes in the interferometric patterns observed can be attributed to a) isotropic phase shifts proportional to the local temperature, b) anisotropic effects due to induced birefringence that affect both the symmetry of the interferometric pattern and the visibility of the fringes, c) localized phase shifts at the entrance and exit points due to surface absorption.

An analysis of the experimental observations is given using a scalar optics approach and temperature rise functions derived previously by the authors. Experimental comparisons of thermal sensitivity of various materials are given. Also, the relative value of the anisotropic changes in optical path as the window aperture is filled at constant flux density is calculated. This result allows the prediction of window behavior in large lasers from the results of interferometric tests with focused beams of the same flux density.

Thermal distortion studies of ZnSe windows by far field irradiance measurements, J. A. Detrio and R. D. Petty, *SP435*, pp. 142-147 (Apr. 1976).

Key words: far field intensity; laser windows; thermal distortion; thermal lensing; ZnSe.

We have experimentally measured the effect of thermal lensing in ZnSe windows on the far field irradiance (at 10.6 μm) as a function of input power and absorption coefficient. These preliminary measurements are compared to the theoretical predictions of the figures of merit analysis. The undesirable effect produced by interference between reflections from the sample faces is successfully minimized by the use of wedged samples and ratiometric detection techniques. Beam slewing, which may also mask the desired data, is minimized by the use of a scanning slit at a primary mirror focus and a detector preceded by a diffuser and integrating sphere.

Spectral emittance measurements with a cryogenically cooled instrument, D. L. Stierwalt, *SP435*, pp. 149-156 (Apr. 1976).

Key words: cryogenically cooled; spectral emittance.

We have been measuring spectral emittance of laser window materials for several years. The sensitivity of our apparatus was limited not by detector noise, but by background fluctuations caused by minute fluctuations in the temperature of the instrument. Because of this limitation a new instrument has been built which operates at 77°K. This greatly reduces the background radiation and allows us to take advantage of the higher sensitivity of a cooled detector. This instrument covers the spectral region from 2.5 to 14.0 microns with a spectral resolution of about 1-1/2 percent. The noise equivalent absorption coefficient appears to be about 10^{-6} cm^{-1} at 10.6 microns and about 10^{-5} cm^{-1} at 5.0 microns.

Several samples of NaF, NaCl, and KBr have been measured at temperatures from 200°K to 373°K. A number of bands were observed in these samples, some of which have been previously reported and some have not. These spectra will be presented as well as a description of the instrument.

Surface studies with acoustic probe techniques, J. H. Parks and D. A. Rockwell, *SP435*, pp. 157-163 (Apr. 1976).

Key words: acoustic probe techniques; infrared window laser absorption; KCl absorption; laser induced damage; surface absorption.

A new measurement technique will be discussed which utilizes acoustic surface waves to detect the surface depth dependence of radiative absorption. This will include a theoretical analysis of the detection process which relates these measurements to a quantitative model of surface absorption phenomena. This technique is generally applicable to study weak surface absorption at wavelengths for which a material is essentially transparent. Surface wave phase variations induced by the absorption of 10.6 μm radiation have been measured on KCl surfaces with a laser pulse energy of only ~50 mJ. The surface absorption σ of these samples were measured by calorimetry to be $\sigma \sim 2\times10^{-4}$, and acoustic probe measurements on the same samples yielded $\sigma \sim 1\times10^{-4}$. Initial results of recent studies on both polished and etched alkali halide surfaces are discussed.

Photoelastic constants of infrared materials, A. Feldman, D. Horowitz, and R. M. Waxler, *SP435*, pp. 164-169 (Apr. 1976).

Key words: birefringence; germanium; KCl; refractive index; single crystal; stress optic constants.

Optical distortion occurs in infrared laser windows due to thermal gradients established by the absorption of high power radiation. Principal sources of distortion are the stresses produced by the thermal gradients. Because of the photoelastic effect, these stresses, which vary from point-to-point in the material, produce changes in the refractive index. We are measuring the photoelastic constants of infrared window materials. The measurements employ null techniques which have several advantages over other techniques that have been employed in the past. We present data obtained on Ge, reactive atmosphere processed (RAP) KCl, and KCl doped with KI.

Refractive index and temperature coefficient of index of CVD zinc selenide, M. J. Dodge and I. H. Malitson, *SP435*, pp. 170-174 (Apr. 1976).

Key words: refractive index; temperature coefficient of refractive index; zinc selenide.

The refractive index of each of two prismatic samples of CVD ZnSe was measured from 0.5086 to 18.2 μm by means of the minimum-deviation method on a precision spectrometer. Data were obtained at temperatures near 20 and 34 °C and each set of data was fitted to a three-term Sellmeier-type dispersion equation, which permits refractive index interpolation within several parts in 10^{-5}. Using the data obtained at the two temperatures, dn/dT was calculated for both samples. A comparison of refractive index and dn/dT is made with other types of ZnSe.

Laser window test facility, J. L. Zar, *SP435*, pp. 175-188 (Apr. 1976).

Key words: diamond absorption coefficient; laser window heating; laser window testing; Type II diamond windows.

A test facility has been constructed for testing laser window material. This utilizes the focused beam from a 15 kW CW laser at 10.6 μm or other available lasers. Provision for cooling the window is included and also instrumentation for measuring optical and mechanical effects.

The irradiated area may be varied by positioning the specimen. The beam profile is very close to Gaussian. The intensity and beam profile is given as a function of diameter and distance from the focus.

Forty-seven natural diamonds have been tested to find the correlation between the UV absorption spectrum, the IR absorption spectrum and the absorption coefficient β at 10.6 μm. Transparency at 0.253 μm is roughly correlated with low values of β. A water cooled diamond window holder is also described.

Optical material damage from 10.6 μm CW radiation, C. A. Huguley and J. S. Loomis, *SP435*, pp. 189-201 (Apr. 1976).

Key words: CO_2 laser radiation; Cu; CW laser damage; grating; infrared windows; KCl; mirror; Mo; NaCl; window; ZnSe.

Damage studies of a variety of optical materials including KCL, SnSe, NaCl, Mo, and Cu substrates were conducted. Most of the samples were substrates with optical coatings, and several were gratings. Typically, a rectangular grid of thirty irradiation sites was used. An analysis of damage thresholds was accomplished.

10.6 μm component damage from a 20 μsec rapidly pulsed laser, A. B. Callender, *SP435*, pp. 202-206 (Apr. 1976).

Key words: mirror damage; pulsed lasers; window damage.

Extrinsic lower bound thresholds have been found for some window materials and coated and uncoated metal mirrors. The results differ from single shot data in that formation of breakdown plasmas in the vicinity of the components appear to be more likely after several high repetition rate shots have been made. No major conditioning effects have been observed.

Laser damage measurements at CO_2 and DF wavelengths, J. D. Porteus, M. J. Soileau, H. E. Bennett, and M. Bass, *SP435*, p. 207-215 (Apr. 1976).

Key words: Al mirrors; Auger spectroscopy; damage morphology; electron emission; electron imaging; ion emission; laser-induced damage; surface characterization; surface temperature.

Preliminary results from laser damage tests conducted with CO_2 and DF lasers on samples mounted in a newly constructed ultrahigh vacuum sample chamber are reported. The lasers operate single mode and the pulse lengths are 100 nsec for CO_2 and about 500 nsec for DF. A precise method of focusing which permits accurate determination of power densities is described. Incorporated in the test chamber are a scanning electron imager, an optical microscope, a profiling Auger system, and a charged particle collector for *in situ* analysis. Analytical results are presented and implications for physical damage processes are discussed. Measurements in nitrogen on aluminum samples indicate that the threshold for N_2 breakdown is reduced some 20 times in the vicinity of the aluminum surface. Laser supported gas plasma waves are formed which shield the surface, and no physical damage occurs for single 100 nsec pulses even at power levels of 10 GW/cm^2. However, in vacuum damage does occur at about the expected power levels. No significant difference between the damage threshold for polished and machined aluminum surfaces was found.

Single and multilongitudinal mode damage in multilayer reflectors at 10.6 μm as a function of spot size and pulse duration, V. Wang, C. R. Giuliano, and B. Garcia, *SP435*, pp. 216-229 (Apr. 1976).

Key words: absorbing inclusions; damage statistics; laser damage; reflectors; ThF_4; thin film; ZnSe; 10.6 μm.

An extensive series of measurements was carried out upon several high reflectivity multilayer dielectric (ZnSe/ThF_4) enhanced reflectors (typically 99.8%) using a CO_2 TEA laser. Measurements were made using smooth single longitudinal mode pulses, partially modelocked multilongitudinal mode pusles, and a range of pulse lengths extending from 0.6 μs to 6 μs. Studies were conducted at spot size diameters ranging from 50 μm to 255 μm. It is observed that damage thresholds are independent of pulse duration or pulse temporal shape (energy dependent) and evidence is presented that the damage is caused by inclusions, and that the average separation of inclusions, their absorption, and the film absorption can be inferred. A defect-limited damage threshold (90 J/cm^2) and a lower limit to the defect-free threshold (4.4 kJ/cm^2) for the film is established.

Temperature and wavelength dependence of the reflectance of multilayer dielectric mirrors for infrared laser applications, D. L. Decker, *SP435*, pp. 230-235 (Apr. 1976).

Key words: multilayer dielectric mirror; optical absorptance; reflectance; scattering; temperature dependence; wavelength dependence.

The absorptance of mirrors used in high energy laser applications is significant in determining the heat load which must be removed by cooling and the magnitude of the associated thermal figure distortion. For design purposes it is necessary to know the absorptance not only at room temperature, but also at temperatures up to and above the actual operating temperature of the mirror. The damage threshold is also related to the absorptance and to its variation with temperature, dA/dT. Since temperature and wavelength dependence is needed, it is most convenient to infer the absorptance from absolute reflectance and scattering measurements, rather than from direct measurement. The present paper describes instrumentation capable of making relative reflectance vs. temperature measurements with a precision and accuracy of 7×10^{-5}. Temperature dependence data over the range from 25 to 125 °C is presented and analyzed for several commercially obtained dielectric multilayer mirror designs intended for use at 3.8 μm. These mirrors have absolute reflectances above 0.997 and show a reflectance variation with temperature, $|dR/dT|$ of 5×10^{-5} or less.

Preparation and evaluation of ZnS/CeF_3 AR coatings for 10.6 micron KCl laser windows, A. Golubovic, W. Ewing, R. Bradbury, I. Berman, J. Bruce, and J. J. Comer, *SP435*, pp. 236-243 (Apr. 1976).

Key words: CeF_3; CO_2 pulsed laser damage; coating topography; KCl; laser window coatings; ZnS.

The possibility of using ZnS/CeF_3 as a 2-layer antireflection coating for 10.6 micron laser window materials was investigated. Both sputtered and sublimed layers of ZnS were deposited on well characterized Bridgman RAP grown KCl substrates. CeF_3 layers were thermally evaporated onto both bare and ZnS coated KCl substrates. The chemistry and structural quality of the coatings were examined by several characterization techniques including x-ray diffraction, electron microscopy and diffraction, scanning electron microscopy, Auger spectroscopy, Nomarski microscopy, and emittance spectroscopy. Pulsed laser damage studies at 10.6 microns were performed to evaluate the damage threshold of the coatings.

As_2S_3 coatings on KCl, A. D. Baer, T. M. Donovan, and M. J. Soileau, *SP435*, pp. 244-247 (Apr. 1976).

Key words: As_2S_3; coating deposition; index of refraction; laser windows; surface composition; 10.6 μm.

Potassium chloride (KCl) and quartz windows were coated with As_2S_3 at deposition temperatures of 80 and 22 °C. The index of refraction of As_2S_3 coatings is a function of deposition temperature for KCl windows, but not for quartz windows. Coatings deposited on KCl at 80 °C are more durable and less absorbing than those deposited at 22 °C. It is suggested that deposition temperature affects the properties of coatings on KCl because the composition of the surface of polished KCl windows changes with temperature. As_2S_3 coatings were produced with an optical absorption of 1.7 cm^{-1} at a wavelength of 10.6 μm, as compared with 1.1 cm^{-1} reported for bulk As_2S_3.

Design for high power resistance, A. L. Bloom and V. R. Costich, *SP435*, pp. 248-253 (Apr. 1976).

Key words: damage threshold; optical coatings; thin films.

The influence of materials parameters such as thermal conductivity, intrinsic stress, thermal expansivity, and Young's modulus on coating performance is discussed. Metal, metal-dielectric, and dielectric multilayer films at both 1.06 μm and 10.6 μm are considered. Calculations are presented for various combinations of coatings and substrates.

Influence of standing-wave fields on the laser damage resistance of dielectric films, B. E. Newnam, D. H. Gill, and G. Faulkner, *SP435*, pp. 254-271 (Apr. 1976).

Key words: damage thresholds; dielectric thin films; electric fields; electron-gun evaporation; picosecond pulses; rf sputtering; standing-wave patterns.

The influence of standing-wave electric fields on the damage resistance of dielectric thin films was evaluated for the case of 30-ps laser pulses at 1.06 μm. Single-layer films of TiO_2, ZrO_2, SiO_2, and MgF_2 were deposited by state-of-the-art electron-gun evaporation on BK-7 glass substrates with uniform surface preparation. The film thicknesses ranged from one to five quarter-wave increments.

The thresholds for TiO_2 films of odd quarter-wave thickness were greater than for even multiples which correlated well with the calculated internal maximum electric fields. Threshold variations for ZrO_2 films were apparent, but not as distinctly periodic with film thickness. Negligible variations were obtained for SiO_2 films, again correlating with electric-field calculations.

Additional tests allowed comparisons of thresholds for 1) back- and front-surface films for normal incidence; 2) S- and P-polarized radiation at an incidence angle of 60°; and 3) circular and linear polarizations for normal incidence. The thresholds were compared with calculated standing-wave field patterns at various locations in the films. A definite correlation was generally found between the internal field maxima and the thresholds, but in a few coatings defects apparently decreased or prevented any correlation.

Threshold ambiguities in absorptive laser damage to dielectric films, R. H. Picard, D. Milam, R. A. Bradbury, and J. C. C. Fan, *SP435*, pp. 272-283 (Apr. 1976).

Key words: damage threshold; dielectric films; heat conduction; laser damage; multiphoton absorption; rf sputtering.

The threshold energy density for laser-induced damage arising from homogeneous absorption in thin dielectric films is dependent upon the laser irradiance. This is illustrated by measurements of the time to breakdown of rf sputtered films irradiated by tightly focused square-waveform ruby laser pulses. We are able to show that the increase of threshold with decreasing irradiance is due to two mechanisms: (1) cooling of the film by conduction of heat to the substrate and (2) two-photon absorption in the film itself.

Time resolved study of laser-induced structural damage in thin films, N. Alyassini and J. H. Parks, *SP435*, pp. 284-288 (Apr. 1976).

Key words: adhesion effect; laser induced damage; optical probe technique; thin film; time resolved damage.

A time resolved optical probe technique reported previously was used to study laser induced structural damage in thin film dielectric coatings. Experimental data indicates that thin film damage frequently occurs without any detectable spark or distortion to the transmitted damaging ruby pulse and that structural damage to thin film can occur up to 40 nsec after passage of the damaging Q-switched ruby pulse through the site. In addition damage threshold of $\lambda/4$ ZnS single layer film indicates the presence of a film/substrate adhesion effect.

The importance of refractive index, number density, and surface roughness in the laser-induced damage of thin films and bare surfaces, J. R. Bettis, R. A. House, A. H. Guenther, and R. Austin, *SP435*, pp. 289-295 (Apr. 1976).

Key words: damage thresholds; laser damage; refractive index; surface damage; surface roughness; thin films.

Results of a laser-induced damage study to optical surfaces and thin-film coatings are reported. Ten different half wave films, placed on fused silica, sapphire, BK-7, and ZnSe, were subjected to 1.06 μm radiation in a 147 μm spot size. Nine different optical materials in bulk form including four glasses were also tested. The results were compared to a phenomenological equation relating threshold optical field to number density, refractive index, and root mean square surface roughness. The films were measured inhomogeneity and were deposited by r.f. sputtering, electron beam heating, and thermal evaporation. Very good correlation was obtained between predicted and observed behavior.

Investigation of the damage properties of multilayer dielectric coatings for use in high power Nd:glass lasers, C. E. Thomas, B. Guscott, K. Moncur, S. Hildum, and R. Sigler, *SP435*, pp. 298-304 (Apr. 1976).

Key words: coating damage; laser damage; mirrors; multilayer dielectric coatings; polarizers.

The development of high-power Nd:glass laser systems has reached a point where the damage in multilayer dielectric coatings limits the available energy from the laser. KMSF has initiated a testing program to identify the parameters that affect the damage levels of dielectric coatings. We will report the measured damage levels as a function of predeposition substrate cleaning, the dielectric material used (TiO_2 vs. ZrO_2), the substrate material (Pyrex vs. BK-7 or quartz), and the laser pulse length (80 to 480 picoseconds). Damage levels will be compared with the light-scattering properties of the coatings.

Correlation of laser-induced damage with surface structure and preparation techniques of several optical glasses at 1.06 μm, R. A. House, J. R. Bettis, A. H. Guenther, and R. Austin, *SP435*, pp. 305-320 (Apr. 1976).

Key words: damage thresholds; fused silica; ion polishing; surface damage; surface roughness; surface structure; thin films; ultrasonic cleaning.

An extensive experimental investigation has been conducted to correlate laser-induced surface damage with surface structural properties in a range of transparent dielectric materials. Materials investigated were Fused Silica (Corning and Optosil); BK-7 (Schott "P" quality); ED-2, ED-4, and Cervit (all Owens-Illinois). Samples were prepared using controlled grinding, conventional polishing, ion polishing, and bowl-feed polishing. Major parameters of interest were the polishing compound used, the rms surface roughness, the subsurface fracture zone, etching, flame polishing, overcoating with $\lambda/2$ of the substrate material, and the possibly deleterious effect of ultrasonic cleaning. The damaging radiation was a focused 1.06 μm laser beam of about 40 ns width in the TEM_{00} transverse mode. Target sites on a given sample were shielded from each other against blowoff and UV radiation.

Picosecond breakdown studies: Threshold and nonlinear refractive index measurements and damage morphology, W. L. Smith, J. H. Bechtel, and N. Bloembergen, *SP435*, pp. 321-330 (Apr. 1976).

Key words: avalanche ionization; dielectric breakdown; inclusions; laser damage threshold; morphology; nonlinear refractive index; picosecond laser pulses.

Single picosecond pulses from a well-calibrated Nd:YAG laser have been used to study the bulk dielectric properties of 14 transparent solids. Measured values of the breakdown thresholds and nonlinear refractive indices are presented. Photomicrographic data of the damage morphology yield information concering spatial and temporal microplasma growth from initiating electrons, and concerning the spatial density of initiating sites. The data indicate avalanche ionization is the damage mechanism. Preliminary results from a breakdown study at 0.53 μm are discussed.

Current status of electron-avalanche-breakdown theories, M. Sparks, *SP435*, pp. 331-346 (Apr. 1976).

Key words: electron-avalanche breakdown; dielectrics; frequency dependence; magnitude.

Evidence is presented that current theories of electron-avalanche breakdown in dielectrics are inadequate to explain existing data or to be predictive. Specific difficulties include the following: (1) The theoretical value of the ionization frequencies are too small, by tens of orders of magnitude in some cases, to explain the experimental damage results even when the large initial conduction electron densities in (4) below are assumed. (2) The theoretical result for the *frequency dependence* of the breakdown electric field $E_B \sim (1+\omega^2\tau^2)^{1/2}$ disagrees with experimental results. The explanation in terms of an anomalously small electron relaxation frequency is inconsistent with the value of τ required to explain the *magnitude* of E_B, with calculated values of τ (by two orders of magnitude), and with the difference between the dc and 10.6 μm experimental values of E_B. (3) The temperature dependence of E_B is incorrect. (4) The assumed value of the electron density $n_c = 10^8 - 10^{10}$ cm^{-3} required to initiate the avalanche is in conflict with results of photoconductivity measurements. Bounds on n_c set by estimates of the value of the electronic conductivity indicate that the probability of finding an electron in the focal volume during the pulse is less than 10^{-6}, possibly much less, in some cases. (5) The theories are not predictive. Tentative new theoretical results hold promise of explaining existing experiments and being predictive.

A statistical analysis of laser induced gas breakdown—A test the lucky electron theory of avalanche formation, D. Milam, R. A. Bradbury, and R. H. Picard, *SP435*, pp. 347-355 (Apr. 1976).

Key words: electron avalanche; laser-induced gas breakdown; photoionization.

It is shown that the statistical distribution of breakdown times of gas volumes irradiated with square waveform ruby laser pulses can be explained by accounting for the probability that initial electrons are reliably produced by photoionization. Furthermore, the nature of the statistics of gas breakdown are closely related to those predicted by the lucky electron theory, and to the experimentally observed statistics of breakdown in solid dielectrics. It is suggested, therefore, that the statistics of intrinsic breakdown in both gases and solids may be related to the probability of obtaining initial charge rather than purely a manifestation of the lucky electron statistical process.

Measurement of free electron density at the onset of laser-induced surface damage in BSC-2, N. Alyassini and J. H. Parks, *SP435*, pp. 356-361 (Apr. 1976).

Key words: damage electron density; electron density transient; free electron absorption; laser induced surface damage; optical probe technique; refractive index variation.

A study of transient processes which occur during laser induced surface damage to BSC-2 glass was conducted. An optical probe technique was employed in this study which used a He-Ne laser to internally probe the surface at the critical angle. The variations in the detected He-Ne beam revealed a decrease in the site specular reflectivity which precedes structural damage by as much as 2.4 nsec. This is shown to be the result of a laser induced increase in the free electron density at the irradiated surface site with a measured average build up time of 1.6 nsec, resulting in a detectable decrease in the site refraction index ($\Delta n = 10^{-5} - 10^{-3}$). From the measured specular reflectivity decrease, a calculation of the free electron density at the onset of damage indicates a density of $10^{18} - 10^{19}$/cm^3. It is shown that the resulting free electron absorption can transfer a damaging amount of energy from the laser pulse to the sample causing at least melting of the irradiated surface site.

Multi-pulse optical damage of NaCl, P. Bräunlich and P. Kelly, *SP435*, pp. 362-365 (Apr. 1976).

Key words: avalanche breakdown, intrinsic damage; mode-locked pulse trains.

Single-shot intrinsic laser damage of NaCl at 1.06 μm is caused by avalanche ionization. The reduction of the damage threshold of an order of magnitude in case the sample is exposed to a mode-locked train of ten pulses, observed by Penzkofer, was assumed to be caused by absorbing inclusions. In this paper we show that the dependence of the damage threshold on the number of pulses in a mode-locked train can be satisfactorily explained by the avalanche breakdown mechanism.

Do multi-photon induced collision chains lead to pre-breakdown material modifications in alkali halides?, A. Schmid, P. Bräunlich, and P. K. Rol, *SP435*, pp. 366-368 (Apr. 1976).

Key words: alkali halides; collision chains; halogen emission; intrinsic damage; multi-photon absorption.

Experiments are described that indicate the existence of a new phenomenon in certain alkali halides: the multi-photon induced collision chain along [211] and [110] directions of the halide sublattice at power densities below the one-shot damage threshold. A preliminary model description of the involved physical processes is given. The sequence of events starts with the multi-photon generation of self-trapped excitons and leads, via nonradiative exciton-decay, to the formation of new color centers and/or to the ejection of atomic species from the surface. Possible implications which these pre-breakdown material modifications may have on intrinsic optical breakdown are discussed.

Multiphoton absorption coefficients in compound semiconductors from ruby to CO_2 laser wavelengths, R. A. Shatas, S. S. Mitra, and L. M. Narducci, *SP435*, pp. 369-388 (Apr. 1976).

Key words: multiphoton processes; nonlinear absorption; nonlinear optical properties; semiconductor optical properties; two-photon absorption coefficients.

A critical review of multiphoton absorption coefficients for direct band semiconductors of interest in laser optical applications is presented. The two-photon nonlinear absorp-

tion coefficients have been calculated in the second order perturbation employing interconduction band transition model of Braunstein and Ockman, two-valence band intraconduction or intravalence band transition model of Basov et al., and the Keldysh electromagnetic field "dressed" valence and conduction band wave-function model. In all models, corrections to the original calculations were needed to account for effective masses, dielectric constants and the energy band dispersion relations. Comparison of theoretical predictions at 0.694, 1.06, 1.318, and 10.6 μm laser wavelengths shows that, in general, the Basov model slightly over-estimates, the Braunstein model substantially under-estimates the nonlinear absorption, and the Keldysh model yields second order nonlinear absorption about three times larger than Braunstein. It is shown that the second order nonlinear absorption coefficient in the photon energy range $E_g/2<h\omega<E_g$ where E_g is the forbidden gap width, can be as high as 10^{-5} cm W^{-1} and therefore under certain circumstances can exceed the linear absorption at laser flux intensities as low as 10^5 W cm^{-2}. In addition, nonlinear absorption coefficients up to the fifth order have been estimated from the Keldysh model. The utility of the Keldysh model is demonstrated by the surprisingly good prediction of the band-edge absorption in GaAs and InSb without any adjustable parameters.

Electroabsorption: A possible damage consideration, R. P. Benedict and A. H. Guenther, *SP435*, pp. 389-394 (Apr. 1976).

Key words: electroabsorption; IR optics; laser damage; multiphoton processes; uv.

Electroabsorption, also known as photon-assisted tunneling or the Franz-Keldysh effect, is the phenomenon in which the application of a large electric field produces a change in the absorption coefficient of a solid material. This effect has been proposed as a possible laser damage mechanism since the effective absorption coefficient will be dependent upon the laser intensity (optically related electric field) rather than the constant it is usually taken to be. The constant value is normally determined from low laser intensity calorimetric or emittance measurements.

A theoretical investigation of the interaction of an EM field with a material shows that the dc field limit is a tunneling effect and the high-frequency limit is multiphoton absorption so that electroabsorption is closely related to the latter. The result being that one should primarily consider multiphoton absorption rather than electroabsorption for potential damage implications in most situations. Calculations are presented that indicate the relative importance of multiphoton absorption for window materials for both visible and IR lasers. The results indicate that multiphoton absorption will usually be unimportant for IR materials except in cases of extremely high fields and no other competing damage mechanisms. For materials used with visible lasers, the phenomenon must be considered as a potential cause of damage.

Irradiance limits for vacuum ultraviolet material failure, C. J. Duthler and M. Sparks, *SP435*, pp. 395-405 (Apr. 1976).

Key words: nonlinear index of refraction; optical distortion; thermal fracture; two-photon absorption.

Calculated values of irradiance I at which materials fail in 7.2 eV pulses of 10 nsec duration by various mechanisms indicate that metallic mirrors melt at very low values, typically I≅20 MW/cm. Improving the aluminum, which is the only good metallic vuv reflector, would increase I by a factor of only three. The lowest of the thresholds for transparent materials are ~140 MW/cm² for the intrinsic reversible process of optical distortion caused by the conduction electrons generated by two-photon absorption and ~200 MW/cm² for the intrinsic irreversible process of thermal fracture by two-photon absorption. Other thresholds are: ~1 GW/cm² for fracture from enhanced stimulated Raman scattering in Raman-active materials; ~1.6 GW/cm² for melting from two-photon absorption; ~2 GW/cm² for optical distortion from the nonlinear refractive index (bound electrons); and ~100 GW/cm² for thermal fracture from extrinsic one-photon absorption with β=0.1 cm^{-1}. Included in the calculations are the Joule heating by the generated electrons, which is greater than the direct heating by the absorption process, and electron-avalanche multiplication. Thermally induced optical distortion has a higher threshold than that for the optical distortion by generated conduction electrons.

SP436. **Detection, diagnosis, and prognosis.** Proceedings of the 22d meeting of the Mechanical Failures Prevention Group held at Anaheim, Calif., Apr. 23-25, 1975, T. R. Shives and W. A. Willard, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 436, 366 pages (Dec. 1975) SD Catalog No. C13.10:436.

Key words: diagnostic case histories; diagnostic systems; failure detection; failure diagnosis; failure prevention; failure prognosis.

These Proceedings consist of a group of nineteen submitted papers and discussions from the 22nd meeting of the Mechanical Failures Prevention Group which was held at the Grand Hotel in Anaheim, California on April 23-25, 1975. Failure detection, diagnosis, and prognosis represent the central theme of the Proceedings. Technology and techniques, ongoing diagnostic programs, and coming requirements in the field of DD&P are discussed. In addition, several case histories are presented. *These proceedings include the following papers (indented):*

Signal analysis techniques for vibration diagnostics, D. R. Houser, *SP436*, pp. 3-15 (Dec. 1975).

A new technology for bearing performance monitoring, G. J. Philips, *SP436*, pp. 18-28 (Dec. 1975).

Bearing contact resistance as a diagnostic aid, R. L. Smith, *SP436*, pp. 31-41 (Dec. 1975).

Nondestructive tire inspection, M. J. Lourenco and L. H. Emery, *SP436*, pp. 43-75 (Dec. 1975).

Measurement of spectra in internal combustion engine cylinders, J. M. Marrs, *SP436*, pp. 78-82 (Dec. 1975).

Sonic analyzer—Case history, J. L. Frarey, *SP436*, pp. 97-102 (Dec. 1975).

Oil analysis in perspective, R. S. Miller (presented by M. Hoobchaak), *SP436*, pp. 104-112 (Dec. 1975).

Instrumentation for predictive maintenance monitoring, R. James, B. Reber, B. Baird, and W. Neal, *SP436*, pp. 114-122 (Dec. 1975).

Gas turbine engine diagnostic test results utilizing a thermodynamic analysis technique, R. L. Stenberg, *SP436*, pp. 137-149 (Dec. 1975).

Problem areas encountered in establishing a data baseline and evaluating the A-7E inflight engine condition monitoring system, A. J. Hess, *SP436*, pp. 151-161 (Dec. 1975).

Tri service oil analysis research and development program, P. B. Senholzi, *SP436*, pp. 165-181 (Dec. 1975).

Development of inspection and diagnostic equipment for motor vehicle equipment for motor vehicle inspection, G. L. Parker (presented by L. H. Emery), *SP436*, pp. 185-192 (Dec. 1975).

On vehicle mobility measurement and recording system, F. K. Chin and R. Watts, *SP436*, pp. 195-219 (Dec. 1975).

VIDEC ship propulsion system performance monitor, R. P. Wallace and W. L. McCarthy, *SP436*, pp. 221-256 (Dec. 1975).

An overview of current efforts to detect and prevent steel wheel failures, G. L. Leadley, *SP436*, pp. 261-287 (Dec. 1975).

Diagnostics for refrigerator car diesel generating sets, R. F. McKee, *SP436*, pp. 289-302 (Dec. 1975).

Using acoustic emission technology to predict structural failure, H. L. Dunegan, *SP436*, pp. 304-319 (Dec. 1975).

Applications of the shock pulse technique to helicopter diagnostics, J. A. George, T. C. Mayer, and E. F. Covill, *SP436*, p. 321-340 (Dec. 1975).

LST 1179 diesel diagnostic system feasibility study, M. B. Peterson, J. Frarey, D. Dominy, H. Hegner, and H. C. Burnett, *SP436*, pp. 342-354 (Dec. 1975).

SP437. **National Bureau of Standards Annual Report FY 1975.** P. A. Powell and S. A. Washburn, Eds., Nat. Bur. Stand. (U.S.), Spec. Publ. 437, 32 pages (Dec. 1975) SD Catalog No. C 13.10:437.

Key words: annual report; computer; energy; environment; measurement; product safety; research; science; standards; technology.

This publication highlights the major achievements of the National Bureau of Standards during FY75 and describes how resources were utilized during this period. In addition, the report will contain sections featuring the Bureau's interaction with the public and private sectors and emphasizing the historical perspective in relation to the Bureau's 75th anniversary and the nation's bicentennial. This publication will serve as (1) an annual accounting of major NBS activities and (2) promotional information on NBS services and capabilities.

Sections of the report feature: increasing measurement competence, sharing measurement techniques, exploring our energy options, expanding computer utilization, preserving environmental quality, promoting better materials use, improving product safety, providing information as a resource, organization, funds and facilities, people.

SP438. **Testing and certification for export products in industrializing countries.** Proceedings of a Regional Seminar held at the Regional English Language Centre and International House, Singapore, May 19-20, 1975, H. S. Peiser and R. S. Marvin, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 438*, 160 pages (Feb. 1976) SD Catalog No. C13.10:438.

Key words: certification; developing countries; exports; industrializing countries; labeling; seminar; South Asia trade; testing.

A regional seminar sponsored by the Singapore Institute of Standards and Industrial Research, the National Bureau of Standards, and the Agency for International Development was held in Singapore in May of 1975. The participants represented most of the countries in South Asia concerned with increasing their exports, and concentrated on various problems connected with the testing and certification of such exports. Most of the prepared papers reviewed the practice and future plans of these countries. During the discussion a number of specific problems and issues were raised, with a good deal of attention focused on the extent to which the standards and certification of goods by an exporting country can be and are recognized by the importer. This report includes both the prepared papers and a mildly edited version of the discussions following each. *These proceedings include the following papers (indented):*

Export testing, labeling and certification—An overview, W. E. Andrus, Jr., *SP438*, pp. 9-21 (Feb. 1976).

Testing and certification of export products in the Republic of China, W. Y. F. Ning, *SP438*, pp. 23-27 (Feb. 1976).

Pre-export testing and certification in Sri Lanka, R. T. Wijewantha, *SP438*, pp. 29-34 (Feb. 1976).

Development of a National infrastructure of support services for quality control for export, M. Probine, *SP438*, pp. 45-62 (Feb. 1976).

Metrology plan for Korean industrial development, K. Zae-Quan, *SP438*, pp. 69-78 (Feb. 1976).

Can data collection and analysis reduce the rejection of exported products?, J. Hilsenrath, *SP438*, pp. 83-89 (Feb. 1976).

The institution of a worldwide integrated system of testing facilities (WISTF), F. von Ranke, *SP438*, p. 95 (Feb. 1976).

Thailand's certification and quality marks program, K. S. Stephens, *SP438*, pp. 105-124 (Feb. 1976).

Basic export inspection policy in Korea, C. Jong Wan, *SP438*, pp. 127-131 (Feb. 1976).

Testing and certification of Philippine export products, V. F. Ranoa, *SP438*, pp. 133-135 (Feb. 1976).

Certification mark and export inspection in India, A. B. Rao, *SP438*, pp. 139-141 (Feb. 1976).

Quality certification in developing countries, R. Estrada, *SP438*, pp. 143-148 (Feb. 1976).

Pre-export quality control scheme for crumb rubber: Pilot project and experience of Indonesia, N. N. Sumantri, *SP438*, pp. 149-151 (Feb. 1976).

SP439. **The Center for Building Technology: A perspective,** M. Olmert, *Nat. Bur. Stand. (U.S.), Spec. Publ. 439*, 30 pages (Jan. 1976) SD Catalog No. C13.10:439.

Key words: building research; criteria; energy; engineering; industry construction; measurement techniques; standards.

The mission of the Center for Building Technology is threefold. They are (1) advance building technology by providing technical and scientific bases for criteria and standards that improve the usefulness, safety, and economy of buildings; (2) facilitate, for the public benefit, the implementation of improved building technology by providing technical assistance to all sectors of the building community; and (3) develop improved techniques by which the end-users in buildings, communities and industrial processes conserve energy. This report presents an overview of the Center for Building Technology's research areas through its accomplishments and ongoing projects.

SP441. **Successful experiences in teaching metric.** A Conference in Celebration of the One Hundredth Anniversary of the Metric Convention, 1875-1975, held at the National Bureau of Standards, Gaithersburg, MD, May 20-21, 1975, J. V. Odom, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 441*, 115 pages (Jan. 1976) SD Catalog No. C13.10:441.

Key words: education; International System of Units; metrication; metric education; metric system; training; Treaty of the Meter.

These proceedings contain the texts of the presentations made at a recent conference on Successful Experiences in Teaching Metric. Specific experiences in introducing the metric system in all areas of educational interest were presented. These ideas will be especially useful to educators just beginning to prepare for their change to the metric system. *These proceedings include the following papers (indented):*

The International System of Units, R. W. Roberts, *SP441*, pp. 1-3 (Jan. 1976).

Principles and practices of teaching the metric system in public schools, G. W. Bright, *SP441*, pp. 4-12 (Jan. 1976).

Metric in general (elementary) education, L. Smith, *SP441*, pp. 13-15 (Jan. 1976).

Metrication and the school librarian, P. Lawrence, *SP441*, pp. 16-17 (Jan. 1976).

Teaching the metric system through television and other audio visual means, N. F. Calhoun, *SP441*, pp. 18-22 (Jan. 1976).

Metric and mathematics education, S. A. Choate, *SP441*, pp. 23-29 (Jan. 1976).

Experiences in teaching the metric system in science classes, B. Logan, *SP441*, pp. 30-42 (Jan. 1976).

Metric gaming, C. R. Trueblood and M. Szabo, *SP441*, pp. 43-50 (Jan. 1976).

Metric in preservice teacher training, J. Lindbeck, *SP441*, pp. 51-54 (Jan. 1976).

Constructing metric education workshops—A model, P. T. Larsen, *SP441*, pp. 55-62 (Jan. 1976).

Metric for the blind, A. Nadash, *SP441*, pp. 63-66 (Jan. 1976).

Metric in sports and physical education, F. Burgee, *SP441*, pp. 67-68 (Jan. 1976).

Metrication and State departments of education, A. V. Buffington, *SP441*, pp. 69-71 (Jan. 1976).

Metrication in a local education agency, T. E. Rowan, *SP441*, pp. 72-76 (Jan. 1976).

Successful experiences in teaching metrics in home economics, C. A. Ford, *SP441*, pp. 81-84 (Jan. 1976).

Successful experiences in teaching metric conference, E. M. Schanbacher, *SP441*, pp. 85-89 (Jan. 1976).

A basis for successful teaching of vocational metric education, R. A. Dieffenderfer, *SP441*, pp. 90-96 (Jan. 1976).

What can we learn from the English and Australian experiences in metric education?, A. B. Chalupsky, *SP441*, pp. 97-100 (Jan. 1976).

SP442. **Report of the 60th National conference on weights and measures 1975,** S. J. Edgerly, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 442*, 272 pages (May 1976) SD Catalog No. C13.10:442.

Key words: calibration; communication; consumers; grain moisture measurement; laws and regulations; measurement; metric; packaging and labeling; police radar equipment; standards; supermarket automation; weights and measures.

This is a report of the proceedings (edited) of the Sixtieth N tional Conference on Weights and Measures, sponsored by th National Bureau of Standards, held in San Diego, Californi July 13-18, 1975, and attended by state, county, and city weigh and measures officials, the Federal Government, business, i dustry, and consumer organizations. *These proceedings inclu the following papers (indented):*

Guarding measurement integrity, S. D. Andrews, *SP442*, p 1-6 (May 1976).

Preparing for a metric America, F. K. Willenbrock, *SP44* pp. 6-12 (May 1976).

Petroleum—Engineering, measurement, marketing, J. Byrn *SP442*, pp. 14-25 (May 1976).

Why not unshackle measurement standards, L. T. Wallac *SP442*, pp. 25-28 (May 1976).

Intergovernmental communication mechanisms, R. J. Barr *SP442*, pp. 29-35 (May 1976).

The State of California measurement system, S. Kozic *SP442*, pp. 36-42 (May 1976).

Calibration of police radar instruments, D. W. Allan, *SP44* pp. 42-47 (May 1976).

Grain moisture measurements and the weights and measur community, F. E. Jones, *SP442*, pp. 52-58 (May 1976).

Impact of electronics in weighing, J. J. Elengo, Jr., *SP442*, p 59-65 (May 1976).

Weights and measures and the consumer, M. H. Becke *SP442*, pp. 67-72 (May 1976).

Representing the consumer interest in weights and measur law enforcement, H. E. Nelson, *SP442*, pp. 74-80 (May 197

Supermarket automation—UPC and the computeriz checkout counter, T. K. Zaucha, *SP442*, pp. 83-98 (May 197

Maintaining an economic balance during inflationary tim K. J. Simila, *SP442*, pp. 104-110 (May 1976).

Overview of consumer issues, C. A. Barrett, *SP442*, pp. 11 121 (May 1976).

The perfect formula and PMTD, A. J. Farrar, *SP442*, p 123-133 (May 1976).

American society for testing and materials—Voluntary co sensus standards, W. T. Cavanaugh, *SP442*, pp. 133-137 (Ma 1976).

International organization of legal metrology—The emergi U.S. role, W. E. Andrus, Jr., *SP442*, pp. 138-156 (May 197

Converting to metric standards in Canada, J. L. Armstron *SP442*, pp. 156-163 (May 1976).

SP443. **Hydraulic research in the United States and Canada, 197** G. Kulin and P. H. Gurewitz, Eds., *Nat. Bur. Stand. (U.S. Spec. Publ. 443*, 359 pages (June 1976) SD Catalog N C13.10:443.

Key words: fluid mechanics; hydraulic engineering; hydra lic research; hydraulics; hydrodynamics; model studie research summaries.

Current and recently concluded research projects in hydra lics and hydrodynamics for the years 1973-1974 are sur marized. Projects from more than 200 university, industri state and federal government laboratories in the United Stat and Canada are reported.

P444. **Wind and seismic effects.** Proceedings of the Sixth Joint Panel Conference of the U.S.-Japan Cooperative Program in Natural Resources, National Bureau of Standards, Gaithersburg, MD, May 15-17 (1974), H. S. Lew, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 444,* 462 pages (Apr. 1976) SD Catalog No. C13.10:444.

Key words: bridges; buildings; codes; disaster; dynamic analysis; earthquakes; modeling; soils; structural response; volcanoes; wind.

The Sixth Joint Meeting of the U.S.-Japan Panel on Wind and eismic Effects was held in Washington, D.C., on May 15-17, 974. The proceedings of the Joint Meeting include the opening marks, the program, the formal resolutions, and the technical apers. The subject matter covered in the papers includes exeme winds in structural design: assessment and experimental chniques for measuring wind loads; dynamics of soil structures id ground response in earthquakes; structural response to wind id earthquakes and design criteria; disaster mitigation against atural hazards; and technological assistance to developing ountries. *These proceedings include the following papers (inented):*

On the gust response of long-span suspension bridges, N. Narita and K. Yokoyama, *SP444,* pp. I-1 – I-20 (Apr. 1976).

Key words: bridge; design; field data; gust response; model; specifications; structure; theory; wind.

In the design of above-ground structures it is established practice to consider the effects of wind. For some structures, like long-span suspension bridges, the influence of wind may be the primary design control which will then govern the inherent safety of the structures and the final construction cost.

This paper, therefore, will describe the required changes in design specifications to incorporate the influence of gusts on long-span suspension bridges.

The necessary numerical calculations are illustrated in addition to some long-term observations on the Kanmon Bridge. The importance and necessity of studies on gust response are emphasized.

Extreme winds in hurricanes and possibility of modifying them, R. C. Gentry, *SP444,* pp. I-21 – I-33 (Apr. 1976).

Key words: cloud seeding; frequency distribution; hurricanes; typhoon; wind; wind intensities.

A hurricane (or similar storm called by other names) is the most destructive of nature's phenomena. This is partly because of the extreme winds associated with the storms (ranging up to 320 kilometers per hour), but also because the winds may continue blowing for several hours, and they are accompanied by rising ocean water, strong along-shore currents, and torrential rains.

Discussions will be presented of the frequency of hurricanes of various intensities, the rate at which the wind speeds decrease after the storm crosses the coast and moves inland, the effect of the winds on the storm surge, and the variation of the wind speed with height.

For several years, members of the United States Government have been experimenting to reduce the maximum intensity of the winds of hurricanes. Summaries will be presented of the progress and future prospects for this work.

Extreme winds in the United States, A. R. Hull and P. E. Hughes, *SP444,* pp. I-34 – I-39 (Apr. 1976).

Key words: building code; damage classification; extreme wind; tornado; wind loads.

The highest winds reported in the United States have been associated with tornadoes. Fujita (1971) has developed a tornado windspeed/damage classification system which permits extreme wind estimations without follow-up surveys. Fujita classifications of tornadoes for the 1965, 1971, and 1972 seasons, as well as extreme wind values associated with thunderstorms and extratropical cyclones during 1973 are reviewed as they relate to ANSI building code requirements for design loads. Next, a new observational tool, an acoustic, doppler-shift "sonar" capable of profiling low-level wind regimes at the actual building site, is briefly described. Finally, the proposed NOAA Severe Environmental Storms and Mesoscale Experiment (SESAME) is examined. SESAME is an observational/research effort to identify the processes and controlling parameters of extreme-wind generating severe weather systems such as squall lines, thunderstorms, and possibly tornadoes, and to aid in the development of conceptual and numerical models of these phenomena.

Wind tunnel experiments for studying a local wind, K. Suda, S. Soma, and K. Takeuchi, *SP444,* pp. II-1 – II-20 (Apr. 1976).

Key words: bridge; gust; meteorological data; topographical model; wind load; wind profile; wind tunnel.

In general, the study of the effects of local winds on structures is primarily based on data obtained from wind tunnel experiments. As an example of such studies, an investigation of air flow around Nakatojima Island relative to the wind resistant design of a long suspension bridge has been conducted and will be presented.

However, it is not reasonable to conduct such a study entirely related to wind tunnel experiments, as the similitude rule has not been established. Therefore, field observations have been made in parallel with the wind tunnel experiments and the data obtained by both sources are then compared. Thus, the results obtained from the wind tunnel experiment are more reliable.

A study of wind pressures on a single-family dwelling in model and full scale, R. D. Marshall, *SP444,* pp. II-21 – II-51 (Apr. 1976)

Key words: aerodynamics; boundary layers; buildings; codes and standards; wind loads; wind tunnels.

Wind pressures measured on a single-family dwelling are compared with results obtained from a 1:50 scale model placed in a turbulent boundary layer. It is shown that the fluctuating components of surface pressures far exceed the mean or steady pressures and are well correlated over sizeable roof areas. The consistently low fluctuating pressure coefficients obtained from the wind tunnel model are attributed to improper simulation of the lower portion of the atmospheric boundary layer. Comparisons between actual loads and specified design loads suggest that certain current provisions are marginal for tributary areas and excessive for localized areas such as ridges, eaves and corners. A procedure for expressing loads on both localized and extended roof areas in terms of mean pressure coefficients and a peak factor is described.

Nonlinear calculations of ground response in earthquakes, W. B. Joyner, A. T. F. Chen, and P. C. Doherty, *SP444,* pp. III-1 – III-12 (Apr. 1976).

Key words: elastic medium; engineering seismology; ground layer; numerical solution; shear wave.

The response of soil to strong earthquake motion involves a high degree of nonlinearity. Because of the difficulties in solving the nonlinear problem, most calculations of ground response are currently made by a method—variously characterized as "equivalent linear", "quasi-linear", or "strain-compatible"—that assumes the true solution can be approximated by the response of a linear model whose properties are chosen to accord with the average strain that occurs in the model during excitation. The average strain level is determined by iterative calculation. To solve the nonlinear problem directly, we have developed algorithms by which the hysteretic behavior of an individual soil element can be efficiently modeled in a computer. The algorithms enable us to model any reasonable set of hysteresis loops of the Masing type that laboratory experiments may dictate. We are experimenting with various numerical techniques for integrating the basic nonlinear differential equations, including the method of characteristics as described by Streeter, Wylie, and Richart. A comparison was made between the equivalent linear and the nonlinear solution (using the method of characteristics) for a 200-meter section of firm alluvium excited at its base by the N21E component of the Taft accelerogram multiplied by four. This excitation produced peak strains of several tenths of a percent. The nonlinear solution showed substantially higher spectral levels of response at five percent damping for periods between 0.1 and 0.6 seconds.

Observation and analysis of ground response in earthquakes, S. Hayashi and H. Tsuchida, *SP444*, pp. III-13—III-23 (Apr. 1976).

Key words: earthquake; field data; ground response; seismic waves; seismometer; soil-structure interaction.

In the field of port and harbor engineering, the ground response due to earthquakes is generally considered. However, there are many problems at present in idealization of the surface layer, input ground motions, and nonlinear behavior of the soil. In order to provide some design data in these areas, research has been conducted using six downhole seismometer arrays established in port areas in Japan. Typical observed acceleration time histories have been obtained and are shown and compared with those calculated by the multiple reflection theory. In order to investigate ground response relative to structures of large length, such as a tunnel, a two-dimensional seismometer array has been established. Examples of the considerations of the ground response required in practice are seen in microzonation in the earthquake proof design of a subaqueous tunnel.

Research study on liquefaction, W. F. Marcuson, III, *SP444*, pp. III-24—III-37 (Apr. 1976).

Key words: earthfill dams; earthquakes; ground shaking; liquefaction; soil density; stability.

A research program is being undertaken by the U.S. Army Corps of Engineers to evaluate the liquefaction phenomena relative to earthquake response of earth-filled dams. Present and future studies are summarized.

Estimation of liquefaction potential by means of explosion test, K. Yamamura and Y. Koga, *SP444*, pp. III-38—III-51 (Apr. 1976).

Key words: earthquake; explosion test; ground strength; ground vibration; liquefaction; pore-water pressure.

A series of field vibration experiments were performed order to estimate the liquefaction potential of sandy soil d ing earthquakes. Bore hole explosions were used as a vib tion source. A significant relation was found between t ground stiffness and the pore-water pressure as caused the explosion. A proposed method has been developed estimation of the liquefaction potential.

Landslide incidence and mechanisms during earthquakes, E. Ericksen, *SP444*, pp. III-52—III-71 (Apr. 1976).

Key words: avalanches; earthquakes; falls; flows; lar slides; mechanisms; slides.

Strong earthquakes affecting mountainous terrain a generally accompanied by hundreds or even thousands large potentially destructive landslides of certain typ earthquakes affecting areas of low relief cause fewer a generally different types of landslides, which, however, m be equally destructive to works of man. On steep slop among the many types of landslides that may occur, fal slides, and avalanches of rock and soil are most freque during earthquakes. These landslides take place whe slides are commonly part of normal mass-wasting process that affect hillslopes; the earthquake causes the reactivati of old slides as well as the formation of new slides. Surfa movement on faults may also cause landslides by the form tion of scarps that change slope stability although landslid of this type are relatively rare. In terrain of low reli failures by rotational slump, translatory sliding, and late spreading are frequent causes of destruction in towns and ties that have been constructed on unstable, generally wate saturated soil or unconsolidated sediment.

Landslides, with the exception of those classified as fal result from failure of earth materials under shear stre Earthquake accelerations trigger landslides by causing transitory increase in shear stress in earth materials at t site of the slide, and by causing a decrease in the she strength of certain materials, such as water-saturated so Most slide failure takes place along one or more planes weakness, except for flow or landspreading, wherein a give mass fails by loss of coherence. Among the most spectacul or earthquake-triggered landslides are large high-spee debris avalanches that move over a cushion of entrappe compressed air.

Stress condition effects on dynamic properties of soils, E. Ki ribayashi and T. Iwasaki, *SP444*, pp. III-72—III-83 (Ap 1976).

Key words: damping; damping coefficients; shear modulu soil; tests; torsional excitation.

In the engineering field, the evaluation of the dynam characteristics of soils and foundation subgrades has bee required in the course of studying vibrational problems an especially problems associated with earthquake engineerin The dynamic characteristics of soils have, therefore, bee obtained by laboratory tests, using a resonant colum method. These tests were conducted to evaluate the shea modulus and the damping characteristics in dry and satu rated specimens of various soils in Japan.

The hollow cylindrical samples tested were 25 cm i height, 10 cm outside diameter, and 6 cm inside diameter This arrangement permitted a more uniform deformation the sample cross-section. The specimens were fixed at th bottom, and at the top of the specimens oscillators wer fastened to a rigid mass, which supply a torsional vibration force to the system. A confining pressure, which was ap

plied equally to the outside and inside of the test sample, was supplied by air pressure. An axial load was also applied, and was independent of the confining pressure in order to produce an anisotropic stress condition.

After the sample was prepared and all proper alignments and forces imposed, the frequency of the torsional excitation was introduced and then varied until the oscillator specimen system resonated. The resonant frequency varied from 40 cps to 100 cps, depending upon the dimensions and density of the sample and the applied stress condition and the shearing strain amplitude. The strain amplitude varied from 5×10^{-6} to 5×10^{-4} for these tests. The shear moduli were calculated from the resonant frequencies and the other parameters, as given above. The damping characteristics were obtained by using the amplitude-time decay response curves of the free vibrations.

In the triaxial state of stress, the mean principal stress, p, is defined by $(\sigma_a+2\sigma_r)/3$ and the deviator stress, q, is given by $\sigma_a-\sigma_r$ are the axial and radial stresses, respectively. The test results indicate the following trends for the dynamic properties of soils;

(1) Under constant values of the other parameters, the shear moduli vary with 1/2 power of p and decreases with an increase in the void ratio and shearing strain amplitude. Furthermore, the damping capacity decreases with an increase in p and also increases with an increase of strain amplitude. However, the damping capacity remains constant irrespective of the change in the void ratio, when the other parameters remain constant.

(2) When the value of p is kept constant, the shear moduli are nearly constant irrespective of the value of q until the stress ratio, q/p, reaches a value of about 1.0. However, beyond this value of q/p, the shear moduli begin to decrease with an increase in q/p. This phenomenon is due to the anisotropic stress condition and the corresponding anisotropy in the inner structure of specimens.

Prediction of maximum earthquake intensities for the San rancisco Bay Region, R. D. Borcherdt and J. F. Gibbs, *P444*, III-84 – III-94 (Apr. 1976).

Key words: earthquake; empirical relation; Franciscan Formation; geological character; ground shaking; intensity.

The intensity data for the California earthquake of April 18, 1906, are strongly dependent on distance from the zone of surface faulting and the geological character of the ground. Considering only those sites (approximately one square city block in size) for which there is good evidence for the degree of ascribed intensity, the empirical relation derived between 1906 intensities and distance for 761 sites underlain by rocks of the Franciscan Formation is

$$\text{Intensity} = 2.30 - 1.90 \log (\text{Distance}).$$

For sites on other geologic units intensity increments, derived with respect to this empirical relation, correlate strongly with the Average Horizontal Spectral Amplifications (AHSA) determined from 99 three-component recordings of ground motion generated by nuclear explosions in Nevada. The resulting empirical relation is

$$\text{Intensity Increment} = 0.27 + 2.70 \log (\text{ASHA}).$$

Resulting average intensity increments for various geologic units are −0.29 for granite, 0.19 for Franciscan Formation, 0.64 for other pre-Tertiary, Tertiary bedrock, 0.82 for Santa Clara Formation, 1.34 for Older Bay sediments, 2.43 for Younger Bay mud. These empirical relations have been used to delineate areas in the San Francisco Bay region of potentially high intensity from future earthquakes on either the San Andreas fault or the Hayward fault.

A statistical approach to loading and failure of structures, R. G. Merritt, *SP444*, pp. IV-1 – IV-15 (Apr. 1976).

Key words: failure; probability theory; random process; safety; statistical analysis; structural engineering.

A fundamental problem of structural engineering is the examination and selection of loading criteria. It is imperative that any solution to the problem center around a rationale that relates information available on loading to selected criteria. Such available information is generally in the form of data. It is the purpose of this brief paper to abstract the problem and outline preliminary work on a rationale for addressing the problem.

The paper begins by defining the general nature of the problem. Solution to the problem is related to consideration of available information in the form of data. The next three sections of the paper discuss the initial stages of a rationale for consistent examination and selection of loading criteria. The first of the sections examines available information on structural load and the second examines available information on instances of structural failure. Classes of statistical methods are discussed in the third section. This section also includes discussion of a proposed method for assessing the overall information content of the available data. Finally, several illustrative examples of application of statistical methods to load and failure data are presented and the paper concludes with a discussion of future extension to this preliminary work.

Synthetic experimental research on the ductility of short reinforced concrete columns under large deflection, K. Nakano and M. Hirosawa, *SP444*, pp. IV-16 – IV-36 (Apr. 1976).

Key words: column; ductility; earthquake; reinforced concrete; shear tests; structural engineering; web reinforcement.

In general, short reinforced concrete columns will fail in a brittle manner. In order to create and establish better ductility in such columns, a synthetic research experimental program has been conducted. This program consisted of the testing of 125 short column specimens, subjected to multicycles of flexure-shear loadings. The result from these tests indicate the following:

1) The ductility of structural members is influenced by shear, bond, and buckling of the compression bars.

2) To prevent buckling of compression reinforcement, under small curvature, the spacing of the web reinforcement must be controlled.

3) In order to prevent a shear failure of structural members within reasonable ductility, an effective set of restrictions on the combination of axial force, tensile reinforcement ratio, and shear span ratio are required.

4) The bond failures which were observed in the test members, where deformed bars were used as axial reinforcement, consisted of bond-splitting of the cover concrete. The conventional method, which uses bond strength as an index to verify bond failure, is not effective for the bond-splitting failure mode. It is, therefore, necessary to restrict the tensile reinforcement ratio in order to prevent this type of bond failure.

Nonlinear analysis of a guyed tower, S. K. Takahashi and W. A. Shaw, *SP444*, pp. IV-37 – IV-54 (Apr. 1976).

Key words: finite element; guyed tower; structural analysis; structural engineering; vibration analysis; wind load.

The Civil Engineering Laboratory has performed an analysis of a tower at a Naval communication facility. The tower is about 600 feet high and is guyed at three levels. The upper guy level contains twelve wires; the middle and lower guy

levels have three wires each. The guy wires had numerous large electrical insulators attached, each weighing 510 pounds.

A nonlinear finite element analysis of the guyed tower was conducted. Separate finite elements were used for portions of the tower and the guy wires were modeled with a truss element. Deflections, forces, and stresses in the tower and guy wires were determined from dead load and an equivalent static wind load corresponding to 90 miles per hour.

Eigenvalue solutions were obtained for the first five mode shapes and natural frequencies of one of the top guy wires; the guy wire had concentrated masses at five different locations and was initially prestressed.

A standard for the structural integrity of prefabricated dwellings, K. Nakano, M. Hirosawa, and T. Murota, *SP444*, pp. IV-55 – IV-69 (Apr. 1976).

Key words: earthquake; housing; performance specification; prefabricated dwelling; standards; structural design.

In 1973, the Ministry of Construction of Japan presented a standard for the performance of prefabricated housing. The purpose of this standard was to provide consumers with an index for selecting their dwellings. The standards are related to fire, heat, sound, durability, and structural safety against earthquakes, winds, snow, etc.

The criteria for evaluating structural properties are outlined in this paper, as well as the history and present status of prefabricated dwellings in Japan. A typical prefabricated structural system is shown in the last section.

An analytical model for determining energy dissipation in dynamically loaded structures, J. F. McNamara and S. K. Sharma, *SP444*, pp. IV-70 – IV-89 (Apr. 1976).

Key words: analytical model; dynamic analysis; dynamic laoding; earthquake; energy dissipation; finite element; seismic response; structural engineering.

An analytical procedure is developed which predicts nonlinear cyclic structural response under large reversals of plastic strains. The structure is discretized by means of the finite element approximation, and the material behavior is simulated by a refined analytical model which describes the realistic hysteretic stress-strain curves of A36 steel under arbitrary cycles of load. In order to test the validity of this material model, some comparisons are made with experimental values of the inelastic response of a simply supported beam under cyclic bending. The model is subsequently used in the dynamic analysis of a portal frame subjected to a selected portion of the El Centro NS earthquake acceleration record. The improved cyclic response with the current approach is illustrated by comparing results with those obtained using a simple bilinear kinematic hardening material approximation. Comparisons are also made with values obtained using a commercially available nonlinear frame analysis computer program. Some final comments are made regarding the rate of solution convergence with integration time step size for two different temporal integration operators used in this analysis.

Design of pile foundations subjected to lateral loads, M. Nagao, T. Okubo, K. Komada, and A. Yamakawa, *SP444*, pp. IV-90 – IV-112 (Apr. 1976).

Key words: design; earthquake; highway bridges; lateral loads; pile head; piles; structural engineering.

This report presents a number of basic items relative to the design of pile foundations subjected to lateral loads, and deals with the present design status of highway bridges Japan. Also presented are items to be further studied for t design standardization of pile foundations subjected lateral loads. Such problems as the deformation mechanis of group-pile structures are examined.

This report presents the method by reinforcement of t pile-head.

Comprehensive seismic design provisions for buildings, C. Culver, *SP444*, pp. IV-113 – IV-126 (Apr. 1976).

Key words: building codes; buildings; design; earthquake structural engineering.

A review of the development of earthquake design pro sions for U.S. building codes is presented. Suggested re sions to the current provisions are noted. A cooperative pr ject directed toward developing comprehensive seism design provisions is described. The organizational structu for the project including a breakdown of the Task Comm tees required to develop the provisions and work statemer for each Task Committee are included.

Wind loading and modern building codes, E. Simiu and R. Marshall, *SP444*, pp. IV-127 – IV-144 (Apr. 1976).

Key words: building codes; buildings; deflections; dynam response; gust factors; structural engineering; wind loads.

The differences between the dynamic alongwi response, the gust factors, and the total alongwind respon obtained using various current procedures may in certa cases be as high as 200, 100, and 60 percent, respectivel The purpose of this paper is to investigate the causes of su differences. To provide a framework for this investigatio the paper presents an overview of the questions involved determining alongwind structural response, and a critic description of the basic features of procedures currently use. A comparison is made between alongwind deflectio of typical buildings selected as case studies, calculated b both new and traditional procedures, some of which a described in various building codes. The reasons for the di ferences between the respective results are pointed out. Th procedures were evaluated on the basis of a recent developed method which utilizes a logarithmic variation wind speed with height above ground, a height-depende expression for the spectrum of the longitudinal wind spee fluctuations. The method also allows for realistic cross-co relations between pressures on the windward and leewar building faces.

Seismic retrofitting of existing highway bridges, J. D. Coope R. R. Robinson, and A. Longinow, *SP444*, pp. V-1 – V-2 (Apr. 1976).

Key words: design; earthquakes; highway bridge retrofitting; soil-structure interaction; structural engine ing.

The retrofitting of existing highway bridges, to provide a added measure of protection against collapse due t earthquake ground motion, is of great importance. This i terest heightened in the United States following the San Fe nando earthquake of 1971, which caused extensive damag to a number of modern freeway structures.

Some of the specific concepts for retrofitting to be ex plored include: (1) widening of bearing supports, (2 motion restrainers across hinges, (3) ties across expansio joints, (4) the elimination of expansion joints, and (5 adding ties or reinforcing to existing columns.

The monetary savings, resulting from an effective retrof program in preventing collapse of structures, would far ex

ceed the cost of the research involved in generating feasible and practical retrofit details.

This is a progress report on research which will result in mathematical techniques to identify the seismically vulnerable bridge details and a catalog of retrofit techniques. Such techniques will permit strengthening of such weak links, in the total structure integrity.

Dynamic tests of structures using a large scale shake table, S. ıaba, *SP444*, pp. V-25 – V-34 (Apr. 1976).

Key words: dynamic tests; earthquake simulator; shake table; structural engineering; tests.

Since 1970, a large scale shake table located at the National Research Center for Disaster Prevention (NRDP) has been widely used for the dynamic testing of structures. This paper presents the results of some of those dynamic tests, using this jumbo earthquake simulator, and the results obtained from some other shake tables operated by other research institutes in Japan.

A methodology for evaluation of existing buildings against rthquakes, hurricanes and tornadoes, H. S. Lew and C. G. ulver, *SP444*, pp. V-35 – V-49 (Apr. 1976).

Key words: buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornadoes, wind.

A methodology is presented for evaluation of existing buildings to determine the risk to life safety from natural hazard conditions and to estimate the amount of expected damage. Damage to structural building components resulting from the extreme environments encountered in earthquakes, hurricanes, and tornadoes is considered. The methodology has the capability of treating a large class of structural types including braced and unbraced steel frames, concrete frames with and without shear walls, bearing wall structures, and long-span roof structures. Three independent but related sets of procedures for estimating damage for each of the natural hazards are included in the methodology. The first set of procedures provides a means for qualitatively determining the damage level on the basis of data collected in field surveys of the building. The second set utilizes a structural analysis of the building to determine the damage level as a function of the behavior of critical elements. The third set is based on a computer analysis of the entire structure. All three sets of procedures are based on the current state-of-the-art. The procedures are presented in a format which allows up-dating and refining.

Experimental research on the aseismic characteristic of spheral steel tank for liquid petroleium gas, K. Nakano and M. 'atabe, *SP444*, pp. V-50 – V-62 (Apr. 1976).

Key words: dynamic analysis; earthquake; seismic design; seismic response; spherical tanks; structural design.

The results of static and dynamic tests on a spherical steel tank are given in detail. A theoretical technique to explain the "sloshing" effect is presented. A proposal for a safer design procedure to replace the present aseismic design practice is presented.

Research on minimizing earthquake structural damage to sine-family dwellings, W. J. Werner, *SP444*, pp. V-63 – V-65 \pr. 1976).

Key words: building codes; construction practices; damage; earthquake; houses; residential dwelling.

This paper discusses proposed research work to be carried out by the Applied Technology Council of the Structural Engineers Association of California under the sponsorship of the Department of Housing and Urban Development. The objective of the project is to develop a manual of recommended construction practice for earthquake resistive dwellings, for use primarily by builders, building officials, field inspectors, plan checkers, and designers.

The manual is intended to explain the structural behavior of single-family dwellings and townhouses subjected to forces produced by earthquake shocks, illustrate the HUD Minimum Property Standards, building code earthquake requirements and sound practical construction methods and details for the reduction of single family dwelling damage. The paper discusses the need for this research, the various tasks the contractor will perform, and the final products expected to be achieved by the research program.

Earthquake engineering research supported by the National Science Foundation, C. C. Thiel, *SP444*, pp. V-66 – V-79 (Apr. 1976).

Key words: earthquake engineering; grant; RANN; sponsorship; structural engineering.

A summary of earthquake engineering research work conducted by various researchers throughout the United States under the sponsorship of the National Science Foundation is presented.

The wind engineering program, M. P. Gaus, *SP444*, pp. V-80 – V-82 (Apr. 1976).

Key words: research programs; sponsorship; wind engineering.

A summary of wind engineering research work conducted by various researchers under the sponsorship of the National Science Foundation is presented.

Preliminary report on present status and development project of volcanological observation and research in Indonesia, A. Suwa, *SP444*, pp. VI-1 – VI-15 (Apr. 1976).

Key words: field observation; Indonesia; Japan; technical aid; volcanoes.

Indonesia has about 130 active volcanoes and their eruptions are characterized by dangerous violent explosions, nuee ardente, and volcanic mud-flows. The Geological Survey of Indonesia (GSI), Ministry of Mines, has, therefore, been carrying out observations and surveillances of volcanic activities throughout the country.

The Government of Japan, in response to a request from the Government of Indonesia, has decided to give assistance in this field of science in the framework of the Colombo Plan. The Overseas Technical Cooperation Agency (OTCA), the executing agency for the Government of Japan, has, therefore, dispatched a preliminary survey mission, headed by the author of this report, Akira Suwa, of the Japan Meteorological Agency to Indonesia in 1972.

The mission stayed in Java and Bali from November 22 to December 23, 1972, and visited the Ministry of Mines at Djakarta, the GSI at Bandung, and eight active volcanoes (eleven observatories) in order to study the possible scope of cooperation in Volcanology between Japan and Indonesia. The mission recognized two serious problems in Indonesia: deficiency of experts in volcanology, and shortage of up-to-date volcanological instruments.

Therefore, the recommendation by the preliminary survey mission to both governments was as follows:

1. Dispatch for several years the following Japanese experts to Indonesia; a. Instrumental seismologist, b. Volcano physicist; c. Volcanological geologist/petrologist.

2. Train junior volcanologists of the GSI in Japan.

3. Provide Indonesia with the following instruments; a. Seismographs for permanent and temporary observations; b. Instruments for petrological and mineralogical laboratory.

Use of stabilized adobe block and cane in construction of low-cost housing in Peru, S. G. Fattal, *SP444*, pp. VI-16–VI-24 (Apr. 1976).

Key words: adobe; cane; earthquake; housing; Peru; technical aid.

A description of the use of adobe block and cane for construction of low-cost housing in seismic areas of Peru is described.

A comment on the technological aid to developing countries, M. Nagao and T. Okubo, *SP444*, pp. VI-25–VI-31 (Apr. 1976).

Key words: earthquake; Japan; natural disaster; storm; structural engineering; technological aid.

This paper describes the technological aid required in developing countries, after a natural disaster, as observed by the writer during surveys of storm and earthquake disasters in these developing countries.

The writer classifies the aid required after a natural disaster into three categories, that is, emergency aid, technological aid, and economic aid. The problems related to the scientific and technological areas in the developing countries after a natural disaster are discussed.

The technological aid is classified into short and long term aid.

Finally, the problems related to the required technological aid are discussed and then the necessary Governmental policy which has been prepared for implementation of a low-cost and disaster resistant housing system is described.

SP445-1. **The National Measurement System for Time and Frequency,** A. S. Risley, *Nat. Bur. Stand. (U.S.), Spec. Publ. 445-1*, 72 pages (June 1976) SD Catalog No. C13.10:445-1.

Key words: atomic frequency standards; aviation industry; electric power industry; National Measurement System, position location; shipping and boating industries; Standards laboratories; telephone industry and specialized carriers; time and frequency; time scales; users of NBS radio broadcasts.

The results of a study of the National Measurement System for Time and Frequency are given. The system is viewed from three vantage points: 1) The *Instrumentation* that provides sources of time and frequency (T&F). 2) The *Suppliers and Users* of T&F. 3) The *Calibration hierarchies* for T&F sources. An attempt is made to determine the technological, scientific, economic, and social effects of the system. Predictions are made about possible important changes in the system. The past, present, and possible future position of NBS in the system is described in detail.

SP446. **Building technology project summaries,** M. Olmert, *Nat. Bur. Stand. (U.S.), Spec. Publ. 446*, 108 pages (May 1976) SD Catalog No. C13.10:446.

Key words: building research; building technology; codes; criteria; project summaries; standards; technical bases.

The Center for Building Technology provides the technical and scientific bases for criteria and standards that improve the usefulness, safety, and economy of buildings while conserving building materials and energy. The Center's activities support the building technology program of the Federal, State and local government; assists design professions, building officials and th research community by developing design criteria that improv buildings; and assists manufacturers of building products b developing criteria for evaluating innovative building materials This report summarizes the Center's projects for calendar yea 1975. It enables individuals to get a clear impression of CB research activities.

SP447. **Weights and measures standards of the United States – brief history,** L. V. Judson, *Nat. Bur. Stand. (U.S.), Spec Publ. 447*, 44 pages (Mar. 1976) SD Catalog No C13.10:447.

Key words: history of measurement standards; measures metric system; standards; units of measurement; weights.

Two publications of the National Bureau of Standards, nov out of print, that deal with weights and measures have ha widespread use and are still in demand. The publications ar NBS Circular 593, The Federal Basis for Weights and Measure (1958), by Ralph W. Smith, and NBS Miscellaneous Publicatio 247, Weights and Measures Standards of the United States – Brief History (1963), by Lewis V. Judson.

To meet the current demand for information on the history c weights and measures in the United States, Miscellaneous Publi cation 247, referred to above, updated where needed to bring i into accord with current usage, is reprinted in this publication together with a brief addendum that discusses important event involving weights and measures of the period 1963-1975. NB Circular 593 is not being reprinted because of the significan overlap of material treated in the two publications.

SP448. **Automation technology applied to public service** Proceedings of a Conference on Automation Technology Ap plied to Public Service, held at the National Bureau of Stan dards, Gaithersburg, MD, May 21-22, 1974, E. G. Johnsen Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 448*, 87 pages (Sept 1976) SD Catalog No. C13.10:448.

Key words: automation technology; economic impact of au tomation; productivity improvement; public services; socia impact of automation.

The Conference on Automation Technology Applied to Publi Service, held in May 1974, was cosponsored by the National Bu reau of Standards, the General Accounting Office, the Nationa Science Foundation and the Urban Institute. The objectives o the conference were first, to explore the use of automatio technology as a means of increasing the efficiency of Govern ment in providing higher quality public services at lower cost and second, to explore the political, social and economic aspect involved in managing the public service applications of automa tion. Potential uses of automation technology discussed includ automating operations in environments hazardous to safety an health of people, such as fire fighting, and the automation of ser vices that are tedious, boring or demeaning for people to do. Th spectrum of potential applications of automation technology i public service ranges from garbage collection to aids to the han dicapped and from water treatment process control to the adap tive computerized regulation of traffic in urban areas. Some par ticipants warn that the way in which automation technology i applied must be carefully thought out and supervised in order t minimize disruptive economic and social effects. *Thes proceedings include the following papers (indented):*

Introductory address, R. M. Davis, *SP448*, pp. 1-4 (Sept 1976).

Keynote address: Automation Technology: Key to public ser vice productivity improvement, T. D. Morris, *SP448*, pp. 5- (Sept. 1976).

Economic and social view of automation: A labor view of automation technology, M. Roberts, *SP448*, pp. 8-9 (Sept. 1976).

Technology, humanity and the cities, L. H. Blair, *SP448*, pp. 9-10 (Sept. 1976).

Session I: Automation for urban public service operations, J. M. Carlson, C. F. Guarino, W. W. Isman, M. G. Stragier, D. S. Wasserman, and J. McManama, *SP448*, pp. 11-19 (Sept. 1976).

Session II: Automation for occupational welfare, J. H. Stender, R. L. Atwood, W. E. Bradley, W. R. Knowles, and R. J. Straw, *SP448*, pp. 20-28 (Sept. 1976).

Session III: Automation for the handicapped, J. M. Benjamin, Jr., K. R. Ingham, E. Kwatny, W. G. Holsberg, and J. S. Albus, *SP448*, pp. 29-35 (Sept. 1976).

Session IV: Recovery of ocean resources for public benefit, A. Spilhaus, M. G. Johnson, A. Mucciardi, E. J. Beck, R. W. Uhrich, G. Guenther, and R. H. Cassis, Jr., *SP448*, pp. 36-43 (Sept. 1976).

Session V: Recovery of underground resources for public benefit, W. B. Schmidt, W. C. Helt, and B. M. Goldwater, Jr., *SP448*, pp. 44-48 (Sept. 1976).

Session VI: Impact of automation on the public, W. Lepkowski, B. Bova, J. McCarthy, J. S. Albus, D. V. DeSimone, L. K. O'Leary, M. MacCoby, and G. Tyler, *SP448*, pp. 49-59 (Sept. 1976).

Session VII: Automation for transportation, R. H. Cannon, Jr., C. R. Peterson, J. D. Ward, D. Roos, and D. L. Cooper, *SP448*, pp. 60-64 (Sept. 1976).

P449. **Chemical kinetics of the gas phase combustion of fuels. (A Bibliography on the Rates and Mechanisms of Oxidation of Aliphatic C_1 to C_{10} Hydrocarbons and of Their Oxygenated Derivatives),** F. Westley, *Nat. Bur. Stand. (U.S.), Spec. Publ. 449*, 138 pages (Oct. 1976) SD Catalog No. C13.10:449.

Key words: bibliography; chemical kinetics; combustion; free radicals; gas phase; hydrocarbons; oxidation; oxygen; oxygenated organic compounds; ozone.

A reaction oriented list of references is provided for papers nd reports containing rate data for gas phase reactions of combustion and oxidation of aliphatic saturated or unsaturated C_1 to $_{10}$ hydrocarbons, alcohols, aldehydes, ketones, ethers, peroxles and their free radicals. The list also includes decomposition, isproportionation, atom transfer and recombination reactions f the oxygen containing species noted above. Pyrolytic reacons of hydrocarbons and their radicals are excluded. All the rocesses listed here have been reported to occur in the gas hase combustion of fuels. In addition, a list of critical reviews ealing with the reaction kinetics of the above processes and a st of papers dealing with generalized mechanisms of the same eactions are also included. More than 800 papers covering 540 eactions are listed. The period covered extends from 1902 rough June 1975.

P451. **Data base directions. The next steps.** Proceedings of the Workshop of the National Bureau of Standards and the Association for Computing Machinery, held at Fort Lauderdale, FL, Oct. 29-31, 1975, J. L. Berg, Ed., R. G. Canning, D. L. Adams, R. W. Bemer, G. Dodd, R. M. Gall, and C. D. Trigg, *Nat. Bur. Stand. (U.S.), Spec. Publ. 451*, 175 pages (Sept. 1976) SD Catalog No. C13.10:451.

Key words: auditing; cost/benefit analysis; data base; data base management; DBMS; government regulation; management objectives; privacy; security; standards; technology assessment; user experience.

What information about data base technology does a manager need to make prudent decisions about using this new technology? To provide this information the National Bureau of Standards and the Association for Computing Machinery established a workshop of approximately 80 experts in five major subject areas. The five subject areas were auditing, evolving technology, government regulations, standards, and user experience. Each area prepared a report contained in these proceedings. The proceedings provide guidance on steps managers should follow to prepare themselves and their organization for the installation of data base management concepts. The auditing working panel noted the increased vulnerability of organizations who integrate their formerly dispersed and redundant files into a data base and suggest actions to address this risk. The technology report noted several promising parallel developments but concluded that the future would see evolving, rather than revolutionary data base progress. Government regulations, particularly the drive for individual privacy rights, were seen to play an important role in determining data base directions and the panel's guidance on cost impact suggest that organizations would experience reduced costs with data base technology. Standards pervaded all issues and were found necessary in several sub-areas of data base technology but the panel saw no immediate likelihood of national data base standards. The user experience working panel noted that data base systems had impacted their organizations to the extent of reconsidering existing data flows, areas of responsibilities, and procedures. *These proceedings include the following papers (indented):*

Introduction, R. G. Canning, General Chairman, *SP451*, pp. 1-2 (Sept. 1976).

A manager's viewpoint, D. B. Magraw, Keynote Speaker, *SP451*, pp. 3-11 (Sept. 1976).

What experience has taught us, R. M. Gall, Chairman, *SP451*, pp. 13-28 (Sept. 1976).

Standards: A data base imperative, R. W. Bemer, Chairman, *SP451*, pp. 31-39 (Sept. 1976).

Auditing the data base, D. L. Adams, Chairman, *SP451*, pp. 41-64 (Sept. 1976).

Impact of government regulations, C. D. Trigg, Chairman, *SP451*, pp. 67-78 (Sept. 1976).

Data base technology—Present and future, G. Dodd, Chairman, *SP451*, pp. 81-103 (Sept. 1976).

Background, *SP451*, pp. 105-106 (Sept. 1976).

SP452. **MFPG—The role of coatings in the prevention of mechanical failures.** Proceedings of the 23d Meeting of the Mechanical Failures Prevention Group, held at the National Bureau of Standards, Gaithersburg, MD, Oct. 29-31, 1975, T. R. Shives and W. A. Willard, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 452*, 199 pages (Sept. 1976) SD Catalog No. C13.10:452.

Key words: barrier film; chemical coatings; failure prevention; mechanical failure; metal coatings; plated coatings; polymer coatings; solid film lubricants; sputtered coatings; wear.

These Proceedings consist of a group of eighteen submitted papers and discussion from the 23d Meeting of the Mechanical Failures Prevention Group which was held at the National Bureau of Standards in Gaithersburg, Maryland on October 29-31, 1975. The central theme of the Proceedings is the Role of

Coatings in the Prevention of Mechanical Failures, with emphasis on polymer coatings, metal coatings, solid film lubricants, and chemical coatings. *These proceedings include the following papers (indented):*

The friction and wear of polymeric coatings on metal, K. C. Ludema, *SP452,* pp. 3-13 (Sept. 1976).

Key words: adhesion; coatings; friction; metal; polymers; wear.

Polymeric coatings on metals wear and/or debond when rubbed. Information on wear is available from tests using bulk polymers which usually have a different structure than do thin films. The bond strength requirements for rubbing surfaces appear to be greater than that developed by the technology centered in adhesives and composite materials industries. Many of the factors involved in wear life and bonding are summarized in the paper. Recent and broad ranging references are given for each of the major points in the paper.

Performance studies of polymer processed mechanical and structural components, M. J. Devine, *SP452,* pp. 14-24 (Sept. 1976).

Key words: components, structural; dry powder painting; mechanical and structural components; polymer processed mechanical and structural components; structural and mechanical components.

A technique which has become known as "dry powder painting" is one of the major advances made in the application of coatings. This technique is based upon the deposition of specially formulated, thermoplastic or thermosetting, heat-fusible powders on metallic substrates. Since there are no solvents present, the coating can be cured immediately after application. One of the most obvious advantages of this method is the absence of pollution and safety problems associated with organic solvents that are used in most liquid paint systems. A second advantage is that coatings may be obtained by this process from materials that cannot be applied by liquid paint techniques because of their poor solubility in organic solvents. Dry powder techniques are readily adaptable to current production methods and are easily learned by product finishing personnel. Because of special requirements in particle size, particle size distribution, and other properties, dry powder coatings are generally more expensive than liquid paint systems. However, in view of the advantages of dry powder processes over wet painting techniques the overall cost differences are probably minimal. In addition as much as 95 percent of the dry powder material can be utilized if a powder recovery system is used.

Advantages similar to those reported for dry powder techniques are also claimed for electrocoating. This process can be compared to electroplating of metals, and, like the dry powder method, it also avoids the use of organic sovents.

Nylon 11 as a lubricant and corrosion preventative coating, R. G. Baker, G. H. Kitchen, and R. R. Wells, *SP452,* pp. 25-30 (Sept. 1976).

Key words: abrasion; corrosion protection; friction; marine environment; powder coating; salt water; solid lubrication.

The working bearing surfaces of Sea Plow IV, a vehicle designed to lay cable in a 4-ft trench in the ocean floor, must be protected from corrosion, internal friction plus abrasion from sand, mud and silt. Examination of this problem suggested that a coating of nylon 11, applied electrostatically as a dry powder, could afford protection against all of thes conditions. Conventional application techniques wer modified to permit application of the coating at dockside Results have been excellent as evidenced by Sea Plow IV more than one year of troublefree operation.

Mechanical design concepts for coated nuclear fuel particle J. M. Tobin, *SP452,* pp. 31-42 (Sept. 1976).

Key words: computer modeling on a microscal elastoplastic micropressure vessels; failure predictabilit through small size; microencapsulated coated fuel particle

Retention of fission products in microspherical coate particles depends upon the mechanical integrity of th coatings. Mechanical design concepts have been develope over a 15-year period which led to the fabrication of high successful multiple coated particles such as the TRIS coated particles. An overview of this development described.

Nickel-phosphorus alloy coatings for wear resistance, C. I Johnson, F. Ogburn, *SP452,* pp. 45-55 (Sept. 1976).

Key words: auto-catalytic nickel; auto-catalytic nicke hardness of; auto-catalytic nickel, wear of; electrole nickel; electroless nickel, hardness of; electroless nicke wear of; nickel, auto-catalytic; nickel, electroless; nicke phosphorus alloy; wear resistant alloy.

Electroless nickel coatings are nickel alloys generally wi a nominal composition of 8 wt percent phosphorus, applie to metal substrates from a nickel solution by an autocat lytic chemical process. They are used for protecting ste from corrosion and wear, and are generally more corrosic and wear resistant than electroplated nickel.

Heat treatments can increase significantly the wear r sistance and hardness of electroless nickel. This occurs b precipitation hardening and the precipitation of a nick phosphide. The hardness depends on the heat treatment an on the alloy composition and often attains a Knoop hardne of 900-1000, equivalent to the hardness of electrodeposite chromium.

Tests by several laboratories show improved wear r sistance with appropriate heat treatment and in some ci cumstances, the electroless nickel coatings have a high wear resistance than electrodeposited chromium. Wear r sistance of electroless nickel can also be improved by the i corporation of small particles and hard material into th coating during the plating process.

Chromium deposit structure has a profound influence on pr perties, W. H. Safranek, *SP452,* pp. 56-63 (Sept. 1976).

Key words: corrosion; crack-free chromium; electroplatin fast plating; fatigue strength; grinding; hardness; stress; te sile strength; wear.

The optimum structure of chromium electroplate shou be specified for each individual application. Crack-fr chromium supplies good corrosion protection and goo wear resistance for some applications. Customary ha chromium is preferred for resisting wear in other applic tions. High-crack-count chromium is mandatory for avoi ing harmful effects on the fatigue strength of high-streng steel substrates. Each of these structures can be deposit by a new process that is 25 to 50 times faster than the cust mary rate for chromium plating.

Plated coatings for electric contacts, M. Antler, *SP452,* p 64-71 (Sept. 1976).

Key words: contact lubrication; corrosion inhibitors; ele

trical contacts; gold plate; palladium; polymer in gold; porosity in gold; solder plate; tin-nickel alloy; tin plate; underplatings for gold; wear of gold.

Electrical contacts, such as those in separable connnectors, are required to have low and stable contact resistance. For high reliability connector applications in low voltage circuits, gold is the preferred contact material because of its chemical inertness. Recent studies have shown that the most common gold electrodeposits, which contain cobalt or nickel as hardeners, are complex materials, containing 10 percent or more by volume of organic polymers, potassium compounds, and other substances. Failure in service can occur if the deposit is porous, since films may form on the surface by reaction of the base substrate metal with air pollutants at pore sites. The use of underplatings and smooth substrates can reduce the thickness of gold required for low porosity; inhibitor coatings may suppress corrosion reactions, and galvanically inert substrates can even eliminate pore corrosion. Wear-induced porosity is also a failure process, and contact lubrication is effective in its control. Degradation by diffusion of substrate metals, such as copper, to the surface where films form is controlled by barriers, like nickel underplate. The high cost of gold has led to the search for alternate contact materials. Palladium plate and the soft base metals, tin and solder plate, have achieved limited acceptance.

Compatibility effects when soft metals are used as solid lubricants, E. Rabinowicz, *SP452*, pp. 72-83 (Sept. 1976).

Key words: compatibility; electropolated soft metal film coatings; metallurgical; metals; soft metals; solid lubricants.

The purpose of this study has been to test, mainly by means of metal cutting experiments, the extent to which the wear life of electroplated soft metal film coatings is governed by the metallurgical compatibility between the coating and the other sliding surface. Experiments have been carried out using hard steel tools coated with various soft metals, and cutting a number of different workpiece metals. Two different configurations were used, namely milling and shaping, and in some cases the lubricant was only applied once at the beginning of the test, while in other cases it was reapplied continuously. It was found that long tool life resulted when the soft metal had low metallurgical compatibility with the workpiece material but not otherwise. The other parameter investigated, namely relative mechanical strength between film and substrate was found to be much less significant. This is in contrast to the case of the friction coefficient, which has been found to be greatly influenced by the mechanical strength ratio.

Reduction of sliding wear by metallic coatings, S. Jahanmir and N. P. Suh, *SP452*, pp. 84-93 (Sept. 1976).

Key words: coatings, metallic; metallic coatings; sliding wear.

The role of soft metallic coatings in sliding wear has been examined experimentally. The results indicate that the tribological behavior of soft coatings is consistent with the delamination theory of wear, especially the critical nature of the plating thickness. It is shown that a reduction in wear rate of three orders of magnitude is possible when the coating material is softer than the substrate and thinner than a critical thickness. The optimum plate thickness was found to be less than 1 μm for cadmium, silver, gold or nickel plated on various steels. As the plate thickness is increased, wear by delamination within the plate occurs. Environmental effects are important in coating utilization.

The search for factors to prevent mechanical failures due to corrosion with solid film lubricants, M. K. Gabel and M. B. Peterson, *SP452*, pp. 97-105 (Sept. 1976).

Key words: corrosion; electrochemical; lubricants; salt-spray.

The failure of mechanical components of contemporary flight vehicles has frequently been attributed to the corrosion characteristics of solid film lubricants. An ongoing program at the Naval Air Development Center is investigating how some parameters affect corrosion between solid film lubricants and various aircraft alloys. This paper will summarize some of the findings of this study.

Rust-inhibited nonreactive perfluorinated polymer greases, J. Messina, *SP452*, pp. 106-119 (Sept. 1976).

Key words: chemisorption; corrosion preventives; inhibitor additives; LOX compatible greases; nonreactive lubricants; rust inhibited perfluoro greases; surface chemistry lubrication.

Perfluoroalkylpolyether fluids thickened with polytetrafluoroethylene were studied in connection with the development of rust-inhibited chemically inert greases for liquid-fueled rocket engines. It was found that 1.0 to 3.0 wt percent of a physically and chemically modified organophilic dimethyloctadecylbenzyl ammonium bentonite + sodium nitrite imparts very effective rust-preventive properties to perfluoro polymer grease mixtures. Data are given which show that the rust-inhibited greases are nonreactive on contact with conventional fuels and oxidizers, exhibit lubricating properties comparable to soap-thickened greases with a significant improvement in extreme pressure properties, and are nonreactive at high impact energies in the presence of LOX. The results of this work are applicable to all liquid-fueled rocket engines for missiles and space vehicles.

The role of coatings in the prevention of erosion damage, A. P. Thiruvengadam and A. A. Hochrein, Jr., *SP452*, pp. 120-123 (Sept. 1976).

Key words: adhesion; cavitation; coatings; design charts; elastomers; erosion; Hopkinson pressure bar apparatus; impedances; mismatching; stress wave interactions; substrates; tearing; vibratory apparatus.

Among the various methods available for protection against cavitation erosion, elastomeric coatings offer great potential. However, adhesion failures, tearing, and substrate mismatching are some of the problems to be solved for a successful application of protecting coatings. Basic studies in understanding this problem includes stress-wave interaction analysis, controlled experiments with a vibratory cavitation erosion apparatus and the generation of high strain data with the help of a Hopkinson pressure bar apparatus. It is hoped that such a coordinated approach would lead to the design and development of successful coating systems.

Solid film lubricant to prevent fretting damage in titanium engine components, B. D. McConnell, *SP452*, pp. 124-131 (Sept. 1976).

Key words: curing agent; fretting; silicone resin; solid lubricants; titanium; wear.

An air drying solid film lubricant originally developed for applications in the field has been found to be an excellent coating for prevention of fretting damage in titanium-titanium mated parts. This film, designated AFSL-41, is composed of molybdenum disulfide (MoS_2) and antimony triox-

ide (Sb_2O_3) carried in a methyl phenyl silicone binder. The film air dries without heat through the use of a curing agent, an amino-alkyl alkoxy-silane. A brief description of the formulation is presented along with laboratory evaluation data comparing its antifretting performance with other candidate materials. The performance on titanium led to its consideration as a candidate antifretting coating for titanium components. The various screening tests used to determine antifretting properties are described along with results which led to AFSL-41 being selected for full scale engine tests. Current use of AFSL-41 by two gas turbine engine manufacturers on a production basis is discussed and the types of applications (over 100 in one engine) are described.

A study of solid lubricated gears at elevated temperatures, A. J. Haltner, D. K. Snediker, K. E. Demorest, and G. C. Marshall, *SP452,* pp. 132-148 (Sept. 1976).

Key words: fluoride films; gears; molybdenum disulfide; solid lubricants; wear.

An experimental study has been made of the performance of advanced, state-of-the-art solid lubricants applied to spur gears expected to operate to high temperatures in reusable space vehicles (space shuttle). Tests of Inconel 718 gears covered the range 25-482 °C in air, and the lubricants studied included MoS_2 in several binders (glass, metal matrix, polyimide, and polyphenylene) and mixed fluoride compositions. All of the combinations demonstrated acceptable wear over portions of the temperature range, but the glass bonded films showed the most promise—particularly at higher temperatures.

Vapor deposition of wear-resistant coatings, W. J. Wilson, M. F. Browning, and J. M. Blocher, Jr., *SP452,* pp. 151-169 (Sept. 1976).

Key words: chemical; coating; deposition; vapor; wear.

Vapor deposition processes by which a variety of wear and environment resistant coatings are applied are described. Criteria for selecting coating/substrate systems are discussed in the light of economic and technological changes.

Several examples of vapor-deposited, wear-resistant coatings are given in addition to specific examples of commercial applications.

Barrier films for miniature bearings, M. K. Bernett and H. Ravner, *SP452,* pp. 170-176 (Sept. 1976).

Key words: barrier films; bearings; fluorinated polymers; lubricant migration; lubricants; spreading prevention.

Miniature bearings (less than 30 mm O.D.) are employed in large numbers by the Navy in synchro-servo motors, guidance systems and general instrument use. The most frequent cause of malfunction of these mechanisms is bearing lubricant failure; in the majority of instances, failure is induced by migration of the lubricant away from the balls and races, both during storage and service. As a result of long-term basic studies at NRL on wetting and spreading of liquids, a low-energy, nonwetting "barrier film" was developed, which when applied to bearing race surfaces, effectively prevented migration of the lubricant. The increasing use of these films has resulted in major reductions in replacement costs and maintenance, and has significantly increased the reliability of the mechanisms involved.

Potential of sputtered coatings for improved gas bearing instrument performance, L. L. Fehrenbacher, B. D. McConnell, C. Pellerin, and K. R. Mecklenburg, *SP452,* pp. 177-186 (Sept. 1976).

Key words: antimony trioxide; friction; molybdenum disulfide; spin axis gas bearings; sputtered coatings; surface characterization; wear life.

Sputtered coatings were applied to I-400 beryllium substrates to determine and eventually optimize their friction and wear performance relative to their potential for gas bearing inertial instrument applications. Solid lubricant-carbide basecoat combinations were sputter deposited under varying conditions of substrate bias and thicknesses. The surface morphology and chemistry of the coatings were characterized prior and after friction and wear evaluations using scanning electron microscopy and scanning Auger microscopy techniques. The friction and wear tests consisted of sliding a 1/8 inch TiC ball under load on the coated disc specimens rotating at 60 RPM. MoS_2-Sb_2O_3 solid lubricants were deposited on TiC, WC and B_4C sputtered undercoats at varying thicknesses and sputtering conditions. The solid lubricant combinations exhibited consistent wear life behavior showing moderate and strong dependency on the substrate bias and solid lubricant thickness, respectively, regardless of the underlying substrate. Correlations between coating chemistry, morphology, sputtering conditions and friction and wear performance are given.

Ferrography of polymer formation under lubricated rubbing contact—An exploratory investigation, A. A. Reda, *SP452,* pp. 187-191 (Sept. 1976).

Key words: ferrographic analysis; lubricated rubbing contact; polymer formation.

Ferrographic analysis of lubricant samples from a variety of operational machines and test rigs has revealed the presence of nonmetallic particles. Some of these particles have characteristic shapes and are composed of polymers. For example, under relatively high load nonmetallic particles shaped like rolling pins were formed when a lubricant per specification Mi 1-L-23699 was used. The same particles were produced when polyphenyl ether was used as lubricant.

It was speculated that under the conditions of the test the lubricant forms a polymeric film at the rubbing surfaces and it is rolled in the shape of rolling pins when it is pealed off. Furey has shown that polymer films are formed directly on rubbing surfaces and that these films are a factor in reducing wear. Furthermore, it is well known that different additive packages in lubricants meeting the same specifications lead to different wear rates under identical load conditions. It was considered useful to determine if ferrography could provide further information on the phenomena and to assess if ferrographyic analysis could be used to study the performance of lubricants.

SP453. **Ultrasonic tissue characterization.** Proceedings of a Seminar held at the National Bureau of Standards, Gaithersburg, MD, May 28-30, 1975, M. Linzer, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 453,* 274 pages (Oct. 1976) SD Catalog No. C13.10:453.

Key words: absorption; acoustic; A-scan; attenuation; B-scan; frequency; image; impedance; medical diagnosis; microscopy; pattern recognition; reconstruction; scattering; tissue characterization; tissue parameters, tissue signature; tumor; ultrasonic spectroscopy; ultrasound; velocity.

An international Seminar on Ultrasonic Tissue Characterization was held at the National Bureau of Standards on May 28-30, 1975. The meeting was cosponsored by the National Bureau of Standards, the National Science Foundation and the Nation

nstitutes of Health. This volume contains extended versions of 0 of the 21 talks presented at the Seminar. Topics covered include techniques for measurement of ultrasonic tissue parameters, the dependence of tissue properties on physical and biological variables (*e.g.*, ultrasonic frequency, temperature) and pattern recognition techniques. *These proceedings include the following papers (indented):*

The NSF (RANN) integrated program on medical ultrasonics, G. B. Devey, *SP453*, pp. 7-10 (Oct. 1976).

Key words: applied research; imaging; instrumentation technology; medical ultrasonics; NSF; RANN; R & D incentives; tissue characterization; tissue signature; ultrasonic diagnosis; ultrasound.

Recommendations made by the National Foundation (NSF) Survey Team on Ultrasonic Imaging for the conduct of a Medical Instrumentation Experiment to provide incentives to commercial firms and for the preparation of an R & D agenda for future developments in medical ultrasonics have been implemented. Projects emphasizing substantial improvements in resolution of medical ultrasonic images and investigations into ultrasonic tissue characterization are listed at high priority. The NSF (RANN) Instrumentation Technology program supports research in these areas. In addition to having good potential for making substantial technological advances, the funded projects must also develop the criteria which should be met before results of the research are introduced into clinical medicine. Successful results from a coordinated research and development program in ultrasonic tissue characterization could revolutionize medical diagnosis.

Challenges and opportunities in ultrasound, J. M. Reid, *SP453*, pp. 11-17 (Oct. 1976).

Key words: diagnosis; Doppler effect; optimization; resonance; scattering; tissue characterization; tissue parameters; tumor detection; ultrasound.

The scientific study of the ultrasonic properties of tissue is on the threshold of being able to contribute useful knowledge needed to improve the utility of ultrasonic medical diagnostic instruments. There is ample evidence to support these contentions and to guide our future course.

Ultrasonic attenuation, absorption, and velocity in tissues and organs, F. Dunn, *SP453*, pp. 21-28 (Oct. 1976).

Key words: absorption; attenuation; mammalian tissues; tissue parameters; ultrasound; velocity.

Propagation relations for compressional waves in isotropic, elastic media are described briefly and discussed with reference to ultrasonic propagation in biological structures. A selected review of experimentally obtained results from tissues and organs is presented. It is shown that characterization of tissues and organs by their acoustic parameters should be possible.

The scattering of ultrasound by tissues, J. M. Reid, *SP453*, pp. 29-47 (Oct. 1976).

Key words: blood; cross-section; diagnosis; scattering; standardization; tissue characterization; ultrasound.

Most ultrasonic diagnostic equipment is based on the observation of the waves scattered by tissues. Although these instruments generally perform useful clinical diagnosis, they do not provide quantitative measurements of the detailed characteristics of the scattered waves. Such measurements should significantly improve the diagnostic capability of medical ultrasound. The properties responsible for scattering have been shown to be differences in compressibility and density between adjacent tissue structures. The rationale of scattering measurements is considered through a review of direct measurements and substitution techniques which correct for wave shape changes. The necessity of correcting for apparatus parameters and the effects of overlying tissue attenuation is considered. Equations are derived which relate the scattered power to the scattering parameters of tissues and the measuring equipment constants for a number of useful cases.

Use of pattern recognition for signal processing in ultrasonic histopathology, K. Preston, Jr., *SP453*, pp. 51-59 (Oct. 1976).

Key words: analog-digital converter; A-scan; digitization; pattern recognition; speech spectrogram; ultrasound.

New developments in high-speed electronics have made possible real-time digitization of the ultrasonic A-scan as a block of binary words. This makes computer processing of such blocks feasible using techniques previously developed in time-series analysis for communications, speech processing, word recognition, etc. The research reported here is concentrating on: (1) advanced digitization techniques having variable block length and skip-block capability; (2) application of speech spectrogram representation and analysis to A-scan processing; and (3) use of human audition (of the recorded A-scan, properly frequency-translated) to assist in defining the features most useful for A-scan pattern recognition.

Quantitative A-scan analysis of normal and cirrhotic liver, P. N. T. Wells, R. A. Mountford, M. Halliwell, and P. Atkinson, *SP453*, pp. 61-70 (Oct. 1976).

Key words: A-scan; attenuation; computer analysis; impedance; liver cirrhosis; ultrasonics.

The development of quantitative methods of analyzing ultrasonic liver scans is reviewed. These methods are based on measurements of intrahepatic echo amplitudes or echo spacings. Simple techniques indicate that the echo amplitude tends to be increased in cirrhosis. Using a frequency of approximately 1-5 MHz, this was confirmed by computer analysis of the measurements of 100 consecutive cycles of the ultrasonic echo wavetrains in each of 30 separate scans from each of 30 individuals with normal livers, and 13 with cirrhosis. These data were acquired manually. In cirrhotics, the mean echo amplitude was 6 dB greater than in normals. Similar results were obtained with an automated system of data acquisition. The results are compatible with a model in which the observed structure is a random noise effect; the dimensions of the pulse determines the scale of the fluctuation which is observed. The echoes from cirrhotic liver, higher in amplitude but otherwise very similar to those from the normal, could be due to similar targets with greater characteristic impedance mismatches.

Digital A-scan analysis in the diagnosis of chronic splenic enlargement, K. J. W. Taylor and J. Milan, *SP453*, pp. 71-78 (Oct. 1976).

Key words: A-scan analysis; digital; grey-scale ultrasound; spleen; splenomegaly.

Before the availability of grey-scale ultrasound machines, signal processing only permitted the display of the layer echoes which were specularly reflected at large discontinuities of acoustic impedance. The enhanced signal-to-noise

ratio inherent in the grey-scale technique permits, in addition, the display of the internal structure of soft tissue. The amplitude of these low-level echoes is relatively independent of beam orientation and appears to be more dependent on the nature of the interface so that the pattern of the tissue may be specific to each pathology. From clinical observations, high-level echoes are usually associated with benign causes of splenic enlargement, while cellular infiltration, as in many malignancies, results in decreased echo amplitude. Digital A-scan analysis concerns and quantitates this difference.

Attenuation and velocity measurements in tissue using time delay spectrometry, D. H. Le Croissette and R. C. Heyser, *SP453*, pp. 81-95 (Oct. 1976).

Key words: attenuation; phase; swept frequency; time delay spectrometry; tissue; transmission; velocity.

A practical ultrasound system is described which is capable of making measurements of attenuation and velocity in tissue as a function of frequency. This method is based upon a technique known as Time Delay Spectrometry which employs a swept frequency signal and has the ability to provide anechoic ultrasonic measurements. A system operating between 2 and 3 MHz has already been shown to be capable of producing images in soft tissue with a resolution of less than 2 mm. Preliminary measurements on excised tissue using this system have indicated a frequency dependence of attenuation in pathological tissue that is substantially different from that of normal tissue. The method generates the time domain response simultaneously with the received frequency sweep. It is shown that the time response in the apparatus is available as a displayed phasor quantity and that the arrival time of the directly-received signal can therefore be measured to within a few nanoseconds.

Methods of tissue identification by ultrasonic spectra, A. Sokollu, E. W. Purnell, E. Holasek, W. Jennings, and A. Kaya, *SP453*, pp. 97-107 (Oct. 1976).

Key words: color-coded B-scan; Fourier transform; spectral analysis; tissue structure; ultrasound.

Ultrasonic spectral characterization of tissue is based on the retrieval of latent frequency information not normally detected in intensity-modulated B-scan displays. The results of tissue studies and tissue-model studies are presented and discussed. A method for color coding this frequency information into a B-scan display for clinical use is described.

Algebraic reconstruction of spatial distributions of refractive index and attenuation in tissues from time-of-flight and amplitude profiles, J. F. Greenleaf and S. A. Johnson, *SP453*, pp. 109-119 (Oct. 1976).

Key words: acoustic attenuation; acoustic velocity; breast tumor; computerized tomography; heart; reconstruction; refractive index; synthetic focus; tissues; ultrasound.

Two-dimensional distributions of refractive index and attenuation were measured in transverse sections through intact isolated organs, using reconstruction techniques. Profiles of time-of-flight (TOF) and/or amplitude of 10 MHz pulses through the specimen were obtained by rectilinearly scanning two opposing transducers along either side of the specimen in the plane of interest. The received pulses were digitized at a rate of one 8-bit sample per 10 ns for 512 samples, and were analyzed with a computer algorithm which calculated the TOF of the pulse to within ± 10 ns and/or its amplitude. Typically, 256 measurements of TOF and/or amplitude were made in each profile scan for each of 37 angles of view separated by 5°. TOF's through tissue, normalized by TOF through water, were used to calculate velocity and hence, refractive index within the specimen, using an algebraic reconstruction technique (ART). A similar approach was taken to calculate attenuation distributions. Images obtained represented acoustic velocities and/or attenuation in individual cross sections within the tissue specimen with a resolution of 64 by 64 elements ($< 2\text{mm}^2$). The disadvantage of TOF and attenuation reconstruction is that transmission scanning is required. Advantages over B- and C-scan imaging are: (1) dynamic changes in receiver gain are not required; (2) attenuation occurs on only one traversal through tissue; and (3) the absolute values of important acoustic parameters (velocity and attenuation) are determined which may have significant diagnostic value.

Measurement of ultrasonic tissue characteristics by direct and phase-contrast imaging, R. S. Mezrich, D. H. R. Vilkomerson and K. F. Etzold, *SP453*, pp. 121-133 (Oct. 1976).

Key words: attenuation; breast tissue; broadband; high resolution; imaging; large aperture; pathology; pellicle; phase-contrast; transmission; ultrasound; velocity.

This paper describes methods for measurement of the ultrasonic attenuation and acoustic velocity of biological tissue. Initial results are given for a series of measurements on excised breast tissue that quantitatively demonstrate the correlation between ultrasonic attenuation and pathologic state. A method for measuring changes in phase (due to velocity and thickness differences) in a wave as it passes through tissue, based on the phase-contrast technique, is described and demonstrated. The principal advantage of this method over other phase measurement techniques is that it is not as sensitive to the effects of structure overlying the region of interest.

Reflection techniques for measurement of attenuation and velocity, G. Kossoff, *SP453*, pp. 135-139 (Oct. 1976).

Key words: attenuation; breast; reflection techniques; ultrasound; velocity.

Pulse reflection techniques may be used for *in vivo* measurement of attenuation and velocity. Measurement of the two-dimensional distribution of pulse attenuation may be obtained based on the equalization of internal echoes while the differential pulse attenuation of encapsulated tissues is obtained by noting the difference in the echo from the posterior boundary at different frequencies. The average velocity in tissues may be measured by a simple technique if a reflector may be positioned at the posterior boundary. A reflection technique for measurement of local values of velocity in heterogeneous tissues using two forward transducers separated by a known distance is suggested.

Ultrasonically-induced transient thermal gradients: Their potential role in acoustic parameter characterization of tissue, J. Fry, *SP453*, pp. 143-151 (Oct. 1976).

Key words: absorption; attenuation; impedance gradient; transient thermal gradients; ultrasonics; velocity.

Induction of transient thermal gradients by ultrasonic means with concurrent detection by ultrasound offers the possibility of determining quantitatively some of the acoustic properties of live tissue. The transient thermal gradient is related to the inherent acoustic absorption property of the tissue. When used appropriately, this gradient can be used to determine acoustic absorption, attenuation, velocity, and to enhance acoustic impedance differences

certain interfaces. Additional work beyond that reported here is needed to explore essential application of this method in the area of acoustic parameter determination which could lead to an enhanced tissue differentiating capability.

TAST: A non-invasive tissue analytic system, T. D. Sachs, P. . Anderson, R. S. Grimes, S. J. Wright, Jr., and R. M. P. Donaghy, *SP453,* pp. 153-163 (Oct. 1976).

Key words: absorption; attenuation; brain; neoplasm; TAST; thermal effects; tissue; tumor; ultrasonic; velocity.

The Thermo-Acoustic Sensing Technique (TAST) uses two intersecting sound fields to measure the acoustic absorption of cerebral tissues at the point of intersection. A resolution of better than 1/8 inch was achieved in initial scans through the coronal plane of a fixed human brain. The sylvian and cortical fissures, basal ganglia, and ventricular boundaries appeared to be profiled by the TAST values. Conceivably, TAST may provide numerical tissue characteristics in 0.002 cubic inches of selected cerebral tissue. Should predictions based on current theory and data prove correct, TAST may become a repeatable noninvasive means of establishing intracerebral diagnosis.

Tissue characterization by ultrasonic frequency-dependent attenuation and scattering, P. P. Lele, A. B. Mansfield, A. I. Murphy, J. Namery, and N. Senapati, *SP453,* pp. 167-196 (Oct. 1976).

Key words: acoustic impedance; Bragg diffraction; computer processing; frequency-dependent attenuation; internal scattering; myocardial infarction; scattering; surface scattering; tissue characterization; ultrasonic spectroscopy; ultrasound diagnosis.

Studies conducted in this laboratory to explore the feasibility of utilizing acoustic impedance, attenuation, and scattering characteristics of tissues for enhancing the diagnostic capabilities of ultrasound are described. Frequency-dependent ultrasonic attenuation is found to be sufficiently greater in infarcted or otherwise necrotized tissues than in normal controls to permit their positive identification. Superficial and internal scattering properties of tissues hold the promise of being significant for diagnostic applications. The difficulties that will have to be overcome to successfully utilize these properties are discussed.

Frequency and angular dependence of ultrasonic scattering from tissue, C. R. Hill, *SP453,* pp. 197-206 (Oct. 1976).

Key words: Bragg diffraction; diagnosis; frequency dependence; orientation dependence; scattering; tissue characterization; ultrasound.

This paper reports on an ongoing program of work that, commencing in 1969, has been aimed at elucidating, and ultimately applying in clinical investigation, the processes by which ultrasound is scattered by volumes of human tissue. The report covers two related aspects of the work, concerned with the specific patterns of dependence of volume backscattering cross-sections on, respectively, acoustic frequency and the relative orientation between the axis of the interrogating ultrasonic beam and the backscattering structure. These two aspects of the subject have been treated from both theoretical and experimental points of view and both aspects show promise as possible bases for practical tissue characterization. Particular interest has centered in the orientation analysis approach, which constitutes an acoustic analog of Bragg diffraction of x-rays and has been shown to be capable of quantitatively significant differentiation between different human tissue types. The feasibility of applying this approach to *in vivo* tissue characterization has been demonstrated.

The scattering of ultrasound by red blood cells, K. K. Shung, R. A. Sigelmann, and J. M. Reid, *SP453,* pp. 207-212 (Oct. 1976).

Key words: angular dependence; blood; compressibility; density; distribution function; erythrocytes; hematocrit; scattering; ultrasound.

This paper reviews the experimental results obtained on the measurement of ultrasonic scattering properties of erythrocytes. The scattering is proportional to the fourth power of the frequency, as predicted by Rayleigh's scattering theory, for frequencies below 15 MHz. The scattering is not linearly dependent upon the hematocrit as would be expected for a single scattering process. Twersky's wave scattering theories are therefore applied to describe this result. The magnitudes of the monopole scattering due to compressibility and of the dipole scattering due to density are in good agreement with theory. Blood is the first tissue for which a nearly complete experimental and theoretical characterization of scattering exists.

Swept-frequency ultrasonic determination of tissue macrostructure, R. C. Waag, R. M. Lerner, and R. Gramiak, *SP453,* pp. 213-228 (Oct. 1976).

Key words: diffraction; Fourier transform; scattering; tissue characterization; ultrasound.

Ultrasound may be used to determine the acoustic structure of tissue on a scale corresponding to the wavelengths employed by using scattered signal to infer the organization of tissue elements. The underlying concept is the selective reinforcement or cancellation of certain frequencies depending on the relation of wavelength, reflector spacing, and orientation. A Fourier analysis of the received signal as a function of frequency or scattering angle reveals the acoustic variations corresponding to structure. By employing a swept-frequency ultrasonic signal, data similar to that obtained by angle scanning at a fixed frequency in x-ray diffraction has been obtained. Predicted deterministic interference patterns have been demonstrated for aluminum plates. Random scattering for two different sizes of dextran particles has also demonstrated predicted differences in scattering spectra. Pilot studies of liver specimens have shown marked variations in intensity-frequency distributions for individual disease processes.

Acoustic impedance profiling: An analytical and physical model study, A. C. Kak and F. J. Fry, *SP453,* pp. 231-251 (Oct. 1976).

Key words: attenuation; computer; deconvolution; impedance; impulse response; layer model; lucite; ultrasound.

Qualitative measurements of the acoustic impedance of tissue have been extensively exploited for medical diagnosis. In this paper, we report on an analytical and physical model study directed towards quantifying this parameter. The model selected is a medium having plane-parallel impedance interfaces which is insonified at normal incidence. Analytical expressions and computer algorithms are given for determining the impulse response of the medium and the impedance profile from this impulse response. Experimental data are presented which shows the accuracy with which the method can presently be applied.

Current problems in ultrasonic impediography, J. P. Jones, *SP453,* pp. 253-258 (Oct. 1976).

Key words: deconvolution; impedance profiling; impediography; impulse response; time-domain deconvolution.

The term impediography is used to describe a rather general class of signal processing operations which, when applied to pulse-echo ultrasonic signals, yield quantitative information concerning the physical properties of the system under study. The method uses deconvolution of acoustical impulses and their echoes to obtain the impulse response as a function of acoustical travel time. The integral of the impulse response can then be analytically related to various physical parameters such as the specific acoustical impedance. This paper provides a general discussion of the problems associated with the practical implementation of impediography and outlines a number of important research areas which require additional study. Major problem areas discussed include: (1) corrections for nonplanar geometry, (2) development of accurate deconvolution algorithms, and (3) corrections and/or development of impediographic processing procedures for attenuation and scattering.

Tissue characterization by means of acoustic microscopy, L. W. Kessler, *SP453,* pp. 261-267 (Oct. 1976).

Key words: acoustic imaging; acoustic microscopy; attenuation; frequency dependence; impedance; microstructural analysis; tissue; ultrasound; velocity.

The complete characterization of tissue is extremely important for objectively identifying abnormalities and disease states. Optical methods of microscopy have been exploited to a great degree and now the electron microscope is being used in search of diagnostic clues at higher magnification levels. It is well appreciated, however, that these methods provide only limited access to the physical properties of tissue. Furthermore, the physical nature of an abnormality may prohibit its ever being revealed with visual observation techniques. Acoustic microscopy, on the other hand, can reveal new information, the structural elastic characteristics of viable tissue. Acoustic microscopy can also provide quantitative data on these tissue characteristics. As this additional information should have great diagnostic value, a general discussion of the methods and procedures employed is presented.

SP454. **An annotated bibliography of compiled thermodynamic data sources for biochemical and aqueous systems (1930 to 1975). Equilibrium, enthalpy, heat capacity, and entropy data,** G. T. Armstrong and R. N. Goldberg, *Nat. Bur. Stand. (U.S.), Spec. Publ. 454,* 67 pages (Sept. 1976) SD Catalog No. C13.10:454.

Key words: aqueous systems; bibliography; biochemical systems; enthalpy data; entropy data; equilibrium data; Gibbs energy data; heat capacity data; partial molal properties; thermochemistry; thermodynamics; review articles; water pollution.

Contained herein is a selected and annotated bibliography of sources of compiled and evaluated chemical thermodynamic data relevant to biochemical and aqueous systems. The principal thermodynamic properties considered herein are Gibbs energy and equilibrium data, enthalpies of formation and reaction, heat capacities and entropies, and the corresponding partial molal properties. Derived quantities used in calculating the above are also included. Transport and mechanical data have also been identified to a lesser degree. Included in the annotations to the data sources are brief descriptions of the types of properties tabulated, the classes of materials dealt with, and the degree o completeness of the compilations.

SP455. **Electrocatalysis on non-metallic surfaces.** Proceedings o a workshop held at the National Bureau of Standards, Gaither sburg, MD, Dec. 9-12, 1975, A. D. Franklin, Ed., *Nat. Bu Stand. (U.S.), Spec. Publ. 455,* 372 pages (Nov. 1976) SI Catalog No. C13.10:455.

Key words: catalysis; characterization; chemisorption; elec trocatalysis; electrochemistry; electrode processes; non metals; photoelectrolysis; solid electrolytes; surfaces.

This book presents the proceedings of a Workshop on Elec trocatalysis on Non-metallic Surfaces, held at the National Bu reau of Standards, Gaithersburg, Maryland, on December 9-1 1975. The Workshop was sponsored by the Institute of Mater als Research, NBS, the Division of Materials Research of th National Science Foundation, and the Division of Conservatio Research and Technology of the Energy Research and Develop ment Administration. The purpose of the Workshop was t review the most recent experimental and theoretical investig tions on electrocatalysis on nonmetals and related topics, and t bring together electrochemists, surfaces scientists, and soli state physicists and chemists involved in research related to th topic. A total of 31 invited and contributed papers are he presented, together with a summary report of the final pan discussion. These proceedings are arranged to reflect, with son small exceptions, the program of the Workshop. The mai groupings of papers are: I. Theory of Electrocatalysis and R lated Topics; II. Characterization; III. Electrochemic Processes on Non-metallic Surfaces; and IV. Electrochemist at Solid Electrolyte Interfaces. In addition, a final panel discu sion (V) considered major problems, advances and opportuniti revealed by the Workshop. *These proceedings include the fo lowing papers (indented):*

Electron transfer and electrocatalysis, H. Gerischer, *SP45.* pp. 1-19 (Nov. 1976).

Key words: chemisorption; electrocatalysis; electrc transfer theory; multistep redox reactions; semiconduct surface states.

Non-catalyzed electron transfer is reasonably defined a an electron exchange between an electron donor or accept and an electrode under the condition of very weak intera tion between the reactants and the electrode. The case strong interaction between reactants and electrodes analyzed with respect to its catalytic effect on electrc transfer. It is pointed out that strong interaction may ofte inhibit electron transfer for a single electron transfer step its individual equilibrium potential. Electrocatalysis is hov ever found in multistep electron transfer reactions when th adsorption of intermediates in the reaction path brings th individual standard potentials of the single electron transf steps closer to that of the overall redox potential. Example for this effect of adsorptive interaction are given for met and nonmetallic electrodes. It is further analyzed where th electron energy levels of the adsorbed reactants are locate with respect to the characteristic energy levels in the meta lic or nonmetallic electrodes and in the nonadsorbed speci in solution. The important role of surface states at a no metallic electrode for chemisorption and electrocatalysis emphasized.

Surface states, chemisorption and catalytic processes transition metal oxides, T. Wolfram, F. J. Morin, and R. Hurs *SP455,* pp. 21-52 (Nov. 1976).

Key words: catalysis; chemisorption; cluster states; electronic structure; energy bands; perovskites; surface states; transition metal oxides.

A discussion of the bulk and surface electronic states of transition metal oxides such as the perovskites is presented. The factors which determine the surface electronic structure are described and several examples of surface states and surface energy bands are presented using both cluster and energy band models.

The role of d-electron surface states in chemisorption and catalytic processes on transition metal oxides is considered. Several examples of surface reactions are given using a cluster model for the substrate. These examples include the chemisorption of OH^- ions, the dissociative adsorption of H_2 and the hydrogenation of ethylene.

A detailed description of a Green's function theory for surface reactions is given in which both the reacting molecule and the solid are described by local basis states. The concept of the spectral weight function (local density of states) is used to describe delocalized bonding of molecules to a solid surface. As an example of the application of the theory the formation of localized electronic states associated with the adsorption of OH^- ions is considered.

Hartree-Fock calculations of hydrogen adsorption on nickel, copper, and magnesium oxide, A. B. Kunz, M. P. Guse, and R. J. Blint, *SP455*, pp. 53-58 (Nov. 1976).

Key words: adsorption; catalysis; copper hydride; magnesium oxide; molecular structure; nickel hydride.

The potential energy curves for NiH, HNiH, CuH, and HCuH resulting from the ground and first excited state atomic configurations are calculated using the unrestricted Hartree-Fock and generalized valence bond methods. NiH bonding in the $3d^84s^2$ configuration and CuH bonding in the $3d^94s^2$ configuration is by means of an sp hybrid orbital which comes from the $4s^2$ shell leaving a singly occupied orbital free to bond to another hydrogen atom. The bonding in the NiH$3d^94s$ and CuH$3d^{10}4s$ configurations is to the 4s orbital leaving in NiH a hole in the nickel 3d shell which interacts with another hydrogen only weakly and in CuH a closed 3d shell resulting in a repulsive potential energy curve. The interaction of hydrogen with a cluster representing a magnesium oxide surface V_I center was calculated using UHF. The lowest energy results when the Mg and O are singly ionized rather than doubly as in the bulk resulting in a surface radical. The hydrogen is bound over one of the oxygen atoms.

Stark model of the excitonic surface states observed on MgO[1], H. J. Zeiger, V. E. Henrich, and G. Dresselhaus, *SP455*, pp. 59-65 (Nov. 1976).

Key words: bulk excitons; electron loss spectroscopy; ionic crystals; Madelung potential; Mg^+; Mg^{2+}; MgO; Stark spectrum; surface excitons.

Using the energy and angle-of-incidence dependence of the electron energy loss spectra of MgO, we have separated the excitonic transitions from the Mg core levels to the excited states into those of bulk and surface origin. The bulk transitions are very nearly those of the free Mg^{2+} ion. The (100) surface-state transitions can be described by Stark-splitting of the energy levels of the surface Mg^{2+} ions in the intense Madelung electric fields at the crystal surface. The observations on other crystal faces of MgO and in amorphous MgO, however, suggest the possibility of the presence of surface Mg^+ ions.

Quantum chemistry and catalysis, R. P. Messmer and K. H. Johnson, *SP455*, pp. 67-86 (Nov. 1976).

Key words: catalysis; chemisorption theory; metal clusters; molecular orbitals; quantum chemistry; transition metal complexes.

A number of recent theoretical calculations on model systems relevant to chemisorption and catalysis is discussed. The approach taken is basically chemical in nature, emphasizing the local active site concept and employing a cluster of atoms to represent the substrate which interacts with the molecular or atomic adsorbate. The computational procedure used in these studies has been the self-consistent-field Xα scattered wave (SCF-Xα-SW) method.

Relationship between electronic structure and catalytic behavior of transition metal carbides, D. R. Jennison, D. L. Klein, A. B. Kunz, K. M. Hall, and W. S. Williams, *SP455*, pp. 87-92 (Nov. 1976).

Key words: adsorption; catalysis; electronic structure; surface states; transition metal carbide.

We have studied the electronic structure of TiC within the unrestricted Hartree-Fock approximation. We find that strong covalent bonding occurs between the carbon 2s and 2p and the metal 3d orbitals. An absence of strong metal-metal bonding was noted. We tested various configurations on the metal atoms and found $4s^o3d^n$ energetically favored. Thus the formation of the carbon-metal bonds results in a loss of 4s character in the electronic structure. Cluster calculations confirm that the strength of the $\overline{b}$onds is sufficient to prevent the reestablishment of 4s character on a surface. The recent studies of Kunz, Guse, and Blint indicate that H bonds strongly to the 4s level, but not to the 3d. Although Ti metal can dissociate H_2, our results explain why the carbide apparently cannot. Similar results are anticipated on WC, suggesting a carbon deficient surface may have properties intermediary to W and WC.

The study of electrode surfaces by electrochemical methods, B. E. Conway and H. Angerstein-Kozlowska, *SP455*, pp. 107-124 (Nov. 1976).

Key words: atomic layers; chemisorption; cyclic-voltammetry; electrochemical adsorption; monolayers; surface processes.

Electrochemical methods for the study of surfaces are reviewed. Unlike high-vacuum techniques, they measure changes in the state of surfaces by virtue of occurrence of electrode surface processes, rather than giving information on the state of the surface itself. However, electrochemical procedures have high sensitivity down to 2 percent of a monolayer and multiple states of chemisorption can be distinguished with an energy resolution of 100-200 small calories. Interactions in the ad-layer can also be derived from the form of electrical transients. Combination of electrochemical methods with optical techniques, such as relative reflectivity and ellipsometry, provides a new dimension for studies in electrochemical surface science.

Electroreflectance study of the defect states in reduced n-type titanium dioxide, S. S. M. Lu, F. H. Pollak, and P. M. Raccah, *SP455*, pp. 125-131 (Nov. 1976).

Key words: defect states; *d*-electrons; electrolyte electroreflectance; surface states; titanium dioxide; transition-metal oxides.

We have investigated the electroreflectance spectrum of reduced n-type TiO_2, particularly below the fundamental absorption edge (~ 3 eV), in aqueous electrolyte, metal-semiconductor and metal-oxide-semiconductor configurations. We have observed for the first time in electroreflectance features in the spectrum for $h\omega < 3$ eV which are related to the defect states. It is found that this structure is strongly dependent on the applied bias electric field. One optical peak appears at about 1.7 eV, an energy region in which structure has been observed in various other measurements which are related to both bulk (optical transmission, photoconductivity) and surface (electrochemical, electron loss spectroscopy) states. The intimate relationship between the bulk defect levels introduced by reduction and surface states will be discussed. Our results will be interpreted in terms of a recent model of Morin and Wolfram for *d*-electron surface states in transition metal oxides.

Electron energy loss spectroscopy of surface states on titanium and vanadium oxides, V. E. Henrich, H. J. Zeiger, and G. Dresselhaus, *SP455*, pp. 133-138 (Nov. 1976).

Key words: adsorption; electron spectroscopy; ligand-field splitting; surface excitons; surface states; transition-metal oxides.

Using electron energy loss spectroscopy, we have studied the surface electronic structure of TiO_2, Ti_2O_3, $TiO_{0.87}$ and V_2O_3. A surface-state transition in the region of 1.5 to 2.5 eV is present in all of these materials when the surface is reduced by Ar-ion bombardment. Subsequent exposure of the surfaces to oxygen or water vapor reduces or completely eliminates this transition. The origin of the transition in terms of d-electron population of surface cations is discussed.

Dislocations in ZnO as channels for electron transfer from surface species, S. R. Morrison and T. Freund, *SP455*, pp. 139-148 (Nov. 1976).

Key words: dislocation; electrochemical; exchange current; semiconductor; traps; zinc oxide.

The results reported show that dislocations strongly affect the properties of the ZnO electrode and that with the help of electrochemical measurements a fairly complete picture of the electrical and chemical behavior of dislocations can be developed. It is shown that dislocations in ZnO act as hole or electron traps in the space charge region, as recombination centers, as points of electric breakdown under anodic polarization, and as current paths leading to exchange current even in an indifferent electrolyte. The dislocations can be passivated by annealing or by precipitation of impurities. A qualitative model is presented that can account for the observed effects of dislocations on the solid state and electrode properties.

Characterization of semiconductor electrodes in nonaqueous solvents, S. N. Frank, D. Laser, K. L. Hardee, and A. J. Bard, *SP455*, pp. 149-152 (Nov. 1976).

Key words: acetonitrile; cyclic voltammetry; electrochemistry; nonaqueous; semiconductor; silicon; titanium dioxide.

The large number of simple and reversible redox couples available in nonaqueous solvents allows convenient investigation of the band structures of semiconductors using electrochemical techniques. Comparisons of the cyclic voltammetric behavior of these couples at platinum and a semiconductor permits estimation of the relative energy levels of the conduction and valence bands and provides a means of mapping the gap region for intermediate levels and surface states. This technique is demonstrated with TiO_2 and n-type Si semiconductors. In spite of the large difference in band gaps between these semiconductors, their electrochemical behavior is similar and is ascribed to a similarity in the energies of their respective conduction bands and the energies of an intermediate energy level in TiO_2 and the valence band in Si.

Chemical theory of chemisorption and catalysis on the surfaces of non-metals, R. L. Burwell, Jr., *SP455*, pp. 155-166 (Nov. 1976).

Key words: catalytic hydrogenation; catalytic oxidation; chemisorption; cus; heterogeneous catalysis; surface coordinative unsaturation.

This paper surveys chemisorption and catalysis on nonmetals primarily from the point of view of localized, coordinatively unsaturated surface (cus) sites and with use of analogies to the chemistry of coordination and organometallic complexes. Topics covered include chemisorption on oxides of main group elements and of transition elements, heterogeneous catalytic hydrogenation and oxidation on oxides of transition elements, and chemisorption on group IV elements and group III-V compounds.

Electrocatalysis at transition metal oxide and carbide surfaces, P. Stonehart, *SP455*, pp. 167-174 (Nov. 1976).

Key words: electrocatalysis; heteropolyanions; phosphotungstate complex ions; "spillover" effect; transition metal carbides; transition metal oxides; tungsten bronze; tungsten carbide.

Due to the cost of noble metal electrocatalysts, significant research has been carried out to find nonnoble metal electrocatalytic materials. Transition metal oxides, usually doped tungsten oxides (bronzes), have been postulated previously due to their favorable electronic conductivity and stability in electrolytes. The surface chemistry of such electrocatalysts has been largely neglected but interesting parallels exist for the electron injection and extraction with heteropolyanions in solution. The heteropolyanions exhibit electrochemical properties of "bronze" crystals and can be considered to be microcrystallites. Optical studies show correlations between absorbance in the visible region and the electron density per transition metal atom. By and large, the transition metal oxide electrocatalysts have not yet fulfilled their expectations.

A related research direction has examined the activity of transition metal carbides for hydrogen oxidation in acid. Here it was found that tungsten carbide was the most active material but that it required a pretreatment. Surface studies established that the active form of the tungsten carbide electrocatalyst was slightly carbon deficient.

Adsorption and oxidation of bromide ion on tin oxide electrodes, H. Yoneyama and H. A. Laitinen, *SP455*, pp. 175-181 (Nov. 1976).

Key words: adsorption; anodic oxidation; electrocatalysis; semiconductor electrode; tin oxide electrode; transparent electrode.

Adsorption of bromide ion on a tin oxide electrode proceeded at such a slow rate that adsorption equilibrium took longer than two days to be reached. The electrode became active for oxidation of bromide ion depending on the extent of soaking in an acidic bromide solution. It was found that hydration of the electrode is an important factor to determine its activity for electro-oxidation of bromide ion. An electrode having a high activity lost its activity owing to

surface oxidation upon polarization into the discharge potential region of bromide ion.

Cathodic pyrophosphate-lead dioxide electrode reaction properties, C. O. Huber, T. A. Berger, and R. E. Reim, *SP455*, pp. 183-189 (Nov, 1976).

Key words: amperometry; cyclic voltammetry; electrosorption; Langmuir; lead dioxide; pyrophosphate; Temkin; wax-bound electrode.

In the vicinity of +0.4 volts *vs.* S.C.E. in pH 8 solution pyrophosphate yields a cathodic current selective over orthophosphate at the lead dioxide electrode. Several aspects of this response were examined using α-electroplated lead dioxide on a platinum base and using mixed α-β wax-bound lead dioxide electrodes prepared from the powdered material. Scanning electron microscope results indicated the topographical nature of the wax-bound electrodes. Current-voltage plots indicated an absence of a limiting current and relatively high residual currents as the potential becomes more cathodic. Scanning cyclic voltammetry suggested adsorption of reactive species. Capacitance and coulometric studies indicated clear evidence of adsorption and showed that the current was necessary to the desorption step. Current *vs.* concentration studies allowed fits to electrosorption models within certain concentration ranges. From these data estimates of some thermodynamic quantities were made. An electrode reaction process involving quasi equilibrium adsorption of the electron transfer product followed desorption of a plumbous-pyrophosphate complex is discussed.

Electrolysis by foreign metal monolayers, R. R. Adžić, A. R. Despić, D. N. Simić, and D. M. Dražić, *SP455*, pp. 191-200 Nov. 1976).

Key words: electrocatalysis; foreign metal monolayers; Fe^{2+}/Fe^{3+} reaction; formic acid oxidation; oxygen reduction; underpotential deposition.

Catalytic effects of foreign metal monolayers deposited at underpotentials have been found in the case of Fe^{2+}/Fe^{3+} redox reaction on gold, oxygen reduction on gold, and oxidation of some small organic molecules on platinum. It was found that the catalytic effects of foreign metal monolayers originate in the change of surface electronic properties and the change of energy of adsorption of oxygen or oxygen-containing species for Fe^{2+}/Fe^{3+} and oxygen reduction respectively. In the case of formic acid oxidation foreign metal monolayers decrease the hydrogen adsorption on platinum thus preventing the formation of the main poisoning species.

Mechanisms of electrochemical reactions on non-metallic surfaces, E. Yeager, *SP455*, pp. 203-219 (Nov. 1976).

Key words: carbon; electrocatalysis; nickel oxide; oxide electrodes; oxygen electrochemistry; semiconductor electrodes.

Oxygen electrocatalysis has assumed new importance because of the involvement of the O_2 electrode in various fuel cells and electrolyzer systems. For O_2 electroreduction to proceed at reasonable current densities requires the adsorption of the O_2 molecule or ion on the electrode surface. Various models for the interaction of such O_2 species with surfaces and the corresponding pathways for the electroreduction are considered. Generally peroxide mechanisms are predominant in aqueous solutions on non-metallic as well as metal surfaces but this leads to less favorable operating potentials for O_2 cathodes. A number of reasonably effective O_2 electroreduction catalysts have been identified for alkaline solutions but so far only high area platinum appears to combine reasonable activity and stability in acid electrolytes. Various electrocatalysts for which results have been reported in the literature are summarized. The electrochemical behavior of various carbons and graphites, lithiated NiO and various defect metal oxides including RuO_2/Ti is considered in some detail relative to O_2 generation as well as reduction kinetics.

Photoelectrolysis of water, J. G. Mavroides, D. I. Tchernev, J. A. Kafalas, and D. F. Kolesar, *SP455*, pp. 221-227 (Nov. 1976).

Key words: energy levels; photocatalytic electrodes; photoelectrolytic cells; photogalvanic cells; quantum efficiency; solar energy.

The photoelectrolysis of water has been investigated by experiments on cells consisting of an illuminated n-type semiconductor anode, an aqueous electrolyte, and a platinized-Pt cathode. It has been found that such cells operate either in the photogalvanic mode (no H_2 evolved) or in the photoelectrolytic mode (H_2 evolved at the cathode by decomposition of water), depending on whether or not the electrolyte surrounding the cathode contains dissolved oxygen. In both cases, current flows through the external circuit and O_2 is evolved at the anode. For operation in the photogalvanic mode, maximum values of 80-85 percent for the external quantum efficiency (η) for current production have been measured at $h\nu \approx 4$ eV with both single-crystal and polycrystalline TiO_2 anodes. Similar results have been obtained with $SrTiO_3$ anodes. The internal quantum efficiencies, corrected for reflection and absorption losses, are close to 100 percent, indicating that the band bending in both cases under photogalvanic conditions is sufficient to separate the electron-hole pairs generated by photon absorption and also that the oxygen overvoltage for charge transfer at the semiconductor-electrolyte interface is negligible for illuminated anodes. For operation in the photoelectrolytic mode, η is only 1-2 percent for TiO_2 and ~ 10 percent for $SrTiO_3$ if the anode and cathode are shorted together, but the efficiency can be greatly increased by applying a bias voltage. All the observations, including the increased efficiency for $SrTiO_3$, can be given a straightforward explanation in terms of the energy levels of the electrodes and the electrolyte.

Electrochemical processes on strontium titanate electrodes, D. M. Tench and D. O. Raleigh, *SP455*, pp. 229-240 (Nov. 1976).

Key words: flat band potential; hydrogen evolution; oxide electrode; perovskite surface composition; rotating electrode voltammetry; semiconductor electrode.

The electrochemical properties of n-type single-crystal $SrTiO_3$ electrodes (10^{18}-10^{19} carriers/cm^3) were investigated in acidic sulfate solutions, with special attention to the hydrogen evolution reaction. AC impedance measurements, together with the voltammetric behavior of the ferro-ferricyanide couple and the onset of anodic photocurrent, established that the flat band potential, U_{fb}, lies about 250 mV cathodic to the reversible hydrogen electrode potential.

Slow-sweep cyclic voltammetry with a rotating electrode assembly established several hydrogen discharge mechanisms in moderately acidic solutions. Anodic to U_{fb}, chemical desorption ($H_{ads} + H_{ads} \rightarrow H_2$) appears to be rate limiting. At more cathodic potentials, electrochemical desorption ($H_3O^+ + e^- + H_{ads} \rightarrow H_2 + H_2O$) dominates. At

still more cathodic potentials, where proton discharge becomes diffusion-limited, hydrogen discharge from H_2O appears to dominate. Anomalous current behavior at low pH values (~ 0.5) suggests possible proton diffusion into the electrode. ESCA measurements showed that the first few atomic layers of the $SrTiO_3$ surface, when brought in contact with aqueous solutions, become depleted in Sr.

Electrochemical activity of polymeric and monomeric iron phthalocyanines as a function of their spectral properties, A. J. Appleby and M. Savy, *SP455*, pp. 241-251 (Nov. 1976).

Key words: electrocatalysis; electronic structure; hydrogen peroxide; iron phthalocyanines; Mössbauer; optical spectra; oxygen; reaction mechanisms; ring-disk electrodes.

Samples of monomer and polymer iron phthalocyanines, prepared both in situ on carbon supports or in the form of thin films, using a gas-phase synthesis method, and by dissolution of liquid-phase preparations in sulfuric acid followed by reprecipitation on carbon, were examined by optical and Mössbauer spectroscopy. Their electrochemical activities for oxygen reduction were examined under steady-state conditions using the ultra-thin porous electrode technique, as a function of O_2 partial pressure, pH (11.8 – 16.4) and H_2O_2 additions. In addition, rotating ring-disk electrode experiments were conducted. Analysis of reaction orders and comparison of activities with those of the support have allowed the most probable mechanism to be determined, in which the rate-determining step is a chemical dissociation of the O-O bond. Correlations between electrochemical activities and spectral properties indicate the role of polymerization and of the spin configuration of the central iron atom in promoting catalysis. These effects result from reoxidation of $Fe^{II}iS$ to $Fe^{II}HS$ or iS, which is favorized by interaction between the polymer π electrons and the d electrons of the iron.

Electrocatalytic activity of phthalocyanines for oxygen reduction, R. J. Brodd, V. Z. Leger, R. F. Scarr, and A. Kozawa, *SP455*, pp. 253-258 (Nov. 1976).

Key words: ferric phthalocyanine; kinetics; oxygen reduction; phthalocyanine catalysts.

A survey of the activity of phthalocyanines as catalysts for oxygen reduction has identified several metal phthalocyanines with good activity. The central metal ion evidently controls the overall activity of the phthalocyanines for oxygen reduction. Ferric phthalocyanine had the best overall activity and approaches platinum in ability to catalyze the oxygen reduction reaction. The structure also influences the phthalocyanic activity. For copper as the central ion the order of activity is: polycopper phthalocyanine > copper phthalocyanine > copper porphyrazine. The substrate also influences the activity of the phthalocyanine as does solution composition. A mechanism for oxygen reduction is proposed which includes a hydrogen peroxide adsorption-desorption step. Rotating ring-disk results satisfactorily fit this model.

Continued growth of anodic oxide films at platinum and the mechanism and catalysis of oxygen evolution, A. Damjanovic, *SP455*, pp. 259-266 (Nov. 1976).

Key words: anodic films; dual barrier, electrocatalysis; oxygen evolution; platinum anodes; reaction mechanism.

It is shown on the example of oxygen evolution at platinum that thin anodic oxide films may profoundly affect kinetics and mechanism of an electrochemical reaction. At any potential above 1.OV an "insulating" oxide film grows over the electrode surface. The potential difference across the anode is then divided into the potential difference across the oxide film and that across the electrolyte double layer. The film is a barrier to electron transfer and together with the reaction across the double layer controls the kinetics and mechanism of the reaction. The exchange current density of the reaction decreases exponentially with thickness of the film. Only when the distribution of potential across the oxide film and double layer is taken into account, it is possible to explain the observed fractional reaction order with respect to activity of hydrogen ions and to propose a mechanism of the reaction that explains this reaction order. In the proposed mechanism a chemical step that follows first electrochemical step controls the rate in the double layer.

Electrochemical surface reactions on non-metals, R. Memming, *SP455*, pp. 267-280 (Nov. 1976).

Key words: anodic decomposition; cathodic decomposition; electrochemistry; inorganic bronze electrodes; metal electrodes; semiconductor electrodes; stability, surface layers; surface reactions.

Various surface reaction of semiconductors during electrochemical polarization are investigated which are of interest in connection with catalytic and photo-electrocatalytic processes. Examples for the anodic and cathodic decomposition are given and discussed with regard to the stability of electrode materials. In addition the formation of semiconducting layers on metal electrodes is described and their analysis and characterization investigated as far as electron transfer is concerned. Reactions at bronze electrodes leading to semiconducting surface films are included.

Oxygen evolution on semiconducting oxides, A. C. C. Tseung and S. Jasem, *SP455*, pp. 281-288 (Nov. 1976).

Key words: nickel cobalt oxides; oxygen evolution, Pourbaix diagram; semiconducting oxides; spinels; teflon bonded electrodes.

The oxygen evolution reaction is of particular interest to secondary metal air batteries and water electrolysis plants. However, most of the earlier work has been on precious metals and there are no guidelines for the choice of semiconducting oxides as oxygen evolving electrodes. In this study, the role of the metal/metal oxide or the lower metal oxide/higher metal oxide couple in determining the minimum voltage required for the evolution of oxygen is emphasized, together with other essential requirements such as electrical resistivity electrode microstructure, corrosion resistance and catalytic properties. A survey of various metal oxides based on the above criterion suggested that $NiCo_2O_4$ is of particular interest and teflon bonded electrodes based on this material gave over 13,000 A/m² at 1.63 V vs DHE, 70 °C, 5N KOH.

Mixed oxides as oxygen electrodes, G. Singh, M. H. Miles, and S. Srinivasan, *SP455*, pp. 289-296 (Nov. 1976).

Key words: electrocatalysis; nickel-cobalt oxide; nickel oxide; oxide electrodes; oxygen electrode reaction; ruthenium dioxide/titanium dioxide; spinel.

The irreversibility of the oxygen electrode reaction on metals and alloys is the main cause of efficiency losses in fuel cells, water electrolysis cells and some battery systems. Oxygen evolution always occurs on oxide covered surfaces while the reduction reaction generally takes place on bare metallic surfaces but can do so on oxides. Since the most likely candidates for reversible oxygen electrodes are oxides, mixed oxides or compound oxides, three types of

oxides – NiO_x, $NiCo_2O_4$ and RuO_2ǀTiO_2 were examined as oxygen electrodes in KOH solution. When these oxide electrodes were prepared by thermal decomposition of their salts on a substrate, ratios of true to apparent surface areas of the electrodes were quite high (over 200) and the transfer coefficients, obtained from the Tafel lines for oxygen evolution in the temperature range 25-100 °C, were 1.5, as compared with about half that value on nickel electrodes. Above 100 °C $NiCo_2O_4$ and RuO_2ǀTiO_2 electrodes corroded in the strong (50%) KOH environment. Mixed oxides are more stable than simple oxides in the region of potential where oxygen reduction occurs. From the values of the Tafel slopes and exchange current densities for oxygen evolution and reduction $NiCo_2O_4$ (a spinel) and RuO_2ǀTiO_2, it is clear that reversibility of this electrode reaction was not obtained. Other mixed oxides (including spinels and perovskites) will have to be investigated with the aim of developing reversible oxygen electrodes.

Surface and electrocatalytic properties of tungsten bronzes, . F. Weber and H. R. Shanks, *SP455*, pp. 297-303 (Nov. 976).

Key words: Auger electron spectroscopy; electrocatalyst; oxygen reduction; sodium depletion; Tafel plots; tungsten bronzes.

Tafel plots have been obtained for the oxygen reaction in acid solution on several alkali tungsten bronzes having different crystal structures. Platinum doped sodium tungsten bronze crystals were studied and the results compared with those of platinum free crystals of the same composition. In both cases sodium tungsten bronzes were found to be poor electrocatalysts for the cathodic reduction of oxygen. Similar results are reported for other alkali tungsten bronzes and for tungsten trioxide. Anodic treatment of the crystals affected the electrocatalytic activity of only the sodium tungsten bronze and the effect was a negative one. Cyclic voltammetry was employed to study the effects of the anodic treatment which created a sodium depletion layer on the sodium tungsten bronze surface. The existence and depth of the sodium depletion layer was determined by an Auger Electron Spectroscopy depth profile.

The electrochemistry of molybdenum oxides, J. Horkans, M. . Shafer, and R. Peekema, *SP455*, pp. 305-312 (Nov. 1976).

Key words: electrochemistry; molybdenum oxides; orientation effects; oxygen reduction.

The general electrochemistry of four oxides of molybdenum, MoO_2, Mo_4O_{11}, Mo_8O_{23}, and Mo_9O_{26}, and the reduction of oxygen on these oxides, in 1 N H_2SO_4 have been investigated on natural faces of single crystals. These compounds are found to undergo electrochemical oxidation and reduction in the potential range between 0.13 and 0.73 V vs NHE. Oxygen does not influence the oxidation of MoO_2 and Mo_4O_{11}, but promotes the anodic dissolution of Mo_8O_{23} and Mo_9O_{26}. Oxygen reduction is supported on all these oxides at low currents and high overpotentials. Large effects of crystal orientation are observed. The chemical composition of the crystal has a much smaller effect. This is apparently due, at least in part, to a change of surface composition with changing electrode potentials. Thus, at a given potential, the composition of the surface layers of all samples may be similar.

Titanates as oxygen electrodes, U. Bertocci, M. I. Cohen, J. . Mullen, and T. Negas, *SP455*, pp. 313-321 (Nov. 1976).

Key words: electrocatalyst; hydrogen evolution; lanthanum titanate; oxygen electrode; photo-assisted electrolysis; rutile.

Single crystal or polycrystalline compacts of five, TiO_2-based, oxide materials were investigated as oxygen electrodes. Potentiostatic and potentiodynamic measurements were accomplished at room temperature using neutral borate or 5M H_3PO_4 and inert (Ar) or oxygen environments. Observations of electrochemical behavior during illumination also were made.

Materials display slow, but continuous, changes in features of potentiodynamic scans, as well as changes in current with time at constant potential. Failure to attain steady-state conditions is attributed to specimen mechanical/chemical inhomogeneities and changes prior to and during measurement, variable surface conditions, together with electrode pre-treatment. For example, cathodic currents for O_2 reduction tend to increase after cathodic polarization, while H_2-evolution is hindered by dissolved O_2. Illumination increases the current density for O_2 reduction at very negative potentials while current decreases are apparent during H_2-evolution in Ar.

Results indicate that these oxides are not promising as electrocatalysts for O_2-reduction, although for a definitive assessment, well-defined and closely controlled surface conditions are necessary.

Ionic transport and electronic exchange at solid electrolyte interfaces, M. W. Breiter and G. C. Farrington, *SP455*, pp. 323-340 (Nov. 1976).

Key words: charge transfer processes; conduction mechanisms; interfacial phenomena; solid electrolyte.

Interest in highly conductive solid electrolytes, compounds that display conductivities comparable to aqueous electrolytes at room temperature, is great because of their many potential applications. This paper reviews conduction mechanisms and charge transfer at solid electrolytes having fast ionic transport. For the discussion, solid electrolytes have been grouped into stoichiometric compounds, doped compounds and nonstoichiometric compounds; interfaces are classified as two-phase and multi-phase boundaries.

Influence of water on beta alumina interfacial ion transport, G. C. Farrington, *SP455*, pp. 341-349 (Nov. 1976).

Key words: beta alumina; blocking electrode; interface; solid electrolyte; water.

Water, adsorbed on a beta alumina surface, significantly influences the nature of Na^+ ion transport across a nonaqueous electrolyte/beta alumina interface and the behavior of a Pt/beta alumina interface. Na^+ interfacial exchange current at 23 °C between beta alumina and propylene carbonate decreases with increasing surface hydration. Adsorbed water undergoes a number of faradaic reactions at a Pt/beta alumina interface, which otherwise should approximate an ideally polarizable or "blocking" electrode. This paper discusses the effects of adsorbed water on ion and electron transport at these two interfaces.

Overvoltage phenomena in solid-oxide electrolyte cells at elevated temperatures, W. L. Worrell, *SP455*, pp. 351-358 (Nov. 1976).

Key words: copper electrodes; interfacial resistance; metal-metal oxide electrodes; oxygen transport; steady-state overvoltages.

To develop a more quantitative understanding of the factors which establish overvoltages in solid-oxide electrolyte cells, constant currents have been passed through two types of symmetrical cells. At temperatures between 800 and 1000 °C, constant and reproducible cell overvoltages are obtained when the imposed current is less than 50 μA. The cell overvoltage (η) is directly proportional to the current (I), and the interfacial resistance, defined as equal to η/I, is constant for each cell at constant temperature. Assuming that oxygen concentration gradients in the metal portion of the electrodes establish the cell overvoltages, a quantitative expression has been derived to calculate the interfacial resistance for each cell. Reasonable agreement between calculated and experimental values of the interfacial resistance is obtained for cells having two-phase metal-metal oxide electrodes. This agreement indicates that oxygen is transferred between metal particles and the electrolyte rather than through oxide particles in the electrodes. For cells with oxygen-saturated copper electrodes, the solubility-diffusivity product of oxygen in solid copper has been calculated from the overvoltage data.

SP456. **Measurements for the safe use of radiation.** Proceedings of an NBS 75th ANNIVERSARY Symposium held at the National Bureau of Standards, Gaithersburg, MD, Mar. 1-4, 1976, S. P. Fivozinsky, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 456,* 437 pages (Nov. 1976) SD Catalog No. C13.10:456.

Key words: calibrations; environment; measurements; medical; radiation; standards.

These proceedings are the compilation of papers presented at the Symposium, "Measurements for the Safe Use of Radiation," held in Gaithersburg, Maryland, March 1-4, 1976. The symposium addressed the present status and future requirements for measurements of ionizing and nonionizing radiation. Emphasis was placed on the needs for standardization and measurement assurance activities in medical, environmental, and personnel protection applications. *These proceedings include the following papers (indented):*

Historical development of the need for radiation protection and measurements in the United States, L. S. Taylor, *SP456,* pp. 5-11 (Nov. 1976).

Key words: radiation exposure; radiation measurement; radiation protection.

Early means of radiation measurement included photographic film, chemical compounds, selenium and ionization of air, and all were uncertain and inaccurate until about 1920. By 1930, ionization measurements between different laboratories and countries agreed within 2 or 3 percent. Also, quantitative limits for the exposure of radiation workers had been proposed and based on air ionization measurements—the roentgen. Accuracy requirements are ±5 percent for radiation therapy but to maximize the benefits to patients greater attention must be given to measurement assurance or traceability. Accuracy for protection purposes will vary with the dose levels involved, for example, ±10 percent at maximum permissible dose levels for radiation workers to perhaps ±200 percent at the level of 10 mrems in a year for the population.

The standards laboratory and the radiation measurement system, R. S. Caswell, *SP456,* pp. 13-24 (Nov. 1976).

Key words: ionizing radiation; measurements; standards, uses of radiation.

In connection with a broad NBS study of the National Measurement System, the measurement system for ionizing radiation has been investigated. Eight classes of radiation users were considered: medical, nuclear power, industrial radiation processing, defense, environmental, science, chemical analysis, and miscellaneous radiation applications. System structure including regulators, standards laboratories, manufacturers, as well as final users of radiation was studied.

Several common threads were observed in these studies for the various classes of users: (1) While there is often a need for new NBS standards where no standards exist, where NBS standards do exist their accuracy is generally sufficient for present needs. (2) There is a great need for measurement assurance, especially where regulatory requirements are involved. (3) A need exists to help users with training, convenient laboratory standards, and handbooks for guidance. In other cases, new or augmented institutional structures within the system (e.g. secondary standards laboratories) are needed.

The federal regulatory agency and the radiation measurement system, R. H. Schneider, *SP456,* pp. 25-29 (Nov. 1976).

Key words: federal regulating agency; Food and Drug Administration; radiation measurements.

The official actions of a federal regulatory agency can have unique health and economic impacts. It is often not feasible for other parties to review the processes leading to such actions in detail and appeal is tedious and expensive. As a matter of equity it is incumbent on the agency to assure that the errors associated with facts on which actions are based are sufficiently small as not to affect the course of such actions. When radiation measurements are used as part of the factual basis for regulatory action this means that these measurements must be an integral part of the national radiation measurements system. The manner in which this has been achieved within the Food and Drug Administration as part of the implementation of the Radiation Control for Health and Safety Act of 1968, (P.L. 90-602) is described.

State responsibilities and the radiation measurement system, M. W. Parrott, *SP456,* pp. 31-36 (Nov. 1976).

Key words: abstract; compromise; ineffectiveness; measurements; radiation; regulations; states.

The states' radiation control programs have attempted to respond to public health need through a radiation measurement system that requires much more than instrument calibration. Few federal agencies can cover their responsibilities without state assistance. This paper explains these areas from one Radiation Control Director's point of view which may be shared by several others. Recommendations for some improvements are made.

Ionization chamber for absorbed-dose calibration, J. S. Pruitt and R. Loevinger, *SP456,* pp. 37-39 (Nov. 1976).

Key words: absorbed dose; calibration; cavity chamber; graphite chamber; ionization chamber.

A cavity ionization chamber has been constructed for in-phantom calibration in terms of absorbed dose. Its principle characteristics are the following: a smooth external shape, allowing insertion in the phantom without unnecessary air gaps; a large collecting electrode and a small internal air gap (1.3 mm), to meet Bragg-Gray cavity requirements; a uniform collecting potential gradient, allowing high potential

gradients and low recombination loss; a guard electrode design which results in a stabilization time of a few seconds; construction of all three electrodes from pure graphite; and a day-to-day precision of about 0.1 percent. The chambers have been used to make the high-precision depth-dose measurements in water and graphite needed to transfer calorimetric absorbed-dose calibration in graphite to absorbed-dose calibration in water.

The development and application of monoenergetic x-ray sources, J. H. Sparrow and C. E. Dick, *SP456,* pp. 41-45 (Nov. 976).

Key words: detector calibrations; fluorescence x-ray sources; K x-ray sources; pulsed x rays; radiographic imaging; steady-state x rays.

High flux standard x-ray beams have been developed in the energy range from 1- to 100-keV. These beams which are produced by direct excitation of characteristic x rays in elemental targets are useful for the investigation of phenomena associated with radiological imaging and the calibration of radiation detectors. The design and performance of the sources and some applications to radiation measurement systems will be discussed.

The design of a mobile radiation calibration laboratory, R. C. Placious and J. C. Humphreys, *SP456,* pp. 47-51 (Nov. 1976).

Key words: mobile laboratory; radiation calibrations; radiation control; radiation measurement assurance; radiation standards.

A mobile x and γ-ray standards laboratory with facilities for calibration and testing of radiation instruments has been proposed as an effective method for propagating the national standards for exposure directly to state agencies responsible for local radiation control. NBS studies indicate that this can be accomplished by equipping a trailer truck with various sources of radiation, reference class instrumentation, and power generating equipment. The trailer described here incorporates radiation shielding which will be optimized in relation to beam collimation, direction, scattering, and maximum weight. The design provides all proper safeguards prescribed by federal or state agencies for transport over the nation's highways.

Automated calibration and recordkeeping system for x-ray survey instruments, T. R. Ohlhaber, F. J. Prevo, and T. L. Miller, *SP456,* pp. 53-57 (Nov. 1976).

Key words: automation; calibration; computer; recordkeeping; x ray.

A system for monitoring and controlling the calibration process for x-ray survey meters has been designed. A minicomputer with a real-time operating system and on-line disk storage provides the acquisition, reduction, and control parameters for the process and also maintains the recordkeeping for instruments dispersed over the country. The system is designed to rapidly provide information to multiple terminals about the calibration and availability status of survey instruments in order to facilitate the use of large numbers of instruments.

Standardization of a nationwide gamma radiation calibration system, E. F. Williams, Jr., P. V. Barrans, and G. H. Brodie, *SP456,* pp. 59-63 (Nov. 1976).

Key words: calibration; exposure rate; geometry; instrument; ion chamber; roentgen; standard; γ radiation; γ response.

A standardized γ radiation calibration system has been developed and is presently being used to provide uniform γ radiation fields for the calibration of ~ 500,000 γ measuring, civil defense survey instruments. The instrumentation, procedures, data handling techniques and secondary standards developed to make the system directly traceable to National Bureau of Standards are described and discussed. A simple test and evaluation of the total system is described. The test data obtained appears to show that the true roentgen is probably being provided to 48 maintenance locations with an accuracy of better than ± 6 percent and that the instruments can be calibrated to within ± 14 percent of the true exposure rate at one point on each detection range.

A reliable calibration program for ionizing radiation measurement, A. Jacobsen, *SP456,* pp. 65-69 (Nov. 1976).

Key words: calibration; dosimetry; ionization chamber; secondary standardization.

The recent availability in this country of the N.P.L. No. 2560 Secondary Standard instrument has afforded a new dimension to instrument calibration procedures. A description is presented of the accuracy, stability, and utility of the N.P.L. No. 2560 for calibration of various instruments to measure a wide range of ionizing radiation energies.

AIF-NBS radioactivity measurements assurance program for the radiopharmaceutical industry, R. Collé, *SP456,* pp. 71-76 (Nov. 1976).

Key words: assurance; measurement; radioactivity; radiopharmaceutical; standards; traceability.

The National Bureau of Standards supervises and administers on behalf of the Atomic Industrial Forum (AIF) a radioactivity measurements technology quality assurance program for the radiopharmaceutical industry. The program provides for a monthly distribution of both millicurie-and microcurie-level Standard Reference Materials to each of eight participating commercial radiopharmaceutical manufacturers. A number of the standards are distributed as "blind" samples to establish traceability to the national radioactivity measurements system. In addition to identifying measurement discrepancies, assistance is provided to the participants in eliminating the sources of difficulties, and in correcting errors in their measurement techniques. In this report, results for the "blind"-sample traceability exercises are given, and a discussion of identified sources of measurement errors and recommendations are also presented.

American National Standards Institute quality assurance program in radioactivity measurements, C. W. Seidel and J. M. R. Hutchinson, *SP456,* pp. 77-82 (Nov. 1976).

Key words: detectors; germanium; ion chamber; liquid scintillation; sodium iodide; standard.

The ongoing ANSI N42.2 program of writing procedural standards for radioactivity measurements with NaI(Tl) and Ge(Li) detectors, liquid scintillation counters and ionization chambers is described.

Filtered beams at the NBS reactor, R. B. Schwartz, I. G. Schroder, and E. D. McGarry, *SP456,* pp. 83-85 (Nov. 1976).

Key words: monoenergetic neutrons; neutron beams; neutron filters; neutrons; reactors; resonant scatterer.

Using a combination of resonant scatterers and filters, we are producing high intensity, very pure beams of 2 keV, 25 keV, and 144 keV neutrons at the NBS reactor. These beams have low background, are well calibrated and very stable, and are intended for use as calibration standards.

Neutron source calibrations at NBS for calibration checks of neutron radiation instruments, V. Spiegel, *SP456,* pp. 87-89 (Nov. 1976).

Key words: calibration; manganous sulfate; neutron source; radiation instruments.

The manganous sulfate bath method of neutron source calibrations at the NBS is described together with the corrections applied for neutron capture in the source itself, capture by competing nuclei of either fast or thermal neutrons, and thermal neutron leakage. The advantage of commercially available Am-Be (α,n) neutron sources as a calibration check for radiation instruments in the MeV range is stressed.

Ultrasonic measurements and calibration, H. F. Stewart, M. E. Haran, and B. A. Herman, *SP456,* pp. 91-97 (Nov. 1976).

Key words: calibration; diagnostic ultrasound; ultrasonic measurements; ultrasonic techniques.

In the past few years ultrasound techniques have become well known and are receiving widespread acceptance in clinical practice. For example, diagnostic ultrasound is rapidly finding use as a compliment to other techniques and often is the modality of choice for visualization of structures within the body supplanting procedures involving the use of ionizing radiation. Some of the main areas of application at the present time are visualization of abdominal organs, pregnant uterus, and the heart. It is estimated that approximately 35 percent of the pregnant women in the United States currently undergo ultrasonic insonations and that by 1980 this number will increase to about 90 percent. Along with the increasing use of this modality come the responsibility for the assessment of the risk that may be involved with its use. This requires the measurement and characterization of ultrasonic fields by researchers engaged in the evaluation of biological effects associated with ultrasonic exposures. There is also the need to determine parameters of the ultrasonic field from fields produced by commercial ultrasonic devices in order to evaluate the potential risk their use may present on the basis of biological effects data. These measurements are especially necessary in view of the wide proliferation of such devices. In addition the establishment of any necessary performance criteria requires the quantification of the ultrasonic fields involved and calibration of measurement devices used.

Methods for the evaluation and calibration of microwave survey instruments, M. L. Swicord, H. I. Bassen, and W. A. Herman, *SP456,* pp. 99-105 (Nov. 1976).

Key words: microwave power density; microwave radiation measurement.

A facility has been established for the evaluation and calibration of microwave power density instrumentation. It includes an anechoic chamber with a precisely positionable cart for measuring gain and chamber standing waves. The operable frequency range is from 900 MHz to 10 GHz. A laser provides a means of aligning antennas. The absolute calibration of distance and microwave power are performed by NBS. The radiated electric field strength is then established by BRH as a primary standard using precise antenna gain measurement methods. An instrument evaluation facility includes an absorber-lined temperature chamber, a probe/slot-source positioning system, and devices for measuring the polarization response, modulation response, and the linearity of the microwave survey instruments.

NBS ultraviolet radiometric standards, W. R. Ott, *SP456,* pp. 107-110 (Nov. 1976).

Key words: detectors; NBS; radiometry; sources; standards; survey; ultraviolet.

A brief review of the standard sources and detectors available as services from NBS will be given. Emphasis will be on the use of such standards to calibrate the radiant power of unknown sources or the response of radiation detectors and spectral radiometers at wavelengths less than 400 nm. The following standards, listed in order of decreasing wavelength, are or will soon be available: the tungsten filament quartz-halogen lamp (above 250 nm); the tungsten strip lamp (above 225 nm); the low pressure mercury vapor lamp (253.7 nm); the deuterium arc lamp (165 to 350 nm); the argon "mini-arc" (115 to 400 nm); photodiode detectors (20 to 254 nm); and the synchrotron radiation source, SURF-II (5 to 400 nm). The relative strengths and limitations of these radiometric standards with respect to accuracy, reliability, convenience, and intensity and wavelength range will be discussed.

Quality assurance for measurements in therapy, R. J. Shalek, P. Kennedy, M. Stovall, J. H. Cundiff, W. F. Gagnon, W. Grant, III, and W. F. Hanson, *SP456,* pp. 111-118 (Nov. 1976).

Key words: medical physicist; radiation measurement; radiation therapy; tumor dose; quality control.

Recommendations regarding quality control in physics relating to radiation therapy are derived from experience with the Radiological Physics Center which is a national review program, and the Texas Regional Medical Physicists, which is a regional consultation activity.

Quality assurance measurements in diagnostic radiology, M. P. Siedband, *SP456,* pp. 119-130 (Nov. 1976).

Key words: diagnostic radiology; pass-fail tests; quality assurance measurements; x-ray quality control.

The concatenation of elements in an x-ray system necessitates a two level approach to system evaluation. The first level tests determine the weakest links of the chain while the second level tests provide more precise measures of elemental performance. Several types of first level pass-fail tests are described in terms of their utility in a routine quality assurance program for use in hospitals and in their relation to the second level tests. The requirements for accuracy and precision of the measurement apparatus are discussed.

Quality assurance for measurements in nuclear medicine, B. A. Rhodes, W. B. Hladik, and J. H. Gallagher, *SP456,* pp. 131-138 (Nov. 1976).

Key words: gamma camera; nuclear medicine; quality assurance; radiopharmaceuticals; ^{99m}Technetium.

This report reviews the measuring systems currently in use to assure safe and effective medical use of radioisotopes. One group of control tests measure the accuracy and precision of *in vitro* radiometric assays. Another group of measurements is applied to *in vivo* studies. This group includes measurements of quantity and quality of administered isotopes, performance of nuclear imaging devices and even the performance of physicians who interpret the images. Measures of overall system performance are also employed. The use of feedback loops to control and improve the quality of nuclear studies is an area of current exploration.

State and federal regulatory measurement responsibilities round medical facilities, L. H. Lanzl, *SP456,* pp. 139-146 Nov. 1976).

Key words: diagnosis; measurement accuracy; medical facilities; regulatory; therapy; traceability.

Radiation exposure to man is due chiefly to diagnostic x-ray procedures, in which radiation is intentionally directed toward a patient. Radiation therapy presents a lesser problem because a smaller percentage of the population is subjected to such treatment. Recently, some innovative steps were taken in the State of Ill ois to reduce patient exposure in four diagnostic procedures without reducing the benefits derived therefrom. However, if these procedures are to be carried out properly, it is necessary to increase the precision and accuracy of radiation exposure measurements to the order of ±2 percent. The usual accuracy and precision of radiation protection measurements are of the order of ±20 percent. Thus, should the Illinois radiation protection rules become widely adopted, our national dosimetry network will need to upgrade exposure measurement techniques.

Nationwide evaluation of x-ray trends (next) program—And adiation measurements in the state, J. W. Shaver, *SP456,* pp. 47-152 (Nov. 1976).

Key words: diagnostic; nationwide evaluation; physician; technologist; x-ray departments; x-ray trends.

A Task Force of state and Bureau of Radiological Health representatives has applied the "standard man" concept as a method of evaluating the impact of government control efforts on medical x-ray exposure. Exposure data are collected using standardized procedures and equipment, and Organ Dose Index values are obtained for selected critical organs. It is expected that these data can be correlated with governmental agency radiological health activities.

Low level environmental radiation measurements with a lastic scintillation detector system, A. P. Hull and G. S. evine, *SP456,* pp. 153-157 (Nov. 1976).

Key words: low level environmental radioactivity measurements scintillation detector.

A plastic scintillation detector-photomultiplier combination, operated in the current mode, has been developed at Brookhaven National Laboratory for the measurement of low level environmental radiation. Its output is digitized and processed by semiconductor circuits, which also provide for hourly compensation of variation in gain utilizing a built-in calibration source.

The instrument has been tested in the field for the past two years to establish its response capability to diurnal and longer term variation in background radiation, as well as small increments produced by a distant γ-field irradiation source. (Supported by U.S. ERDA.)

Precise environmental gamma-ray measurements utilizing tandard Ge(Li) detectors, R. M. Keyser, G. V. Walford, and . A. Cooper, *SP456,* pp. 159-167 (Nov. 1976).

Key words: environmental gamma-ray measurements; environmental samples; gamma-ray measurements; Ge(Li) detectors.

The analysis of environmental samples for radionuclides is fast becoming a large segment of the gamma-ray analyses performed. Many research laboratories and routine testing stations encounter a large number of samples. Some of these are relatively complex. In this paper we are concerned with the physical parameters of the measuring system; that is the characterization of the detector, the sample-detector relationship and the multichannel analyzer (analog to digital converter) and how these characteristics affect the accuracy of the measurement.

The counting sensitivity of a system can be used as a figure of merit for that system and can be defined as the minimum detectable limit or minimum acceptable limit. There are five factors affecting the sensitivity of a system. These are: the background, the system energy resolution, the detector efficiency and sample shape, the time allotted for the measurement, and the accuracy required for the result. We will discuss these parameters and their measurement and how they affect sensitivity for a series of standard germanium detectors.

The minimum-detectable-activity concept, J. C. Lochamy, *SP456,* pp. 169-172 (Nov. 1976).

Key words: background; critical level; detection limit; determination limit; less-than level; minimum detectable activity; statistical.

Various definitions of "minimum detectable activity (MDA)" are discussed and statistically valid representatives are presented. The methods of Currie are given primary emphasis and include development of the Critical Level, Detection Limit, Less-Than Level, and Determination Limit in terms of count-rate.

Use of NBS mixed-radionuclide gamma-ray standards for calibration of Ge(Li) detectors used in the assay of environmental radioactivity, B. M. Coursey, *SP456,* pp. 173-179 (Nov. 1976).

Key words: environment: gamma-ray measurements; Ge(Li) detectors; radioactivity; standards.

The NBS mixed-radionuclide gamma-ray emission-rate standards were first distributed in 1972 for use in calibrating Ge(Li) detectors used for measuring environmental radioactivity. These sources allow the user to prepare full-energy-peak efficiency vs. γ-ray energy curves for the detector from measurements made with a single standard. This paper will discuss the development of these standards and examine their current use in the assay of radioactivity in liquid, gaseous, and soil samples.

The safety and reliability of decentralized TLD, C. O. Widell, *SP456,* pp. 181-185 (Nov. 1976).

Key words: decentralized TLD; dosimeters; TLD reliability; TLD systems.

Decentralized reading of personnel TLD is in Sweden performed at the different nuclear power stations. The TLD results are automatically processed in the central dose register at Studsvik. In order to check and correct the readers, reference dosed dosimeters are used in each batch of TLD to be read. The reference dosed results are processed by the computer and will show the status of the different TLD readers. The reference dose irradiation is done with a Sr-90 source, which is placed above a rotating table in a brass shielding. The dosimeters are placed on this rotating table and will get a dose equivalent to 300 mrem gamma. In addition to this procedure a serie of calibration dosimeters is irradiated at a central calibration facility each month and read in the local TLD-reader.

Error analysis of environmental radiation measurements made with integrating detectors, G. de Planque Burke and T. F. Gesell, *SP456,* pp. 187-198 (Nov. 1976).

Key words: environmental radiation measurements; error; integrating detectors; TLD.

Proper use of integrating detectors (e.g., TLDs) for environmental monitoring, particularly around nuclear facilities, requires a high degree of measurement accuracy and a meticulous assessment of measurement errors.

Mathematical expressions for the dose in air at a site are formulated in terms of factors affecting the measurement including detector efficiency and calibration techniques as well as characteristics inherent to the detector such as energy dependence and contributions to the total during storage and transport of the detector. The assessment of errors for individual terms in the equations is discussed and errors are combined to determine the accuracy of the estimated dose.

Radio-frequency electromagnetic radiation from portable and mobile telecommunication transmitters, J. F. Thiel, *SP456,* pp. 199-202 (Nov. 1976).

Key words: antenna specifications; mobile telecommunication transmitters; RF radiation.

The increasing number of sources of electromagnetic radiation in the environment has placed more emphasis on the evaluation of such sources. Several of the more common sources of electromagnetic radiation to which individuals and equipment are exposed have been surveyed in an attempt to assess potential personnel hazards from the radiated fields. Measurements and examples of several typical types of antenna and transmitter combinations are presented.

An automated measurement system for determining environmental radiofrequency field intensities II, R. A. Tell, N. N. Hankin, J. C. Nelson, T. W. Athey, and D. E. Janes, Jr., *SP456,* pp. 203-213 (Nov. 1976).

Key words: antenna; microwave; minicomputer; radiofrequency; RF exposure; spectrum analyzer.

A measurement system is described which is used to measure environmental RF exposure levels. The system uses a spectrum analyzer interfaced to a minicomputer for data acquisition and is contained within a van for nationwide use. Special antenna systems allow isotropic field intensity measurements in selected bands between 0.5 MHz and 10 GHz.

The measurement of optical radiations: Selected practical considerations, R. W. Peterson, J. M. Coakley, K. Mohan, and R. James, *SP456,* pp. 215-221 (Nov. 1976).

Key words: calibrations; calorimeters; detectors; lasers; radiometry.

This paper describes the measurement capabilities for coherent and incoherent optical radiations at the Bureau of Radiological Health and discusses some problems that arise in developing a program of measurements required for enforcing compliance with Federal standards and for related regulatory responsibilities.

X-ray leakage from conventional and high voltage electron microscopes, D. F. Parsons, V. A. Phillips, and J. S. Lally, *SP456,* pp. 223-224 (Nov. 1976).

Key words: electron microscopes; health hazards; high voltage electron microscopes; x-ray leakage.

A survey of the x-ray leakages from the electron microscopes used by members of the Electron Microscopy Society of America has been carried out. Few, if any, out of several thousand long term microscope users received an exposure detrimental to health. However, a sufficient number of design errors, and accidental over exposures have occurred to make standardization of maximum allowed leakage desirable. The radiation hazards of high voltage electron microscopes are also discussed.

Intercomparison of personnel dosimeters, H. W. Dickson, W. F. Fox, and F. F. Haywood, *SP456,* pp. 225-232 (Nov. 1976).

Key words: dosimetry; gamma; intercomparison; neutron; personnel; reactor.

The first intercomparison of personnel monitoring dosimeters at Oak Ridge National Laboratory's DOSAR Facility was conducted during the period May 14-16, 1974. Ten independent laboratories and companies participated in an intercomparison of neutron and gamma-ray dosimeters used for routine personnel monitoring. The dosimeters, which were sent through the mail, were exposed at the Health Physics Research Reactor in three "standardized" radiation fields, which have been used for the past several years for intercomparing nuclear accident dosimeters. In addition, a 14-MeV neutron field was used as a fourth exposure condition. The results of the intercomparison show widely varying dose estimates; e.g., reported values of neutron dose equivalent have standard deviations ranging from 47-102 percent of the mean. A second intercomparison was conducted in a similar manner on February 18-19, 1976; however, only a few preliminary results are available at this time.

Environmental radiation measurements, J. E. McLaughlin, *SP456,* pp. 233-248 (Nov. 1976).

Key words: calibration; environmental gamma-rays; field testing; instruments; source distributions.

Determinations of radiation dose rates and radionuclide concentrations depend on systematic considerations of detector characteristics and instrument system calibrations, as well as the composition, source distributions, and flux-energy and angle distributions of the environmental radiation field. Routine *in situ* measurements around nuclear facilities are made primarily to monitor changes in certain radiation parameters. Even these measurements should be based on absolute determinations in order to attribute changes correctly to the source. The systematic considerations required for monitoring environmental sources are discussed and realistic examples of gamma-ray measurements are presented along with a suggestion for beta ray measurement.

Environmental measurements and regulatory responsibilities, J. M. Matuszek, *SP456,* pp. 249-261 (Nov. 1976).

Key words: environmental samples, laboratories; quality assurance; radioactive effluents; radioanalytical data; regulations.

During recent years, federal and state regulatory agencies have exhibited a propensity for issuing environmental radiation regulations regardless of the quality of the data base available for derivation of the standards. Particular examples of this trend are the AEC/NRC Regulatory Guide 4.3, EPA's Federal Safe Drinking Water Regulations, and some state and local edicts. Though the federal agencies appear to be improving in their efforts to obtain a sound environmental data base in certain areas, recent estimates of health effects attributable to ^{14}C effluents show that some interest continues for the "estimate and speculate" method of arriving at environmental radiation standards. Some state and local regulatory agencies, more closely attuned to political and media pressure, have rendered decisions or made statements which are not readily supported by the data obtained

from environmental measurements. Environmental radiochemical laboratories, on the other hand, have found that quality assurance requirements ordinarily acceptable for routine surveillance programs are not always sufficient at low radioactivity levels for the regulatory needs developed. As even more stringent analytical requirements are imposed, the staffs of both the laboratories and the regulatory agencies must be fully cognizant of the statistical limitations of environmental data developed at very low radioactivity levels and respond accordingly in making regulatory decisions or setting environmental regulations.

Environmental radioactivity standards, A. N. Jarvis and D. . Easterly, *SP456*, pp. 263-265 (Nov. 1976).

Key words: calibration; intercomparison studies; quality assurance; quality control; radioactivity; reference methods.

Policy decisions concerning environmental quality must be based on valid and comparable data. The distribution of radioactive reference samples and conducting interlaboratory studies aids in the critical evaluation of such data and helps assure that measurements are correctly made, accurate, traceable to national radiation standards, and comparable. Standards distribution and intercomparison studies are discussed. Traceability studies between the National Bureau of Standards and the U.S. Environmental Protection Agency are reviewed. Identification and documentation of potential radioactive pollutants that could result from expanded energy programs are also discussed.

Personnel monitoring measurements, R. V. Griffith, *SP456*, p. 267-276 (Nov. 1976).

Key words: betas; calibrations; dosimetry; gammas; neutrons; plutonium; x rays.

A personnel monitoring program must include a well integrated combination of dose determination methods, and should not depend on a single dosimetry system. Many of the necessary techniques have become well developed and dependable, such as the personnel gamma dosimeters in use today. However, other monitoring methods are still not adequate. The two most important personnel monitoring problems remaining are development of personnel neutron dosimeter and in-vivo measurement of plutonium at sublung burden levels. Although there are a few techniques under development to attack these problems, satisfactory long-term solutions will require much more work. As the developments in nuclear power and medicine continue, the need for solutions to these problems will intensify.

Personnel monitoring performance standards, B. H. Weiss, *P456*, pp. 277-284 (Nov. 1976).

Key words: film badges, TLD, HPS working group; personnel dosimeters.

Efforts in the United States to provide some measure of uncertainty to the interpretation of routine personnel monitoring badge results have received the attention of various groups, individuals and governmental agencies for over 20 years. However, in general, health physicists and the users of these personnel monitoring devices still do not have great confidence in the results. This paper will review the history of the significant activities in trying to develop a system for testing the performance of personnel dosimetry services. This will also include a discussion of the current published standards and those in draft with respect to their different approaches and objectives. In particular, the paper will describe activities of the Nuclear Regulatory Commission in considering mandatory performance testing of personnel dosimetry and the work of a Health Physics Society Working Group which could be the basis for an NRC proposed rule.

Optical interferometric measurements of ultrasonic radiation and its applications to medicine, M. E. Haran and H. F. Stewart, *SP456*, pp. 285-297 (Nov. 1976).

Key words: optical interferometric measurements; ultrasonic medicine; ultrasonic radiation.

A modified Michelson interferometer is currently being used to map particle displacement amplitude within a beam of pulses ultrasound. One leg of the interferometer is raster scanned across a 4 micrometer thick, opaque gold coated membrane upon which the sound is incident. The reference leg of the interferometer has been modified to provide stability. Sensitivity has been found to be at least 10 picometers which corresponds to 1.0 micro watts/cm^2 at 1.5 MHz. Particle displacement amplitude is displayed in two modes: 1) displacement vs. position for each horizontal scan, 2) displacement vs. position for an entire frame by Z-axis modulation of a CRO. Frame rates of 2/sec. can be achieved. This system has been used to determine measured ultrasonic field patterns. Parameters of interest include peak intensity, intensity distribution, ratio of peak to average intensity and calculation of beam area. Methods for specifying beam areas will be discussed as well as the application of the system to evaluate medical diagnostic and therapy transducers. This system was developed by RCA Laboratories, Princeton, New Jersey.

Photon mass energy-absorption coefficient air/medium ratios for ionometric dosimetry 0.1 keV to 20 MeV, J. H. Hubbell, *SP456*, pp. 299-306 (Nov. 1976).

Key words: attenuation coefficient; cross section; dosimetry; energy-absorption coefficient; gamma-ray; photon; x ray.

The determination of photon absorbed dose in a medium by means of an air-ionization chamber depends in part on the ratio of the mass energy-absorption coefficient μ_{en}/ρ for air to that for the chamber wall material, to account for the differing atomic compostions. In this paper, mass attenuation coefficients μ/ρ developed at the National Bureau of Standards by the X-Ray and Ionizing Radiation Data Center from the latest theoretical cross section data are compared with measurements for selected low-Z elements of dosimetric interest. From this cross section data base, mass energy-absorption coefficients μ_{en}/ρ are derived for air and selected media, along with air/medium ratios, over the photon energ yrange 0.1 keV to 20 MeV including values at the cesium-137 and cobalt-60 energies. Comparisons are made with earlier published μ_{en}/ρ values and air/medium ratios.

Electron dosimetry with ionization chambers, M. J. Berger, S. M. Seltzer, S. R. Domen, and P. J. Lamperti, *SP456*, pp. 307-312 (Nov. 1976).

Key words: calorimeter; dose/ionization conversion; dosimetry; electrons; ionization chamber; stopping-power ratios.

This paper describes work at NBS dealing with the conversion of ionization measurements to absorbed-dose values in high-energy electron dosimetry. This work was done by two approaches: experimentally, through the comparison of calorimeter and ionization-chamber measurements in a gra-

phite phantom, for incident-beam energies from 15 to 50 MeV; theoretically, via transport calculations of electron flux spectra and application of Bragg-Gray cavity theory, for beam energies from 1 to 60 MeV and for various media including water, tissue, graphite and plastics. The pertinent dose/ionization conversion factor has been determined with an estimated accuracy of 1 percent as a function of the beam energy and of the depth in the phantom. Experimental evidence has also been obtained on the influence of lead scattering foils on the value of the conversion factor.

Dose profiles in tissue and in air for therapeutic electron beams, G. Osman, *SP456*, pp. 313-326 (Nov. 1976).

Key words: dose profiles; electron dosimetry; pencil beam; therapeutic beam.

Electron dose profiles in body tissues and in air were obtained in this work theoretically and experimentally for 3 to 30 MeV incident beam energies. A knowledge of dose profiles in air is necessary for any extended SSD treatments or air gap beyond the end of collimator. Theoretical dose profiles were predicted at various depths in tissue using the Osman's Model for therapeutic electron beams. Experiments were carried out with unfiltered beams in air and in tissue equivalent materials and results were compared with those predicted from our theoretical model. During the initial depth of penetration in muscle, fat, bone, lung and air, the electron dose profiles showed flat-top distributions within the geometrical configuration of the beam. At considerable depths in air or tissue (comparable to the range and field size), electron dose profiles have shown Gaussian distributions of various half-widths. Between the two extremes, electron dose distribution experiences a gradual transition from flat-top to the Gaussian. Slopes of these Gaussian curves varied inversely with the incident electron energy. The Gaussian dose distributions in tissues are generally not clinically acceptable. The flat distributions, however, can be obtained by proper design of scattering foils and electron cones. Tissue dose profiles as obtained from our model could provide useful input data for programming treatment planning with high energy electron beams, using mini-computers. It is expected that the predicted dose distribution by our model could also account for cone design and body-inhomogeneity.

Calorimetric dose measurements in fast neutron and cobalt-60 gamma-ray fields, J. C. McDonald, J. S. Laughlin, and L. J. Goodman, *SP456*, pp. 327-333 (Nov. 1976).

Key words: calorimeter; dosimetry; fast neutron; tissue equivalent.

A portable calorimeter, constructed of A-150 tissue equivalent (T.E.) plastic, was employed to measure dose in a cyclotron-produced fast neutron field and in a ^{60}Co gamma-ray field. The precision of these measurements ranged from $\pm$ 1-2 percent depending upon dose rate and signal to noise ratio. The absolute accuracy of measurements in the neutron field is estimated to be $\pm$ 5 percent and those in the ^{60}Co field to be $\pm$ 2 percent. A method for determining the magnitude of endothermic radiochemical effects which occur in T.E. plastic will be described along with other sources of uncertainty in calorimetric dosimetry.

Scattered radiation from a neutron collimator, F. H. Attix, L. S. August, and P. Shapiro, *SP456*, pp. 335-341 (Nov. 1976).

Key words: albedo; collimation; dosimetry; ion chambers; n-γ dosimetry; neutrons; scattering.

Fast-neutron beams are being employed in radiotherapy trials and associated radiobiology studies at numerous centers in the U.S., Europe, and Japan. Since collimated beams of various sizes and shapes are employed, it is desirable to know the composition of the scattered radiation component contributed by the collimator. A simple method is shown for deducing the field composition in terms of a 3-component model, from measurements made with three ionization chambers (tissue-equivalent, graphite, and magnesium). The dose contributed by the scattered radiation in the present example was found to be predominantly due to fast neutrons indistinguishable from those in the primary spectrum (from 35-MeV D^+ on Be). This method may prove useful for measurements in phantoms as well.

Dose control in radiation therapy, K. R. Kase, B. E. Bjarngard, B. J. Maddox, and G. K. Svensson, *SP456*, pp. 343-350 (Nov. 1976).

Key words: dosimetry; ion chamber; patient; precision; therapy; TLD.

Accurate and precise dose delivery is necessary in radiation therapy because of the steep tissue response-dose curve. This paper discusses the precision of dose measuring devices, therapy machines, patient dose delivery at the Joint Center for Radiation Therapy. Ion Chambers used for therapy machine calibrations show a precision of 0.7 to 1.3 percent while a thermoluminescent dosimetry (TLD) system shows a precision of 1.5 percent. Thereapy machines are calibrated on a weekly schedule and the variation in dose delivery between calibrations varies from 1 to 2 percent. Daily constancy checks on the linear accelerators using TLD show a variation of about 2 percent from day to day. Patient dose measurements using TLD at orthovoltage energies appear to have a precision of about 5 percent except for very small treatment fields where it is about 12 percent. Patient dosimetry at megavoltage x-ray energies shows a precision of 3.5 percent while at megavoltage electron energies it is about 5 percent.

Dosimetry procedures at the Northwest Medical Physics Center, D. Jones, D. Schumacher, and J. Washington, *SP456*, pp. 351-358 (Nov. 1976).

Key words: calibration; megavoltage radiotherapy; quality assurance.

The Northwest Medical Physics Center provides physics support to 28 radiotherapy institutions in the Northwest from a central location. The methods employed in on-site physical measurements, organization of data and long-term quality assurance are described.

Intercomparison of prescription dose delivery in the New England region, J. S. Blinick, J. Spira, D. Cail, and P. Plazeski, *SP456*, pp. 359-363 (Nov. 1976).

Key words: dosimetry; intercomparisons; radiation; supervoltage; therapy.

An intercomparison of radiation dosimetry among 16 institutions within the New England area was performed using a hand carried water phantom-ionization chamber system. Participants were asked to deliver 200 rads using their own beam data and computations to the chamber for each of eight field size and depth combinations. Average measured doses ranged from 200 to 204 rads. For all combinations, the standard deviation of the measured values was 3 percent.

Electron-therapy dosimetry, M. Ehrlich and P. J. Lamperti, *456*, pp. 365-370 (Nov. 1976).

Key words: dosimetry; electrons; impact; improvement; performance; radiation therapy; service.

A service for checking the dosimetry of electron beams in the energy range from 5 to 50 MeV was established in 1967, mainly for use by radiation-therapy departments. Since then, 34 radiation-therapy departments and several other groups have participated, a relatively large number of them only intermittently or for a total of only a few tests. There has been little improvement of overall performance over the years, less than one-half of the total number of irradiated dosimeters involved in any one test showing agreement to within 5 percent between the dose reported by the participants and the NBS dose interpretation, and up to one-quarter of the dosimeters showing disagreements of more than 10 percent. Only in a few exceptional cases was there an improvement in individual performance with continuing participation. It is concluded that means must be sought, in collaboration with the therapy community, to secure a more favorable impact of this service on electron-therapy dosimetry.

Thyroid monitoring and minimizing I-125 uptake, M. M. abel, K. W. Price, and G. R. Holeman, *SP456*, pp. 371-379 Nov. 1976).

Key words: bioassay; I-125 uptake; thyroid monitoring.

A method is described for the quantitative determination of I-125 uptake by the thyroid gland of all users of I-125. Causes for uptake are discussed and the need for monitoring is illustrated.

Attenuation phantoms for patient exposure measurement dur-ıg radiographic examinations utilizing phototiming techniques, . J. P. Lin, *SP456*, pp. 381-388 (Nov. 1976).

Key words: attenuation; exposure; phantoms; phototiming; radiographic examination; x-ray tube potential.

Aluminum phantoms have been obtained for patient simulation in radiographic procedures utilizing phototiming techniques. Thickness of these phantoms have been determined by (a) monitoring radiographic parameters of phototimed examinations and (b) attenuation measurements of x-rays in aluminum. Four of the eight selected radiographic procedures, namely (1) A-P cervical spine, (2) Lateral lumbar spine, (3) A-P abdomen, and (4) A-P skull examinations, have been subject to patient exposure limitation in the State of Illinois since January 1, 1975. Use of these aluminum phantoms in compliance testing and estimation of patient exposure are discussed.

Effects of measuring apparatus on x-ray attenuation measure-ıents, T. J. Morgan, L. B. Smith, and Z. R. Hashmi, *SP456*, p. 389-394 (Nov. 1976).

Key words: chamber energy response; geometry effects; half-value layer; photon attenuation.

Measurements of x-ray exposure are affected by the photon energy dependence of instrument response, and measurement geometry.

The effects of these factors on measured x-ray attenuation curves and estimates of first half-value layer in aluminum under certain test conditions are described, and estimates of the magnitudes of the effects are given.

A method for correcting half-value layer estimates obtained under less than ideal, but well-controlled, conditions is discussed.

kVp measurement for dental x-ray units, M. S. Moroz and J. A. Vukan, *SP456*, pp. 395-401 (Nov. 1976).

Key words: dental; kVp; x ray.

The kVp measurement of a sealed x-rav system using filtered radiation from a scatterer is discussed and compared to direct voltage measurement techniques.

National ionizing radiation standards, J. E. Leiss, *SP456*, pp. 403-416 (Nov. 1976).

Key words: ionizing radiation; measurement assurance; radiation users; standards.

Ionizing radiation in its many forms is used in an increasing number of ways to help solve important problems of our technological society. As these applications become more mature, the needs for reliable radiation measurement continue to increase, both to achieve the maximum benefit from the radiation use and also to assure that these applications are carried out safely. To meet these measurement needs, the National Bureau of Standards provides a wide variety of measurement standards and services. New standards are also being developed to meet a variety of new needs.

It is recognized that these radiation measurement standards by themselves are of limited usefulness unless they can be related to measurements made at the user level. Various mechanisms exist for this, including measurement calibrations, measurement traceability testing, and measurement assurance programs. The National Bureau of Standards carries out an increasing number of activities of this type. In some cases new or augmented institutional arrangements within the national measurement system for ionizing radiation appear necessary.

Non-ionizing electromagnetic radiation standardization, R. C. Baird and A. A. Sanders, *SP456*, pp. 417-425 (Nov. 1976).

Key words: calibrations; laser calorimeters; measurement assurance programs; non-ionizing EM radiation hazards; RF and microwave measurements; standards.

Calorimeters have been developed by NBS as accurate (± 1%) standards for calibrating laser power and energy measuring devices. A pilot measurement assurance program (MAP) is underway, with 12 industrial organizations participating. The anticipated accuracy is ± 5 percent. A formal MAP service will be announced about July 1976. Accurate standards for rf and microwave fields are not as well developed because of the inherently greater difficulty in measuring these fields caused by diffraction, interference, reactive fields, modulation, etc. NBS has developed accurate measurement and calibration techniques which will be fully implemented about August 1976 when a new anechoic (reflection-free) chamber will be completed. NBS is also developing stable transfer standards suitable for measurement assurance programs, and a pilot MAP with uncertainties of about ±0.5 dB (±12%) is anticipated during FY 1977.

SP457. **Building technology publications 1965-1975,** J. R. Debelius, S. G. Weber, and K. N. DeCorte, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 457*, 107 pages (Dec. 1976) SD Catalog No. C13.10:457.

Key words: abstracts; Center for Building Technology; key words; publications.

This report presents the National Bureau of Standard's (NBS) Center for Building Technology (CBT) publications of the past decade. Publications constitute a major end product of CBT's efforts. They appear in several publication series (Building Science

Series, Technical Note, NBS Report, NBS Interagency Report, Handbook, Special Publication, the Journal of Research, and the Consumer Information Series).

SP459. **Performance evaluation of programmable robots and manipulators.** Report of a Workshop held at Annapolis, MD, Oct. 23-25, 1975, T. B. Sheridan, Ed., *Nat. Bur. Stand. (U.S.), Spec. Publ. 459,* 213 pages (Oct. 1976) SD Catalog No. C13.10:459.

Key words: guidelines; industrial robots; manipulator; performance evaluation; programmable robots; specifications.

The Workshop brought together representatives of industry, academic institutions and government agencies, including the potential designers, suppliers and users of a new generation of manipulators and robots which include varying degrees of control by both people and computers. The Conference was motivated by the lack of common bases for comparing one such device with another in terms of performance, or one task with another in terms of how well a given device will perform it.

The Workshop concluded that there is a need for (1) common definitions of many terms which now are the source of pervasive confusion, (2) common test codes, (3) checklists, guidelines, and specifications to help users and suppliers better communicate with one another, and (4) common tests for demonstration and exhibition of new research and development in this field. Conference participants emphasized that once these needs were met to allow communication in the field, actual performance testing should be left to the user and supplier in the free marketplace. *These proceedings include the following papers (indented):*

Evaluation of tools and tasks: Reflections on the problem of specifying robot/manipulator performance, T. B. Sheridan, *SP459,* pp. 27-37 (Oct. 1976).

Performance evaluation of manipulators from a kinematic viewpoint, B. Roth, *SP459,* pp. 39-61 (Oct. 1976).

Performance evaluation of ROMANSY from the viewpoints of mechanics and control, A. E. Kobrinski, *SP459,* pp. 63-68 (Oct. 1976).

Performance measurement and evaluation of general purpose manipulators, R. L. Paul, *SP459,* pp. 69-83 (Oct. 1976).

Manipulator system performance evaluation: Problems and approaches, N. L. Shields, Jr., T. B. Malone, and M. Kirkpatrick, *SP459,* pp. 83-90 (Oct. 1976).

Contributions to forming criteria for the evaluation of robots and manipulators, M. Vukobratovic, *SP459,* pp. 197-203 (Oct. 1976).

SP460. **Use of Monte Carlo calculations in electron probe microanalysis and scanning electron microscopy.** Proceedings of a workshop held at the National Bureau of Standards, Gaithersburg, MD, Oct. 1-3, 1975, K. F. J. Heinrich, D. E. Newbury, and H. Yakowitz, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 460,* 169 pages (Feb. 1977) SD Catalog No. C13.10:460.

Key words: electron probe microanalysis; electron-solid interactions, magnetic domains; Monte Carlo electron trajectory calculations; particle analysis; scanning electron microscopy; thin film analysis.

This book is the formal report of the Workshop on the Use of Monte Carlo Calculations in Electron Probe Microanalysis and Scanning Electron Microscopy held at the National Bureau of Standards, October 1-3, 1975. The papers cover a wide range of topics within the field: the history and development of Monte Carlo methods for use in x-ray microanalysis; the study of the distribution of electron and x-ray signals by Monte Carlo techniques; the effect of the choice of scattering models on the calculations; techniques for considering the distribution of energies of the beam electrons propagating in the specimen; evaluation of ionization cross-section models; and applications of Monte Carlo techniques to the study of particles, thin films, and magnetic domain images. The contributions include reviews of general interest as well as papers treating specific topics. The volume should be of wide interest to workers in the fields of scanning electron microscopy, electron probe microanalysis, electron physics, and other fields involving the interaction of electrons with solids. *These proceedings include the following papers (indented):*

The history and development of Monte Carlo methods for use in x-ray microanalysis, H. E. Bishop, *SP460,* pp. 5-14 (Dec 1976).

Key words: electron probe microanalysis; electron scattering; electron-specimen interactions; Monte Carlo electron trajectory calculations; scanning electron microscopy; x-ray microanalysis.

Green in 1963 first demonstrated the usefulness of Monte Carlo calculations to the understanding and development of the theory of x-ray microanalysis. As his calculations was based on experimental scattering data it was of relatively limited application. By 1965, at the 4th International Conference on X-Ray Optics and Microanalysis in Paris, papers from Japan and the United Kingdom demonstrated that a more general approach based on theoretical cross-sections was possible. Since then many further developments have been reported and a number of Fortran programs have become available.

Monte Carlo calculations may be divided conveniently into two classes; those aimed at a general understanding of the electron scattering process leading to x-ray production and those intended to solve particular problems. For conventional quantitative microprobe analysis of a flat specimen, uniform over the analyzed volume, the first class is the most important as it should lead to improvements in the conventional ZAF procedures. In a situation where there are special boundary conditions, such as thin surface films or particles, the second class is useful in predicting or interpreting the observed results. In this paper, the various approaches to Monte Carlo calculations are reviewed and their suitability for different applications is discussed.

Studies of the distribution of signals in the SEM/EPMA by onte Carlo electron trajectory calculations—An outline, D. E. ewbury and H. Yakowitz, *SP460*, pp. 15-44 (Dec. 1976).

Key words: backscattered electrons; electron probe microanalysis; Monte Carlo electron trajectory simulation; scanning electron microscopy; secondary electrons; x rays.

Monte Carlo electron trajectory calculations provide a powerful technique for the study of the characteristics and distributions of the various signals generated in electron-specimen interactions. This paper is a review of the diverse applications of Monte Carlo techniques to the calculation of signal distributions. The following topics will be considered: extent of the primary interaction volume; lateral, depth, angular and energy distributions of backscattered and secondary electrons; the extent of the x-ray generation volume, and the depth distribution of characteristic and continuum x rays. Numerous examples of these calculated distributions are drawn from the literature and compared, when possible, with appropriate experimental results.

The effect of scattering models on the results of Monte Carlo alculations, L. Reimer and E. R. Krefting, *SP460*, pp. 45-60 Dec. 1976).

Key words: electron microscopy; electron probe microanalysis; electron-specimen interactions; Monte Carlo electron trajectory simulation: scanning electron microscopy; x-ray generation.

A special Monte Carlo model is presented considered Mott scattering for scattering angles $\zeta > 10°$, a mean angular deviation caused by multiple scattering for $\zeta < 10°$, individual inelastic scattering events with energy loss $\Delta E >$ 200 eV and a continuous energy loss for $\Delta E < 200$ eV. Results of the Monte Carlo calculations are compared with experimental results of the backscattering coefficient, the angular and energy distribution of backscattered electrons and the transmission of thin films. Some calculations of the depth distribution of x-ray emission are reported. Parts of the program are changed to see which parts of the model influence the results.

Characteristics of a Monte Carlo program for microanalysis tudy of energy loss, J. Heńoc and F. Maurice, *SP460*, pp. 61-76 (Dec. 1976).

Key words: electron energy loss; Landau electron deceleration theory; microanalysis; Monte Carlo electron trajectory calculations; scanning electron microscopy; x-ray microanalysis.

The x-ray depth distribution curves obtained by the Monte Carlo method are in disagreement with the experiment. For this reason, Bishop proposed in his thesis the use of the theory of Landau, which takes into account the statistical nature of the energy loss of the electrons. This procedure gives a more realistic description of the events. We have taken into account, in this way, the effects of electron straggling upon the function $\phi(\rho Z)$ and the energy loss distribution of electrons passing through thin films. The general solution of the problem of electron trajectory simulation is straightforward, but it requires lengthy and expensive calculations. The procedure can be reduced in length by means of two simplifications, one of which was proposed by Bishop. Different treatments affect in different ways the statistical distributions of the variables which are being studied. In addition, the importance of the parameters and physical models which govern the diffusion of electrons (step length, diffusion model, screening parameter, etc.) will be discussed.

Evaluation of formulas for inner-shell ionization cross sections, C. J. Powell, *SP460*, pp. 97-104 (Dec. 1976).

Key words: cross sections; electron-probe microanalysis; electrons; inner-shell; ionization.

An evaluation is presented of various formulas that can be used to describe cross sections for inner-shell ionization by electron impact in the electron-probe microanalyzer. Owing to lack of experimental data, most of the discussion pertains to the case of K-shell ionization. For incident energies greater than four times threshold ($U_K > 4$), the Bethe equation can describe adequately the observed cross-sections and recommended values are given for the two Bethe parameters. For ($U_K < 4$), the classical result of Gryzinski or the expressions of Lotz or Fabre should be useful.

NBS Monte Carlo electron trajectory calculation program, R. L. Myklebust, D. E. Newbury, and H. Yakowitz, *SP460*, pp. 105-128 (Dec. 1976).

Key words: electron trajectories; magnetic effects; Monte Carlo calculations; multiple scattering x-ray generation; particle analysis; quantitative x-ray microanalysis; thin films; x-ray emission.

A number of Monte Carlo programs for obtaining information of interest to x-ray microanalysts and scanning electron microscopists have been developed; the outputs from many of these programs are discussed elsewhere in this volume. The purpose of this paper is to present the Monte Carlo program for microanalysis currently in use at the National Bureau of Standards. This program is a considerably extended treatment of the Curgenven-Duncumb formulation. A large number of electron trajectories can be simulated rapidly—about 1200 per minute of central processing unit time—at a reasonable cost. The electron scattering calculation is an approximation to multiple elastic electron scattering in an amorphous solid. Details of other assumptions made in constructing the program, as well as a number of comparisons of calculated and experimental data, are given in the text.

Application of Monte Carlo simulation to electron microprobe analysis of thin films on substrates, D. F. Kyser and K. Murata, *SP460*, pp. 129-138 (Dec. 1976).

Key words: electron probe microanalysis; Monte Carlo electron trajectory calculations; nuclear backscattering analysis; scanning electron microscopy; thin films; x-ray analysis.

A Monte Carlo simulation procedure has been developed for high-energy (1-50 keV) electron beam scattering, energy loss, and x-ray production in targets consisting of thin alloy

films on thick substrates. The method utilizes experimental x-ray intensities referenced to thick standards, and avoids the problems associated with preparation and characterization of thin film standards. The chemical analysis C_t (weight percent) and mass thickness ρt (g/cm²) of the alloy film can be deduced separately; specific examples are given of alloy films Mn_xBi_{1-x} and CO_xPt_{1-x} on SiO_2 substrates. The chemical analysis obtained with the Monte Carlo procedure is correlated with that obtained from nuclear backscattering energy analysis.

Monte Carlo-generated calibration curves of total electron backscatter yield η are presented for the case of Al films on Au substrates and Au films on Al substrates. These curves show a smooth transition of η versus ρt between the asymptotic limits of η(Al) and η(Au). The shape of the curve depends on the electron beam voltage E_0 (keV). Further experimental work is necessary to confirm the accuracy of these calculations for η, and then the method may be useful for a nondestructive, localized thickness measurement of thin films on substrates.

Calculation of type II magnetic contrast in the low-loss image in the scanning electron microscope, O. C. Wells, *SP460,* pp. 139-150 (Dec. 1976).

Key words: contrast calculations; energy filtering; low-loss electron image; magnetic contrast; Monte Carlo electron trajectory calculations; scanning electron microscopy.

The backscattered electrons which are often most useful in the scanning electron microscope (SEM) are those which have lost the least energy. (We have called these the "low-loss" electrons.) The question is whether they can be analyzed by a simple electron scattering model, or whether the Monte Carlo method must be used. Previously, it has been shown that a simple model based jointly on the Bethe energy loss law and a single Rutherford wide-angle scattering event can account for both the angular distribution and the absolute magnitude of the low-loss electron emission from amorphous SiO_2 with oblique incidence with an accuracy of a few percent provided that the energy loss is less than about 1 percent. This simple model has been extended to allow for curvature of the electron trajectories in the specimen, so as to calculate the contribution to Type II magnetic contrast in a suitable specimen caused by those backscattered electrons which have been scattered by a single wide-angle scattering event. Some preliminary theoretical results are given.

A study of type II magnetic domain contrast in the SEM by Monte Carlo electron trajectory simulation, D. E. Newbury, H. Yakowitz, and R. L. Myklebust, *SP460,* pp. 151-164 (Dec. 1976).

Key words: iron-silicon transformer steel; magnetic contrast; magnetic domain images; magnetic domains; Monte Carlo electron trajectory calculations; scanning electron microscope.

Magnetic contrast in the scanning electron microscope occurs by two distinct mechanisms: Type I magnetic contrast arises from the interaction of secondary electrons which have exited the specimen with leakage magnetic fields above the surface and Type II magnetic contrast arises from the interaction of beam electrons with the internal magnetic field. The observed properties of Types I and II magnetic contrast are reviewed. The proposed mechanism of Type II magnetic contrast, that of internal beam-magnetic field interactions, is modeled with the Monte Carlo electron trajectory technique. Details of the modifications to the standard Monte Carlo technique to account for magnetic deflection are given. Monte Carlo results are given for the following cases: contrast as a function of specimen magnetization, tilt, rotation, beam energy and energy fraction. The spatial resolution of domain edges is also considered. Calculated results are compared with experimental values, and the correspondence is excellent.

SP462. **Laser induced damage in optical materials: 1976.** Proceedings of a Symposium Sponsored by: National Bureau of Standards, American Society for Testing and Materials, Office of Naval Research, Energy Research and Development Administration, Defense Advanced Research Project Agency, July 13-15, 1976, NBS Boulder, CO, A. J. Glass and A. H. Guenther, Eds., *Nat. Bur. Stand. (U.S.), Spec. Publ. 462,* 410 pages (Dec. 1976) SD Catalog No. C13.10:462.

Key words: avalanche ionization; infrared windows; laser damage; metal mirrors; optical fabrication; optical materials; thin films.

The Eighth Annual Symposium on Optical Materials for High Power Lasers, the Boulder Damage Symposium, was hosted by the National Bureau of Standards in Boulder, Colorado, from July 13th to 15th. The Symposium was held under the auspices of ASTM Committee F-1, Subcommittee on Laser Standards, with the joint sponsorship of NBS, the Defense Advanced Research Project Agency, the Energy Research and Development Administration, and the Office of Naval Research.

About 160 scientists attended the Symposium, including representatives of the United Kingdom, France, Canada, and Brazil. The Symposium was divided into five half-day sessions, concerning Bulk Material Properties and Thermal Behavior, Mirrors and Surfaces, Thin Film Properties, Thin Film Damage, and Scaling Laws and Fundamental Mechanisms.

As in previous years, the emphasis of the papers presented at the Symposium was directed towards new frontiers and new developments. Particular emphasis was given to new materials for use at 10.6 μm in mirror substrates, windows, and coatings. New techniques in film deposition, and advanced in diamond turning of optics were described. The scaling of damage thresholds with pulse duration, focal area, and wavelength are discussed.

Alexander J. Glass of Lawrence Livermore Laboratory and Arthur H. Guenther of the Air Force Weapons Laboratory were Co-chairpersons of the Symposium. The Ninth Annual Symposium is scheduled for October 4-6, 1977, at the National Bureau of Standards, Boulder, Colorado. *These proceedings include the following papers (indented):*

Thermal distortion thresholds for optical trains handling high pulse powers, H. E. Bennett, *SP462,* pp. 11-24 (Dec. 1976).

Key words: laser windows and mirrors; optical figure; pulsed laser; thermal distortion.

The maximum pulse power level which components in the optical train of a high energy laser can pass is determined by the catastrophic damage threshold for the system. Before that level is reached, however, thermally induced optical distortion may make the beam unfocusable and hence for most practical purposes unusable. The amount of thermally induced optical distortion which may be tolerated depends strongly on the initial optical figures of the various components, and in the case of windows, on their optical homogeneity. Requirements for these parameters in a multicomponent infrared optical train can be surprisingly severe, and are frequently comparable to those commonly used for high quality optics designed for the visible region of the spectrum. Figure requirements for mirrors are more

severe than for windows unless their index of refraction is above about 2.4. Adaptive optics may be used to remove some of the resultant wave front error, but the lower the requirements made by the optical train the more easily the adaptive optics system can correct for wave front distortions arising from the laser medium and from the optical path. A detailed analysis is required to set optimum tolerances for the various components in the optical path of a particular system. Simple relations can be developed, however, which can be used to predict the approximate pulse power handling capability of the optical train for short periods of time in terms of the material parameters of the various components in the system, their optical figures, and in the case of windows, their homogeneity. These relations can be used as figures of merit to select between materials and preliminary calculations for system design.

Electric fields and power dissipation in windows at oblique incidence, J. H. Apfel, *SP462*, pp. 25-28 (Dec. 1976).

Key words: electric fields; laser damage; oblique incidence; standing waves.

Formulas are provided for calculating the strength of the electric fields and the power dissipation due to weak absorption in a window illuminated by a collimated beam at nonnormal incidence. For a glass window the power dissipation per unit volume varies approximately as the cosine of the incident angle.

Analysis of laser-induced thermal stresses in laser windows, . E. Rondeau and D. Ford, *SP462*, pp. 29-35 (Dec. 1976).

Key words: computer analysis; laser induced stresses; stress analysis; thermal analysis; zinc selenide window.

Laser induced damage in the ZnSe output coupler of a 15 kilowatt cw CO_2 coaxial electric discharge laser has been investigated. An analytical technique has been developed for predicting thermal stresses from in depth absorption of laser energy in laser window materials. A two-dimensional transient heat transfer code, APPLE, (Aerotherm Prediction Procedure for Laser Effects) was used to obtain the temperature histories of the irradiated window. The effect of window thickness, transmitted power level, absorptance and exposure time were investigated. The stress distribution in the circular disk was computed from radial and axial temperature distributions obtained from the APPLE code. This analytical technique has been used to determine maximum power levels and exposure times to prevent window damage in laser experiments.

Interferometric measurement of laser heated windows, E. rnal and J. S. Loomis, *SP462*, pp. 36-44 (Dec. 1976).

Key words: interferometry; laser windows; optical materials; thermal distortion.

The optical aberrations in infrared window materials irradiated with a CO_2 laser have been measured at 0.6328 μm. The contributions of anisotropic aberrations due to polarization dependence were examined and found to be small for several materials of interest. Techniques for the semi-automatic digital analysis of our interferometric data will be discussed. The results will be applied to figure-of-merit characterization of window performance and calculation of far-field irradiance degradation.

Model calculations of the thermal profiles in irradiated windows and the resulting optical aberrations will be reviewed. Synthetic interferograms generated from these calculations were used to exhibit many of the experimentally observed features and to test the digital analysis techniques mentioned earlier.

New materials for chemical laser windows, J. A. Harrington, *SP462*, pp. 45-49 (Dec. 1976).

Key words: chemical lasers; infrared materials; laser windows; multiphonon absorption; optical absorption; water repellent coatings.

Many of the more common materials such as the alkaline earth fluorides, ZnSe, and the alkali halides have been studied for use as low loss windows on DF-HF chemical lasers yet there remain others which have received little or no attention at these wavelengths. We have begun to investigate some of these other materials in hopes of finding additional low absorbing materials which show potential as laser windows. Specifically, our measurements of the optical absorption in $LiYF_4$, Yttralox, ZnS, CdTe, KBr, SrF_2, and KRS-5 will be discussed and related to the intrinsic absorption in these hosts. In all cases, the measured absorption has been found to be greater than the intrinsic value. In addition to the absorption measurements on these substances, some recent optical absorption measurements on water repellent coatings on KCl will be discussed.

Studies of absorption in mid IR laser window materials, A. Hordvik, B. Bendow, H. G. Lipson, L. H. Skolnik, and R. N. Brown, *SP462*, pp. 50-57 (Dec. 1976).

Key words: bulk absorption; CO laser; HF laser; infrared laser window materials; multiphonon absorption; surface absorption.

An investigation has been made of the absorption properties of various potential laser window materials in the wavelength ranges of the CO_2, CO, and HF lasers. Various experimental techniques were utilized including emittance spectroscopy, Fourier spectroscopy, laser calorimetry, and a new photoacoustic technique which allowed both bulk and surface absorption to be determined simultaneously. The materials investigated were ZnSe, Al_2O_3, MgO, LiF, MgF_2, CaF_2, SrF_2, and BaF_2. At both the CO and HF laser wavelengths it was found that surface absorption was substantial in most cases and particularly so in the HF laser region. Among the materials tested, sapphire emerged as an excellent candidate for use with the HF laser provided its large surface absorption can be reduced substantially. Preliminary theoretical calculations have been made of the intrinsic absorption in ZnSe to interpret the measurements.

Effect of temperature and stress on the refractive index of window materials, A. Feldman, D. Horowitz, and R. M. Waxler, *SP462*, pp. 58-63 (Dec. 1976).

Key words: BaF_2; CaF_2; fused silica; interferometry; photoelasticity; piezo-optic constants; thermal coefficient of refractive index; thermal expansion coefficient; ZnSe.

Windows subjected to high average power laser radiation experience a rise in temperature due to residual absorption. The temperature distribution, which is nonuniform, will distort the wavefront of the beam. The distortion results both from changes of refractive index with temperature and from changes of refractive index with stress induced by the temperature gradients. We are presently measuring dn/dT and the photoelastic constants of laser window materials at 632.8 nm, 1.15 μm, 3.39 μm, and 10.6 μm. Two new experimental arrangements have been constructed. The first permits measuring dn/dT and thermal expansion from −180 °C to +200 °C. The second is a highly stable and sensitive interferometer for measuring photoelastic constants in the visible, the near infrared, and the near ultraviolet. Thermal expansion data are obtained on CVD ZnSe, CaF_2 and BaF_2

between −100 °C and +120 °C and fitted to a third degree polynomial in temperature. We obtain dn/dT for CVD ZnSe at 632.8 nm over the same temperature range. The piezo-optic constants of fused silica and CVD ZnSe obtained with the new interferometer at 632.8 nm are in excellent agreement with values obtained by other methods.

Refractive index and temperature coefficient of refractive index of hot-forged calcium fluoride, M. J. Dodge, *SP462*, pp. 64-68 (Dec. 1976).

Key words: calcium fluoride; refractive index; temperature coefficient of refractive index.

The refractive index of a sample of hot-forged CaF_2 was measured from 0.25 μm to 8.0 μm by means of the minimum-deviation method on a precision spectrometer. Data were obtained near 21 °C and 34 °C. Each data set was fitted to a three-term Sellmeier-type dispersion equation, which permits interpolation of refractive index as a function of wavelength within a few parts in 10^{-5}. Using the index values obtained at the two temperatures, the change in index with temperature, $\Delta n/\Delta T(°C)^{-1}$ was calculated. The refractive index and $\Delta n/\Delta T(°C)^{-1}$ values obtained for this specimen are compared with data previously published.

Fabrication and properties of laser window materials, R. M. Cannon, H. K. Bowen, A. M. Glaeser, H. J. Mayson, F. A. McClintock, W. M. Sherry, J. B. Vander Sande, and M. F. Yan, *SP462*, pp. 69-81 (Dec. 1976).

Key words: CaF_2; crack coalescence; flaw detection; flaw distribution; forging; grain boundary mobility; subgrains.

In hot forged CaF_2, as in forged alkali halides, fine subgrains develop and the subgrain size varies inversely with the forging stress. Dynamic recrystallization is more of a problem than for KCl or KBr; it results in very coarse grained regions in which the subgrains are poorly developed. In alkali halides aliovalent impurities exert a significant drag on grain boundaries causing large reductions in grain boundary migration rates and significant retardation of recrystallization and grain growth. Theoretical results for the boundary mobility and for the conditions under which a boundary may escape from the segregated impurity cloud are presented.

Theory of the macroscopic fracture behavior resulting from failure by coalescence of subcritical cracks shows the extent of detectable precracking and the effects of biaxial stresses, specimen size, and the distribution of microstrengths. The ultimate strengths do not fit an extreme value distribution even if the microscopic strengths do; this makes statistical design more difficult and may necessitate proof testing or inspection. Flaw strength distribution curves can be determined from acoustic emission measurements during microhardness testing. Crack openings as small as 0.1 μm have been nondestructively detected using scattered light. Better resolution is required for stronger materials for which crack openings as small as 0.01 μm must be detected.

Double-doped alkali halide laser windows, H. Posen, N. Klausutis, J. Bruce, J. A. Adamski, J. R. Weiner, and S. A. Kulin, *SP462*, pp. 82-86 (Dec. 1976).

Key words: double-doped KCl laser windows; grain boundary stability; hot forging; KCl; mechanical strength; microstructure; optical absorption; RbCl; $SrCl_2$.

We have observed grain boundary instability in alloys doped with 1.75 percent RbCl. Theoretical studies have indicated that doping with divalent ions can provide some strengthening, and at the same time provide grain boundary stability. In an attempt to provide both solid-solution strengthening and grain-boundary stability, we have studied a series of double-doped RAP-grown KCl crystals. The primary dopant is fixed at 1.75 mole percent RbCl, while the secondary dopant is varied from 10 ppm to 250 ppm $SrCl_2$. Polycrystalline discs were forged under constant strain rate. The strength, texture, 10.6 μm absorption, and grain-boundary stability were studied as a function of $SrCl_2$ dopant level. Our studies indicate that double doping with a divalent ion enhances grain-boundary stability without degrading other desirable window properties.

Intermediate temperature (0.5 to 0.7 T_{mp} K) forging of calcium fluoride crystals, R. H. Anderson, B. G. Koepke, and E. Bernal, *SP462*, pp. 87-94 (Dec. 1976).

Key words: annealing; fracture energy (γ_c); isostatic forging; kinking; microstructures; recrystallization temperature; veiling.

Crack free forgings have been successfully produced from CaF_2 crystals at temperatures as low as 0.5 T_{mp} (K) using an isostatic forging technique. Forging temperatures and isostatic pressures have ranged from 500° to 750 °C and to 2[illegible] MN/m² respectively. Most forging has been along ⟨111⟩ directions. The resulting microstructures varied from highly deformed structures with barely recognizable subgrains to structures with subgrain sizes of around 10 μm in crystals forged at higher temperatures. Annealing for long times at 720 °C resulted in recrystallization and a large grained polycrystalline structure. Internal cloudiness or "veiling" is observed in all ⟨111⟩ oriented forgings. The extent of the veiling decreases with increasing forging temperature. The fracture energies of several forgings are compared with the fracture energies of single crystals and large grained polycrystalline material.

Forging finished halide optical components, R. H. Anderson, E. Bernal, and R. J. Stokes, *SP462*, pp. 95-99 (Dec. 1976).

Key words: closed die; forging; isostatic; polishing; quartz; shaping.

The forging of completely finished halide optical components to eliminate the necessity of shaping and polishing is being evaluated. The forging operation is being done isostatically using a closed die technique. Quartz die faces are being used to produce the desired surface shape and finish. A synthetic oil is being used as the lubricant while the forging is performed at 275 °C.

To produce the finished component, two forging operations are being used. The first forging is necessary to produce uniform strain distribution. This pressing is then preshaped by water polishing before the final minor shaping operation.

These, as forged surfaces, appear superior to mechanically prepared surfaces for the deposition of the required protective and optical coating of thallium iodide.

Optical performance results obtained with these lenses will be compared with those obtained with conventional polished halide and glass lenses.

Vapor deposition and mechanical properties of CdTe, H. Tuller, K. Uematsu, J. B. Vander Sande, E. L. Hall, and H. K. Bowen, *SP462*, pp. 100-118 (Dec. 1976).

Key words: cadmium telluride; growth kinetics; mechanical properties; microstructure; stoichiometry; transmission electron microscopy; vapor deposition.

The vapor deposition of CdTe from elemental cadmium

and tellurium sources was studied as a function of the Cd/Te ratio, the supersaturation, and the substrate temperature. A multisubstrate arrangement was designed to enable simultaneous acquisition of growth data on six CdTe windows under conditions where substrate temperature and radial positioning remained the only variables. Polycrystalline blanks 4 $cm^2 \times 1$ mm thick were grown at rates of .02 – .10 mm/h with the growth rate exhibiting sensitivity to all of the above parameters. The affects of varying P_{Cd}/P_{Te_2} ratios during growth, as well as post growth annealing, on surface microstructure, grain size and void density, as observed under SEM and IR microscopy, will be presented.

Shear stress-shear strain results have been obtained from single crystal CdTe deformed in compression at 300 °C. The defect microstructures associated with this deformation schedule have been observed by transmission electron microscopy. The macroscopic mechanical behavior will be discussed in terms of the dislocation interactions observed for the various deformation states.

Absorbing tellurium inclusions in polycrystalline cadmium luride: Estimates for extrinsic damage thresholds, H. S. nnett and C. D. Cantrell, *SP462*, pp. 119-125 (Dec. 1976).

Key words: cadmium telluride; elastic compliance tensor; elastic moduli; extrinsic damage thresholds; high-power lasers; infrared materials; tensile stress.

Cubic cadmium telluride is a promising infrared material for highly transparent windows. However, one problem encountered in high-power laser systems is thermal extrinsic damage to the optical elements which arise from absorbing inclusions. Absorbing inclusions are impurities with physical and optical properties which differ substantially from those of the host material. Such inclusions may absorb an appreciable amount of the incident radiation and thereby may undergo thermal expansion. This produces major stresses within the host. In this paper, we give estimates of the maximum tensile stress as a function of inclusion size, laser pulse width, and laser power for polycrystalline Te spheres in polycrystalline CdTe. Our computations suggest that the heating of 0.1 μm to 10 μm aggregates of Te in CdTe when subjected to power densities of about 100 MW/cm^2 and pulse widths of about 200 ns may produce stresses comparable to or greater than the breaking strength of the CdTe host.

Hot-pressed $CdCr_2S_4$ for Faraday effect isolation at 10.6 μm: eliminary damage tests, S. D. Jacobs and K. J. Teegarden, *P462*, pp. 126-135 (Dec. 1976).

Key words: $CdCr_2S_4$; chalcogenide spinel; Faraday effect; ferromagnetic semiconductor; hot-pressed; infrared transmission; laser induced damage; optical isolation.

The ferromagnetic spinel, $CdCr_2S_4$ is considered an attractive candidate for future use in target back reflection isolation of high power infrared lasers for fusion investigations. Used with liquid nitrogen refrigerant in a Faraday rotator configuration, this material demonstrates isolation in excess of 30 dB and an insertion loss (due to material attenuation) of 30 percent in saturating magnetic fields of 3500 Oe. Minimal homogeneity requirements for dc magnetic field biasing and the scalability of the hot-pressing process make $CdCr_2S_4$ suitable for large aperture applications. Single crystal growth and hot-pressing procedures are currently being optimized to reduce extrinsic attenuation at 10.6 μm.

The threshold for laser induced damage in $CdCr_2S_4$ ($n_{10.6} = 2.84$) is of fundamental importance to the proposed application. Preliminary measurements have been made using a 50 ns, TEA CO_2 laser with a multimode output of 20 joules. The results indicate that this material has a damage threshold in excess of 2 J/cm^2.

Pulsed laser induced damage at the DF laser wavelength, M. Bass, K. M. Leung, C. Tang, and M. J. Soileau, *SP462*, pp. 136-144 (Dec. 1976).

Key words: alkali-halides; alkaline-earth fluorides; bulk damage; focal spot diameter; inclusion damage; interference ripples; pulsed DF laser damage; sapphire; scattering; waveform distortion.

A pulsed TE DF laser has been used to study the damage phenomenon in materials which are transparent to DF laser light (3.5 – 4.1 μm). We measured the bulk damage threshold in several alkaline-earth fluorides, alkali-halides, and sapphire. The peak on axis intensity which damaged CaF_2 and sapphire was 25 GW/cm^2. Surface damage occurred at intensities less than 1/10 that required for bulk damage. This was attributed to poor surface finish quality and points out the need for improvements in finishing optics for use with DF lasers.

Naval Weapons Center diamond turned optics facility, D. L. Decker and R. E. Cram, *SP462*, pp. 145-148 (Dec. 1976).

Key words: diamond single point turning; interferometric control; laser damage threshold; optical absorption; optical components; optical scattering.

The generation of optical surfaces by diamond single point turning or milling is of much current interest. This fabrication method can be cost effective and can readily produce very unconventional surfaces and components, allowing radically new system designs. In addition, this fabrication method can reliably produce optical components with superior characteristics including very low scatter, near intrinsic absorption and laser damage threshold. This paper will briefly describe the requirements and existing machines for diamond single point machining of high quality optics, and materials known to be amenable to this fabrication method. The characteristics of a new machine at NWC, which includes an air bearing spindle and carriage ways and closed loop interferometer control will also be discussed. The emphasis of the NWC effort is to explore selected areas of machine technology and to further explore the capabilities of diamond turned components.

10.6 μm pulsed laser damage studies of diamond turned KCl window surfaces, M. J. Soileau, J. M. Bennett, J. O. Porteus, W. Faith, J. Jernigan, and T. T. Saito, *SP462*, pp. 149-157 (Dec. 1976).

Key words: diamond turning; KCl laser windows; laser damage; 10.6 μm laser.

Laser damage measurements at 10.6 μm are presented for diamond turned surfaces of polycrystalline KCl. The two types of windows tested were hot-forged RbCl- and EuCl-doped KCl. Surface damage thresholds of the two materials range from 1.8 to 2.4 GW/cm^2. The optical properties of these specimens were measured after diamond turning and compared to chemically etched surfaces on the same specimens. RMS roughness, infrared scattering, and absorption at 10.6 μm were measured. The influence of the machining grooves on the character of the laser damage on the surface is discussed. The regularity of the surface defects produced by the diamond turning process offers a unique opportunity to study the effects of surface defects on the laser damage threshold of optical surfaces.

Surface, optical and laser damage characteristics of diamond-turned metal mirrors, D. L. Decker, M. J. Soileau, J. O. Porteus, and J. M. Bennett, *SP462*, pp. 158-164 (Dec. 1976).

Key words: Auger analysis; diamond-turned metal mirrors; laser damage; light scattering; optical absorption; surface roughness.

Diamond turning, in addition to its attractive manufacturing advantages, can produce superior optical components. Low scattered light, low absorption, and high damage threshold can be reliably realized with present technology. This paper intercompares the surface and optical characteristics of a large number of diamond-turned metal mirrors, including bare, electroplated, and sputtered substrates. Many diamond-turned specimens display near intrinsic pulsed laser damage threshold values, often accompanied by slip banding. This phenomenon has been previously observed only on atomically clean, well ordered single crystal surfaces of aluminum. In contrast, however, some electroplated specimens fail catastrophically by delamination. Regardless of sample type, most sites fail by melting initiated by localized absorbing centers.

Character of pulsed laser damage to Al at 10.6 μm inferred from single-crystal targets in vacuum, J. O. Porteus, M. J. Soileau, and C. W. Fountain, *SP462*, pp. 165-180 (Dec. 1976).

Key words: laser-induced stress; plastic deformation; single-crystal aluminum; slip bands; vaporization.

Pulsed laser-induced stress can produce permanent damage to metal surfaces, even in the absence of melting. Possible causes of such damage in Al are differential expansion resulting from thermal gradients and compression resulting from vaporization. By using single-crystal targets in which plastic deformation can be observed in the form of slip bands, one may obtain information on the direction, magnitude, and thus on the origin of stress. Targets having (111), (001), and (110) surface plane orientations were prepared and tested under oxide-free, ultrahigh vacuum conditions, using well-characterized 100 ns, 10.6 μm focused laser pulses. Vapor particle emission was monitored to provide an indication of vaporization pressure. At energy densities ≥ 37 J/cm^2 the results indicate the dominance of evaporative compression. At energy densities near and below the threshold for melting (14.2 J/cm^2) the interpretation of the observed slip banding is less clear, apparently due to the combined effects of thermal and evaporative stresses.

Laser-induced damage of mirror and window materials at 10.6 μm, R. Gibbs and R. M. Wood, *SP462*, pp. 181-188 (Dec. 1976).

Key words: dielectric coatings; infrared laser windows; laser heating of metal surfaces; laser mirrors; pulsed CO_2 laser damage; surface damage; 10.6 μm absorption; 10.6 μm optical components.

Pulsed laser-induced damage thresholds (CO_2 TEA laser, 60 ns FWHH) and 10.6 μm absorption measurements have been made on a wide variety of mirror and window materials. The effects due to different methods of substrate preparation and coating of metal mirrors have been studied, and as a result, mirrors of higher damage threshold have been manufactured. Front surface damage thresholds of uncoated windows have been measured and correlated with microscopically visible surface features. Improvement has been achieved by ion-beam etching of single-crystal materials. The damage threshold of dielectric coatings, both reflecting and antireflecting, has been found to be limited by microscopically visible coating defects.

Absorptance of dielectric enhanced mirrors at 5.3 μm, P. Kraatz, J. R. Buckmelter, and S. J. Holmes, *SP462*, pp. 189-194 (Dec. 1976).

Key words: absorptance; CO laser calorimetry; CO laser mirrors; dielectric-enhanced mirrors; infrared laser mirrors metal mirrors; reflectance.

The absorptance of a variety of dielectric-enhanced mirrors has been measured in the 5.3 μm region using CO laser calorimetry. The samples comprise nineteen designs fabricated from ten dielectric material combinations deposited on thirteen basic mirror types (i.e., four substrate materials with a total of six metallic coating combinations). Thirty-two samples were fabricated by six vendors without duplications of any complete mirror design among any two (or more) vendors.

Results are grouped according to dielectric material combinations and design. Effects of substrate material selection and metallic coatings (if any) are discussed. The precision (i.e., standard deviation) of all absorptance measurements is presented. Accuracy, relative to (1-R) obtained from standard reflectometer measurements, is evaluated for selected mirrors.

Optical properties of mirrors prepared by ultraclean dc sputter deposition, P. A. Temple, D. K. Burge, and J. M. Bennett, *SP462*, pp. 195-202 (Dec. 1976).

Key words: aluminum; copper; flash desorption spectroscopy; gold; reflectance; silver; sputter deposition.

Sputter deposition is a method for producing mirror surfaces. However, the sputtering gas is generally incorporated in the metal film. This investigation was undertaken to determine the amount of gas trapped and the effect this gas had on film optical properties. Thin film mirrors of aluminum, silver, copper, and gold were prepared by dc sputter deposition under ultraclean conditions using argon or xenon as the sputtering gas. The sputtering gas entrapment was measured by a flash desorption technique. Film reflectance was correlated with preparation conditions and gas entrapment. In general, the film reflectance was reduced by the presence of sputtering gas. The gas trapped was a function of the metal being sputtered, the sputtering gas type, and the sputtering gas pressure. For example, the gas content of silver films could be varied over nearly two orders of magnitude. In some cases, films with reflectances as high as the best UHV evaporated films were prepared.

Materials for high-power window and mirror coatings and multilayer-dielectric reflectors, M. Sparks, *SP462*, pp. 203-21 (Dec. 1976).

Key words: attenuated total reflection spectroscopy; dielectric coatings; infrared lasers; laser damage; thin films.

Antireflection coatings and reflectors having lower values of absorptance than are presently available are needed for high-power, and even some low-power, applications. Intrinsic values of absorptance of antireflection coatings, multilayer-dielectric reflectors, and metallic-reflection-enhancing coatings are orders of magnitude lower than current experimental values A_{exp}. A major factor limiting the values A_{exp} is that a given coating material usually has orders magnitude greater absorption when deposited as a film than when grown as a bulk crystal. The most likely source of the extra film absorptance A_f is contamination of the film. Numerous contaminants include water, HCO_3, ClO_3, NO_3, OH^-, and CN^-. Contamination can occur before or during deposition, upon exposure to the atmosphere (where absorption by porous films and surface adsorption are impo

tant), or during use or storage. At 10.6 μm only two molecular layers of water or a packing density of 99.95 percent are formally required to give $A_f = 10^{-4}$, which is a typical desired value. High-packing-density films should be vacuum vapor deposited using ultraclean deposition conditions including thorough baking of the entire system, high-purity single-crystal starting materials, special care in evaporation, state-of-the-art substrate preparation, and ultrahigh vacuum. Spectroscopic and calorimetric measurements of $A_f(\omega)$ on very thick films and on normal-thickness films, both deposited on attenuated-total-reflection plates, should be made. Material-selection guidelines, including a *bulk* absorption coefficient less than 0.5 cm^{-1} and a value of the index of refraction in the required range, are developed and used to select the following 10.6 μm candidate materials: ThF_4, NaF, BaF_2, SrF_2, NaCl, KCl, $KGaF_4$, As_2S_3, As_2Se_3, ZnS, ZnSe, and TlI. Distinguishing absorption on the coating surface from that in the bulk of the coatings by utilizing the nearly zero electric field on the surface of certain coatings is proposed. Inclusion damage is expected at ~ 1-10 J/cm² for nanosecond pulses or ~ 10 to several hundred J/cm² for microsecond pulses. Intrinsic damage is expected by heating at ~ 100 J/cm² for a 10 μs pulse and $A_f = 10^{-3}$, or by such nonlinear processes as electron-avalanche breakdown at ~ 10 J/cm² (i.e., I ≅ 10 GW per cm²) for a 10 ns pulse. Strongly absorbing 1-μm-radius inclusions spaced 175 μm apart in the coating give rise to absorptance $A_f \cong 10^{-4}$. Thermally induced stresses in a 2 mm-diameter detached film segment may be sufficient to cause additional detachment and a runaway process.

Alternate materials for infrared window coatings, A. D. Baer, T. M. Donovan, A. K. Green, and G. Turner, *SP462*, pp. 214-220 (Dec. 1976).

Key words: alkali halides; antireflectance coating; chalcogenide glasses; infrared optical properties; laser damage; optical absorption; optical scattering; thin-film coating.

The results from studies of a number of new materials (NaF, SrF_2 and As_2Se_3) to be used in antireflectance coatings for KCl and NaCl windows are reported. The preparation and measured properties of thin films of these materials are reported. The properties studied include absorption at 10.6 μm, scattering, structure, index of refraction, and damage threshold. NaF is a promising material in that it has a relatively low absorption and high damage threshold and can be used as a single-layer antireflectance coating on NaCl. The properties of NaF films are good enough that this material can be used as a component of 10.6 μm coatings. SrF_2 films are higher absorbing, but less easily damaged than BaF_2 films. As_2Se_3 films are more easily damaged than As_2S_3 films.

Design of three-layer antireflectance coatings, A. D. Baer, *SP462*, pp. 221-229 (Dec. 1976).

Key words: absorptance; antireflectance coating; bandwidth; coating design; multilayer coating.

Design constraints are less stringent for three-layer coatings than for two-layer coatings. Mathematical relationships which govern the design of three-layer antireflectance coatings are presented. These new relationships are analogous to those governing the design of two-layer coatings; however, a continuous range of solutions exists. Three-layer solutions are represented by closed curves in coating-thickness space, while two-layer solutions are represented by two discrete points. Armed with a knowledge of the performance of similar designs with similar materials, one can select the three-layer solution with lowest absorptance (within 10%). Three-layer coatings offer greater design flexibility than two-layer coatings not only because of the wider-range of solutions, but also because of a wider choice of viable materials. Three-layer antireflectance coatings can be formed entirely of low-index materials (BaF_2, NaF), or with the low index material next to the window (As_2S_3, NaF).

Characteristics of plasma polymerized ethane for laser window coating, T. A. Reis, H. Hiratsuka, A. T. Bell, and M. Shen, *SP462*, pp. 230-238 (Dec. 1976).

Key words: laser window coating; plasma polymerized.

Thin film coatings were produced by passing ethane through a radiofrequency glow discharge in a tubular plasma polymerization reactor. Infrared absorption characteristics of the plasma polymerized ethane (PPE) depends on the reactor conditions. Absorptions are large for C-H stretching (3.5 μm) and bending (7.0 μm) frequency regions. However, outside of these regions the absorptions are low. Under appropriate polymerization conditions, the absorption coefficient at 10.6 μm for PPE film on polished, finished KCl crystal is 4-7 cm^{-1}. The refractive index for PPE is 1.51 (at sodium D line), which is higher than that of KCl. Thus the use of multilayer coating for good antireflection is indicated. Moisture resistance was tested by exposing the coated crystals at room temperature and 84 percent relative humidity for 100 hours.

Epitaxy and optical scattering in TlI films, R. A. Skogman, *SP462*, pp. 239-245 (Dec. 1976).

Key words: biaxial birefringence; epitaxial microstructure; optical scattering.

Thallium iodide has been identified as a protective high index coating material for potassium chloride laser windows. TlI has a high refractive index and an optical absorption of less than 1 cm^{-1} at 10.6 μm. The protective quality of TlI lies in its insolubility and remarkable adhesion to potassium chloride. This adhesion is due, in part, to the epitaxial growth of TlI and KCl. TlI microstructures resulting from different epitaxial growth habits are responsible for the optical scattering observed in films grown on certain KCl orientations.

We have found that the alignment of the TlI b_0 axis parallel to the KCl ⟨110⟩ direction nearest the substrate surface determines the epitaxial growth habit. On the precise KCl (100) orientation, for example, *two* KCl ⟨110⟩ directions lie in the surface. This causes the TlI to nucleate in *two* orientations rotated 90° from one another. This unusual microstructure results in scattering by the diffraction of light passing from one biaxially birefringent orientation to another.

This model has been demonstrated for all KCl orientations and is well supported by x-ray data and polarized light microscopy. A practical solution to this problem has been found which routinely yields visibly clear TlI coatings.

Thin-film coating evaluation by attenuated total reflection, R. T. Holm and E. D. Palik, *SP462*, pp. 246-252 (Dec. 1976).

Key words: absorption; antireflection coatings; attenuated total reflection; laser windows; spectroscopic.

Attenuated total reflection (ATR) is a particularly attractive technique for the determination of absorption constants of thin-film coatings because a wide spectral range can be studied in a relatively simple way. Calculations of ATR spectra have been made for typical thin-film laser-window

coatings, e.g., ZnSe on BaF_2 and ThF_4 on ZnSe. With the aid of such calculations, it is possible to establish the optimum ATR trapezoid geometry, angle of incidence, and film thickness for particular film-substrate configurations to maximize the sensitivity of the experiment to the absorption constant. ATR has potential applications in thin-film characterization for large-window coatings, as examination of an ATR sample coated at the same time would enable rapid quantitative evaluation of resulting coatings.

ZnSe sputtered coatings, D. A. Walsh and J. A. Detrio, *SP462*, pp. 253-263 (Dec. 1976).

Key words: absorption damage levels; coatings; CVD; hot pressed; sputtered.

The sputter deposition of ZnSe for laser window coating preparation has been studied using substrates of ZnSe and KCl. Sputtering targets made from CVD ZnSe and commercially hot pressed material were also compared. Self films of ZnSe and ZnSe were studied for absorption versus thickness using films of $\lambda/4$, $3\lambda/4$, and $5\lambda/4$ at 10.6 μm. Calorimetric absorption measurements showed the HP target material produced coatings with 3 to 6 times greater absorption. Auger analysis indicated the presence of sulfur in the HP films, but none in films made with the CVD target. Both types of coatings appeared to be nonstoichiometric. Film and substrate inhomogeneity prevented reliable measurements of the film absorption coefficient. ZnSe on KCl coatings were investigated with Auger Spectroscopy in order to distinguish between target material effects and the influence of surface preparation methods. As-polished material showed Al and oxygen present at the interface which indicate a residue of polishing compound. The residue was readily removed by etching in concentrated HCl. Damage measurements were also made on the ZnSe coatings.

Laser damage studies of low index coating materials at 10.6 μm, M. J. Soileau, A. D. Baer, J. O. Porteus, J. L. Hernigan, W. N. Faith, T. M. Donovan, and A. K. Green, *SP462*, pp. 264-278 (Dec. 1976).

Key words: coatings; laser damage; laser windows; 10.6 μm lasers.

The 10.6 μm laser damage thresholds were measured for a variety of promising low index coating materials. Coatings deposited on KCl and NaCl windows were studied. Measurements on NaF, BaF_2, and SrF_2 indicate that all these materials have thresholds in excess of 1 GW/cm² when properly deposited. A comparison of the bulk and thin film threshold of these materials will be given. Our results indicate that NaF is an attractive alternative to ThF_4 since it has reasonably low absorption, a high damage threshold, and can be used as a single layer antireflection coating on NaCl. The primary mechanism of failure in the coatings tested was found to be coating delamination associated with defects on the substrate surfaces.

The use of rare earth fluorides as 10.6 μm antireflective coatings, A. Golubovic, J. Fitzgerald, I. Berman, J. Bruce, R. Bradbury, J. J. Comer, W. S. Ewing, and H. G. Lipson, *SP462*, pp. 27 -278 (Dec. 1976).

Key words: laser antireflective coatings; materials purification requirements; pulsed laser damage; rare earth fluorides; zinc selenide coatings.

The rare earth fluorides have been evaluated as possible antireflective laser window coatings at 10.6 μm. Emphasis was placed on SmF_3, EuF_3, and GdF_3 as a single layer coating for ZnSe and as the low index material in a 2-layer design with ZnSe on KCl substrates. The chemistry, structure and texture of the coatings were examined by several techniques including electron and optical microscopy, x-ray diffraction, Auger spectroscopy, and optical spectroscopy. Pulsed laser damage studies at 10.6 μm were performed to evaluate the relative merits of these coatings. As expected, the damage threshold for the single layer fluoride coatings as ZnSe were found to exceed the threshold of the 2-layer designs on KCl substrates.

Performance of $Ge_{0.45}Se_{0.55}/As_2S_3$ antireflection coatings at 3.8, 5.3, and 10.6 μm, J. F. Lewis and M. C. Ohmer, *SP462*, pp. 279-282 (Dec. 1976).

Key words: absorption; antireflection coatings; germanium selenide; infrared laser windows.

Transparent vitreous films of Ge_xSe_{1-x} have been grown by conventional evaporation techniques whose refractive index can be varied from 2.5 to 3.1 by varying x from .35 to .5. For x = .45 it is possible to construct a two-layer double-quarter wave AR coating where $Ge_{.45}Se_{.55}$ is the layer nearest the substrate and As_2S_3 is the outer layer. In a cooperative program, AR coatings of this type were synthesized at the Materials Research Laboratories, Victoria, Australia, and evaluated at the Air Force Material Laboratory. AR coatings were deposited on Eu^{++} doped KCl (10.6 μm), BaF_2 (5.3 μm), and CaF_2 (3.8 μm). The coatings were characterized with regard to absorption, transmission, and bandwidth. For the KCl sample, the cw CO_2 damage threshold was determined. The absorption per surface for all wavelengths was less than .1 percent. Absorption bands at the shorter wavelengths were not visible in the spectrophotometer data.

AR-coated KCl damage at 10.6 μm, J. A. Detrio, R. D. Petty, M. C. Ohmer, and O. F. Swenson, *SP462*, pp. 283-291 (Dec. 1976).

Key words: alkali halides; antireflection coatings; coatings; KCl; laser damage.

Antireflection coatings on KCl windows for high power CO_2 lasers have been studied using focused radiation to establish relative damage thresholds. Single layer coatings composed of TlI, multilayer designs employing TlI and either KCl or ThF_4 were capable of withstanding 9 second irradiation at an average power density of nearly 130 kW cm^{-2}. Two definitions of the onset of mechanical damage were used; physical degradation including thermally induced fracture, and the first appearance of permanent residual strain as observed in a plane polariscope. Nomarski microscopic observations were also utilized to search for subtle signs of damage. Data were taken to detect any "conditioning" effects due to below-threshold irradiation. Conditioning was found to be negligible in all coatings studied except possibly one. No special handling precautions were taken and therefore these values represent the inclusion of ordinary laboratory environmental degradation. Correlations between damage levels and factors such as absorption were investigated.

Spectral dependence of damage resistance of refractory oxide optical coatings, B. E. Newnam and D. H. Gill, *SP462*, pp. 292-300 (Dec. 1976).

Key words: damage thresholds; electron avalanche; picosecond pulses; refractory oxides; standing-wave field; thin films; two-photon absorption.

The laser damage thresholds of three refractory oxide

material coatings (TiO_2, ZrO_2, and HfO_2) and SiO_2 were measured at three wavelengths (355, 532, and 1064 nm). For each wavelength, quarter-wave thick films were deposited on fused silica substrates by three manufacturers using electron-gun evaporation. Samples were irradiated with the primary, doubled and tripled frequency of a mode-locked Nd:YAG laser with pulse duration 20-30 ps. An increase of the threshold electric field from 1064 to 532 nm was measured, which was consistent with that predicted for electron-avalanche breakdown. Reduced thresholds at 355 nm indicated dominance of two-photon absorption.

The role of electric field strength in laser damage of dielectric ultilayers, J. H. Apfel, J. S. Matteucci, B. E. Newnam, and). H. Gill, *SP462*, pp. 301-309 (Dec. 1976).

Key words: dielectric films; electric fields; laser damage; optical coatings; standing-waves.

The intensity of the local electric field within a multilayer illuminated by a laser beam is determined by the vector addition of forward and reverse flowing waves as a result of interference. The profile of the electric field intensity will therefore depend upon the multilayer design and can have a peak value which is more or less than the peak field of the incident beam. We have examined four multilayer designs, each composed of approximately equal numbers of high and low index films arranged so that the electric field profiles are significantly different. Laser damage thresholds for these coatings were compared with calculated electric field strength profiles.

For electron-gun evaporated titania/silica coatings damaged by 30 picosecond pulses of 1.064 μm radiation the damage threshold is dictated by electric field intensity in the titania layers.

Preparation techniques and hydroxyl concentration vs. surface damage threshold, R. A. House, J. R. Bettis, and A. H. Guenther, *SP462*, pp. 310-314 (Dec. 1976).

Key words: damage threshold; etching; flame polishing; fused silica; hydroxyl; ion polishing; polishing; roughness; surface damage; thin films; threshold.

A previous study on pulsed laser-induced damage on fused silica and other optical materials indicated that the damage threshold E (in V/cm) depended upon the RMS surface roughness σ (in A) as follows: $E\sqrt{\sigma} \sim$ const. Application of this relationship to previously measured thresholds affords a measure of the efficacies of various surface preparation techniques in improving surface damage thresholds, allowing a quantitative comparison. We have, in addition, observed an apparent correlation between thin film damage threshold and hydroxyl concentration in fused silica substrates. Depending on the particular film materials, the results imply that hydroxyl ions on the surface of silica substrates can be either beneficial or deleterious.

Laser induced damage to thin films immersed in liquids, A. Balbin-Villaverde and L. G. DeShazer, *SP462*, pp. 315-330 Dec. 1976).

Key words: high power ruby laser damage; multilayer reflectors; single layer coatings; spark detection; thin films immersed in liquids.

A high power ruby laser system, operating in a single longitudinal and transverse mode was used to measure the damage threshold of a series of quarter-wave and half-wave single coatings, as well as for multilayer reflectors and antireflection "vee" coatings, immersed in different liquids: water, carbon disulfide, nitrobenzene, ethanol, methanol, acetone, and diiodomethane. Coatings of TiO_2, MgF_2, SiO_2, ZrO_2, and ZnS on substrates of glass were studied. Liquids were chosen covering a wide range of their physical properties. A correlation is intended between the damage threshold of the coatings and liquid properties. It is found that the damage threshold for all the films increases steadily with the low frequency dielectric constant of the liquids. For multilayer reflectors is also observed a clear dependence of the damage threshold on the liquid index of refraction, through the modification of the electric field inside the films.

Dielectric coatings on metal substrates, S. S. Glaros, P. Baker, and D. Milam, *SP462*, pp. 331-337 (Dec. 1976).

Key words: laser damage; laser fusion; metal mirrors; reflecting optics.

Large aperture, beryllium substrate based mirrors have been used to focus high intensity pulsed laser beams. Finished surfaces have high reflectivity, low wavefront distortion and high laser damage thresholds. This paper describes the development of a series of metallic coatings, surface finishing techniques and dielectric overcoatings to meet specified performance requirements. Beryllium substrates were coated with copper, diamond machined to within 5 microinches to final contour, nickel plated and abrasively figured to final contour. Bond strengths for several bonding processes will be presented. Dielectric overcoatings were deposited on finished multimetallic substrates to increase both reflectivity and the damage thresholds. Coatings were deposited using both high and low temperature processes which induce varying stresses in the finished coating substrate system. Data will be presented to show the evolution of wavefront distortion, reflectivity, and damage thresholds throughout the many steps involved in fabrication.

Spot size and pulse duration dependence of laser-induced damage, J. R. Bettis, R. A. House, and A. H. Guenther, *SP462*, pp. 338-345 (Dec. 1976).

Key words: frequency dependence; laser damage; spot size dependence; time dependence.

The threshold electric field for laser-induced damage in transparent dielectrics is shown to follow an inverse relation with the fourth root of the pulse duration. Preliminary analytical studies suggest the process involves the free-free plasma heating rate. The relationship is demonstrated for pulse durations ranging from a few picoseconds to several tens of nanoseconds. Furthermore, from considerations of total energy deposition, it is proposed that the threshold electric field follows an inverse relation with the square root of the damaging spot size. The results are compared to measured values with acceptable agreement.

Re-examination of laser induced breakdown in the alkali halides at 10.6 μm, C. C. Tang, K. M. Leung, and M. Bass, *SP462*, pp. 346-349 (Dec. 1976).

Key words: alkali halide crystals; laser induced damage; RAP grown materials.

Since the 10.6 μm bulk laser damage thresholds of alkali halides have been shown to depend on the experimental procedures used, we have remeasured the damage flux for these materials. Multiple shot per site thresholds were found to be higher than single shot per site thresholds for samples containing a large density of defects. By irradiating with two different spot sizes and observing an increase in damage threshold with decreasing spot size, a correlation between

damage thresholds and the distribution of defects was determined. The single shot per site bulk breakdown electric field for NaCl using a 59 μm spot diameter was 1.8 MV/cm. Measurements made on conventional and RAP grown samples showed that both types of material preparation techniques are not yet able to produce samples with reproducible damage thresholds. Some, but not all, RAP grown samples are harder to damage than conventionally prepared materials.

Can a model which describes gas breakdown also describe laser damage to the bulk and surfaces of solid dielectrics, D. Milam, *SP462*, pp. 350-356 (Dec. 1976).

Key words: absorption; avalanche ionization; damage morphology; damage statistics; distribution of damage times; photoionization.

By assuming that laser-induced breakdown in highly transparent solids is a three-step process consisting of preionization, ionization growth, and absorption, it is possible to explain "explosive" threshold damage, typical surface damage morphology, the presence or absence of damage statistics, and the distribution of breakdown times. Special constraints on the preionization stage necessary to explain these phenomena are discussed.

Laser damage to semiconductor materials from 10.6 μm CW CO_2 laser radiation, S. K. Gulati and W. W. Grannemann, *SP462*, pp. 357-364 (Dec. 1976).

Key words: carrier mobility; damping rates; laser damage of semiconductors; parametric plasma instability; photon induced excitation.

Damage thresholds for Si, Ge, GaAs, GaAsP, and GaP have been found experimentally. All the damage thresholds are of the order of KW/cm^2 for an irradiation time of 0.15 to 0.18 second. The damaged devices of Si and Ge show 30 to 50 percent decreases in carrier mobility at lower tempera tures, thereby showing lattice damage. It is found that th experimental damage thresholds, surface and lattice damag can all be explained by applying the theory of parametric in stability of the type formulated by DuBois and Goldman The same theory is also applied to explain CW CO_2 damag thresholds for KCl windows as experimentally observed b Loomis and Huguly.

Phototransport damage of optical materials, S. M. Wong an D. L. Olson, *SP462*, pp. 365-370 (Dec. 1976).

Key words: absorption; electrotransport; ionic segregation laser; momentum transfer; phototransport; scattering vacancies.

Described as well-established electrotranspo phenomena which may serve as analogies for studies c laser-induced damage in optical materials throug phototransport. Phototransport or photomigration relates t the segregation of ionic species or in vacancies in the optic materials caused by a competitive momentum transfer fro the scattered photons to the specific ionic species of the o tical material. Such microstructural changes in the materi are expected to cause severe increases in localized absor tion and enhance laser-induced damage.

Resonant defect enhancement of the laser electric field, P. A Temple and M. J. Soileau, *SP462*, pp. 371-378 (Dec. 1976).

Key words: damage theory; laser damage; 10.6 μm laser.

This paper describes a physical model for laser damage i duced by surface defects. The model predicts that: (a) polarizable defect will give rise to an electric field which c interfere with the laser field, (b) the interference pattern w be fixed in space along the direction of the laser bea polarization and with a spacing equal to the wavelength the laser beam in the material, and (c) there is a strong defe size effect causing a significant increase in the field streng when the defect size is an odd number of half wavelengt Experimental evidence supporting this model is presente

3.10. APPLIED MATHEMATICS SERIES

Mathematical tables, manuals, and studies of special interest to physicists, engineers, chemists, biologists, mathematicians, computer programmers, and others engaged in scientific and technical work.

MS59. **Tables relating to Mathieu functions, Characteristic values, coefficients, and joining factors,** NBS Appl. Math. Series 59 (Aug. 1, 1967).

Key words: Characteristic values; coefficients; joining factors; Mathieu's equation.

This second edition of "Tables Relating to Mathieu unctions" (Columbia University Press, New York, 1951) corporates the article "Table of Characteristic Values of athieu's Equation for Large Values of the Parameter" by ertrude Blanch and Ida Rhodes, Journal of the Washington cademy of Sciences, Volume 45, No. 6, 166-196, June 1955, t makes no essential changes in tables or introductory aterial. However, a number of misprints in the first edition ve been corrected and the bibliography updated. (A reissue, th additions, of Columbia University Press 13).

MS60. **Matrix representations of groups,** M. Newman, Nat. Bur. Stand. (U.S.), Appl. Math. Series 60, 82 pages (July 1968).

Key words: Algebraic numbers; groups; matrices; representations.

The theory of group representations is presented from the atrix standpoint. Many special representations are worked out detail, and there are appendices on the elements of the theory f algebraic numbers.

MS61. **Lectures on modular forms,** J. Lehner, Nat. Bur. Stand. (U.S.), Appl. Math. Series 61, 77 pages (Dec. 1969).

Key words: Automorphism; finite field; genus; Hecke operator; Klein's invariant; linear transformation; modular form; Riemann surface.

This book is an expository account of the theory of modular rms and its application to number theory and analysis. The first apter defines modular forms and develops their most impor- nt properties. The second and third chapters introduce the ecke modular forms. A Hecke form f is a simultaneous eigen- nction of a family of linear operators T_p, where p runs over the ositive primes. The eigenvalue corresponding to T_p is the pth ourier coefficient a(p) of f. The Fourier coefficients of f are ultiplicative, i.e., a(mn) = a(m) a(n) when m and n have no com- on divisors. The intimate connection of these results to the eory of certain zeta-functions is indicated in a note to Chapter . The fourth chapter is devoted to the automorphisms of a com- act Riemann surface. It is shown what groups of linear-frac- onal transformations with coefficients in a finite field can be the roup of automorphisms of a compact Riemann surface. In the ast two chapters congruences and other arithmetic properties re developed for the Fourier coefficients of Klein's absolute odular invariant. Analogies with the Hecke theory as well as ith the Ramanujan congruences for the partition function are iscussed.

AMS62. **Cyclic designs,** J. A. John, F. W. Wolock, H. A. David, J. M. Cameron, and J. A. Speckman, Nat. Bur. Stand. (U.S.), Appl. Math. Ser. 62, 79 pages (Apr. 1972).

Key words: Analysis of variance; cyclic designs; design of experiments; designs for calibration; incomplete block designs.

Cyclic designs are incomplete block designs based on cyclic development of an initial block or blocks. Their flexibility, ease in conduct of the experiment and natural grouping for elimination of heterogeneity make them worthy of attention in their own right even though their analysis does not possess the ease of computation of the more common completely balanced or partially balanced incomplete block designs with two associate classes. Methods for construction and analysis of the designs are given along with a numerical example. Applications of the designs are discussed and an appendix on their use in calibration is given.

AMS63. **Tables of two-associate-class partially balanced designs,** W. H. Clatworthy, J. M. Cameron, and J. A. Speckman, Nat. Bur. Stand. (U.S.), Appl. Math. Ser. 63, 327 pages (May 1973) $3.45, SD Catalog No. C13.32:63.

Key words: Analysis of PBIB designs; experiment designs; finite fields; finite geometries; finite projective planes; incidence matrices; incomplete block designs, partially balanced; mathematics; partially balanced incomplete block designs; PBIB designs; statistics; tables of PBIB designs.

This book is a revised and vastly expanded version of the monograph of R. C. Bose, W. H. Clatworthy, and S. S. Shrikhande, *Tables of Partially Balanced Designs with Two Associate Classes,* Tech. Bull. No. 107 of the North Carolina Agricultural Experiment Station, Raleigh, N.C., 1954.

Approximately 950 combinatorially distinct designs are given, which represents a doubling of the number of parametric specifications for designs of the original publication. The introduction includes special instructions to aid analysis using hand calculations and a section on the general least squares approach for use when the analysis is to be done on an electronic computer.

For those interested in the construction of the designs, information is provided on methods of construction and extensive references, including original sources for the designs, are given. A tabulation of known information about uniqueness, resolvability, and the nature of the corresponding dual and complementary designs is also included for each design.

3.11. NATIONAL STANDARD REFERENCE DATA SERIES

Provides quantitative data on the physical and chemical properties of materials, compiled from the world's literature and critically evaluated. Developed under a worldwide program coordinated by NBS. Program under the authority of National Standard Data Act (Public Law 90-396).

NSRDS-NBS3, Section 2. **Selected tables of atomic spectra; atomic energy levels and multiplet tables; Si I**, C. E. Moore, NBS Natl. Std. Ref. Data Series 3, Section 2 (Nov. 30, 1967).

Key words: Atomic energy levels; atomic spectra Si I; first spectrum; multiplet table; silicon; spectrum, Si I; wavelengths, Si I.

The present publication is the second Section of a series being prepared in response to the increasing demand for a current revision of two sets of tables containing data on atomic spectra as derived from analyses of optical spectra.

Both the atomic energy levels and the multiplet table are included in the same publication, as parts A and B, respectively. The Sections are being prepared at irregular intervals for these spectra whose analyses are essentially complete. A flexible paging system permits the arrangement of the various Sections by atomic number regardless of the order in which the spectra are published in this series. Section 1 included three spectra of silicon, Z=14: Si II, Si III, Si IV. The present Section contains similar data for Si I. The form of presentation is described in detail in the text to Section 1, and need not be repeated here.

NSRDS-NBS3, Section 3. **Selected tables of atomic spectra. A. Atomic energy levels-second edition, B. Multiplet tables, NIV, CIII, CIV, CV, CVI, data derived from the analyses of optical spectra,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 3, Sec. 3, 71 pages (Nov. 1970).

Key words: Atomic energy levels, carbon spectra; atomic spectra of carbon; carbon spectra; multiplet tables, carbon spectra; spectra, carbon; wavelengths, carbon spectra.

The present publication is the third Section of a series being prepared in response to the persistent need for a current revision of two sets of tables containing data on atomic spectra as derived from analyses of optical spectra. As in the first two Sections, Part A contains the atomic energy levels and Part B the multiplet tables: All six spectra of carbon, CI through CVI are included. The form of presentation is described in detail in the text to Section 1, and need not be repeated here.

NSRDS-NBS3, Section 4. **Selected tables of atomic spectra. A. Atomic energy levels-second edition, B. Multiplet tables, NIV, NV, NVI, NVII, data derived from the analyses of optical spectra,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 3, Sec. 4, 46 pages (Aug. 1971).

Key words: Atomic energy levels, NIV-NVII; multiplet tables, NIV-NVII; nitrogen spectra, NIV-NVII; spectra, NIV-NVII; wavelengths, nitrogen spectra NIV-NVII.

The present publication is the fourth Section of a series being prepared in response to the persistent need for a current revision of two sets of tables containing data on atomic spectra as derived from analyses of optical spectra. As in the previous Sections, Part A contains the atomic energy levels and Part B the multiplet tables. Four spectra of nitrogen, NIV, NV, NVI and NVII, are included. The form of presentation is described in detail in the test to Section 1.

NSRDS-NBS3, Section 5. **Selected tables of atomic spectra. A: Atomic energy levels—Second edition. B: Multiplet tables. N I, N II, N III,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 3, Sec. 5, 67 pages (May 1975) SD Catalog No. 13.48:3/Sec.5.

Key words: atomic energy levels, N I, N II, N III; multiplet tables, N I, N II, N III; nitrogen spectra, N I, N II, N III; spectra, N I, N II, N III; wavelengths, nitrogen spectra N I, N II, N III.

The present publication is the fifth Section of a series being prepared in response to the persistent need for a current revision of two sets of tables containing data on atomic spectra as derived from analyses of optical spectra. As in the previous sections, Part A contains the atomic energy levels and Part B the multiplet tables. The first three spectra of nitrogen, N I, N II and N III are included. The form of presentation is described in detail in the text of Section 1.

NSRDS-NBS3. Section 6. **Selected tables of atomic spectra: A Atomic energy levels—second edition; B. Multiplet tables, HI D, T (Data derived from the analyses of optical spectra),** C. E Moore and E. O. Hulburt, Nat. Stand. Ref. Data Ser., Nat Bur. Stand. (U.S.), 3, Sec. 6, 36 pages (Sept. 1972).

Key words: Atomic energy levels, HI, D, T; hydroge spectra, HI, D, T; multiplet tables, HI, D, T; spectra HI, D T; wavelengths, hydrogen spectra HI, D, T.

The present publication is the sixth Section of a series bein prepared in response to the persistent need for a current revisio of two sets of tables containing data on atomic spectra as derive from analyses of optical spectra. As in the previous section Part A contains the atomic energy levels and Part B the multiple tables. The spectra of hydrogen and of the isotopes deuteriun and tritium are included. The form of presentation is describe in detail in the text to Section 1.

NSRDS-NBS3, Section 7. **Selected tables of atomic spectra. A Atomic energy levels—Second edition. B: Multiplet tables. O** C. E. Moore, *Nat. Stand. Ref. Data Ser., Nat. Bur. Stand (U.S.), 3, Sec. 7,* 30 pages (Apr. 1976) SD Catalog No C13.48:3/Sec. 7.

Key words: atomic energy levels, O I; atomic spectra, O multiplet table, O I; oxygen, first spectrum; spectrum O wavelengths, O I.

The present publication is the seventh Section of a series bein prepared in response to the need for a current revision of tw sets of the author's tables containing data on atomic spectra a derived from analyses of optical spectra. As in the previous Se tions, Part A contains the atomic energy levels and Part B th multiplet tables. Section 7 presents this material for the fir spectrum of oxygen, O I. The form of presentation is describe in detail in the text to Section 1.

NSRDS-NBS5. **The band spectrum of carbon monoxide,** P. Krupenie, NBS Natl. Std. Ref. Data Series 5 (July 8, 1966).

Key words: Carbon monoxide; spectrum; review.

This is an exhaustive review of the literature and a critic compilation of the observed and predicted spectroscopic data CO, CO^+, and CO^{2+} in the gas phase.

NSRDS-6, Superseded by National Standard Reference Data Series 39.

NSRDS-NBS7. **High temperature properties and decomposition of inorganic salts. Part I. Sulfates,** K. H. Stern and E. L. Weise, NBS Natl. Std. Ref. Data Series 7 (Oct. 1, 1966).

Key words: Sulfates; thermodynamic functions; decomposition pressures.

The literature dealing with the high-temperature behavior of organic sulfates has been critically reviewed. Free energy nctions of reactants and products of the decomposition actions were calculated and have been tabulated from 298 °K o to as high a temperature as possible. Free energy functions, quilibrium constants of reactions, and partial pressures of aseous components were tabulated. Auxiliary data on phase ansitions, densities, and kinetics of chemical decomposition ave also been included.

NSRDS-NBS8. **Thermal conductivity of selected materials,** R. W. Powell, C. Y. Ho, and P. E. Liley, NBS Natl. Std. Ref. Data Series 8 (Nov. 25, 1966).

Key words: Gases; liquids; metals; solids; thermal conductivity.

The data presented in this publication consists of the critical valuation and analysis of the available thermal conductivity ta on eleven metals and nine nonmetals for the solid state, on ven fluids for both the liquid and gaseous states and on two for e liquid state only. The materials studied were selected imarily for their potential applicability as reference standards because of their technical importance. The temperature range r which values are given often exceeds that for which these lues are known with a high degree of certainty.

NSRDS-NBS9. **Tables of bimolecular gas reactions,** A. F. Trotman-Dickenson and G. S. Milne, NBS Natl. Std. Ref. Data Series 9 (Oct. 27, 1967).

Key words: Activation energies; Arrhenius equation; bimolecular: chemical kinetics; data; gas; rate constants; reactions; tables.

This survey covers the kinetics of bimolecular and rmolecular gas reactions that do not involve atoms or olecules in electronically excited states. Bimolecular reactions e here defined as reactions in which two molecules are volved as reactants, that yield two or more molecules as oducts. Those reactions in which two molecules combine to rm one molecule are most usefully considered as the reverse of nimolecular reactions which will be dealt with in another rvey. Reactions of oxygen and nitrogen atoms have been mitted as they will also form the subject of another survey.

The literature from 1954 to December 31, 1965 has been khaustively searched and it is hoped that for this period nothing as been omitted that should have been included.

The survey of earlier work has been based on one of the riters' books on "Gas Kinetics" which covered the literature to 954. Use of the book for over ten years has revealed few missions and these have been included in these tables. Data for e period January to August 1966 has been included where ossible.

NSRDS-NBS10. **Selected values of electric dipole moments for molecules in the gas phase,** R. D. Nelson, Jr., D. R. Lide, Jr., and A. A. Maryott, NBS Natl. Std. Ref. Data Series 10 (Sept. 1, 1967).

Key words: Dielectric constant; electric dipole moments; gas phase; microwave; microwave absorption; molecular beam; permittivity; refractive index; spectroscopy.

This table revises, brings up to date, and extends the coverage on numerical values for dipole moments which was included in NBS Circular 537, Tables of Dielectric Constants and Electric Dipole Moments of Substances in the Gaseous State, prepared by Maryott and Buckley in 1953. A recommended value with an estimate of accuracy is presented for more than five hundred organic and inorganic compounds. Extensive comments are given on the definition of dipole moment and principal methods of dipole moment measurement, as well as an exposition of the criteria employed in selecting the tabulated data. (Supersedes the data on dipole moments included in NBS Circ. 537).

NSRDS-11, Superseded by National Standard Reference Data Series 39.

NSRDS-NBS12. **Tables for the rigid asymmetric rotor: transformation coefficients from symmetric to asymmetric bases and expectation values of P_z^2, P_z^4, and P_z^6,** R. H. Schwendeman, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 12, 102 pages (June 1968).

Key words: Angular momentum; asymmetric rotor; eigenfunction; microwave spectra; rotational spectrum; transformation coefficients.

Tables of computed quantities associated with the rigid asymmetric rotor are presented. The first group of tables gives transformation coefficients from symmetric to asymmetric rotor bases. These coefficients permit the eigenfunctions of the asymmetric rotor to be written in terms of symmetric-rotor eigenfunctions. In Part II the angular-momentum expectation values (P_z^2), (P_z^4), and P_z^6 are tabulated. In both sets of tables values are given at intervals of 0.1 in the asymmetry parameter κ and for $J \leqq 15$. The tabulated quantities find use in the analysis of microwave rotational spectra and the rotational fine structure in vibrational and electronic band spectra.

NSRDS-NBS13. **Hydrogenation of ethylene on metallic catalysts,** J. Horiuti and K. Miyahara, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 13, 66 pages (June 1968).

Key words: Critical data; ethylene; hydrogenation; metallic catalysts; reaction mechanisms; reaction rates.

Reaction rate data for the catalyzed hydrogenation of ethylene, primarily in the presence of unsupported metallic catalysts, are critically reviewed. Reaction mechanisms are discussed in detail, and a statistical mechanical treatment of the reaction is given, according to the generalized theory of reaction starting from the well-known procedure of Glasstone, Laidler, and Eyring. Data for single-element catalysts and alloys are included and interpreted, as are data illustrating differences due to the physical form of the catalyst (film, foil, wire, powder, and some supported systems). Problems are discussed concerning reproducibility of experimental results over repeated runs, and as a function of catalyst pretreatment. The data is analyzed in 29 graphs and 29 tables, some of which are very extensive. The bibliography includes 141 references.

NSRDS-NBS14. **X-ray wavelengths and X-ray atomic energy levels,** NBS Natl. Std. Ref. Data Series 14 (Sept. 25, 1967).

Key words: Absorption; atomic; data compilation; emission; energy levels; x-ray wavelength.

X-ray wavelengths, J. A. Bearden:

Inconsistencies in accepted values (in x units) of x-ray reference lines have recently been demonstrated, although all are supposedly based on "good" calcite crystals. Factors supporting the selection of the W $K\alpha_1$ line as *the X-Ray Wavelength*

Standard are critically discussed. A review is given of the experimental measurements which are used to establish the wavelength of this line on an absolute angstrom basis. Its value is λ W $K\alpha_1$=(0.2090100±5 ppm) Å. This may be used to define a new unit, denoted by Å*, such that the W $K\alpha_1$ wavelength is exactly 0.2090100 Å*; hence 1Å=1Å±5ppm. The wavelengths of the Ag $K\alpha_1$, Mo $K\alpha_1$, Cu $K\alpha_1$, and the Cr $K\alpha_2$ have been established as secondary standards with probable error of approximately one part per million. Sixty-one additional x-ray lines have been used as reference values in a comprehensive review and reevaluation of more than 2700 emission and absorption wavelengths. The recommended wavelength values are listed in Å* units together with probable errors; corresponding energies are given in keV. A second table lists the wavelengths in numerical order, and likewise includes their energies in keV.

Reevaluation of X-ray atomic energy levels, J. A. Bearden and A. F. Burr:

All of the x-ray emission wavelengths have recently been reevaluated and placed on a consistent Å* scale. For most elements these data give a highly overdetermined set of equations for energy level differences, which have been solved by least-squares adjustment for each case. This procedure makes "best" use of all x-ray wavelength data, and also permits calculation of the probable error for each energy difference. Photoelectron measurements of absolute energy levels are more precise than x-ray absorption edge data. These have been used to establish the absolute scale for eighty-one elements and, in many cases, to provide additional energy level difference data. The x-ray absorption wavelengths were used for eight elements and ionization measurements for two; the remaining five were interpolated by a Moseley diagram involving the output values of energy levels from adjacent elements. Probable errors are listed on an absolute energy basis. In the original source of the present data, a table of energy levels in Rydberg units is given. Difference tables in volts, Rydbergs, and milli-Å* wavelength units, with the respective probable errors, are also included there.

NSRDS-NBS15. **Molten salts: Volume 1. Electrical conductance, density, and viscosity data,** G. J. Janz, F. W. Dampier, G. R. Lakshminarayanan, P. K. Lorenz, and R. P. T. Tomkins, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 15, 145 pages (Oct. 1968).

Key words: Data compilation; density; electrical conductance; molten salts; standard reference data; viscosity.

Data on the electrical conductance, density and viscosity of single-salt melts were compiled from a comprehensive search of the literature up to December 1966 and a critical assessment made of the compiled data. Recommended values were determined and are presented as functions of temperature in the form of equations and tables.

The results for some 174 compounds as single-salt melts are reported; no attempt was made in the present effort to embrace the results for molten salt mixtures. Data are presented for fluorides, chlorides, bromides, iodides, carbonates, nitrites, nitrates, oxides, sulfides, sulfates, and a miscellaneous group.

NSRDS-NBS16, Part 2. **Thermal conductivity of selected materials,** C. Y. Ho, R. W. Powell, and P. E. Liley, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 16, Part 2, 154 pages (Feb 1968).

Key words: Critical evaluation; gases; graphites; metalli elements; metals; recommended values; standard referenc data; thermal conductivity.

The work presented in this report comprises the critic evaluation, analysis, and synthesis of the available thermal co ductivity data and the generation of recommended values f twelve metallic elements, mainly for the solid state, for a range graphites, and for three fluids in the gaseous state. These are ca mium, chromium, lead, magnesium, molybdenum, nickel, niob um, tantalum, tin, titanium, zinc, zirconium, Acheson graphit ATJ graphite, pyrolytic graphite, 875S graphite, 890S graphit acetone, ammonia, and methane. For each of the materia recommended values are given over a wide range of temperatur

NSRDS-17, Superseded by National Standard Reference Data Series 39

NSRDS-NBS18. **Critical analysis of the heat-capacity data of th literature and evaluation of thermodynamic properties c copper, silver, and gold from 0 to 300 °K,** G. T. Furukawa, W G. Shaba, and M. L. Reilly, Nat. Stand. Ref. Data Ser., Na Bur. Stand. (U.S.), 18, 53 pages (Apr. 1968).

Key words: Calorimetry; copper; Debye theta (θ); ele tronic coefficient of heat capacity; enthalpy; entropy; Gibl energy; gold; heat capacity; silver; temperature scales; the modynamic properties.

The literature sources of heat-capacity data on copper, silve and gold between 0 and 300 °K have been compiled and the da critically analyzed. Tables of heat capacity (C_p), enthalpy (H $H_0°$), entropy ($S°$), Gibbs energy ($G-H_0°$), enthalpy function ($-H_0°)/(T)$, and Gibbs energy function $(G-H_0°)/(T)$ have be obtained from the analyses. The literature values of the he capacity, the electronic coefficient of heat capacity (γ), and t 0 °K limiting Debye characteristic temperature ($\theta_D(0)$) are co pared with the selected values. The sources of the data are tab lated chronologically along with the temperature range of me surements, purity of sample, and the pertinent experimen procedures used. A bibliography of the references is listed. brief appraisal of low-temperature calorimetry is given.

NSRDS-NBS19. **Thermodynamic properties of ammonia as ideal gas,** L. Haar, Nat. Stand. Ref. Data Ser., Nat. Bur. Stan (U.S.), 19, 13 pages (Aug. 1968).

Key words: Ammonia; ideal gas; thermodynamic functio

Thermodynamic functions for ammonia as an ideal gas at o atmosphere pressure have been evaluated. The contribution the highly anharmonic out-of-plane vibrational mode, includi its large coupling with rotation and its coupling with the oth vibrational modes, is considered in detail. Tables of $C_P°/R$, ($-E_0°)/RT$, $(E_0°-G°)/RT$, and $S°/R$ have been calculated closely spaced intervals from 50 to 5000 °K within an overall u certainty of less than 0.1 percent at 1000 °K. (Reprinted from t Journal of Research of the NBS—A. Physics and Chemist Vol. 72A, No. 2, March-April 1968).

NSRDS-NBS20. **Gas phase reaction kinetics of neutral oxyg species,** H. S. Johnston, Nat. Stand. Ref. Data Ser., Nat. B Stand. (U.S.), 20, 54 pages (Sept. 1968).

Key words: Chemical kinetics; dissociation; isoto exchange; oxygen atom; oxygen molecule; ozone; reco bination; review.

The available data for reactions among neutral oxygen species, ygen atoms, oxygen molecules and ozone, have been viewed. Selected data have been reanalyzed and used to tablish values for the rates of these reactions:

$$O_2 + M \rightarrow O + O + M \quad -\ (M = O_2, Ar)$$

$$O + O + M \rightarrow O_2 + M \quad -\ (M = O_2)$$

$$O_3 + M \rightarrow O + O_2 + M \quad -\ (M = O_2, O_3, He, Ar, N_2, CO_2)$$

$$O + O_2 + M \rightarrow O_3 + M \quad -\ (M = O_2, O_3, He, Ar, N_2, CO_2)$$

$$O + O_3 \rightarrow O_2 + O_2$$

$$O + O_2 \rightarrow O + O_2 \text{ (isotopic exchange)}$$

SRDS-NBS21. **Kinetic data on gas phase unimolecular reactions,** S. W. Benson, H. E. O'Neal, Nat. Bur. Stand. (U.S.), Nat. Stand. Ref. Data Series 21, 645 pages. (Feb. 1970).

Key words: Arrhenius parameters; chemical kinetics; critical review data; gas phase; mechanisms; molecular reactions; rate constants; reaction rates.

Available rate data on thermally induced, unimolecular, homoneous gas phase reactions of molecules and free radicals have en reviewed and critically evaluated. Introductory discussion given of theory and assumptions used in compiling the selected ta. Mechanisms of reaction are discussed. The major portion 37 out of 617 pages) of the work presents selected data, with erences, in the form of data sheets (one to two pages per olecule). Preferred values are indicated and discussed.

SRDS-NBS22. **Atomic transition probabilities. Volume II. Sodium through calcium,** W. L. Wiese, M. W. Smith, and B. M. Miles, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 22, 306 pages (Oct. 1969).

Key words: Allowed and forbidden transitions; aluminum; argon; calcium; chlorine; magnesium; oscillator strengths; phosphorus; potassium; silicon; sodium; sulfur; transition probabilities.

Atomic transition probabilities for about 5,000 spectral lines the second ten elements, based on all available literature urces, are critically compiled. The data are presented in parate tables for each element and stage of ionization. For ch ion the transitions are arranged according to multiplets, supermultiplets, transition arrays, and increasing quantum numers. Allowed and forbidden transitions are listed separately. or each line the transition probability for spontaneous emison, the absorption oscillator strength, and the line strength are ven along with the spectroscopic designation, the wavelength, e statistical weights, and the energy levels of the upper and wer states. In addition, the estimated accuracy and the source e indicated. In short introductions, which precede the tables r each ion, the main justifications for the choice of the adopted ata and for the accuracy rating are discussed. A general inoduction contains a detailed discussion of the critical factors ntering into each major experimental and theoretical method. It so includes a general critical assessment of the widely used oulomb approximation, and a number of illustrative examples r the exploitation of regularities of systematic trends among scillator strengths.

SRDS-NBS23. **Partial Grotrian diagrams of astrophysical interest,** C. E. Moore and P. W. Merrill, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 23, 70 pages (June 1968).

Key words: Atomic spectra; Grotrian diagrams; partial Grotrian diagrams.

This publication is a reprint of Appendix A of the book by Paul W. Merrill entitled, "Lines of the Chemical Elements in Astronomical Spectra" (Carnegie Inst. Wash. Publ. 610, 1956). It contains partial Grotrian Diagrams of selected spectra of astrophysical interest, which give wavelengths, multiplet numbers and key letters for the transitions shown. The diagrams are accompanied by tabular keys in which the key letters indicate related lines in spectra similar in structure to those illustrated in the diagrams. There are 39 diagrams of spectra between hydrogen and nickel and tabular keys for 90 spectra between lithium and rhenium.

NSRDS-NBS24. **Theoretical mean activity coefficients of strong electrolytes in aqueous solutions from 0 to 100 °C,** W. J. Hamer, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 24, 276 pages (Dec. 1968).

Key words: Activity coefficients; electrolytes; interionic attraction expressions.

In determining the activity coefficients of electrolytes in aqueous solutions from the freezing point to the boiling point of the solvent, various equations have been used in the treatment of the data. This paper gives values for activity coefficients of electrolytes of various valence types from 0 to 100 °C, and for ionic strengths from zero to 0.1 molal or 0.1 molar, as calculated by seven different equations based on the theory of interionic attraction. These equations are those of Debye and Hückel, Güntelberg, Davies, Scatchard, and Bjerrum, and what may be termed an extended Güntelberg equation and an extended Scatchard equation.

NSRDS-NBS25. **Electron impact excitation of atoms,** B. L. Moiseiwitsch and S. J. Smith, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 25, 120 pages (Aug. 1968).

Key words: Atom; electron; excitation; experimental; helium; hydrogen; impact; review; theoretical.

The experimental and theoretical literature about the electron impact excitation of atoms is reviewed. Theoretical methods ranging from the Bethe and Born approximations to the close coupling approximations are discussed and intercompared. Where possible, on theoretical grounds or through intercomparison, the reliability of the various methods is discussed.

A general critique of the optical method of measuring excitation functions is given, with the objective of promoting higher quality future experimental work. A critical study of existing experimental work leads to the conclusion that most workers have ignored important physical and instrumental effects, and it may be presumed that the data in the literature is subject to many unrecognized systematic errors. The literature on hydrogen and helium is discussed critically. The literature on the alkalis, heavy rare gases, mercury, cadmium and zinc is surveyed but the quality of the literature does not support critical review beyond some general comments about the physics of these atoms.

NSRDS-NBS26. **Ionization potentials, appearance potentials, and heats of formation of gaseous positive ions,** J. L. Franklin, J. G. Dillard, H. M. Rosenstock, J. T. Herron, K. Draxl, and F. H. Field, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 26, 289 pages (June 1969).

Key words: Appearance potential; compilation; data; heat of formation; ionization potential; ions; positive ions.

This is a compilation of ionization and appearance potentials of positive ions published from 1955 through June 1966. The compilation lists the ion formed, the parent species from which it was formed, the other products of the process, the threshold energy for the formation of this ion, and the method by which this data was obtained.

Where feasible, the heat of formation at 298 K of the positive ion has been computed for each entry using auxiliary thermochemical data. From these computed values "best" values have been chosen.

NSRDS-NBS27. **Thermodynamic properties of argon from the triple point to 300 K at pressures to 1000 atmospheres,** A. L. Gosman, R. D. McCarty, and J. G. Hust, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 27, 151 pages (Mar. 1969).

Key words: Argon; compressibility factor; enthalpy; entropy; equation of state; internal energy; Joule-Thomson coefficient; P-V-T; specific heat; vapor pressure; virial coefficient.

Tabular values of density, internal energy, enthalpy, and entropy of liquid and gaseous argon are presented for temperatures from 83.8 to 300 K at pressures of 0.01 to 1000 atmospheres. Diagrams of specific heats, compressibility factor, and entropy are included. The properties presented are calculated from an equation of state which was fitted to experimental P-ρ-T data from the world literature. Extensive comparisons were made between the equation of state and the experimental data, and deviation plots are presented. The second virial coefficient and Joule-Thomson inversion curve were also calculated and comparisons made with values from other sources. A vapor pressure equation which covers the range from the triple point to the critical point is also given.

NSRDS-NBS28. **Molten salts: Volume 2. Section 1. Electrochemistry of molten salts: Gibbs free energies and excess free energies from equilibrium-type cells,** G. J. Janz and Chr. G. M. Dijkhuis. **Section 2. Surface tension data,** G. J. Janz, G. R. Lakshminarayanan, R. P. T. Tomkins, and J. Wong, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 28, 116 pages (Aug. 1969).

Key words: Critically evaluated data; equilibrium electrochemical cells; excess entropies; excess Gibbs free energies; Gibbs free energies; molten salt mixtures; molten salts; surface tension; thermodynamics of molten salts.

This book consists of two sections as follows:

Section 1. The critical evaluation of excess free energies of binary molten salt mixtures with a common ion from equilibrium-type electrochemical cells is described in this report. For this purpose calculations using the original emf data were systematically undertaken to establish comparisons of free energy values of various workers that would be significant. The reversibility of electrodes is investigated by comparing the electromotive force of cells with a single molten salt as liquid electrolyte with thermochemical data.

Section 2. Data on the surface tensions of single salt melts have been systematically collected and evaluated. Results are given for 106 inorganic compounds over a range of temperatures where available.

NSRDS-NBS29. **Photon cross sections, attenuation coefficients, and energy absorption coefficients from 10 keV to 100 GeV,** J. H. Hubbell, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 29, 85 pages (Aug. 1969).

Key words: Attenuation coefficient; Compton scattering; cross section; energy absorption coefficient; gamma rays; pair production; photoelectric absorption; photons; x-rays.

This report updates and extends previous NBS tabulations. Section 1 contains the information of most immediate practical use: (a) a tabulation of the attenuation coefficient for 23 elements ($_1$H to $_{92}$U) between 10 keV and 100 GeV and (b) a tabulation of the energy absorption coefficient for air, water, and 18 elements between 10 keV and 10 MeV, and for air, water, and 7 elements up to 100 MeV. Section 2 contains detailed information on the predominant processes (photoelectric absorption, Compton scattering and pair production) and a brief discussion of other processes which combine to give the attenuation coefficient. Theoretical and experimental data are reviewed, and auxiliary tables and approximation formulas are given. Section 3 contains tabulations of cross sections for the predominant processes between 10 keV and 100 GeV for 23 elements and for 13 compounds and mixtures.

NSRDS-NBS30. **High temperature properties and decomposition of inorganic salts, Part 2. Carbonates,** H. H. Stern, and E. L. Weise, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 30, 32 pages (Dec. 1969).

Key words: Carbonates; thermal decomposition; thermodynamic functions.

The literature dealing with the high-temperature behavior of inorganic carbonates has been critically reviewed. Free energy functions of reactants and products of the decomposition reactions were calculated and have been tabulated from 298 °K up to as high a temperature as possible. Free energy functions and equilibrium constants of reactions were tabulated. Auxiliary data on phase transitions, densities, and kinetics of thermal decomposition have also been included. The literature of the endothermic decomposition kinetics of solids, as it applies to carbonates, has been reviewed.

NSRDS-NBS31. **Bond dissociation energies in simple molecules,** B. deB. Darwent, Nat. Bur. Stand. (U.S.), Nat. Stand. Ref. Data Series 31, 52 pages (January 1970).

Key words: Bond dissociation energy; gaseous state; inorganic simple compounds; recommended value; zero vibrational state of the ground electronic state.

Bond dissociation energy values (kcal/mol) and (kJ/mol) for simple compounds are tabulated from a literature review covering the years 1962-1966 inclusively. Some selected values which appeared in the years 1956-1962 are also included. Organic compounds are excluded except those containing one carbon atom. The groups $>$CO and $-$CN are not considered to be organic.

The values are quoted usually at 0 K or 298 K and refer to the gaseous state. They represent the energy required to break a bond at the specified temperature with all substances in the zero vibrational state of the ground electronic state. The experimental method for the energy value listed is given and referenced in the table. A value recommended by the author is listed as the final value for each reaction.

NSRDS-NBS32. **Phase behavior in binary and multicomponent systems at elevated pressures: *n*-pentane and methane-*n*-pentane,** V. M. Berry and B. H. Sage, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 32, 73 pages (June 1970).

Key words: Evaluated data; liquid-vapor equilibria; methane-*n*-pentane system; *n*-pentane; thermodynamics.

This paper, which is concerned with the critical evaluation of data on the phase behavior of binary systems, consists of three parts. In the first part the rationale of the evaluation process used is discussed, in the second the behavior of *n*-pentane, and in the third the behavior of the system methane-*n*-pentane.

The properties of *n*-pentane considered are the critical constants and the vapor pressures and densities of the saturated coexistent phases as functions of temperature. For the methane-*n*-pentane system the compositions and densities of the coexisting phases are given as functions of temperature and total pressure. Data for the unique states of the two-component sys-

re also presented.

Discussions are given of the reliability of the selected values nd of the differences between the selected values and various neasured values.

NSRDS-NBS33. **Electrolytic conductance and the conductances of the halogen acids in water,** W. J. Hamer and H. J. DeWane, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 33, 37 pages (May 1970).

Key words: Conductances of HF, HCl, HBr, and HI; electrolytic conductance; theories of electrolytic conductance.

Definitions, symbols, general principles, and general laws related to the electrolytic conductance of aqueous solutions are presented. The general laws considered are Coulomb's law for charged bodies, Poisson's equation relating the electrostatic potential to charge distribution, and the Stokes and Oseen laws for the velocity of a sphere in a fluid medium. The relations between electrical resistance, electrical conductance, specific resistance, specific conductance, and equivalent conductance are set forth. Theoretical expressions for the equivalent conductance as derived by Debye, Onsager, and Fuoss are given in general form and in a somewhat more detailed fashion in an appendix. The general methods of treating the equivalent conductances of onophores and ionogens, especially in regard to the determination of the limiting equivalent conductance, the degree of ionic association, and the degree of ionic dissociation are discussed. Data on the equivalent conductances of the halogen acids, hydrofluoric, hydrochloric, hydrobromic, and hydriodic acids in water are given for a wide range of concentration and temperature.

NSRDS-NBS34. **Ionization potentials and ionization limits derived from the analyses of optical spectra,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 34, 22 pages (Sept. 1970).

Key words: Atomic spectra, ground terms; ground terms, atomic spectra; ionization limits; ionization potentials.

A current table of ionization potentials expressed in electron volts and a detailed table giving the limits from which they have been derived are presented. For each spectrum the ground term is given, with the limit as the ground state. The energy levels of terms of the lowest configuration determined from ground state zero, are also included for selected spectra. The literature references used for each spectrum are indicated by number and listed in a bibliography with some 200 entries.

The latest recommended conversion factor (cm^{-1} to eV) 0.000123981 corresponding to 1 eV = 8065.73 cm^{-1} has been used throughout.

NSRDS-NBS35. Volume I. **Atomic energy levels as derived from the analyses of optical spectra, ^{1}H to ^{23}V,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 35/V.I, 359 pages (Dec. 1971).

Key words: Energy levels; H-V.

This series of three volumes is a critical compilation of atomic energy levels prepared at the National Bureau of Standards from the analyses of optical spectra. Volume I contains data on the spectra of hydrogen, deuterium, tritium, helium, lithium, beryllium, boron, carbon, nitrogen, oxygen, fluorine, neon, sodium, magnesium, aluminum, silicon, phosphorus, sulfur, chlorine, argon, potassium, calcium, scandium, titanium, and vanadium (^{1}H to ^{23}V). Volume II covers the spectra of chromium, manganese, iron, cobalt, nickel, copper, zinc, gallium, germanium, arsenic, selenium, bromine, krypton, rubidium, strontium, yttrium, zirconium, and niobium (^{24}Cr to ^{41}Nb). Volume III includes the spectra of molybdenum, technetium, ruthenium, rhodium, palladium, silver, cadmium, indium, tin, antimony, tellurium, iodine, xenon, cesium, barium, lanthanum; hafnium, tantalum, tungsten, rhenium, osmium, iridium, platinum, gold, mercury, thallium, lead, bismuth, polonium, radon, radium, and actinium (^{42}Mo to ^{57}La; ^{72}Hf to ^{89}Ac). This is a reprint of NBS Circular 467, Volume I.

NSRDS-NBS35. Volume II. **Atomic energy levels as derived from the analyses of optical spectra, ^{24}Cr to ^{41}Nb,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 35/V.II, 259 pages (Dec. 1971).

Key words: Cr-Nb; energy levels.

This series of three volumes is a critical compilation of atomic energy levels prepared at the National Bureau of Standards from the analyses of optical spectra. Volume I contains data on the spectra of hydrogen, deuterium, tritium, helium, lithium, beryllium, boron, carbon, nitrogen, oxygen, fluorine, neon, sodium, magnesium, aluminum, silicon, phosphorus, sulfur, chlorine, argon, potassium, calcium, scandium, titanium, and vanadium (^{1}H to ^{23}V). Volume II covers the spectra of chromium, manganese, iron, cobalt, nickel, copper, zinc, gallium, germanium, arsenic, selenium, bromine, krypton, rubidium, strontium, yttrium, zirconium, and niobium (^{24}Cr to ^{41}Nb). Volume III includes the spectra of molybdenum, technetium, ruthenium, rhodium, palladium, silver, cadmium, indium, tin, antimony, tellurium, iodine, xenon, cesium, barium, lanthanum; hafnium, tantalum, tungsten, rhenium, osmium, iridium, platinum, gold, mercury, thallium, lead, bismuth, polonium, radon, radium, and actinium (^{42}Mo to ^{57}La; ^{72}Hf to ^{89}Ac). This is a reprint of NBS Circular 467, Volume II.

NSRDS-NBS35. Volume III. **Atomic energy levels as derived from the analyses of optical spectra, ^{42}Mo to ^{57}La, ^{72}Hf to ^{89}Ac,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 35/V.III, 282 pages (Dec. 1971).

Key words: Energy levels; Hf-Ac; Mo-La.

This series of three volumes is a critical compilation of atomic energy levels prepared at the National Bureau of Standards from the analyses of optical spectra. Volume I contains data on the spectra of hydrogen, deuterium, tritium, helium, lithium, beryllium, boron, carbon, nitrogen, oxygen, fluorine, neon, sodium, magnesium, aluminum, silicon, phosphorus, sulfur, chlorine, argon, potassium, calcium, scandium, titanium, and vanadium (^{1}H to ^{23}V). Volume II covers the spectra of chromium, manganese, iron, cobalt, nickel, copper, zinc, gallium, germanium, arsenic, selenium, bromine, krypton, rubidium, strontium, yttrium, zirconium, and niobium (^{24}Cr to ^{41}Nb). Volume III includes the spectra of molybdenum, technetium, ruthenium, rhodium, palladium, silver, cadmium, indium, tin, antimony, tellurium, iodine, xenon, cesium, barium, lanthanum; hafnium, tantalum, tungsten, rhenium, osmium, iridium, platinum, gold, mercury, thallium, lead, bismuth, polonium, radon, radium, and actinium (^{42}Mo to ^{57}La, ^{72}Hf to ^{89}Ac). This is a reprint of NBS Circular 467, Volume III.

NSRDS-NBS36. **Critical micelle concentrations of aqueous surfactant systems,** P. Mukerjee and K. J. Mysels, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 36, 227 pages (Feb. 1971).

Key words: Association colloid; bibliography; CMC; colloid; colloidal electrolyte; critical concentration; critical micelle concentration; detergent; hydrophobic bonding; Krafft point; long chain compounds; micelle; paraffin chain salts; selected values; soap; solubilization; standard values; surface active agents; surface chemistry; surface tension; surfactant.

Critical micelle concentrations (CMC's), have been collected, organized and evaluated. The literature has been scanned for numerical values from 1926 up to and including 1966. In addition, over 800 values, hitherto available only in graphical form or implied in experimental data, have been extracted from the publications and are included. Close to 5,000 entries, based on 333 references, dealing with 720 compounds are tabulated in the main tables. Whenever available, the temperature, any additives present, the method of determination and the literature source are given for each CMC value and an indication of the apparent quality of the preparation and method used are included. A shorter table gives selected values which are believed to be particularly reliable, including highly accurate ones. Among these, concordant values from at least two independent laboratories are emphasized.

Included in the Introduction is a general discussion of the importance and significance of CMC values and of methods for their determination, as well as a summary of the procedures used in the collection, evaluation and presentation of these values in the present work. Extensive indexes are provided.

NSRDS-NBS37. **JANAF thermochemical tables, second edition,** D. R. Stull and H. Prophet, Project Directors, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 37, 1141 pages (June 1971).

Key words: Evaluated data; thermal functions; thermodynamic properties of materials; thermodynamics.

This is the second edition of the JANAF Thermochemical Tables. It contains thermodynamic properties for some 1099 chemical species. The following properties are tabulated as functions of temperatures: C_p°, S°, $(F^\circ\text{-}H_{298}^\circ)/T$, $H^\circ\text{-}H_{298}^\circ$, ΔH_f° and Log Kp. Superseding PB168-370 and Addenda 1, 2, and 3.

NSRDS-NBS38. **Critical review of ultraviolet photoabsorption cross sections for molecules of astrophysical and aeronomic interest,** R. D. Hudson, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 38, 106 pages (Aug. 1971).

Key words: Aeronomic; astrophysical; partial; photoabsorption cross sections; photodissociation; photoexcitation; photoionization; photon-scattering; total; ultraviolet cross sections.

This paper is devoted to a critical review of photoabsorption cross sections for molecules of aeronomic and astrophysical interest at wavelengths less than 3000 A. A discussion of the relative merits of various experimental techniques is given along with possible systematic and random errors that may be associated with them. The problems in data analysis associated with finite spectral bandwidths are reviewed, with special emphasis on the interpretation of published absorption cross sections. This review does not contain a complete set of cross-section-versus-wavelength values for each molecule; the prepared figures are used to compare the results of several determinations or to point out where difficulties of interpretation might arise. However, references to all papers believed to contain the more reliable data are given.

NSRDS-NBS39. **Tables of molecular vibrational frequencies, consolidated Volume I,** T. Shimanouchi, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 39, 164 pages (June 1972).

Key words: Fundamental frequencies; infrared spectra; polyatomic molecules; Raman spectra; vibrational frequencies.

The compilations of fundamental vibrational frequencies of molecules previously published as NSRDS-NBS6, NSRDS-NBS11, and NSRDS-NBS17 have been revised and extended to 52 additional molecules. This consolidated volume includes data on a total of 223 molecules. Selected values of the fundamental vibrational frequencies are given for each molecule, together with observed infrared and Raman spectral data and citations to the original literature. The selection of vibrational fundamentals has been based on careful studies of the spectral data and comprehensive normal-coordinate analyses. An estimate of the accuracy of the selected values is included. The tables provide a convenient source of information for those who require vibrational energy levels and related properties in molecular spectroscopy, thermodynamics, analytical chemistry, and other fields of physics and chemistry.

NSRDS-NBS40. **A multiplet table of astrophysical interest, (Revised Edition), Part I—Table of multiplets and Part II—Finding list of all lines in the table of multiplets,** C. E. Moore, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 40, 253 pages (Feb. 1972).

Key words: Atomic spectra, multiplet table; finding list, atomic spectra; multiplet table; spectra, atomic.

Pending the completion of a current edition, the 1945 Multiplet Table is being reprinted here to meet continuing demands. The leading lines in 196 atomic spectra of 85 chemical elements are listed in related groups called multiplets. Estimated intensities, excitation potentials and multiplet designations are given for the individual lines, and each multiplet is assigned a number. An extensive bibliography covers the source material used for the compilation.

The Table is presented in two parts: Part I includes the multiplets, with the spectra of each element being given in order of increasing ionization, and the elements in order of increasing atomic number. Part II is a Finding List in which all the lines in Part I are entered in order of increasing wavelength, with their multiplet numbers.

The range of the Table is from 2951 Å to 13164 Å. A supplementary table of "Forbidden Lines" extends from 2972 Å to 12645 Å. Reprint of NBS Technical Note 36 (PB151395).

NSRDS-NBS41. **Crystal structure transformations in binary halides,** C. N. R. Rao and M. Natarajan, Nat. Stand Ref. Data Ser., Nat. Bur. Stand. (U.S.), 41, 53 pages (July 1972).

Key words: Binary halides; crystal structure transforma tion; electronic data; phase transformation; spectroscopi data; thermodynamic data; x-ray diffraction data.

A critical survey of the data describing crystal structure trans formations in binary halides is compiled. Data on thermodynam ic, crystallographic, spectroscopic and electronic properties ar given for each transformation. Experimental techniques used t obtain the data are named and comments on the data are ir cluded in the tables. The literature is surveyed up to 197(References have been selected on the basis of their pertinence t the data which are cited and do not represent all the availabl literature.

NSRDS-NBS42. **Selected specific rates of reactions of the so vated electron in alcohols,** E. Watson, Jr., and S. Roy, N Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 42, 22 pag (Aug. 1972).

Key words: Alcohols; chemical kinetics; data compilatio radiation chemistry; rates; solvated electron.

Solvated electrons are generated in alcohols by radiolysi photolysis, reaction with sodium, etc. Rates of reactions of e with solvent and solute molecules, ions, and transients, in a cohol solutions, have been compiled. Arrhenius parameters a tabulated for some reactions.

NSRDS-NBS43. **Selected specific rates of reactions of transients from water in aqueous solution. 1. Hydrated electron,** M. Anbar, M. Bambenek, and A. B. Ross, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 43, 67 pages (May 1973) 90 cents, SD Catalog No. C13.48:43.

Key words: Aqueous solution; chemical kinetics; data compilation; hydrated electron; radiation chemistry; rates.

Rates of reactions of hydrated electrons with over 700 different organic and inorganic molecules, ions, and transients have been tabulated. Most of the data are derived from pulse radiolysis of aqueous solutions; results from photolysis and from steady-state radiolysis by competition kinetics are also included.

NSRDS-NBS43. Supplement. **Selected specific rates of reactions of transients from water in aqueous solution. Hydrated electron, supplemental data.** A. B. Ross, Nat. Stand. Ref. Data. Ser., Nat. Bur. Stand. (U.S.), 43, Suppl., 43 pages (June 1975) SD Catalog No. C13.48:43, Suppl.

Key words: aqueous solution; chemical kinetics; data compilation; hydrated electron; radiation chemistry; rates.

A compilation of rates of reactions of hydrated electrons with other transients and with organic and inorganic solutes in aqueous solution appeared in NSRDS-NBS43, and covered the literature up to early 1971. This supplement includes additional rates which have been published through July 1973.

NSRDS-NBS45. **Radiation chemistry of nitrous oxide gas. Primary processes, elementary reactions, and yields,** G. R. A. Johnson, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 45, 27 pages (Dec. 1973) 60 cents, SD Catalog No. C13.48:45.

Key words: Chemical kinetics; data compilation; dosimetry; G; gas; nitrous oxide; radiation chemistry; rates; review.

Data on the radiation yields from nitrous oxide gas, and the effects of variables, including dose-rate, total dose, pressure, temperature, applied fields and scavengers are reviewed and tabulated. The use of N_2O as a gas-phase, chemical dosimeter is discussed. Primary processes in irradiated N_2O are discussed and elementary reactions, relevant to the system, are listed.

NSRDS-NBS46. **Reactivity of the hydroxyl radical in aqueous solutions,** L. M. Dorfman, G. E. Adams, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 46, 72 pages (June 1973) 90 cents, SD Catalog No. C13.48:46.

Key words: Abstraction reactions; addition reactions; aqueous solution; biological molecules; electron transfer reactions; hydroxyl radical; oxide radical ion; radical reactions; rate constants; reference data.

The reaction rate data of the hydroxyl radical in aqueous solution are compiled and evaluated in this critical review. The values are reported in a series of tables covering additon, hydrogen abstraction, inorganic electron transfer and radical reactions. Rate constants for the hydroxyl radical with biological molecules are included. In addition, the rate constant data for the oxide radical ion are given. Physical properties are listed and the experimental methods employed in OH radical chemistry are reviewed. An analysis involving rate constant data comparisons is made.

NSRDS-NBS47. **Tables of collision integrals and second virial coefficients for the (m,6,8) intermolecular potential function,** M. Klein, H. J. M. Hanley, F. J. Smith, and P. Holland, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 47, 157 pages (June 1974) SD Catalog No. C13.48:47.

Key words: collision integrals; diffusion; potential; thermal conductivity; thermal diffusion; transport properties; viscosity.

Tables of collision integrals and second virial coefficients are presented for the (m,6,8) potential function. Ten values of the repulsive exponent m are included which range in unit steps from $m=9$ through $m=18$. Approximately 6 values of the parameter, γ, associated with the inverse eighth power term, are included for each value of m. These tables are equivalent, therefore, to tables for 60 three-parameter (m,6) potential functions. Comparisons of our results for $m=12$ and $\gamma=0$ (corresponding to the (12,6) function) have been made with other calculations. Based on these comparisons, the accuracy of the present calculation appears to be at least two or three parts in 10,000 depending on the temperature. A table is included which contains the Boyle temperature, the Boyle volume, and the ratio of the intermolecular separation at the potential minimum to the separation at the zero of the potential.

NSRDS-NBS48. **Radiation chemistry of ethanol: A review of data on yields, reaction rate parameters, and spectral properties of transients,** G. R. Freeman, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 48, 43 pages (Feb. 1974) SD Catalog No. C13.48:48.

Key words: chemical kinetics; data compilation; ethanol; G; radiation chemistry; rates; review; spectra.

The yields (G) for products and intermediates formed by irradiation of ethanol, in the solid, liquid and gaseous state, have been compiled and reviewed. Rates of reactions of transient ions and radicals and spectroscopic parameters, including optical and esr spectra, are also included.

NSRDS-NBS49. **Transition metal oxides. Crystal chemistry, phase transition and related aspects,** C. N. R. Rao and G. V. Subba Rao, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 49, 138 pages (June 1974) SD Catalog No. C13.48:49.

Key words: critical data, transition metal oxides; crystal structure transformations; electronic properties; magnetic properties; phase equilibria; phase transitions.

A survey is made of the data describing the thermodynamics of phase equilibria, crystal chemistry and phase transformations of binary oxides of $3d$, $4d$, and $5d$ transition metals. Changes in electrical, magnetic, and other properties which accompany phase transitions are discussed. Nearly complete coverage of the literature is provided up to 1973.

NSRDS-NBS 50. **Resonances in electron impact on atoms and diatomic molecules,** G. J. Schulz, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 50, 118 pages (Oct. 1973) $1.35, SD Catalog No. C13.48:50.

Key words: Atoms; compound states; cross-sections; diatomic molecules; electron impact; energy levels; resonances; temporary negative ions.

Two reviews are presented on the energies, configuration and other properties of resonances in electron impact on atoms and diatomic molecules. Included are discussions of the experimental methods which are useful for studying resonances and of the results obtained by various investigations. Much of the information is presented in the form of tables and energy level diagrams.

NSRDS-NBS51. **Selected specific rates of reactions of transients from water in aqueous solution. II. hydrogen atom,** M. Anbar, Farhataziz, and A. B. Ross, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 51, 56 pages (May 1975) SD Catalog No. C13.48:51.

Key words: aqueous solution; chemical kinetics; data compilation; hydrogen atom; radiation chemistry; rates.

Rates of reactions of hydrogen atoms (from radiolysis of water and other sources) with organic and inorganic molecules, ions, and transients in aqueous solution have been tabulated. Directly measured rates obtained by kinetic spectroscopy or conductimetric methods, and relative rates determined by competition kinetics are included.

NSRDS-NBS52. **Electronic absorption and internal and external vibrational data of atomic and molecular ions doped in alkali halide crystals,** S. C. Jain, A. V. R. Warrier, and S. K. Agarwal, Nat. Stand. Ref. Data. Ser., Nat. Bur. Stand. (U.S.), 52, 59 pages (July 1974) SD Catalog No. C13.48:52.

Key words: atomic ions; doped alkali halide crystals; external vibrational modes; internal vibrational modes; molecular ions.

Spectral data for more than 70 atomic and molecular ions doped in alkali halide crystals are tabulated. The tables include electronic absorption data, listings of internal vibrational frequencies of doped complex ions, and tabulations of the frequencies of external modes. The data that appear in the tables were selected on the basis of the consistency among different authors, the types of instruments, and the temperature of measurement. In addition to the data, the tables include the spectroscopic assignments given by the authors in the references cited.

NSRDS-NBS53. **Crystal structure transformations in inorganic nitrites, nitrates, and carbonates,** C. N. R. Rao, B. Prakash, and M. Natarajan, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 53, 54 pages (May 1975) SD Catalog No. C13.48:53.

Key words: carbonates; crystal structure transformation; nitrates; nitrites; phase transformation; x-ray diffraction data.

A critical survey of the data describing crystal structure transformations in inorganic nitrites, nitrates, and carbonates is compiled. Data on crystallographic, thermodynamic, spectroscopic, electrical, dielectric, and other properties are given for each solid. Experimental techniques used to obtain the data are given and comments on the data are included in the tables. The literature is surveyed up to June 1973. References have been selected on the basis of their pertinence to the data cited.

NSRDS-NBS54. **The radiolysis of methanol: product yields, rate constants, and spectroscopic parameters of intermediates,** J. H. Baxendale and P. Wardman, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 54, 26 pages (Apr. 1975) SD Catalog No. C13.48:54.

Key words: chemical kinetics; data compilation; methanol; radiation chemistry; rates; review.

Product yields and primary yields in the radiolysis of methanol in the solid, liquid and vapor phase have been compiled and reviewed. Preferred values for G of the major products in the vapor and liquid states are listed. Rates of reactions of solvated and trapped electrons and other transient ions and radicals, and optical absorption and esr parameters for e_s^-, e_t^-, $\dot{C}H_2OH$ and $CH_3O\cdot$ are also included.

NSRDS-NBS55. **Property index to NSRDS data compilations, 1964-1972,** D. R. Lide, Jr., G. B. Sherwood, C. H. Douglass, Jr., and H. M. Weisman, Nat. Stand. Ref. Data. Ser., Nat. Bur. Stand. (U.S.), 55, 15 pages (June 1975) SD Catalog No. C13.48:55.

Key words: cumulative property index; data compilations; National Standard Reference Data System.

A property index to data contained in publications of the National Standard Reference Data System during the period 1964-1972 is presented. Data compilations published in the NSRDS-NBS series, other publication series of the National Bureau of Standards, scientific journals, and books of commercial publishers are included. When used with the cumulative property index published annually since 1972 in the *Journal of Physical and Chemical Reference Data*, this index serves as an entry to the complete output of the NSRDS program.

NSRDS-NBS56. **Crystal structure transformations in inorganic sulfates, phosphates, perchlorates, and chromates,** C. N. R. Rao and B. Prakash, Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 56, 38 pages (Nov. 1975) SD Catalog No. C13.48:56.

Key words: chromates: crystal structure; crystal structure transformations; perchlorates; phase transformations; phosphates; sulfates; thermodynamic data; x-ray diffraction data.

Literature dealing with crystal structure transformations of simple inorganic sulfates, phosphates, perchlorates and chromates has been critically reviewed. Data on thermodynamic, crystallographic, spectroscopic, dielectric and other properties are given. Experimental techniques employed to obtain the data are indicated and comments on the data are made wherever necessary. All pertinent references to the published literature (up to 1974) are listed.

NSRDS-NBS57. **Yields of free ions formed in liquids by radiation,** A. O. Allen, *Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 57,* 25 pages (Apr. 1976) SD Catalog No. C13.48:57.

Key words: electrons; free ions; ion yields; liquid; nonpolar systems; radiation chemistry; radiation physics.

Free ions are those produced by ionizing radiation which escape initial recombination. Yields of free-ion pairs are tabulated for liquid alkanes, alkenes, alkynes, dienes and aromatic hydrocarbons, and other nonpolar and polar compounds, including alcohols, ethers, esters, halides, amines, nitriles, etc. Total ion yields for a few liquids are compared with gas phase ion yields. Theoretical treatments of these data are discussed.

NSRDS-NBS58. **Drift mobilities and conduction band energies of excess electrons in dielectric liquids,** A. O. Allen, *Nat. Stand. Ref. Data Ser., Nat. Bur. Stand. (U.S.), 58,* 23 pages (May 1976) SD Catalog No. C13.48:58.

Key words: conduction band; drift mobility; energy levels; excess electrons; hydrocarbons; ion mobility; liquids; mobility; quasifree electrons; solvated electrons.

The properties of electrons in liquids which are covered in this review include drift mobilities and the energy level (V_0) at the base of the conduction band. Tables are given of zero-field electron mobilities for several liquefied diatomic and inert gases, a number of aliphatic and aromatic hydrocarbons, and polar solvents. V_0 values are given for liquid helium and argon, a number of hydrocarbons, tetramethylsilane, and tetramethyltin. Theories attempting to explain these results are described in a qualitative way.

3.12. BUILDING SCIENCE SERIES

Disseminates technical information developed at the Bureau on building materials, components, systems, and whole structures. The series presents research results, test methods, and performance criteria related to the structural and environmental functions and the durability and safety characteristics of building elements and systems.

BSS0. **Building research at the National Bureau of Standards,** P. R. Achenbach, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 0, 59 pages (Oct. 1970).

Key words: Building materials; building performance; building research; building systems; building technology; history.

The history of building research and technology at the National Bureau of Standards is as long as the history of the institution itself. The participation of the Bureau in the application of science and engineering to building materials and components played an early and important role in the development of steel and reinforced concrete as structural materials; in the understanding of physics and chemistry of cement, lime and gypsum; in the evaluation of the fire properties of building components; in safe plumbing practices; in laboratory evaluation of the effects of weather on deterioration of building materials; and in measurement of the heat and sound transmission properties of building materials and constructions. The central and continuing objectives of the building research program are shown to be the development of new technical information and new measurement methods for building materials, components, and systems, and the application of this knowledge to the specifications for Federal procurement, to the national standards of the building industry, and to the building code structure of the nation. The Bureau has served as a major technical resource in three large-scale national efforts to accelerate the construction of economical and effective buildings for housing and commercial purposes. One of these efforts is currently in progress and is characterized by an emphasis on the design of buildings to meet the performance requirements of the user rather than through the specification of the properties of the materials used.

BSS1. **Performance of buildings—concept and measurement.** Proceedings of the 1st conference in a series of Conferences on Man and His Shelter held at the National Bureau of Standards, Gaithersburg, Md., September 23-25, 1968. W. W. Walton and B. C. Cadoff, Editors, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 1, 132 pages (Jan. 1970).

Key words: Building systems; performance of buildings; standards; test methods; urban planning; user needs.

The Conference entitled "Performance of Buildings—Concept and Measurement" was held at the National Bureau of Standards, Gaithersburg, Md. on September 23-25, 1968. This was the first in a planned series of conferences on "Man and His Shelter." The purpose of these conferences is to bring together those people from various disciplines who may contribute to improving the quality of man's shelter. At the present conference, papers were presented by nineteen authors representing govern-

BSS7. **Organic coatings. Properties, selection, and use,** A. G. Roberts, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 7, 202 pages (Feb. 1968).

Key words: Application; coatings; coating systems; corrosion-inhibiting; Federal specifications; fire-retardant; lacquer; latex; multicolor; organic coatings; paint; pigments; polymers; properties; resins; selection; substrates; surface preparation; varnish; water-thinned.

This publication was prepared to fill the need for a comprehensive, unifying treatise in the field of organic coatings. Besides presenting practical information on the properties, selection, and use of organic coatings (and certain inorganic coatings), it provides basic principles in a number of important areas such as polymer structure, coatings formulation, pigment function, use of thinners, coating system compatibility, and theory of corrosion. Each chapter deals with a major area of the coatings field, including types of coatings, properties of synthetic resins, selection of coating systems, storage and safety, application methods, and surface preparation and pretreatment. There is also a consolidating chapter with illustrative examples of solutions to typical coatings problems. Interrelationships among the various areas of information are indicated through appropriate cross-referencing in the text. Specific references to Federal, Military, and other specifications are given where pertinent, and an entire chapter is devoted to a quick guide and summary of Federal specifications for organic coating materials. Finally, a selected bibliography and a comprehensive index are provided. While written primarily to meet the informational needs of the engineer, architect, maintenance superintendent, and responsible coatings procurement officer, the treatise is sufficiently broad in scope to serve as a general manual, a concise text, or a convenient reference source in the field of organic coatings.

BSS8. **Interrelations between cement and concrete properties, Part 3. Compressive strengths of portland cement test mortars and steam-cured mortars,** (Contains section 7 and section 8.) R. L. Blaine, H. T. Arni, and M. R. DeFore, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 8, Part 3, 101 pages (Apr. 1968).

Section 7. **Compressive strength of test mortars.**

Key words: Chemical composition; fineness; heat of hydration; strength gain of portland cements; trace elements.

The relationships between cement characteristics and compressive strength of 1:2.75 (cement to graded Ottawa sand) mortars of standard consistency at ages of 24 hours to 10 years, and made with 199 cements of different types, were studied by fitting multivariable regression equations with the aid of a digital computer. The dominant variables associated with the differences of compressive strength, strength gain, and strength ratios were different at the various test ages, and after different curing conditions. The additional use of certain trace elements with commonly determined independent variables resulted in a significantly better fit between the equations and the observed data. Interactions between the fineness values and other independent variables were noted. Certain parallelisms and differences were noted with respect to variables associated with compressive strength differences at various ages and the heat of hydration of the cements at these ages.

Section 8. **Compressive strength of steam-cured portland cement mortars.**

Key words: Accelerated curing of cements; autoclave curing of portland cement mortars; chemical composition; compressive strength of portland cement; compressive strength of steam-cured cements; mortars; steam curing of portland cement mortars; trace elements.

The relationships between the chemical and physical characteristics of 161 portland cements and the compressive strengths of 2-inch mortar cubes made from those cements after both low- and high-pressure steam, as well as moist-air curing, were studied by computing multivariable regression equations with the aid of a digital computer, and determining which of the independent variables appeared to have a significant relationship to the compressive-strength values. An increase in C_3A, SO_3, and K_2O each appeared associated with higher compressive strengths with the low-pressure-steam-cured specimens but not with 28-day strengths of the 23 °C moist-air-cured specimens. Increases of C_3A, C_3S, C_2S, SO_3 and fineness were all associated with

higher strength values when autoclave curing was started after 5 hours, but when started after 24 hours, variations of neither C_3A nor C_3S appear to have any effect. The use of certain of the trace elements in the equations together with commonly determined variables resulted in a reduction in variance although the coefficients of the individual trace elements were, in most instances, not highly significant.

BSS9. **Thermal-shock resistance for built-up membranes,** W. C. Cullen and T. H. Boone, NBS Bldg. Sci. Series 9 (Aug. 21, 1967).

Section 1. Progress in the development of a thermal-shock resistance factor for bituminous built-up roofing membranes.

Key words: Development; roofing membrane; strength properties; thermally induced forces; thermal-shock resistance factor.

The resistance of bituminous built-up roofing membranes to thermally induced forces is considered in terms of their strength properties such as breaking load in tension, modulus of elongation and apparent linear thermal expansion coefficient. The development of a Thermal-Shock Resistance Factor is described and values are given for three bituminous built-up membranes at temperatures of -30 °F (-34.4 °C), 0 °F (-17.8 °C), 30 °F (-1.1 °C) and 73 °F (22.8 °C). The apparent relation between the values obtained in the laboratory and the observed performance of roofing membranes in service is considered. The utilization of the Thermal-Shock Resistance Factor in the reduction of potential failures of bituminous built-up roofing membranes in service from thermally induced forces is also discussed.

Section 2. Thermal-shock resistance for bituminous built-up roofing membranes--Its relation to service life.

Key words: Bituminous-built-up roofing; roofing membrane; service life; thermal-shock resistance factor; tension splitting.

The assignment of a service life to a bituminous built-up roofing system is frequently difficult because of the many variables involved. A knowledge of these variables, and of their effect on the performance of the total building system, will greatly assist in the selection of a roofing assembly and the assignment of a service life to such an assembly.

Some of the factors such as breaking load in tension, modulus of elongation, and apparent linear thermal expansion coefficient of roofing membranes of different composition are given for both laboratory-prepared and field-obtained samples. Membranes of 2, 3, and 4-plies of felt are included. The relations of some engineering properties of a roofing membrane to performance in sevice as expressed by a Thermal-Shock Resistance Factor are also given. Ways and means to reduce potential failures of bituminous built-up roofing membranes resulting from thermally induced forces are discussed.

BSS10. **Field burnout tests of apartment dwelling units,** D. Gross, NBS Bldg. Sci. Series 10 (Sept. 29, 1967).

Key words: Apartment dwelling; burnout test; fire load; fire performance; flame penetration; potential heat; structural load.

Results are reported of three burnout tests in an experimental test building, using a wood crib fuel load of 6 lb/ft², representing combustible contents, and a structural design load of 40 lb/ft² applied to the floor or roof above the test room. Measurements were made of temperature, radiation, smoke, gas composition, and structural deflection. A discussion of the fire performance of materials and methods of construction, and conclusions with regard to specific fireprotective objectives are presented.

BSS11. **Fire resistance of steel deck floor assemblies,** H. Shoub and S. H. Ingberg, NBS Bldg. Sci. Series 12 (Dec. 1967).

Key words: Burnout tests; fire endurance; fire severity; floor tests; steel plate floors.

Tests were conducted to determine the resistance to fire of welded steel plate and beam floor assemblies with various conditions of floor covering on the plates, and ceiling protections beneath the beams. The trials included fire exposures from the burnout of combustible materials ranging from 10 to 40 lb/ft² on the floor surface as well as standard fire endurance tests in which the ceiling of the structure was exposed to fire.

The results of the tests indicated that the use of steel floor structures was practical from considerations of fire safety. For the test conditions established, fire exposure on top of the floor did not heat the structural steel supporting members sufficiently to cause load failure or collapse, and did not produce untenable conditions in the room below. In tests involving fire exposure to the underside of floors, the fire endurance times, based solely on heat transmission criteria, ranged from 1 hr 24 min to over 4 hr. Temperature levels attained by the structural members and deflection of the floor assemblies are also reported.

BSS12. **Performance of square-edged orifices and orifice-target combinations as air mixers,** T. K. Faison, Jr., J. C. Davis, and P. R. Achenbach, NBS Bldg. Sci. Series 12 (Nov. 24, 1967).

Key words: Diameter ratio; mixing effectiveness; square-edged orifice; temperature measurement; temperature pattern.

A study was made at the National Bureau of Standards to determine the effectiveness of the square-edged orifice, or the orifice in combination with a target (circular baffle), for mixing an air stream which was initially nonuniform with respect to temperature. By achieving uniformity of temperature at all points within the cross section of an air stream, instrumentation for measurement might be simplified and a more representative temperature value obtained. Orifices having throat diameters of 8, 12, and 16 in were evaluated in a 24-in circular test duct to determine mixing effectiveness under selected test conditions of temperature distribution and flow rate. Targets of 8, 12, and 16 in in diameter in combination with a 12-in orifice were also investigated under similar conditions.

Graphic material is presented which illustrates how the orifice and orifice-target combinations perform as mixing devices under selected conditions. Results indicate that the 8-in (0.33 diam ratio) orifice effectively diminished the nonuniformity of temperature but only at a high pressure drop across the orifice and that a distance of 4.5 duct diameters was required for mixing.

BSS13. **Shrinkage and creep in prestressed concrete,** P. H. Petersen and D. Watstein, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 13 (Mar. 22, 1968).

Key words: Creep; loss of prestress; prestressed concrete; relaxation; shrinkage; variable prestress.

The loss of prestress resulting from creep and shrinkage in concrete was investigated for concrete specimens made with Type I portland cement and with Type III portland cement. The primary variables in this study were: (1) Relative humidity at which the concrete was maintained while under observation. (2) Age of the concrete at the time it was prestressed. (3) Ratio of prestress to strength; variation of this parameter required that the ratio of reinforcement be a variable. (4) Mass ratio factor defined as the ratio of the cross-section area of concrete specimen to its surface area per unit length.

Forty-nine sets of specimens were fabricated and tested; each et consisted of a prestressed specimen and an otherwise identi- al companion specimen without reinforcement.

The length changes with time were observed at intervals up to n age of 500 days. These observations were made for concretes ubjected to different levels of prestress, and for concretes restressed at different ages. Length changes in nonreinforced ompanion specimens were also obtained. Thus this study is oncerned with elastic deformation occurring at time of stress ransfer, shrinkage or swelling, and creep.

SS14. **Experimental determination of eccentricity of floor loads applied to a bearing wall,** D. Watstein and P. V. Johnson, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 14 (June 1968).

Key words: Bearing pads; bearing walls; brick masonry; design of bearing walls; eccentricity of applied loads.

The eccentricity of the loads applied to a specially calibrated ompressive strut simulating a brick bearing wall was experi- entally determined for a variety of bearing materials and condi- ons of contact. In one series of tests, an I-beam was bedded in gh strength gypsum plaster, bonded and unbonded. For the un- onded plaster bed the eccentricity ratio increased with the ap- lied load to a maximum value of about 0.42, while for the onded plaster bearing this ratio decreased to an average value f about 0.24 at the maximum load.

In the second series of tests the eccentricity was observed for n I-beam supported on neoprene rubber pads, capped and un- apped, of different thicknesses, and of different bearing length. n general the eccentricity ratio increased slightly with the ap- lied load. Lack of intimate contact between the I-beam and the ubber pad 1/8 in thick resulted in an eccentricity ratio of about .40, or nearly the same as for unbonded plaster bearing. Intima- y of contact produced by plaster capping resulted in a marked eduction in the eccentricity ratio to about 0.29; the confinement f the bearing length of the rubber pad to one-half of that used in revious tests and placing it at the extreme end of the beam, rther reduced the eccentricity ratio to about 0.18, and to 0.13 r a rubber pad 0.25 in thick.

SS15. **Interrelations between cement and concrete properties, Part 4. Shrinkage of neat portland cement pastes and concretes,** (Contains section 9 and section 10.) R. L. Blaine, H. T. Arni, and D. N. Evans, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 15, Part 4, 79 pages (Mar. 1969).

ection 9. **Shrinkage of hardened portland cement pastes,** R. L. Blaine, H. T. Arni, and D. N. Evans.

Key words: Chemical composition of portland cements; cracking of portland cements; cracking resistance of cements; portland cement; shrinkage of portland cements; trace elements.

The relationship between cement properties and drying hrinkage of partially hydrated neat cement pastes of normal onsistency made of a large number of portland cements of dif- erent types and composition were studied by fitting multivaria- le regression equations with the aid of a digital computer. The me of cracking of annular specimens restrained from shrinking y a steel core varied from 0.1 to more than 40 hours. The prin- ipal variables which appeared to have the greatest effect were he fineness and K_2O and C_4AF contents of the cements. The ineness and K_2O contents of the cements appeared to have the reatest effect on the nonrestrained shrinkage of prisms at the me of cracking of the annular specimens. The shrinkage of neat ement bars after 1, 6, 27 days, and 6 months in laboratory air iffered greatly with different cements. The principal variables ppeared to be the C_3A, SO_3, and C_3A/SO_3 ratios. Other com- only determined variables were associated with each of the above test values. The trace elements, other than Na_2O and K_2O, were not generally associated with the shrinkage or cracking characteristics.

Section 10. **Shrinkage and expansion of concrete,** R. L. Blaine and H. T. Arni.

Key words: Cement composition; expansion-shrinkage ratios; portland cement concrete; shrinkage of concrete; trace elements.

The relationship between the cement characteristics and the drying shrinkages of concretes made of a large number of cements of different types and compositions, as well as the subsequent expansions when the concretes were rewetted, were studied by fitting multivariable regression equations with the aid of a digital computer. Specimens $6 \times 8 \times 16$ inches, were made using 5.5 bags of cement (nominal) per cubic yard with a water/cement ratio of 0.635, as well as with a slump of 5 ± 1 inches. Increases in C_3A, C_4AF, fineness of the cement, and air content of the concrete were associated with increases in both shrinkage on drying and expansion on rewetting of the concretes. Increases in Na_2O, SO_3, and ignition loss of the cements were associated with decreases in the shrinkage values of the concretes. None of the individual trace elements, except possibly Rb and SrO, were associated to a highly significant degree with shrinkage or expansion characteristics of the concretes. The use of trace elements in equations with other more commonly determined variables resulted in a significant reduction in variance. There was no relationship between the shrinkage of concrete specimens moist cured 14 days and then dried in laboratory air for eight weeks, and the shrinkage of neat cements, moist cured only 24 hours and then dried in laboratory air. Higher values for dynamic Young's modulus of elasticity of the concretes were associated with lower shrinkage and expansion values.

BSS16. **Techniques for the survey and evaluation of live floor loads and fire loads in modern office buildings,** J. O. Bryson and D. Gross, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 16, 32 pages (Dec. 1968).

Key words: Fire loads; live floor loads; loads survey techniques; occupancy loads.

The procedures and techniques developed for measuring and evaluating the live floor loads and fire loads in modern office buildings are summarized. The main features of a computer program for analyzing the data are outlined. This program provides a tabulation of the data, some statistical properties, and selected graphical relationships between the measured loads and the characteristics and usage of the structure. A rationale is developed which is intended to achieve the ultimate goal—easier and less expensive means of surveying live loads in buildings and their combustible content.

Two office buildings have been surveyed in a pilot evaluation of the survey techniques—the National Bureau of Standards Administration Building in Gaithersburg, Maryland, and the U. S. Civil Service Commission in downtown Washington, D.C. Typical results are presented to illustrate the computer output.

BSS17. **Causes of variation in chemical analyses and physical tests of portland cement,** B. L. Bean and J. R. Dise, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 17, 34 pages (Mar. 1969).

Key words: Chemical analyses; physical tests; portland cement.

Variations in testing that could lead to the rejection of a material fully conforming to specification requirements, or the acceptance of a material with undesirable chemical or physical properties, are apparent in the results reported by laboratories participating in comparative tests of portland cements. Many of the causes for variation in chemical analyses and physical test results are listed in this discussion, and remedies for some of the

more frequently encountered deficiencies in apparatus and methods are suggested. Particular consideration is given to problems which do not seem to have been covered in sufficient detail in previous discussions of cement testing procedures. Literature references are given for additional information. (Supersedes NBS Monograph 28.)

BSS18. **Smoke and gases produced by burning aircraft interior materials,** D. Gross, J. J. Loftus, T. G. Lee, and V. E. Gray, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 18, 29 pages (Feb. 1969).

Key words: Aircraft materials; combustion products; fire tests; interior finish; smoke; toxic gases.

Measurements are reported of the smoke produced during both flaming and smoldering exposures on 141 aircraft interior materials. Smoke is reported in terms of specific optical density, a dimensionless attenuation coefficent which defines the photometric obscuration produced by a quantity of smoke accumulated from a specimen of given thickness and unit surface area within a chamber of unit volume. A very wide range in the maximum specific optical density was observed. For the majority of materials, more smoke was produced during the flaming exposure test. However, certain materials produced significantly more smoke in the absence of open flaming.

During the smoke chamber tests, indications of the maximum concentrations of CO, HCl, HCN, and other selected potentially toxic combustion products were obtained using commercial colorimetric detector tubes. A study was made of the operation, accuracy, and limitations of the detector tubes used. Measurements of the concentrations of HCl were also made using specific ion electrode techniques.

Qualitative identification of the major components of the original test materials was accomplished primarily by infrared absorption spectrophotometry.

BSS19. **A study of the variables involved in the saturating of roofing felts,** S. H. Greenfeld, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 19, 18 pages (June 1969).

Key words: Absorption; asphalts; felts; moisture; roofing; saturation.

The degree of saturation of a No. 27 felt with a typical roll saturant and a No. 55 felt with roll, mixed, and shingle saturants varied with saturation time and pressure, saturant temperature and viscosity, felt conditions, and press roll pressure and clearance. Optimum temperature and viscosity ranges were determined for each asphalt-felt combination. Both pressure and vacuum increased the completeness of saturation under optimum conditions, but frequently shortened the working temperature range in which optimum saturation could be produced.

Rate and degree of moisture and liquid water absorption decreased with increasing saturation. Air permeability decreased with increasing saturation. The consequences of some of these findings are discussed.

BSS20. **Durability of insulating glass.** Proceedings of a seminar held at the National Bureau of Standards, Gaithersburg, Md., November 14-15, 1968, H. E. Robinson, Editor, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 20, 84 pages (Feb. 1970).

Key words: Accelerated laboratory tests; double-glazed window units; factory-sealed insulating glass units; field performance tests, correlation with laboratory tests; sealant performance; standardized testing; test methods.

A two-day seminar on the Durability of Insulating Glass was attended by some 130 persons on November 14 and 15, 1968. The seminar was held at the Gaithersburg, Maryland, facilities of the National Bureau of Standards and featured fourteen speakers who participated in panel discussions or delivered individual papers. Numerous agencies interested in design, manufacture, specification, purchase, installation or maintenance of windows were represented at the seminar.

Among the topics considered in the panel discussions were: (1) The need for reliability and durability of insulating glass; (2) manufacturers' test methods; (3) proposals for future action. The Canadian experience with an accelerated test method and acceptance program was presented and discussed, as were the Norwegian accelerated test methods and their correlation with field experience. A review of current practices leading to new test methods and standards was also presented, and a "round robin" program that would compare various test methods now employed in the industry was proposed. Affirmative interest in participating in the proposed round robin was expressed by about a score of manufacturers present at the seminar. *These proceedings include the following papers (indented):*

BSS21. **Algorithms for psychrometric calculations (skeleton tables for the thermodynamic properties of moist air),** T. Kusuda, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 21, 53 pages (Jan. 1970).

Key words: Computer algorithm; psychrometrics; saturated and unsaturated moist air; thermodynamic properties.

Computer algorithms to obtain thermodynamic properties of saturated and unsaturated moist air are presented in this paper. The saturated moist air properties are calculated by the methodology developed by J. A. Goff and S. Gratch for their ASHRAE tables (1967 Book of Fundamentals, The American Society of Heating, Refrigerating and Air Conditioning Engineers). Sample calculations were performed using a computer program based upon the algorithms presented herein and the results are attached.

BSS22. **Investigation of performance characteristics for sanitary plumbing fixtures,** P. R. Achenbach, Project Director Coordinator, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 22, 72 pages (Jan. 1970).

Key Words: Abrasion resistance; chemical resistance; cigarette-burn resistance; cleanability and soilability; concentrated static-load capacity; performance characteristics; performance level; sanitary plumbing fixtures; scratch resistance; stain resistance; surface-impact resistance; test methods.

This report gives findings and recommendations developed during an investigation of performance characteristics for sanitary plumbing fixtures, conducted at the request of the Building Research Advisory Board of the National Academy of Sciences—National Research Council. The report describes the test methods that are recommended for the evaluation of 16 performance characteristics, and the nature of further work required to complete the development of four or five additional test procedures.

The suitability of various existing test methods for evaluating the functional and performance characteristics of sanitary plumbing fixtures was investigated in the laboratory. In addition, new or modified tests for certain characteristics were developed. The laboratory work was performed only on bathtubs and flat specimens provided by industry through appropriate arrangements with the Building Research Advisory Board. Field inspection trips were made to provide the NBS project staff with up-to-date information on certain manufacturing processes and on installation and use problems. The complexities involved in the selection of valid performance levels are discussed, as well as the elements of judgment involved. A format that might be used in specifying performance is suggested for each test procedure, and the rationale underlying each suggested format is given.

SS23. **Hail resistance of roofing products,** S. H. Greenfeld, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 23, 11 pages (Aug. 1969).

Key words: Asphalt shingles; built-up roofing; hail; roofing; shingles; storm damage.

A test was developed for evaluating the hail resistance of ofings, in which synthetic hailstones (ice spheres) of various zes were shot at roof assemblies at their free-fall terminal locities. Indentations, granule loss and roofing fracture were bserved. The following conclusions have been made from these sults: (a) All roofing materials have some resistance to hail mage, but as the size of the hail increases, a level of impact ergy is reached at which damage occurs. This level lies in the nge of 1 1/2 to 2 inch (3.8–5.1 cm) hailstones for most epared roofings. (b) Because of the ways in which prepared ofings are applied, most products have areas of different vulrability. (c) The solidly supported areas of roofing tend to be e most resistant to hail damage. (d) Heavier shingles tend to be ore hail-resistant than Type 235 shingles. (e) Weathering tends lower the hail resistance of asphalt shingles. (f) Built-up roofs dense substrates tend to resist hail better than those on soft bstrates. (g) Built-up roofs made with inorganic felts tend to be ore hail resistant than those made with organic felts. (h) Coarse gregrate surfacing tends to increase the hail resistance of roofg.

SS24. **Natural weathering of mineral stabilized asphalt coatings on organic felt,** S. H. Greenfeld, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 24, 17 pages (Oct. 1969).

Key words: Additive; asphalt; durability; felt; stabilizer; weathering.

Sixteen years of outdoor weathering of laboratory-prepared nooth-surface and mineral-surfaced, felt-base roofing ecimens has provided information on the effects of mineral adives on the durability of coating-grade roofing asphalts. Six ely divided mineral additives (blue black slate, clay, dolomite, ash, mica and silica) were evaluated at concentrations up to percent in California, Mid-Continent and Venezuela asphalts. e mineral-surfaced specimens are all performing satisfactorily, d show only minor degrees of degradation. Of the smooth-surced specimens, the Mid-Continent asphalt performed the best d the California asphalt the poorest. The mica and blue black te increased the durabilities of all three asphalts at all concenations and two coating thicknesses. Fly ash, clay, dolomite and ica were beneficial in some combinations, but had little effect others. In general, these early results from outdoor exposure d to corroborate the results obtained on these coatings exsed in weatherometers.

SS25. **Structural performance evaluation of a building system,** E. O. Pfrang and F. Y. Yokel, Nat. Bur. Stand. (U.S.), Bldg. Sci. Series 25, 127 pages (Nov. 1969).

Key words: Building systems; low-income housing; performance criteria; performance testing.

A full-scale, first-story portion of a building system was tested the laboratory in such a manner as to simulate the structural havior of a three-story building under both service and potenl ultimate loading conditions. Additional tests were performed the system components to provide behavioral data needed for e evaluation of the system.

Performance criteria for the evaluation of the structural safety d adequacy of certain building systems were developed. This port presents the results of the physical tests performed in the aluation of the safety and structural adequacy of one such stem, and discusses their significance. The report also presents ta concerning the complex interaction between components hich takes place in the building system.

The primary conclusions reached were: (1) The system, as erected in the laboratory, satisfied the performance criteria which were set for its evaluation with a substantial margin. As a system, it exhibited strength and stiffness in excess of service and ultimate load requirements. (2) The walls of the system behaved as an integral part of the structure. They provided most of the stiffness of the system with respect to lateral loads, and provided a significant portion of the stiffness against vertical loads.

BSS26. **Radiation errors in air ducts under nonisothermal conditions using thermocouples, thermistors, and a resistance thermometer,** J. C. Davis, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 26, 14 pages (Nov. 1969).

Key words: Conduction error; radiation error; resistance thermometer; temperature measurement; thermistor; thermocouple.

Studies were made to determine the radiation error in temperature measurements made with thermocouples, thermistors, and a resistance thermometer in moving air at velocities ranging from 300 to 1300 fpm when the temperature of the duct wall surrounding the air stream was from 0 to 50 °F higher than that of the air in the center of the duct. To eliminate all but the variable under study, conduction errors were minimized to a point where they were almost nonexistent by using Chromel P-constantan thermocouple wire and by employing other techniques. Radiation effects were studied when the probe housing the three types of temperature sensors was unshielded and again when it was shielded. The studies showed that when the sensors were unshielded and the temperature difference between the duct wall and the air was 50 °F (28 K, approximately), the error in the sensors was about 3.8 °F (2.1 K) for an air velocity of 300 fpm (1.5 m/s) and 1.0 °F (0.6 K) for an air velocity of 1300 fpm (6.6 m/s). When the sensors were shielded, the error was about 0.2 °F (0.1 K) for 300 and 500 fpm velocities and the same duct wall air-temperature difference. Tests were not performed at 1300 fpm with the sensors shielded because theory indicated that radiation error would be negligible at this velocity. Under the test conditions that prevail in the testing of air conditioners and heat pumps in laboratories, it should be possible to reduce the error in temperature measurement of the moving air to about 0.2 °F (0.1 K) by a suitable combination of air mixers, duct insulation, radiation shields, and calibration techniques.

BSS27. **Performance of louvered devices as air mixers,** T. K. Faison, Jr., J. C. Davis, and P. R. Achenbach, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 27, 22 pages (Mar. 1970).

Key words: Effectiveness; forced mixing; mixing device; pressure drop; temperature; uniformity.

As part of a study of evaluating methods for reducing thermal gradients within the cross section of an air stream, three louvered mixing devices were investigated. Each of these devices was found to be capable of reducing the cross-sectional nonuniformity of air temperature to a few percent of the entering value. The three devices covered in this report contain combinations of louvers (directing vanes) and baffles as mixing elements. Two of the devices were designed at the National Bureau of Standards; the third was a modification of a previous design. The three mixers (the louvered strip, the concentric louvers, and the louvered-baffle) required 4.75, 3.8, and 3.0 duct diameters, respectively, to reach a mixing effectiveness level of 97 percent. The mixing effectiveness of the louvered strip and concentric louver models was independent of the approach velocity, whereas the effectiveness of the louver-baffle model was somewhat dependent on the approach velocity. The pressure drops accompanying air flow through the mixers, expressed as multiples of the velocity head of the entering air, were approximately 7, 5, and 38 for the lou-

vered strip, concentric louver, and louver-baffle mixers, respectively.

BSS28. **Exploratory studies of early strength development in portland cement pastes and mortars,** R. L. Blaine and L. A. Tomes, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 28, 14 pages (July 1970).

Key words: Cement; cement mortar; cement paste; early strength; false set; hardening of cement; hydration; shear resistance; theory of cement hardening; time of set; vane-shear apparatus.

A modified vane-shear apparatus was used to measure the shear resistance of neat cement pastes of normal consistency and 1:2.75 (cement to sand) mortars of standard consistency, and to measure the increase in shear resistance with time as the cements hardened. The hardening process appeared to occur in three stages. The rate of increase of shear resistance as well as the duration of the different phases differed with the different cements. The results were analyzed in terms of the various theories proposed to explain the hardening of cements.

BSS29. **1964 exposure test of porcelain enamels on aluminum—three year inspection,** M. A. Baker, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 29, 13 pages (April 1970).

Key words: Color; gloss; porcelain enamel on aluminum; weather resistance.

An exposure test of porcelain enamels on aluminum was initiated by the National Bureau of Standards and the Porcelain Enamel Institute in 1964. The enamels were returned from the exposure sites to the laboratory at NBS to be measured for changes in gloss and color after exposures of six months, one year, and three years. Changes were found to be greatest at Kure Beach and least at Montreal and Los Angeles, with moderate changes occurring at Washington and New York.

Although the boiling citric acid test is used as an acceptance test for these enamels, the correlation with color change, particularly at Kure Beach, was not as good as expected. A cupric chloride test was developed which shows an improvement in this correlation.

BSS30. Wind loads on buildings and structures. Proceedings of a Technical Meeting held at the National Bureau of Standards, Gaithersburg, Maryland, January 27-28, 1969, R. D. Marshall, Editor, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 30, 169 pages (Nov. 1970).

Key words: Aerodynamic forces; atmospheric boundary layer; structural design; turbulence; wind effects; wind loads.

A technical meeting concerning wind loads on buildings and structures was held at the Gaithersburg Facility of the National Bureau of Standards on January 27 and 28, 1969. The meeting, jointly sponsored by the Building Research Division of the National Bureau of Standards and the Environmental Data Service of the Environmental Science Services Administration, was intended to promote the exchange of information between research workers and practicing engineers engaged in this important area of technology.

Thirteen papers covering four themes were presented. These themes were as follows: engineering problems in the design of structures to resist wind loads; atmospheric considerations; experimental and theoretical determination of aerodynamic forces; and recent advances in design procedures and current deficiencies. Presentations were followed by a panel discussion which included a summary of each theme. The last session of the meeting was devoted to open discussion.

Design and construction for what wind loads and why, L. C. Maugh, *BSS30,* pp. 5-8 (Nov. 1970).

Key words: Buildings; design criteria; dynamics; gust factors; smoke stacks; structural failure; wind loads.

This paper is primarily concerned with the design of various structures for wind forces from the viewpoint of the average structural engineer. The subject matter focuses attention upon three important types of structural problems whose solutions are still so uncertain as to require considerably more study and research. These problems are:

1. Wind action upon structural frameworks during construction with emphasis upon the relatively large number of partial or complete failures.

2. The behavior of completed structures of relatively high frequencies when subjected to wind loads. An important factor here is the amount and characteristics of motion in high-rise buildings that will be accepted by the occupants.

3. Some dynamic problems associated with wind forces acting upon structures of low frequencies such as tall chimneys and guyed towers.

The above problems are discussed from the need fo better design criteria and specifications as well as mor exact mathematical analysis and more refined wind mea surements. The importance of the latter factor is recognize but the many empirical factors in structural design are als considered in this paper.

Design wind loads for building wall elements, W. F. Koppes *BSS30,* pp. 9-18 (Nov. 1970).

Key words: Buildings; fluctuating pressure; gust factors walls; wind damage; wind loads.

It is principally the structural engineer who has been con cerned with wind forces acting on buildings, because it is hi responsibility to design the structure to resist their overa effect. Recently, however, the importance of localized win loads acting on the surfaces of buildings has also bee receiving much attention. These local loads affect wa design, and are a matter of concern to both the architect an the manufacturer of wall parts.

The important differences between overall and local win loads include magnitude of intensity, character, period c duration, significance in relation to building size and shape and importance in respect to potential property loss Complete destruction of buildings by wind action is rare, bu local failures are not uncommon and, on the whole, are mor costly.

Because gust and shape factors are highly unpredictable increasing reliance is being placed on wind tunnel tests an measurements on actual buildings. Both confirm that nega tive pressures usually exceed positive pressures on parts o wall areas. Few building codes in this country recogniz this, in specifying design wind loads for walls, though code in some other countries do. The importance of terrain cond tions is not reflected, either, in code provisions.

Failures of windows and other wall elements due to win loads occur rather frequently, but relatively few of them ar documented. Several interesting examples of such failure can, however, be cited.

Another important aspect of local wind effects is the fur neling often experienced near the base of tall buildings Notable examples of this phenomenon have been observed and research studies directed at their causes have produce significant findings.

Codes and standards cannot be expected to provide guidance for designers in respect to unique local wind effects, but they should provide information as to loads which wall surfaces of typical buildings will likely experience. The only standard currently providing this kind of data is the Tentative Standard for Design Wind Loads on Walls of Rectangular Buildings, published by the National Association of Architectural Metal Manufacturers. The background, purpose and features of this Standard are noteworthy, and it is serving a useful purpose.

A review of current investigations of local wind loads, both by wind tunnel tests and field measurements, indicates that certain common assumptions regarding their intensity and distribution on building surfaces should be reexamined. Further information regarding the nature of these loads is urgently needed by, and should be more promptly disseminated to, the designers and producers of building wall systems.

Guidelines in selecting wind measuring instruments and their ocations for wind loading studies, G. C. Gill, *BSS30,* p. 21 Nov. 1970).

Key words: Anemometers; instrumentation; tower interference; transducers; wind vanes; wind loads.

The different types of wind speed sensors (cup, propeller, pressure tube, pressure sphere, hot wire, and sonic) will be discussed in relation to their suitability for wind loading studies. For very sound reasons the rotational types of anemometers (cup and propeller) have become the standard wind speed sensors used in North America today. Pressure type wind speed sensors will be considered but they have inherent weaknesses as anemometers. In view of the versatility of the rotational anemometers and in view of all weather records and charts being based on observations with these instruments it appears advisable for wind loading studies to measure wind speed with these conventional anemometers.

Wind vanes of different types (flat plate, splayed vane, and aerodynamic cross section) will be discussed and the transducers to be used with them. Very light vanes of the flat plate type are recommended.

The dynamic response and fidelity of recording of both anemometers and wind vanes will be discussed.

The wind-shadow effect of towers on the wind sensors mounted thereon, and the orientation of the sensors will be discussed. For good exposure the sensors should be mounted one to two tower widths out from the tower, and, either into the prevailing wind, or, into the wind direction of maximum concern. The height and location of towers relative to the building or structure under study will be discussed.

The adequacy of existing meteorological data for evaluating ructural problems, I. A. Singer and M. E. Smith, *BSS30,* pp. 3-25 (Nov. 1970).

Key words: Climatology; meteorology; spatial correlation; turbulence; wind observations; wind profiles.

Available meteorological data are usually unsuitable for application to structural problems for a variety of reasons. The most obvious deficiency involves instrument location in the three-dimensional sense. Most meteorological observations have been obtained at low elevation in open country, and they therefore do not reveal the wind structure at the typical heights of modern urban buildings. Furthermore, few of the data have been processed to reflect the turbulent structure of the flow. More subtle problems are involved with the failure of any current programs to define the horizontal structure of turbulence, although a small number of appropriate studies have been made in the vertical. Very important also is the lack of data taken under extreme meteorological conditions, such as thunderstorms and hurricanes. These deficiencies derive in part from the difference in objectives that have led to existing meteorological programs and those that would suit the structural engineer, but they are also associated with the failure of the latter to define his requirements. An experimental program that may fill some of the gaps is outlined for discussion and criticism.

The characteristics of atmospheric turbulence as related to wind loads on tall structures, G. H. Fichtl, J. W. Kaufman, and W. W. Vaughan, *BSS30,* pp. 27-41 (Nov. 1970).

Key words: Atmospheric boundary layer; gust factors; peak values; power spectra; turbulence; wind profiles.

An engineering boundary layer wind model based upon data collected at the NASA 150-meter meteorological power facility at the Kennedy Space Center, Florida is discussed. A statistical power-law peak wind profile is used to extrapolate peak wind statistics valid at the 10-meter to other levels. The relationship between the instantaneous extreme wind profile and the peak wind profile for various periods of exposure up to ten minutes is examined. The gust factor profile, which depends on the peak wind speed, height, and averaging time, is applied to the peak wind profile to obtain a mean wind profile. A spectral model of the longitudinal and lateral components of turbulence for the neutral boundary layer (high wind speeds) is presented.

Fluctuating moments on tall buildings produced by wind loading, J. E. Cermak, W. Z. Sadeh, and G. Hsi, *BSS30,* pp. 45-59 (Nov. 1970).

Key words: Boundary layer; buildings; instrumentation; overturning moments; pressure fluctuations; wind loads; wind tunnel modeling.

Wind loading on a 1:384 scale model of a building 666 ft high was studied experimentally in a thick-boundary-layer wind tunnel. Measurements of mean velocity and turbulence intensity upstream of the model building verified that the wind tunnel flow was an adequate simulation of atmospheric-surface-layer flow over an urban area.

Mean pressure distributions and local pressure fluctuations were measured for a variety of upstream roughness conditions and wind directions. Use of a high frequency response pressure-measuring system permitted rms and peak values of the local pressure fluctuations to be determined at numerous points on the building surface.

Emphasis was placed on direct measurement of mean and fluctuating overturning moments by means of a strain-gage dynamometer. A stiff model, $U/Dn < 1$, was used to obtain moments due to wind action alone. Peak values of the moment fluctuations were found to have a magnitude of $\pm 34\%$ of the mean moment. Root-mean-square values of the moment fluctuations were also determined in an effort to relate the moment fluctuations to the measured pressure fluctuations.

Experience with wind pressure measurements on a full-scale building, W. A. Dalgliesh, *BSS30,* pp. 61-71 (Nov. 1970).

Key words: Buildings; full-scale tests; power spectra; pressure fluctuations; wind loads; wind tunnel modeling.

Wind pressure measurements made over a 4-year period on a 34-story building in downtown Montreal were used to obtain data for checking and improving wind tunnel techniques of modeling flow characteristics of wind and aerodynamic behavior of buildings. It had been hoped that the measurements could be applied directly to certain

problems of design such as evaluation of peak suction load over small wall areas. The small number of pressures recorded, however, combined with limitations of field measurements made direct application of the data extremely difficult.

The major problems involved in making field measurements and in comparing them with wind tunnel measurements were found to be:

(*a*) difficulty of establishing a static reference pressure and its relation to the static pressure in the wind tunnel;

(*b*) inadequacy of wind velocity information, which in this case consisted of one anemometer and wind vane located 1,500 ft southwest of the building;

(*c*) lack of stationarity and homogeneity of the velocity field as compared with the wind tunnel situation.

Comparisons with model measurements are made on the basis of mean pressures, rms pressures, power spectra, and the correlation between selected pairs of pressures measured at various points on the building. Examples have been found of excellent agreement in almost all respects, but for some wind directions the comparisons gave unsatisfactory correlation. The lack of agreement is attributed mainly to differences between indicated and actual on-site wind direction, but this cannot be shown conclusively because of incomplete wind information.

The total cost of the project over the 4-year period was of the order of $100,000. A greater expenditure would have been advisable, primarily for instrumentation to permit a better definition of the wind velocity around the building. Measurements are now under way on a 600-ft office building using a much more sophisticated data acquisition system by means of which it should be possible to acquire the desired information more efficiently and in a shorter period of time.

Influence of architectural features on the static wind loading of buildings, H. J. Leutheusser, *BSS30,* pp. 73-86 (Nov. 1970).

Key words: Architectural features; buildings; mullions; parapets; roof projections; static pressures; wind effects; wind tunnel modeling.

The paper deals with the exploration, by model tests, of the effects of roof parapets and roof projections onto the roof wind-loading, and of wall mullions (or ribs) onto the wall wind-loading, of bluff building forms. Results are presented which suggest that parapets are effective in equalizing the pressure distribution over the roof surface while slightly reducing the uplift force. Roof projections, on the other hand, have the opposite effects. The presence of wall mullions causes sawtooth like deviations from the peripheral wall pressure-distribution for the no-rib case. The deviations are particularly significant in regions of attached flow and tend to become more pronounced with an increase in rib spacing.

The unsteady surface pressure around circular cylinders in two-dimensional flow, W. E. Simon, *BSS30,* pp. 87-91 (Nov. 1970).

Key words: Circular cylinders; power spectra; pressure fluctuations; subcritical flow; supercritical flow; transcritical flow; turbulence.

The unsteady surface pressure around circular cylinders in two-dimensional flow has been measured in the subcritical, supercritical, and transcritical flow regions. A representation of the crosspower spectral density has been developed which is a reasonable representation of the data and which applies to all three regions. The most important result is the essential similarity of the subcritical and transcritical regions.

On the reliability of gust loading factors, B. J. Vickery *BSS30,* pp. 93-104 (Nov. 1970).

Key words: Buildings; dynamics; gust factor; mode shape probability theory; wind loads.

The accuracy of the simplified gust factor approach to the determination of wind loads is examined. An expression for the gust factor is derived which treats the scale of turbulence, mode shape of vibration, and parameters defining the vertical and crosswind cospectra as variables. The method formulated in this paper differs from previous methods primarily in the size reduction factor and in the form of the spectrum of velocity fluctuations. Predicted values of gust factors are compared with those observed on eight different aeroelastic models tested in a boundary layer wind tunnel. The gust factor relates only to overall loads in the mean wind direction. Where basic data are well defined, the ratio of expected peak values of wind-induced stress or deflection to their average values can be predicted to an accuracy of typically 5 percent to 10 percent.

The treatment of wind in the design of very tall buildings, L. E. Robertson and P. W. Chen, *BSS30,* pp. 107-114 (Nov. 1970).

Key words: Aeroelasticity; buildings; dynamics; statistical analysis; structural engineering; wind loads; wind tunnel modeling.

This paper describes briefly some highlights of a study of the wind effects for the design of the United States Steel Office Building in Pittsburgh, Pennsylvania. Three types of models were used in a boundary layer wind tunnel to obtain data of the wind effects on the building. The wind tunnel results are combined with Weather Bureau data to obtain statistical estimates of the design parameters. These parameters include the envelopes of maximum deflections, the contours of maximum and minimum wind pressures on the exterior walls, and the expected number of cycles of oscillation per year which exceeds specific values of acceleration and of deflection.

Dynamic response of tall flexible structures to wind loading J. Vellozzi and E. Cohen, *BSS30,* pp. 115-128 (Nov. 1970).

Key words: Aeroelasticity; buildings; circular cylinders; gust factors; masts; structural engineering; towers; vortex shedding; wind loads.

The purpose of this paper is to present and discuss methods of calculating the dynamic response of tall, flexible structures, such as towers, stacks and masts, to wind loading. The paper is presented in two parts; the first part deals with the dynamic response of cylindrical structures to vortex shedding and the second part deals with dynamic response to gust loading.

Some deficiencies in current methods of analysis, R. W. Clough, Chairman, *BSS30,* pp. 129-131 (Nov. 1970).

Key words: Buildings; climatology; seismic loads; structural engineering: vibrations; wind loads.

Deficiencies in methods of analysis for structures subjected to wind forces are considered. Areas of similarity between wind and seismic forces and their treatment by current building codes are discussed. Deficiencies include neglect of the dynamic nature of the wind problem, a lack of basic information, and an inadequate definition of acceptable levels of risk.

Combining a wind tunnel analysis with a three-dimensional analytic building analysis, G. C. Hart, *BSS30,* pp. 145-147 (Nov. 1970).

Key words: Buildings; dynamics; gust loads; matrix analysis; mode shape; probability theory; wind loads.

A three-dimensional oriented stiffness representation of a high-rise building is described. Statistical quantities obtained from aeroelastic models in a boundary layer wind tunnel are combined with the three-dimensional analytical building model to obtain a probabilistic description of the building's response. The response is expressed in terms of the mean and covariance of floor displacements and stresses in the structural members. The procedure is intended to provide a more realistic combination of the aerodynamic and structural behavior of a high-rise building.

The engineering interpretation of Weather Bureau records for wind loading on structures, S. C. Hollister, *BSS30,* pp. 151-164 (Nov. 1970).

Key words: Buildings; climatology; extreme value theory; gust factors; structural engineering; wind loads; wind profile.

This paper utilizes the records of the fastest mile as published by the United States Weather Bureau from data obtained at their airport stations, to develop wind loadings on engineering structures. It analyzes gusts and shows how gust loadings should be dealt with in structural design. Roughness of terrain and extent of cover in rural and urban localities are systemized for engineering purposes. Occurrence of extreme winds, as studied by the Weather Bureau, is extended to a stage where a practical code may be written. Finally, designing for a given structural life and for a desired level of risk is discussed.

BSS31. **Flexural behavior of prestressed concrete composite Tee-beams,** J. O. Bryson and E. F. Carpenter, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 31, 14 pages (July 1970).

Key words: Composite concrete construction; prestressed concrete beams; Tee-beams.

Prestressed Tee-beams constructed by the split-beam method were tested to failure in flexure to study the behavior and ultimate strength of these beams and to compare their flexural characteristics with those of prestressed beams of conventional construction. The compressive portion of the cross section of the split-beam is cast after the web of the beam has been formed and prestressed. The variables in the study included the precentage of prestressing steel, strength of concrete in the compressive element of the composite split-beams, manner of prestressing and web reinforcement.

Results showed that the composite split-beams behaved similarly to the monolithically constructed beams on the basis of flexural response and ultimate load. The strength of the concrete for the compressive element can be reduced within limits from that required for the prestressed element without sacrificing ultimate load capacity. The required percentage of reinforcing steel is less for the split-beam compared with conventional beams.

BSS32. **Precoordination—basis for industrialized building.** Proceedings of a conference held at Gaithersburg, Md., September 24-26, 1969, R. W. Smith, Jr., Editor, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 32, 136 pages (Jan. 1971).

Key words: Building; components; precoordination; standards.

The Conference entitled "Precoordination—Basis for Industrialized Building" was held at the National Bureau of Standards, Gaithersburg, Md., on September 24-26, 1969. The Conference was sponsored by the American National Standards Institute's Committee A62, Precoordination of Building Components and Systems, to explore the standards required to establish a basis for an industrywide system of building using interchangeable components. Coordinated components, conforming to these standards, will be compatible and interchangeable in both dimension and function and thereby offer unlimited opportunities for product and material selection as well as design flexibility.

BSS33. **Compressive strength of slender concrete masonry walls,** F. Y. Yokel, R. G. Mathey, and R. D. Dikkers, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 33, 32 pages (Dec. 1970).

Key words: Buckling; compressive strength; concrete block walls; elastic stability; flexural strength; masonry walls; reinforced concrete masonry walls; slenderness effect; structural stability.

Sixty reinforced and unreinforced concrete masonry walls of different slenderness ratios were tested to failure under vertical loads applied axially and at various eccentricities. Prism specimens, made of similar masonry units and mortars, were also tested under the same loading conditions. Analysis of test results indicates that wall strength can be conservatively predicted by evaluating cross-sectional wall capacity on the basis of prism strength and reducing the capacity for slenderness effects by evaluating the added moments attributable to wall deflection. Test results were also compared with allowable loads computed in accordance with the current NCMA standard.

BSS34. **Strength of masonry walls under compressive and transverse loads,** F. Y. Yokel, R. G. Mathey, and R. D. Dikkers, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 34, 74 pages (Mar. 1971).

Key words: Brick; cavity walls; composite walls; compressive strength; concrete block; flexural strength; masonry; mortar; slenderness effects; standards; structural stability; walls.

Ninety walls of 10 different types of masonry construction were tested under various combinations of vertical and transverse load. It is shown that the effect of vertical load and wall slenderness on transverse strength can be predicted by rational analysis. The analysis is based on established theory which has been extended to account for the properties of masonry. Similar methods of rational analysis have been adopted for the design of steel structures and are presently being considered for reinforced concrete structures.

BSS35. **Interrelations between cement and concrete properties, Part 5. Freezing-and-thawing durability, saturation, water loss and absorption, dynamic modulus,** R. L. Blaine and H. T. Arni, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 35, 129 pages (Nov. 1971).

Key words: Absorption; autogenous healing; durability factor; dynamic modulus of elasticity; saturation coefficient.

The concretes described in earlier parts of this series were subjected to laboratory freezing and thawing tests, and measurements were made of the weight loss, dynamic modulus, durability factor, and number of cycles required to reach 40 percent reduction in dynamic modulus. Companion specimens were subjected to drying and subsequent soaking in the laboratory and to dynamic modulus tests at various ages and moisture conditions. The effect on these properties of a large number of variables connected with chemical and physical properties of the cements and with properties of the concretes was studied by multivariable regression techniques. Air content of the concretes and degree of saturation generally had the greatest effect on the measurements. In general, minor constituents and trace elements did not show significant relationships with the measured properties, but there was evidence that some of the variables, such as alkali content, water cement ratio, slump, and possibly setting time might have influenced durability through an effect on the air-void system. Specimens stored in the fog room after the freezing-and-thawing tests generally regained most or all of their original

dynamic modulus. There were significant differences between cements with respect to regain of dynamic modulus (autogenous healing), with the non-air-entrained cements gaining more than the air-entraining cements, on the average.

BSS36. **Interrelations between cement and concrete properties, Part 6. Compilation of data from laboratory studies,** J. R. Clifton and R. G. Mathey, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 36, 118 pages (Aug. 1971).

Key words: Cement; chemical composition; concrete; durability; material properties; physical properties.

Data are presented on the properties of Portland cements, mortars and concretes from a long term study reported principally by Blaine and Arni.

These data are from laboratory studies and cover a wide range of cements and concretes. A total of 199 different cements were included in the study.

BSS37. **The effect of moisture on the heat transfer performance of insulated flat-roof constructions,** F. J. Powell and H. E. Robinson, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 37, 81 pages (Oct. 1971).

Key words: Flat roofs; heat transfer; moisture transfer; thermal insulation.

A solution to the problem of unwanted moisture in the thermal insulation of flat roofs was found during a recently completed laboratory investigation of the effects of moisture on heat transfer through these constructions. The objective of the research was to ascertain how much the insulating performance of conventional constructions, having insulation over concrete decks, was affected by moisture. This is presented as Part I. Also, the objective was to investigate properties of materials, their arrangement and dimensions which would yield a construction having an adequate degree of self-drying ability, combined with low winter moisture regain rate. This is presented as Part II. The results show that the best insulating and moisture performance was obtained by utilizing the heat of the summer sun on the roof to vaporize and transfer to the room beneath any free moisture contained within the construction. Roof specimens made from moderately vapor-permeable materials without conventional vapor barriers were, in winter, able to accommodate the small quantity of slowly accumulated condensation without dripping or severe loss of insulating value. During the nine-year investigation, the performance characteristics of 73 insulated roof deck specimens were obtained and two new methods of measurement were developed. Criteria for the design of self-drying insulated flat roofs were developed and limits of the parameters containing the main variables that affect performance were suggested.

This paper presents complete results of the research which was sponsored jointly by the National Bureau of Standards, the Army, the Navy, and the Air Force.

BSS38. **1939 exposure test of porcelain enamels on steel 30-year inspection,** M. A. Baker, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 38, 9 pages (Aug. 1971).

Key words: Acid resistance; color; gloss; porcelain enamel; weather resistance.

The weather resistance of 192 porcelain enameled panels representing 14 enamel types was evaluated after being exposed for 30 years at Washington, D.C. A direct correlation was found between the acid resistance and weather resistance of the enamels tested. The porcelain enamel protected the base metal from corrosion if the initial coverage was complete.

Similar evaluations and findings were made on 58 panels representing 13 enamel types that were added to this test in 1947.

BSS39. **Use of computers for environmental engineering related to buildings.** Proceedings of a Symposium sponsored by the National Bureau of Standards, the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc., and the Automated Procedures for Engineering Consultants, Inc., held at the National Bureau of Standards, Gaithersburg, Md., Nov. 30-Dec. 2, 1970, T. Kusuda, Editor, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 39, 826 pages (Sept. 1971).

Key words: Building heat transfer analysis; energy usage; environmental engineering; heating and air conditioning; use of computers.

This proceedings of the First Symposium on the Use of Computers for Environmental Engineering Related to Buildings contains all of the technical papers and invited addresses presented at the symposium, which was held November 30-December 2, 1970, at the National Bureau of Standards.

The fifty-nine papers deal with the application of the computer to such environmental engineering problems as building heat transfer calculations, heating and cooling load calculations, system simulations, energy usage analyses, computer graphics, air and smoke movement inside buildings, and weather data analyses for load and energy usage calculations.

BSS40. **Engineering aspects of the 1971 San Fernando earthquake,** H. S. Lew, E. V. Leyendecker, and R. D. Dikkers, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 40, 419 pages (Dec. 1971).

Key words: Bridge; building; codes; dams; earthquake damage; earthquakes; foundation geology; highways; hospital; housing; mobile home; seismic; standards; structural engineering.

Immediately following the San Fernando, California earthquake (February 9, 1971), a four-man team from the Building Research Division of the National Bureau of Standards' Institute for Applied Technology, surveyed the damage to buildings and other structures. This report is based primarily on the data gathered during the survey but includes some data provided by other agencies and individuals. Based on study of these data and observations made during the survey, recommendations are made pertaining to the improvement of building and other structural design and construction practices.

BSS41. **Performance of a single-stack DWV system utilizing low-angle stack-branch confluence and bottom shunt venting,** R. S. Wyly and G. C. Sherlin, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 41, 24 pages (Apr. 1972).

Key words: Criteria for plumbing; hydraulic test loads; performance of plumbing; single stack plumbing.

Among the more important criteria for hydraulic and pneumatic performance of sanitary drain-waste-vent systems are (1) maintenance of water seals in fixture traps, (2) limitation of pneumatic pressures, (3) limitation of hydrostatic and hydrodynamic pressures, and (4) limitation of cross-flow between horizontal branches or trap arms.

Recent tests of a single-stack drainage system proposed for a high-rise apartment project in Fairfax County, Virginia have produced the following findings with respect to these performance criteria: (1) test loads (total discharge rates) ranging up to magnitudes greater than predicted loads yielded reasonable average trap-seal retention; (2) the use of trap-seal retention as a measure of performance appears to be more meaningful than the traditional pneumatic-pressure measure; (3) fitting geometry and branch arrangement can be more critical in single-stack systems than in conventional vented systems, and (4) present procedures for selecting test loads, for making tests, and for reporting and interpreting measured values need improvement and standardization.

BSS42. **Design loads for inserts embedded in concrete,** T. W. Reichard, E. F. Carpenter, and E. V. Leyendecker, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 42, 28 pages (May 1972).

Key words: Anchors; concrete slabs; design loads; fatigue; inserts; pull-out loads; sustained load.

Detailed test procedures are presented for a research program on cast-in-place inserts embedded in reinforced concrete. Three types of inserts, two of malleable iron and one of ductile steel, capable of receiving a 3/4 inch threaded rod were tested. Other variables included concrete aggregate type, concrete strength, reinforcement cover and spacing, angular loading, flexural cracking, sustained load and fatigue loading.

It was found that the pull-out load for an insert could be approximated by a linear function of the concrete unit weight and square root of the compressive strength in a statically loaded reinforced concrete slab. The effect of other variables is related to the insert pull-out loads in these slabs. Design recommendations are presented.

BSS43. **Paper honeycomb sandwich panels as lightweight structural components,** T. W. Reichard, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 43, 7 pages (Apr. 1972).

Key words: Adhesives; paper honeycomb; sandwich facings; sandwich panels.

This paper presents a resume of current practice in the U.S. with regard to the use of sandwich panels in single-story buildings. A description and the properties of typical paper honeycomb cores are given. Some of the factors which are considered in choosing sandwich facings and adhesives are given.

BSS44. **Full scale test on a two-story house subjected to lateral load,** F. Y. Yokel, G. Hsi, and N. F. Somes, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 44, 26 pages (Nov. 1972) 50 cents, SD Catalog No. C13.29/2:44.

Key words: Building damping; drift; dynamics; earthquake; frequency; housing; lateral resistance; racking; stiffness; structural deflections; vibration; wind load; wood frame construction.

Tests were carried out on a house to determine its deflection characteristics under lateral loads. The house is a two-story building of conventional wood-frame construction. Two series of tests were conducted. The first of these was to determine the stiffness of the house when subjected to a simulation of wind loading. The second was to determine the dynamic response of the house to a single impulse load.

The report presents the results of these tests from which the following primary conclusions were derived:

1. The measured second-story drift of the building under the test load was considerably less than the drift permitted for medium- and high-rise buildings by present design criteria for most areas of the United States.

2. Only a small portion of the distortion of the exterior walls was transmitted to the interior gypsum board.

3. The upper ceiling diaphragm experienced significant in-plane deformation. On the other hand, the floor/ceiling diaphragm at the lower ceiling level tended to act as a rigid diaphragm and to translate as a rigid body when the building was subjected to lateral load.

4. The natural frequency of the structure was approximately 9 Hz and damping averaged approximately 6 percent of critical damping varying from 4 to 9 percent.

BSS45. **Dynamic thermal performance of an experimental masonry building,** B. A. Peavy, F. J. Powell, and D. M. Burch, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 45, 103 pages (July 1973) $1.25, SD Catalog No. C13.29/2:45.

Key words: Building heat transfer; computer programs; dynamic thermal performance; heat flow analysis; heating and cooling loads; temperature predictions; thermal analysis; thermal behavior; transient heat flows.

Measurements of the dynamic heat transfer in an experimental masonry building were made in a large environmental chamber to explore the validity of a computer program developed at NBS, labeled NBSLD, for computing heating and cooling loads, and indoor air temperatures. This study was jointly supported by the National Bureau of Standards and the Department of Housing and Urban Development, and is a part of a broader research program being supported by both agencies to improve performance test procedures and criteria for housing.

The experimental structure was a one-room house 20 ft long 20 ft wide, and 10 ft high with walls of solid concrete blocks and a flat roof made of reinforced precast concrete slabs. During the tests changes were made in fenestration, the amount and location of insulation, and the indoor mass; and the building was exposed to a diurnal temperature cycle.

It was found that the combination of mass in the masonry walls and roof, and insulation placed on the outside of the masonry was very effective in reducing and controlling the variation of indoor air temperature. The NBSLD computer program realistically predicted the heat storage effects, and maximum heating loads during these tests. For five heating tests, the greatest difference between computed maximum heating load and measured values was 8 percent and the average difference was 4.3 percent. It was shown that steady-state methods of heating load calculation could result in oversizing heating equipment by 30 percent or more for this particular building and imposed exterior conditions if the lowest outdoor temperature was selected as the design temperature.

BSS46. **Building practices for disaster mitigation.** Proceedings of a workshop sponsored by The National Science Foundation, Research Applied to National Needs Program, and The National Bureau of Standards, held at the National Bureau of Standards, Boulder, Colo., Aug. 28-Sept. 1, 1972, R. Wright, S. Kramer, and C. Culver, Editors, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 46, 483 pages (Feb. 1973) $5.30, SD Catalog No. C13.29/2:46.

Key words: Building; earthquakes; hazards; land use; structural engineering; wind effects.

The national workshop on building practices for disaster mitigation was concerned with earthquakes, extreme winds, and similar dynamic hazards. These proceedings present recommendations derived at the workshop and addressed to policy makers in government and industry, as well as practitioners in engineering, architecture, land use planning, and the earth and meteorological sciences. The recommendations evaluate current building practices, define opportunities for improving current practice from documented research findings, and recommend research to fill gaps in knowledge. Recommendations are made for implementation of improved practices at professional and policy levels. The objectives include avoidance of human suffering, reduction of property loss, and maintenance of vital function in buildings under conditions threatening disaster. Fifteen review articles were prepared by experts in the professions and research disciplines to define the state-of-the-art in disaster mitigation and to guide discussions at the workshop. These articles are included in the proceedings as follows:

Workshop recommendations, *BSS46*, pp. 7–39 (Feb. 1973).

Values and costs, H. Kunreuther, *BSS46*, pp. 41-62 (Feb. 1973).

Approaches to implementation, P. E. Baseler, *BSS46*, pp. 63-81 (Feb. 1973).

Earthquake hazards for buildings, N. C. Donovan, *BSS46*, pp. 82-111 (Feb. 1973).

The problem of seismic zoning, S. T. Algermissen, *BSS46*, pp. 112-125 (Feb. 1973).

Wind hazards for buildings, J. W. Vellozzi and J. J. Healey, *BSS46*, pp. 126-138 (Feb. 1973).

Land use planning and natural disaster mitigation, W. J. Petak, M. McCoy, W. J. Monasch, J. E. Slosson, D. F. Moran, J. H. Wiggins, Jr., *BSS46*, pp. 139-178 (Feb. 1973).

Architectural approaches to hazard mitigation, E. C. Hillman Jr., A. E. Mann, *BSS46*, pp. 179-187 (Feb. 1973).

Procedures and criteria for earthquake resistant design, C. W. Pinkham, *BSS46*, pp. 188-208 (Feb. 1973).

Procedures and criteria for earthquake resistant design, N. M. Newmark and W. J. Hall, *BSS46*, pp. 209-236 (Feb. 1973).

Procedures and criteria for wind resistant design, J. W. Vellozzi and J. J. Healey, *BSS46*, pp. 237-252 (Feb. 1973).

Criteria for building services and furnishings, J. M. Ayres and T.-Y. Sun, *BSS46*, pp. 253-285 (Feb. 1973).

Behavior of structural elements. A review, B. Bresler, *BSS46*, pp. 286-351 (Feb. 1973).

Behavior of structural systems under dynamic loads, R. L. Sharpe, G. Kost, and J. Lord, *BSS46*, pp. 352-394 (Feb. 1973).

Survey and evaluation of existing buildings, F. E. McClure, *BSS46*, pp. 395-426 (Feb. 1973).

Abnormal loading on buildings and progressive collapse, N. F. Somes, *BSS46*, pp. 427-470 (Feb. 1973).

BSS47. **Structural deflections. A literature and state-of-the-art survey,** T. V. Galambos, P. L. Gould, M. K. Ravindra, H. Suryoutomo, and R. A. Crist, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 47, 104 pages (Oct. 1973) $1.25, SD Catalog No. C13.29/2:47.

Key words: Analysis; deflection; design; dynamic; experimental; human sensitivity; loading functions; specifications; static; structural engineering; subsystems; vibration.

A literature survey and state-of-the-art study was compiled using 233 primary source documents, research papers, and texts. Over 800 documents were scanned to arrive at the primary source documents. The problem of structural deflections is discussed and reviewed in its component areas of static and dynamic deflections as related to forcing functions and structural characteristics. Also the interactions of major structural deflections with building structures subsystems and human occupants is reviewed. Emphasis is placed on serviceability limit states of deflections. Detailed comparisons of human response to structural vibrations are also made. This report is broad in scope and covers the areas of analysis, design and experimentation.

BSS48. **Design, siting, and construction of low-cost housing and community buildings to better withstand earthquakes and windstorms,** W. F. Reps and E. Simiu, Eds., Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 48, 152 pages (Jan. 1974) SD Catalog No. C13.29/2:48.

Key words: buildings; construction; design; developing countries; earthquakes; low-cost housing; natural disasters; structures; windstorms.

The extensive loss of life and property caused in developing countries by earthquakes and windstorms (hurricanes, typhoons and tropical cyclones) may be reduced to a considerable degree by the adoption and implementation of improved design, siting and construction procedures practicable within the context of the cultural and socioeconomic constraints prevailing in these countries.

The report provides technical information regarding characteristics of materials and building systems, and discusses the structural performance of buildings subjected to the action of earthquakes and wind forces with specific reference to structures typical of developing countries. Potential ways are described in which structures can be made more resistant to such action. Siting considerations are discussed from a geological, seismic and climatological viewpoint, and recommendations relating to siting problems are made. Techniques of housing construction, both traditional and industrialized, are described and improvements resulting in better earthquake or windstorm resistance are suggested. Building codes, their improvement and their enforcement are also discussed.

The report discusses cultural and socio-economic constraints influencing the adoption of improved practices, describes various feasible technical improvements of construction materials, composite systems and building systems, identifies mechanisms for stimulating technical improvements and discusses the role of institutions in this regard. Throughout the report, specific references are made to Peru, the Philippines and Turkey, countries which suffer from frequent devastation from natural disasters such as earthquakes and typhoons and which were selected as case studies for the purpose of this report.

BSS49. **Laboratory studies of the hydraulic performance of one-story and split-level residential plumbing systems with reduced-size vents,** R. S. Wyly, G. C. Sherlin, and R. W. Beausoliel, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 49, 53 pages (Mar. 1974) SD Catalog No. C13.29/2:49.

Key words: hydraulic criteria for plumbing; hydraulic test loads; plumbing-vent sizing; reduced-size vents; sanitary DWV systems; secondary ventilation; testing plumbing systems; vents for plumbing.

A laboratory study on one-story and split-level experimental drainage systems where the vents in some cases were varied from one to six pipe-sizes smaller than those presently specified by codes showed satisfactory hydraulic and pneumatic performance under various loading conditions. The research was originally sponsored by the National Association of Home Builders and the National Bureau of Standards and more recently by a program of the Department of Defense through the Tri-Services Investigational Committee on Building Materials. This paper presents criteria recommended for the design and evaluation of systems using reduced-sized vents and a sizing table for one- and two-story systems. The laboratory work also contributed to the development of analytical and test procedures needed for evaluating the application of reduced-size venting to a broad range of innovative drain-waste-vent designs for buildings of any height.

This work indicates that, in some circumstances, reduced-size venting might be a good alternative to other types of drainage

stems for multistory buildings which use either conventional innovative venting concepts. Because this study involved only limited number of drainage system designs, it is recommended at ongoing field and laboratory studies be explored if code anges are contemplated to permit the use of smaller vents.

SS50. **Weather resistance of porcelain enamels—15-year inspection of the 1956 exposure test,** M. A. Baker, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 50, 15 pages (July 1974) SD Catalog No. C13.29/2:50.

Key words: acid resistance; color; gloss; pH; porcelain enamel; relative humidity; weather resistance.

In 1956, and exposure test of porcelain enamels at 4 urban and ocean shore sites in the continental United States was initiated the National Bureau of Standards and the Porcelain Enamel stitute. After 15 years, all exposed specimens were returned to e Bureau and the changes in gloss and color determined. The oss changes were found to be significantly different at all expore sites except Pittsburgh, Los Angeles and Dallas. The most vere changes occurred at the Kure Beach, N.C., site nearest e ocean, while the least changes occurred at Pittsburgh, Los ngeles and Dallas. The differences in behavior of the ecimens correlated with both the average relative humidity d the pH of the suspended particulate matter at the different tes.

A correlation appeared to exist between the acid resistance of e enamels and changes in gloss and color. The regular, glossy, id-resistant enamels on steel showed the best weather restance of the various types tested.

Comparison with enamel specimens exposed for 15 years in an rlier test showed that porcelain enamels produced in the early 50's were equally resistant to changes in gloss and color as ose produced in the late 1930's.

SS51. **Structural evaluation of steel faced sandwich panels,** J. H. Pielert, T. W. Reichard, and L. W. Masters, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 51, 43 pages (Apr. 1974) SD Catalog No. C13.29/2:51.

Key words: accelerated aging; adhesive bond; ductility; flexural shear; housing systems; local buckling; material variability; moisture conditioning; Operation BREAKTHROUGH; paper honeycomb; structural sandwich; sustained load.

A series of structural evaluation tests performed on components and materials intended for use in one of the Operation REAKTHROUGH housing systems is described. Four samples of steel faced, paper honeycomb, sandwich panel material d four full size prototype roof panels were evaluated.

The samples of sandwich panel material were used to evaluate e variability of panel material properties and the effect of aging tensile and shear strength. The roof panels were used to determine the behavior in service considering the effects of adverse vironmental conditions on ultimate strength and mode of ilure. In addition, the performance of one panel under stained loading was evaluated.

SS52. **The effect of impact loadings on the performance of wood joist subflooring systems,** H. S. Lew, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 52, 35 pages (May 1974) SD Catalog No. C13.29:2/52.

Key words: concentrated load; deflection; floor; hardboard; housing; impact energy; Operation BREAKTHROUGH; plywood; subfloors; underlayment; wood; wood joists.

This report presents the results of an experimental study of ood-joist subflooring systems subjected to impact load. Six diffent types of subflooring systems were tested following the test method described in the ASTM Standard Methods (ASTM Designation E-72). The magnitude of impact load was varied by dropping a 60-lb bag from different heights.

A concentrated static load of 400 lb was applied to the subfloor after it was exposed to impact load. It is suggested that the deflection under this concentrated load be used as a measure of the impact resistance of the subfloor. Supersedes NBSIR 73-187 (PB 221-188).

BSS53. **Study of the local resistance of conventional plywood subflooring to concentrated load,** F. Y. Yokel, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 53, 43 pages (May 1974) SD Catalog No. C13.29:2/53.

Key words: evaluation criteria; floors; hardboard; load capacity, performance criteria; plywood subflooring; subflooring; underlayment; wood-frame construction.

Representative specimens, simulating the performance of five conventional plywood floor systems, were tested under concentrated load in order to compare their performance with that stipulated by performance criteria developed on the basis of anticipated occupancy loads.

In 24 out of 26 tests the performance of the specimens exceeded that required by the criteria. Data on failure loads, load-deflection characteristics and failure modes are presented and discussed. Supersedes NBSIR 73-116 (PB 220-432/9).

BSS54. **Health and medical facilities design.** Proceedings of the First Federal Agency Workshop, held at the National Bureau of Standards Gaithersburg, Md., December 5, 1972, R. J. Kapsch, Ed., Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 54, 87 pages (July 1974) SD Catalog No. C13.29/2:54.

Key words: architecture; design; hospital design; medical facilities; medical facility research.

The Federal Agencies have a large involvement in this area of Medical Facility Design; both in directly operated Federal facilities and indirectly through grant, loan and funding programs. Because of the impact of technology and because of the very large cost for new medical facilities in the last few years, there has been the rise of a field best described as medical facility research. These papers, presented at a National Bureau of Standard's Federal Agency Workshop, describe the latest medical facility research efforts by the Federal Agencies including, the Department of Defense, Department of Health, Education, and Welfare, the Veterans' Administration and the National Bureau of Standards. *These proceedings include the following papers (indented):*

The new generation hospital, S. I. Gerber, *BSS54*, 1-12 (July 1974).

Key words: architecture; design; hospital design; medical facilities; military construction; new generation military hospital; system design.

The Department of Defense has some 240 major hospitals and 460 dispensaries serving over 10 million people and employing about one quarter of a million medical and allied personnel. In 1968, a new project was initiated; A New Generation of Military Hospitals. The objectives of this project were to provide a more efficient health care delivery system through the extensive use of technology. The project consisted of two phases; Phase I was the systems analysis study of military and civilian hospitals and Phase II was the design and construction of a test bed military hospital. A number of recommendations resulted from Phase I, including use of a completely computerized hospital, convenience food system, light care nursing, outpatient surgery and others. Travis Air Force Base in California was selected as the site for implementation of

Phase II. The organization and the planning of this project are discussed. The beneficial occupancy of the Phase II, Travis Hospital is scheduled for 1977.

Rationale for change—The Hill-Burton Program, J. W. Reese, *BSS54*, pp. 13-24 (July 1974).

Key words: architecture; building regulations; construction standards; design; Hill-Burton; hospital design; medical facilities.

The Hill-Burton Program was established in 1946 for the financing of needed health facilities in the United States. An important function of the Hill-Burton Program is the continual updating of minimum construction requirements with which Hill-Burton projects must comply. Many States, architects, and engineers use these requirements for all health facility contstruction. Some of the newly proposed changes described include modification of Fire Safety requirements to make them compatible with other government agencies; improved parking facilities; increased emphasis on making health facilities accessible to the physically handicapped; a new section for intensive and coronary care units, and a new section dealing with natural disasters. Government building regulations will continue to change, probably in the direction of making the environment more livable and in the increased concern for conserving human resources.

Space planning and equipment requirements—application of advanced technologies to hospital design in the Veterans' Administration, H. J. Fogarty, *BSS54*, pp. 25-26 (July 1974).

Key words: criteria; hospital planning; medical facilities; planning; Veterans' Administration.

Prior to 1958, the Veterans' Administration (VA) used a 500 bed prototype as the basis of all design and construction. This proved undesirable since almost all new VA hospitals were to be teaching facilities with widely varying requirements not well suited to any single prototype. At the end of the 1950's the Bureau of the Budget issued the Federal Space Planning Criteria. The VA expanded and refined this criteria and has been successfully applying it for over ten years.

Use of the computer in planning hospitals—application of advanced technologies to hospital design in the Veterans' Administration, B. D. Keane, *BSS54*, pp. 27-30 (July 1974).

Key words: computer-aided planning; design; electronic data processing; hospital planning; medical facilities; planning; Veterans' Administration.

In 1965, the Veterans' Administration (VA) began developing the facilities Planning and Construction Requirements System to aid the VA in planning new facilities. This system is presently in use today. This computerized system utilizes files containing medical statistics, staffing, criteria and other information necessary for hospital planning. This system produces a master plan. This master plan provides a listing of medical functions, projected staffing, space requirements and other information. After review and approval of this master plan, it is used by architects and engineers for the design of VA hospitals. Future work on this system will include provisions for equipment, addition of special environmental factors and extension of the system to field station manangement.

Veterans' Administration Hospital Building System—application of advanced technologies to hospital design in the Veterans' Administration, J. C. Cook, *BSS54*, pp. 31-44 (July 1974).

Key words: architecture; building systems; design; hospital design; medical facilities; modular design; performance; Veterans' Administration.

The Veterans' Administration (VA) Hospital Building System was begun to provide new VA Hospitals with improved cost control, improved performance, increased adaptability, a reduction in the time to go from planning to beneficial occupancy and to provide a system that could be continuously updated. The Building System is composed of three parts; the data base, the planning modules and the building subsystems. The data base contains the "user needs" necessary to determine functional and performance requirements for new VA Hospitals. The planning modules are areas of space large enough to accomodate a wide variety of hospital activities. Four types of planning modules are used: a structural bay with a constant width of 22.5 feet (6.86 meters); a service module of from 5000 square feet (464.5 square meters) to 15,000 square feet (1393.5 square meters); a space module, which is a sub-unit of the service module and a fire section not to exceed 20,000 square feet (1858.0 square meters). The building subsystems are the components of the VA Hospital Building System. Six subsystems have been developed in detail; structure; partitions; ceiling; heating-ventilating-cooling; plumbing distribution; and electrical distribution. Advantages of the application of the VA Hospital Building System include better response to the medical program, more accurate estimate and control of costs, improved performance, better functioning of the building and increased adaptability.

Introduction—current issues in health care facility delivery, D. D. Boyle, *BSS54*, pp. 45-48 (July 1974).

Key words: architecture; construction; design; hospital design; management; medical facilities; performance specifications.

Some of the issues of concern to Health Care Facility Delivery are better planning, better prediction of facility needs, improved sensitivity to the need for responsive facilities, containment of parochial attitudes, restatement of the emphasis in planning and design and improvement of the management process. Failures in this area include lack of consideration of life cycle cost, non-utilization of available management and procedural skills and the numerous Federal, regional, State and local building and life safety codes that hamper technological advance. In a recent report to Congress, the General Accounting Office (GAO) identified these items and others and provided detailed recommendations. The Facilities Engineering and Construction Agency (FECA) presently has three projects dealing with these issues and problems. These projects include the investigation of the design process, the construction of three office buildings to performance specifications and using new management concepts and the third is the construction of five Indian Health Service hospitals using a sophisticated management plan.

Application—current issues in health care facility design, J. D. Russo, *BSS54*, pp. 49-62 (July 1974).

Key words: architecture; building systems; construction management; design; hospital design; medical facilities; performance; planning; programming.

The Facilities Engineering and Construction Agency (FECA) is presently accomplishing a project for the delivery of five health facilities. Unlike conventional projects, FECA commissioned an Executive Architect/Engineer (A/E) to review the programs of requirements

develop a functional definitive design kit upon which schematics would be based and to oversee the work of five regional A/E's who would be responsible for final design. Other unique aspects of this project include the use of a flexible management system, the use of a functional definitive design kit, the requirement for a guaranteed maximum price early in the design process from the construction manager and other innovations. Benefits include better quality Health Facilities delivered in shorter time and at a lower cost than through traditional means and the basis for continuous improvements of future health care facilities.

An evaluation methodology for hospital nursing units, R. Wehrli, *BSS54,* pp. 63-76 (July 1974).

Key words: architecture; design; evaluation; hospitals; medical facilities; nursing units.

Hospital planners and designers are facing the twin trends of greater construction costs and greater demand to access to the health care delivery systems. Because of these twin trends, these planners and designers must become increasingly aware of the various requirements involved in nursing units. One method of achieving this is through evaluation. The evaluation methodology that was developed by the Architectural Research Section relies on the research aids of architectural psychology, building systems and the performance approach. In this methodology, requirements are systematically identified and schematic drawings of nursing units are weighted and rated based on these requirements. When allied with costs, this methodology permits a comparison of various schemes on a performance-cost basis. It also aids the designer in improving his design of nursing units.

SS55. **Preliminary performance criteria for bituminous membrane roofing,** R. G. Mathey and W. C. Cullen, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 55, 16 pages (Nov. 1974) SD Catalog No. C13.29/2:55.

Key words: bituminous roof membranes; performance attributes; performance criteria; physical and engineering properties; test methods.

This report is the first in a series of publications on performance criteria for built-up roof membranes. The development a performance approach to bituminous built-up roof membranes is described and preliminary performance criteria are commended. A number of test methods have been developed order to obtain data to evaluate roofing membranes against the commended criteria. Twenty attributes that effect the performance of roof membranes under service conditions are entified and laboratory tests are described for measuring the gineering properties of the membrane that pertain to many of ese attributes. A level of performance is recommended for nine the identified performance attributes.

SS56. **Development of improved design criteria for low-rise buildings in developing countries to better resist the effects of extreme winds,** Proceedings of a Workshop held at the Dr. Paulino J. Garcia Memorial Hall, National Science Development Board, Manila, Philippines, Nov. 14-17, 1973, N. J. Raufaste, Jr., and R. D. Marshall, Eds., Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 56, 171 pages (Oct. 1974) SD Catalog No. 13.29/2:56.

Key words: codes and standards; information transfer; low-rise buildings; pressure transducers; socio-economic; structural design; technology implementation; wind effects; wind loads.

An International Workshop held in Manila, Philippines, on ovember 14-17, 1973, addressed the state-of-the-art in mitigatg building damages from winds. The workshop was jointly sponsored by the United States Agency for International Development (USAID), the Philippine Advisory Committee (formed in conjunction with this research project), and the U.S. National Bureau of Standards (NBS). This report presents the proceedings derived from the workshop. The proceedings present recommendations, the workshop program, five reports, and nine technical articles. The technical articles addressed four primary topics which were used to guide subsequent workshop discussions. The topics addressed were: wind and aerodynamics, structural related technology, socio-economic and architectural considerations, and codes and standards.

The results of the workshop will serve a twofold purpose. The first suggests improved building practices for developing countries. This was accomplished through the development of recommendations designed to upgrade to a minimum acceptable level design critera for low-rise buildings. The second involves integrating appropriate workshop information into the overall three-year AID sponsored research project to develop improved design criteria for low-rise buildings in developing countries to better resist the effects of extreme winds. *These proceedings include the following papers (indented):*

Climatology and wind related problems in the Philippines, R. L. Kintanar, *BSS56,* pp. 28-62 (Oct. 1974).

Aerodynamics of structures and wind tunnel modeling, R. D. Marshall, *BSS56,* pp. 63-76 (Oct. 1974).

Some problems in the analysis of lateral wind force resisting systems, J. Ma. de Castro, *BSS56,* pp. 78-90 (Oct. 1974).

Socio-economic and architectural considerations in housing, G. V. Manahan and J. M. Ramos, *BSS56,* pp. 91-98 (Oct. 1974).

Lessons learned from post wind disaster investigation, E. O. Pfrang, *BSS56,* pp. 99-101 (Oct. 1974).

Low-rise low-cost housing and extreme wind related problems in Bangladesh, J. R. Choudhury, *BSS56,* pp. 102-120 (Oct. 1974).

Low-cost housing and extreme-wind-related problems in Jamaica, A. D. Adams, *BSS56,* pp. 123-139 (Oct. 1974).

Wind pressure provisions of the National Building Code Republic of the Philippines, A. R. Flores, *BSS56,* pp. 140-152 (Oct. 1974).

Standardization in the Philippines today, A. R. Flores, *BSS56,* pp. 153-155 (Oct. 1974).

Wind research in the United Kingdom, K. J. Eaton, *BSS56,* pp. 156-159 (Oct. 1974).

BSS57. **Comparison of measured and computer-predicted thermal performance of a four bedroom wood-frame townhouse,** B. A. Peavy, D. M. Burch, F. J. Powell, and C. M. Hunt, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 57, 62 pages (Apr. 1975) SD Catalog No. C13.29/2:57.

Key words: air leakage measurement; building heat transfer; computer programs; dynamic thermal performance; heat flow analysis; heating and cooling loads; temperature predictions; thermal analysis; thermostat setback; transient heat flows.

Measurements of the dynamic heat transfer in a four bedroom townhouse were made under controlled conditions in a large environmental chamber to explore the validity of a computer program developed at NBS, labelled NBSLD, for predicting heating and cooling loads and inside air temperatures. This study was supported jointly by the Department of Housing and Urban Development and the National Bureau of Standards, and is a

part of a broader research program supported by both agencies to improve performance test procedures and criteria for housing.

The test house was a factory-produced four bedroom townhouse of modular design and of lightweight (wood) construction. Tests were performed with simulated outside summer, winter and fall diurnal temperature cycles. The inside temperature was maintained at about 75 °F. Also during the tests, the activities of a six-member family were simulated.

The time-varying energy requirements were measured, and these values were compared with computer predicted values. For example, the disparity between predicted and measured daily heating energy requirements averaged 3.1 percent with a maximum departure of 4.9 percent for five tests. The computer program NBSLD was experimentally validated for predicting the peak heating and cooling loads and the energy requirements for the test house.

The air leakage of the house was measured by a tracer gas technique over a range of outdoor conditions, and algorithms were developed to account for its effect on heating loads and energy requirements.

Separate tests were also performed to investigate the energy savings achieved by night temperature setback. An 8-h 9 °F setback from 75 °F produced an 11 percent diurnal savings in energy for an average nighttime temperature of 20 °F and a 9 percent savings in energy was achieved for the same setback when the average nighttime temperature was 2 °F.

BSS58. **State-of-the-art of structural test methods for walls, floors, roofs and complete buildings,** C. W. C. Yancey and L. E. Cattaneo, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 58, 136 pages (Nov. 1974) SD Catalog No. C13.29/2:58.

Key words: building construction; complete buildings; floors; roofs; standardization; test methods; walls.

As part of a comprehensive research program concerned with the structural testing of building components, conducted for the U.S. Department of Housing and Urban Development (HUD), a search for information was conducted. This search was undertaken in order to document existing information pertaining to structural testing of wall, floor and roof assemblies. Various information sources were consulted to trace the evolution of structural testing of building construction from the 1930's to the present time. This task was a prerequisite to defining the state-of-the-art and to identifying the test areas requiring fundamental research.

Based on information obtained from a review of the literature and from liaison with committees concerned with the development and revision of voluntary standards, it was found that there is a dearth of research information contributing directly to the development of test methods. Most of the research conducted on building components has been carried out either to observe the behavior of a sample of a particular type of construction or to evaluate the performance of a specimen against some performance requirements. However, helpful interferences can be made on the basis of some of the documentation, especially that contained in reports of full-scale tests on housing.

As a result of comparing the test methods used by the National Bureau of Standards in HUD project Operation BREAKTHROUGH with American Society for Testing and Materials (ASTM) Standard methods, several recommendations have been made by the authors for improving present structural test practice.

An up-to-date status report of voluntary test standards activities (in the U.S.) was prepared through verbal and written communication with members of the technical subcommittees of ASTM Committee E-6 on Performance of Building Construction.

BSS59. **The adherence of porcelain enamel to aluminum,** M. A. Baker, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 59, 39 pages (Nov. 1974) SD Catalog No. C13.29/2:59.

Key words: adherence; aluminum; electron microprobe; electron microscope; porcelain enamel; spalling; x-ray diffraction.

Electron microscopy, electron microprobe, and x-ray diffraction techniques were used to determine the mechanisms of adherence of porcelain enamel to aluminum. Adherence appears to depend upon diffusion of aluminum into the enamel and further the diffusion zone should be relatively free of reaction products for the enamel-metal system to retain good adherence after exposure to chemical solutions or to weathering. Round-robin testing of 6063 aluminum extrusions indicated that this alloy could be enameled if care were exercised in the selection of the enamel and the pretreatment.

BSS60. **Hydraulic performance of a full-scale townhouse drain-waste- vent system with reduced-size vents,** M. J. Orloski and R. S. Wyly, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 60, 43 pages (Aug. 1975) SD Catalog No. C13.29/2:60.

Key words: DWV; performance testing; reduced-size vents; trap-seal retention; venting; venting criteria; vents, reduced-size.

This report describes the experimental findings of tests on a full-scale two-story plumbing system with reduced-size vents under a range of operating conditions including tests with the earlier work on full-scale systems of substantially different geometry, criteria for sizing reduced-size vents are given for general application to conventional 1-2 story housing units. In addition to the practical evidence in terms of acceptable trap performance, the current study provided fundamental evidence of the excessive present design criteria. For the first time measurements were obtained which relate traditional design criteria (air flow and vent pressure) to presently recommended performance criteria (trap-seal retention) under dynamic conditions. These findings indicate that the vents can be sized on the basis of 1.5 in water gage (equals 372 pascals) suction in the vent rather than the 1.0 in W.G. (equals 248.8 Pa) presently specified in the plumbing codes. Also air demands measured were significantly less than assumed in current practice for short stacks and for systems with vent networks.

BSS61. **Natural hazards evaluation of existing buildings,** C. G. Culver, H. S. Lew, G. C. Hart, and C. W. Pinkham, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 61, 958 pages (Jan. 1975) SD Catalog No. C13.29/2:61.

Key words: buildings; damage; disaster; dynamic analysis; earthquakes; hurricanes; natural hazards; structural engineering; tornadoes; wind.

A methodology is presented for survey and evaluation of existing buildings to determine the risk to life safety under natural hazard conditions and estimate the amount of expected damage. Damage to both structural and nonstructural building components resulting from the extreme natural environments encountered in earthquakes, hurricanes, and tornadoes is considered. The methodology has the capability of treating a large class of structural types including braced and unbraced steel frames, concrete frames with and without shear walls, bearing wall structures, and long-span roof structures. Three independent but related sets of procedures for estimating damage for each of the natural hazards are included in the methodology. The first set of procedures provides a means for qualitatively determining the damage level on the basis of data collected in field surveys of the building. The second set utilizes a structural analysis of the building to determine the damage level as a function of the behavior of critical elements. The third set is based on

omputer analysis of the entire structure. All three sets of rocedures are based on the current state of the art. The rocedures are presented in a format which allows updating and fining. Numerical examples illustrating application of the rocedures are included.

SS63. **Analysis of current technology on electrical connections in residential branch circuit wiring,** W. J. Meese and R. L. Cilimberg, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 63, 23 pages (Mar. 1975) SD Catalog No. C13.29/2:63.

Key words: contact resistance; electrical codes; electrical connections; fire safety; house wiring; materials properties; performance testing.

In the Operation BREAKTHROUGH research and demonstration program the U.S. Department of Housing and Urban Development became concerned with the inability to properly evaluate innovative electrical connections. Long life requirements, fire safety considerations, the lack of adequate technical information, and long established conventional practices and evaluation procedures have led to slow-changing regulations concerning electrical connections used in branch circuit wiring in housing. This report discusses the present methods of evaluating electrical connections, the technical parameters involved, and innovative electrical connection developments. Innovations involving electrical connections may lead to significant advancements in housing construction if it could be demonstrated that functional and safety requirements over the expected life of the electrical connections were adequately satisfied. Research is needed to enable prediction of long term performance of electrical connections based on the results of accelerated performance tests.

SS64. **Retrofitting existing housing for energy conservation: An economic analysis,** S. R. Petersen, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 64, 76 pages (Dec. 1974) SD Catalog No. C13.29:2/64.

Key words: benefit-cost analysis; building economics; building envelope; economic analysis; economic efficiency; energy conservation; engineering economics; insulation; life-cycle costs; marginal analysis; thermal efficiency.

This study examines the economic aspects of energy conservation techniques suitable for retrofitting into existing housing, including insulation, storm windows and doors, and weather stripping. The objective of this study is to determine that combination of techniques which will maximize net dollar savings in life-cycle operating costs for heating and cooling operations in existing homes, subject to specific climate conditions, fuel costs, and retrofitting costs. Using microeconomic marginal analysis we find that such a combination must be economically balanced i.e., the ratio of savings to cost must be equal at the margin for each technique) and that each technique should be utilized up to the point where the present value of the life-cycle savings generated by the last increment will just cover the costs of that last increment. Thermal engineering data is combined with the economic analysis in a computer-assisted model which estimates such optimal combinations for a wide range of climatic conditions and fuel costs. These combinations include levels of application higher than what has been previously recognized as "economical."

BSS65. **Nonmetallic coatings for concrete reinforcing bars,** J. R. Clifton, H. F. Beeghly, and R. G. Mathey, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 65, 41 pages (Aug. 1975) SD Catalog No. C13.29/2:65.

Key words: bridge decks; chloride ions; concrete; corrosion; deicing salts; epoxy coatings; organic coatings; polyvinyl chloride coatings; steel reinforcing bars.

This work was undertaken to ascertain the feasibility of using organic coatings, especially epoxies, to protect the steel reinforcing bars embedded in concrete of bridge decks from rapid corrosion. This corrosion is caused by the chloride ions from the most commonly applied deicing salts, sodium chloride and calcium chloride. Altogether, 47 different coating materials were evaluated to some extent, consisting of 21 liquid and 15 powder epoxies; 5 polyvinyl chlorides; 3 polyurethanes; 1 polypropylene; 1 phenolic nitrile; and one zinc rich coating. The chemical and physical durabilities, chloride permeabilities, and protective qualities of coatings were assessed. The bonds between coated and uncoated bars and concrete were measured by both pullout and creep tests.

The results indicate that both epoxy and polyvinyl chloride coatings, if properly applied, should adequately protect steel reinforcing bars from corrosion. However, only the epoxy coated bars had acceptable bond and creep characteristics when embedded in concrete. The powder epoxy coatings overall performed better than the liquid epoxies, and four powder epoxy coatings have been identified as promising materials to be used on reinforcing bars embedded in concrete decks of experimental bridges.

BSS66. **Underground heat and chilled water distribution systems,** T. Kusuda, Ed., Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 66, 146 pages (May 1975) SD Catalog No. C13.29/2:66.

Key words: corrosion of underground pipes; district heating; hot and chilled water systems; insulation of underground pipes; specifications for underground systems.

This publication contains the keynote address and all the technical papers presented during the Symposium on Underground Heat and Chilled Water Distribution Systems, which was held on November 26 and 27, 1973 in Washington, D.C.

The Symposium was sponsored jointly by the National Bureau of Standards, the National Capital Chapter of the American Society of Heating, Refrigerating and Air-Conditioning Engineers, the Building Research Institute and the Association of Physical Plant Administrators.

The subject matter covered in the papers includes energy, economics, design criteria, heat transfer, corrosion protection, specification, operation, and maintenance related to underground pipes. *These proceedings include the following papers (indented):*

The energy situation and central plant, T. R. Casberg, *BSS66*, pp. 5-8 (May 1975).

Key words: central plant system; coal gasification; heat pump system; heat recovery and conservation system; nuclear fuel; on-site power generation system; petroleum problems.

Several optimistic myths regarding the energy situation in the United States are clarified by using factual data leading to an inevitable conclusion that there exists a real, rough and long lasting energy shortage.

The author stresses that the energy crisis demands engineers to forget yesterdays' data on building design practices and fuel cost, and to play an entirely new ball game that requires new thinking, a fresh approach, and a daring attitude. Several innovative approaches pertaining to central plant concept, such as on-site power generation, solar energy utilization, large scale heat pumps and energy storage are discussed.

Economic advantages of central heating and cooling systems, J. E. Mesko, *BSS66*, pp. 9-17 (May 1975).

Key words: central heating and cooling plants; cost analysis; cost comparison; economics; future trend; local building heating/cooling plants, Southeast Federal Area, Washington, D.C.

Economic comparisons between central and local building heating and cooling plants have been prepared and analyzed. Inherent and basic economic advantages in the distribution of heat and cooling from a single central district plant, over those practically attainable from individual local building plants, are analyzed and presented graphically. Factors contributing to the economic advantages of central plants are described.

The cost comparison performed for a 30-year future time period for the Southeast Federal Area of Washington, D.C., indicates that by year 2000 it will cost 15 to 20 percent less annually to own and operate a properly selected and phased central plant system than the optimum cost local plant systems.

Heat transfer studies of underground chilled water and heat distribution systems, T. Kusuda, *BSS66*, pp. 18-41 (May 1975).

Key words: chilled water pipe; earth temperature; heat transfer; multiple pipe system; underground pipe.

Heat transfer theory of underground pipe systems which include systems of more than one pipe at different temperatures buried in the same trench is summarized in this paper. Experimental observation made on a two-pipe chilled water system connecting the Pentagon and another Federal Office Building (FOB2) in Washington, D.C., was used to verify the theoretical analysis. In addition, the paper presents a concept of using integrated 10 ft average temperatures I10ET of selected earth temperature stations in the United States for design calculations.

The I10ET's could be used for selecting the pipe insulation in lieu of the ground water temperatures on certain average temperatures, which are currently being used.

Design criteria of underground heat and chilled water distribution systems for corrosion protection, J. H. Fitzgerald, III, and K. J. Moody, *BSS66*, pp. 42-51 (May 1975).

Key words: anodes; cathodic protection; coatings; corrosion; deterioration; inhibitors; materials selection; nonmetallics; rectifiers; water treatment.

Corrosion failures occur in all types of heat and chilled water distribution systems unless precautions are taken. Failures are expensive and cause shutdowns, hazardous conditions, occasional catastrophies and inconvenience to involved personnel and the general public. Corrosion leaks cause wetting of thermal insulation, resulting in thermal losses. For new construction, a corrosion survey should be made to determine best course of action, materials to use and the precautions needed to achieve the desired life of the piping. Cathodic protection is necessary for steel conduit or direct burial piping. Protection is also needed for steel pipe in insulative backfills. Mini-tunnels need to be kept dry or protection used. Internal corrosion is controlled with inhibitors. Nonmetallic materials and various means of construction should be considered to establish the best long-term approach. For existing systems, a survey should be made to determine if protection, repairs or replacement is the best course. Several case histories illustrate typical corrosion problems.

which will affect Agency Specifications, and plans f revising the present specifications are discussed.

Specifications for an underground heated and chilled wat system for private sector contracts, G. S. Campbell, *BSS6* pp. 78-87 (May 1975).

Key words: cascade heater; insulated underground pipin insulation; limitation of liability; "or equal" specificatior performance specifications; schematic diagrams; specific tions; specification writer.

Based on 30 years experience in Consulting Engineerir an over-view is given of the technical specifications r quired (1) to show the designers' intent, (2) to set out clear the material and equipment required under the propos contract, and (3) to establish the construction metho which will be required for certain operations. The necessa capabilities of a specification writer are suggested. The tr scope of a complete specification is outlined and a workab format is given. The impossibility of following the "3 nam and catalogue numbers" approach is shown. A comment to the practicality of the performance specification given. Certain design considerations underlying an unde ground heated and chilled water system are enumerate The need for accurate site utility information is emphasize The need for accurate delineation of contract limits in tl Contract Documents is shown. The typical equipment the Central Energy Plant serving an underground syste is enumerated. The various types of piping materials a their applications are discussed. Particular attention given: cascade heaters, pumps, and insulated undergrou piping. The problems of protecting insulation are explore Several thoughts on unexpected design and installati problems are given. The need for Limitation of Design Liability is explained. Finally, a method is suggested obtain maximum competition at minimum contract cost.

Fiberglass reinforced plastic pipe in underground condensa return service, H. O. Andersen, *BSS66*, pp. 88-101 (M 1975).

Key words: condensate return; epoxy; fiberglass rei forced plastic; filament-wound; insulated; molded; morp oline; prefabricated steel conduit; Qualified Products Lis tieline.

In 1967 approximately 3,700 lineal feet of uninsulate fiberglass reinforced plastic (FRP) pipe was installed f condensate return service in a steel conduit with an i sulated steam line at the Naval Weapons Center, Chi Lake, California. The FRP fittings failed. Factors co tributing to the failures were: (1) improper supports for th FRP line which prevented free movement; and, (2) th FRP elbows installed had a lower pressure rating tha specified. The testing procedure followed to evaluate th product of another FRP pipe manufacturer and measur taken to provide a successful condensate return system a discussed.

Inter-building heat energy distribution systems: growt operation and maintenance experience, W. L. Viar, *BSS6* pp. 102-115 (May 1975).

Key words: anchor; controls; corrosion; gorwth; meterin modern; museum; primary; reliability; renovation; secon ary; system; variable.

District heating concepts are used in heat energy supp to the vast majority of buildings at the University of Vi

Available types of underground heat distribution systems, H. A. Borger, *BSS66*, pp. 52-59 (May 1975).

Key words: heat distribution; heating; high temperature water; hot water; insulation; piping; steam; underground piping.

This paper briefly discusses the main features and characteristics of various types of currently-available underground heat distribution system, including concrete trenches, clay tile conduits, pressure testable steel conduits, sectionalized conduits, insulating envelopes, and sealed insulation systems.

Design criteria for auxiliary equipment for underground heating and cooling distribution systems, R. O. Couch, *BSS66*, p. 60-72 (May 1975).

Key words: accesses; ball joints; concrete manholes; expansion joints; expansion loops; o-ring gaskets; prefabricated manholes; restrained piping.

Manholes are an important and necessary part of any distribution system. They may be made of concrete or prefabricated steel. Design considerations must be given to sizing, accesses, ventilation, sumps, and miscellaneous equipment. Expansion provisions must also be provided for piping in distribution systems by using natural piping flexibility, expansion joints, ball joints, or gasketed couplings on the pipe.

Federal agency specification for underground heat distribution systems, L. V. Irvin, Jr., *BSS66*, pp. 73-77 (May 1975).

Key words: ASTM; criteria; Federal Construction Council; interagency; prequalification; system performance; triservice; underground heat distribution.

Past and present efforts of the Federal Construction Council (FCC) Task Group on Underground Heat Distribution Systems are reviewed. It is pointed out that the present FCC criteria, properly implemented by Inter-Agency performance specifications, have been very successful in reducing the number of system failures. It is also noted that these criteria are too inflexible, and have resulted in the use of unnecessarily expensive systems in some areas and prevented the acceptance of promising new concepts. The FCC criteria are now being updated and are expected to be made available in early 1974. General provisions of the proposed criteria, activities in other areas such as ASTM, ginia. Building ages and construction methods range from 1825 to the present. A number of buildings are too distant from the central heating plant, and are heated by their respective small fired-furnace circulating water systems. Services distributed underground from the central plant include multi-pressure steam lines, medium temperature hot water and domestic hot water. Demands have increased severely on all systems, particularly since 1952. During the period 1965–75 University building space will have been increased by about 112 percent; not all new loads will be placed on central heating facilities. Growth, renovation and upgrading effects on operation and maintenance of heat generating and distributing equipment and personnel have been encumbering at times. Proper planning, scheduling, design and construction followed by satisfactory performance of equipment, systems and personnel have been combined to achieve adequate winter conditioning for this institution, with continuity. Summer air conditioning is relatively new here. Refrigeration units are scattered, vary from one-half to 1,000 tons capacity, have been added in less than systematic fashion, to be generous. There is no inter-building distribution of chilled liquids to date. It is envisioned that central heating and central cooling concepts will ultimately be blended here for most efficient utilization and rejection of heat energy in the pursuit of controlled environment.

Cathodic protection can be an effective means for preventing corrosion on underground metallic structures, R. C. Young, *BSS66*, pp. 116–119 (May 1975).

Key words: cathodic protection; insulating joints; nonconducting coating; sacrificial anodes; soil resistivity.

Cathodic protection can effectively prevent electrochemical corrosion on underground metallic piping and other structures for as long as the use of the piping is required. However, the system must be designed to suit the soil environment, and physical makeup of the structure by someone fully experienced in such work. Thorough inspection must be maintained during installation to assure that the system is properly installed as verified by a completion check by a knowledgeable person. Included in the final report should be a maintenance program to monitor the cathodic protection system preferably one that can be made by regular maintenance personnel. The maintenance program should be carried out fully, and any failures that occur should be remedied promptly otherwise early failure of the structure may be experienced.

Operation and maintenance of steel conduit systems, R. J. Ruschell, *BSS66*, pp. 120–121 (May 1975).

Key words: design specification; guide and installation procedures; steel conduit system.

Thousands of manhours have been devoted to preparing a "Guide Specification for Military Construction, Heat Distribution Systems Outside of Buildings". This specification has been in mandatory use since 1965 by the Department of Defense and other Federal and State agencies. The system design and installation procedures have incorporated the knowledge and experience of many of the most able mechanical engineers from government and private industry. Only minor changes have been made to the Guide Specification during the past twelve years. No guide or procedure has been issued in regard to maintaining these underground systems. Additional years of useful, economic life could be realized from a program of inspection and prompt repair procedures where indicated.

Experience with central heat distribution systems in cold regions, W. Tobiasson, *BSS66*, pp. 122–135 (May 1975).

Key words: air leakage; Arctic; central heat distribution systems; construction materials; drainage; insulation; permafrost; seasonal frost; snow drifting; utilidors; ventilation.

Buried, on-grade and elevated central heat distribution systems have been built in the cold regions of the Northern Hemisphere. Heating lines are frequently routed along with water lines, sewers and other utilities in conduits known as utilidors. In areas where the ground is permanently frozen, systems are generally designed to prevent thaw and subsidence of the supporting soil as well as prevent freezing liquids in the lines. One approach is to support the utilidor on piles. Such utilidors are often elevated several feet above the surface to minimize snow drifting problems. Elevated utilidors can be obstructions to the movement of individuals and vehicles in a community. Elevated utilidors subjected to differential heave and settlement have developed gaps through which cold air infiltrated and caused freezeups.

The bulb of thaw created around a buried conduit containing warm utilities can be a collecting point for ground water, especially in the spring. Flooding can result unless the conduit is watertight or provisions are made to redirect the ground water. Many large buried utilidors in Siberia are ventilated in the winter to annually refreeze the surrounding soil.

Provisions for winter maintenance are important features of all central heat distribution systems in cold regions.

To illustrate the above points, design and performance data are presented in this paper for several central heat distribution systems in Alaska, Canada, Greenland and Siberia.

BSS67. **Abnormal loading on buildings and progressive collapse. An annotated bibliography,** E. V. Leyendecker, J. E. Breen, N. F. Somes, and M. Swatta, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 67,* 60 pages (Jan. 1976) SD Catalog No. C13.29/2:67.

Key words: abnormal loading; alternate path; annotated bibliography; bibliography; building code; building regulations; collapse; failures; progressive collapse; specific resistance.

This bibliography on the subjects of abnormal loading and progressive collapse is an annotated listing of articles that have appeared in the technical literature from 1948 through 1973. The entries have been arranged chronologically by year and alphabetically within years. Both subject and author indexes have been included. The references listed have been selected as most representative of the historical background and best representing the origin and present state-of-the-art of current practice without undue repetition of data.

References pertaining to characteristics, frequencies, incidents, tests, design procedures, and regulations for many types of abnormal loadings are included. Among these are various types of accidental impacts, construction loads, explosions, faulty practices, and extreme atmospheric loads. Heavy emphasis was placed on referencing applicable building codes and regulations pertaining to the subjects of progressive collapse and abnormal loadings. This bibliography also contains numerous references to contemporary professional opinion as expressed in editorials and discussions of the subject and particularly, on the various regulations proposed. A large number of proposed analysis and design procedures, as well as applicable test results, are referenced. In addition to the general reference material, a careful search was made of the ten most recent years (1964-1973) of *Engineering News Record* to identify and annotate possible progressive collapse examples from building failures reported by that publication.

BSS68. **Review of standards and other information on thermoplastic piping in residential plumbing,** R. S. Wyly, W. J. Parker, D. E. Rorrer, J. R. Shaver, G. C. Sherlin, and M. Tryon, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 68, 65 pages (May 1975) SD Catalog No. C13.29:2/68.

Key words: fire performance of piping; functional performance of piping; performance characteristics for piping; thermal/structural performance of piping; thermoplastic piping in plumbing.

The paper is a review of existing information on the physical characteristics of thermoplastic piping that are of particular interest in considering its potential for use in residential, aboveground plumbing. The presentation is oriented to considerations of adequacy of functional performance of plumbing systems from the user's/owner's viewpoint in contrast with the typical product-specifications oriented format reflected in current standards.

Not only are the physical characteristics emphasized that re late most directly to the determination of functional performanc of installed systems, but the importance of design and installatio detail in the context is discussed.

In conclusion, this review indicates the need for better use c existing knowledge as well as for some research and tes development work particularly in the areas of thermal propertie response to building fires, and resistance to water hammer.

BSS69. **NBSLD, the computer program for heating and coolin loads in buildings,** T. Kusuda, *Nat. Bur. Stand. (U.S.), Bldg Sci. Ser. 69,* 398 pages (July 1976) SD Catalog No C13.29/2:69.

Key words: ASHRAE task group on energy requirement conduction transfer functions; heating and cooling load; Na tional Bureau of Standards heating and cooling load com puter program.

A comprehensive computer program called NBSLD, the Na tional Bureau of Standards Load Determination program, ha been developed at NBS to reflect the time change of the man building parameters which are pertinent to accurate estimatio of energy usage for heating and cooling. Current status of heatin and cooling load techniques is reviewed. Of general interest a unique features of NBSLD which are not available in existin computer programs. A summary of various subroutines NBSLD is given along with the detailed procedures for then These subroutines constitute the recommended subroutine a gorithms of the ASHRAE Task Group on Energy Requir ments. Complete Fortran listing of NBSLD and data preparatic forms are given for those who wish to use the program. Tl NBSLD computation is on the basis of the detailed solution simultaneous heat balance equations at all the interior surfac of a room or space. Transient heat conduction through exteri walls and the interior structures is handled by using conductic transfer functions. The use of heat balance equations, althou time-consuming in calculation, can avoid the vagueness and u certainties inherent in the more popularly used weighting fact approach. In addition, it is more accurate for a specific buildi design.

BSS70. **Windows and people: A literature survey. Psychologic reaction to environments with and without windows,** B. L. Co lins, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 70, 92 pag (June 1975) SD Catalog No. C13.29/2:70.

Key words: daylight; fenestration; psychological; sol glass; spaciousness; sunshine; view; windowless; window

An understanding of human requirements for windows buildings can be developed through a survey of the literature c the reaction to environments with and without windows. Evalu tion of the response to a variety of windowless situations revea that although the attitudes toward a windowless space are ofte somewhat unfavorable, the most adverse reaction occurs in small, restricted and essentially static environment. This su gests that one function performed by a window is the addition a dynamic, active quality to an interior environment. Consider tion of the response to the actual presence of windows indicat that another essential function of a window is the provision of view of the external world. Although almost any view is accept ble, there is some evidence that views with a high informatic content are preferable. In addition, windows admit illuminatio in the form of daylight and sunshine which furnish a dynami changing character to a room. Yet, the functions of windows e tend beyond view and illumination to an enhancement of th basic character of a room, such that the mere presence of a wi dow may cause a room to appear more spacious. Finally, the o timum size and shape of a window for fulfilling these vario functions is discussed.

BSS71. **A proposed concept for determining the need for air conditioning for buildings based on building thermal response and human comfort,** J. E. Hill, T. Kusuda, S. T. Liu, and F. J. Powell, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 71, 155 pages (Aug. 1975) SD Catalog No. C13.29/2:71.

Key words: air conditioning criteria; building thermal response; comfort indices; human comfort; predicted indoor habitability index.

Determining the need for air conditioning can be based on a wide variety of factors. To date, the only criteria that have been written and can be referenced are those of several federal organizations and many are not really criteria in the true sense of the word. They are guidelines to be used in the determination of fund allocation; in other words, provisions are made to air condition federal facilities in specific geographical locations if pertinent weather characteristics of that locality meet certain requirements. This paper presents the concept that a true criteria can be established based both on weather characteristics of the locality as well as characteristics of the building or structure under consideration.

The paper gives the details of a study showing the feasibility of such a scheme. A simulation was made of two proposed residences in several geographical localities. For the simulation, actual hour-by-hour weather data was used in conjunction with a sophisticated computer program. The results revealed for the non air-conditioned spaces, the extent and duration of undesirable indoor conditions based upon generally accepted comfort indices. The concept of a new "comfort" or "discomfort" index called Predicted Indoor Habitability Index (PIHI) is introduced. The authors indicate the way in which a criterion could be established that would be in the form of tables, indicating for a given specified building and geographical locality, whether mechanical cooling should or should not be installed.

BSS72. **Fire endurance of gypsum board walls and chases containing plastic and metallic drain, waste and vent plumbing systems,** W. J. Parker, M. Paabo, J. T. Scott, D. Gross and I. A. Benjamin, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 72, 114 pages (Sept. 1975) SD Catalog No. C13.29/2:72.

Key words: ABS; DWV; fire endurance; fire spread; fire test; gases; plastic pipe plumbing; PVC; smoke.

The use of plastic pipe in plumbing systems of multiple-occupancy buildings has raised considerations regarding fire safety. To provide needed data, ten full-scale fire endurance tests were performed involving a total of 39 plumbing chase and wall assemblies containing plastic and metal drain, waste, and vent (DWV) systems typical of installations serving one or two story buildings. Two tests were conducted using plumbing chase configurations simulating kitchen sink drain systems. The PVC DWV piping in these installations did not contribute to spread of fire from one side of the construction to the other. Six fire endurance tests were conducted in which the performance of ABS, PVC, copper and iron was compared directly in kitchen sink drain systems as installed in wood-stud and gypsum-board walls. The stacks ranged from 2 inch to 4 inch in diameter and laterals from 2-1/2 inch to 4 inches. In these tests it was noted that the plumbing configuration and wall construction details, particularly the sealing of plumbing penetrations, seriously affected the fire endurance of the barrier. Satisfactory performance was achieved when certain conditions were met. In the two tests involving nominal 2 by 4 steel-stud-and-gypsum-board walls it was determined that the one-hour fire resistance rating of the wall was reduced considerably when ABS or PVC DWV was installed within it using the construction details described in this report. These details included back to back 1-1/2-in diameter laterals feeding directly into 2-in diameter stacks.

BSS73. **Structural performance of masonry walls under compression and flexure,** S. G. Fattal and L. E. Cattaneo, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 73,* 65 pages (June 1976) SD Catalog No. C13.29/2:73.

Key words: brick; buckling; composite walls; compressive strength; concrete block; constitutive relations; flexural strength; masonry; masonry walls; mortar; slenderness ratio; standards; stiffness; structural stability; walls.

Ninety-five prisms and fifty-six walls of brick, concrete block and composite brick and block masonry construction were tested under various combinations of compressive and transverse loads. Constitutive relations for masonry are developed from test results. By using rational analysis it is shown that prism strength can be predicted on the basis of linear behavior at failure. It is also shown that wall strength can be predicted on the basis of prism strength when an appropriate allowance is made for the effect of wall slenderness on sectional capacity.

BSS74. **The buffeting of tall structures by strong winds,** E. Simiu and D. W. Lozier, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 74, 90 pages (Oct. 1975) SD Catalog No. C13.29/2:74.

Key words: accelerations; buffeting; building codes; buildings; deflections; dynamic response; gust factors; structural engineering; wind engineering; wind loads.

Certain shortcomings of current procedures for computing alongwind structural response have been shown to result in unrealistic estimates of tall building behavior under the action of strong winds. Differences between predictions of fluctuating response based on various such procedures may be as high as 200 percent. In recent years, advances in the state of the art have been made which provide a basis for significantly improved alongwind response predictions. The purpose of the present work is to present a procedure for calculating alongwind response which incorporates and utilizes these advances. The basic structural, meteorological and aerodynamic models employed are described, and expressions for the alongwind deflections and accelerations, consistent with those models, are derived. A computer program is presented for calculating the alongwind response of structures with unusual modal shapes or for which the contribution of the higher modes to the response is significant. For more common situations, a simple procedure is presented which makes use of graphs and on the basis of which rapid manual calculations of the alongwind deflections and accelerations can be performed. Numerical examples are given to illustrate the use of the computer program and of the graphs. Results of numerical calculations are used to discuss some of the approximations and errors inherent in the models employed.

BSS76. **Analysis of reinforced concrete beams subjected to fire,** B. Ellingwood and J. R. Shaver, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 76,* 83 pages (July 1976) SD Catalog No. C13.29/2:76.

Key words: creep; fire endurance; fire tests; reinforced concrete; sensitivity analysis; steel; structural mechanics; uncertainty.

Methods for analytically predicting the behavior of simply supported reinforced concrete beams subjected to fire are presented. This is generally a two-step process involving a thermal analysis followed by a stress analysis. This study emphasizes the latter, wherein the determination of moment-curvature-time relationships for the beam cross section incorporates the temperature-dependent strength degradation in the steel and concrete as well as thermal and creep strains. The sensitivity of the predictions to various phases of analytical modeling is in-

vestigated to establish the parameters most important for the prediction of beam behavior and to indicate where additional data should be gathered. A comparison of predicted behavior with that observed in fire tests shows excellent agreement when realistic reinforcement temperature histories are used.

BSS77. **Acoustical and thermal performance of exterior residential walls, doors and windows,** H. J. Sabine, M. B. Lacher, D. R. Flynn, and T. L. Quindry, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 77, 170 pages (Nov. 1975) SD Catalog No. C13.29/2:77.

Key words: acoustics; air infiltration; air leakage; architectural acoustics; building acoustics; doors; energy conservation; heat loss from buildings; heat transfer; sound transmission loss; thermal resistance; thermal transmittance; windows.

Laboratory tests of sound transmission loss, thermal transmittance, and rate of air leakage were conducted on full scale (9 feet high × 14 feet wide; 2.7 × 4.3 meters) specimens of typical residential exterior wall constructions, either unbroken or penetrated by a door or window. The walls were of wood frame construction with gypsum board drywall interior finish and exterior finishes of wood siding, stucco, or brick veneer. Additional acoustical tests were run on a number of individual doors and windows. A total of 109 acoustical tests and 48 thermal tests are reported. The resultant data are compared with literature data on similar constructions. Correlations developed among the several quantities measured will assist more rational design where both energy conservation and noise isolation must be considered.

BSS78. **Pre-design analysis of energy conservation options for a multi-story demonstration office building,** T. Kusuda, J. E. Hill, S. T. Liu, J. P. Barnett, and J. W. Bean, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 78, 64 pages (Nov. 1975) SD Catalog No. C13.29/2:78.

Key words: building design; building energy analysis; energy conservation options; energy design optimization; heating and cooling load calculation.

The design phase of the GSA-Manchester Building included extensive analysis of the building design and operation to determine the potential for energy conservation. Described in this report are highlights and a summary of the calculations performed during the design phase. The analysis included a study of the exterior shell, ventilation rate, lighting and occupancy levels, room temperature controls, and nighttime flushing of the building using outdoor air, on the predicted yearly energy consumption of the building.

BSS79. **Energy conservation potential of modular gas-fired boiler systems,** G. E. Kelly and D. A. Didion, Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 79, 54 pages (Dec. 1975) SD Catalog No. C13.29/2:79.

Key words: boiler oversizing; efficiency vs. heating load; modular boilers; modular concept; seasonal efficiency.

The modular concept of boiler operation was examined in a laboratory test of five gas-fired, cast iron, hydronic boilers. Four of the boilers, each having an input rating of 85,000 Btu per hour, were arranged so that they could either be operated like a single boiler (i.e., all of the boilers either on or off) or as a modular installation in which the boilers are sequentially fired to match the number in operation with the heating load. The fifth boiler had an input rating of 300,000 Btu per hour and was operated as a single boiler installation. Efficiency vs. heating load curves were obtained for the single boiler installation, the four small boilers run like a single boiler and the modular installation operated with and without water flowing through the "idle" modules. These efficiency curves were then used to theoretically predict the effect of the modular concept and boiler oversizing on the seasonal efficiency of gas-fired heating plants. It was found that under certain conditions the use of a gas-fired modular boiler installation instead of a single large boiler could result in considerable energy savings.

BSS80. **Safety during construction of concrete buildings—A status report,** H. S. Lew, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 80,* 56 pages (Jan. 1976) SD Catalog No. C13.29/2:80.

Key words: building; codes; concrete; construction; falsework; formwork; loads; reshoring; safety; shoring; standards.

The current state-of-the-art of safety in concrete building construction is reviewed and summarized. The material presented considers only the technical aspects of the construction safety. Safety of the individual in using equipment and in following construction procedures is not included in this study.

The report presents comparative accident frequencies in concrete construction. Based on reported construction failures, the relative vulnerability of various categories of concrete construction is estimated. The report examines causes of construction failures and reviews major regulatory standards at the federal, state, city and industry level affecting safety in concrete construction.

The factors which affect safety in concrete construction are examined relative to the state-of-the-knowledge and, where appropriate, recommendations are made for areas needing improved standards.

BSS81. **Survey of ground fault circuit interrupter usage for protection against hazardous shock,** R. W. Beausoliel and W. J. Meese, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 81,* 19 pages (Mar. 1976) SD Catalog No. C13.29/2:81.

Key words: branch circuit protection; electrical safety; electric shock; ground fault; leakage current; prevention of electrocution.

The ground fault circuit interrupter (GFCI) is increasingly becoming an integral part of building electrical systems to protect human life. Building researchers, designers, and contractors should have a working knowledge of their purpose and operational characteristics. This report describes the functional principles of GFCIs and relates their performance to effects of electric current on the human body. Information concerning the history, research and testing, installation practices, fire protection aspects, types, manufacturers and costs of GFCIs are included. The trend of requiring installation of GFCIs on more and more electrical circuits by regulatory authorities for safety purposes is outlined. Controversies concerning feasibility, reliability, nuisance tripping and other problems are discussed; laboratory and field investigations addressing these problems should be undertaken.

Permanent installations of GFCIs are being made in new residential and other construction, but very few are being installed in older buildings. The rationale for this needs to be examined. Because of higher leakage currents probable in most older construction, GFCIs manufactured under present standards may not be feasible in older buildings.

BSS82. **A new look at the research basis for lighting level recommendations,** G. T. Yonemura and Y. Kohayakawa, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 82,* 13 pages (Mar. 1976) SD Catalog No. C13.29/2:82.

Key words: gratings; illuminating engineering; lighting;

modulation transfer function; suprathreshold visibility; visibility; vision.

The validity of using threshold studies as the basis for lighting vel recommendations is questioned. The performance of the e at suprathreshold levels was investigated with sine- and uare-wave gratings. The results of the study indicate that the havior of the eye is significantly different at suprathreshold vels as opposed to threshold levels. For threshold studies, hen contrast is plotted against luminance, the function is a onotonically decreasing function. At suprathreshold levels the nction indicates the existence of a definite minimum, luminances greater or less requiring more contrast to appear subtively equal. It is recommended that lighting levels be based laboratory studies that appraise visual requirements and permance simulating conditions encountered in real world enronments.

SS83. **Polymer impregnated hardened cement pastes and mortars,** J. R. Clifton, J. E. Fearn, and E. D. Anderson, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 83,* 21 pages (Apr. 1976) SD Catalog No. C13.29/2:83.

Key words: cement; compressive strength; flexural strength; fracture mechanics; polymer impregnated cement; polymer impregnated mortar; porosity; scanning electron microscopy.

Polymer impregnated hardened cement pastes and mortars ve been prepared and their properties compared to those of ntrol specimens. Specimens were made by impregnating dried d evacuated precast hardened cement pastes and mortars with ethyl methacrylate, under pressure, which was thermally lymerized. The effects of the microstructure of the cement stes and mortars on the performance of polymer impregnated rtars were determined by preparing specimens with a wide nge of porosities by varying the water to cement ratio and the uring times prior to impregnation.

The properties of impregnated and control specimens were inestigated by: scanning electron microscopy; porosity deterinations; fracture mechanics studies; and strength determinaons. The polymer impregnated materials had compressive and exural strengths, moduli of elasticity, and fracture toughnesses hich were substantially higher than unimpregnated materials.

SS85. **Survey results for fire loads and live loads in office buildings,** C. G. Culver, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 85,* 157 pages (May 1976) SD Catalog No. C13.29/2:85.

Key words: buildings; fire loads; load surveys; occupancy live loads; structural engineering.

Fire load and live load data obtained from a survey of 23 office uildings located in various regions throughout the United States e presented. The survey design is described including the haracteristics of the building population used to select the samle. Data are presented on the magnitude and distribution of the ads. Information is also included on the characteristics of ofce loads such as the type of items (furniture, equipment, etc.) nd their properties (material type, dimensions, exposure, etc.). tatistical summaries of the data and a determination of the uilding and occupancy characteristics affecting these loads are resented. The data do not indicate any significant differences etween the loads in private and government buildings. imilarly, geographic location, building height, and building age ere not found to have a significant influence on load magnitude. he use of the rooms surveyed, however, did affect load magitude. A mathematical model developed from a regression analsis of the survey data is presented for calculating fire loads and ve loads in offices. The data presented may be used to evaluate rrent requirements for design loads for buildings.

BSS86. **Engineering aspects of Cyclone Tracy, Darwin, Australia, 1974,** R. D. Marshall, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 86,* 39 pages (June 1976) SD Catalog No. C13.29/2:86.

Key words: buildings; cyclones; disasters; structural engineering; tides; wind.

During the early morning hours of December 25, 1974, the city of Darwin was devastated by the most damaging cyclone ever to strike the Australian Continent. Winds of up to 75 m/s caused extensive damage to housing in particular, requiring the evacuation of approximately half of the 45,000 residents to other major cities in Australia. This report is a result of the author spending several days on temporary assignment with the Department of Housing and Construction – Australian Government to inspect the damage, and to participate in discussions regarding the establishment of new design criteria and construction practices for cyclone areas. The fact that most of the damage was caused by wind forces rather than a combination of wind and storm surge greatly simplified the assessment of damage and structural performance. The experience at Darwin points out the danger in depending too heavily upon past experience and intuition in the design of housing. It also makes clear the need for additional research into the behavior of certain building materials under repeated loads and missile impact, and the racking strength of walls subjected to uplift loads.

BSS87. **Model documents for the evaluation, approval, and inspection of manufactured buildings,** P. W. Cooke, R. D. Dikkers, H. R. Trechsel, H. K. Tejuja, and L. P. Zelenka, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 87,* 296 pages (July 1976) SD Catalog No. C13.29/2:87.

Key words: building codes; certification; compliance assurance; evaluation; inspection; manufactured building; model documents; NCSBCS; standards; state regulation.

To assist the states in developing their building regulatory activities and functions, the Coordinated Evaluation System (CES) Project has defined and developed model informational documentation pertaining to the functional areas of (1) data submission, (2) evaluation, (3) approval, (4) compliance assurance, and (5) installation data.

This report gives the results of the project's investigations and presents sample model documents pertaining to manufactured buildings and building components. The model documentation is based on the Model Rules and Regulations for manufactured buildings developed by a Department of Commerce sponsored working task group, and the results of a comprehensive state-of-the-art study of most state building regulatory programs. The documentation presented covers all functional areas except owner information which is not usually subject to regulation. Emphasis was placed on developing documentation applicable primarily to one and two family detached dwellings.

BSS88. **Energy conservation in buildings—A human factors/systems viewpoint,** A. I. Rubin, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 88,* 19 pages (Nov. 1976) SD Catalog No. C13.29/2:88.

Key words: energy conservation; human factors; people in buildings.

The current emphasis on energy conservation in buildings must be balanced by a careful consideration of how proposed approaches affect building occupants. A head-long rush toward building designs which conserve energy at the expense of the quality of buildings as judged by occupants, would be a very shortsighted approach. There must be a continual awareness and sensitivity of the consequences on people when selecting among alternative "technical" options designed as a result of energy

conservation needs. We need an increasing understanding of such factors as thermal comfort and illumination needs in buildings, as decisions likely to influence these requirements are made by designers.

Another area of concern which should not be overlooked is the interactions of people with their environments. "Hardware" approaches to energy conservation problems are often defeated by building occupants. Tight seals around doors and windows are useless if doors and windows are kept open. Building occupants have no choice but to turn all of the lights on or off if these are the only control options available to them. Building managers, operators and occupants have an important, though not well understood role to play in any energy conservation program. This problem deserves serious attention.

BSS89. **The incidence of abnormal loading in residential buildings,** E. V. Leyendecker and E. F. P. Burnett, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 89,* 10 pages (Sept. 1976) SD Catalog No. C13.29/2:89.

Key words: bombs; building codes; design criteria; explosions; gas; hazardous materials; loads; progressive collapse; sonic boom; vehicular collision.

The findings of an analysis of available U.S. statistics concerning the incidence of abnormal loading events in residential buildings are presented. The study evaluates natural gas explosions, bomb explosions, motor vehicle collision, sonic boom aircraft collision, and explosion of hazardous materials.

It is concluded that the gas related explosion, bomb explosion, and vehicular collision are of significance in building design for progressive collapse. Of these, the natural gas explosion is the most significant in terms of incidence. The gas explosion causing severe damage occurs with an annual frequency of 1.6 per million dwelling units and approaches a probability of 1×10^{-3} per apartment building per year.

BSS90. **The structure of building specifications,** S. J. Fenves, K. Rankin, and H. K. Tejuja, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 90,* 83 pages (Sept. 1976) SD Catalog No. C13.29/2:90.

Key words: building code provisions; building codes; building component classification; building specifications; building standards; performance concept.

This paper provides a scientific basis for the formulation and expression of performance standards and specifications and for explicit attention to performance in procedural and prescriptive standards and specifications.

The provisions of the NBS-developed *Interim Performance Criteria for Solar Heating and Combined Heating/Cooling Systems and Dwellings,* a performance specification, are classified in terms of the physical entities addressed, the attributes of the built environment, and the properties which group together particular physical entities which may be subject to similar dysfunctions. These provisions are also subjected to a linguistic analysis which examines in detail the wording used and formalizes certain key concepts which are realized in the wording.

The provisions of the *Uniform Plumbing Code,* a prescriptive code, are classified in terms of the physical entities addressed and the performance attributes which can be inferred (though they are not explicitly addressed).

Guidelines for the expression of provisions in performance codes and specifications are presented. These guidelines are based on the classification studies and the linguistic analysis mentioned above.

BSS91. **The development of an improved test for evaluating the racking resistance of wall panels,** C. W. C. Yancey, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 91,* 75 pages (Nov. 1976) SD Catalog No. C13.29/2:91.

Key words: lateral loads; loading rate; racking; test method; vertical loads; wall panels; walls.

An experimental investigation of the primary factors involved in the laboratory testing of prototype wall panels, under simulated wind-induced racking loads, is reported. The objective of the investigation was to recommend a static racking test method, generally applicable to a variety of wall construction types, that features realistic boundary and loading conditions. Initially, a literature survey was conducted for the purpose of evaluating the test methods which have been, or are being employed in determining the resistance of wall panels to static racking loads. In the experimental program, 17 exploratory tests were conducted on a sample comprised of two types of wall panel construction. The 8 ft by 8 ft steel-frame and wood-frame panels were subjected to a combination of vertical and horizontal loading and their resulting deformation behavior was systematically monitored. Modifications to the testing procedure and to the boundary condition at the top of the panels were introduced as the experiments progressed. Detailed descriptions of the laboratory procedures used are presented. As the tests were developmental in nature and not intended for performance evaluation of the types of construction, selected results are presented. A static racking test method, applicable to traditional and innovative wall construction was derived as a result of the laboratory study and the literature survey. The principal new features of the proposed standard method are: (a) the application of distributed vertical loading, (b) the capability of testing panels of various height-to-width ratios and (c) the provision of top and bottom boundary conditions which do not force unrealistic modes of failure.

BSS92. **The viscosities of roofing asphalts at application temperatures,** W. J. Rossiter, Jr., and R. G. Mathey, *Nat. Bur. Stand. (U.S.), Bldg. Sci. Ser. 92,* 44 pages (Nov. 1976) SD Catalog No. C13.29/2:92.

Key words: application temperature; asphalt; built-up roofing; interply thickness; roofing membranes; viscosity.

The optimum range of viscosity over which hot asphalt should be applied in the fabrication of built-up roofing membranes was determined to be 50 to 150 centistokes (mm^2/s). This viscosity range was based on the relationship between interply thickness and application temperature of asphalt obtained from roofing membrane specimens fabricated in the field. Because laboratory measurements showed a wide range of viscosities for roofing asphalts of the same type over their application temperature ranges, it was recommended that asphalts be applied at temperatures based on viscosity and not empirically determined temperature limits. In practice, the viscosity-temperature relationship should be determined for each roofing asphalt for the application temperature range prior to use. Using this relationship and the optimum viscosity range, the temperature range for applying each asphalt can be determined.

3.13. FEDERAL INFORMATION PROCESSING STANDARDS PUBLICATIONS

Publications in this series collectively constitute the Federal Information Processing Standards Register. Register serves as the official source of information in the Federal Government regarding standards issued by NBS pursuant to the Federal Property and Administrative Services Act of 1949 as amended, Public Law 89-306 (79 Stat. 1127), and as implemented by Executive Order 11717 (38 FR 12315, dated May 11, 1973) and Part 6 of Title 15 CFR (Code of Federal Regulations). This series is available only from the National Technical Information Services, Springfield, VA 22161. See page 17 for price list.

FIPS PUB 0. **General description of Federal Information Processing Standards register,** H. S. White, Jr., Editor, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 0, 8 pages (Nov. 1, 1968).

Key words: Federal Information Processing Standards Register; general description.

This document defines the responsibilities for the Register, defines its contents and categories of standards, and suggests a method for establishing and maintaining standards within an activity.

FIPS PUB 1. **Code for information interchange. Hardware standard interchange codes and media,** H. S. White, Jr., Editor, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 1, 4 pages (Nov. 1, 1968).

Key words: Federal Information Processing Standard; code for interchange.

This document provides administrative, policy, and guidance information relative to the implementation and utilization of the standard code for information interchange.

The technical specifications of this standard are available to Federal Government activities from the General Services Administration Specifications Activity at a cost of 40 cents per copy. Refer to FIPS 1. Others may obtain copies from the United States of America Standards Institute for $2.00 per copy. Refer to USA Standard X3.4-1968. The technical specifications define a code and character set for use in Federal information processing systems, communications systems and associated equipments.

FIPS PUB 2. **Perforated tape code for information interchange. Hardware standard interchange codes and media,** H. S. White, Jr., Editor, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 2, 4 pages (Nov. 1, 1968).

Key words: Federal Information Processing Standard; perforated tape code for information interchange.

This document provides administrative, policy, and guidance information pertaining to the implementation and utilization of the standard perforated tape code for information interchange. The technical specifications of this standard are available to Federal Government activities from the GSA Specifications Activity at 45 cents per copy. Refer to FIPS 2. Others may obtain copies from the United States of America Standards Institute for $1.50 per copy. Refer to USA Standard X3.6-1965. The technical specifications of the standard specify the representation of the Federal Standard Code for Information Interchange (FIPS) on perforated tape used in Federal information processing systems, communications systems, and associated equipments.

FIPS PUB 3, Superseded by FIPS PUB 3-1.

FIPS PUB 3-1. **Recorded magnetic tape for information interchange (800 CPI, NRZI),** P. S. Johnson, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process Stand. Publ. (FIPS PUB) 3-1, 4 pages (1973) 20 cents, SD Catalog No. C13.52:3-1.

Key words: Communications; computers; computer system hardware; data processing; data processing equipment; information systems; magnetic tape recording; magnetic tapes; magnetic tape transports; standards.

This standard specifies the recorded characteristics of 9-track, one-half inch wide magnetic computer tape, including the data format for implementing the Federal Standard Code for Information Interchange at the recording density of 800 characters per inch (CPI). It is one of a series of Federal Standards implementing the Federal Standard Code for Information Interchange (FIPS 1) on magnetic tape media. This revision to FIPS PUB 3 reflects a change in scope from the earlier version of X3.22-1967, and encompasses the recorded tape requirements only. The unrecorded tape standard will include the requirements for the physical properties of the tape and reels that were previously included in FIPS 3. Supersedes NBS FIPS PUB 3.

FIPS PUB 4. **Calendar date (Federal general data standard representations and codes),** H. S. White, Jr., Editor, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 4, 4 pages (Nov. 1, 1968).

Key words: Calendar date; Federal Information Processing Standard.

This publication announces the adoption of a Federal standard for representing calendar dates used in the interchange of formatted machine sensible coded data between and among agencies. The technical specifications (FIPS 4) are affixed to the FIPS PUB.

FIPS PUB 5, Superseded by FIPS PUB 5-1.

FIPS PUB 5-1. **States and outlying areas of the United States. Federal General Data Standard Representations and Codes,** Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub) 5-1, 4 pages (1970).

Key words: ADP standards; computers; data elements and codes; data processing; Federal Information Processing Standards; geography; information processing standards; information systems; National Government; representations and codes; standards; states; statistical data.

This publication provides names, abbreviations, and codes for representing the 50 States, the District of Columbia, and the outlying areas, all of which are considered to be "first order subdivisions" of the United States for use in the interchange of formatted machine sensible data. (Supersedes FIPS Pub. 5.)

FIPS PUB 6, 6-1, Superseded by FIPS PUB 6-2.

FIPS PUB 6-2. **Counties and county equivalents of the states of the United States. Federal general data standard representations and codes,** *(ANS X3.31-1973),* H. E. McEwen, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 6-2, 35 pages (1973) 65 cents, SD Catalog No. C13.52:6-2.

Key words: ADP standards; computers; data elements and codes; data processing; Federal Information Processing Standards; geography; information processing standards; information systems; national government; representation and codes; standards; statistical data.

This publication provides names and codes for representing the Counties of the 50 States or county equivalents thereof for use in the interchange of formatted machine sensible data. Also included in the set of codes are the independent cities of Maryland, Missouri, Nevada, and Virginia and the Census Divisions and boroughs of Alaska. Supersedes NBS FIPS PUB. 6-1.

FIPS PUB 7. **Implementation of the code for information interchange and related media standards. Hardware standards interchange codes and media,** H. S. White, Jr., Editor, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 7, 14 pages (Mar. 7, 1969).

Key words: Federal Information Processing Standard; hardware standards interchange codes.

This FIPS PUB provides further details covering the implementation of the Code for Information Interchange (FIPS 1), Perforated Tape Code for Information Interchange (FIPS 2), and Recorded Magnetic Tape Code for Information Interchange (800 CPI, NRZI) (FIPS 3). The publication includes a letter of approval of these standards by the President of the United States and a letter with attachments by the Secretary of Commerce providing details and policy of their implementation.

FIPS PUB 8,8-1,8-2,8-3, Superseded by FIPS PUB 8-4.

FIPS PUB 8-4. **Standard Metropolitan Statistical Areas,** H. E. McEwen, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 8-4, 20 pages (1974) SD Catalog No. C13.52:8-4.

Key words: computers; data processing; Federal Information Processing Standards Publication; representations and codes; Standard Metropolitan Statistical Areas.

This publication provides standard identifications and codes for representing Standard Metropolitan Statistical Areas for the interchange of machine sensible data among agencies. It supersedes FIPS 8-3, Standard Metropolitan Statistical Areas, dated 1973 August 15. The general concept of a Standard Metropolitan Statistical Area, commonly referred to as "SMSA" is one of an integrated economic and social unit with a recognized large population nucleus. The codes are available on Hollerith punched cards. The following data elements are provided: SMSA Title (Name) and SMSA Code. Supersedes FIPS PUB 8-3.

FIPS PUB 9. **Congressional districts of the United States. Federal general data standard representations and codes,** H. S. White, Jr., Editor, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 9, 4 pages (November 14, 1969).

Key words: Congressional districts of the United States; Federal Information Processing Standard.

Congressional districts are considered to be any of the districts into which a State is divided for the purpose of electing representatives to the House of Representatives of the United States Congress. This standard provides codes for representing the congressional districts identified in the various Congresses of the United States.

FIPS PUB 10,10-1, Superseded by FIPS PUB 10-2.

FIPS PUB 11, Superseded by FIPS PUB 11-1.

FIPS PUB 12, 12-1, Superseded by FIPS PUB 12-2.

FIPS PUB 12-2. **Federal information processing standards index,** H. E. McEwen, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 12-2, 195 pages (1974) SD Catalog No. C13.52:12-2.

Key words: American National Standards; computers; data elements and codes; data processing systems; Federal Information Processing Standards; management information systems; International Organization for Standardization; standards; U.S. Government.

This publication provides material concerning standardization activities in the area of information processing at the Federal, National, and International levels. Also included are related policy and procedural guideline documents. A list of Federal Government participants involved in the development of Federal Information Processing Standards is provided. This FIPS PUB is revised and updated annually. Supersedes NBS FIPS PUB 12-1.

FIPS PUB 13. **Rectangular holes in twelve-row punched cards** H. S. White, Jr., Nat. Bur. Stand. (U.S.), Fed. Info. Process Stand. Publ. (FIPS Pub.) 13, 4 pages (1971).

Key words: American Standard Code for Information Interchange; ASCII; card punch; card reader; data communications; data interchange; data processing; EAM cards electric accounting machine; Federal Information Processing Standard; Hollerith punched cards; information interchange; information processing; punched cards; rectangular holes.

This publication provides information on the size, location and dimensional tolerances of rectangular holes in 12-row, 3 1/4 inch wide punched cards. It applies to card reading and punching equipment used in data processing, communications and similar operations in the Federal government. This Federal standard adopts in whole a revised version of American National Standard X3.21-1967, Rectangular Holes in 12-Row Punched cards.

FIPS PUB 14. **Hollerith punched card code,** H. S. White, Jr. Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 14, 4 pages (1971).

Key words: American Standard Code for Information Interchange; ASCII; card punch; card reader; data communications; data interchange; data processing; EAM cards electric accounting machine; Federal Information Processing Standard; Hollerith punched card code; Hollerith punched cards; information interchange; information processing; punched cards.

This publication provides a standard set of 128 hole patterns which represent the 128 characters of the Federal Standard Code for Information Interchange (ASCII) FIPS 1, in 12-row 80 column, rectangular hole, "Hollerith" punched cards, or the subsets of ASCII as specified in FIPS 15, Subsets of the Standard Code for Information Interchange. It adopts one-half of the 256 hole patterns given in the American National Standard X3.26-1969, Hollerith Punched Card Code.

FIPS PUB 15. **Subsets of the standard code for information interchange,** H. S. White, Jr., Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 15, 10 pages (1971).

Key words: American Standard Code for Information Interchange; ASCII; coded character subsets; codes; da

communication; data interchange; data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets.

This publication provides three subsets of 95, 64 and 16 raphic characters derived from the Federal Standard Code for nformation Interchange (FIPS 1), which was adopted from the merican Standard Code for Information Interchange (ASCII) 3.4-1968. These subsets are for use in Federal printers, display evices, punched card equipment, and other data processing or ommunication equipments which utilize a character subset less an the full 128-character set of FIPS 1.

IPS PUB 16, Superseded by FIPS PUB 16-1.

IPS PUB 17, Superseded by FIPS PUB 17-1.

IPS PUB 18, Superseded by FIPS PUB 18-1.

IPS PUB 19. **Guidelines for registering data codes,** H. S. White, Jr., Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 19, 7 pages (1972).

Key words: Data codes; data elements; data processing systems standards; Federal information processing standards; management information systems; United States Government.

Office of Management and Budget Circular No. A-86, Standardization of data elements and codes assigns to the National Bureau of Standards responsibility for maintaining registers of data elements and codes, and to Federal departments and agencies the responsibility for registering program and agency codes with NBS. This publication provides guidelines for registering data codes with NBS and for reporting the use of the codes to maintaining agencies for purposes of receiving changes.

IPS PUB 20. **Guidelines for describing information interchange formats,** H. S. White, Jr., Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 20, 11 pages (1972).

Key words: Data processing systems standards; Federal Information Processing Standards; formatted records; information interchange; United States Government.

This publication provides guidelines which identify and escribe the various characteristics of formatted information that ould be considered whenever formatted information is interchanged. The objective is to clarify and improve the documentation necessary to effectively provide, process, or use the information involved. The guidelines provided are to be used roughout the Federal Government as a checklist for preparing fective documentation of formatted information interchange.

IPS PUB 21, Superseded by FIPS PUB 1-1.

PS PUB 21-1. **COBOL,** M. V. Vickers, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 21-1, 5 pages (Dec. 1, 1975) SD Catalog No. C13.52:21-1.

Key words: COBOL; data processing; Federal Information Processing Standard; information interchange; information processing; programming language; software; standards conformance.

This FIPS PUB announces the adoption of the American National Standard COBOL (X3.23-1974) as the Federal Standard OBOL. This revision supersedes FIPS PUB 21 and reflects ajor changes and improvements to the COBOL specifications. he American National Standard defines the elements of the OBOL Programming Language and the rules for their use. The standard is used by implementors as the reference authority in developing compilers and by users for writing programs in COBOL. The primary purpose of the standard is to promote a high degree of interchangeability of programs for use on a variety of automatic data processing systems.

The COBOL language is intended for use in computer applications that emphasize the manipulation of characters, records, and files.

FIPS PUB 22, Superseded by FIPS PUB 22-1.

FIPS PUB 23. **Objectives and requirements of the Federal Information Processing Standards Program,** H. S. White, Jr., Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 23, 8 pages (1972) 35 cents, SD Catalog No. C13.52: 23.

Key words: Computers; data processing; Federal Information Processing Standards; management; standards; U.S. Government.

Public Law 89-306 (the Brooks legislation) was enacted to provide for the economic and efficient purchase, lease, maintenance, operation and utilization of automatic data processing equipment by Federal departments and agencies. Among the other provisions of PL89-306, the Secretary of Commerce is authorized to make appropriate recommendations to the President relating to the establishment of uniform Federal automatic data processing standards. The Federal Information Processing Standards Program was established in response to this part of the legislation. The purpose of this document is to outline the objectives of the Federal Information Processing Standards Program and to identify requirements for specific standards necessary to accomplish these objectives.

FIPS PUB 24. **Flowchart symbols and their usage in information processing,** M. Keplinger, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 24, 4 pages (1973) 20 cents, SD Catalog No. C13.52:24.

Key words: Computer programming; computers; data processing, Federal Information Processing Standards; flow charting; flowchart symbols; information processing; standards.

This publication establishes standard flowchart symbols and specifies their use in the preparation of flowcharts in documenting information processing systems. This standard applies to any Federal information processing operation where symbolic representation is desirable to document the sequence of operations and the flow of data and paperwork.

FIPS PUB 25. **Recorded magnetic tape for information interchange (1600 CPI, phase encoded),** P. S. Johnson, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process Stand. Publ. (FIPS PUB) 25, 4 pages (1973) 20 cents, SD Catalog No. C13.52:25.

Key words: Communications; computers; computer systems hardware; data processing; data processing equipment; information systems; magnetic tape recording; magnetic tapes; magnetic tape transports; standards.

This standard specifies the recorded characteristics of 9-track, one-half inch wide magnetic computer tape, including the data format for implementing the Federal Standard Code for Information Interchange at the recording density of 1600 characters per inch (CPI). It is one of a series of Federal Standards implementing the Federal Standard Code for Information Interchange (FIPS 1) on magnetic tape media.

FIPS PUB 26. **One-inch perforated paper tape for information interchange,** P. S. Johnson, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 26, 4 pages (1973) 20 cents, SD Catalog No. C13.52:26.

Key words: Data processing; Federal Information Processing Standard; information interchange; information processing; paper tape; paper perforator tape.

This standard specifies the physical dimensions and tolerances of one-inch wide paper tape, including the size and location of the perforations used for recording information.

FIPS PUB 27. **Take-up reels for one-inch perforated tape for information interchange,** P. S. Johnson, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process Stand. Publ. (FIPS PUB) 27, 4 pages (1973) 20 cents, SD Catalog No. C13.52:27.

Key words: Data processing; Federal Information Processing Standard; information interchange; information processing; paper tape; paper perforator tape.

This standard specifies the physical dimensions of paper tape take-up (or storage) reels, with either fixed or separate flanges. The two types of reels specified differ in the size and shape of the drive hub, but both are intended for use with one-inch perforated paper tape devices.

FIPS PUB 28. **Standardization of data elements and representations,** H. S. White, Jr., Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 28, 12 pages (1973) SD Catalog No. C13.52:28.

Key words: computers; data elements and representations; data processing systems; Federal Information Processing Standards; management information systems; standards; U.S. Government.

Pursuant to the authority delegated to the Secretary of Commerce by Executive Order 11717 (38 FR 12315, dated May 11, 1973), Subtitle A of Title 15 of the Code of Federal Regulations has been amended to add a new Part 6 which implements the provisions of Section III (f) (2) of the Federal Property and Administrative Services Act of 1949, as amended (79 Stat. 1127). This new Part 6 supersedes and replaces in its entirety the provision of Office of Management and Budget Circular A-86 entitled, "Standardization of data elements and codes in data systems," dated September 30, 1967 which was rescinded by the Director of the Office of Management and Budget on August 29, 1973. Part 6 provides policy and identifies responsibilities of executive branch departments and independent agencies for a government-wide program for the standardization of data elements and representations used in Federal automated data systems. This publication provides a copy of Part 6 and other documents relating to this amendment.

FIPS PUB 29. **Interpretation procedures for Federal Standard COBOL,** R. E. Rountree, Jr., Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 29, 4 pages (1974) SD Catalog No. C13.52:29.

Key words: COBOL; compilers; data processing; Federal Information Processing Standard; information interchange; information processing; programming language; software.

This FIPS PUB defines the procedures that will be followed in requesting interpretations of the Federal Standard COBOL and in providing responses to those requests. The provisions of this document apply to all Federal departments and agencies and to vendors of COBOL compilers in their dealings with the Federal Government.

FIPS PUB 30. **Software summary for describing computer programs and automated data systems,** B. Marron, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 30, 5 pages (1974) SD Catalog No. C13.52:30.

Key words: computer programs; computers; computer software; data processing; Federal Information Processing Standards; information processing.

This publication provides a standard software summary form (SF-185) together with instructions for describing computer programs and/or automated data systems for identification, reference, and dissemination purposes. Federal Information Processing Standard Software Summary Form (SF-185) will be used in documenting summaries or abstracts of programs and/or automated data systems that are developed or acquired by Federal departments and agencies. This form will also be used by the General Services Administration in the establishment of a centralized registry of selected government software.

FIPS PUB 31. **Guidelines for automatic data processing physical security and risk management,** S. K. Reed, Ed., Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS Pub.) 31, 92 pages (1974) SD Catalog No. C13.52:31.

Key words: ADP security; computer reliability; contingency plans; Federal Information Processing Standard; fire safety; natural disasters; physical security; risk analysis; security audit; security awareness; supporting utilities.

This publication provides guidelines to be used by Federal organizations in structuring physical security programs for their ADP facilities. It treats security analysis, natural disasters, supporting utilities, system reliability, procedural measures and controls, off-site facilities, contingency plans, security awareness and security audit. It contains statistics and information relevant to physical security of computer data and facilities and references any applicable publications for a more exhaustive treatment of specific subjects.

FIPS PUB 32. **Optical character recognition character sets,** P. Mantek, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 32, 78 pages (1974) SD Catalog No. C13.52:32.

Key words: alternate character; centerline drawings; character positioning; character sets; character shape; character sizes; font; lower case character; Optical Character Recognition; upper case character.

This standard provides the description, scope, and identification for standard sets of graphic shapes to be used in the application of Optical Character Recognition (OCR) systems. Two font styles, known as Style A and B, are described. Style A comprises a font of 92 characters which is designed to provide a maximum of machine efficiency in reading under a wide variety of applications. Style B comprises a font of 96 characters, which stresses esthetic appearance, but which may be applied under a substantial range of applications. Three sizes of characters designated as Size I, III and IV are presented. The basic requirements related to character positioning are also specified. Individual character drawings for both styles of character sets are included.

FIPS PUB 33. **Character set for handprinting,** R. E. Rountree, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 33, 4 pages (1974) SD Catalog No. C13.52:33.

Key words: character sets; character shape; character size; Federal Information Processing Standards; handprinting; Optical Character Recognition.

This FIPS PUB announces the adoption of the American National Standard X3.45-1974, Character Set for Handprinting as a Federal Standard. This standard provides the description, scope, and application rules for a character set for handprinting. A major purpose of this standard is to reduce the cost of data input into ADP systems which use Optical Character Recognition (OCR) equipment.

FIPS PUB 34. **Guide for the use of International System of Units (SI)**, R. R. Roundtree, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 34, 4 pages (1975) SD Catalog No. C13.52:34.

Key words: ADP standards; computers; data processing, Federal Information Processing Standards; metric conversion; SI units; standards.

The use of SI (International System of Units) within the United States is increasing. The Secretary of Commerce has established the policy that publications of the Department will provide dual-dimensions to the extent practicable.

The Federal Information Processing Standards (FIPS) Program in response to Public Law 89-306 (the Brooks Act) strives to improve the utilization of ADP equipment, goods and services within the Federal Government through the establishment of uniform Federal automatic data processing standards. These standards and guidelines which are published by the National Bureau of Standards as FIPS contain specifications which should be expressed as dual-dimensions. Accordingly, this guideline will be used in the preparation of all new FIPS PUBS and existing FIPS PUBS when revised.

FIPS PUB 35. **Code extension techniques in 7 or 8 bits**, J. L. Little, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 35, 4 pages (1975) SD Catalog No. C13.52:35.

Key words: American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets.

This FIPS PUB announces the adoption of the American National Standard X3.41-1974, Code Extension Techniques for use with the 7-Bit Coded Character Set of ASCII. This standard specifies methods of extending the 7-bit code of ASCII (FIPS 1), remaining in a 7-bit environment or increasing to an 8-bit environment, building upon the structure of ASCII to describe various means of extending the control and graphic sets of the code. It also describes techniques for constructing codes related to ASCII so as to allow application dependent usage without preventing the interchangeability of their data and describes 8-bit codes for general information interchange in which ASCII is a subset.

FIPS PUB 36. **Graphic representation of the control characters of ASCII (FIPS 1)**, J. L. Little, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 36, 4 pages (1975) SD Catalog No. C13.52:36.

Key words: American Standard Code for Information Interchange; ASCII, coded character subsets; codes; data communication, data interchange, data processing; Federal Information Processing Standards; graphic character subsets; graphic subsets; information interchange; information processing; standards; subsets.

This FIPS PUB announces the adoption of the American National Standard X3.32-1973, Graphic Representation of the Control Characters of American National Standard Code for Information Interchange. This standard specifies graphical representations for the 34 characters of ASCII (FIPS 1) for which a graphic representation is not indicated in FIPS 1. Graphical representations are given for the 32 control functions of columns 0 and 1 as well as the characters "Space" and "Delete." Two forms of graphical representations for each of the 34 characters are provided: a pictorial symbol, and a 2-letter alphanumeric code.

FIPS PUB 37. **Synchronous high speed data signaling rates between data terminal equipment and data communications equipment**, G. E. Clark, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 37, 4 pages (1975) SD Catalog No. C13.52:37.

Key words: data communication equipment; data processing terminal equipment; data transmission (high speed); Federal Information Processing Standards; synchronous signaling rates; teleprocessing; wide band.

This FIPS PUB announces the adoption of the American National Standard X3.36-1975, Synchronous High Speed Data Signaling Rates Between Data Terminal Equipment and Data Communication Equipment, and is the same as Federal Standard Number 1001. This standard specifies a series of signaling speeds for synchronous high speed serial data transfer.

FIPS PUB 38. **Guidelines for documentation of computer programs and automated data systems**, B. Marron, Standards Coordinator, *Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 38*, 50 pages (1975).

Key words: automated data systems; computer programs; documentation; documentation content guidelines; FIPS guidelines; software.

These guidelines provide a basis for determining the content and extent of documentation for computer programs and automated data systems. Software development phases and related document types are identified, several examples of documentation options are given, and content guidelines for ten document types are provided. The ten document types are: Functional Requirements Document; Data Requirements Document; System/Subsystem Specification; Program Specification; Data Base Specification; Users Manual; Operations Manual; Program Maintenance Manual; Test Plan; Test Analysis Report.

The guidelines are intended to be a basic reference and a checklist for general use throughout the Federal Government to plan and evaluate documentation practices.

FIPS PUB 39. **Glossary for computer systems security**, D. Branstad and R. Krell, *Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 39*, 19 pages (Jan. 1976).

Key words: computer; data processing; definitions; Federal Information Processing Standards Publication; information processing; privacy; security; terms; vocabulary.

This glossary provides an alphabetic listing of approximately 170 terms and definitions pertaining to privacy, and security related to data, information systems hardware and software. Multiple word terms are listed in natural order, synonyms are referenced, and glossary terms appearing within a definition are indicated.

FIPS PUB 40. **Guideline for optical character recognition forms**, T. C. Bagg, Standard Coordinator, *Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 40*, 60 pages (1976).

Key words: business forms; computers; data entry systems; information processing systems; information processing standards; OCR; OCR forms; optical character recognition; standards.

This publication provides materials relating to the design, preparation, acquisition, inspection, and application of OCR forms in data entry systems. Since the materials are advisory and tutorial in nature this publication has been issued as a guideline rather than as a standard in the FIPS publication series. Full color illustrations are employed to show specific features of reflective ink applications, a phenomena unique to OCR forms requirements. Appropriate references are made to cognizant standards in the OCR area.

FIPS PUB 41. **Computer security guidelines for implementing The Privacy Act of 1974**, T. C. Lowe, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 41, 20 pages (1975) SD Catalog No. C13.52:41.

Key words: access controls; ADP security; computer security; Federal Information Processing Standards; information management; personal data; physical security; privacy risk assessment.

This publication provides guidelines for use by Federal ADP organizations in implementing the computer security safeguards necessary for compliance with Public Law 93-579, the Privacy Act of 1974. A wide variety of technical and related procedural safeguards are described. These fall into three broad categories: Physical security, information management practices, and computer system/network security controls. As each organization processing personal data has unique characteristics, specific organizations should draw upon the material provided in order to select a well-balanced combination of safeguards which meets their particular requirements.

FIPS PUB 42, 42-1, Superseded by FIPS PUB 42-2.

FIPS PUB 43. **Aids for COBOL program conversion (FIPS PUB 21 to FIPS PUB 21-1)**, M. V. Vickers, Standards Coordinator, Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 43, 54 pages (1975) SD Catalog No. C13.52:43.

Key words: COBOL; Federal Standard COBOL; program conversion; programming aids; programming languages.

Since COBOL is a "living" language, in the sense that it is under constant development and clarification, the Federal community which relies heavily on COBOL to satisfy their programming needs has a large degree of assurance that COBOL will continue to meet their data processing needs as future generation systems are introduced. However, along with the advantage of having more sophisticated and better COBOL tools to interact with new systems requirements, there is a short term disadvantage. As clarifications and new facilities are added, they must interact with the language specifications already standardized, and this interaction sometimes requires changes in source programs. An analysis, in the form of narrative descriptions and syntax comparisons, is provided to aid in the transitioning of COBOL programs for use with compilers developed in accordance with the 1968 COBOL Standard (FIPS PUB 21) to compilers developed in accordance with the 1974 COBOL Standard (FIPS PUB 21-1).

FIPS PUB 44. **COBOL coding form**, M. V. Vickers, Standards Coordinator, *Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 44*, 3 pages (1976).

Key words: COBOL; COBOL coding form; Federal Information Processing Standard; Federal Standard COBOL; software; standards conformance.

This publication provides a standard COBOL Coding Form (SF-268) together with an explanation of its use and physical specifications. The standard form is based upon a review and analysis of numerous COBOL coding forms being used throughout the Federal Government. The development of the standard form was accomplished through the cooperative efforts of FIPS Task Group 9 (COBOL) under the auspices of the National Bureau of Standards and the Interagency Reports and Standards Forms Division of the National Archives. It is anticipated that significant economic benefits will be realized by Federal departments and agencies as a result of the availability of a single standard form for government-wide use. This standard conforms to the provisions of Federal Standard COBOL (FIPS 21-1).

FIPS PUB 45. **Guide for the development, implementation and maintenance of standards for the representation of computer processed data elements**, H. S. White, Ed., *Nat. Bur. Stand. (U.S.), Fed. Info. Process. Stand. Publ. (FIPS PUB) 45, 51 pages (1976).*

Key words: American National Standards; computers; data; data elements; data processing; information; information processing; International Standards; U.S. Government.

Provides technical and administrative guidelines for the development, use and maintenance of standards for representing data elements used in computer based systems. Basic concepts and terminology of data standardization are provided in addition to evaluation criteria for assessing various coding alternatives. The guide is used as a basic reference document in the development of Federal and voluntary national and international standards for data. The guide was developed by the X3L81 Standards Task Group of the American National Standards Institute and has been adopted for use by the International Organization for Standardization.

3.14. COMMERCIAL STANDARDS

The name of this series was changed to Product Standards in 1965.

This series define the quality levels for products in accordance ith the principal needs of the trade. Their use is voluntary.

CS188-66. **Cast iron soil pipe and fittings,** NBS Comm. Std. 188-66 (July 1, 1966).

Key words: Cast iron pipe, requirements; soil pipe and fittings; soil pipe dimensions.

This standard covers pipe and fittings of the following patterns and, when so designated, may apply to any other patterns that conform with the requirements given therein. (Supersedes CS188-59).

CS236-66. **Mat-formed wood particleboard,** NBS Comm. Std. 236-66 (Apr. 15, 1966).

Key words: Mat-formed particleboard; particleboard requirements; particleboard, wood; wood particleboard.

This Commercial Standard covers two types of mat-formed wood particleboard; one for interior applications and one for certain exterior applications in addition to interior applications. Each type is further divided into several density grades which are subdivided into strength classifications. It is intended that the applications of the products will be consistent with the properties of the respective density grades and strength classifications described. Also included are definitions, dimensional tolerances, test methods, inspection practices, and methods of marking and certification to identify products that comply with all requirements of this Standard. (Supersedes CS236-61).

CS251-63. **Hardboard,** NBS Comm. Std. 251-63 (Nov. 15, 1966).

Key words: Fiber board; hardboard; ligno-cellulosic fibers; and lignin and hot pressed fibers.

This standard sets forth the standard commercial types, and sizes of hardboard, and gives information on special hardboards available. It provides specifications for physical requirements and test methods for static bending (modulus of rupture), tensile strength, water absorption, and thickness swelling. It includes a glossary of terms used in the hardboard industry, and recommends a uniform means of marking and certifying for the consumer hardboards that comply with this Standard. (Reprinted April 1967 with Amendments effective November 15, 1966).

CS274-66. **TFE-fluorocarbon (polytetrafluoroethylene) resin sintered thin coatings for dry film lubrication,** NBS Comm. Std. 274-66 (Jan. 20, 1966).

Key words: Coatings, dry film; dry film lubrication; polytetrafluoroethylene; resin sintered coatings; and TFE-fluorocarbon.

This standard establishes the requirements and methods of test for the material, thickness, workmanship, and properties of TFE-fluorocarbon resin coatings 0.001 inch or less in thickness for the purpose of dry film lubrication. Methods of marking and indicating compliance with this standard are included.

3.15. SIMPLIFIED PRACTICE RECOMMENDATIONS

The name of this series was changed to Product Standards in 1965.

This series list the staple sizes, kinds, types, and applicable methods for certain commodities produced and stocked in greatest quantity, to aid in holding variety to a minimum. Their use is voluntary.

SPR174-65. **Cast-iron radiators,** NBS Simpl. Prac. Recomd. 174 65 (Dec. 31, 1965).

Key words: Cast iron radiators; radiators, cast iron; radiator ratings; radiator sizes.

This recommendation covers sizes, types and dimensions of radiators, stock assemblies and general provisions. It does not cover baseboard type of radiation. (Supersedes SPR174-47.)

3.16. PRODUCT STANDARDS

Developed under procedures published by the Department of Commerce in Part 10, Title 15, of the Code of Federal Regulations. The purpose of the standards is to establish nationally recognized requirements for products, and to provide all concerned interests with a basis for common understanding of the characteristics of the products. The National Bureau of Standards administers the Voluntary Product Standards program as a supplement to the activities of the private sector standardizing organizations.

PS0-70. **Editorial format for Voluntary Product Standards,** D. R. Mackay, Nat. Bur. Stand. (U.S.), Prod. Stand. 0-70, 13 pages (Mar. 1971).

Key words: Editorial format; format; Product Standards; standard; Voluntary Product Standards.

This publication is intended to assist individuals, organizations, and agencies which are concerned with the writing of standards. It establishes and describes the material to be contained in a standard and provides specific instructions for writing standards. It is primarily intended for those developing initial drafts of standards to be submitted to the Bureau under the *Procedures for the Development of Voluntary Product Standards* published by the Department of Commerce. Supersedes NBS PS0-67.

PS1-74. **Construction and industrial plywood.** *(ANS A199.1-1974),* K. G. Newell, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 1-74, 34 pages (Mar. 1975) SD Catalog No. C13.20/2:1-74.

Key words: construction and industrial plywood; industrial plywood; plywood, construction, and industrial.

This Voluntary Product Standard covers requirements and methods of test for the wood species, veneer grading, glue bonds, panel construction and workmanship, dimensional tolerances, marking, moisture content, and packing of plywood intended for construction and industrial uses.

Also included are a glossary of trade terms and a quality certification program. Information regarding generally available

sizes, methods of orderings, and reinspecting practices, is provided in the appendix.

PS2-66. **Standard sizes of blackboard slate,** NBS Prod. Std. 2-66 (May 15, 1966).

Key words: Blackboards; dimensions; natural markings; slabs; slate; standard sizes; thickness; tolerances.

This recommendation covers dimensions for blackboard slabs and dimensions of blackboard slates for other than wall use. Also included are requirements for thickness, finish, and color and imperfections of natural slate. (Supersedes SPR15-35).

PS3-66. **TFE-fluorocarbon (polytetrafluoroethylene) resin skived tape,** NBS Prod. Std. 3-66 (Sept. 1, 1966).

Key words: Electrical tape, plastic; plastic tape; polytetrafluoroethylene; resin skived tape; skived tape; TFE-fluorocarbon.

This standard establishes requirements and methods of test for the material, dimensions, workmanship, and the physical and electrical properties of three grades of skived tape manufactured entirely of TFE-fluorocarbon resin in accordance with good commercial practice. The materials covered range in thickness from 0.002 inch to 0.125 inch, and are normally manufactured by skiving.

PS4-66. **Standard stock light-duty 1 3/8- and 1 3/4-inch thick flush-type interior steel doors and frames,** NBS Prod. Std. 4-66 (Nov. 1, 1966).

Key words: Interior steel doors; standard interior steel doors; steel door frames, steel doors, interior.

This Product Standard covers sizes, types, materials, construction, hardware installation, and finishing of the doors, frames, and accessories. They are intended to be stock items for use in light-duty applications where low cost flush doors are desired. The standard also provides a uniform method of marking, identifying, and labeling. (Supersedes CS211-57).

PS5-66. **Porcelain enameled formed steel plumbing fixtures,** NBS Prod. Std. 5-66 (Nov. 1, 1966).

Key words: Abrasion resistance; chemical resistance; porcelain enamel; sanitary ware; sheet steel.

The standard covers materials, dimensions, construction and methods of inspection, testing, and labeling. Definitions are given for certain trade terms. The types and sizes of fixtures in general use and demand are listed for bathtubs, lavatories, kitchen sinks and sink-and-laundry-tray combinations. (Supersedes CS144-47).

PS6-66. **Trim for water-closet bowls, tanks and urinals (dimensional standards),** NBS Prod. Std. 6-66 (Nov. 1, 1966).

Key words: Bowls; brass; dimensions; nuts; plastic; plumbing equipment; tanks; valves.

The purpose of this standard is to establish a basis for dimensional interchangeability for those items of trim for water-closet bowls, tanks and urinals known as spuds, lock nuts for spuds, flush valves for staple low tanks, float valves, flush elbows, and coupling nuts. It is also intended to provide a basis for understanding between buyers and sellers for the dimensions and tolerances that govern the fit of trim in the fixtures and connecting parts of trim. (Supersedes CS172-50).

PS7-66. **Wire bar supports for reinforced concrete construction,** NBS Prod. Std. 7-66 (Aug. 1, 1966).

Key words: Bars, concrete reinforcement; concrete construction, supports; reinforced concrete construction; reinforcement bars; wire bar supports.

The standard lists twelve types of wire bar supports and the sizes of each in greatest demand. The minimum size of wire is given for each type of bar support. Maximum spacings at which the bar supports will function properly in ordinary slabs, joists, beams, and girders are included. The standard also lists a number of modifications of the standard bar supports for special applications in concrete reinforcement, which are not regularly stocked but may be obtained as standard items when specified.

PS8-67. **Grading of abrasive grain on coated abrasive products,** NBS Prod. Std. 8-67 (Jan. 9, 1967).

Key words: Abrasive grain; accumulation curve; coated abrasive products; grain, abrasive; micron; overgrade; sedimentation; sieve; standard sieve.

The scope of this Product Standard is confined to a determination of the grit sizes of the abrasive grain on the coated product. However, the information may also be of use in the preparation of abrasive grain for making coated abrasive products. It has been developed to cover, insofar as possible, the grading of the grit sizes of abrasive grain on the standard coated abrasive products listed in Simplified Practice Recommendation R89-55. (Supersedes CS217-59).

PS9-68. **Fabrics for book covers,** J. W. Eisele, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 9-68, 13 pages (Apr. 1968).

Key words: Bookbinders; book cloths; book covers; buckrams; starch filled: impregnated; testing procedures.

This Standard covers the requirements and test procedures for seven groups of plain finished book cloths and buckrams which are impregnated or starch filled and which are used in the bookbinding industry for book covers. Definitions which apply to this standard are also included. (Supersedes NBS Commercial Standard CS7-40.)

PS10-69. **Polyethylene (PE) plastic pipe (schedule 40—inside diameter dimensions),** H. A. Philo, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 10-69, 14 pages (Mar. 1970).

Key words: Dimensions; inside diameter; materials; pipe; polyethylene plastic; schedule 40.

This Product Standard covers the principal materials, sizes and pressure ratings for commercially available PE plastic pipe made in Schedule 40 size with the inside diameter controlled for use with insert fittings. Included are requirements and methods of test for materials, workmanship, dimensions, sustained pressure, burst pressure, and environmental stress cracking.

PS11-69. **Polyethylene (PE) plastic pipe (SDR),** H. A. Philo, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 11-69, 14 pages (Mar. 1970).

Key words: Inside diameter dimensions; materials; pipe; polyethylene (PE); pressure; standard dimension ratio (SDR).

This Product Standard covers the principal materials, sizes and pressure ratings for commercially available PE pipe made in Standard Dimension Ratios with the inside diameter controlled for use with insert fittings. Included are requirements and methods of test for materials, workmanship, dimensions, sustained pressure, burst pressure, and environmental stress cracking.

PS12-69. **Polyethylene (PE) plastic pipe (schedules 40 and 80—outside diameter dimensions),** H. A. Philo, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 12-69, 14 pages (Mar. 1970).

Key words: Dimensions; materials; outside diameter; pipe; polyethylene (PE); schedule size (40 and 80).

This Product Standard covers the principal types, grades, sizes, and pressure ratings for commercially available PE plastic pipe made in Schedule 40 and 80 sizes with the outside diameter controlled for use with socket-type fittings. Included are requirements and methods of test for materials, workmanship, dimensions, sustained pressure, burst pressure, and environmental stress cracking.

PS13-69. **Uncored slab urethane foam for bedding and furniture cushioning,** J. W. Eisele, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 13-69, 6 pages (Dec. 1969).

Key words: Cellular; flexible; slab; uncored; urethane foam.

The foam covered by this Product Standard is intended for uses such as inserts for mattresses and cushions for indoor and outdoor furniture. This Standard provides material and dimensional requirements for uncored slab urethane foam and requirements and methods of test for the specific properties of load bearing capacity, permanent set, moisture resistance, fatigue resistance, and resiliency. The fatigue requirements will be revised to incorporate dynamic fatigue specifications when adequate data are available. Methods for marking and labeling to indicate compliance with this Standard are also provided.

PS14-69. **Salt packages,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 14-69, 9 pages (May 1970).

Key words: Salt; salt packages; sodium chloride.

This Product Standard specifies the recommended salt packages for each kind of salt, the labeled net weight of the packages, and the type and capacity of shipping containers. Definitions and uses for salt are also included. While no attempt is made to list all of the packages, sizes, and containers which might be packed by one or more producer, table 1 includes those items common to the entire industry.

PS15-69. **Custom contact-molded reinforced-polyester chemical-resistant process equipment,** D. R. Stevenson. Technical Standards Coordinator. Nat. Bur. Stand. (U.S.), Prod. Stand. 15-69, 28 pages (June 1970).

Key words: Chemical-resistant; contact-molded; ducts; equipment; plastic; reinforced-polyester; tanks.

This Product Standard covers materials, construction and workmanship, physical properties, and methods of testing reinforced-polyester materials for process equipment and auxiliaries intended for use in aggressive chemical environments, including but not limited to pipe, ducts, and tanks. The Standard is based on the technology of fabrication by hand lay-up or contact pressure molding. Methods for identifying products which comply with the requirements of this Standard are included.

PS16-69. **Types and sizes of forms for one-way concrete joist construction,** J. W. Eisele, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 16-69, 16 pages (June 1970).

Key words: Concrete; floor and roof; forms joist; one-way.

This Product Standard covers four types of forms for one-way concrete joist construction and standard sizes for these types. Definitions of concrete joist construction and one-way joist construction are provided under section 4. (Supersedes NBS Simplified Practice Recommendation 87-32.)

PS17-69. **Polyethylene sheeting (construction, industrial, and agricultural applications),** D. R. Stevenson, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 17-69, 20 pages (June 1970).

Key words: Agricultural; composition; construction; industrial; polyethylene; properties; sheeting.

This Product Standard covers polyethylene sheeting of 10 mils (0.010 inch) or less in thickness and establishes requirements for the composition, impact resistance, mechanical properties, reflectance, opaqueness (low luminous transmittance), water vapor transmission, weight, and appearance of the sheeting. Also included are tolerance requirements for the thickness width and length of the sheeting. Provisions for identifying polyethylene sheeting conforming to this Standard are also provided. (Supersedes Commercial Standard CS238-61.)

PS18-69. **Acrylonitrile-butadiene-styrene (ABS) plastic pipe (schedules 40 and 80),** K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 18-69, 15 pages (June 1970).

Key words: Acrylonitrile-butadiene (ABS), outside diameter; dimensions; pipe; schedule size (40 and 80).

This Product Standard covers the principal types, grades, sizes, and pressure ratings for commercially available ABS plastic pipe made in Schedule 40 and 80 sizes with the outside diameter controlled. Included are requirements and methods of test for materials, workmanship, dimensions, sustained pressure, and burst pressure. Methods of marking and labeling to indicate compliance with this Standard are also provided. (Supersedes Commercial Standard CS218-59.)

PS19-69. **Acrylonitrile-butadiene-styrene (ABS) plastic pipe (Standard dimension ratio),** K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 19-69, 13 pages (June 1970).

Key words: Acrylonitrile-butadiene-styrene (ABS); outside diameter dimensions; pipe; standard dimension ratio (SDR).

This Product Standard covers the principal types, grades, sizes, and pressure ratings of commercially available ABS plastic pipe made in Standard Dimension Ratios (SDR) with the outside diameter controlled. Included are requirements and methods of test for materials, workmanship, dimensions, sustained pressure, and burst pressure. Methods of marking and labeling to indicate compliance with this Standard are also provided. (Supersedes Commercial Standard CS254-63.)

PS20-70. **American softwood lumber standard,** D. R. Mackay, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 20-70, 26 pages (Jan. 1970).

Key words: Grades; lumber; sizes; softwood; species; timber.

This Product Standard covers the principal trade classifications and sizes of softwood lumber for yard, structural, and shop use. It provides a common basis of understanding for the classification, measurement, grading, and grade marking of rough and dressed sizes of various items of lumber, including finish, boards, dimension, and timbers. (Supersedes NBS Simplified Practice Recommendation 16-53.)

PS21-70. **Poly(vinyl chloride) (PVC) plastic pipe (schedules 40, 80, and 120),** K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 21-70, 16 pages (June 1970).

Key words: Dimensions; hydrostatic design stress; materials; pipe; poly(vinyl chloride) (PVC); pressure; pressure rating (PR); schedule 40, 80, and 120 sizes.

This Product Standard covers the principal types, grades, sizes, and pressure ratings for commercially available PVC plastic pipe made in Schedule 40, 80, and 120 sizes, with the outside diameter controlled. Included are requirements and methods of test for materials, workmanship, dimensions, sustained pressure, burst pressure, flattening, and extrusion

quality. Methods of marking and labeling to indicate compliance with this Standard are also provided. (Supersedes Commercial Standard CS207-60.)

PS22-70. **Poly(vinyl chloride) (PVC) plastic pipe (standard dimension ratio),** K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 22-70, 14 pages (June 1970).

Key words: Class T; dimensions; hydrostatic design stress; materials; pipe; poly(vinyl chloride) (PVC); pressure; pressure rating (PR); standard dimension ratio (SDR); threads.

This Product Standard covers the principal types, grades, sizes, and pressure ratings for commercially available PVC plastic pipe made in Standard Dimension Ratios (SDR) with the outside diameter controlled. Included are requirements and methods of test for materials, workmanship, dimensions, sustained pressure, burst pressure, flattening, and extrusion quality. Methods of marking and labeling to indicate compliance with this Standard are also provided. (Supersedes Commercial Standard CS256-63.)

PS23-70. **Horticultural grade perlite,** J. W. Eisele, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 23-70, 9 pages (May 1970).

Key words: Horticultural grade; perlite horticultural grade.

This Product Standard includes requirements for the grading, density, pH value, and sterility of horticultural grade perlite and gives test methods for these requirements with the exception of sterility. A provision for identifying a product as conforming to the Standard is included.

PS24-70. **Melamine dinnerware (alpha-cellulose-filled) for household use,** D. R. Stevenson, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod Stand. 24-70, 9 pages (Aug. 1970).

Key words: Alpha-cellulose-filled; dinnerware; household alpha-cellulose filled melamine dinnerware; household use; melamine dinnerware; melamine plastic.

This Product Standard covers the properties, the methods of test, and the thickness and weight of household dinnerware molded from alpha-cellulose-filled melamine-formaldehyde and other amino-triazine-formaldehyde plastic materials. Requirements for the finish and decorations are also covered by the Standard. Methods for identifying melamine dinnerware complying with the requirements of this Standard are provided.

This Standard does not cover the design or color of melamine dinnerware.

PS25-70. **Heavy-duty alpha-cellulose-filled melamine tableware,** D. R. Stevenson, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 25-70, 8 pages (Aug. 1970).

Key words: Alpha-cellulose-filled, heavyduty; heavyduty alpha-cellulose-filled melamine tableware; melamine tableware; tableware.

This Product Standard covers the thickness, properties, and methods of test for heavy-duty tableware molded from alpha-cellulose-filled melamine-formaldehyde and other amino-triazine-formaldehyde plastic materials. Requirements for the finish and decoration are also covered by the Standard. Methods for identifying melamine tableware complying with the requirements of this Standard are provided.

This Standard does not cover the design, size, or color of the melamine tableware.

PS26-70. **Rigid poly(vinyl chloride) (PVC) profile extrusions,** D. R. Stevenson, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 26-70, 7 pages (Oct. 1970).

Key words: Extrusions; poly(vinyl chloride); profile; profile extrusions; PVC profile extrusions; rigid PVC.

This Product Standard establishes requirements for the material and properties, including dimensional stability and extrusion quality, of rigid PVC profile extrusions. Methods for identifying profile extrusions that comply with the requirements of this Standard are provided.

PS27-70. **Mosaic-parquet hardwood slat flooring,** W. H. Furcolow, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 27-70, 13 pages (Sept. 1970).

Key words: Flooring; hardwood flooring; mosaic-parquet flooring; slat flooring.

This Product Standard covers requirements for grading, moisture content, dimensions, construction, and finish for mosaic-parquet hardwood slat flooring which is intended for use in residential, institutional, and commercial buildings. A method for marking and labeling to indicate compliance with the Standard is also provided. Manufacturers' recommendations on ordering and installation are included in an appendix. The Standard does not cover flooring squares or blocks which are fabricated from conventional tongue and groove type strips.

PS28-70. **Glass stopcocks with polytetrafluoroethylene (PTFE) plugs,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 28-70, 10 pages (Sept. 1970).

Key words: Glass stopcocks with PTFE plugs; glass with PTFE plugs; PTFE plugs for glass stopcocks; stopcocks.

This Product Standard covers the design, dimensions, tolerances, and performance criteria for glass stopcocks with PTFE plugs. Also included are methods of marking and labeling to indicate compliance with this Standard. This Product Standard does not cover glass stopcocks with glass plugs, nor glass stopcocks intended for use in high vacuum work.

PS29-70. **Plastic heat-shrinkable film,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 29-70, 16 pages (Jan. 1971).

Key words: Balanced and unbalanced film; film, plastic; orientation release stress; plastic heat-shrinkable film; retraction ratio; shrink film, plastic.

This Voluntary Product Standard covers plastic film which, within its useful temperature range, will shrink at least 20 percent in either or both the machine and the transverse directions. Included are requirements and methods of test for shrink properties, dimensions, yield, weight, and slip.

PS30-70. **School chalk,** J. W. Eisele, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 30-70, 14 pages (May 1971).

Key words: Calcium carbonate; calcium sulfate; chalk; chroma; toxicity; whiting.

This standard provides requirements for the dimensions, material, breaking strength, characteristics, toxicity, workmanship, and chroma (as applicable) for six types and several classes and grades of school chalk. Test methods for determining the material content, breaking strength, and chroma are provided. Standard packages are given, and methods for labeling to indicate compliance with the standard are provided.

PS31-70. **Polystyrene plastic sheet,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 31-70, 14 pages (Jan. 1971).

Key words: Impact resistance, plastic sheet; oriented sheet; plastic sheet; polystyrene plastic sheet; sheet; plastic.

This Voluntary Product Standard covers requirements and methods of test for dimensions, and mechanical and physical properties of hot-melt extruded polystyrene plastic sheet. The standard does not cover polystyrene foam or biaxially oriented

sheet.

PS32-70. **Hinged interior wood door units,** W. H. Furcolow, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 32-70, 15 pages (Mar. 1971).

Key words: Door units, wood; hinged door units, interior; prefabricated door units; wood door units.

This Voluntary Product Standard covers the designs, grades, sizes, materials (including hardware), and construction of prefabricated wood door units, as well as a means of identifying units represented as conforming to the standard, and definitions of terms used in the standard.

PS33-70. **Polytetrafluoroethylene (PTFE) plastic lined steel pipe and fittings,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 33-70, 12 pages (Mar. 1971).

Key words: Pipe and fittings, steel, plastic lined; plastic lined steel pipe; polytetrafluoroethylene plastic lined pipe; PTFE lined pipe; steel pipe and fittings, plastic lined.

This Voluntary Product Standard covers requirements and methods of test for the material, dimensions, construction, and performance of commercially available steel pipe and fittings lined with polytetrafluoroethylene (PTFE) plastic intended to be used for conveying acids, gases, solvents, and other corrosive materials.

PS34-70. **Fluorinated ethylene-propylene (FEP) plastic lined steel pipe and fittings,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 34-70, 12 pages (Mar. 1971).

Key words: FEP lined pipe; fluorinated ethylene-propylene plastic lined pipe; pipe and fittings, steel, plastic lined; plastic lined steel pipe; steel pipe and fittings, plastic lined.

This Voluntary Product Standard covers requirements and methods of test for the material, dimensions, construction, and performance of commercially available steel pipe and fittings lined with fluorinated ethylene-propylene (FEP) plastic intended to be used for conveying acids, gases, solvents, and other corrosive materials.

PS35-70. **Poly(vinylidene fluoride) (PVF_2) plastic lined steel pipe and fittings,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 35-70, 12 pages (Mar. 1971).

Key words: Pipe and fittings, steel, plastic lined; plastic lined steel pipe; poly(vinylidene fluoride) plastic lined pipe; PVF_2 lined pipe; steel pipe and fittings, plastic lined.

This Voluntary Product Standard covers requirements and methods of test for the material, dimensions, construction, and performance of commercially available steel pipe and fittings lined with poly(vinylidene fluoride) (PVF_2) plastic intended to be used for conveying acids, gases, solvents, and other corrosive materials.

PS36-70. **Body measurements for the sizing of boys' apparel,** C. W. Devereux, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 36-70, 24 pages (Dec. 1971).

Key words: Apparel, boys'; body measurements, boys'; pattern sizes, boys'; size designations, boys'; span charts, boys' sizing.

This Voluntary Product Standard covers standard size designations, size classifications, and body measurements for the sizing of boys' apparel. The standard includes sections on applications of the system, recommended methods of identification, methods of measuring, and clothing allowances. The measurements given in this standard are body, not garment, measurements.

PS37-70. **Package quantities of instant nonfat dry milk,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 37-70, 9 pages (Apr. 1971).

Key words: Dry milk package quantities; instant nonfat dry milk; nonfat dry milk, package quantities of; package quantities of dry milk.

This Voluntary Product Standard covers package quantities of instant nonfat dry milk based on quart equivalents within the range of 3 to 20 quarts. It also establishes the weight of instant nonfat dry milk required to make 1 quart. This Standard covers all types of packages of instant nonfat dry milk intended for household use including those containing individual quart or multi-quart equivalent envelopes.

PS38-70. **Steel bi-fold closet door units, frames, and trim,** C. W. Devereux, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 38-70, 12 pages (May 1971).

Key words: Bi-fold doors, steel; closet doors, steel bi-fold; doors, steel bi-fold; steel bi-fold doors.

This Voluntary Product Standard covers sizes, types, materials, construction, hardware, and finishing of steel bi-fold closet door units and frames intended to be stock items not subject to variations according to the customer's special requirements. Methods of marking and labeling are included so that products which comply with the standard may be clearly identified. Provisions for the erection of doors, frames, and accessories are not included in the standard, but certain recommendations for storage and erection as generally endorsed by the manufacturers are given for information and guidance.

PS39-70. **Clinical thermometers (maximum-self-registering, mercury-in-glass),** W. H. Furcolow, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 39-70, 12 pages (May 1971).

Key words: Clinical thermometers; glass thermometers, clinical; mercury-in-glass thermometers; thermometers, self-registering, clinical.

This Voluntary Product Standard covers the requirements and methods of testing maximum-self-registering, mercury-in-glass thermometers of the types commonly used for measuring body temperatures, such as oral and rectal types in both regular and basal temperature scales. It is intended to serve as a nationally recognized basis for certification of compliance by manufacturers and for procurement purposes by consumers. The standard includes requirements for bulb and stem glasses, mercury, dimensions, temperature scale ranges, and graduations, and performance criteria for thermometer aging, hard shaking determination, and accuracy of scale reading.

PS40-70. **Package quantities of green olives,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 40-70, 9 pages (May 1971).

Key words: Green olives, package quantities of; olives, green, package quantities of; package quantities of green olives.

This Voluntary Product Standard covers a range of package quantities that are recommended for green olives and establishes specific packaging requirements in terms of net drained weight. Methods of labeling products which comply with this Standard are provided.

PS41-70. **Package quantities of instant mashed potatoes,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand.

(U.S.), Prod. Stand. 41-70, 8 pages (Apr. 1971).

Key words: Instant mashed potatoes, package quantities of; mashed potatoes, instant, package quantities of; package quantities of instant mashed potatoes; potatoes, instant mashed, package quantities of.

This Voluntary Product Standard covers a range of package quantities based on servings and establishes the definition of a serving which is based on the weight of the reconstituted product.

PS42-70. **Body measurements for the sizing of women's patterns and apparel,** C. W. Devereux, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 42-70, 29 pages (Sept. 1971).

Key words: Apparel, women's; body measurements, women's; classifications, women's size; grading charts, women's size; pattern size, women's; size designations, women's; span charts, women's sizing.

This Voluntary Product Standard covers standard size classifications, size designations, and body measurements to aid in the consistency of sizing of women's apparel and, by doing so, provides a means for the consumer to identify her body type and size for proper fit. This standard also covers applications of the system, definitions, methods of measurement, adjustments to compensate for the effect of foundation garments, spanning charts, and a recommended method of identification. The measurements given in this standard are body, not garment, measurements.

PS43-71. **Fluorinated ethylene-propylene (FEP) plastic tubing,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 43-71, 12 pages (Sept. 1971).

Key words: Chemical, mechanical, and electrical tubing; FEP tubing; fluorocarbon plastic tubing; plastic tubing, fluorinated ethylene-propylene; tubing, FEP-fluorocarbon.

This Voluntary Product Standard covers plastic tubing made from fluorinated ethylene-propylene (FEP) resin intended for chemical, mechanical, or electrical use. It provides requirements and methods of test for materials, dimensions, and physical and chemical properties of FEP tubing. A method for identifying products which comply with this standard is provided.

PS44-71. **Paper ice bag sizes,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 44-71, 12 pages (Sept. 1971).

Key words: Bag sizes, ice; ice bag sizes; paper ice bag sizes.

This Voluntary Product Standard covers the dimensions and the capacities of paper ice bags intended for use in the packaging of cubed, sized, crushed, and block ice. Methods of measuring and for identifying bags that conform to this standard are provided.

PS45-71. **Body measurements for the sizing of apparel for young men (students),** C. W. Devereux, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 45-71, 16 pages (Jan. 1972).

Key words: Apparel, young men's (students'); body measurements, young men's (students'); classification, young men's (students') size; grading charts, young men's (students') size; size designations, young men's (students').

This Voluntary Product Standard covers size categories, size designations, and body measurements for the sizing of apparel for boys designated young men or students. The young men (students) category is intended to include those boys and young men who have achieved most of their adult height, but not adult girth. The Standard includes the following: applications of the body sizing system, methods of measuring the body, an explanation of the development of the Standard (appendix A) and sizing grades (appendix B). Also included is a method of identifying products that are sized using the measurements and designations in the Standard.

PS46-71. **Flame-resistant paper and paperboard,** J. W. Eisele, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 46-71, 10 pages (Oct. 1971).

Key words: Flame-resistant; paper and paperboard; paper, paperboard, flame-resistant; paperboard, paper, flame-resistant.

This Voluntary Product Standard covers requirements and test methods for flame-resistant paper and paperboard which are 0.060 inch or less thick. Definitions are provided, and a method for identifying products conforming to the standard is given. Two classifications of flame-resistant paper and paperboard are covered: Type I, which if flame-resistant only before water leaching and Type II, which is flame-resistant both before and after water leaching.

PS47-71. **Heat-shrinkable fluorocarbon plastic tubing,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 47-71, 14 pages (Sept. 1971).

Key words: FEP heat-shrinkable tubing; fluorocarbon plastic heat-shrinkable tubing; plastic tubing, fluorocarbon PTFE heat-shrinkable tubing; tubing, heat-shrinkable fluorocarbon plastic.

This Voluntary Product Standard covers commercially available PTFE and FEP plastic tubing which can be reduced to a predetermined inside diameter by the application of heat. Included are requirements and methods of test for material, dimensions, and physical and electrical properties. A method for identifying products which comply with this standard is provided.

PS48-71. **Package quantities of cubed, sized, crushed, and block ice,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 48-71, 10 pages (Nov. 1971).

Key words: Block ice, package quantities of; crushed ice, package quantities of; cubed ice, package quantities of; package quantities of ice; sized ice, package quantities of.

This Voluntary Product Standard covers the net weights of the package quantities recommended for cubed, sized, crushed, and block ice. Definitions of terms and methods for identifying products packaged in accordance with this Standard are included.

PS49-71. **Portable picnic coolers,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 49-71, 9 pages (Oct. 1971).

Key words: Coolers, portable picnic; picnic coolers, portable; portable picnic coolers.

This Voluntary Product Standard covers portable picnic coolers in which the smallest of the internal dimensions exceed 6 inches and the total continuous volume exceeds 1.1 cubic feet. Included in the Standard are requirements relating to the construction of coolers and to the closures, release devices, and handles of picnic coolers. A test for determining the force required to release the closure is included also. Methods of identifying products which conform to the Standard are provided.

For the purposes of this Standard, the term "picnic cooler" shall be used to include "beverage coolers," "ice chests," portable "food chests," and the like, which are designed to be carried by an individual.

PS50-71. **Package quantities of toothpaste,** C. B. Phucas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 50-71, 8 pages (July 1971).

Key words: Package quantities of toothpaste; toothpaste, package quantities.

This Voluntary Product Standard covers the net weights of the package quantities recommended for toothpaste having specific gravities within the range of 1.45 to 1.75. This standard also provides for the package quantities of toothpaste having specific gravities below 1.45 and above 1.75.

PS51-71. **Hardwood and decorative plywood,** P. R. Sutula, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 51-71, 18 pages (Jan. 1972).

Key words: Decorative plywood; hardwood plywood; plywood, hardwood and decorative; softwood plywood, decorative; veneer grades, decorative softwood and hardwood.

This Voluntary Product Standard for hardwood and decorative plywood establishes the nationally recognized marketing classifications, quality criteria, test methods, definitions, and grade-marking and certification practices for plywood produced primarily from hardwoods. It is intended for voluntary use by reference in trade literature, catalogs, sales contracts, building codes, and procurement specifications to describe the quality aspects of the product and the means to determine conformance.

Requirements are given for wood species, veneer grading, lumber-core, particleboard-core, hardboard-core, glue bond, panel constructions, dimensions, moisture content, sanding, and finishing. Sampling and testing provisions cover dry shear, cyclic-boil, three cycle wet and dry, and cold soak test methods for plywood delamination determinations, and field and laboratory moisture content measuring methods. A glossary of trade terms is provided for better communication and understanding, and provisions are made for panel grade-marking and certification to indicate compliance. Supersedes NBS CS 35-61.

PS52-71. **Polytetrafluoroethylene (PTFE) plastic tubing,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 52-71, 12 pages (Apr. 1972).

Key words: Chemical, mechanical, and electrical tubing; fluorocarbon plastic tubing; plastic tubing, polytetrafluoroethylene; PTFE tubing; tubing, PTFE-fluorocarbon.

This Voluntary Product Standard covers commercially available PTFE tubing intended for chemical, mechanical, and electrical applications. Included are requirements and methods of test for materials, dimensions, and physical and chemical properties. A method for identifying products which comply with this Standard is provided.

PS53-72. **Glass-fiber reinforced polyester structural plastic panels,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 53-72, 13 pages (Apr. 1972).

Key words: Glass-fiber reinforced polyester panels; panels, glass-fiber reinforced polyester; plastic panels, structural; structural panels.

This Voluntary Product Standard covers two types of plastic panels furnished in three weights and seven geometrical configurations, including flat panels, intended for use in structural applications. The Standard covers requirements for the sizes, configurations, weights, and squareness of the panels. Included are requirements for materials, appearance, color uniformity, light transmission, transverse load, bearing load, flammability, packing, and marking. Methods for identifying products that conform to this Standard are also included. Information on chemical resistance and available panels is provided in an appendix.

PS54-72. **Body measurements for the sizing of girls' apparel,** C. W. Devereux, II, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 54-72, 19 pages (July 1973) 30 cents, SD Catalog No. C13.20/54-72.

Key words: Apparel, girls'; body measurements, girls'; classifications, girls' size; grading charts, girls' size; size designations, girls'; span charts, girls' sizing.

This Voluntary Product Standard establishes a nationally recognized sizing system for girls, based on body measurements. The standard covers three classifications: slims, regulars, and chubbies. In each classification, sizes 7, 8, 10, 12, 14, and 16 are defined by 33 body measurements.

PS55-72. **Rigid poly (vinyl chloride) (PVC) plastic siding,** L. H. Breden, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 55-72, 11 pages (Nov. 1972).

Key words: Building materials; flammability of outdoor siding; plastic material; poly (vinyl chloride) siding; siding, poly (vinyl chloride); weathering of plastic siding.

This Voluntary Product Standard establishes requirements and methods of test for the materials, dimensions, weight, warp, shrinkage, flammability, impact strength, weatherability, expansion, and appearance of extruded single wall siding, manufactured from rigid PVC compound. Methods of indicating compliance with this Standard are also provided.

PS56-73. **Structural glued laminated timber,** *(ANS A190. 1-1973),* K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 56-73, 12 pages (Oct. 1973) 45 cents, SD Catalog No. C13.20/2:56-73.

Key words: Glued laminated timber; laminated timber; structural glued laminated timber; timber, structural glued laminated.

This Voluntary Product Standard covers requirements for the dimensions, grade combinations, lumber for laminating, appearance grades, adhesive, and laminating of structural glued laminated timber as well as inspection and test procedures, marking, and the certification by a qualified inspection and testing agency. Definitions of the trade terms used are given, and guides for ordering and information on inspection practices are provided in the appendices.

PS57-73. **Cellulosic fiber insulating board.** *(ANS A194.1-1973),* K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 57-73, 8 pages (Nov. 1973) SD Catalog No. C13.20/2:57-73.

Key words: board, cellulosic fiber insulating; cellulosic fiber insulating board; fiber, cellulosic insulating board; insulating, cellulosic fiber board.

This Voluntary Product Standard covers requirements and applicable methods of test for the composition, construction, dimensions, moisture content, and physical properties of cellulosic fiber insulating board. Methods of identifying products which comply with this standard are included and information concerning surface finishes and edge details is given in appendix A. Supersedes CS42-49 and R179-63.

PS58-73. **Basic hardboard.** *(ANS A135.4-1973),* K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 58-73, 6 pages (June 1974) SD Catalog No. C13.20/2:58-73.

Key words: basic hardboard; hardboard.

This Voluntary Product Standard covers requirements and methods of test for water resistance, modulus of rupture, tensile strength, surface finish, dimensions, squareness, edge straightness, and moisture content of five classes of basic hardboard. Methods of identifying hardboard that conforms to the standard are provided. Supersedes CS251-63.

PS59-73. **Prefinished hardboard paneling.** *(ANS A135.5-1973),* K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 59-73, 7 pages (Feb. 1974) SD Catalog No. C13.20/2:59-73.

Key words: hardboard paneling; paneling, hardboard; prefinished hardboard paneling.

This Voluntary Product Standard covers requirements and methods of test for the dimensions, squareness, edge straightness, and moisture content of prefinished hardboard paneling; for the physical properties of the hardboard substrate; and for the finish of the paneling. Methods of identifying products which conform to the requirements of the standard are included.

PS60-73. **Hardboard siding.** *(ANS A135.6-1973),* K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.) Prod. Stand. 60-73, 7 pages (Feb. 1974) SD Catalog No. C13.20/2:60-73.

Key words: hardboard siding; siding, hardboard.

This Voluntary Product Standard covers requirements and methods of test for the dimensions, straightness, squareness, physical properties, and surface characteristics of hardboard siding. Definitions of trade terms used and methods of identifying products that comply with the standard are included.

PS61-74. **Plastic containers (jerry-cans) for petroleum products.** *(ANS MH 17.1-1974),* K. G. Newell, Jr., Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 61-74, 6 pages (May 1975) SD Catalog No. C13.20/2:61-74.

Key words: containers for petroleum products; jerry-cans; petroleum products, containers for; plastic containers for petroleum products.

This Voluntary Product Standard covers requirements and methods of test for the material, design, and properties of plastic containers (jerry-cans) intended for use with petroleum products. Methods of identifying containers that conform to the requirements of the standard are included.

PS62-74. **Grading of diamond powder in sub-sieve sizes.** *(ANS Z300.1-1974),* C. W. Devereux, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 62-74, 5 pages (Jan. 1975) SD Catalog No. C13.20/2:62-74.

Key words: diamond powder, grading; grading of diamond powder; powder, diamond; sizes, sub-sieve of diamond powder.

This Voluntary Product Standard covers the quality requirements of sub-sieve sizes of diamond powder and establishes the standard particle size ranges for micron sizes. It establishes size designations of the size ranges and the grading limits that are acceptable in each size range. It also gives a method of inspection to determine compliance with this standard and directions for the labeling of powder to indicate such compliance.

PS63-75. **Latex foam mattresses for hospitals.** *(ANS Z 255.1-1975),* G. S. Chaconas, Technical Standards Coordinator, Nat. Bur. Stand. (U.S.), Prod. Stand. 63-75. 8 pages (Apr. 1975) SD Catalog No. C13.20/2:63-75.

Key words: foam mattresses; hospital mattresses; latex; latex foam mattresses; latex foam for hospitals; mattresses.

The purpose of this Voluntary Product Standard is to establish nationally recognized dimensional and quality requirements for latex foam mattresses intended for use in hospitals, and to provide producers, distributors, and users with a basis for common understanding of the characteristics of this product.

PS64-75. **School paste.** *(ANS Z 297.2-1975),* C. W. Devereux, Technical Standards Coordinator, *Nat. Bur. Stand. (U.S.) Prod. Stand. 64-75,* 6 pages (Apr. 1976) SD Catalog No. C13.20/2:64-75.

Key words: paste, water-based, semi-liquid; school paste.

The purpose of this Voluntary Product Standard is to establish nationally recognized quality, safety, and packaging requirements for school paste and to provide a basis for common understanding among producers, distributors, and users of this product.

PS65-75. **Paints and inks for art education in schools.** *(ANS Z297.1-1975),* G. S. Chaconas, Technical Standards Coordinator, *Nat. Bur. Stand. (U.S.), Prod. Stand. 65-75,* 7 pages (Mar. 1976) SD Catalog No. C13.20/2:65-75.

Key words: art education; inks for art education; paints and inks; schools, paints and inks.

This Voluntary Product Standard covers the establishment of requirements for preservatives, toxicity, course particle content, performance, working qualities, and packaging for school paints and inks, and provides producers, distributors, and users with a basis for common understanding of the characteristics of this product.

PS66-75. **Safety requirements for home playground equipment.** *(ANS Z 304.1-1975),* J. M. Tascher, Technical Standards Coordinator, *Nat. Bur. Stand. (U.S.), Prod. Stand. 66-75,* 1 pages (July 1976) SD Catalog No. C13.20/2:66.75.

Key words: home playground equipment, safety of; jungl gyms, safety of; playground equipment, safety of; safety of home playground equipment; slides, safety of; swing sets safety of.

This Voluntary Product Standard provides safety requirements for various types of home playground equipment intended for use by children aged from 2 through 10 years. The requirements are concerned with the design and performance of the units and their components, the structural integrity of the units and their components during and after exposure to static loads and the instructions and information to be enclosed with the equipment. Methods of identifying products which comply with this standard are given.

3.17. TECHNICAL NOTES

Studies or reports which are complete in themselves but restrictive in their treatment of a subject. Analogous to monographs but not so comprehensive in scope or definitive in treatment of the subject area. Often serve as a vehicle for final reports of work performed at NBS under the sponsorship of other Government agencies.

TN100-A, Supplement to Appendix C of TN100. **Loading factors and FDM-FM system performance calculations,** E. F. Florman, NBS Tech. Note 100-A (Sept. 1967).

Key words: Modulators; radio communications; radio receivers; transistors.

This supplement was written for the purpose of extending the scope of the original paper, by providing a more complete set of system-performance design equations, which apply to the Frequency Division Multiplex--Frequency Modulation type of multichannel telecommunication systems; these equations may be used for various types, and combinations of types, of message signals.

TN213. Unassigned.

TN246. **A survey of some empirical and semi-empirical interatomic and intermolecular potentials,** B. N. Axilrod, NBS Tech. Note 246 (Oct. 3, 1966).

Key words: Atoms; compressibility; heat of sublimation; molecules; potential functions; empirical and semi-empirical; transport properties; virial coefficients.

Many empirical and semi-empirical potential functions have been proposed or developed to represent the pairwise interaction of atoms and molecules. The simple pair potentials proposed usually contain parameters to be adjusted to fit certain properties, for example, when chemical combination does not occur, virial coefficients and similar quantities for the gaseous state, or compressibility and heat of sublimation for the crystalline state. In the present survey a number of potentials proposed recently are examined to indicate the variety of concepts employed and the suitability of the potential functions.

TN270-3. **Selected values of chemical thermodynamic properties. Tables for the first thirty-four elements in the standard order of arrangement,** D. D. Wagman, W. H. Evans, V. B. Parker, I. Halow, S. M. Bailey, and R. H. Schumm, Nat. Bur. Stand. (U.S.), Tech. Note 270-3, 267 pages (Jan. 1968).

Key words: Enthalpy of formation; entropy; Gibbs energy of formation; heat of formation; specific heat; thermodynamic properties.

The tables contain values where known of the enthalpy and Gibbs energy of formation, enthalpy, entropy, and heat capacity at 298.15 K (25 °C), and the enthalpy of formation at 0 K, for all inorganic substances and organic molecules containing not more than two carbon atoms, for the first thirty-four elements in the standard order of arrangement. (Supersedes NBS Tech. Notes 270-1 and 270-2.)

TN270-4. **Selected values of chemical thermodynamic properties. Tables for elements 35 through 53 in the standard order of arrangement,** D. D. Wagman, W. H. Evans, V. B. Parker, I. Halow, S. M. Bailey, and R. H. Schumm, Nat. Bur. Stand. (U.S.), Tech. Note 270-4, 152 pages (May 1969).

Key words: Enthalpy of formation; entropy; Gibbs energy of formation; heat capacity; heat of formation; thermodynamic properties.

Tables of selected values of the enthalpy and Gibbs energy of formation, enthalpy, entropy, and heat capacity at 298.15 K (25 °C) and the enthalpy of formation at 0 K, are given for compounds of mercury, copper, silver, gold, nickel, cobalt, iron, palladium, rhodium, ruthenium, platinum, iridium, osmium, manganese, technetium, rhenium, chromium, molybdenum, and tungsten.

TN270-5. **Selected values of chemical thermodynamic properties. Tables for elements 54 through 61 in the Standard Order of Arrangement,** D. D. Wagman, W. H. Evans, V. B. Parker, I. Halow, S. M. Bailey, R. H. Schumm, K. L. Churney, Nat. Bur. Stand. (U.S.), Tech. Note 270-5, 49 pages (Mar. 1971).

Key words: Enthalpy; entropy; Gibbs energy of formation; hafnium compounds; heat of formation; niobium compounds; scandium compounds; tantalum compounds; titanium compounds; vanadium compounds; yttrium compounds; zirconium compounds.

Contains tables of values for the standard heats and Gibbs (free) energies of formation, entropies and enthalpies at 298.15 K and heats of formation at 0 K for compounds of vanadium, niobium, tantalum, titanium, zirconium, hafnium, scandium, and yttrium (elements 54-61 in the Standard Order of Arrangement). These tables are a continuation of the comprehensive revision of NBS Circular 500.

TN270-6. **Selected values of chemical thermodynamic properties. Tables for the alkaline earth elements (elements 92 through 97 in the Standard Order of Arrangement),** V. B. Parker, D. D. Wagman, and W. H. Evans, Nat. Bur. Stand. (U.S.), Tech. Note 270-6, 119 pages (Nov. 1971).

Key words: Barium compounds; beryllium compounds; calcium compounds; enthalpy; entropy; Gibbs energy of formation; magnesium compounds; radium compounds; strontium compounds.

Contains tables of values for the standard heats and Gibbs (free) energies of formation, entropies and enthalpies at 298.15 K and heats of formation at 0 K for compounds of beryllium, magnesium, calcium, strontium, barium, and radium (elements 92-97 in the Standard Order of Arrangement). These tables are a continuation of the comprehensive revision of NBS Circular 500.

TN270-7. **Selected values of chemical thermodynamic properties. Tables for the lanthanide (rare earth) elements (elements 62 through 76 in the standard order of arrangement),** R. H. Schumm, D. D. Wagman, S. Bailey, W. H. Evans, and V. B. Parker, Nat. Bur. Stand. (U.S.), Tech. Note 270-7, 93 pages (Apr. 1973) $1.25, SD Catalog No. C13.46:270-7.

Key words: Cerium compounds; dysprosium compounds; enthalpy; entropy; erbium compounds; europium compounds; gadolinium compounds; Gibbs energy of formation; holium compounds; lanthanides; lanthanum compounds; lutetium compounds; neodymium compounds; praseodymium compounds; promethium compounds; rare-earth elements; samarium compounds; terbium compounds; thulium compounds; ytterbium compounds.

Contains tables of values for the standard heats and Gibbs (free) energies of formation, entropies and enthalpies at 298.15 K and heats of formation at 0 K for compounds of the rare-earth elements (the lanthanides; lutetium through lanthanum; elements 62 through 76 in the Standard Order of Arrangement). These tables are a continuation of the comprehensive revision of NBS Circular 500.

TN277. **Analytical Mass Spectrometry Section: instrumentation and procedures for isotopic analysis,** Edited by W. R. Shields, NBS Tech. Note 277 (July 25, 1966).

Key words: Mass spectrometry; instrumentation; procedures; isotopic analysis.

This report describes the general instrumentation of the Analytical Mass Spectrometry Section and the specific analytical techniques which have been devised for the measurement of isotopic ratios of Ag, Br, Cl, Cr, Cs, Cu, Mg, Pu, and U. Interim procedures for B, Li, Rb, and Sr are also given.

In the appendix some general statistical principles used in the design and analysis are briefly discussed; an example is given in detail illustrating the various steps involved leading from original data to the reported uncertainties for the isotopic ratio of bromine.

TN278. **Scanning electron probe microanalysis,** K. F. J. Heinrich, NBS Tech. Note 278 (Feb. 3, 1967).

Key words: Electron probe; microanalysis; x-ray spectrometry; scanning electron microscopy; electron backscatter; cathodoluminescence.

The combination of electron microprobe x-ray emission spectrometry with the scanning techniques first developed for the scanning electron microscope permits using the scanning electron probe as a microscope sensitive to elemental composition. This technique is particularly useful in the many applications in which spatial distribution of one or more elements in a specimen is more important than local composition. Although oscilloscope representation of probe scanning is usually obtained by the simple technique of producing a dot of light for each arriving photon, more sophisticated scanning techniques such as expanded contrast registration and concentration mapping can provide more quantitative information. Signals other than x-rays, such as target current, electron backscatter, or cathodoluminescence may be used for image formation. Electron beam scanning can also be performed in a discontinuous fashion, so that the electron beam irradiates in succession a number of spots arranged in a square or rectangular pattern, and the number of photons registered in each position is retained in the memory of a multichannel analyzer. The application of these diverse scanning techniques is illustrated.

TN292. **Procedures for precise determination of thermal radiation properties, November 1964 to October 1965,** J. C. Richmond, G. J. Kneissl, D. L. Kelley, and F. J. Kelly, NBS Tech. Note 292 (Feb. 10, 1967).

Key words: Emissivity; emittance; high temperature reflectance; infrared reflectance; radiation properties; reflectance; spectral emittance; spectral reflectance; thermal radiation; total emittance.

The broad overall objective of this continuing program is to develop equipment and procedures for measuring the important thermal radiation properties of materials, particularly those used in aircraft, missiles, and space vehicles, at temperatures up to the melting point of the most refractory material, and to develop physical standards for checking such equipment and procedures. During the period covered by this report the specific objectives were: (1) continued development of the laser-source integration sphere reflectometer, (2) an error analysis of the shallow cavity technique for measuring normal spectral emittance, and (3) a study of the feasibility of preparing emittance standards for use at temperatures above 1400 °K (about 2000 °F).

An error analysis of the shallow cavity technique for measuring total normal emittance of ceramic materials at very high temperatures showed that there was an error due to the translucency of the specimens that was as much as +60% for alumina, and a second error due to thermal gradients in the specimen that was on the order of -10%. Two new techniques were devised in the hope of greatly reducing the translucency error. Progress was made in developing codes to compute and correct for the thermal gradients present in the specimen. The laser-source integrating sphere reflectometer for measuring reflectance of specimens at very high temperatures was extensively redesigned to eliminate errors due to flux reaching the detector on the first reflection, and to convert the reflectometer from the substitution to the comparison mode. A literature search was made of techniques for measuring thermal radiation properties of solids at temperatures above 2500 °K (4000 °F).

TN293. **Research on crystal growth and characterization at the National Bureau of Standards, June 1966,** Editor, H. C. Allen, Jr., NBS Tech. Note 293 (Aug. 26, 1966.)

Key words: Crystal growth; crystal characterization; crystalline materials.

The National Bureau of Standards with partial support from the Advanced Research Projects Agency of the Department of Defense is continuing a wide program of studies involving crystalline materials. These include investigation of methods and theory of growth, study of detection and effects of defects, determination of physical properties, refinement of chemical analysis, and determination of stability relations and atomic structure. The types of materials range from organic compounds, through metals, and inorganic salts to refractory oxides. This report summarizes progress in those projects wholly or partially supported by ARPA.

TN294. **Notes on the state-of-the-art of benefit-cost analysis as related to transportation systems,** J. D. Crumlish, NBS Tech. Note 294 (Nov. 1, 1966).

Key words: Benefit-cost analysis; transportation economics; transport systems; systems analysis; state of the art.

This review of benefit-cost analysis as a tool for evaluating alternative courses of action describes the technique, discusses a number of benefit-cost studies, and indicates the difficulties inherent in this area of applied economics. The author concentrates on the application of the technique to large scale transport problems, reviews the literature and indicates in his conclusions where the technique can be helpful and where there is little chance for its success.

An accompanying matrix of benefit-cost studies and a commentary thereon is supplied by Marsha Geier, an NBS economist. Miss Geier's literature search failed to produce any analytic methods which were comprehensive, theoretically justifiable, operational or significant. This finding tended to support the views of the author. (Introduction by Alan J. Goldman, Applied Mathematics Division, Institute for Basic Standards, National Bureau of Standards.)

TN295. **Disclosures on: A transrotor engine; high temperature platinum resistance thermometer; dynamic analog correlation system; and combination metering and safety valve for filling sonde balloons with hydrogen,** Editors, D. Robbins and A. J. Englert, NBS Tech. Note 295 (Oct. 21, 1966).

Key words: Transrotor engine; platinum resistance; dynamic analog correlation system; combination metering and safety valve; high temperatures.

This note presents descriptions and drawings of four devices embodying interesting and unusual solutions to problems frequently encountered in their respective fields: a transroto

ngine, a dynamic analog correlation system, a high temperature atinum resistance thermometer, and a combination metering nd safety valve for filling sonde balloons with hydrogen.

Other disclosures on various subjects may be found in NBS echnical Notes 237, 253, 263, 282, and 287.

N296. **A grammar for component combination in Chinese characters,** B. K. Rankin, III, S. Siegel, A. McClelland, and J. L. Tan, NBS Tech. Note 296 (Dec. 1966).

Key words: Chinese characters; grammar; generative grammar; component combination; phrase structure grammar; linguistics; frame embedding; two-dimensional languages.

A linguistic analysis of one aspect of the structure of Chinese haracters is presented. The analysis is an extension into two imensions of a general approach to one-dimensional language tudy. Results of the analysis are in the form of a three-level enerative grammar. The first level formalizes restrictions overning the general complexity of well-formed Chinese haracters; the second level formalizes co-occurrence onstraints among character components and the particular patial arrangement of these components in classes of haracters; the third level constitutes a procedure for selecting ctual components from a lexicon. Finally an evaluation of the rammar is presented, in terms of criteria used in evaluating natural language grammars.

N297. **Evaluation of information systems: A selected bibliography with informative abstracts,** M. M. Henderson, NBS Tech. Note 297 (Dec. 1967).

Key words: Effectiveness; evaluation; performance; relevance; testing of information systems.

A survey of the literature on evaluation of information systems as been conducted by the Technical Information Exchange, Center for Computer Sciences and Technology, National Bureau of Standards. During the early stages of the survey, the literature was divided among descriptions of programs which compared the performance of two or more information systems, accounts of programs which studied the performance of one system, papers and reports which discussed the problems of evaluation programs, and documents which proposed new techniques for evaluation of systems. From the total literature collected, those references which were judged to be most directly concerned with the subject of evaluation of information systems were selected and abstracted. The abstracts are designed to give a summary of the content of the corresponding paper; the author's own wording was used extensively, in order to avoid misinterpretation. All of the references collected are listed, in alphabetic order of authors' names, in the appendix to the main body of this publication.

TN298. **A survey of ionization vacuum gages and their performance characteristics,** W. G. Brombacher, NBS Tech. Note 298 (Feb. 3, 1967).

Key words: Bayard-Alpert gages; cold cathode vacuum gages; conductance pressure dividers; hot cathode vacuum gages; ionization gages; vacuum gage calibration systems; vacuum gages; volumetric pressure dividers.

The design of various types of ionization gages is outlined, with particular attention to the design elements important to performance. The performance and the many factors affecting the performance of the various gages are reviewed. Methods of calibration are discussed in some detail, including the use of volumetric pressure dividers, conductance pressure dividers and constant rate of pressure change methods. About 365 references to the literature are cited.

TN299. **Calculation of the heating value of a sample of high purity methane for use as a reference material,** G. T. Armstrong, NBS Tech. Note 299 (Dec. 15, 1966).

Key words: Methane; heating value; heat of combustion; reference material; gross heating value.

The heat of combustion of CH_4 has been recalculated in kJ $(mol)^{-1}$, Btu $(mol)^{-1}$, Btu (cu ft)$^{-1}$ (dry basis) and Btu (std. cu ft)$^{-1}$ (saturated basis), using the best available experimental determinations of the heat of combustion and other measured quantities and the most recent generally accepted physical constants and defined physical units. The calculations are outlined in detail. The resulting quantities are applied to calculation of the heat of combustion of a reference sample of CH_4 submitted for analysis of composition and certification of heating value by the Institute of Gas Technology.

TN340. Unassigned.

TN341. **The long-term performance of two rubidium vapor frequency standards,** B. E. Blair and A. H. Morgan, NBS Tech. Note 341 (June 22, 1966).

Key words: Aging; calibration (USFS); frequency standards; gas cells; performance (long term); reliability; rubidium; stability.

Since mid-1961 the National Bureau of Standards has used two rubidium vapor frequency standards as transfer or Working Frequency Standards (WFS). The WFS provides a continuously available frequency which is periodically calibrated in terms of the United States Frequency Standard (USFS). This paper evaluates these calibration data over a 44.5-month period of time. It gives the long-term performance of the rubidium standards in terms of the USFS, compares them with a commercial cesium-beam frequency standard, and presents their reliability characteristics as shown by the mean-time-between-failures (MTBF). The calibration data are graphed with applicable tolerance limits for the between-adjustment periods. The average standard error of estimate about least squares lines fitted to the frequency data is about 2 parts in 10^{11}. The rubidium standards also show a rather consistent daily aging rate of parts in 10^{13}. This would indicate that the frequency of either unit would change a few parts in 10^{10} if operated continuously for one year without any frequency adjustments.

TN342. **Hydromagnetic wave propagation near 1 c/s in the upper atmosphere and the properties and interpretation of pc 1 micropulsations,** J. A. Dawson, NBS Tech. Note. 342 (June 30, 1966).

Key words: Alfven; dispersion; hydromagnetic; magnetosphere; multicomponent; pc 1 micropulsations; plasma; polarization; propagation.

Part I. Hydromagnetic wave propagation near 1 c/s in the upper magnetosphere: Dispersion and polarization relations are developed from basic considerations for a hydromagnetic wave at about 1 c/s propagating in a cold uniform plasma. The treatment is then extended to include the effects of ion-electron collisions. It is shown that the approximations used are valid in the earth's magnetosphere for heights between 10,000 and 50,000 km (2.6 to 8.8 earth radii). At lower elevations the plasma must be considered as nonuniform. Above 50,000 km the small amplitude assumption is invalid. Finally the theory is extended to include the effects of a multicomponent plasma.

Part II. The properties and interpretation of pc 1 micropulsations: A reasonable hydromagnetic model for the propagation of pc 1 micropulsations is one in which Alfven (left-hand) waves travel along field lines to reach the earth's surface at

auroral latitudes and then propagate equatorward as modified Alfven (right-hand) waves just above the ionosphere. The isotropic right-hand wave is constrained to a duct between 400 and 2000 km above the earth by refractive processes. It is shown how many of the observed properties of pc 1's can be related to such a model. Mechanisms for the generation of pc 1's are also discussed and it is concluded that particle instabilities are the most likely source.

TN343. **Temperature-entropy diagram for parahydrogen triple-point region,** C. F. Sindt and D. B. Mann, NBS Tech. Note 343 (June 22, 1966).

Key words: Enthalpy; entropy; parahydrogen; pressure-volume; properties; temperatures; triple-point region; T-S diagram.

The three-phase region at and near the triple point of parahydrogen is presented on the graphical coordinates of temperature and entropy. Isobars from 10 mm Hg to 340 atmospheres, temperatures from 11° to 23 °K and specific volumes covering the range of from 10.5 cc/gm to 15,000 cc/gm are included. The energy base of enthalpy and entropy are consistent with previous data published by this laboratory.

TN344. **A sensitive recording NMR ultrasonic spectrometer,** L. W. James, NBS Tech. Note 344 (Sept. 7, 1966).

Key words: Boxcar integrator; nuclear magnetic resonance; phonon nuclear interaction; ultrasonics.

Instrumentation is described for automatically obtaining a continuous recording of ultrasonic absorption lines. Ultrasonic power is added to the crystal lattice by a transducer mounted on a single crystal of the sample. The interaction of the ultrasonics with the nuclear spin system is recorded by using a pulse NMR system in conjunction with a boxcar integrator. This technique is more sensitive and provides more easily interpretable results than earlier systems.

TN345. **A new near-zone electric field-strength meter,** F. M. Greene, NBS Tech. Note 345 (Nov. 15, 1966).

Key words: Device, electro-explosive ordnance; field, near-zone electromagnetic; hazards, electromagnetic radiation; line, non-metallic electrical transmission; line, semi-conducting plastic transmission; meter, electric field-strength; telemetry, novel form of.

The National Bureau of Standards has recently completed the development of prototype instrumentation for measuring the electric-field components of complex, high-level, near-zone electromagnetic fields from 0.1 to 1000 volts per meter, at frequencies from 150 kHz to 30 MHz with a present uncertainty of less than ±2 dB. The design of the NBS meters is based on the use of a novel form of telemetry, employing a completely non-metallic electrical transmission line, which apparently has not been fully exploited heretofore. This avoids the perturbing effects on the field being measured, usually caused by field-strength meters employing metallic RF transmission lines. The design and performance of the meter are discussed in some detail.

TN346. **On the natural shift of a resonance frequency,** R. J. Harrach, NBS Tech. Note 346 (Sept. 29, 1966).

Key words: Atomic beam; frequency shift; radiation field; resonance; thallium.

The natural resonance frequency shift, caused by the transition-inducing radiation field, is examined for a magnetic dipole transition between hyperfine structure levels in the ground state of a thallium atom. A calculation predicts, for an atomic beam experiment, a natural shift magnitude of 1.4 parts in 10^{10} of the thallium resonance frequency, per mW/Oe. In th experiment, frequency shifts caused by overlap of neighborin resonances were observed, but the natural shift was unresolved indicating that its size is more than an order of magnitude belov the calculated value. Subsequently it has been shown that th natural shift was inhibited by the particular radiation field mod used in the experiment. When the theory correctly takes thi mode into account, the calculated natural frequency shift i consistent with the experimental results.

TN347. **A standard for accurate phase-angle measurements a audio frequencies,** W. W. Scott, Jr., NBS Tech. Note 347 (Oct 14, 1966).

Key words: Phase-angle; standard; audio frequency thermal voltage converter; inductive voltage divider measurement.

A method is described for the measurement of phase angle from 0 ° to 360 ° (except for a band ±10 ° about the 180 ° point with an uncertainty at audio frequencies of ±0.05 ° to ±0.01 ° depending on the phase-angle. The method utilizes readil available equipment which may be assembled and connected t serve as a standard. The principal advantage of this standard i in its potentially broad frequency-response; namely, 10 Hz to 1 kHz or higher. It makes use of inductive voltage dividers an thermal voltage converters to compare voltage magnitudes which are related to phase-angle by the law of cosines. Th thermal voltage converters are compared with each other befor each phase-angle measurement. Their outputs are connected s that short-time power supply variations do not affect th measurements. The repeatability of measurements with thi standard at a phase-angle of 60 ° is within a range of 0.001 °.

A model has been built which shows good measuremen precision, but it has not been thoroughly tested or studied a many frequencies and phase-angles for sources of error. Thi report serves as a record of the development work completed o this standard to date.

TN348. **Infrared reflectances of metals at cryogenic temperature — a compilation from the literature,** P. F. Dickson and M. C Jones, NBS Tech. Note 348 (Oct. 14, 1966).

Key words: Compilation; cryogenic; infrared; metals reflectance.

Spectral and total reflectances for metals at cryogeni temperatures in the infrared wavelength region are compile from the literature. Information concerning sample preparatio and purity, radiation source, and methods of reflectanc measurements are also presented. Observations regarding th effects on reflectance of temperature, oxide layer, wavelength and sample preparation are given.

TN349. **The design and operation of a high-voltage calibratio facility,** W. W. Scott, Jr., NBS Tech. Note 349 (Nov. 10 1966).

Key words: Alternating-current; calibration; direct-curren high-voltage; ratio; safety; standards enclosure transformer; voltage-divider; voltmeter.

The high-voltage calibration facility, in operation for seve years at the National Bureau of Standards Radio Standard Laboratory (RSL) but now at NBS Washington, is describe with emphasis on several novel construction features an calibration techniques. The more usual calibration technique are also outlined for the assistance of those personnel i standards laboratories assigned the task of calibrating with hig accuracy, electrostatic voltmeters, resistive dividers, an potential transformers at high voltage. Precautions, based o experience in the calibration and use of high voltage standard are given so that certain errors may be avoided by the users.

TN350. **The viscosity and thermal conductivity coefficients of dilute nitrogen and oxygen,** G. E. Childs and H. J. M. Hanley, NBS Tech. Note 350 (Oct. 31, 1966).

Key words: Dilute gases; nitrogen; oxygen; transport coefficients; Lennard-Jones; Kihara; Exp: 6; Morse potential functions; Eucken correction; correlation.

The coefficients of viscosity and thermal conductivity for dilute nitrogen and oxygen were examined using a method proved suitable for argon. Given the kinetic theory expressions for the transport coefficients, this method indicates a selection of a potential function and its parameters to correlate theory with experimental data. The potential functions chosen were the Lennard-Jones, Kihara, Exp: 6 and the Morse. It was found that the Kihara was most suitable and theoretical viscosity coefficients were computed with this function. The usual correction to the kinetic theory equation for thermal conductivity, the Eucken correction, was found not to be sufficient and it was decided to use an empirical polynomial equation to correlate the thermal conductivity coefficients. Tables of the transport coefficients for both gases are given between 100 and 1000 °K.

TN351. **Discussion of errors in gain measurements of standard electromagnetic horns,** R. W. Beatty, NBS Tech. Note 351 (Mar. 1967).

Key words: Antennas; calibration; comparison; effective aperture; electromagnetic horns; gain; measurement; microwave; mismatch errors; Rayleigh distance; standard gain horns.

In setting up a calibration service for measuring the gain of standard electromagnetic horns, one needs a reference horn in which one has developed a high degree of confidence. Although it is possible to calculate the gain of horns of certain design, confidence can be increased by carefully measuring the gain. This note examines a method for measuring the gain of two identical horns, listing the assumptions made in making such a measurement. The theory of 2-port waveguide junctions is applied to the analysis of the measurement technique. The method is shown to be essentially an attenuation measurement which has additional sources of error. Although these errors are not analyzed and evaluated in this note, the problem is perhaps more clearly stated than it was previously. The mismatch error in comparing two horns as receiving antennas is analyzed. Data is given on the aperture efficiency of standard horns which indicates that improvements in the design of such horns are feasible. It is concluded that, at present, an uncertainty limit of the order of tenths of decibels seems realistic, but hundredths of decibels seems unattainable until further refinements are made both in the standard horns themselves and in the measurement techniques.

TN352. **The viscosity and thermal conductivity coefficients of dilute neon, krypton, and xenon,** H. J. M. Hanley and G. E. Childs, NBS Tech. Note 352 (Mar. 23, 1967).

Key words: Dilute gases; neon; krypton; xenon; transport coefficients; correlations; m-6; Kihara; Exp: 6, Morse; potential functions.

The coefficients of viscosity and thermal conductivity for dilute neon, krypton, and xenon were examined by a method already proved successful for dilute argon, oxygen, and nitrogen. This method selects a suitable potential function, and its parameters, which is then used to correlate theory with experimental data, given the kinetic theory expressions for the transport coefficients. The method has recently been expanded and generalized and the results of this general study are applied in this note. The potential functions examined were members of the m-6, Kihara, Exp: 6, and Morse families. It was found that the Kihara was most suitable for neon, and the m-6, with m=17 and m=24, was most suitable for krypton and xenon, respectively. Viscosity and thermal conductivities were calculated from these functions and tables are given between 100 and 1000 °K.

TN353. **Connector for saturated standard cells,** J. J. Barth, NBS Tech. Note 353 (April 21, 1967).

Key words: Connector; electromotive force; oil baths; standard cells; thermoelectric.

This paper describes a connector used for making electrical connections to saturated standard cells in oil baths. The connector has at least three advantages over other methods in common use. These advantages are namely: (1) it does not generate thermoelectromotive forces; (2) it allows cell racks to be placed close together in the bath; and (3) it is economical to fabricate since it can be made from a common inside caliper.

TN354. **The single-engine Claude cycle as a 4.2 °K refrigerator,** R. C. Muhlenhaupt and T. R. Strobridge, NBS Tech. Note 354 (June 1, 1967).

Key words: Claude; cryogenics; refrigeration.

The performance of the 4.2 °K Claude-cycle refrigerator has been computed taking into account the efficiencies of the various components. The results are presented in graphical form. These charts give the input power requirements, mass flow rates for both the compressor and expander, pertinent temperatures, and allow selection of the optimum high pressure for a given set of component characteristics.

TN355. **Correlations for predicting leakage through closed valves,** J. Hord, NBS Tech. Note 355 (Aug. 1, 1967).

Key words: Leak detection; leak flow rates; leak rates; leakage through valves; predicting leak rates; seal leakage; valve seat leakage.

Safety, convenience, and economy often demand the inference of leakage of a given fluid from known leakage of another test fluid across valve seats, welded and threaded fittings, seals, etc. The temperatures of the fluids also may be different. An example is the prediction of gaseous hydrogen leakage at 20 °K from test data obtained with nitrogen gas at 77 °K. Various flow formulae (molecular, transition, and continuum) are examined, and two simple methods of correlating leakage for single-phase fluids are deduced. The correlations obtained (excluding transition flow through long channels) indicate the leakage is inversely proportional to the square root of the density, or inversely proportional to the absolute viscosity, of the fluid. Thus, for gases, the leakage is directly proportional to the sonic velocity of the gas. The proper relationship must be established by experiment for each valve, fitting, etc.

TN356. **Comparison of incompressible flow and isothermal compressible flow formulae,** J. Hord, NBS Tech. Note 356 (Aug. 17, 1967).

Key words: Compressible flow; flow comparison; fluid flow; incompressible flow; mass flow; pressure drop.

Mass flow formulae for incompressible and "modified-incompressible" flow are compared with the isothermal compressible flow relation under the following conditions: The gas flow is steady, isothermal, and fully developed in a horizontal pipe of constant cross section with a prescribed static pressure drop (P_1-P_2). The comparative data are limited to static pressure ratios (P_2/P_1) > ½, and subsonic isothermal flow. Laminar and turbulent flows are treated. Under the limitations of the comparison, modified-incompressible flow and isothermal gas flow relations are identical when $fL/2D \geqslant \ln(P_1/P_2)$. Graphical

plots idicate the degree of approximation or error involved in using incompressible relations to solve compressible flow problems. Pressure losses due to end effects are briefly discussed.

TN357. **Signal design for time dissemination: some aspects,** J. L. Jespersen, NBS Tech. Note 357 (Nov. 2, 1967).

Key words: HF; noise; satellite; synchronization; time and frequency dissemination; VHF; VLF.

The purpose of this paper is to discuss, in a general way, some problems of time signal dissemination in a noisy environment. Most of the paper applies to any timing system, but particular emphasis is given to a CW two-frequency system. This is done for two reasons: first, as will be shown, a two-frequency CW system evolves naturally from fundamental considerations to meet certain user requirements; and second, a two-frequency VLF system is being investigated experimentally at the present time.

TN358. **A review of studies made on the decade fluctuations in the earth's rate of rotation,** W. R. Davey, NBS Tech. Note 358 (Oct. 16, 1967).

Key words: Core-mantle coupling; decade fluctuations; dynamo theory; earth's core; geomagnetism; rotation of the earth; westward drift.

Studies of variations in the length of the day (l.o.d.) on the order of a few milliseconds over the period of a few decades are briefly reviewed. In this connection, studies of the dynamo theory of geomagnetism, the westward drift of the magnetic field, and electromagnetic core-mantle coupling preface the theory of the decade fluctuations in the l.o.d.

TN359. **Two-phase (liquid-vapor), mass-limiting flow with hydrogen and nitrogen,** J. A. Brennan, D. K. Edmonds, and R. V. Smith, Nat. Bur. Stand. (U.S.), Tech. Note 359, 24 pages (Jan. 30, 1968).

Key words: Choking; hydrogen; nitrogen; shocks; two-phase flow.

Experimental data on critical (choked) mass flow in a constant area test section are presented. The data are compared to some simple analytical models which have been recommended for design purposes. The data show the same general behavior as that reported for other noncryogenic fluids.

TN360. **On the selection of the intermolecular potential function: Application of statistical mechanical theory to experiment,** H. J. M. Hanley and M. Klein, NBS Tech. Note 360 (Nov. 20, 1967).

Key words: Correlation; equilibrium properties; experimental data; intermolecular potential function; theory; transport properties.

We have developed a method here to evaluate quantitatively the relationship between model intermolecular potential functions and macroscopic experimental properties. Specifically, we have studied the function families: m-6, Kihara, exp:6, and Morse, and the properties: viscosity coefficient, diffusion coefficient, second virial, and Joule-Thomson coefficient. Our method is not restricted to these functions and properties; it is valid for any function and any property provided the appropriate theoretical expressions are available.

The principal conclusions from this work are: 1. A temperature range exists (around room temperature for most

TN361, Revised October 1972. **Liquid densities of oxygen nitrogen, argon, and parahydrogen,** H. M. Roder, R. D. Mc Carty, and V. J. Johnson, Nat. Bur. Stand. (U.S.), Tech. Not 361 (Revised), 181 pages (Oct. 1972) $1.25, SD Catalog Nc C13.46:361 (Revised).

Key words: Argon; compressed liquid; density; graphs liquid; nitrogen; oxygen; parahydrogen; pressure; saturate liquid; tables; temperature; uncertainties; volume; volum correction factor.

Tables of pressure, volume, density and temperature for th saturated liquid and for compressed liquid states from the tripl point to the critical point, of oxygen, nitrogen, argon, an parahydrogen are presented. The table entries of temperature ar in Kelvin and Rankine, table entries in pressure are in a mospheres and psia. Volumes or densities are given in sever different units, and density ratios or "volume correction factors are tabulated for each entry. Estimates of the uncertainty for th tabulated data are given. The tables and graphs were prepared i the style and in the units preferred by users. They are intende as source for both technician and engineer. Revises and update NBS Technical Note 361, issued January 31, 1968.

TN361. (Revised). Metric Supplement. **Liquid densities of ox ygen, nitrogen, argon and parahydrogen,** H. M. Roder, Na Bur. Stand. (U.S.), Tech. Note 361 (Revised), (Metric Supple ment), 114 pages (June 1974) SD Catalog No. C13.46:36 (Rev.), Metric Supplement.

Key words: argon; compressed liquid; density; densit ratios; liquid; nitrogen, oxygen; parahydrogen; pressure saturated liquid; tables; temperature; uncertainties; volume

Tables of pressure, volume, density and temperature for th saturated liquid and for compressed liquid states from the tripl point to the critical point, of oxygen, nitrogen, argon, an parahydrogen are presented. The table entries of temperature ar in Kelvin and degrees Celsius, table entries in pressure are i bars and kp/cm^2. Volumes or densities are given in several di ferent units, and density ratios are tabulated for each entry. Est mates of the uncertainty for the tabulated data are given. The ta bles were prepared in the style and in the units preferred by th users. They are intended as source for both technician and en gineer.

TN362. **Thermodynamic properties of He^3-He^4 solutions wit applications to the He^3-He^4 dilution refrigerator,** R. Radebaugh NBS Tech. Note 362 (Dec. 29, 1967).

Key words: Cryogenics; dilution refrigerator; enthalpy entropy; Fermi-Dirac gas; helium-3; helium-4; liquid mixtures; osmotic pressure; quantum fluid; specific hea thermodynamic properties.

The thermodynamic properties of liquid He^3-He^4 solution between 0 and 1.5 °K are calculated by using the weakl interacting Fermi-Dirac gas model for He^3 in He^4. Certai experimental data below about 0.4 °K are used to evaluate som of the parameters in the model. The properties of both He^3 i He^4 and the total solution are calculated for concentrations He^3 up to 30 percent. All experimental data agree very well wit the calculated results, although little data exist below 0.4 °K The calculated properties are used to analyze the behavior of th He^3-He^4 dilution refrigerator in both the continuous and singl cycle processes. The maximum heat absorption below abou 0.04 °K is found to be 82 T^2 joules per mole of He^3 circulate The effect of an imperfect heat exchanger and He^4 circulation o the refrigeration capacity is discussed. An analysis of two ne types of single-cycle processes is also given.

N363. **Computer solutions for thermal-acoustical oscillations in gas-filled tubes,** M. T. Norton and R. C. Muhlenhaupt, Nat. Bur. Stand. (U.S.), Tech. Note 363, 86 pages (Nov. 30, 1967).

Key words: Cryogenics; liquid helium; thermal oscillations.

A digital computer program to determine solutions for hermal-acoustical oscillations in gas-filled pipes is described. sing a typical temperature gradient and tube length from test ata, the program calculates the effect of changes in heat transfer oefficient, friction factor, and pipe diameter. Details of the pro-ram are explained. A comparison is made between computation nd one particular test datum point. Although the calculations re based on helium as the media, the program can accommodate ny fluid treated as a perfect gas.

N364. **Slush hydrogen pumping characteristics,** D. E. Daney, P. R. Ludtke, D. B. Chelton, and C. F. Sindt, Nat. Bur. Stand. (U.S.), Tech. Note 364, 41 pages (Apr. 1968).

Key words: Cavitation; centrifugal pump; cryogenic pump; liquid-solid hydrogen mixtures; slush hydrogen.

The pumping characteristics of liquid-solid mixtures of arahydrogen (slush hydrogen) were investigated using a centrifugal type liquid hydrogen pump with a specific speed range of 600 to 3100. Performance tests at 8,000, 11,000, 14,000, and 9,000 rpm and cavitation tests at 11,000 and 14,000 rpm were nade. As predicted by theory, the developed head for liquid and slush hydrogen are the same when the difference in density is onsidered. The pump efficiency, cavitation constant and NPSH equirements for slush hydrogen are also the same as for the tri-le-point liquid. After 34 minutes running time with slush ydrogen out of a total running time of 79 minutes, the pump components showed no wear over that expected from operation n liquid.

TN365. **Survey of electrical resistivity measurements on 16 pure metals in the temperature range 0 to 273 °K,** L. A. Hall, Nat. Bur. Stand. (U.S.), Tech. Note 365, 114 pages (Feb. 1968).

Key words: Aluminum; beryllium; cobalt; copper; compilation; electrical resistivity; gold; indium; iron; lead; low temperature; magnesium; molybdenum; nickel; niobium; platinum; silver; tantalum; tin.

Experimental electrical resistivity data for 16 pure metals have been compiled, tabulated, and graphically illustrated for a temperature range of 0 to 273 °K. A section has been prepared for each particular metal which includes references, brief comments concerned with preparation of sample, purity, and any other pertinent information, tabulated data, and graph.

TN366. **An analysis of the Brayton cycle as a cryogenic refrigerator,** R. C. Muhlenhaupt and T. R. Strobridge, Nat. Bur. Stand. (U.S.), Tech. Note 366, 116 pages (Aug. 1968).

Key words: Brayton; cryogenics; refrigeration.

The performance of a Brayton-cycle refrigerator has been computed taking into account the efficiencies of the various components. The results are presented in graphical form. These charts give the input power requirements, mass flow rate, pertinent temperatures, and allow selection of the optimum high pressure for a given set of component characteristics.

TN367. **A bibliography of thermophysical properties of methane from 0 to 300 °K,** L. A. Hall, Nat. Bur. Stand. (U.S.), Tech. Note 367, 121 pages (May 1968).

Key words: Bibliography; equation of state; low temperature; mechanical properties; methane; thermodynamic properties; transport properties.

References together with an abbreviated abstract are presented for mechanical, thermodynamic, and transport properties of methane from 0 to 300 °K published up to December 1967. A total of 660 articles have been indexed. Each article has been reviewed and coded with regard to properties studied, type of article (i.e., experimental, theoretical, etc.), and method of presentation of data. The temperature and pressure ranges for each property under consideration are also given. An index has been prepared according to property with four sub-categories: solid, liquid, gas up to 200 °K, and gas above 200 °K.

TN368. **Solution of the Abel integral transform for a cylindrical luminous region with optical distortions at its boundary,** E. R. Mosburg, Jr., and M. S. Lojko, Nat. Bur. Stand. (U.S.), Tech. Note 368, 27 pages (July 12, 1968).

Key words: Abel inversion; Abel transform; emissivity profile; plasma diagnostics; radiance profile.

The use of orthogonal polynomial expansions in the calculation of the Abel integral transform is discussed. Particular attention is directed to the effects of optical and instrumental distortions when the luminous region is contained by a cylindrical glass tube. An easily calculable solution of the Abel integral is presented which reduces the effect of such distortions by employing a weighting function which has a maximum at the center and vanishes at the boundary. This approach results in a more accurate solution of the Abel integral transform in the case where significant optical and instrumental distortions are present near the boundary of the luminous region.

TN369. **Interferometric measurements of the complex dielectric constant of liquids,** W. S. Lovell and L. M. Thiel, Nat. Bur. Stand. (U.S.), Tech. Note 369, 89 pages (Aug. 1968).

Key words: Approximation errors; complex dielectric constant; convergence confidence interval; contour diagrams; dielectric liquid; diffraction; experimental apparatus; Fresnel equations; generalized Newton iteration function; imperfect reflections; interferometric measurements; interferometry; least squares iteration function; liquid dielectrics; method of selected points; millimeter waves; multiple reflections; outliers; perpendicular polarization; quasi-optics; reflection coefficient; transverse displacement; vector solution.

Paper I. Errors in the "perfect square" approximation.— Errors arising from the use of a "perfect square" approximation in treating free-space, interferometric measurements of the complex dielectric constant of liquids are described. It is shown that such errors (1) are generally positive, (2) often exceed values previously estimated for the measurement technique as a whole, and (3) are not generally predictable without some prior knowledge of the dielectric properties of the material being investigated. In addition, these errors depend upon the dielectric thickness over which data are incorporated into the calculations. Finally, an anomaly in the calculations previously attributed to experimental error is shown to arise from the "perfect square" approximation itself. It is concluded that this approximation may at best provide initial estimates for ϵ' and ϵ'' which may then be used in a more complete mathematical treatment.

Paper II. Experiment apparatus.— Design details of a free-space, millimeter-wave interferometer are described. The apparatus radiates at oblique incidence to an air-dielectric-metal configuration placed between dissimilar horns. Errors arising from the quasi-optical nature of this radiation are described, and quantitative data are presented which demonstrate techniques for minimizing such errors. The techniques employed should have general applicability in millimeter-wave measurements. For

the particular instrument described, the errors are shown to be of such magnitude that experimental reflection coefficient profiles should conform to an adequate theoretical description. A means for more accurate measurements of the complex dielectric constant of liquids is then provided.

Paper III. Derivation of the absolute reflection coefficient. — For measurements of the complex dielectric constant of liquids by free-space reflection and interference of electromagnetic radiation, a theoretical reflection coefficient for the air-dielectric-metal configuration is derived. The derivation is based on a model which treats multiple reflections within the dielectric explicity. As an extension of earlier theory, this reflection coefficient incorporates effects of (1) imperfect reflections at the dielectric-metal interface, together with other losses, and (2) radiation sources presenting nonplanar wavefronts and having finite bandwidths. Effects arising from a finite sample or receiving surface are also discussed.

Paper IV. A numerical method for determining the best complex dielectric constant. — A numerical method is presented for determining the best complex dielectric constant $\epsilon^* = \epsilon' - i\epsilon''$ from an experimental record obtained at millimeter-wavelengths from free-space, interferometric measurements of liquids. The method of selected points is applied to the reflection coefficient expression to obtain a set of simultaneous equations which is solved for an initial vector solution using the generalized Newton iteration function. The principle of least squares is then applied to achieve the best fit between the reflection coefficient expression and experimental record. The desired values of ϵ' and ϵ'' are included as components of a final vector solution of the best fitting theoretical curve.

TN370. **Calibration principles and procedures for field strength meters (30 Hz to 1 GHz),** H. E. Taggart and J. L. Workman, Nat. Bur. Stand. (U.S.), Tech. Note 370, 157 pages (Mar. 1969).

Key words: Calibration procedures; dipole antennas; field strength meters; loop antennas.

The National Bureau of Standards has been calibrating many types of field strength meters and their related antennas at frequencies up to 1000 MHz for several years. Various techniques of measurement have been investigated regarding accuracy, calibration time, ease of operation, and reliability. This report discusses some of these calibration techniques in detail, and in some cases lists step-by-step procedures for performing the complete calibration. Typical calibration data are used to take the reader from the beginning of the calibration to the completed test report. All measurement setups are clearly illustrated, listing the equipment necessary to perform the calibration. Methods of calibrating two basic types of antennas are described: (1) the loop antenna at frequencies from 30 Hz to 30 MHz and (2) half-wavelength dipole antennas from 30 to 1000 MHz. Two methods of calibrating loop antennas are discussed in detail, the standard-field method and the injection method. The standard-antenna method of calibrating dipole antennas is fully described. Measurement uncertainties of various methods are discussed. This report was written to help technical personnel actively participate in antenna calibration work. Hopefully this information will help people to set up new calibration services and to improve existing calibrating facilities.

TN371. **Transistorized low voltage regulator circuits and design,** J. H. Rogers, Nat. Bur. Stand. (U.S.), Tech. Note 371, 38 pages (Sept. 1968).

Key words: D-C amplifier; design equations; differential amplifier; dual regulator; integrated circuit; output resistance; power dissipation; power supply; preregulat regulation factor; ripple voltage; transistor; voltage regu tion; zener diode.

Simplified design equations and circuits are presented f three separate transistor voltage regulator circuits covering t range of 2 to 30 volts. Examples of design, use of equatio selection of components and performance data are presented. appendix is included to show the use of recent integrated circ (I.C.) voltage regulators.

TN372. **Mathematical techniques for EPR analysis of S = 5/2 io in C_2 symmetry. Application to Fe^{3+} in quartz,** R. L. Petersc L. M. Matarrese, and J. S. Wells, Nat. Bur. Stand. (U.S Tech. Note 372, 23 pages (June 1969).

Key words: Electron paramagnetic resonance; ferric io synthetic quartz.

Various formulas and mathematical techniques useful for t analysis of the EPR spectra of ions of angular momentum 5/2 sites of C_2 symmetry are presented. Special emphasis is given the spectrum of Fe^{3+} in synthetic brown quartz. Included a matrix elements of the Racah operators for arbitrary direction the axis of quantization relative to the crystalline electric fi axes, spectral line-position formulas based upon a usage second-order perturbation theory which is somewhat differe from the usual, and line-intensity formulas.

TN373. **Radio-frequency measurements in the NBS Institute f Basic Standards,** R. S. Powers and W. F. Snyder, Editors, N Bur. Stand. (U.S.), Tech. Note 373, 116 pages (June 1969).

Key words: Accuracy; calibration services; measurement measurement techniques; radio frequency; uncertainties measurement.

This volume is a collection of diagrams, tables, and te material, which has been assembled to show the interrelatio ships between various radio frequency measurements made the Institute for Basic Standards (IBS). In particular, the me surements are those which lead to services provided to the pub or to other government agencies. These services include not on calibrations made for fees, but the broadcast services of the fo NBS radio stations. Measurements made as part of the IE research and development program are not included.

The information included is designed to give the users a potential users of the radio frequency services a clearer u derstanding of the origins of the measurement output of IBS this field.

TN374. **Incipient and developed cavitation in liquid cryogens,** K. Edmonds and J. Hord, Nat. Bur. Stand. (U.S.), Tech. No 374, 31 pages (Feb. 1969).

Key words: Cavitation; cryogens; incipience.

Cavitation characteristics of liquid hydrogen and liqu nitrogen flowing in a transparent plastic venturi have been dete mined and conventional cavitation-inception-parameter curv are given. Representative developed-cavitation data, consistir of pressure and temperature measurements within full developed cavities, are also given; measured temperatures a pressures within the cavities were generally not in the modynamic equilibrium. Existing theory was used to obta equations which correlate the experimental data for develop cavities in liquid hydrogen or liquid nitrogen. The theory is e tended to include the effect of cavity thickness and the expe mental data are used to evaluate the results. Some recommend tions for future work are given.

4375. **Tables of bias functions, B_1 and B_2, for variances based on finite samples of processes with power law spectral densities,** J. A. Barnes, Nat. Bur. Stand. (U.S.), Tech. Note 375, 39 pages Jan. 1969).

Key words: Spectral density; statistics; unbiased estimate; variance.

D. W. Allan showed that if y(t) is a sample function of a ran- m noise process with a power law spectral density (i.e., $S_y(f)$ $\eta|f|^\alpha$), then there is generally bias to the estimated variance of defined as

$$\sigma_y^2(N,T,\tau) = 1/N - 1 \sum_{n=1}^{N} (\bar{y}_n - \langle \bar{y} \rangle)^2,$$

here N is the number of samples, y_n is the average value of y(t) er the n-th interval of duration τ, I is the time between the ginnings of any two successive sample intervals, and

$$\langle \bar{y} \rangle \equiv 1/N \sum_{n=1}^{N} \bar{y}_n.$$

lan also showed that, under these conditions, the expectation lue of the estimated variance is proportional to $\tau\mu$ where μ is constant related to α, the exponent in the spectral density; i.e.,

$$E[\sigma_y^2(N,T,\tau)] \propto \tau^\mu.$$

ased on this work one may define the two bias functions

$$B_1(N,r,\mu) \equiv \frac{E[\sigma_y^2(N,T,\tau)]}{E[\sigma_y^2(2,T,\tau)]}$$

nd

$$B_2(r,\mu) \equiv \frac{E[\sigma_y^2(2,T,\tau)]}{E[\sigma_y^2(2,T,\tau)']}.$$

here $r \equiv T/\tau$ and the B's are functions of μ through their depen- ence on y(t).

If one has a sample variance, $\sigma_y^2(N_1, T_1, \tau_1)$, the bias functions llow one to give an unbiased estimate for $\sigma_y^2(N_2, T_2, \tau_2)$ pro- ided the spectral type is known (i.e., μ is known).

The tables give values of $B_1(N,r,\mu)$ and $B_2(r,\mu)$ accurate to our significant figures for the following values of N,r,μ:

$$\mu = -2.0 \text{ to } 2.0 \text{ in steps of } 0.2;$$

$$N = 4, 8, 16, 32, 64, 128, 256, 512, 1024, \infty;$$

$$= 0.001, 0.003, 0.01, 0.03, 0.1, 0.2, 0.4, 0.8, 1, 1.01, 1.1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024, 2048, \infty.$$

TN376. **Unassigned.**

TN377. **Slush hydrogen fluid characterization and instrumentation,** C. F. Sindt, P. R. Ludtke, and D. E. Daney, Nat. Bur. Stand. (U.S.), Tech. Note 377, 69 pages (Feb. 1969).

Key words: Cryogenic; flow restrictions; friction angle; gel; liquid-solid mixtures; particle size; plug flow; slurry flow; slush hydrogen.

Areas of the slush hydrogen fluid characterization program covered are production, transfer, and storage of liquid-solid mixtures.

An experiment has been performed in which a second component was added to liquid hydrogen to determine the effect on the size of the solid particles produced by the freeze-thaw method. Also, an experiment performed with 4.4 percent oxygen in nitrogen resulted in particles an order of magnitude smaller in size than those normally observed in freeze-thaw production of pure nitrogen slush.

The friction angle of settled solids of slush hydrogen on several metals was determined for surface finishes ranging from 2 to 110 micro inches rms. The angle at which solids slide from the surface was found to be a function of the surface finish.

Data were taken in the flow loop over a range of velocities from 1.5 to 40 ft/sec (0.46 to 12.2 m/s). The friction losses determined from the flow data are compared to losses predicted for Newtonian fluids. Losses with slush of solid fractions from 0.1 to 0.4 were found to be lower than with triple-point liquid hydrogen at the higher Reynolds numbers.

Liquid-solid mixtures of hydrogen with solid fraction of 0.5 were transferred through three types of flow restrictions. The restrictions were a globe valve, an orifice, and a venturi. Losses through the restrictions were essentially the same with the high solid fraction slush as with triple-point liquid.

A brief review of the pumping characteristics of slush hydrogen is presented. A comparison of developed head, efficiency, cavitation constant, and net positive suction head is discussed.

Gelling of slush hydrogen with pyrogenic silica was accomplished with solid fractions from 0 to 0.2. The amount of gelling agent required to gel slush was found to be proportional to the liquid volume of the slush.

TN378. **Preparation and characterization of slush hydrogen and nitrogen gels,** A. S. Rapial and D. E. Daney, Nat. Bur. Stand. (U.S.), Tech. Note 378, 43 pages (May 1969).

Key words: Gels; liquid hydrogen gels; liquid nitrogen gels; liquid-solid hydrogen mixtures; rocket propellants; slush hydrogen; slush hydrogen gels; slush nitrogen gels.

An experimental apparatus has been developed for the gelation of slush hydrogen, and slush hydrogen was gelled for the first time. Measurements of the weight-bearing capacity of the gel as a function of mass percent gelant were made for liquid and slush nitrogen and hydrogen. These measurements verify the simple models discussed here for gelled liquid and slush within the experimental accuracy; the models predict a reduction in gelant concentration from 38 mass percent to 25 mass percent in going from the Normal Boiling Point liquid hydrogen to slush hydrogen of 0.40 solid fraction for the silica gelant used in this work. Reduction in the mass percent gelant for other gelants should be similar.

TN379. **Standard time and frequency: its generation, control, and dissemination from the National Bureau of Standards time and frequency division,** J. B. Milton, Nat. Bur. Stand. (U.S.), Tech. Note 379, 27 pages (Aug. 1969).

Key words: Clock synchronization; frequency and time dissemination; primary frequency standard; standard frequency broadcasts; time interval; time scales.

The Time and Frequency Division of the National Bureau of Standards produces the NBS time scales, AT(NBS), SAT(NBS), and UTC(NBS). These time scales are developed by utilizing the properties of the NBS frequency standard, NBS-III. The main byproduct of these time scales is the operational clock systems. These operational clock systems are used, among other things, to calibrate the clocks and secondary standards necessary for the operation of the NBS radio stations, WWV, WWVB, WWVL, and WWVH. These stations transmit SAT(NBS), UTC(NBS), and various tones, alerts, and corrections for time-of-day information.

TN379-1. **Standard time and frequency: its generation, control, and dissemination from the National Bureau of Standards Time and Frequency Division,** J. B. Milton, Nat. Bur. Stand. (U.S.), Tech. Note 379-1, 26 pages (June 1972).

Key words: Clock synchronization; frequency and time dissemination; primary frequency standard; standard frequency broadcasts; time interval; time scales.

The Time and Frequency Division of the National Bureau of Standards produces the NBS time scales, AT(NBS) and UTC(NBS). These time scales are developed by utilizing the properties of the NBS frequency standard, NBSFS. The main byproduct of these time scales is the operational clock systems. These operational clock systems are used, among other things, to calibrate the clocks and secondary standards necessary for the operation of the NBS radio stations, WWV, WWVB, WWVL, and WWVH. These stations transmit UTC(NBS), and various tones, alerts, and corrections for time-of-day information.

TN381. **Some applications of the Josephson effect,** R. A. Kamper, L. O. Mullen, and D. B. Sullivan, Nat. Bur. Stand. (U.S.), Tech. Note 381, 63 pages (Oct. 1969).

Key words: Josephson effect; superconductivity; thermometry; tunnel junctions.

We describe techniques for fabricating permanent Josephson junctions between thin films of niobium and lead, and for absolute noise thermometry at very low temperatures using the Josephson effect. We discuss the possible benefits of applying superconductivity to nuclear magnetic resonance detection, and review other applications of the Josephson effect.

TN382. **Laser power and energy measurements,** D. A. Jennings, E. D. West, K. M. Evenson, A. L. Rasmussen, and W. R. Simmons, Nat. Bur. Stand. (U.S.), Tech. Note 382, 64 pages (Oct. 1969).

Key words: Calorimetry; laser; laser calorimetry; laser energy; laser power.

Most laser calorimeters operate in a constant temperature environment. The calorimeters can be used as deflection devices or the data can be analyzed by extrapolation or integration. Consideration of the heat flow problem common to all of these methods points up the underlying assumptions and the possible errors involved.

Calorimeters for measuring the output energy of pulsed ruby and neodymium glass lasers have been built and calibrated. The absorbing medium is an aqueous solution of $CuSO_4$. Calibration of laser energy detectors has an estimated uncertainty of ± 2 percent for input energies of 0.1J to 100J. Comparisons of absorption cell calorimeters with metal plate calorimeters agree within 1 percent.

Instrumentation is described that is used for the calibration of CW laser power meters. The calibration unit employs an absorption cell calorimeter to calibrate the output of a photovoltaic cell transfer detector. The power meter to be calibrated is then compared to the calibrated output of the transfer detector. The calibrations are within an accuracy of 4 percent.

A discussion and description is also given of several types of calorimeters that have been used to measure the output of a 100 watt CO_2 laser. The most recent design provides for measurement from 1 watt to 5 kilowatts with a measured accuracy of better than 3 percent.

TN383. **A bibliography of thermophysical properties of air from 0 to 300 K,** L. A. Hall, Nat. Bur. Stand. (U.S.), Tech. Note 383, 121 pages (Oct. 1969).

Key words: Air; bibliography; equation of state; low ter perature; mechanical properties; thermodynamic prope ties; transport properties.

References together with an abbreviated abstract a presented for mechanical, thermodynamic, and transport prope ties of air from 0 to 300 K published up to December 1968. total of 610 articles have been indexed. Each article has be reviewed and coded with regard to properties studied, type of a ticle (i.e., experimental, theoretical, etc.), and method of prese tation of data. The temperature and pressure ranges for each pr perty under consideration are also given. An index has be prepared according to property with four sub-categories: soli liquid, gas up to 200 K, and gas above 200 K.

TN384. **Thermophysical properties of oxygen from the freezi liquid line to 600 R for pressures to 5000 psia,** R. D. McCar and L. A. Weber, Nat. Bur. Stand. (U.S.), Tech. Note 38 189 pages (July 1971).

Key words: Density; dielectric constant; enthalpy; entrop equation of state; fixed points; heat transfer coefficient index of refraction; Joule-Thomson; latent heat; melti point; oxygen; Prandtl number; specific heat; speed sound; surface tension; thermal conductivity; thermal d fusivity; vapor pressure; viscosity; volume.

Tables of thermophysical properties of oxygen are present for temperatures from the melting line to 600 R for pressures 5000 psia. The tables include, entropy, enthalpy, internal energ density, volume, speed of sound, specific heat, thermal condu tivity, viscosity, thermal diffusivity, Prandtl number and t dielectric constant for 79 isobars. Also included in the isobar tables are quantities of special utility in heat transfer calcul tions: $(\partial P/\partial V)_T$, $(\partial P/\partial T)_\rho$, $V(\partial H/\partial V)_P$, $V(\partial P/\partial U)_V$, $-V(\partial P/\partial V$ $I/V(\partial V/\partial T)_P$.

In addition to the isobaric tables, tables for the saturated vap and liquid are given which include all of the above propertie plus the surface tension. Tables for the P-T of the freezing liqui index of refraction and the derived Joule-Thomson inversi curve are also presented. The specific heat of the saturated liqu is given in graphical form. A temperature-entropy chart and Mollier diagram are also included.

TN385. **Thermal conductance at the interface of a solid and he um II (Kapitza conductance),** N. S. Snyder, Nat. Bur. Stan (U.S.), Tech. Note 385, 90 pages (Dec. 1969).

Key words: Heat transfer; helium II; Kapitza conductanc

A review is presented of the experimental and theoretic work on Kapitza conductance, including a compilation of t available data on conductance to helium II. A short derivation the phonon radiation limit indicates the reason for the appro mate T^3 temperature dependence and the small size of the Kap za conductance for most solids. Considerable qualitative a quantitative correspondence of the data with this limit is foun From the limited evidence available, the role of surface con tions, and of bulk parameters such as the Debye temperature determining the conductance are considered empirical Theoretical knowledge of the Kapitza conductance is seen give an inadequate explanation of the data. In addition, t phenomena which occur when the heat flux is high enough th properties of the bulk liquid are also involved in the measur conductance are described briefly.

TN386. **A precision, high frequency calibration facility for coaxi capacitance standards,** R. N. Jones and L. E. Huntley, Na Bur. Stand. (U.S.), Tech. Note 386, 27 pages (Mar. 1970).

Key words: Calibration; capacitance; capacitance, measur ment; coaxial capacitance standards; impedance, measur

ments, capacitance; standards; statistical control.

Using high frequency impedance standards which are fitted h precision coaxial connectors, and limiting calibrations to cific frequencies and impedance values, can contribute atly toward improving measurement agreement and stan- dization. These advantages have been utilized in the develop- nt of a new and much improved calibration service for pacitance in the high frequency region. The service is for pacitances of 50, 100, 200, 500 and 1000 picofarads at 100 z, 1 MHz, and 10 MHz. This paper describes the instrumen- ion used in the measurements and the method of data ndling, and gives a detailed breakdown of the measurement certainties.

N387. **Hydrogen spin exchange frequency shifts,** H. Hellwig, Nat. Bur. Stand. (U.S.), Tech. Note 387, 13 pages (Mar. 1970).

Key words: Frequency pulling; hydrogen beam tube; hydrogen maser; maser tuning; spin exchange.

Frequency shifts due to hydrogen spin exchange collisions are scussed for the hydrogen maser and the hydrogen storage am tube. The combined effects of spin exchange and cavity lling in the hydrogen maser are evaluated with emphasis on equency errors introduced by standard tuning procedures. It is und that an automatic cavity tuning system based on a varia- on of the linewidth does not introduce a frequency error. In ntrast, manual tuning procedures based on an interpolation of easurements at different cavity settings do not yield a perfect mpensation of spin exchange effects. However, the frequency ror becomes only significant at unnecessarily large cavity off- ts.

The smallness of the spin exchange shifts and the near absence cavity pulling in a hydrogen storage beam tube are expected to ermit a determination of spin exchange shifts by varying the eam intensity with a precision adequate for stability and accura- y figures of 10^{-14} or better.

N389. **Quantifying hazardous electromagnetic fields: Practical considerations,** R. R. Bowman, Nat. Bur. Stand. (U.S.), Tech. Note 389, 15 pages (Apr. 1970).

Key words: Electromagnetic fields; field parameters; hazards; instrumentation; quantifying.

The usefulness of power density to express the hazard poten- al of electromagnetic fields is limited to simple fields that are pproximately uniform and plane wave. For fields that are com- licated by having reactive components or by having multipath nterference patterns, power density is not a suitable parameter or quantifying the potential hazards because: (a) such fields can e very strong even though the power density is small, and (b) he power density in such fields is very difficult to measure. Since some of the most important hazardous fields can involve ery complicated field configurations (for instance, fields near eaking cracks in microwave ovens), it is important to establish more rational measure for hazardous fields. A qualitative liscussion is given of the many issues involved in selecting a uitable field parameter for quantifying hazardous electromag- netic fields in general. It is concluded that the total energy densi- y of the field is the best parameter, but in many instances the electric energy density alone will be adequate. Some general liscussion is given concerning "ideal" instrumentation for quan- ifying hazardous fields.

TN390. **Far infrared absorption in liquefied gases,** M. C. Jones, Nat. Bur. Stand. (U.S.), Tech. Note 390, 39 pages (Apr. 1970).

Key words: Absorption coefficient; argon; carbon monoxide; far infrared; hydrogen; liquefied gases; methane; nitrogen; oxygen.

Experimental results are given for the absorption coefficient of the liquids hydrogen (three para concentrations), nitrogen, oxygen, carbon monoxide, methane and argon in the wave number range 20-250 cm^{-1} (40-500 μm). In addition, data for liquid hydrogen are given at wave numbers up to 600 cm^{-1} (16.7 μm). The results are discussed in terms of the induced dipole, and, in the case of carbon monoxide, the permanent dipole. An indication of the way in which the data may be employed in calculations of thermal radiative transfer is made by calculation of the modified Planck mean absorption coefficient.

TN391. **Quantifying hazardous microwave fields: analysis,** P. F. Wacker, Nat. Bur. Stand. (U.S.), Tech. Note 391, 19 pages (Apr. 1970).

Key words: Electromagnetic radiation; energy density; hazards; measurement; microwave radiation; probe; radiation; standards.

The familiar power density radiation hazard standards are quite satisfactory for a field consisting of a single infinite traveling plane wave. However, for microwave and lower-frequency fields, hazards occur primarily in near fields which cannot be approximated as the aforementioned plane wave. Further, power density can be quite misleading or even meaningless as a measure of hazard in a near field. Thus, power density in a standing wave can be precisely zero, yet the hazard of such a field can be arbitrarily large. Similarly, a reactive field may present a considerable hazard, yet have zero time-average power density.

The major hazard from microwave and lower frequency radiation is believed to arise from dielectric heating of body tissues, and the heating of an isotropic medium is proportional to the sum of the squares of the absolute values of the electric field components $|E_x|^2 + |E_y|^2 + |E_z|^2$. Hence, electric field energy density is proposed for a radiation hazard standard.

Analytical limitations of various types of probes are considered and the advantages of a spherically-symmetric probe of lossy dielectric are discussed. For a rather general spherically-symmetric probe in an arbitrary field, both exact and approximate treatments are given for the calibration constant with full correction for the perturbation of the field by the probe. Conditions for a constant factor are also given.

TN392. (Revised September 1973). **Thermodynamic properties of compressed gaseous and liquid fluorine,** R. Prydz and G. C. Straty, Nat. Bur. Stand. (U.S.), Tech. Note 392, 197 pages (Sept. 1974) $1.50, SD Catalog No. C13.46:392 (Rev. 1973).

Key words: Density; enthalpy; entropy; fixed points (PVT); fluorine; Joule-Thomson; latent heat; melting curve; PVT measurements; saturation densities; specific heats; vapor pressure; velocity of sound; virial coefficients.

An apparatus has been constructed and used successfully to measure vapor pressure and PVT data of fluorine from the triple point to 300 K at pressures to about 24 MN/m^2. Material problems caused by the toxic and corrosive nature of fluorine were solved. A network of isotherm and isochore polynomials and a truncated virial equation were used to represent all PVT data. These equations represent the data with an average standard deviation of about 0.02 percent in density, the corresponding accuracy being estimated at 0.1 percent. Equations for the saturated liquid and vapor densities, the vapor pressure curve, the melting line, and the ideal gas properties are also presented. Comparisons are given to published values of the second virial coefficients, vapor pressures, and saturation densities. Additional comparisons are also made to measured specific heats and latent heats of vaporization. New values are reported for the triple point and critical point parameters together with the temperature and saturation densities at the normal boiling point. Finally,

extensive tables of thermodynamic properties of fluorine are given which include pressure, temperature, density, isotherm and isochore derivatives, internal energy, enthalpy, entropy, specific heats at constant pressure and volume and velocity of sound. Some erroneous values for the internal energy and enthalpy of the compressed liquid below 135 K, published previously, have been corrected in this revision. Supersedes Technical Note 392, Oct. 1970 Ed.

TN393. **A method for designing multi-screw waveguide tuners,** M. P. Weidman and E. Campbell, Nat. Bur. Stand. (U.S.), Tech. Note 393, 20 pages (Oct. 1970).

Key words: Capacitive screw tuner; impedance transformer; waveguide tuner.

Capacitive screw, waveguide tuners are commonly used in microwave measurement systems and as devices for adjusting the impedance of various waveguide terminations. The design of a broadband tuner of this type has been a problem in the past.

This paper describes a method for designing tuners which will work effectively for relatively wide ranges of frequencies.

TN394. **Characterization of frequency stability,** J. A. Barnes, A. R. Chi, L. S. Cutler, D. J. Healey, D. B. Leeson, T. E. McGunigal, J. A. Mullen, W. L. Smith, R. Sydnor, R. F. C. Vessot, and G. M. R. Winkler, Nat. Bur. Stand. (U.S.), Tech. Note 394, 50 pages (Oct. 1970).

Key words: Allan variance; frequency; frequency stability; sample variance; spectral density; variance.

Consider a single generator whose instantaneous output voltage $V(t)$ may be written as

$$V(t)=[V_0+\epsilon(t)]\sin[2\pi\nu_0 t+\phi(t)]$$

where V_0 and ν_0 are the nominal amplitude and frequency respectively of the output. Provided that $\epsilon(t)$ and $\phi(t)=d\phi/dt$ are sufficiently small for all time t, one may define the fractional instantaneous frequency deviation from nominal by the relation

$$y(t)\equiv\frac{\dot{\phi}(t)}{2\pi\nu_0}.$$

A proposed definition for the measure of frequency stability is the spectral density $S_y(f)$ of the function $y(t)$ where the spectrum is considered to be one-sided on a per hertz basis.

An alternative definition for the measure of stability is the infinite time average of the sample variance of two adjacent averages of $y(t)$; that is, if

$$\bar{y}_k=\frac{1}{\tau}\int_{t_k}^{t_k+\tau}y(t)dt,$$

where τ is the averaging period, $t_{k+1}=t_k+T$, $k=0, 1, 2\ldots$, t_0 is arbitrary, and T is the time interval between the beginnings of two successive measurements of average frequency; then the second measure of stability is

$$\sigma_y^2(\tau)\equiv\left\langle\frac{(\bar{y}_{k+1}-\bar{y}_k)^2}{2}\right\rangle,$$

where $\langle\ \rangle$ denotes infinite time average and where $T=\tau$.

In practice, data records are of finite length and the infinite time averages implied in the definitions are normally not available; thus estimates for the two measures must be used. Estimates of $S_y(f)$ would be obtained from suitable averages either in the time domain or the frequency domain. An obvious estimate for $\sigma_y^2(\tau)$ is

$$\sigma_y^2(\tau)\approx\frac{1}{m}\sum_{k=1}^{m}\frac{(\bar{y}_{k+1}-\bar{y}_k)^2}{2}.$$

Parameters of the measuring system and estimating procedu are of critical importance in the specification of frequency stab ty. In practice, one should experimentally establish confiden limits for an estimate of frequency stability by repeated trials.

TN395. **Design for a variable-output-coupling far-infrar Michelson laser,** J. S. Wells, K. M. Evenson, L. M. Matarre D. A. Jennings, and G. L. Wichman, Nat. Bur. Stand. (U.S Tech. Note 395, 23 pages (Jan. 1971).

Key words: HCN Lasers; H_2O lasers; infrared lasers; var ble coupling lasers.

A technique for varying the coupling of power from far- frared gas lasers and the design and construction of these lase are described. The coupling method is based on Michelson's i terferometric principle and permits a continuously variat coupling of the available power from the laser. The present las design is the result of evolution over the last year and a half.

TN396. **Data analysis for isoperibol laser calorimetry,** E. West, Nat. Bur. Stand. (U.S.), Tech. Note 396, 34 pages (Fe 1971).

Key words: Calorimetry; laser; laser calorimetry; las energy; laser power.

Isoperibol calorimeters (those operating in a constant-tei perature environment) are used to measure the power and ener in laser beams relative to electrical standards. The derivation the basic formula is reviewed. Two methods are presented f analyzing the data taken at equal time intervals: (1) An appro mate manual method with criteria for avoiding significant erro of approximation and (2) A least squares method for use with a tomatic digital computers.

TN397. **Tabulated values of cavitation B-factor for helium, H_2, F_2, O_2, refrigerant 114, and H_2O,** J. Hord and R. O. Voth, N Bur. Stand. (U.S.), Tech. Note 397, 116 pages (Feb. 1971).

Key words: Cavitation; cryogenics; pumps.

A brief history is given on the development of the B-fact concept and its application to the design of liquid pumps. Ada tation of the "quasi-static" vaporization model to the cavitati process is discussed; previous methods of computing B-fact are reviewed and a simplified, more precise computation, co sistent with the "quasi-static" model, is established. Merits the different computational techniques are discussed and two the methods are graphically compared. The best available pr perty data are used to compute B-factors for several fluids ov a wide range of temperatures. The results are tabulated reference data; they are useful in the application of the B-fact concept to the prediction of performance in cavitating liqu pumps.

TN398. **Power and energy measurement of repetitively pulse lasers,** D. A. Jennings, Nat. Bur. Stand. (U.S.), Tech. No 398, 10 pages (Mar. 1971).

Key words: Average power; energy per pulse; laser; pea power; repetitively pulsed lasers.

The problem of measuring average power, energy per puls and peak power of some of the more common repetitively pulse lasers is discussed. The techniques which have been used at th National Bureau of Standards are mentioned along with some the accuracies obtained. Accuracies of 3 to 10 percent can b achieved, depending on the laser source and the parameter of i terest.

TN399. **The physical basis of atomic frequency standards,** A. Risley, Nat. Bur. Stand. (U.S.), Tech. Note 399, 54 page (Apr. 1971).

Key words: Atomic frequency standards; cesium beam; energy levels; hydrogen maser; hyperfine interaction; rubidium gas cell; transition probability.

A tutorial discussion of the physical basis of atomic frequency ndards is given. These principles are then related to the condi- ns under which an atom can be used as the working substance a stable and accurate frequency standard. The three primary amples of atomic frequency standards—the hydrogen maser, e cesium beam, and the rubidium gas cell—are then discussed terms of these principles and conditions. The functions of the ndamental parts of each device become apparent through this velopment.

N400. **Electrochemical analysis: Studies of acids, bases, and salts by Emf, conductance, optical, and kinetic methods, July 1965 to June 1966,** Edited by R. G. Bates, NBS Tech. Note 400 (Sept. 6, 1966).

Key words: Acidity; analytical chemistry; conductance; deuterium oxide; dissociation processes; electrochemistry; electrolytes; Emf; indicators; isopiestic; vapor pressure; methanol-water solvents; thermodynamics.

This survey of the activities of the Electrochemical Analysis ction, Analytical Chemistry Division, covers the period July 65 to June 1966. An attempt is made to summarize a year's ogress on the technical projects of the Section in such a way as stress the program and capabilities of the organizational unit a whole. A description of facilities and equipment is esented and the directions of new programs are indicated. ief summaries of the several lines of work now under way are ven. The main areas include the study of acidity measurement water, deuterium oxide, and methanol-water solvents, along ith the development and certification of standard reference aterials with which acidity scales in these media can be efined. Solvent effects and isotope effects are being studied, nd equilibrium data for certain systems of analytical interest ave been obtained. Progress on a conductometric method for etermining traces of water is reported, and the thermodynamic roperties of some salt mixtures have been measured by a vapor ressure method. Kinetic methods for trace analysis have been xamined, and a new lot of potassium hydrogen phthalate Standard Reference Material 84h) has been certified for use as n acidimetric standard. The survey concludes with lists of the embers of the Section staff, publications and manuscripts roduced during the year, talks given by the staff, and committee ssignments.

N401. **Activities of the NBS Spectrochemical Analysis Section, July 1965 to June 1966,** Edited by B. F. Scribner, NBS Tech. Note 401 (Sept. 30, 1966).

Key words: Analysis; arc temperature; atomic absorption spectrometry; analog computer; bibliography; computer; electrodeposition; electron back scatter; electron probe microanalyzer; emission spectroscopy; laser probe; mass spectroscopy; photographic photometry; plasma jet; preconcentration; pulse height analyzer; spectrochemical analysis; spectroscopy; standard reference materials; time-shared computer; x-ray spectroscopy.

A summary is given of the activities of the NBS Spectrochemical Analysis Section for the period from July, 1965 hrough June, 1966, during which the move into the new facilities t Gaithersburg, Md. was made. Activities in optical pectrometry included development of programs for calculations n a time-sharing computer, measurement of arc temperatures, pplications of the laser probe and the plasma jet, and studies on tomic absorption spectrometry. In x-ray spectroscopy, there ave been some modifications of equipment, improvements in computation methods, and several applications. Improvements and additions were made to the electron probe analyzer, along with studies on measurement techniques, including non-dispersive analysis and computation procedures. The spark-source mass spectrometer has also been modified, and a new analog computer has been built and tested for reduction of photographic plate data; applications of this instrument to analyses of pure materials are described. Enrichment methods are being studied for the analysis of pure materials by emission spectroscopy, particularly with an electrodeposition technique. Homogeneity studies and analyses have been performed in the development of standard reference materials. Other activities included analyses of samples to assist other NBS groups and government agencies, and literature surveys. Listings are given of 20 publications and 26 talks by members of the Section during the year.

TN402. **Analytical coordination chemistry: Titrimetry, gravimetry, flame photometry, spectrophotometry, gas evaluation and isotopic preparations, July 1965 to June 1966,** Edited by O. Menis, NBS Tech. Note 402 (July 21, 1967).

Key words: Spectrophotometric titration; controlled potential coulometric; molybdenum; homogeneous precipitation; aluminum; beryllium; thermoanalytical standards; tricalcium silicate; spectrophotometry; antimony; high precision determination of nickel; simultaneous determination copper; cobalt; "releasing agents" in flame emission and atomic absorption; magnesium; ferrous SRMs; stoichiometric mixtures uranium oxide; isotope ratio determination.

Studies in four areas of analytical chemistry: titrimetry, gravimetry, flame emission and atomic absorption, and solution spectrophotometry, are described from the standpoint of analytical coordination chemistry and applications to NBS standard reference materials. In the first two competences these investigations dealt with spectrophotometric titrations and homogeneous precipitation methods. Advances are described in the latter two areas through the unique applications of ternary complexes, displacement reactions in metal-ligand systems and the use of complexing media as "releasing agents". This approach is described for the determination of nanogram quantities of Sb, Cu, Ni and Au in very high purity zinc by both spectrophotometric and flame procedures. Also in flame emission and atomic absorption a current table is presented for the detection limits of 70 elements. Progress of a new method is reported for the simultaneous determination of Ni, Cu and Co by the dimethylglyoxime method. Descriptive tables of results are also given for ferrous, non-ferrous and ceramic materials which were analyzed by one of the four competences. In another analytical area dealing with the analysis of gases in metals results of homogeneity and precision studies lead to certification of three new ferrous SRM's for their oxygen content. Also reported are the initial investigations of pyrohydrolytic separations of fluoride, nitrides and borons, separations of molybdenum from tungsten, controlled potential coulometric titration of molybdenum, and a description of improved instrumentation in flame emission and atomic absorption. Finally data are given on the preparation of stoichiometric mixtures of uranium oxide of varied isotopic composition and a list describing the variety of special analyses is included.

TN403. **Microchemical Analysis Section: Summary of activities, July 1965 to June 1966,** Edited by J. K. Taylor, NBS Tech. Note 403 (Sept. 1, 1966).

Key words: Atomic weights; coulometric analysis; gas analysis; mass spectrometric gas analysis; microchemical analysis; polarographic analysis; standard reference materials, analysis of; stoichiometry.

This report describes the scientific programs and research activities of the Microchemical Analysis Section of the Analytical Chemistry Division of the NBS Institute for Materials Research during the period July 1965 to June 1966. General activities are reported in the areas of gas analysis by mass spectrometry, polarography, coulometry, stoichiometry, and classical microchemical analysis. Research accomplishments described in some detail include: improvements in the sensitivity of gas analysis using high-pressure mass spectrometry; analysis of deuterated compounds by mass spectrometry; comparative polarographic analysis of high precision; polarographic methods for trace and ultra-trace determination of a number of elements; highly accurate coulometric iodimetric titration; a highly precise method for determination of magnesium based on its final weighing as magnesium sulfate; and a number of microchemical procedures for the analysis of a variety of materials.

TN404. **Radiochemical analysis: Activation analysis, instrumentation, radiation techniques, and radioisotope techniques, July 1965 to June 1966,** Edited by J. R. DeVoe, NBS Tech. Note 404 (Sept. 30, 1966).

Key words: NBS reactor; NBS Linac; Cockroft-Walton generator; digital computers; activation analysis; standard reference materials; photo-neutron reactions; flux monitors; Cu, Se, Al, V in irons and steels; homogeneity testing; pneumatic rabbit sensor; Mossbauer spectroscopy; tin standard for chemical shift; PARLORS program for Mössbauer spectra; Mössbauer instrumentation; Mössbauer laboratories; radiometric trace chromatography; radioisotope dilution; substoichiometry by controlled potential coulometry; radiochemical separations; theoretical detection limits for activation analysis; CLSQ program for multicomponent decay; solid state detectors; electronic data handling.

This is the third summary of progress of radiochemical analysis which encompasses the work of both the Radiochemical Analysis and Activation Analysis Sections of the Analytical Chemistry Division at the National Bureau of Standards.

Pertinent information on the irradiation facilities of the nuclear reactor, Linac, and Cockroft-Walton generator are described. A number of analyses of standard reference materials by activation analysis are described (e.g., Cu in cast iron, SRM 82b; Se in selenium steel, SRM 1170; Al in steel, SRM 14e; and V in stainless steel, SRM 73c). Various aspects of the technical problems in activation analysis such as its use for homogeneity testing, production of suitable flux monitors, and experimental design with respect to increasing selectivity (such as by using variable neutron energy) and reducing systematic and random errors, are presented. A realistic procedure for estimating sensitivity and for designing the analysis to optimize the detection limit is described. A computer program that resolves complex decay curves utilizes parameter changes convenient for the conversational aspect of "time sharing" digital computers. A highly specific radiochemical separation for copper using a type of amalgam exchange is described.

Description of specialized data handling equipment as well as information on a fast rise preamplifier, solid state detector system, and other special instruments such as a pneumatic transport system rabbit sensor, are presented.

A description of the laboratories used in Mossbauer spectroscopy is presented. Special problems in radiation detection for use in a spectrometer are also described. The Standard Reference Material Program for chemical shift in Mossbauer spectroscopy is discussed with particular reference to the search for a tin standard. The computer program, "Parlors M," that is used for resolving complex Mossbauer spectra i presented in its entirety in Appendix II.

The use of thin layer chromatography in conjunction wit radioactive reagent analysis for trace elements is describe Substoichiometric radioisotope dilution continues to be studie by evaluating systematic and random errors, as well as b developing the technique from physio-chemical principles suc as controlled potential coulometry.

TN405. **Organic Chemistry Section: Air pollution studies; kineti behavior of sugars in solution carbon-14- and tritium-labele carbohydrates; characterization of chemical structure phenylhydrazono-phenylazo tautomerism; synthesis of researc materials, cyclopentitols and related substances; novel researc materials; standard reference materials (organic), July 196 through June 1966,** Edited by H. S. Isbell, NBS Tech Not 405 (Sept. 30, 1966).

Key words: Air-pollution studies; oxidation of polycycli aromatic hydrocarbons; sugars in solution; conformationa analysis; carbon-14- and tritium-labeled carbohydrates large-scale paper chromatography; phenylhydrazon phenylazo tautomerism; cyclopentitols and relate substances; unsaturated alditols; infrared spectra c acylamido derivatives; carbohydrate reference materials metallo-organic standard reference materials.

This report describes work in progress in the Organi Chemistry Section of the Analytical Chemistry Division of th NBS Institute for Materials Research. It includes certai historical material, presented to give perspective to the overa program. The following research areas are discussed: ai pollution studies, kinetic behavior of sugars in solution, carbor 14- and tritium-labeled carbohydrates, characterization c chemical structure; phenylhydrazonophenylazo tautomerism synthesis of research materials: Cyclopentitols and relate substances, novel research materials, and standard referenc materials.

TN406. **X-ray wavelength conversion tables and graphs fo qualitative electron probe microanalysis,** K. F. J. Heinrich an M. A. M. Giles, NBS Tech. Note 406 (Sept. 25, 1967).

Key words: Electron probe microanalyzer; wavelengths; x ray emission; x-ray spectrometers.

Tables and graphs have been constructed for electron probe x ray spectrometers equipped with crystal changers and calibrate for LiF crystals in angstroms. These tables indicate th equivalent reading for the lines which can be normally expecte to appear in wavelength scans using the following crystals: LiF EDDT, ADP, KAP, and Pb stearate (LSD). The readings wer extracted from the tables of E. W. White, et al. The tables ar arranged by the atomic numbers of the emitting elements; th graphs show the readings for observable lines as a function c atomic number for each of the aforementioned crystals. A suggested method for using the tables and graphs is included.

TN407. **Applications of a time-sharing computer in a spec trochemistry laboratory: optical emission and x-ra fluorescence,** S. D. Rasberry, M. Margoshes, and B. F Scribner, Nat. Bur. Stand. (U.S.), Tech. Note 407, 58 page (Feb. 1968).

Key words: Analytical chemistry; calculations; computer emission spectroscopy; programming; spectrochemic analysis; time-sharing computer; x-ray spectroscopy.

A time-sharing computer system employing the Dartmou College Basic compiler has been in use in this laboratory fo more than two years, and it has been applied to both routine ar non-routine calculations. Descriptions are given of the comput

tem and its associated programming language and commands. pical applications and advantages and disadvantages of the tem are discussed. An appendix contains descriptions of 13 grams thought to be of interest to other optical and x-ray ctrochemistry laboratories. Examples of input and output are en with each of these programs.

N408. Superseded by Technical Note 24.

N409. **Fortran programs for the calculation of Wigner 3j, 6j, and 9j coefficients for angular momenta ≤ 80,** R. S. Caswell and L. C. Maximon, NBS Tech. Note 409 (Nov. 15, 1966).

Key words: Fortran program; Wigner coefficients; quantum theory of angular momentum; 3j coefficient; 6j coefficient; 9j coefficient; Clebsch-Gordan coefficients.

Fortran II and Fortran IV programs are given for the lculation of Wigner 3j, 6j and 9j coefficients containing dividual angular momenta less than or equal to 80. The large mbers, resulting from the factorials which appear in the pressions for these coefficients, are handled by taking garithms and performing most of the pertinent arithmetic with e logarithms. The alternating series involved in the pressions for the 3j and 6j coefficients are summed ithmetically in double precision. We present two versions of e basic program for the calculation of these coefficients (each rsion being given both in Fortran II and in Fortran IV). All rograms are called as single-precision Fortran functions. The fference between Versions I and II is in the internal structure these programs. In Version I, only the series summation is in uble precision, resulting in a faster program which occupies ss memory in the computer, the computation time being of the rder of 0.001 to 0.01 sec per 6j and 0.1 to 1 sec per 9j. Version I, being entirely in double precision internally, is much more curate (the errors being of the order of one percent of the rrors in Version I), but the computation time for a given efficient is approximately 50% greater than in Version I. nformation relative to the accuracy and memory requirements f the two versions of the program is provided, and Fortran II nd IV lists of the programs and calling instructions are given.

N410. **Improved Fortran program for single particle energy levels and wave functions in nuclear structure calculations,** R. S. Caswell, NBS Tech. Note 410 (Sept. 30, 1966).

Key words: Eigenvalues; eigenfunctions; energy levels; wave functions; single particle shell model.

An improved program has been developed for numerical alculations of single particle energy levels and wave functions or Woods-Saxon or other real potential wells. The program is lesigned to be used as a subroutine of a larger program for uclear structure calculation but may be used separately if lesired. Improvements over the previous program include: (1) or bound states the wave function is calculated by integrating outward from zero radius and inward from a maximum radius beyond the nuclear potential well with matching at an ntermediate radius; (2) a first order correction has been made to he starting conditions at small radius for the integration of the wave function; (3) a large step size is used until the calculation has nearly converged on the eigenvalue; then a small step size is used to provide maximum accuracy; (4) the correction of a small error in the Kutta-Runge integration procedure has been made. As a result of the changes the program is approximately five times faster than the previous version. Checks with harmonic oscillator potentials give an accuracy of .01% in the energy level values. Listings of Fortran II and Fortran IV versions are given.

TN411. **Methods for performance-testing of electro-mechanical pressure transducers,** P. S. Lederer, NBS Tech. Note 411 (Feb. 9, 1967).

Key words: Electro-mechanical; pressure; transducer; calibration; performance; test method; dynamic calibration and telemetering.

This publication describes methods in one particular program at NBS for the performance-testing of electro-mechanical pressure transducers (such as telemetering transducers used in aerospace testing). It covers static and dynamic calibration procedures in detail, delineates environmental and other tests, and describes the test equipment used. Examples of dynamic calibration results are interpreted.

TN412. **Quantum mechanical calculations of the second virial coefficients for hydrogen,** M. E. Boyd and S. Y. Larsen, NBS Tech. Note 412 (Apr. 10, 1967).

Key words: Second virial coefficient; quantum mechanics; hydrogen; equation of state; statistical mechanics; intermolecular potential.

Quantum mechanical second virial coefficients of dilute ortho and para hydrogen have been calculated for the case of a Lennard-Jones potential. These computations cover the temperature range from 0 °K to 80 °K. Special attention is paid to the behavior of the Boltzmann and exchange contributions. The purely statistical contribution to the ortho-para difference is shown to vanish to three decimal places by about 10.5 °K. Comparison with experimental data indicates that considerable improvement in the potential function and inclusion of non-spherical terms will be required at the low temperatures considered here.

TN413. **The solid system. II. Numeric compression,** P. A. D. deMaine, K. Kloss, and B. A. Marron; and **The solid system. III. Alphanumeric compression,** P. A. D. deMaine, B. A. Marron, and K. Kloss, NBS Tech. Note 413 (Aug. 15, 1967).

Part I.

Key words: Numeric compression; information handling; high-speed information transmission; information storage and retrieval; systems analysis.

This part of NBS Technical Note 413 describes the general NUMERIC COMPRESSOR (NUPAK) Algorithm for automatically compressing (encoding) or decoding compressed numerical information, which may of course have come from graphical information. The amount of compression achieved is determined by the "lowest limit of significance," the range, and the sequential patterns of the data to be stored. The encoded information can be stored in memory or on external storage devices in a small fraction of the space normally required, and can be expanded (decoded) item-by-item whenever needed by the system.

Part II.

Key words: Alphanumeric compression; information handling; high-speed information transmission; information storage and retrieval; systems analysis.

An algorithm for compressing alphanumeric information is described. Unlike other methods which depend upon frequency of occurrence of words in a particular class of publications, this scheme is language and content independent since the information for compression is obtained from the text itself. The compressed bit stream is preceded by sufficient information for automatic reconstruction of the original bit stream whenever the system requires it. Even with this additional information required for expansion, compression rates approaching 40% have been achieved. Because this ALPHANUMERIC

COMPRESSOR (ANPAK) is fully automatic and self-organizing, it can operate on information which has already been compressed via the NUMERIC COMPRESSOR (NUPAK).

TN414. **Quantitative methods for management,** G. Suzuki, NBS Tech. Note 414 (May 23, 1967).

Key words: Operations research; quantitative analysis; management; decision-making; education.

An elementary treatment of some of the better known and widely used analytical methods in operations research/systems analysis. The material is presented in a manner which attempts to indicate why quantitative methods are useful in managerial decision-making situations. Some basic references are provided.

TN415. **Thermal radiation property measurement techniques,** S. T. Dunn, J. C. Geist, D. G. Moore, H. E. Clark, and J. C. Richmond, NBS Tech. Note 415 (Apr. 27, 1967).

Key words: Averaging spheres; diffuse reflectance; emissivity; emittance; flux averaging devices; infrared reflectance; spectral reflectance; spectral emittance; specular reflectance.

This is an annual summary report of work completed on NASA Contract R-09-022-032. The work comprised (1) completion of the development and calibration of a rotating cylinder procedure for measuring normal spectral emittance of non-conducting materials at temperatures in the range of 1200 to 1600 °K, (2) analysis and calibration of an ellipsoidal mirror reflectometer, and (3) a study of the relation between surface roughness and geometric distribution of flux reflected from a surface.

TN416. **Study of a Halpern-type 4π neutron detector,** H. M. Gerstenberg and E. G. Fuller, NBS Tech. Note 416 (June 12, 1967).

Key words: Detector; efficiency; four-pi; Halpern; neutron; photoneutron; response; yields.

The response to various neutron spectra of a 2-inch diameter BF_3 proportional counter in a Halpern-type geometry has been studied as a function of moderator thickness. Neutron sources used were a calibrated RaDBe(α,n) source and a series of photoneutron sources using a number of bremsstrahlung spectra. The reactions used were $^{16}O(\gamma,n)$, $^{31}P(\gamma,n)$ and $d(\gamma,n)$. For these sources absolute neutron yields were determined either from the residual $\beta+$ activity or from the known cross section and the absolute bremsstrahlung intensity. Using these empirical data a final detector with 13 BF_3 counters was constructed. Over the spectral range covered by the above sources the measured efficiency for counting neutrons of the final detector was 9.6 percent with an estimated uncertainty of ± 0.5 percent, independent of spectrum. The detector was used to measure the neutron yields from Pb, Au, Ta, Ho, Ag, Cu, Co, Ca, P, Al, O and C for a series of bremsstrahlung energies between 12.0 and 29.0 MeV. These yields were compared with those calculated from previously published neutron yield cross sections. The data indicate that previously reported discrepancies in neutron yield data can probably be traced to the determination of neutron detector efficiencies.

TN417. **Spectral emission properties of NBS standard phosphor samples under photo-excitation,** C. F. Shelton, Nat. Bur. Stand. (U.S.), Tech. Note 417, 31 pages (Mar. 1968).

Key words: Phosphors; photo-excitation; photoluminescence; spectral emission; spectral radiometry; standard phosphor samples.

The photo-excitation spectral emission properties of 10 of the 14 NBS standard phosphor samples have been determined. Pressed tablets of the phosphors were excited by radiation from a mercury arc lamp, passing through a narrow band-pass filter to obtain either 2537Å or 3650Å excitation. The measurement system is described, correction of the data is discussed, and the spectral emission data are presented. Relative quantum efficiencies were calculated. The results are compared with measurements reported by two other laboratories.

Among the items treated are: pushbutton word generators providing automatic typing of often used programming instructions; and option switches for full or half-duplex operation, for inserting the sixth bit for lower case letters, and the eighth bit for parity compatibility.

TN418. **Radiometric methods for measuring laser output,** D. A. McSparron, C. A. Douglas, and H. L. Badger, NBS Tech. Note 418 (Nov. 1967).

Key words: Laser; laser energy measurement; optical attenuator; photoelectric photometry; radiometric calibration; radiometry.

The output of pulsed lasers may be measured with reasonable accuracy by modifications of established radiometric methods. The receiver, thermopile or phototube, is used ballistically. It is calibrated by an incandescent-lamp standard of spectral irradiance. The laser beam is attenuated to make its irradiation on the receiver comparable to that from the calibrating source. Attenuation is accomplished by intercepting the entire laser beam on a diffusely reflecting surface. The attenuation factor is determined from direct measurement of the reflectance of this diffusing surface and the geometric constants of the system. The accuracy of the measurement of laser output is dependent upon the accuracy of calibration of the standard of spectral irradiance and the accuracy with which the spectral sensitivity of the receiver, the spectral transmittance of the band-pass filters, and the reflectance of the diffuser can be determined. Measurements made with different photoelectric receivers agree to about 1.5% using a 1/4-joule pulsed ruby laser as a source. Total uncertainty is estimated to be about 5%. Measurements made using these radiometric methods have been compared with calorimetric measurements and a discrepancy of 9% was observed.

TN419. **Accessory equipment and teletypewriter modifications for remote computer consoles,** C. H. Popenoe and R. C. Thompson, Nat. Bur. Stand. (U.S.), Tech. Note 419, 22 pages (Feb. 1968).

Key words: Remote access; teletype; time-sharing.

Equipment auxiliary to, and simple modifications of a teletypewriter are described which enable it to be used more efficiently as a remote console of a computer. The descriptions and drawings are sufficiently detailed to enable one to duplicate the modifications or construct the auxiliary equipment with little or no design effort.

TN420. **Drawings of micrometer U-tube manometers for the ranges up to 100 mm of mercury,** A. M. Thomas and J. L. Cross, NBS Tech. Note 420 (Aug. 26, 1967).

Key words: Manometer; micrometer; u-tube; vacuum; medium-vacuum measurements.

Drawings with sufficient detail are presented so that micrometer U-tube manometers for use with mercury, oil, and water may be constructed. Measurements made with the oil manometer have an uncertainty of about 4×10^{-4} mm of Hg plus one part in 10^4 of the reading. Measurements made with the mercury manometer have an uncertainty of about 4×10^{-3} mm of Hg plus eight parts in 10^5 of the reading. The operation and an error analysis are described elsewhere.

N421. **Radiochemical analysis: Nuclear instrumentation, radiation techniques, nuclear chemistry, radioisotope techniques July 1966 through June 1967,** Edited by J. R. DeVoe, NBS Tech. Note 421 (Nov. 1967).

Key words: Computers; cross sections; detection limits for analysis; flux monitors; Mossbauer instrumentation; Mossbauer spectroscopy; NBS Linac; nickel-61; PARLORS program for Mossbauer spectra; photoneutron reaction; solid state detectors; standard reference materials; tin standard for chemical shift.

This is the fourth summary of progress of the Radiochemical nalysis Section of the Analytical Chemistry Division at the ational Bureau of Standards.

The section's effort comprises four major areas: Mossbauer ectroscopy, nuclear chemistry, nuclear instrumentation, and e application of statistics in nuclear and analytical chemistry.

A new design of transducer which is more compact than the evious design has been made so that low temperature periments can be more easily performed. A method of multaneously measuring two spectra with a single transducer s been devised. A single line nickel-61 source has been made d the magnetic moment of the excited 5/2 state has been easured with this source. Efforts have continued on the terpretation of the spectral parameters and their relation to ructure analysis. Studies are continuing on the production of a andard for chemical shift of tin compounds.

Equipment is in the final state of assembly and initial testing r measuring cross sections of reactions such as $(\gamma,^3He)$ or $(\gamma,^4He)$ by mass spectrometry of the reaction products.

The precision of an analytical method must be carefully used hen expressing a detection limit. In addition, care must be aken to be definitive about the meaning of a limit of detection. A suggested procedure for uniformity in reporting these often sed terms is presented in this report.

The practical operation of Ge(Li) and Si(Li) detectors has een evaluated. It is found that careful control of the reamplifier noise and response is required for optimum erformance.

A study of the precision and accuracy of gamma-ray excited x-ay fluorescence was made. Using as a basis the analysis of ertified Standard Reference Materials, an improvement of a actor of two in precision was measured. The major advantage oncluded from this work is that if rapid analysis requiring ortability is desired, the radioisotopic source approach is useful.

TN422. **Activities of the NBS Spectrochemical Analysis Section July 1966 to June 1967,** B. F. Scribner, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 422, 84 pages (Jan. 1968).

Key words: Computing; digital readout; electron probe; gold analysis; isotope dilution method; laser probe; liquid Q-switch; mass attenuation coefficients; microphotometer; optical spectrometry; plasma torch; platinum analysis; preconcentration; selenium analysis; spark source mass spectrometry; spectrochemical analysis; standard reference materials; sulfur analysis; time-shared computer; x-ray absorption coefficients; x-ray fluorescence analysis; vacuum spectrometer.

A summary is given of activities of the NBS Spectrochemical Analysis Section for the year July 1966 through June 1967. In optical spectrometry, studies were made of (1) the effectiveness of a liquid Q-switch for laser pulse control and (2) the applicability of the high-frequency plasma torch in atomic emission and absorption spectroscopy. Two papers on laser probe spectrochemical analysis were published. In electron probe microanalysis an alignment procedure was developed for the x-ray spectrometer, data on x-ray mass absorption coefficients were collected and critically evaluated, and a review of techniques for scanning microprobe analysis was published. The factors entering into quantitative electron probe analysis are being investigated. In x-ray spectrometry studies were made of interferences especially in the analysis of complex alloys. A combination of techniques involving enrichment by electrodeposition, stable isotope dilution, and determination by the spark source mass spectrometer has provided an accurate method for trace analysis. Improvements in the Section's equipment, including digital readout devices, and developments in computer applications are also discussed. Listings are given of 15 publications and 23 talks by members of the Section during the year.

TN423. **Electrochemical Analysis Section: Summary of activities, July 1966 to June 1967,** Edited by R. G. Bates, NBS Tech. Note 423 (Oct. 1967).

Key words: Acidity; analysis; conductance measurements; electrochemical analysis; electrochemistry of solutions; glass electrodes; medium effects; pH measurements.

This survey of the activities of the Electrochemical Analysis Section, Analytical Chemistry Division, covers the period July 1966 to June 1967. An attempt is made to summarize a year's progress on the technical projects of the Section in such a way as to stress the program and capabilities of the organizational unit as a whole. A description of facilities and equipment is presented, and the directions of the programs are indicated. Brief summaries of several lines of work now under way are given. The main areas include the measurement of acidity with progress toward the establishment of standards for pH, pH*, and pD being reported. Studies of the behavior of glass electrodes in deuterium oxide are described and solvent effects on ionic processes are discussed. Equilibrium data for certain ionic systems have been obtained, modifications of a precision conductance bridge are described, and a method for titrating hydrogen fluoride in dimethylformamide is outlined. The survey concludes with lists of the members of the Section staff, publications and manuscripts produced during the year, talks given by the staff, and committee assignments.

TN424. **Analytical coordination chemistry: Titrimetry, gravimetry, flame photometry, spectrophotometry, and gas evolution July 1966 to June 1967,** O. Menis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 424, 106 pages (Jan. 1968).

Key words: Absorption and fluorescence spectrophotometry; arsenic; atomic absorption; beryllium; DTA studies; dysprosium in a glass; flame emission; gases in metals; gravimetry; homogeneous precipitation; impurities in zinc and selenium; Li_2O in glass; nitrogen; oxygen in titanium; titrimetry.

In the related areas of gravimetry, titrimetry, flame emission and atomic absorption spectroscopy, absorption and fluorescence spectrophotometry, and gases in metals, the versatile aspects of coordination chemistry have, in several instances, been uniquely exploited to yield either more precise and accurate results or lower detection limits. Fivefold improvement in the gravimetric analysis for beryllium has been obtained by means of an incomplete homogeneous precipitation followed by a selective spectrophotometric examination of the filtrate. In the field of thermal analysis a survey of fifteen compounds has revealed several promising, future standards for DTA studies covering the range of 75 to 900 °C. In the section on titrimetry highly precise procedures are described for the determination of boron and beryllium. Various instrumental parameters have been investigated in flame emission and atomic absorption spectroscopy in order to optimize such variables as nebulizer-burner and oxidant-fuel systems, elimination of interferences, and source difficulties. The use of chelate extraction systems has led to the

extension of detection limits to the submicrogram level for impurities in zinc and selenium, while modified electronics has permitted the precise determination of 10 percent Li_2O in glass with a relative standard deviation of better than 0.2 percent. In absorption and fluorescence spectrophotometry the research aspect of ternary complexes or mixed chelates are described together with their potential use at the nanogram-picogram level. In the same area improvement in accuracy has been obtained by controlled dissolution of samples in closed systems with particular attention being given to the determination of arsenic in cast iron. Also described in this section is the differential spectrophotometric determination of dysprosium in a glass to be used as a neutron flux monitor, in which case the relative error was reduced to less than 0.25 percent. Finally, in the area of high vacuum fusion a new standard was certified for oxygen in titanium and in two titanium alloys. In addition, research in the use of the same technique for the determination of nitrogen has apparently eliminated the problem of low values that have in the past so frequently plagued the analyst.

TN425. **Microchemical Analysis Section: Summary of activities, July 1966 to June 1967,** Edited by J. K. Taylor, NBS Tech Note 425 (Oct. 1967).

Key words: Coulometric analysis; gas analysis; mass spectrometric gas analysis; microchemical analysis; null-point potentiometry; polarographic analysis; standard reference materials, analysis.

This report describes the research activities and scientific programs of the Microchemical Analysis Section of the Analytical Chemistry Division of the NBS Institute for Materials Research during the period July 1966 to June 1967. General activities are reported in the areas of gas analysis, polarography, potentiometry, coulometry, chemical microscopy, and classical microchemical analysis. Research accomplishments described in some detail include the following: high pressure mass spectrometry; high precision differential polarography; an improved coulometric technique for titration of halides; developments in micro null-point potentiometry; techniques for the accurate weighing of small liquid samples. A number of microchemical procedures which have been developed for the analysis of a variety of materials are also included.

TN426. **Analytical Mass Spectrometry Section: Summary of activities, July 1966 to June 1967,** Edited by W. R. Shields, NBS Tech. Note 426 (Sept. 15, 1967).

Key words: Instrumentation; isotopic analyses; mass spectrometry; procedures.

This report describes the advances in instrumentation and the research activities of the Analytical Mass Spectrometry Section during the period July 1966 to June 1967.

Advances in instrumentation include the construction of a multi-stage mass spectrometer, a high vacuum beam valve, a Z focussing lens, a re-designed collector, a filament degas chamber, and new equipment for sample drying. The new facilities at Gaithersburg are described.

Elements studied during this period include: B, Cr, Pb, Rb, U, and Pu. Chemical procedures are given for B, Cr, Pb, and Pu; mass spectrometric procedures are given for B, Cr, Pb, Pu, Rb, and U.

TN427. **Organic Chemistry Section: Air pollution studies; characterization of chemical structures; synthesis of research materials; novel research materials; isotopic methods for analysis of carbohydrates; occurrence, preparation, and properties of naturally occurring monosaccharides (including 6-deoxy sugars); standard reference materials (organic), July 1966 through June 1967,** Edited by R. Schaffer, NBS Tech. No 427 (Oct. 1967).

Key words: Air pollution studies; characterization chemical structures; disaccharide of d-lyxofuranos infrared absorption methods for analysis of carbohydrate naturally occurring monosaccharides and 6-deoxy sugar oxidation of polycyclic aromatic hydrocarbon phenylhydrazono-phenylazo tautomerism; quebrachitc levo-inositol; standard reference materials; 1,2-(isopropylidene-β-L-idofuranose; 2,3-0-isoptropylidene-β-(threo-pentulofuranose.

This report describes work in progress in the Organ Chemistry Section of the Analytical Chemistry Division of th NBS Institute for Materials Research. The following researc areas are discussed: air pollution studies; characterization chemical structures; synthesis of research materials; disaccharide of d-lyxofuranose; novel research material isotopic methods for analysis of carbohydrates; occurrenc preparation, and properties of naturally occurrir monosaccharides, including 6-deoxy sugars; and standa reference materials.

TN428. **Activation analysis: Cockcroft-Walton generator, nucle reactor, Linac, July 1966 through June 1967,** Edited by J. DeVoe, NBS Tech. Note 428 (Nov. 1967).

Key words: Activation analysis; biological; botanic samples; carbon in sodium; Cockroft-Walton generato digital computers; flux monitors; high precision 14 Me neutron activation; homogeneity testing; instrumentatio NBS Linac; NBS reactor; photoneutron reactions; se absorption corrections; standard reference material vanadium in irons and steels.

This is the first separate (not combined with that Radiochemical Analysis) summary of progress for th Activation Analysis Section of the Analytical Chemist Division of the National Bureau of Standards.

Pertinent information on the irradiation facilities of the nucle reactor, Linac and Cockcroft-Walton generator are describe The initial installation of pneumatic transfer tubes is complete Of great significance is the completion of a clean room that used for pre-irradiation chemical separation for high sensitivi activation analysis.

A dual-sample biaxial rotating 14 MeV neutron-irradiatic assembly has been tested. This assembly is part of a system th is controlled by a relay type of programmer to automate thos irradiation steps that adversely affect precision of the analysi This system was used to improve greatly the precision analysis for oxygen and fluorine.

As a result of improved precision with the 14 MeV neutr irradiation, a study of systematic errors is now possible. Effor to establish a reproducible correction factor for neutron ar gamm-ray absorption between different matrices within th sample have shown considerable promise.

Standard Reference Material (SRM) steel chip Nos. 3b, 3 and 30f have been analyzed for vanadium. Preliminary analys of high purity platinum (a potential SRM) showed silver, coppe gold, palladium, and iridium at the ppm level. Future biologic SRM's, (tree leaves, and beef liver) were tested for homogenei and found satisfactory.

A variety of service analyses were performed. In particula very pure aluminum was found to contain fractions of a ppm chromium and scandium.

Additional efforts are being made to monitor reactor neutr fluxes. Additional nuclear instrumentation is being assembled improve the versatility of the analysis technique.

Performance of the bremsstrahlung target, used with the linear ectron accelerator, has been evaluated. Photon intensity istribution and stability was found to be within usable range. nalyses using the (γ,n) or (γ,p) reactions have been developed r magnesium in steels, and carbon in sodium metal.

N429. **Separation and Purification Section: summary of initial activities February 1966 through June 1967,** D. H. Freeman, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 429, 48 pages (Feb. 1968).

Key words: Ion exchange; purification; reagents; zone refining.

This report describes the initial growth and research activities f the Separation and Purification Section since its formal or- anization in February 1966.

A research capability for the study and refined adaptation of n exchange materials is described. There are new activities re- orted for the areas of extreme purification, chemical reagents, rganic chemicals, including the use of crystallization for the chievement, protection, and measurement of chemical purity. pecific studies have been conducted in the purification of ineral acids, nitrobenzene, and the development of zone refin- ng methods.

TN430. **Designs for surveillance of the volt maintained by a small group of saturated standard cells,** W. G. Eicke and J. M. Cameron, NBS Tech. Note 430 (Oct. 9, 1967).

Key words: Control charts; experiment design; saturated standard cells; standard cells calibration; statistics; voltage standard.

This technical note describes a procedure for maintaining urveillance over a small group of saturated standard cells. The neasurement process is briefly discussed and the principle of eft-right balance as a means of eliminating certain systematic errors is developed. Specific designs and their analysis for ntercomparing 3, 4, 5 and 6 cells in a single temperature ontrolled environment are given. Procedures for setting up ontrol charts on the appropriate parameters are given, and a echnique is described for detecting certain types of systematic errors.

TN431. **Second breakdown in semiconductor devices - A bibliography,** H. A. Schafft, NBS Tech. Note 431 (Oct. 1967).

Key words: Bibliography; device reliability; diodes; failure mechanisms; failure modes; second breakdown; semiconductor devices; thermal breakdown; transistors.

Almost 200 references with appropriate key words are listed which provide, it is believed, a comprehensive coverage of the iterature of second breakdown in transistors and other semiconductor devices from 1958 through much of 1967. A representative list of earlier papers dealing with what appears to e second breakdown in point-contact and p-n junction diodes is lso included. The indexes consist of an author index and an ndex to subject matter with reference tabulations and with key word assignments.

TN432. **Connection tables from Wiswesser chemical structure notation—a partial algorithm,** G. F. Fraction, J. C. Walker, and S. J. Tauber, Nat. Bur. Stand. (U.S.), Tech. Note 432, 63 pages (Sept. 1968).

Key words: Acyclic; benzene; chemical structure notations; connection tables; contractions; ring system; syntax analysis; transformation algorithm; Wiswesser.

An algorithm has been developed for transforming certain types of Wiswesser organic structure notations into connection tables. Acyclic and benzene structures are treated, and provision has been made for all of the types of contractions used by the Wiswesser notation system. A separate algorithm is presented for treating linearly fused ring aggregates. A syntax has been developed to describe those portions of Wiswesser notations which refer to non-benzene ring systems.

TN433. **Input/output packages for the systems 360 assembly language processor,** P. A. D. deMaine, Nat. Bur. Stand. (U.S.), Tech. Note 433, 14 pages (Sept. 1968).

Key words: Assembly language; card punch; card read; input/output; on-line print; system 360.

Three input-output (I/O) software packages for use with the Assembly Language Processor (ALP) of the Systems 360 are described. They are for card read, on-line-print and card punch operations. A single pseudo-operation statement, which contains all required formats and addresses, suffices for the execution of each input-output package. Printed error and guide messages aid in program debugging. In addition to the conventional formats (A, I, F and E), Systems 360 column binary (X) and hexadecimal (J and B) are permitted. With a single pseudo-operation these I/O packages can handle up to eight individual items or arrays of any length in a single or mixed format.

TN434. **"Life cycling" test on several strain gage pressure transducers,** P. S. Lederer, NBS Tech. Note 434 (Oct. 1967).

Key words: Life cycling; life testing; pressure cycling; pressure transducer; strain gage.

This publication reports the effects of many thousands of pressure cycles on the performance characteristics of several types of strain gage pressure transducers. The results obtained indicate permanent changes in zero pressure output and sensitivity. Most of these changes tend to occur during the first few thousands of cycles. The equipment and procedures used to obtain the data are described.

TN435. **The hyperbolic character of certain experimental results which tend toward limiting values,** A. F. Kirstein, NBS Tech. Note 435 (Nov. 1967).

Key words: Experimental; graphical solution; hyperbolic character; limiting values.

The hyperbolic character of certain experimental data obtained from structural and mechanical testing provides an extremely simple graphical method for use in approximating the limiting values associated with the data. The method, developed by Southwell to explain the behavior of eccentrically loaded thin elastic struts, is shown to have much wider application. A limited number of illustrations are given to describe the method and to show how it might be used as a research tool.

TN436. **Studies of calibration procedures for load cells and proving rings as weighing devices,** G. B. Anderson and R. C. Raybold, Nat. Bur. Stand. (U.S.), Tech. Note 436, 22 pages (Jan. 1969).

Key words: Calibration; force; load cells; proving rings; transducers; uncertainty; weighing.

Elastic devices such as load cells and proving rings, when used with comparison measurement techniques, yield uncertainties orders of magnitude smaller than generally accepted. Their use, in direct reading application, is affected by numerous characteristics of materials, as well as the techniques of application and interpretation of data. This paper is intended to present progress made in the evaluation of calibration techniques, to the end that such transducers may be used with a predictable uncertainty in direct reading applications. Attempts are being made to formulate calibration procedures which are consistent with application procedures. The confusion existing in the derivation and application of practical force units is considered sufficient justification

for a brief discussion of forces derived from mass standards and gravitational acceleration.

TN437. **Disclosures on: Autosort, an automatic collating and sorting machine; optical heterodyne refractometer; liquid metering pump; stable wideband relaxation oscillator using three inverting amplifiers; and seat belt webbing abrasion resistance testing machine,** Editors, D. Robbins and A. J. Englert, NBS Tech. Note 437 (Nov. 1967).

Key words: Abrasion resistance testing; automatic document distribution; flexible tubing pump; inverting amplifiers; laser beam phase shift; laser heterodyning; liquid metering pump; optical refractive index; programmed document distribution; relaxation oscillator; rotatable document bin array; seat belt webbing abrasion.

This Note presents descriptions and drawings of five devices that embody interesting and unusual solutions to problems frequently encountered in their respective fields. The devices are: autosort, an automatic collating and sorting machine, optical heterodyne refractometer, liquid metering pump, stable wideband relaxation oscillator using three inverting amplifiers, and seat belt webbing abrasion resistance testing machine.

Other disclosures on various subjects may be found in NBS Technical Notes 237, 253, 263, 282, 287, and 295.

TN438. **Compendium of *ab initio* calculations of molecular energies and properties,** M. Krauss, NBS Tech. Note 438 (Dec. 1967).

Key words: *Ab initio* electronic calculation; dipole moment; dissociation energy; electron affinity; energy; field gradient; magnetic constants; molecular electronic structure; orbital energy; polarizability; quadrupole moment; spectroscopic constants.

The number of *ab initio* molecular electronic calculations has increased dramatically in the last few years. Both the practitioners and other interested students of the results of the calculations have found it increasingly difficult to determine the present status of these calculations. This compendium references the work from 1960 to the present and abstracts from the mass of data the best values for several observable properties including the total energy, dissociation energy, electron affinity, spectroscopic constants, electric moments, field gradients, polarizabilities, and magnetic constants. In order to provide and insight into molecular electronic structure tables of orbital energies are also included.

These tables are meant to direct attention to the successes and failures of the calculations by compiling a large percentage of the best results in a reasonably compact form. Its usefulness will be limited in time by rapid advance in the field.

TN439. **A laser-source integrating sphere reflectometer,** G. J. Kneissel and J. C. Richmond, Nat. Bur. Stand. (U.S.), Tech. Note 439, 70 pages (Feb. 1968).

Key words: Diffuse reflectance; graphite; high temperature reflectance; infrared reflectance; integrating sphere reflectometer; laser; reflectance; sodium chloride coating; synchronous amplification; thoria; tungsten.

A reflectometer was developed for measuring the absolute spectral reflectance of materials at temperatures up to 2500 °K. The equipment included (1) a helium-neon laser as the source, capable of operation at 0.6328, 1.15 or 3.39μm, (2) a 35 cm diameter integrating sphere coated with sodium chloride, (3) a lead sulfide detector, and (4) a radio frequency generator for heating the specimen by induction. A spike filter transmitting at the laser wavelength in front of the detector absorbed most of the background radiation from the hot specimen, and a chopped incident beam together with synchronous amplification of the signal from the detector was used to eliminate the effect of the remaining background radiation. The integrating sphere could be evacuated, or operated under a slight positive pressure of purified helium. An error analysis showed that the measured absolute reflectances are in error by less than one percent. Preliminary data are presented for thoria, tungsten and graphite. Graphite was found to be stable in reflectance on heating to 2150 °K in vacuum. Both thoria and tungsten were somewhat unstable in reflectance on heating in vacuum.

TN440. **Disclosure on: Autoeditor — a semi-automatic copy-editing apparatus,** D. Robbins, Editor, Nat. Bur. Stand. (U.S.), Tech Note 440, 49 pages (Apr. 1968).

Key words: Automatic capitalization; automatic deletions; automatic stop for revision; editorial mark sensing; manual additions; narrative text editing; punched paper tape typewriter.

This note is a disclosure on a semi-automatic apparatus for incorporating editorial revisions in narrative text using punched paper tape combined with mark-sensing techniques. Pencil marks placed on the original draft by the editor are sensed and arranged to automatically capitalize the first letter of a word, to capitalize an entire word, or stop the apparatus at the point where a change is to be made. Addition of text is entered manually with an electric typewriter; deletion of text is accomplished by activating a "mark skip" key which advances the tape without typing until the next control mark is sensed.

TN441. **Tabulation of published data on Soviet electron devices through October 1967,** C. P. Marsden, Nat. Bur. Stand. (U.S.), Tech. Note 441, 98 pages (July 1968).

Key words: Electron devices; electron tubes; Soviet electron devices; semiconductors.

This tabulation includes published data on Soviet electron devices as collected from publications, mostly handbooks, published by the various ministries and institutes of the USSR. Information is given on all active devices ranging from receiving to microwave devices, semiconductor devices, and miscellaneous devices such as, for example, photographic flash tubes and thermistors. (Supersedes NBS Tech. Note 265).

TN442. **An empirical formula for the coherent scattering cross section of gamma rays,** A. Nath and A. M. Chose. Nat. Bur. Stand. (U.S.), Tech. Note 442, 16 pages (Apr. 1968).

Key words: Coherent scattering; Delbrück; empirical formula; gamma rays; nuclear Thomson; Rayleigh.

An empirical formula has been developed for estimating coherent scattering cross sections of γ-rays of energies below 1 MeV and in the range of 0 — 2.5mc units of momentum transfer. The formula has been compared with the experimental data available in the literature in the case of Pb, Sn and Cu scattered for different photon energies between 0.279 — 1.33 MeV. Experimental data, in general, have been found to be in good agreement with the results of the empirical formula, the deviation being within $\pm$10 percent in most of the cases. The empirical formula has also been compared with the form factor results of Nelms and Oppenheim and with the accurate theoretical data of the Birmingham group. The latter is in excellent agreement with the empirical formula.

TN443. **A computer oriented single-fingerprint identification system,** J. H. Wegstein, Nat. Bur. Stand. (U.S.), Tech. Note 443, 28 pages (Mar. 1968).

Key words: Classification; computer; descriptor; file; fingerprint; identification; pattern-recognition.

A procedure is described for computing a set of numeric

criptors that identify a single fingerprint. The procedure rts with the X and Y coordinates and the individual directions the minutiae (ridge endings and bifurcations) of a fingerprint pression. Sets of descriptors are computed corresponding to ups or constellations of these minutiae. Descriptors corponding to various fingerprint impressions are stored on magic tape. A fragment of a fingerprint impression such as occurs a latent fingerprint may also be used.

A second computer program reads the descriptors correspondto two different fingerprint impressions from magnetic tape. score is computed that indicates how well the two impressions tch. Preliminary experimental results suggest that this cedure might be suitable as a basis for a single-fingerprint ssification system.

N444. **Reform: a general-purpose program for manipulating formatted data files,** R. McClenon and J. Hilsenrath, Nat. Bur. Stand. (U.S.), Tech. Note 444, 28 pages (Aug. 1968).

Key words: File editor; fixed-field file editor; Fortran program; insert program; packing program; reformatting; report generator; unpacking program.

A program listing and description is given of REFORM, an inpendent program with which it is possible to manipulate and it files containing as many as nine different fixed-field card forats. It can select or abridge information from any of the cards d print that information, or reformat new cards in any desired der or arrangement. Provision is made for introducing as many twenty-six arbitrary strings of characters, each of which may up to seventy-nine characters in length, thereby permitting the sertion of labels, headings, or comments into the file. The proam, which operates on the 1108 computer at NBS, is written ASA FORTRAN, and care has been taken to reduce to a inimum the program changes required to make the program run other computers.

N445. **A bibliography on methods for the measurement of inhomogeneities in semiconductors (1953-1967),** H. A. Schafft and S. G. Needham, Nat. Bur. Stand. (U.S.), Tech. Note 445, 47 pages (May 1968).

Key words: Bibliography; electron voltaic; measurement methods; photoconductivity; photovoltaic; point potential probe; semiconductor material inhomogeneities; spreading resistance; voltage breakdown.

About 130 papers which deal with the measurement chniques useful in detecting the type and location of various inomogeneities, primarily in germanium and silicon, are listed ith key words. The types of inhomogeneities considered are ose in impurity concentration, resistivity, mobility, diffusion ngth, lifetime, surface conditions, crystal perfection, and p-n nctions. Some of the twenty-two effects or methods used to dect these inhomogeneities are: photovoltaic, electron-voltaic, notoconductivity, one-, two- and four-point probe, spreading sistance, and voltage breakdown. There are three indexes: a ference tabulation according to key words, a reference tabulaon according to methods or effects used to detect an inomogeneity, and an author index.

N446. **PRECISE: A multiple precision version of Omnitab,** A. E. Bean and J. Hilsenrath, Nat. Bur. Stand. (U.S.), Tech. Note 446, 84 pages (June 1968).

Key words: Double precision; elementary functions; equation solver; linear equation solver; magnetic tape utility program; multiple-precision computing; multiple-precision programming; PRECISE; triple-precision; user's manual.

This users manual describes PRECISE—a completely assemled interpretive program for the IBM 7090/7094 which enables he user to carry out arithmetic operations and function generation in multiple precision (accuracy to 28 significant figures). PRECISE operates as a sub-monitor under the IBSYS or DC-IBSYS monitor systems. Appendixes describe how jobs are set up to be run under the PRECISE sub-monitor, and how the system may be expanded to include new subroutines. The program, which responds to instructions in the form of plain English sentences or contractions thereof, has provision for handling numbers out of the normal 7090/7094 range. It handles numbers as large as 10 to the 10 to the 9 power. Other features of the program include: free-field input; a work-sheet of 7,500 cells (3 × 2500 computer words) which can be dimensioned by the user at run time (75 rows by 100 columns, 300 rows by 25 columns, etc.); solution of systems of linear equations in as many as 85 unknowns; flexible formatting; tape handling facility; and row and column sums. A description of the UOM Multiple Precision Package (SHARE Dist. No. 3081) is included as an appendix.

TN447. **Research on high temperature materials at the National Bureau of Standards,** E. Passaglia, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 447, 19 pages (July 1968).

Key words: High temperature materials; materials properties.

The National Bureau of Standards, with support from the Advanced Research Projects Agency of the Department of Defense, has begun a program on High Temperature Materials. This program includes projects on properties of high temperature materials, projects on their preparation, and others designed to explain basic phenomena limiting the use of materials at high temperatures. A summary of the progress in this program is given here.

TN448. **Status report. National standard reference data system, April 1, 1968,** E. L. Brady, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 448, 132 pages (June 1968).

Key words: Atomic and molecular data; chemical kinetics; colloid and surface properties; data systems design and development; information services; mechanical properties; nuclear data; solid state data; standard reference data; thermodynamic and transport properties.

This report summarizes the status of activities of the NBS Office of Standard Reference Data as of April 1968. It provides a detailed review of the data compilation activities within the seven broad categories of the technical scope of the program: (1) nuclear data, (2) atomic and molecular data, (3) solid state data, (4) thermodynamic and transport data, (5) chemical kinetics, (6) colloid and surface properties, and (7) mechanical properties. Progress in data systems design and development and in information services are reviewed. Certain problem areas of the program are identified. The appendix includes: (1) a listing of information and data centers associated with the Office of Standard Reference Data, (2) publications of the National Standard Reference Data System, and (3) a listing of organizations, groups, or individuals compiling or evaluating data.

TN449. **Research on laser standards and materials at the National Bureau of Standards,** K. G. Kessler, E. Passaglia, and N. N. Winogradoff, Editors, Nat. Bur. Stand. (U.S), Tech. Note 449, 32 pages (June 1968).

Key words: Holography; laser energy; laser materials; laser power; laser radiometry; laser standards; laser transitions; modulation of lasers; near and far field patterns; optical properties.

A brief report is presented on research in the areas of laser standards and laser materials now in progress at the National Bureau of Standards. Included are the measurement of the power and energy output of lasers, their near and far field patterns and their optical properties. The physical and chemical properties of laser materials are studied in an attempt to relate such properties to the operating characteristics of lasers.

TN450. **Unassigned.**

TN451. **Radiochemical Analysis Section: summary of activities July 1967 to June 1968,** J. R. DeVoe, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 451, 131 pages (Jan. 1969).

Key words: Backscatter geometry; computer programs for Mössbauer spectrometry; computers; corrosion products; counting statistics; cross sections; detection limits for analysis; electric field gradient tensors; flux monitors; interferometric Mössbauer spectrometer; Mössbauer instrumentation; Mössbauer spectrometry, NBS Linac; nickel-61; nuclear recoil; overflow counter; photonuclear reactions; proportional counter; quantitative Mössbauer spectrometry; standard reference materials.

This is the fifth summary of progress of the Radiochemical Analysis Section of the Analytical Chemistry Division at the National Bureau of Standards.

The sections' effort comprises four major areas: Mössbauer spectrometry, nuclear chemistry, nuclear instrumentation and the application of statistics in nuclear and analytical chemistry.

Studies in nuclear reactions have centered around measurement by time of flight mass spectrometry of helium-4 produced from reactions such as $^{7}Li(\gamma,\alpha)^{3}H$.

Statistical methods have been applied to the measurement of peaks in radiation spectra, to reporting trace amounts of radioactivity, to the calibration of Standard Reference materials, and to the reporting of detection limits of a system of measurement.

A procedure for cooling a moving absorber with a stationary source for Mössbauer spectrometry is described. A system for taking spectra using the scattering mode is described along with a large "pancake" shaped proportional counter that is used in the system. Theoretical interpretations of Mössbauer spectra of nickel compounds are given. Computer programs which incorporate constraints such as field intensity and quadrupole moments have been written. Several applications of Mössbauer spectrometry, such as surface corrosion studies are described. Preliminary data are given on the charge states of ^{119m}Sn after nuclear recoil. A technique for resolving some of the difficulties in quantitative analysis of chemical structures is also described.

An overflow counter for collecting more counts than the memory capacity of a pluse height analyzer is described. A sequential scanner for a frequency synthesizer has adapted the NBS Optical Interferometric Mössbauer Spectrometer from a constant velocity to a constant acceleration mode.

TN452. **Activities of the NBS Spectrochemical Analysis Section July 1967 through June 1968,** B. F. Scribner, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 452, 80 pages (Sept. 1968).

Key words: Computing; digital readout; electron probe; emulsion calibration; emulsion sensitivity; gold analysis; isotope dilution method; microprobe grid scanner; optical spectrometry; plasma torch; platinum analysis; preconcentration; silicon detector; spark source mass spectrometry; spectrochemical analysis; standard reference materials; time-shared computer; x-ray absorption coefficients; x-ray fluorescence analysis; x-ray mass attenuation coefficients; zinc analysis.

A summary is given of activities of the NBS Spectrochemical Analysis Section for the year July 1967 through June 1968. This covers research activities, improvement in equipment, and applications in analysis including the certification of standard reference materials. In optical spectrometry studies were completed on the plasma torch as a means of excitation of solutions, and on computer programs for the calibration of photographic emulsions. In electron probe microanalysis a matrix scanner for automatic point-by-point grid scans was tested a a lithium-drifted silicon detector was installed for non-diffracti x-ray dispersion. A study was made of color composites for co bining the information of three x-ray area scans. In quantitati probe analysis, measurements were made of x-ray mass atten tion coefficients, and a study of atomic corrections is underwa In x-ray fluorescence considerable improvement was realized replacement of electronics by solid state circuitry, and metho are being studied for corrections of interelement effects, utilizi the digital computer. Spark source mass spectrometry was a plied, by means of chemical separations and by isotope diluti techniques, to the accurate determination of impurities in zi platinum, and gold. A critical study was made of the uniform of response of ion-sensitive emulsions over the area of the pla used in the mass spectrometry. Improvements in the Sectio equipment and further developments in computer applicatic are also discussed. Listings are given of 23 publications and talks by members of the Section during the year.

TN453. **Electrochemical Analysis Section: summary of activit July 1967 to June 1968,** R. G. Bates, Editor, Nat. Bur. Sta (U.S.), Tech. Note 453, 88 pages (July 1968).

Key words: Acidity; analysis; conductance measuremer electrochemical analysis; electrochemistry of solutio ionic activity; ion-selective electrodes; pD measuremer pH measurements; medium effects; solvent effects.

This survey of the activities of the Electrochemical Analy Section, Analytical Chemistry Division, covers the period J 1967 to June 1968. An attempt is made to summarize a yea progress on the technical projects of the Section in such a wa to stress the program and capabilities of the organizational u as a whole. Brief summaries of several lines of work under v are given. The review describes briefly new equipment and fa ties acquired during the year. A major effort devoted to aci measurements has led to new pH standards and new refere solutions for pD in heavy water. Solvent effects on acid-b phenomena in mixed solvents have shed some light on the f tors, including solvent structure, governing ion-solvent inte tions. A start was made on the study of ion-specific electro and the establishment of standard scales for ionic activ Equilibrium data for hydrochloric acid in 92.41 wt. per ethanol and for the ionization of carbonic acid in heavy w have been obtained. The establishment of conductance st dards for oceanographic research was begun. The survey c cludes with lists of the members of the Section staff, publicati and manuscripts produced during the year, talks given by staff, and committee assignments.

TN454. **Analytical Coordination Chemistry Section: summar activities July 1967 to June 1968,** O. Menis, Editor, Nat. B Stand. (U.S.), Tech. Note 454, 92 pages (July 1968).

Key words: Atomic absorption and atomic fluoresce spectrometry; differential thermal analysis; flame emissi gases in metals; gravimetry and titrimetry; sp trophotometry and spectrofluorometry; standard refere materials.

This annual report outlines the progress made in titrime gravimetry, flame emission, atomic absorption and fluoresce spectrophotometry, spectrofluorometry and the determina of gases in metals in conjunction with the analysis of Stand Reference Materials. It describes recent developments in ins mentation and in sample dissolution techniques and discus some unique applications of coordination systems and ter complexes.

In flame spectroscopy considerable progress was made in development and testing of electrodeless discharge lamps,

arc continuum sources, a.c. scanning systems, resonance detectors and improved nebulizer-burner combinations. The relative merits of flame emission, atomic absorption and atomic fluorescence were evaluated from theoretical and practical standpoints. Specialized instrumentation was also developed for use in thermal analysis studies and in spectrofluorometry. In the area of gases in metals, a new inert gas fusion apparatus having a unique sampling valve and gas flow system was constructed and coupled to a high sensitivity gas chromatograph. In addition, a new commerical inert gas fusion apparatus was tested and a vacuum fusion unit modified to permit more readily the successive determination of oxygen and nitrogen.

Studies were made of the dissolution of refractory materials containing volatile or easily hydrolizable components. Sealed Teflon-lined bombs and quartz tubes were successfully applied to the determination of trace nitrides in steels and niobium alloys and of antimony at the 10-50 ppm level in ferrous alloys. The latter was prerequisite to the provision of standards for correlating the presence of trace antimony in rotor blades with power turbine failures. Teflon-lined bombs were also used for the dissolution of clays prior to the determination of trace components.

The formation and extraction of ternary complex systems were investigated to provide enhanced spectrophotometric and spectrofluorometric sensitivity for trace metal determination. Improvement in the detection limits of existing procedures were effected by the use of micro-volume techniques. Also, the utilization of recently developed spectrofluorometric chelating agents have yielded significant improvement in sensitivity. Beryllium, for example, was readily determined in resin beads at the 50 picogram level.

Finally, a large number of Standard Reference Materials and potential standards were certified for their major, minor and trace constituents. These included clays, tungsten-molybdenum compacts, neutron flux glasses, aluminum alloys, organo-metallic compounds, ferrous alloys, solder, and high-purity and doped zinc, platinum and gold. Many of the values obtained were confirmed by independent methods.

TN455. **Microchemical Analysis Section: summary of activities July 1967 to June 1968,** J. K. Taylor, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 455, 145 pages (Oct. 1968).

Key words: Coulometric analysis; gas analysis; methods of chemical analysis; microchemical analysis; microscopic analysis; polarographic analysis; specific ion electrodes.

This report describes the research activities and scientific programs of the Microchemical Analysis Section of the Analytical Chemistry Division of the NBS Institute for Materials Research during the period July 1967 to June 1968. General activities are reported in the areas of gas analysis, polarography, potentiometry, coulometry, chemical microscopy, and classical microchemical analysis. Research activities described in some detail include: determination of trace amounts of oxygen in gases, development of a coulometric method for precise analysis of boric acid, improvements in microdetermination of silver and fluorine by null-point potentiometry, the electrochemical generation of fluoride ion, preparation of resin-bead particle standards, and determination of trace elements by the nuclear track technique. A number of microchemical procedures which have been developed for the analysis of a variety of materials are also included.

TN456. **Analytical Mass Spectrometry Section: summary of activities July 1967 to June 1968,** W. R. Shields, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 456, 54 pages (Nov. 1968).

Key words: Instrumentation; isotopic analyses; mass spectrometry; procedures.

This report describes the advances in instrumentation and the research activities of the Analytical Mass Spectrometry Section during the period July 1967 to June 1968.

Advances in instrumentation include the construction of the electronic interface automating both the control of the multistage instrument, and the digital readout and data reduction. A new and improved beam valve is also described.

Elements studied during this period include: B, Ni, Pb, Li, U, and Pu. Chemical procedures are given for B, Pb, CaF_2, U, and Pu; mass spectrometric procedures are given for B.

TN457. **Organic Chemistry Section: summary of activities July 1967 to June 1968,** R. Schaffer, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 457, 127 pages (Sept. 1968).

Key words: Acetylation; analysis of corn syrups; carbohydrate structure and characterization; cholesterol; clinical chemistry; creatinine; di-*O*-isopropylidene-D-*erythro*-pentulofuranose; D-psicose, dextrose; n.m.r. spectroscopy; nicotinic acid; 1,2:3-4-metallo-organic standard reference materials; periodic acid; polycyclic air-pollutants; polyhydroxy cyclic compounds; standard reference materials; sucrose; sulfonic Ka measurements; urea; uric acid.

This report describes work in progress in the organic Chemistry Section of the Analytical Chemistry Division of the NBS Institute for Materials Research. The following research areas are discussed:

Carbohydrate Synthesis, Structure, and Characterization: Novel Research Materials and Model Compounds. The reaction of sulfonic esters of D-mannitol with methoxide has been examined, and a new dianhydrohexitol has been isolated, and identified as 2,3:4,5-dianhydro-D-iditol. Methods for the esterification of tetrahydroxy-*p*-benzoquinone and benzenepentol, and the disproportionation of the former compound during acetylation have been studied. A novel method for acetylation in 100 percent phosphoric acid has been developed. The usefulness of bromine for oxidizing cyclohexanehexols into inososes and diketoinositols was investigated. Acetylations of certain inosose phenylhydrazones was proved to provide arylazocyclohexene derivatives, whereas previous workers had reported otherwise. NMR spectroscopy was used to determine the conformations of several bi- and tri-cyclic carbohydrate derivatives in solution, and the influence of substituents and of dipolar interactions on conformation was analyzed. The factors that determine the rates of reaction of the cyclic disulfones that are intermediates in the MacDonald-Fischer degradation of sugars were evaluated by pKa measurements and NMR analysis. Syntheses of "D-ribulose" and D-psicose have been carried out.

Clinical Chemistry. Extensive examinations of the properties of high-purity samples of creatinine, uric acid, and urea have been made, as a preliminary stage in the development of Standard Reference Materials for these compounds. The application of phase solubility analysis and differential scanning calorimetry has been studied where appropriate for evaluations of purity. The properties and methods for determining the purity of SRM cholesterol were studied.

Properties of Polycyclic Air-Pollutants. The oxidation of a variety of polycyclic, aromatic compounds by periodic acid was studied and found to proceed by (1) a free-radical mechanism that gives rise to coupling products, or (2) a two-equivalent oxidation mechanism that leads to quinonoid derivatives, or both. On treatment with periodic acid, azulene, a non-benzenoid, aromatic compound, gave a free-radical-containing, polymeric material having ionic properties.

Analytical Chemistry of Corn Sugars and Related Products. As a preliminary but basic step in a program for developing relationships between the compositions and physical properties of

corn syrups prepared by various processes, a variety of methods have been explored for assaying the water content in syrups.

In order to describe experimental procedures adequately, it has occasionally been necessary to identify commercial materials and equipment in this report. In no case does such identification imply recommendation or endorsement by the National Bureau of Standards, nor does it imply that the material or equipment identified is necessarily the best available for the purpose.

TN458. **Activation Analysis Section: summary of activities July 1967 to June 1968,** P. D. LaFleur, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 458, 109 pages (Mar. 1969).

Key words: Activation analysis; Cockcroft-Walton neutron generator; computer literature searching; extraction; group separations; homogeneity testing; hydrogen bis(2-ethylhexyl) phosphate; matrix effect; molybdenum; NBS LINAC; NBS reactor; photon activation analysis sensitivities; standard reference materials; zinc.

The facilities used by the reactor, LINAC and neutron generator groups for activation analysis are described. Proposed installation of four new irradiation terminals and a new pneumatic transfer tube system are outlined.

A new 2.5-mA neutron generator has been installed and the biological shield, pneumatic transfer system and the detector assembly modified. Studies of blank problems for oxygen determination and self-absorption corrections in photopeak analysis have resulted in greatly improved precision for Standard Reference Materials. Halide in photographic emulsions, using 14-MeV and 2.6-MeV neutrons, have been determined.

Considerable emphasis has been placed on the development of group radiochemical separations, SRM steel and high purity zinc samples have been analyzed using this technique.

Eighteen different SRMs were analyzed for a variety of elements and a variety of service analyses were performed.

The self-absorption effects of the matrix on irradiation photons were studied and calculations of sensitivities for photon activation analysis were made. Carbon in sulfur, yttrium in rare earth oxides and oxygen in sodium were determined by photon activation.

The extraction of metals by bis(2-ethylhexyl) orthophosphoric acid has been studied, and distribution coefficients are given for many of the transition metals. The results indicate enhanced applicability of this reagent for radiochemical separations.

Updated keys for computer literature searching and a sample output are included.

TN459. **Separation and Purification Section: summary of activities July 1967 to June 1968,** D. H. Freeman, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 459, 56 pages (Dec. 1968).

Key words: Analytical distillation; clinical standards; crystallization; divinylbenzene; EDTA; ion exchange resins; microstandards; particulate matter; reagents; resin structure; ultra-pure reagents; urea; uric acid.

The research activities of the Separation and Purification Section are described, including their significance to the program of the Office of Standard Reference Materials. The work involves basic developments to characterize ion exchange resins using infrared spectrophotometry, stoichiometric analysis of resin structure, and the study of chain scission. The availability of spherical particles of homogeneous ion exchange resin has been exploited with the recently developed microstandards. Analytical gas chromatography has been developed with emphasis given to the specialized needs of measuring trace contaminants in purified organic compounds including divinylbenzene, EDTA, and clinical standards such as uric acid and urea. Purification capabilities involving the use of crystallization, analytical distillation, and of the newly installed low temperature (−30 °C) laboratory are described. The activities of the ultra-pure reagents project, including work on the laser light scattering measurement of traces of liquid borne particulate matter, on reagent preparation, and methods of reagent storage are described.

TN460. **Unassigned.**

TN461. **Tables of solutions to Bragg's equation for copper, cobalt, iron, and chromium Kᾱ radiation and small diffraction angles,** J. P. Colson and E. S. Clark, Nat. Bur. Stand. (U.S.), Tech. Note 461, 75 pages (Aug. 1968).

Key words: Bragg's equation; Co; Cr; Cu; Fe; Kᾱ radiation; small angle.

Tables of solutions to Bragg's equation are presented for the Kᾱ radiation of Cu(1.541838 Å*), Co(1.790260 Å*), Fe(1.937355 Å*), and Cr(2.291002 Å*). The value of 2θ is increased in increments of 0.001 degree from 0.001 to 2.999 degrees and in increments of 0.00001 radian from 0.00002 to 0.04999 radian. The solutions are rounded off to five digits.

TN462. **Nonnumeric data processing in Europe: a field trip report,** M. E. Stevens, Nat. Bur. Stand. (U.S.), Tech. Note 462, 66 pages (Nov. 1968).

Key words: Artificial intelligence; automatic abstracting; automatic indexing; computational linguistics; computer centers; documentation; information storage; library automation; optical character recognition; pattern recognition; programming languages; selection and retrieval; speech and speaker recognition.

A number of nonnumeric data processing projects in the United Kingdom, Belgium, the Netherlands, Italy, Sweden, the Federal Republic of Germany, and the U.S.S.R. have been visited. Topics covered include character and pattern recognition; speech analysis, synthesis, and recognition; artificial intelligence; mechanized documentation and library automation; linguistic data processing, and computing and programming theory.

TN463. **Mössbauer effect study of magnetic ordering in copper-rich Cu-Ni-Fe alloys,** L. J. Schwartzendruber, Nat. Bur. Stand. (U.S.), Tech. Note 463, 138 pages (Aug. 1968).

Key words; Alloys; copper; gold; iron; magnetism; Mössbauer effect; nickel.

The ^{57}Fe Mössbauer effect has been observed in a series of copper rich Cu-Ni-Fe alloys, and for two samples of gold rich Au-Fe. At low temperatures most of these alloys order magnetically and the Mössbauer effect spectra develop typical six-line hyperfine field structure. For dissolved Fe the room temperature Cu-Fe and Au-Fe spectra consist of a doublet superimposed on a central line. In Cu-Ni-Fe the spectra at room temperature consist of a doublet with no evidence of a central line when the Ni concentration is above 10 atomic percent. The doublet separations at room temperature (and their estimated uncertainties) are 0.69 ± 0.02, 0.58 ± 0.02 and 0.22 ± 0.04 mm/sec in Au-Fe, Cu-Fe, and Cu-Ni-Fe respectively. By observation of the spectra in a magnetic field the doublet structure is shown to be due to magnetic interactions between Fe and other Fe or Ni atoms. Isomer shifts, metallurgy in Cu-Ni-Fe alloys, sample preparation techniques, and the Mössbauer effect equipment developed are also discussed.

TN464. **The NBS Alloy Data Center: function, bibliographic system, related data centers, and reference books,** G. C. Carter, L. H. Bennett, J. R. Cuthill, and D. J. Kahn, Nat. Bur. Stand. (U.S), Tech. Note 464, 199 pages (Aug. 1968).

Key words: Alloys; annotation; automated; bibliography; data; indexing; information; Knight shifts; metals; NMR

soft x-ray spectroscopy.

The Alloy Data Center, part of the National Standard Reference Data System, has two primary functions. One is to stimulate cooperation and coordination among the existing data centers in the area of the physical properties of well characterized alloys. The final data generated by these centers for publication should be consistent with one another where correlation or possible overlap exists. The other purpose is the collection (from publications as well as private communications), evaluation, and publication of data in some areas where special competence exists in the Alloy Physics Section. Of interest to the center are metals, semimetals, intermetallic compounds, and alloys. Excluded are those materials which have ill-defined constitutions and heat treatments. An automated system has been developed to meet the bibliographic needs of the center. This system will be described as well as the specific properties of interest. The system presently contains a complete annotated file on papers dealing with NMR Knight shift measurements. The soft x-ray spectroscopy compilation is being kept up-to-date with the same system.

TN465. **Measurement of carrier lifetime in semiconductors—an annotated bibliography covering the period 1949-1967,** W. M. Bullis, Nat. Bur. Stand. (U.S.), Tech. Note 465, 64 pages (Nov. 1968).

Key words: Bibliography; diffusion length; diode recovery; excess carrier lifetime; measurement methods; photoconductive decay; photoconductivity; photomagnetoelectric effect; recombination of excess carriers; semiconductors; surface photovoltage.

About 300 papers concerned with the measurement and interpretation of carrier lifetime in semiconductors are listed together with key words and a brief comment for each. Eight types of entries are included: Description of Methods, Analysis of Results, Standard Methods, Experimental Results, Theoretical Models, Auxiliary Procedures and Data, Reviews, and Books. Emphasis is placed on methods of carrying out measurements of carrier lifetime. Hence complete coverage was attempted and nearly two thirds of the entries appear in the first three categories. A large fraction of the papers listed describe the photoconductivity or photoconductive decay methods. The other most popular methods are based on diode characteristics or the photomagnetoelectric effect. In all, 35 methods for measuring carrier lifetime are represented by entries. In addition, representative papers which describe various models for recombination are included together with a number of papers which discuss the influence of surface recombination and trapping phenomena. Auxiliary procedures such as surface preparation, formation of ohmic contacts, control of temperature, and the like are described in some of the entries. Two indexes, a Key Word Index and an Author Index, are provided together with a classification of the various methods for measuring carrier lifetime.

TN466. **Matching fingerprints by computer,** J. H. Wegstein, J. F. Rafferty, and W. J. Pencak, Nat. Bur. Stand. (U.S.), Tech. Note 466, 17 pages (July 1968).

Key words: Computerized-fingerprint-identification; fingerprints; pattern-recognition.

A procedure is described for determining whether two fingerprint impressions were made by the same finger. The procedure uses the X and Y coordinates and the individual directions of the minutiae (ridge endings and bifurcations). The identity of two impressions is established by matching a constellation or group of minutiae in one impression with a corresponding constellation in the other impression in terms of the relative distances and relative angles of the minutiae.

TN467. **Activation analysis: a bibliography through 1971,** G. J. Lutz, R. J. Boreni, R. S. Maddock, and J. Wing, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 467, 892 pages (Aug. 1972).

Key words: Activation analysis; bibliography; element determined; literature file; matrix analyzed; technique used.

References to papers published in the open literature which describe work using activation analysis are printed from a computer based storage and retrieval system. Published as a two-part volume, part 1 is a listing of references according to accession numbers (approximately 6200) while part 2 is composed of four appendices. Appendix I is an index for the element determined, Appendix II is an index of the matrix analyzed, Appendix III is an index of the technique used, Appendix IV is an author index. The two parts when used together, permit a literature search defined by the several indices. Supersedes NBS TN467, Parts 1 and 2 issued May 1971.

TN468. **Unassigned.**

TN469. **NBS interagency transducer project,** P. S. Lederer, Nat. Bur. Stand. (U.S.), Tech. Note 469, 23 pages (Oct. 1968).

Key words: Dynamic calibration; evaluation; InterAgency Transducer Project; performance characteristics; telemetry; transducer.

For a number of years, the National Bureau of Standards has been engaged in a continuing project to study the performance of transducers, primarily those used in telemetry. This project has been supported by agencies of the Defense Department and NASA. This report provides a brief description of the background and history of the project, of its objectives, of some of the specialized facilities developed and used, and of some of the publications that have issued from the project.

TN470. **EDPAC: utility programs for computer-assited editing, copy production, and data retrieval,** C. G. Messina and J. Hilsenrath, Nat. Bur. Stand. (U.S.), Tech. Note 470, 80 pages (Jan. 1969).

Key words: Alphanumeric data files; computer-assisted text preparation; data retrieval; FORTRAN programs; free field text files; mechanized text editing.

A description and listings are given of EDPAC, a package of five related utility computer programs: SCRAMBLE, SUBSTITUTE, SEARCH, BLOCKSEARCH, JUSTIFY, and their subroutines. These programs perform transformations on alphanumeric data. The programs have been written in FORTRAN, with care taken to make them as system and machine-independent as possible, permitting their use on many different computers.

SCRAMBLE scans an input file for specified characters, which it replaces by different characters. SUBSTITUTE similarly replaces strings of characters by other strings. SEARCH and BLOCKSEARCH scan for the occurrence of certain strings and list the lines or blocks, respectively, in which they occur. JUSTIFY produces text, for printing on a card-controlled typewriter or on an extended character printer, which has been left- and right-justified between specified margins.

Some applications of the EDPAC programs are discussed. Emphasis is placed on computer-assisted text preparation.

TN472. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly report July 1 to September 30, 1968,** W. M. Bullis, Editor, Nat Bur. Stand. (U.S.), Tech. Note 472, 45 pages (Dec. 1968).

Key words: Carrier lifetime; electrical properties; germanium; methods of measurement; microelectronics; resistivity; semiconductor devices; semiconductor materials; semicon-

ductor process control; silicon; thermal properties; wire bonds.

This quarterly progress report describes NBS activities relating to: measurement of resistivity, carrier lifetime, inhomogeneities, and Hall effect in semiconductor crystals; study of infrared measurement methods, properties of deep-lying impurities (in InSb), and high field effects; establishment of a processing facility; evaluation of wire bonds; review of NASA measurement methods; and measurement of second breakdown in transistors, thermal properties of devices, and noise in microwave diodes. Projects on silicon nuclear radiation detectors and specification of germanium are also described. Supplementary data concerning staff, committee activities, technical and information services, and publications are included as appendixes. A list of ASTM Standards relevant to integrated circuit processing is also included.

TN473. **Laboratory-field comparison of built-up roofing membranes,** T. H. Boone, L. F. Skoda, and W. C. Cullen, Nat. Bur. Stand. (U.S.), Tech. Note 473, 15 pages (Dec. 1968).

Key words: Bituminous adhesive; bituminous built-up membranes; engineering properties; laboratory-field comparison; strength-thickness.

The values of breaking load, elongation and thermal expansion of nine bituminous built-up membranes prepared by roofing contractors under field conditions and by technicians in the laboratory were measured at subfreezing temperatures. The data indicated that the field-prepared specimens agreed favorably with laboratory-prepared specimens, although the samples from the field frequently reflected higher values for thermal-shock resistance than did their laboratory-prepared counterparts. The higher values were attributed to the smaller amounts of bitumen used between the plies of the field specimens. The results appeared to support the validity of the application of the "strength-thickness rule" to bituminous built-up membranes.

TN474. **Critically evaluated transition probabilities for Ba I and II,** B. M. Miles and W. L. Wiese, Nat. Bur. Stand. (U.S.), Tech. Note 474, 22 pages (Jan. 1969).

Key words: Ba I; Ba II; line strengths; oscillator strengths; transition probabilities.

Critically evaluated transition probabilities, in order of increasing quantum numbers, are compiled for Ba I and II from available literature sources.

TN475. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly report October 1 to December 31, 1968,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 475, 38 pages (Feb. 1969).

Key words: Carrier lifetime; die attachment; electrical properties; germanium; metallization; methods of measurement; microelectronics; resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; wire bonds.

This second quarterly progress report in this series describes NBS activities relating to: measurement of resistivity, carrier lifetime, inhomogeneities, and Hall effect in semiconductor crystals; study of infrared measurement methods, properties of deep-lying impurities (in InSb), and high field effects; establishment of a processing facility; evaluation of aluminum metallization, wire bonds, and wafer die attachment; review of NASA measurement methods; and measurement of second breakdown in transistors, thermal properties of devices, and noise in microwave diodes. Projects on silicon nuclear radiation detectors and specification of germanium are also described. Supplementary data concerning staff, committee activities, technical services, and publications are included as appendixes.

TN476. **Line emission sources for concentration measurements and photochemistry,** W. Braun and T. Carrington, Nat. Bur. Stand. (U.S.), Tech. Note 476, 23 pages (Mar. 1969).

Key words: Absorption; analysis; gas; photochemistry; spectroscopy; vacuum ultraviolet.

When a resonance line is absorbed in its own gas, measurements of this absorption can be used to derive a value of the product, nf, of concentration of the absorber and f value of the transition. This line absorption process is also important in the study of fluorescence and photochemistry, where it is possible to produce atoms or molecules in a single quantum state without otherwise disturbing the system. The interpretation and success of these applications of line absorption depend critically on the shape of the line emitted by the light source. This is strongly influenced by the optical depth in the emitting region, and by the inevitable presence of a reversing layer through which the light must travel on its way out of the lamp. This paper presents a simple model which can be used to estimate the effects of these properties of the light source on the threshold and sensitivity of measurements of nf, and on the power which can be delivered to absorbing atoms outside the lamp. Emphasis is on the general principles of lamp design and diagnosis, rather than on accurate description of a particular lamp.

TN477. **The performance of roofing made with Asplund felts,** S. H. Greenfeld, Nat. Bur. Stand. (U.S.), Tech. Note 477, 27 pages (Mar. 1969).

Key words: Asphalt; Asplund; felt; mineral-surfaced roll roofing; shingles; wood fibers.

A study of the durability of roofing made with Asplund wood fibers was conducted from 1942 to 1967. Concentrations of 0 to 60 percent wood fibers (oak or pine) prepared by three variations of the Asplund process were evaluated. All the mineral-surfaced roll roofings and shingles were performing well after 25 years with only four specimens showing more deterioration than the controls (only rags and paper in their felts). No differences in performance could be related to the felt composition.

TN478. **Some evolving conventions and standards for character information coded in six, seven, and eight bits,** J. L. Little, Nat. Bur. Stand. (U.S.), Tech. Note 478, 30 pages (May 1969).

Key words: ASCII; character codes; code extension; code character sets; collating sequence; computer codes; data transmission codes; information code structure; international information code; Russian code standard; standard information codes; USASCII.

This Technical Note describes some of the properties of the USA Standard Code for Information Interchange, widely known as ASCII or USASCII. It also relates this code to similar international codes and presents the national code for Russia as an example of the worldwide acceptance of this code, which is comprised of seven information bits representing 128 coded characters. Some of the conventions which are evolving to relate these seven bit codes to six and eight bit computer codes are given, and conventions for extending the code to represent an unlimited repertoire of concepts is also given. Two alternate arrangements of the code table are shown to facilitate an understanding of its structure and application.

TN479. **A Fortran program for analysis of ellipsometer measurements,** F. L. McCrackin, Nat. Bur. Stand. (U.S.), Tech. Note 479, 82 pages (Apr. 1969).

Key words: Computer programs; ellipsometry; Fortran program; multiple films; optical constants; reflection coefficients; thin films.

A general Fortran program is given that performs the calculations required to analyze ellipsometer measurements. This pro-

gram replaces the program given in NBS Technical Note 242, entitled "A Fortran Program for Analysis of Ellipsometer Measurements and Calculation of Reflection Coefficients From Thin Films." The main changes from the previous program are: (1) the new program is in Fortran IV and V rather than Fortran II; (2) the relative transmission of the wave plate is considered in analyzing ellipsometer readings; (3) an improved method is used for calculating the refractive index of a film; (4) the form of the input data is improved; (5) a method for calculating and correcting for tilt of the reflecting surface is given; (6) an improved method of calculating confidence limits for the calculated values of thickness and refractive index of a film is used; and (7) a method for calculating the optical constants of an adsorbing film of given thickness is included.

TN480. **Misalinement detector for axial loading fatigue machines,** D. C. Robinson, Nat. Bur. Stand. (U.S), Tech. Note 480, 15 pages (Apr. 1969).

Key words: Axial loading; fatigue machine; misalinement; test fixtures.

A strain gage device for measuring changes in alinement between the test fixtures of axial loading fatigue machines is described. Variations in fixture orientation are determined by measurement of the bending induced in a compliant beam clamped in parallel mounts attached to the test fixtures. Changes in bending with applied tension loads are an indication of alterations in the alinement between the load transmitting members of a machine. An approximately linear relationship was found to exist between changes in bending determined by the detector and the fatigue life of high strength fasteners for various levels of misalinement induced in a fatigue machine.

TN481. **A semi-automated single fingerprint identification system,** J. H. Wegstein, Nat. Bur. Stand. (U.S.), Tech. Note 481, 21 pages (Apr. 1969).

Key words: Computerized-fingerprint identification; fingerprints; pattern-recognition.

A system is described in which a fingerprint is manually coded by tracing certain ridges and noting events such as ridge endings and ridge beginnings. This code is sent by teleprinter to a central file where a computer identifies the fingerprint by comparing the code with codes previously entered in the file. The scheme for comparing codes is given along with some preliminary test results using typical fingerprints.

TN482, Superseded by Technical Note 724.

TN483. **Construction and operation of a simple high-precision copper-point blackbody and furnace,** R. D. Lee, Nat. Bur. Stand. (U.S.), Tech. Note 483, 16 pages (May 1969).

Key words: Blackbody; optical pyrometry; radiometry.

Detailed instructions for the construction and operation of an inexpensive copper-point blackbody and furnace are presented. Such a source may be expected to realize the radiance temperature of 1083.3 °C (Int. 48) with an uncertainty of 0.2 °C and a variation in successive use of less than 0.033 °C. The furnace requires no inert gas or vacuum and utilizes only 225 watts to reach a melt in about an hour after turn on. Melts and freezes last about five minutes each and at least fifty melts and freezes are expected during the lifetime of the furnace.

TN484. **A review of rate constants of selected reactions of interest in re-entry flow fields in the atmosphere,** M. H. Bortner, Nat. Bur. Stand. (U.S.), Tech. Note 484, 62 pages (May 1969).

Key words: Attachment-detachment reaction; charge exchange reaction; collisional ionization reaction; evaluated rate constants; flow field kinetics; O_2-N_2 systems.

The major reactions normally encountered in flow field reentry calculations for the oxygen nitrogen system are reviewed and a rate constant value for each reaction is recommended. Collisional ionization processes, charge exchange reactions and attachment-detachment reactions are included. Rate constant coefficients to fit the equation $k = aT^b e^{-c/T}$ are reported in tabular form for the selected rate constant. The data are also graphed as log k vs T(K). In all, over twenty forward and reverse reactions are reviewed. Additionally, a large number of rate constant values for reactions which also effect flow field calculations are given.

TN485. **An evaluation of certain methods for the chemical analysis of styrene-butadiene rubber,** E. J. Parks and F. J. Linnig, Nat. Bur. Stand. (U.S.), Tech. Note 485, 27 pages (July 1969).

Key words: Bound styrene; carbon black; chemical analysis; latexes; oil; organic acid; serums; soap; stabilizer; styrene-butadiene rubber (SBR); washes.

The applicability of available methods for the analysis of unvulcanized styrene-butadiene rubber (SBR, formerly GR-S) for organic acid and soap is influenced by the type of coagulation (alum or salt-acid), the type of acid present (fatty acid, rosin acid, or mixed acids), and the presence of carbon black or oil. No single method is universally applicable for the analysis of organic acid and soap, but reasonably unbiased results can be attained by proper selection of the available procedures.

The complete-solution procedure for alum-coagulated (AC) SBR has given reasonably good results for organic acid in samples containing mixed acids, while the extraction procedure using aqueous isopropanol-toluene azeotrope (ITA) gives good results for AC samples containing fatty acid only.

The complete-solution procedure for SBR coagulated with salt and acid gives less biased results for organic acid and soap than the aqueous ITA extraction procedure, but the latter should be used for all SBR containing carbon black and for estimating oil in oil-rubber masterbatches. Both complete-solution procedures and the ITA extraction procedure can be adapted for the determination of stabilizer and bound styrene. The present ASTM extraction procedure using ethanol-toluene azeotrope is less satisfactory than the other procedures.

TN486. **Some problems in measuring tread wear of tires,** S. Spinner and F. W. Barton, Nat. Bur. Stand. (U.S.), Tech. Note 486, 27 pages (Aug. 1969).

Key words: Statistics; tires; tread wear testing.

Some problems in tread wear testing of tires are discussed and methods for dealing with these problems are presented. Experimental data are shown to illustrate these methods. Finally some recommendations are made, based primarily on this information, in order to achieve greater uniformity and a statistically valid approach to tread wear testing.

TN487. **Considerations in computing the useful frequency range of piezoelectric accelerometers,** N. Newman, Nat. Bur. Stand. (U.S.), Tech. Note 487, 20 pages (June 1969).

Key words: Electrical excitation; lowest resonant frequency; mechanical excitation; piezoelectric accelerometer; usable frequency range.

This paper analyzes two lumped-parameter models for computing the usable frequency range of piezoelectric accelerometers. The analyses indicate why application of an electrical excitation to the piezoelectric element of a mounted pickup does

not, in general, give the same result as application of a mechanical acceleration to the structure on which the pickup is mounted. Tabular results of the computations for various sets of parameters indicate those cases for which the electrical drive will give resonant frequency values within 2 percent of those for the pickup mounted on a vibrating structure. For these parameter sets, the electrical drive can be used as a reliable substitute.

TN488. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly report January 1 to March 31, 1969,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 488, 44 pages (July 1969).

Key words: Carrier lifetime; die attachment; electrical properties; gamma detectors; germanium; gold-doped silicon; indium antimonide; metallization; methods of measurement; microelectronics; nuclear radiation detectors; resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; wire bonds.

This quarterly progress report, third of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal emphasis is placed on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconducting crystals; evaluation of wire bonds; and measurement of thermal properties of semiconductor devices. Other tasks involve: study of infrared measurement methods, deep-lying impurities in InSb, gold in silicon, and high field effects; establishment of a processing facility; evaluation of aluminum metallization and wafer die attachment; review of NASA measurement methods; and measurement of Hall effect in semiconductor crystals, second breakdown in transistors, and noise in microwave diodes. Related projects on silicon nuclear radiation detectors and specification of germanium are also described. Supplementary data concerning staff, committee activities, technical services, and publications are included as appendixes.

TN489. **Tables of response functions for silicon electron detectors,** M. J. Berger, S. M. Seltzer, S. E. Chappell, J. C. Humphreys, and J. W. Motz, Nat. Bur. Stand. (U.S.), Tech. Note 489, 62 pages (Aug. 1969).

Key words: Detector response function; electron back-scattering; electron energy absorption; electron transmission; silicon detectors.

Calculated response functions are presented which describe the pulse-height distributions produced by monoenergetic electrons incident on silicon detectors. It is assumed that the direction of incidence is perpendicular, and that the detectors are wide enough so that lateral leakage of energy is insignificant. The validity of the calculations has been confirmed experimentally for incident energies between 0.25 MeV and 1.0 MeV and detectors with thicknesses between 0.061 mm and 3.0 mm. The calculated response functions cover a wider range of conditions, including fourteen energies between 0.15 MeV and 5.0 MeV and ten detector thicknesses between 0.05 and 10.0 mm. At energies $\geq$ 1 MeV, response functions are given not only for bare detectors but also for an arrangement in which the detectors are shielded on the transmission side by another detector operating in anti-coincidence.

TN490. **Thermal gradient effects on thirteen flush mounted pressure transducers,** L. Horn, Nat. Bur. Stand. (U.S.), Tech. Note 490, 23 pages (Aug. 1969).

Key words: Pressure measurement errors; pressure transducers; response; temperature; thermal gradients; zero shift.

Thirteen different flush mounted pressure transducers of seven manufacturers were tested by creating a thermal gradient in them and recording the resultant zero shifts. Photographs of typical outputs are shown and the results are compared. A typical recording shows these general characteristics; (1) a very rapid change in output reaching a peak in a second or less, (2) a more gradual shift which reaches a peak in a time which may be a few seconds or more than a minute, and (3) a shift in reading which remains as long as the gradient is maintained. Examples were found in which each of these were positive or negative. The magnitude in a few cases was small, in many was a large fraction of its range, and in one case well in excess of the full scale range.

TN491. **Gravity measurements and the standards laboratory,** D. R. Tate, Nat. Bur. Stand. (U.S.), Tech. Note 491, 10 pages (Aug. 1969).

Key words: Absolute gravity; deadweight; force; geodetic pendulum; gravity; gravity meter; Potsdam system; standard gravity; units of force.

The local value of the acceleration due to gravity is a fundamental datum for almost every standards laboratory as it, together with accurate standards of mass, is the basis for the standards involving force. Instruments used as standards in this area include precise deadweight piston gages, deadweight calibrators for force transducers, liquid manometers, and earth field accelerometer calibrators. The practical realization of the absolute ampere and the absolute volt require a knowledge of force. This paper presents the basic information about how gravity measurements are made and outlines procedures for obtaining a suitable value for a given location. It also gives a brief discussion of the background and meaning of the term "standard gravity," and its application in the computation of forces in units of the pound-force and the kilogram-force.

TN492. **Component combination and frame-embedding in Chinese character grammars,** K. Rankin and J. L. Tan, Nat. Bur. Stand. (U.S.), Tech. Note 492, 36 pages (Feb. 1970).

Key words: Blocking; Chinese characters; component combination; frame-embedding; generative grammar; grammar; linguistics.

Chinese characters can be almost completely described from the point of view that each character is composed of a number of components and that each component is composed of a number of strokes. This note offers a grammatical treatment of component combination. It is concerned with the three most productive processes of component arrangement. This grammar differs from previous grammars in that the constraints on recursion have been minimized and great lexical economy has been achieved.

TN494. **ARPA-NBS program of research on high temperature materials,** A. D. Franklin, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 494, 28 pages (Sept. 1969).

Key words: Copper; creep; crystal growth; diffusion; enthalpy; evaporation; fracture; glass band structure; high temperature materials; mass transport; materials properties; mechanical relaxation; oxides; polymers; pyrolytic graphite; transition metal borides.

Brief reviews are given of work performed during the period of July 1 to December 31, 1968, on a number of projects concerning High Temperature Materials. Topics include the optical constants of titanium, diffusion of oxygen in oxides, growth of Al_2O_3 bicrystals by chemical vapor deposition, high temperature creep in copper, fracture in glass, the electronic structure of transition metal borides and related compounds, the enthalpy of pyrolytic graphite at high temperatures, the mechanism of volatilization of polymers, and the interaction between mechanical relaxation and annealing in polymers.

TN495. **Methods of measurement for semiconductor materials, process control, and devices. Quarterly Report April 1 to June 30, 1969,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 495, 45 pages (Sept. 1969).

Key words: Carrier lifetime; die attachment; electrical properties; gamma detectors; germanium; gold-doped silicon; indium antimonide; metallization; methods of measurement; microelectronics; nuclear radiation detectors; resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; wire bonds.

This quarterly progress report, fourth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal emphasis is placed on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconductor crystals; evaluation of wire bonds; and measurement of thermal properties of semiconductor devices. Other tasks involve study of infrared measurement methods, deep-lying impurities in InSb, gold in silicon; and high field effects; establishment of a processing facility; evaluation of aluminum metallization and wafer die attachment; review of NASA measurement methods; and measurement of Hall effect in semiconductor crystals, second breakdown in transistors, and noise in microwave diodes. Related projects on silicon nuclear radiation detectors and specification of germanium are also described. Supplementary data concerning staff, committee activities, technical services, and publications are included as appendixes.

TN496. **Rare gas resonance lamps,** R. Gorden, Jr., R. E. Rebbert and P. Ausloos, Nat. Bur. Stand. (U.S.), Tech. Note 496, 55 pages (Oct. 1969).

Key words: Aluminum window; extinction coefficients; ionization quantum yield; photochemistry; photoionization; rare gases; resonance lamps; saturation ion current.

Rare gas resonance lamps having high spectral purity, high intensity, and long lifetimes have successfully been manufactured. The design and filling procedure for these lamps is described in detail. Particular operational characteristics of the xenon, krypton, argon, neon, and helium resonance lamps are also given. Windows suitable for use with each of these lamps are described, with particular emphasis given to the procedure for fabricating thin aluminum windows for use with neon and helium lamps. In addition, a method for determining extinction coefficients and ionization quantum yields based on the measurement of saturation ion currents is described.

TN497. **The effects of extended high-temperature storage on the performance characteristics of several strain gage pressure transducers,** R. Williams, Nat. Bur. Stand. (U.S.), Tech. Note 497, 22 pages (Oct. 1969).

Key words: Life testing; pressure transducer; sensitivity shift; strain gage; temperature cycling; temperature storage; zero shift.

This publication reports the results of a test program to evaluate the effects of high-temperature storage on the performance characteristics of several types of commercial strain gage pressure transducers. The results obtained indicate shifts in the zero pressure output and the sensitivity, some of which are permanent. The equipment used and the procedure followed are described.

TN498. **Bibliographies on fabric flammability. Part 1. Wearing apparel. Part 2. Fabrics used on beds. Part 3. Carpets and rugs,** S. H. Greenfeld, E. R. Warner, and H. W. Reinhart, Nat. Bur. Stand. (U.S.), Tech. Note 498, 36 pages (Feb. 1970).

Key words: Apparel; bedding; beds; blankets; carpets; clothing; fabrics; fibers; fire; flame; flammability; flammable; floor coverings; mattresses; pillow cases; pillows; rugs; sheets; springs; wearing apparel.

As recognition of the urgency of the flammable fabrics problem, the Flammable Fabrics Act of 1953 was amended in 1967 to include all items of wearing apparel and interior furnishings. In order to facilitate research and assist in the development of new standards and test methods in these areas, a series of bibliographies is being prepared by the NBS Office of Flammable Fabrics. The first three, on wearing apparel, bed fabrics and carpets and rugs, are included in this Technical Note.

TN498-1. **Bibliographies on fabric flammability. Part 4. Interior furnishings,** S. H. Greenfeld, E. R. Warner, and H. W. Reinhart, Nat. Bur. Stand. (U.S.), Tech. Note 498-1, 24 pages (June 1970).

Key words: Bedding; beds; blankets; carpets; curtains; drapes; fabrics; fibers; fire; flames; flammability; flammable; floor coverings; furnishings; furniture; interior furnishings; mattresses; pads; pillow cases; pillows; plastics; rugs; sheets; springs; upholstered furniture; upholstery.

As recognition of the urgency of the flammable fabrics problem, the Flammable Fabrics Act of 1953 was amended in 1967 to include all items of wearing apparel and interior furnishings. In order to facilitate research and assist in the development of new standards and test methods in these areas, a series of bibliographies is being prepared by the NBS Office of Flammable Fabrics in cooperation with the NBS Library. The first three bibliographies, on wearing apparel, fabrics used on beds, and carpets and rugs, were published in NBS Technical Note 498. This one is on interior furnishings. It includes all of the references on bed fabrics and carpets and rugs that appeared in TN498, along with those on upholstered furniture, draperies, curtains, and materials that are used in interior furnishings.

TN498-2. **Bibliographies on fabric flammability. Part 5. Testing and test methods,** S. H. Greenfeld, E. R. Warner, and H. W. Reinhart, Nat. Bur. Stand. (U.S.), Tech. Note 498-2, 39 pages (Sept. 1970).

Key words: Bibliography of test methods; burning; burning rate; combustion; fire; fire retardant; flame; flame spread; gases; ignition; smoke.

This, the fifth of a series of bibliographies on fabric flammability, relates to test methods and testing of fabrics and products made from fabrics and related materials. Unlike the earlier bibliographies, which cited references to flammability of categories of fabric products, this one cuts across product lines and covers all of the products within the ranges defined in the 1967 amendment to the Flammable Fabrics Act. Approximately 300 citations are included.

TN499. **Multiple scattering corrections for the associated-particle neutron time-of-flight technique,** A. C. B. Richardson, Nat. Bur. Stand. (U.S.), Tech. Note 499, 68 pages (Oct. 1969).

Key words: Associated-particle; cross-section; Monte Carlo; multiple scattering; neutron; time-of-flight.

The computer code, MAGGIE, for the calculation of multiple scattering and sample attenuation in neutron differential cross-section measurements, has been revised and corrected. The particular case of the scattering geometry required by the associated-particle time-of-flight is considered in detail.

TN500. **Edit-insertion programs for automatic typesetting of computer printout,** C. G. Messina, J. Hilsenrath, Nat. Bur. Stand. (U.S.), Tech. Note 500, 50 pages (Apr. 1970).

Key words: Applications, computers; computer-assisted typesetting; FORTRAN programs; KWIC index; phototypesetting; printing.

SETLST and KWIND are FORTRAN programs which accept a card deck or Fortran records on magnetic tape and insert the appropriate flags and shift symbols required by many of the "standard" typesetting programs associated with phototypesetting devices. The programs are specialized to the particular application; the typesetting device and associated programs; and to the desired typeface, by means of control cards and substitution tables supplied at run time. Examples are shown of applications to program listings, KWIC indexes, and normal computer output. When the input is in tabular form, the program permits more sophisticated operations including rearrangement, removal of trailing blanks, typeface changes between columns, etc. These programs can handle any records which can be read by a FORTRAN READ statement under an "A" format control.

TN501. **Radiochemical analysis: Mössbauer effect, nuclear chemistry, nuclear instrumentation, statistical analysis and radioisotope techniques, July 1968 to June 1969,** J. R. DeVoe, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 501, 149 pages (Feb. 1970).

Key words: Calculations; conversion electrons; counting statistics; cross sections; cryostats; electric field gradient tensor; electronics; gas analysis; heterogeneity; interferometric; internal magnetic field; iron; molybdenum; Mössbauer spectrometer; Mössbauer spectrometry; nickel-61; proportional detector; radiochemistry; radioisotope dilution; rutile; self-consistent crystal field; standard reference materials; structure analysis.

This is the sixth summary of progress of the Radiochemical Analysis Section of the Analytical Chemistry Division at the National Bureau of Standards.

The section's effort comprises five major areas: Mössbauer spectroscopy, nuclear chemistry, nuclear instrumentation, radioisotope tracer techniques and the application of statistics in nuclear and analytical chemistry.

Low temperature devices for Mössbauer spectroscopy are a subject of continuing interest, and this year's effort is centered around the design of variable temperature devices. A high temperature device is also described.

Preliminary data on the detection of conversion electrons show the potential for Mössbauer spectroscopy in the field of chemical bonding in surfaces.

Further exploration of the potential of Mössbauer spectroscopy for the measure of structural parameters of nickel compounds have been made.

Preliminary data are presented on the structure of iron doped rutile (TiO_2) which is of significance to the determination of mineral structures found on the moon. Theoretical predictions of Mössbauer spectra resulting from electric field gradients due to crystal field interactions are presented. Evaluation of the basic integrals using the self-consistent Hartree-Fock method is given for ions of the first row of transition elements.

Precautions to be taken in the analysis of gamma-ray spectra are presented when model errors exist and when a gain shift is detected.

A system for gas analysis which utilizes gas chromatography is described. Its application to nuclear cross section studies is also presented. A method for setting limits on sample heterogeneity using a specific analysis method provides a useful indicator for evaluation of the adequacy of standard reference materials.

An interesting presentation of detection and measurement in the femtogram region is given.

The complete circuitry for the optical interferometric Mössbauer spectrometer is presented in this report.

Quantitative analysis for molybdenum and iron using radioisotope dilution to a precision that rivals most other techniques is described.

TN502. **Activities of the NBS Spectrochemical Analysis Section, July 1968 through June 1969,** B. F. Scribner, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 502, 108 pages (Dec. 1969).

Key words: Analytical curve functions; color composite; computer programs; electron probe; gold analysis; isotope dilution method; laser probe; metal foil analysis; microanalysis; non-diffractive x-ray spectra; optical spectrometry; platinum analysis; preconcentration techniques; spark source mass spectrometry; spectrochemical analysis; spectrograph; standard reference materials; steel analysis; target current scanning; trace analysis; x-ray absorptiometry; x-ray fluorescence analysis; x-ray scans.

Spectrochemical research activities, improvements in equipment, and applications are summarized. In optical emission spectrometry micro methods were investigated and computer programs were completed for fitting analytical curves. In electron probe microanalysis studies of corrections for quantitative analysis and new gains in non-diffractive analysis and target current scanning were made. X-ray absorptiometry was applied to the analysis of thin metal foils and computer programs were improved for correction of x-ray fluorescence analysis. Chemical pre-concentration of impurities combined with isotope dilution spark source mass spectrometry found increased application in accurate trace analysis. Resolution of the mass spectrometer was improved and the behavior of ion samples was studied. Extensive involvement in the standard reference materials program contributed to certification of several SRM's including high purity Zn and Au, two sets of wires, Au-Ag and Au-Cu, for microprobe analysis, and electronic and magnetic alloys. Listings are given of 21 publications and 29 talks by members of the Section during the year.

TN503. **Electrochemical Analysis Section: summary of activities July 1968 to June 1969,** R. G. Bates, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 503, 99 pages (Aug. 1969).

Key words: Acidity; analysis; conductivity; electrochemical analysis; electrochemistry of solutions; ionic activity; ion-selective electrodes; pD measurements; pH measurements; medium effects; solvent effects; standard reference materials.

This survey of the activities of the Electrochemical Analysis Section, Analytical Chemistry Division, covers the period July 1968 to June 1969. An attempt is made to summarize a year's progress on the technical projects of the Section, to indicate the composition and capabilities of the unit as a whole, and to stress the Section's role in the mission of the Institute. Brief summaries of several lines of work under way are given. The concept of a broad program on acidity measurements is outlined, and new efforts to provide assistance in clinical acid-base measurements are summarized. Progress toward reference standards for the calibration of ion-selective electrodes is reported. Equilibrium data for phosphoric acid in heavy water, for piperazinium ion in 50 wt percent methanol-water, and for hydrochloric acid in a solvent composed of 2-methoxyethanol (80 wt percent) and water (20 wt percent) have been obtained. Considerable effort has been devoted to the development of new standard reference materials, including standards for conductivity measurements. Lists of publications, talks, and committee assignments of staff members are given.

504. **Analytical Coordination Chemistry Section: summary of activities July 1968 to June 1969,** O. Menis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 504, 120 pages (Oct. 1969).

Key words: Certification of standard reference materials; differential thermal analysis; flame emission and atomic absorption; gases in metals; spectrofluorimetry; spectrophotometry.

Research developments are described in flame emission and omic absorption spectrometry, spectrophotometry, spectofluorometry, differential thermal analysis and the analysis and rtification of Standard Reference Materials. The application of wavelength scanning and second derivative measurements of ectral line intensities serve to overcome broad-band and conuum interferences of matrices in flame emission analysis. It so provides for the analysis of samples as small as 50 μl. In omic absorption studies of arsenic, basic corrections for specal interferences are given.

New spectrophotometric methods have been developed for e analysis of multicomponent systems. These include the multaneous determinations of cobalt, nickel and copper with ,3-quinoxalinedithiol and of vanadium and iron with β-isopropyltropolone. The extraction of ternary ion association comlexes initially containing non-colored or non-fluorescent oranic cations, followed by displacement of these groups by ighly colored or highly fluorescent dye cations directly in the rganic phase, has provided a means of simultaneously improvng sensitivity and selectivity in absorption and fluorescence pectrophotometry. The determinations of gold and uranium are escribed to illustrate the approach. Spectrofluorometric studies f the determination of rare earth elements in synthetic borate lass are also presented.

Instrument modifications and temperature measurement echniques now provide a tenfold increase in the precision of neasurements of phase transition temperatures of quartz and otassium nitrate on differential thermal analysis standards.

Procedures, analytical data and background information are resented for Standard Reference Materials of steels, cast and nodular irons, ferrosilicon, high-purity materials, neutron flux monitor wire, organo-metallic compounds, glasses, and clays. These descriptions include atomic absorption methods for copper in steel, magnesium in nodular iron, impurities in calcium carbonate, high precision spectrophotometric methods for cobalt in aluminum wire, molybdenum and tungsten in microprobe standard, traces of iron and copper in high purity gold and methods for the determination of silica and aluminum in clays.

TN505. **Microchemical Analysis Section: summary of activities July 1968 to June 1969,** J. K. Taylor, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 505. 140 pages (Oct. 1969).

Key words: Chemical analysis; coulometric analysis; gas analysis; ionic equilibria; ion-selective electrodes; microchemical analysis; microscopic analysis; polarographic analysis.

This report describes the research activities and scientific programs of the Microchemical Analysis Section of the Analytical Chemistry Division of the NBS Institute for Materials Research during the period July 1968 to June 1969. General activities are reported in the areas of gas analysis, polarography, potentiometry, coulometry, chemical microscopy, and classical microchemical analysis. Research activities described in some detail include: gravimetric preparation of gas analysis standards; polarographic determination of trace elements in glass; fabrication and performance of a microfluorine electrode; elucidation of the boric acid-borate-mannitol system; investigation of the relation between the equilibrium point and inflection point in acidimetric titrimetry; coulometric determination of trace quantities of chromium; and determination of trace elements by nuclear track measurements. A number of procedures which have been developed for the analysis of a variety of materials, utilizing the techniques mentioned above, are also included.

TN506. **Analytical Mass Spectrometry Section: Summary of activities, July 1968 to June 1969,** W. R. Shields, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 506, 55 pages (May 1970).

Key words: Instrumentation; isotope dilution; isotopic analyses; mass spectrometry; procedures.

This report describes the advances in instrumentation and the research activities of the Analytical Mass Spectrometry Section during the period July 1968 to June 1969.

Chemical and mass spectrometric procedures are described for the determinations of the absolute isotopic abundance ratios of natural rubidium, boron in a natural boric acid and a ^{10}B enriched boric acid, and of uranium in six SRMs.

Procedures are also described for the determination of trace amounts of copper and lead in steel, and silver, copper, boron and uranium in glass by isotope dilution mass spectrometry.

TN507. **Organic Chemistry Section: summary of activities July 1968 to June 1969,** R. Schaffer, Editor, Nat. Bur. Stand. (U.S.). Tech. Note 507, 145 pages (Oct. 1969).

Key words: Bilirubin analysis; calcium carbonate SRM; conformations by NMR; corn syrup analysis; creatinine SRM; D-glucose (clinical SRM); organic trace analysis; SRM's for clinical analysis; urea SRM; uric acid SRM; 6-amino-6-dexoy-D-glucose-6-^{15}N.

This report by the Organic Chemistry Section of the National Bureau of Standards' Institute for Materials Research summarizes a year's scientific activities; consequently, it covers both work that was completed and some that is still in progress. It reports new work on carbohydrates and polyhydroxy cyclic compounds, and analytical studies leading to (*a*) the development of Standard Reference Materials for clinical chemistry, (*b*) characterizations of trace quantities of organic compounds, and (*c*) understanding the properties of starch hydrolyzates.

In research on carbohydrates, rules on selective hydrolysis of certain ketose acetals, a new crystalline derivative of potential use as an SRM for "D-ribulose," conformations of compounds having *m*- and *p*-dioxane rings, and a synthesis of ^{15}N-labeled "6-amino-D-glucose" are described.

Work on polyhydroxy cyclic compounds has shown that (*a*) phenylosotriazoles of diketoinositols favor a half-chair conformation, (*b*) mercuric acetate is a superior reagent for preparing these osotriazoles, (*c*) acetylation in 100 percent phosphoric acid gives an octaacetoxydibenzo-*p*-dioxin from 4,6/5-trihydroxy-1,2,3-cyclohexanetrione, whereas acetylation in pyridine had been shown to produce aromatized products, (*s*) periodic acid oxidizes phenylhydrazino to phenylazo derivatives, and (*e*) phenylformazans and bis(phenylhydrazones) form highly colored salts with strong acids.

In examining a variety of commercial samples of bilirubin in the course of developing an SRM for clinical analysis, data have been obtained by several techniques, including thin-layer chromatography and thermogravimetric analysis. Visible spectrophotometry gave data on the stability of bilirubin dissolved in a variety of solvents. Measurements were made by the diazo assay. A materials-balance analysis of bilirubin samples was developed.

Various chromatographic procedures, used to examine a

supply of D-glucose as an SRM, are described. Measurements of optical rotation in water and methyl sulfoxide, and other analytical data, are also given. Some of the work pertaining to the creatinine, urea, calcium carbonate, uric acid, and cholesterol SRM's that have been issued are presented.

Finally, work on the detection and identification of trace quantities of a few organic compounds is summarized, and the description and statistical evaluations of several methods developed for the characterization of the properties of corn starch hydrolyzates are summarized.

TN508. **Activation Analysis Section: Summary of activities, July 1968 to June 1969,** Nat. Bur. Stand. (U.S.), Tech. Note 508, 147 pages (July 1970).

Key words: Activation analysis; ancient stained glass; carbon; Cockcroft-Walton neutron generator; coincidence spectrometer; group separations; homogeneity testing; hydrated antimony pentoxide; NBS LINAC; NBS Reactor; neutron flux measurements; photofission; standard reference materials; tetracycline.

The design and installation of irradiation facilities for the NBS Reactor are described, and studies of the operating characteristics of the pneumatic tube facilities are reported. Procedures have been developed for determining molybdenum in the presence of large amounts of tungsten and for the determination of uranium. Methods for determining a contamination-free blank for application to liquid samples, and a study of the application of neutron activation to the analysis of stained glass were begun. The application of thermal and fast neutron activation analysis and photonuclear activation analysis to the NBS Standard Reference Material program is discussed. Studies have been made of the application of 3-MeV neutrons from a Cockcroft-Walton neutron generator to activation analysis and of the 3-MeV neutron buildup in 14-MeV neutron activation analysis. The determination of carbon by photonuclear activation has been extended to several metals other than sodium; thallium has been determined in glass samples by photon bombardment, and the photofission of thallium, bismuth and lead has been studied. Hydrated antimony pentoxide has been used to separate sodium from glass samples for subsequent instrumental activation analysis, and the antibiotic, tetracycline, has been applied to radiochemical separations.

TN509. **Separation and Purification Section: Summary of activities, July 1968 to June 1969,** D. H. Freeman and W. L. Zielinski, Jr., Editors, Nat. Bur. Stand. (U.S.), Tech. Note 509, 73 pages (Feb. 1970).

Key words: Gas chromatography; infrared analysis; ion exchange; liquid chromatography; purification; separation; styrene/divinylbenzene; ultrapure reagents.

This is the annual progress report on the Separation and Purification Section activities. The major task of developing a certified ion exchange microstandard as a Standard Reference Material is presented in terms of the preparative and characterizational work involved. Fundamental studies of ion exchange substrates includes the application of quantitative analytical infrared spectrophotometry to measure crosslinking in the copolymer network, and to determine the degree of sulfonation. Optical microscopy is applied to the study of swelling kinetics for single copolymer particles. Analytical gas chromatography is applied to the isomers of divinylbenzene. The recently acquired quadrupole mass spectrometer is described. Liquid chromatography at high pressures and with high resolution has been begun recently. The activities of a project dealing exclusively with ultrapure reagents is described including the problems of contamination free storage.

TN510. **Use of a time-shared computer system to control a Hall e fect experiment,** W. M. Bullis, W. R. Thurber, T. N. Pyke, Jr F. H. Ulmer, and A. L. Koenig, Nat. Bur. Stand. (U.S.), Tecl Note 510, 46 pages (Oct. 1969).

Key words: Computer-controlled experiment; data acquis tion system; digital scanner; experiment-computer inte face; Hall effect; system control module; teletypewriter ir terface; time-shared computer.

An experimental time-shared computer system has been use to control and collect data from a Hall effect experiment. In add tion to selection of the voltage sequence and control of specime current and magnetic flux directions, the computer exerts pos tive control over the specimen temperature in accordance wit a series of thermocouple voltages entered by the operator at th beginning of the run. The interface circuitry is constructed fro four general purpose modules and a single special purpose uni Details of the interface system and the programs used to contr the experiment and to perform intermediate calculations a given. It was found that the time-shared system was well-suite to control an experiment of this type. The demands on the con puter were essentially similar to those required by a human us interacting in a conversational mode. Substantial savings in tim over manual data collection and reduction were realized; a ten perature run with 38 to 40 data points between 10 and 320 could be completed in less than 4 hours.

TN511. **Measurement methods for the semiconductor devi industry—a summary of NBS activity,** W. M. Bullis. Na Bur. Stand. (U.S.). Tech. Note 511. 24 pages (Decemb 1969).

Key words: Carrier lifetime; germanium; lithium-drift gamma-ray detectors; resistivity; resistivity inhom geneities; second breakdown; silicon.

Work at NBS which led to the development of a broad pr gram on Methods of Measurement for Semiconductor Material Process Control, and Devices is described. Initial work w concentrated on resistivity of silicon wafers and second breal down in transistors. In the first case, the basis for a significa improvement in the method for measuring resistivity of silic wafers was established. and in the second. concepts were d veloped which formed the basis of a new type of specificatic for operating conditions free from second breakdown. Wo was extended to include other projects, including studies germanium for gamma-ray detectors. carrier lifetime. a resistivity inhomogeneities which are still in progress. Form tion of the broad program in response to increased interest improved measurement methods is described.

TN512. **The accuracy of air tower pressure gages in suburb Washington, D.C.,** B. G. Simson and R. W. Radlinski, Na Bur. Stand. (U.S.), Tech. Note 512, 10 pages (Dec. 1969).

Key words: Air towers; tire pressure.

A survey of 50 air tower pressure gages in service stations suburban Washington, D.C., was performed. Results show that a motorist using these towers has only a 20 percent chan of inflating his tires within ±1 psi of the pressure indicated by t tower's gage. It is shown that a calibration of the tower gag would reduce the standard deviation of the obtained pressure 0.5 psi.

TN513. **Hydrogen fluoride and the thermochemistry of fluorin** G. T. Armstrong, Nat. Bur. Stand. (U.S.), Tech. Note 51 21 pages (Feb. 1970).

Key words: Fluorides; fluorine dissociation energy; fl orine thermochemistry; heats of formation; hydrofluo acid; hydrogen fluoride.

The thermochemistry of hydrogen fluoride is reviewed. The principal emphasis is on the experimental basis of the heats of formation of HF(g) and of HF(aq). Data from flame calorimetry in which HF(g) and HF(aq) are formed, evidence from processes involving other fluorine compounds, and some evidence from spectroscopic and photodissociation studies are brought together.

TN514. **ARPA-NBS program of research on high temperature materials and laser materials, January 1-June 30, 1969,** A. D. Franklin and H. S. Bennett, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 514, 98 pages (Jan. 1970).

Key words: Band structure; chemical analysis; copper; creep; crystal defects; crystal growth; diffusion; evaporation; fracture; glass; high temperature materials; inhomogeneities in glass; laser damage; laser glass; lasers; mass transport; materials properties; mechanical relaxation; metal borides; optical properties; opto-elastic properties; oxides; polymers; ruby; titanium; transition.

Brief reviews are given of work performed during the period January 1 to June 30, 1969, on a number of projects concerned with High Temperature Materials and with Laser Materials. Under the High Temperature Materials heading, topics include diffusion of oxygen in oxides, growth of Al_2O_3 crystals by chemical vapor deposition, the electronic structure of transition metal borides and related compounds, the optical constants of titanium, high temperature creep in copper, fracture in glass, the mechanism of volatilization of polymers and long-chain compounds, and the interaction between mechanical relaxation and annealing in polymers. Work on Laser Materials includes measurement of bulk optical and elastic properties of laser materials, a study of the "orange" degradation of ruby, measurements of sub-crystal misalignment in ruby, damage in glass induced by high-energy laser pulses, chemical analyses for ruby and Nd-doped laser glasses, and preliminary studies on detection of submicroscopic inhomogeneities in glass.

TN515. **Use of an on-line computer in neutron time-of-flight measurements,** H. T. Heaton, II, Nat. Bur. Stand (U.S.), Tech. Note 515, 31 pages (Jan. 1970).

Key words: Data handling system; interruptable computer; neutron time-of-flight; neutron total cross section; on-line computer; Program Selector Board.

This paper describes the on-line data handling system at the NBS Electron Linear Accelerator facility as it is used for measuring neutron total cross sections by time-of-flight techniques.

TN516. **A selective roll-to-roll printer for producing duplicate microfilm copies, "Selectaframe" Printer,** J. N. Strohlein and T. C. Bagg, Nat. Bur. Stand. (U.S.), Tech. Note 516, 9 pages (Feb. 1970).

Key words: Information retrieval device; microcopier; microfilm duplicator; reader-printer; selective copier.

The "Selectaframe" printer, a convenient device for copying onto roll film selected frames from other rolls of film for subsequent automatic enlargement printing is described in detail.

TN517. **Accelerometer calibration with the earth's field dynamic calibrator,** J. S. Hilten, Nat. Bur. Stand. (U.S.). Tech. Note 517, 30 pages (Mar. 1970).

Key words: Accelerometer; air bearings; calibrator; accelerometer; dynamic; earth's field; interAgency transducer project; low frequency; rotational frequency response; transducer.

This paper describes a simple device for the precise dynamic calibration of certain accelerometers at low frequencies. Calibration of an accelerometer is achieved by rotating the instrument in the earth's gravitational field at a number of constant rotational speeds.

TN518. **Tabulation of data on semiconductor amplifiers and oscillators at microwave frequencies,** C. P. Marsden and R. Y. Cowan, Nat. Bur. Stand. (U.S.), Tech. Note 518, 66 pages (Feb. 1970)

Key words: Amplifiers; basic characteristics; microwave; oscillators; solid-state.

This tabulation includes some of the basic characteristics of semiconductor microwave devices, specifically amplifiers and oscillators of foreign and domestic origin.

TN519. **Forensic Science: A bibliography of activation analysis papers,** G. J. Lutz, Editor, Nat. Bur. Stand. (U.S), Tech. Note 519, 47 pages (Mar. 1970).

Key words: Activation analysis in forensic science; forensic science.

References to Activation Analysis in Forensic Science are indexed into 32 categories for precise literature searching by the Forensic Scientist. An Author index is included.

TN520. **Methods of measurement for semiconductor materials, process control, and devices, Quarterly Report, July 1 to September 30, 1969,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 520, 69 pages (Mar. 1970).

Key words: Alpha detectors; aluminum wire; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma detectors; germanium; gold-doped silicon; indium antimonide; metallization; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic microphone; wire bonds.

This quarterly progress report, fifth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal emphasis is placed on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconductor crystals; evaluation of wire bonds; and measurement of thermal properties of semiconductor devices. Other tasks involve study of infrared measurement methods, deep-lying impurities in InSb, and gold in silicon; establishment of a processing facility; evaluation of aluminum metallization and wafer die attachment; review of NASA measurement methods; and measurement of Hall effect in semiconductor crystals, second breakdown in transistors, and properties of microwave devices. Related projects on silicon nuclear radiation detectors and specification of germanium are also described. Supplementary data concerning staff, committee activities, technical services, and publications are included as appendixes. Laboratory procedures for use and calibration of a capacitor microphone to measure vibration amplitude of the tool tip of an ultrasonic wire bonder are also described in a separate appendix.

TN521, Superseded by Technical Note 719.

TN522. **Beam handling techniques for electron linear accelerators,** S. Penner, Nat. Bur. Stand. (U.S.), Tech. Note 522, 21 pages (Apr. 1970).

Key words: Beam handling; beam optics; beam transport; electron linear accelerator; instrumentation for electron beams; linac.

The design of beam transport systems for electron linear accelerators intended for nuclear physics research is discussed. The subjects covered include beam optics, diagnostics and control of electron beams, and problems of handling high power beams.

TN523. **Experimental techniques for electron scattering investigations,** S. Penner, Nat. Bur. Stand. (U.S.), Tech. Note 523, 46 pages (Apr. 1970).

Key words: Background; current monitoring; detector ladders; electron scattering; experimental techniques; lineshape fitting; on-line computer systems; radiative tails; resolution; spectrometer design.

Modern experimental techniques for high energy electron scattering are discussed. Subjects included are: high resolution spectrometer design, the energy loss spectrometer concept, detector ladder systems, beam current monitoring techniques, suppression and measurement of background, the use of on-line computer systems, theoretical considerations and the analysis of data, and 180° scattering.

TN524. **Determination of the light elements in metals: A bibliography of activation analysis papers,** G. J. Lutz, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 524, 70 pages (May 1970).

Key words: Boron; carbon; light elements; metals; nitrogen; oxygen; phosphorous; silicon; sulfur.

References to the Determination of the Light Elements in Metals using Activation Analysis are indexed according to the elements boron, carbon, nitrogen, oxygen, phosphorous, silicon and sulfur. The indexes are arranged by Element Determined and subdivided according to Matrices and Nuclear Reactions involved. An Author Index is included.

TN525. **The flammable fabrics program 1968-1969. U.S. Department of Commerce report of activities under the Flammable Fabrics Act 1968-1969,** Nat. Bur. Stand. (U.S.), Tech. Note 525, 84 pages (Apr. 1970).

Key words: Flammable fabrics; Flammable Fabrics Act of 1953; flammable fabrics program 1968-1969; reducing flammability; research authorized.

The 90th Congress amended the Flammable Fabrics Act of 1953 to authorize the Secretary of Commerce to conduct research on the flammability of fabrics, related materials, and products; to conduct studies on the feasibility of reducing their flammability; to develop test methods and devices; and to offer training in the use of these devices. In this publication, the National Bureau of Standards, to which responsibility for these activities was delegated, reports to Congress of the work done under this program from October 1968, when funds first were made available, to the end of 1969. Future reports will be issued annually.

The new action by Congress gives recognition to the fact that although many thousands of persons have been injured or killed as a result of the burning of flammable fabrics, adequate details have not been available on the causes of the accidents, the frequency of ignition of different kinds of garments and interior furnishings, the nature, extent, and severity of injury, and the nature of the hazards to which the public is exposed from burning fabrics. Much of the emphasis in the research summed up in this report has been on identifying these hazards and obtaining quantitative information about them. Some of the studies are being made by outside organizations, and these are reported as well as the in-house research at NBS.

TN526, Superseded by Technical Note 715.

TN527. **Methods of measurement for semiconductor materials, process control, and devices, Quarterly Report, October 1 to December 31, 1969,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 527, 60 pages (May 1970).

Key words: Alpha detectors; aluminum wire; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma detectors; germanium; gold-doped silicon; metallization; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, sixth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal emphasis is placed on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconductor crystals; evaluation of wire bonds, metallization adhesion, and die attachment; and measurement of thermal properties of semiconductor devices and electrical properties of microwave devices. Work on related projects on silicon nuclear radiation detectors and specification of germanium for gamma-ray detectors is also described. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN528. **Tire use survey. The physical condition, use, and performance of passenger car tires in the United States of America,** J. L. Harvey and F. C. Brenner, Nat. Bur. Stand. (U.S.), Tech. Note 528, 59 pages (May 1970).

Key words: Accident; review; survey; tire disablement; tire inflation; tire loading; tire pressure gages; tire use; tread wear.

This review summarizes the results of two surveys of the physical condition and use of passenger car tires in the continental U.S.A., conducted under contract for the Office of Vehicle Systems Research (OVSR) of the National Bureau of Standards (NBS) during the period June 1967 through May 1968.

Data and results are compared with those in four related reports recently published by the Traffic Institute of Northwestern University. The latter reports cover studies on the use, condition, and performance of passenger car tires on the Illinois Tollway during the period September 1966 through August 1967. Pertinent information from various other sources is also included.

Based on the compiled evidence, some conclusions are drawn concerning the physical condition, use, and abuse of passenger car tires in service during these years, particularly with regard to tread depth, inflation pressures, and degree of overloading. The various estimates of tire disablement rates are compared, and contributions of tires to motor vehicle accidents explored.

The authors make several recommendations directed toward upgrading the level of quality of passenger car tires in service and reducing their abuse, with the hope and expectation that service performance will be improved, and contributions of tires to highway accidents reduced.

TN529. **Determination of oxygen concentration in silicon and germanium by infrared absorption,** W. R. Thurber, Nat. Bur. Stand. (U.S.), Tech. Note 529, 21 pages (May 1970).

Key words: Absorption coefficient; infrared absorption; germanium; methods of measurement; oxygen in germanium; oxygen in silicon; silicon.

Infrared absorption measurements were made at room temperature, 80 K, and 20 K to determine the absorption coefficien

oxygen in silicon and germanium single crystals. A study was one to compare the results of four experimental methods, which volved both absolute and difference procedures. Sources of ror were identified, including that due to calculating the ab-rption coefficient with an approximate equation which eglects multiple internal reflections. Measurements made on e same specimen at several temperatures give additional data n the relation of oxygen concentration to absorption coefficient low temperatures.

N530. **Systems analysis of inland consolidation centers for marine cargo,** R. H. Jordan, M. C. Stark, C. O. Bunn, J. L. Donaldson, W. J. Obright, H. R. Millie, J. Gilsinn, A. J. Goldman, W. A. Horn, Nat. Bur. Stand. (U.S.), Tech. Note 530, 162 pages (Nov. 1970).

Key words: Containerization; maritime, cargo; mathematical models; optimal locations; systems analysis; transportation.

This Technical Note documents a study, carried out for the U.S. Maritime Administration and completed by interested Bureau staff, to develop analytical techniques to optimize the locations and characteristics of inland consolidation centers for marine cargo. Such centers would consolidate less-than-container lots of cargo into "full" container loads for export, and would unload and distribute containerized import cargo.

After discussing the nature and scope of the study problem and outlining the functions and operations of the centers, the paper reports the fact-finding phase of the analysis. Successive chapters present and analyze data on: initial and operating costs for centers, current demand for their services as derived from a recent survey by the Delaware River Port Authority of its hinterland, and relevant (ground) transportation rates for containerized and uncontainerized material.

Reported next is the development of a mathematical model for estimating good locations and sizes for the consolidation centers. The selective implementation of this model as a computer program is described in sufficient detail to guide prospective users. A final chapter describes the illustrative application of this program to the data at hand, with results quite encouraging for the "inland center" concept.

TN531. **ARPA-NBS program of research on high temperature materials and laser materials, Reporting Period 1 July to 31 Dec., 1969,** High Temperature Materials Reports edited by A. D. Franklin, Laser Materials Reports edited by H. S. Bennett, Nat. Bur. Stand. (U.S.), Tech. Note 531, 75 pages (June 1970).

Key words: Band structure; chemical analysis; copper; creep; crystal defects; crystal growth; diffusion; evaporation; glass; high temperature materials; inhomogeneities in glass; laser damage; laser glass; lasers; mass transport; materials properties; metal properties; optical properties; opto-elastic properties; oxides; polymers; ruby; titanium; transition.

Brief reviews are given of work performed during the period July 1 to December 31, 1969, on a number of projects concerned with High Temperature Materials and with Laser Materials. Under the High Temperature Materials heading, topics include diffusion of oxygen in oxides, growth of Al_2O_3 crystals by chemical vapor deposition, the electronic structure of transition metal borides and related compounds, the optical constants of titanium, high temperature creep in copper, and the mechanism of volatilization of polymers and long-chain compounds. Work on Laser Materials includes measurement of bulk optical and elastic properties of laser materials, a study of the "orange" degradation of ruby, measurements of sub-crystal misalignment in ruby, damage in glass induced by high-energy laser pulses, chemical analyses for ruby and Nd-doped laser glasses, and preliminary studies on detection of submicroscopic inhomogeneities in glass.

TN532. **Pollution analysis: A bibliography of the literature of activation analysis,** G. J. Lutz, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 532, 32 pages (June 1970).

Key words: Activation analysis; element determined; matrix analyzed; pollution analysis; technique used.

The literature of the use of activation analysis of pollution samples is reindexed in detail with respect to Element Determined, Matrix Analyzed and Technique Used for precise literature searching. An author index is included.

TN533. **14-MeV neutron generators in activation analysis: A bibliography,** G. J. Lutz, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 533, 91 pages (June 1970).

Key words: Activation analysis; element determined; matrix analyzed; technique used; 14-MeV neutron generators.

The literature of 14-MeV neutron generators in activation analysis is reindexed in detail with respect to Element Determined, Matrix Analyzed and Technique Used for precise literature searching. An author index is included.

TN534. **Oceanography: A bibliography of selected activation analysis literature,** G. J. Lutz, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 534, 36 pages (June 1970).

Key words: Activation analysis; element determined; matrix analyzed; oceanography; technique used.

The literature of oceanography in activation analysis is reindexed in detail with respect to Element Determined, Matrix Analyzed and Technique Used for precise literature searching. An author index is included.

TN535. **Compilation and use of criminal court data in relation to pre-trial release of defendants. Pilot study,** J. W. Locke, R. Penn, J. Rick, E. Bunten, and G. Hare, Nat. Bur. Stand. (U.S.), Tech. Note 535, 242 pages (Aug. 1970).

Key words: Bail; criminal court data; criminal justice system; dangerousness; data collection problems and procedures; District of Columbia; judicial system; prediction research; pre-trial release; preventive detention; recidivism; statistical relationships.

A number of Pre-Trial Release studies which have been conducted during the past several years show that various measures of criminal activity while on release vary from 7.9 percent (reindictment for those indicted on felony charges) to 70 percent (rearrest of those originally arrested on a robbery charge). Little actual sentence data were available for or presented in these studies, and no personal data on the defendants or facts about the crimes themselves were shown. This document describes a pilot study of a very thorough analysis of criminal cases, including both felonies and misdemeanors, in a four week sample of cases in the District of Columbia during the first half of 1968. The method of data collection is described, together with attendant problems. Possible techniques of data presentation are shown along with criteria and relevant factors pertinent in quantifying "dangerousness." The potential for developing "dangerousness" prediction methods as a basis for decisions on pre-trial release is analyzed, with the conclusion that much work needs to be done before an effective prediction device based on a "dangerousness" criterion can be formulated.

Summary data for 712 defendants in a sample of 4 weeks taken from the first half of 1968 are presented. Comparisons are made

to show the re-arrest rates for defendants initially charged with particular classes of crime. Personal characteristics are examined to determine if any are significant predictors of recidivism. A recidivism index is formulated to give the rate of re-arrest per man-day of exposure. Robbery cases are examined in more detail.

TN536. **Disclosures on: Viscous damped wind vane; nonskid road or runway; regrooved pneumatic tire with removal inserts; device for radially positioning a rotating wheel; method for fabricating precision waveguide sections; distortion-cancelling loudspeaker system; cryogenic fluid density measurement system; and controlled-atmosphere weathering device,** D. Robbins and A. J. Englert, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 536, 25 pages (June 1970).

Key words: Accelerated weathering test; acoustic distortion, cancelling; averaging wind vane; cryogen density, measuring; distortion-cancelling loudspeakers; grooved runway; hydroplaning skidding, prevention of; loudspeaker system; photoactivated weathering test; radial positioning, wheel on shaft; rubber-surfaced road; slush cryogen density; tire groove insert; tire regrooving; waveguide, precision fabrication; waveguide, adjustable width; weathering test; wheel-shaft angle, shifting during rotation; wind vane, damped.

This Note describes and illustrates eight developments that are believed to embody interesting and unusual solutions to current problems in their fields.

TN537. **Nomographs for use in the fabrication and testing of Ge(Li) detectors,** A. H. Sher, Nat. Bur. Stand. (U.S.), Tech. Note 537, 18 pages (Aug. 1970).

Key words: Capacitance; detector resolution; effective Fano factor; Ge(Li) detector; lithium-ion drift; nomograph; oxygen concentration.

Six nomographs which can facilitate the fabrication and testing of lithium-drifted germanium gamma-ray detectors [Ge(Li) detectors] have been constructed which relate the following parameters: (1) time, temperature, applied bias, and drifted depth; (2) lithium mobility, crystal resistivity, and oxygen concentration; (3) area, capacitance, and drifted depth for planar Ge(Li) detectors; (4) drifted depth, length, and capacitance for coaxial Ge(Li) detectors; (5) total spectral resolution, system noise, and detector resolution; and, (6) detector resolution, gamma-ray energy, and effective Fano factor. The use of these nomographs is described and illustrative examples are given.

TN538. **Automated fingerprint identification,** J. H. Wegstein, Nat. Bur. Stand. (U.S.), Tech. Note 538, 33 pages (Aug. 1970).

Key words: Computerized-fingerprint-identification; fingerprint; pattern recognition.

A procedure is described for determining whether two fingerprint impressions were made by the same finger. The procedure uses the x and y coordinates and the individaul directions of the minutiae (ridge endings and bifurcations). The identity of two impressions is established by computing the density of clusters of points in $\Delta x - \Delta y$ space where Δx and Δy are the differences in coordinates that are found in going from one of the fingerprint impressions to the other. Experimental results using machine-read minutiae data are given along with results from a previously reported procedure that utilized constellations of minutiae in its matching process.

TN539. **Improvements in oscilloscopic measurements in high-speed experiments,** A. Cezairliyan, M. S. Morse, and H. A. Berman, Nat. Bur. Stand. (U.S.), Tech. Note 539, 20 pages (Oct. 1970).

Key words: High-speed measurements; high-speed recording; oscilloscopes.

Two refinements in oscilloscopic recording have been made which improve considerably the recording of isolated events in heavy current discharge studies, where substantially rectangular pulses are employed. The accuracy of the method employed has been verified experimentally to be in the region of 0.01 to 0.1 percent. The first refinement is a unit for the differential suppression of the incoming signal by an adjustable amount, and the second refinement is a system by which time markers are sent to several oscilloscopes at adjustable time intervals simultaneously with the actual incoming signal.

TN541. **Preliminary study on the characteristics and design parameters for a Mössbauer resonant detector,** J. J. Spijkerman, J. C. Travis, P. A. Pella, and J. R. DeVoe, Nat. Bur. Stand. (U.S.), Tech. Note 541, 65 pages (Jan. 1971).

Key words: Conversion electrons; iron; Mössbauer spectroscopy; resonant detector.

Progress in the design and fabrication of a resonant detector for Mössbauer spectroscopy is described. This report begins with a review of all of the methods of detection for this spectroscopy and describes the expected advantages of the resonant detector. If one uses conversion electron detection, considerable enhancement in signal to noise ratio and decrease in linewidth may be realized. Efforts to produce an iron bearing resonant material are described.

TN542. **Activities of the NBS spectrochemical analysis section July 1969 to June 1970,** B. F. Scribner, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 542, 114 pages (Nov. 1970).

Key words: Analysis; computer program; electron probe microanalysis; optical spectrometry; pre-concentration techniques; spectrochemical analysis; standard reference materials; x-ray fluorescence analysis.

Spectrochemical research activities, improvements in equipment, and applications, especially to the certification of NBS Standard Reference Materials, are summarized. In electron probe microanalysis, a comprehensive computer correction program for accurate analysis of materials relative to single elements or simple compounds was developed, an improved lithium-doped silicon detector was found to provide increased resolution, and improvements in microprobe instrumentation produced a high level of stability. Studies of procedures for correction of x-ray fluorescence measurements were made, instrumental changes resulted in marked improvement in performance reliability, and new applications were made. In optical emission spectrometry, studies were made of beryllium determination in an air pollution investigation and trace analyses were made of organic materials to parts per billion (10^{-9}) limits. Methods of pre-concentration of impurities are described for optical emission and isotope dilution spark source mass spectrometric analysis of ingot iron, botanical materials, and high purity reagents. Work on Standard Reference Materials resulted in certification of stainless steel, clays, ferrosilicon, blast furnace irons, white irons, lead bearing metal, and ductile irons. Listings are given of 18 publications and 28 talks by members of the Section during the year.

TN543. **Electrochemical analysis section: Summary of activities July 1969 to June 1970,** R. A. Durst, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 543, 92 pages (Nov. 1970).

Key words: Acidity; conductivity; coulometric analysis; electrochemical analysis; ionic activity; ion-selective electrodes; pH measurements; potentiometry; standard reference materials.

This survey of the activities of the Electrochemical Analysis Section, Analytical Chemistry Division, covers the period from July 1969 to June 1970. An attempt is made to briefly summarize a year's progress on the technical projects of the Section, to indicate the composition and capabilities of the unit as a whole, and to stress the Section's role in the mission of the Institute. Summaries of the work in each of the Section competences are given. In the area of acidity measurements, work continued on the standardization of tris(hydroxymethyl)aminomethane for use as a biologic pH buffer material and standard for clinical pH measurements. Progress toward reference standards for the calibration of ion-selective electrodes is reported including pM and pCl values for both NaCl and KCl. A study using the silver sulfide ion-selective electrode for measuring trace silver ion losses due to adsorption on selected surfaces is described. High-precision coulometry is used to determine the atomic weight of zinc, the purity of EDTA, and the stoichiometry of gallium arsenide.

TN544. **Analytical coordination chemistry section: Summary of activities, July 1969 to June 1970,** O. Menis and J. I. Shultz, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 544, 151 pages (Sept. 1970).

Key words: Bilirubin solvent extraction with β-isopropyltropolone; clinical; filter; fluorimetric standards; inert gas fusion; lead-base alloys; multi-element flame spectrometer; spectrophotometric standards; steels and metallo-organics; thermal analysis DTA Standards; trace elements-glass standards.

Progress in research and development in several areas of analytical chemistry, as related to the Standard Reference Materials program is described. Based on the need for spectrophotometric standards by clinical chemists, both solid and liquid filters for calibrating the photometric scale are being developed. Similar needs and plans are reviewed for fluorimetric quantum yield standards. Development of flame spectrometry instruments are described which include a high precision multi-element flame spectrometer for simultaneous atomic absorption and flame emission, a ratio recording double beam spectrometer, new burner designs and the evaluation of a hollow cathode designed by Grimm. The multichannel spectrometer provides for the simultaneous determination of elements such as Na, K, Ca, CaOH and Mg with Li as the internal standard, and a seventh position for background of wavelength scan, and a digital system with tape for computer calculations.

The beginning of a comprehensive study of the absorbing and non-absorbing lines in atomic absorption is presented. Description is given of homogeneity studies and the analysis of glass standards containing 60 elements at the 0.2 to 500 ppm level with a relative standard deviation of 1-2 percent. Gold, iron, manganese, nickel, potassium, rubidium and strontium were determined, without prior chemical separations by spectrophotometric or atomic absorption and flame emission methods. A precise method for the flame emission determination of aluminum in ferrous materials by derivative optical scanning is also described.

Solution complexation studies involve the reactions of metals with bilirubin and the evaluation of equilibrium constants and kinetics in solvent extraction of iron and vanadium with β-isopropyltropolone.

In the area of thermal analysis, provisional certification of potassium nitrate (SRM 756) and quartz (SRM 755) for temperature scale DTA standards, and the studies of sulfur, stearic acid and hexachloroethane for the lower temperature scale are reported. For gases in metals, improvements in inert gas fusion analysis involved instrumental modifications which permitted sample changes in less than 12 seconds. Finally, the characterization of the following Standard Reference Materials are discussed: lead-bearing alloys, SRM 53e and 1132; carbon steel, SRM 20g; stainless steel, SRM 101f; low-carbon stainless steel, SRM 166c; metallo-organic, SRM 1061c, special steels, SRM 361, 362 and 365.

TN545. **Microchemical analysis section: Summary of activities July 1969 to June 1970,** J. K. Taylor, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 545, 126 pages (Dec. 1970).

Key words: Air pollutant analysis; chemical analysis; gas analysis; microchemical analysis; microscopic analysis; polarographic analysis.

This report describes the research activities and scientific programs of the Microchemical Analysis Section of the Analytical Chemistry Division of the National Bureau of Standards, Institute for Materials Research during the period July 1969 to June 1970. General Activities are reviewed in areas of gas analysis polarography, chemical microscopy, and classical microchemical analysis. Research activities described in some detail include: preparation and analysis of carbon monoxide mixture for standard reference materials; evaluation of sulfur dioxide permeation tubes as analytical standards; polarographic methods for determination of trace elements in a number of materials; certification of urea as a microchemical standard. A chapter reviewing the state-of-the-art of analysis for air pollutants is also included.

TN 546. **Analytical Mass Spectrometry Section: Summary of activities, July 1969 to June 1970,** W. R. Shields, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 546, 120 pages (Nov. 1970).

Key words: Instrumentation; isotopic analysis; mass spectrometry; procedures.

This report describes the advances in instrumentation and the research activities of the Analytical Mass Spectrometry Section during the period July 1969 to June 1970.

Advances in instrumentation include the construction of a computer controlled mass spectrometer with appropriate interconnecting components, power supplies with greatly increased stability and the utilization of a magnetic field control.

Elements studied during this period include: B, Cu, Ag, Pb, Tl, U, Pu, K, Rb, Ni and Mo. Chemical procedures are given for Cu, Ag, Pg, Tl, U, K, Rb, Ni and Mo. Mass spectrometric procedures are given for Pb, Tl, U, K, Ni and Mo. Chemical procedures for the intercomparison of redox standards are also given.

TN547. **Organic chemistry section: Summary of activities July 1969 to June 1970,** R. Schaffer, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 547, 134 pages (Nov. 1970).

Key words: "Azobilirubin"; bilirubin; β-NAD; β-NADH; cholesterol; cortisol; D-mannitol; electron spin resonance; proton magnetic resonance; skew conformations; standard reference materials; uric acid; VMA.

This report of the Organic Chemistry Section of the National Bureau of Standard's Institute for Materials Research provides a summary of a year's scientific activity; as such, it covers both work that was completed and some that is still in progress. The development of Standard Reference Materials (SRMs) and their certification constitute a significant output that we term the sample aspect of our programs. The research component appears in the form of journal publications.

About one-half of the report concerns SRMs. Spectrophotometric measurements of bilirubin and of "azobilirubin" in simple solvents and in serum or proteins are given much attention. D-Glucose for use as a clinical standard is examined by gas-liquid chromatography and differential scanning calorimetry to ascertain changes in the proportions of the anomeric forms of the sugar during these measurements. Additional compounds for development as SRMs are cortisol, 4-hydroxy-3-methoxy-DL-mandelic acid (VMA), D-mannitol, and the reduced form of β-NAD. Some properties thus far studied on commercially available specimens are reported.

In carbohydrate research programs, the purity of 1,2:4,5-di-*O*-isopropylidene-D-fructose and the importance of using it pure for conversion into pure D-psicose are described. The proton magnetic parameters of the unquestioned, skew conformation of 3-*O*-benzoyl-1,2,4-*O*-benzylidyne-α-D-ribopyranose are analyzed. These parameters have major utility as a model for conformational analysis. Iterative analysis of p.m.r. spectra and the conformations of some D-glucose derivatives are described. Also, work is reported on cyclic polyhydroxy compounds, including oxidation, electron spin resonance, and new derivatives.

Finally, a number of other topics are described: iodination of β-diketones with periodic acid, and reactions of bilirubin, hemin, and related bile pigments; also, some work on the detection of polynitro aromatic compounds is given.

TN548. **Activation Analysis Section: Summary of activities, July 1969 to June 1970,** P. D. LaFleur and D. A. Becker, Editors, Nat. Bur. Stand. (U.S.), Tech. Notes 548, 164 pages (Dec. 1970).

Key words: Activation analysis; Cockcroft-Walton neutron generator; computer programming; NBS LINAC; NBS reactor; standard reference materials.

This survey of the activities of the Activation Analysis Section covers the period July 1969 to June 1970. An overview of the progress made by the various projects in the Section is given. A discussion of the operating characteristics of the NBS Reactor for activation analysis is given and the research activities of the various projects are discussed. Special attention is given to the many practical problems encountered by the Section during the year, and the results of the solutions to these problems, especially the analysis of Trace Elements in Glass Standard Reference Material (SRM) and of the botanical SRM. The quantitative analysis for boron using the nuclear track technique is discussed as well as extension of the analysis for uranium using this technique.

An extensive discussion of the value of 3-MeV neutrons in neutron generator activation analysis and the experimental parameters for using these neutrons is discussed. The new target and pneumatic transfer systems at the NBS LINAC for photon activation analysis are described and the application of photon activation analysis for determining thallium in glass and high purity metals and gold, manganese and iron in high purity cadmium is discussed. Research into determination of nitrogen by photon activation analysis is described.

A computer program, ALSPIS, for peak finding and integration is described and the application of a mini-computer to the Activation Analysis Section is noted.

TN549. **Separation and Purification Section: summary of activities July 1969 to June 1970,** D. H. Freeman and W. L. Zielinski, Jr., Editors, Nat. Bur. Stand. (U.S.), Tech. Note 549, 86 pages (Jan. 1971).

Key words: Air pollution; bilirubin; infrared analysis; ion exchange; liquid chromatography; purification; separation; styrene/divinylbenzene; zeolites.

This represents the report of activities for the Separation and Purification Section for fiscal year 1970. Studies on the properties of ion exchange Standard Reference Material microbeads is extended into the effect of humidity on bead volume, thermal effects on bead stability, and measurement of ion exchanger capacity. Zeolitic particles are evaluated for their potential as ion exchange microstandards. Preliminary investigations are completed for the quantitative infrared measurement of cross-linking in poly (styrene/divinylbenzene) copolymers. Light and electron microscopy are used to help reveal the heterogeneity in a test dust standard. Progress is reported in the development and understanding of analytical liquid chromatography with an increased direction toward gel chromatography. The selection of apparatus components, their performance, and their application to examination of the clinical Standard Reference Material, bilirubin, is described. Particle contamination in inorganic salts and in container walls are examined, the former by ultrafiltration and accurate light scattering measurements and the latter by microscopic methods.

TN550. **A systems programmer's guide for implementing OMNITAB II,** S. T. Peavy, R. N. Varner, and S. G. Bremer, Nat. Bur. Stand. (U.S.), Tech. Note 550, 43 pages (Nov. 1970).

Key words: ANSI FORTRAN; double precision; general-purpose computer program; implementation of OMNITAB II; labeled common; machine independent; OMNITAB II; overlay; segmentation; system parameters; transportable computer programs.

OMNITAB II is a general-purpose program which permits direct use of a computer without prior knowledge of computer languages. Every effort has been made to produce a system as machine independent as possible to make implementation of any large computer configuration relatively easy. However, there are a few modifications which may have to be made.

This Technical Note provides assistance to the systems programmer, with the task of implementing OMNITAB II, by pointing out where difficulties may occur and how to cope with them. It furthermore outlines a method for segmenting the OMNITAB II system which is very large. It is a partial documentation of the OMNITAB program.

OMNITAB II is a large system requiring a large computer. Overlay and segmentation are virtually essential. A method for segmenting OMNITAB II is outlined. The method should be useful for many computers.

TN551. **Test problems and results for OMNITAB II,** R. N. Varner and S. T. Peavy, Nat. Bur. Stand. (U.S.), Tech. Note 551, 190 pages (Dec. 1970).

Key words: Accuracy; ANSI FORTRAN; computer system implementation; examples; OMNITAB II; software; test problems.

The lack of test problems and results for many software packages is a great hindrance to both the systems programmer and the general user. In this publication a set of fifty-two test problems and results for the OMNITAB II system is provided to assist individuals in checking the implementation of the OMNITAB II program on their particular computer. The general user will also find these descriptive examples instructive in the use of OMNITAB commands.

TN552. **OMNITAB II user's reference manual,** D. Hogben, S. T. Peavy, and R. N. Varner, Nat. Bur. Stand. (U.S.), Tech. Note 552, 264 pages (Oct. 1971).

Key words: Automatic printing; Bessel functions; data analysis; data manipulation; easy and effective programming in English; list of instructions; matrix operations; numerical analysis; OMNITAB II user oriented computing system; self-teaching; statistical analysis.

OMNITAB II, a highly user-oriented system for a large com-

er, is designed to make computing easy, accurate and effec-, particularly for persons who are not programmers. It is a eral-purpose program, which can be learned quickly, for both ple and complex numerical, statistical and data analysis. OM-TAB executes instructions written in the form of simple En-h sentences. Problem-solving is further enhanced by the natu-structure of the system and its many features. OMNITAB been used successfully in government, industry and universi-across the country and in several centers abroad. The system been implemented on large computers of at least seven dif-ent manufacturers.

The original version of OMNITAB has been completely written to make it as machine independent as possible and to plement many improvements. This manual describes Version . Details are presented so that the user can easily find the cific information needed in any particular instance. PART A a simple, compact introduction to OMNITAB for people who ve had no experience using a large computer. PART B scribes the general and special features of the OMNITAB stem. PART C gives explanations, with short examples, for use of specific instructions. PART D is a complete alphabeti-list of the instructions which are in the system.

N553, Superseded by Technical Note 47.

N554. **Annotated accession list of data compilations of the NBS Office of Standard Reference Data,** H. M. Weisman and G. B. Sherwood, Nat. Bur. Stand. (U.S.), Tech. Note 554, 196 pages (Sept. 1970).

Key words: Accession list; atomic and molecular properties; chemical kinetics; colloid and surface properties; fundamental particles properties; general collections; mechanical properties; nuclear properties; solid state properties; thermodynamic and transport properties.

The National Bureau of Standards, Office of Standard Reference Data has attempted to acquire all significant reference data compilations on a worldwide basis. This publication lists the collection of documents so acquired, together with their abstracts. The documents are organized in the following categories: General Collections, Nuclear Properties (including Fundamental Particles Properties), Atomic and Molecular Properties, Solid State Properties, Chemical Kinetics, Colloid and Surface Properties, Mechanical Properties, and Thermodynamic and Transport Properties. Sources of availability for the listed publications are also provided.

N555. **Methods of measurement for semiconductor materials, process control, and devices, Quarterly Report, January 1 to March 31, 1970,** W. M. Bullis and A. J. Baroody, Jr., Editors, Nat. Bur. Stand. (U.S.), Tech. Note 555, 63 pages (Sept. 1970).

Key words: Alpha-particle detectors; aluminum wire; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; metallization; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, seventh of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal emphasis is placed on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconductor crystals; evaluation of wire bonds, metallization adhesion, and die attachment; and measurement of thermal properties of semiconductor devices and electrical properties of microwave devices. Work on related projects on silicon nuclear radiation detectors and specification of germanium for gamma-ray detectors is also described. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN556. **Development and current status of the standard nuclear instrument module (NIM) system,** L. Costrell, Nat. Bur. Stand. (U.S.), Tech. Note 556, 15 pages (October 1970).

Key words: Instrumentation; instruments; modules; nuclear; standards, NIM.

The standard Nuclear Instrument Module (NIM) system described in AEC Report TID-20893 is widely used in laboratories throughout the world. This report presents a history of the development and reviews the current status of the NIM system.

TN557. **The brake pedal force capability of adult females,** R. W. Radlinski and J. I. Price, Nat. Bur. Stand. (U.S.), Tech. Note 557, 25 pages (Oct. 1970).

Key words: Automotive braking systems; brakes; brake pedal forces; Federal Motor Vehicle Safety Standards; pedal effort; women, strength of.

A survey of the brake pedal force capability of 105 women employees at the National Bureau of Standards, Washington, D.C., was performed utilizing two stationary passenger automobiles as test vehicles. Results showed that over 50% of the test subjects could not achieve an average sustained brake pedal force of 200 lb, a value which is considered an acceptable braking system input force under certain conditions of the current Federal Motor Vehicle Safety Standard (FMVSS No. 105) for passenger vehicle braking system performance.

TN558. **Lubbock tornado: a survey of building damage in an urban area,** N. F. Somes, R. D. Dikkers, and T. H. Boone, Nat. Bur. Stand. (U.S.), Tech. Note 558, 38 pages (Mar. 1971).

Key words: Anchorage; building performance; glazing; hailstones; masonry; mobile homes; roofs; structural engineering; wind load.

The Building Research Division of the National Bureau of Standards' Institute of Applied Technology sent a three-man team to investigate the damage to buildings and other structures caused by the tornado which struck Lubbock, Texas, on May 11, 1970. The team members—the authors of this report—carried out photographic surveys on the ground and from a helicopter on the days of May 14, 15, and 16, 1970. The report is based largely on data gathered during this period but includes some data provided by other agencies and individuals whose assistance is acknowledged in the report. The report concludes that current good practice in the design and construction of buildings and mobile homes would have greatly reduced the damage observed at Lubbock. It also notes that natural disasters provide full-scale tests of buildings and urges the development of performance criteria with respect to wind loads for certain building elements.

TN559. **Spectroradiometry and conventional photometry—an interlaboratory comparison,** D. A. McSparron, K. Mohan, R. C. Raybold, R. D. Saunders, and E. F. Salewski, Nat. Bur. Stand. (U.S.), Tech. Note 559, 197 pages (Nov. 1970).

Key words: Barnes colorimeter; chromaticity coordinate; color correction; cool white fluorescent lamp; correlated color temperature; daylight fluorescent lamp; heterochromatic photometry; integrating sphere; intercomparison; luminous flux; photometry; spectroradiometry.

This report summarizes the results of a fluorescent lamp intercomparison carried out under the aegis of the National Bureau of Standards Photometry Section. The purpose of the intercomparison was to evaluate the interlaboratory precision obtainable in photometric and spectroradiometric measurements. The tests were also designed to disclose suspected systematic errors in measurement techniques.

The intercomparison consisted of five parts: (1) A homochromatic, photometric measurement of cool white fluorescent lamps and a heterochromatic, photometric measurement of a daylight fluorescent lamp and an incandescent lamp utilizing cool white fluorescent lamps as standards, all within an integrating sphere. (2) Spectroradiometric measurement of the above mentioned lamps in an integrating sphere. (3) Spectroradiometric measurement of a 25 cm section of the fluorescent lamps in a baffled enclosure. (4) An experiment designed to reveal systematic errors in heterochromatic photometry. (5) Measurement of the x and y chromaticity coordinates with a Barnes colorimeter.

TN560. **Methods of measurement for semiconductor materials, process control, and devices, quarterly report April 1 to June 30, 1970,** W. M. Bullis and A. J. Baroody, Jr., Editors, Nat. Bur. Stand. (U.S.), Tech. Note 560, 58 pages (Nov. 1970).

Key words: Alpha-particle detectors; aluminum wire; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; metallization; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, eight of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Principal emphasis is placed on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconductor crystals; evaluation of wire bonds, metallization adhesion, and die attachment; and measurement of thermal properties of semiconductor devices and electrical properties of microwave devices. Work on related projects on silicon nuclear radiation detectors and specification of germanium for gamma-ray detectors is also described. Supplementary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN561. **Unassigned.**

TN562. **A right angle ^{3}He cryostat incorporating a high field superconducting solenoid,** H. Marshak and R. B. Dove, Nat. Bur. Stand. (U.S.), Tech. Note 562, 22 pages (Dec. 1970).

Key words: ^{3}He cryostat; ^{3}He refrigerator; nuclear orientation; superconducting solenoid.

Construction and operation of a novel ^{3}He cryostat, incorporating a large superconducting solenoid mounted at right angles to the cryostat's vertical axis, is described. This new cryostat which is part of the transportable National Bureau of Standards ^{3}He refrigerator, has been used successfully for nuclear orientation studies at the Atomic Energy Research Establishment, Harwell, England.

TN563. **Surface pressure fluctuations near an axisymmetric stagnation point,** R. D. Marshall, Nat. Bur. Stand. (U.S.), Tech. Note 563, 67 pages (Aug. 1971).

Key words: Disk; pressure fluctuations; stagnation point; turbulence.

Surface pressure fluctuations on a circular disk placed normal to a turbulent air stream have been investigated. Turbulence intensities of approximately 10% were produced by a coarse grid installed at the test-section entrance. The turbulent field in t neighborhood of the disk was homogeneous and nearly isotrop

Experimental results indicate that existing linear theor which do not consider distortion of the flow fail to predict the f ture of surface pressure fluctuations on a bluff body. Only wavelengths which are large compared to the body do the theories yield satisfactory results. A strong attenuation of t high frequency components occurs as the flow stagnates. This accompanied by a transfer of energy from short to lo wavelengths. The opposite effect is observed as the flow attai a radial direction and approaches the edge of the disk. A neut wavelength which undergoes little change in energy was o served. Integral scales of surface pressure fluctuations are mu larger than the lateral integral scale of the free-stream turb lence.

Pressure-velocity correlations indicate the existence of t distinct regions, an inner region in which correlations and o timum delay times exhibit considerable change along the rad of the disk, and an outer region where there is little depender on radial distance. Maximum values of the optimum correlatio are found in the outer region. There is qualitative agreem between the experimental results and theoretical predictio which consider the effect of vortex stretching.

TN564. **Glass limit standards deposited at NBS for railw highway and airway traffic signal colors—history, permanen -and colorimetric properties,** G. W. Haupt, Nat. Bur. Sta (U.S.), Tech. Note 564, 121 pages (June 1971).

Key words: Aircraft signals; color standards; filter p manence; limit filters; railroad signals; signal colors; sig standards; spectral transmittance of glass filters; traf signals.

Signal glass limit standards for railway, highway, and aviati colors, selected by user-organizations, are on deposit at the N tional Bureau of Standards. Many duplicates of these standa have been issued by NBS.

The first standards were selected in 1931 for railway u Highway standards were adopted in 1940, and selection of av tion standards began in 1942. At the present time the NBS custodian of 63 standards for these signal colors.

Permanence of the filters is examined, based on colorimet conversions for CIE standard illuminant A derived from sp trophotometric measurements made on different instrume over periods of years.

Spectral transmittance data and the resulting colorimetric d are given for 9 illuminants ranging in distribution temperatu from 1500 to 3250 kelvins and for CIE standard illuminants and C. Figures show, for several filters of each color, the shi occurring both in chromaticity (x,y) and in redness a brightness index (u,W*) with changes in illuminant.

TN565. **ARPA-NBS program of research on high temperatu and laser materials, reporting period 1 January to 30 June, 19** A. D. Franklin and H. S. Bennett, Editors, Nat. Bur. Sta (U.S.), Tech. Note 565, 84 pages (Jan. 1971).

Key words: Aluminum oxide; band structure; borides; bi optical properties; chemical analysis; chromium ion corundum; crystal defects; crystal growth; density of stat diffusion; glass; high temperature materials; laser dama laser degradation; laser glass; laser materials; mass tra port; neodymium glass; optical properties; opto-elastic p perties; oxides; ruby; rutile; titanium; titanium dioxi transition metal.

Brief reviews are given of work performed during this repo ing period of several problems in the areas of High Temperatu Materials and Laser Materials. Under the High Temperatu

aterials extremely pure Al_2O_3 crystals have been prepared and alysed chemically with the aim of providing specimens for search on mass transport, electronic, and similar properties. xygen diffusion data on TiO_2, obtained by the gas uptake ethod, agree with literature values, and work is now proceeding developing a sectioning technique for oxygen diffusion. The tical constants of titanium have been determined over the visi- e portion of the spectrum. Soft x-ray spectra, nmr data, össbauer spectra, magnetic susceptibility, and other probes of e electronic density of states have been determined for a group diborides of the first-series transition metals (Sc, Ti, V, Cr, d Mn) and interpreted in terms of the *d*-electron contribution the density of states near the Fermi level. Both this project d the previous one on the optical properties of titanium have en completed. Under Laser Materials, the measurement of lk optical properties and chemical analyses of ruby and Nd- ass are complete. Several techniques for determining the Cr^{3+} ntent in laser ruby have been developed and shown to agree; ith these, it has been shown that very little loss of Cr^{3+} occurs hen ruby turns orange under optical (x-ray or γ-ray) irradiation. theory of laser pulse-induced damage at foreign particles in d-glass has been worked out; it suggests that detection before mage might be easiest with pulses of microsecond or longer uration. A high-power Nd-glass laser, Q-switched, has been rchased for damage studies. The beam characteristics, which ust be properly controlled for meaningful damage threshold easurements, are currently being studied.

N566. **Wet traction of tractionized tires,** A. H. Neill, Jr., Nat. Bur. Stand. (U.S.), Tech. Note 566, 14 pages (Feb. 1971).

Key words: Siping; stability; stopping distance; tires; traction; tractionizing.

A series of dynamic vehicle tests was performed at NBS to valuate the performance of tractionized or siped tires. Stopping istance and lateral breakaway data is presented from a two heel diagonally braked automobile which clearly shows that ped tires do not represent any improvement in the lateral sta- ility or stopping distance characteristics of a typical passenger utomobile.

N567. **Reactor Radiation Division annual progress report for period ending October 31, 1970,** R. S. Carter, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 567, 66 pages (Mar. 1971).

Key words: Crystal structure; diffraction; molecular structure; neutron; nuclear reactor; radiation; scattering.

The reactor has completed its first year of full power operation o it is now appropriate to review the progress made during the ast year. This report is the first annual progress report of the Reactor Radiation Division.

N568. **Simulation of air traffic control radar beacon code assignment plans. Final report,** R. D. Elbourn and J. F. Gilsinn, Nat. Bur. Stand. (U.S.), Tech. Note 568, 76 pages (Mar. 1971).

Key words: Air traffic control; beacon code assignment; digital simulation; radar beacon system.

In the Air Traffic Control Radar Beacon System transponders in the aircraft use one of 4096 identity codes when replying to interrogation from the Secondary Surveillance Radar. Two types of plans for assigning identity codes to aircraft were tested by simulating in a digital computer a peak day's IFR traffic in the USA. In one type each Air Route Traffic Control Center assigns codes independently of all the others, while in the other type a single master center makes all the code assignments for the USA. Four other types of plans are discussed, and an assignment plan of mixed type is proposed for further study. The strategy of simulation and the use of the SIMSCRIPT language are discussed in an appendix.

TN569. **Hurricane Camille—August 1969. A survey of structural damage along the Mississippi Gulf Coast,** R. D. Dikkers, R. D. Marshall, and H. C. S. Thom, Nat. Bur. Stand. (U.S.), Tech. Note 569, 71 pages (Mar. 1971).

Key words: Buildings; failure; hurricanes; mobile homes; roofs; structural engineering; tides; wind.

One week after Hurricane Camille devastated the Mississippi-Louisiana Gulf Coast with 125 mph winds and 20-ft tides on August 17, 1969, a four-man NBS team investigated the damage to buildings and other structures. This report presents photographic survey data from this investigation along with additional data on wind speeds and storm surge. Based on these data, suggestions are made pertaining to the improvement of building design and construction practices.

TN570. **Determination of deep impurities in silicon and germanium by infrared photoconductivity,** W. R. Thurber, Nat. Bur. Stand. (U.S.), Tech. Note 570, 13 pages (Mar. 1971).

Key words: Deep impurities; germanium; infrared; photoconductivity; photoresponse; semiconductors; silicon.

The feasibility of using infrared photoresponse and photoconductivity measurements to study deep impurities in germanium and silicon is examined by reviewing the literature. It is concluded that photoconductivity is useful in detecting the presence of specific impurities because each impurity has a long wavelength cut off in response associated with its ionization energy. However, when there are several deep impurities in the same specimen, it is difficult to be certain of detecting each one because some have broad cut offs and many have nearly the same ionization energies. Photoconductivity as a general technique has serious limitations for determining the total concentration of deep impurities. The equations for determining impurity concentration from the magnitude of the photoconductivity signal depend on the relative influence of deep and shallow centers. Equations are derived for several situations and experimental results from the literature are discussed for each one. Only uncompensated centers are available for photoionization and therefore the total concentration can not be obtained directly. In some situations the response due to a deep center is independent of its concentration. Other techniques for studying deep impurities are discussed briefly.

TN571. **Methods of measurement for semiconductor materials, process control, and devices, quarterly report July 1 to September 30, 1970.** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 571, 58 pages (Apr. 1971).

Key words: Alpha-particle detectors; aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; metallization; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; probe techniques (a-c); resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, ninth of a series, describes NBS activities directed toward the development of methods of measurement for semiconductor materials, process control, and devices. Work is continuing on measurement of resistivity, carrier lifetime, and electrical inhomogeneities in semiconductor crystals; specification of germanium for gamma-ray detectors; evaluation of wire bonds, metallization adhesion, and die attachment; measurement of thermal properties of semiconductor devices and electrical properties of microwave devices; and characterization of silicon nuclear radiation detectors. New effort is being started on the measurement of transit-time and related carrier transport properties in junction devices. Supple-

mentary data concerning staff, standards committee activities, technical services, and publications are included as appendixes.

TN572. **On computer performance measurement programming measuring indexing adroitness by isolating complex primes,** G. W. Reitwiesner, Nat. Bur. Stand. (U.S.), Tech. Note 572, 25 pages (Apr. 1971),

Key words: Assessment; complex; composite; computer; criteria; evaluation; Gaussian primes; indexing; measurement; performance; prime; program; test.

This writing, describing a computer performance test program, is concerned not primarily with specific measurements, but rather with a procedure for making measurement regarding specific properties of computer operation.

The program is written in a particular problem-oriented programming language; therefore assessment perforce spans the effects of the computer hardware, of the programming language, and of the intervening compiler processes.

The objective of the test is to assess adroitness in certain indexing operations. Assessment is accomplished by measuring execution time of a recursive programming loop.

The test problem was chosen as a convenient artifice to use certain specific indexing-type operations in the programming employed for solution.

The test program performs a simple computation for which the solution is completely definitive, yet for which both the solution and the time for achieving it are variable under parameters whose values are introduced as program input data.

TN573. **Application of capacitor microphones and magnetic pickups to the tuning and trouble-shooting of microelectronic ultrasonic bonding equipment,** G. G. Harman and H. K. Kessler, Nat. Bur. Stand. (U.S.), Tech. Note 573, 24 pages (May 1971).

Key words: Capacitor microphone; flip-chip; magnetic pickup; microelectronic interconnections; spider bonding; ultrasonic bonding; wire bonding.

Microelectronic ultrasonic wire bonding equipment typically welds wires to integrated circuits at frequencies between 50 and 65 kHz. Mechanical vibrations of these frequencies are difficult to measure directly and malfunctions of the system may not be recognized. Two different methods of measuring these vibrations are described. The first method involves use of a capacitor microphone and a tapered tip, and the second method use of a small magnetic pickup. Procedures are given for establishing a specific ultrasonic vibration amplitude, tuning the ultrasonic system to resonance, and diagnosing both mechanical and electrical problems in wire bonding equipment. Although these techniques and procedures were developed for ultrasonic wire bonding equipment, they are applicable to other ultrasonic welding systems of lead attachment, such as flip-chip, beam lead and spider bonding.

TN574. **ARPA-NBS program of research on high temperature materials and laser materials, reporting period July 1 to December 31, 1970,** A. D. Franklin and H. S. Bennett, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 574, 44 pages (May 1971).

Key words: Al_2O_3; crystal growth; damage threshold; glass; high temperature materials; laser; oxides; oxygen diffusion; pure materials; sapphire.

Progress reports are given for projects on the growth of ultrapure Al_2O_3 crystals, the development of a mass spectrometer-based sectioning technique for measuring oxygen diffusion in oxides, the development of a precision facility for measuring the threshold energy in a laser beam producing damage in a trans parent substance, and the study of the factors influencing thi damage threshold in glass.

TN575. **On the absorptance of cavity-type receivers,** J. C. Gei and J. C. Richmond, Nat. Bur. Stand. (U.S.), Tech. Note 57 38 pages (July 1971).

Key words: Absorptance; black coatings; cavity ab sorptance; cavity reflectance; laser-source reflectomete Parsons black; retro-reflectance.

The directional-hemispherical reflectance of a number of fl samples that had been coated with Parsons Optical Blac Lacquer procured from Thos. Parsons and Sons and The Epple Laboratory, respectively, was measured at 0.6328 and 1.15 μ with a laser-source integrating sphere reflectometer. Th reflectance varied significantly with method of application, an was significantly higher for the Eppley lacquer than for the Pa sons lacquer. The reflectance of two cavity receivers, one coate with each lacquer, was also measured. At 0.6328 μm th reflectance of the Parsons cavity was higher, but at 1.15 μm was lower. The measured reflectance of the Parsons cavity wa appreciably higher than that computed from the measure reflectance of the lacquer and the geometry of the cavity, assun ing the coating to be a perfectly diffuse reflector. Retro reflectance measurements revealed that both lacquers reflecte more radiant energy back into directions near the direction of i cidence than would a perfect diffuser of the same direction hemispherical reflectance, but the Parsons lacquer was by far th more pronounced retro-reflector. The principal conclusion that the diffuse assumption can lead to significant errors in com puting the absorptance of cavity-type receivers, when the cavit coating is in fact not diffuse.

TN576. **Computer code for the calculation of thermal neutron ab sorption in spherical and cylindrical neutron sources,** V Spiegel, Jr. and W. M. Murphey, Nat. Bur. Stand. (U.S), Tech Note 576, 25 pages (May 1971).

Key words: Manganous sulfate bath calibration of neutro sources; neutron; neutron standards.

A computer code has been written in FORTRAN IV for th calculation of thermal neutron absorption in spherical and cylin drical neutron sources. The formalism of the calculation, th structure of the computer code, a listing of the code, and som sample results are presented. The comparison of the results c this calculation to experiment appears elsewhere.

TN577. **Method of calibrating weights for piston gages,** H. L Almer, Nat. Bur. Stand. (U.S.), Tech. Note 577, 54 page (May 1971).

Key words: Balance; buoyancy; calibration; standards; sub stitution weighing; transposition weighing; true mass; uncer tainty; value.

Generally weights for piston gages have odd denominatio that are often not readily calibrated by intercomparison method Therefore, these weights are frequently calibrated by direct com parison methods. This paper presents direct comparis methods for calibrating piston gage weights for use with bo equal-arm balances and single-pan balances. Methods of estima ing the uncertainty of the values obtained are given. Also i cluded are methods of checking for blunders or gross errors.

TN578. **Determination of dynamic loads in a high-frequen direct-stress fatigue machine,** D. C. Robinson, Nat. Bur. Stan (U.S.), Tech. Note 578, 24 pages (June 1971).

Key words: Dynamic loads; dynamometer; fatigue machin

A refined test procedure is given for accurately recording th dynamic signals from instrumented test bars used to measu

ads during simulated fatigue tests. Loads indicated by the load ansducer of a direct-stress fatigue machine are compared with ose determined from these instrumented test bar specimens hich have been calibrated under static conditions. An applica-n of this procedure is described for a resonant, electromag-tic, direct-stress fatigue machine having an optical dynamome-r for indicating programmed loads. The variables investigated ere the operating frequency, cyclic load and specimen stiffness. addition, the influence of test fixture mass on the load mea-rements was determined at one test frequency. The mean ads indicated by the instrumented test bars are compared with ose indicated by the dynamometer to determine the errors in ad measurements under various test conditions.

N579. **Testing of cover glasses for hemacytometer chambers,** J. S. Beers, Nat. Bur. Stand. (U.S.), Tech. Note 579, 7 pages (Sept. 1971).

Key words: Cover glass, test method for; hemacytometer; interferometry; planarity.

If cover glasses used with hemacytometer chambers are not ufficiently flat, a volume error, causing erroneous blood cell ounts, may be introduced in the chamber. This document escribes a method of testing cover glasses for conformity to a lanarity specification.

N580. **Unassigned.**

TN582. **Activities of the NBS Spectrochemical Analysis Section, July 1970 to June 1971,** K. F. J. Heinrich and S. D. Rasberry, Nat. Bur. Stand. (U.S.), Tech. Note 582, 126 pages (Jan. 1972).

Key words: Analysis; computer program; electron probe; microanalysis; optical spectrometry; pre-concentration techniques; spectrochemical analysis; standard reference materials; x-ray fluorescence analysis.

Spectrochemical research activities, improvements in equip-nent and applications, especially to the certification of NBS Standard Reference Materials, are summarized. In optical emis-ion spectroscopy, studies have been carried out on a modified as-sheath arc excitation source. Application has been made of his source and several other conventional excitation sources to analytical problems related to both standard reference materials and other materials being investigated at NBS. Newly derived computation procedures for quantitative x-ray fluorescence anal-ysis are described as well as new instrumentation added for x-ray spectrochemical studies. In electron probe microanalysis, research and new instrumentation has been directed to improved detection limits and quantitation; special emphasis has been given to methods for small particles and biological thin cuts. Methods of pre-concentration of impurities have been advanced and applied, in some cases at parts per billion (10^{-9}) limits, to water pollution, river sediment specimens. Mercury, cadmium, and lead were among the elements determined. Work on Standard Reference Materials resulted in certification of several special steels, several high temperature alloys, a high-silicon steel and a titanium alloy, among others. Listings are given of 8 publications and 25 talks by members of the Section during the year.

TN583. **Electrochemical Analysis Section: Summary of activities, July 1970 to June 1971,** R. A. Durst, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 583, 113 pages (Feb. 1973) 75 cents, SD Catalog No. C13.46:583.

Key words: Acidity; coulometric analysis; electrochemical analysis; ionic activity; ion-selective electrodes; pH measurements; polarography; potentiometry; Standard Reference Materials.

This survey of the activities of the Electrochemical Analysis Section, Analytical Chemistry Division, covers the period from July 1970 to June 1971. An attempt is made to briefly summarize a year's progress on the technical projects of the Section, to indicate the composition and capabilities of the unit as a whole, and to stress the Section's role in the mission of the Institute. Summaries of the work in each of the Section competences are given. In the area of acidity measurements, work was completed on the standardization of tris(hydroxymethyl)aminomethane for use as a biologic pH buffer material and standard for clinical pH measurements. High-precision coulometry is used to determine the atomic weight of zinc, the stoichiometry of gallium arsenide, and the purity of KCl and NaCl. Polarography is used to determine trace elements in a variety of environmental samples and Standard Reference Materials.

TN584. **Analytical Coordination Chemistry Section: Summary of activities July 1970 to June 1971,** O. Menis and J. I. Shultz, Editors, Nat. Bur. Stand. (U.S.), Tech. Note 584, 175 pages (Dec. 1971).

Key words: Aluminum in steel; bilirubin; DTA standards; fluorescence filters Tl(I), Ce(III), Pb(II); glass filters (SRM 930); mercury in botanical; quantum efficiencies.

Progress in research in spectrophotometry, spectrofluorometry, flame emission, atomic absorption, thermal analysis and related programs is described. Efforts to improve accuracy of spectrophotometric measurements led to the construction of a high accuracy spectrophotometer, certification of glass filters, establishment of a more accurate value for molar absorptivity of the acid dichromate system, and the evaluation of spectrally neutral filters of interest for automation in clinical studies. The linearity of the single beam spectrophotometer was calibrated by the light addition technique. Glass filters were calibrated at 4 wavelengths with an uncertainty of 0.5 percent. Data for the dichromate system in perchloric acid led to new values for the dimerization equilibrium constant.

Studies were made of new fluorescence filters incorporating Ti(I), Ce(III), Pb(II) and rare earths in a variety of glass matrices. Quantum efficiencies of Tl in KCl and Eu in a silicate matrix were determined.

Developments in instrumentation led to increased sensitivity and improved precision and accuracy by flame spectroscopy. Mg, Ca, K and Na were determined with the multichannel spectrometer. A newly designed optical system and an ultrasonic spraying system provided increased signal and efficiency. The repetitive optical scan of flame emission overcame matrix and flame background problems for the determination of aluminum in steel. Certification was made on eight new materials in cooperation with the International Confederation on Thermal Analysis.

TN585. **Microchemical Analysis Section: Summary of activities, July 1970 to June 1971,** J. K. Taylor, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 585, 77 pages (Jan. 1972).

Key words: Air pollution analysis; carbon monoxide; fire research; microchemical analysis; nitrogen dioxide; ozone; particulate analysis; sulfur dioxide.

This report describes the scientific program of the Microchemical Analysis Section of the Analytical Chemistry Division of the National Bureau of Standards, Institute for Materials Research during July 1970 to June 1971. General activities are reported in the areas of air pollution measurement standards including both gases and particulates, in the field of microchemical analysis, in fire research and in electrochemical analysis performed under an international research grant pro-

gram. A sulfur dioxide standard reference material for use in monitoring ambient atmosphere, and the initial work on a similar standard for stationery sources are described. Research activities on potential standard reference materials for ozone, nitrogen dioxide, and carbon monoxide are also described.

TN587. **Organic Chemistry Section: Summary of activities, July 1970 to June 1971,** R. Schaffer, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 587, 131 pages (Aug. 1972).

Key words: Bilirubin; cholesterol; cortisol; e.s.r.; D-mannitol; NADH; n.m.r.; purity; SRM; Standard Reference Materials; VMA.

This report of the Organic Chemistry Section of the National Bureau of Standard's Institute for Materials Research provides a summary of a year's scientific activity; as such, it covers both work that was completed and some that is still in progress. The development of Standard Reference Materials (SRM's) and their certification, and journal publications describing aspects of that work, as well as other research activities, are the output of the Section.

In the SRM category, the major subjects of this report are bilirubin, cholesterol, cortisol, D-glucose, 4-hydroxy-3-methoxy-DL-mandelic acid (VMA), D-mannitol, and the reduced form of nicotinamide adenine dinucleotide (NADH).

Studies concerning carbohydrates include synthetic work with D-psicose, n.m.r. employing internuclear double-resonance, and mass spectroscopy of 6-deoxy-1,2:3,5-di-*O*-isopropylidene-α-D-glucose, spectroscopic studies of derivatives of 6-amino-6-deoxy-D-glucose-6-^{15}N (employing mass spectrometry, Fourier-transform, ^{13}C-n.m.r. and heteronuclear, ^{15}N indor techniques), and *p*-bromophenylosotriazoles of inositols.

Other research utilized e.s.r. and involved periodic acid oxidation of azines, solid-state oxidation of benzenehexol on active manganese dioxide, and the formation of stable radical-anions from glyoxal bis(phenylhydrazone).

TN589. **Separation and Purification Section: Summary of activities—July 1970 to June 1971,** D. H. Freeman and W. L. Zielinski, Jr., Editors, Nat. Bur. Stand. (U.S.), Tech. Note 589, 64 pages (Oct. 1971).

Key words: Clinical Standard Reference Materials; fraction collecting; gas chromatography; interactive gels; liquid chromatography design; nitrilotriacetic acid.

This is the annual progress report on the activities of the Separation and Purification Section. During the past year our studies in liquid chromatography, its application, control, and systems design were continued at an accelerated rate. Mobile phase flow was treated as an analogy to current in direct current circuitry, following removal of liquid pulses generated by a piston pump. A sophisticated, yet simple and inexpensive liquid chromatograph design is fully described. This design has been incorporated into all liquid chromatography studies being conducted in this Section. The operating parameters of this system design are discussed. The development of the underlying theory and synthesis procedures for interactive gels has led to the control and prediction of solute retention, selectivity, and a magnified column capacity for use in fraction collection and ancillary characterization of solute impurities in clinical Standard Reference Materials. A gas chromatographic method is described for the analysis of nitrilotriacetic acid based upon the formation of its trisilyl ester derivative.

TN590. **A preliminary design of a data retrieval language to handle a generalized data base: DRL,** E. Fong, Nat. Bur. Stand. (U.S.), Tech. Note 590, 26 pages (July 1971).

Key words: Data base; data retrieval; data structure; information storage and retrieval; language extension; preprocessor; programming language.

DRL (Data Retrieval Language) is a high-level programming language for information retrieval. The language includes a data description language which can describe fixed-length hierarchical data structures, and DRL includes a data retrieval statement whereby a user can retrieve data by specifying conditions on the data value. DRL also has an environment declaration statement in which the user can indicate specific peripheral devices by unit number for files. The rest of the language consists of an operation repertory of input-output functions and other data manipulations.

DRL is implemented as a preprocessor to FORTRAN V on the UNIVAC 1108, under EXEC II Operating system. Keywords act as triggers and are replaced by blocks of FORTRAN code.

The purpose of this project is to investigate the design of an information retrieval language to handle a generalized data base. The DRL system consists of a set of primitives utilizing both compile-time macros and run-time subroutines. These primitives are embedded in a high-level procedure-oriented programming language—the "host language"—FORTRAN in this case. These primitives form a base upon which a class of languages can be defined.

TN591. **A technique for measuring the surface temperature of transistors by means of fluorescent phosphor,** D. J. Brenner, Nat. Bur. Stand. (U.S.), Tech. Note 591, 49 pages (July 1971).

Key words: Surface temperature; temperature measurement; temperature-sensitive phosphor; thermographic phosphor; transistor-chip temperature.

A technique that uses temperature-sensitive phosphor (TSP) to make quantitative measurements of transistor-chip surface temperatures over the range of 170-210 °C is described. The experimental procedure consisted of depositing a thin coating of phosphor on uncapped power transistors, and then photographing the visible fluorescence generated under near-ultraviolet (uv) excitation. The cooler regions produced a brighter fluorescence than the hotter areas. The surface temperatures of operating transistors were determined by comparing, on a point-by-point basis, the photographic density of operating photographs to the density of a family of calibration photographs. Repeated temperature measurements always fell within a 4 °C overall error range when the phosphor surface was scanned with a 25×25 μm aperture. The error band dropped to less than 2 °C when a 50×50 μm aperture was used. Coarseness of the phosphor coating seemed to limit spacial resolution to about 25 μm. Any narrow temperature range between 20 and 400 °C can probably be measured by selecting a suitable level of uv irradiation and/or a suitable phosphor.

TN592. **Methods of measurement for semiconductor material process control, and devices, quarterly report October 1 to December 31, 1970,** W. M. Bullis, Editor, Nat. Bur. Stand. (U.S.), Tech. Note 592, 72 pages (Aug. 1971).

Key words: Alpha-particle detectors; aluminum wire; base transit time; carrier lifetime; die attachment; electrical properties; epitaxial silicon; gamma-ray detectors; germanium; gold-doped silicon; metallization; methods of measurement; microelectronics; microwave devices; nuclear radiation detectors; probe techniques (a-c); resistivity; semiconductor devices; semiconductor materials; semiconductor process control; silicon; thermal resistance; thermographic measurements; ultrasonic bonder; wire bonds.

This quarterly progress report, tenth of a series, describes

S activities directed toward the development of methods of asurement for semiconductor materials, process control, and ices. Significant accomplishments during this reporting iod include successful application of the surface photovoltage nnique, a non-contacting method, to the measurement of car- diffusion length in silicon epitaxial layers and development a novel, but simple, method for measurement of acceleration l terminal angular velocity of a photoresist spinner. Work is ntinuing on measurement of resistivity, carrier lifetime, and ctrical inhomogeneities in semiconductor crystals; specifica- n of germanium for gamma-ray detectors; evaluation of wire nds, metallization adhesion, and die attachment; measurement hermal properties of semiconductor devices, transit-time and ated carrier transport properties in junction devices, and elec- al properties of microwave devices; and characterization of con nuclear radiation detectors. Supplementary data concern- staff, standards committee activities, technical services, and blications are included as appendixes.

N593. **Wire-bond electrical connections: testing, fabrication and degradation-A bibliography 1957-1971,** H. A. Schafft, Nat. Bur. Stand. (U.S.), Tech. Note 593, 58 pages (Jan. 1972).

Key words: Bibliography; degradation (wire-bond); discrete devices; electrical interconnection; fabrication (wire-bond); failure (wire-bond); hybrid circuits; integrated circuits; microelectronics; reliability; testing (wire-bond); wire-bond.

More than 245 papers relevant to wire-bond type electrical in- connections used in microelectronic and low-power discrete d hybrid devices are listed together with key words. The bliographic search concentrated on compiling papers which ap- ared in the period from 1965 to 1970, inclusive. The selection papers was generally limited to those that were pertinent to re-bonds where the wire diameter is less than about 50 μm (2 ils) and where the wire is bonded by either thermocompressive ultrasonic means. Two indexes are provided: (1) an Author dex and (2) a Key Word Index. The latter includes a tabulation the literature citations.

N594-1. **Optical radiation measurements: Fundamental principles of absolute radiometry and the philosophy of this NBS program (1968 to 1971),** J. Geist, Nat. Bur. Stand. (U.S.), Tech. Note 594-1, 59 pages (June 1972).

Key words: Absolute detector radiometry; electrically calibrated detectors; International Pyrheliometric Scale; irradiance; radiometry.

The philosophy of the present NBS program in realizing a cale of total irradiance with electrically calibrated (absolute) de- ectors, a theoretical analysis of the sources of error in such a cale realization, a description of the electrically calibrated de- ector developed from 1968 to 1971, and participation in the hird International Pyrheliometer Comparison are presented.

N594-2. **Optical radiation measurements: Photometric instrumentation and research (1970 to 1971),** E. F. Zalewski, A. R. Schaefer, K. Mohan, and D. A. McSparron, Nat. Bur. Stand. (U.S.), Tech. Note 594-2, 44 pages (Sept. 1972).

Key words: Instrumentation; lamp orientation; lamp power circuitry; lamp stability; photodetector amplifier; photometry.

This document was written primarily to serve two purposes. First, some of the basic instrumentation which has recently been developed for use in photometry at NBS is described. The design and application of photodetector amplifiers, lamp power circuitry, and mechanical instrumentation are discussed. Second, three photometric experiments are described: the stability testing of some flux lamps and intensity lamps and the determination of the dependence of relative intensity on orientation. These experiments and their conclusions have proven useful in pointing out areas which need further investigation and in planning the directions of future work.

TN594-3. **Optical radiation measurements: Photometric calibration procedures,** V. I. Burns and D. A. McSparron, Nat. Bur. Stand. (U.S.), Tech. Note 594-3, 35 pages (Nov. 1972).

Key words: Calibration procedures; color temperatures; luminous flux; luminous intensity; photometry; uncertainty.

The National Bureau of Standards supplies calibrations of luminous intensity, luminous flux and color temperature on a routine basis. The procedures, equipment, and techniques used to perform these calibrations as of October 1972 are described. Details of the uncertainty information currently available, including estimates and procedures for determining uncertainties of the reported values, are also presented.

TN594-4. **Optical radiation measurements: The impact of radiometry and photometry and the role of NBS,** B. Steiner, Nat. Bur. Stand. (U.S.), Tech. Note 594-4, 56 pages (Mar. 1973) 80 cents, SD Catalog No. C13.46:594-4.

Key words: Agriculture; clinical analysis; economic impact; energy crisis; meteorology; photometry; phototherapy; pollution; radiometry; remote sensing.

Serious measurement discrepancies universally plague quantitative measurement in the electro-optics industry. The impact of the resulting problems is reviewed and the role of NBS explored. The measurement discrepancies arise chiefly through the recent explosive expansion of this industry. The growth has precipitated a complex development in the variety and accuracy of measurements required. The impact of problems in optical radiation measurement falls in many areas. One is the increasing Federal responsibility for public life defined in recent legislation. Another is the influence of good optical radiation measurement on the technical development of the electro-optics industry. The impact of these measurements on a number of public issues is reviewed: public health, public safety, the energy crisis, meteorology, pollution, agriculture, crime prevention, and surveillance from air and space. The economic impact of improved measurement both on a fair domestic market and on the balance of payments operates through unit production cost, quality control, product improvement, and innovation. Leadership by NBS has been urged by the industry not only in fulfillment of its legislative responsibility but also to permit the focus of elaborate and impartial resources on the complex problem of optical radiation measurement. In keeping with its mission to help improve industrial technology and the competitiveness of American industry, NBS has an opportunity of major proportions in the electro- optics industry. Leaders of this industry are calling for NBS initiatives to resolve many of the measurement problems now hindering further progress.

TN594-5. **Optical radiation measurements: Stability and temperature characteristics of some silicon and selenium photodetectors,** K. Mohan, A. R. Schaefer, and E. F. Zalewski, Nat. Bur. Stand. (U.S.), Tech. Note 594-5, 16 pages (June 1973) 35 cents, SD Catalog No. C13.46:594-5.

Key words: Fatigue; light memory; photocells; photodiodes; photometry; radiometry; selenium; silicon; stability; temperature dependence.

This paper describes the comparison of some characteristics of selenium barrier layer photocells and silicon PIN and PN type photodiodes operated in the photovoltaic or nonbiased mode. The work was done to study the suitability of these detectors specifically for goniometric measurements of flux and possibly

for other photometric (or radiometric) measurements. The characteristics studied were the stability of detector output over approximately twenty hours, fatigue or light memory effects over short periods of time, and the temperature dependence of detector output.

TN594-6. **Optical radiation measurements: The present state of radiometry and photometry,** B. Steiner, Nat. Bur. Stand. (U.S.), Tech. Note 594-6, 56 pages (Mar. 1974) SD Catalog No. C13.46:594-6.

Key words: measurement system; photometry; professional societies; radiometry; standards.

The electro-optics industry and the public that depends on it are part of an informal but influential system for optical radiation measurement. The growth of this industry and of public concerns related technically to it have put severe new strains on this measurement system. The system itself must therefore be analyzed. The state of the art, on which the measurement system depends, is surveyed in terms of basic measurement parameters. The measurement system is analyzed in terms of its three basic components: the flow of physical standards, the generation of procedural standards, and the funding framework. The roles of the professional society and of the Council for Optical Radiation Measurement are reviewed. New requirements of the system are identified. Finally, the methodology of the study is reviewed in detail.

TN594-7. **Optical radiation measurements: Approximate theory of the photometric integrating sphere,** W. B. Fussell, Nat. Bur. Stand. (U.S), Tech. Note 594-7, 39 pages (Mar. 1974) SD Catalog No. C13.46:594-7.

Key words: illuminance distribution; integrating sphere; lamp comparisons; photometric accuracy; photometry; total luminous flux.

An approximate mathematical theory of the photometric integrating sphere is developed. The analysis is accurate to the first order in the ratio of the baffle area to the sphere wall area. The sphere is assumed to be occupied by a circular baffle and a spherical lamp; the centers of the baffle and the lamp lie on a diameter of the sphere. The surfaces of the sphere and the baffle are assumed to reflect in a uniformly diffuse manner. The lamp is assumed to absorb a fraction of the radiation incident upon it, and to transmit (or specularly reflect) the remainder. The luminance distribution at the sphere window is derived for a general source input at any point of the sphere wall. A model lamp illuminance distribution is assumed, and a formula for the fractional error in comparing the total luminous fluxes of two lamps in the integrating sphere, is derived. The physical significance of the formula is described.

TN594-8. **Tables of diffraction losses,** W. B. Fussell, Nat. Bur. Stand. (U.S.), Tech. Note 594-8, 39 pages (June 1974) SD Catalog No. C13.46:594-8.

Key words: diffraction; diffraction losses; Fresnel diffraction; Kirchhoff diffraction theory; photometry; radiometry; scalar diffraction theory.

Tables of diffraction losses are given for a range of typical experimental geometries for wavelengths from 0.2 to 100 micrometers. The scaling relationships for the diffraction losses for varying wavelengths and geometries are also given, and sample calculations are presented. General formulas are given for the diffraction losses; the formulas are derived from the Kirchhoff scalar paraxial diffraction theory. The accuracy of the tabulated values is estimated.

TN594-9. **Optical radiation measurements: Describing spectrophotometric measurements,** W. H. Venable, Jr., and J. J. Hsia, Nat. Bur. Stand. (U.S.), Tech. Note 594-9, 49 pa (Nov. 1974) SD Catalog No. C13.46:594-9.

Key words: accuracy; appearance; colorimetry; definit of spectrophotometry; error analysis; photometry; radiat transfer; reflectance; scattering; spectrophotometry; tra mittance.

A general method is presented to describe spectrophotome measurements mathematically. All space is divided into inst ment space or sample space. Idealized absolute and relative m surements are defined at the boundary between the instrum and sample space by four descriptors: a radiance input L, a sc tering function S, a relative responsivity R, and a scaling funct K. Real measurements are also defined at the boundary described by these four descriptors, and general expressions fractional error are derived. A 45-degree, 0-degree reflecta measurement is used as a specific example to illustrate an ap cation of this method to describing measurements and perfo ing an error analysis.

TN594-10. **Optical radiation measurements: The NBS 20-, and 85-degree specular gloss scales,** J. J. Hsia, Nat. Bur. Sta (U.S.), Tech. Note 594-10, 32 pages (July 1975) SD Cata No. C13.46:594-10.

Key words: accuracy; appearance; error analysis; gl photometry; reflectance; scattering; spectrophotome specular gloss.

The 20-, 60-, and 85-degree specular gloss scales established at NBS with an accuracy of about one half gloss u This is one of many programs of the spectrophotometry grou the Optical Radiation Section of NBS directed toward impro the accuracy and assurance of spectrophotometric meas ments made throughout the scientific and industrial commun

The specular gloss scales are established through a uni technique employing polarized light flux both parallel and pendicular to the plane of incidence. General calibration ec tions are derived. NBS instrumentation and measurem procedures are described. Instrument calibration and e analyses are performed. Some of the analyses can also be app to reflectance measurements in general.

TN594-11. **Optical radiation measurements: Development o NBS reference spectrophotometer for diffuse transmittance reflectance,** W. H. Venable, Jr., J. J. Hsia, and V. R. Weid *Nat. Bur. Stand. (U.S.), Tech. Note 594-11,* 47 pages (1976) SD Catalog No. C13.46:594-11.

Key words: bidirectional reflectance factor; dif reflectance; diffuse transmittance; reflectance; s trophotometry.

A new reference spectrophotometer, designed primarily the analysis of diffuse transmittance and reflectance, has b developed in the Institute for Basic Standards at NBS. spectrophotometer consists of a broad band monochrom with optional bandpasses of 2, 5, 10, and 20 nanometers. exit aperture of the monochromator is provided with special ror optics to collimate and switch the beam for optional use reference or sample beam. These collimated beams are dire into a dark room where a variety of sample mounts, light gat ing devices, and detectors can be installed. Measurements which provisions have been made or are planned incl directional-hemispherical reflectance of solids, liquids, and p ders, directional-hemispherical reflectance as a function of a of incidence, diffuse transmittance, haze, and bidirecti reflectance factor. This technical note describes the design of instrument in detail, and gives the results of the performa tests and detailed error analyses which have been carried ou date.

TN594-12. **Optical radiation measurements: The translucent blurring effect—Method of evaluation and estimation,** J. J. Hsia, *Nat. Bur. Stand. (U.S.), Tech. Note 594-12,* 31 pages (Oct. 1976) SD Catalog No. C13.46:594-12.

Key words: blurring effect; edge loss; error analysis; flux loss; plastics; reflectance; scattering; spectrophotometry; translucency; transmittance; Vitrolite glass.

The translucent phenomenon which causes flux loss in the spectrophotometric measurement is described. Methods for mathematically evaluating the flux loss are examined, and experimental methods using laser and conventional light sources are described. A widely used Vitrolite glass standard is employed to demonstrate the error estimation and correction.
